Contents

1 Before You Start.....	1
1.1 Overview.....	1
1.2 API Calling.....	1
1.3 Concepts.....	1
1.4 Endpoints.....	2
1.5 Project ID and Account ID.....	4
1.6 Instance ID and Workspace ID.....	5
1.7 Constraints.....	5
2 API Overview.....	6
2.1 DataArts Migration API Overview.....	6
2.2 DataArts Factory API (V1) Overview.....	9
2.3 DataArts Factory API (V2) Overview.....	13
2.4 DataArts Architecture API Overview.....	15
2.5 DataArts Quality API Overview.....	34
2.6 DataArts DataService API Overview.....	38
3 Calling APIs.....	47
3.1 Making an API Request.....	47
3.2 Authentication.....	53
3.3 Response.....	55
4 DataArts Migration APIs.....	57
4.1 Cluster Management.....	57
4.1.1 Querying Cluster Details.....	57
4.1.2 Deleting a Cluster.....	65
4.1.3 Querying All AZs.....	69
4.1.4 Querying Supported Versions.....	74
4.1.5 Querying Version Specifications.....	79
4.1.6 Querying Details About a Flavor.....	84
4.1.7 Querying the Enterprise Project IDs of All Clusters.....	89
4.1.8 Querying the Enterprise Project ID of a Specified Cluster.....	94
4.1.9 Query a Specified Instance in a Cluster.....	98
4.1.10 Modifying a Cluster.....	104
4.1.11 Restarting a Cluster.....	109

4.1.12 Starting a Cluster.....	115
4.1.13 Stopping a Cluster (To Be Taken Offline).....	119
4.1.14 Creating a Cluster.....	122
4.1.15 Querying the Cluster List.....	133
4.2 Job Management.....	142
4.2.1 Querying a Job.....	142
4.2.2 Deleting a Job.....	154
4.2.3 Modifying a Job.....	158
4.2.4 Creating and Executing a Job in a Random Cluster.....	177
4.2.5 Stopping a Job.....	198
4.2.6 Creating a Job in a Specified Cluster.....	202
4.2.7 Starting a Job.....	221
4.2.8 Querying Job Status.....	224
4.2.9 Querying Job Execution History.....	230
4.3 Link Management.....	236
4.3.1 Creating a Link.....	236
4.3.2 Querying a Link.....	248
4.3.3 Deleting a Link.....	255
4.3.4 Modifying a Link.....	259
4.4 Public Data Structures.....	271
4.4.1 Link Parameter Description.....	271
4.4.1.1 Link to a Relational Database.....	271
4.4.1.2 Link to OBS.....	276
4.4.1.3 Link to HDFS.....	277
4.4.1.4 Link to HBase.....	280
4.4.1.5 Link to CloudTable.....	284
4.4.1.6 Link to Hive.....	286
4.4.1.7 Link to an FTP or SFTP Server.....	289
4.4.1.8 Link to MongoDB.....	290
4.4.1.9 Link to Redis.....	291
4.4.1.10 Link to Kafka.....	292
4.4.1.11 Link to DIS.....	294
4.4.1.12 Link to Elasticsearch/Cloud Search Service.....	295
4.4.1.13 Link to DLI.....	296
4.4.1.14 Link to DMS Kafka.....	297
4.4.2 Source Job Parameters.....	299
4.4.2.1 From a Relational Database.....	299
4.4.2.2 From Object Storage.....	301
4.4.2.3 From HDFS.....	307
4.4.2.4 From Hive.....	314
4.4.2.5 From HBase/CloudTable.....	315
4.4.2.6 From FTP/SFTP.....	317

4.4.2.7 From HTTP/HTTPS.....	323
4.4.2.8 From MongoDB/DDS.....	324
4.4.2.9 From Redis.....	326
4.4.2.10 From DIS.....	328
4.4.2.11 From Kafka.....	329
4.4.2.12 From Elasticsearch/Cloud Search Service.....	331
4.4.3 Destination Job Parameters.....	332
4.4.3.1 To a Relational Database.....	332
4.4.3.2 To OBS.....	335
4.4.3.3 To HDFS.....	341
4.4.3.4 To Hive.....	345
4.4.3.5 To HBase/CloudTable.....	346
4.4.3.6 To DDS.....	349
4.4.3.7 To Elasticsearch/Cloud Search Service.....	350
4.4.3.8 To DLI.....	352
4.4.3.9 To DIS.....	353
4.4.4 Job Parameter Description.....	354
5 DataArts Factory APIs (V1).....	359
5.1 Script Development APIs.....	359
5.1.1 Creating a Script.....	359
5.1.2 Modifying a Script.....	363
5.1.3 Querying Script Details.....	368
5.1.4 Querying a Script List.....	372
5.1.5 Querying the Execution Result of a Script Instance.....	376
5.1.6 Deleting a Script.....	379
5.1.7 Executing a Script.....	381
5.1.8 Stopping Executing a Script Instance.....	383
5.2 Resource Management APIs.....	384
5.2.1 Creating a Resource.....	385
5.2.2 Modifying a Resource.....	387
5.2.3 Querying Resource Details.....	390
5.2.4 Deleting a Resource.....	392
5.2.5 Querying a Resource List.....	393
5.3 Job Development APIs.....	396
5.3.1 Creating a Job.....	396
5.3.2 Modifying a Job.....	423
5.3.3 Viewing a Job List.....	448
5.3.4 Viewing Job Details.....	451
5.3.5 Viewing a Job File.....	476
5.3.6 Exporting a Job.....	478
5.3.7 Batch Exporting Jobs.....	480
5.3.8 Importing a Job.....	482

5.3.9 Executing a Job Immediately.....	486
5.3.10 Starting a Job.....	488
5.3.11 Stopping a Job.....	490
5.3.12 Deleting a Job.....	491
5.3.13 Stopping a Job Instance.....	493
5.3.14 Rerunning a Job Instance.....	494
5.3.15 Viewing Running Status of a Real-Time Job.....	496
5.3.16 Viewing a Job Instance List.....	499
5.3.17 Viewing Job Instance Details.....	503
5.3.18 Querying System Task Details.....	508
5.4 Connection Management APIs (To Be Taken Offline).....	511
5.4.1 Creating a Connection (to Be Taken Offline).....	511
5.4.2 Querying a Connection List (to Be Taken Offline).....	520
5.4.3 Querying Connection Details (to Be Taken Offline).....	522
5.4.4 Modifying a Connection (to Be Taken Offline).....	525
5.4.5 Deleting a Connection (to Be Taken Offline).....	527
5.4.6 Exporting Connections (to Be Taken Offline).....	528
5.4.7 Importing Connections (to Be Taken Offline).....	530
6 DataArts Factory APIs (V2).....	533
6.1 Job Development APIs.....	533
6.1.1 Creating a PatchData Instance.....	533
6.1.2 Querying PatchData Instances.....	537
6.1.3 Stopping a PatchData Instance.....	541
6.1.4 Changing a Job Name.....	542
6.1.5 Querying Release Packages.....	544
6.1.6 Querying Details About a Release Package.....	549
6.1.7 Configuring Job Tags.....	553
6.1.8 Querying Alarm Notifications.....	555
6.1.9 Releasing Task Packages.....	558
6.1.10 Canceling Task Packages.....	561
6.1.11 Querying the Instance Execution Status.....	562
6.1.12 Querying Completed Tasks.....	565
6.1.13 Querying Instances of a Specified Job.....	567
7 DataArts Architecture APIs.....	573
7.1 Overview.....	573
7.1.1 Overview Statistics.....	573
7.1.2 Model Statistics.....	581
7.1.3 Relational Modeling Statistics.....	601
7.1.4 Standard Coverage Statistics.....	615
7.2 Information Architecture.....	636
7.2.1 Querying Information About Multiple Types of Tables.....	636
7.3 Data Standards.....	666

7.3.1 Obtaining Data Standards.....	666
7.3.2 Creating a Data Standard.....	685
7.3.3 Deleting Data Standards.....	716
7.3.4 Modifying Data Standards.....	723
7.3.5 Viewing Data Standard Details.....	756
7.3.6 Associated Attributes and Data Standards.....	772
7.4 Data Sources.....	780
7.4.1 Obtaining Data Connection Information.....	780
7.5 Process Architecture.....	786
7.5.1 Obtain all BPA directory trees.....	786
7.5.2 Querying the BPA List.....	794
7.5.3 Create BPA.....	802
7.5.4 Modified the process architecture.....	811
7.5.5 Delete BPA.....	820
7.5.6 Search for BPA Details.....	827
7.6 Data Standard Templates.....	835
7.6.1 Querying a Data Standard Template.....	835
7.6.2 Creating a Data Standard Template.....	850
7.6.3 Modifying a Data Standard Template.....	860
7.6.4 Deleting a Data Standard Template.....	870
7.6.5 Standard Template for Initializing Data.....	877
7.7 Approval Management.....	899
7.7.1 Obtaining an Application.....	899
7.7.2 Withdrawing an Application.....	915
7.7.3 Application Processing.....	921
7.7.4 Batch Publish.....	930
7.7.5 Taking Services Offline in Batches.....	943
7.7.6 Create Approver.....	956
7.7.7 Querying the Approver List.....	964
7.7.8 Delete Approver.....	972
7.7.9 Deleting an Entity.....	978
7.7.10 Obtain the difference between the displayed information and the released entity.....	985
7.8 Subject Management.....	1005
7.8.1 Searching for a Topic List.....	1005
7.8.2 Deleting a Topic.....	1018
7.8.3 Creating a topic.....	1025
7.8.4 Changing a topic.....	1041
7.8.5 Obtaining Topic Tree Information.....	1057
7.8.6 Find Topic List (New).....	1097
7.8.7 Deleting a Theme (New).....	1110
7.8.8 Creating a Topic (New).....	1117
7.8.9 Modify Theme (New).....	1131

7.9 Subject Levels.....	1144
7.9.1 Obtains the topic level.....	1144
7.9.2 Modifying or Deleting a Topic Level.....	1152
7.10 Catalog Management.....	1162
7.10.1 Obtains all directories.....	1162
7.10.2 Create a Directory.....	1170
7.10.3 Modifying a Directory.....	1178
7.10.4 Deleting a Directory.....	1186
7.11 Atomic Metrics.....	1192
7.11.1 Searching for Atomic Metrics.....	1192
7.11.2 Creating Atomic Metrics.....	1211
7.11.3 Updating an Atomic Metric.....	1239
7.11.4 Deleting Atomic Metrics.....	1268
7.11.5 Viewing Atomic Metric Details.....	1275
7.12 Derivative Metrics.....	1293
7.12.1 Searching for Derivative Indicators.....	1293
7.12.2 Creating a Derivative Metric.....	1328
7.12.3 Updating a Derivative Metric.....	1351
7.12.4 Deleting Derivative Metrics.....	1401
7.12.5 Viewing Derivative Indicator Details.....	1407
7.13 Compound Metrics.....	1441
7.13.1 Searching for a Composite Metric.....	1441
7.13.2 Creating a Compound Metric.....	1462
7.13.3 Updating a Compound Metric.....	1494
7.13.4 Deleting Compound Metrics.....	1526
7.13.5 Viewing Composite Metric Details.....	1532
7.14 Dimensions.....	1552
7.14.1 Search Dimension.....	1552
7.14.2 Creating a Dimension.....	1589
7.14.3 Updating a Dimension.....	1642
7.14.4 Deleting Dimensions.....	1693
7.14.5 Viewing Dimension Details.....	1699
7.14.6 View Dimension Granularity.....	1734
7.14.7 View Reverse Dimension Table Task.....	1803
7.15 Filters.....	1809
7.15.1 Searching for a Service Filter.....	1809
7.15.2 Viewing Restriction Details.....	1836
7.16 Dimension Tables.....	1851
7.16.1 Searching for a Dimension Table.....	1851
7.16.2 Deleting Dimension Tables.....	1886
7.16.3 Viewing Dimension Table Details.....	1892
7.17 Fact Tables.....	1924

7.17.1 Searching for a Fact Table.....	1924
7.17.2 Deleting Fact Tables.....	1979
7.17.3 Viewing Fact Table Details.....	1985
7.17.4 Viewing a Reverse Fact Table Task.....	2037
7.18 Summary Tables.....	2043
7.18.1 Searching for a Summary Table.....	2043
7.18.2 Creating Summary Tables.....	2079
7.18.3 Update Summary Table.....	2130
7.18.4 Deleting Summary Tables.....	2158
7.18.5 Viewing SDR Table Details.....	2164
7.19 Business Metrics.....	2199
7.19.1 Querying Service Indicator Information.....	2199
7.19.2 Creating a Service Indicator.....	2224
7.19.3 Updating Service Indicators.....	2262
7.19.4 Delete Business Metrics.....	2301
7.19.5 Viewing Indicator Details.....	2307
7.19.6 Viewing Indicator Dimension Information.....	2329
7.19.7 View Metric Owner Information.....	2335
7.19.8 Obtains indicator association information.....	2341
7.20 Version Information.....	2350
7.20.1 Searching for Version Information.....	2350
7.20.2 Comparing Versions.....	2367
7.21 ER Modeling.....	2382
7.21.1 Lookup Table Model List.....	2382
7.21.2 Creating a Table Model.....	2424
7.21.3 Updating a Table Model.....	2485
7.21.4 Deleting a Table Model.....	2553
7.21.5 Querying a Relationship.....	2560
7.21.6 Viewing Relationship Details.....	2570
7.21.7 Querying All Relationships in a Model.....	2578
7.21.8 Viewing Table Model Details.....	2618
7.21.9 Obtaining a Model.....	2658
7.21.10 Creating a Model Workspace.....	2666
7.21.11 Updating the Model Workspace.....	2676
7.21.12 Deleting a Model Workspace.....	2685
7.21.13 Viewing Details About a Model.....	2690
7.21.14 Querying Destination Tables and Fields (To Be Offline).....	2698
7.21.15 Exporting DDL Statements of Tables in a Model.....	2704
7.21.16 Converting a Logical Model to a Physical Model.....	2710
7.21.17 Obtaining the Operation Result.....	2720
7.22 Import and Export.....	2728
7.22.1 Import models, relationship modeling, dimension modeling, code tables, service indicators, and process architecture.....	2728

7.22.2 Importing subjects.....	2734
7.22.3 Querying the Import Result.....	2740
7.22.4 Exporting Service Data.....	2747
7.22.5 Obtain the Excel export result.....	2754
7.23 Customized Items.....	2761
7.23.1 Querying Customized Items.....	2761
7.23.2 Modifying a Customized Item.....	2769
7.24 Quality Rules.....	2779
7.24.1 Update the abnormal data output configuration of the table.....	2779
7.24.2 Clear Quality Rule.....	2820
7.25 Tag API.....	2826
7.25.1 Add a tag.....	2826
7.25.2 Delete a tag.....	2833
7.26 Lookup Table Management.....	2839
7.26.1 Querying the Lookup List.....	2839
7.26.2 Creating a Lookup Table.....	2856
7.26.3 Deleting Lookup Tables.....	2885
7.26.4 Modifying a Lookup Table.....	2892
7.26.5 Viewing Lookup Table Details.....	2922
7.26.6 Viewing Field Values in the Code Table.....	2938
7.26.7 Edit Code Table Field Value.....	2946
8 DataArts Quality APIs.....	2963
8.1 Catalogs.....	2963
8.1.1 Obtaining Job Catalogs.....	2963
8.2 Rule Templates.....	2968
8.2.1 Obtaining the Rule Template List.....	2968
8.2.2 Creating a Rule Template.....	2974
8.2.3 Obtaining Rule Template Details.....	2981
8.2.4 Updating a Rule Template.....	2986
8.2.5 Deleting Rule Templates.....	2993
8.3 Quality Jobs.....	2998
8.3.1 Obtaining the Quality Job List.....	2998
8.3.2 Obtaining the Quality Job List.....	3004
8.3.3 Obtaining Quality Job Details.....	3010
8.3.4 Deleting Quality Jobs.....	3018
8.4 Comparison Jobs.....	3020
8.4.1 Obtaining the Comparison Job List.....	3020
8.4.2 Obtaining Comparison Job Details.....	3026
8.4.3 Deleting Comparison Jobs.....	3033
8.5 O&M.....	3036
8.5.1 Obtaining the Task Execution Result List.....	3036
8.5.2 Obtaining the Instance Result.....	3042

8.5.3 Data quality O&M management operation processing and recording.....	3046
8.6 Quality Reports.....	3049
8.6.1 Obtaining a Quality Report Scoring System.....	3049
8.6.2 Obtaining the Quality Report Overview.....	3051
8.6.3 Obtaining the Quality Report Trend.....	3054
8.6.4 Obtaining the Quality Report Rules.....	3057
8.6.5 Obtaining Sub-rule Fields of a Quality Report.....	3061
8.6.6 Obtaining the Technical Report Data.....	3064
8.6.7 Obtaining the Business Report Data.....	3068
8.7 Import/Export.....	3072
8.7.1 Export Resources.....	3072
8.7.2 Obtaining the Status of an Import/Export Task.....	3074
8.7.3 Downloading a Resource File.....	3077
8.7.4 Uploading a Resource File.....	3079
8.7.5 Importing Resources.....	3082
8.8 Job Instances.....	3084
8.8.1 Stopping Instances.....	3084
9 DataArts DataService APIs.....	3088
9.1 API Management.....	3088
9.1.1 Create an API.....	3088
9.1.2 Querying an API List.....	3120
9.1.3 Updating an API.....	3129
9.1.4 Querying API Information.....	3143
9.1.5 Deleting APIs.....	3157
9.1.6 Publishing an API.....	3162
9.1.7 API operations (offline/suspension/resumption).....	3167
9.1.8 Batch Authorization API (Exclusive Edition).....	3173
9.1.9 Debugging an API.....	3178
9.1.10 API authorization operations (authorization/authorization cancellation/application/renewal)....	3185
9.1.11 Querying API Publishing Messages in DLM Exclusive.....	3188
9.1.12 Querying Instances for API Operations in DLM Exclusive.....	3194
9.1.13 Querying API Debugging Messages in DLM Exclusive.....	3201
9.1.14 Importing an Excel File Containing APIs.....	3207
9.1.15 Exporting an Excel File Containing APIs.....	3212
9.1.16 Exporting a .zip File Containing All APIs.....	3216
9.1.17 Downloading an Excel Template.....	3222
9.2 Application Management.....	3226
9.2.1 Querying the Application List.....	3226
9.2.2 Reviewing Applications.....	3233
9.2.3 Obtaining Application Details.....	3237
9.3 Message Management.....	3243
9.3.1 Querying the Message List.....	3244

9.3.2 Processing Messages.....	3250
9.3.3 Obtaining Message Details.....	3255
9.4 Authorization Management.....	3261
9.4.1 Querying Apps Bound to an API.....	3261
9.4.2 Querying Authorized APIs of an App.....	3266
9.5 Service Catalog Management.....	3272
9.5.1 Obtaining the List of APIs and Catalogs in a Catalog.....	3272
9.5.2 Obtaining the List of APIs in a Catalog.....	3277
9.5.3 Obtaining the List of Sub-Catalogs in a Catalog.....	3285
9.5.4 Updating a Service Catalog.....	3290
9.5.5 Query the service catalog.....	3295
9.5.6 Creating a Service Catalog.....	3300
9.5.7 Deleting Directories in Batches.....	3306
9.5.8 Moving a Catalog to Another Catalog.....	3310
9.5.9 Moving APIs to Another Catalog.....	3315
9.5.10 Obtaining the ID of a Catalog Through Its Path.....	3317
9.5.11 Obtaining the Path of a Catalog Through Its ID.....	3322
9.5.12 Obtaining the Paths to a Catalog Through Its ID.....	3326
9.5.13 Querying the Service Catalog API List.....	3331
9.6 Gateway Management.....	3339
9.6.1 Obtaining a Gateway Instance (Exclusive Edition).....	3339
9.6.2 Obtaining a Gateway Group.....	3344
9.7 App Management.....	3350
9.7.1 Creating an App.....	3350
9.7.2 Querying the App List.....	3356
9.7.3 Updating an App.....	3362
9.7.4 Deleting an Ap.....	3367
9.7.5 Querying the Details About an App.....	3371
9.8 Overview.....	3376
9.8.1 Querying and Collecting Statistics on User-related Overview Development Indicators.....	3376
9.8.2 This API is used to query and collect statistics on user-related overview invoking metrics.....	3381
9.8.3 Querying Top N API Services Invoked.....	3384
9.8.4 Querying Top N Services Used by an App.....	3390
9.8.5 Querying API Statistics Details.....	3397
9.8.6 Querying App Statistics.....	3403
9.8.7 Querying API Dashboard Data Details.....	3408
9.8.8 Querying Data Details of a Specified API Dashboard.....	3414
9.8.9 Querying App Dashboard Data Details.....	3419
9.8.10 Querying Top N APIs Called by a Specified API Application.....	3425
9.9 Cluster Management.....	3432
9.9.1 Querying the List of Cluster Overview Information.....	3432
9.9.2 Querying the List of Cluster Details.....	3438

9.9.3 Querying Cluster Details.....	3445
9.9.4 Querying Access Logs of a DataArts DataService Cluster.....	3452
9.9.5 Enabling Log Dump to OBS for a DataArts DataService Cluster.....	3456
9.9.6 Enabling Log Dump to LTS for a DataArts DataService Cluster.....	3458
10 Application Cases.....	3461
10.1 Example of Using DataArts Migration APIs.....	3461
10.2 Example of Using DataArts Factory APIs.....	3469
11 Appendix.....	3471
11.1 Common Message Headers	3471
11.2 Parsing a Stream in a Response Message.....	3474
11.3 Status Codes.....	3474
11.4 Error Codes.....	3478
11.4.1 DataArts Migration Error Codes.....	3478
11.4.2 Data Development Error Codes.....	3501

1 Before You Start

1.1 Overview

Welcome to DataArts Studio. DataArts Studio is a one-stop operations platform that provides data lifecycle management and intelligent data management for enterprises' digital operations. It provides functions such as DataArts Migration, DataArts Architecture, DataArts Factory, DataArts Quality, DataArts Catalog, and DataArts DataService. DataArts Studio supports intelligent construction of industrial knowledge libraries as well as data foundations such as big data storage and big data computing and analysis engines. DataArts Studio helps you quickly construct intelligent end-to-end data systems from data ingestion to data analysis. It helps eliminate data silos, unify standards, accelerate monetization, and generally assist with digital transformation.

This document describes how to use APIs to perform operations on DataArts Studio components, such as creating clusters and connections. For details about all supported operations, see [API Overview](#).

Before calling a DataArts Studio API, ensure that you have fully understood the concepts related to DataArts Studio. For details, see [Service Overview](#).

1.2 API Calling

DataArts Studio provides REST APIs, allowing you to call APIs using HTTPS.

For details about how to call APIs, see [Calling APIs](#).

- [Making an API Request](#)
- [Authentication](#)
- [Response](#)

1.3 Concepts

- Domain
A domain has full access permissions for all of its cloud services and resources. It can be used to reset user passwords and grant user permissions.

The domain should not be used directly to perform routine management. For security purposes, create users and grant them permissions for routine management.

- User

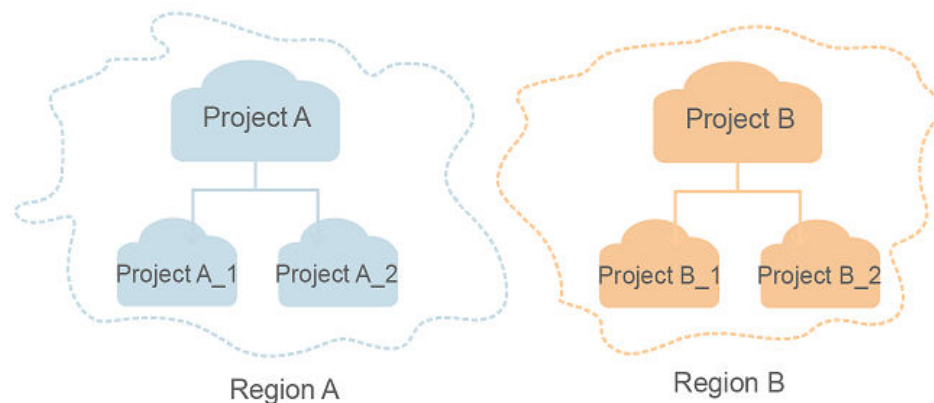

A user is created in Identity and Access Management (IAM) to use cloud services. Each user has its own identity credentials (password and access keys).

You can view the account ID and user ID in [Project ID and Account ID](#). The domain name, username, and password will be required for API authentication.

- Project

A project corresponds to a region. Projects group and isolate resources (including compute, storage, and network resources) across physical regions. Users can be granted permissions in a default project to access all resources in the region associated with the project. If you want more refined access control, create subprojects under a project and create resources in the subprojects. Then, grant users the permissions to access only specific resources in the subprojects.

Figure 1-1 Project isolating model

1.4 Endpoints

Obtaining an Endpoint

An endpoint is the **request address** for calling an API. Endpoints vary depending on services and regions.

DataArts Studio endpoints are in the following formats. Select an endpoint based on your service requirements.

- DataArts Migration (or CDM) APIs: `cdm.{region_id}.myhuaweicloud.com`. See [Table 1-1](#) for details.
- DataArts Factory V1 APIs: `dayu-dlf.{region_id}.myhuaweicloud.com`. See [Table 1-2](#) for details.
- DataArts Factory V2 APIs: `dayu.{region_id}.myhuaweicloud.com`. See [Table 1-2](#) for details.

Table 1-1 CDM endpoints

Region Name	Region ID	Endpoint	Protocol
CN-Hong Kong	ap-southeast-1	cdm.ap-southeast-1.myhuaweicloud.com	HTTPS
AP-Bangkok	ap-southeast-2	cdm.ap-southeast-2.myhuaweicloud.com	HTTPS
AP-Singapore	ap-southeast-3	cdm.ap-southeast-3.myhuaweicloud.com	HTTPS
LA-Sao Paulo1	sa-brazil-1	cdm.sa-brazil-1.myhuaweicloud.com	HTTPS
LA-Santiago	la-south-2	cdm.la-south-2.myhuaweicloud.com	HTTPS
LA-Mexico City1	na-mexico-1	cdm.na-mexico-1.myhuaweicloud.com	HTTPS

Table 1-2 DataArts Factory endpoints

Region Name	Region ID	V1 API Endpoint	V2 API Endpoint	Protocol
CN-Hong Kong	ap-southeast-1	dayu-dlf.ap-southeast-1.myhuaweicloud.com	dayu.ap-southeast-1.myhuaweicloud.com	HTTPS
AP-Bangkok	ap-southeast-2	dayu-dlf.ap-southeast-2.myhuaweicloud.com	dayu.ap-southeast-2.myhuaweicloud.com	HTTPS
AP-Singapore	ap-southeast-3	dayu-dlf.ap-southeast-3.myhuaweicloud.com	dayu.ap-southeast-3.myhuaweicloud.com	HTTPS
LA-Sao Paulo1	sa-brazil-1	dayu-dlf.sa-brazil-1.myhuaweicloud.com	dayu.sa-brazil-1.myhuaweicloud.com	HTTPS
LA-Santiago	la-south-2	dayu-dlf.la-south-2.myhuaweicloud.com	dayu.la-south-2.myhuaweicloud.com	HTTPS
LA-Mexico City1	na-mexico-1	dayu-dlf.na-mexico-1.myhuaweicloud.com	dayu.na-mexico-1.myhuaweicloud.com	HTTPS

1.5 Project ID and Account ID

Obtaining a Project ID and Account ID

A project is a group of tenant resources, and an account ID corresponds to the current account. The IAM ID corresponds to the current user. You can view the project IDs, account IDs, and user IDs in different regions on the corresponding pages.

1. Register with and log in to the management console.
2. Hover the cursor on the username in the upper right corner and select **My Credentials** from the drop-down list.
3. On the **API Credentials** page, obtain the account name, account ID, IAM username, and IAM user ID, and obtain the project and its ID from the project list.

Obtaining a Project ID by Calling an API

You can obtain the project ID by calling the API to [query project information](#). The API is GET `https://{Endpoint}/v3/projects`, in which {Endpoint} is the IAM endpoint and can be obtained from IAM documentation.

For details about API authentication, see [Authentication](#).

The following is a response example. The value of `id` under `projects` is the project ID. If multiple IDs are returned, obtain the desired one based on your actual region (name).

```
{
  "projects": [
    {
      "domain_id": "65382450e8f64ac0870cd180d14e684b",
      "is_domain": false,
      "parent_id": "65382450e8f64ac0870cd180d14e684b",
      "name": "region-name",
      "description": "",
      "links": {
        "next": null,
        "previous": null,
        "self": "https://www.example.com/v3/projects/a4a5d4098fb4474fa22cd05f897d6b99"
      },
      "id": "a4a5d4098fb4474fa22cd05f897d6b99",
      "enabled": true
    }
  ],
  "links": {
    "next": null,
    "previous": null,
    "self": "https://www.example.com/v3/projects"
  }
}
```

1.6 Instance ID and Workspace ID

Obtaining a DataArts Studio Instance ID and Workspace ID

To obtain a DataArts Studio instance ID and workspace ID, perform the following steps:

1. On the DataArts Studio console, locate a workspace and click any module, such as **Management Center**.
2. On the **Management Center** page, obtain the values of **instanceId** and **workspace** in the browser address bar, which are the instance ID and workspace ID, respectively.

As shown in [Figure 1-2](#), the instance ID is **6b88...2688**, and the workspace ID is **1dd3bc...d93f0**.

Figure 1-2 Obtaining the instance ID and workspace ID

dayu/?workspace=1dd3bc...1d93f0&instanceId=6b88...2688

1.7 Constraints

- An IAM user can pass the authentication and access DataArts Studio through an API or SDK only if **Programmatic access** is selected for **Access Type** during the creation of the IAM user.
- For details about the API request throttling limit of each component, see [API Overview](#).
- The restrictions on DataArts Catalog APIs are as follows:
 - CDM jobs carry large volumes of data, which increases the database load. You are advised to periodically delete unused jobs.
 - If a large number of jobs are delivered in a short period, cluster resources may be exhausted.
 - CDM is a batch offline migration tool. You are advised not to create a large number of small jobs using CDM.
- For the constraints of other modules' APIs, see their API descriptions.

2 API Overview

2.1 DataArts Migration API Overview

Table 2-1 DataArts Migration API types

Type	Description
Cluster Management	Cluster management APIs
Job Management	Job management APIs
Link Management	Link management APIs

Cluster Management

Table 2-2 Cluster Management

API	Description	Throttling Policy
Querying Cluster Details	This API is used to query cluster details.	cdm_common
Deleting a Cluster	This API is used to delete a cluster.	cdm_b
Querying All AZs	This API is used to query all AZs of a CDM cluster.	cdm_common
Querying Supported Versions	This API is used to query the versions supported by CDM clusters.	cdm_c
Querying Version Specifications	This API is used to query all compatible specifications by version ID.	cdm_common

API	Description	Throttling Policy
Querying Details About a Flavor	This API is used to query the details of a flavor with a specified ID.	cdm_common
Querying the Enterprise Project IDs of All Clusters	This API is used to query the enterprise project IDs of all clusters in the current project.	cdm_common
Querying the Enterprise Project ID of a Specified Cluster	This API is used to query the enterprise project ID of a specified cluster.	cdm_common
Querying an Instance in a Cluster	This API is used to query a specified instance in a cluster.	cdm_common
Modifying a Cluster	This API is used to modify the configuration of a CDM cluster.	cdm_common
Restarting a Cluster	This API is used to restart a cluster.	cdm_b
Starting a Cluster	This API is used to start a cluster.	cdm_b
Stopping a Cluster (To Be Taken Offline)	This API is used to stop a cluster.	cdm_b
Creating a Cluster	This API is used to create a cluster.	cdm_a
Querying the List of Clusters	This API is used to query the cluster list.	cdm_common

Job Management

Table 2-3 Job management

API	Description	Throttling Policy
Querying Jobs	This API is used to query jobs.	cdm_common
Deleting a Job	This API is used to delete a job.	cdm_job
Modifying a Job	This API is used to modify a job.	cdm_job_create

API	Description	Throttling Policy
Creating and Executing a Job in a Random Cluster	This API is used to create and execute a job in a random cluster.	cdm_common
Stopping a Job	This API is used to stop a job.	cdm_job
Creating a Job in a Specified Cluster	This API is used to create a job in a specified cluster.	cdm_job_create
Starting a Job	This API is used to start a job.	cdm_job_start
Querying Job Status	This API is used to query the job status.	cdm_d
Querying Job Execution History	This API is used to query the job execution history.	cdm_common

Link Management

Table 2-4 Link management

API	Description	Throttling Policy
Creating Links	This API is used to create a link.	cdm_common
Querying Links	This API is used to query links.	cdm_common
Deleting a Link	This API is used to delete a link.	cdm_common
Modifying a Link	This API is used to modify a link.	cdm_common

Reference: Throttling Policy Details

Table 2-5 DataArts Migration API throttling policy

Throttling Policy Name	Policy Type	Maximum API Requests per Minute	Maximum User Requests per Minute
cdm_a	Shared throttling (applies to all APIs of this policy)	100	5

Throttling Policy Name	Policy Type	Maximum API Requests per Minute	Maximum User Requests per Minute
cdm_b	Shared throttling (applies to all APIs of this policy)	200	20
cdm_c	Shared throttling (applies to all APIs of this policy)	6000	50
cdm_d	Shared throttling (applies to all APIs of this policy)	6000	120
cdm_job	Shared throttling (applies to all APIs of this policy)	6000	1200
cdm_job_create	Shared throttling (applies to all APIs of this policy)	6000	1200
cdm_job_start	Shared throttling (applies to all APIs of this policy)	6000	1200
cdm_common	Shared throttling (applies to all APIs of this policy)	6000	120

2.2 DataArts Factory API (V1) Overview

Table 2-6 DataArts Factory API (V1) types

Type	Description
Connection Management (to Be Taken Offline)	Connection management APIs NOTE The connection management capability is provided by Management Center. This API is no longer maintained. You are advised to use the APIs in Management Center for connection management.
Script Development	Script development APIs
Resource Management	Resource management APIs
Job Development	Job development APIs

Connection Management (to Be Taken Offline)

Table 2-7 Connection management (to be taken offline)

API	Description	Maximum API Requests per Second	Maximum User Requests per Second
Creating a Connection (to Be Taken Offline)	This API is used to create a connection.	None	None
Querying a Connection List (to Be Taken Offline)	This API is used to query a connection list.	None	None
Querying Connection Details (to Be Taken Offline)	This API is used to query details of a connection.	None	None
Modifying a Connection (to Be Taken Offline)	This API is used to edit a connection.	None	None
Deleting a Connection (to Be Taken Offline)	This API is used to delete a connection.	None	None
Exporting a Connection (to Be Taken Offline)	This API is used to export all connection information that is compressed in ZIP format.	None	None
Importing a Connection (to Be Taken Offline)	This API is used to import one or more connection files from OBS to the Data Development module.	None	None

Script Development

Table 2-8 Script development

API	Description	Maximum API Requests per Second	Maximum User Requests per Second
Creating a Script	This API is used to create a script.	300	30
Modifying a Script	This API is used to modify the configuration items or script contents of a script.	300	30
Querying Script Details	This API is used to query a script, including the script type and script content.	300	30
Querying a Script List	This API is used to query a script list.	300	30
Querying the Execution Result of a Script Instance	This API is used to obtain the execution status and result of a script instance.	300	30
Deleting a Script	This API is used to delete a specific script.	300	30
Executing a Script	This API is used to execute a specified script. Each time a script is executed, a script instance is generated.	300	30
Stopping Executing a Script Instance	This API is used to stop executing a script instance.	300	30

Resource Management

Table 2-9 Resource management

API	Description	Maximum API Requests per Second	Maximum User Requests per Second
Creating a Resource	This API is used to create a resource.	100	10
Querying a Resource List	This API is used to query a resource list.	100	10
Modifying a Resource	This API is used to modify a resource.	100	10
Deleting a Resource	This API is used to delete a resource.	100	10
Querying Resource Details	This API is used to query resource details.	300	30

Job Development

Table 2-10 Job development

API	Description	Maximum API Requests per Second	Maximum User Requests per Second
Creating a Job	This API is used to create a job.	300	30
Modifying a Job	This API is used to modify a job.	300	30
Querying a Job List	This API is used to query a job list.	300	30
Querying Job Details	This API is used to query job details.	100	10
Querying a Job File	This API is used to query a job file.	100	10
Exporting a Job	This API is used to export a job.	100	10
Exporting Jobs	This API is used to export jobs.	100	10

API	Description	Maximum API Requests per Second	Maximum User Requests per Second
Importing Jobs	This API is used to import jobs.	100	10
Executing a Job Immediately	This API is used to execute a job immediately.	300	30
Starting a Job	This API is used to start a job.	300	30
Stopping a Job	This API is used to stop a job.	300	30
Deleting a Job	This API is used to delete a job.	300	30
Stopping a Job Instance	This API is used to stop a job instance.	300	30
Rerunning a Job Instance	This API is used to rerun a job instance.	300	30
Querying Running Status of a Real-Time Job	This API is used to query the running status of a real-time job.	300	30
Querying a Job Instance List	This API is used to query a job instance list.	300	30
Querying Job Instance Details	This API is used to query job instance details.	300	30
Querying System Task Details	This API is used to query details about asynchronous tasks.	100	10

2.3 DataArts Factory API (V2) Overview

Table 2-11 DataArts Factory API (V2) types

Type	Description
Job Development	Job development APIs

Job Development

Table 2-12 Job development

API	Description	Maximum API Requests per Second	Maximum User Requests per Second
Creating a PatchData Instance	This API is used to create a PatchData instance.	100	10
Querying PatchData Instances	This API is used to query PatchData instances. Pagination query is supported.	100	10
Stopping a PatchData Instance	This API is used to stop a specified PatchData instance.	100	10
Changing a Job Name	This API is used to change the name of a job.	100	10
Querying Release Packages	This API is used to query release packages.	100	10
Querying Details About a Release Package	This API is used to query details about a release package.	100	10
Configuring Job Tags	This API is used to configure job tags.	100	10
Querying Alarm Notifications	This API is used to query the alarm notifications in a specified period.	100	10
Releasing Task Packages	This API is used to release task packages.	100	10
Canceling Task Packages	This API is used to cancel task packages.	100	10
Querying the Instance Execution Status	This API is used to query the instance statuses of the current day, previous day, the day before the previous day, and last seven days.	1	1

API	Description	Maximum API Requests per Second	Maximum User Requests per Second
Querying Completed Tasks	This API is used to query the tasks completed on the current day, on the previous day, and over the last seven days.	1	1
Querying Instances of a Specified Job	This API is used to query the instances of a job based on the job name.	100	10

2.4 DataArts Architecture API Overview

Table 2-13 DataArts Architecture API types

Type	Description
Dashboard	Dashboard APIs
Information Architecture	Information architecture APIs
Data Standard	Data standard APIs
Data Source	Data source APIs
Lookup Table Management	Lookup table management APIs
Catalog	Catalog APIs
Data Standard Template	Data standard template APIs
Approval Management	Approval management APIs
Subject Management	Subject management APIs
Subject Level	Subject level APIs
Catalog Management	APIs for managing the catalogs of lookup tables and data standards
Atomic Metric	Atomic metric APIs
Derivative Metric	Derivative metric APIs

Type	Description
Compound Metric	Compound metric APIs
Dimension	Dimension APIs
Filter	Filter APIs, including those for time filters and general filters
Dimension Table	Dimension table APIs
Fact Table	Fact table APIs
Summary Table	Summary table APIs
Business Metric	Business metric APIs
Version Information	Version information APIs
ER Modeling	Table model APIs
Import/Export	Import and export APIs
Custom Item	Custom item APIs
Tag	Tag APIs
Quality Rule	Quality rule APIs

Dashboard

Table 2-14 Dashboard

API	Description	Maximum API Requests per Minute	Maximum User Requests per Minute
Obtaining Overview Statistics	This API is used to obtain overview statistics.	21,600	240
Obtaining Model Statistics	This API is used to obtain statistics in a model.	21,600	240
Obtaining ER Modeling Statistics	This API is used to obtain outer-layer statistics on the ER modeling page.	21,600	240

API	Description	Maximum API Requests per Minute	Maximum User Requests per Minute
Obtaining Standard Coverage Statistics	This API is used to obtain the coverage of a data standard in all model fields, that is, the percentage of fields that use the standard to the total fields.	21,600	240

Information Architecture

Table 2-15 Information architecture

API	Description	Maximum API Requests per Minute	Maximum User Requests per Minute
Querying Tables	This API is used to query multiple types of tables, including logical entities, physical tables, dimension tables, fact tables, and summary tables.	21,600	240

Data Standard

Table 2-16 Data standard

API	Description	Maximum API Requests per Minute	Maximum User Requests per Minute
Querying Data Standards	This API is used to query data standards and sort them by modification time in descending order.	21,600	240
Creating a Data Standard	This API is used to create a data standard.	10,800	120
Deleting a Data Standard	This API is used to delete a data standard.	10,800	120

API	Description	Maximum API Requests per Minute	Maximum User Requests per Minute
Modifying a Data Standard	This API is used to modify a data standard.	10,800	120
Querying Data Standard Details	This API is used to query the details of a data standard with a specified ID.	21,600	240
Associating Attributes with a Data Standard	This API is used to associate attributes with a data standard.	10,800	120

Data Source

Table 2-17 Data source

API	Description	Maximum API Requests per Minute	Maximum User Requests per Minute
Obtaining Data Connections	This API is used to obtain data connections of a specified type.	21,600	240

Lookup Table Management

Table 2-18 Lookup table management

API	Description	Maximum API Requests per Minute	Maximum User Requests per Minute
Querying the Lookup List	This API is used to query the lookup table list.	21,600	240
Creating a Lookup Table	This API is used to create a lookup table.	10,800	120
Deleting Lookup Tables	This API is used to delete lookup tables.	10,800	120
Modifying a Lookup Table	This API is used to modify a lookup table.	10,800	120

API	Description	Maximum API Requests per Minute	Maximum User Requests per Minute
Querying Lookup Table Details	This API is used to query details about a lookup table by ID.	21,600	240
Querying Field Values in a Lookup Table	This API is used to query field values in a lookup table.	21,600	240
Editing Field Values in a Lookup Table	This API is used to edit field values in a lookup table.	10,800	120

Catalog

Table 2-19 Catalog

API	Description	Maximum API Requests per Minute	Maximum User Requests per Minute
Obtaining the Tree of All Catalogs	This API is used to obtain the tree of all catalogs.	21,600	240
Querying the Catalog List	This API is used to query the catalog list.	21,600	240
Creating a Catalog	This API is used to create a catalog.	10,800	120
Modifying a Catalog	This API is used to modify a catalog.	10,800	120
Deleting a Catalog	This API is used to delete a catalog.	10,800	120
Querying Catalog Details	This API is used to query the details of a catalog.	21,600	240

Data Standard Template

Table 2-20 Data standard template

API	Description	Maximum API Requests per Minute	Maximum User Requests per Minute
Querying Data Standard Templates	This API is used to query the data standard templates in the current workspace.	21,600	240
Creating a Data Standard Template	This API is used to create a data standard template in the current workspace.	10,800	120
Modifying a Data Standard Template	This API is used to modify a data standard template.	10,800	120
Deleting a Data Standard Template	This API is used to delete a data standard template.	10,800	120
Initializing a Data Standard Template	This API is used to initialize a data standard template.	10,800	120

Approval Management

Table 2-21 Approval management

API	Description	Maximum API Requests per Minute	Maximum User Requests per Minute
Obtaining an Application	This API is used to obtain an application.	21,600	240
Withdrawing an Application	This API is used to withdraw an application.	10,800	120
Processing Applications	This API is used to reject or approve one or more applications.	10,800	120
Batch Publishing Resources	This API is used to publish resources in batches.	10,800	120

API	Description	Maximum API Requests per Minute	Maximum User Requests per Minute
Batch Unpublishing Resources	This API is used to unpublish resources in batches.	10,800	120
Creating a Reviewer	This API is used to create a reviewer.	10,800	120
Querying the Reviewer List	This API is used to query the reviewer list.	21,600	240
Deleting a Reviewer	This API is used to delete a reviewer.	10,800	120
Deleting the Extension of an Entity	When a released entity is edited, an extension is generated. This API is used to delete the extension information of the entity.	10,800	120
Obtaining the Difference Between the Extension Information and a Released Entity	When a released entity is edited, an extension is generated. This interface is used to obtain the difference between the extension information and the released entity.	21,600	240

Subject Management

Table 2-22 Subject management

API	Description	Maximum API Requests per Minute	Maximum User Requests per Minute
Querying the Subject List	This API is used to query subjects by name (fuzzy query is supported), creator, owner, status, or modification time.	21,600	240
Deleting a Subject	This API is used to delete a subject.	10,800	120

API	Description	Maximum API Requests per Minute	Maximum User Requests per Minute
Creating a Subject	This API is used to create a subject.	10,800	120
Modifying a Subject	This API is used to modify a subject.	10,800	120
Obtaining Subject Tree Information	This API is used to obtain the data asset subject tree information, including l1, l2, and l3.	21,600	240
Querying the Subject List (New)	This API is used to query the subject list.	21,600	240
Deleting a Subject (New)	This API is used to delete a subject.	10,800	120
Creating a Subject (New)	This API is used to create a subject.	10,800	120
Modifying a Subject (New)	This API is used to modify a subject.	10,800	120

Subject Level

Table 2-23 Subject level

API	Description	Maximum API Requests per Minute	Maximum User Requests per Minute
Obtaining a Subject Level	This API is used to obtain a subject level.	21,600	240
Modifying or Deleting a Subject Level	This API is used to modify or delete a subject level.	10,800	120

Directory Management

Table 2-24 Directory management

API	Description	Maximum API Requests per Minute	Maximum User Requests per Minute
Obtaining All Directories	This API is used to obtain all directories of data standards and lookup tables.	21,600	240
Creating a Directory	This API is used to create a directory of data standards or lookup tables.	10,800	120
Modifying a Directory	This API is used to modify a directory of data standards or lookup tables.	10,800	120
Deleting a Directory	This API is used to delete a directory of data standards or lookup tables.	10,800	120

Atomic Metric

Table 2-25 Atomic metric

API	Description	Maximum API Requests per Minute	Maximum User Requests per Minute
Querying Atomic Metrics	This API is used to query atomic metrics by name, creator, reviewer, status, or modification time. Fuzzy query is supported.	21,600	240
Creating an Atomic Metric	This API is used to create an atomic metric.	10,800	120
Updating an Atomic Metric	This API is used to update an atomic metric.	10,800	120
Deleting Atomic Metrics	This API is used to delete atomic metrics.	10,800	120

API	Description	Maximum API Requests per Minute	Maximum User Requests per Minute
Querying Atomic Metric Details	This API is used to obtain the details of an atomic metric with a specified ID.	21,600	240

Derivative Metric

Table 2-26 Derivative metric

API	Description	Maximum API Requests per Minute	Maximum User Requests per Minute
Querying Derivative Metrics	This API is used to query derivative metrics by name, creator, reviewer, status, modification time, or l3Id.	21,600	240
Creating a Derivative Metric	This API is used to create a derivative metric based on parameters.	10,800	120
Updating a Derivative Metric	This API is used to update a derivative metric.	10,800	120
Deleting a Derivative Metric	This API is used to delete a derivative metric with a specified ID.	10,800	120
Querying Derivative Metric Details	This API is used to obtain the details of a derivative metric with a specified ID.	21,600	240

Compound Metric

Table 2-27 Compound metric

API	Description	Maximum API Requests per Minute	Maximum User Requests per Minute
Querying Compound Metrics	This API is used to query compound metrics by name, creator, reviewer, status, modification time, or l3Id.	21,600	240
Creating a Compound Metric	This API is used to create a compound metric based on parameters.	10,800	120
Updating a Compound Metric	This API is used to update a compound metric based on parameters.	10,800	120
Deleting a Compound Metric	This API is used to delete a compound metric with a specified ID set.	10,800	120
Querying Compound Metric Details	This API is used to obtain the details of a compound metric with a specified ID.	21,600	240

Dimension

Table 2-28 Dimension

API	Description	Maximum API Requests per Minute	Maximum User Requests per Minute
Querying Dimensions	This API is used to query dimensions by name, description, creator, reviewer, status, l3Id, derivative metric idList, or modification time.	21,600	240
Creating a Dimension	This API is used to create a dimension based on parameters.	10,800	120

API	Description	Maximum API Requests per Minute	Maximum User Requests per Minute
Updating a Dimension	This API is used to update a dimension based on parameters.	10,800	120
Deleting a Dimension	This API is used to delete a dimension with a specified ID.	10,800	120
Querying Dimension Details	This API is used to query the details of a dimension with a specified ID.	21,600	240
Querying Dimension Granularities	This API is used to query the granularities of all dimensions based on tableId . If tableId is not transferred, the granularities of all dimension groups are queried.	21,600	240
Querying a Dimension Table Reversing Task	This API is used to query a dimension table reversing task.	21,600	240

Filter

Table 2-29 Filter

API	Description	Maximum API Requests per Minute	Maximum User Requests per Minute
Querying a Service Filter	This API is used to query filter information by name, description, creator, reviewer, filter group ID, modification time, and status.	21,600	240
Querying Filter Details	This API is used to query the details of a filter with a specified ID.	21,600	240

Dimension Table

Table 2-30 Dimension table

API	Description	Maximum API Requests per Minute	Maximum User Requests per Minute
Querying Dimension Tables	This API is used to query dimension tables by name, creator, reviewer, status, or modification time.	21,600	240
Deleting a Dimension Table	This API is used to delete a dimension table with a specified ID.	10,800	120
Querying Dimension Table Details	This API is used to query the details about a dimension table by ID.	21,600	240

Fact Table

Table 2-31 Fact table

API	Description	Maximum API Requests per Minute	Maximum User Requests per Minute
Querying Fact Tables	This API is used to query fact tables by name, creator, reviewer, status, or modification time.	21,600	240
Deleting Fact Tables	This API is used to delete fact tables with specified IDs.	10800	120
Querying Fact Table Details	This API is used to query the details of a fact table with a specified ID.	21,600	240
Querying a Fact Table Reversing Task	This API is used to query a fact table reversing task.	21,600	240

Summary Table

Table 2-32 Summary table

API	Description	Maximum API Requests per Minute	Maximum User Requests per Minute
Querying Summary Tables	This API is used to query summary tables by name, creator, reviewer, status, or modification time. Fuzzy query is supported.	21,600	240
Creating a Summary Table	This API is used to create a summary table.	10,800	120
Updating a Summary Table	This API is used to update a summary table.	10,800	120
Deleting Summary Tables	This API is used to delete summary tables in draft, unpublished, or rejected state.	10,800	120
Querying Summary Table Details	This API is used to query the details of a summary table with a specified ID.	21,600	240

Business Metric

Table 2-33 Business metric

API	Description	Maximum API Requests per Minute	Maximum User Requests per Minute
Querying Business Metrics	This API is used to query business metrics by name, creator, or modification time.	21,600	240
Creating a Business Metric	This API is used to create a business metric.	10,800	120
Updating a Business Metric	This API is used to update a business metric.	10,800	120
Deleting a Business Metric	This API is used to delete a business metric.	10,800	120

API	Description	Maximum API Requests per Minute	Maximum User Requests per Minute
Querying Metric Details	This API is used to query the details of a metric with a specified ID.	21,600	240
Querying Metric Dimension Information	This API is used to query the dimension information of a metric.	21,600	240
Querying the Metric Owner	This API is used to query the owner of a metric.	21,600	240
Obtaining Metric Association Information	This API is used to obtain the current metric graph.	21,600	240

Version Information

Table 2-34 Version information

API	Description	Maximum API Requests per Minute	Maximum User Requests per Minute
Querying Version Information	This API is used to query version information by name, creator, or modification time.	21,600	240
Comparing Versions	This API is used to compare two versions with different IDs.	60	24

ER Modeling

Table 2-35 ER modeling

API	Description	Maximum API Requests per Minute	Maximum User Requests per Minute
Querying Table Models	This API is used to query table models, including logical entities, physical tables, and their attributes, by name, creator, reviewer, status, or modification time.	21,600	240
Creating a Table Model	This API is used to create a table model (logical entity or physical table).	10,800	120
Updating a Table Model	This API is used to update a table model (logical entity or physical model) and its attributes.	10,800	120
Deleting a Table Model	This API is used to delete a table model (logical entity or physical model) and its attributes.	10,800	120
Querying Relationships	This API is used to query relationships by name, creator, start time, or end time. Fuzzy query is supported.	21,600	240
Querying Relationship Details	This API is used to obtain the details of a relationship with a specified ID.	21,600	240
Querying All Relationships in a Model	This API is used to query all relationships in a model.	21,600	240
Querying Table Model Details	This API is used to obtain the details of a table model with a specified ID.	21,600	240
Obtaining Models	This API is used to obtain all models in the current workspace.	21,600	240

API	Description	Maximum API Requests per Minute	Maximum User Requests per Minute
Creating a Model Workspace	This API is used to create a model workspace.	10,800	120
Updating a Model Workspace	This API is used to update a model workspace.	10,800	120
Deleting a Model Workspace	This API is used to delete a model workspace.	10,800	120
Querying Model Details	This API is used to query the workspace details of a physical or logical model.	21,600	240
Querying Destination Tables and Fields (to Be Taken Offline)	This API is used to query destination tables and fields.	21,600	240
Exporting DDL Statements of a Table in a Model	This API is used to export the DDL statements of a specified table based on the model ID.	10	4
Converting a Logical Model to a Physical Model	This API is used to convert a logical model to a physical model and returns information about the target model.	10,800	120
Obtaining the Operation Result	This API is used to obtain the result of a batch operation, for example, converting a logical model to a physical model and reversing a database.	21,600	240

Import and Export

Table 2-36 Import and export

API	Description	Maximum API Requests per Minute	Maximum User Requests per Minute
Importing Subjects	This API is used to import subjects.	10	4
Importing ER Models, Dimension Models, Lookup Tables, Business metrics, or Catalogs	This API is used to import ER models, dimension models, lookup tables, business metrics, or catalogs	10	4
Querying the Import Result	This API is used to query the processing result of the imported Excel file. The value of uuid can be obtained via the /design/models/action or /design/catalogs/action API.	21,600	240
Exporting Service Data	This API is used to export service data, including lookup tables, data standards, atomic metrics, derivative metrics, compound metrics, summary tables, business metrics, subjects, processes, logical models, physical models, dimensions, and fact tables.	10	4
Obtaining the Exported Excel	This API is used to obtain the exported Excel based on the UUID returned by the /export-model API.	21,600	240

Custom Item

Table 2-37 Customized item

API	Description	Maximum API Requests per Minute	Maximum User Requests per Minute
Querying Custom Items	This API is used to query custom items of tables, attributes, subjects, or business metrics.	21,600	240
Modifying a Custom Item	This API is used to modify a custom table, attribute, subject, or business metric item.	10,800	120

Tag

Table 2-38 Tag

API	Description	Maximum API Requests per Minute	Maximum User Requests per Minute
Adding Tags	This API is used to add tags to an asset (table or attribute) with a specified ID.	10,800	120
Deleting Tags	This API is used to delete tags of an asset (table or attribute) with a specified ID.	10,800	120

Quality Rule

Table 2-39 Quality rule

API	Description	Maximum API Requests per Minute	Maximum User Requests per Minute
Updating Abnormal Data Output Configuration of a Table	This API is used to update the abnormal data output configuration of a table, including whether to generate abnormal data, database or schema for storing abnormal data, and prefix or suffix of an abnormal table.	10,800	120
Clearing Quality Rules	This API is used to clear quality rules of a table.	10,800	120

2.5 DataArts Quality API Overview

Table 2-40 DataArts Quality API types

Type	Description
Catalog	Catalog APIs
Rule Template	Rule template APIs
Quality Job	Quality job APIs
Comparison Job	Comparison job APIs
O&M	O&M APIs
Quality Report	Quality report APIs
Import/Export	Import and export APIs

Directory

Table 2-41 Directory

API	Description	Maximum API Requests in 10 Seconds	Maximum User Requests in 10 Seconds
Obtaining Job Directories	This API is used to obtain job directories.	300	40

Rule Template

Table 2-42 Rule template

API	Description	Maximum API Requests in 10 Seconds	Maximum User Requests in 10 Seconds
Obtaining the Rule Template List	This API is used to obtain the rule template list.	300	40
Creating a Rule Template	This API is used to create a rule template.	300	40
Obtaining Rule Template Details	This API is used to obtain the details of a rule template.	300	40
Updating a Rule Template	This API is used to update a rule template.	300	40
Deleting Rule Templates	This API is used to delete rule templates.	300	40

Quality Job

Table 2-43 Quality job

API	Description	Maximum API Requests in 10 Seconds	Maximum User Requests in 10 Seconds
Obtaining the Quality Job List (V1)	This API is used to obtain quality jobs.	300	40

API	Description	Maximum API Requests in 10 Seconds	Maximum User Requests in 10 Seconds
Obtaining the Quality Job List	This API is used to obtain the list of quality jobs.	300	40
Obtaining Quality Job Details	This API is used to obtain the details of a quality job.	300	40

Comparison Job

Table 2-44 Comparison job

API	Description	Maximum API Requests in 10 Seconds	Maximum User Requests in 10 Seconds
Obtaining the Comparison Job List	This API is used to obtain the comparison job list.	300	40
Obtaining Comparison Job Details	This API is used to obtain the details of a comparison job.	300	40

O&M

Table 2-45 O&M

API	Description	Maximum API Requests in 10 Seconds	Maximum User Requests in 10 Seconds
Obtaining the Task Execution Result List	This API is used to obtain the task execution result list.	300	40
Obtaining the Instance Result	This API is used to obtain the instance result.	300	40

API	Description	Maximum API Requests in 10 Seconds	Maximum User Requests in 10 Seconds
Rectifying Issues of an Instance	This API is used to rectify issues of an instance. On the DataArts Quality console, you can click More and select Rectify to rectify issues.	300	40

Quality Report

Table 2-46 Quality report

API	Description	Maximum API Requests in 10 Seconds	Maximum User Requests in 10 Seconds
Obtaining a Quality Report Scoring System	This API is used to obtain a quality report scoring system.	300	40
Obtaining the Quality Report Overview	This API is used to obtain the quality report overview.	300	40
Obtaining the Quality Report Trend	This API is used to obtain the quality report trend.	300	40
Obtaining the Quality Report Rule Score	This API is used to obtain the score of a quality report rule.	300	40
Obtaining the Score of a Sub-rule Field in the Quality Report	This API is used to obtain the score of a sub-rule field in the quality report.	300	40
Obtaining Technical Report Data	This API is used to obtain technical report data.	300	40
Obtaining Business Report Data	This API is used to obtain business report data.	300	40

Import and Export

Table 2-47 Import and export

API	Description	Maximum API Requests in 10 Seconds	Maximum User Requests in 10 Seconds
Exporting Resources	This API is used to export resources from DataArts Quality, such as quality jobs and comparison jobs.	1800	20
Obtaining the Status of an Import/Export Task	This API is used to obtain the status of an export or import task.	300	40
Downloading a Resource File	This API is used to download a resource file.	300	40
Uploading a Resource File	This API is used to import a file to DataArts Quality.	1800	20
Importing Resources	This API is used to import resources to DataArts Quality.	1800	20

2.6 DataArts DataService API Overview

Table 2-48 DataArts DataService API types

Type	Description
API Management	API management APIs
Application Management	Application management APIs
Message Management	Message management APIs
Authorization Management	Authorization management APIs
Service Catalog Management	Service catalog management APIs
Gateway Management	Gateway management APIs
App Management	App management APIs

Type	Description
Overview	Overview APIs
Cluster Management	Cluster management APIs.

API Management

Table 2-49 API management

API	Description	Maximum API Requests in 10 Seconds	Maximum User Requests in 10 Seconds
Creating an API.	This API is used to create an API.	2400	120
Querying the API List	This API is used to query the API list.	2400	120
Updating an API	This API is used to update an API.	2400	120
Querying API Information	This API is used to query API information.	2400	120
Deleting APIs	This API is used to delete APIs.	2400	120
Publishing an API	This API is used to publish an API. Only published APIs can be called. You can choose to publish an API to a specified gateway.	2400	120
Performing an API Operation	This API is used to unpublish, stop, or recover an API. After the API is unpublished, its authorization will be canceled and the API cannot be called.	2400	120
Authorizing APIs (Exclusive Edition)	An app cannot access any APIs after being created. To enable an app to access an API, authorize the API to the app. After the authorization is successful, the app can access the API within the validity period.	2400	120
Debugging an API	This API is used to debug an API.	2400	120

API	Description	Maximum API Requests in 10 Seconds	Maximum User Requests in 10 Seconds
Performing an API Authorization Operation	The API reviewer can initiate a request to authorize an API. After the authorization is successful, the app can access the API within the validity period. API authorization includes authorization and renewal.	2400	120
Querying API Publishing Messages in DataArts DataService Exclusive	This API is used to query the API publishing messages in different clusters.	2400	120
Querying Instances for API Operations in DataArts DataService Exclusive	This API is used to query instances for API operations.	2400	120
Querying API Debugging Messages in DataArts DataService Exclusive	This API is used to query the API debugging information in different clusters.	2400	120
Importing an Excel File Containing APIs	This API is used to import an Excel file that contains APIs.	2400	120
Exporting an Excel File Containing APIs	This API is used to export an Excel file that contains APIs.	2400	120
Exporting a .zip File Containing All APIs	This API is used to export a .zip file that contains all APIs.	2400	120
Downloading an Excel Template	This API is used to download an Excel template.	2400	120

Application Management

Table 2-50 Application management

API	Description	Maximum API Requests in 10 Seconds	Maximum User Requests in 10 Seconds
Querying the Application List	This API is used to query the application list.	2400	120
Reviewing an Application	This API is used to review an application.	2400	120
Obtaining Application Details	This API is used to obtain the details of an application.	2400	120

Message Management

Table 2-51 Message management

API	Description	Maximum API Requests in 10 Seconds	Maximum User Requests in 10 Seconds
Querying the Message List	This API is used to query the list of notification messages in the review center. Different from applications, notification messages cannot be rejected and can be processed only within a specified time period.	2400	120
Processing Messages	This API is used to process received notification messages within a specified time period.	2400	120
Obtaining Message Details	This API is used to obtain the details of a message. This function is only used for displaying application details and not for processing. Therefore, background parameters such as the ID are not displayed.	2400	120

Authorization Management

Table 2-52 Authorization management

API	Description	Maximum API Requests in 10 Seconds	Maximum User Requests in 10 Seconds
Querying Apps Authorized to Call an API	This API is used to query the apps that have been authorized to call an API.	2400	120
Querying Authorized APIs of an App	This API is used to query authorized APIs of an app.	2400	120

Service Catalog Management

Table 2-53 Service catalog management

API	Description	Maximum API Requests in 10 Seconds	Maximum User Requests in 10 Seconds
Obtaining the List of APIs and Catalogs in a Catalog	This API is used to obtain the list of APIs and catalogs in the current catalog. The list is displayed in the data format of the catalog.	2400	120
Obtaining the List of APIs in the Current Catalog	This API is used to obtain the list of APIs in a catalog.	2400	120
Obtaining the List of Sub-Catalogs in a Catalog	This API is used to obtain the list of sub-catalogs in a catalog. (The returned sub-catalogs are displayed on the same page. It is recommended that this API be used only in scenarios where pagination is not supported, for example, generating a catalog tree.)	2400	120
Updating a Service Catalog	This API is used to update a service catalog.	2400	120

API	Description	Maximum API Requests in 10 Seconds	Maximum User Requests in 10 Seconds
Querying a Service Catalog	This API is used to query a service catalog.	2400	120
Creating a Service Catalog	This API is used to create a service catalog. The ID of the root directory is 0.	2400	120
Deleting Catalogs	This API is used to delete service catalogs.	2400	120
Moving a Catalog to Another Catalog	This API is used to move a catalog to another catalog.	2400	120
Moving APIs to Another Catalog	This API is used to move APIs to another catalog.	2400	120
Obtaining the ID Through the Path	This API is used to obtain the ID through the path.	2400	120
Obtaining the Path Through the ID	This API is used to obtain the path through the ID.	2400	120
Obtaining the Path to a Catalog Through Its ID	This API is used to obtain the path to a catalog through its ID.	2400	120
Querying the Service Catalog API List	This API is used to query the service catalog API list.	2400	120

Gateway Management

Table 2-54 Gateway management

API	Description	Maximum API Requests in 10 Seconds	Maximum User Requests in 10 Seconds
Obtaining a Gateway Instance (Exclusive Edition)	This API is used to obtain a gateway instance (exclusive edition).	2400	120

API	Description	Maximum API Requests in 10 Seconds	Maximum User Requests in 10 Seconds
Obtaining a Gateway Group	This API is used to obtain a gateway group.	2400	120

App Management

Table 2-55 App management

API	Description	Maximum API Requests in 10 Seconds	Maximum User Requests in 10 Seconds
Creating an App	This API is used to create an app.	2400	120
Querying the App List	This API is used to query the app list.	2400	120
Updating an App	This API is used to update an app.	2400	120
Deleting an App	This API is used to delete an app.	2400	120
Querying App Details	This API is used to query the details of an app.	2400	120

Overview

Table 2-56 Overview

API	Description	Maximum API Requests in 10 Seconds	Maximum User Requests in 10 Seconds
Querying the API Overview	This API is used to query the API overview.	2400	120
Querying the App Overview	This API is used to query the app overview.	2400	120

API	Description	Maximum API Requests in 10 Seconds	Maximum User Requests in 10 Seconds
Querying Top N APIs Called	This API is used to query the top N APIs called.	2400	120
Querying Top N Apps Used	This API is used to query the top N apps used.	2400	120
Querying API Statistics Details	This API is used to query API statistics details.	2400	120
Querying App Statistics Details	This API is used to query app statistics details.	2400	120
Querying API Dashboard Data Details	This API is used to query API dashboard data details.	2400	120
Querying Data Details of a Specified API Dashboard	This API is used to query details of a specified API dashboard.	2400	120
Querying App Dashboard Data Details	This API is used to query app dashboard data details.	2400	120
Querying Top N APIs Called by a Specified App	This API is used to query top N APIs called by a specified app.	2400	120

Cluster Management

Table 2-57 Cluster management

API	Description	Maximum API Requests in 10 Seconds	Maximum User Requests in 10 Seconds
Querying the Cluster Overview Information List	This API is used to query the cluster overview information list.	2400	120
Querying the List of Cluster Details	This API is used to query the list of cluster details.	2400	120

API	Description	Maximum API Requests in 10 Seconds	Maximum User Requests in 10 Seconds
Querying Cluster Details	This API is used to query the details of a cluster.	2400	120
Querying the Access Log List of a DataArts DataService Cluster	This API is used to query the access log list of a DataArts DataService cluster.	2400	120
Enabling Log Dump to OBS for DataArts DataService Clusters	This API is used to enable log dump to OBS for DataArts DataService clusters.	2400	120
Enabling Log Dump to LTS for DataArts DataService Clusters	This API is used to enable log dump to LTS for DataArts DataService clusters.	2400	120

3 Calling APIs

3.1 Making an API Request

This section describes the structure of a REST API request, and uses the IAM API for [creating an IAM user](#) as an example to demonstrate how to call an API. This API is used by the administrator to create an IAM user.

Request URI

A request URI is in the following format:

{URI-scheme}://{Endpoint}/{resource-path}?{query-string}

Although a request URI is included in the request header, most programming languages or frameworks require the request URI to be transmitted separately.

Table 3-1 URI parameters

Parameter	Description
URI-scheme	Protocol used to transmit requests. All APIs use HTTPS.
Endpoint	Domain name or IP address of the server bearing the REST service endpoint. The endpoint varies between services in different regions. An endpoint is the request address for calling an API. Endpoints vary depending on services and regions. You can obtain endpoints of the service from Endpoints . For example, the endpoint of IAM in region CN-Hong Kong is iam.ap-southeast-1.myhuaweicloud.com .
resource-path	Access path of an API for performing a specified operation. Obtain the value from the URI of an API. For example, resource-path of the API used to create an IAM user is /v3.0/OS-USER/users .

Parameter	Description
query-string	Query parameter, which is optional. Ensure that a question mark (?) is included before each query parameter that is in the format of " <i>Parameter name=Parameter value</i> ", for example, ?limit=10 , it indicates that a maximum of 10 data records are allowed.

For example, if you want to create an IAM user, combine the endpoint of any region (for example, iam.ap-southeast-1.myhuaweicloud.com for **CN-Hong Kong**) with the **resource-path (/v3.0/OS-USER/users)** in the URI of the API used to **create an IAM user**. The following is an example:

`https://iam.ap-southeast-1.myhuaweicloud.com/v3.0/OS-USER/users`

Figure 3-1 Example URI

NOTE

To simplify the URI display in this document, each API is provided only with a **resource-path** and a request method. The **URI-scheme** value of all APIs is **HTTPS**, and the endpoints of all APIs in the same region are identical.

Request Method

The HTTP protocol defines the following request methods that can be used to send a request to the server:

Table 3-2 HTTP methods

Method	Description
GET	Requests the server to return specified resources.
PUT	Requests the server to update specified resources.
POST	Requests the server to add resources or perform special operations.
DELETE	Requests the server to delete specified resources, for example, an object.
HEAD	Same as GET except that the server must return only the response header.

Method	Description
PATCH	Requests the server to update partial content of a specified resource. If the resource does not exist, a new resource will be created.

For example, in the URI of the IAM API for [creating an IAM user](#), the request method is **POST**. An example request is as follows:

```
POST https://iam.ap-southeast-1.myhuaweicloud.com/v3.0/OS-USER/users
```

Request Header

You can also add additional header fields to a request, such as the fields required by a specified URI or HTTP method. For example, to request the authentication information, add **Content-Type**, which specifies the request body type.

Table 3-3 lists common request header fields.

Table 3-3 Common request header fields

Field	Description	Mandatory	Example
Content-Type	Request body type or format. Its default value is application/json .	Yes	application/json
Content-Length	Specifies the length of the request body. The unit is byte.	No	3495
X-Language	Request language	No	en_us
X-Auth-Token	Specifies a user token. The user token is the value returned by the API used to obtain a user token . This API is the only API that does not require authentication. The token is the value of X-Subject-Token in the response header.	This field is mandatory for token authentication.	The following is part of an example token: MIIPAgYJKoZlhvc-NAQcCo...ggg1BBI INPXsidG9rZ

Field	Description	Mandatory	Example
Authorization	Authentication information. When AK/SK authentication is enabled, this field is automatically specified when SDK is used to sign the request.	This field is mandatory for AK/SK-based authentication.	None
X-Sdk-Date	Time when the request is sent. The format is YYYYMMDD'T'HHMMSS'Z'. The value is the current GMT time of the system. When AK/SK authentication is enabled, this field is automatically specified when SDK is used to sign the request.	This field is mandatory for AK/SK-based authentication.	20150907T101459Z
Host	Specifies the server domain name and port number of the resources being requested. The value can be obtained from the URL of the service API. The value is in the format of <i>hostname[:port]</i> . If the port number is not specified, the default port is used. The default port number for HTTPS is 443.	This field is mandatory for AK/SK-based authentication.	code.test.com or code.test.com:443
X-Project-Id	Subproject ID. Obtain the project ID by following the instructions in Project ID and Account ID .	This field is mandatory for calling service APIs that use AK/SK authentication in subprojects.	e9993fc787d94b6c886cbaa340f9c0f4
X-Domain-ID	Domain ID. Obtain the domain ID by following the instructions in Project ID and Account ID .	This field is mandatory for calling global APIs that use AK/SK authentication.	0a2f5e28af00f3850f31c00f31e884e0

Field	Description	Mandatory	Example
workspace	Workspace ID. For details about how to obtain it, see Instance ID and Workspace ID .	<ul style="list-style-type: none"> You do not need to set this field when calling a CDM or DIS API. This field is mandatory when there are multiple DataArts Studio instances during a call to a DataArts Factory API. This field is optional when there is only one DataArts instance. This field is optional when there is only one DataArts Studio instance. If this field is not specified, data in the default workspace is queried by default. To query data in other workspaces, include this field in the request header. This header is mandatory for calling the APIs of other modules. Otherwise, API calls will fail. 	d1cd7861478748a6925bc02f47c69279
X-Dlm-Type	DataArts DataService edition, which is Exclusive	This parameter is mandatory for calling DataArts DataService APIs.	EXCLUSIVE: exclusive edition

 NOTE

In addition to supporting token-based authentication, APIs also support authentication using access key ID/secret access key (AK/SK). During AK/SK-based authentication, an SDK is used to sign the request, and the **Authorization** (signature authentication) and **X-Sdk-Date** (time when the request is sent) header fields are automatically added to the request.

For more information, see "AK/SK-based Authentication" in [Authentication](#).

The following is an example request of the API that is used to [create an IAM user](#) and that uses AK/SK authentication:

```
POST https://iam.ap-southeast-1.myhuaweicloud.com/v3.0/OS-USER/users
Content-Type: application/json
X-Sdk-Date: 20240416T095341Z
Authorization: SDK-HMAC-SHA256 Access=*****, SignedHeaders=content-type;host;x-sdk-date,
Signature=*****
```

Request Body

The body of a request is often sent in a structured format (for example, JSON or XML) as specified in the **Content-Type** header field. The request body transfers content except the request header. If the request body contains Chinese characters, these characters must be coded in UTF-8.

The request body varies between APIs. Some APIs do not require the request body, such as the APIs requested using the **GET** and **DELETE** methods.

For the API used to [obtain an IAM user](#), you can obtain the request parameters and their descriptions from the API request. The following provides an example request with a body included. Replace the italic fields in bold with the actual values.

- **accountid** indicates the ID of the account to which the IAM user belongs.
- **username** indicates the IAM username to be created.
- **email** indicates the email address of the IAM user.
- ********* indicates the login password of the IAM user.

```
POST https://iam.ap-southeast-1.myhuaweicloud.com/v3.0/OS-USER/users
Content-Type: application/json
X-Sdk-Date: 20240416T095341Z
Authorization: SDK-HMAC-SHA256 Access=*****, SignedHeaders=content-type;host;x-sdk-date,
Signature=*****

{
  "user": {
    "domain_id": "accountid",
    "name": "username",
    "password": "*****",
    "email": "email",
    "description": "IAM User Description"
  }
}
```

If all data required for the API request is available, you can send the request to call the API through [curl](#), [Postman](#), or coding.

3.2 Authentication

Requests for calling an API can be authenticated using either of the following methods:

- Token-based authentication: Requests are authenticated using a token.
- AK/SK-based authentication: Requests are authenticated by encrypting the request body using an AK/SK pair.

NOTE

An IAM user can pass the authentication and access DataArts Studio through an API or SDK only if **Programmatic access** is selected for **Access Type** during the creation of the IAM user.

Token-based Authentication

NOTE

- The validity period of a token is 24 hours. When using a token for authentication, cache it to prevent frequently calling the IAM API used to obtain a user token.
- Ensure that the token is valid when you use it. Using a token that will soon expire may cause API calling failures.

A token specifies temporary permissions in a computer system. During API authentication using a token, the token is added to a request to get permissions for calling the API.

When calling the API to **obtain a user token**, you must set **auth.scope** in the request body to **project**.

```
{
  "auth": {
    "identity": {
      "methods": [
        "password"
      ],
      "password": {
        "user": {
          "name": "username",
          "password": "*****",
          "domain": {
            "name": "domainname"
          }
        }
      }
    }
  },
  "scope": {
    "project": {
      "id": "xxxxxxxxxxxxxxxxxxxxxx"
    }
  }
}
```

After a token is obtained, the X-Auth-Token header field must be added to requests to specify the token when calling other APIs, for example, the API used to query a connection list. For example, if the token is **ABCDEFJ....**, **X-Auth-Token: ABCDEFJ....** can be added to a request as follows:

```
GET https://iam.ap-southeast-1.myhuaweicloud.com/v1/{project_id}/connections
Content-Type: application/json
X-Auth-Token: ABCDEFJ....
```

AK/SK-based Authentication

NOTE

- AK/SK-based authentication supports API requests with a body not larger than 12 MB. For API requests with a larger body, use token-based authentication.
- You can use the AK/SK in a permanent or temporary access key. The **X-Security-Token** field must be configured if the AK/SK in a temporary access key is used, and the field value is **security_token** of the temporary access key.

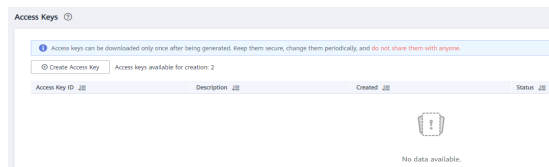

In AK/SK-based authentication, AK/SK is used to sign requests and the signature is then added to the requests for authentication.

- **AK**: access key ID, which is a unique identifier used in conjunction with a secret access key to sign requests cryptographically.
- **SK**: secret access key used in conjunction with an AK to sign requests cryptographically. It identifies a request sender and prevents the request from being modified.

To obtain an access key, perform the following steps:

1. Log in to the management console, move the cursor to the username in the upper right corner, and select **My Credentials** from the drop-down list.
2. On the **My Credentials** page, choose **Access Keys**, and click **Create Access Key**. See [Figure 3-2](#).

Figure 3-2 Clicking Create Access Key

3. Click **OK** and save the access key file as prompted. The access key file will be saved to your browser's configured download location. Open the **credentials.csv** file to view **Access Key Id** and **Secret Access Key**.

NOTE

- Only two access keys can be added for each user.
- To ensure access key security, the access key is automatically downloaded only when it is generated for the first time and cannot be obtained from the management console later. Keep them properly.

In AK/SK-based authentication, you can use an AK/SK to sign requests based on the signature algorithm or use the signing SDK to sign requests. For details about how to sign requests and use the signature SDK, see [API Request Signing Guide](#).

NOTICE

The signing SDKs are only used for signing requests and different from the SDKs provided by services.

3.3 Response

After sending a request, you will receive a response, including a status code, response header, and response body.

Status Code

After sending a request, you will receive a response, including a status code, response header, and response body.

A status code is a group of digits, ranging from 1xx to 5xx. It indicates the status of a request. For more information, see [Status Codes](#).

For example, if status code **201** is returned for calling the API used to [obtain a user token](#), the request is successful.

Response Header

Similar to a request, a response also has a header, for example, **Content-Type**.

If status code **201** is returned for the API used to [create an IAM user](#), the request is successful.

Response Body

The body of a response is often returned in structured format (for example, JSON or XML) as specified in the **Content-Type** header field. The response body transfers content except the response header.

Part of the response body for the API used to [create an IAM user](#) is as follows:

```
{
  "user": {
    "id": "c131886aec...",
    "name": "IAMUser",
    "description": "IAM User Description",
    "areacode": "",
    "phone": "",
    "email": "****@***.com",
    "status": null,
    "enabled": true,
    "pwd_status": false,
    "access_mode": "default",
    "is_domain_owner": false,
    "xuser_id": "",
    "xuser_type": "",
    "password_expires_at": null,
    "create_time": "2024-05-21T09:03:41.000000",
    "domain_id": "d78cbac1.....",
    "xdomain_id": "30086000.....",
    "xdomain_type": "",
    "default_project_id": null
  }
}
```

If an error occurs during API calling, an error code and a message will be displayed. The following shows an error response body.

```
{
  "error_msg": "Request body is invalid.",
}
```

```
"error_code": "IAM.0011"  
}
```

In the response body, **error_code** is an error code, and **error_msg** provides information about the error.

4 DataArts Migration APIs

4.1 Cluster Management

4.1.1 Querying Cluster Details

Function

This API is used to query cluster details.

Calling Method

For details, see [Calling APIs](#).

URI

GET /v1.1/{project_id}/clusters/{cluster_id}

Table 4-1 Path Parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Project ID. For details about how to obtain it, see Project ID and Account ID .
cluster_id	Yes	String	Cluster ID

Request Parameters

Table 4-2 Request header parameters

Parameter	Mandatory	Type	Description
X-Auth-Token	Yes	String	User token. It can be obtained by calling the IAM API (value of X-Subject-Token in the response header).

Response Parameters

Status code: 200

Table 4-3 Response body parameters

Parameter	Type	Description
publicEndpoint	String	EIP bound to the cluster
instances	Array of ClusterDetail Instance objects	Cluster node information. For details, see the descriptions of instances parameters.
security_group_id	String	Security group ID
subnet_id	String	Subnet ID
vpc_id	String	VPC ID
customerConfig	CustomerConfig object	User configuration
datastore	Datastore object	CDM information
isAutoOff	Boolean	Automatic shutdown
publicEndpointDomainName	String	Domain name for the EIP bound to the cluster
bakExpectedStartTime	String	Start time
bakKeepDay	Integer	Retention period
maintainWindow	maintainWindow object	Maintenance window

Parameter	Type	Description
recentEvent	Integer	Number of events
flavorName	String	Flavor name
azName	String	AZ name
endpointDomainName	String	Peer domain name
publicEndpointStatus	publicEndpointStatus object	EIP status
isScheduleBootOff	Boolean	Whether to enable scheduled startup/shutdown. The scheduled startup/shutdown and auto shutdown functions cannot be enabled at the same time.
namespace	String	Namespace
eipId	String	EIP ID
failedReasons	FailedReasons object	Failure cause. If this parameter is left empty, the cluster is in normal state.
dbuser	String	Database user
links	Array of ClusterLinks objects	Cluster link information
clusterMode	String	Cluster mode: sharding
task	ClusterTask object	Task information
created	String	Cluster creation time in ISO 8601 format: YYYY-MM-DDThh:mm:ssZ
statusDetail	String	Cluster status: normal
config_status	String	Cluster configuration status. <ul style="list-style-type: none">● In-Sync: The configuration has been synchronized.● Applying: The cluster is being configured.● Sync-Failure: The configuration failed.
actionProgress	ActionProgress object	Cluster operation progress, which consists of a key and a value. The key indicates an ongoing task, and the value indicates the progress of the ongoing task. An example is "action_progress":{"SNAPSHOTTING":"16%"}.
name	String	Cluster name

Parameter	Type	Description
id	String	Cluster ID
isFrozen	String	Whether the cluster is frozen. The value can be 0 (not frozen) or 1 (frozen).
actions	Array of strings	Cluster configuration status. Options: - In-Sync : The cluster configuration has been synchronized. - Applying : The cluster is being configured. - Sync-Failure : The cluster configuration failed.
updated	String	Cluster update time in ISO 8601 format: YYYY-MM-DDThh:mm:ssZ
status	String	Cluster status. The options are as follows: <ul style="list-style-type: none"> ● 100: creating ● 200: normal ● 300: failed ● 303: creation failed ● 800: frozen ● 900: stopped ● 910: stopping ● 920: starting

Table 4-4 ClusterDetailInstance

Parameter	Type	Description
flavor	flavor object	VM flavor of a node. For details, see the descriptions of flavor parameters.
volume	volume object	Disk information of a node. For details, see the descriptions of volume parameters.
status	String	Node status <ul style="list-style-type: none"> ● 100: creating ● 200: normal ● 300: failed ● 303: failed to be created ● 400: deleted ● 800: frozen

Parameter	Type	Description
actions	Array of strings	Node operation status <ul style="list-style-type: none">● REBOOTING: restarting● RESTORING: restoring● REBOOT_FAILURE: failed to restart
type	String	Node type. Currently, only cdm is available.
id	String	Node VM ID
name	String	Name of the VM on the node
isFrozen	String	Whether the node is frozen. The value can be 0 (not frozen) or 1 (frozen).
components	String	Components
config_status	String	Node configuration status. The value is null when the cluster list is queried. <ul style="list-style-type: none">● In-Sync: The configuration has been synchronized.● Applying: The configuration is in progress.● Sync-Failure: The configuration fails.
role	String	Instance role
group	String	Group
links	Array of ClusterLinks objects	Links (null is returned for querying the cluster list)
paramsGroupID	String	Group ID
publicip	String	Public IP address
manageip	String	Management IP address
trafficip	String	Traffic IP address
shard_id	String	Slice ID
manage_fix_ip	String	Management fix IP address
private_ip	String	Private IP address
internal_ip	String	Internal IP address
resource	Array of Resource objects	Resource information (null is returned for querying the cluster list)

Table 4-5 flavor

Parameter	Type	Description
id	String	VM flavor ID
links	Array of ClusterLinks objects	Links

Table 4-6 volume

Parameter	Type	Description
type	String	Type of disks on the node. Only local disks are supported.
size	Long	Size of the disk on the node (GB)

Table 4-7 Resource

Parameter	Type	Description
resource_id	String	Resource ID
resource_type	String	Resource type: server

Table 4-8 CustomerConfig

Parameter	Type	Description
failureRemind	String	Failure notification
clusterName	String	Cluster type
serviceProvider	String	Service provider
localDisk	String	Whether the disk is a local disk
ssl	String	Whether to enable SSL
createFrom	String	Source
resourceId	String	Resource ID
flavorType	String	Flavor type
workspaceId	String	Workspace ID
trial	String	Trial

Table 4-9 Datastore

Parameter	Type	Description
type	String	Type. Generally, the value is cdm .
version	String	Cluster version

Table 4-10 maintainWindow

Parameter	Type	Description
day	String	Day of a week
startTime	String	Start time
endTime	String	End time

Table 4-11 publicEndpointStatus

Parameter	Type	Description
status	String	Status
errorMessage	String	Error message

Table 4-12 FailedReasons

Parameter	Type	Description
CREATE_FAILED	CREATE_FAILED object	Cause of the cluster creation failure

Table 4-13 CREATE_FAILED

Parameter	Type	Description
errorCode	String	Error code
errorMsg	String	Failure cause

Table 4-14 ClusterLinks

Parameter	Type	Description
rel	String	Relationship

Parameter	Type	Description
href	String	Link address

Table 4-15 ClusterTask

Parameter	Type	Description
description	String	Task description
id	String	Task ID
name	String	Task name

Table 4-16 ActionProgress

Parameter	Type	Description
CREATING	String	Cluster creation progress, for example, 29%
GROWING	String	Cluster expansion progress, for example, 29%
RESTORING	String	Cluster restoration progress, for example, 29%
SNAPSHOTTING	String	Cluster snapshotting progress, for example, 29%
REPAIRING	String	Cluster repairing progress, for example, 29%

Example Requests

```
GET /v1.1/1551c7f6c808414d8e9f3c514a170f2e/clusters/bae65496-643e-47ca-84af-948672de7eeb
```

Example Responses

Status code: 200

Request succeeded.

```

"status" : "200"
}
```

Status Codes

Status Code	Description
200	Request succeeded.
400	Request error.
401	Authentication failed.
403	No operation permissions.
404	No resources found.
500	Internal service error. For details about the returned error code, see Error Codes.
503	Service unavailable.

Error Codes

See [Error Codes](#).

4.1.2 Deleting a Cluster

Function

This API is used to delete a cluster.

Calling Method

For details, see [Calling APIs](#).

URI

DELETE /v1.1/{project_id}/clusters/{cluster_id}

Table 4-17 Path Parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Project ID. For details about how to obtain it, see Project ID and Account ID .
cluster_id	Yes	String	Cluster ID

Request Parameters

Table 4-18 Request header parameters

Parameter	Mandatory	Type	Description
X-Auth-Token	Yes	String	User token. It can be obtained by calling the IAM API (value of X-Subject-Token in the response header).

Table 4-19 Request body parameters

Parameter	Mandatory	Type	Description
keep_last_manual_backup	Yes	Integer	Number of backup log files. Retain the default value 0 .

Response Parameters

Status code: 202

Table 4-20 Response body parameters

Parameter	Type	Description
jobId	String	Job ID

Example Requests

```
DELETE /v1.1/1551c7f6c808414d8e9f3c514a170f2e/clusters/6ec9a0a4-76be-4262-8697-e7af1fac7920
{
  "keep_last_manual_backup": 0
}
```

Example Responses

Status code: 202

Accepted.

```
{
  "jobId" : "ff8080815e55125a015e552eddba001a"
}
```

SDK Sample Code

The SDK sample code is as follows.

Java

```
package com.huaweicloud.sdk.test;

import com.huaweicloud.sdk.core.auth.ICredential;

More

For SDK sample code of more programming languages, see the Sample Code tab in [API Explorer](#). SDK sample code can be automatically generated.

Status Codes

Status Code	Description
202	Accepted.
400	Request error.
401	Authorization failed.
403	No operation permissions.
404	No resources found.
500	Internal service error. For details about the returned error code, see Error Codes.
503	Service unavailable.

Error Codes

See [Error Codes](#).

4.1.3 Querying All AZs

Function

This API is used to query all AZs of a CDM cluster.

Calling Method

For details, see [Calling APIs](#).

URI

GET /v1.1/{project_id}/regions/{region_id}/availability_zones

Table 4-21 Path Parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Project ID. For details about how to obtain the project ID, see Project ID and Account ID .
region_id	Yes	String	Region ID. You can obtain it from the response message of the "Querying the Region List" API of the IAM service.

Request Parameters

Table 4-22 Request header parameters

Parameter	Mandatory	Type	Description
X-Auth-Token	Yes	String	User token. This parameter is mandatory when token authentication is used. You can obtain it from the value of X-Subject-Token in the response message header returned by the "Obtaining a User Token" API of the IAM service.

Response Parameters

Status code: 200

Table 4-23 Response body parameters

Parameter	Type	Description
regionId	String	Region ID.
defaultAZ	String	Specifies the default AZ.

Parameter	Type	Description
availableZones	Array of CdmClusterAvailabilityZone objects	Indicates the AZ.

Table 4-24 CdmClusterAvailabilityZone

Parameter	Type	Description
availableZoneId	String	ID of the AZ
availableZoneName	String	AZ name
availableZoneCode	String	Indicates the AZ code.
azStatus	String	AZ status.
type	String	Indicates the AZ type.
tags	Object	AZ tag

Example Requests

```
GET /v1.1/1551c7f6c808414d8e9f3c514a170f2e/regions/xxx-xxx-xxx/availability_zones
```

Example Responses

Status code: 200

The request is successful.

```
{
  "regionId": "xxx-xxx-xxx",
  "defaultAZ": "xxx-xxx-xxx",
  "availableZones": [ {
    "availableZoneId": "xxx-xxx-xxx",

More

For SDK sample code of more programming languages, see the Sample Code tab in [API Explorer](#). SDK sample code can be automatically generated.

Status Codes

Status Code	Description
200	The request is successful.
400	Request error.
401	Authentication failed.
403	No operation permission.
404	No resources found.
500	Internal service error. For details about the returned error code, see Error Codes.
503	Service unavailable.

Error Codes

See [Error Codes](#).

4.1.4 Querying Supported Versions

Function

This API is used to query the versions supported by CDM clusters.

Calling Method

For details, see [Calling APIs](#).

URI

GET /v1.1/{project_id}/datastores

Table 4-25 Path Parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Project ID. For details about how to obtain the project ID, see Project ID and Account ID .

Request Parameters

Table 4-26 Request header parameters

Parameter	Mandatory	Type	Description
X-Auth-Token	Yes	String	User token. This parameter is mandatory when token authentication is used. You can obtain it from the value of X-Subject-Token in the response message header returned by the "Obtaining a User Token" API of the IAM service.

Response Parameters

Status code: 200

Table 4-27 Response body parameters

Parameter	Type	Description
datastores	Array of CdmClusterDatastore objects	Specifies the database list.

Table 4-28 CdmClusterDatastore

Parameter	Type	Description
id	String	Service ID, which is used to differentiate services.
name	String	Service name
bigclusterEnable	Boolean	Specifies whether large-scale clusters are supported.
defaultVersion	String	Default version.
versions	Array of CdmClusterVersion objects	Indicates the version.

Table 4-29 CdmClusterVersion

Parameter	Type	Description
active	String	Version status.
id	String	Version ID.
image	String	Version image.
name	String	Version name.
packages	String	Version package.
datastore	String	Service ID, which is used to differentiate services.
links	Array of ClusterLinks objects	URL information.

Table 4-30 ClusterLinks

Parameter	Type	Description
rel	String	Relationship
href	String	Link address

Example Requests

```
GET /v1.1/1551c7f6c808414d8e9f3c514a170f2e/datastores
```

Example Responses

Status code: 200

The request is successful.

Error Codes

See [Error Codes](#).

4.1.5 Querying Version Specifications

Function

This API is used to query all compatible specifications by version ID.

Calling Method

For details, see [Calling APIs](#).

URI

GET /v1.1/{project_id}/datastores/{datastore_id}/flavors

Table 4-31 Path Parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Project ID. For details about how to obtain it, see Project ID and Account ID .
datastore_id	Yes	String	Version ID. For details about how to obtain the version ID, see Versions Supported by CDM .

Request Parameters

Table 4-32 Request header parameters

Parameter	Mandatory	Type	Description
X-Auth-Token	Yes	String	User token. This parameter is mandatory when token authentication is used. You can obtain it from the value of X-Subject-Token in the response message header returned by the "Obtaining a User Token" API of the IAM service.

Response Parameters

Status code: 200

Table 4-33 Response body parameters

Parameter	Type	Description
id	String	Service ID, which is used to differentiate services.
dbname	String	Database name. Generally, the value is cdm.
versions	Array of CdmClusterDatastoreVersion objects	API version list

Table 4-34 CdmClusterDatastoreVersion

Parameter	Type	Description
id	String	Specifies the version ID.
name	String	Version name.
flavors	Array of CdmClusterFlavor objects	Flavor information.

Table 4-35 CdmClusterFlavor

Parameter	Type	Description
cpu	Integer	CPU.
ram	Integer	Indicates the memory.
name	String	Flavor name
region	String	region.
typename	String	Type.
clusterMode	String	multinode cluster
status	String	Flavor status. Options:
str_id	String	Indicates the flavor ID.

Example Requests

```
GET /v1.1/1551c7f6c808414d8e9f3c514a170f2e/datastores/736270b9-27c7-4f03-823b-447d8245e1c2/flavors
```

Example Responses

Status Codes

Status Code	Description
200	The request is successful.
400	Request error
401	Authorization failed.
403	No operation permissions.
404	No resources found.
500	Internal service error. For details about the returned error code, see Error Codes.
503	Service unavailable.

Error Codes

See [Error Codes](#).

4.1.6 Querying Details About a Flavor

Function

This API is used to query the details of a flavor with a specified ID.

Calling Method

For details, see [Calling APIs](#).

URI

GET /v1.1/{project_id}/flavors/{flavor_id}

Table 4-36 Path Parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Project ID. For details about how to obtain the project ID, see Project ID and Account ID .
flavor_id	Yes	String	Flavor ID. For details about how to obtain it, see Querying Version Flavors .

Request Parameters

Table 4-37 Request header parameters

Parameter	Mandatory	Type	Description
X-Auth-Token	Yes	String	User token. This parameter is mandatory when token authentication is used. You can obtain it from the value of X-Subject-Token in the response message header returned by the "Obtaining a User Token" API of the IAM service.

Response Parameters

Status code: 200

Table 4-38 Response body parameters

Parameter	Type	Description
name	String	Flavor name
str_id	String	Flavor ID
flavor_detail	Array of flavorAttribute objects	List of flavor details

Table 4-39 flavorAttribute

Parameter	Type	Description
name	String	Flavor attribute name, such as mem and cpu
value	String	Flavor attribute value

Example Requests

```
GET /v1.1/1551c7f6c808414d8e9f3c514a170f2e/flavors/a79fd5ae-1833-448a-88e8-3ea2b913e1f6
```

Example Responses

Status code: 200

Request succeeded.

```
{
  "str_id": "a79fd5ae-1833-448a-88e8-3ea2b913e1f6",
  "name": "cdm.large",

4.1.7 Querying the Enterprise Project IDs of All Clusters

Function

This API is used to query the enterprise project IDs of all clusters in the current project.

Calling Method

For details, see [Calling APIs](#).

URI

GET /v1.1/{project_id}/enterprise-projects

Table 4-40 Path Parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Project ID. For details about how to obtain the project ID, see Project ID and Account ID .

Request Parameters

Table 4-41 Request header parameters

Parameter	Mandatory	Type	Description
X-Auth-Token	Yes	String	User token. This parameter is mandatory when token authentication is used. You can obtain it from the value of X-Subject-Token in the response message header returned by the "Obtaining a User Token" API of the IAM service.

Response Parameters

Status code: 200

Table 4-42 Response body parameters

Parameter	Type	Description
resources	Array of CdmClusterEnterpriseProject objects	Enterprise projects of the cluster

Table 4-43 CdmClusterEnterpriseProject

Parameter	Type	Description
cluster_id	String	Cluster ID
sys_tags	Array of sys_tags objects	Enterprise projects

Table 4-44 sys_tags

Parameter	Type	Description
value	String	Enterprise project ID
key	String	The value is fixed at _sys_enterprise_project_id .

Example Requests

```
GET /v1.1/1551c7f6c808414d8e9f3c514a170f2e/enterprise-projects
```

Example Responses

Status code: 200

Request succeeded.

GET /v1.1/{project_id}/instances/{instance_id}

Table 4-49 Path Parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Project ID. For details about how to obtain the project ID, see Project ID and Account ID .
instance_id	Yes	String	Instance ID. For details about how to obtain it, see Querying the Cluster List .

Request Parameters

Table 4-50 Request header parameters

Parameter	Mandatory	Type	Description
X-Auth-Token	Yes	String	User token. This parameter is mandatory when token authentication is used. You can obtain it from the value of X-Subject-Token in the response message header returned by the "Obtaining a User Token" API of the IAM service.

Response Parameters

Status code: 200

Table 4-51 Response body parameters

Parameter	Type	Description
instance	CdmQueryClusterInstanceDetail object	Instance information

Table 4-52 CdmQueryClusterInstanceDetail

Parameter	Type	Description
configuration Status	String	Cluster configuration status. The options are as follows: <ul style="list-style-type: none"> • In-Sync: The configuration has been synchronized. • Applying: The cluster is being configured. • Sync-Failure: The configuration failed.
paramsGroupID	String	Configuration ID
type	String	Service type, which is cdm
role	String	Instance mode, which is Standalone
subnetid	String	Subnet ID of the instance
securegroup	String	Security group ID

Parameter	Type	Description
vpc	String	VPC ID of the instance
azcode	String	AZ name
region	String	Site name
created	String	Instance creation time in ISO 8601 format: YYYY-MM-DDThh:mm:ssZ
updated	String	Instance update time in ISO 8601 format: YYYY-MM-DDThh:mm:ssZ
name	String	Instance name
id	String	Instance ID
flavor	flavor object	VM flavor of a node. For details, see the descriptions of flavor parameters.
datastore	Datastore object	Cluster information. For details, see the descriptions of datastore parameters.
dbuser	String	Database user, which is cdm
payModel	Integer	Payment mode <ul style="list-style-type: none">• 0: pay-per-use• 1: yearly/monthly
publicip	String	Public IP address bound to the cluster
trafficip	String	Private IP address of the cluster
trafficipv6	String	Private IPv6 address of the cluster
cluster_id	String	Cluster ID

Table 4-53 flavor

Parameter	Type	Description
id	String	VM flavor ID
links	Array of ClusterLinks objects	Links

Table 4-54 ClusterLinks

Parameter	Type	Description
rel	String	Relationship

Parameter	Type	Description
href	String	Link address

Table 4-55 Datastore

Parameter	Type	Description
type	String	Type. Generally, the value is cdm .
version	String	Cluster version

Example Requests

```
GET /v1.1/1551c7f6c808414d8e9f3c514a170f2e/instances/2c529048-ed06-4bcb-a48e-bf1800e1f496
```

Example Responses

Status code: 200

Request succeeded.

Status Codes

Status Code	Description
200	Request succeeded.
400	Request error.
401	Authentication failed.
403	No operation permissions.
404	No resources found.
500	Internal service error. For details about the returned error code, see Error Codes.
503	Service unavailable.

Error Codes

See [Error Codes](#).

4.1.10 Modifying a Cluster

Function

Modify the CDM cluster configuration.

Calling Method

For details, see [Calling APIs](#).

URI

POST /v1.1/{project_id}/cluster/modify/{cluster_id}

Table 4-56 Path Parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Project ID. For details about how to obtain the project ID, see Project ID and Account ID .

Parameter	Mandatory	Type	Description
cluster_id	Yes	String	CDM cluster ID. For details about how to obtain the CDM cluster ID, see Querying the Cluster List .

Request Parameters

Table 4-57 Request header parameters

Parameter	Mandatory	Type	Description
Content-Type	Yes	String	Type (format) of the message body. This parameter is mandatory if the message body exists. If the message body does not exist, leave this parameter blank. If the request body contains Chinese characters, use charset=utf8 to specify the Chinese character set, for example, application/json;charset=utf8.
X-Auth-Token	Yes	String	User token. This parameter is mandatory when token authentication is used. You can obtain it from the value of X-Subject-Token in the response message header returned by the "Obtaining a User Token" API of the IAM service.
X-Language	Yes	String	Request language.

Table 4-58 Request body parameters

Parameter	Mandatory	Type	Description
autoOff	No	Boolean	The phone automatically shuts down.
scheduleBoot Off	No	Boolean	Scheduled shutdown.
scheduleBoot Time	No	String	Scheduled startup.

Parameter	Mandatory	Type	Description
scheduleOffTime	No	String	Scheduled shutdown time.
autoRemind	No	Boolean	Message notification.
phoneNum	No	String	Mobile number. A maximum of 20 mobile numbers can be entered and separated by commas (,).
email	No	String	Email address. A maximum of 20 email addresses can be entered and separated by commas (,).

Response Parameters

None

Example Requests

Modify the cluster configuration.

Status Codes

Status Code	Description
202	The request is successful.
400	Request error.
401	Authentication failed.
403	No operation permission.
404	No resources found.
500	The internal API of the service is abnormal.
503	Service unavailable.

Error Codes

See [Error Codes](#).

4.1.11 Restarting a Cluster

Function

This API is used to restart a cluster.

Calling Method

For details, see [Calling APIs](#).

URI

POST /v1.1/{project_id}/clusters/{cluster_id}/action

Table 4-59 Path Parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Project ID. For details about how to obtain it, see Project ID and Account ID .
cluster_id	Yes	String	Cluster ID

Request Parameters

Table 4-60 Request header parameters

Parameter	Mandatory	Type	Description
X-Auth-Token	Yes	String	User token. It can be obtained by calling the IAM API (value of X-Subject-Token in the response header).

Table 4-61 Request body parameters

Parameter	Mandatory	Type	Description
restart	Yes	restart object	Cluster restart. For details about how to define the cluster to restart, see the descriptions of restart parameters.

Table 4-62 restart

Parameter	Mandatory	Type	Description
restartDelayTime	No	Integer	Restart delay, in seconds

Parameter	Mandatory	Type	Description
restartMode	No	String	Restart mode. <ul style="list-style-type: none"> ● IMMEDIATELY: immediate restart ● FORCELY: forcible restart ● SOFTLY: normal restart The default value is IMMEDIATELY . Forcibly restarting service processes will interrupt services and restart VMs in the cluster.
restartLevel	No	String	Restart level. The options are as follows: <ul style="list-style-type: none"> ● SERVICE: service restart ● VM: VM restart The default value is SERVICE .
type	Yes	String	Type of the cluster node. The value can only be cdm .
instance	No	String	This parameter is reserved. When restartLevel is set to SERVICE , this parameter is mandatory. Set it to an empty string.
group	No	String	This parameter is reserved. When restartLevel is set to SERVICE , this parameter is mandatory. Set it to an empty string.

Response Parameters

Status code: 200

Table 4-63 Response body parameters

Parameter	Type	Description
jobId	String	Job ID

Example Requests

Restart a cluster.

```
POST /v1.1/1551c7f6c808414d8e9f3c514a170f2e/clusters/bae65496-643e-47ca-84af-948672de7eeb/action
```

```

200	Request succeeded.
400	Request error.
401	Authentication failed.
403	No operation permissions.
404	No resources found.
500	Internal service error. For details about the returned error code, see Error Codes.
503	Service unavailable.

Error Codes

See [Error Codes](#).

4.1.12 Starting a Cluster

Function

This API is used to start a cluster.

Calling Method

For details, see [Calling APIs](#).

URI

POST /v1.1/{project_id}/clusters/{cluster_id}/action

Table 4-64 Path Parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Project ID. For details about how to obtain it, see Project ID and Account ID .
cluster_id	Yes	String	Cluster ID

Request Parameters

Table 4-65 Request header parameters

Parameter	Mandatory	Type	Description
X-Auth-Token	Yes	String	User token. It can be obtained by calling the IAM API (value of X-Subject-Token in the response header).

Table 4-66 Request body parameters

Parameter	Mandatory	Type	Description
start	Yes	Object	Starting a cluster. This parameter is an empty object.

Response Parameters

Status code: 200

Table 4-67 Response body parameters

Parameter	Type	Description
jobId	Array of strings	Job ID

Example Requests

Start a cluster.

```
POST /v1.1/1551c7f6c808414d8e9f3c514a170f2e/clusters/bae65496-643e-47ca-84af-948672de7eeb/action
{
  "start" : { }
}
```

Example Responses

Status code: 200

Request succeeded.

```
{
  "jobId" : [ "ff8080815e59d92d015e5b27ccb0004d" ]
}
```

4.1.13 Stopping a Cluster (To Be Taken Offline)

Function

This API is used to stop a cluster.

Calling Method

For details, see [Calling APIs](#).

URI

POST /v1.1/{project_id}/clusters/{cluster_id}/action

Table 4-68 Path Parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Project ID. For details about how to obtain it, see Project ID and Account ID .
cluster_id	Yes	String	Cluster ID

Request Parameters

Table 4-69 Request header parameters

Parameter	Mandatory	Type	Description
X-Auth-Token	Yes	String	User token. It can be obtained by calling the IAM API (value of X-Subject-Token in the response header).

Table 4-70 Request body parameters

Parameter	Mandatory	Type	Description
stop	Yes	stop object	Cluster stop operation. For details, see the descriptions of stop parameters.

Table 4-71 stop

Parameter	Mandatory	Type	Description
stopMode	Yes	String	Stop mode. <ul style="list-style-type: none">• IMMEDIATELY: immediate stop• GRACEFULLY: graceful stop

Parameter	Mandatory	Type	Description
delayTime	No	Integer	Shutdown delay, in seconds. This parameter is valid only when stopMode is set to GRACEFULLY . If the value is -1 , the system waits until all jobs are complete and stops accepting new jobs. If the value is greater than 0 , the system stops the cluster after the specified delay and stops accepting new jobs.

Response Parameters

Status code: 200

Table 4-72 Response body parameters

Parameter	Type	Description
jobId	Array of strings	Job ID

Example Requests

Stopping a Cluster

```
POST /v1.1/1551c7f6c808414d8e9f3c514a170f2e/clusters/bae65496-643e-47ca-84af-948672de7eeb/action
{
  "stop": {
    "stopMode": "GRACEFULLY",
    "delayTime": -1
  }
}
```

Example Responses

Status code: 200

Request succeeded.

```
{
  "jobId": [ "ff8080815e59d92d015e5b27ccb0004d" ]
}
```

Status Codes

Status Code	Description
200	Request succeeded.
400	Request error.
401	Authentication failed.
403	No operation permissions.
404	No resources found.
500	Internal service error. For details about the returned error code, see Error Codes.
503	Service unavailable.

Error Codes

See [Error Codes](#).

4.1.14 Creating a Cluster

Function

This API is used to create a cluster.

Calling Method

For details, see [Calling APIs](#).

URI

POST /v1.1/{project_id}/clusters

Table 4-73 Path Parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Project ID. For details about how to obtain it, see Project ID and Account ID .

Request Parameters

Table 4-74 Request header parameters

Parameter	Mandatory	Type	Description
X-Auth-Token	Yes	String	User token. It can be obtained by calling the IAM API (value of X-Subject-Token in the response header).
X-Language	Yes	String	Request language

Table 4-75 Request body parameters

Parameter	Mandatory	Type	Description
cluster	Yes	cluster object	Cluster object. For details, see the descriptions of cluster parameters.
auto_remind	No	Boolean	Whether to enable message notifications. If the function is enabled, you can configure a maximum of 20 mobile numbers or email addresses. You will be notified of job failures (only table/file migration jobs) and EIP exceptions by SMS message or email.
phone_num	No	String	Mobile number for receiving notifications
email	No	String	Email address for receiving notifications

Table 4-76 cluster

Parameter	Mandatory	Type	Description
scheduleBoot Time	No	String	Time for scheduled startup of a CDM cluster. The CDM cluster starts at this time every day.

Parameter	Mandatory	Type	Description
isScheduleBoo tOff	No	Boolean	Whether to enable scheduled startup/shutdown. The scheduled startup/shutdown and auto shutdown functions cannot be enabled at the same time.
instances	No	Array of instance objects	Node list. For details, see the descriptions of instances parameters.
datastore	No	Datastore object	Cluster information. For details, see the descriptions of datastore parameters.
extended_pro perties	No	ExtendedPro perties object	Extended attribute. For details, see the descriptions of extended_properties parameters.
scheduleOffTi me	No	String	Time for scheduled shutdown of a CDM cluster. The CDM cluster shuts down directly at this time every day without waiting for unfinished jobs to complete.
vpclId	No	String	VPC ID, which is used for configuring a network for the cluster.
name	No	String	Cluster name
sys_tags	No	Array of sys_tags objects	Enterprise project information. For details, see the descriptions of sys_tags parameters.
isAutoOff	No	Boolean	Whether to enable auto shutdown. The auto shutdown and scheduled startup/shutdown functions cannot be enabled at the same time. After auto shutdown is enabled, if no job is running in the cluster and no scheduled job is created, a cluster will automatically shut down 15 minutes later to reduce costs.

Table 4-77 instance

Parameter	Mandatory	Type	Description
availability_zone	Yes	String	AZ where a cluster is located. It can be obtained from https://developer.huaweicloud.com/intl/en-us/endpoint .
nics	Yes	Array of nics objects	NIC list. A maximum of two NICs are supported. For details, see the descriptions of nics parameters.
flavorRef	Yes	String	Instance flavor. <ul style="list-style-type: none"> • a79fd5ae-1833-448a-88e8-3ea2b913e1f6: cdm.small with 2 vCPUs and 4 GB memory applicable to Proof of Concept (PoC) verification and development tests • fb8fe666-6734-4b11-bc6c-43d11db3c745: cdm.medium with 4 vCPUs and 8 GB memory applicable to the migration of a single database table with fewer than 10 million pieces of data • 5ddb1071-c5d7-40e0-a874-8a032e81a697: cdm.large with 8 vCPUs and 16 GB memory applicable to the migration of a single database table with 10 million pieces of data or more • 6ddb1072-c5d7-40e0-a874-8a032e81a698: cdm.xlarge with 16 vCPUs and 32 GB memory applicable to TB-level data migration requiring 10GE high-speed bandwidth
type	Yes	String	Node type. Currently, only cdm is available.

Table 4-78 nics

Parameter	Mandatory	Type	Description
securityGroupId	Yes	String	Security group ID
net-id	Yes	String	Subnet ID

Table 4-79 Datastore

Parameter	Mandatory	Type	Description
type	No	String	Type. Generally, the value is cdm .
version	No	String	Cluster version

Table 4-80 ExtendedProperties

Parameter	Mandatory	Type	Description
workspaceId	No	String	Workspace ID
resourceId	No	String	Resource ID
trial	No	String	Whether the cluster is a trial cluster

Table 4-81 sys_tags

Parameter	Mandatory	Type	Description
value	Yes	String	Enterprise project ID
key	Yes	String	The value is fixed at _sys_enterprise_project_id .

Response Parameters

Status code: 202

Table 4-82 Response body parameters

Parameter	Type	Description
name	String	Cluster name

Parameter	Type	Description
id	String	Cluster ID
task	Task object	Task information
datastore	Datastore object	Cluster information
instances	Array of ClusterInstance objects	Cluster node information

Table 4-83 Task

Parameter	Type	Description
id	String	Task ID
name	String	Task name

Table 4-84 Datastore

Parameter	Type	Description
type	String	Type. Generally, the value is cdm .
version	String	Cluster version

Table 4-85 ClusterInstance

Parameter	Type	Description
id	String	Node VM ID
name	String	Name of the VM on the node
type	String	Node type. Currently, only cdm is available.
shard_id	String	Shard ID

Example Requests

Creating a CDM cluster whose version is 1.8.10 and name is **cdm-ab82**

Status Codes

Status Code	Description
202	Accepted.
400	Request error.
401	Authorization failed.
403	No operation permissions.
404	No resources found.
500	Internal interface error.
503	Service unavailable.

Error Codes

See [Error Codes](#).

4.1.15 Querying the Cluster List

Function

This API is used to query the cluster list.

Calling Method

For details, see [Calling APIs](#).

URI

GET /v1.1/{project_id}/clusters

Table 4-86 Path Parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Project ID. For details about how to obtain it, see Project ID and Account ID .

Request Parameters

Table 4-87 Request header parameters

Parameter	Mandatory	Type	Description
X-Auth-Token	Yes	String	User token. It can be obtained by calling the IAM API (value of X-Subject-Token in the response header).

Response Parameters

Status code: 200

Table 4-88 Response body parameters

Parameter	Type	Description
clusters	Array of clusters objects	Cluster list. For details, see the descriptions of clusters parameters.

Table 4-89 clusters

Parameter	Type	Description
customerConfig	CustomerConfig object	User configuration
datastore	Datastore object	CDM information
instances	Array of ClusterDetail Instance objects	Cluster node information. For details, see the descriptions of instances parameters.
azName	String	AZ name
dbuser	String	Database user
flavorName	String	Flavor name
recentEvent	Integer	Number of events
isAutoOff	Boolean	Automatic shutdown

Parameter	Type	Description
isScheduleBoo tOff	Boolean	Whether to enable scheduled startup/ shutdown. The scheduled startup/shutdown and auto shutdown functions cannot be enabled at the same time.
clusterMode	String	Cluster mode: sharding
namespace	String	Namespace
task	ClusterTask object	Task information
publicEndpoin t	String	EIP bound to the cluster
actionProgres s	ActionProgre ss object	Cluster operation progress, which consists of a key and a value. The key indicates an ongoing task, and the value indicates the progress of the ongoing task. An example is "action_progress":{"SNAPSHOTTING":"16%"}.
created	String	Cluster creation time in ISO 8601 format: YYYY-MM-DDThh:mm:ssZ
bakExpectedS tartTime	String	Start time
bakKeepDay	Integer	Retention period
name	String	Cluster name
statusDetail	String	Cluster status: normal
id	String	Cluster ID
isFrozen	String	Whether the cluster is frozen. The value can be 0 (not frozen) or 1 (frozen).
updated	String	Cluster update time in ISO 8601 format: YYYY- MM-DDThh:mm:ssZ
status	String	Cluster status. The options are as follows: <ul style="list-style-type: none">● 100: creating● 200: normal● 300: failed● 303: creation failed● 500: restarting● 800: frozen● 900: stopped● 910: stopping● 920: starting

Parameter	Type	Description
failedReasons	FailedReasons object	Failure cause. If this parameter is left empty, the cluster is in normal state.

Table 4-90 CustomerConfig

Parameter	Type	Description
failureRemind	String	Failure notification
clusterName	String	Cluster type
serviceProvider	String	Service provider
localDisk	String	Whether the disk is a local disk
ssl	String	Whether to enable SSL
createFrom	String	Source
resourceId	String	Resource ID
flavorType	String	Flavor type
workspaceId	String	Workspace ID
trial	String	Trial

Table 4-91 Datastore

Parameter	Type	Description
type	String	Type. Generally, the value is cdm .
version	String	Cluster version

Table 4-92 ClusterDetailInstance

Parameter	Type	Description
flavor	flavor object	VM flavor of a node. For details, see the descriptions of flavor parameters.
volume	volume object	Disk information of a node. For details, see the descriptions of volume parameters.

Parameter	Type	Description
status	String	Node status <ul style="list-style-type: none">● 100: creating● 200: normal● 300: failed● 303: failed to be created● 400: deleted● 800: frozen
actions	Array of strings	Node operation status <ul style="list-style-type: none">● REBOOTING: restarting● RESTORING: restoring● REBOOT_FAILURE: failed to restart
type	String	Node type. Currently, only cdm is available.
id	String	Node VM ID
name	String	Name of the VM on the node
isFrozen	String	Whether the node is frozen. The value can be 0 (not frozen) or 1 (frozen).
components	String	Components
config_status	String	Node configuration status. The value is null when the cluster list is queried. <ul style="list-style-type: none">● In-Sync: The configuration has been synchronized.● Applying: The configuration is in progress.● Sync-Failure: The configuration fails.
role	String	Instance role
group	String	Group
links	Array of ClusterLinks objects	Links (null is returned for querying the cluster list)
paramsGroupID	String	Group ID
publicIp	String	Public IP address
manageIp	String	Management IP address
trafficIp	String	Traffic IP address
shard_id	String	Slice ID
manage_fix_ip	String	Management fix IP address

Parameter	Type	Description
private_ip	String	Private IP address
internal_ip	String	Internal IP address
resource	Array of Resource objects	Resource information (null is returned for querying the cluster list)

Table 4-93 flavor

Parameter	Type	Description
id	String	VM flavor ID
links	Array of ClusterLinks objects	Links

Table 4-94 volume

Parameter	Type	Description
type	String	Type of disks on the node. Only local disks are supported.
size	Long	Size of the disk on the node (GB)

Table 4-95 ClusterLinks

Parameter	Type	Description
rel	String	Relationship
href	String	Link address

Table 4-96 Resource

Parameter	Type	Description
resource_id	String	Resource ID
resource_type	String	Resource type: server

Table 4-97 ClusterTask

Parameter	Type	Description
description	String	Task description
id	String	Task ID
name	String	Task name

Table 4-98 ActionProgress

Parameter	Type	Description
CREATING	String	Cluster creation progress, for example, 29%
GROWING	String	Cluster expansion progress, for example, 29%
RESTORING	String	Cluster restoration progress, for example, 29%
SNAPSHOTTING	String	Cluster snapshotting progress, for example, 29%
REPAIRING	String	Cluster repairing progress, for example, 29%

Table 4-99 FailedReasons

Parameter	Type	Description
CREATE_FAILED	CREATE_FAILED object	Cause of the cluster creation failure

Table 4-100 CREATE_FAILED

Parameter	Type	Description
errorCode	String	Error code
errorMsg	String	Failure cause

Example Requests

```
GET /v1.1/1551c7f6c808414d8e9f3c514a170f2e/clusters
```

Example Responses

Status code: 200

Request succeeded.

For details, see [Calling APIs](#).

URI

GET /v1.1/{project_id}/clusters/{cluster_id}/cdm/job/{job_name}

Table 4-101 Path Parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Project ID. For details about how to obtain it, see Project ID and Account ID .
cluster_id	Yes	String	Cluster ID
job_name	Yes	String	Job name. When this parameter is set to all , all jobs are to be queried.

Table 4-102 Query Parameters

Parameter	Mandatory	Type	Description
filter	No	String	When job_name is all , this parameter is used for fuzzy job filtering.
page_no	No	Integer	Page number
page_size	No	Integer	Number of jobs on each page. The value ranges from 10 to 100.
jobType	No	String	Type of the jobs to be queried <ul style="list-style-type: none">• jobType=NORMAL_JOB: table/file migration job• jobType=BATCH_JOB: entire DB migration job• jobType=SCENARIO_JOB: scenario migration job If this parameter is not specified, only table/file migration jobs are queried by default.

Request Parameters

Table 4-103 Request header parameters

Parameter	Mandatory	Type	Description
X-Auth-Token	Yes	String	User token. It can be obtained by calling the IAM API (value of X-Subject-Token in the response header).

Response Parameters

Status code: 200

Table 4-104 Response body parameters

Parameter	Type	Description
total	Integer	Number of jobs. The value is 0 for querying a single job.
jobs	Array of Job objects	Job list. For details, see the descriptions of jobs parameters.
page_no	Integer	Page number. Jobs on the specified page will be returned.
page_size	Integer	Number of jobs on each page

Table 4-105 Job

Parameter	Type	Description
job_type	String	Job type <ul style="list-style-type: none">• NORMAL_JOB: table/file migration• BATCH_JOB: entire DB migration• SCENARIO_JOB: scenario migration

Parameter	Type	Description
from-connector-name	String	Source link type. The corresponding link parameters are as follows: <ul style="list-style-type: none">● generic-jdbc-connector: link to relational database● obs-connector: link to OBS● hdfs-connector: link to HDFS● hbase-connector: link to HBase and link to CloudTable● hive-connector: link to Hive● ftp-connector/sftp-connector: link to an FTP or SFTP server● mongodb-connector: link to MongoDB● redis-connector: link to Redis/DCS● kafka-connector: link to Kafka● dis-connector: link to DIS● elasticsearch-connector: link to Elasticsearch/Cloud Search Service (CSS)● [dli-connector: link to DLI] (tag:nohcs)● http-connector: link to HTTP/HTTPS servers (No link parameters are required.)● dms-kafka-connector: link to DMS Kafka
to-config-values	ConfigValues object	Destination link parameters, which vary depending on the destination. For details, see Destination Job Parameters .
to-link-name	String	Name of the destination link, that is, the name of the link created through the API used to create a link
driver-config-values	ConfigValues object	Job parameters, such as Retry upon Failure and Concurrent Extractors . For details, see Job Parameter Description .
from-config-values	ConfigValues object	Source link parameters, which vary depending on the source. For details, see Source Job Parameters .

Parameter	Type	Description
to-connector-name	String	Destination link type. The corresponding link parameters are as follows: <ul style="list-style-type: none">● generic-jdbc-connector: link to relational database● obs-connector: link to OBS● hdfs-connector: link to HDFS● hbase-connector: link to HBase and link to CloudTable● hive-connector: link to Hive● ftp-connector/sftp-connector: link to an FTP or SFTP server● mongodb-connector: link to MongoDB● redis-connector: link to Redis/DCS● kafka-connector: link to Kafka● dis-connector: link to DIS● elasticsearch-connector: link to Elasticsearch/Cloud Search Service (CSS)● [dli-connector: link to DLI] (tag:nohcs)● http-connector: link to HTTP/HTTPS servers (No link parameters are required.)● dms-kafka-connector: link to DMS Kafka
name	String	Job name, which contains 1 to 240 characters
from-link-name	String	Name of the source link, that is, the name of the link created through the API used to create a link
creation-user	String	User who created the job. The value is generated by the system.
creation-date	Long	Time when the job was created, accurate to millisecond. The value is generated by the system.
update-date	Long	Time when the job was last updated, accurate to millisecond. The value is generated by the system.
is_incre_job	Boolean	Whether the job is an incremental job. This parameter has been discarded.
flag	Integer	Whether the job is a scheduled job. If yes, the value is 1 . Otherwise, the value is 0 . The value is generated by the system based on the scheduled task configuration.

Parameter	Type	Description
files_read	Integer	Number of read files. The value is generated by the system.
update-user	String	User who last updated the job. The value is generated by the system.
external_id	String	ID of the job to be executed. For a local job, the value is in the format of job_local1202051771_0002 . For a DLI job, the value is the DLI job ID, for example, **"12345"**. The value is generated by the system and does not need to be set.
type	String	Job type. The value of this parameter is the same as that of job_type . The options are as follows: <ul style="list-style-type: none">● NORMAL_JOB: table/file migration job● BATCH_JOB: entire DB migration job● SCENARIO_JOB: scenario migration job
execute_start_date	Long	Time when the last task was started, accurate to millisecond. The value is generated by the system.
delete_rows	Integer	Number of rows deleted by an incremental job. This parameter is deprecated.
enabled	Boolean	Whether the link is enabled. The value is generated by the system.
bytes_written	Long	Number of bytes written by the job. The value is generated by the system.
id	Integer	Job ID, which is generated by the system
is_use_sql	Boolean	Whether to use SQL statements. The value is generated by the system based on whether SQL statements are used for source data extraction. You do not need to set this parameter.
update_rows	Integer	Number of updated rows in an incremental job. This parameter is deprecated.
group_name	String	Group name
bytes_read	Long	Number of bytes read by the job. The value is generated by the system.
execute_update_date	Long	Time when the last task was updated, accurate to millisecond. The value is generated by the system.

Parameter	Type	Description
write_rows	Integer	Number of rows written by an incremental job. This parameter is deprecated.
rows_written	Integer	Number of rows written by the job. The value is generated by the system.
rows_read	Long	Number of rows read by the job. The value is generated by the system.
files_written	Integer	Number of written files. The value is generated by the system.
is_incrementing	Boolean	Whether the job is an incremental job. Similar to parameter is_incre_job , this parameter is deprecated.
execute_create_date	Long	Time when the last task was created, accurate to millisecond. The value is generated by the system.
status	String	Job execution status <ul style="list-style-type: none"> ● BOOTING: The job is starting. ● RUNNING: The job is running. ● SUCCEEDED: The job was successfully executed. ● FAILED: The job execution failed. ● NEW: The job was not executed.

Table 4-106 ConfigValues

Parameter	Type	Description
configs	Array of configs objects	The data structures of source link parameters, destination link parameters, and job parameters are the same. However, the inputs parameter varies. For details, see the descriptions of configs parameters.
extended-configs	extended-configs object	Extended configuration. For details, see the descriptions of extended-configs parameters. The extended configuration is not open to external systems. You do not need to set it.

Table 4-107 configs

Parameter	Type	Description
inputs	Array of Input objects	Input parameter list. Each element in the list is in <i>name,value</i> format. For details, see the descriptions of inputs parameters. In the from-config-values data structure, the value of this parameter varies with the source link type. For details, see section "Source Job Parameters" in the <i>Cloud Data Migration User Guide</i> . In the to-config-values data structure, the value of this parameter varies with the destination link type. For details, see section "Destination Job Parameters" in the <i>Cloud Data Migration User Guide</i> . For details about the inputs parameter in the driver-config-values data structure, see the job parameter descriptions.
name	String	Configuration name. The value is fromJobConfig for a source job, toJobConfig for a destination job, and linkConfig for a link.
id	Integer	Configuration ID, which is generated by the system. You do not need to set this parameter.
type	String	Configuration type, which is generated by the system. You do not need to set this parameter. The value can be LINK (for link management APIs) or JOB (for job management APIs).

Table 4-108 Input

Parameter	Type	Description
name	String	Parameter name. <ul style="list-style-type: none">For link management APIs, parameter names start with linkConfig. The parameters vary depending on the link type. For details, see the parameter descriptions of the corresponding link in Link Parameters.For job management APIs, source link parameter names start with fromJobConfig. For details, see the source job parameters in Source Job Parameters. Destination link parameter names start with toJobConfig. For details, see Destination Job Parameters. For details about job parameters, see the task parameter descriptions in Job Parameters.

Parameter	Type	Description
value	Object	Parameter value, which must be a string.
type	String	Value type, such as STRING and INTEGER . The value is set by the system.

Table 4-109 extended-configs

Parameter	Type	Description
name	String	Extended configuration name. This parameter is unavailable for external systems and does not need to be set.
value	String	Extended configuration value. This parameter is unavailable for external systems and does not need to be set.

Example Requests

```
GET /v1.1/1551c7f6c808414d8e9f3c514a170f2e/clusters/6ec9a0a4-76be-4262-8697-e7af1fac7920/cdm/job/all?jobType=NORMAL_JOB
```

Example Responses

Status code: 200

Request succeeded.

More

For SDK sample code of more programming languages, see the Sample Code tab in [API Explorer](#). SDK sample code can be automatically generated.

Status Codes

Status Code	Description
200	Request succeeded.

Error Codes

See [Error Codes](#).

4.2.2 Deleting a Job

Function

This API is used to delete a job.

Calling Method

For details, see [Calling APIs](#).

URI

DELETE /v1.1/{project_id}/clusters/{cluster_id}/cdm/job/{job_name}

Table 4-110 Path Parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Project ID. For details about how to obtain it, see Project ID and Account ID .
cluster_id	Yes	String	Cluster ID
job_name	Yes	String	Job name

Request Parameters

Table 4-111 Request header parameters

Parameter	Mandatory	Type	Description
X-Auth-Token	Yes	String	User token. It can be obtained by calling the IAM API (value of X-Subject-Token in the response header).

Response Parameters

Status code: 500

Table 4-112 Response body parameters

Parameter	Type	Description
errCode	String	Error code
externalMessage	String	Error message

Example Requests

```
DELETE /v1.1/1551c7f6c808414d8e9f3c514a170f2e/clusters/6ec9a0a4-76be-4262-8697-  
e7af1fac7920/cdm/job/jdbc2hive
```

Example Responses

Status code: 500

Internal service error. For details about the returned error code, see Error Codes.

```
{  
  "errCode" : "Cdm.0100",  
  "externalMessage" : "Job[jdbc2hive] doesn't exist."  
}
```

More

For SDK sample code of more programming languages, see the Sample Code tab in [API Explorer](#). SDK sample code can be automatically generated.

Status Codes

Status Code	Description
200	Request succeeded.
400	Request error.
401	Authentication failed.
403	No operation permissions.
404	No resources found.

Status Code	Description
500	Internal service error. For details about the returned error code, see Error Codes.

Error Codes

See [Error Codes](#).

4.2.3 Modifying a Job

Function

This API is used to modify a job.

Calling Method

For details, see [Calling APIs](#).

URI

PUT /v1.1/{project_id}/clusters/{cluster_id}/cdm/job/{job_name}

Table 4-113 Path Parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Project ID. For details about how to obtain it, see Project ID and Account ID .
cluster_id	Yes	String	Cluster ID
job_name	Yes	String	Job name

Request Parameters

Table 4-114 Request header parameters

Parameter	Mandatory	Type	Description
X-Auth-Token	Yes	String	User token. It can be obtained by calling the IAM API (value of X-Subject-Token in the response header).

Table 4-115 Request body parameters

Parameter	Mandatory	Type	Description
jobs	Yes	Array of Job objects	Job list. For details, see the descriptions of jobs parameters.

Table 4-116 Job

Parameter	Mandatory	Type	Description
job_type	Yes	String	Job type <ul style="list-style-type: none">• NORMAL_JOB: table/file migration• BATCH_JOB: entire DB migration• SCENARIO_JOB: scenario migration

Parameter	Mandatory	Type	Description
from-connector-name	Yes	String	<p>Source link type. The corresponding link parameters are as follows:</p> <ul style="list-style-type: none"> • generic-jdbc-connector: link to relational database • obs-connector: link to OBS • hdfs-connector: link to HDFS • hbase-connector: link to HBase and link to CloudTable • hive-connector: link to Hive • ftp-connector/sftp-connector: link to an FTP or SFTP server • mongodb-connector: link to MongoDB • redis-connector: link to Redis/DCS • kafka-connector: link to Kafka • dis-connector: link to DIS • elasticsearch-connector: link to Elasticsearch/Cloud Search Service (CSS) • [dli-connector]: link to DLI (tag:nohcs) • http-connector: link to HTTP/HTTPS servers (No link parameters are required.) • dms-kafka-connector: link to DMS Kafka
to-config-values	Yes	ConfigValues object	Destination link parameters, which vary depending on the destination. For details, see Destination Job Parameters .
to-link-name	Yes	String	Name of the destination link, that is, the name of the link created through the API used to create a link

Parameter	Mandatory	Type	Description
driver-config-values	Yes	ConfigValues object	Job parameters, such as Retry upon Failure and Concurrent Extractors . For details, see Job Parameter Description .
from-config-values	Yes	ConfigValues object	Source link parameters, which vary depending on the source. For details, see Source Job Parameters .
to-connector-name	Yes	String	Destination link type. The corresponding link parameters are as follows: <ul style="list-style-type: none"> • generic-jdbc-connector: link to relational database • obs-connector: link to OBS • hdfs-connector: link to HDFS • hbase-connector: link to HBase and link to CloudTable • hive-connector: link to Hive • ftp-connector/sftp-connector: link to an FTP or SFTP server • mongodb-connector: link to MongoDB • redis-connector: link to Redis/DCS • kafka-connector: link to Kafka • dis-connector: link to DIS • elasticsearch-connector: link to Elasticsearch/Cloud Search Service (CSS) • [dli-connector: link to DLI] (tag:nohcs) • http-connector: link to HTTP/HTTPS servers (No link parameters are required.) • dms-kafka-connector: link to DMS Kafka
name	Yes	String	Job name, which contains 1 to 240 characters

Parameter	Mandatory	Type	Description
from-link-name	Yes	String	Name of the source link, that is, the name of the link created through the API used to create a link
creation-user	No	String	User who created the job. The value is generated by the system.
creation-date	No	Long	Time when the job was created, accurate to millisecond. The value is generated by the system.
update-date	No	Long	Time when the job was last updated, accurate to millisecond. The value is generated by the system.
is_incre_job	No	Boolean	Whether the job is an incremental job. This parameter has been discarded.
flag	No	Integer	Whether the job is a scheduled job. If yes, the value is 1 . Otherwise, the value is 0 . The value is generated by the system based on the scheduled task configuration.
files_read	No	Integer	Number of read files. The value is generated by the system.
update-user	No	String	User who last updated the job. The value is generated by the system.
external_id	No	String	ID of the job to be executed. For a local job, the value is in the format of job_local1202051771_0002 . For a DLI job, the value is the DLI job ID, for example, ***12345** . The value is generated by the system and does not need to be set.

Parameter	Mandatory	Type	Description
type	No	String	Job type. The value of this parameter is the same as that of job_type . The options are as follows: <ul style="list-style-type: none">• NORMAL_JOB: table/file migration job• BATCH_JOB: entire DB migration job• SCENARIO_JOB: scenario migration job
execute_start_date	No	Long	Time when the last task was started, accurate to millisecond. The value is generated by the system.
delete_rows	No	Integer	Number of rows deleted by an incremental job. This parameter is deprecated.
enabled	No	Boolean	Whether the link is enabled. The value is generated by the system.
bytes_written	No	Long	Number of bytes written by the job. The value is generated by the system.
id	No	Integer	Job ID, which is generated by the system
is_use_sql	No	Boolean	Whether to use SQL statements. The value is generated by the system based on whether SQL statements are used for source data extraction. You do not need to set this parameter.
update_rows	No	Integer	Number of updated rows in an incremental job. This parameter is deprecated.
group_name	No	String	Group name
bytes_read	No	Long	Number of bytes read by the job. The value is generated by the system.
execute_update_date	No	Long	Time when the last task was updated, accurate to millisecond. The value is generated by the system.

Parameter	Mandatory	Type	Description
write_rows	No	Integer	Number of rows written by an incremental job. This parameter is deprecated.
rows_written	No	Integer	Number of rows written by the job. The value is generated by the system.
rows_read	No	Long	Number of rows read by the job. The value is generated by the system.
files_written	No	Integer	Number of written files. The value is generated by the system.
is_incrementing	No	Boolean	Whether the job is an incremental job. Similar to parameter is_incre_job , this parameter is deprecated.
execute_create_date	No	Long	Time when the last task was created, accurate to millisecond. The value is generated by the system.
status	No	String	Job execution status <ul style="list-style-type: none"> ● BOOTING: The job is starting. ● RUNNING: The job is running. ● SUCCEEDED: The job was successfully executed. ● FAILED: The job execution failed. ● NEW: The job was not executed.

Table 4-117 ConfigValues

Parameter	Mandatory	Type	Description
configs	Yes	Array of configs objects	The data structures of source link parameters, destination link parameters, and job parameters are the same. However, the inputs parameter varies. For details, see the descriptions of configs parameters.
extended-configs	No	extended-configs object	Extended configuration. For details, see the descriptions of extended-configs parameters. The extended configuration is not open to external systems. You do not need to set it.

Table 4-118 configs

Parameter	Mandatory	Type	Description
inputs	Yes	Array of Input objects	Input parameter list. Each element in the list is in <i>name,value</i> format. For details, see the descriptions of inputs parameters. In the from-config-values data structure, the value of this parameter varies with the source link type. For details, see section "Source Job Parameters" in the <i>Cloud Data Migration User Guide</i> . In the to-config-values data structure, the value of this parameter varies with the destination link type. For details, see section "Destination Job Parameters" in the <i>Cloud Data Migration User Guide</i> . For details about the inputs parameter in the driver-config-values data structure, see the job parameter descriptions.

Parameter	Mandatory	Type	Description
name	Yes	String	Configuration name. The value is fromJobConfig for a source job, toJobConfig for a destination job, and linkConfig for a link.
id	No	Integer	Configuration ID, which is generated by the system. You do not need to set this parameter.
type	No	String	Configuration type, which is generated by the system. You do not need to set this parameter. The value can be LINK (for link management APIs) or JOB (for job management APIs).

Table 4-119 Input

Parameter	Mandatory	Type	Description
name	Yes	String	<p>Parameter name.</p> <ul style="list-style-type: none"> For link management APIs, parameter names start with linkConfig. The parameters vary depending on the link type. For details, see the parameter descriptions of the corresponding link in Link Parameters. For job management APIs, source link parameter names start with fromJobConfig. For details, see the source job parameters in Source Job Parameters. Destination link parameter names start with toJobConfig. For details, see Destination Job Parameters. For details about job parameters, see the task parameter descriptions in Job Parameters.

Parameter	Mandatory	Type	Description
value	Yes	Object	Parameter value, which must be a string.
type	No	String	Value type, such as STRING and INTEGER . The value is set by the system.

Table 4-120 extended-configs

Parameter	Mandatory	Type	Description
name	No	String	Extended configuration name. This parameter is unavailable for external systems and does not need to be set.
value	No	String	Extended configuration value. This parameter is unavailable for external systems and does not need to be set.

Response Parameters

Status code: 200

Table 4-121 Response body parameters

Parameter	Type	Description
validation-result	Array of JobValidationResult objects	Validation result. - If a job fails to be modified, the failure cause is returned. - If a job is successfully modified, an empty list is returned.

Table 4-122 JobValidationResult

Parameter	Type	Description
message	String	Error description
status	String	Error level, for example, ERROR or WARNING

Status code: 400

Table 4-123 Response body parameters

Parameter	Type	Description
code	String	Return code
errCode	String	Error code
message	String	Error message
externalMessage	String	Additional information

Example Requests

Modifying a data migration job whose name is **es_css**, source link is an Elasticsearch link, and destination link is a DIS link

PUT /v1.1/1551c7f6c808414d8e9f3c514a170f2e/cluster/6ec9a0a4-76be-4262-8697-e7af1fac7920/cdm/job/es_css

Status Codes

Status Code	Description
200	Request succeeded.
400	Error code

Error Codes

See [Error Codes](#).

4.2.4 Creating and Executing a Job in a Random Cluster

Function

This API is used to create and execute a job in a random cluster.

Calling Method

For details, see [Calling APIs](#).

URI

POST /v1.1/{project_id}/clusters/job

Table 4-124 Path Parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Project ID. For details about how to obtain it, see Project ID and Account ID .

Request Parameters

Table 4-125 Request header parameters

Parameter	Mandatory	Type	Description
X-Auth-Token	Yes	String	User token. It can be obtained by calling the IAM API (value of X-Subject-Token in the response header).
X-Language	Yes	String	Request language

Table 4-126 Request body parameters

Parameter	Mandatory	Type	Description
jobs	Yes	Array of Job objects	Job list. For details, see the descriptions of jobs parameters.
clusters	Yes	Array of strings	IDs of CDM clusters. The system selects a random cluster in running state from the specified clusters and creates and executes a migration job in the cluster.

Table 4-127 Job

Parameter	Mandatory	Type	Description
job_type	Yes	String	<p>Job type</p> <ul style="list-style-type: none"> ● NORMAL_JOB: table/file migration ● BATCH_JOB: entire DB migration ● SCENARIO_JOB: scenario migration
from-connector-name	Yes	String	<p>Source link type. The corresponding link parameters are as follows:</p> <ul style="list-style-type: none"> ● generic-jdbc-connector: link to relational database ● obs-connector: link to OBS ● hdfs-connector: link to HDFS ● hbase-connector: link to HBase and link to CloudTable ● hive-connector: link to Hive ● ftp-connector/sftp-connector: link to an FTP or SFTP server ● mongodb-connector: link to MongoDB ● redis-connector: link to Redis/DCS ● kafka-connector: link to Kafka ● dis-connector: link to DIS ● elasticsearch-connector: link to Elasticsearch/Cloud Search Service (CSS) ● [dli-connector]: link to DLI (tag:nohcs) ● http-connector: link to HTTP/HTTPS servers (No link parameters are required.) ● dms-kafka-connector: link to DMS Kafka

Parameter	Mandatory	Type	Description
to-config-values	Yes	ConfigValues object	Destination link parameters, which vary depending on the destination. For details, see Destination Job Parameters .
to-link-name	Yes	String	Name of the destination link, that is, the name of the link created through the API used to create a link
driver-config-values	Yes	ConfigValues object	Job parameters, such as Retry upon Failure and Concurrent Extractors . For details, see Job Parameter Description .
from-config-values	Yes	ConfigValues object	Source link parameters, which vary depending on the source. For details, see Source Job Parameters .

Parameter	Mandatory	Type	Description
to-connector-name	Yes	String	<p>Destination link type. The corresponding link parameters are as follows:</p> <ul style="list-style-type: none"> • generic-jdbc-connector: link to relational database • obs-connector: link to OBS • hdfs-connector: link to HDFS • hbase-connector: link to HBase and link to CloudTable • hive-connector: link to Hive • ftp-connector/sftp-connector: link to an FTP or SFTP server • mongodb-connector: link to MongoDB • redis-connector: link to Redis/DCS • kafka-connector: link to Kafka • dis-connector: link to DIS • elasticsearch-connector: link to Elasticsearch/Cloud Search Service (CSS) • [dli-connector]: link to DLI (tag:nohcs) • http-connector: link to HTTP/HTTPS servers (No link parameters are required.) • dms-kafka-connector: link to DMS Kafka
name	Yes	String	Job name, which contains 1 to 240 characters
from-link-name	Yes	String	Name of the source link, that is, the name of the link created through the API used to create a link
creation-user	No	String	User who created the job. The value is generated by the system.

Parameter	Mandatory	Type	Description
creation-date	No	Long	Time when the job was created, accurate to millisecond. The value is generated by the system.
update-date	No	Long	Time when the job was last updated, accurate to millisecond. The value is generated by the system.
is_incre_job	No	Boolean	Whether the job is an incremental job. This parameter has been discarded.
flag	No	Integer	Whether the job is a scheduled job. If yes, the value is 1 . Otherwise, the value is 0 . The value is generated by the system based on the scheduled task configuration.
files_read	No	Integer	Number of read files. The value is generated by the system.
update-user	No	String	User who last updated the job. The value is generated by the system.
external_id	No	String	ID of the job to be executed. For a local job, the value is in the format of job_local1202051771_0002 . For a DLI job, the value is the DLI job ID, for example, ***12345*** . The value is generated by the system and does not need to be set.
type	No	String	Job type. The value of this parameter is the same as that of job_type . The options are as follows: <ul style="list-style-type: none">● NORMAL_JOB: table/file migration job● BATCH_JOB: entire DB migration job● SCENARIO_JOB: scenario migration job

Parameter	Mandatory	Type	Description
execute_start_date	No	Long	Time when the last task was started, accurate to millisecond. The value is generated by the system.
delete_rows	No	Integer	Number of rows deleted by an incremental job. This parameter is deprecated.
enabled	No	Boolean	Whether the link is enabled. The value is generated by the system.
bytes_written	No	Long	Number of bytes written by the job. The value is generated by the system.
id	No	Integer	Job ID, which is generated by the system
is_use_sql	No	Boolean	Whether to use SQL statements. The value is generated by the system based on whether SQL statements are used for source data extraction. You do not need to set this parameter.
update_rows	No	Integer	Number of updated rows in an incremental job. This parameter is deprecated.
group_name	No	String	Group name
bytes_read	No	Long	Number of bytes read by the job. The value is generated by the system.
execute_update_date	No	Long	Time when the last task was updated, accurate to millisecond. The value is generated by the system.
write_rows	No	Integer	Number of rows written by an incremental job. This parameter is deprecated.
rows_written	No	Integer	Number of rows written by the job. The value is generated by the system.
rows_read	No	Long	Number of rows read by the job. The value is generated by the system.

Parameter	Mandatory	Type	Description
files_written	No	Integer	Number of written files. The value is generated by the system.
is_incrementing	No	Boolean	Whether the job is an incremental job. Similar to parameter is_incre_job , this parameter is deprecated.
execute_create_date	No	Long	Time when the last task was created, accurate to millisecond. The value is generated by the system.
status	No	String	Job execution status <ul style="list-style-type: none"> • BOOTING: The job is starting. • RUNNING: The job is running. • SUCCEEDED: The job was successfully executed. • FAILED: The job execution failed. • NEW: The job was not executed.

Table 4-128 ConfigValues

Parameter	Mandatory	Type	Description
configs	Yes	Array of configs objects	The data structures of source link parameters, destination link parameters, and job parameters are the same. However, the inputs parameter varies. For details, see the descriptions of configs parameters.
extended-configs	No	extended-configs object	Extended configuration. For details, see the descriptions of extended-configs parameters. The extended configuration is not open to external systems. You do not need to set it.

Table 4-129 configs

Parameter	Mandatory	Type	Description
inputs	Yes	Array of Input objects	Input parameter list. Each element in the list is in <i>name,value</i> format. For details, see the descriptions of inputs parameters. In the from-config-values data structure, the value of this parameter varies with the source link type. For details, see section "Source Job Parameters" in the <i>Cloud Data Migration User Guide</i> . In the to-config-values data structure, the value of this parameter varies with the destination link type. For details, see section "Destination Job Parameters" in the <i>Cloud Data Migration User Guide</i> . For details about the inputs parameter in the driver-config-values data structure, see the job parameter descriptions.
name	Yes	String	Configuration name. The value is fromJobConfig for a source job, toJobConfig for a destination job, and linkConfig for a link.
id	No	Integer	Configuration ID, which is generated by the system. You do not need to set this parameter.
type	No	String	Configuration type, which is generated by the system. You do not need to set this parameter. The value can be LINK (for link management APIs) or JOB (for job management APIs).

Table 4-130 Input

Parameter	Mandatory	Type	Description
name	Yes	String	<p>Parameter name.</p> <ul style="list-style-type: none"> For link management APIs, parameter names start with linkConfig.. The parameters vary depending on the link type. For details, see the parameter descriptions of the corresponding link in Link Parameters. For job management APIs, source link parameter names start with fromJobConfig.. For details, see the source job parameters in Source Job Parameters. Destination link parameter names start with toJobConfig.. For details, see Destination Job Parameters. For details about job parameters, see the task parameter descriptions in Job Parameters.
value	Yes	Object	Parameter value, which must be a string.
type	No	String	Value type, such as STRING and INTEGER . The value is set by the system.

Table 4-131 extended-configs

Parameter	Mandatory	Type	Description
name	No	String	Extended configuration name. This parameter is unavailable for external systems and does not need to be set.
value	No	String	Extended configuration value. This parameter is unavailable for external systems and does not need to be set.

Response Parameters

Status code: 200

Table 4-132 Response body parameters

Parameter	Type	Description
submissions	Array of StartJobSubmission objects	Job running information. For details, see the descriptions of submission parameters.

Table 4-133 StartJobSubmission

Parameter	Type	Description
isIncrementing	Boolean	Whether the job migrates incremental data
delete_rows	Integer	Number of deleted rows
update_rows	Integer	Number of updated rows
write_rows	Integer	Number of written rows
submission-id	Integer	Job submission ID
job-name	String	Job name
creation-user	String	User who started the job
creation-date	Long	Job creation time, accurate to millisecond
execute-date	Long	Execution time
progress	Float	Job progress. If a job fails, the value is -1 . Otherwise, the value ranges from 0 to 100.
status	String	Job status <ul style="list-style-type: none"> ● BOOTING: The job is starting. ● FAILURE_ON_SUBMIT: The job failed to be submitted. ● RUNNING: The job is running. ● SUCCEEDED: The job was executed successfully. ● FAILED: The job failed. ● UNKNOWN: The job status is unknown. ● NEVER_EXECUTED: The job was not executed.

Parameter	Type	Description
isStopingIncrement	String	Whether to stop incremental data migration
is-execute-auto	Boolean	Whether to execute the job as scheduled
last-update-date	Long	Time when the job was last updated
last-udpate-user	String	User who last updated the job status
isDeleteJob	Boolean	Whether to delete the job after it is executed

Example Requests

Randomly selecting a CDM cluster and creating a job named **es_css** to migrate tables from Elasticsearch to DIS

More

For SDK sample code of more programming languages, see the Sample Code tab in [API Explorer](#). SDK sample code can be automatically generated.

Status Codes

Status Code	Description
200	Request succeeded.

Error Codes

See [Error Codes](#).

4.2.5 Stopping a Job

Function

This API is used to stop a job.

Calling Method

For details, see [Calling APIs](#).

URI

PUT /v1.1/{project_id}/clusters/{cluster_id}/cdm/job/{job_name}/stop

Table 4-134 Path Parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Project ID. For details about how to obtain it, see Project ID and Account ID .
cluster_id	Yes	String	Cluster ID
job_name	Yes	String	Job name

Request Parameters

Table 4-135 Request header parameters

Parameter	Mandatory	Type	Description
X-Auth-Token	Yes	String	User token. It can be obtained by calling the IAM API (value of X-Subject-Token in the response header).

Response Parameters

Status code: 200

Table 4-136 Response body parameters

Parameter	Type	Description
validation-result	Array of JobValidationResult objects	Validation result. If the job fails to be stopped, the failure cause is returned. For details, see the validation-result parameter. If the job is stopped, an empty list is returned.

Table 4-137 JobValidationResult

Parameter	Type	Description
message	String	Error description
status	String	Error level, for example, ERROR or WARNING

Example Requests

```
PUT /v1.1/1551c7f6c808414d8e9f3c514a170f2e/clusters/6ec9a0a4-76be-4262-8697-e7af1fac7920/cdm/job/jdbc2hive/stop
```

Example Responses

Status code: 200

Request succeeded.

```
{ }
```

Status Codes

Status Code	Description
200	Request succeeded.

Error Codes

See [Error Codes](#).

4.2.6 Creating a Job in a Specified Cluster

Function

This API is used to create a job in a specified cluster.

Calling Method

For details, see [Calling APIs](#).

URI

POST /v1.1/{project_id}/clusters/{cluster_id}/cdm/job

Table 4-138 Path Parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Project ID. For details about how to obtain it, see Project ID and Account ID .
cluster_id	Yes	String	Cluster ID

Request Parameters

Table 4-139 Request header parameters

Parameter	Mandatory	Type	Description
X-Auth-Token	Yes	String	User token. It can be obtained by calling the IAM API (value of X-Subject-Token in the response header).

Table 4-140 Request body parameters

Parameter	Mandatory	Type	Description
jobs	Yes	Array of Job objects	Job list. For details, see the descriptions of jobs parameters.

Table 4-141 Job

Parameter	Mandatory	Type	Description
job_type	Yes	String	<p>Job type</p> <ul style="list-style-type: none"> ● NORMAL_JOB: table/file migration ● BATCH_JOB: entire DB migration ● SCENARIO_JOB: scenario migration
from-connector-name	Yes	String	<p>Source link type. The corresponding link parameters are as follows:</p> <ul style="list-style-type: none"> ● generic-jdbc-connector: link to relational database ● obs-connector: link to OBS ● hdfs-connector: link to HDFS ● hbase-connector: link to HBase and link to CloudTable ● hive-connector: link to Hive ● ftp-connector/sftp-connector: link to an FTP or SFTP server ● mongodb-connector: link to MongoDB ● redis-connector: link to Redis/DCS ● kafka-connector: link to Kafka ● dis-connector: link to DIS ● elasticsearch-connector: link to Elasticsearch/Cloud Search Service (CSS) ● [dli-connector]: link to DLI (tag:nohcs) ● http-connector: link to HTTP/HTTPS servers (No link parameters are required.) ● dms-kafka-connector: link to DMS Kafka

Parameter	Mandatory	Type	Description
to-config-values	Yes	ConfigValues object	Destination link parameters, which vary depending on the destination. For details, see Destination Job Parameters .
to-link-name	Yes	String	Name of the destination link, that is, the name of the link created through the API used to create a link
driver-config-values	Yes	ConfigValues object	Job parameters, such as Retry upon Failure and Concurrent Extractors . For details, see Job Parameter Description .
from-config-values	Yes	ConfigValues object	Source link parameters, which vary depending on the source. For details, see Source Job Parameters .

Parameter	Mandatory	Type	Description
to-connector-name	Yes	String	<p>Destination link type. The corresponding link parameters are as follows:</p> <ul style="list-style-type: none"> • generic-jdbc-connector: link to relational database • obs-connector: link to OBS • hdfs-connector: link to HDFS • hbase-connector: link to HBase and link to CloudTable • hive-connector: link to Hive • ftp-connector/sftp-connector: link to an FTP or SFTP server • mongodb-connector: link to MongoDB • redis-connector: link to Redis/DCS • kafka-connector: link to Kafka • dis-connector: link to DIS • elasticsearch-connector: link to Elasticsearch/Cloud Search Service (CSS) • [dli-connector]: link to DLI (tag:nohcs) • http-connector: link to HTTP/HTTPS servers (No link parameters are required.) • dms-kafka-connector: link to DMS Kafka
name	Yes	String	Job name, which contains 1 to 240 characters
from-link-name	Yes	String	Name of the source link, that is, the name of the link created through the API used to create a link
creation-user	No	String	User who created the job. The value is generated by the system.

Parameter	Mandatory	Type	Description
creation-date	No	Long	Time when the job was created, accurate to millisecond. The value is generated by the system.
update-date	No	Long	Time when the job was last updated, accurate to millisecond. The value is generated by the system.
is_incre_job	No	Boolean	Whether the job is an incremental job. This parameter has been discarded.
flag	No	Integer	Whether the job is a scheduled job. If yes, the value is 1 . Otherwise, the value is 0 . The value is generated by the system based on the scheduled task configuration.
files_read	No	Integer	Number of read files. The value is generated by the system.
update-user	No	String	User who last updated the job. The value is generated by the system.
external_id	No	String	ID of the job to be executed. For a local job, the value is in the format of job_local1202051771_0002 . For a DLI job, the value is the DLI job ID, for example, ***12345*** . The value is generated by the system and does not need to be set.
type	No	String	Job type. The value of this parameter is the same as that of job_type . The options are as follows: <ul style="list-style-type: none"> ● NORMAL_JOB: table/file migration job ● BATCH_JOB: entire DB migration job ● SCENARIO_JOB: scenario migration job

Parameter	Mandatory	Type	Description
execute_start_date	No	Long	Time when the last task was started, accurate to millisecond. The value is generated by the system.
delete_rows	No	Integer	Number of rows deleted by an incremental job. This parameter is deprecated.
enabled	No	Boolean	Whether the link is enabled. The value is generated by the system.
bytes_written	No	Long	Number of bytes written by the job. The value is generated by the system.
id	No	Integer	Job ID, which is generated by the system
is_use_sql	No	Boolean	Whether to use SQL statements. The value is generated by the system based on whether SQL statements are used for source data extraction. You do not need to set this parameter.
update_rows	No	Integer	Number of updated rows in an incremental job. This parameter is deprecated.
group_name	No	String	Group name
bytes_read	No	Long	Number of bytes read by the job. The value is generated by the system.
execute_update_date	No	Long	Time when the last task was updated, accurate to millisecond. The value is generated by the system.
write_rows	No	Integer	Number of rows written by an incremental job. This parameter is deprecated.
rows_written	No	Integer	Number of rows written by the job. The value is generated by the system.
rows_read	No	Long	Number of rows read by the job. The value is generated by the system.

Parameter	Mandatory	Type	Description
files_written	No	Integer	Number of written files. The value is generated by the system.
is_incrementing	No	Boolean	Whether the job is an incremental job. Similar to parameter is_incre_job , this parameter is deprecated.
execute_create_date	No	Long	Time when the last task was created, accurate to millisecond. The value is generated by the system.
status	No	String	Job execution status <ul style="list-style-type: none"> • BOOTING: The job is starting. • RUNNING: The job is running. • SUCCEEDED: The job was successfully executed. • FAILED: The job execution failed. • NEW: The job was not executed.

Table 4-142 ConfigValues

Parameter	Mandatory	Type	Description
configs	Yes	Array of configs objects	The data structures of source link parameters, destination link parameters, and job parameters are the same. However, the inputs parameter varies. For details, see the descriptions of configs parameters.
extended-configs	No	extended-configs object	Extended configuration. For details, see the descriptions of extended-configs parameters. The extended configuration is not open to external systems. You do not need to set it.

Table 4-143 configs

Parameter	Mandatory	Type	Description
inputs	Yes	Array of Input objects	Input parameter list. Each element in the list is in <i>name,value</i> format. For details, see the descriptions of inputs parameters. In the from-config-values data structure, the value of this parameter varies with the source link type. For details, see section "Source Job Parameters" in the <i>Cloud Data Migration User Guide</i> . In the to-config-values data structure, the value of this parameter varies with the destination link type. For details, see section "Destination Job Parameters" in the <i>Cloud Data Migration User Guide</i> . For details about the inputs parameter in the driver-config-values data structure, see the job parameter descriptions.
name	Yes	String	Configuration name. The value is fromJobConfig for a source job, toJobConfig for a destination job, and linkConfig for a link.
id	No	Integer	Configuration ID, which is generated by the system. You do not need to set this parameter.
type	No	String	Configuration type, which is generated by the system. You do not need to set this parameter. The value can be LINK (for link management APIs) or JOB (for job management APIs).

Table 4-144 Input

Parameter	Mandatory	Type	Description
name	Yes	String	<p>Parameter name.</p> <ul style="list-style-type: none"> For link management APIs, parameter names start with linkConfig.. The parameters vary depending on the link type. For details, see the parameter descriptions of the corresponding link in Link Parameters. For job management APIs, source link parameter names start with fromJobConfig.. For details, see the source job parameters in Source Job Parameters. Destination link parameter names start with toJobConfig.. For details, see Destination Job Parameters. For details about job parameters, see the task parameter descriptions in Job Parameters.
value	Yes	Object	Parameter value, which must be a string.
type	No	String	Value type, such as STRING and INTEGER . The value is set by the system.

Table 4-145 extended-configs

Parameter	Mandatory	Type	Description
name	No	String	Extended configuration name. This parameter is unavailable for external systems and does not need to be set.
value	No	String	Extended configuration value. This parameter is unavailable for external systems and does not need to be set.

Response Parameters

Status code: 200

Table 4-146 Response body parameters

Parameter	Type	Description
name	String	Job name
validation-result	Array of JobValidationResult objects	Check result <ul style="list-style-type: none"> • If the modification fails, the failure cause is returned. • If the modification is successful, an empty list is returned.

Table 4-147 JobValidationResult

Parameter	Type	Description
message	String	Error description
status	String	Error level, for example, ERROR or WARNING

Status code: 400

Table 4-148 Response body parameters

Parameter	Type	Description
code	String	Return code
errCode	String	Error code
message	String	Error message
externalMessage	String	Additional information

Example Requests

Creating a data migration job whose name is **es_css**, source link is an Elasticsearch link, and destination link is a DIS link

More

For SDK sample code of more programming languages, see the Sample Code tab in [API Explorer](#). SDK sample code can be automatically generated.

Status Codes

Status Code	Description
200	Request succeeded.
400	Request error.

Error Codes

See [Error Codes](#).

4.2.7 Starting a Job

Function

This API is used to start a job.

Calling Method

For details, see [Calling APIs](#).

URI

PUT /v1.1/{project_id}/clusters/{cluster_id}/cdm/job/{job_name}/start

Table 4-149 Path Parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Project ID. For details about how to obtain it, see Project ID and Account ID .
cluster_id	Yes	String	Cluster ID
job_name	Yes	String	Job name

Request Parameters

Table 4-150 Request header parameters

Parameter	Mandatory	Type	Description
X-Auth-Token	Yes	String	User token. It can be obtained by calling the IAM API (value of X-Subject-Token in the response header).

Table 4-151 Request body parameters

Parameter	Mandatory	Type	Description
variables	No	Object	Start a job and configure variable parameters. If no variable is configured for the job, the object is empty.

Response Parameters

Status code: 200

Table 4-152 Response body parameters

Parameter	Type	Description
submissions	Array of StartJobSubmission objects	Job running information. For details, see the descriptions of submission parameters.

Table 4-153 StartJobSubmission

Parameter	Type	Description
isIncrementing	Boolean	Whether the job migrates incremental data
delete_rows	Integer	Number of deleted rows
update_rows	Integer	Number of updated rows
write_rows	Integer	Number of written rows
submission-id	Integer	Job submission ID

Parameter	Type	Description
job-name	String	Job name
creation-user	String	User who started the job
creation-date	Long	Job creation time, accurate to millisecond
execute-date	Long	Execution time
progress	Float	Job progress. If a job fails, the value is -1 . Otherwise, the value ranges from 0 to 100.
status	String	Job status <ul style="list-style-type: none"> ● BOOTING: The job is starting. ● FAILURE_ON_SUBMIT: The job failed to be submitted. ● RUNNING: The job is running. ● SUCCEEDED: The job was executed successfully. ● FAILED: The job failed. ● UNKNOWN: The job status is unknown. ● NEVER_EXECUTED: The job was not executed.
isStoppingIncrement	String	Whether to stop incremental data migration
is-execute-auto	Boolean	Whether to execute the job as scheduled
last-update-date	Long	Time when the job was last updated
last-udpate-user	String	User who last updated the job status
isDeleteJob	Boolean	Whether to delete the job after it is executed

Example Requests

Start a job with empty parameters.

```
PUT /v1.1/1551c7f6c808414d8e9f3c514a170f2e/clusters/6ec9a0a4-76be-4262-8697-e7af1fac7920/cdm/job/jdbc2hive/start
{
  "variables" : {}
}
```

Example Responses

Status code: 200

Request succeeded.

```
{
  "submissions" : [ {
    "job-name" : "jdbc2hive",
    "creation-user" : "cdm",
    "creation-date" : "1536905778725",
    "progress" : 1,
    "status" : "BOOTING"
  } ]
}
```

Status Codes

Status Code	Description
200	Request succeeded.

Error Codes

See [Error Codes](#).

4.2.8 Querying Job Status

Function

This API is used to query the job status.

Calling Method

For details, see [Calling APIs](#).

URI

GET /v1.1/{project_id}/clusters/{cluster_id}/cdm/job/{job_name}/status

Table 4-154 Path Parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Project ID. For details about how to obtain it, see Project ID and Account ID .
cluster_id	Yes	String	Cluster ID
job_name	Yes	String	Job name

Request Parameters

Table 4-155 Request header parameters

Parameter	Mandatory	Type	Description
X-Auth-Token	Yes	String	User token. It can be obtained by calling the IAM API (value of X-Subject-Token in the response header).

Response Parameters

Status code: 200**Table 4-156** Response body parameters

Parameter	Type	Description
submissions	Array of Submission objects	Job running information. For details, see the descriptions of submission parameters.

Table 4-157 Submission

Parameter	Type	Description
isIncrementing	Boolean	Whether the job migrates incremental data
job-name	String	Job name
counters	counters object	Job running result statistics. This parameter is available only when status is SUCCEEDED . For details, see the description of the counters parameter.
isStoppingIncrement	String	Whether to stop incremental data migration
is-execute-auto	Boolean	Whether to execute the job as scheduled
last-update-date	Long	Time when the job was last updated
last-update-user	String	User who last updated the job status
isDeleteJob	Boolean	Whether to delete the job after it is executed

Parameter	Type	Description
creation-user	String	User who submitted the job
creation-date	Long	Creation time
external-id	String	Job ID
progress	Float	Job progress. If a job fails, the value is -1 . Otherwise, the value ranges from 0 to 100.
submission-id	Integer	Job submission ID
delete_rows	Integer	Number of deleted rows
update_rows	Integer	Number of updated rows
write_rows	Integer	Number of written rows
execute-date	Long	Execution time
status	String	Job status <ul style="list-style-type: none"> ● BOOTING: The job is starting. ● FAILURE_ON_SUBMIT: The job failed to be submitted. ● RUNNING: The job is running. ● SUCCEEDED: The job was executed successfully. ● FAILED: The job failed. ● UNKNOWN: The job status is unknown. ● NEVER_EXECUTED: The job was not executed.
error-details	String	Error details. This parameter is available only when status is FAILED .
error-summary	String	Error summary. This parameter is available only when status is FAILED .

Table 4-158 counters

Parameter	Type	Description
org.apache.sqoop.submission.counter.SqoopCounters	counter object	Job running result statistics. For details, see the descriptions of counter parameters.

Table 4-159 counter

Parameter	Type	Description
BYTES_WRITTEN	Long	Number of bytes written
TOTAL_FILES	Integer	Total number of files
ROWS_READ	Long	Number of rows read
BYTES_READ	Long	Number of bytes read
ROWS_WRITTEN	Long	Number of rows written
FILES_WRITTEN	Integer	Number of files written
FILES_READ	Integer	Number of files read
TOTAL_SIZE	Long	Total number of bytes
FILES_SKIPPED	Integer	Number of files skipped
ROWS_WRITTEN_SKIPPED	Long	Number of rows skipped

Example Requests

```
GET /v1.1/1551c7f6c808414d8e9f3c514a170f2e/clusters/6ec9a0a4-76be-4262-8697-e7af1fac7920/cdm/job/jdbc2hive/status
```

Example Responses

Status code: 200

Request succeeded.

```
{
  "submissions" : [ {
    "job-name" : "jdbc2hive",
    "creation-user" : "cdm",
    "creation-date" : "1536905778725",
    "progress" : 1,
    "status" : "BOOTING"
  } ]
}
```

See [Error Codes](#).

4.2.9 Querying Job Execution History

Function

This API is used to query the job execution history.

Calling Method

For details, see [Calling APIs](#).

URI

GET /v1.1/{project_id}/clusters/{cluster_id}/cdm/submissions

Table 4-160 Path Parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Project ID. For details about how to obtain it, see Project ID and Account ID .
cluster_id	Yes	String	Cluster ID

Table 4-161 Query Parameters

Parameter	Mandatory	Type	Description
jname	Yes	String	Job name

Request Parameters

Table 4-162 Request header parameters

Parameter	Mandatory	Type	Description
X-Auth-Token	Yes	String	User token. It can be obtained by calling the IAM API (value of X-Subject-Token in the response header).

Response Parameters

Status code: 200

Table 4-163 Response body parameters

Parameter	Type	Description
submissions	Array of Submission objects	Job running information. For details, see the descriptions of submission parameters.
total	Integer	Total number of historical records for a job
page_no	Integer	Page number
page_size	Integer	Number of records on each page. The default value is 10 .

Table 4-164 Submission

Parameter	Type	Description
isIncrementing	Boolean	Whether the job migrates incremental data
job-name	String	Job name
counters	counters object	Job running result statistics. This parameter is available only when status is SUCCEEDED . For details, see the description of the counters parameter.
isStoppingIncrement	String	Whether to stop incremental data migration
is-execute-auto	Boolean	Whether to execute the job as scheduled

Parameter	Type	Description
last-update-date	Long	Time when the job was last updated
last-udpate-user	String	User who last updated the job status
isDeleteJob	Boolean	Whether to delete the job after it is executed
creation-user	String	User who submitted the job
creation-date	Long	Creation time
external-id	String	Job ID
progress	Float	Job progress. If a job fails, the value is -1 . Otherwise, the value ranges from 0 to 100.
submission-id	Integer	Job submission ID
delete_rows	Integer	Number of deleted rows
update_rows	Integer	Number of updated rows
write_rows	Integer	Number of written rows
execute-date	Long	Execution time
status	String	Job status <ul style="list-style-type: none">● BOOTING: The job is starting.● FAILURE_ON_SUBMIT: The job failed to be submitted.● RUNNING: The job is running.● SUCCEEDED: The job was executed successfully.● FAILED: The job failed.● UNKNOWN: The job status is unknown.● NEVER_EXECUTED: The job was not executed.
error-details	String	Error details. This parameter is available only when status is FAILED .
error-summary	String	Error summary. This parameter is available only when status is FAILED .

Table 4-165 counters

Parameter	Type	Description
org.apache.sqoop.submission.counter.SqoopCounters	counter object	Job running result statistics. For details, see the descriptions of counter parameters.

Table 4-166 counter

Parameter	Type	Description
BYTES_WRITTEN	Long	Number of bytes written
TOTAL_FILES	Integer	Total number of files
ROWS_READ	Long	Number of rows read
BYTES_READ	Long	Number of bytes read
ROWS_WRITTEN	Long	Number of rows written
FILES_WRITTEN	Integer	Number of files written
FILES_READ	Integer	Number of files read
TOTAL_SIZE	Long	Total number of bytes
FILES_SKIPPED	Integer	Number of files skipped
ROWS_WRITTEN_SKIPPED	Long	Number of rows skipped

More

For SDK sample code of more programming languages, see the Sample Code tab in [API Explorer](#). SDK sample code can be automatically generated.

Status Codes

Status Code	Description
200	Request succeeded.

Error Codes

See [Error Codes](#).

4.3 Link Management

4.3.1 Creating a Link

Function

This API is used to create a link.

Calling Method

For details, see [Calling APIs](#).

URI

POST /v1.1/{project_id}/clusters/{cluster_id}/cdm/link

Table 4-167 Path Parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Project ID. For details about how to obtain it, see Project ID and Account ID .
cluster_id	Yes	String	Cluster ID

Table 4-168 Query Parameters

Parameter	Mandatory	Type	Description
validate	No	String	When the parameter is set to true , the API only validates whether the parameters are correctly configured, but does not create any link.

Request Parameters

Table 4-169 Request header parameters

Parameter	Mandatory	Type	Description
X-Auth-Token	Yes	String	User token. It can be obtained by calling the IAM API (value of X-Subject-Token in the response header).

Table 4-170 Request body parameters

Parameter	Mandatory	Type	Description
links	Yes	Array of links objects	Link list. For details, see the descriptions of links parameters.

Table 4-171 links

Parameter	Mandatory	Type	Description
link-config-values	Yes	link-config-values object	Link parameters. For details, see the descriptions of link-config-values parameters.
creation-user	No	String	User who created a link
name	Yes	String	Link name
id	No	Integer	Link ID
creation-date	No	Long	Time when a link was created

Parameter	Mandatory	Type	Description
connector-name	Yes	String	Connector name. The corresponding link parameter is generic-jdbc-connector , which indicates a relational database link. obs-connector : link to OBS hdfs-connector : link to HDFS hbase-connector : link to HBase and link to CloudTable hive-connector : link to Hive ftp-connector/sftp-connector : link to an FTP or SFTP server mongodb-connector : link to MongoDB redis-connector : link to Redis/DCS kafka-connector : link to Kafka dis-connector : link to DIS elasticsearch-connector : link to Elasticsearch/Cloud Search Service (CSS) [dli-connector : link to DLI] (tag:nohcs) http-connector : link to HTTP/HTTPS (No link parameters are required.) dms-kafka-connector : link to DMSKafka
update-date	No	Long	Time when a link was updated
enabled	No	Boolean	Whether to activate the link. The default value is true .
update-user	No	String	User who updated a link

Table 4-172 link-config-values

Parameter	Mandatory	Type	Description
configs	Yes	Array of configs objects	Data structure of link parameters. For details, see the descriptions of configs parameters.
extended-configs	No	extended-configs object	Extended configuration. For details, see the descriptions of extended-configs parameters.
validators	No	Array of strings	Validator

Table 4-173 configs

Parameter	Mandatory	Type	Description
inputs	Yes	Array of Input objects	Input parameter list. Each element in the list is in <i>name,value</i> format. For details, see the descriptions of inputs parameters. In the from-config-values data structure, the value of this parameter varies with the source link type. For details, see section "Source Job Parameters" in the <i>Cloud Data Migration User Guide</i> . In the to-config-values data structure, the value of this parameter varies with the destination link type. For details, see section "Destination Job Parameters" in the <i>Cloud Data Migration User Guide</i> . For details about the inputs parameter in the driver-config-values data structure, see the job parameter descriptions.
name	Yes	String	Configuration name. The value is fromJobConfig for a source job, toJobConfig for a destination job, and linkConfig for a link.
id	No	Integer	Configuration ID, which is generated by the system. You do not need to set this parameter.
type	No	String	Configuration type, which is generated by the system. You do not need to set this parameter. The value can be LINK (for link management APIs) or JOB (for job management APIs).

Table 4-174 Input

Parameter	Mandatory	Type	Description
name	Yes	String	<p>Parameter name.</p> <ul style="list-style-type: none"> For link management APIs, parameter names start with linkConfig.. The parameters vary depending on the link type. For details, see the parameter descriptions of the corresponding link in Link Parameters. For job management APIs, source link parameter names start with fromJobConfig.. For details, see the source job parameters in Source Job Parameters. Destination link parameter names start with toJobConfig.. For details, see Destination Job Parameters. For details about job parameters, see the task parameter descriptions in Job Parameters.
value	Yes	Object	Parameter value, which must be a string.
type	No	String	Value type, such as STRING and INTEGER . The value is set by the system.

Table 4-175 extended-configs

Parameter	Mandatory	Type	Description
name	No	String	Name
value	No	String	Value

Response Parameters

Status code: 200

Table 4-176 Response body parameters

Parameter	Type	Description
name	String	Link name
validation-result	Array of validationResult objects	Validation structure. If a link fails to be created, the failure cause is returned. For details, see the descriptions of validation-result parameters. If a link is successfully created, an empty list is returned.

Table 4-177 validationResult

Parameter	Type	Description
linkConfig	Array of validationLinkConfig objects	Validation result of link creation or update. For details, see the descriptions of validationLinkConfig parameters.

Table 4-178 validationLinkConfig

Parameter	Type	Description
message	String	Error message
status	String	Error level, for example, ERROR or WARNING

Status code: 400**Table 4-179** Response body parameters

Parameter	Type	Description
code	String	Return code
errCode	String	Error code
message	String	Error message
externalMessage	String	Additional information

Status code: 500

Table 4-180 Response body parameters

Parameter	Type	Description
message	String	Error message
status	String	Error level, for example, ERROR or WARNING

Example Requests

Creating a link named `mysql_link`

POST /v1.1/1551c7f6c808414d8e9f3c514a170f2e/clusters/6ec9a0a4-76be-4262-8697-e7af1fac7920/cdm/link

```
{
  "links": [ {

  "connector-name": "generic-jdbc-connector",
  "update-date": 1496654788622,
  "enabled": true
} ] }
```

Example Responses

Status code: 200

Request succeeded.

```
{
  "name": "rdb_link",
  "validation-result": [ { } ]
}
```

Status code: 400

Request error.

```
{
  "code" : "Cdm.0315",
  "errCode" : "Cdm.0315",
  "message" : "Link name [ftp_link] already exist or created by other user.",
  "externalMessage" : "Link name [ftp_link] already exist or created by other user."
}
```

Status code: 500

Internal service error. For details about the returned error code, see Error Codes.

```
{
  "validation-result" : [ {
    "linkConfig" : [ {
      "message" : "Can't connect to the database with given credentials: The authentication type 12 is not supported. Check that you have configured the pg_hba.conf file to include the client's IP address or subnet, and that it is using an authentication scheme supported by the driver.",
      "status" : "ERROR"
    } ]
  } ]
}
```

More

For SDK sample code of more programming languages, see the Sample Code tab in [API Explorer](#). SDK sample code can be automatically generated.

Status Codes

Status Code	Description
200	Request succeeded.
400	Request error.
401	Authentication failed.
403	No operation permissions.
404	No resources found.
500	Internal service error. For details about the returned error code, see Error Codes.
503	Service unavailable.

Error Codes

See [Error Codes](#).

4.3.2 Querying a Link

Function

This API is used to query a link.

Calling Method

For details, see [Calling APIs](#).

URI

GET /v1.1/{project_id}/clusters/{cluster_id}/cdm/link/{link_name}

Table 4-181 Path Parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Project ID. For details about how to obtain it, see Project ID and Account ID .
cluster_id	Yes	String	Cluster ID
link_name	Yes	String	Link name

Request Parameters

Table 4-182 Request header parameters

Parameter	Mandatory	Type	Description
X-Auth-Token	Yes	String	User token. It can be obtained by calling the IAM API (value of X-Subject-Token in the response header).

Response Parameters

Status code: 200

Table 4-183 Response body parameters

Parameter	Type	Description
links	Array of links objects	Link list. For details, see the descriptions of links parameters.
fromTo-unMapping	String	Source and destination data sources not supported by table/file migration
batchFromTo-mapping	String	Source and destination data sources supported by entire DB migration

Table 4-184 links

Parameter	Type	Description
link-config-values	link-config-values object	Link parameters. For details, see the descriptions of link-config-values parameters.
creation-user	String	User who created a link
name	String	Link name
id	Integer	Link ID
creation-date	Long	Time when a link was created
connector-name	String	Connector name. The corresponding link parameter is generic-jdbc-connector , which indicates a relational database link. obs-connector : link to OBS hdfs-connector : link to HDFS hbase-connector : link to HBase and link to CloudTable hive-connector : link to Hive ftp-connector/sftp-connector : link to an FTP or SFTP server mongodb-connector : link to MongoDB redis-connector : link to Redis/DCS kafka-connector : link to Kafka dis-connector : link to DIS elasticsearch-connector : link to Elasticsearch/Cloud Search Service (CSS) [dli-connector : link to DLI] (tag:nohcs) http-connector : link to HTTP/HTTPS (No link parameters are required.) dms-kafka-connector : link to DMSKafka
update-date	Long	Time when a link was updated
enabled	Boolean	Whether to activate the link. The default value is true .
update-user	String	User who updated a link

Table 4-185 link-config-values

Parameter	Type	Description
configs	Array of configs objects	Data structure of link parameters. For details, see the descriptions of configs parameters.
extended-configs	extended-configs object	Extended configuration. For details, see the descriptions of extended-configs parameters.
validators	Array of strings	Validator

Table 4-186 configs

Parameter	Type	Description
inputs	Array of Input objects	Input parameter list. Each element in the list is in <i>name,value</i> format. For details, see the descriptions of inputs parameters. In the from-config-values data structure, the value of this parameter varies with the source link type. For details, see section "Source Job Parameters" in the <i>Cloud Data Migration User Guide</i> . In the to-config-values data structure, the value of this parameter varies with the destination link type. For details, see section "Destination Job Parameters" in the <i>Cloud Data Migration User Guide</i> . For details about the inputs parameter in the driver-config-values data structure, see the job parameter descriptions.
name	String	Configuration name. The value is fromJobConfig for a source job, toJobConfig for a destination job, and linkConfig for a link.
id	Integer	Configuration ID, which is generated by the system. You do not need to set this parameter.
type	String	Configuration type, which is generated by the system. You do not need to set this parameter. The value can be LINK (for link management APIs) or JOB (for job management APIs).

Table 4-187 Input

Parameter	Type	Description
name	String	Parameter name. <ul style="list-style-type: none">For link management APIs, parameter names start with linkConfig. The parameters vary depending on the link type. For details, see the parameter descriptions of the corresponding link in Link Parameters.For job management APIs, source link parameter names start with fromJobConfig. For details, see the source job parameters in Source Job Parameters. Destination link parameter names start with toJobConfig. For details, see Destination Job Parameters. For details about job parameters, see the task parameter descriptions in Job Parameters.

Parameter	Type	Description
value	Object	Parameter value, which must be a string.
type	String	Value type, such as STRING and INTEGER . The value is set by the system.

Table 4-188 extended-configs

Parameter	Type	Description
name	String	Name
value	String	Value

Example Requests

```
GET /v1.1/1551c7f6c808414d8e9f3c514a170f2e/clusters/6ec9a0a4-76be-4262-8697-e7af1fac7920/cdm/link/sftplink
```

Example Responses

See [Error Codes](#).

4.3.3 Deleting a Link

Function

This API is used to delete a link.

Calling Method

For details, see [Calling APIs](#).

URI

DELETE /v1.1/{project_id}/clusters/{cluster_id}/cdm/link/{link_name}

Table 4-189 Path Parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Project ID. For details about how to obtain it, see Project ID and Account ID .
cluster_id	Yes	String	Cluster ID
link_name	Yes	String	Name of the link to be deleted

Request Parameters

Table 4-190 Request header parameters

Parameter	Mandatory	Type	Description
X-Auth-Token	Yes	String	User token. It can be obtained by calling the IAM API (value of X-Subject-Token in the response header).

Response Parameters

Status code: 500

Table 4-191 Response body parameters

Parameter	Type	Description
errCode	String	Error code
externalMessage	String	Error message

Example Requests

```
DELETE /v1.1/1551c7f6c808414d8e9f3c514a170f2e/clusters/6ec9a0a4-76be-4262-8697-e7af1fac7920/cdm/link/jdbclink
```

Example Responses

Status code: 500

Internal service error. For details about the returned error code, see Error Codes.

```
{
  "errCode": "Cdm.0021",
```

```
"externalMessage" : "Given link name is in use"  
}
```

connector-name	Yes	String	Connector name. The corresponding link parameter is generic-jdbc-connector , which indicates a relational database link. obs-connector : link to OBS hdfs-connector : link to HDFS hbase-connector : link to HBase and link to CloudTable hive-connector : link to Hive ftp-connector/sftp-connector : link to an FTP or SFTP server mongodb-connector : link to MongoDB redis-connector : link to Redis/DCS kafka-connector : link to Kafka dis-connector : link to DIS elasticsearch-connector : link to Elasticsearch/Cloud Search Service (CSS) [dli-connector : link to DLI] (tag:nohcs) http-connector : link to HTTP/HTTPS (No link parameters are required.) dms-kafka-connector : link to DMSKafka
update-date	No	Long	Time when a link was updated
enabled	No	Boolean	Whether to activate the link. The default value is true .
update-user	No	String	User who updated a link

Table 4-196 link-config-values

Parameter	Mandatory	Type	Description
configs	Yes	Array of configs objects	Data structure of link parameters. For details, see the descriptions of configs parameters.
extended-configs	No	extended-configs object	Extended configuration. For details, see the descriptions of extended-configs parameters.
validators	No	Array of strings	Validator

Table 4-197 configs

Parameter	Mandatory	Type	Description
inputs	Yes	Array of Input objects	Input parameter list. Each element in the list is in <i>name,value</i> format. For details, see the descriptions of inputs parameters. In the from-config-values data structure, the value of this parameter varies with the source link type. For details, see section "Source Job Parameters" in the <i>Cloud Data Migration User Guide</i> . In the to-config-values data structure, the value of this parameter varies with the destination link type. For details, see section "Destination Job Parameters" in the <i>Cloud Data Migration User Guide</i> . For details about the inputs parameter in the driver-config-values data structure, see the job parameter descriptions.
name	Yes	String	Configuration name. The value is fromJobConfig for a source job, toJobConfig for a destination job, and linkConfig for a link.
id	No	Integer	Configuration ID, which is generated by the system. You do not need to set this parameter.
type	No	String	Configuration type, which is generated by the system. You do not need to set this parameter. The value can be LINK (for link management APIs) or JOB (for job management APIs).

Table 4-198 Input

Parameter	Mandatory	Type	Description
name	Yes	String	<p>Parameter name.</p> <ul style="list-style-type: none"> For link management APIs, parameter names start with linkConfig.. The parameters vary depending on the link type. For details, see the parameter descriptions of the corresponding link in Link Parameters. For job management APIs, source link parameter names start with fromJobConfig.. For details, see the source job parameters in Source Job Parameters. Destination link parameter names start with toJobConfig.. For details, see Destination Job Parameters. For details about job parameters, see the task parameter descriptions in Job Parameters.
value	Yes	Object	Parameter value, which must be a string.
type	No	String	Value type, such as STRING and INTEGER . The value is set by the system.

Table 4-199 extended-configs

Parameter	Mandatory	Type	Description
name	No	String	Name
value	No	String	Value

Response Parameters

Status code: 200

Table 4-200 Response body parameters

Parameter	Type	Description
validation-result	Array of validationResult objects	Validation structure. If a link fails to be created, the failure cause is returned. For details, see the descriptions of validation-result parameters. If a link is successfully created, an empty list is returned.

Table 4-201 validationResult

Parameter	Type	Description
linkConfig	Array of validationLinkConfig objects	Validation result of link creation or update. For details, see the descriptions of validationLinkConfig parameters.

Table 4-202 validationLinkConfig

Parameter	Type	Description
message	String	Error message
status	String	Error level, for example, ERROR or WARNING

Status code: 500

Table 4-203 Response body parameters

Parameter	Type	Description
message	String	Error message
status	String	Error level, for example, ERROR or WARNING

Example Requests

Modifying a link named **mysql_link**

```
PUT /v1.1/1551c7f6c808414d8e9f3c514a170f2e/clusters/6ec9a0a4-76be-4262-8697-e7af1fac7920/cdm/link/rdb_link
```

```

Status Codes

Status Code	Description
200	Request succeeded.
400	Request error.
401	Authentication failed.
403	No operation permissions.
404	No resources found.
500	Internal service error. For details about the returned error code, see Error Codes.
503	Service unavailable.

Error Codes

See [Error Codes](#).

4.4 Public Data Structures

4.4.1 Link Parameter Description

4.4.1.1 Link to a Relational Database

Description

By creating a JDBC link, you can extract data from or load data to the following relational databases:

- RDS for PostgreSQL
- RDS for SQL Server
- PostgreSQL
- Microsoft SQL Server

Sample Link

```
{
  "links": [
    {
      "link-config-values": {
        "configs": [
          {
            "inputs": [
              {
                "name": "linkConfig.databaseType",
                "value": "MYSQL"
              }
            ]
          }
        ]
      }
    }
  ]
}
```

```

    {
      "name": "linkConfig.host",
      "value": "10.120.205.30"
    },
    {
      "name": "linkConfig.port",
      "value": "3306"
    },
    {
      "name": "linkConfig.database",
      "value": "DB_name"
    },
    {
      "name": "linkConfig.username",
      "value": "username"
    },
    {
      "name": "linkConfig.password",
      "value": "Add password here"
    },
    {
      "name": "linkConfig.fetchSize",
      "value": "10000"
    },
    {
      "name": "linkConfig.commitSize",
      "value": "10000"
    },
    {
      "name": "linkConfig.usingNative",
      "value": "false"
    },
    {
      "name": "linkConfig.useSSL",
      "value": "false"
    }
  ],
  "name": "linkConfig"
}
],
"name": "mysql_link",
"connector-name": "generic-jdbc-connector"
}
]
}

```

Link Parameters

Parameter	Mandatory	Type	Description
linkConfig.data baseType	Yes	Enumeration	Database type. The options are as follows: <ul style="list-style-type: none"> ● ORACLE ● MYSQL ● SQLSERVER ● DB2 ● POSTGRESQL ● DWS ● DDM ● SAP HANA

Parameter	Mandatory	Type	Description
linkConfig.host	Yes	String	IP address of the database server
linkConfig.port	Yes	String	Port number of the database server
linkConfig.databaseconfig	No	Enumeration	Oracle database link type. This parameter is available only when an Oracle link is created. The options are as follows: <ul style="list-style-type: none">• SERVICENAME: Use SERVICE_NAME to connect to the Oracle database.• SID: Use SID to connect to the Oracle database.
linkConfig.sidname	No	String	Oracle instance ID, which is used to differentiate databases by instances. This parameter is available only when an Oracle link is created and the database link type linkConfig.databaseconfig is set to SID .
linkConfig.database	No	String	Database name
linkConfig.username	Yes	String	Username
linkConfig.password	Yes	String	Password
linkConfig.fetchSize	No	String	Number of data rows obtained each time
linkConfig.commitSize	No	String	Number of data rows submitted in each request

Parameter	Mandatory	Type	Description
linkConfig.using Native	No	Boolean	<p>Whether to use the local API acceleration function of the database</p> <p>When creating a MySQL link, you can use the LOAD DATA function of MySQL to accelerate data import and improve the performance of importing data to the MySQL database.</p> <p>NOTE</p> <p>The REPLACE and IGNORE modifiers are used to process the injected rows that have the same unique key value (PRIMARY KEY or UNIQUE index value) as an existing row.</p> <ul style="list-style-type: none"> • If Constraint Conflict Handling is set to replace into or local and the REPLACE modifier is used, a new row with the same unique key value as an existing row will replace the existing row. • If Constraint Conflict Handling is set to insert into, the IGNORE modifier is used by default, and a new row with the same unique key value as an existing row will be discarded, but the task will not be terminated. The MySQL service cannot stop file transfer in progress. Therefore, the number of written records displayed on the CDM console is inconsistent with the actual number of updated rows. <p>For details about the MySQL local mode, visit https://dev.mysql.com/doc/refman/8.0/en/load-data.html.</p>
linkConfig.isRds	No	Boolean	<p>Whether RDS is supported. The default value true is used for cloud databases and false is used for other databases.</p>

Parameter	Mandatory	Type	Description
linkConfig.useSSL	No	Boolean	Whether to enable SSL encrypted transmission for RDS. This parameter is available only when you create a DWS connection.
linkConfig.jdbcProperties	No	Map	Link attribute, which specifies the JDBC connector attributes of the data source. For details about how to configure the link attributes, see the JDBC connector description of the corresponding database.
linkConfig.version	No	Enumeration	<p>Oracle database version. This parameter is available only when you create an Oracle link. The options are as follows:</p> <ul style="list-style-type: none">● HIGH_VERSION: Select this value if the Oracle database version is later than 12.1.● MED_VERSION: Select this value if the Oracle database version is 12.1.● LOW_VERSION: Select this value if the Oracle database version is earlier than 12.1. <p>If error message "java.sql.SQLException: Protocol violation" is displayed, select another option.</p>
dialect.identifierEnclose	No	String	Reference identifier, which is the delimiter between the referenced table names or column names. For details, see the product documentation of the corresponding database.

4.4.1.2 Link to OBS

Description

By creating an OBS link, you can extract files from or load files to Object Storage Service (OBS). Files in CSV, JSON, and binary format are supported.

Sample Link

The following is the message body of a sample link. You are advised to store the AK and SK in ciphertext in the configuration file or environment variables and decrypt them when needed to ensure security.

```
{
  "links": [
    {
      "link-config-values": {
        "configs": [
          {
            "inputs": [
              {
                "name": "linkConfig.storageType",
                "value": "OBS"
              },
              {
                "name": "linkConfig.obsBucketType",
                "value": "PFS"
              },
              {
                "name": "linkConfig.server",
                "value": "10.121.16.183"
              },
              {
                "name": "linkConfig.port",
                "value": "443"
              },
              {
                "name": "linkConfig.accessKey",
                "value": "<YOUR AK>"
              },
              {
                "name": "linkConfig.securityKey",
                "value": "<YOUR SK>"
              }
            ],
            "name": "linkConfig"
          }
        ]
      },
      "name": "obs_link",
      "connector-name": "obs-connector"
    }
  ]
}
```

Link Parameters

Parameter	Mandatory	Type	Description
linkConfig.storageType	Yes	String	Storage class of an object

Parameter	Mandatory	Type	Description
linkConfig.obsBucketType	No	String	OBS bucket type <ul style="list-style-type: none"> ● OB: object bucket ● PFS: parallel file system NOTE A parallel file system is recommended because filtering files in an object bucket is slow.
linkConfig.server	Yes	String	Endpoint of the OBS server.
linkConfig.port	Yes	String	Data transmission port. The HTTPS port number is 443 and the HTTP port number is 80.
linkConfig.accessKey	Yes	String	AK. You are advised to store it in ciphertext in the configuration file or an environment variable and decrypt it when needed to ensure security.
linkConfig.securityKey	Yes	String	SK. You are advised to store it in ciphertext in the configuration file or an environment variable and decrypt it when needed to ensure security.

4.4.1.3 Link to HDFS

Description

By creating an HDFS link, you can extract files from or load files to MRS, FusionInsight HD, or Apache Hadoop. Files in CSV, Parquet, and binary formats are supported.

Sample Link

```
{
  "links": [
    {
      "link-config-values": {
        "configs": [
          {
            "inputs": [
              {
                "name": "linkConfig.hadoopType",
                "value": "FusionInsight HD"
              },
              {
                "name": "linkConfig.host",
```

```

        "value": "10.120.205.143"
    },
    {
        "name": "linkConfig.casPort",
        "value": "20009"
    },
    {
        "name": "linkConfig.port",
        "value": "28443"
    },
    {
        "name": "linkConfig.authType",
        "value": "KERBEROS"
    },
    {
        "name": "linkConfig.user",
        "value": "admin"
    },
    {
        "name": "linkConfig.password",
        "value": "Add password here"
    },
    {
        "name": "linkConfig.runMode",
        "value": "STANDALONE"
    }
  ],
  "name": "linkConfig"
}
],
"name": "hdfslink",
"connector-name": "hdfs-connector"
}
]
}

```

Link Parameters

Parameter	Mandatory	Type	Description
linkConfig.hadoopType	Yes	Enumeration	Hadoop type. The options are as follows: <ul style="list-style-type: none"> ● MRS: link to HDFS of MRS ● FusionInsight HD: link to HDFS of FusionInsight HD ● Apache Hadoop: link to HDFS of Apache Hadoop
linkConfig.uri	No	String	NameNode URI required for the link to Apache Hadoop. The format is <i>ip:port</i> .
linkConfig.host	No	String	IP address of Manager required for the link to MRS or FusionInsight HD
linkConfig.port	No	String	Port number of Manager required for the link to FusionInsight HD

Parameter	Mandatory	Type	Description
linkConfig.casPort	No	String	Port number of CAS Server that connects to FusionInsight HD required for the link to FusionInsight HD
linkConfig.user	No	String	Username for logging in to Manager. This parameter is not required if the cluster configuration is used.
linkConfig.password	No	String	Password for logging in to Manager. This parameter is not required if the cluster configuration is used.
linkConfig.authType	No	Enumeration	Authentication method. The options are as follows: <ul style="list-style-type: none">• Simple: for non-security mode• Kerberos: for security mode
linkConfig.principal	No	String	Account principal required for Kerberos authentication. You can contact the administrator to obtain the account. Before using the cluster configuration, you must set this parameter in cluster configuration management.
linkConfig.keytab	No	FileContent	Local absolute path of the keytab file required for Kerberos authentication. You can also contact the administrator to obtain the file. Before using the cluster configuration, you must set this parameter in cluster configuration management.

Parameter	Mandatory	Type	Description
linkConfig.run Mode	No	Enumeration	<p>Running mode of the HDFS link. The options are as follows:</p> <ul style="list-style-type: none"> • EMBEDDED: The link instance runs with CDM. This mode delivers better performance. • STANDALONE: The link instance runs in an independent process. If CDM needs to connect to multiple Hadoop data sources (MRS, Hadoop, or CloudTable) with both Kerberos and Simple authentication methods, STANDALONE is used. If STANDALONE is selected, CDM can migrate data between HDFSs of multiple MRS clusters. <p>If a CDM cluster connects to two or more clusters with Kerberos authentication enabled and the same realm, only one cluster can be connected in EMBEDDED mode, and the other clusters must be connected in STANDALONE mode.</p>
linkConfig.properties	No	Map	<p>Properties. You can add configuration properties of the client. Each property must contain a name and a value.</p>

4.4.1.4 Link to HBase

Description

By creating an HBase link, you can extract data from or load data to HBase of MRS, FusionInsight HD, and Apache Hadoop.

Sample Link

```
{
  "links": [
    {
```

```
"link-config-values": {
  "configs": [
    {
      "inputs": [
        {
          "name": "linkConfig.hbaseType",
          "value": "MRS"
        },
        {
          "name": "linkConfig.host",
          "value": "192.168.0.34"
        },
        {
          "name": "linkConfig.user",
          "value": "zephyr"
        },
        {
          "name": "linkConfig.password",
          "value": "Add password here."
        },
        {
          "name": "linkConfig.authType",
          "value": "KERBEROS"
        },
        {
          "name": "linkConfig.serviceType",
          "value": "HDFS"
        },
        {
          "name": "linkConfig.hBaseVersion",
          "value": "HBASE_2_X"
        },
        {
          "name": "linkConfig.runMode",
          "value": "EMBEDDED"
        }
      ],
      "name": "linkConfig"
    }
  ],
  "extended-configs": {
    "name": "linkConfig.extendedFields",
    "value":
"eyJL1c2VDhHVzdGVyQ29uZmlnIjoiZmFsc2UiJCLjBHVzdGVyQ29uZmlnUHLpbmNpcGFsIjoiemVwaHlyIn0="
  },
  "name": "mrs_hbase_dlf",
  "connector-name": "hbase-connector"
}
]
```

Link Parameters

Parameter	Mandatory	Type	Description
linkConfig.hbaseType	Yes	Enumeration	HBase type. The options are as follows: <ul style="list-style-type: none"> • CloudTable: link to CloudTable Service (CloudTable) • MRS: link to HBase of MRS • FusionInsight HD: link to HBase of FusionInsight HD • Apache Hadoop: link to HBase of Apache Hadoop
linkConfig.uri	No	String	NameNode URI required for the link to Apache Hadoop. The format is <i>ip:port</i> .
linkConfig.host	No	String	IP address of Manager required for the link to MRS or FusionInsight HD
linkConfig.port	No	String	Port number of Manager required for the link to FusionInsight HD
linkConfig.casPort	No	String	Port number of CAS Server that connects to FusionInsight HD required for the link to FusionInsight HD
linkConfig.hbaseVersion	Yes	Enumeration	HBase version <ul style="list-style-type: none"> • HBASE_1_X • HBASE_2_X
linkConfig.user	No	String	Username for logging in to Manager. This parameter is not required if the cluster configuration is used.
linkConfig.password	No	String	Password for logging in to Manager. This parameter is not required if the cluster configuration is used.
linkConfig.authType	No	Enumeration	Authentication method. The options are as follows: <ul style="list-style-type: none"> • Simple: for non-security mode • Kerberos: for security mode

Parameter	Mandatory	Type	Description
linkConfig.principal	No	String	Account principal required for Kerberos authentication. You can contact the administrator to obtain the account.
linkConfig.keytab	No	FileContent	Local absolute path of the keytab file required for Kerberos authentication. You can also contact the administrator to obtain the file.
linkConfig.serviceType	No	String	Service type Currently, HDFS and HBase are supported.
linkConfig.runMode	No	Enumeration	<p>This parameter is used only when the HBase version is HBase_2_X. Possible values are:</p> <ul style="list-style-type: none"> • EMBEDDED: The link instance runs with CDM. This mode delivers better performance. • STANDALONE: The link instance runs in an independent process. If CDM needs to connect to multiple Hadoop data sources (MRS, Hadoop, or CloudTable) with both Kerberos and Simple authentication methods, STANDALONE is used. If STANDALONE is selected, CDM can migrate data between HDFSs of multiple MRS clusters. <p>If a CDM cluster connects to two or more clusters with Kerberos authentication enabled and the same realm, only one cluster can be connected in EMBEDDED mode, and the other clusters must be connected in STANDALONE mode.</p>
linkConfig.properties	No	Map	Properties. You can add configuration properties of the client. Each property must contain a name and a value.

4.4.1.5 Link to CloudTable

Description

By creating a CloudTable link, you can extract data from or load data to CloudTable.

Sample Link

The following is the message body of a sample link. You are advised to store the AK and SK in ciphertext in the configuration file or environment variables and decrypt them when needed to ensure security.

```
{
  "links": [
    {
      "link-config-values": {
        "configs": [
          {
            "inputs": [
              {
                "name": "linkConfig.hbaseType",
                "value": "CloudTable"
              },
              {
                "name": "linkConfig.zookeeperQuorum",
                "value": "cloudtable-pass-zk2-bae54VGN.cloudtable.com:2181,cloudtable-pass-zk1-
Fu828so2.cloudtable.com:2181"
              },
              {
                "name": "linkConfig.iamAuth",
                "value": "true"
              },
              {
                "name": "linkConfig.cloudtableUser",
                "value": "zane"
              },
              {
                "name": "linkConfig.accessKey",
                "value": "<YOUR AK>"
              },
              {
                "name": "linkConfig.securityKey",
                "value": "<YOUR SK>"
              },
              {
                "name": "linkConfig.runMode",
                "value": "EMBEDDED"
              }
            ],
            "name": "linkConfig"
          }
        ],
        "name": "cloudtablelink",
        "connector-name": "hbase-connector"
      }
    ]
  }
}
```

Link Parameters

Parameter	Mandatory	Type	Description
linkConfig.hbaseType	Yes	Enumeration	<p>HBase type. The options are as follows:</p> <ul style="list-style-type: none"> • CloudTable: link to CloudTable • MRS: link to MRS • FusionInsight HD: link to FusionInsight HD • Apache Hadoop: link to Apache Hadoop
linkConfig.zookeeperQuorum	Yes	String	ZooKeeper link of CloudTable. This parameter is mandatory for the CloudTable link.
linkConfig.iamAuth	Yes	Boolean	If you choose IAM for identity authentication, enter the username, AK, and SK.
linkConfig.runMode	Yes	Enumeration	<p>Running mode of the HBase link. The options are as follows:</p> <ul style="list-style-type: none"> • EMBEDDED: The link instance runs with CDM. This mode delivers better performance. • STANDALONE: The link instance runs in an independent process. If CDM needs to connect to multiple Hadoop data sources (MRS, Hadoop, or CloudTable) with both Kerberos and Simple authentication methods, STANDALONE is used.
linkConfig.cloudtableUser	Yes	String	Username for accessing the CloudTable cluster
linkConfig.accessKey	Yes	String	AK for accessing the CloudTable cluster. You are advised to store it in ciphertext in the configuration file or an environment variable and decrypt it when needed to ensure security.

Parameter	Mandatory	Type	Description
linkConfig.securityKey	Yes	String	SK for accessing the CloudTable cluster. You are advised to store it in ciphertext in the configuration file or an environment variable and decrypt it when needed to ensure security.

4.4.1.6 Link to Hive

Description

By creating a Hive link, you can extract data from or load data to Hive of MRS.

Sample Link

The following is the message body of a sample link. You are advised to store the AK and SK in ciphertext in the configuration file or environment variables and decrypt them when needed to ensure security.

```
{
  "links": [
    {
      "link-config-values": {
        "configs": [
          {
            "inputs": [
              {
                "name": "linkConfig.host",
                "value": "10.120.205.230"
              },
              {
                "name": "linkConfig.authType",
                "value": "KERBEROS"
              },
              {
                "name": "linkConfig.user",
                "value": "cdm"
              },
              {
                "name": "linkConfig.password",
                "value": "Add password here"
              }
            ],
            "name": "linkConfig"
          }
        ],
        "name": "hive_link",
        "connector-name": "hive-connector"
      }
    }
  ]
}
```

Link Parameters

Parameter	Mandatory	Type	Description
linkConfig.host	Yes	String	IP address of MRS Manager
linkConfig.authType	Yes	Enumeration	Authentication method of MRS. The options are as follows: <ul style="list-style-type: none">● SIMPLE: for non-security mode● KERBEROS: for security mode
linkConfig.principal	No	String	Account principal required for Kerberos authentication. You can contact the administrator to obtain the account. Before using the cluster configuration, you must set this parameter in cluster configuration management.
linkConfig.keytab	No	FileContent	Local absolute path of the keytab file required for Kerberos authentication. You can also contact the administrator to obtain the file. Before using the cluster configuration, you must set this parameter in cluster configuration management.
linkConfig.hiveVersion	Yes	Enumeration	Hive version <ul style="list-style-type: none">● HIVE_1_X● HIVE_3_X
linkConfig.user	No	String	Username for logging in to Manager. This parameter is not required if the cluster configuration is used.
linkConfig.password	No	String	Password for logging in to Manager. This parameter is not required if the cluster configuration is used.
linkConfig.uri	No	String	NameNode URI required for the link to Apache Hadoop. The format is <i>ip:port</i> .

Parameter	Mandatory	Type	Description
linkConfig.hiveMsUris	No	String	Hive metadata address for connecting to Apache Hadoop. For details, see the hive.metastore.uris configuration item. Example: thrift://host-192-168-1-212:9083
linkConfig.obsSupport	Yes	Boolean	The server must support OBS storage. When creating a Hive table, you can store the table in OBS.
linkConfig.runMode	Yes	Enumeration	This parameter is used only when the Hive version is HIVE_3_X . Possible values are: <ul style="list-style-type: none"> • EMBEDDED: The link instance runs with CDM. This mode delivers better performance. • STANDALONE: The link instance runs in an independent process. If you want to connect CDM to multiple Hadoop data sources (MRS, Hadoop, or CloudTable), and both KERBEROS and SIMPLE authentication modes are available, you must select STANDALONE for this parameter. Note: The STANDALONE mode is used to solve the version conflict problem. If the connector versions of the source and destination ends of the same link are different, a JAR file conflict occurs. In this case, you need to place the source or destination end in the STANDALONE process to prevent the migration failure caused by the conflict.
linkConfig.accessKey	No	String	AK. This parameter is mandatory when OBS is supported. You are advised to store it in ciphertext in the configuration file or an environment variable and decrypt it when needed to ensure security.

Parameter	Mandatory	Type	Description
linkConfig.securityKey	No	String	SK. This parameter is mandatory when OBS is supported. You are advised to store it in ciphertext in the configuration file or an environment variable and decrypt it when needed to ensure security.
linkConfig.properties	No	Map	Properties. You can add configuration properties of the client. Each property must contain a name and a value.

4.4.1.7 Link to an FTP or SFTP Server

Description

By creating an FTP or SFTP link, you are able to extract files from or load files to the FTP or SFTP server. Files in CSV, JSON, and binary format are supported.

Sample Link

```
{
  "links": [
    {
      "link-config-values": {
        "configs": [
          {
            "inputs": [
              {
                "name": "linkConfig.server",
                "value": "10.120.85.167"
              },
              {
                "name": "linkConfig.port",
                "value": "22"
              },
              {
                "name": "linkConfig.username",
                "value": "username"
              },
              {
                "name": "linkConfig.password",
                "value": "Add password here"
              }
            ],
            "name": "linkConfig"
          }
        ],
        "name": "sftp_link",
        "connector-name": "sftp-connector"
      }
    ]
  }
}
```

Link Parameters

Parameters for creating the FTP or SFTP link are the same.

Parameter	Mandatory	Type	Description
linkConfig.server	Yes	String	IP address of the FTP or SFTP server
linkConfig.port	Yes	String	Port number of the FTP or SFTP server
linkConfig.username	Yes	String	Username for logging in to the FTP or SFTP server
linkConfig.password	Yes	String	Password for logging in to the FTP or SFTP server

4.4.1.8 Link to MongoDB

Description

By creating a Link to MongoDB, you can extract data from or load data to MongoDB.

Sample Link

```
{
  "links": [
    {
      "link-config-values": {
        "configs": [
          {
            "inputs": [
              {
                "name": "linkConfig.serverList",
                "value": "10.120.84.149:27017"
              },
              {
                "name": "linkConfig.database",
                "value": "DB_name"
              },
              {
                "name": "linkConfig.userName",
                "value": "username"
              },
              {
                "name": "linkConfig.password",
                "value": "Add password here"
              }
            ]
          },
          {
            "name": "linkConfig"
          }
        ]
      },
      "name": "mongo_link",
      "connector-name": "mongodb-connector"
    }
  ]
}
```

Link Parameters

Parameter	Mandatory	Type	Description
linkConfig.serverList	Yes	String	Server IP address list in <i>host1:port1;host2:port2</i> format
linkConfig.database	Yes	String	Name of the MongoDB database
linkConfig.userName	Yes	String	Username for logging in to the MongoDB server
linkConfig.password	Yes	String	Password for logging in to the MongoDB server

4.4.1.9 Link to Redis

Description

By creating a Redis link, you can extract data from or load data to the Redis server.

Sample Link

```
{
  "links": [
    {
      "link-config-values": {
        "configs": [
          {
            "inputs": [
              {
                "name": "linkConfig.deploymentMode",
                "value": "Cluster"
              },
              {
                "name": "linkConfig.serverlist",
                "value": "10.120.84.149:7300"
              },
              {
                "name": "linkConfig.password",
                "value": "Add password here"
              },
              {
                "name": "linkConfig.dbIndex",
                "value": "0"
              }
            ],
            "name": "linkConfig"
          }
        ],
        "name": "linkConfig"
      }
    },
    {
      "name": "redis_link",
      "connector-name": "redis-connector"
    }
  ]
}
```

Link Parameters

Parameter	Mandatory	Type	Description
linkConfig.deploymentMode	Yes	Enumeration	Redis deployment mode. The options are as follows: <ul style="list-style-type: none">• Single: single-node deployment• Cluster: cluster deployment
linkConfig.serverlist	Yes	String	Server IP address list in <i>host1:port1;host2:port2</i> format
linkConfig.password	Yes	String	Password for logging in to the Redis server
linkConfig.databaseIndex	Yes	String	Redis database index

4.4.1.10 Link to Kafka

Description

By creating a Kafka link, you are able to access open source Kafka and migrate data from Kafka to other data sources as required. Currently, only data export from Kafka is supported.

Sample Link

```
{
  "links": [
    {
      "link-config-values": {
        "configs": [
          {
            "inputs": [
              {
                "name": "linkConfig.hadoopType",
                "value": "MRS"
              },
              {
                "name": "linkConfig.host",
                "value": "192.168.1.147"
              },
              {
                "name": "linkConfig.user",
                "value": "liuhuan1"
              },
              {
                "name": "linkConfig.password",
                "value": "Add password here."
              },
              {
                "name": "linkConfig.authType",
                "value": "KERBEROS"
              }
            ]
          },
          {
            "name": "linkConfig"
          }
        ]
      }
    }
  ]
}
```

```

    ],
    "extended-configs": {
      "name": "linkConfig.extendedFields",
      "value": "e30="
    }
  },
  "name": "mrs_kafka_link",
  "connector-name": "kafka-connector"
}
]
}

```

Link Parameters

Parameter	Mandatory	Type	Description
linkConfig.hadoopType	Yes	Enumeration	Hadoop type. The options are as follows: <ul style="list-style-type: none"> ● MRS: link to Kafka of MRS ● Apache Kafka: link to Kafka of Apache
linkConfig.brokerList	Yes	String	This parameter is mandatory for Apache Kafka links. Kafka broker list in <i>host1:port1,host2:port2</i> format
linkConfig.host	Yes	String	Floating IP address of MRS Manager. Click Select next to the Manager IP text box to select an MRS cluster. CDM automatically fills in the authentication information.
linkConfig.userName	Yes	String	Username used for logging in to MRS Manager.
linkConfig.password	Yes	String	Password used for logging in to MRS Manager.
linkConfig.authType	Yes	Enumeration	Authentication method. The options are as follows: <ul style="list-style-type: none"> ● Simple: for non-security mode ● Kerberos: for security mode
linkConfig.properties	No	Map	Properties. You can add configuration properties of the client. Each property must contain a name and a value.

4.4.1.11 Link to DIS

Description

By creating a DIS link, you can access DIS and migrate data from DIS to other data sources as required.

Sample Link

```
{
  "links": [
    {
      "link-config-values": {
        "configs": [
          {
            "inputs": [
              {
                "name": "linkConfig.region",
                "value": "Region"
              },
              {
                "name": "linkConfig.endpoint",
                "value": "https://dis.ap-southeast-1.myhuaweiclouds.com"
              },
              {
                "name": "linkConfig.ak",
                "value": "RSO6TTEZMJ6TTFBBAACE"
              },
              {
                "name": "linkConfig.sk",
                "value": "Add password here"
              },
              {
                "name": "linkConfig.projectId",
                "value": "11d4d5af17c84660bc90b6631327d7c7"
              }
            ],
            "name": "linkConfig"
          }
        ],
        "name": "dis_link",
        "connector-name": "dis-connector"
      }
    ]
  }
}
```

Link Parameters

Parameter	Mandatory	Type	Description
linkConfig.region	Yes	String	Region where DIS resides
linkConfig.endpoint	Yes	String	URL of DIS in the format of <code>https://Endpoint</code>
linkConfig.ak	Yes	String	AK for accessing the DIS server
linkConfig.sk	Yes	String	SK for accessing the DIS server

Parameter	Mandatory	Type	Description
linkConfig.projectId	Yes	String	Project ID. For details about how to obtain the project ID, see Project ID and Account ID .

4.4.1.12 Link to Elasticsearch/Cloud Search Service

Description

By creating an Elasticsearch link, you can extract data from or load data to the Elasticsearch server or Cloud Search Service.

Sample Link

```
{
  "links": [
    {
      "link-config-values": {
        "configs": [
          {
            "inputs": [
              {
                "name": "linkConfig.host",
                "value": "192.168.0.50:9200;192.168.0.62:9200"
              },
              {
                "name": "linkConfig.safemode",
                "value": "true"
              },
              {
                "name": "linkConfig.user",
                "value": "admin"
              },
              {
                "name": "linkConfig.password",
                "value": "Add password here."
              },
              {
                "name": "linkConfig.linkType",
                "value": "CSS"
              }
            ]
          },
          {
            "name": "linkConfig"
          }
        ],
        "extended-configs": {
          "name": "linkConfig.extendedFields",
          "value": "eyJodHRwcz0FjY2VzcyI6InRydWUifQ=="
        }
      },
      "name": "css-cdm-autotest-nodel",
      "connector-name": "elasticsearch-connector"
    }
  ]
}
```

Link Parameters

Parameter	Mandatory	Type	Description
linkConfig.host	Yes	String	List of one or more Elasticsearch servers, including the port number. The format is <i>ip:port</i> . Use semicolons (;) to separate multiple IP addresses. For example, 192.168.0.1:9200;192.168.0.2:9200 .
linkConfig.securitymode	No	Boolean	If you select the security authentication mode, you must enter the username and password, and choose whether to enable HTTPS access.
linkConfig.username	No	String	For Elasticsearch that supports username and password authentication, configure the username and password when creating a link.
linkConfig.password	No	String	Password for accessing the Elasticsearch server
linkConfig.linkType	Yes	String	Link type, which is used to distinguish the Elasticsearch link from the Cloud Search Service link

4.4.1.13 Link to DLI

Description

By creating a DLI link, you can import data to DLI. Currently, you cannot export data from DLI using CDM.

Sample Link

```
{
  "links": [
    {
      "link-config-values": {
        "configs": [
          {
            "inputs": [
              {
                "name": "linkConfig.ak",
                "value": "GRC2WR0IDC6NGROYLWU2"
              },
              {
                "name": "linkConfig.sk",
                "value": "Add password here"
              }
            ]
          }
        ]
      }
    }
  ]
}
```

```

    },
    {
      "name": "linkConfig.region",
      "value": "ap-southeast-1"
    },
    {
      "name": "linkConfig.projectId",
      "value": "c48475ce8e174a7a9f775706a3d5ebe2"
    }
  ],
  "name": "linkConfig"
}
]
},
"name": "dli",
"connector-name": "dli-connector"
}
]
}

```

Link Parameters

Parameter	Mandatory	Type	Description
linkConfig.ak	Yes	String	AK for accessing the DLI database
linkConfig.sk	Yes	String	SK for accessing the DLI database
linkConfig.region	Yes	String	Region where DLI resides
linkConfig.projectId	Yes	String	Project ID of the DLI service

4.4.1.14 Link to DMS Kafka

Description

By creating a DMS Kafka link, you can connect to Kafka Basic or Kafka Platinum on DMS. Currently, you can only export data from DMS Kafka to Cloud Search Service.

Sample Link

```

{
  "links": [
    {
      "link-config-values": {
        "configs": [
          {
            "inputs": [
              {
                "name": "linkConfig.kafkaType",
                "value": "Platinum"
              },
              {
                "name": "linkConfig.brokerList",
                "value": "100.85.121.112:9094,100.85.220.134:9094,100.85.127.232:9094"
              }
            ]
          }
        ]
      }
    }
  ]
}

```

```

    },
    {
      "name": "linkConfig.isPlatinumInstance",
      "value": "false"
    }
  ],
  "name": "linkConfig"
}
],
"extended-configs": {
  "name": "linkConfig.extendedFields",
  "value": "e30="
}
},
"name": "dms_kafka",
"connector-name": "dms-kafka-connector"
}
]
}

```

Link Parameters

Parameter	Mandatory	Type	Description
linkConfig.kafkaType	Yes	Enumeration	DMS Kafka edition. Currently, only the Platinum edition is available. <ul style="list-style-type: none"> • Basic: DMS Kafka Basic • Platinum: DMS Kafka Platinum
linkConfig.brokerList	Yes	String	The DMS endpoint is in host1:port1,host2:port2 format.
linkConfig.isPlatinumInstance	Yes	Boolean	Whether to enable SSL authentication when a client connects to a Kafka premium instance. If Kafka SASL_SSL is enabled, data will be encrypted before transmission for higher security, but performance will suffer.
linkConfig.user	No	String	Username for connecting to DMS Kafka. This parameter is displayed when Kafka SASL_SSL is enabled.

Parameter	Mandatory	Type	Description
linkConfig.password	No	String	Password for connecting to DMS Kafka. This parameter is displayed when Kafka SASL_SSL is enabled.

4.4.2 Source Job Parameters

4.4.2.1 From a Relational Database

Sample JSON File

```
"from-config-values": {
  "configs": [
    {
      "inputs": [
        {
          "name": "fromJobConfig.useSql",
          "value": "false"
        },
        {
          "name": "fromJobConfig.schemaName",
          "value": "rf_database"
        },
        {
          "name": "fromJobConfig.tableName",
          "value": "rf_from"
        },
        {
          "name": "fromJobConfig.columnList",
          "value": "AA&BB"
        },
        {
          "name": "fromJobConfig.incrMigration",
          "value": "false"
        }
      ],
      "name": "fromJobConfig"
    }
  ]
}
```

Parameter Description

Parameter	Mandatory	Type	Description
fromJobConfig.useSql	Yes	Boolean	Whether to use the customized SQL statement to export data when exporting relational database data
fromJobConfig.sql	No	String	Customized SQL statement. CDM executes the SQL statement to export data.

Parameter	Mandatory	Type	Description
fromJobConfig.schemaName	Yes	String	<p>Database mode or tablespace. For example, public.</p> <p>NOTE The parameter value can contain wildcard characters (*), which is used to export all databases whose names start with a certain prefix or end with a certain suffix. The examples are as follows:</p> <ul style="list-style-type: none"> • SCHEMA* indicates that all databases whose names starting with SCHEMA are exported. • *SCHEMA indicates that all databases whose names ending with SCHEMA are exported. • *SCHEMA* indicates that all databases whose names containing SCHEMA are exported.
fromJobConfig.tableName	Yes	String	<p>Table name. For example, TBL_EXAMPLE.</p> <p>NOTE The table name can contain wildcard characters (*), which is used to export all tables whose names start with a certain prefix or end with a certain suffix. The number and types of fields in the tables must be the same. The examples are as follows:</p> <ul style="list-style-type: none"> • table* indicates that all tables whose names starting with table are exported. • *table indicates that all tables whose names ending with table are exported. • *table* indicates that all tables whose names containing table are exported.
fromJobConfig.whereClause	No	String	<p>WHERE clause used to specify the data to be extracted. If no WHERE clause is configured, the entire table will be extracted. For example, age > 18 and age <= 60.</p>
fromJobConfig.columnList	No	String	<p>List of fields to be extracted. Use & to separate field names. For example, id&gid&name.</p>

Parameter	Mandatory	Type	Description
fromJobConfig.partitionColumn	No	String	Partition field to be extracted, by which a job is split in multiple sub-jobs executed concurrently. For example, id .
fromJobConfig.usePartition	No	Boolean	When data is exported from the Oracle database, data can be extracted from each partition in a partitioned table. When this function is enabled, you can use the fromJobConfig.partitionList parameter to specify the partitions in the Oracle table. This function does not support non-partitioned tables.
fromJobConfig.partitionList	No	String	Oracle table partitions to be migrated. Separate multiple partitions with ampersands (&). If you do not set this parameter, all partitions will be migrated.

4.4.2.2 From Object Storage

Sample JSON File

```
"from-config-values": {
  "configs": [
    {
      "inputs": [
        {
          "name": "fromJobConfig.bucketName",
          "value": "cdm-est"
        },
        {
          "name": "fromJobConfig.inputDirectory",
          "value": "/obsfrom/varchar.txt"
        },
        {
          "name": "fromJobConfig.inputFormat",
          "value": "CSV_FILE"
        },
        {
          "name": "fromJobConfig.columnList",
          "value": "1&2&3"
        },
        {
          "name": "fromJobConfig.fieldSeparator",
          "value": ","
        },
        {
          "name": "fromJobConfig.quoteChar",
          "value": "false"
        }
      ]
    }
  ]
}
```

```

    "name": "fromJobConfig.regexSeparator",
    "value": "false"
  },
  {
    "name": "fromJobConfig.firstRowAsHeader",
    "value": "false"
  },
  {
    "name": "fromJobConfig.encodeType",
    "value": "UTF-8"
  },
  {
    "name": "fromJobConfig.fromCompression",
    "value": "NONE"
  },
  {
    "name": "fromJobConfig.splitType",
    "value": "FILE"
  }
],
"name": "fromJobConfig"
}
]
}

```

Parameter Description

Parameter	Mandatory	Type	Description
fromJobConfig.bucketName	Yes	String	Bucket name
fromJobConfig.inputDirectory	Yes	String	Path for storing files to be extracted. You can enter a maximum of 50 file paths, which are separated by vertical bars (). You can also customize the separators. For example, FROM/example.csv FROM/b.txt .

Parameter	Mandatory	Type	Description
fromJobConfig.inputFormat	Yes	Enumeration	<p>File format required for data transmission. Currently, the following file formats are supported:</p> <ul style="list-style-type: none"> • CSV_FILE: CSV format, used to migrate files to data tables • JSON_FILE: JSON format, used to migrate files to data tables • BINARY_FILE: Files (even not in binary format) will be directly transferred without resolution. It is applicable to file copy. <p>If you select BINARY_FILE, the migration destination must also be a file system.</p>
fromJobConfig.lineSeparator	No	String	<p>Line feed character in a file. By default, the system automatically identifies <code>\n</code>, <code>\r</code>, and <code>\r\n</code>. You can configure special characters. For spaces and carriage returns, encode them with URL. You can also configure them by editing the job JSON, in which case URL encoding is not required.</p>
fromJobConfig.columnList	No	String	<p>Numbers of columns to be extracted. Use & to separate column numbers in ascending order. For example, 1&3&5.</p>
fromJobConfig.regexSeparator	No	Boolean	<p>Whether to use the regular expression to separate fields. This parameter is valid only when the file format is CSV_FILE.</p>
fromJobConfig.regex	No	String	<p>Regular expression. This parameter is valid only when the regular expression is used to separate fields.</p>
fromJobConfig.fieldSeparator	No	String	<p>Field delimiter. This parameter is valid only when the file format is CSV_FILE. The default value is <code>,</code>.</p>

Parameter	Mandatory	Type	Description
fromJobConfig.quoteChar	No	Boolean	Whether to use the encircling symbol. If this parameter is set to true , the field delimiters in the encircling symbol are regarded as a part of the string value. Currently, the default encircling symbol of CDM is double quotation mark (").
fromJobConfig.firstRowAsHeader	No	Boolean	Whether to regard the first line as the heading line. This parameter is valid only when the file format is CSV_FILE . When you migrate a CSV file to a table, CDM writes all data to the table by default. If this parameter is set to true , CDM uses the first line of the CSV file as the heading line and does not write the line to the destination table.
fromJobConfig.fromCompression	No	Enumeration	Compression format. This parameter is valid only when the file format is CSV_FILE or JSON . The options are as follows: <ul style="list-style-type: none">• NONE: Files in all formats are transferred.• GZIP: Files in gzip format are transferred.• ZIP: Files in Zip format are transferred.
fromJobConfig.jsonReferenceNode	No	String	Reference node. This parameter is valid when the file format is JSON_FILE . Resolve data on the JSON node. If the data corresponding to the node is a JSON array, the system extracts data from the array in the same mode. Nested JSON nodes are separated by periods (.). For example, data.list .
fromJobConfig.encodingType	No	String	Encoding type. For example, UTF_8 or GBK .

Parameter	Mandatory	Type	Description
fromJobConfig.useMarkerFile	No	Boolean	Whether to start a job by a marker file. A job is started only when a marker file for starting the job exists in the source path. Otherwise, the job will be suspended for a period of time specified by fromJobConfig.waitTime .
fromJobConfig.markerFile	No	String	Name of the marker file for starting a job. After a marker file is specified, the task is executed only when the file exists in the source path. If the marker file is not specified, this function is disabled by default. For example, ok.txt .
fromJobConfig.waitTime	No	String	Period of waiting for a marker file. If you set Start Job by Marker File to Yes but no marker file exists in the source path, the job fails upon suspension timeout. If you set this parameter to 0 and no marker file exists in the source path, the job will fail immediately. Unit: second
fromJobConfig.filterType	No	Enumeration	Filter type. Possible values are as follows: <ul style="list-style-type: none"> • WILDCARD: Enter a wildcard character to filter paths or files. CDM will migrate the paths or files that meet the filter condition. • TIME: Specify a time filter. CDM will migrate the files modified after the specified time point.
fromJobConfig.pathFilter	No	String	Path filter, which is configured when the filter type is WILDCARD . It is used to filter the file directories. For example, *input .

Parameter	Mandatory	Type	Description
fromJobConfig.fileFilter	No	String	File filter, which is configured when the filter type is WILDCARD . It is used to filter files in the specified directory. Use commas (,) to separate multiple files. For example, *.csv*.txt .
fromJobConfig.startTime	No	String	If you set Filter Type to Time Filter , and specify a point in time for this parameter, only the files modified at or after the specified time are transferred. The time format must be <i>yyyy-MM-dd HH:mm:ss</i> . This parameter can be set to a macro variable of date and time. For example, \${timestamp(dateformat(yyy y-MM-dd HH:mm:ss,-90,DAY))} indicates that only files generated within the latest 90 days are migrated.
fromJobConfig.endTime	No	String	If you set Filter Type to Time Filter , and specify a point in time for this parameter, only the files modified before the specified time are transferred. The time format must be <i>yyyy-MM-dd HH:mm:ss</i> . This parameter can be set to a macro variable of date and time. For example, \${timestamp(dateformat(yyy y-MM-dd HH:mm:ss))} indicates that only the files whose modification time is earlier than the current time are migrated.
fromJobConfig.fileSeparator	No	String	File separator. If you enter multiple file paths in fromJobConfig.inputDirectory , CDM uses the file separator to separate files. The default value is .

Parameter	Mandatory	Type	Description
fromJobConfig.md5FileSuffix	No	String	Check whether the files extracted by CDM are consistent with those in the migration source.

4.4.2.3 From HDFS

Sample JSON File

```
"from-config-values": {
  "configs": [
    {

```

Parameter Description

- HDFS job parameter description

Parameter	Mandatory	Type	Description
fromJobConfig.inputDirectory	Yes	String	Path for storing data to be extracted. For example, / data_dir .
fromJobConfig.inputFormat	Yes	Enumeration	File format required for data transmission. Currently, the following file formats are supported: <ul style="list-style-type: none"> • CSV_FILE: CSV format • PARQUET_FILE: Parquet format • BINARY_FILE: binary format If you select BINARY_FILE , the migration destination must also be a file system.
fromJobConfig.columnList	No	String	Numbers of columns to be extracted. Use & to separate column numbers in ascending order. For example, 1&3&5 .
fromJobConfig.lineSeparator	No	String	Line feed character in a file. By default, the system automatically identifies \n , \r , and \r\n . You can configure special characters. For spaces and carriage returns, encode them with URL. You can also configure them by editing the job JSON, in which case URL encoding is not required.

Parameter	Mandatory	Type	Description
fromJobConfig.fieldSeparator	No	String	Field delimiter. This parameter is valid only when the file format is CSV_FILE . The default value is ,.
fromJobConfig.quoteChar	No	Boolean	Whether to use the encircling symbol. If this parameter is set to true , the field delimiters in the encircling symbol are regarded as a part of the string value. Currently, the default encircling symbol of CDM is double quotation mark (").
fromJobConfig.regexSeparator	No	Boolean	Whether to use the regular expression to separate fields. This parameter is valid only when the file format is CSV_FILE .
fromJobConfig.encodeType	No	String	Encoding type. For example, UTF_8 or GBK .
fromJobConfig.firstRowAsHeader	No	Boolean	Whether to regard the first line as the heading line. This parameter is valid only when the file format is CSV_FILE . When you migrate a CSV file to a table, CDM writes all data to the table by default. If this parameter is set to true , CDM uses the first line of the CSV file as the heading line and does not write the line to the destination table.
fromJobConfig.fromCompression	No	Enumeration	Compression format. Only the source files in specified compression format are transferred. NONE indicates files in all formats are transferred.

Parameter	Mandatory	Type	Description
fromJobConfig.compressedFileSuffix	No	String	Extension of the files to be decompressed. The decompression operation is performed only when the file name extension is used in a batch of files. Otherwise, files are transferred in the original format. If you enter * or leave the parameter blank, all files are decompressed.
fromJobConfig.splitType	No	Enumeration	<p>Whether to split files by file or size. If HDFS files are split, each shard is regarded as a file.</p> <ul style="list-style-type: none"> • FILE: Split files by file quantity. If there are 10 files and throttlingConfig.numExtractors is set to 5, each shard consists of two files. • SIZE: Split files by file size. Files will not be split for balance. Suppose there are 10 files, among which nine are 10 MB and one is 200 MB in size. If throttlingConfig.numExtractors is set to 2, two shards will be created, one for processing the nine 10 MB files, the other for processing the 200 MB file.
fromJobConfig.useMarkerFile	No	Boolean	Whether to start a job by a marker file. A job is started only when a marker file for starting the job exists in the source path. Otherwise, the job will be suspended for a period of time specified by fromJobConfig.waitTime .

Parameter	Mandatory	Type	Description
fromJobConfig.markerFile	No	String	Name of the marker file for starting a job. After a marker file is specified, the task is executed only when the file exists in the source path. If the marker file is not specified, this function is disabled by default. For example, ok.txt .
fromJobConfig.fileSeparator	No	String	File separator. If you enter multiple file paths in fromJobConfig.inputDirectory , CDM uses the file separator to separate files. The default value is .
fromJobConfig.filterType	No	Enumeration	Filter type. Possible values are as follows: <ul style="list-style-type: none"> • WILDCARD: Enter a wildcard character to filter paths or files. CDM will migrate the paths or files that meet the filter condition. • TIME: Specify a time filter. CDM will migrate the files modified after the specified time point.
fromJobConfig.pathFilter	No	String	Path filter, which is configured when the filter type is WILDCARD . It is used to filter the file directories. For example, *input .
fromJobConfig.fileFilter	No	String	File filter, which is configured when the filter type is WILDCARD . It is used to filter files in the specified directory. Use commas (,) to separate multiple files. For example, *.csv,*.txt .

Parameter	Mandatory	Type	Description
fromJobConfig. startTime	No	String	<p>If you set Filter Type to Time Filter, and specify a point in time for this parameter, only the files modified at or after the specified time are transferred. The time format must be <i>yyyy-MM-dd HH:mm:ss</i>.</p> <p>This parameter can be set to a macro variable of date and time. For example, <code>\${timestamp(dateformat(yy yy-MM-dd HH:mm:ss,-90,DAY))}</code> indicates that only files generated within the latest 90 days are migrated.</p>
fromJobConfig. endTime	No	String	<p>If you set Filter Type to Time Filter, and specify a point in time for this parameter, only the files modified before the specified time are transferred. The time format must be <i>yyyy-MM-dd HH:mm:ss</i>.</p> <p>This parameter can be set to a macro variable of date and time. For example, <code>\${timestamp(dateformat(yy yy-MM-dd HH:mm:ss))}</code> indicates that only the files whose modification time is earlier than the current time are migrated.</p>
fromJobConfig. createSnapshot	No	Boolean	<p>If this parameter is set to true, CDM creates a snapshot for the source directory to be migrated (the snapshot cannot be created for a single file) before it reads files from HDFS. Then CDM migrates the data in the snapshot.</p> <p>Only the HDFS administrator can create a snapshot. After the CDM job is completed, the snapshot is deleted.</p>

Parameter	Mandatory	Type	Description
fromJobConfig.formats	No	Data structure	Time format. This parameter is mandatory only when fromJobConfig.inputFormat is set to CSV_FILE and the time field exists in the file. For details, see Description of the fromJobConfig.formats parameter .
fromJobConfig.decryption	No	Enumeration	This parameter is available only when fromJobConfig.inputFormat is set to BINARY_FILE . It specifies whether to decrypt the encrypted file before export, and the decryption method. The options are as follows: <ul style="list-style-type: none"> • NONE: Do not decrypt but directly export the file. • AES-256-GCM: Use the AES-256-GCM (NoPadding) algorithm to decrypt the file and then export the file.
fromJobConfig.dek	No	String	Data decryption key. The key is a string of 64-bit hexadecimal numbers and must be the same as the data encryption key toJobConfig.dek configured during encryption. If the encryption and decryption keys are inconsistent, the system does not report an exception, but the decrypted data is incorrect.

Parameter	Mandatory	Type	Description
fromJobConfig.iv	No	String	Initialization vector required for decryption. The initialization vector is a string of 32-bit hexadecimal numbers and must be the same as the initialization vector toJobConfig.iv configured during encryption. If the encryption and decryption keys are inconsistent, the system does not report an exception, but the decrypted data is incorrect.

- Description of the **fromJobConfig.formats** parameter

Parameter	Mandatory	Type	Description
name	Yes	String	Column number. For example, 1 .
value	Yes	String	Time format. For example, <i>yyyy-MM-dd</i> .

4.4.2.4 From Hive

Sample JSON File

```
"from-config-values": {
  "configs": [
    {
      "inputs": [
        {
          "name": "fromJobConfig.hive",
          "value": "hive"
        },
        {
          "name": "fromJobConfig.database",
          "value": "rf_database"
        },
        {
          "name": "fromJobConfig.table",
          "value": "rf_from"
        },
        {
          "name": "fromJobConfig.columnList",
          "value": "tiny&small&int&integer&bigint&float&double&timestamp&char&varchar&text"
        }
      ],
      "name": "fromJobConfig"
    }
  ]
}
```

Parameter Description

Parameter	Mandatory	Type	Description
fromJobConfig.hive	No	String	Data source to be extracted. If the data source is Hive, set this parameter to hive .
fromJobConfig.database	No	String	Database from which data is extracted. For example, default .
fromJobConfig.table	Yes	String	Name of the table from which data is extracted. For example, cdm .
fromJobConfig.columnList	No	String	Numbers of columns to be extracted. Use & to separate column numbers in ascending order. For example, 1&3&5 .

4.4.2.5 From HBase/CloudTable

Sample JSON File

```

"from-config-values": {
  "configs": [
    {
      "inputs": [
        {
          "name": "fromJobConfig.table",
          "value": "rf_from"
        },
        {
          "name": "fromJobConfig.columnFamilies",
          "value": "rowkey&f"
        },
        {
          "name": "fromJobConfig.columns",
          "value": "rowkey:rowkey&f:_small"
        },
        {
          "name": "fromJobConfig.formats",
          "value": {
            "f_date": "yyyy-MM-dd",
            "f_timestamp": "yyyy-MM-dd HH:mm:ss"
          }
        }
      ],
      "name": "fromJobConfig"
    }
  ]
}

```

Parameter Description

- HBase/CloudTable job parameter description

Parameter	Mandatory	Type	Description
fromJobConfig.table	Yes	String	Name of the table from which data is extracted. For example, cdm .
fromJobConfig.columnFamilies	No	String	Column family to which the data to be extracted belongs
fromJobConfig.columns	No	String	Columns to be extracted. Use & to separate column numbers and : to separate column families and columns. For example, cf1:c1&cf2:c2 .
fromJobConfig.isSplit	No	Boolean	Whether to split the rowkey. For example, true .
fromJobConfig.delimiter	No	String	Delimiter used for splitting rowkeys. If this parameter is not set, row keys will not be split. For example, vertical bars ().
fromJobConfig.startTime	No	String	Minimum timestamp of the time range (the time point is included). The format is <i>yyyy-MM-dd hh:mm:ss</i> . Only the data created at this point in time and later is extracted.
fromJobConfig.endTime	No	String	Maximum timestamp of the time range (the time point is not included). The format is <i>yyyy-MM-dd hh:mm:ss</i> . Only the data created before this point in time is extracted.
fromJobConfig.formats	No	Data structure	Time format. For details, see Description of the fromJobConfig.formats parameter .

- Description of the **fromJobConfig.formats** parameter

Parameter	Mandatory	Type	Description
name	Yes	String	Column number. For example, 1 .
value	Yes	String	Time format. For example, <i>yyyy-MM-dd</i> .

4.4.2.6 From FTP/SFTP

Sample JSON File

```
"from-config-values": {
  "configs": [
    {
      "inputs": [
        {
          "name": "fromJobConfig.inputDirectory",
          "value": "/sftpfrom/from_sftp.csv"
        },
        {
          "name": "fromJobConfig.inputFormat",
          "value": "CSV_FILE"
        },
        {
          "name": "fromJobConfig.columnList",
          "value": "1&2&3&4&5&6&7&8&9&10&11&12"
        },
        {
          "name": "fromJobConfig.fieldSeparator",
          "value": ","
        },
        {
          "name": "fromJobConfig.regexSeparator",
          "value": "false"
        },
        {
          "name": "fromJobConfig.firstRowAsHeader",
          "value": "false"
        },
        {
          "name": "fromJobConfig.encodeType",
          "value": "UTF-8"
        },
        {
          "name": "fromJobConfig.fromCompression",
          "value": "NONE"
        },
        {
          "name": "fromJobConfig.splitType",
          "value": "FILE"
        }
      ],
      "name": "fromJobConfig"
    }
  ]
}
```

Parameter Description

Source link job parameters of FTP and SFTP are the same. [Table 4-204](#) describes the parameters.

Table 4-204 Source link job parameters of file systems

Parameter	Mandatory	Type	Description
fromJobConfig.inputDirectory	Yes	String	Path for storing files to be extracted. You can enter a maximum of 50 file paths, which are separated by vertical bars (). You can also customize the separators. For example, FROM/example.csv FROM/b.txt .
fromJobConfig.inputFormat	Yes	Enumeration	File format required for data transmission. Currently, the following file formats are supported: <ul style="list-style-type: none"> • CSV_FILE: CSV format, used to migrate files to data tables • JSON_FILE: JSON format, used to migrate files to data tables • BINARY_FILE: Files (even not in binary format) will be directly transferred without resolution. It is applicable to file copy. If you select BINARY_FILE , the migration destination must also be a file system.
fromJobConfig.lineSeparator	No	String	Line feed character in a file. By default, the system automatically identifies <code>\n</code> , <code>\r</code> , and <code>\r\n</code> . You can configure special characters. For spaces and carriage returns, encode them with URL. You can also configure them by editing the job JSON, in which case URL encoding is not required.
fromJobConfig.columnList	No	String	Numbers of columns to be extracted. Use & to separate column numbers in ascending order. For example, 1&3&5 .
fromJobConfig.fieldSeparator	No	String	Field delimiter. This parameter is valid only when the file format is CSV_FILE . The default value is <code>,</code> .

Parameter	Mandatory	Type	Description
fromJobConfig.quoteChar	No	Boolean	Whether to use the encircling symbol. If this parameter is set to true , the field delimiters in the encircling symbol are regarded as a part of the string value. Currently, the default encircling symbol of CDM is double quotation mark (").
fromJobConfig.regexSeparator	No	Boolean	Whether to use the regular expression to separate fields. This parameter is valid only when the file format is CSV_FILE .
fromJobConfig.regex	No	String	Regular expression. This parameter is valid only when the regular expression is used to separate fields.
fromJobConfig.firstRowAsHeader	No	Boolean	Whether to regard the first line as the heading line. This parameter is valid only when the file format is CSV_FILE . When you migrate a CSV file to a table, CDM writes all data to the table by default. If this parameter is set to true , CDM uses the first line of the CSV file as the heading line and does not write the line to the destination table.
fromJobConfig.fromCompression	No	Enumeration	Compression format. This parameter is valid only when the file format is CSV_FILE or JSON . The options are as follows: <ul style="list-style-type: none"> • NONE: Files in all formats are transferred. • GZIP: Files in gzip format are transferred. • ZIP: Files in Zip format are transferred.

Parameter	Mandatory	Type	Description
fromJobConfig.splitType	No	Enumeration	<p>Whether to split files by file or size.</p> <ul style="list-style-type: none"> • FILE: Split files by file quantity. If there are 10 files and throttlingConfig.numExtractors is set to 5, each shard consists of two files. • SIZE: Split files by file size. Files will not be split for balance. Suppose there are 10 files, among which nine are 10 MB and one is 200 MB in size. If throttlingConfig.numExtractors is set to 2, two shards will be created, one for processing the nine 10 MB files, the other for processing the 200 MB file.
fromJobConfig.jsonReferenceNode	No	String	<p>Reference node. This parameter is valid when the file format is JSON_FILE. Resolve data on the JSON node. If the data corresponding to the node is a JSON array, the system extracts data from the array in the same mode. Nested JSON nodes are separated by periods (.). For example, data.list.</p>
fromJobConfig.encodingType	No	String	<p>Encoding type. For example, UTF_8 or GBK.</p>
fromJobConfig.useMarkerFile	No	Boolean	<p>Whether to start a job by a marker file. A job is started only when a marker file for starting the job exists in the source path. Otherwise, the job will be suspended for a period of time specified by fromJobConfig.waitTime.</p>

Parameter	Mandatory	Type	Description
fromJobConfig.markerFile	No	String	Name of the marker file for starting a job. After a marker file is specified, the task is executed only when the file exists in the source path. If the marker file is not specified, this function is disabled by default. For example, ok.txt .
fromJobConfig.waitTime	No	String	Period of waiting for a marker file. If you set Start Job by Marker File to Yes but no marker file exists in the source path, the job fails upon suspension timeout. If you set this parameter to 0 and no marker file exists in the source path, the job will fail immediately. Unit: second
fromJobConfig.filterType	No	Enumeration	Filter type. Possible values are as follows: <ul style="list-style-type: none"> • WILDCARD: Enter a wildcard character to filter paths or files. CDM will migrate the paths or files that meet the filter condition. • TIME: Specify a time filter. CDM will migrate the files modified after the specified time point.
fromJobConfig.pathFilter	No	String	Path filter, which is configured when the filter type is WILDCARD . It is used to filter the file directories. For example, *input .
fromJobConfig.fileFilter	No	String	File filter, which is configured when the filter type is WILDCARD . It is used to filter files in the specified directory. Use commas (,) to separate multiple files. For example, *.csv,*.txt .

Parameter	Mandatory	Type	Description
fromJobConfig.startTime	No	String	<p>If you set Filter Type to Time Filter, and specify a point in time for this parameter, only the files modified at or after the specified time are transferred. The time format must be <i>yyyy-MM-dd HH:mm:ss</i>.</p> <p>This parameter can be set to a macro variable of date and time. For example, <code>\${timestamp(dateformat(yyyy-MM-dd HH:mm:ss,-90,DAY))}</code> indicates that only files generated within the latest 90 days are migrated.</p>
fromJobConfig.endTime	No	String	<p>If you set Filter Type to Time Filter, and specify a point in time for this parameter, only the files modified before the specified time are transferred. The time format must be <i>yyyy-MM-dd HH:mm:ss</i>.</p> <p>This parameter can be set to a macro variable of date and time. For example, <code>\${timestamp(dateformat(yyyy-MM-dd HH:mm:ss))}</code> indicates that only the files whose modification time is earlier than the current time are migrated.</p>
fromJobConfig.fileSeparator	No	String	<p>File separator. If you enter multiple file paths in fromJobConfig.inputDirectory, CDM uses the file separator to separate files. The default value is .</p>
fromJobConfig.md5FileSuffix	No	String	<p>Check whether the files extracted by CDM are consistent with those in the migration source.</p>

4.4.2.7 From HTTP/HTTPS

Sample JSON File

```

"from-config-values": {
  "configs": [
    {
      "inputs": [
        {
          "name": "fromJobConfig.inputDirectory",
          "value": "http://10.114.196.186:8080/httpfrom/symbol.txt"
        },
        {
          "name": "fromJobConfig.inputFormat",
          "value": "BINARY_FILE"
        },
        {
          "name": "fromJobConfig.fromCompression",
          "value": "TARGZ"
        },
        {
          "name": "fromJobConfig.compressedFileSuffix",
          "value": "*"
        },
        {
          "name": "fromJobConfig.fileSeparator",
          "value": "|"
        }
      ],
      "name": "fromJobConfig"
    }
  ]
}

```

Parameter Description

Parameter	Mandatory	Type	Description
fromJobConfig.inputDirectory	Yes	String	URL of the file to be extracted These connectors are used to read files with an HTTP/HTTPS URL, such as reading public files on the third-party object storage system and web disks.
fromJobConfig.inputFormat	Yes	Enumeration	File format required for data transmission. Currently, only the binary format is supported.

Parameter	Mandatory	Type	Description
fromJobConfig.fromCompression	No	Enumeration	<p>Compression format of the source files. The options are as follows:</p> <ul style="list-style-type: none"> • NONE: Files in all formats are transferred. • GZIP: Files in gzip format are transferred. • ZIP: Files in Zip format are transferred. • TAR.GZ: Files in TAR.GZ format are transferred.
fromJobConfig.compressedFileSuffix	No	String	<p>Extension of the files to be decompressed. The decompression operation is performed only when the file name extension is used in a batch of files. Otherwise, files are transferred in the original format. If you enter * or leave the parameter blank, all files are decompressed.</p>
fromJobConfig.fileSeparator	No	String	<p>File separator. When multiple files are transferred, CDM uses the file separator to separate files. The default value is .</p>
fromJobConfig.useQuery	No	Boolean	<ul style="list-style-type: none"> • If you set this parameter to true, the name of the objects uploaded to OBS does not carry the query parameter. • If you set this parameter to false, the name of the objects uploaded to OBS carries the query parameter.
fromJobConfig.md5FileSuffix	No	String	<p>Check whether the files extracted by CDM are consistent with those in the migration source.</p>

4.4.2.8 From MongoDB/DDS

Sample JSON File

```
"from-config-values": {
  "configs": [
```

```

{
  "inputs": [
    {
      "name": "fromJobConfig.database",
      "value": "cdm"
    },
    {
      "name": "fromJobConfig.collectionName",
      "value": "rf_from"
    },
    {
      "name": "fromJobConfig.columnList",
      "value": "TINYTEST&SMALLTEST&INTTEST&INTEGERTEST&BIGINTTEST&FLOATTEST"
    },
    {
      "name": "fromJobConfig.isBatchMigration",
      "value": "false"
    },
    {
      "name": "fromJobConfig.filters",
      "value": "{ 'last_name': 'Smith' }"
    }
  ],
  "name": "fromJobConfig"
}

```

Parameter Description

Parameter	Mandatory	Type	Description
fromJobConfig.database	Yes	String	Name of the MongoDB/DDS database
fromJobConfig.collectionName	Yes	String	Name of the MongoDB/DDS collection
fromJobConfig.columnList	No	String	List of fields to be extracted. Use & to separate field names. For example, id&gid&name .
fromJobConfig.isBatchMigration	No	Boolean	Whether to migrate all data in the database

Parameter	Mandatory	Type	Description
fromJobConfig.filters	No	String	<p>Filter condition for files. CDM migrates only the data that meets the filter condition.</p> <p>Examples:</p> <ol style="list-style-type: none"> Filter by expression: {'last_name': 'Smith'} indicates that all files whose last_name value is Smith are queried. Filter by parameter: { x : "john" }, { z : 1 } indicates that all z fields whose x is john are queried. Filter by condition: { "field" : { \$gt: 5 } } indicates that the field values greater than 5 are queried.

4.4.2.9 From Redis

Sample JSON File

```

"from-config-values": {
  "configs": [
    {
      "inputs": [
        {
          "name": "fromJobConfig.isBatchMigration",
          "value": "false"
        },
        {
          "name": "fromJobConfig.keyPrefix",
          "value": "rf_string_from"
        },
        {
          "name": "fromJobConfig.keySeparator",
          "value": ":"
        },
        {
          "name": "fromJobConfig.valueStoreType",
          "value": "STRING"
        },
        {
          "name": "fromJobConfig.valueSeparator",
          "value": ","
        },
        {
          "name": "fromJobConfig.columnList",
          "value": "1&2&3&4&5&6&7&8&9&10&11&12"
        }
      ],
      "name": "fromJobConfig"
    }
  ]
}

```

Parameter Description

- Redis job parameter description

Parameter	Mandatory	Type	Description
fromJobConfig.isBatchMigration	No	Boolean	Whether to migrate all data in the database
fromJobConfig.keyPrefix	Yes	String	Key prefix, which is the name of the corresponding association table. Mapping between Redis and the association table: <i>Name of the association table + delimiter</i> is a Redis key, and a row of data in the association table is a Redis value.
fromJobConfig.keySeparator	Yes	String	Key delimiter, which separates the association table and primary key
fromJobConfig.valueStoreType	Yes	String	Storage mode of rows of data in the association table on Redis. The options are string and hash . <ul style="list-style-type: none">STRING: indicates that a row of data is stored as a character string using delimiters to separate columns. This mode reduces storage space occupation.HASH: indicates that a row of data is stored in <i>column name:column value</i> format in the hash table.
fromJobConfig.valueSeparator	No	String	Value delimiter. The default value is <code>\tab</code> . This parameter is valid when valueStoreType is set to STRING .
fromJobConfig.columnList	No	String	List of fields to be extracted. Use & to separate field names. For example, id&gid&name .

Parameter	Mandatory	Type	Description
fromJobConfig.formats	No	Data structure	Time format. For details, see Description of the fromJobConfig.formats parameter .

- Description of the **fromJobConfig.formats** parameter

Parameter	Mandatory	Type	Description
name	Yes	String	Column number. For example, 1 .
value	Yes	String	Time format. For example, <i>yyyy-MM-dd</i> .

4.4.2.10 From DIS

Sample JSON File

```
"from-config-values": {
  "configs": [
    {
      "inputs": [
        {
          "name": "fromJobConfig.streamName",
          "value": "cdm"
        },
        {
          "name": "fromJobConfig.disConsumerStrategy",
          "value": "FROM_LAST_STOP"
        },
        {
          "name": "fromJobConfig.isPermanency",
          "value": "true"
        },
        {
          "name": "fromJobConfig.maxPollRecords",
          "value": "100"
        },
        {
          "name": "fromJobConfig.shardId",
          "value": "0"
        },
        {
          "name": "fromJobConfig.dataFormat",
          "value": "BINARY"
        },
        {
          "name": "fromJobConfig.separator",
          "value": ","
        }
      ],
      "name": "fromJobConfig"
    }
  ]
}
```

Parameter Description

Parameter	Mandatory	Type	Description
fromJobConfig.streamName	Yes	String	DIS stream name
fromJobConfig.disConsumerStrategy	Yes	Enumeration	Used to set the initial offset when data is pulled from DIS. The options are as follows: <ul style="list-style-type: none"> • LATEST: maximum offset, that is, the latest data • FROM_LAST_STOP: data after the last stop • EARLIEST: minimum offset, that is, the earliest data
fromJobConfig.isPermanency	Yes	Boolean	Whether to run permanently
fromJobConfig.maxPollRecords	No	String	Maximum number of requests that can be sent to DIS each time
fromJobConfig.partitionId	Yes	String	ID of the DIS partition. You can enter multiple partition IDs, which are separated by commas (,).
fromJobConfig.dataFormat	Yes	Enumeration	Format used for parsing data. The options are as follows: <ul style="list-style-type: none"> • BINARY: Data is transferred without being parsed, which is applicable to file migration. • CSV: Source data will be migrated after being parsed in CSV format.
fromJobConfig.separator	No	String	Field delimiter
fromJobConfig.appName	No	String	Unique identifier of the consumer application

4.4.2.11 From Kafka

Sample JSON File

```
"from-config-values": {
  "configs": [
    {
```

```

"inputs": [
  {
    "name": "fromJobConfig.topicsList",
    "value": "est1,est2"
  },
  {
    "name": "fromJobConfig.kafkaConsumerStrategy",
    "value": "EARLIEST"
  },
  {
    "name": "fromJobConfig.isPermanency",
    "value": "true"
  }
],
"name": "fromJobConfig"
}
]
}

```

Parameter Description

Parameter	Mandatory	Type	Description
fromJobConfig.topicsList	Yes	String	List of Kafka topics. Separate multiple topics by commas (,).
fromJobConfig.kafkaConsumerStrategy	Yes	Enumeration	Used to set the initial offset when data is pulled from Kafka. The options are as follows: <ul style="list-style-type: none"> • LATEST: maximum offset, that is, the latest data • EARLIEST: minimum offset, that is, the earliest data
fromJobConfig.isPermanency	Yes	Boolean	Whether to run permanently
fromJobConfig.groupId	No	String	Consumer group ID If you export data from DMS Kafka, enter any value for Kafka Platinum but a valid consumer group ID for Kafka Basic.
fromJobConfig.dataFormat	Yes	Enumeration	Format used for parsing data. The options are as follows: <ul style="list-style-type: none"> • BINARY: Data is transferred without being parsed, which is applicable to file migration. • CSV: Source data will be migrated after being parsed in CSV format.

Parameter	Mandatory	Type	Description
fromJobConfig.maxPollRecords	No	String	Maximum number of requests that can be sent to Kafka each time
fromJobConfig.maxPollInterval	No	String	Maximum interval between each poll
fromJobConfig.separator	No	String	Field delimiter

4.4.2.12 From Elasticsearch/Cloud Search Service

Sample JSON File

```
"from-config-values": {
  "configs": [
    {
      "inputs": [
        {
          "name": "fromJobConfig.index",
          "value": "cdm"
        },
        {
          "name": "fromJobConfig.type",
          "value": "es"
        },
        {
          "name": "fromJobConfig.columnList",
          "value": "a1:numeric&s1:string"
        },
        {
          "name": "fromJobConfig.splitNestedField",
          "value": "true"
        },
        {
          "name": "fromJobConfig.queryString",
          "value": "last_name:Smith"
        }
      ],
      "name": "fromJobConfig"
    }
  ]
}
```

Parameter Description

Parameter	Mandatory	Type	Description
fromJobConfig.index	Yes	String	Index of the extracted data, which is similar to the database name in the relational database

Parameter	Mandatory	Type	Description
fromJobConfig.type	Yes	String	Type of the extracted data, which is similar to the table name in the relational database
fromJobConfig.columnList	No	String	List of fields to be extracted. Use & to separate field names. For example, id&gid&name .
fromJobConfig.splitNestedField	No	Boolean	Whether to split the JSON content of the nested field. For example, a:{ b:{ c:1, d:{ e:2, f:3 } } } can be split into a.b.c , a.b.d.e , and a.b.d.f .
fromJobConfig.queryString	No	String	Whether to use the Elasticsearch query string to filter the source data. CDM migrates only the data that meets the filter criteria.

4.4.3 Destination Job Parameters

4.4.3.1 To a Relational Database

Sample JSON File

```
"to-config-values": {
  "configs": [
    {
      "inputs": [
        {
          "name": "toJobConfig.schemaName",
          "value": "cdm"
        },
        {
          "name": "toJobConfig.tablePreparation",
          "value": "DROP_AND_CREATE"
        },
        {
          "name": "toJobConfig.tableName",
          "value": "rf_to"
        },
        {
          "name": "toJobConfig.columnList",
          "value": "id&gid&name"
        },
        {
          "name": "toJobConfig.isCompress",
          "value": "false"
        },
        {
          "name": "toJobConfig.orientation",
          "value": "ROW"
        }
      ],
    }
  ]
}
```

```

    "name": "toJobConfig.useStageTable",
    "value": "false"
  },
  {
    "name": "toJobConfig.shouldClearTable",
    "value": "false"
  },
  {
    "name": "toJobConfig.extendCharLength",
    "value": "false"
  }
],
"name": "toJobConfig"
}
]
}

```

Parameter Description

Parameter	Mandatory	Type	Description
toJobConfig.schemaName	Yes	String	Database mode or tablespace
toJobConfig.tablePreparation	Yes	Enumeration	<p>This parameter is available only when both the source and destination databases are relational databases. The options for data write to tables are as follows:</p> <ul style="list-style-type: none"> • DO_NOTHING: Do not create the table automatically. • CREATE_WHEN_NOT_EXISTS: If the destination database does not contain the table specified by tableName, CDM automatically creates the table. • DROP_AND_CREATE: Delete the table specified by tableName, and then create the table again.
toJobConfig.tableName	Yes	String	Name of the table to which data is written
toJobConfig.columnList	No	String	List of fields to be loaded. Use & to separate field names. For example, id&gid&name .

Parameter	Mandatory	Type	Description
toJobConfig.beforeImportType	No	Enumeration	<p>Whether to clear the data in the target table before data import. The options are as follows:</p> <ul style="list-style-type: none"> • none: Do not clear the data in the target table before data import but append data to the table. • shouldClearTable: Clear the data in the target table before data import. • whereClause: To clear data in the target table based on the WHERE clause, set the toJobConfig.whereClause parameter. CDM deletes the data from the target table as specified.
toJobConfig.whereClause	No	String	WHERE clause used to delete data from the target table before data import
toJobConfig.orientation	No	Enumeration	<p>Storage mode. This parameter is enabled only for the DWS database. When the DWS database table needs to be automatically created, the optional data storage modes of the table are as follows:</p> <ul style="list-style-type: none"> • ROW: Data in the table is stored in rows. • COLUMN: Data in the table is stored in columns.
toJobConfig.isCompress	No	Boolean	Whether to perform compression. This parameter is enabled only for the DWS database. When the DWS database table needs to be automatically created, you can specify whether to store the data in the table after compression.

Parameter	Mandatory	Type	Description
toJobConfig.useStageTable	No	Boolean	Whether to import data to the phase table first. If this parameter is set to true , the data is imported to the phase table before it is imported to the destination table. After the data is successfully imported to the phase table, it is then imported from the phase table to the destination table. In this way, the data that is successfully imported to the destination table remains in case the data import fails.
toJobConfig.extendCharLength	No	Boolean	Whether to extend the length of the character string field. If this parameter is set to true , the length of the character string field in the destination table is three times the length of the corresponding field in the source table when the destination table needs to be automatically created.
toJobConfig.useNullable	No	Boolean	If you choose to create a target table automatically and specify the NOT NULL constraint, keep the NOT NULL constraints of the source and target tables consistent.

4.4.3.2 To OBS

Sample JSON File

```
"to-config-values": {
  "configs": [
    {
      "inputs": [
        {
          "name": "toJobConfig.bucketName",
          "value": "cdm"
        },
        {
          "name": "toJobConfig.outputDirectory",
          "value": "/obsfrom/advance/"
        },
        {
          "name": "toJobConfig.outputFormat",
          "value": "CSV_FILE"
        }
      ]
    }
  ]
}
```

```

    "name": "toJobConfig.fieldSeparator",
    "value": ",",
  },
  {
    "name": "toJobConfig.writeToTempFile",
    "value": "false"
  },
  {
    "name": "toJobConfig.validateMD5",
    "value": "false"
  },
  {
    "name": "toJobConfig.recordMD5Result",
    "value": "false"
  },
  {
    "name": "toJobConfig.encodeType",
    "value": "UTF-8"
  },
  {
    "name": "toJobConfig.markerFile",
    "value": "finish.txt"
  },
  {
    "name": "toJobConfig.duplicateFileOpType",
    "value": "REPLACE"
  },
  {
    "name": "toJobConfig.columnList",
    "value": "1&2"
  },
  {
    "name": "toJobConfig.quoteChar",
    "value": "false"
  },
  {
    "name": "toJobConfig.encryption",
    "value": "NONE"
  },
  {
    "name": "toJobConfig.copyContentType",
    "value": "false"
  }
],
"name": "toJobConfig"
}
]
}

```

Parameter Description

Parameter	Mandatory	Type	Description
toJobConfig.bucketName	Yes	String	OBS bucket name. For example, cdm .
toJobConfig.outputDirectory	Yes	String	Path to which data is written. For example, data_dir .

Parameter	Mandatory	Type	Description
toJobConfig.outputFormat	Yes	Enumeration	<p>File format required for data writes (except the binary format). Currently, the following file formats are supported:</p> <ul style="list-style-type: none"> • CSV_FILE: Write data in CSV format. • BINARY_FILE: Files are directly transferred without resolving the content. CDM writes the file without changing the file format. <p>If you select BINARY_FILE, the migration source must also be a file system.</p>
toJobConfig.fieldSeparator	No	String	<p>Column delimiter. This parameter is valid only when toJobConfig.outputFormat is CSV_FILE. The default value is <code>,</code>.</p>
toJobConfig.lineSeparator	No	String	<p>Line feed character. This parameter is valid only when toJobConfig.outputFormat is CSV_FILE. The default value is <code>\r\n</code>.</p>
toJobConfig.writeFileSize	No	String	<p>Whether to fragment multiple files by size so that the files are exported in proper size. The unit is MB. This parameter is valid when the migration source is a database.</p>

Parameter	Mandatory	Type	Description
toJobConfig.duplicateFileType	No	Enumeration	Method for processing duplicate files. If the name and size of a file are the same as those of another file, the file is regarded as a duplicate file. Duplicate files can be processed in the following ways: <ul style="list-style-type: none"> • REPLACE: Replace duplicate files. • SKIP: Skip duplicate files. • ABANDON: Stop the job when any duplicate file is found.
toJobConfig.columnList	No	String	List of fields to be extracted. Use & to separate field names. For example, id&gid&name .
toJobConfig.encryption	No	Enumeration	Whether to encrypt the uploaded data and the encryption method. The options are as follows: <ul style="list-style-type: none"> • NONE: Directly write data without encryption. • KMS: Use KMS in Data Encryption Workshop (DEW) for encryption. If KMS encryption is enabled, MD5 verification for data cannot be performed.
toJobConfig.kmsID	No	String	Key used for encryption during data upload. You must create a key in KMS before data upload.
toJobConfig.projectID	No	String	ID of the project to which the KMS key belongs.
toJobConfig.writeToTempFile	No	Boolean	The binary file is written to a .tmp file first. After the migration is successful, run the rename or move command at the migration destination to restore the file.

Parameter	Mandatory	Type	Description
toJobConfig.validateMD5	No	Boolean	Whether to verify the MD5 value. MD5 verification cannot be used together with KMS encryption. MD5 values can be verified only when files are transferred in binary format. Calculate the MD5 value of the source file and verify it with the MD5 value returned by OBS. If an MD5 file exists on the source end, directly read the MD5 file and verify the MD5 file with the MD5 value returned by OBS.
toJobConfig.recordMD5Result	No	Boolean	Whether to record the verification result when the MD5 value is verified
toJobConfig.recordMD5Link	No	String	OBS link where the bucket to which the MD5 verification result is written resides
toJobConfig.recordMD5Bucket	No	String	OBS bucket to which the MD5 verification result is written
toJobConfig.recordMD5Directory	No	String	Directory to which the MD5 verification result is written
toJobConfig.encodeType	No	String	Encoding type. For example, UTF_8 or GBK .
toJobConfig.markerFile	No	String	Whether to generate a marker file with a custom name in the destination directory after a job is executed successfully. If you do not specify a file name, this function is disabled by default.

Parameter	Mandatory	Type	Description
toJobConfig.copyContentType	No	Boolean	<p>This parameter is displayed only when toJobConfig.outputFormat is BINARY_FILE and both the migration source and destination are object storage.</p> <p>If you set this parameter to Yes, the Content-Type attribute of the source file is copied during object file migration. This function is mainly used for static website migration</p> <p>The Content-Type attribute cannot be written to Archive buckets. Therefore, if you set this parameter to Yes, the migration destination must be a non-Archive bucket.</p>
toJobConfig.quoteChar	No	Boolean	<p>This parameter is available only when toJobConfig.outputFormat is CSV_FILE. It is used when database tables are migrated to file systems.</p> <p>If you set this parameter to Yes and a field in the source data table contains a field delimiter or line separator, CDM uses double quotation marks (") as the quote character to quote the field content as a whole to prevent a field delimiter from dividing a field into two fields, or a line separator from dividing a field into different lines. For example, if the hello,world field in the database is quoted, it will be exported to the CSV file as a whole.</p>

Parameter	Mandatory	Type	Description
toJobConfig.firstRowAsHeader	No	Boolean	This parameter is available only when toJobConfig.outputFormat is CSV_FILE . When a table is migrated to a CSV file, CDM does not migrate the heading line of the table by default. If this parameter is set to Yes , CDM writes the heading line of the table to the file.
toJobConfig.filePrefix	No	String	Custom file name prefix. It can be any custom name or a combination of the table name macro, time macro, and version macro. Example: \${tableName}_\${dateformat(yyyy-MM-dd HH:mm:ss, -1, DAY)}_\${version} . The file name must comply with the OBS file path naming rules.

4.4.3.3 To HDFS

Sample JSON File

```
"to-config-values": {
  "configs": [
    {
      "inputs": [
        {
          "name": "toJobConfig.outputDirectory",
          "value": "/hdfsto"
        },
        {
          "name": "toJobConfig.outputFormat",
          "value": "BINARY_FILE"
        },
        {
          "name": "toJobConfig.writeToTempFile",
          "value": "false"
        },
        {
          "name": "toJobConfig.duplicateFileOpType",
          "value": "REPLACE"
        },
        {
          "name": "toJobConfig.compression",
          "value": "NONE"
        },
        {
          "name": "toJobConfig.appendMode",
          "value": "true"
        }
      ]
    }
  ]
}
```

```

    }
  ],
  "name": "toJobConfig"
}
]
}

```

Parameter Description

Parameter	Mandatory	Type	Description
toJobConfig.outputDirectory	Yes	String	Path to which data is written. For example, <code>/data_dir</code> .
toJobConfig.outputFormat	Yes	Enumeration	File format required for data writes (except the binary format). Currently, the following file formats are supported: <ul style="list-style-type: none"> • CSV_FILE: Write data in CSV format. • BINARY_FILE: Files are directly transferred without resolving the content. CDM writes the file without changing the file format. If you select BINARY_FILE , the migration source must also be a file system.
toJobConfig.lineSeparator	No	String	Line feed character. This parameter is valid only when toJobConfig.outputFormat is CSV_FILE . The default value is <code>\r\n</code> .
toJobConfig.fieldSeparator	No	String	Column delimiter. This parameter is valid only when toJobConfig.outputFormat is CSV_FILE . The default value is <code>,</code> .
toJobConfig.writeToTempFile	No	Boolean	The binary file is written to a .tmp file first. After the migration is successful, run the rename or move command at the migration destination to restore the file.

Parameter	Mandatory	Type	Description
toJobConfig.duplicateFileType	No	Enumeration	<p>Method for processing duplicate files. If the name and size of a file are the same as those of another file, the file is regarded as a duplicate file. Duplicate files can be processed in the following ways:</p> <ul style="list-style-type: none"> • REPLACE: Replace duplicate files. • SKIP: Skip duplicate files. • ABANDON: Stop the job when any duplicate file is found.
toJobConfig.compression	No	Enumeration	<p>After the file is written, select the compression format of the file. The following compression formats are supported:</p> <ul style="list-style-type: none"> • NONE: Do not compress the file. • DEFLATE: Compress the file in DEFLATE format. • GZIP: Compress the file in gzip format. • BZIP2: Compress the file in bzip2 format. • LZ4: Compress the file in LZ4 format. • SNAPPY: Compress the file in Snappy format.
toJobConfig.appendMode	Yes	Boolean	<p>Whether to write data when one or more files exist in the loading path. The default value is false.</p>

Parameter	Mandatory	Type	Description
toJobConfig.encryption	No	Enumeration	<p>This parameter is available only when toJobConfig.outputFormat is set to BINARY_FILE. It specifies whether to encrypt the uploaded data, and the encryption method. The options are as follows:</p> <ul style="list-style-type: none"> • NONE: Directly write data without encryption. • AES-256-GCM: Use the AES 256-bit encryption algorithm to encrypt data. Currently, only the AES-256-GCM (NoPadding) encryption algorithm is supported.
toJobConfig.dek	No	String	<p>Data encryption key. This parameter is available when toJobConfig.encryption is set to AES-256-GCM. The key is a string of 64-bit hexadecimal numbers.</p> <p>Remember the key configured here because the decryption key must be the same as that configured here. If the encryption and decryption keys are inconsistent, the system does not report an exception, but the decrypted data is incorrect.</p>
toJobConfig.iv	No	String	<p>Initialization vector. This parameter is available when toJobConfig.encryption is set to AES-256-GCM. The initialization vector is a string of 32-bit hexadecimal numbers.</p> <p>Remember the initialization vector configured here because the initialization vector used for decryption must be the same as that configured here. If the encryption and decryption keys are inconsistent, the system does not report an exception, but the decrypted data is incorrect.</p>

Parameter	Mandatory	Type	Description
toJobConfig.file Prefix	No	String	Custom file name prefix, which can be a time macro, for example, test_\${dateformat(yyyyMMdd, -1, DAY)} . The file name must comply with the HDFS file path naming rules.

4.4.3.4 To Hive

Sample JSON File

```
"to-config-values": {
  "configs": [
    {
      "inputs": [
        {
          "name": "toJobConfig.hive",
          "value": "hive"
        },
        {
          "name": "toJobConfig.database",
          "value": "rf_database"
        },
        {
          "name": "toJobConfig.table",
          "value": "rf_to"
        },
        {
          "name": "toJobConfig.tablePreparation",
          "value": "DO_NOTHING"
        },
        {
          "name": "toJobConfig.columnList",
          "value": "aa&bb&cc&dd"
        },
        {
          "name": "toJobConfig.shouldClearTable",
          "value": "true"
        }
      ]
    },
    {
      "name": "toJobConfig"
    }
  ]
}
```

Parameter Description

Parameter	Mandatory	Type	Description
toJobConfig.hive	No	String	Data source to which data is written

Parameter	Mandatory	Type	Description
toJobConfig.database	No	String	Name of the database to which data is written. For example, default .
toJobConfig.table	Yes	String	Name of the table to which data is written
toJobConfig.tablePreparation	Yes	Enumeration	The options for data write to tables are as follows: <ul style="list-style-type: none">• DO_NOTHING: Do not create the table automatically.• CREATE_WHEN_NOT_EXISTS: If the destination database does not contain the table specified by tableName, CDM automatically creates the table.• DROP_AND_CREATE: Delete the table specified by tableName, and then create the table again.
toJobConfig.columnList	No	String	List of fields to be loaded. Use & to separate field names. For example, id&gid&name .
toJobConfig.shouldClearTable	No	Boolean	Whether to clear the data in the target table before data import. If this parameter is set to true , the data in the target table is cleared before the job is started.

4.4.3.5 To HBase/CloudTable

Sample JSON File

```
"to-config-values": {
  "configs": [
    {
      "inputs": [
        {
          "name": "toJobConfig.table",

    "value": "false"
  },
  {
    "name": "toJobConfig.isRowkeyRedundancy",
    "value": "false"
  },
  {
    "name": "toJobConfig.algorithm",
    "value": "NONE"
  },
  {
    "name": "toJobConfig.writeToWAL",
    "value": "true"
  },
  {
    "name": "toJobConfig.transType",
    "value": "false"
  }
],
"name": "toJobConfig"
}
]
}

```

Parameter Description

Parameter	Mandatory	Type	Description
toJobConfig.table	Yes	String	Name of the table to which data is written. For example, TBL_EXAMPLE .
toJobConfig.storageType	Yes	Enumeration	Mode for writing data to an HBase table. The options are as follows: <ul style="list-style-type: none"> ● PUTLIST: Data is written using the putList() function.
toJobConfig.columns	No	String	Columns to be extracted. Use & to separate column numbers and : to separate column families and columns. For example, cf1:c1&cf2:c2 .
toJobConfig.rowKeyColumn	Yes	String	Columns serve as rowkeys. Use & to separate column numbers and : to separate column families and columns. For example, cf1:c1&cf2:c2 .

Parameter	Mandatory	Type	Description
toJobConfig.isO verride	No	Boolean	Whether to clear data when data is imported in BULKLOAD mode. For example, true .
toJobConfig.deli miter	No	String	Delimiter used for separating columns when multiple columns are used as rowkeys. For example, vertical bars ().
toJobConfig.isRo wkeyRedundanc y	No	Boolean	Whether to write rowkey data to the HBase column at the same time
toJobConfig.alg orithm	No	Enumeratio n	Compression algorithm used when a new HBase table is created. The Snappy and GZ algorithms are supported. The default value is None .
toJobConfig.writ eToWAL	No	Boolean	Whether to enable Write Ahead Log (WAL) of HBase. The options are as follows: <ul style="list-style-type: none">• Yes: If the HBase server breaks down after the function is enabled, you can replay the operations that have not been performed in WAL.• No: If you set this parameter to No, the write performance is improved. However, if the HBase server breaks down, data may be lost.

Parameter	Mandatory	Type	Description
toJobConfig.transType	No	Boolean	<ul style="list-style-type: none"> true: Data of the Short, Int, Long, Float, Double, and Decimal columns in the source database is converted into Byte[] arrays (binary) and written into HBase. Other types of data are written as character strings. If several types of data mentioned above are combined as rowkeys, they will be written as character strings. This function saves storage space. In specific scenarios, the rowkey distribution is even. false: All types of data in the source database are written into HBase as character strings.

4.4.3.6 To DDS

Sample JSON File

```

"to-config-values": {
  "configs": [
    {
      "inputs": [
        {
          "name": "toJobConfig.database",
          "value": "demo"
        },
        {
          "name": "toJobConfig.collectionName",
          "value": "cdmbase"
        },
        {
          "name": "toJobConfig.columnList",
          "value": "_char&_varchar"
        },
        {
          "name": "toJobConfig.isBatchMigration",
          "value": "false"
        }
      ]
    },
    {
      "name": "toJobConfig"
    }
  ]
}

```

Parameter Description

Parameter	Mandatory	Type	Description
toJobConfig.database	Yes	String	Name of the MongoDB/DDS database
toJobConfig.collectionName	Yes	String	Name of the MongoDB/DDS collection
toJobConfig.columnList	No	String	List of fields to be extracted. Use & to separate field names. For example, id&gid&name .
toJobConfig.isBatchMigration	No	Boolean	Whether to migrate all data in the database

4.4.3.7 To Elasticsearch/Cloud Search Service

Sample JSON File

```

"to-config-values": {
  "configs": [
    {
      "inputs": [
        {
          "name": "toJobConfig.index",
          "value": "cdm"
        },
        {
          "name": "toJobConfig.type",
          "value": "type1"
        },
        {
          "name": "toJobConfig.shouldClearType",
          "value": "false"
        },
        {
          "name": "toJobConfig.pipeLine",
          "value": "es_03"
        }
      ],
      "name": "toJobConfig"
    }
  ]
}

```

Parameter Description

Parameter	Mandatory	Type	Description
toJobConfig.index	Yes	String	Index of the written data, which is similar to the database name in the relational database

Parameter	Mandatory	Type	Description
toJobConfig.type	Yes	String	Type of the written data, which is similar to the table name in the relational database
toJobConfig.shouldClearType	No	Boolean	Whether to clear data before import
toJobConfig.primaryKey	No	String	Primary key or unique index
toJobConfig.columnList	No	String	List of fields to be written. Use & to separate field names. For example, id&gid&name .
toJobConfig.pipeline	No	String	This parameter is available only after a pipeline ID is created in Kibana. It is used to convert the data format using the data transformation pipeline of Cloud Search Service or Elasticsearch after data is transferred to Cloud Search Service or Elasticsearch.

Parameter	Mandatory	Type	Description
toJobConfig.createIndexStrategy	No	Enumeration	<p>For streaming jobs that continuously write data to Elasticsearch, CDM periodically creates indexes and writes data to the indexes, which helps you delete expired data. The indexes can be created based on the following periods:</p> <ul style="list-style-type: none"> • EveryHour: CDM creates indexes on the hour. The new indexes are named in the format of <i>Index name+Year+Month+Day+Hour</i>, for example, index2018121709. • EveryDay: CDM creates indexes at 00:00 every day. The new indexes are named in the format of <i>Index name+Year+Month+Day</i>, for example, index20181217. • EveryWeek: CDM creates indexes at 00:00 every Monday. The new indexes are named in the format of <i>Index name+Year+Week</i>, for example, index201842. • EveryMonth: CDM creates indexes at 00:00 on the first day of each month. The new indexes are named in the format of <i>Index name+Year+Month</i>, for example, index201812. <p>When extracting data from a file, you must configure a single extractor, which means setting Concurrent Extractors to 1. Otherwise, this parameter is invalid.</p>

4.4.3.8 To DLI

Sample JSON File

```

"to-config-values": {
  "configs": [
    {
      "inputs": [

```

```

    {
      "name": "toJobConfig.queue",
      "value": "cdm"
    },
    {
      "name": "toJobConfig.database",
      "value": "sqoop"
    },
    {
      "name": "toJobConfig.table",
      "value": "est1"
    },
    {
      "name": "toJobConfig.columnList",
      "value":
"string_&int_&date_&double_&boolean_&short_&timestamp_&long_&smallint_&bigint_"
    },
    {
      "name": "toJobConfig.shouldClearTable",
      "value": "false"
    }
  ],
  "name": "toJobConfig"
}
]
}

```

Parameter Description

Parameter	Mandatory	Type	Description
toJobConfig.queue	Yes	String	Resource queue to which data is written
toJobConfig.database	Yes	String	DLI database to which data is written
toJobConfig.table	Yes	String	Name of the table to which data is written
toJobConfig.columnList	No	String	List of fields to be loaded. Use & to separate field names. For example, id&gid&name .
toJobConfig.shouldClearTable	No	Boolean	Whether to clear data in the resource queue before data import

4.4.3.9 To DIS

Sample JSON File

```

"to-config-values": {
  "configs": [
    {
      "inputs": [
        {
          "name": "toJobConfig.streamName",
          "value": "cdm"
        },
        {

```

```

        "name": "toJobConfig.separator",
        "value": " ",
      },
      {
        "name": "toJobConfig.identifierEnclose",
        "value": ""
      }
    ],
    "name": "toJobConfig"
  }
]
}

```

Parameter description

Parameter	Mandatory	Type	Description
toJobConfig.streamName	Yes	String	DIS stream name
toJobConfig.separator	No	String	Field separator. The default value is a space.
toJobConfig.identifierEnclose	No	String	Delimiter used to separate referenced table names or column names. By default, this parameter is left blank.

4.4.4 Job Parameter Description

When you perform the operations in [Creating a Job in a Specified Cluster](#) or [Creating and Executing a Job in a Random Cluster](#), the **driver-config-values** parameter specifies the job configuration, which includes the following functions:

- **Retry upon Failure:** If a job fails to be executed, you can choose whether to automatically restart the job.
- **Job Group:** CDM allows you to group jobs. You can filter, delete, start, or export jobs by group.
- **Schedule Execution:** Specify whether to execute scheduled jobs.
- **Concurrent Extractors:** Enter the number of concurrent extractors.
- **Write Dirty Data:** Specify this parameter if data that fails to be processed or filtered out during job execution needs to be written to OBS for future viewing. Before writing dirty data, create an OBS link.
- **Delete Job After Completion:** Specify whether to delete a job after the job is executed.

Sample JSON File

```

"driver-config-values": {
  "configs": [
    {
      "inputs": [
        {
          "name": "throttlingConfig.numExtractors",
          "value": "1"
        }
      ]
    }
  ]
}

```

```

    {
      "name": "throttlingConfig.numLoaders",
      "value": "1"
    },
    {
      "name": "throttlingConfig.recordDirtyData",
      "value": "false"
    }
  ],
  "name": "throttlingConfig"
},
{
  "inputs": [],
  "name": "jarConfig"
},
{
  "inputs": [
    {
      "name": "schedulerConfig.isSchedulerJob",
      "value": "false"
    },
    {
      "name": "schedulerConfig.disposableType",
      "value": "NONE"
    }
  ],
  "name": "schedulerConfig"
},
{
  "inputs": [],
  "name": "transformConfig"
},
{
  "inputs": [
    {
      "name": "retryJobConfig.retryJobType",
      "value": "NONE"
    }
  ],
  "name": "retryJobConfig"
}
]
}

```

Parameter Description

Parameter	Mandatory	Type	Description
throttlingConfig.numExtractors	No	Integer	Maximum number of concurrent extraction jobs. For example, 20 .
groupJobConfig.groupName	No	Enumeration	Group to which a job belongs. The default group is DEFAULT .
throttlingConfig.numLoaders	No	Integer	This parameter is available only when HBase or Hive serves as the destination data source. Maximum number of loading jobs. For example, 5 .
throttlingConfig.recordDirtyData	No	Boolean	Whether to write dirty data. For example, true .

Parameter	Mandatory	Type	Description
throttlingConfig.writeToLink	No	String	Link to which dirty data is written. Currently, dirty data can be written only to OBS or HDFS. For example, obslink .
throttlingConfig.obsBucket	No	String	Name of the OBS bucket to which dirty data is written. This parameter is valid only when dirty data is written to OBS. For example, dirtyData .
throttlingConfig.dirtyDataDirectory	No	String	Directory to which dirty data is written <ul style="list-style-type: none"> To write dirty data to HDFS, set this parameter to the specified HDFS directory. To write dirty data to OBS, set this parameter to the directory in the OBS bucket. For example, /data/dirtydata/.
throttlingConfig.maxErrorRecords	No	String	Maximum number of error records in a single shard. When the number of error records of a map exceeds the upper limit, the task automatically ends. The imported data will not be rolled back.
schedulerConfig.isSchedulerJob	No	Boolean	Whether to enable a scheduled task. For example, true .
schedulerConfig.cycleType	No	String	Cycle type of a scheduled task. The options are as follows: <ul style="list-style-type: none"> minute: minute hour: hour day: day week: week month: month
schedulerConfig.cycle	No	Integer	Cycle of a scheduled task. If cycleType is set to minute and cycle is set to 10 , the scheduled task is executed every 10 minutes.

Parameter	Mandatory	Type	Description
schedulerConfig. runAt	No	String	<p>Time when a scheduled task is triggered in a cycle. This parameter is valid only when cycleType is set to hour, week, or month.</p> <ul style="list-style-type: none"> If cycleType is set to month, cycle is set to 1, and runAt is set to 15, the scheduled task is executed on the 15th day of each month. You can set runAt to multiple values and separate the values with commas (,). For example, if runAt is set to 1,2,3,4,5, the scheduled task is executed on the first day, second day, third day, fourth day, and fifth day of each month. If cycleType is set to week and runAt is set to mon,tue,wed,thu,fri, the scheduled task is executed on Monday to Friday. If cycleType is set to hour and runAt is set to 27,57, the scheduled task is executed at the 27th and 57th minute in the cycle.
schedulerConfig. startDate	No	String	<p>Start time of a scheduled task. For example, 2018-01-24 19:56:19.</p>
schedulerConfig. stopDate	No	String	<p>End time of a scheduled task. For example, 2018-01-27 23:59:00.</p> <p>If you do not set the end time, the scheduled task is always executed and will never stop.</p>

Parameter	Mandatory	Type	Description
schedulerConfig. disposableType	No	Enumeration	Whether to delete a job after the job is executed. The options are as follows: <ul style="list-style-type: none">• NONE: A job will not be deleted after it is executed.• DELETE_AFTER_SUCCEED: A job will be deleted only after it is successfully executed. It is applicable to massive one-time jobs.• DELETE: A job will be deleted after it is executed, regardless of the execution result.
retryJobConfig. retryJobType	No	Enumeration	Whether to automatically retry if a job fails to be executed. The options are as follows: <ul style="list-style-type: none">• NONE: Do not retry.• RETRY_TRIPLE: Retry three times.

5 DataArts Factory APIs (V1)

5.1 Script Development APIs

5.1.1 Creating a Script

Function

This API is used to create a script. Currently, the following script types are supported: DLI SQL, Flink SQL, RDS SQL, Spark SQL, Hive SQL, DWS SQL, Shell, Presto SQL, ClickHouse SQL, HetuEngine SQL, Python, Impala SQL, and Spark Python.

URI

- URI format
POST /v1/{project_id}/scripts
- Parameter description

Table 5-1 URI parameter

Parameter	Man dator y	Type	Description
project_id	Yes	String	Project ID. For details about how to obtain a project ID, see Project ID and Account ID .

Request Parameters

Table 5-2 Request header parameter

Parameter	Mandatory	Type	Description
workspace	No	String	<p>Workspace ID.</p> <ul style="list-style-type: none"> If this parameter is not set, data in the default workspace is queried by default. To query data in other workspaces, this header must be carried.

Table 5-3 Script parameters

Parameter	Mandatory	Type	Description
name	Yes	String	Script name. The name contains a maximum of 128 characters, including only letters, numbers, hyphens (-), and periods (.). The script name must be unique.
type	Yes	String	<p>Script type.</p> <ul style="list-style-type: none"> FlinkSQL DLISQL SparkSQL HiveSQL DWSSQL RDSSQL Shell PRESTO ClickHouseSQL HetuEngineSQL PYTHON ImpalaSQL SparkPython
content	Yes	String	Script content. A maximum of 4 MB is supported.

Parameter	Mandatory	Type	Description
directory	No	String	Directory for storing the script. Access the DataArts Studio console and go to the DataArts Factory page. In the left navigation pane, choose Data Development > Develop Script . In the directory tree of the script, you can view the created directories. The default directory is the root directory.
connectionName	No	String	Name of the connection associated with the script. This parameter is mandatory when type is set to DLISQL, SparkSQL, HiveSQL, DWSSQL, Shell, PRESTO, ClickHouseSQL, HetuEngineSQL, RDSSQL, ImpalaSQL, PYTHON, or SparkPython . To obtain the existing connections, refer to the instructions in Querying a Connection List (to Be Taken Offline) . By default, this parameter is left blank.
database	No	String	Database associated with an SQL statement. This parameter is available only when type is set to DLISQL, SparkSQL, HiveSQL, DWSSQL, PRESTO, RDSSQL, ClickHouseSQL, ImpalaSQL, or HetuEngineSQL . <ul style="list-style-type: none"> If type is set to DLI SQL, obtain database information by calling the API for querying all databases in the <i>Data Lake Insight API Reference</i>. This parameter is mandatory when the script is not of any type listed.
queueName	Yes	String	Queue name of the DLI resource. This parameter is available only when type is set to DLISQL . You can obtain the queue information by calling the API for "Querying All Queues" in the <i>Data Lake Insight API Reference</i> . By default, this parameter is left blank.

Parameter	Mandatory	Type	Description
configuration	No	map <String, Object>	Configuration defined by a user for the job. This parameter is available only when type is set to DLISQL . For details about the supported configuration items, see conf parameter description in the "Submitting a SQL Job" section of the <i>Data Lake Insight API Reference</i> . By default, this parameter is left blank.
description	No	String	The description contains a maximum of 255 characters.
owner	No	String	Owner name
targetStatus	No	String	This parameter is required if the review function is enabled. It indicates the target status of the script. The value can be SAVED , SUBMITTED , or PRODUCTION . <ul style="list-style-type: none"> • SAVED indicates that the script is saved but cannot be scheduled or executed. It can be executed only after submitted and approved. • SUBMITTED indicates that the script is automatically submitted after it is saved and can be executed after it is approved. • PRODUCTION indicates that the script can be directly executed after it is created. Note: Only the workspace administrator can create scripts in the PRODUCTION state.
approvers	No	List<JobApprover>	Script approver. This parameter is required if the review function is enabled. For details, see Table 5-4 .

Table 5-4 Approver attributes

Parameter	Mandatory	Type	Description
approverName	Yes	String	Approver name

Response Parameters

None.

Example Request

Create a script named **echoTimeShell** whose type is Shell, content is **echo a**, and associated connection is **con**.

```
POST /v1/b384b9e9ab9b4ee8994c8633aabc9505/scripts
{
  "name": "echoTimeShell",
  "type": "Shell",
  "content": "echo a",
  "queueName": "default",
  "connectionName": "con"
}
```

Create a script when the review function is enabled.

```
POST /v1/b384b9e9ab9b4ee8994c8633aabc9505/scripts
{
  "name": "echoTimeShell",
  "type": "Shell",
  "content": "echo a",
  "queueName": "default",
  "connectionName": "con",
  "targetStatus": "SUBMITTED",
  "approvers": [
    {
      "approverName": "userName1"
    },
    {
      "approverName": "userName2"
    }
  ]
}
```

Example Response

- Success response
HTTP status code 204
- Failure response
HTTP status code 400

```
{
  "error_code": "DLF.6247",
  "error_msg": "The script type is not specified."
}
```

Status Code

See [Status Codes](#).

5.1.2 Modifying a Script

Function

This API is used to modify the configuration items or script contents of a script.

- When modifying a script, specify the name of the script to be modified.
- The script name and type cannot be modified.

URI

- URI format

PUT /v1/{project_id}/scripts/{script_name}

- Parameter description

Table 5-5 URI parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Project ID. For details about how to obtain a project ID, see Project ID and Account ID .
script_name	Yes	String	Script name.

Request Parameters

Table 5-6 Request header parameter

Parameter	Mandatory	Type	Description
workspace	No	String	Workspace ID. <ul style="list-style-type: none"> • If this parameter is not set, data in the default workspace is queried by default. • To query data in other workspaces, this header must be carried.

Table 5-7 Script parameters

Parameter	Mandatory	Type	Description
name	Yes	String	Script name. The name contains a maximum of 128 characters, including only letters, numbers, hyphens (-), and periods (.). The script name must be unique.

Parameter	Mandatory	Type	Description
type	Yes	String	Script type. <ul style="list-style-type: none"> • FlinkSQL • DLISQL • SparkSQL • HiveSQL • DWSSQL • RDSSQL • Shell • PRESTO • ClickHouseSQL • HetuEngineSQL • PYTHON • ImpalaSQL • SparkPython
content	Yes	String	Script content. A maximum of 4 MB is supported.
directory	No	String	Directory for storing the script. Access the DataArts Studio console and choose Data Development . In the left navigation pane, choose Development > Develop Script . In the directory tree of the script, you can view the created directories. The default directory is the root directory.
connectionName	No	String	Name of the connection associated with the script. This parameter is mandatory when type is set to DLISQL, SparkSQL, HiveSQL, DWSSQL, Shell, PRESTO, ClickHouseSQL, HetuEngineSQL, RDSSQL, ImpalaSQL, PYTHON, or SparkPython . To obtain the existing connections, refer to the instructions in Querying a Connection List (to Be Taken Offline) . By default, this parameter is left blank.

Parameter	Mandatory	Type	Description
database	No	String	<p>Database associated with an SQL statement. This parameter is available only when type is set to DLISQL, SparkSQL, HiveSQL, DWSSQL, PRESTO, RDSSQL, ClickHouseSQL, ImpalaSQL, or HetuEngineSQL.</p> <ul style="list-style-type: none"> If type is set to DLI SQL, obtain database information by calling the API for querying all databases in the <i>Data Lake Insight API Reference</i>. Connect to the cluster in JDBC mode to query database information if type is not set to DLISQL. By default, this parameter is left blank.
queueName	Yes	String	<p>Queue name of the DLI resource. This parameter is available only when type is set to DLISQL. You can obtain the queue information by calling the API for "Querying All Queues" in the <i>Data Lake Insight API Reference</i>. By default, this parameter is left blank.</p>
configuration	No	map <String, Object>	<p>Configuration defined by a user for the job. This parameter is available only when type is set to DLISQL. For details about the supported configuration items, see conf parameter description in the "Submitting a SQL Job" section of the <i>Data Lake Insight API Reference</i>. By default, this parameter is left blank.</p>
description	No	String	<p>Description of the script. The description contains a maximum of 255 characters.</p>

Parameter	Mandatory	Type	Description
targetStatus	No	String	<p>This parameter is required if the review function is enabled. It indicates the target status of the script. The value can be SAVED, SUBMITTED, or PRODUCTION.</p> <ul style="list-style-type: none"> • SAVED indicates that the script is saved but cannot be scheduled or executed. It can be executed only after submitted and approved. • SUBMITTED indicates that the script is automatically submitted after it is saved and can be executed after it is approved. • PRODUCTION indicates that the script can be directly executed after it is created. Note: Only the workspace administrator can create scripts in the PRODUCTION state.
approvers	No	List<JobApprover>	<p>Script approver. This parameter is required if the review function is enabled. For details, see Table 5-8.</p> <p>For details about how to enable the review function, see Review Center.</p>

Table 5-8 Approver attributes

Parameter	Mandatory	Type	Description
approverName	Yes	String	Approver name

Response Parameters

None.

Example Request

Modify a script named **echoTimeShell** whose type is Shell, content is **echo a**, and associated connection is **con**.

```
PUT /v1/b384b9e9ab9b4ee8994c8633aabc9505/scripts/echoTimeShell
{
  "name": "echoTimeShell",
  "type": "Shell",
  "content": "echo a",
  "queueName": "default",
  "connectionName": "con"
}
```

Change the script content when the review function is enabled.

```
PUT /v1/b384b9e9ab9b4ee8994c8633aabc9505/scripts/echoTimeShell
{
  "name": "echoTimeShell",
  "type": "Shell",
  "content": "echo a",
  "queueName": "default",
  "connectionName": "con",
  "approvers": [
    {
      "approverName": "userName1"
    },
    {
      "approverName": "userName2"
    }
  ]
}
```

Example Response

- Success response
HTTP status code 204
- Failure response

5.1.3 Querying Script Details

Function

This API is used to query a script, including the script type and script content.

URI

- URI format
GET /v1/{project_id}/scripts/{script_name}?version={version}
- Parameter description

Table 5-9 URI parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Project ID. For details about how to obtain a project ID, see Project ID and Account ID .
script_name	Yes	String	Script name.

Parameter	Mandatory	Type	Description
version	No	integer	Script version. If the version number is transferred, the script of the specified version is queried. If the version number is not transferred, the script of the latest version is queried.
status	No	String	Used to query the script status if version is not specified. The default value is SAVED , indicating that the latest submitted version is to be queried. If the value is PUBLISHED , the production version of the script is to be queried.

Request Parameters

Table 5-10 Request header parameter

Parameter	Mandatory	Type	Description
workspace	No	String	Workspace ID. <ul style="list-style-type: none"> If this parameter is not set, data in the default workspace is queried by default. To query data in other workspaces, this header must be carried.

Response Parameters

Table 5-11 Script parameters

Parameter	Mandatory	Type	Description
name	Yes	String	Script name. The name contains a maximum of 128 characters, including only letters, numbers, hyphens (-), and periods (.). The script name must be unique.

Parameter	Mandatory	Type	Description
type	Yes	String	Script type. <ul style="list-style-type: none"> • FlinkSQL • DLISQL • SparkSQL • HiveSQL • DWSSQL • RDSSQL • Shell • PRESTO • ClickHouseSQL • HetuEngineSQL • PYTHON • ImpalaSQL • SparkPython
content	Yes	String	Script content. A maximum of 64 KB is supported.
directory	No	String	Directory for storing the script. Access the DataArts Studio console and choose DataArts Factory . In the left navigation pane, choose Data Development > Develop Script . In the directory tree of the script, you can view the created directories. The default directory is the root directory.
connectionName	No	String	Name of the connection associated with the script. This parameter is mandatory when type is set to DLISQL, SparkSQL, HiveSQL, DWSSQL, Shell, PRESTO, ClickHouseSQL, ImpalaSQL, RDSSQL, or HetuEngineSQL . To obtain the existing connections, refer to the instructions in Querying a Connection List (to Be Taken Offline) . By default, this parameter is left blank.

Parameter	Mandatory	Type	Description
database	No	String	<p>Database associated with an SQL statement. This parameter is available only when type is set to DLISQL, SparkSQL, HiveSQL, DWSSQL, PRESTO, RDSSQL, ClickHouseSQL, ImpalaSQL, or HetuEngineSQL.</p> <ul style="list-style-type: none"> If type is set to DLISQL, obtain database information by calling the API for querying all databases in the <i>Data Lake Insight API Reference</i>. Connect to the cluster in JDBC mode to query database information if type is not set to DLISQL. By default, this parameter is left blank.
queueName	No	String	<p>Queue name of the DLI resource. This parameter is available only when type is set to DLISQL. You can obtain the queue information by calling the API for "Querying All Queues" in the <i>Data Lake Insight API Reference</i>. By default, this parameter is left blank.</p>
configuration	No	map <String, Object>	<p>Configuration defined by a user for the job. This parameter is available only when type is set to DLISQL. For details about the supported configuration items, see conf parameter description in the "Submitting a SQL Job" section of the <i>Data Lake Insight API Reference</i>. By default, this parameter is left blank.</p>
description	No	String	<p>Description of the script. The description contains a maximum of 255 characters.</p>
autoAcquireLock	No	boolean	<p>Whether to automatically obtain the edit lock parameters. The default value is true.</p>

Example Request

```
GET /v1/b384b9e9ab9b4ee8994c8633aabc9505/scripts/scriptName
```

Example Response

- Success response
HTTP status code 200

```
{
  "configuration": {},
```

```
"connectionName":"mrs_spark",
"content":"SELECT 1;",
"database":"aaa",
"description":"",
"directory":"/",
"name":"mrs_spark_sql",
"type":"SparkSQL"
}
```

- Failure response

HTTP status code 400

```
{
  "error_code":"DLF.6201",
  "error_msg":"The script does not exist."
}
```

Status Codes

See [Status Codes](#).

5.1.4 Querying a Script List

Function

This API is used to query the script list. A maximum of 1,000 scripts can be returned for each query.

URI

- URI format
GET /v1/{project_id}/scripts?
offset={offset}&limit={limit}&scriptName={scriptName}
- Parameter description

Table 5-12 URI parameters

Parameter	Man dator y	Type	Description
project_id	Yes	String	Project ID. For details about how to obtain a project ID, see Project ID and Account ID .
limit	No	Integer	The maximum number of records on each page. The value ranges from 1 to 100. Default value: 10
offset	No	Integer	Start page of the paging list. The default value is 0 . The value must be greater than or equal to 0 .
scriptName	No	String	Script name.

Request Parameters

Table 5-13 Request header parameter

Parameter	Mandatory	Type	Description
workspace	No	String	Workspace ID. <ul style="list-style-type: none"> If this parameter is not set, data in the default workspace is queried by default. To query data in other workspaces, this header must be carried.

Response Parameters

Parameter	Mandatory	Type	Description
total	Yes	Integer	The total number of scripts.
scripts	Yes	List<Script>	A list of scripts.

Table 5-14 Script parameters

Parameter	Mandatory	Type	Description
name	Yes	String	Script name. The name contains a maximum of 128 characters, including only letters, numbers, hyphens (-), and periods (.). The script name must be unique.

Parameter	Mandatory	Type	Description
type	Yes	String	Script type. <ul style="list-style-type: none"> • FlinkSQL • DLISQL • SparkSQL • HiveSQL • DWSSQL • RDSSQL • Shell • PRESTO • ClickHouseSQL • HetuEngineSQL • PYTHON • ImpalaSQL • SparkPython
content	Yes	String	Script content. A maximum of 64 KB is supported.
directory	No	String	Directory for storing the script. Access the DataArts Studio console and choose DataArts Factory . In the left navigation pane, choose Data Development > Develop Script . In the directory tree of the script, you can view the created directories. The default directory is the root directory.
connectionName	No	String	Name of the connection associated with the script. This parameter is mandatory when type is set to DLISQL, SparkSQL, HiveSQL, DWSSQL, Shell, PRESTO, ClickHouseSQL, ImpalaSQL, RDSSQL, or HetuEngineSQL . To obtain the existing connections, refer to the instructions in Querying a Connection List (to Be Taken Offline) . By default, this parameter is left blank.

Parameter	Mandatory	Type	Description
database	No	String	<p>Database associated with an SQL statement. This parameter is available only when type is set to DLISQL, SparkSQL, HiveSQL, DWSSQL, PRESTO, RDSSQL, ClickHouseSQL, ImpalaSQL, or HetuEngineSQL.</p> <ul style="list-style-type: none"> If type is set to DLISQL, obtain database information by calling the API for querying all databases in the <i>Data Lake Insight API Reference</i>. If type is not set to DLISQL, connect to the cluster in JDBC mode to query database information. By default, this parameter is left blank.
queueName	No	String	<p>Queue name of the DLI resource. This parameter is available only when type is set to DLISQL. You can obtain the queue information by calling the API for "Querying All Queues" in the <i>Data Lake Insight API Reference</i>. By default, this parameter is left blank.</p>
configuration	No	map <String, Object>	<p>Configuration defined by a user for the job. This parameter is available only when type is set to DLISQL. For details about the supported configuration items, see conf parameter description in the "Submitting a SQL Job" section of the <i>Data Lake Insight API Reference</i>. By default, this parameter is left blank.</p>
description	No	String	<p>Description of the script. The description contains a maximum of 255 characters.</p>

Example Request

Query a script list.

```
GET /v1/b384b9e9ab9b4ee8994c8633aabc9505/scripts
```

Example Response

- Success response

HTTP status code 200

```
{
  "total": 1,
  "scripts": [
    {
      "configuration": {},

```

```
    "connectionName": "mrs_spark",
    "content": "SELECT 1;",
    "database": "aaa",
    "description": "",
    "directory": "/",
    "name": "mrs_spark_sql",
    "type": "SparkSQL"
  }
]
```

- Failure response

HTTP status code 400

```
{
  "error_code": "DLF.3051",
  "error_msg": "The request parameter is invalid."
}
```

5.1.5 Querying the Execution Result of a Script Instance

Function

This API is used to obtain the execution status and result of a script instance. During the query, specify the script name and script instance ID.

URI

- URI format
GET /v1/{project_id}/scripts/{script_name}/instances/{instance_id}
- Parameter description

Table 5-15 URI parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Project ID. For details about how to obtain a project ID, see Project ID and Account ID .
script_name	Yes	String	Script name.
instance_id	Yes	String	Script instance ID. For details about how to obtain the ID, see the response parameters in Executing a Script .

Request Parameters

Table 5-16 Request header parameter

Parameter	Mandatory	Type	Description
workspace	No	String	<p>Workspace ID.</p> <ul style="list-style-type: none"> If this parameter is not set, data in the default workspace is queried by default. To query data in other workspaces, this header must be carried.

Response Parameters

Table 5-17 Response parameters

Parameter	Mandatory	Type	Description
status	Yes	String	<p>Execution status.</p> <p>LAUNCHING: The script instance is being submitted.</p> <p>RUNNING: The script instance is running.</p> <p>FINISHED: The script instance is successfully run.</p> <p>FAILED: The script instance fails to be run.</p>
results	Yes	List<Result>	Execution result of the script instance.
message	No	String	Execution failure message

Table 5-18 Result data structure description

Parameter	Mandatory	Type	Description
message	No	Object	Returned message
schema	No	List<Map<String, String>>	Metadata information

Parameter	Mandatory	Type	Description
rows	No	List<List<Object>>	Result data
rowCount	No	Long	Number of the result rows
inputRowCount	No	Long	Number of the input result rows. (This result is returned when scripts such as DLI scripts are executed.)
resultCount	No	Long	Number of the result rows. (This result is returned when scripts such as DLI scripts are executed.)
duration	No	Float	Duration of executing the script instance. Unit: second
rawResult	No	Map<String, Object>	Script execution result

Example Request

GET /v1/b384b9e9ab9b4ee8994c8633aabc9505/scripts/dwsscript/instances/a1ad-448a-9d56-4154193d49c5

Example Response

- Success response

HTTP status code 200

```
{
  "results": [{
    "message": "",
    "duration": 0.5,
    "rowCount": 1,
    "rows": [[913460.0,
      765.0,
      "8/31/2015 23:26",
      "Harry Bridges Plaza (Ferry Building)",
      50.0,
      "8/31/2015 23:39",
      "San Francisco Caltrain (Townsend at 4th)",
      70.0,
      "288",
      "Subscriber",
      "2139"]],
    "schema": [{
      "TripID": "int"
    }],
    {
      "Duration": "int"
    },
    {
      "StartDate": "string"
    },
    {
      "StartStation": "string"
    },
    {
      "StartTerminal": "int"
    }
  ]
}
```

```

    },
    {
      "EndDate": "string"
    },

    {
      "EndTerminal": "int"
    },
    {
      "Bike": "string"
    },
    {
      "SubscriberType": "string"
    },
    {
      "ZipCode": "string"
    }
  ]],
  "status": "FINISHED"
}

```

- Failure response

HTTP status code 400

```

{
  "error_code": "DLF.6201",
  "error_msg": "The script does not exist."
}

```

Status Codes

See [Status Codes](#).

5.1.6 Deleting a Script

Function

This API is used to delete a specific script.

URI

- URI format
DELETE /v1/{project_id}/scripts/{script_name}
- Parameter description

Table 5-19 URI parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Project ID. For details about how to obtain a project ID, see Project ID and Account ID .
script_name	Yes	String	Script name.

Request Parameters

Table 5-20 Request header parameter

Parameter	Mandatory	Type	Description
workspace	No	String	Workspace ID. <ul style="list-style-type: none"> If this parameter is not set, data in the default workspace is queried by default. To query data in other workspaces, this header must be carried.

Table 5-21 Parameters

Parameter	Mandatory	Type	Description
approvers	No	List<JobApprover>	Script approver. This parameter is required if the review function is enabled. For details, see Table 5-22 .

Table 5-22 Approver attributes

Parameter	Mandatory	Type	Description
approverName	Yes	String	Approver name

Response Parameters

None.

Example Request

```
DELETE /v1/b384b9e9ab9b4ee8994c8633aabc9505/scripts/echoTime
```

Delete a script when the review function is enabled.

```
DELETE /v1/b384b9e9ab9b4ee8994c8633aabc9505/scripts/echoTime
{
  "approvers": [
    {
      "approverName": "userName1"
    },
    {
      "approverName": "userName2"
    }
  ]
}
```

Example Response

- Success response
HTTP status code 204
- Failure response
HTTP status code 400

```
{
  "error_code": "DLF.6201",
  "error_msg": "The script does not exist."
}
```

Status Codes

See [Status Codes](#).

5.1.7 Executing a Script

Function

This API is used to execute specified scripts, including DWS SQL, DLI SQL, RDS SQL, Hive SQL, Spark SQL, Presto SQL, Shell, ClickHouse SQL, HetuEngine SQL, Python, Impala SQL, or Spark Python scripts. A script instance is generated each time the script is executed. You can call the API [Querying the Execution Result of a Script Instance](#) to obtain script execution results.

NOTE

DLI SQL and Presto SQL scripts do not support multi-statement scenarios.

URI

- URI format
POST /v1/{project_id}/scripts/{script_name}/execute
- Parameter description

Table 5-23 URI parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Project ID. For details about how to obtain a project ID, see Project ID and Account ID .
script_name	Yes	String	Script name.

Request Parameters

Table 5-24 Request header parameter

Parameter	Mandatory	Type	Description
workspace	No	String	<p>Workspace ID.</p> <ul style="list-style-type: none"> If this parameter is not set, data in the default workspace is queried by default. To query data in other workspaces, this header must be carried.

Table 5-25 Parameters

Parameter	Mandatory	Type	Description
params	No	Object	Script parameters of the Map<String,String> type. If a parameter is defined in the script, the parameter value is carried in the params.

Script parameters refer to the parameters in the script content, as shown in the following figure.

Response Parameters

Table 5-26 Response parameters

Parameter	Mandatory	Type	Description
instanceId	Yes	String	<p>ID of the instance that executes the script. You can obtain the execution result by using the instance ID in Querying the Execution Result of a Script Instance.</p>

Example Request

Run the `dws_sql` script. In the script, the value of `tableVar` is `citys`, and the value of `time` is `2019-07-25`.

```
POST /v1/b384b9e9ab9b4ee8994c8633aabc9505/scripts/dws_sql/execute
{
  "params": {
    "tableVar": "citys",
    "time": "2019-07-25"
  }
}
```

Example Response

- Success response
HTTP status code 200
- Failure response
HTTP status code 400

```
{
  "error_code": "DLF6201",
  "error_msg": "The script does not exist."
}
```

Status Codes

See [Status Codes](#).

5.1.8 Stopping Executing a Script Instance

Function

This API is used to stop executing a script instance.

URI

- URI format
POST /v1/{project_id}/scripts/{script_name}/instances/{instance_id}/stop
- Parameter description

Table 5-27 URI parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Project ID. For details about how to obtain a project ID, see Project ID and Account ID .
script_name	Yes	String	Script name.

Parameter	Mandatory	Type	Description
instance_id	Yes	String	Script instance ID. For details about how to obtain the ID, see the response parameters in Executing a Script .

Request Parameters

Table 5-28 Request header parameter

Parameter	Mandatory	Type	Description
workspace	No	String	Workspace ID. <ul style="list-style-type: none"> If this parameter is not set, data in the default workspace is queried by default. To query data in other workspaces, this header must be carried.

Response Parameters

None.

Example Request

```
POST /v1/b384b9e9ab9b4ee8994c8633aabc9505/scripts/dwsscript/instances/a1ad-448a-9d56-4154193d49c5/stop
```

Example Response

- Success response
HTTP status code 204
- Failure response
HTTP status code 400

```
{
  "error_code": "DLF.6205",
  "error_msg": "The script running history does not exist."
}
```

Status Codes

See [Status Codes](#).

5.2 Resource Management APIs

5.2.1 Creating a Resource

Function

This API is used to create a resource. Types of nodes, including DLI Spark, MRS Spark, and MRS MapReduce, can reference files such as JAR and properties through resources.

URI

- URI format
POST /v1/{project_id}/resources
- Parameter description

Table 5-29 URI parameter

Parameter	Mandatory	Type	Description
project_id	Yes	String	Project ID. For details about how to obtain a project ID, see Project ID and Account ID .

Request Parameters

Table 5-30 Request header parameter

Parameter	Mandatory	Type	Description
workspace	No	String	Workspace ID. <ul style="list-style-type: none">• If this parameter is not set, data in the default workspace is queried by default.• To query data in other workspaces, this header must be carried.

Table 5-31 Resource parameters

Parameter	Mandatory	Type	Description
name	Yes	String	Name of the resource. The name contains a maximum of 32 characters, including only letters, numbers, underscores (_), and hyphens (-).

Parameter	Mandatory	Type	Description
type	Yes	String	Resource type. <ul style="list-style-type: none"> • archive • file • jar
location	Yes	String	OBS path for storing the resource file. When type is set to jar , location is the path for storing the main JAR package. The path contains a maximum of 1,023 characters. For example, obs://myBucket/test.jar
dependFiles	No	List<String >	JAR package and properties file that the main JAR package depends on. The description contains a maximum of 10,240 characters.
desc	No	String	Description of the resource. The description contains a maximum of 255 characters.
directory	No	String	Directory for storing the resource. Log in to the DataArts Studio console and access the DataArts Factory console. In the navigation pane, choose Configuration > Configure . In the resource directory tree, you can view the created directories. The default directory is the root directory.

Response Parameters

Table 5-32 Response parameter

Parameter	Mandatory	Type	Description
resourceId	Yes	String	Resource ID.

Example Request

Create a resource named **test**. The resource type is **jar**. The OBS path where the resource file is located is **obs://dlf-test/hadoop-mapreduce-examples-2.4.1.jar**. The JAR package and properties file on which the resource's main JAR package depends are **obs://dlf-test/depend1.jar**,"**obs://dlf-test/depend2.jar**. The description is **test**. The directory where the resource is located is **/resource**.

```
POST /v1/b384b9e9ab9b4ee8994c8633aabc9505/resources
{
  "name": "test",
  "type": "jar",
  "location": "obs://dlf-test/hadoop-mapreduce-examples-2.4.1.jar",
  "dependFiles": ["obs://dlf-test/depend1.jar","obs://dlf-test/depend2.jar"],
  "desc": "test",
  "directory": "/resource"
}
```

Example Response

- Success response

```
{
  "resourceId": "3624d1c3-5df5-4f20-9af9-98eadad6c5f9"
}
```

- Failure response

HTTP status code 400

```
{
  "error_code": "DLF.6259",
  "error_msg": "Files of the same name exist in the directory."
}
```

Status Codes

See [Status Codes](#).

5.2.2 Modifying a Resource

Function

This API is used to modify a specific resource. When modifying the resource, specify the resource ID.

- The resource type and directory cannot be modified.

URI

- URI format
PUT /v1/{project_id}/resources/{resource_id}
- Parameter description

Table 5-33 URI parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Project ID. For details about how to obtain a project ID, see Project ID and Account ID .
resource_id	Yes	String	Resource ID. For details about how to obtain the resource ID, see Querying a Resource List . The returned ID is resource_id .

Request Parameters

Table 5-34 Request header parameter

Parameter	Mandatory	Type	Description
workspace	No	String	<p>Workspace ID.</p> <ul style="list-style-type: none"> If this parameter is not set, data in the default workspace is queried by default. To query data in other workspaces, this header must be carried.

Table 5-35 Resource parameters

Parameter	Mandatory	Type	Description
name	Yes	String	Name of the resource. The name contains a maximum of 32 characters, including only letters, numbers, underscores (_), and hyphens (-).
type	Yes	String	<p>Resource type.</p> <ul style="list-style-type: none"> archive file jar
location	No	String	OBS path for storing the resource file. When type is set to jar , location is the path for storing the main JAR package. The path contains a maximum of 1,023 characters. For example, obs://myBucket/test.jar
dependFiles	No	List<String>	JAR package and properties file that the main JAR package depends on. The description contains a maximum of 10,240 characters.
dependPackages	No	List<DependPackage>	JAR package and properties file that the main JAR package depends on. The description contains a maximum of 10,240 characters. If this parameter and the dependFiles parameter are both available, this parameter is preferentially parsed.

Parameter	Mandatory	Type	Description
desc	No	String	Description of the resource. The description contains a maximum of 255 characters.
directory	Yes	String	Directory for storing the resource. Log in to the DataArts Studio console and access the DataArts Factory console. In the navigation pane, choose Configuration > Configure . In the resource directory tree, you can view the created directories. The default directory is the root directory.

Table 5-36 DependPackage parameters

Parameter	Mandatory	Type	Description
type	No	String	File type
location	No	String	File path

Response Parameters

None.

Example Request

Modify a resource named **test**. The resource type is **jar**. The OBS path where the resource file is located is **obs://dlf-test/hadoop-mapreduce-examples-2.4.1.jar**. The JAR package and properties file on which the resource's main JAR package depends are **obs://dlf-test/depend1.jar**, "**obs://dlf-test/depend2.jar**". The description is **test**. The directory where the resource is located is **/resource**.

```
PUT /v1/b384b9e9ab9b4ee8994c8633aabc9505/resources/3624d1c3-5df5-4f20-9af9-98eadad6c5f9
{
  "name": "test",
  "type": "jar",
  "location": "obs://dlf-test/hadoop-mapreduce-examples-2.4.1.jar",
  "dependFiles": ["obs://dlf-test/depend1.jar","obs://dlf-test/depend2.jar"],
  "desc": "test",
  "directory": "/resource"
}
```

Example Response

- Success response
HTTP status code 204

- Failure response
HTTP status code 400

```
{
  "error_code": "DLF6241",
  "error_msg": "The resource information does not exist."
}
```

5.2.3 Querying Resource Details

Function

This API is used to query resource details. A resource contains various files such as JAR, ZIP, and properties files. A created resource can be used in job nodes such as DLI Spark and MRS Spark.

URI

- URI format
GET /v1/{project_id}/resources/{resource_id}
- Parameter description

Table 5-37 URI parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Project ID. For details about how to obtain a project ID, see Project ID and Account ID .
resource_id	Yes	String	Resource ID. For details about how to obtain the resource ID, see Querying a Resource List . The returned ID is resource_id .

Request Parameters

Table 5-38 Request header parameter

Parameter	Mandatory	Type	Description
workspace	No	String	Workspace ID. <ul style="list-style-type: none"> • If this parameter is not set, data in the default workspace is queried by default. • To query data in other workspaces, this header must be carried.

Response Parameters

Table 5-39 Resource parameters

Parameter	Mandatory	Type	Description
name	Yes	String	Name of the resource. The name contains a maximum of 32 characters, including only letters, numbers, underscores (_), and hyphens (-).
type	Yes	String	Resource type. <ul style="list-style-type: none"> archive file jar
location	Yes	String	OBS path for storing the resource file. When type is set to jar , location is the path for storing the main JAR package. The path contains a maximum of 256 characters. For example, obs://myBucket/test.jar
dependFiles	No	List<String>	JAR package and properties file that the main JAR package depends on. The description contains a maximum of 10,240 characters.
desc	No	String	Description of the resource. The description contains a maximum of 255 characters.
directory	No	String	Directory for storing the resource. Log in to the DataArts Studio console and access the DataArts Factory console. In the navigation pane, choose Configuration > Configure . In the resource directory tree, you can view the created directories. The default directory is the root directory.

Example Request

View resource details.

```
GET /v1/b384b9e9ab9b4ee8994c8633aabc9505/resources/3624d1c3-5df5-4f20-9af9-98eadad6c5f9
```

Example Response

- Success response

```
{
  "name": "test",
  "type": "jar",
```

```
"location": "obs://dlf-test/hadoop-mapreduce-examples-2.4.1.jar",
"dependFiles": ["obs://dlf-test/depend1.jar","obs://dlf-test/depend2.jar"],
"desc": "test",
"directory":"/resource"
}
```

- Failure response

HTTP status code 400

```
{
"error_code":"DLF.6241",
"error_msg":"The resource information does not exist."
}
```

Status Codes

See [Status Codes](#).

5.2.4 Deleting a Resource

Function

This API is used to delete a resource.

URI

- URI format
DELETE /v1/{project_id}/resources/{resource_id}
- Parameter description

Table 5-40 URI parameters

Parameter	Man dator y	Type	Description
project_id	Yes	String	Project ID. For details about how to obtain a project ID, see Project ID and Account ID .
resource_id	Yes	String	Resource ID. For details about how to obtain the resource ID, see Querying a Resource List . The returned ID is resource_id .

Request Parameters

Table 5-41 Request header parameter

Parameter	Mandatory	Type	Description
workspace	No	String	<p>Workspace ID.</p> <ul style="list-style-type: none"> If this parameter is not set, data in the default workspace is queried by default. To query data in other workspaces, this header must be carried.

Response Parameters

None.

Example Request

```
DELETE /v1/b384b9e9ab9b4ee8994c8633aabc9505/resources/3624d1c3-5df5-4f20-9af9-98eadad6c5f9
```

Example Response

- Success response
HTTP status code 204
- Failure response
HTTP status code 400

```
{
  "error_code": "DLF.6241",
  "error_msg": "The resource information does not exist."
}
```

Status Codes

See [Status Codes](#).

5.2.5 Querying a Resource List

Function

This API is used to query a resource list. During the query, you can specify the page number and the maximum number of records on each page.

URI

- URI format
GET /v1/{project_id}/resources?
offset={offset}&limit={limit}&resourceName={resourceName}

- Parameter description

Table 5-42 URI parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Project ID. For details about how to obtain a project ID, see Project ID and Account ID .
offset	No	Integer	Start page of the paging list. Default value: 0 The value must be greater than or equal to 0 .
limit	No	Integer	The maximum number of records on each page. The value ranges from 1 to 100. Default value: 10
resourceName	No	String	Name of the resource.

Request Parameters

Table 5-43 Request header parameter

Parameter	Mandatory	Type	Description
workspace	No	String	Workspace ID. <ul style="list-style-type: none">• If this parameter is not set, data in the default workspace is queried by default.• To query data in other workspaces, this header must be carried.

Response Parameters

Table 5-44 Parameter description

Parameter	Mandatory	Type	Description
total	Yes	Integer	The total number of resources.

Parameter	Mandatory	Type	Description
resources	Yes	List<Resource>	A list of resources.

Table 5-45 Resource parameters

Parameter	Mandatory	Type	Description
id	Yes	String	ID of the resource. The resource ID is used to query the resource.
name	Yes	String	Name of the resource. The name contains a maximum of 32 characters, including only letters, numbers, underscores (_), and hyphens (-).
type	Yes	String	Resource type. <ul style="list-style-type: none"> • archive • file • jar
location	Yes	String	OBS path for storing the resource file. When type is set to jar , location is the path for storing the main JAR package. The path contains a maximum of 256 characters. For example, obs://myBucket/test.jar
dependFiles	No	List<String>	JAR package and properties file that the main JAR package depends on. The description contains a maximum of 10,240 characters.
desc	No	String	The description contains a maximum of 255 characters.
directory	No	String	Directory for storing the resource. Log in to the DataArts Studio console and access the DataArts Factory console. In the navigation pane, choose Configuration > Configure . In the resource directory tree, you can view the created directories. The default directory is the root directory.

Example Request

Query a list of resources.

```
GET /v1/b384b9e9ab9b4ee8994c8633aabc9505/resources
```

Example Response

- Success response

HTTP status code 200

```
{
  "total":1,
  "resources":[
    {
      "id":"b384b9e9ab9b4ee8994c8633aabc9505",
      "name":"test",
      "type":"jar",
      "location":"obs://00000000dlf-test/hadoop-mapreduce-examples-2.4.1.jar",
      "dependFiles":[
        "obs://00000000dlf-test/depend1.jar",
        "obs://00000000dlf-test/depend2.jar"
      ],
      "desc":"test",
      "directory":"/resource"
    }
  ]
}
```

- Failure response

HTTP status code 400

```
{
  "error_code":"DLF.3051",
  "error_msg":"The request parameter is invalid."
}
```

5.3 Job Development APIs

5.3.1 Creating a Job

Function

This API is used to create a job. A job consists of one or more nodes, such as Hive SQL and CDM Job nodes. DLF supports two types of jobs: batch jobs and real-time jobs.

URI

- URI format
POST /v1/{project_id}/jobs
- Parameter description

Table 5-46 URI parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Project ID. For details about how to obtain a project ID, see Project ID and Account ID .

Request Parameters

Table 5-47 Request header parameter

Parameter	Mandatory	Type	Description
workspace	No	String	<p>Workspace ID.</p> <ul style="list-style-type: none"> If this parameter is not set, data in the default workspace is queried by default. To query data in other workspaces, this header must be carried. <p>NOTE</p> <ul style="list-style-type: none"> You need to specify a workspace for multiple DataArts Studio instances. This parameter is mandatory if no default workspace is available. Otherwise, an error is reported.

Table 5-48 Parameters

Parameter	Mandatory	Type	Description
name	Yes	String	Job name. The name contains a maximum of 128 characters, including only letters, numbers, hyphens (-), underscores (_), and periods (.). The job name must be unique.
nodes	Yes	List<Node>	Node definition. For details, see Table 5-49 .
schedule	Yes	Schedule data structure	Scheduling configuration. For details, see Table 5-50 .
params	No	List<Param>	Job parameter definition. For details, see Table 5-51 .

Parameter	Mandatory	Type	Description
directory	No	String	Path of a job in the directory tree. If the directory of the path does not exist during job creation, a directory is automatically created in the root directory /, for example, /dir/a/ .
processType	Yes	String	Job type. <ul style="list-style-type: none"> ● REAL_TIME: real-time processing ● BATCH: batch processing
singleNodeJobFlag	No	Boolean	Whether the job is a single-task job. The default value is false .
singleNodeJobType	No	String	Single task type. If processType is BATCH , the following values are available for this parameter: <ul style="list-style-type: none"> ● DLISQL ● DWSSQL ● HiveSQL ● SparkSQL ● RDSSQL If Type is set to REAL_TIME, Type can be set to FlinkSQL, FlinkJar , or DLISpark.
lastUpdateUser	No	String	User who last updated the job
logPath	No	String	OBS path for storing job run logs
basicConfig	No	BasicConfig data structure	Basic job information. For details, see Table 5-74 .
emptyRunningJob	No	String	The value can be 0 or 1 . 1 indicates dry run, and 0 indicates canceling dry run. If this parameter is not set, the default value 0 is used.

Parameter	Mandatory	Type	Description
targetStatus	No	String	<p>This parameter is required if the review function is enabled. It indicates the target status of the job. The value can be SAVED, SUBMITTED, or PRODUCTION.</p> <ul style="list-style-type: none"> • SAVED indicates that the job is saved but cannot be scheduled or executed. It can be executed only after submitted and approved. • SUBMITTED indicates that the job is automatically submitted after it is saved and can be executed after it is approved. • PRODUCTION indicates that the job can be directly executed after it is created. Note: Only the workspace administrator can create jobs in the PRODUCTION state.
approvers	No	List<JobApprover>	Job approver. This parameter is required if the review function is enabled. For details, see Table 5-78 .

Table 5-49 Node data structure description

Parameter	Mandatory	Type	Description
name	Yes	String	Node name. The name contains a maximum of 128 characters, including only letters, numbers, hyphens (-), underscores (_), and periods (.). Names of the nodes in a job must be unique.

Parameter	Mandatory	Type	Description
type	Yes	String	<p>Node type. The options are as follows:</p> <ul style="list-style-type: none"> • Hive SQL: runs Hive SQL scripts. • Spark SQL: runs Spark SQL scripts. • DWS SQL: runs DWS SQL scripts. • DLI SQL: runs DLI SQL scripts. • Shell: runs shell SQL scripts. • CDM Job: runs CDM jobs. • DIS Transfer Task: creates DIS dump tasks. • CloudTable Manager: manages CloudTable tables, including creating and deleting tables. • OBS Manager: manages OBS paths, including creating and deleting paths. • RestClient: sends REST API requests. • SMN: sends short messages or emails. • MRS Spark: runs Spark jobs of MRS. • MapReduce: runs MapReduce jobs of MRS. • MRSFlinkJob: runs FlinkJob jobs of MRS. • MRS HetuEngine: runs HetuEngine jobs of MRS. • DLI Spark: runs Spark jobs of DLF. • RDSSQL: transfers SQL statements to RDS for execution. • ModelArts Train: executes workflow jobs of ModelArts. • Dummy: job with no node
location	Yes	Location data structure	<p>Location of a node on the job canvas. For details, see Table 5-52.</p>
preNodeName	No	List<String>	<p>Name of the previous node on which the current node depends</p>
conditions	No	List<Condition>	<p>Node execution condition. Whether the node is executed or not depends on the calculation result of the EL expression saved in the expression field of condition. For details, see Table 5-53.</p>

Parameter	Mandatory	Type	Description
properties	Yes	List<Property>	<p>Node properties. For details, see Table 5-59.</p> <p>Each type of node has its own property definition.</p> <ul style="list-style-type: none"> • Hive SQL: For details, see Table 5-60. • Spark SQL: For details, see Table 5-61. • DWS SQL: For details, see Table 5-62. • DLI SQL: For details, see Table 5-63. • Shell: For details, see Table 5-64. • CDM Job: For details, see Table 5-65. • DIS TransferTask: For details, see Table 5-66. • CloudTableManager: For details, see Table 5-67. • OBSManager: For details, see Table 5-68. • RestClient: For details, see Table 5-69. • SMN: For details, see Table 5-70. • MRS Spark: For details, see Table 5-71. • MapReduce: For details, see Table 5-72. • DLI Spark: For details, see Table 5-73. • MRS Flink: For details, see Table 5-75. • MRS HetuEngine: For details, see Table 5-76. • ModelArts Train: For details, see Table 5-77.
pollingInterval	No	Int	<p>Interval at which node running results are checked.</p> <p>Unit: second; value range: 1 to 60</p> <p>Default value: 10</p>
execTimeOutRetry	No	String	<p>Whether to retry a node upon timeout. The default value is false.</p>

Parameter	Mandatory	Type	Description
maxExecutionTime	No	Int	Maximum execution time of a node. If a node is not executed within the maximum execution time, the node is set to the failed state. The unit is minute. The value ranges from 5 to 7200. Other values do not take effect. Default value: 60
retryTimes	No	Int	Number of the node retries. The value ranges from 1 to 100. Default value: 1
retryInterval	No	Int	Interval at which a retry is performed upon a failure. The value ranges from 5 to 600. Unit: second Default value: 120
failPolicy	No	String	Node failure policy <ul style="list-style-type: none"> ● FAIL: Terminate the execution of the current job. ● IGNORE: Continue to execute the next node. ● SUSPEND: Suspend the execution of the current job. ● FAIL_CHILD: Terminate the execution of the subsequent node. The default value is FAIL.
eventTrigger	No	Event data structure	Event trigger for the real-time job node. For details, see Table 5-56 .
cronTrigger	No	Cron data structure	Cron trigger for the real-time job node. For details, see Table 5-54 .

Table 5-50 Schedule data structure description

Parameter	Mandatory	Type	Description
type	Yes	String	Scheduling type. <ul style="list-style-type: none"> ● EXECUTE_ONCE: The job runs immediately and runs only once. ● CRON: The job runs periodically. ● EVENT: The job is triggered by events.

Parameter	Mandatory	Type	Description
cron	No	Data structure	When type is set to CRON , configure the scheduling frequency and start time. For details, see Table 5-55 .
event	No	Data structure	When type is set to EVENT , configure information such as the event source. For details, see Table 5-56 .

Table 5-51 Param data structure description

Parameter	Mandatory	Type	Description
name	Yes	String	Name of a parameter. The name contains a maximum of 64 characters, including only letters, numbers, hyphens (-), and underscores (_).
value	Yes	String	Value of the parameter. It cannot exceed 1,024 characters.
type	No	String	Parameter type <ul style="list-style-type: none"> • variable • constants Default value: variable

Table 5-52 Location data structure description

Parameter	Mandatory	Type	Description
x	Yes	Int	Position of the node on the horizontal axis of the job canvas
y	Yes	Int	Position of the node on the vertical axis of the job canvas

Table 5-53 condition data structure description

Parameter	Mandatory	Type	Description
preNodeName	Yes	String	Name of the previous node on which the current node depends

Parameter	Mandatory	Type	Description
expression	Yes	String	EL expression. If the calculation result of the EL expression is true, this node is executed.

Table 5-54 CronTrigger data structure description

Parameter	Mandatory	Type	Description
startTime	Yes	String	Scheduling start time in the format of yyyy-MM-dd'T'HH:mm:ssZ, which is an ISO 8601 time format. For example, 2018-10-22T23:59:59+08, which indicates that a job starts to be scheduled at 23:59:59 on October 22nd, 2018.
endTime	No	String	Scheduling end time in the format of yyyy-MM-dd'T'HH:mm:ssZ, which is an ISO 8601 time format. For example, 2018-10-22T23:59:59+08, which indicates that a job stops to be scheduled at 23:59:59 on October 22nd, 2018. If the end time is not set, the job will continuously be executed based on the scheduling period.
expression	Yes	String	Cron expression in the format of <second><minute><hour><day><month>><week>. For details about the value input in each field, see Table 5-57 .
expressionTime Zone	No	String	Time zone corresponding to the Cron expression, for example, GMT+8. Default value: time zone where DataArts Studio is located
period	Yes	String	Job execution interval consisting of a time and time unit Example: 1 hour, 1 day, 1 week, 1 month The value must match the value of expression .

Parameter	Mandatory	Type	Description
dependPrePeriod	No	Boolean	Indicates whether to depend on the execution result of the current job's dependent job in the previous scheduling period. Default value: false
dependJobs	No	DependJobs data structure	Job dependency configuration. For details, see Table 5-58 .
concurrent	No	Integer	Number of concurrent executions allowed

Table 5-55 Cron data structure description

Parameter	Mandatory	Type	Description
startTime	Yes	String	Scheduling start time in the format of yyyy-MM-dd'T'HH:mm:ssZ, which is an ISO 8601 time format. For example, 2018-10-22T23:59:59+08, which indicates that a job starts to be scheduled at 23:59:59 on October 22nd, 2018.
endTime	No	String	Scheduling end time in the format of yyyy-MM-dd'T'HH:mm:ssZ, which is an ISO 8601 time format. For example, 2018-10-22T23:59:59+08, which indicates that a job stops to be scheduled at 23:59:59 on October 22nd, 2018. If the end time is not set, the job will continuously be executed based on the scheduling period.
expression	Yes	String	Cron expression in the format of <second><minute><hour><day><month>><week>. For details about the value input in each field, see Table 5-57 .
expressionTime Zone	No	String	Time zone corresponding to the Cron expression, for example, GMT+8. Default value: time zone where DataArts Studio is located

Parameter	Mandatory	Type	Description
dependPrePeriod	No	Boolean	Indicates whether to depend on the execution result of the current job's dependent job in the previous scheduling period. Default value: false
dependJobs	No	DependJobs data structure	Job dependency configuration. For details, see Table 5-58 .

Table 5-56 Event data structure description

Parameter	Mandatory	Type	Description
eventType	Yes	String	Select the corresponding connection name and topic. When a new Kafka message is received, the job is triggered. Set this parameter to KAFKA . Event type. Currently, only newly reported data events from the DIS stream can be monitored. Each time a data record is reported, the job runs once. This parameter is set to DIS . Select the OBS path to be listened to. If new files exist in the path, scheduling is triggered. The path name can be referenced using variable Job.trigger.obsNewFiles. The prerequisite is that DIS notifications have been configured for the OBS path. Set this parameter to OBS .
channel	Yes	String	DIS stream name. Perform the following operations to obtain the stream name: 1. Log in to the management console. 2. Click Data Ingestion Service and select Stream Management from the left navigation pane. 3. The stream management page lists the existing streams.

Parameter	Mandatory	Type	Description
failPolicy	No	String	Job failure policy <ul style="list-style-type: none"> • SUSPEND: Suspend the event. • IGNORE: Ignore the failure and process with the next event. Default value: SUSPEND
concurrent	No	int	Number of the concurrently scheduled jobs Value range: 1 to 128 Default value: 1
readPolicy	No	String	Access policy. <ul style="list-style-type: none"> • LAST: Access data from the last location. • NEW: Access data from a new location. Default value: LAST

Table 5-57 Values in the Cron expression fields

Field	Value Range	Allowed Special Character	Description
Second	0-59	, - * /	In the current version, only 0 is allowed.
Minute	0-59	, - * /	None
Hour	0-23	, - * /	None
Day	1-31	, - * ? / L W C	None
Month	1-12	, - * /	In the current version, only * is allowed.
Week	1-7	, - * ? / L C #	Starting from Sunday.

Table 5-58 DependJobs data structure description

Parameter	Mandatory	Type	Description
jobs	Yes	List<String>	A list of dependent jobs. Only the existing jobs can be depended on.

Parameter	Mandatory	Type	Description
dependPeriod	No	String	<p>Dependency period.</p> <ul style="list-style-type: none"> • SAME_PERIOD: To run a job or not depends on the execution result of its depended job in the current scheduling period. • PRE_PERIOD: To run a job or not depends on the execution result of its depended job in the previous scheduling period. <p>Default value: SAME_PERIOD</p>
dependFailPolicy	No	String	<p>Dependency job failure policy.</p> <ul style="list-style-type: none"> • FAIL: Stop the job and set the job to the failed state. • IGNORE: Continue to run the job. • SUSPEND: Suspend the job. <p>Default value: FAIL</p>

Table 5-59 Property parameters

Parameter	Mandatory	Type	Description
name	Yes	String	Property name
value	Yes	String	Property value

Table 5-60 Parameters of the Hive SQL node

Parameter	Mandatory	Type	Description
scriptName	Yes	String	Script name.
database	No	String	<p>Database name.</p> <p>Database in the MRS Hive. The default value is default.</p>
connectionName	No	String	Name of a connection
scriptArgs	No	String	<p>Script parameter in format of key and value. Multiple parameters are separated by newlines (\n), for example, key1=value1\nkey2=value2.</p>

Table 5-61 Parameters of the Spark SQL node

Parameter	Mandatory	Type	Description
scriptName	Yes	String	Script name.
database	No	String	Database name. Database in the MRS Spark SQL. The default value is default .
connectionName	No	String	Name of a connection
scriptArgs	No	String	Script parameter in format of key and value. Multiple parameters are separated by newlines (\n), for example, key1=value1\nkey2=value2 .

Table 5-62 Parameters of the DWS SQL node

Parameter	Mandatory	Type	Description
scriptName	Yes	String	Script name.
database	No	String	Database name. Database in DWS. The default value is postgres .
connectionName	No	String	Name of a connection
scriptArgs	No	String	Script parameter in format of key and value. Multiple parameters are separated by newlines (\n), for example, key1=value1\nkey2=value2 .

Table 5-63 Parameters of the DLI SQL node

Parameter	Mandatory	Type	Description
scriptName	Yes	String	Script name.
database	No	String	Database name. Database in DLI.
connectionName	No	String	Name of a connection

Parameter	Mandatory	Type	Description
scriptArgs	No	String	Script parameter in format of key and value. Multiple parameters are separated by newlines (\n), for example, key1=value1\nkey2=value2 .

Table 5-64 Parameters of the shell node

Parameter	Mandatory	Type	Description
scriptName	Yes	String	Script name.
connectionName	Yes	String	Name of a connection
arguments	No	String	Shell script parameter.

Table 5-65 Parameters of the CDM Job node

Parameter	Mandatory	Type	Description
clusterName	Yes	String	Cluster name. You can obtain the cluster name from the CDM cluster list on the DataArts Migration page of the DataArts Studio console.
jobName	Yes	String	Job name. To obtain the job name, access the DataArts Studio console, choose DataArts Migration , click a cluster name on the Cluster Management page, and click Job Management on the displayed page.

Table 5-66 Parameters of the DISTransferTask node

Parameter	Mandatory	Type	Description
streamName	Yes	String	DIS stream name. Perform the following operations to obtain the stream name: <ol style="list-style-type: none"> 1. Log in to the management console. 2. Click Data Ingestion Service and select Stream Management from the left navigation pane. 3. The stream management page lists the existing streams.
destinationType	Yes	String	Dump target. <ul style="list-style-type: none"> • CloudTable • OBS
duplicatePolicy	Yes	String	Duplicate name policy. <ul style="list-style-type: none"> • OVERWRITE • IGNORE
configuration	Yes	Data structure	Dump configuration. For details, see the descriptions of the obs_destination_descriptor and cloudtable_destination_descriptor parameters in .

Table 5-67 Parameters of the CloudTableManager node

Parameter	Mandatory	Type	Description
namespace	No	String	Namespace. Default value: default
action	Yes	String	Action type. <ul style="list-style-type: none"> • CREATE_TABLE: Create a table. • DELETE_TABLE: Delete a table.
table	No	String	Table name.
columnFamily	No	String	Column family.

Table 5-68 Parameters of the OBSManager node

Parameter	Mandatory	Type	Description
action	Yes	String	Action type. <ul style="list-style-type: none"> ● CREATE_PATH: Create an OBS path. ● DELETE_PATH: Delete an OBS path.
path	Yes	String	OBS path.

Table 5-69 Parameters of the RestClient node

Parameter	Mandatory	Type	Description
url	Yes	String	URL address. URL of the cloud service.
method	Yes	String	HTTP method. <ul style="list-style-type: none"> ● GET ● POST ● PUT ● DELETE
headers	No	String	HTTP message header in the format of <message header name>=<value>. Multiple message headers are separated by newlines.
body	No	String	Message body.

Table 5-70 Parameters of the SMN node

Parameter	Mandatory	Type	Description
topic	Yes	String	SMN topic URN Perform the following operations to obtain an SMN topic URN: <ol style="list-style-type: none"> 1. Log in to the management console. 2. Click Simple Message Notification and choose Topic Management > Topics from the list on the left. You can obtain the SMN topic URN in the topic list.

Parameter	Mandatory	Type	Description
subject	Yes	String	Message title, which is used as the subject of an email sent to a subscriber.
messageType	Yes	String	Message type. <ul style="list-style-type: none"> • NORMAL • STRUCTURE • TEMPLATE
message	Yes	String	Message to be sent.

Table 5-71 Parameters of the MRS Spark node

Parameter	Mandatory	Type	Description
clusterName	Yes	String	MRS cluster name Perform the following operations to obtain the MRS cluster name: 1. Log in to the management console. 2. Click MapReduce Service and choose Clusters > Active Clusters from the left navigation pane. You can obtain the cluster name from the active clusters.
jobName	Yes	String	MRS job name The job name is user-defined.
resourcePath	Yes	String	OBS resource path of the custom Spark JAR package
parameters	Yes	String	Custom parameters of the Spark JAR package You can specify parameters for a custom JAR package.
input	No	String	Input path. Input data path of the MRS Spark job. The path can be an HDFS or OBS path.
output	No	String	Output path. Output data path of the MRS Spark job. The path can be an HDFS or OBS path.

Parameter	Mandatory	Type	Description
programParameter	No	String	Program parameter Multiple key-value pairs are allowed and separated by vertical bars ().

Table 5-72 Parameters of the MapReduce node

Parameter	Mandatory	Type	Description
clusterName	Yes	String	MRS cluster name Perform the following operations to obtain the MRS cluster name: 1. Log in to the management console. 2. Click MapReduce Service and choose Clusters > Active Clusters from the left navigation pane. You can obtain the cluster name from the active clusters.
jobName	Yes	String	MRS job name The job name is user-defined.
resourcePath	Yes	String	Resource path.
parameters	Yes	String	Job parameter.
input	Yes	String	Input path. Input data path of the MapReduce job. The path can be an HDFS or OBS path.
output	Yes	String	Output path. Output data path of the MapReduce job. The path can be an HDFS or OBS path.

Table 5-73 Parameters of the DLI Spark node

Parameter	Mandatory	Type	Description
clusterName	Yes	String	DLI queue name Perform the following operations to obtain the DLI queue name: 1. Log in to the management console. 2. Click Data Lake Insight and then Queue Management . You can obtain the queue name from the queue management list.
jobName	Yes	String	DLI job name. Perform the following operations to obtain the job name: 1. Log in to the management console. 2. Click Data Lake Insight and then Spark Jobs . 3. Choose Job Management . You can obtain the job name from the job management list.
resourceType	No	String	Type of the running resource of the DLI job . This parameter is optional. 1. OBS path: OBS 2. DLI package: DLIResources
jobClass	No	String	Main class name. When the application type is .jar , the main class name cannot be empty.
resourcePath	Yes	String	JAR package resource path.
jarArgs	No	String	Main-class entry parameter.
sparkConfig	No	String	Running parameter of the Spark job.

Table 5-74 BasicConfig job information

Parameter	Mandatory	Type	Description
owner	No	String	Job owner. The length cannot exceed 128 characters.
agency	No	String	Job agency

Parameter	Mandatory	Type	Description
isIgnoreWaiting	No	int	Whether to ignore the waiting time in the instance timeout duration. The value can be 0 or 1 (default). 0: The waiting time is not ignored. 1: The waiting time is ignored.
priority	No	int	Job priority. The value ranges from 0 to 2. The default value is 0 . 0 indicates a top priority, 1 indicates a medium priority, and 2 indicates a low priority.
executeUser	No	String	Job execution user. The value must be an existing username.
instanceTimeout	No	int	Instance timeout interval. The unit is minute. The value ranges from 5 to 1440. The default value is 60 .
customFields	No	Map<String,String>	User-defined field. The length cannot exceed 2048 characters.

Table 5-75 Parameters of the MRS Flink node

Parameter	Mandatory	Type	Description
clusterName	Yes	String	MRS cluster name Perform the following operations to obtain the MRS cluster name: 1. Log in to the management console. 2. Click MapReduce Service and choose Clusters > Active Clusters from the left navigation pane. You can obtain the cluster name from the active clusters.
jobName	Yes	String	MRS job name The job name is user-defined.
flinkJobType	Yes	String	Flink job type, which can be FLink SQL or Flink JAR
flinkJobProcessType	Yes	String	Flink job processing mode, which can be batch or stream
scriptName	No	String	SQL script associated with the Flink SQL job
resourcePath	No	String	OBS resource path of the custom Flink JAR package

Parameter	Mandatory	Type	Description
input	No	String	Input path. Input data path of the MRS Flink job. The path can be an HDFS or OBS path.
output	No	String	Output path. Output data path of the MRS Flink job. The path can be an HDFS or OBS path.
programParameter	No	String	Program parameter Multiple key-value pairs are allowed and separated by vertical bars ().

Table 5-76 Parameters of the MRS HetuEngine node

Parameter	Mandatory	Type	Description
clusterName	Yes	String	MRS cluster name Perform the following operations to obtain the MRS cluster name: 1. Log in to the management console. 2. Click MapReduce Service and choose Clusters > Active Clusters from the left navigation pane. You can obtain the cluster name from the active clusters.
jobName	Yes	String	MRS job name The job name is user-defined.
statementOrScript	Yes	String	Whether to use an SQL statement for the node or associate an SQL script with the node
scriptName	No	String	SQL script to be associated with the node
statement	No	String	Custom content of the SQL statement
Data Warehouse	Yes	String	Data connection required by HetuEngine

Parameter	Mandatory	Type	Description
Schema	Yes	String	Name of the schema to be accessed through HetuEngine
Database	Yes	String	Name of the database to be accessed through HetuEngine
Queue	No	String	Name of the resource queue required by HetuEngine

Table 5-77 Parameters of the ModelArts Train node

Parameter	Mandatory	Type	Description
clusterName	Yes	String	<p>MRS cluster name</p> <p>Perform the following operations to obtain the MRS cluster name:</p> <ol style="list-style-type: none"> 1. Log in to the management console. 2. Click MapReduce Service and choose Clusters > Active Clusters from the left navigation pane. <p>You can obtain the cluster name from the active clusters.</p>
jobName	Yes	String	<p>MRS job name</p> <p>You can set a custom value.</p>

Parameter	Mandatory	Type	Description
statementOrScript	Yes	String	Whether to use an SQL statement for the node or associate an SQL script with the node
scriptName	No	String	SQL script to be associated with the node

Table 5-78 Approver attributes

Parameter	Mandatory	Type	Description
approverName	Yes	String	Approver name

Response Parameters

None.

Example Request

Create a job named **myJob** whose type is **BATCH**, scheduling configuration is **CRON**, path in the directory tree is **/myDir**, and OBS path for storing job run logs is **obs://dlf-test-log**.

```
POST /v1/b384b9e9ab9b4ee8994c8633aabc9505/jobs
```

```
{
  "basicConfig": {
    "customFields": {},
    "executeUser": "",
    "instanceTimeout": 0,
    "owner": "test_user",
    "priority": 0
  },
  "directory": "/myDir",
  "logPath": "obs://dlf-test-log",
  "name": "myJob",
  "nodes": [
    {
      "failPolicy": "FAIL_CHILD",
      "location": {
        "x": "-45.5",
        "y": "-134.5"
      },
      "maxExecutionTime": 360,
      "name": "MRS_Hive_SQL",
      "pollingInterval": 20,
      "preNodeName": [],
      "properties": [
        {
          "name": "scriptName",
          "value": "test_hive_sql"
        }
      ]
    }
  ]
}
```

```
{
  {
    "name": "connectionName",
    "value": "mrs_hive_test"
  },
  {
    "name": "database",
    "value": "default"
  },
  {
    "name": "scriptArgs",
    "value": "test_var=111"
  }
],
"retryInterval": 120,
"retryTimes": 0,
"type": "HiveSQL"
}
],
"processType": "BATCH",
"schedule": {
  "type": "CRON"
}
}
```

Create a job when the review function is enabled.

POST /v1/b384b9e9ab9b4ee8994c8633aabc9505/jobs

```
{
  "basicConfig": {
    "customFields": {},
    "executeUser": "",
    "instanceTimeout": 0,
    "owner": "test_user",
    "priority": 0
  },

    },
    {
      "approverName": "userName2"
    }
  ]
}

```

Example Response

- Success response
HTTP status code 204
- Failure response
HTTP status code 400

```

{
  "error_code": "DLF.0102",
  "error_msg": "The job name already exists."
}

```

5.3.2 Modifying a Job

Function

This API is used to edit a job.

URI

- URI format
PUT /v1/{project_id}/jobs/{job_name}
- Parameter description

Table 5-79 URI parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Project ID. For details about how to obtain a project ID, see Project ID and Account ID .
job_name	Yes	String	Job name

Request Parameters

Table 5-80 Request header parameter

Parameter	Mandatory	Type	Description
workspace	No	String	<p>Workspace ID.</p> <ul style="list-style-type: none"> If this parameter is not set, data in the default workspace is queried by default. To query data in other workspaces, set this parameter.

Table 5-81 Parameters

Parameter	Mandatory	Type	Description
name	Yes	String	Job name. The name contains a maximum of 128 characters, including only letters, numbers, hyphens (-), underscores (_), and periods (.). The job name must be unique.
nodes	Yes	List<Node>	Node definition. For details, see Table 5-82 .
schedule	Yes	Schedule data structure	Scheduling configuration. For details, see Table 5-83 .
params	No	List<Param>	Job parameter definition. For details, see Table 5-84 .
directory	No	String	Path of a job in the directory tree. If the directory of the path does not exist during job creation, a directory is automatically created in the root directory /, for example, /dir/a/ .
cleanOverdueDays	No	Int	Maximum timeout duration of the job
cleanWaitingJob	No	String	Whether to clear waiting jobs
emptyRunningJob	No	String	The value can be 0 or 1 . Value 1 indicates dry run, and value 0 indicates that dry run is canceled. If this parameter is not set, the default value 0 is used.

Parameter	Mandatory	Type	Description
processType	Yes	String	Job type. <ul style="list-style-type: none"> • REAL_TIME: real-time processing • BATCH: batch processing
id	No	Long	Job ID For details about how to obtain it, see Viewing Job Details . The returned ID is the job ID.
lastUpdateUser	No	String	User who last updated the job
logPath	No	String	OBS path for storing job run logs
basicConfig	No	BasicConfig data structure	Basic job information. For details, see Table 5-107 .
targetStatus	No	String	This parameter is required if the review function is enabled. It indicates the target status of the job. The value can be SAVED , SUBMITTED , or PRODUCTION . <ul style="list-style-type: none"> • SAVED indicates that the job is saved but cannot be scheduled or executed. It can be executed only after submitted and approved. • SUBMITTED indicates that the job is automatically submitted after it is saved and can be executed after it is approved. • PRODUCTION indicates that the job can be directly executed after it is created. Note: Only the workspace administrator can create jobs in the PRODUCTION state.
approvers	No	List<JobApprover>	Job approver. This parameter is required if the review function is enabled. For details, see Table 5-111 . For details about how to enable the review function, see Review Center .

Table 5-82 Node data structure description

Parameter	Mandatory	Type	Description
name	Yes	String	Node name. The name contains a maximum of 128 characters, including only letters, numbers, hyphens (-), underscores (_), and periods (.). Names of the nodes in a job must be unique.
type	Yes	String	Node type. The options are as follows: <ul style="list-style-type: none"> • Hive SQL: runs Hive SQL scripts. • Spark SQL: runs Spark SQL scripts. • DWS SQL: runs DWS SQL scripts. • DLI SQL: runs DLI SQL scripts. • Shell: runs shell SQL scripts. • CDM Job: runs CDM jobs. • DIS Transfer Task: creates DIS dump tasks. • CloudTable Manager: manages CloudTable tables, including creating and deleting tables. • OBS Manager: manages OBS paths, including creating and deleting paths. • RestClient: sends REST API requests. • SMN: sends short messages or emails. • MRS Spark: runs Spark jobs of MRS. • MapReduce: runs MapReduce jobs of MRS. • MRSFlinkJob: runs FlinkJob jobs of MRS. • MRS HetuEngine: runs HetuEngine jobs of MRS. • DLI Spark: runs Spark jobs of DLF. • RDSSQL: transfers SQL statements to RDS for execution. • ModelArts Train: executes workflow jobs of ModelArts.
location	Yes	Location data structure	Location of a node on the job canvas. For details, see Table 5-85 .
preNodeName	No	List<String>	Name of the previous node on which the current node depends

Parameter	Mandatory	Type	Description
conditions	No	List<Condition>	Node execution condition. Whether the node is executed or not depends on the calculation result of the EL expression saved in the expression field of condition. For details, see Table 5-86 .
properties	Yes	List<Property>	Node properties. For details, see Table 5-92 . Each type of node has its own property definition. <ul style="list-style-type: none"> • Hive SQL: For details, see Table 5-93. • Spark SQL: For details, see Table 5-94. • DWS SQL: For details, see Table 5-95. • DLI SQL: For details, see Table 5-96. • Shell: For details, see Table 5-97. • CDM Job: For details, see Table 5-98. • DIS TransferTask: For details, see Table 5-99. • CloudTableManager: For details, see Table 5-100. • OBSManager: For details, see Table 5-101. • RESTAPI: For details, see Table 5-102. • SMN: For details, see Table 5-103. • MRS Spark: For details, see Table 5-104. • MapReduce: For details, see Table 5-105. • DLI Spark: For details, see Table 5-106. • MRS Flink: For details, see Table 5-108. • MRS HetuEngine: For details, see Table 5-109. • ModelArts Train: For details, see Table 5-110.
pollingInterval	No	Int	Interval at which node running results are checked. Unit: second; value range: 1 to 60 Default value: 10

Parameter	Mandatory	Type	Description
execTimeOutRetry	No	String	Whether to retry a node upon timeout. The default value is false .
maxExecutionTime	No	Int	Maximum execution time of a node. If a node is not executed within the maximum execution time, the node is set to the failed state. Unit: minute; value range: 5 to 1440 Default value: 60
retryTimes	No	Int	Number of the node retries. The value ranges from 1 to 100. Default value: 1
retryInterval	No	Int	Interval at which a retry is performed upon a failure. The value ranges from 5 to 600. Unit: second Default value: 120
failPolicy	No	String	Node failure policy <ul style="list-style-type: none"> ● FAIL: Terminate the execution of the current job. ● IGNORE: Continue to execute the next node. ● SUSPEND: Suspend the execution of the current job. ● FAIL_CHILD: Terminate the execution of the subsequent node. The default value is FAIL.
eventTrigger	No	Event data structure	Event trigger for the real-time job node. For details, see Table 5-89 .
cronTrigger	No	Cron data structure	Cron trigger for the real-time job node. For details, see Table 5-87 .

Table 5-83 Schedule data structure description

Parameter	Mandatory	Type	Description
type	Yes	String	Scheduling type. <ul style="list-style-type: none"> ● EXECUTE_ONCE: The job runs immediately and runs only once. ● CRON: The job runs periodically. ● EVENT: The job is triggered by events.
cron	No	Data structure	When type is set to CRON , configure the scheduling frequency and start time. For details, see Table 5-88 .
event	No	Data structure	When type is set to EVENT , configure information such as the event source. For details, see Table 5-89 .

Table 5-84 Param data structure description

Parameter	Mandatory	Type	Description
name	Yes	String	Parameter name. It contains only letters, digits, hyphens (-), and underscores (_), and can contain no more than 64 characters.
value	Yes	String	Value of the parameter. It cannot exceed 1,024 characters.
type	No	String	Type <ul style="list-style-type: none"> ● variable ● constants Default value: variable

Table 5-85 Location data structure description

Parameter	Mandatory	Type	Description
x	Yes	Int	Position of the node on the horizontal axis of the job canvas
y	Yes	Int	Position of the node on the vertical axis of the job canvas

Table 5-86 condition data structure description

Parameter	Mandatory	Type	Description
preNodeName	Yes	String	Name of the previous node on which the current node depends
expression	Yes	String	EL expression. If the calculation result of the EL expression is true, this node is executed.

Table 5-87 CronTrigger data structure description

Parameter	Mandatory	Type	Description
startTime	Yes	String	Scheduling start time in the format of yyyy-MM-dd'T'HH:mm:ssZ, which is an ISO 8601 time format. For example, 2018-10-22T23:59:59+08, which indicates that a job starts to be scheduled at 23:59:59 on October 22nd, 2018.
endTime	No	String	Scheduling end time in the format of yyyy-MM-dd'T'HH:mm:ssZ, which is an ISO 8601 time format. For example, 2018-10-22T23:59:59+08, which indicates that a job stops to be scheduled at 23:59:59 on October 22nd, 2018. If the end time is not set, the job will continuously be executed based on the scheduling period.
expression	Yes	String	Cron expression in the format of <second><minute><hour><day><month>><week>. For details about the value input in each field, see Table 5-90 .
expressionTime Zone	No	String	Time zone corresponding to the Cron expression, for example, GMT+8. Default value: time zone where DataArts Studio is located
period	Yes	String	Job execution interval consisting of a time and time unit Example: 1 hour, 1 day, 1 week, 1 month The value must match the value of expression .

Parameter	Mandatory	Type	Description
dependPrePeriod	No	Boolean	Indicates whether to depend on the execution result of the current job's dependent job in the previous scheduling period. Default value: false
dependJobs	No	DependJobs data structure	Job dependency configuration. For details, see Table 5-91 .
concurrent	No	Integer	Number of concurrent executions allowed

Table 5-88 Cron data structure description

Parameter	Mandatory	Type	Description
startTime	Yes	String	Scheduling start time in the format of yyyy-MM-dd'T'HH:mm:ssZ, which is an ISO 8601 time format. For example, 2018-10-22T23:59:59+08, which indicates that a job starts to be scheduled at 23:59:59 on October 22nd, 2018.
endTime	No	String	Scheduling end time in the format of yyyy-MM-dd'T'HH:mm:ssZ, which is an ISO 8601 time format. For example, 2018-10-22T23:59:59+08, which indicates that a job stops to be scheduled at 23:59:59 on October 22nd, 2018. If the end time is not set, the job will continuously be executed based on the scheduling period.
expression	Yes	String	Cron expression in the format of <second><minute><hour><day><month>><week>. For details about the value input in each field, see Table 5-90 .
expressionTime Zone	No	String	Time zone corresponding to the Cron expression, for example, GMT+8. Default value: time zone where DataArts Studio is located

Parameter	Mandatory	Type	Description
dependPrePeriod	No	Boolean	Indicates whether to depend on the execution result of the current job's dependent job in the previous scheduling period. Default value: false
dependJobs	No	DependJobs data structure	Job dependency configuration. For details, see Table 5-91 .

Table 5-89 Event data structure description

Parameter	Mandatory	Type	Description
eventType	Yes	String	Select the corresponding connection name and topic. When a new Kafka message is received, the job is triggered. Set this parameter to KAFKA . Event type. Currently, only newly reported data events from the DIS stream can be monitored. Each time a data record is reported, the job runs once. This parameter is set to DIS . Select the OBS path to be listened to. If new files exist in the path, scheduling is triggered. The path name can be referenced using variable Job.trigger.obsNewFiles. The prerequisite is that DIS notifications have been configured for the OBS path. Set this parameter to OBS .
channel	Yes	String	DIS stream name. Perform the following operations to obtain the stream name: <ol style="list-style-type: none"> 1. Log in to the management console. 2. Click Data Ingestion Service and select Stream Management from the left navigation pane. 3. The stream management page lists the existing streams.

Parameter	Mandatory	Type	Description
failPolicy	No	String	Job failure policy <ul style="list-style-type: none"> • SUSPEND: Suspend the event. • IGNORE: Ignore the failure and process with the next event. Default value: SUSPEND
concurrent	No	int	Number of the concurrently scheduled jobs Value range: 1 to 128 Default value: 1
readPolicy	No	String	Read policy <ul style="list-style-type: none"> • LAST: Access data from the last location. • NEW: Access data from a new location. Default value: LAST

Table 5-90 Values in the Cron expression fields

Field	Value Range	Allowed Special Character	Description
Second	0-59	, - * /	In the current version, only 0 is allowed.
Minute	0-59	, - * /	None
Hour	0-23	, - * /	None
Day	1-31	, - * ? / L W C	None
Month	1-12	, - * /	In the current version, only * is allowed.
Week	1-7	, - * ? / L C #	Starting from Sunday.

Table 5-91 DependJobs data structure description

Parameter	Mandatory	Type	Description
jobs	Yes	List<String>	A list of dependent jobs. Only the existing jobs can be depended on.

Parameter	Mandatory	Type	Description
dependPeriod	No	String	<p>Dependency period.</p> <ul style="list-style-type: none"> • SAME_PERIOD: To run a job or not depends on the execution result of its depended job in the current scheduling period. • PRE_PERIOD: To run a job or not depends on the execution result of its depended job in the previous scheduling period. <p>Default value: SAME_PERIOD</p>
dependFailPolicy	No	String	<p>Dependency job failure policy.</p> <ul style="list-style-type: none"> • FAIL: Stop the job and set the job to the failed state. • IGNORE: Continue to run the job. • SUSPEND: Suspend the job. <p>Default value: FAIL</p>

Table 5-92 Property parameters

Parameter	Mandatory	Type	Description
name	Yes	String	Property name
value	Yes	String	Property value

Table 5-93 Parameters of the Hive SQL node

Parameter	Mandatory	Type	Description
scriptName	Yes	String	Script name
database	No	String	<p>Database name</p> <p>Database in the MRS Hive. The default value is default.</p>
connectionName	No	String	Name of a connection
scriptArgs	No	String	<p>Script parameter in format of key and value. Multiple parameters are separated by newlines (\n), for example, key1=value1\nkey2=value2.</p>

Table 5-94 Parameters of the Spark SQL node

Parameter	Mandatory	Type	Description
scriptName	Yes	String	Script name
database	No	String	Database name Database in the MRS Spark SQL. The default value is default .
connectionName	No	String	Name of a connection
scriptArgs	No	String	Script parameter in format of key and value. Multiple parameters are separated by newlines (\n), for example, key1=value1\nkey2=value2 .

Table 5-95 Parameters of the DWS SQL node

Parameter	Mandatory	Type	Description
scriptName	Yes	String	Script name
database	No	String	Database name Database in DWS. The default value is postgres .
connectionName	No	String	Name of a connection
scriptArgs	No	String	Script parameter in format of key and value. Multiple parameters are separated by newlines (\n), for example, key1=value1\nkey2=value2 .

Table 5-96 Parameters of the DLI SQL node

Parameter	Mandatory	Type	Description
scriptName	Yes	String	Script name.
database	No	String	Database name Database in DLI.
connectionName	No	String	Name of a connection

Parameter	Mandatory	Type	Description
scriptArgs	No	String	Script parameter in format of key and value. Multiple parameters are separated by newlines (\n), for example, key1=value1\nkey2=value2 .

Table 5-97 Parameters of the shell node

Parameter	Mandatory	Type	Description
scriptName	Yes	String	Script name
connectionName	Yes	String	Name of a connection
arguments	No	String	Shell script parameter.

Table 5-98 Parameters of the CDM Job node

Parameter	Mandatory	Type	Description
clusterName	Yes	String	Cluster name You can obtain the cluster name from the CDM cluster list on the DataArts Migration page of the DataArts Studio console.
jobName	Yes	String	Job name To obtain the job name, access the DataArts Studio console, choose DataArts Migration , click a cluster name on the Cluster Management page, and click Job Management on the displayed page.

Table 5-99 Parameters of the DISTransferTask node

Parameter	Mandatory	Type	Description
streamName	Yes	String	DIS stream name. Perform the following operations to obtain the stream name: <ol style="list-style-type: none"> 1. Log in to the management console. 2. Click Data Ingestion Service and select Stream Management from the left navigation pane. 3. The stream management page lists the existing streams.
destinationType	Yes	String	Dump target <ul style="list-style-type: none"> • CloudTable • OBS
duplicatePolicy	Yes	String	Duplicate name policy. <ul style="list-style-type: none"> • OVERWRITE • IGNORE
configuration	Yes	Data structure	Dump configuration. For details, see the descriptions of the obs_destination_descriptor and cloudtable_destination_descriptor parameters in .

Table 5-100 Parameters of the CloudTableManager node

Parameter	Mandatory	Type	Description
namespace	No	String	Namespace Default value: default
action	Yes	String	Action type <ul style="list-style-type: none"> • CREATE_TABLE: Create a table. • DELETE_TABLE: Delete a table.
table	No	String	Table name
columnFamily	No	String	Column family

Table 5-101 Parameters of the OBSManager node

Parameter	Mandatory	Type	Description
action	Yes	String	Action type <ul style="list-style-type: none"> ● CREATE_PATH: Create an OBS path. ● DELETE_PATH: Delete an OBS path.
path	Yes	String	OBS path

Table 5-102 Parameters of the RESTAPI node

Parameter	Mandatory	Type	Description
url	Yes	String	URL URL of the cloud service.
method	Yes	String	HTTP method <ul style="list-style-type: none"> ● GET ● POST ● PUT ● DELETE
headers	No	String	HTTP message header in the format of <message header name>=<value>. Multiple message headers are separated by newlines.
body	No	String	Message body

Table 5-103 Parameters of the SMN node

Parameter	Mandatory	Type	Description
topic	Yes	String	SMN topic URN Perform the following operations to obtain an SMN topic URN: <ol style="list-style-type: none"> 1. Log in to the management console. 2. Click Simple Message Notification and choose Topic Management > Topics from the list on the left. You can obtain the SMN topic URN in the topic list.

Parameter	Mandatory	Type	Description
subject	Yes	String	Message title, which is used as the subject of an email sent to a subscriber.
messageType	Yes	String	Message type <ul style="list-style-type: none"> • NORMAL • STRUCTURE • TEMPLATE
message	Yes	String	Message to be sent.

Table 5-104 Parameters of the MRS Spark node

Parameter	Mandatory	Type	Description
clusterName	Yes	String	MRS cluster name Perform the following operations to obtain the MRS cluster name: 1. Log in to the management console. 2. Click MapReduce Service and choose Clusters > Active Clusters from the left navigation pane. You can obtain the cluster name from the active clusters.
jobName	Yes	String	MRS job name The job name is user-defined.
resourcePath	Yes	String	OBS resource path of the custom Spark JAR package
parameters	Yes	String	Custom parameters of the Spark JAR package You can specify parameters for a custom JAR package.
input	No	String	Input path Input data path of the MRS Spark job. The path can be an HDFS or OBS path.
output	No	String	Output path Output data path of the MRS Spark job. The path can be an HDFS or OBS path.

Parameter	Mandatory	Type	Description
programParameter	No	String	Program parameter Multiple key-value pairs are allowed and separated by vertical bars ().

Table 5-105 Parameters of the MapReduce node

Parameter	Mandatory	Type	Description
clusterName	Yes	String	MRS cluster name Perform the following operations to obtain the MRS cluster name: 1. Log in to the management console. 2. Click MapReduce Service and choose Clusters > Active Clusters from the left navigation pane. You can obtain the cluster name from the active clusters.
jobName	Yes	String	MRS job name The job name is user-defined.
resourcePath	Yes	String	Resource path
parameters	Yes	String	Job parameters
input	Yes	String	Input path Input data path of the MapReduce job. The path can be an HDFS or OBS path.
output	Yes	String	Output path Output data path of the MapReduce job. The path can be an HDFS or OBS path.

Table 5-106 Parameters of the DLI Spark node

Parameter	Mandatory	Type	Description
clusterName	Yes	String	DLI queue name Perform the following operations to obtain the DLI queue name: <ol style="list-style-type: none">1. Log in to the management console.2. Click Data Lake Insight and then Queue Management. You can obtain the queue name from the queue management list.
jobName	Yes	String	DLI job name. Perform the following operations to obtain the job name: <ol style="list-style-type: none">1. Log in to the management console.2. Click Data Lake Insight and then Spark Jobs.3. Choose Job Management. You can obtain the job name from the job management list.
resourceType	No	String	Type of the running resource of the DLI job . This parameter is optional. <ol style="list-style-type: none">1. OBS path: OBS2. DLI package: DLIResources
jobClass	No	String	Main class name. When the application type is .jar , the main class name cannot be empty.
resourcePath	Yes	String	JAR package resource path.
jarArgs	No	String	Main-class entry parameter.
sparkConfig	No	String	Running parameter of the Spark job.

Table 5-107 BasicConfig job information

Parameter	Mandatory	Type	Description
owner	No	String	Job owner. The length cannot exceed 128 characters.

Parameter	Mandatory	Type	Description
priority	No	int	Job priority. The value ranges from 0 to 2. The default value is 0 . 0 indicates a top priority, 1 indicates a medium priority, and 2 indicates a low priority.
executeUser	No	String	Job execution user. The value must be an existing username.
instanceTimeout	No	int	Instance timeout interval. The unit is minute. The value ranges from 5 to 1440. The default value is 60 .
customFields	No	Map<String,String>	User-defined field. The length cannot exceed 2048 characters.

Table 5-108 Parameters of the MRS Flink node

Parameter	Mandatory	Type	Description
clusterName	Yes	String	MRS cluster name Perform the following operations to obtain the MRS cluster name: <ol style="list-style-type: none"> 1. Log in to the management console. 2. Click MapReduce Service and choose Clusters > Active Clusters from the left navigation pane. You can obtain the cluster name from the active clusters.
jobName	Yes	String	MRS job name The job name is user-defined.

Parameter	Mandatory	Type	Description
flinkJobType	Yes	String	Flink job type, which can be FLink SQL or Flink JAR
flinkJobProcessType	Yes	String	Flink job processing mode, which can be batch or stream
scriptName	No	String	SQL script associated with the Flink SQL job
resourcePath	No	String	OBS resource path of the custom Flink JAR package
input	No	String	Input path Input data path of the MRS Flink job. The path can be an HDFS or OBS path.
output	No	String	Output path Output data path of the MRS Flink job. The path can be an HDFS or OBS path.
programParameter	No	String	Program parameter Multiple key-value pairs are allowed and separated by vertical bars ().

Table 5-109 Parameters of the MRS HetuEngine node

Parameter	Mandatory	Type	Description
clusterName	Yes	String	MRS cluster name Perform the following operations to obtain the MRS cluster name: 1. Log in to the management console. 2. Click MapReduce Service and choose Clusters > Active Clusters from the left navigation pane. You can obtain the cluster name from the active clusters.
jobName	Yes	String	MRS job name The job name is user-defined.
statementOrScript	Yes	String	Whether to use an SQL statement for the node or associate an SQL script with the node
scriptName	No	String	SQL script to be associated with the node
statement	No	String	Custom content of the SQL statement
Data Warehouse	Yes	String	Data connection required by HetuEngine

Parameter	Mandatory	Type	Description
Schema	Yes	String	Name of the schema to be accessed through HetuEngine
Database	Yes	String	Name of the database to be accessed through HetuEngine
Queue	No	String	Name of the resource queue required by HetuEngine

Table 5-110 Parameters of the ModelArts Train node

Parameter	Mandatory	Type	Description
clusterName	Yes	String	<p>MRS cluster name</p> <p>Perform the following operations to obtain the MRS cluster name:</p> <ol style="list-style-type: none"> 1. Log in to the management console. 2. Click MapReduce Service and choose Clusters > Active Clusters from the left navigation pane. <p>You can obtain the cluster name from the active clusters.</p>
jobName	Yes	String	<p>MRS job name</p> <p>You can set a custom value.</p>

Parameter	Mandatory	Type	Description
statementOrScript	Yes	String	Whether to use an SQL statement for the node or associate an SQL script with the node
scriptName	No	String	SQL script to be associated with the node

Table 5-111 Approver attributes

Parameter	Mandatory	Type	Description
approverName	Yes	String	Approver name

Example Request

Modify the attributes of a job named **myJob**. The job ID is **608627**, the last modifier is **test_user**, the job type is **BATCH**, the job scheduling configuration is **CRON**, the job path in the directory tree is **/myDir**, and the OBS path for storing job run logs is **obs://dlf-test-log**.

PUT /v1/b384b9e9ab9b4ee8994c8633aabc9505/jobs/myJob

```
{
  "basicConfig": {
    "customFields": {},
    "executeUser": "",
    "instanceTimeout": 0,
    "owner": "test_user",
    "priority": 0
  },
  "directory": "/myDir",
  "id": 608627,
  "lastUpdateUser": "test_user",
  "logPath": "obs://dlf-test-log",
  "name": "myJob",
  "nodes": [
    {
      "failPolicy": "FAIL_CHILD",
      "location": {
        "x": "-45.5",
        "y": "-134.5"
      },
      "maxExecutionTime": 360,
      "name": "MRS_Hive_SQL",
      "pollingInterval": 20,
      "preNodeName": [],
      "properties": [
        {
          "name": "scriptName",
          "value": "test_hive_sql"
        },

Example Response

- Success response
HTTP status code 204
- Failure response
HTTP status code 400

```

{
  "error_code": "DLF.0100",
  "error_msg": "The job does not exists."
}

```

5.3.3 Viewing a Job List

Function

This API is used to query a list of batch or real-time jobs. A maximum of 100 jobs can be returned for each query.

URI

- URI format
GET /v1/{project_id}/jobs?
jobType={jobType}&offset={offset}&limit={limit}&jobName={jobName}&tags={tags}
- Parameter description

Parameter	Mandatory	Type	Description
project_id	Yes	String	Project ID. For details about how to obtain a project ID, see Project ID and Account ID .
jobType	No	String	Job type <ul style="list-style-type: none"> • REAL_TIME: real-time processing • BATCH: batch processing Default value: BATCH

Parameter	Mandatory	Type	Description
offset	No	Integer	Number of pages of the paging list. Default value: 0 The value must be greater than or equal to 0 .
limit	No	Integer	The maximum number of records on each page. The value ranges from 1 to 1,000. Default value: 10
jobName	No	String	Job name.
tags	No	String	List of job tags. Separate multiple tags with commas (,), for example, tag1,tag2,tag3 .

Request Parameters

Table 5-112 Request header parameter

Parameter	Mandatory	Type	Description
workspace	No	String	Workspace ID. <ul style="list-style-type: none"> If this parameter is not set, data in the default workspace is queried by default. To query data in other workspaces, this header must be carried.

Response Parameters

Table 5-113 Response parameters

Parameter	Mandatory	Type	Description
total	Yes	Integer	Number of jobs.
jobs	Yes	List<Job>	Job list. For details, see Table 5-114 .

Table 5-114 Job data structure description

Parameter	Mandatory	Type	Description
name	Yes	String	Job name.
jobType	Yes	String	Job type. <ul style="list-style-type: none"> ● REAL_TIME: real-time processing ● BATCH: batch processing
owner	No	String	Job owner. The length cannot exceed 128 characters.
priority	No	int	Job priority. The value ranges from 0 to 2. The default value is 0 . 0 indicates a top priority, 1 indicates a medium priority, and 2 indicates a low priority.
status	Yes	String	Job status. When jobType is set to REAL_TIME , the status is as follows: <ul style="list-style-type: none"> ● STARTING ● NORMAL ● EXCEPTION ● STOPPING ● STOPPED When jobType is set to BATCH , the status is as follows: <ul style="list-style-type: none"> ● SCHEDULING ● STOPPED ● PAUSED
createUser	Yes	String	Job creator.
createTime	Yes	Long	Time when the job is created.
startTime	No	Long	Time when the job starts running.
endTime	No	Long	Time when the job stops running.
lastInstanceStatus	No	String	Most recent running status of the job instance. This parameter is available only when jobType is set to BATCH .
lastInstanceEndTime	No	Long	Time when the most recent job instance stops to run. This parameter is available only when jobType is set to BATCH .
lastUpdateTime	No	Long	Time when the job was last updated
lastUpdateUser	No	String	User who last updated the job

Parameter	Mandatory	Type	Description
path	No	String	Path of the job
singleNodeJobFlag	No	boolean	Whether the job is a single-task job

Example Request

Query the job list.

```
GET /v1/ff6b627b9d7b45b48f773be511c1a2b8/jobs
```

Example Response

- Success response

```
{
  "jobs": [
    {
      "createTime": 1680783636000,
      "createUser": "test_user",
      "jobType": "BATCH",
      "lastInstanceEndTime": 1682519407000,
      "lastInstanceStatus": "success",
      "lastUpdateUser": "test_user",
      "name": "myJob",
      "owner": "test_user",
      "path": "/",
      "priority": 0,
      "singleNodeJobFlag": false,
      "status": "SCHEDULING"
    }
  ],
  "total": 1
}
```

- Failure response

HTTP status code 400

```
{
  "error_code": "DLF.3051",
  "error_msg": "The request parameter is invalid."
}
```

5.3.4 Viewing Job Details

Function

This API is used to view job details.

URI

- URI format
GET /v1/{project_id}/jobs/{job_name}?version={version}
- Parameter description

Parameter	Mandatory	Type	Description
project_id	Yes	String	Project ID. For details about how to obtain a project ID, see Project ID and Account ID .
job_name	Yes	String	Job name.
version	No	Integer	Job version number. If this parameter is specified, jobs of the specified version are queried. If this parameter is not specified, jobs of the latest version are queried.

Request Parameters

Table 5-115 Request header parameter

Parameter	Mandatory	Type	Description
workspace	No	String	Workspace ID. <ul style="list-style-type: none"> If this parameter is not set, data in the default workspace is queried by default. To query data in other workspaces, this header must be carried.

Response Parameters

Table 5-116 Parameters

Parameter	Mandatory	Type	Description
name	Yes	String	Job name. The name contains a maximum of 128 characters, including only letters, numbers, hyphens (-), underscores (_), and periods (.). The job name must be unique.
nodes	Yes	List<Node>	Node definition. For details, see Table 5-117 .
schedule	Yes	Schedule data structure	Scheduling configuration. For details, see Table 5-118 .

Parameter	Mandatory	Type	Description
params	No	List<Param>	Job parameter definition. For details, see Table 5-119 .
directory	No	String	Path of a job in the directory tree. If the directory of the path does not exist during job creation, a directory is automatically created in the root directory /, for example, /dir/a/.
processType	Yes	String	Job type. <ul style="list-style-type: none">● REAL_TIME: real-time processing● BATCH: batch processing
id	No	Long	Job ID This parameter is required for querying jobs.
createTime	No	Long	Job creation time
downstreamJobs	No	String	Name of the downstream job that depends on the current job
lastUpdateUser	No	String	User who last updated the job
logPath	No	String	OBS path for storing job run logs
basicConfig	No	BasicConfig data structure	Basic job information. For details, see Table 5-142 .
description	No	String	Job description
cleanoverdueDays	No	integer	Maximum timeout duration of the job
cleanWaitingJob	No	String	Whether to clear waiting jobs
emptyRunningJob	No	String	Whether to enable dry run
version	No	String	Job version

Table 5-117 Node data structure description

Parameter	Mandatory	Type	Description
name	Yes	String	Node name. The name contains a maximum of 128 characters, including only letters, numbers, hyphens (-), underscores (_), and periods (.). Names of the nodes in a job must be unique.
type	Yes	String	Node type. The options are as follows: <ul style="list-style-type: none"> ● Hive SQL: Runs Hive SQL scripts. ● Spark SQL: Runs Spark SQL scripts. ● DWS SQL: Runs DWS SQL scripts. ● DLI SQL: Runs DLI SQL scripts. ● Shell: Runs shell SQL scripts. ● CDM Job: Runs CDM jobs. ● DIS Transfer Task: Creates DIS dump tasks. ● CloudTableManager: Manages CloudTable tables, including creating and deleting tables. ● OBS Manager: Manages OBS paths, including creating and deleting paths. ● RestClient: Sends REST API requests. ● SMN: Sends short messages or emails. ● MRS Spark: Runs Spark jobs of MRS. ● MapReduce: Runs MapReduce jobs of MRS. ● MRSFlinkJob: Runs FlinkJob jobs of MRS. ● MRS HetuEngine: Runs HetuEngine jobs of MRS. ● DLI Spark: Runs Spark jobs of DLF. ● RDSSQL: Transfers SQL statements to RDS for execution. ● Dummy: job with no node
location	Yes	Location data structure	Location of a node on the job canvas. For details, see Table 5-120 .
preNodeName	No	List<String >	Name of the previous node on which the current node depends.

Parameter	Mandatory	Type	Description
conditions	No	List<Condition>	Node execution condition. Whether the node is executed or not depends on the calculation result of the EL expression saved in the expression field of condition. For details, see Table 5-121 .
properties	Yes	List<Property>	Node properties. For details, see Table 5-127 . Each type of node has its own property definition. <ul style="list-style-type: none"> • Hive SQL: For details, see Table 5-128. • Spark SQL: For details, see Table 5-129. • DWS SQL: For details, see Table 5-130. • DLI SQL: For details, see Table 5-131. • Shell: For details, see Table 5-132. • CDM Job: For details, see Table 5-133. • DIS TransferTask: For details, see Table 5-134. • CloudTableManager: For details, see Table 5-135. • OBSManager: For details, see Table 5-136. • RESTAPI: For details, see Table 5-137. • SMN: For details, see Table 5-138. • MRS Spark: For details, see Table 5-139. • MapReduce: For details, see Table 5-140. • DLI Spark: For details, see Table 5-141. • MRS Flink: For details, see Table 5-143. • MRS HetuEngine: For details, see Table 5-144.
pollingInterval	No	Int	Interval at which node running results are checked. Unit: second; value range: 1 to 60 Default value: 10

Parameter	Mandatory	Type	Description
execTimeOutRetry	No	String	Whether to retry a node upon timeout. The default value is false .
maxExecutionTime	No	Int	Maximum execution time of a node. If a node is not executed within the maximum execution time, the node is set to the failed state. Unit: minute; value range: 5 to 1440 Default value: 60
retryTimes	No	Int	Number of the node retries. The value ranges from 0 to 5. 0 indicates no retry. Default value: 0
retryInterval	No	Int	Interval at which a retry is performed upon a failure. The value ranges from 5 to 120. Unit: second Default value: 120
failPolicy	No	String	Node failure policy. <ul style="list-style-type: none"> ● FAIL: Terminate the execution of the current job. ● IGNORE: Continue to execute the next node. ● SUSPEND: Suspend the execution of the current job. ● FAIL_CHILD: Terminate the execution of the subsequent node. The default value is FAIL.
eventTrigger	No	Event data structure	Event trigger for the real-time job node. For details, see Table 5-124 .
cronTrigger	No	Cron data structure	Cron trigger for the real-time job node. For details, see Table 5-122 .

Table 5-118 Schedule data structure description

Parameter	Mandatory	Type	Description
type	Yes	String	Scheduling type. <ul style="list-style-type: none"> ● EXECUTE_ONCE: The job runs immediately and runs only once. ● CRON: The job runs periodically. ● EVENT: The job is triggered by events.
cron	No	Data structure	When type is set to CRON , configure the scheduling frequency and start time. For details, see Table 5-123 .
event	No	Data structure	When type is set to EVENT , configure information such as the event source. For details, see Table 5-124 .

Table 5-119 Param data structure description

Parameter	Mandatory	Type	Description
name	Yes	String	Parameter name. It contains only letters, digits, hyphens (-), and underscores (_), and can contain no more than 64 characters.
value	Yes	String	Value of the parameter. It cannot exceed 1,024 characters.
type	No	String	Type <ul style="list-style-type: none"> ● variable ● constants Default value: variable

Table 5-120 Location data structure description

Parameter	Mandatory	Type	Description
x	Yes	Int	Position of the node on the horizontal axis of the job canvas.
y	Yes	Int	Position of the node on the vertical axis of the job canvas.

Table 5-121 condition data structure description

Parameter	Mandatory	Type	Description
preNodeName	Yes	String	Name of the previous node on which the current node depends.
expression	Yes	String	EL expression. If the calculation result of the EL expression is true, this node is executed.

Table 5-122 CronTrigger data structure description

Parameter	Mandatory	Type	Description
startTime	Yes	String	Scheduling start time in the format of yyyy-MM-dd'T'HH:mm:ssZ, which is an ISO 8601 time format. For example, 2018-10-22T23:59:59+08, which indicates that a job starts to be scheduled at 23:59:59 on October 22nd, 2018.
endTime	No	String	Scheduling end time in the format of yyyy-MM-dd'T'HH:mm:ssZ, which is an ISO 8601 time format. For example, 2018-10-22T23:59:59+08, which indicates that a job stops to be scheduled at 23:59:59 on October 22nd, 2018. If the end time is not set, the job will continuously be executed based on the scheduling period.
expression	Yes	String	Cron expression in the format of <second><minute><hour><day><month>><week>. For details about the value input in each field, see Table 5-125 .
expressionTime Zone	No	String	Time zone corresponding to the Cron expression, for example, GMT+8. Default value: time zone where DataArts Studio is located
period	Yes	String	Job execution interval consisting of a time and time unit Example: 1 hours, 1 days, 1 weeks, 1 months The value must match the value of expression .

Parameter	Mandatory	Type	Description
dependPrePeriod	No	Boolean	Indicates whether to depend on the execution result of the current job's dependent job in the previous scheduling period. Default value: false
dependJob	No	DependJob data structure	Dependent job configuration. For details, see Table 12 DependJob data structure description .
concurrent	No	Integer	Number of concurrent executions allowed

Table 5-123 Cron data structure description

Parameter	Mandatory	Type	Description
startTime	Yes	String	Scheduling start time in the format of yyyy-MM-dd'T'HH:mm:ssZ, which is an ISO 8601 time format. For example, 2018-10-22T23:59:59+08, which indicates that a job starts to be scheduled at 23:59:59 on October 22nd, 2018.
endTime	No	String	Scheduling end time in the format of yyyy-MM-dd'T'HH:mm:ssZ, which is an ISO 8601 time format. For example, 2018-10-22T23:59:59+08, which indicates that a job stops to be scheduled at 23:59:59 on October 22nd, 2018. If the end time is not set, the job will continuously be executed based on the scheduling period.
expression	Yes	String	Cron expression in the format of <second><minute><hour><day><month>><week>. For details about the value input in each field, see Table 5-125 .
expressionTime Zone	No	String	Time zone corresponding to the Cron expression, for example, GMT+8. Default value: time zone where DataArts Studio is located

Parameter	Mandatory	Type	Description
dependPrePeriod	No	Boolean	Indicates whether to depend on the execution result of the current job's dependent job in the previous scheduling period. Default value: false
dependJobs	No	DependJob data structure	Dependent job configuration. For details, see Table 12 DependJob data structure description .
intervalType	No	String	Scheduling interval type. The following options are available: <ul style="list-style-type: none"> • minutes • hours • days • weeks • months • seasons • years

Table 5-124 Event data structure description

Parameter	Mandatory	Type	Description
eventType	Yes	String	Select the corresponding connection name and topic. When a new Kafka message is received, the job is triggered. Set this parameter to KAFKA . Event type. Currently, only newly reported data events from the DIS stream can be monitored. Each time a data record is reported, the job runs once. This parameter is set to DIS . Select the OBS path to be listened to. If new files exist in the path, scheduling is triggered. The path name can be referenced using variable Job.trigger.obsNewFiles. The prerequisite is that DIS notifications have been configured for the OBS path. Set this parameter to OBS .

Parameter	Mandatory	Type	Description
channel	Yes	String	DIS stream name. Perform the following operations to obtain the stream name: 1. Log in to the management console. 2. Click Data Ingestion Service and select Stream Management from the left navigation pane. 3. The stream management page lists the existing streams.
failPolicy	No	String	Job failure policy. <ul style="list-style-type: none"> • SUSPEND: Suspend the event. • IGNORE: Ignore the failure and process with the next event. Default value: SUSPEND
concurrent	No	int	Number of the concurrently scheduled jobs. Value range: 1 to 128 Default value: 1
readPolicy	No	String	Access policy. <ul style="list-style-type: none"> • LAST: Access data from the last location. • NEW: Access data from a new location. Default value: LAST

Table 5-125 Values in the Cron expression fields

Field	Value Range	Allowed Special Character	Description
Second	0-59	, - * /	In the current version, only 0 is allowed.
Minute	0-59	, - * /	None
Hour	0-23	, - * /	None
Day	1-31	, - * ? / L W C	None
Month	1-12	, - * /	In the current version, only * is allowed.

Field	Value Range	Allowed Special Character	Description
Week	1-7	, - * ? / L C #	Starting from Sunday.

Table 5-126 DependJob data structure description

Parameter	Mandatory	Type	Description
jobs	Yes	List<String>	A list of dependent jobs. Only the existing jobs can be depended on.
dependPeriod	No	String	Dependency period. <ul style="list-style-type: none"> • SAME_PERIOD: To run a job or not depends on the execution result of its depended job in the current scheduling period. • PRE_PERIOD: To run a job or not depends on the execution result of its depended job in the previous scheduling period. Default value: SAME_PERIOD
dependFailPolicy	No	String	Dependency job failure policy. <ul style="list-style-type: none"> • FAIL: Stop the job and set the job to the failed state. • IGNORE: Continue to run the job. • SUSPEND: Suspend the job. Default value: FAIL
sameWorkspaceJobs	No	DependWorkspaceJob data structure	List of dependent jobs in the current workspace. For details, see Table 5-145 .
otherWorkspaceJobs	No	DependWorkspaceJob data structure	List of dependent jobs in other workspaces. For details, see Table 5-145 .

Table 5-127 Property parameters

Parameter	Mandatory	Type	Description
name	Yes	String	Property name

Parameter	Mandatory	Type	Description
value	Yes	String	Property value

Table 5-128 Parameters of the Hive SQL node

Parameter	Mandatory	Type	Description
scriptName	Yes	String	Script name
database	No	String	Database name Database in the MRS Hive. The default value is default .
connectionName	No	String	Name of a connection
scriptArgs	No	String	Script parameter in format of key and value. Multiple parameters are separated by newlines (\n), for example, key1=value1\nkey2=value2 .

Table 5-129 Parameters of the Spark SQL node

Parameter	Mandatory	Type	Description
scriptName	Yes	String	Script name
database	No	String	Database name Database in the MRS Spark SQL. The default value is default .
connectionName	No	String	Name of a connection
scriptArgs	No	String	Script parameter in format of key and value. Multiple parameters are separated by newlines (\n), for example, key1=value1\nkey2=value2 .

Table 5-130 Parameters of the DWS SQL node

Parameter	Mandatory	Type	Description
scriptName	Yes	String	Script name

Parameter	Mandatory	Type	Description
database	No	String	Database name Database in DWS. The default value is postgres .
connectionName	No	String	Name of a connection
scriptArgs	No	String	Script parameter in format of key and value. Multiple parameters are separated by newlines (\n), for example, key1=value1\nkey2=value2 .

Table 5-131 Parameters of the DLI SQL node

Parameter	Mandatory	Type	Description
scriptName	Yes	String	Script name
database	No	String	Database name Database in DLI.
connectionName	No	String	Name of a connection
scriptArgs	No	String	Script parameter in format of key and value. Multiple parameters are separated by newlines (\n), for example, key1=value1\nkey2=value2 .

Table 5-132 Parameters of the shell node

Parameter	Mandatory	Type	Description
scriptName	Yes	String	Script name
connectionName	Yes	String	Name of a connection
arguments	No	String	Shell script parameter.

Table 5-133 Parameters of the CDM Job node

Parameter	Mandatory	Type	Description
clusterName	Yes	String	Cluster name You can obtain the cluster name from the CDM cluster list on the DataArts Migration page of the DataArts Studio console.
jobName	Yes	String	Job name To obtain the job name, access the DataArts Studio console, choose DataArts Migration , click a cluster name on the Cluster Management page, and click Job Management on the displayed page.

Table 5-134 Parameters of the DISTransferTask node

Parameter	Mandatory	Type	Description
streamName	Yes	String	DIS stream name. Perform the following operations to obtain the stream name: <ol style="list-style-type: none">1. Log in to the management console.2. Click Data Ingestion Service and select Stream Management from the left navigation pane.3. The stream management page lists the existing streams.
destinationType	Yes	String	Dump target <ul style="list-style-type: none">• CloudTable• OBS
duplicatePolicy	Yes	String	Duplicate name policy. <ul style="list-style-type: none">• OVERWRITE• IGNORE
configuration	Yes	Data structure	Dump configuration. For details, see the descriptions of the obs_destination_descriptor and cloudtable_destination_descriptor parameters in .

Table 5-135 Parameters of the CloudTableManager node

Parameter	Mandatory	Type	Description
namespace	No	String	namespaces Default value: default
action	Yes	String	Action type <ul style="list-style-type: none">● CREATE_TABLE: Create a table.● DELETE_TABLE: Delete a table.
table	No	String	Table name
columnFamily	No	String	Column family

Table 5-136 Parameters of the OBSManager node

Parameter	Mandatory	Type	Description
action	Yes	String	Action type <ul style="list-style-type: none">● CREATE_PATH: Create an OBS path.● DELETE_PATH: Delete an OBS path.
path	Yes	String	OBS path

Table 5-137 Parameters of the RESTAPI node

Parameter	Mandatory	Type	Description
url	Yes	String	URL address URL of the cloud service.
method	Yes	String	HTTP method <ul style="list-style-type: none">● GET● POST● PUT● DELETE
headers	No	String	HTTP message header in the format of <message header name>=<value>. Multiple message headers are separated by newlines.
body	No	String	Message body

Table 5-138 Parameters of the SMN node

Parameter	Mandatory	Type	Description
topic	Yes	String	SMN topic URN. Perform the following operations to obtain an SMN topic URN: <ol style="list-style-type: none">1. Log in to the management console.2. Click Simple Message Notification and choose Topic Management > Topics from the list on the left. You can obtain the SMN topic URN in the topic list.
subject	Yes	String	Message title, which is used as the subject of an email sent to a subscriber.
messageType	Yes	String	Message type <ul style="list-style-type: none">• NORMAL• STRUCTURE• TEMPLATE
message	Yes	String	Message to be sent.

Table 5-139 Parameters of the MRS Spark node

Parameter	Mandatory	Type	Description
clusterName	Yes	String	MRS cluster name. Perform the following operations to obtain the MRS cluster name: <ol style="list-style-type: none">1. Log in to the management console.2. Click MapReduce Service and choose Clusters > Active Clusters from the left navigation pane. You can obtain the cluster name from the active clusters.
jobName	Yes	String	MRS job name. The job name is user-defined.
resourcePath	Yes	String	OBS resource path of the custom Spark JAR package

Parameter	Mandatory	Type	Description
parameters	Yes	String	Custom parameters of the Spark JAR package You can specify parameters for a custom JAR package.
input	No	String	Input path Input data path of the MRS Spark job. The path can be an HDFS or OBS path.
output	No	String	Output path Output data path of the MRS Spark job. The path can be an HDFS or OBS path.
programParameter	No	String	Program parameter Multiple key-value pairs are allowed and separated by vertical bars ().

Table 5-140 Parameters of the MapReduce node

Parameter	Mandatory	Type	Description
clusterName	Yes	String	MRS cluster name. Perform the following operations to obtain the MRS cluster name: 1. Log in to the management console. 2. Click MapReduce Service and choose Clusters > Active Clusters from the left navigation pane. You can obtain the cluster name from the active clusters.
jobName	Yes	String	MRS job name. The job name is user-defined.
resourcePath	Yes	String	Resource path
parameters	Yes	String	Job parameters
input	Yes	String	Input path Input data path of the MapReduce job. The path can be an HDFS or OBS path.
output	Yes	String	Output path Output data path of the MapReduce job. The path can be an HDFS or OBS path.

Table 5-141 Parameters of the DLI Spark node

Parameter	Mandatory	Type	Description
clusterName	Yes	String	DLI queue name Perform the following operations to obtain the DLI queue name: 1. Log in to the management console. 2. Click Data Lake Insight and then Queue Management . You can obtain the queue name from the queue management list.
jobName	Yes	String	DLI job name. Perform the following operations to obtain the job name: 1. Log in to the management console. 2. Click Data Lake Insight and then Spark Jobs . 3. Choose Job Management . You can obtain the job name from the job management list.
resourceType	No	String	Type of the running resource of the DLI job . This parameter is optional. 1. OBS path: OBS 2. DLI package: DLIResources
jobClass	No	String	Main class name. When the application type is .jar , the main class name cannot be empty.
resourcePath	Yes	String	JAR package resource path.
jarArgs	No	String	Main-class entry parameter.
sparkConfig	No	String	Running parameter of the Spark job.

Table 5-142 BasicConfig job information

Parameter	Mandatory	Type	Description
owner	No	String	Job owner. The length cannot exceed 128 characters.

Parameter	Mandatory	Type	Description
isIgnoreWaiting	No	integer	Whether to exclude waiting time from the instance timeout duration. The value can be 0 or 1 . 0 indicates that the waiting time is not excluded from the instance timeout duration, and 1 indicates that the waiting time is excluded from the instance timeout duration
priority	No	int	Job priority. The value ranges from 0 to 2. The default value is 0 . 0 indicates a top priority, 1 indicates a medium priority, and 2 indicates a low priority.
executeUser	No	String	Job execution user. The value must be an existing username.
instanceTimeout	No	int	Instance timeout interval. The unit is minute. The value ranges from 5 to 1440. The default value is 60 .
customFields	No	Map<String,String>	User-defined field. The length cannot exceed 2048 characters.
agency	No	String	Agency name
tags	No	List<String>	Job tags

Table 5-143 Parameters of the MRS Flink node

Parameter	Mandatory	Type	Description
clusterName	Yes	String	MRS cluster name. Perform the following operations to obtain the MRS cluster name: 1. Log in to the management console. 2. Click MapReduce Service and choose Clusters > Active Clusters from the left navigation pane. You can obtain the cluster name from the active clusters.
jobName	Yes	String	MRS job name. The job name is user-defined.
flinkJobType	Yes	String	Flink job type, which can be FLink SQL or Flink JAR
flinkJobProcessType	Yes	String	Flink job processing mode, which can be batch or stream
scriptName	No	String	SQL script associated with the Flink SQL job
resourcePath	No	String	OBS resource path of the custom Flink JAR package

Parameter	Mandatory	Type	Description
input	No	String	Input path Input data path of the MRS Flink job. The path can be an HDFS or OBS path.
output	No	String	Output path Output data path of the MRS Flink job. The path can be an HDFS or OBS path.
programParameter	No	String	Program parameter Multiple key-value pairs are allowed and separated by vertical bars ().

Table 5-144 Parameters of the MRS HetuEngine node

Parameter	Mandatory	Type	Description
clusterName	Yes	String	MRS cluster name. Perform the following operations to obtain the MRS cluster name: 1. Log in to the management console. 2. Click MapReduce Service and choose Clusters > Active Clusters from the left navigation pane. You can obtain the cluster name from the active clusters.
jobName	Yes	String	MRS job name. The job name is user-defined.
statementOrScript	Yes	String	Whether to use an SQL statement for the node or associate an SQL script with the node
scriptName	No	String	SQL script to be associated with the node
statement	No	String	Custom content of the SQL statement
Data Warehouse	Yes	String	Data connection required by HetuEngine

Parameter	Mandatory	Type	Description
Schema	Yes	String	Name of the schema to be accessed through HetuEngine
Database	Yes	String	Name of the database to be accessed through HetuEngine
Queue	No	String	Name of the resource queue required by HetuEngine

Table 5-145 DependWorkspaceJob data structure description

Parameter	Mandatory	Type	Description
workSpace	Yes	String	Workspace name
workSpaceId	No	String	Workspace ID
jobName	Yes	String	Job name
dependOnLastPeriod	No	Boolean	Whether to depend on the latest instance of an upstream job
dependType	No	String	Dependency rule
dependOnLastNPeriodValue	No	Integer	Number of previous periods on which the job depends

Example Request

View details about job **myJob**.

GET /v1/b384b9e9ab9b4ee8994c8633aabc9505/jobs/myJob

Example Response

NOTE

If **dependencies=true** is contained in the parameters for calling the API used to query job details, the downstream jobs (first layer) that depend on the current job are returned.

```
GET /v1/b384b9e9ab9b4ee8994c8633aabc9505/jobs/xxx_1?dependencies=true
```

xxx_1 indicates the job name.

The response message returns the downstream jobs that depends on the current job, as shown in the **downstreamJobs** field in the following example response message:

- Success response

5.3.5 Viewing a Job File

Function

This API is used to check whether there are jobs and scripts in the job file to be imported from OBS to DLF.

URI

- URI format
POST /v1/{project_id}/jobs/check-file
- Parameter description

Table 5-146 URI parameter

Parameter	Mandatory	Type	Description
project_id	Yes	String	Project ID. For details about how to obtain a project ID, see Project ID and Account ID .

Request Parameters

Table 5-147 Request parameters

Parameter	Mandatory	Type	Description
path	Yes	String	If OBS is deployed, the job definition file is stored on OBS, for example, obs://myBucket/jobs.zip.

Parameter	Mandatory	Type	Description
workspace	No	String	Workspace ID <ul style="list-style-type: none"> If this parameter is not set, data in the default workspace is queried by default. To query data in other workspaces, this header must be carried.

Response Parameters

Table 5-148 Response parameters

Parameter	Mandatory	Type	Description
jobs	No	List<Job>	Job information. For details, see Table 5-149 .
scripts	No	List<Script>	Script information. For details, see Table 5-150 .

Table 5-149 job data structure description

Parameter	Mandatory	Type	Description
params	No	Map<String,String>	Job parameter.
name	Yes	String	Job name.
path	Yes	String	Path of the job

Table 5-150 Data structure description of **Script**

Parameter	Mandatory	Type	Description
name	Yes	String	Script name.
path	Yes	String	Path of the script.

Example Request

Query the parameter definitions in the job file on OBS. The OBS path of the job definition file is **obs://aaaaa/DLF_myJob.zip**.

```
POST /v1/b384b9e9ab9b4ee8994c8633aabc9505/jobs/check-file
{
  "path": "obs://aaaaa/DLF_myJob.zip"
}
```

Example Response

- Success response

```
{
  "jobs":[
    {
      "name":"test",
      "path":"/test",
      "params":{"
        "ddd":"dddd"
      }
    },
    {
      "name":"test1",
      "path":"/test",
      "params":{"
        "ddd":"dddd"
      }
    }
  ],
  "scripts":[
    {
      "name":"script1",
      "path":"/path1"
    },
    {
      "name":"script2",
      "path":"/path1"
    }
  ]
}
```

- Failure response

HTTP status code 400

```
{
  "error_code":"DLF.0815",
  "error_msg":"Fail to read OBS file."
}
```

Status Codes

See [Status Codes](#).

5.3.6 Exporting a Job

Function

This API is used to export a job, including job definitions, job dependency scripts, and CDM job definitions.

URI

- URI format

POST /v1/{project_id}/jobs/{job_name}/export

- Parameter description

Table 5-151 URI parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Project ID. For details about how to obtain a project ID, see Project ID and Account ID .
job_name	Yes	String	Job name.

Request Parameters

Table 5-152 Request header parameter

Parameter	Mandatory	Type	Description
workspace	No	String	Workspace ID. <ul style="list-style-type: none"> • If this parameter is not set, data in the default workspace is queried by default. • To query data in other workspaces, this header must be carried.

Response Parameters

The value of **Content-Type** in the response message is **application/octet-stream** that needs to be converted into a file. For details, see [Parsing a Stream in a Response Message](#). Response messages are compressed as a file. The file name format is **DLF_job_name.zip**. The file directory is as follows:

```
jobs
├── {job_name}.job
scripts
├── {script_name}.script
resources
├── {resource_name}.resource
```

[Table 5-153](#) describes the file directory parameters.

Table 5-153 Response parameters

Parameter	Mandatory	Type	Description
job_name	Yes	String	Job name.

Parameter	Mandatory	Type	Description
script_name	No	String	Name of the script that the job depends on.
resource_name	No	String	Name of the resource that the job depends on.

- {job_name}.job
The parameters in the file are the same as the request parameters of the API for creating a job. For details, see [Creating a Job](#).
- {script_name}.script
The parameters in the file are the same as the request parameters of the API for creating a resource. For details, see [Creating a Script](#).

Example Request

Export job **myJob**.

```
POST /v1/b384b9e9ab9b4ee8994c8633aabc9505/jobs/myJob/export
```

Example Response

- Success response
HTTP status code 200
The name of the exported file is **DLF_myJob.zip**. The file structure after decompression is as follows:

```
jobs
├─myJob.job
scripts
├─CS_PROCESS_TRIP.script
├─TRIP_RAW_STANDARD.script
```

- Failure response
HTTP status code 400

```
{
  "error_code":"DLF.0100",
  "error_msg":"The job does not exists."
}
```

5.3.7 Batch Exporting Jobs

Function

This API is used to batch export jobs, including job dependency scripts and CDM job definitions.

URI

- URI format
POST /v1/{project_id}/jobs/batch-export

- Parameter description

Table 5-154 URI parameter

Parameter	Mandatory	Type	Description
project_id	Yes	String	Project ID. For details about how to obtain a project ID, see Project ID and Account ID .

Request Parameters

Table 5-155 Request header parameter

Parameter	Mandatory	Type	Description
workspace	No	String	Workspace ID. <ul style="list-style-type: none"> • If this parameter is not set, data in the default workspace is queried by default. • To query data in other workspaces, this header must be carried.

Table 5-156 Parameters

Parameter	Mandatory	Type	Description
jobList	Yes	List	A list of jobs to be exported. A maximum of 100 jobs can be exported at a time.
exportDepend	No	boolean	Whether to export the scripts and resources that the job depends on Default value: true

Response Parameters

The response message of batch exporting jobs is the same as that of exporting jobs. For details, see [Response Parameters](#).

Example Request

Export two jobs named **job_batch** and **job_stream**, respectively. Scripts and resources on which the job depends are exported by default.

```
POST /v1/b384b9e9ab9b4ee8994c8633aabc9505/jobs/batch-export
{
```

```
"jobList":["job_batch","job_stream"],
"exportDepend":true
}
```

Example Response

- Success response

The value of **Content-Type** in the response message is **application/octet-stream** that needs to be converted into a file. For details, see [Parsing a Stream in a Response Message](#). The response is a compressed file named **jobs.zip**. The file structure after decompression is as follows:

```
jobs
+---job_batch
|   dws_sql.script
|   job_batch.job
\---job_stream
    job_stream.job
```

job_batch.job and **job_stream.job** are job definition files.

dws_sql.script is the DWS SQL script file used by **job_batch.job**.

- Failure response

HTTP status code 400

```
{
  "error_code":"DLF.3051",
  "error_msg":"The request parameter is invalid."
}
```

5.3.8 Importing a Job

Function

This API is used to import one or more job files from OBS to DLF.

NOTE

Before using this API, store job files in OBS buckets.

URI

- URI format
POST /v1/{project_id}/jobs/import
- Parameter description

Table 5-157 URI parameter

Parameter	Mandatory	Type	Description
project_id	Yes	String	Project ID. For details about how to obtain a project ID, see Project ID and Account ID .

Request Parameters

Table 5-158 Request parameters

Parameter	Mandatory	Type	Description
path	Yes	String	If OBS is deployed, it refers to the OBS path for storing the job definition file. For the format of the job definition file, see the response message of the exported job, for example, obs://myBucket/jobs.zip.
params	No	Map<String,String>	Public job parameters
sameNamePolicy	No	String	Policy for specifying how to handle duplicate names. The options are as follows: <ul style="list-style-type: none">• SKIP• OVERWRITE Default value: SKIP
jobsParam	No	List<JobParam>	Job parameter. For details, see Table 5-159 .
executeUser	No	String	User that executes the job
targetStatus	No	String	This parameter is required if the review function is enabled. It indicates the target status of the job. The value can be SAVED , SUBMITTED , or PRODUCTION . <ul style="list-style-type: none">• SAVED indicates that the job is saved but cannot be scheduled or executed. It can be executed only after submitted and approved.• SUBMITTED indicates that the job is automatically submitted after it is saved and can be executed after it is approved.• PRODUCTION indicates that the job can be directly executed after it is created. Note: Only the workspace administrator can create jobs in the PRODUCTION state.

Parameter	Mandatory	Type	Description
approvers	No	List<JobApprover>	Job approver. This parameter is required if the review function is enabled. For details, see Table 5-160 . For details about how to configure the review function, see Review Center .
resources	No	List<JobResourceInfo>	This parameter is mandatory for replacing a resource. You must set the name and type of the resource to be replaced, and the name of the resource used to replace the existing resource. For details, see Table 5-161 .

Table 5-159 JobParam parameters

Parameter	Mandatory	Type	Description
name	Yes	String	Job name
params	No	Map<String,String>	Job parameters

Table 5-160 Approver attributes

Parameter	Mandatory	Type	Description
approverName	Yes	String	Approver name

Table 5-161 Resource table parameters

Parameter	Mandatory	Type	Description
name	Yes	String	Resource name

Parameter	Mandatory	Type	Description
type	Yes	String	Resource type. The following resource types are supported: DWS_CONNECTION, DIS_STREAM, CDM_CLUSTER, MRS_CLUSTER, MRS_HIVE_CONNECTION, MRS_SPARK_CONNECTION, GES_GRAPH, ROMA_INSTANCE, TICS_INSTANCE, and DRS_TASK
replace	No	String	Name of the resource used to replace the existing resource

Response

Table 5-162 Response parameter

Parameter	Mandatory	Type	Description
taskId	Yes	String	ID of the task. Used to call the API for querying system tasks to obtain the import status.

Example Request

Import jobs from OBS to DLF. If there are jobs and scripts with the same name, overwrite them. The definition file of the imported job is in the **obs://aaaaa/job_batch.zip** OBS path, and the job name is **job_batch**.

```
POST /v1/b384b9e9ab9b4ee8994c8633aabc9505/jobs/import
```

```
{
  "path": "obs://aaaaa/job_batch.zip",
  "jobsParam": [
    {
      "name": "job_batch"
    }
  ]
}
```

Import jobs from OBS to DLF when the review function is enabled. If there are jobs and scripts with the same name, overwrite them.

```
POST /v1/b384b9e9ab9b4ee8994c8633aabc9505/jobs/import
{
  "path": "obs://aaaaa/job_batch.zip",
  "jobsParam": [
    {
      "name": "job_batch"
    }
  ],
  "targetStatus": "SUBMITTED",
  "approvers": [
    {
      "approverName": "userName1"
    },
    {
      "approverName": "userName2"
    }
  ]
}
```

Example Response

- Success response

HTTP status code 200

```
{
  "taskId": "008aae2e675933c7016759418e870000"
}
```

- Failure response

HTTP status code 400

```
{
  "error_code": "DLF.0815",
  "error_msg": "Fail to read OBS file."
}
```

5.3.9 Executing a Job Immediately

Function

This API is used to execute a job immediately and check whether the job can be executed successfully.

URI

- URI format
POST /v1/{project_id}/jobs/{job_name}/run-immediate
- Parameter description

Table 5-163 URI parameter

Parameter	Mandatory	Type	Description
project_id	Yes	String	Project ID. For details about how to obtain a project ID, see Project ID and Account ID .
job_name	Yes	String	Job name

Request Parameters

Table 5-164 Request header parameter

Parameter	Mandatory	Type	Description
workspace	No	String	Workspace ID. <ul style="list-style-type: none">• If this parameter is not set, data in the default workspace is queried by default.• To query data in other workspaces, this header must be carried.

Table 5-165 Parameter

Parameter	Mandatory	Type	Description
jobParams	No	List<JobParam>	Parameters for executing a job immediately

Table 5-166 JobParam data structure description

Parameter	Mandatory	Type	Description
name	Yes	String	Name of the parameter. It cannot exceed 64 characters.
value	Yes	String	Value of the parameter. It cannot exceed 1,024 characters.
type	No	String	Parameter type <ul style="list-style-type: none">• variable• constants

Response Parameters

Table 5-167 Response parameter

Parameter	Mandatory	Type	Description
instanceId	Yes	Long	Job instance ID

Example Request

Execute the **myJob** job once. The job contains parameter **aaa** with value **111** and parameter **bbb** with value **222**.

```
POST /v1/b384b9e9ab9b4ee8994c8633aabc9505/jobs/myJob/run-immediate
{
  "jobParams":[
    {
      "name":"aaa",
      "value":"111"
    },
    {
      "name":"bbb",
      "value":"222"
    }
  ]
}
```

Example Response

- Success response

```
{
  "instanceId":132343
}
```

- Failure response

HTTP status code 400

```
{
  "error_code":"DLF.0100",
  "error_msg":"The job does not exists."
}
```

5.3.10 Starting a Job

Function

This API is used to start a job.

URI

- URI format
POST /v1/{project_id}/jobs/{job_name}/start
- Parameter description

Table 5-168 URI parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Project ID. For details about how to obtain a project ID, see Project ID and Account ID .
job_name	Yes	String	Job name

Request Parameters

Table 5-169 Request header parameter

Parameter	Mandatory	Type	Description
workspace	No	String	Workspace ID. <ul style="list-style-type: none">• If this parameter is not set, data in the default workspace is queried by default.• To query data in other workspaces, this header must be carried.

Table 5-170 Parameters

Parameter	Mandatory	Type	Description
jobParams	No	List<JobParam>	Parameter for starting the job
start_date	No	Long	Start date, for example, 20241030
ignore_first_self_dep	No	boolean	Whether to ignore first-day self-dependency

Table 5-171 JobParam data structure description

Parameter	Mandatory	Type	Description
name	Yes	String	Name of the parameter. It cannot exceed 64 characters.
value	Yes	String	Value of the parameter. It cannot exceed 1,024 characters.
paramType	No	String	Parameter type <ul style="list-style-type: none">• variable• constants

Response Parameters

None.

Example Request

Start job **myJob**.

```
POST /v1/b384b9e9ab9b4ee8994c8633aabc9505/jobs/myJob/start
{
  "jobParams": [
    {
      "name": "string",
      "value": "string",
      "paramType": "variable"
    }
  ]
}
```

Example Response

- Success response
HTTP status code 204
- Failure response
HTTP status code 400

```
{
  "error_code": "DLF.0100",
  "error_msg": "The job does not exists."
}
```

5.3.11 Stopping a Job

Function

This API is used to stop a job.

URI

- URI format
POST /v1/{project_id}/jobs/{job_name}/stop
- Parameter description

Table 5-172 URI parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Project ID. For details about how to obtain a project ID, see Project ID and Account ID .
job_name	Yes	String	Job name

Request Parameters

Table 5-173 Request header parameter

Parameter	Mandatory	Type	Description
workspace	No	String	<p>Workspace ID.</p> <ul style="list-style-type: none"> If this parameter is not set, data in the default workspace is queried by default. To query data in other workspaces, this header must be carried.

Response Parameters

None.

Example Request

Stops job **myJob**.

```
POST /v1/b384b9e9ab9b4ee8994c8633aabc9505/jobs/myJob/stop
```

Example Response

- Success response
HTTP status code 204
- Failure response
HTTP status code 400

```
{
  "error_code": "DLF.0100",
  "error_msg": "The job does not exists."
}
```

5.3.12 Deleting a Job

Function

This API is used to delete a job in DataArts Factory. A job that is being scheduled cannot be deleted. To delete such a job, stop it first.

URI

- URI format
DELETE /v1/{project_id}/jobs/{job_name}
- Parameter description

Table 5-174 URI parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Project ID. For details about how to obtain a project ID, see Project ID and Account ID .
job_name	Yes	String	Job name

Request Parameters

Table 5-175 Request header parameter

Parameter	Mandatory	Type	Description
workspace	No	String	Workspace ID. <ul style="list-style-type: none">If this parameter is not set, data in the default workspace is queried by default.To query data in other workspaces, this header must be carried.

Table 5-176 Parameters

Parameter	Mandatory	Type	Description
approvers	No	List<JobApprover>	Job approver. This parameter is required if the review function is enabled. For details, see Table 5-177 .

Table 5-177 Approver attributes

Parameter	Mandatory	Type	Description
approverName	Yes	String	Approver name

Response Parameters

None.

Example Request

```
DELETE /v1/b384b9e9ab9b4ee8994c8633aabc9505/jobs/joba
```

Delete a job when the review function is enabled.

```
DELETE /v1/b384b9e9ab9b4ee8994c8633aabc9505/jobs/joba
{
  "approvers": [
    {
      "approverName": "userName1"
    },
    {
      "approverName": "userName2"
    }
  ]
}
```

Example Response

- Response
HTTP status code 204
- Failure response
HTTP status code 400

```
{
  "error_code": "DLF.0100",
  "error_msg": "The job does not exists."
}
```

Status Codes

See [Status Codes](#).

5.3.13 Stopping a Job Instance

Function

This API is used to stop a specific job instance. A job instance can be stopped only when it is in the running state.

URI

- URI format
POST /v1/{project_id}/jobs/{job_name}/instances/{instance_id}/stop
- Parameter description

Table 5-178 URI parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Project ID. For details about how to obtain a project ID, see Project ID and Account ID .
job_name	Yes	String	Job name

Parameter	Mandatory	Type	Description
instance_id	Yes	Long	Job instance ID. For details about how to obtain it, see Viewing a Job Instance List .

Request Parameters

Table 5-179 Request header parameter

Parameter	Mandatory	Type	Description
workspace	No	String	<p>Workspace ID.</p> <ul style="list-style-type: none"> If this parameter is not set, data in the default workspace is queried by default. To query data in other workspaces, this header must be carried.

Response Parameters

None.

Example Request

```
POST /v1/b384b9e9ab9b4ee8994c8633aabc9505/jobs/job_batch/instances/34765/stop
```

Example Response

- Success response
HTTP status code 204
- Failure response
HTTP status code 400

```
{
  "error_code": "DLF.0137",
  "error_msg": "Job instance does not exist."
}
```

5.3.14 Rerunning a Job Instance

Function

This API is used to rerun a specific job instance. A job instance can be rerun only when it is in the successful, failed, or canceled state.

URI

- URI format
POST /v1/{project_id}/jobs/{job_name}/instances/{instance_id}/restart
- Parameter description

Table 5-180 URI parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Project ID. For details about how to obtain a project ID, see Project ID and Account ID .
job_name	Yes	String	Job name
instance_id	Yes	Long	Job instance ID. For details about how to obtain it, see Viewing a Job Instance List .

Request Parameters

Table 5-181 Request header parameter

Parameter	Mandatory	Type	Description
workspace	No	String	Workspace ID. <ul style="list-style-type: none"> • If this parameter is not set, data in the default workspace is queried by default. • To query data in other workspaces, this header must be carried.

Table 5-182 Parameters

Parameter	Mandatory	Type	Description
retry_location	No	String	Where the job rerun starts. The value can be error_node (error node), first_node (first node), or specified_node (a specified node). The default value is first_node .
job_parameter_version	No	String	Parameters to use. The value can be original_version (parameters of the original job) or latest_version (parameters of the latest job).

Parameter	Mandatory	Type	Description
ignore_obs_monitor	No	boolean	Whether to ignore OBS listening
node_name	No	String	Name of the node from which the job rerun starts when retry_location is set to specified_node

Response Parameters

None.

Example Request

```
POST /v1/b384b9e9ab9b4ee8994c8633aabc9505/jobs/job_batch/instances/34765/restart
```

Example Response

- Success response
HTTP status code 204
- Failure response
HTTP status code 400

```
{
  "error_code": "DLF.0137",
  "error_msg": "Job instance does not exist."
}
```

5.3.15 Viewing Running Status of a Real-Time Job

Function

This API is used to view running status of a real-time job.

URI

- URI format
GET /v1/{project_id}/jobs/{job_name}/status
- Parameter description

Table 5-183 URI parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Project ID. For details about how to obtain a project ID, see Project ID and Account ID .
job_name	Yes	String	Job name

Request Parameters

Table 5-184 Request header parameter

Parameter	Mandatory	Type	Description
workspace	No	String	Workspace ID. <ul style="list-style-type: none"> If this parameter is not set, data in the default workspace is queried by default. To query data in other workspaces, this header must be carried.

Response Parameters

Table 5-185 Response parameters

Parameter	Mandatory	Type	Description
name	Yes	String	Solution name
nodes	No	List	Node status list
status	No	String	Job status <ul style="list-style-type: none"> STARTING: The job is starting. NORMAL: The job is normal. EXCEPTION: The job is abnormal. STOPPING: The job is being stopped. STOPPED: The job is stopped.
startTime	Yes	Date	Start time
endTime	No	Date	End time
lastUpdateTime	No	Date	Last update time

Table 5-186 Data structure description of **nodes**

Parameter	Mandatory	Type	Description
name	Yes	String	Node name

Parameter	Mandatory	Type	Description
status	No	String	Node status. <ul style="list-style-type: none"> ● STARTING: The node is starting. ● NORMAL: The node is normal. ● EXCEPTION: The node is abnormal. ● STOPPING: The node is being stopped. ● STOPPED: The node is stopped.
logPath	No	String	Path for storing node run logs.
type	Yes	String	Node type <ul style="list-style-type: none"> ● Hive SQL: runs Hive SQL scripts. ● Spark SQL: runs Spark SQL scripts. ● DWS SQL: runs DWS SQL scripts. ● DLI SQL: runs DLI SQL scripts. ● Shell: runs shell SQL scripts. ● CDM Job: runs CDM jobs. ● DIS Transfer Task: creates DIS dump tasks. ● CS Job: creates and starts CloudStream jobs. ● CloudTable Manager: manages CloudTable tables, including creating and deleting tables. ● OBS Manager: manages OBS paths, including creating and deleting paths. ● RESTAPI: sends REST API requests. ● SMN: sends short messages or emails. ● MRS Spark: runs Spark jobs of MRS. ● MapReduce: runs MapReduce jobs of MRS.

Example Request

View running status of real-time job **job_sms** and the running status of each node in the job.

```
GET /v1/b384b9e9ab9b4ee8994c8633aabc9505/jobs/job_sms/status
```

Example Response

- Success response

```
{
  "name": "job_sms",
  "nodes": [
```

```

    {
      "bufferRecords": 0,
      "jobInstanceId": 0,
      "lastInstanceStatus": "waiting",
      "name": "MRS_Flink_Job_8635",
      "speed": 0,
      "totalGetBytes": 0,
      "totalGetRecords": 0,
      "totalPutBytes": 0,
      "totalPutRecords": 0
    }
  ],
  "status": "NORMAL"
}

```

- Failure response

HTTP status code 400

```

{
  "error_code": "DLF0100",
  "error_msg": "The job does not exists."
}

```

5.3.16 Viewing a Job Instance List

Function

This API is used to view a job instance list.

A job instance is generated each time you run a batch job for which periodic scheduling or event-based scheduling is configured. If a real-time job contains a node for which periodic scheduling or event-based scheduling is configured, you can call this API to view the instance list of the subjobs associated with the node. The format of the **jobName** parameter is *real-time job name_node name*.

URI

- URI format

GET /v1/{project_id}/jobs/instances/detail?

jobName={jobName}&minPlanTime={minPlanTime}&maxPlanTime={maxPlanTime}&limit={limit}&offset={offset}&status={status}&instanceType={instanceType}&preciseQuery={preciseQuery}

- Parameter description

Table 5-187 URI parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Project ID. For details about how to obtain a project ID, see Project ID and Account ID .

Parameter	Mandatory	Type	Description
jobName	No	String	Job name. <ul style="list-style-type: none"> If you want to query the instance list of a specific batch job, jobName is the batch job name. If you want to query sub-jobs associated with a node in a real-time job, the jobName format is <i>real-time job name _ node name</i>.
minPlanTime	No	Long	Minimum planned job execution time in milliseconds. Job instances whose start time is later than this time are returned. The default value is 00:00:00 of the current day.
maxPlanTime	No	Long	Maximum planned job execution time in milliseconds. Job instances whose start time is earlier than this time are returned.
limit	No	int	The maximum number of records on each page. The parameter value ranges from 1 to 1000. Default value: 10
offset	No	int	Start page of the paging list. The default value is 0 . The value must be greater than or equal to 0 .
status	No	String	Job instance status. <ul style="list-style-type: none"> waiting running success fail running-exception pause manual-stop
instanceType	No	int	Job scheduling modes. <ul style="list-style-type: none"> 0: General scheduling 2: Manual scheduling 5: PatchData 6: Subjob scheduling 7: Schedule once

Parameter	Mandatory	Type	Description
preciseQuery	No	boolean	Whether exact search of jobs by name is supported

Request Parameters

Table 5-188 Request header parameter

Parameter	Mandatory	Type	Description
workspace	No	String	<p>Workspace ID.</p> <ul style="list-style-type: none"> If this parameter is not set, data in the default workspace is queried by default. To query data in other workspaces, this header must be carried.

Response Parameters

Table 5-189 Response parameters

Parameter	Mandatory	Type	Description
total	Yes	int	Total number of records.
instances	Yes	List<Instance>	Job instance status. For details, see Table 5-190 .

Table 5-190 instances parameters

Parameter	Mandatory	Type	Description
jobName	Yes	String	Job name. When you view the instance list of a specified batch job, jobName is the name of the batch job. When you view the subjobs associated with a node in a real-time job, jobName is in format of <i>real-time job name_node name</i> .
jobId	No	Long	Job ID

Parameter	Mandatory	Type	Description
jobInstanceName	Yes	String	Name of a job instance recorded by the log, rather than the name defined during job creation
status	Yes	String	Job instance status. <ul style="list-style-type: none"> • waiting • running • success • fail • running-exception • pause • manual-stop
planTime	Yes	Long	Planned execution time of the job instance
startTime	Yes	Long	Actual execution start time of the job instance
endTime	No	Long	Actual execution end time of the job instance
executeTime	No	Long	Execution duration in milliseconds
instanceId	Yes	Long	Job instance ID, which is used to query job instance details.
submitTime	Yes	Long	Time when a job is submitted.
instanceType	Yes	int	Job scheduling modes. <ul style="list-style-type: none"> • 0: General scheduling • 2: Manual scheduling • 5: PatchData • 6: Subjob scheduling • 7: Schedule once
forceSuccess	No	boolean	Whether the job instance status is forcibly successful Default value: false
ignoreSuccess	No	boolean	Whether the job instance status is failure ignored Default value: false
version	No	int	Job instance version

Example Request

View the instance list of batch job **job_batch**.

```
GET /v1/b384b9e9ab9b4ee8994c8633aabc9505/jobs/instances/detail?jobName=job_batch
```

Example Response

Success response

```
{
  "total": 2,
  "instances": [
    {
      "endTime": 1551671598000,
      "executeTime": 0.3,
      "forceSuccess": false,
      "ignoreSuccess": false,
      "instanceId": 34765,
      "instanceType": 2,
      "jobId": 608627,
      "jobName": "job_batch",
      "jobInstanceName": "job_batch",
      "planTime": 1551671580000,
      "startTime": 1551671580000,
      "status": "success",
      "submitTime": 1550910278706,
      "version": 1
    },
    {
      "endTime": 1551671538000,
      "executeTime": 0.3,
      "forceSuccess": false,
      "ignoreSuccess": false,
      "instanceId": 34764,
      "instanceType": 5,
      "jobId": 608627,
      "jobName": "job_batch",
      "jobInstanceName": "job_batch",
      "planTime": 1551671520000,
      "startTime": 1551671521000,
      "status": "success",
      "submitTime": 1550910278706,
      "version": 1
    }
  ]
}
```

5.3.17 Viewing Job Instance Details

Function

This API is used to view job instance details, including the execution information about each node in a job instance.

URI

- URI format
GET /v1/{project_id}/jobs/{job_name}/instances/{instance_id}
- Parameter description

Table 5-191 URI parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Project ID. For details about how to obtain a project ID, see Project ID and Account ID .
job_name	Yes	String	Job name
instance_id	Yes	string	Job instance ID. For details about how to obtain the ID, see the response parameters in Viewing a Job Instance List .

Request Parameters

Table 5-192 Request header parameter

Parameter	Mandatory	Type	Description
workspace	No	String	Workspace ID. <ul style="list-style-type: none"> If this parameter is not set, data in the default workspace is queried by default. To query data in other workspaces, this header must be carried.

Response Parameters

Table 5-193 Response parameters

Parameter	Mandatory	Type	Description
jobName	Yes	String	Job name
instanceId	Yes	Long	Job instance ID

Parameter	Mandatory	Type	Description
status	Yes	String	Job instance status. <ul style="list-style-type: none"> • waiting • running • success • fail • running-exception • pause • manual-stop
planTime	Yes	Long	Planned execution time of the job instance
startTime	Yes	Long	Actual execution start time of the job instance
endTime	No	Long	Actual execution end time of the job instance
executeTime	No	Long	Execution duration in milliseconds
total	Yes	Integer	Total number of node records
nodes	Yes	List<Node>	Node instance status. For details, see Table 5-194 .
instanceType	Yes	Integer	Job scheduling modes. <ul style="list-style-type: none"> • 0: General scheduling • 2: Manual scheduling • 5: PatchData • 6: Subjob scheduling • 7: Schedule once
forceSuccess	No	boolean	Whether the job instance status is forcibly successful Default value: false
ignoreSuccess	No	boolean	Whether the job instance status is failure ignored Default value: false

Table 5-194 Node parameters

Parameter	Mandatory	Type	Description
nodeName	Yes	String	Node name

Parameter	Mandatory	Type	Description
status	Yes	String	Node status. <ul style="list-style-type: none">• waiting• running• success• fail• skip• pause• manual-stop
queue	Yes	String	DLI resource queue name NOTE Only the DLI SQL or DLI SPARK operator returns the DLI queue name in the response.
planTime	Yes	Long	Planned execution time of the job instance
startTime	Yes	Long	Actual execution start time of the node
endTime	No	Long	Actual execution end time of the node

Parameter	Mandatory	Type	Description
type	Yes	String	Node type. <ul style="list-style-type: none">• Hive SQL: runs Hive SQL scripts.• Spark SQL: runs Spark SQL scripts.• DWS SQL: runs DWS SQL scripts.• DLI SQL: runs DLI SQL scripts.• Shell: runs shell SQL scripts.• CDM Job: runs CDM jobs.• DIS Transfer Task: creates DIS dump tasks.• CloudTableManager: manages CloudTable tables, including creating and deleting tables.• OBS Manager: manages OBS paths, including creating and deleting paths.• RestClient: sends REST API requests.• SMN: sends short messages or emails.• MRS Spark: runs Spark jobs of MRS.• MapReduce: Runs MapReduce jobs of MRS.• MRSFlinkJob: runs FlinkJob jobs of MRS.• MRS HetuEngine: runs HetuEngine jobs of MRS.• DLI Spark: runs Spark jobs of DLF.• RDSSQL: transfers SQL statements to RDS for execution.• ModelArts Train: executes workflow jobs of ModelArts.
retryTimes	No	Integer	Number of attempts upon a failure
instanceId	Yes	Long	Job instance ID
inputRowCount	No	Long	Rows of input data
speed	No	number	Write speed (row/second)
logPath	No	String	Path for storing node execution logs

Example Request

View details about the instance whose ID is 34765 in job **job_batch**.

```
GET /v1/b384b9e9ab9b4ee8994c8633aabc9505/jobs/job_batch/instances/34765
```

Example Response

- Success response

```
{
  "jobName": "job_batch",
  "instanceId": 34765,
  "instanceType": 2,
  "status": "fail",
  "planTime": 1551425326540,
  "startTime": 1551425327000,
  "endTime": 1551425387000,
  "executeTime": 1,
  "forceSuccess": false,
  "ignoreSuccess": false,
  "total": 2,
  "nodes": [
    {
      "endTime": 1551671590000,
      "inputRowCount": 0,
      "instanceId": 34765,
      "nodeName": "Dummy_8556",
      "queue": "dlf_notdelete",
      "planTime": 1551671580000,
      "retryTimes": 0,
      "startTime": 1551671584000,
      "status": "success",
      "type": "Dummy"
    },
    {
      "endTime": 1551671598000,
      "inputRowCount": 0,
      "instanceId": 34765,
      "logPath": "obs://dlf-test-log/job_batch/2019-03-04 11_53_00.000/error/error.job",
      "nodeName": "error",
      "planTime": 1551671580000,
      "retryTimes": 0,
      "startTime": 1551671594000,
      "status": "success",
      "type": "DWS SQL"
    }
  ]
}
```

- Failure response

HTTP status code 400

```
{
  "error_code": "DLF0137",
  "error_msg": "Job instance does not exist."
}
```

5.3.18 Querying System Task Details

Function

This API is used to query details about asynchronous tasks.

URI

- URI format
GET /v1/{project_id}/system-tasks/{task_id}
- Parameter description

Table 5-195 URI parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Project ID. For details about how to obtain a project ID, see Project ID and Account ID .
task_id	Yes	String	Task ID. For details about how to obtain the ID, see the response parameters in Importing a Job .

Request Parameters

Table 5-196 Request header parameter

Parameter	Mandatory	Type	Description
workspace	No	String	Workspace ID. <ul style="list-style-type: none">If this parameter is not set, data in the default workspace is queried by default.To query data in other workspaces, this header must be carried.

Response Parameters

Table 5-197 Response parameters

Parameter	Mandatory	Type	Description
id	Yes	String	Task ID
name	Yes	String	Task name
startTime	Yes	Long	Start time
endTime	No	Long	End time
lastUpdate	Yes	Long	Update time
status	Yes	String	Status <ul style="list-style-type: none">RUNNINGSUCCESSFULFAILED
projectId	No	String	Project ID

Parameter	Mandatory	Type	Description
subtasks	No	List<SubTask>	Subtask. For details, see Table 5-198 .

Table 5-198 subtasks parameters

Parameter	Mandatory	Type	Description
id	Yes	String	Subtask ID
name	Yes	String	Subtask name
lastUpdate	Yes	Long	Update time
status	Yes	String	Status <ul style="list-style-type: none"> ● RUNNING ● SUCCESSFUL ● FAILED
taskId	No	String	Task information

Example Request

Query the task for exporting a job.

```
GET /v1/b384b9e9ab9b4ee8994c8633aabc9505/systemTasks/008aae2e675d3bcb01675d40ab3f0005
```

Example Response

- Success response

```
{
  "endTime": 1544777083000,
  "id": "008aae2e67abe2ff0167abe3a28f0000",
  "lastUpdate": 1544777083000,
  "name": "Import the job from obs://aaaaa/job_batch.zip.",
  "projectId": "b384b9e9ab9b4ee8994c8633aabc9505",

- Failure response

HTTP status code 400

```
{
  "error_code": "DLF.20810",
}
```

```
"error_msg": "Task[008aae2e675d3bcb01675d40ab3f0005] does not exist"  
}
```

5.4 Connection Management APIs (To Be Taken Offline)

5.4.1 Creating a Connection (to Be Taken Offline)

NOTE

The connection management capability is provided by Management Center. This API is no longer maintained. You are advised to use the APIs in Management Center for connection management.

Function

This API is used to create a connection. The supported connection types include DWS, DLI, Spark SQL, RDS, CloudTable, and Hive.

URI

- URI format
POST /v1/{project_id}/connections
- Parameter description

Table 5-199 URI parameter

Parameter	Mandatory	Type	Description
project_id	Yes	String	Project ID. For details about how to obtain a project ID, see Project ID and Account ID .

Request Parameters

Table 5-200 Request header parameter

Parameter	Mandatory	Type	Description
workspace	No	String	Workspace ID. <ul style="list-style-type: none">• If this parameter is not set, data in the default workspace is queried by default.• To query data in other workspaces, this header must be carried.

Table 5-201 Connection parameters

Parameter	Mandatory	Type	Description
name	Yes	String	Connection name. The name contains a maximum of 100 characters, including only letters, numbers, hyphens (-), and underscores (_). The connection name must be unique.
type	Yes	String	Connection type. <ul style="list-style-type: none">• DWS• DLI• SparkSQL• HIVE• RDS• CloudTable• HOST
config	No	Map<String,String>	Connection configuration item. The configuration item varies with the connection type. You do not need to set the config parameter for DLI connections. For other types of connections, see the description of connection configuration items.
description	No	String	Description of the connection. The description contains a maximum of 255 characters.

Table 5-202 DWS connection parameters

Parameter	Mandatory	Type	Description
clusterName	No	String	<p>Name of a DWS cluster.</p> <p>Perform the following operations to obtain the DWS cluster name:</p> <ol style="list-style-type: none"> 1. Log in to the management console. 2. Click Data Warehouse Service and select Cluster Management from the list on the left. <p>You can obtain the cluster name from the cluster management list.</p> <p>By default, this parameter is left blank.</p>
ip	No	String	<p>IP address for accessing the DWS cluster.</p> <p>Perform the following operations to obtain the DWS access address:</p> <ol style="list-style-type: none"> 1. Log in to the management console. 2. Click Data Warehouse Service and select Cluster Management from the list on the left. 3. Click the cluster name. The basic information page of the cluster is displayed. <p>You can obtain the private network IP address on the Database Attribute tab page. If there are multiple IP addresses, select the first IP address.</p> <p>By default, this parameter is left blank.</p>
port	No	String	<p>Port for accessing the DWS cluster.</p> <p>Perform the following operations to obtain the DWS access port:</p> <ol style="list-style-type: none"> 1. Log in to the management console. 2. Click Data Warehouse Service and select Cluster Management from the list on the left. 3. Click the cluster name. The basic information page of the cluster is displayed. <p>You can obtain the port information on the Database Attribute tab page.</p> <p>For example, set port to 8000. By default, this parameter is left blank.</p>

Parameter	Mandatory	Type	Description
userName	Yes	String	Username of the database. This username is the username entered during the creation of the DWS cluster.
password	Yes	String	Password for accessing the database. This password is the password entered during the creation of the DWS cluster.
sslEnable	Yes	boolean	Specifies whether to enable the SSL connection.
kmsKey	Yes	String	Name of a KMS key. Perform the following operations to obtain the key: <ol style="list-style-type: none"> 1. Log in to the management console. 2. Click Key Management Service and select Key Management Service from the list on the left. You can obtain the key name from the key list.
agentName	Yes	String	Name of a CDM cluster. You can obtain the cluster name from the CDM cluster list on the DataArts Migration page of the DataArts Studio console.

Table 5-203 Spark SQL connection parameters

Parameter	Mandatory	Type	Description
clusterName	Yes	String	Name of an MRS cluster. Perform the following operations to obtain the MRS cluster name: <ol style="list-style-type: none"> 1. Log in to the management console. 2. Click MapReduce Service and select Active Clusters from the list on the left. You can obtain the cluster name from the active clusters, such as mrsCluster1 .

Parameter	Mandatory	Type	Description
connectionMethod	Yes	String	Method to connect. <ul style="list-style-type: none"> • agent: connected through an agent. • direct: connected directly.
userName	No	String	Username of the MRS cluster. This parameter is mandatory when connectionMethod is set to agent .
password	No	String	Password for accessing the MRS cluster. This parameter is mandatory when connectionMethod is set to agent .
agentName	No	String	Name of a CDM cluster. This parameter is mandatory when connectionMethod is set to agent . You can obtain the cluster name from the CDM cluster list on the DataArts Migration page of the DataArts Studio console.
kmsKey	No	String	Name of a KMS key. This parameter is mandatory when connectionMethod is set to agent . Perform the following operations to obtain the key: <ol style="list-style-type: none"> 1. Log in to the management console. 2. Click Key Management Service and select Key Management Service from the list on the left. You can obtain the key name from the key list.

Table 5-204 Hive connection parameters

Parameter	Mandatory	Type	Description
clusterName	Yes	String	Name of an MRS cluster, for example, mrsCluster1 .
connectionMethod	Yes	String	Method to connect. <ul style="list-style-type: none"> • agent: connected through an agent. • direct: connected directly.

Parameter	Mandatory	Type	Description
userName	No	String	Username of the MRS cluster. This parameter is mandatory when connectionMethod is set to agent .
password	No	String	Password for accessing the MRS cluster. This parameter is mandatory when connectionMethod is set to agent .
agentName	No	String	Name of a CDM cluster. This parameter is mandatory when connectionMethod is set to agent . You can obtain the cluster name from the CDM cluster list on the DataArts Migration page of the DataArts Studio console.
kmsKey	No	String	Name of a KMS key. This parameter is mandatory when connectionMethod is set to agent . Perform the following operations to obtain the key: <ol style="list-style-type: none">1. Log in to the management console.2. Click Key Management Service and select Key Management Service from the list on the left. You can obtain the key name from the key list.

Table 5-205 RDS connection parameters

Parameter	Mandatory	Type	Description
ip	Yes	String	<p>Address for accessing RDS.</p> <p>Perform the following operations to obtain the RDS access address:</p> <ol style="list-style-type: none"> 1. Log in to the management console. 2. Click Relational Database Service and select Instance Management from the list on the left. 3. Click the name of an instance. The basic information page of the instance is displayed. <p>You can obtain the IP address on the Connection Information tab.</p>
port	Yes	String	<p>Port for accessing RDS.</p> <p>Perform the following operations to obtain the RDS access port:</p> <ol style="list-style-type: none"> 1. Log in to the management console. 2. Click Relational Database Service and select Instance Management from the list on the left. 3. Click the name of an instance. The basic information page of the instance is displayed. <p>You can obtain the database port on the Connection Information tab page.</p>
userName	Yes	String	<p>Username of the database. This username is the username entered during the creation of the cluster.</p>
password	Yes	String	<p>Password for accessing the database. This password is the password entered during the creation of the cluster.</p>
kmsKey	Yes	String	<p>Name of a KMS key.</p> <p>Perform the following operations to obtain the key:</p> <ol style="list-style-type: none"> 1. Log in to the management console. 2. Click Key Management Service and select Key Management Service from the list on the left. <p>You can obtain the key name from the key list.</p>

Parameter	Mandatory	Type	Description
agentName	Yes	String	Name of a CDM cluster. You can obtain the cluster name from the CDM cluster list on the DataArts Migration page of the DataArts Studio console.
driverName	Yes	String	Name of the driver. <ul style="list-style-type: none"> com.mysql.jdbc.Driver org.postgresql.Driver
driverPath	Yes	String	Path of the driver on OBS.

Table 5-206 CloudTable connection parameters

Parameter	Mandatory	Type	Description
clusterName	Yes	String	Name of a CloudTable cluster. Perform the following operations to obtain the cluster name: <ol style="list-style-type: none"> Log in to the management console. Click CloudTable Service and select Cluster Mode from the list on the left. You can obtain the cluster name from the cluster list.

Table 5-207 HOST connection parameters

Parameter	Mandatory	Type	Description
ip	Yes	String	IP address of the host
port	Yes	String	SSH port number of the host
userName	Yes	String	Username for logging in to the host
password	Yes	String	Password for logging in to the host

Parameter	Mandatory	Type	Description
agentName	Yes	String	Name of a CDM cluster. You can obtain the cluster name from the CDM cluster list on the DataArts Migration page of the DataArts Studio console.
kmsKey	Yes	String	Name of a KMS key. Perform the following operations to obtain the key: <ol style="list-style-type: none">1. Log in to the management console.2. Click Key Management Service and select Key Management Service from the list on the left. You can obtain the key name from the key list.

Response Parameters

None.

Example Request

```
Create a connection.
POST /v1/b384b9e9ab9b4ee8994c8633aabc9505/connections
{
  "name":"connection1",
  "type":"DWS",
  "config":{
    "clusterName":"test",
    "userName":"dbadmin",
    "password":"*****",
    "kmsKey":"cdm-dlf",
    "agentName":"cdm-donotdelete",
    "sslEnable":false
  }
}
```

Example Response

- Success response
HTTP status code 204
- Failure response
HTTP status code 400

```
{
  "error_code":"DLF.6309",
  "error_msg":"The name already exists."
}
```

Status Codes

See [Status Codes](#).

5.4.2 Querying a Connection List (to Be Taken Offline)

NOTE

The connection management capability is provided by Management Center. This API is no longer maintained. You are advised to use the APIs in Management Center for connection management.

Function

This API is used to query a connection list.

URI

- URI format
GET /v1/{project_id}/connections?
offset={offset}&limit={limit}&connectionName={connectionName}
- Parameter description

Table 5-208 URI parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Project ID. For details about how to obtain a project ID, see Project ID and Account ID .
offset	No	Integer	The value is no less than 0 . The default value is 0 .
limit	No	Integer	The maximum number of records on each page. Value range: 1 to 100 Default value: 10
connectionName	No	String	Name of a connection.

Request Parameters

Table 5-209 Request header parameter

Parameter	Mandatory	Type	Description
workspace	No	String	<p>Workspace ID.</p> <ul style="list-style-type: none"> If this parameter is not set, data in the default workspace is queried by default. To query data in other workspaces, this header must be carried.

Response Parameters

Parameter	Mandatory	Type	Description
total	Yes	Integer	The total number of connections.
connections	Yes	List< Connections >	Connection list.

Table 5-210 connections parameters

Parameter	Mandatory	Type	Description
name	Yes	String	<p>Connection name. The name contains a maximum of 100 characters, including only letters, numbers, hyphens (-), and underscores (_). The connection name must be unique.</p>
type	Yes	String	<p>Connection type.</p> <ul style="list-style-type: none"> DWS DLI SparkSQL HIVE RDS CloudTable HOST

Parameter	Mandatory	Type	Description
config	No	Map<String,String>	Connection configuration item. The configuration item varies with the connection type. You do not need to set the config parameter for DLI connections. For other types of connections, see the description of connection configuration items.
description	No	String	Description of the connection. The description contains a maximum of 255 characters.

Example Request

Query connections.

```
GET /v1/b384b9e9ab9b4ee8994c8633aabc9505/connections
```

Example Response

- Success response

HTTP status code 200

```
{
  "total":1,
  "connections":[
    {
      "name":"connection1",
      "type":"DWS",
      "config":{
        "clusterName":"test",
        "userName":"dbadmin",
        "password":"*****",
        "kmsKey":"cdm-dlf",
        "agentName":"cdm-donotdelete",
        "sslEnable":false
      }
    }
  ]
}
```

- Failure response

HTTP status code 400

```
{
  "error_code":"DLF.3051",
  "error_msg":"The request parameter is invalid."
}
```

5.4.3 Querying Connection Details (to Be Taken Offline)

NOTE

The connection management capability is provided by Management Center. This API is no longer maintained. You are advised to use the APIs in Management Center for connection management.

Function

This API is used to query details of a connection.

URI

- URI format
GET /v1/{project_id}/connections/{connection_name}
- Parameter description

Table 5-211 URI parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Project ID. For details about how to obtain a project ID, see Project ID and Account ID .
connection_name	Yes	String	Name of a connection.

Request Parameters

Table 5-212 Request header parameter

Parameter	Mandatory	Type	Description
workspace	No	String	Workspace ID. <ul style="list-style-type: none">• If this parameter is not set, data in the default workspace is queried by default.• To query data in other workspaces, this header must be carried.

Response Parameters

Table 5-213 Connection parameters

Parameter	Mandatory	Type	Description
name	Yes	String	Connection name. The name contains a maximum of 100 characters, including only letters, numbers, hyphens (-), and underscores (_). The connection name must be unique.
type	Yes	String	Connection type. <ul style="list-style-type: none">• DWS• DLI• SparkSQL• HIVE• RDS• CloudTable• HOST
config	No	Map<String,String>	Connection configuration item. The configuration item varies with the connection type. You do not need to set the config parameter for DLI connections. For other types of connections, see the description of connection configuration items.
description	No	String	Description of the connection. The description contains a maximum of 255 characters.

Example Request

Query connection details.

```
GET /v1/b384b9e9ab9b4ee8994c8633aabc9505/connections/connection1
```

Example Response

- Success response

HTTP status code 200

```
{
  "name": "connection1",
  "type": "DWS",
  "config": {
    "clusterName": "test",
    "userName": "dbadmin",
    "password": "*****",
    "kmsKey": "cdm-dlf",
```

```
"agentName":"cdm-donotdelete",
"sslEnable":false
}
```

- Failure response

HTTP status code 400

```
{
"error_code":"DLF6322",
"error_msg":"The data connection does not exist."
}
```

Status Codes

See [Status Codes](#).

5.4.4 Modifying a Connection (to Be Taken Offline)

NOTE

The connection management capability is provided by Management Center. This API is no longer maintained. You are advised to use the APIs in Management Center for connection management.

Function

This API is used to edit a connection.

URI

- URI format
PUT /v1/{project_id}/connections/{connection_name}?ischeck=true
- Parameter description

Table 5-214 URI parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Project ID. For details about how to obtain a project ID, see Project ID and Account ID .
connection_name	Yes	String	Name of a connection.
ischeck	No	String	Indicates whether to perform check. The default value is No .

Request Parameters

Table 5-215 Request header parameter

Parameter	Mandatory	Type	Description
workspace	No	String	<p>Workspace ID.</p> <ul style="list-style-type: none"> If this parameter is not set, data in the default workspace is queried by default. To query data in other workspaces, this header must be carried.

Table 5-216 Connection parameters

Parameter	Mandatory	Type	Description
name	Yes	String	<p>Connection name. The name contains a maximum of 100 characters, including only letters, numbers, hyphens (-), and underscores (_). The connection name must be unique.</p>
type	Yes	String	<p>Connection type.</p> <ul style="list-style-type: none"> DWS DLI SparkSQL HIVE RDS CloudTable HOST
config	No	Map<String,String>	<p>Connection configuration item. The configuration item varies with the connection type. You do not need to set the config parameter for DLI connections. For other types of connections, see the description of connection configuration items.</p>
description	No	String	<p>Description of the connection. The description contains a maximum of 255 characters.</p>

Response Parameters

None.

Example Request

Modify a connection.

```
PUT /v1/b384b9e9ab9b4ee8994c8633aabc9505/connections/connection1?ischeck=true
{
  "name":"connection1",
  "type":"DWS",
  "config":{
    "clusterName":"test",
    "userName":"dbadmin",
    "password":"*****",
    "kmsKey":"cdm-dlf",
    "agentName":"cdm-donotdelete",
    "sslEnable":false
  }
}
```

Example Response

- Success response
HTTP status code 204
- Failure response
HTTP status code 400

```
{
  "error_code":"DLF.6322",
  "error_msg":"The data connection does not exist."
}
```

Status Codes

See [Status Codes](#).

5.4.5 Deleting a Connection (to Be Taken Offline)

NOTE

The connection management capability is provided by Management Center. This API is no longer maintained. You are advised to use the APIs in Management Center for connection management.

Function

This API is used to delete a connection.

URI

- URI format
DELETE /v1/{project_id}/connections/{connection_name}
- Parameter description

Table 5-217 URI parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Project ID. For details about how to obtain a project ID, see Project ID and Account ID .
connection_name	Yes	String	Name of a connection.

Request Parameters

Table 5-218 Request header parameter

Parameter	Mandatory	Type	Description
workspace	No	String	Workspace ID. <ul style="list-style-type: none">If this parameter is not set, data in the default workspace is queried by default.To query data in other workspaces, this header must be carried.

Response Parameters

None.

Example Request

Delete the connection.

```
DELETE /v1/b384b9e9ab9b4ee8994c8633aabc9505/connections/connection1
```

Example Response

Success response

HTTP status code 204

5.4.6 Exporting Connections (to Be Taken Offline)

NOTE

The connection management capability is provided by Management Center. This API is no longer maintained. You are advised to use the APIs in Management Center for connection management.

Function

This API is used to export all connection information that is compressed in ZIP format.

URI

- URI format
POST /v1/{project_id}/connections/export
- Parameter description

Table 5-219 URI parameter

Parameter	Mandatory	Type	Description
project_id	Yes	String	Project ID. For details about how to obtain a project ID, see Project ID and Account ID .

Request Parameters

Table 5-220 Request header parameter

Parameter	Mandatory	Type	Description
workspace	No	String	Workspace ID. <ul style="list-style-type: none"> • If this parameter is not set, data in the default workspace is queried by default. • To query data in other workspaces, this header must be carried.

Response Parameters

The value of **Content-Type** in the response message is **application/octet-stream** that needs to be converted into a file. For details, see [Parsing a Stream in a Response Message](#). Response messages are compressed as a file. The file name format is **DLF_All_DataConnections.zip**. The file directory is as follows:

```
connections
├─{dwsConnection}.conn
```

Example Request

Export a connection.
POST /v1/b384b9e9ab9b4ee8994c8633aabc9505/connections/export

Example Response

- Success response

HTTP status code 200

Response messages are compressed as a file. The file directory is as follows:

```
connections
├──{dwsConnection}.conn
```

- Failure response

HTTP status code 400

```
{
  "error_code":"DLF.6322",
  "error_msg":"The data connection does not exist."
}
```

Status Codes

See [Status Codes](#).

5.4.7 Importing Connections (to Be Taken Offline)

NOTE

The connection management capability is provided by Management Center. This API is no longer maintained. You are advised to use the APIs in Management Center for connection management.

Function

This API is used to import one or more connection files from OBS to the Data Development module. Before using this API, store connection files in OBS buckets.

URI

- URI format
POST /v1/{project_id}/connections/import
- Parameter description

Table 5-221 URI parameter

Parameter	Mandatory	Type	Description
project_id	Yes	String	Project ID. For details about how to obtain a project ID, see Project ID and Account ID .

Request Parameters

Request parameters

Parameter	Mandatory	Type	Description
path	Yes	String	With OBS deployed: OBS path for storing the connection definition file. For details about the format of the job definition file, see the response message of the exported connection. Without OBS deployed: local path for storing the connection definition file.
params	No	List<Params>	Connection parameter. By default, this parameter is left blank.
sameNamePolicy	No	String	Policy for specifying how to handle duplicate names. The options are as follows: <ul style="list-style-type: none"> • SKIP • OVERWRITE Default value: SKIP

Params connection parameters

Parameter	Mandatory	Type	Description
name	Yes	String	Name of a connection.
type	Yes	String	Connection type.
params	No	Map<String,String>	Connection parameter. For details about parameter names, see the description of each type of connection configuration item. By default, this parameter is left blank.

Response Parameters

Parameter	Mandatory	Type	Description
taskId	Yes	String	ID of the task. Used to call the API for querying system tasks to obtain the import status.

Example Request

```
POST /v1/b384b9e9ab9b4ee8994c8633aabc9505/connections/import
{
  "path":"obs://00zyx/2019-07-02/DLF_ALL_DataConnections.zip",
  "sameNamePolicy":"OVERWRITE",
  "params":[
    {
      "name":"DWS",
      "type":"DWS",
      "params":{"clusterName":"cluster1"}
    },
    {
      "name":"hive",
      "type":"HIVE",
      "params":{"clusterName":"mrs_ymcc",
        "connectionMethod":"agent",
        "userName":"admin",
        "agentName":"cdm-donotdelete",
        "kmsKey":"KMS-42ab"}
    }
  ]
}
```

Example Response

- Success response

HTTP status code 200

```
{
  "taskId":"008aae2e675933c7016759418e870000"
}
```

- Failure response

HTTP status code 400

```
{
  "error_code":"DLF0815",
  "error_msg":"Fail to read OBS file."
}
```

Status Codes

See [Status Codes](#).

6 DataArts Factory APIs (V2)

6.1 Job Development APIs

6.1.1 Creating a PatchData Instance

Function

This API is used to create a PatchData instance.

URI

- URI format
POST /v2/{project_id}/factory/supplement-data
- Parameter description

Parameter	Mandatory	Type	Description
project_id	Yes	String	Project ID. For details about how to obtain a project ID, see Project ID and Account ID .

Request Parameters

Table 6-1 Request header parameters

Parameter	Mandatory	Type	Description
workspace	No	String	Workspace ID <ul style="list-style-type: none"> If this parameter is not set, data in the default workspace is queried by default. To query data in other workspaces, this header must be carried.
X-Auth-Token	Yes	String	IAM Token Minimum length: 0 Maximum length: 4096
Content-Type	Yes	String	MIME type of the request body

Table 6-2 Body parameters

Parameter	Mandatory	Type	Description
name	Yes	String	Name of the PatchData job
job_name	Yes	String	Name of the job to which data is to be patched
start_date	Yes	String	Start time for the PatchData job, for example, 2023-08-21T00:00:00 +08
end_date	Yes	String	End time for the PatchData job, for example, 2023-08-21T23:59:59 +08
parallel	Yes	int	Number of parallel periods. The value ranges from 1 to 5.
depend_jobs	No	List<JobDTO>	See Table 6-3 .
is_day_granularity	No	Boolean	Whether to patch data by day. The value can be true (yes) or false (no).

Parameter	Mandatory	Type	Description
priority	No	int	Priority of the PatchData job. If system resources are insufficient, computing resources are preferentially allocated to jobs with higher priorities. A larger value indicates a higher priority. Priorities can be set only for DLI SQL operators.
is_stop_when_fail	No	Boolean	Whether to stop a PatchData job if it fails. The value can be true (yes) or false (no).
reverse_order	No	int	Whether to patch data in descending order of date. The value can be 0 (ascending order) or 1 (descending order).
force	No	String	Whether to forcibly patch data. The value true indicates that data can be forcibly patched, that is, if a job has two PatchData instances, data can still be patched. The value false indicates that data cannot be forcibly patched.
supplement_data_run_time	No	Object	PatchData time period. Currently, data can only be patched only every day. If this parameter is not specified, the default value 00:00-00:00 is used. For details, see Table 6-4 .
supplement_data_instance_time	No	Object	Discrete time for the PatchData job. For details, see Table 6-5 .

Table 6-3 JobDTO parameters

Parameter	Mandatory	Type	Description
job_name	No	String	Job name
workspace_id	No	String	Workspace ID

Table 6-4 SupplementDataRunTime parameters

Parameter	Mandatory	Type	Description
time_of_day	No	String	Time period for patching data every day, for example, 10:15-23:30 .
day_of_week	No	String	Days of each week for patching data, for example, 10:15 to 23:30 on Monday and Wednesday
day_of_month	No	String	Days in each month for patching data, for example, 1,3 which indicates the first and third day in each month

Table 6-5 SupplementDataInstanceTime parameters

Parameter	Mandatory	Type	Description
days	No	array[string]	Discrete days
time_of_day	No	String	Time period on a specified day

Response Parameters

None.

Example Request

Create a PatchData instance named **P_job_6796_20230823_9991** which depends on **job_5799**.

```
POST /v2/62099355b894428e8916573ae635f1f9/factory/supplement-data
```

```
{
  "name": "P_job_6796_20230823_9991",
  "job_name": "job_5799",
  "start_date": "2023-08-23T00:00:00 +08",
  "end_date": "2023-08-23T23:59:59 +08",
  "parallel": 1,
  "depend_jobs": [],
  "is_day_granularity": false,
  "priority": 0,
  "is_stop_when_fail": false,
  "reverse_order": 0,
  "supplement_data_run_time": {
    "time_of_day": "01:03-02:00"
  },
  "supplement_data_instance_time": {
    "days": ["2023/09/05-2023/09/05"],
    "time_of_day": "00:00-23:59"
  },
  "force": "true"
}
```

Example Response

- Success response
HTTP status code 200
- Failure response
HTTP status code 400

```
{
  "error_code": "DLF.3051",
  "error_msg": "The request parameter is invalid."
}
```

6.1.2 Querying PatchData Instances

Function

This API is used to query PatchData instances. Pagination query is supported.

URI

- URI format
GET /v2/{project_id}/factory/supplement-data?
sort={sort}&page={page}&size={size}&name={name}&user_name={user_name}
&status={status}&start_date={start_date}&end_date={end_date}
- Parameter description

Parameter	Mandatory	Type	Description
project_id	Yes	String	Project ID. For details about how to obtain a project ID, see Project ID and Account ID .
name	No	String	PatchData name
user_name	No	String	Username
status	No	String	Instance status <ul style="list-style-type: none">• SUCCESS: The job is successful.• RUNNING: The job is running.• CANCEL: The job has been canceled.
sort	No	String	Sorting field <ul style="list-style-type: none">• desc: The results are displayed in descending order of creation time.• asc: The results are displayed in ascending order of creation time. The default value is desc .
page	No	Integer	Start page of the paging list. Default value: 0 The value must be greater than or equal to 0 .

Parameter	Mandatory	Type	Description
size	No	Integer	The maximum number of records on each page. Default value: 10
start_date	No	Long	13-digit timestamp of the start date of the query job
end_date	No	Long	13-digit timestamp of the end date of the query job

Request Parameters

Table 6-6 Request header parameters

Parameter	Mandatory	Type	Description
workspace	No	String	Workspace ID <ul style="list-style-type: none"> If this parameter is not set, data in the default workspace is queried by default. To query data in other workspaces, this header must be carried.
X-Auth-Token	Yes	String	IAM Token Minimum length: 0 Maximum length: 4096

Response Parameters

Table 6-7 Parameter description

Parameter	Mandatory	Type	Description
total	Yes	Integer	Number of jobs
success	Yes	Boolean	true or false
msg	Yes	String	success
rows	Yes	List<row>	Information about PatchData instances. For details, see Table 6-8 .

Table 6-8 row data structure description

Parameter	Mandatory	Type	Description
job_list	Yes	List<String>	PatchData job. There may be dependent jobs, so there may be multiple jobs.
name	Yes	String	PatchData name
user_name	Yes	String	Username
type	Yes	int	How a PatchData job is triggered. The value is 0 or 1 . Value 0 indicates that the PatchData job is triggered on the job monitoring page, and value 1 indicates that the PatchData job is triggered by a restoration.
start_date	Yes	Long	13-digit timestamp of the start date of the job
end_date	Yes	Long	13-digit timestamp of the end date of the job
parallel	Yes	int	Number of parallel periods. The value ranges from 1 to 5.
status	Yes	String	Instance status <ul style="list-style-type: none"> • SUCCESS: The job is successful. • RUNNING: The job is running. • CANCEL: The job has been canceled.
submitted_date	Yes	Long	Job creation time
supplement_data_run_time	No	supplement_data_run_time object	PatchData time period. Currently, data can only be patched only every day. If this parameter is not specified, the default value 00:00-00:00 is used. For details, see Table 6-9 .
supplement_data_instance_time	No	supplement_data_instance_time object	Discrete time for the PatchData job. For details, see Table 6-10 .

Table 6-9 SupplementDataRunTime parameters

Parameter	Mandatory	Type	Description
time_of_day	Yes	String	Time period for patching data every day, for example, 10:15-23:30 .

Parameter	Mandatory	Type	Description
day_of_week	No	String	Days of each week for patching data, for example, 10:15 to 23:30 on Monday and Wednesday
day_of_month	No	String	Days in each month for patching data, for example, 1,3 which indicates the first and third day in each month

Table 6-10 SupplementDataInstanceTime parameters

Parameter	Mandatory	Type	Description
days	No	array[string]	Discrete days
time_of_day	No	String	Time period on a specified day

Example Request

Query the job list.

```
GET /v2/62099355b894428e8916573ae635f1f9/factory/supplement-data
```

Example Response

- Success response: HTTP status code 200

```
{
  "msg": "success",
  "rows": [
    {
      "end_date": 1692633599000,
      "job_list": [

      "type": 0,
      "user_name": "user_test"
    }
  ],
  "success": true,
  "total": 1
}
```

- Failure response
HTTP status code 400

```
{
  "error_code": "DLF.3051",
  "error_msg": "The request parameter is invalid."
}
```

6.1.3 Stopping a PatchData Instance

Function

This API is used to stop a specified PatchData instance. A PatchData instance can be stopped only when it is in running state.

URI

- URI format
POST /v2/{project_id}/factory/supplement-data/{instance_name}/stop
- Parameter description

Table 6-11 URI parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Project ID. For details about how to obtain a project ID, see Project ID and Account ID .
instance_name	Yes	String	PatchData name

Request Parameters

Table 6-12 Request header parameters

Parameter	Mandatory	Type	Description
workspace	No	String	Workspace ID <ul style="list-style-type: none">• If this parameter is not set, data in the default workspace is queried by default.• To query data in other workspaces, this header must be carried.
X-Auth-Token	Yes	String	IAM Token Minimum length: 0 Maximum length: 4096

Response Parameters

None

Example Request

```
POST /v2/62099355b894428e8916573ae635f1f9/factory/supplement-data/P_job_8002_203_aa/stop
```

Example Response

- Success response
HTTP status code 200
- Failure response
HTTP status code 400

```
{  
  "error_code": "DLF.0113",  
  "error_msg": "The supplement [P_job_1000_20230821_1540182] does not exist."  
}
```

6.1.4 Changing a Job Name

Function

This API is used to change the name of a job.

URI

- URI format
PUT /v2/{project_id}/factory/jobs/{job_name}/rename
- Parameter description

Table 6-13 URI parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Project ID. For details about how to obtain a project ID, see Project ID and Account ID .
job_name	Yes	String	Job name

Request Parameters

Table 6-14 Request header parameters

Parameter	Mandatory	Type	Description
workspace	No	String	Workspace ID <ul style="list-style-type: none"> If this parameter is not set, data in the default workspace is queried by default. To query data in other workspaces, this header must be carried.
X-Auth-Token	No	String	This parameter is mandatory for token authentication. The length of a user token must meet the following requirements: Minimum length: 0 Maximum length: 4096
Content-Type	No	String	This parameter is mandatory if the body is available. If the body is unavailable, you do not need to set and verify this parameter. Example: Content-Type: application/json;charset=UTF-8
Authorization	No	String	This field is mandatory for AK/SK authentication.
Host	No	String	This field is mandatory for AK/SK authentication.

Table 6-15 Body parameters

Parameter	Mandatory	Type	Description
name	Yes	String	Job name

Response Parameters

Table 6-16 Parameter description

Parameter	Mandatory	Type	Description
is_success	Yes	Boolean	true or false

Parameter	Mandatory	Type	Description
status_code	Yes	Integer	Response status code

Example Request

```
PUT /v2/62099355b894428e8916573ae635f1f9/factory/jobs/job_2284221/rename
{
  "name": "job_4269F"
}
```

Example Response

- Success response

HTTP status code 200

```
{
  "is_success": true,
  "status_code": 200
}
```

- Failure response

HTTP status code 400

```
{
  "error_code": "DLF.30100",
  "error_msg": "Job[job_2284221] does not exist"
}
```

6.1.5 Querying Release Packages

Function

This API is used to query release packages.

URI

- URI format
POST /v2/{project_id}/factory/release-packages
- Parameter description

Table 6-17 URI parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Project ID. For details about how to obtain a project ID, see Project ID and Account ID .

Request Parameters

Table 6-18 Request header parameters

Parameter	Mandatory	Type	Description
workspace	No	String	<p>Workspace ID</p> <ul style="list-style-type: none"> If this parameter is not set, data in the default workspace is queried by default. To query data in other workspaces, this header must be carried.
X-Auth-Token	No	String	<p>This parameter is mandatory for token authentication. The length of a user token must meet the following requirements:</p> <p>Minimum length: 0 Maximum length: 4096</p>
Content-Type	No	String	<p>This parameter is mandatory if the body is available. If the body is unavailable, you do not need to set and verify this parameter.</p> <p>Example: Content-Type: application/json;charset=UTF-8</p>
Authorization	No	String	<p>This field is mandatory for AK/SK authentication.</p>
Host	No	String	<p>This field is mandatory for AK/SK authentication.</p>

Table 6-19 Body parameters

Parameter	Mandatory	Type	Description
key_word	No	String	Keyword of the package name
apply_user_name	No	String	Applicant name
deploy_user_name	No	String	Deployer name
apply_begin_time	No	Long	Start time of the application. Its value is a 13-digit timestamp.
apply_end_time	No	Long	End time of the application. Its value is a 13-digit timestamp.

Parameter	Mandatory	Type	Description
deploy_begin_time	No	Long	Start time of the release. Its value is a 13-digit timestamp.
deploy_end_time	No	Long	End time of the release. Its value is a 13-digit timestamp.
apply_user_name_filter	No	array[string]	Array of applicant names used to filter applicants. If apply_user_name is set, it must be contained in the array.
deploy_user_name_filter	No	array[string]	Array of deployer names used to filter deployers. If deploy_user_name is set, it must be contained in the array.
deploy_statuses_filter	No	array[integer]	Release status array 1 : to be reviewed 2 : successful 3 : failed 5 : being released
sorted_direction	No	String	Sorting direction. The default value is desc .
order_column	No	String	Sorting field. The default value is apply_timestamp .
limit	No	Integer	Number of results returned for each page. The default value is 10 .
offset	No	Integer	Start page. The value must be greater than or equal to 0. The default value is 0 .

Response Parameters

Table 6-20 Parameter description

Parameter	Mandatory	Type	Description
data	Yes	array[object]	Release package information. For details, see Table 6-21 .
total	Yes	Integer	Number of release packages

Table 6-21 Release package parameters

Parameter	Mandatory	Type	Description
apply_timestamp	No	Long	Application time. The value is a 13-digit timestamp.
apply_user_id	No	String	Applicant ID
apply_user_name	No	String	Applicant name
delete_flag	No	integer	Whether to delete the package 0 : It will not be deleted. 1 : It will be deleted.
deploy_status	No	integer	Release status 1 : to be reviewed 2 : successful 3 : failed 5 : being released
deploy_timestamp	No	Long	Release time. Its value is a 13-digit timestamp.
deploy_user_id	No	String	Deployer ID
deploy_user_name	No	String	Deployer name
package_approvers	No	array[object]	Release package review information. For details, see Table 6-22 .
package_id	No	String	Release package ID
package_name	No	String	Release package name
project_id	No	String	Project ID and workspace information in the following format: <i>Project ID-workspace-Workspace ID</i>
workspace_id	No	String	ID of the workspace where the release package is located

Table 6-22 Release package review parameters

Parameter	Mandatory	Type	Description
user_id	No	String	ID of the release package reviewer
user_name	No	String	Name of the release package reviewer

Example Request

```
POST /v2/62099355b894428e8916573ae635f1f9/factory/packages
{
  "key_word": "",
  "apply_user_name": "",
  "deploy_user_name": "",
  "apply_begin_time": 1699113600999,

6.1.6 Querying Details About a Release Package

Function

This API is used to query details about a release package.

URI

- URI format
GET /v2/{project_id}/factory/release-packages/{package_id}
- Parameter description

Table 6-23 URI parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Project ID. For details about how to obtain a project ID, see Project ID and Account ID .
package_id	Yes	String	Release package ID. For details about how to obtain the value, see the response parameter package_id in the "Querying Release Packages" API.

Request Parameters

Table 6-24 Request header parameters

Parameter	Mandatory	Type	Description
workspace	No	String	Workspace ID <ul style="list-style-type: none">• If this parameter is not set, data in the default workspace is queried by default.• To query data in other workspaces, this header must be carried.

Parameter	Mandatory	Type	Description
X-Auth-Token	No	String	This parameter is mandatory for token authentication. The length of a user token must meet the following requirements: Minimum length: 0 Maximum length: 4096
Content-Type	No	String	This parameter is mandatory if the body is available. If the body is unavailable, you do not need to set and verify this parameter. Example: Content-Type: application/json;charset=UTF-8
Authorization	No	String	This field is mandatory for AK/SK authentication.
Host	No	String	This field is mandatory for AK/SK authentication.

Response Parameters

Table 6-25 Parameter description

Parameter	Mandatory	Type	Description
release_package	Yes	object	Release package details. For details, see Table 6-26 .
task_details	Yes	array[object]	Release task details. For details, see Table 6-27 .

Table 6-26 Parameters in release package details

Parameter	Mandatory	Type	Description
apply_timestamp	No	Long	Application time. The value is a 13-digit timestamp.
apply_user_id	No	String	Applicant ID
apply_user_name	No	String	Applicant name

Parameter	Mandatory	Type	Description
delete_flag	No	integer	Whether to delete the package 0 : It will not be deleted. 1 : It will be deleted.
deploy_status	No	integer	Release status 1 : to be reviewed 2 : successful 3 : failed 5 : being released
deploy_timestamp	No	Long	Release time. Its value is a 13-digit timestamp.
deploy_user_id	No	String	Deployer ID
deploy_user_name	No	String	Deployer name
package_approvers	No	array[object]	Release package review information. For details, see Table 6-28 .
package_id	No	String	Release package ID
package_name	No	String	Release package name
project_id	No	String	Project ID and workspace information in the following format: <i>Project ID-workspace-Workspace ID</i>
workspace_id	No	String	ID of the workspace where the release package is located

Table 6-27 Parameters in release task details

Parameter	Mandatory	Type	Description
deploy_status	No	integer	Release status 1 : to be reviewed 2 : successful 3 : failed 5 : being released
deployed_version	No	integer	Released node version
item_name	No	String	Release task name

Parameter	Mandatory	Type	Description
pending_item_id	No	String	Release task ID
pending_version	No	integer	Current node version
script_id	No	String	Script ID
task_id	No	String	Job ID
start_job_status	No	integer	Job start status 2: successful 3: failed
submit_timestamp	No	Long	Submission time, which is a 13-digit timestamp
submit_user_id	No	String	Submitter ID
submit_user_name	No	String	Submitter name
task_type	No	integer	Task type 1: job 2: script 3: resource
update_type	No	integer	Change type. The default value is 1. 1: adding 2: modification 3: deletion

Table 6-28 Release package review parameters

Parameter	Mandatory	Type	Description
user_id	No	String	ID of the release package reviewer
user_name	No	String	Name of the release package reviewer

Example Request

```
GET /v2/62099355b894428e8916573ae635f1f9/factory/release-packages/1
```

Example Response

- Success response

HTTP status code 200

```
{
  "release_package": {
    "apply_timestamp": 1700288912934,

      "update_type": 1
    }
  ]
}
```

- Failure response

HTTP status code 400

```
{
  "error_code": "DLE.3051",
  "error_msg": "The request parameter is invalid. "
}
```

6.1.7 Configuring Job Tags

Function

This API is used to configure job tags.

URI

- URI format
POST /v2/{project_id}/factory/jobs/{job_name}/tags
- Parameter description

Table 6-29 URI parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Project ID. For details about how to obtain a project ID, see Project ID and Account ID .
job_name	Yes	String	Job name

Request Parameters

Table 6-30 Request header parameters

Parameter	Mandatory	Type	Description
workspace	No	String	Workspace ID <ul style="list-style-type: none"> If this parameter is not set, data in the default workspace is queried by default. To query data in other workspaces, this header must be carried.
X-Auth-Token	Yes	String	IAM Token Minimum length: 0 Maximum length: 4096
Content-Type	No	String	This parameter is mandatory if the body is available. If the body is unavailable, you do not need to set and verify this parameter. Example: Content-Type: application/json;charset=UTF-8

Table 6-31 Body parameters

Parameter	Mandatory	Type	Description
tag_names	No	List<String>	Tag list. If the list is empty, all tags of the job will be deleted. Example: ["tag1", "tag2"]

Response Parameters

None

Example Request

Add **tag1** to job **myJob**.

```
POST /v2/b384b9e9ab9b4ee8994c8633aabc9505/factory/jobs/myJob/tags
{
  "tag_names": ["tag1"]
}
```

Delete all the tags of job **myJob**.

```
POST /v2/b384b9e9ab9b4ee8994c8633aabc9505/factory/jobs/myJob/tags
{
  "tag_names": []
}
```

Example Response

- Success response
HTTP status code 204
- Failure response
HTTP status code 400

```
{
  "error_code": "DLF.100",
  "error_msg": "The job does not exists."
}
```

6.1.8 Querying Alarm Notifications

Function

This API is used to query the alarm notifications in a specified period.

URI

- URI format
GET /v2/{project_id}/factory/alarm-info?
start_time={start_time}&end_time={end_time}&limit={limit}&offset={offset}
- Parameter description

Table 6-32 URI parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Project ID. For details about how to obtain a project ID, see Project ID and Account ID .
start_time	No	Long	Start time of an alarm. The default value is one hour before the current time. The value is a 13-digit timestamp.

Parameter	Mandatory	Type	Description
end_time	No	Long	End time of an alarm. The default value is the current time. The value is a 13-digit timestamp. The time range can be the last week.
offset	No	Integer	Start page of the paging list. The default value is 0 . The value must be greater than or equal to 0 .
limit	No	Integer	The maximum number of records on each page. The default value is 100 and the value ranges from 1 to 1000.

Request Parameters

Table 6-33 Request header parameters

Parameter	Mandatory	Type	Description
workspace	No	String	Workspace ID <ul style="list-style-type: none"> If this parameter is not set, data in the default workspace is queried by default. To query data in other workspaces, this header must be carried.
X-Auth-Token	No	String	IAM token Minimum length: 0 Maximum length: 4096

Response Parameters

Table 6-34 Parameter description

Parameter	Mandatory	Type	Description
alarm_info	No	List<AlarmInfo>	Notification information. For details, see Table 6-35 .
total	No	Integer	Number of notifications

Table 6-35 AlarmInfo data structure

Parameter	Mandatory	Type	Description
alarm_time	No	Long	Alarm notification time
job_name	No	String	Job name
schedule_type	No	Integer	Job instance scheduling mode. Possible values are: 0: general scheduling 2: manual scheduling 5: PatchData 6: subjob scheduling 7: one-off scheduling
send_msg	No	String	Message sent
plan_time	No	Long	Planned time
remind_type	No	Integer	Alarm notification type. The following values are available: 0: successful execution 1: execution exception/failure 3: unfinished 4: busy resources 12: cycle not completed 13: cancellation 14: successful rerun of a failed job 15: job modification
send_status	No	Integer	Job sending status. Available values include: 0: The notification was sent successfully. 1: The notification failed to be sent.
job_id	No	Long	Job ID

Example Request

```
GET /v2/b384b9e9ab9b4ee8994c8633aabc9505/factory/alarm-info?
start_time=1702378620000&end_time=1702710169595&limit=3&offset=0
```

Example Response

- Success response

HTTP status code 200

```
{
  "alarm_info": [
```

```
{

6.1.9 Releasing Task Packages

Function

This API is used to release task packages.

URI

- URI format
POST /v2/{project_id}/factory/release-packages/deploy
- Parameter description

Table 6-36 URI parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Project ID. For details about how to obtain a project ID, see Project ID and Account ID .

Request Parameters

Table 6-37 Request header parameters

Parameter	Mandatory	Type	Description
workspace	No	String	<p>Workspace ID</p> <ul style="list-style-type: none"> If this parameter is not set, data in the default workspace is queried by default. To query data in other workspaces, this header must be carried.
X-Auth-Token	No	String	<p>IAM Token</p> <p>Minimum length: 0</p> <p>Maximum length: 4096</p>
Content-Type	No	String	<p>This parameter is mandatory if the body is available. If the body is unavailable, you do not need to set and verify this parameter.</p> <p>Example: Content-Type: application/json;charset=UTF-8</p>

Table 6-38 Request body parameters

Parameter	Mandatory	Type	Description
package_ids	Yes	array[string]	<p>IDs of the packages to be released. The value cannot be empty or contain more than 100 IDs.</p>
startup_mode	No	Integer	<p>Whether to start a job immediately after the package is released. The value can be 0 or 1. The default value is 1.</p> <p>1: A job is immediately started after the package is released.</p> <p>0: A job is not immediately started after the package is released.</p>

Response Parameters

Table 6-39 Parameters

Parameter	Mandatory	Type	Description
deploy_package_details	No	List<Object>	Information about the package to be released. For details, see Table 6-40 .

Table 6-40 deploy_package_details data structure

Parameter	Mandatory	Type	Description
asy_subtask_num	No	Integer	Total number of subtasks that are executed asynchronously
asy_task_id	No	String	ID of the asynchronous job, which is returned to the console for polling.
package_id	No	Long	Release package ID

Example Request

```
POST /v2/b384b9e9ab9b4ee8994c8633aabc9505/factory/release-packages/deploy
{
  "package_ids": ["23"],
  "startup_mode": 0
}
```

Example Response

- Success response

HTTP status code 200

```
{
  "deploy_package_details": [
    {
      "asy_subtask_num": 1,
      "asy_task_id": "ff8080818c81c8ab018c8b43f85d0008",
      "package_id": 23
    }
  ]
}
```

- Failure response

HTTP status code 400

```
{
  "error_code": "DLF.0810",
  "error_msg": "Task does not exist."
}
```

6.1.10 Canceling Task Packages

Function

This API is used to cancel task packages.

URI

- URI format
POST /v2/{project_id}/factory/release-packages/unpack
- Parameter description

Table 6-41 URI parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Project ID. For details about how to obtain a project ID, see Project ID and Account ID .

Request Parameters

Table 6-42 Request header parameters

Parameter	Mandatory	Type	Description
workspace	No	String	Workspace ID <ul style="list-style-type: none">• If this parameter is not set, data in the default workspace is queried by default.• To query data in other workspaces, this header must be carried.
X-Auth-Token	No	String	IAM token Minimum length: 0 Maximum length: 4096
Content-Type	No	String	This parameter is mandatory if the body is available. If the body is unavailable, you do not need to set and verify this parameter. Example: Content-Type: application/json;charset=UTF-8

Table 6-43 Request body parameters

Parameter	Mandatory	Type	Description
package_ids	No	array[string]	IDs of release packages

Response Parameters

None

Example Request

```
POST /v2/b384b9e9ab9b4ee8994c8633aabc9505/factory/release-packages/unpack
{"package_ids":["12","13"]}
```

Example Response

- Success response
HTTP status code 200
- Failure response
HTTP status code 400

```
{
  "error_code": "DLF.0810",
  "error_msg": "Task does not exist."
}
```

6.1.11 Querying the Instance Execution Status

Function

This API is used to query the instance statuses of the current day, previous day, the day before the previous day, and last seven days.

URI

- URI format
GET /v2/{project_id}/factory/monitor/task-statistics-overview?
is_own={is_own}&query_days={query_days}
- Parameter description

Table 6-44 URI parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Project ID. For details about how to obtain a project ID, see Project ID and Account ID .

Parameter	Mandatory	Type	Description
is_own	No	String	Whether to query the statuses of the current user's instances. The default value is false , indicating that the statuses of all users' instances will be queried. Value true indicates that the statuses of the current user's instances will be queried.
query_days	No	String	Number of days for query. The value can be today , yesterday , before_yesterday , or all . The default value is today , indicating that instance statuses of the current day will be queried. today : Instance statuses of the current day will be queried. yesterday : Instance statuses of yesterday will be queried. before_yesterday : Instance statuses of the day before yesterday will be queried. all : Instance statuses of the last seven days will be queried.

Request Parameters

Table 6-45 Request header parameters

Parameter	Mandatory	Type	Description
workspace	No	String	Workspace ID <ul style="list-style-type: none"> If this parameter is not set, data in the default workspace is queried by default. To query data in other workspaces, this header must be carried.
X-Auth-Token	No	String	IAM Token Minimum length: 0 Maximum length: 4096

Response Parameters

Table 6-46 Parameters

Parameter	Mandatory	Type	Description
fail_count	No	Integer	Number of failed instances
force_success_count	No	Integer	Number of instances that were forced to be successful
freeze_count	No	Integer	Number of frozen instances
ignore_success_count	No	Integer	Number of instances whose failures were ignored
manual_stop_count	No	Integer	Number of canceled instances
pause_count	No	Integer	Number of paused instances
running_count	No	Integer	Number of running instances
running_exception_count	No	Integer	Number of abnormal instances
skip_count	No	Integer	Number of skipped instances
success_count	No	Integer	Number of successful instances
waiting_confirm_count	No	Integer	Number of instances to be confirmed for execution
waiting_count	No	Integer	Number of instances waiting to be executed
total_count	No	Integer	Total number of instances

Example Request

```
GET /v2/b384b9e9ab9b4ee8994c8633aabc9505/factory/monitor/task-statistics-overview?  
is_own=false&query_days=today
```

Example Response

- Success response

HTTP status code 200

```
{  
  "fail_count": 0,  
  "force_success_count": 0,  
  "freeze_count": 0,  
  "ignore_success_count": 0,  
  "manual_stop_count": 0,  
  "pause_count": 0,  
  "running_count": 0,  
  "running_exception_count": 0,
```

```
"skip_count": 0,
"success_count": 1,
"total_count": 1,
"waiting_confirm_count": 0,
"waiting_count": 0
}
```

- Failure response

HTTP status code 400

```
{
  "error_code": "DLF.21113",
  "error_msg": "The task query parameters [today2] are incorrect. Currently, the supported types of parameters are today, yesterday, before_yesterday, and all."
}
```

6.1.12 Querying Completed Tasks

Function

This API is used to query the tasks completed on the current day, on the previous day, and over the last seven days.

URI

- URI format
GET /v2/{project_id}/factory/monitor/task-completion-data?type={type}
- Parameter description

Table 6-47 URI parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Project ID. For details about how to obtain a project ID, see Project ID and Account ID .
type	No	String	Type of the tasks to be queried. The default value is all , indicating that all types of tasks will be queried. The following job operators are supported: Dummy, CDM Job, MRS Hive SQL, MRS Spark SQL, DLI SQL, DLI Spark, Python, DWS SQL, or Shell. NOTE The above operators are only examples. This API collects successfully executed instances once an hour. A task is a job operator.

Request Parameters

Table 6-48 Request header parameters

Parameter	Mandatory	Type	Description
workspace	No	String	Workspace ID <ul style="list-style-type: none"> If this parameter is not set, data in the default workspace is queried by default. To query data in other workspaces, this header must be carried.
X-Auth-Token	No	String	IAM Token Minimum length: 0 Maximum length: 4096

Response Parameters

Table 6-49 Parameters

Parameter	Mandatory	Type	Description
yesterday	No	array[object]	Task information of the previous day. For details, see task_record structure .
average	No	array[object]	Task information over the last seven days. For details, see task_record structure .
today	No	array[object]	Task information of the current day. For details, see task_record structure .

Table 6-50 task_record parameters

Parameter	Mandatory	Type	Description
record_time	No	Long	Time point. The value is a 13-digit timestamp.
task_completion_num	No	Long	Number of tasks completed at the current time point.

Example Request

```
GET /v2/b384b9e9ab9b4ee8994c8633aabc9505/factory/monitor/task-completion-data?type=all
```

Example Response

- Success response

HTTP status code 200

```
{
  "yesterday": [
    {
      "record_time": 1704124800000,
      "task_completion_num": 0
    },
    {
      "record_time": 1704128400000,
      "task_completion_num": 0
    },
    {
      "record_time": 1704132000000,
      "task_completion_num": 0
    }
  ],
  "average": [
    {
      "record_time": 1704124800000,
      "task_completion_num": 0
    },
    {
      "record_time": 1704128400000,
      "task_completion_num": 0
    },
    {
      "record_time": 1704132000000,
      "task_completion_num": 0
    }
  ],
  "today": [
    {
      "record_time": 1704124800000,
      "task_completion_num": 0
    },
    {
      "record_time": 1704128400000,
      "task_completion_num": 0
    },
    {
      "record_time": 1704132000000,
      "task_completion_num": 0
    }
  ]
}
```

- Failure response

HTTP status code 400

```
{
  "error_code": "DLF.3051",
  "error_msg": "The request parameter is invalid. "
}
```

6.1.13 Querying Instances of a Specified Job

Function

This API is used to query the instances of a job based on the job name.

URI

- URI format
GET /v2/{project_id}/factory/jobs/{job_name}/instances/detail
?
min_plan_time={min_plan_time}&max_plan_time={max_plan_time}&limit={limit}&offset={offset}&status={status}&instance_type={instance_type}&force_success={force_success}&ignore_success={ignore_success}
- Parameter description

Table 6-51 URI parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Project ID. For details about how to obtain a project ID, see Project ID and Account ID .
job_name	Yes	String	Job name <ul style="list-style-type: none">• If you want to query the instance list of a specific batch job, job_name is the batch job name.• If you want to query sub-jobs associated with a node in a real-time job, the job_name format is <i>Real-time job name_Node name</i>.
min_plan_time	No	Long	Minimum planned job execution time in milliseconds. Job instances whose start time is later than this time are returned. The default value is 00:00:00 of the current day. Instances of up to one month can be queried.
max_plan_time	No	Long	Minimum planned job execution time in milliseconds. Job instances whose start time is earlier than this time are returned. The default value is the current time.
limit	No	int	Maximum number of records on each page The parameter value ranges from 1 to 1000. Default value: 10
offset	No	int	Start page of the paging list. The default value is 0 . The value must be greater than or equal to 0 .

Parameter	Mandatory	Type	Description
status	No	String	<p>Job instance status</p> <ul style="list-style-type: none"> • waiting • running • success • fail • running-exception • skip-by-depend • freeze • pause • manual-stop <p>By default, all instances will be queried.</p>
instance_type	No	int	<p>Job scheduling mode</p> <ul style="list-style-type: none"> • 0: general scheduling • 2: manual scheduling • 5: PatchData • 6: subjob scheduling • 7: one-off scheduling <p>By default, all instances will be queried.</p>
force_success	No	boolean	<p>This parameter is available when status is success. If this parameter is set to true, job instances that were forced to be successful will be queried.</p> <p>Default value: false</p>
ignore_success	No	boolean	<p>This parameter is available when status is success. If this parameter is set to true, job instances whose failures were ignored will be queried.</p> <p>Default value: false</p>

Request Parameters

Table 6-52 Request header parameters

Parameter	Mandatory	Type	Description
workspace	No	String	<p>Workspace ID</p> <ul style="list-style-type: none"> If this parameter is not set, data in the default workspace is queried by default. To query data in other workspaces, this header must be carried.

Response Parameters

Table 6-53 Parameter description

Parameter	Mandatory	Type	Description
total	Yes	Long	Total number of records
instances	Yes	List<Instance>	Job instance status. For details, see Table 6-54 .

Table 6-54 instances parameters

Parameter	Mandatory	Type	Description
job_name	Yes	String	Job name. When you view the instance list of a specified batch job, job_name is the name of the batch job. When you view the subjobs associated with a node in a real-time job, job_name is in format of <i>real-time job name_node name</i> .
job_id	No	Long	Job ID
job_instance_name	Yes	String	Name of a job instance recorded by the log, rather than the name defined during job creation

Parameter	Mandatory	Type	Description
status	Yes	String	Job instance status <ul style="list-style-type: none">• waiting• running• success• fail• running-exception• skip-by-depend• freeze• pause• manual-stop
plan_time	Yes	Long	Planned execution time of the job instance
start_time	Yes	Long	Actual execution start time of the job instance
end_time	No	Long	Actual execution end time of the job instance
execute_time	No	Long	Execution duration in milliseconds
instance_id	Yes	Long	Job instance ID, which is used to query job instance details
submit_time	Yes	Long	Time when a job is submitted
instance_type	Yes	int	Job scheduling mode <ul style="list-style-type: none">• 0: general scheduling• 2: manual scheduling• 5: PatchData• 6: subjob scheduling• 7: one-off scheduling
force_success	No	boolean	Whether the job instance status is forcibly successful Default value: false
ignore_success	No	boolean	Whether the job instance status is failure ignored Default value: false
version	No	int	Job instance version

Example Request

View the instance list of batch job **job_batch**.

GET /v2/b384b9e9ab9b4ee8994c8633aabc9505/factory/jobs/job_batch/instances/detail

Example Response

- Success response

HTTP status code 200

```
{
  "total": 2,
  "instances": [
    {
      "end_time": 1551671598000,
      "execute_time": 0.3,
      "force_success": false,
      "ignore_success": false,
      "instance_id": 34765,
      "instance_type": 2,
      "job_id": 608627,
      "job_name": "job_batch",
      "job_instance_name": "job_batch",
      "plan_time": 1551671580000,
      "start_time": 1551671580000,
      "status": "success",

      "version": 1
    },
    {
      "end_time": 1551671538000,
      "execute_time": 0.3,
      "force_success": false,
      "ignore_success": false,
      "instance_id": 34764,
      "instance_type": 5,
      "job_id": 608627,
      "job_name": "job_batch",
      "job_instance_name": "job_batch",
      "plan_time": 1551671520000,
      "start_time": 1551671521000,
      "status": "success",
      "submit_time": 1550910278706,
      "version": 1
    }
  ]
}
```

- Failure response

HTTP status code 400

```
{
  "error_code": "DLF.0100",
  "error_msg": "The job does not exists."
}
```

7 DataArts Architecture APIs

7.1 Overview

7.1.1 Overview Statistics

Function

Overview statistics.

Calling Method

For details, see [Calling APIs](#).

URI

GET /v2/{project_id}/design/definitions/statistic

Table 7-1 Path Parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Project ID. For details about how to obtain the project ID, see Project ID and Account ID .

Request Parameters

Table 7-2 Request header parameters

Parameter	Mandatory	Type	Description
X-Auth-Token	Yes	String	IAM token, which is obtained by calling the IAM API for obtaining a user token (value of X-Subject-Token in the response header). This field is mandatory for authentication using tokens.
workspace	Yes	String	Workspace ID. For details about how to obtain the workspace ID, see Instance ID and Workspace ID .
X-Project-Id	No	String	Project ID. For details about how to obtain the project ID, see Project ID and Account ID . This parameter is mandatory for API requests that use AK/SK authentication in multi-project scenarios.
Content-Type	No	String	Default value: application/json;charset=UTF-8 This parameter is optional. If the body is available, this parameter is mandatory. If the body is unavailable, you do not need to set this parameter or verify it.

Response Parameters

Status code: 200

Table 7-3 Response body parameters

Parameter	Type	Description
data	data object	data: unified outermost data structure of the returned result.

Table 7-4 data

Parameter	Type	Description
value	StatisticInfo object	value: unified outer data structure of the returned result.

Table 7-5 StatisticInfo

Parameter	Type	Description
atomic_index	StatisticSchema object	Atomic metric.
derivative_index	StatisticSchema object	Derivative indicator.
compound_metric	StatisticSchema object	Composite index.
biz_index	StatisticSchema object	Service indicator.
dimension	StatisticSchema object	Dimension.
condition_group	StatisticSchema object	Indicates the restriction group.
time_condition	StatisticSchema object	Time limit.
common_condition	StatisticSchema object	General restriction.
dimension_logic_table	StatisticSchema object	Dimension table.
fact_logic_table	StatisticSchema object	Fact table.
aggregation_logic_table	StatisticSchema object	Summary table.
data_standard	StatisticSchema object	Data standard.
table_model	StatisticSchema object	Service table.
lookup_table	StatisticSchema object	Indicates the code table.
pending_review	Integer	Waiting for my review.
my_applications	Integer	My Application.

Table 7-6 StatisticSchema

Parameter	Type	Description
increase	Integer	Added this month.
total	Integer	Total number.
standard_coverage	Double	Standard coverage.

Status code: 400**Table 7-7** Response body parameters

Parameter	Type	Description
error_code	String	Error code, for example, DS.6000, indicating that the request fails to be processed.
error_msg	String	Error message
data	Object	Returned data information.

Status code: 401**Table 7-8** Response body parameters

Parameter	Type	Description
error_code	String	Error code, for example, DS.6000, indicating that the request fails to be processed.
error_msg	String	Error message
data	Object	Returned data information.

Status code: 403**Table 7-9** Response body parameters

Parameter	Type	Description
error_code	String	Error code, for example, DS.6000, indicating that the request fails to be processed.
error_msg	String	Error message

Parameter	Type	Description
data	Object	Returned data information.

Example Requests

Statistics on the Overview page.

GET https://{endpoint}/v2/{project_id}/design/definitions/statistic

Example Responses

Status code: 200

This operation succeeds, and the returned data is StatisticInfo.

SDK Sample Code

The SDK sample code is as follows.

Java

```
package com.huaweicloud.sdk.test;

import com.huaweicloud.sdk.core.auth.ICredential;
import com.huaweicloud.sdk.core.auth.BasicCredentials;
import com.huaweicloud.sdk.core.exception.ConnectionException;
import com.huaweicloud.sdk.core.exception.RequestTimeoutException;
import com.huaweicloud.sdk.core.exception.ServiceResponseException;
import com.huaweicloud.sdk.dataartsstudio.v1.region.DataArtsStudioRegion;
import com.huaweicloud.sdk.dataartsstudio.v1.*;
import com.huaweicloud.sdk.dataartsstudio.v1.model.*;
```

```
public class CountOverviewsSolution {
    public static void main(String[] args) {
        // The AK and SK used for authentication are hard-coded or stored in plaintext, which has great
        // security risks. It is recommended that the AK and SK be stored in ciphertext in configuration files or
        // environment variables and decrypted during use to ensure security.
        // In this example, AK and SK are stored in environment variables for authentication. Before running
        // this example, set environment variables CLOUD_SDK_AK and CLOUD_SDK_SK in the local environment
        String ak = System.getenv("CLOUD_SDK_AK");
        String sk = System.getenv("CLOUD_SDK_SK");

Status Codes

Status Code	Description
200	This operation succeeds, and the returned data is StatisticInfo.
400	BadRequest

Status Code	Description
401	Unauthorized
403	Forbidden

7.1.2 Model Statistics

Function

Statistics in a single model.

Calling Method

For details, see [Calling APIs](#).

URI

GET /v2/{project_id}/design/table-models/statistic

Table 7-10 Path Parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Project ID. For details about how to obtain the project ID, see Project ID and Account ID .

Table 7-11 Query Parameters

Parameter	Mandatory	Type	Description
model_id	No	String	ID of the relational model based on which statistics are queried. The ID is a string.

Request Parameters

Table 7-12 Request header parameters

Parameter	Mandatory	Type	Description
X-Auth-Token	Yes	String	IAM token, which is obtained by calling the IAM API for obtaining a user token (value of X-Subject-Token in the response header). This field is mandatory for authentication using tokens.
workspace	Yes	String	Workspace ID. For details about how to obtain the workspace ID, see Instance ID and Workspace ID .
X-Project-Id	No	String	Project ID. For details about how to obtain the project ID, see Project ID and Account ID . This parameter is mandatory for API requests that use AK/SK authentication in multi-project scenarios.
Content-Type	No	String	Default value: application/json;charset=UTF-8 This parameter is optional. If the body is available, this parameter is mandatory. If the body is unavailable, you do not need to set this parameter or verify it.

Response Parameters

Status code: 200

Table 7-13 Response body parameters

Parameter	Type	Description
data	data object	data: unified outermost data structure of the returned result.

Table 7-14 data

Parameter	Type	Description
value	TableModelStatisticVO object	value: unified outer data structure of the returned result.

Table 7-15 TableModelStatisticVO

Parameter	Type	Description
total	StatisticStandardCoverageVO object	Number of logical entities.
published	StatisticStandardCoverageVO object	Number of released logical entities.
sync_total	SyncStatusStatisticVO object	Indicates the overall synchronization status.
physical_table	SyncStatusStatisticVO object	Table creation status.
technical_asset	SyncStatusStatisticVO object	Synchronization status of technology assets.
business_asset	SyncStatusStatisticVO object	Service asset synchronization status.
meta_data_link	SyncStatusStatisticVO object	Asset association status.
data_quality	SyncStatusStatisticVO object	Quality job status.

Table 7-16 StatisticStandardCoverageVO

Parameter	Type	Description
all_col_num	String	Total number of fields, which is a string
col_num	String	Number of associated standard fields, which is a string
coverage	Double	Standard coverage.
details	Array of AllTableVO objects	Array of reference tables.

Table 7-17 AllTableVO

Parameter	Type	Description
id	String	L1 ID, which is a string
name	String	L1 name.
tb_logic_guid	String	GUID of the logical entity after the table is released.
quality_id	String	Quality ID.
reversed	Boolean	Indicates whether it is reverse.
partition_conf	String	Partition expression.
dirty_out_switch	Boolean	Indicates whether to output abnormal data.
dirty_out_database	String	Abnormal data output library.
dirty_out_prefix	String	Prefix of an exception table.
dirty_out_suffix	String	Suffix of an exception table.
tb_guid	String	GUID of the physical table after the table is released.
code	String	Code.
create_by	String	Creator.
tenant_id	String	Tenant ID.
description	String	Description.
status	String	Release status of an entity. This parameter is read-only and does not need to be set during creation and update. Options: <ul style="list-style-type: none">• DRAFT: draft• PUBLISH_DEVELOPING: to be reviewed• PUBLISHED: released• OFFLINE_DEVELOPING: to be reviewed• OFFLINE: offline• REJECT: rejected

Parameter	Type	Description
biz_type	String	<p>Business entity type.</p> <p>Options:</p> <ul style="list-style-type: none"> • AGGREGATION_LOGIC_TABLE: summary table • ATOMIC_INDEX: atomic metric • ATOMIC_METRIC: atomic metric (new) • BIZ_CATALOG: process architecture directory • BIZ_METRIC: service indicator • CODE_TABLE: code table • COMMON_CONDITION: general filter • COMPOSITE_METRIC: Compound Metric (new) • COMPOUND_METRIC: compound metric • CONDITION_GROUP: restriction group • DEGENERATE_DIMENSION: degenerate dimension • DERIVATIVE_INDEX: derivative indicator • DERIVED_METRIC: derivative indicator (new) • DIMENSION: dimension • DIMENSION_ATTRIBUTE: dimension attribute • DIMENSION_HIERARCHIES: dimension level • DIMENSION_LOGIC_TABLE: dimension table • DIMENSION_TABLE_ATTRIBUTE: dimension attribute • DIRECTORY: directory • FACT_ATTRIBUTE: fact table attribute • FACT_DIMENSION: fact table dimension • FACT_LOGIC_TABLE: fact table • FACT_MEASURE: fact table measurement • FUNCTION: function

Parameter	Type	Description
		<ul style="list-style-type: none"> • INFO_ARCH: information architecture (used for modifying themes in batches) • MODEL: model • QUALITY_RULE: quality rule • SECRECY_LEVEL: security level • STANDARD_ELEMENT: data standard • STANDARD_ELEMENT_TEMPLATE: data standard template • SUBJECT: theme • Dimension attributes of SUMMARY_DIMENSION_ATTRIBUTE: summary tables • SUMMARY_INDEX: summary table indicator attribute • SUMMARY_TIME: time period attribute of the SDR table • TABLE_MODEL: relationship model (logical model/physical model) • TABLE_MODEL_ATTRIBUTE: relationship model attribute (logical model/physical model) • TABLE_MODEL_LOGIC: logical entity • TABLE_TYPE: table type • TAG: tag • TIME_CONDITION: time restriction
create_time	String	Creation time, which is read-only. The format complies with RFC3339 and is accurate to seconds. The UTC time zone is yyyy-mm-ddTHH:MM:SSZ, for example, 1970-01-01T00:00:00Z.
update_time	String	Update time, which is read-only. The format complies with RFC3339 and is accurate to seconds. The UTC time zone is yyyy-mm-ddTHH:MM:SSZ, for example, 1970-01-01T00:00:00Z.
db_name	String	Indicates the database name.

Parameter	Type	Description
dw_type	String	Data connection type, which corresponds to the type of the data warehouse where the table is located. The value can be DWS , MRS_HIVE , POSTGRESQL , MRS_SPARK , CLICKHOUSE , MYSQL , ORACLE , or DORIS .
queue_name	String	Queue required for executing SQL statements through the DLI data connection. This parameter is mandatory when the data connection type is DLI.
schema	String	Required by the DWS type.
l1	String	Chinese name of the subject area group. This parameter is read-only and does not need to be set when you create or update a subject area group.
l2	String	Chinese name of the subject area. This parameter is read-only and does not need to be set during creation and update.
l3	String	Chinese name of the business object. This parameter is read-only and does not need to be set during creation and update.
l1_id	String	Subject area group ID, which is a read-only string
l2_id	String	Subject area ID. This parameter is read-only and does not need to be set during creation and update.
l3_id	String	Business object ID, which is a read-only string
new_biz	BizVersionManag eVO object	Service version management. This parameter is read-only.

Parameter	Type	Description
physical_table	String	<p>Synchronization status.</p> <p>Options:</p> <ul style="list-style-type: none"> • NO_NEED: not synchronized • CREATE_SUCCESS: The creation is successful. • CREATE_FAILED: Creation failed • UPDATE_SUCCESS: The update is successful. • UPDATE_FAILED: The update fails. • SUMMARY_SUCCESS: overall success • SUMMARY_FAILED: overall failure • RUNNING: overall running • OFFLINE: offline

Options: <ul style="list-style-type: none"> • NO_NEED: not synchronized • CREATE_SUCCESS: The creation is successful. • CREATE_FAILED: Creation failed • UPDATE_SUCCESS: The update is successful. • UPDATE_FAILED: The update fails. • SUMMARY_SUCCESS: overall success • SUMMARY_FAILED: overall failure • RUNNING: overall running • OFFLINE: offline
standard_count	String	Standard quantity, which is a read-only string
alias	String	Alias
api_id	String	API ID of the SDR table.
workspace_id	String	Workspace ID
workspace_name	String	Workspace name
dev_version	String	Development environment version, which is a read-only string
prod_version	String	Production environment version, which is a read-only string

Parameter	Type	Description
dev_version_name	String	Version name of the development environment, which is read-only
prod_version_name	String	Version name of the production environment, which is read-only
env_type	String	Type of the development and production environment. Options: <ul style="list-style-type: none">• INVALID_TYPE: invalid environment• DEV_TYPE: development environment• PROD_TYPE: production environment• DEV_PROD_TYPE: development and production environment

Table 7-18 BizVersionManageVO

Parameter	Type	Description
id	String	Field ID, which is a string

Parameter	Type	Description
biz_type	String	<p>Business entity type.</p> <p>Options:</p> <ul style="list-style-type: none"> • AGGREGATION_LOGIC_TABLE: summary table • ATOMIC_INDEX: atomic metric • ATOMIC_METRIC: atomic metric (new) • BIZ_CATALOG: process architecture directory • BIZ_METRIC: service indicator • CODE_TABLE: code table • COMMON_CONDITION: general filter • COMPOSITE_METRIC: Compound Metric (new) • COMPOUND_METRIC: compound metric • CONDITION_GROUP: restriction group • DEGENERATE_DIMENSION: degenerate dimension • DERIVATIVE_INDEX: derivative indicator • DERIVED_METRIC: derivative indicator (new) • DIMENSION: dimension • DIMENSION_ATTRIBUTE: dimension attribute • DIMENSION_HIERARCHIES: dimension level • DIMENSION_LOGIC_TABLE: dimension table • DIMENSION_TABLE_ATTRIBUTE: dimension attribute • DIRECTORY: directory • FACT_ATTRIBUTE: fact table attribute • FACT_DIMENSION: fact table dimension • FACT_LOGIC_TABLE: fact table • FACT_MEASURE: fact table measurement • FUNCTION: function

Parameter	Type	Description
		<ul style="list-style-type: none"> • INFO_ARCH: information architecture (used for modifying themes in batches) • MODEL: model • QUALITY_RULE: quality rule • SECRECY_LEVEL: security level • STANDARD_ELEMENT: data standard • STANDARD_ELEMENT_TEMPLATE: data standard template • SUBJECT: theme • Dimension attributes of SUMMARY_DIMENSION_ATTRIBUTE: summary tables • SUMMARY_INDEX: summary table indicator attribute • SUMMARY_TIME: time period attribute of the SDR table • TABLE_MODEL: relationship model (logical model/physical model) • TABLE_MODEL_ATTRIBUTE: relationship model attribute (logical model/physical model) • TABLE_MODEL_LOGIC: logical entity • TABLE_TYPE: table type • TAG: tag • TIME_CONDITION: time restriction
biz_id	String	Business ID, which is a string
biz_info	String	Business object information.

Parameter	Type	Description
status	String	Release status of an entity. This parameter is read-only and does not need to be set during creation and update. Options: <ul style="list-style-type: none"> • DRAFT: draft • PUBLISH_DEVELOPING: to be reviewed • PUBLISHED: released • OFFLINE_DEVELOPING: to be reviewed • OFFLINE: offline • REJECT: rejected
biz_version	Integer	Service version, which is read-only.
create_time	String	Creation time, which is read-only. The format complies with RFC3339 and is accurate to seconds. The UTC time zone is yyyy-mm-ddTHH:MM:SSZ, for example, 1970-01-01T00:00:00Z.
update_time	String	Update time, which is read-only. The format complies with RFC3339 and is accurate to seconds. The UTC time zone is yyyy-mm-ddTHH:MM:SSZ, for example, 1970-01-01T00:00:00Z.

Table 7-19 SyncStatusStatisticVO

Parameter	Type	Description
success	String	Number of synchronized data records, which is a string
failed	String	Number of failures, which is a string
running	String	Number of data records being synchronized, which is a string
other	String	Number of unsynchronized data records, which is a string

Status code: 400

Table 7-20 Response body parameters

Parameter	Type	Description
error_code	String	Error code, for example, DS.6000, indicating that the request fails to be processed.
error_msg	String	Error message
data	Object	Returned data information.

Status code: 401

Table 7-21 Response body parameters

Parameter	Type	Description
error_code	String	Error code, for example, DS.6000, indicating that the request fails to be processed.
error_msg	String	Error message
data	Object	Returned data information.

Status code: 403

Table 7-22 Response body parameters

Parameter	Type	Description
error_code	String	Error code, for example, DS.6000, indicating that the request fails to be processed.
error_msg	String	Error message
data	Object	Returned data information.

Example Requests

Relational modeling statistics.

GET https://{endpoint}/v2/{project_id}/design/table-models/statistic

Example Responses

Status code: 200

This operation succeeds, and the returned data is TableModelStatisticVO.

```

More

For SDK sample code of more programming languages, see the Sample Code tab in [API Explorer](#). SDK sample code can be automatically generated.

Status Codes

Status Code	Description
200	This operation succeeds, and the returned data is TableModelStatisticVO.
400	BadRequest
401	Unauthorized
403	Forbidden

7.1.3 Relational Modeling Statistics

Function

Outer-layer statistics on the relational modeling page.

Calling Method

For details, see [Calling APIs](#).

URI

GET /v2/{project_id}/design/models/statistic

Table 7-23 Path Parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Project ID. For details about how to obtain the project ID, see Project ID and Account ID .

Request Parameters

Table 7-24 Request header parameters

Parameter	Mandatory	Type	Description
X-Auth-Token	Yes	String	IAM token, which is obtained by calling the IAM API for obtaining a user token (value of X-Subject-Token in the response header). This field is mandatory for authentication using tokens.
workspace	Yes	String	Workspace ID. For details about how to obtain the workspace ID, see Instance ID and Workspace ID .
X-Project-Id	No	String	Project ID. For details about how to obtain the project ID, see Project ID and Account ID . This parameter is mandatory for API requests that use AK/SK authentication in multi-project scenarios.
Content-Type	No	String	Default value: application/json;charset=UTF-8 This parameter is optional. If the body is available, this parameter is mandatory. If the body is unavailable, you do not need to set this parameter or verify it.

Response Parameters

Status code: 200**Table 7-25** Response body parameters

Parameter	Type	Description
data	data object	data: unified outermost data structure of the returned result.

Table 7-26 data

Parameter	Type	Description
value	AllModelStatisticVO object	value: unified outer data structure of the returned result.

Table 7-27 AllModelStatisticVO

Parameter	Type	Description
frequent	Array of ModelStatisticVO objects	Indicates whether it is commonly used.
top	Array of ModelStatisticVO objects	First-layer model.
logic	Array of ModelStatisticVO objects	Logical model.
physical	Array of ModelStatisticVO objects	Physical model.
dwr	ModelStatisticVO object	DWR data reporting layer.
dm	ModelStatisticVO object	DM data integration layer.

Table 7-28 ModelStatisticVO

Parameter	Type	Description
biz_type	String	<p>Business entity type.</p> <p>Options:</p> <ul style="list-style-type: none"> • AGGREGATION_LOGIC_TABLE: summary table • ATOMIC_INDEX: atomic metric • ATOMIC_METRIC: atomic metric (new) • BIZ_CATALOG: process architecture directory • BIZ_METRIC: service indicator • CODE_TABLE: code table • COMMON_CONDITION: general filter • COMPOSITE_METRIC: Compound Metric (new) • COMPOUND_METRIC: compound metric • CONDITION_GROUP: restriction group • DEGENERATE_DIMENSION: degenerate dimension • DERIVATIVE_INDEX: derivative indicator • DERIVED_METRIC: derivative indicator (new) • DIMENSION: dimension • DIMENSION_ATTRIBUTE: dimension attribute • DIMENSION_HIERARCHIES: dimension level • DIMENSION_LOGIC_TABLE: dimension table • DIMENSION_TABLE_ATTRIBUTE: dimension attribute • DIRECTORY: directory • FACT_ATTRIBUTE: fact table attribute • FACT_DIMENSION: fact table dimension • FACT_LOGIC_TABLE: fact table • FACT_MEASURE: fact table measurement

Parameter	Type	Description
		<ul style="list-style-type: none"> • FUNCTION: function • INFO_ARCH: information architecture (used for modifying themes in batches) • MODEL: model • QUALITY_RULE: quality rule • SECRECY_LEVEL: security level • STANDARD_ELEMENT: data standard • STANDARD_ELEMENT_TEMPLATE: data standard template • SUBJECT: theme • Dimension attributes of SUMMARY_DIMENSION_ATTRIBUTE: summary tables • SUMMARY_INDEX: summary table indicator attribute • SUMMARY_TIME: time period attribute of the SDR table • TABLE_MODEL: relationship model (logical model/physical model) • TABLE_MODEL_ATTRIBUTE: relationship model attribute (logical model/physical model) • TABLE_MODEL_LOGIC: logical entity • TABLE_TYPE: table type • TAG: tag • TIME_CONDITION: time restriction
level	String	Data governance layers. Options: <ul style="list-style-type: none"> • SDI: source data layer • DWI: data integration layer • DWR: data reporting layer • DM: data mart layer
db	Integer	Indicates the database.
tb	Integer	Data table.
tb_published	Integer	Released data table.
fd	Integer	Field.
fd_published	Integer	Published field.

Parameter	Type	Description
st	Double	Standard coverage.
st_published	Double	Coverage of released standards.
model	WorkspaceVO object	Model information

Table 7-29 WorkspaceVO

Parameter	Type	Description
id	String	ID, which is a string
name	String	Name of the workspace.
description	String	Description.
is_physical	Boolean	Indicates whether a table is a physical table.
frequent	Boolean	Indicates whether it is commonly used.
top	Boolean	Hierarchical governance.
level	String	Data governance layers. Options: <ul style="list-style-type: none"> • SDI: source data layer • DWI: data integration layer • DWR: data reporting layer • DM: data mart layer
dw_type	String	Data connection type, which corresponds to the type of the data warehouse where the table is located. The value can be DWS , MRS_HIVE , POSTGRESQL , MRS_SPARK , CLICKHOUSE , MYSQL , ORACLE , or DORIS .
create_time	String	Creation time, which is read-only. The format complies with RFC3339 and is accurate to seconds. The UTC time zone is yyyy-mm-ddTHH:MM:SSZ, for example, 1970-01-01T00:00:00Z.
update_time	String	Update time, which is read-only. The format complies with RFC3339 and is accurate to seconds. The UTC time zone is yyyy-mm-ddTHH:MM:SSZ, for example, 1970-01-01T00:00:00Z.

Parameter	Type	Description
create_by	String	Creator.
update_by	String	Person who updates the information.
type	String	Defines the workspace type enumeration. Options: <ul style="list-style-type: none"> • THIRD_NF: relational modeling • DIMENSION: dimensional modeling
biz_catalog_ids	String	{"l1Ids":[],"l2Ids":[],"l3Ids":[]}: ID list of associated service catalogs.
databases	Array of strings	Array of database names.
table_model_prefix	String	Model verification prefix. The value contains a maximum of 100 characters, including digits, letters, and underscores (_), and starts with a letter.

Status code: 400

Table 7-30 Response body parameters

Parameter	Type	Description
error_code	String	Error code, for example, DS.6000, indicating that the request fails to be processed.
error_msg	String	Error message
data	Object	Returned data information.

Status code: 401

Table 7-31 Response body parameters

Parameter	Type	Description
error_code	String	Error code, for example, DS.6000, indicating that the request fails to be processed.
error_msg	String	Error message
data	Object	Returned data information.

Status code: 403**Table 7-32** Response body parameters

Parameter	Type	Description
error_code	String	Error code, for example, DS.6000, indicating that the request fails to be processed.
error_msg	String	Error message
data	Object	Returned data information.

Example Requests

Relational modeling statistics.

```
GET https://{endpoint}/v2/{project_id}/design/models/statistic
```

Example Responses**Status code: 200**

This operation succeeds, and the returned data is AllModelStatisticVO.

More

For SDK sample code of more programming languages, see the Sample Code tab in [API Explorer](#). SDK sample code can be automatically generated.

Status Codes

Status Code	Description
200	This operation succeeds, and the returned data is AllModelStatisticVO.
400	BadRequest
401	Unauthorized
403	Forbidden

7.1.4 Standard Coverage Statistics

Function

View the coverage of a data standard in all model fields, that is, the percentage of fields that use the standard to the total fields.

Calling Method

For details, see [Calling APIs](#).

URI

GET /v2/{project_id}/design/definitions/statistic/{id}

Table 7-33 Path Parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Project ID. For details about how to obtain the project ID, see Project ID and Account ID .
id	Yes	String	Entity ID, which is a string

Table 7-34 Query Parameters

Parameter	Mandatory	Type	Description
biz_type	No	String	Query by service type. The options are ATOMIC_INDEX (atomic indicator), DERIVATIVE_INDEX (derivative indicator), DIMENSION (dimension), and TIME_CONDITION (time filter). DIMENSION_LOGIC_TABLE (dimension table), FACT_LOGIC_TABLE (fact table), AGGREGATION_LOGIC_TABLE (summary table), TABLE_MODEL (relational modeling table), CODE_TABLE (code table), STANDARD_ELEMENT (data standard), BIZ_METRIC (business metric), COMPOUND_METRIC (compound metric), SUBJECT (subject), ATOMIC_METRIC (atomic metric (new)), DERIVED_METRIC (Derivative (new)), COMPOSITE_METRIC (Compound (new))).

Request Parameters

Table 7-35 Request header parameters

Parameter	Mandatory	Type	Description
X-Auth-Token	Yes	String	IAM token, which is obtained by calling the IAM API for obtaining a user token (value of X-Subject-Token in the response header). This field is mandatory for authentication using tokens.
workspace	Yes	String	Workspace ID. For details about how to obtain the workspace ID, see Instance ID and Workspace ID .
X-Project-Id	No	String	Project ID. For details about how to obtain the project ID, see Project ID and Account ID . This parameter is mandatory for API requests that use AK/SK authentication in multi-project scenarios.
Content-Type	No	String	Default value: application/json;charset=UTF-8 This parameter is optional. If the body is available, this parameter is mandatory. If the body is unavailable, you do not need to set this parameter or verify it.

Response Parameters

Status code: 200**Table 7-36** Response body parameters

Parameter	Type	Description
data	data object	data: unified outermost data structure of the returned result.

Table 7-37 data

Parameter	Type	Description
value	StatisticStandardCoverageVO object	value: unified outer data structure of the returned result.

Table 7-38 StatisticStandardCoverageVO

Parameter	Type	Description
all_col_num	String	Total number of fields, which is a string
col_num	String	Number of associated standard fields, which is a string
coverage	Double	Standard coverage.
details	Array of AllTableVO objects	Array of reference tables.

Table 7-39 AllTableVO

Parameter	Type	Description
id	String	L1 ID, which is a string
name	String	L1 name.
tb_logic_guid	String	GUID of the logical entity after the table is released.
quality_id	String	Quality ID.
reversed	Boolean	Indicates whether it is reverse.
partition_conf	String	Partition expression.
dirty_out_switch	Boolean	Indicates whether to output abnormal data.
dirty_out_databas e	String	Abnormal data output library.
dirty_out_prefix	String	Prefix of an exception table.
dirty_out_suffix	String	Suffix of an exception table.
tb_guid	String	GUID of the physical table after the table is released.

Parameter	Type	Description
code	String	Code.
create_by	String	Creator.
tenant_id	String	Tenant ID.
description	String	Description.
status	String	Release status of an entity. This parameter is read-only and does not need to be set during creation and update. Options: <ul style="list-style-type: none">• DRAFT: draft• PUBLISH_DEVELOPING: to be reviewed• PUBLISHED: released• OFFLINE_DEVELOPING: to be reviewed• OFFLINE: offline• REJECT: rejected

Parameter	Type	Description
biz_type	String	<p>Business entity type.</p> <p>Options:</p> <ul style="list-style-type: none"> • AGGREGATION_LOGIC_TABLE: summary table • ATOMIC_INDEX: atomic metric • ATOMIC_METRIC: atomic metric (new) • BIZ_CATALOG: process architecture directory • BIZ_METRIC: service indicator • CODE_TABLE: code table • COMMON_CONDITION: general filter • COMPOSITE_METRIC: Compound Metric (new) • COMPOUND_METRIC: compound metric • CONDITION_GROUP: restriction group • DEGENERATE_DIMENSION: degenerate dimension • DERIVATIVE_INDEX: derivative indicator • DERIVED_METRIC: derivative indicator (new) • DIMENSION: dimension • DIMENSION_ATTRIBUTE: dimension attribute • DIMENSION_HIERARCHIES: dimension level • DIMENSION_LOGIC_TABLE: dimension table • DIMENSION_TABLE_ATTRIBUTE: dimension attribute • DIRECTORY: directory • FACT_ATTRIBUTE: fact table attribute • FACT_DIMENSION: fact table dimension • FACT_LOGIC_TABLE: fact table • FACT_MEASURE: fact table measurement • FUNCTION: function

Parameter	Type	Description
		<ul style="list-style-type: none"> • INFO_ARCH: information architecture (used for modifying themes in batches) • MODEL: model • QUALITY_RULE: quality rule • SECRECY_LEVEL: security level • STANDARD_ELEMENT: data standard • STANDARD_ELEMENT_TEMPLATE: data standard template • SUBJECT: theme • Dimension attributes of SUMMARY_DIMENSION_ATTRIBUTE: summary tables • SUMMARY_INDEX: summary table indicator attribute • SUMMARY_TIME: time period attribute of the SDR table • TABLE_MODEL: relationship model (logical model/physical model) • TABLE_MODEL_ATTRIBUTE: relationship model attribute (logical model/physical model) • TABLE_MODEL_LOGIC: logical entity • TABLE_TYPE: table type • TAG: tag • TIME_CONDITION: time restriction
create_time	String	Creation time, which is read-only. The format complies with RFC3339 and is accurate to seconds. The UTC time zone is yyyy-mm-ddTHH:MM:SSZ, for example, 1970-01-01T00:00:00Z.
update_time	String	Update time, which is read-only. The format complies with RFC3339 and is accurate to seconds. The UTC time zone is yyyy-mm-ddTHH:MM:SSZ, for example, 1970-01-01T00:00:00Z.
db_name	String	Indicates the database name.

Parameter	Type	Description
dw_type	String	Data connection type, which corresponds to the type of the data warehouse where the table is located. The value can be DWS, MRS_HIVE, POSTGRESQL, MRS_SPARK, CLICKHOUSE, MYSQL, ORACLE, or DORIS.
queue_name	String	Queue required for executing SQL statements through the DLI data connection. This parameter is mandatory when the data connection type is DLI.
schema	String	Required by the DWS type.
l1	String	Chinese name of the subject area group. This parameter is read-only and does not need to be set when you create or update a subject area group.
l2	String	Chinese name of the subject area. This parameter is read-only and does not need to be set during creation and update.
l3	String	Chinese name of the business object. This parameter is read-only and does not need to be set during creation and update.
l1_id	String	Subject area group ID, which is a read-only string
l2_id	String	Subject area ID. This parameter is read-only and does not need to be set during creation and update.
l3_id	String	Business object ID, which is a read-only string
new_biz	BizVersionManag eVO object	Service version management. This parameter is read-only.

Parameter	Type	Description
physical_table	String	<p>Synchronization status.</p> <p>Options:</p> <ul style="list-style-type: none"> • NO_NEED: not synchronized • CREATE_SUCCESS: The creation is successful. • CREATE_FAILED: Creation failed • UPDATE_SUCCESS: The update is successful. • UPDATE_FAILED: The update fails. • SUMMARY_SUCCESS: overall success • SUMMARY_FAILED: overall failure • RUNNING: overall running • OFFLINE: offline

biz_id	String	Business ID, which is a string
biz_info	String	Business object information.

Parameter	Type	Description
status	String	Release status of an entity. This parameter is read-only and does not need to be set during creation and update. Options: <ul style="list-style-type: none"> • DRAFT: draft • PUBLISH_DEVELOPING: to be reviewed • PUBLISHED: released • OFFLINE_DEVELOPING: to be reviewed • OFFLINE: offline • REJECT: rejected
biz_version	Integer	Service version, which is read-only.
create_time	String	Creation time, which is read-only. The format complies with RFC3339 and is accurate to seconds. The UTC time zone is yyyy-mm-ddTHH:MM:SSZ, for example, 1970-01-01T00:00:00Z.
update_time	String	Update time, which is read-only. The format complies with RFC3339 and is accurate to seconds. The UTC time zone is yyyy-mm-ddTHH:MM:SSZ, for example, 1970-01-01T00:00:00Z.

Status code: 400

Table 7-41 Response body parameters

Parameter	Type	Description
error_code	String	Error code, for example, DS.6000, indicating that the request fails to be processed.
error_msg	String	Error message
data	Object	Returned data information.

Status code: 401

Table 7-42 Response body parameters

Parameter	Type	Description
error_code	String	Error code, for example, DS.6000, indicating that the request fails to be processed.
error_msg	String	Error message
data	Object	Returned data information.

Status code: 403

Table 7-43 Response body parameters

Parameter	Type	Description
error_code	String	Error code, for example, DS.6000, indicating that the request fails to be processed.
error_msg	String	Error message
data	Object	Returned data information.

Example Requests

View the table attribute coverage of the data standard whose ID is 1186622399320305665.

```
GET https://{endpoint}/v2/{project_id}/design/definitions/statistic/1186622399320305665?
biz_type=STANDARD_ELEMENT
```

Example Responses

Status code: 200

This operation succeeds, and the returned data is StatisticStandardCoverageVO.

    // risks. It is recommended that the AK and SK be stored in ciphertext in configuration files or environment
    // variables and decrypted during use to ensure security.
    // In this example, AK and SK are stored in environment variables for authentication. Before running this
    // example, set environment variables CLOUD_SDK_AK and CLOUD_SDK_SK in the local environment
    ak := os.Getenv("CLOUD_SDK_AK")
    sk := os.Getenv("CLOUD_SDK_SK")
    projectId := "{project_id}"

    auth := basic.NewCredentialsBuilder().
        WithAk(ak).
        WithSk(sk).
        WithProjectId(projectId).
        Build()

    client := dataartsstudio.NewDataArtsStudioClient(
        dataartsstudio.DataArtsStudioClientBuilder().
            WithRegion(region.ValueOf("<YOUR REGION>")).
            WithCredential(auth).
            Build())

    request := &model.CountStandardsRequest{}
    request.Id = "{id}"
    response, err := client.CountStandards(request)
```

```
if err == nil {
    fmt.Printf("%+v\n", response)
} else {
    fmt.Println(err)
}
```

More

For SDK sample code of more programming languages, see the Sample Code tab in [API Explorer](#). SDK sample code can be automatically generated.

Status Codes

Status Code	Description
200	This operation succeeds, and the returned data is StatisticStandard-CoverageVO.
400	BadRequest
401	Unauthorized
403	Forbidden

7.2 Information Architecture

7.2.1 Querying Information About Multiple Types of Tables

Function

Query information about multiple types of tables from the information architecture, including logical entities, physical tables, dimension tables, fact tables, and summary tables.

Calling Method

For details, see [Calling APIs](#).

URI

GET /v2/{project_id}/design/all-tables

Table 7-44 Path Parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Project ID. For details about how to obtain the project ID, see Project ID and Account ID .

Table 7-45 Query Parameters

Parameter	Mandatory	Type	Description
name	No	String	Fuzzy query by name or code.
create_by	No	String	Query by creator.
status	No	String	Specifies the service status. Options: <ul style="list-style-type: none">• DRAFT: draft• PUBLISH_DEVELOPING: to be approved• PUBLISHED: released• OFFLINE_DEVELOPING: to be approved• OFFLINE: offline• REJECT: rejected
sync_status	No	String	Defines the enumeration of the synchronization status. Options: <ul style="list-style-type: none">• RUNNING: synchronizing• NO_NEED: not synchronized• SUMMARY_SUCCESS: overall success• SUMMARY_FAILED: overall failure

Parameter	Mandatory	Type	Description
sync_key	No	Array of strings	<p>Defines the enumeration of synchronization task types.</p> <p>Options:</p> <ul style="list-style-type: none"> • BUSINESS_ASSET: synchronizes service assets. • DATA_QUALITY: Create a quality job. • TECHNICAL_ASSET: synchronizes technology assets. • META_DATA_LINK: asset association • PHYSICAL_TABLE: Create a table (production environment). • DEV_PHYSICAL_TABLE: Create a table in the development environment. • DLF_TASK: creates a data development job. • MATERIALIZATION: Data is stored in the database (code table). • PUBLISH_TO_DLM: publishes data service APIs. • SUMMARY_STATUS: overall status
biz_catalog_id	No	String	ID of the service catalog to which the belongs.
begin_time	No	String	<p>Left boundary of time filtering. This parameter is used together with end_time. Only time range filtering is supported. Unilateral filtering is invalid. The format complies with RFC3339 and is accurate to seconds. The UTC time zone is yyyy-mm-ddTHH:MM:SSZ, for example, 1970-01-01T00:00:00Z.</p>

Parameter	Mandatory	Type	Description
end_time	No	String	Right boundary for time filtering. This parameter is used together with begin_time to support only time range filtering. The format complies with RFC3339 and is accurate to seconds. The UTC time zone is yyyy-mm-ddTHH:MM:SSZ, for example, 1970-01-01T00:00:00Z.
limit	No	Integer	Number of records to be queried on each page, that is, Y records to be queried. The default value is 50, and the value range is [1,100].
offset	No	Integer	Start coordinate of the query, that is, the number of skipped data records. The value can only be 0 or an integer multiple of limit. If the value does not meet the requirement, the value is rounded down. The default value is 0.
biz_catalog_id_list	No	Array of strings	List of the subject IDs. The value is a string.
biz_type_list	Yes	Array of strings	Type of the table to be queried, which is mandatory. Options: <ul style="list-style-type: none"> • TABLE_MODEL_LOGIC: logical entity • TABLE_MODEL: physical table • DIMENSION_LOGIC_TABLE: dimension table • FACT_LOGIC_TABLE: fact table • AGGREGATION_LOGIC_TABLE: summary table

Request Parameters

Table 7-46 Request header parameters

Parameter	Mandatory	Type	Description
X-Auth-Token	Yes	String	IAM token, which is obtained by calling the IAM API for obtaining a user token (value of X-Subject-Token in the response header). This field is mandatory for authentication using tokens.
workspace	Yes	String	Workspace ID. For details about how to obtain the workspace ID, see Instance ID and Workspace ID .
X-Project-Id	No	String	Project ID. For details about how to obtain the project ID, see Project ID and Account ID . This parameter is mandatory for API requests that use AK/SK authentication in multi-project scenarios.
Content-Type	No	String	Default value: application/json;charset=UTF-8 This parameter is optional. If the body is available, this parameter is mandatory. If the body is unavailable, you do not need to set this parameter or verify it.

Response Parameters

Status code: 200**Table 7-47** Response body parameters

Parameter	Type	Description
data	data object	data: unified outermost data structure of the returned result.

Table 7-48 data

Parameter	Type	Description
value	value object	value: unified outer data structure of the returned result.

Table 7-49 value

Parameter	Type	Description
total	Integer	Total number.
records	Array of AllTableVO objects	Number of application object (AllTableVO) groups that are found.

Table 7-50 AllTableVO

Parameter	Type	Description
id	String	L1 ID, which is a string
name	String	L1 name.
tb_logic_guid	String	GUID of the logical entity after the table is released.
quality_id	String	Quality ID.
reversed	Boolean	Indicates whether it is reverse.
partition_conf	String	Partition expression.
dirty_out_switch	Boolean	Indicates whether to output abnormal data.
dirty_out_databas e	String	Abnormal data output library.
dirty_out_prefix	String	Prefix of an exception table.
dirty_out_suffix	String	Suffix of an exception table.
tb_guid	String	GUID of the physical table after the table is released.
code	String	Code.
create_by	String	Creator.
tenant_id	String	Tenant ID.
description	String	Description.

Parameter	Type	Description
status	String	<p>Release status of an entity. This parameter is read-only and does not need to be set during creation and update.</p> <p>Options:</p> <ul style="list-style-type: none">• DRAFT: draft• PUBLISH_DEVELOPING: to be reviewed• PUBLISHED: released• OFFLINE_DEVELOPING: to be reviewed• OFFLINE: offline• REJECT: rejected

Parameter	Type	Description
biz_type	String	<p>Business entity type.</p> <p>Options:</p> <ul style="list-style-type: none"> • AGGREGATION_LOGIC_TABLE: summary table • ATOMIC_INDEX: atomic metric • ATOMIC_METRIC: atomic metric (new) • BIZ_CATALOG: process architecture directory • BIZ_METRIC: service indicator • CODE_TABLE: code table • COMMON_CONDITION: general filter • COMPOSITE_METRIC: Compound Metric (new) • COMPOUND_METRIC: compound metric • CONDITION_GROUP: restriction group • DEGENERATE_DIMENSION: degenerate dimension • DERIVATIVE_INDEX: derivative indicator • DERIVED_METRIC: derivative indicator (new) • DIMENSION: dimension • DIMENSION_ATTRIBUTE: dimension attribute • DIMENSION_HIERARCHIES: dimension level • DIMENSION_LOGIC_TABLE: dimension table • DIMENSION_TABLE_ATTRIBUTE: dimension attribute • DIRECTORY: directory • FACT_ATTRIBUTE: fact table attribute • FACT_DIMENSION: fact table dimension • FACT_LOGIC_TABLE: fact table • FACT_MEASURE: fact table measurement • FUNCTION: function

Parameter	Type	Description
		<ul style="list-style-type: none"> • INFO_ARCH: information architecture (used for modifying themes in batches) • MODEL: model • QUALITY_RULE: quality rule • SECRECY_LEVEL: security level • STANDARD_ELEMENT: data standard • STANDARD_ELEMENT_TEMPLATE: data standard template • SUBJECT: theme • Dimension attributes of SUMMARY_DIMENSION_ATTRIBUTE: summary tables • SUMMARY_INDEX: summary table indicator attribute • SUMMARY_TIME: time period attribute of the SDR table • TABLE_MODEL: relationship model (logical model/physical model) • TABLE_MODEL_ATTRIBUTE: relationship model attribute (logical model/physical model) • TABLE_MODEL_LOGIC: logical entity • TABLE_TYPE: table type • TAG: tag • TIME_CONDITION: time restriction
create_time	String	Creation time, which is read-only. The format complies with RFC3339 and is accurate to seconds. The UTC time zone is yyyy-mm-ddTHH:MM:SSZ, for example, 1970-01-01T00:00:00Z.
update_time	String	Update time, which is read-only. The format complies with RFC3339 and is accurate to seconds. The UTC time zone is yyyy-mm-ddTHH:MM:SSZ, for example, 1970-01-01T00:00:00Z.
db_name	String	Indicates the database name.

Parameter	Type	Description
dw_type	String	Data connection type, which corresponds to the type of the data warehouse where the table is located. The value can be DWS , MRS_HIVE , POSTGRESQL , MRS_SPARK , CLICKHOUSE , MYSQL , ORACLE , or DORIS .
queue_name	String	Queue required for executing SQL statements through the DLI data connection. This parameter is mandatory when the data connection type is DLI.
schema	String	Required by the DWS type.
l1	String	Chinese name of the subject area group. This parameter is read-only and does not need to be set when you create or update a subject area group.
l2	String	Chinese name of the subject area. This parameter is read-only and does not need to be set during creation and update.
l3	String	Chinese name of the business object. This parameter is read-only and does not need to be set during creation and update.
l1_id	String	Subject area group ID, which is a read-only string
l2_id	String	Subject area ID. This parameter is read-only and does not need to be set during creation and update.
l3_id	String	Business object ID, which is a read-only string
new_biz	BizVersionManag eVO object	Service version management. This parameter is read-only.

Parameter	Type	Description
physical_table	String	Synchronization status. Options: <ul style="list-style-type: none">• NO_NEED: not synchronized• CREATE_SUCCESS: The creation is successful.• CREATE_FAILED: Creation failed• UPDATE_SUCCESS: The update is successful.• UPDATE_FAILED: The update fails.• SUMMARY_SUCCESS: overall success• SUMMARY_FAILED: overall failure• RUNNING: overall running• OFFLINE: offline
dev_physical_table	String	Synchronization status. Options: <ul style="list-style-type: none">• NO_NEED: not synchronized• CREATE_SUCCESS: The creation is successful.• CREATE_FAILED: Creation failed• UPDATE_SUCCESS: The update is successful.• UPDATE_FAILED: The update fails.• SUMMARY_SUCCESS: overall success• SUMMARY_FAILED: overall failure• RUNNING: overall running• OFFLINE: offline

Parameter	Type	Description
technical_asset	String	Synchronization status. Options: <ul style="list-style-type: none"> ● NO_NEED: not synchronized ● CREATE_SUCCESS: The creation is successful. ● CREATE_FAILED: Creation failed ● UPDATE_SUCCESS: The update is successful. ● UPDATE_FAILED: The update fails. ● SUMMARY_SUCCESS: overall success ● SUMMARY_FAILED: overall failure ● RUNNING: overall running ● OFFLINE: offline
business_asset	String	Synchronization status. Options: <ul style="list-style-type: none"> ● NO_NEED: not synchronized ● CREATE_SUCCESS: The creation is successful. ● CREATE_FAILED: Creation failed ● UPDATE_SUCCESS: The update is successful. ● UPDATE_FAILED: The update fails. ● SUMMARY_SUCCESS: overall success ● SUMMARY_FAILED: overall failure ● RUNNING: overall running ● OFFLINE: offline

Parameter	Type	Description
meta_data_link	String	<p>Synchronization status.</p> <p>Options:</p> <ul style="list-style-type: none"> • NO_NEED: not synchronized • CREATE_SUCCESS: The creation is successful. • CREATE_FAILED: Creation failed • UPDATE_SUCCESS: The update is successful. • UPDATE_FAILED: The update fails. • SUMMARY_SUCCESS: overall success • SUMMARY_FAILED: overall failure • RUNNING: overall running • OFFLINE: offline
data_quality	String	<p>Synchronization status.</p> <p>Options:</p> <ul style="list-style-type: none"> • NO_NEED: not synchronized • CREATE_SUCCESS: The creation is successful. • CREATE_FAILED: Creation failed • UPDATE_SUCCESS: The update is successful. • UPDATE_FAILED: The update fails. • SUMMARY_SUCCESS: overall success • SUMMARY_FAILED: overall failure • RUNNING: overall running • OFFLINE: offline

Parameter	Type	Description
dlf_task	String	<p>Synchronization status.</p> <p>Options:</p> <ul style="list-style-type: none"> • NO_NEED: not synchronized • CREATE_SUCCESS: The creation is successful. • CREATE_FAILED: Creation failed • UPDATE_SUCCESS: The update is successful. • UPDATE_FAILED: The update fails. • SUMMARY_SUCCESS: overall success • SUMMARY_FAILED: overall failure • RUNNING: overall running • OFFLINE: offline
materialization	String	<p>Synchronization status.</p> <p>Options:</p> <ul style="list-style-type: none"> • NO_NEED: not synchronized • CREATE_SUCCESS: The creation is successful. • CREATE_FAILED: Creation failed • UPDATE_SUCCESS: The update is successful. • UPDATE_FAILED: The update fails. • SUMMARY_SUCCESS: overall success • SUMMARY_FAILED: overall failure • RUNNING: overall running • OFFLINE: offline

Parameter	Type	Description
publish_to_dlm	String	Synchronization status. Options: <ul style="list-style-type: none"> • NO_NEED: not synchronized • CREATE_SUCCESS: The creation is successful. • CREATE_FAILED: Creation failed • UPDATE_SUCCESS: The update is successful. • UPDATE_FAILED: The update fails. • SUMMARY_SUCCESS: overall success • SUMMARY_FAILED: overall failure • RUNNING: overall running • OFFLINE: offline
summary_status	String	Synchronization status. Options: <ul style="list-style-type: none"> • NO_NEED: not synchronized • CREATE_SUCCESS: The creation is successful. • CREATE_FAILED: Creation failed • UPDATE_SUCCESS: The update is successful. • UPDATE_FAILED: The update fails. • SUMMARY_SUCCESS: overall success • SUMMARY_FAILED: overall failure • RUNNING: overall running • OFFLINE: offline
standard_count	String	Standard quantity, which is a read-only string
alias	String	Alias
api_id	String	API ID of the SDR table.
workspace_id	String	Workspace ID
workspace_name	String	Workspace name
dev_version	String	Development environment version, which is a read-only string
prod_version	String	Production environment version, which is a read-only string

Parameter	Type	Description
dev_version_name	String	Version name of the development environment, which is read-only
prod_version_name	String	Version name of the production environment, which is read-only
env_type	String	Type of the development and production environment. Options: <ul style="list-style-type: none">• INVALID_TYPE: invalid environment• DEV_TYPE: development environment• PROD_TYPE: production environment• DEV_PROD_TYPE: development and production environment

Table 7-51 BizVersionManageVO

Parameter	Type	Description
id	String	Field ID, which is a string

Parameter	Type	Description
biz_type	String	<p>Business entity type.</p> <p>Options:</p> <ul style="list-style-type: none"> • AGGREGATION_LOGIC_TABLE: summary table • ATOMIC_INDEX: atomic metric • ATOMIC_METRIC: atomic metric (new) • BIZ_CATALOG: process architecture directory • BIZ_METRIC: service indicator • CODE_TABLE: code table • COMMON_CONDITION: general filter • COMPOSITE_METRIC: Compound Metric (new) • COMPOUND_METRIC: compound metric • CONDITION_GROUP: restriction group • DEGENERATE_DIMENSION: degenerate dimension • DERIVATIVE_INDEX: derivative indicator • DERIVED_METRIC: derivative indicator (new) • DIMENSION: dimension • DIMENSION_ATTRIBUTE: dimension attribute • DIMENSION_HIERARCHIES: dimension level • DIMENSION_LOGIC_TABLE: dimension table • DIMENSION_TABLE_ATTRIBUTE: dimension attribute • DIRECTORY: directory • FACT_ATTRIBUTE: fact table attribute • FACT_DIMENSION: fact table dimension • FACT_LOGIC_TABLE: fact table • FACT_MEASURE: fact table measurement • FUNCTION: function

Parameter	Type	Description
		<ul style="list-style-type: none"> • INFO_ARCH: information architecture (used for modifying themes in batches) • MODEL: model • QUALITY_RULE: quality rule • SECRECY_LEVEL: security level • STANDARD_ELEMENT: data standard • STANDARD_ELEMENT_TEMPLATE: data standard template • SUBJECT: theme • Dimension attributes of SUMMARY_DIMENSION_ATTRIBUTE: summary tables • SUMMARY_INDEX: summary table indicator attribute • SUMMARY_TIME: time period attribute of the SDR table • TABLE_MODEL: relationship model (logical model/physical model) • TABLE_MODEL_ATTRIBUTE: relationship model attribute (logical model/physical model) • TABLE_MODEL_LOGIC: logical entity • TABLE_TYPE: table type • TAG: tag • TIME_CONDITION: time restriction
biz_id	String	Business ID, which is a string
biz_info	String	Business object information.

Parameter	Type	Description
status	String	Release status of an entity. This parameter is read-only and does not need to be set during creation and update. Options: <ul style="list-style-type: none"> • DRAFT: draft • PUBLISH_DEVELOPING: to be reviewed • PUBLISHED: released • OFFLINE_DEVELOPING: to be reviewed • OFFLINE: offline • REJECT: rejected
biz_version	Integer	Service version, which is read-only.
create_time	String	Creation time, which is read-only. The format complies with RFC3339 and is accurate to seconds. The UTC time zone is yyyy-mm-ddTHH:MM:SSZ, for example, 1970-01-01T00:00:00Z.
update_time	String	Update time, which is read-only. The format complies with RFC3339 and is accurate to seconds. The UTC time zone is yyyy-mm-ddTHH:MM:SSZ, for example, 1970-01-01T00:00:00Z.

Status code: 400

Table 7-52 Response body parameters

Parameter	Type	Description
error_code	String	Error code, for example, DS.6000, indicating that the request fails to be processed.
error_msg	String	Error message
data	Object	Returned data information.

Status code: 401

Table 7-53 Response body parameters

Parameter	Type	Description
error_code	String	Error code, for example, DS.6000, indicating that the request fails to be processed.
error_msg	String	Error message
data	Object	Returned data information.

Status code: 403

Table 7-54 Response body parameters

Parameter	Type	Description
error_code	String	Error code, for example, DS.6000, indicating that the request fails to be processed.
error_msg	String	Error message
data	Object	Returned data information.

Example Requests

Query the first ten data records of logical entities, physical tables, dimension tables, fact tables, and summary tables from the information architecture.

```
GET https://{endpoint}/v2/{project_id}/design/all-tables?
offset=1&limit=10&biz_type_list=TABLE_MODEL_LOGIC&biz_type_list=TABLE_MODEL&biz_type_list=DIMENSI
ON_LOGIC_TABLE&biz_type_list=FACT_LOGIC_TABLE&biz_type_list=AGGREGATION_LOGIC_TABLE&advOnInit
Flg=true
```

Example Responses

Status code: 200

This operation succeeds, and the returned data is an AllTableVO list.

```

More

For SDK sample code of more programming languages, see the Sample Code tab in [API Explorer](#). SDK sample code can be automatically generated.

Status Codes

Status Code	Description
200	This operation succeeds, and the returned data is an AllTableVO list.
400	BadRequest
401	Unauthorized

Status Code	Description
403	Forbidden

7.3 Data Standards

7.3.1 Obtaining Data Standards

Function

Obtain the data standard set based on the query conditions in pagination mode and sort the data by modification time in descending order.

Calling Method

For details, see [Calling APIs](#).

URI

GET /v2/{project_id}/design/standards

Table 7-55 Path Parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Project ID. For details about how to obtain the project ID, see Project ID and Account ID .

Table 7-56 Query Parameters

Parameter	Mandatory	Type	Description
directory_id	No	String	Catalog ID. Obtain the data standards in the directory. If there are subdirectories, obtain the data standards of all subdirectories.

Parameter	Mandatory	Type	Description
begin_time	No	String	Left boundary of time filtering. This parameter is used together with end_time. Only time range filtering is supported. Unilateral filtering is invalid. The format complies with RFC3339 and is accurate to seconds. The UTC time zone is yyyy-mm-ddTHH:MM:SSZ, for example, 1970-01-01T00:00:00Z.
end_time	No	String	Right boundary for time filtering. This parameter is used together with begin_time to support only time range filtering. The format complies with RFC3339 and is accurate to seconds. The UTC time zone is yyyy-mm-ddTHH:MM:SSZ, for example, 1970-01-01T00:00:00Z.
limit	No	Integer	Number of records to be queried on each page, that is, Y records to be queried. The default value is 50, and the value range is [1,100].
offset	No	Integer	Start coordinate of the query, that is, the number of skipped data records. The value can only be 0 or an integer multiple of limit. If the value does not meet the requirement, the value is rounded down. The default value is 0.

Request Parameters

Table 7-57 Request header parameters

Parameter	Mandatory	Type	Description
X-Auth-Token	Yes	String	IAM token, which is obtained by calling the IAM API for obtaining a user token (value of X-Subject-Token in the response header). This field is mandatory for authentication using tokens.
workspace	Yes	String	Workspace ID. For details about how to obtain the workspace ID, see Instance ID and Workspace ID .
X-Project-Id	No	String	Project ID. For details about how to obtain the project ID, see Project ID and Account ID . This parameter is mandatory for API requests that use AK/SK authentication in multi-project scenarios.
Content-Type	No	String	Default value: application/json;charset=UTF-8 This parameter is optional. If the body is available, this parameter is mandatory. If the body is unavailable, you do not need to set this parameter or verify it.

Response Parameters

Status code: 200

Table 7-58 Response body parameters

Parameter	Type	Description
data	data object	The data standard set is returned.

Table 7-59 data

Parameter	Type	Description
value	value object	Returned data standard details.

Table 7-60 value

Parameter	Type	Description
records	Array of StandElementValueVOList objects	StandElementValueVO array.
total	Integer	Total number of data standards.

Table 7-61 StandElementValueVOList

Parameter	Type	Description
values	Array of StandElementValueVO objects	Attributes
id	String	Data standard ID, which is a string
directory_id	String	ID of the directory to which the standard belongs. The value is a string.
directory_path	String	Directory tree.
row_id	String	Row ID, which is a string
status	String	Release status of an entity. This parameter is read-only and does not need to be set during creation and update. Options: <ul style="list-style-type: none"> • DRAFT: draft • PUBLISH_DEVELOPING: to be reviewed • PUBLISHED: released • OFFLINE_DEVELOPING: to be reviewed • OFFLINE: offline • REJECT: rejected

Parameter	Type	Description
approval_info	ApprovalVO object	Approval information. This parameter is read-only. Latest review information about a business object, including the business details, reviewer information, and review time.
new_biz	BizVersionManageVO object	Service version management. This parameter is read-only.
from_public	Boolean	Indicates whether the data is from the public layer.
create_by	String	Creator.
update_by	String	Person who updates the information.
create_time	String	Creation time, which is read-only. The format complies with RFC3339 and is accurate to seconds. The UTC time zone is yyyy-mm-ddTHH:MM:SSZ, for example, 1970-01-01T00:00:00Z.
update_time	String	Update time, which is read-only. The format complies with RFC3339 and is accurate to seconds. The UTC time zone is yyyy-mm-ddTHH:MM:SSZ, for example, 1970-01-01T00:00:00Z.

Table 7-62 StandElementValueVO

Parameter	Type	Description
fd_name	String	Attribute name.
fd_value	String	Property value.
fd_id	String	Attribute ID, which is a string
directory_id	String	ID of the directory to which the standard belongs. The value is a string.
row_id	String	ID of the row to which the standard belongs. The value is a string.
id	String	Data standard ID, which is a string

Parameter	Type	Description
status	String	Release status of an entity. This parameter is read-only and does not need to be set during creation and update. Options: <ul style="list-style-type: none">• DRAFT: draft• PUBLISH_DEVELOPING: to be reviewed• PUBLISHED: released• OFFLINE_DEVELOPING: to be reviewed• OFFLINE: offline• REJECT: rejected
create_by	String	Creator.
update_by	String	Person who updates the information.
create_time	String	Creation time, which is read-only. The format complies with RFC3339 and is accurate to seconds. The UTC time zone is yyyy-mm-ddTHH:MM:SSZ, for example, 1970-01-01T00:00:00Z.
update_time	String	Update time, which is read-only. The format complies with RFC3339 and is accurate to seconds. The UTC time zone is yyyy-mm-ddTHH:MM:SSZ, for example, 1970-01-01T00:00:00Z.

Table 7-63 ApprovalVO

Parameter	Type	Description
id	String	Application ID, which is a string
tenant_id	String	Project ID. For details about how to obtain the project ID, see the API path parameter project_id.
name_ch	String	Chinese name of a service.
name_en	String	English name of a service.
biz_id	String	Business ID, which is a string

Parameter	Type	Description
biz_type	String	<p>Business entity type.</p> <p>Options:</p> <ul style="list-style-type: none"> • AGGREGATION_LOGIC_TABLE: summary table • ATOMIC_INDEX: atomic metric • ATOMIC_METRIC: atomic metric (new) • BIZ_CATALOG: process architecture directory • BIZ_METRIC: service indicator • CODE_TABLE: code table • COMMON_CONDITION: general filter • COMPOSITE_METRIC: Compound Metric (new) • COMPOUND_METRIC: compound metric • CONDITION_GROUP: restriction group • DEGENERATE_DIMENSION: degenerate dimension • DERIVATIVE_INDEX: derivative indicator • DERIVED_METRIC: derivative indicator (new) • DIMENSION: dimension • DIMENSION_ATTRIBUTE: dimension attribute • DIMENSION_HIERARCHIES: dimension level • DIMENSION_LOGIC_TABLE: dimension table • DIMENSION_TABLE_ATTRIBUTE: dimension attribute • DIRECTORY: directory • FACT_ATTRIBUTE: fact table attribute • FACT_DIMENSION: fact table dimension • FACT_LOGIC_TABLE: fact table • FACT_MEASURE: fact table measurement • FUNCTION: function

Parameter	Type	Description
		<ul style="list-style-type: none"> • INFO_ARCH: information architecture (used for modifying themes in batches) • MODEL: model • QUALITY_RULE: quality rule • SECRECY_LEVEL: security level • STANDARD_ELEMENT: data standard • STANDARD_ELEMENT_TEMPLATE: data standard template • SUBJECT: theme • Dimension attributes of SUMMARY_DIMENSION_ATTRIBUTE: summary tables • SUMMARY_INDEX: summary table indicator attribute • SUMMARY_TIME: time period attribute of the SDR table • TABLE_MODEL: relationship model (logical model/physical model) • TABLE_MODEL_ATTRIBUTE: relationship model attribute (logical model/physical model) • TABLE_MODEL_LOGIC: logical entity • TABLE_TYPE: table type • TAG: tag • TIME_CONDITION: time restriction
biz_info	String	Serialized service details. The type is string.
biz_info_obj	Object	Service details. The type is object.
biz_version	Integer	Service version.

Parameter	Type	Description
biz_status	String	Release status of an entity. This parameter is read-only and does not need to be set during creation and update. Options: <ul style="list-style-type: none"> • DRAFT: draft • PUBLISH_DEVELOPING: to be reviewed • PUBLISHED: released • OFFLINE_DEVELOPING: to be reviewed • OFFLINE: offline • REJECT: rejected
approval_status	String	Service approval status. This parameter is read-only. Options: <ul style="list-style-type: none"> • DEVELOPING: being reviewed • APPROVED: approved • REJECT: rejected • WITHDREW: approval cancellation
approval_type	String	Service review type. Options: <ul style="list-style-type: none"> • PUBLISH: released • OFFLINE: offline
submit_time	String	Submitted At
create_by	String	Creator.
l1	String	Chinese name of the subject area group. This parameter is read-only and does not need to be set when you create or update a subject area group.
l2	String	Chinese name of the subject area. This parameter is read-only and does not need to be set during creation and update.
l3	String	Chinese name of the business object. This parameter is read-only and does not need to be set during creation and update.
approval_time	String	Review time.

Parameter	Type	Description
approver	String	Reviewer.
email	String	Email address of the reviewer.
msg	String	Review information.
directory_path	String	Directory tree.

Table 7-64 BizVersionManageVO

Parameter	Type	Description
id	String	Field ID, which is a string

Parameter	Type	Description
biz_type	String	<p>Business entity type.</p> <p>Options:</p> <ul style="list-style-type: none"> • AGGREGATION_LOGIC_TABLE: summary table • ATOMIC_INDEX: atomic metric • ATOMIC_METRIC: atomic metric (new) • BIZ_CATALOG: process architecture directory • BIZ_METRIC: service indicator • CODE_TABLE: code table • COMMON_CONDITION: general filter • COMPOSITE_METRIC: Compound Metric (new) • COMPOUND_METRIC: compound metric • CONDITION_GROUP: restriction group • DEGENERATE_DIMENSION: degenerate dimension • DERIVATIVE_INDEX: derivative indicator • DERIVED_METRIC: derivative indicator (new) • DIMENSION: dimension • DIMENSION_ATTRIBUTE: dimension attribute • DIMENSION_HIERARCHIES: dimension level • DIMENSION_LOGIC_TABLE: dimension table • DIMENSION_TABLE_ATTRIBUTE: dimension attribute • DIRECTORY: directory • FACT_ATTRIBUTE: fact table attribute • FACT_DIMENSION: fact table dimension • FACT_LOGIC_TABLE: fact table • FACT_MEASURE: fact table measurement • FUNCTION: function

		<ul style="list-style-type: none"> • INFO_ARCH: information architecture (used for modifying themes in batches) • MODEL: model • QUALITY_RULE: quality rule • SECRECY_LEVEL: security level • STANDARD_ELEMENT: data standard • STANDARD_ELEMENT_TEMPLATE: data standard template • SUBJECT: theme • Dimension attributes of SUMMARY_DIMENSION_ATTRIBUTE: summary tables • SUMMARY_INDEX: summary table indicator attribute • SUMMARY_TIME: time period attribute of the SDR table • TABLE_MODEL: relationship model (logical model/physical model) • TABLE_MODEL_ATTRIBUTE: relationship model attribute (logical model/physical model) • TABLE_MODEL_LOGIC: logical entity • TABLE_TYPE: table type • TAG: tag • TIME_CONDITION: time restriction
biz_id	String	Business ID, which is a string
biz_info	String	Business object information.

Parameter	Type	Description
status	String	Release status of an entity. This parameter is read-only and does not need to be set during creation and update. Options: <ul style="list-style-type: none"> • DRAFT: draft • PUBLISH_DEVELOPING: to be reviewed • PUBLISHED: released • OFFLINE_DEVELOPING: to be reviewed • OFFLINE: offline • REJECT: rejected
biz_version	Integer	Service version, which is read-only.
create_time	String	Creation time, which is read-only. The format complies with RFC3339 and is accurate to seconds. The UTC time zone is yyyy-mm-ddTHH:MM:SSZ, for example, 1970-01-01T00:00:00Z.
update_time	String	Update time, which is read-only. The format complies with RFC3339 and is accurate to seconds. The UTC time zone is yyyy-mm-ddTHH:MM:SSZ, for example, 1970-01-01T00:00:00Z.

Status code: 400

Table 7-65 Response body parameters

Parameter	Type	Description
error_code	String	Error code, for example, DS.6000, indicating that the request fails to be processed.
error_msg	String	Error message
data	Object	Returned data information.

Status code: 401

Table 7-66 Response body parameters

Parameter	Type	Description
error_code	String	Error code, for example, DS.6000, indicating that the request fails to be processed.
error_msg	String	Error message
data	Object	Returned data information.

Status code: 403**Table 7-67** Response body parameters

Parameter	Type	Description
error_code	String	Error code, for example, DS.6000, indicating that the request fails to be processed.
error_msg	String	Error message
data	Object	Returned data information.

Status code: 404**Table 7-68** Response body parameters

Parameter	Type	Description
error_code	String	Error code, for example, DS.6000, indicating that the request fails to be processed.
error_msg	String	Error message
data	Object	Returned data information.

Example Requests

Query the set of the first 10 data standards in the directory whose ID is 1193957835831218179 and its subdirectories.

```
GET https://{endpoint}/v2/{project_id}/design/standards?offset=1&limit=10&directory_id=1193957835831218179
```

Example Responses

Status code: 200

This operation succeeds. The returned data is the standard set of all data in the directory and its subdirectories and the total number of data.

More

For SDK sample code of more programming languages, see the Sample Code tab in [API Explorer](#). SDK sample code can be automatically generated.

Status Codes

Status Code	Description
200	This operation succeeds. The returned data is the standard set of all data in the directory and its subdirectories and the total number of data.
400	Failed. The user request is invalid.
401	Failed. User identity authentication failed.
403	Failed. The user does not have the permission to call this API.
404	Failed. The API requested by the user does not exist.

7.3.2 Creating a Data Standard

Function

Create a data standard.

Calling Method

For details, see [Calling APIs](#).

URI

POST /v2/{project_id}/design/standards

Table 7-69 Path Parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Project ID. For details about how to obtain the project ID, see Project ID and Account ID .

Request Parameters

Table 7-70 Request header parameters

Parameter	Mandatory	Type	Description
X-Auth-Token	Yes	String	IAM token, which is obtained by calling the IAM API for obtaining a user token (value of X-Subject-Token in the response header). This field is mandatory for authentication using tokens.
workspace	Yes	String	Workspace ID. For details about how to obtain the workspace ID, see Instance ID and Workspace ID .
X-Project-Id	No	String	Project ID. For details about how to obtain the project ID, see Project ID and Account ID . This parameter is mandatory for API requests that use AK/SK authentication in multi-project scenarios.
Content-Type	No	String	Default value: application/json;charset=UTF-8 This parameter is optional. If the body is available, this parameter is mandatory. If the body is unavailable, you do not need to set this parameter or verify it.

Table 7-71 Request body parameters

Parameter	Mandatory	Type	Description
values	Yes	Array of StandElementValueVO objects	Attributes
id	No	String	Data standard ID, which is a string
directory_id	Yes	String	ID of the directory to which the standard belongs. The value is a string.

Parameter	Mandatory	Type	Description
directory_path	No	String	Directory tree.
row_id	No	String	Row ID, which is a string
status	No	String	Release status of an entity. This parameter is read-only and does not need to be set during creation and update. Options: <ul style="list-style-type: none"> • DRAFT: draft • PUBLISH_DEVELOPING: to be reviewed • PUBLISHED: released • OFFLINE_DEVELOPING: to be reviewed • OFFLINE: offline • REJECT: rejected
approval_info	No	ApprovalVO object	Approval information. This parameter is read-only. Latest review information about a business object, including the business details, reviewer information, and review time.
new_biz	No	BizVersionManagementVO object	Service version management. This parameter is read-only.
from_public	No	Boolean	Indicates whether the data is from the public layer.
create_by	No	String	Creator.
update_by	No	String	Person who updates the information.

Table 7-72 StandElementValueVO

Parameter	Mandatory	Type	Description
fd_name	Yes	String	Attribute name.
fd_value	No	String	Property value.
fd_id	No	String	Attribute ID, which is a string
directory_id	No	String	ID of the directory to which the standard belongs. The value is a string.

Parameter	Mandatory	Type	Description
row_id	No	String	ID of the row to which the standard belongs. The value is a string.
id	No	String	Data standard ID, which is a string
status	No	String	Release status of an entity. This parameter is read-only and does not need to be set during creation and update. Options: <ul style="list-style-type: none"> • DRAFT: draft • PUBLISH_DEVELOPING: to be reviewed • PUBLISHED: released • OFFLINE_DEVELOPING: to be reviewed • OFFLINE: offline • REJECT: rejected
create_by	No	String	Creator.
update_by	No	String	Person who updates the information.

Table 7-73 ApprovalVO

Parameter	Mandatory	Type	Description
id	No	String	Application ID, which is a string
tenant_id	No	String	Project ID. For details about how to obtain the project ID, see the API path parameter project_id.
name_ch	No	String	Chinese name of a service.
name_en	No	String	English name of a service.
biz_id	No	String	Business ID, which is a string

Parameter	Mandatory	Type	Description
biz_type	No	String	<p>Business entity type.</p> <p>Options:</p> <ul style="list-style-type: none"> ● AGGREGATION_LOGIC_TABLE: summary table ● ATOMIC_INDEX: atomic metric ● ATOMIC_METRIC: atomic metric (new) ● BIZ_CATALOG: process architecture directory ● BIZ_METRIC: service indicator ● CODE_TABLE: code table ● COMMON_CONDITION: general filter ● COMPOSITE_METRIC: Compound Metric (new) ● COMPOUND_METRIC: compound metric ● CONDITION_GROUP: restriction group ● DEGENERATE_DIMENSION: degenerate dimension ● DERIVATIVE_INDEX: derivative indicator ● DERIVED_METRIC: derivative indicator (new) ● DIMENSION: dimension ● DIMENSION_ATTRIBUTE: dimension attribute ● DIMENSION_HIERARCHIES: dimension level ● DIMENSION_LOGIC_TABLE: dimension table ● DIMENSION_TABLE_ATTRIBUTE: dimension attribute ● DIRECTORY: directory ● FACT_ATTRIBUTE: fact table attribute ● FACT_DIMENSION: fact table dimension ● FACT_LOGIC_TABLE: fact table

Parameter	Mandatory	Type	Description
			<ul style="list-style-type: none"> ● FACT_MEASURE: fact table measurement ● FUNCTION: function ● INFO_ARCH: information architecture (used for modifying themes in batches) ● MODEL: model ● QUALITY_RULE: quality rule ● SECRECY_LEVEL: security level ● STANDARD_ELEMENT: data standard ● STANDARD_ELEMENT_TEMPLATE: data standard template ● SUBJECT: theme ● Dimension attributes of SUMMARY_DIMENSION_ATTRIBUTE: summary tables ● SUMMARY_INDEX: summary table indicator attribute ● SUMMARY_TIME: time period attribute of the SDR table ● TABLE_MODEL: relationship model (logical model/physical model) ● TABLE_MODEL_ATTRIBUTE: relationship model attribute (logical model/physical model) ● TABLE_MODEL_LOGIC: logical entity ● TABLE_TYPE: table type ● TAG: tag ● TIME_CONDITION: time restriction
biz_info	No	String	Serialized service details. The type is string.
biz_info_obj	No	Object	Service details. The type is object.

Parameter	Mandatory	Type	Description
biz_version	No	Integer	Service version.
biz_status	No	String	Release status of an entity. This parameter is read-only and does not need to be set during creation and update. Options: <ul style="list-style-type: none"> • DRAFT: draft • PUBLISH_DEVELOPING: to be reviewed • PUBLISHED: released • OFFLINE_DEVELOPING: to be reviewed • OFFLINE: offline • REJECT: rejected
approval_status	No	String	Service approval status. This parameter is read-only. Options: <ul style="list-style-type: none"> • DEVELOPING: being reviewed • APPROVED: approved • REJECT: rejected • WITHDREW: approval cancellation
approval_type	No	String	Service review type. Options: <ul style="list-style-type: none"> • PUBLISH: released • OFFLINE: offline
submit_time	No	String	Submitted At
create_by	No	String	Creator.
l1	No	String	Chinese name of the subject area group. This parameter is read-only and does not need to be set when you create or update a subject area group.
l2	No	String	Chinese name of the subject area. This parameter is read-only and does not need to be set during creation and update.

Parameter	Mandatory	Type	Description
l3	No	String	Chinese name of the business object. This parameter is read-only and does not need to be set during creation and update.
approval_time	No	String	Review time.
approver	No	String	Reviewer.
email	No	String	Email address of the reviewer.
msg	No	String	Review information.
directory_path	No	String	Directory tree.

Table 7-74 BizVersionManageVO

Parameter	Mandatory	Type	Description
id	No	String	Field ID, which is a string

Parameter	Mandatory	Type	Description
biz_type	No	String	<p>Business entity type.</p> <p>Options:</p> <ul style="list-style-type: none"> • AGGREGATION_LOGIC_TABLE: summary table • ATOMIC_INDEX: atomic metric • ATOMIC_METRIC: atomic metric (new) • BIZ_CATALOG: process architecture directory • BIZ_METRIC: service indicator • CODE_TABLE: code table • COMMON_CONDITION: general filter • COMPOSITE_METRIC: Compound Metric (new) • COMPOUND_METRIC: compound metric • CONDITION_GROUP: restriction group • DEGENERATE_DIMENSION: degenerate dimension • DERIVATIVE_INDEX: derivative indicator • DERIVED_METRIC: derivative indicator (new) • DIMENSION: dimension • DIMENSION_ATTRIBUTE: dimension attribute • DIMENSION_HIERARCHIES: dimension level • DIMENSION_LOGIC_TABLE: dimension table • DIMENSION_TABLE_ATTRIBUTE: dimension attribute • DIRECTORY: directory • FACT_ATTRIBUTE: fact table attribute • FACT_DIMENSION: fact table dimension • FACT_LOGIC_TABLE: fact table

			<ul style="list-style-type: none"> ● FACT_MEASURE: fact table measurement ● FUNCTION: function ● INFO_ARCH: information architecture (used for modifying themes in batches) ● MODEL: model ● QUALITY_RULE: quality rule ● SECRECY_LEVEL: security level ● STANDARD_ELEMENT: data standard ● STANDARD_ELEMENT_TEMPLATE: data standard template ● SUBJECT: theme ● Dimension attributes of SUMMARY_DIMENSION_ATTRIBUTE: summary tables ● SUMMARY_INDEX: summary table indicator attribute ● SUMMARY_TIME: time period attribute of the SDR table ● TABLE_MODEL: relationship model (logical model/physical model) ● TABLE_MODEL_ATTRIBUTE: relationship model attribute (logical model/physical model) ● TABLE_MODEL_LOGIC: logical entity ● TABLE_TYPE: table type ● TAG: tag ● TIME_CONDITION: time restriction
biz_id	No	String	Business ID, which is a string
biz_info	No	String	Business object information.

Parameter	Mandatory	Type	Description
status	No	String	Release status of an entity. This parameter is read-only and does not need to be set during creation and update. Options: <ul style="list-style-type: none"> • DRAFT: draft • PUBLISH_DEVELOPING: to be reviewed • PUBLISHED: released • OFFLINE_DEVELOPING: to be reviewed • OFFLINE: offline • REJECT: rejected

Response Parameters

Status code: 200

Table 7-75 Response body parameters

Parameter	Type	Description
data	data object	The data result is returned when the data standard is created.

Table 7-76 data

Parameter	Type	Description
value	StandElementValueVOList object	Attribute value list.

Table 7-77 StandElementValueVOList

Parameter	Type	Description
values	Array of StandElementValueVO objects	Attributes
id	String	Data standard ID, which is a string
directory_id	String	ID of the directory to which the standard belongs. The value is a string.

Parameter	Type	Description
directory_path	String	Directory tree.
row_id	String	Row ID, which is a string
status	String	Release status of an entity. This parameter is read-only and does not need to be set during creation and update. Options: <ul style="list-style-type: none">• DRAFT: draft• PUBLISH_DEVELOPING: to be reviewed• PUBLISHED: released• OFFLINE_DEVELOPING: to be reviewed• OFFLINE: offline• REJECT: rejected
approval_info	ApprovalVO object	Approval information. This parameter is read-only. Latest review information about a business object, including the business details, reviewer information, and review time.
new_biz	BizVersionManageVO object	Service version management. This parameter is read-only.
from_public	Boolean	Indicates whether the data is from the public layer.
create_by	String	Creator.
update_by	String	Person who updates the information.
create_time	String	Creation time, which is read-only. The format complies with RFC3339 and is accurate to seconds. The UTC time zone is yyyy-mm-ddTHH:MM:SSZ, for example, 1970-01-01T00:00:00Z.
update_time	String	Update time, which is read-only. The format complies with RFC3339 and is accurate to seconds. The UTC time zone is yyyy-mm-ddTHH:MM:SSZ, for example, 1970-01-01T00:00:00Z.

Table 7-78 StandElementValueVO

Parameter	Type	Description
fd_name	String	Attribute name.
fd_value	String	Property value.
fd_id	String	Attribute ID, which is a string
directory_id	String	ID of the directory to which the standard belongs. The value is a string.
row_id	String	ID of the row to which the standard belongs. The value is a string.
id	String	Data standard ID, which is a string
status	String	Release status of an entity. This parameter is read-only and does not need to be set during creation and update. Options: <ul style="list-style-type: none">• DRAFT: draft• PUBLISH_DEVELOPING: to be reviewed• PUBLISHED: released• OFFLINE_DEVELOPING: to be reviewed• OFFLINE: offline• REJECT: rejected
create_by	String	Creator.
update_by	String	Person who updates the information.
create_time	String	Creation time, which is read-only. The format complies with RFC3339 and is accurate to seconds. The UTC time zone is yyyy-mm-ddTHH:MM:SSZ, for example, 1970-01-01T00:00:00Z.
update_time	String	Update time, which is read-only. The format complies with RFC3339 and is accurate to seconds. The UTC time zone is yyyy-mm-ddTHH:MM:SSZ, for example, 1970-01-01T00:00:00Z.

Table 7-79 ApprovalVO

Parameter	Type	Description
id	String	Application ID, which is a string
tenant_id	String	Project ID. For details about how to obtain the project ID, see the API path parameter <code>project_id</code> .
name_ch	String	Chinese name of a service.
name_en	String	English name of a service.
biz_id	String	Business ID, which is a string

Parameter	Type	Description
biz_type	String	<p>Business entity type.</p> <p>Options:</p> <ul style="list-style-type: none"> • AGGREGATION_LOGIC_TABLE: summary table • ATOMIC_INDEX: atomic metric • ATOMIC_METRIC: atomic metric (new) • BIZ_CATALOG: process architecture directory • BIZ_METRIC: service indicator • CODE_TABLE: code table • COMMON_CONDITION: general filter • COMPOSITE_METRIC: Compound Metric (new) • COMPOUND_METRIC: compound metric • CONDITION_GROUP: restriction group • DEGENERATE_DIMENSION: degenerate dimension • DERIVATIVE_INDEX: derivative indicator • DERIVED_METRIC: derivative indicator (new) • DIMENSION: dimension • DIMENSION_ATTRIBUTE: dimension attribute • DIMENSION_HIERARCHIES: dimension level • DIMENSION_LOGIC_TABLE: dimension table • DIMENSION_TABLE_ATTRIBUTE: dimension attribute • DIRECTORY: directory • FACT_ATTRIBUTE: fact table attribute • FACT_DIMENSION: fact table dimension • FACT_LOGIC_TABLE: fact table • FACT_MEASURE: fact table measurement • FUNCTION: function

Parameter	Type	Description
error_code	String	Error code, for example, DS.6000, indicating that the request fails to be processed.
error_msg	String	Error message
data	Object	Returned data information.

Status code: 404

Table 7-84 Response body parameters

Parameter	Type	Description
error_code	String	Error code, for example, DS.6000, indicating that the request fails to be processed.
error_msg	String	Error message
data	Object	Returned data information.

Example Requests

Create a data standard based on parameters.

```
POST https://{endpoint}/v2/{project_id}/design/standards
{
  "id" : 0,
  "directory_id" : "1228084836548411397",
  "values" : [ {
    "fd_name" : "nameCh",
    "fd_value" : "test_create_data_standard"
  }, {

```

```
"fd_name": "nameEn",
"fd_value": ""
}, {
"fd_name": "englishName",
"fd_value": "test_create_data_standard"
}, {
"fd_name": "dataType",
"fd_value": "STRING"
}, {
"fd_name": "dataLength",
"fd_value": "1,256"
}, {
"fd_name": "hasAllowValueList",
"fd_value": false
}, {
"fd_name": "allowList",
"fd_value": ""
}, {
"fd_name": "referCodeTable",
"fd_value": ""
}, {
"fd_name": "codeStandColumn",
"fd_value": ""
}, {
"fd_name": "dqcRule"
}, {
"fd_name": "ruleOwner",
"fd_value": "zty_tess"
}, {
"fd_name": "dataMonitorOwner",
"fd_value": "zty_tess"
}, {
"fd_name": "standardLevel",
"fd_value": ""
}, {
"fd_name": "description",
"fd_value": "This is a test case."
}
}]
}
```

Example Responses

Status code: 200

Success

```
{
  "data": {
    "value": {

400	BadRequest
401	Unauthorized
403	Forbidden
404	Not Found

7.3.3 Deleting Data Standards

Function

Delete a data standard.

Calling Method

For details, see [Calling APIs](#).

URI

DELETE /v2/{project_id}/design/standards

Table 7-85 Path Parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Project ID. For details about how to obtain the project ID, see Project ID and Account ID .

Request Parameters

Table 7-86 Request header parameters

Parameter	Mandatory	Type	Description
X-Auth-Token	Yes	String	IAM token, which is obtained by calling the IAM API for obtaining a user token (value of X-Subject-Token in the response header). This field is mandatory for authentication using tokens.
workspace	Yes	String	Workspace ID. For details about how to obtain the workspace ID, see Instance ID and Workspace ID .
X-Project-Id	No	String	Project ID. For details about how to obtain the project ID, see Project ID and Account ID . This parameter is mandatory for API requests that use AK/SK authentication in multi-project scenarios.
Content-Type	No	String	Default value: application/json;charset=UTF-8 This parameter is optional. If the body is available, this parameter is mandatory. If the body is unavailable, you do not need to set this parameter or verify it.

Table 7-87 Request body parameters

Parameter	Mandatory	Type	Description
ids	Yes	Array of strings	ID list, which is a string

Parameter	Mandatory	Type	Description
del_types	No	String	Deletion type. Enumerated values: <ul style="list-style-type: none"> PHYSICAL_TABLE: whether to delete physical database tables. This parameter is valid only for tables that can be materialized. (If this parameter is set, physical database tables are deleted.)

Response Parameters

Status code: 200

Table 7-88 Response body parameters

Parameter	Type	Description
data	data object	Indicates the final deletion result, that is, the number of objects that are successfully deleted.

Table 7-89 data

Parameter	Type	Description
value	String	Number of successfully deleted objects

Status code: 400

Table 7-90 Response body parameters

Parameter	Type	Description
error_code	String	Error code, for example, DS.6000, indicating that the request fails to be processed.
error_msg	String	Error message
data	Object	Returned data information.

Status code: 401

Table 7-91 Response body parameters

Parameter	Type	Description
error_code	String	Error code, for example, DS.6000, indicating that the request fails to be processed.
error_msg	String	Error message
data	Object	Returned data information.

Status code: 403

Table 7-92 Response body parameters

Parameter	Type	Description
error_code	String	Error code, for example, DS.6000, indicating that the request fails to be processed.
error_msg	String	Error message
data	Object	Returned data information.

Status code: 404

Table 7-93 Response body parameters

Parameter	Type	Description
error_code	String	Error code, for example, DS.6000, indicating that the request fails to be processed.
error_msg	String	Error message
data	Object	Returned data information.

Example Requests

Delete a data standard.

```
DELETE https://{endpoint}/v2/{project_id}/design/standards
{
  "ids" : [ "1228086003290537985", "1228084992354222081" ]
}
```

Example Responses

Status code: 200

Success. The returned data is the number of deleted data records. Note that the transferred ID list is rowid, and the entire data standard instead of an attribute is deleted.

```
{
  "data" : {
    "value" : 0
  }
}
```

Status code: 400

BadRequest

```
{
  "error_code" : "DS.60xx",
  "error_msg" : "The user request is illegal."
}
```

Status code: 401

Unauthorized

```
{
  "error_code" : "DS.60xx",
  "error_msg" : "User authentication failed."
}
```

Status code: 403

Forbidden

```
{
  "error_code" : "DS.60xx",
  "error_msg" : "The user does not have permission to call this API."
}
```

Status code: 404

Not Found

```
{
  "error_code" : "DS.60xx",
  "error_msg" : "The User Request API does not exist."
}
```

SDK Sample Code

The SDK sample code is as follows.

Java

Delete a data standard.

```
package com.huaweicloud.sdk.test;

import com.huaweicloud.sdk.core.auth.ICredential;

7.3.4 Modifying Data Standards

Function

Modify the data standard.

Calling Method

For details, see [Calling APIs](#).

URI

PUT /v2/{project_id}/design/standards/{id}

Table 7-94 Path Parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Project ID. For details about how to obtain the project ID, see Project ID and Account ID .
id	Yes	String	Entity ID, which is a string

Request Parameters

Table 7-95 Request header parameters

Parameter	Mandatory	Type	Description
X-Auth-Token	Yes	String	IAM token, which is obtained by calling the IAM API for obtaining a user token (value of X-Subject-Token in the response header). This field is mandatory for authentication using tokens.
workspace	Yes	String	Workspace ID. For details about how to obtain the workspace ID, see Instance ID and Workspace ID .
X-Project-Id	No	String	Project ID. For details about how to obtain the project ID, see Project ID and Account ID . This parameter is mandatory for API requests that use AK/SK authentication in multi-project scenarios.
Content-Type	No	String	Default value: application/json;charset=UTF-8 This parameter is optional. If the body is available, this parameter is mandatory. If the body is unavailable, you do not need to set this parameter or verify it.

Table 7-96 Request body parameters

Parameter	Mandatory	Type	Description
values	Yes	Array of StandElementValueVO objects	Attributes
id	No	String	Data standard ID, which is a string
directory_id	Yes	String	ID of the directory to which the standard belongs. The value is a string.
directory_path	No	String	Directory tree.
row_id	No	String	Row ID, which is a string
status	No	String	Release status of an entity. This parameter is read-only and does not need to be set during creation and update. Options: <ul style="list-style-type: none">• DRAFT: draft• PUBLISH_DEVELOPING: to be reviewed• PUBLISHED: released• OFFLINE_DEVELOPING: to be reviewed• OFFLINE: offline• REJECT: rejected
approval_info	No	ApprovalVO object	Approval information. This parameter is read-only. Latest review information about a business object, including the business details, reviewer information, and review time.
new_biz	No	BizVersionManagementVO object	Service version management. This parameter is read-only.
from_public	No	Boolean	Indicates whether the data is from the public layer.
create_by	No	String	Creator.
update_by	No	String	Person who updates the information.

Table 7-97 StandElementValueVO

Parameter	Mandatory	Type	Description
fd_name	Yes	String	Attribute name.
fd_value	No	String	Property value.
fd_id	No	String	Attribute ID, which is a string
directory_id	No	String	ID of the directory to which the standard belongs. The value is a string.
row_id	No	String	ID of the row to which the standard belongs. The value is a string.
id	No	String	Data standard ID, which is a string
status	No	String	Release status of an entity. This parameter is read-only and does not need to be set during creation and update. Options: <ul style="list-style-type: none">• DRAFT: draft• PUBLISH_DEVELOPING: to be reviewed• PUBLISHED: released• OFFLINE_DEVELOPING: to be reviewed• OFFLINE: offline• REJECT: rejected
create_by	No	String	Creator.
update_by	No	String	Person who updates the information.

Table 7-98 ApprovalVO

Parameter	Mandatory	Type	Description
id	No	String	Application ID, which is a string
tenant_id	No	String	Project ID. For details about how to obtain the project ID, see the API path parameter project_id.

Parameter	Mandatory	Type	Description
name_ch	No	String	Chinese name of a service.
name_en	No	String	English name of a service.
biz_id	No	String	Business ID, which is a string

Parameter	Mandatory	Type	Description
biz_type	No	String	<p>Business entity type.</p> <p>Options:</p> <ul style="list-style-type: none"> ● AGGREGATION_LOGIC_TABLE: summary table ● ATOMIC_INDEX: atomic metric ● ATOMIC_METRIC: atomic metric (new) ● BIZ_CATALOG: process architecture directory ● BIZ_METRIC: service indicator ● CODE_TABLE: code table ● COMMON_CONDITION: general filter ● COMPOSITE_METRIC: Compound Metric (new) ● COMPOUND_METRIC: compound metric ● CONDITION_GROUP: restriction group ● DEGENERATE_DIMENSION: degenerate dimension ● DERIVATIVE_INDEX: derivative indicator ● DERIVED_METRIC: derivative indicator (new) ● DIMENSION: dimension ● DIMENSION_ATTRIBUTE: dimension attribute ● DIMENSION_HIERARCHIES: dimension level ● DIMENSION_LOGIC_TABLE: dimension table ● DIMENSION_TABLE_ATTRIBUTE: dimension attribute ● DIRECTORY: directory ● FACT_ATTRIBUTE: fact table attribute ● FACT_DIMENSION: fact table dimension ● FACT_LOGIC_TABLE: fact table

Parameter	Mandatory	Type	Description

biz_status	String	Release status of an entity. This parameter is read-only and does not need to be set during creation and update. Options: <ul style="list-style-type: none"> • DRAFT: draft • PUBLISH_DEVELOPING: to be reviewed • PUBLISHED: released • OFFLINE_DEVELOPING: to be reviewed • OFFLINE: offline • REJECT: rejected
approval_status	String	Service approval status. This parameter is read-only. Options: <ul style="list-style-type: none"> • DEVELOPING: being reviewed • APPROVED: approved • REJECT: rejected • WITHDREW: approval cancellation
approval_type	String	Service review type. Options: <ul style="list-style-type: none"> • PUBLISH: released • OFFLINE: offline
submit_time	String	Submitted At
create_by	String	Creator.
l1	String	Chinese name of the subject area group. This parameter is read-only and does not need to be set when you create or update a subject area group.
l2	String	Chinese name of the subject area. This parameter is read-only and does not need to be set during creation and update.
l3	String	Chinese name of the business object. This parameter is read-only and does not need to be set during creation and update.
approval_time	String	Review time.

Parameter	Type	Description
approver	String	Reviewer.
email	String	Email address of the reviewer.
msg	String	Review information.
directory_path	String	Directory tree.

Table 7-105 BizVersionManageVO

Parameter	Type	Description
id	String	Field ID, which is a string

Parameter	Type	Description
biz_type	String	<p>Business entity type.</p> <p>Options:</p> <ul style="list-style-type: none"> • AGGREGATION_LOGIC_TABLE: summary table • ATOMIC_INDEX: atomic metric • ATOMIC_METRIC: atomic metric (new) • BIZ_CATALOG: process architecture directory • BIZ_METRIC: service indicator • CODE_TABLE: code table • COMMON_CONDITION: general filter • COMPOSITE_METRIC: Compound Metric (new) • COMPOUND_METRIC: compound metric • CONDITION_GROUP: restriction group • DEGENERATE_DIMENSION: degenerate dimension • DERIVATIVE_INDEX: derivative indicator • DERIVED_METRIC: derivative indicator (new) • DIMENSION: dimension • DIMENSION_ATTRIBUTE: dimension attribute • DIMENSION_HIERARCHIES: dimension level • DIMENSION_LOGIC_TABLE: dimension table • DIMENSION_TABLE_ATTRIBUTE: dimension attribute • DIRECTORY: directory • FACT_ATTRIBUTE: fact table attribute • FACT_DIMENSION: fact table dimension • FACT_LOGIC_TABLE: fact table • FACT_MEASURE: fact table measurement • FUNCTION: function

Parameter	Type	Description
		<ul style="list-style-type: none"> • INFO_ARCH: information architecture (used for modifying themes in batches) • MODEL: model • QUALITY_RULE: quality rule • SECRECY_LEVEL: security level • STANDARD_ELEMENT: data standard • STANDARD_ELEMENT_TEMPLATE: data standard template • SUBJECT: theme • Dimension attributes of SUMMARY_DIMENSION_ATTRIBUTE: summary tables • SUMMARY_INDEX: summary table indicator attribute • SUMMARY_TIME: time period attribute of the SDR table • TABLE_MODEL: relationship model (logical model/physical model) • TABLE_MODEL_ATTRIBUTE: relationship model attribute (logical model/physical model) • TABLE_MODEL_LOGIC: logical entity • TABLE_TYPE: table type • TAG: tag • TIME_CONDITION: time restriction
biz_id	String	Business ID, which is a string
biz_info	String	Business object information.

Parameter	Type	Description
status	String	Release status of an entity. This parameter is read-only and does not need to be set during creation and update. Options: <ul style="list-style-type: none"> • DRAFT: draft • PUBLISH_DEVELOPING: to be reviewed • PUBLISHED: released • OFFLINE_DEVELOPING: to be reviewed • OFFLINE: offline • REJECT: rejected
biz_version	Integer	Service version, which is read-only.
create_time	String	Creation time, which is read-only. The format complies with RFC3339 and is accurate to seconds. The UTC time zone is yyyy-mm-ddTHH:MM:SSZ, for example, 1970-01-01T00:00:00Z.
update_time	String	Update time, which is read-only. The format complies with RFC3339 and is accurate to seconds. The UTC time zone is yyyy-mm-ddTHH:MM:SSZ, for example, 1970-01-01T00:00:00Z.

Status code: 400

Table 7-106 Response body parameters

Parameter	Type	Description
error_code	String	Error code, for example, DS.6000, indicating that the request fails to be processed.
error_msg	String	Error message
data	Object	Returned data information.

Status code: 401

Table 7-107 Response body parameters

Parameter	Type	Description
error_code	String	Error code, for example, DS.6000, indicating that the request fails to be processed.
error_msg	String	Error message
data	Object	Returned data information.

Status code: 403

Status Codes

Status Code	Description
200	Success
400	BadRequest
401	Unauthorized
403	Forbidden
404	Not Found

7.3.5 Viewing Data Standard Details

Function

This API is used to obtain data standard details by ID.

Calling Method

For details, see [Calling APIs](#).

URI

GET /v2/{project_id}/design/standards/{id}

Table 7-110 Path Parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Project ID. For details about how to obtain the project ID, see Project ID and Account ID .
id	Yes	String	Entity ID, which is a string

Request Parameters

Table 7-111 Request header parameters

Parameter	Mandatory	Type	Description
X-Auth-Token	Yes	String	IAM token, which is obtained by calling the IAM API for obtaining a user token (value of X-Subject-Token in the response header). This field is mandatory for authentication using tokens.
workspace	Yes	String	Workspace ID. For details about how to obtain the workspace ID, see Instance ID and Workspace ID .
X-Project-Id	No	String	Project ID. For details about how to obtain the project ID, see Project ID and Account ID . This parameter is mandatory for API requests that use AK/SK authentication in multi-project scenarios.
Content-Type	No	String	Default value: application/json;charset=UTF-8 This parameter is optional. If the body is available, this parameter is mandatory. If the body is unavailable, you do not need to set this parameter or verify it.

Response Parameters

Status code: 200**Table 7-112** Response body parameters

Parameter	Type	Description
data	data object	The data standard query returns the data result.

Table 7-113 data

Parameter	Type	Description
value	StandElementValueVOList object	Attribute value list.

Table 7-114 StandElementValueVOList

Parameter	Type	Description
values	Array of StandElementValueVO objects	Attributes
id	String	Data standard ID, which is a string
directory_id	String	ID of the directory to which the standard belongs. The value is a string.
directory_path	String	Directory tree.
row_id	String	Row ID, which is a string
status	String	Release status of an entity. This parameter is read-only and does not need to be set during creation and update. Options: <ul style="list-style-type: none"> • DRAFT: draft • PUBLISH_DEVELOPING: to be reviewed • PUBLISHED: released • OFFLINE_DEVELOPING: to be reviewed • OFFLINE: offline • REJECT: rejected
approval_info	ApprovalVO object	Approval information. This parameter is read-only. Latest review information about a business object, including the business details, reviewer information, and review time.
new_biz	BizVersionManagementVO object	Service version management. This parameter is read-only.
from_public	Boolean	Indicates whether the data is from the public layer.
create_by	String	Creator.

Parameter	Type	Description
update_by	String	Person who updates the information.
create_time	String	Creation time, which is read-only. The format complies with RFC3339 and is accurate to seconds. The UTC time zone is yyyy-mm-ddTHH:MM:SSZ, for example, 1970-01-01T00:00:00Z.
update_time	String	Update time, which is read-only. The format complies with RFC3339 and is accurate to seconds. The UTC time zone is yyyy-mm-ddTHH:MM:SSZ, for example, 1970-01-01T00:00:00Z.

Table 7-115 StandElementValueVO

Parameter	Type	Description
fd_name	String	Attribute name.
fd_value	String	Property value.
fd_id	String	Attribute ID, which is a string
directory_id	String	ID of the directory to which the standard belongs. The value is a string.
row_id	String	ID of the row to which the standard belongs. The value is a string.
id	String	Data standard ID, which is a string
status	String	Release status of an entity. This parameter is read-only and does not need to be set during creation and update. Options: <ul style="list-style-type: none"> • DRAFT: draft • PUBLISH_DEVELOPING: to be reviewed • PUBLISHED: released • OFFLINE_DEVELOPING: to be reviewed • OFFLINE: offline • REJECT: rejected
create_by	String	Creator.
update_by	String	Person who updates the information.

Parameter	Type	Description
create_time	String	Creation time, which is read-only. The format complies with RFC3339 and is accurate to seconds. The UTC time zone is yyyy-mm-ddTHH:MM:SSZ, for example, 1970-01-01T00:00:00Z.
update_time	String	Update time, which is read-only. The format complies with RFC3339 and is accurate to seconds. The UTC time zone is yyyy-mm-ddTHH:MM:SSZ, for example, 1970-01-01T00:00:00Z.

Table 7-116 ApprovalVO

Parameter	Type	Description
id	String	Application ID, which is a string
tenant_id	String	Project ID. For details about how to obtain the project ID, see the API path parameter project_id.
name_ch	String	Chinese name of a service.
name_en	String	English name of a service.
biz_id	String	Business ID, which is a string

Parameter	Type	Description
biz_type	String	<p>Business entity type.</p> <p>Options:</p> <ul style="list-style-type: none"> • AGGREGATION_LOGIC_TABLE: summary table • ATOMIC_INDEX: atomic metric • ATOMIC_METRIC: atomic metric (new) • BIZ_CATALOG: process architecture directory • BIZ_METRIC: service indicator • CODE_TABLE: code table • COMMON_CONDITION: general filter • COMPOSITE_METRIC: Compound Metric (new) • COMPOUND_METRIC: compound metric • CONDITION_GROUP: restriction group • DEGENERATE_DIMENSION: degenerate dimension • DERIVATIVE_INDEX: derivative indicator • DERIVED_METRIC: derivative indicator (new) • DIMENSION: dimension • DIMENSION_ATTRIBUTE: dimension attribute • DIMENSION_HIERARCHIES: dimension level • DIMENSION_LOGIC_TABLE: dimension table • DIMENSION_TABLE_ATTRIBUTE: dimension attribute • DIRECTORY: directory • FACT_ATTRIBUTE: fact table attribute • FACT_DIMENSION: fact table dimension • FACT_LOGIC_TABLE: fact table • FACT_MEASURE: fact table measurement • FUNCTION: function

Parameter	Type	Description
		<ul style="list-style-type: none"> • INFO_ARCH: information architecture (used for modifying themes in batches) • MODEL: model • QUALITY_RULE: quality rule • SECRECY_LEVEL: security level • STANDARD_ELEMENT: data standard • STANDARD_ELEMENT_TEMPLATE: data standard template • SUBJECT: theme • Dimension attributes of SUMMARY_DIMENSION_ATTRIBUTE: summary tables • SUMMARY_INDEX: summary table indicator attribute • SUMMARY_TIME: time period attribute of the SDR table • TABLE_MODEL: relationship model (logical model/physical model) • TABLE_MODEL_ATTRIBUTE: relationship model attribute (logical model/physical model) • TABLE_MODEL_LOGIC: logical entity • TABLE_TYPE: table type • TAG: tag • TIME_CONDITION: time restriction
biz_info	String	Serialized service details. The type is string.
biz_info_obj	Object	Service details. The type is object.
biz_version	Integer	Service version.

Parameter	Type	Description
biz_status	String	Release status of an entity. This parameter is read-only and does not need to be set during creation and update. Options: <ul style="list-style-type: none"> • DRAFT: draft • PUBLISH_DEVELOPING: to be reviewed • PUBLISHED: released • OFFLINE_DEVELOPING: to be reviewed • OFFLINE: offline • REJECT: rejected
approval_status	String	Service approval status. This parameter is read-only. Options: <ul style="list-style-type: none"> • DEVELOPING: being reviewed • APPROVED: approved • REJECT: rejected • WITHDREW: approval cancellation
approval_type	String	Service review type. Options: <ul style="list-style-type: none"> • PUBLISH: released • OFFLINE: offline
submit_time	String	Submitted At
create_by	String	Creator.
l1	String	Chinese name of the subject area group. This parameter is read-only and does not need to be set when you create or update a subject area group.
l2	String	Chinese name of the subject area. This parameter is read-only and does not need to be set during creation and update.
l3	String	Chinese name of the business object. This parameter is read-only and does not need to be set during creation and update.
approval_time	String	Review time.

Parameter	Type	Description
approver	String	Reviewer.
email	String	Email address of the reviewer.
msg	String	Review information.
directory_path	String	Directory tree.

Table 7-117 BizVersionManageVO

Parameter	Type	Description
id	String	Field ID, which is a string

Parameter	Type	Description
biz_type	String	<p>Business entity type.</p> <p>Options:</p> <ul style="list-style-type: none"> • AGGREGATION_LOGIC_TABLE: summary table • ATOMIC_INDEX: atomic metric • ATOMIC_METRIC: atomic metric (new) • BIZ_CATALOG: process architecture directory • BIZ_METRIC: service indicator • CODE_TABLE: code table • COMMON_CONDITION: general filter • COMPOSITE_METRIC: Compound Metric (new) • COMPOUND_METRIC: compound metric • CONDITION_GROUP: restriction group • DEGENERATE_DIMENSION: degenerate dimension • DERIVATIVE_INDEX: derivative indicator • DERIVED_METRIC: derivative indicator (new) • DIMENSION: dimension • DIMENSION_ATTRIBUTE: dimension attribute • DIMENSION_HIERARCHIES: dimension level • DIMENSION_LOGIC_TABLE: dimension table • DIMENSION_TABLE_ATTRIBUTE: dimension attribute • DIRECTORY: directory • FACT_ATTRIBUTE: fact table attribute • FACT_DIMENSION: fact table dimension • FACT_LOGIC_TABLE: fact table • FACT_MEASURE: fact table measurement • FUNCTION: function

Status code: 400

Table 7-118 Response body parameters

Parameter	Type	Description
error_code	String	Error code, for example, DS.6000, indicating that the request fails to be processed.
error_msg	String	Error message
data	Object	Returned data information.

Status code: 401

Table 7-119 Response body parameters

Parameter	Type	Description
error_code	String	Error code, for example, DS.6000, indicating that the request fails to be processed.
error_msg	String	Error message
data	Object	Returned data information.

Status code: 403

Table 7-120 Response body parameters

Parameter	Type	Description
error_code	String	Error code, for example, DS.6000, indicating that the request fails to be processed.
error_msg	String	Error message
data	Object	Returned data information.

Status code: 404

Table 7-121 Response body parameters

Parameter	Type	Description
error_code	String	Error code, for example, DS.6000, indicating that the request fails to be processed.
error_msg	String	Error message
data	Object	Returned data information.

Example Requests

Query details about the data standard whose ID is 1082235079767502848.

GET https://{endpoint}/v2/{project_id}/design/standards/1082235079767502848

Example Responses

Status code: 200

This operation succeeds, and the data standard details are returned.

7.3.6 Associated Attributes and Data Standards

Function

Associate attributes with data standards.

Calling Method

For details, see [Calling APIs](#).

URI

PUT /v2/{project_id}/design/standards/attribute

Table 7-122 Path Parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Project ID. For details about how to obtain the project ID, see Project ID and Account ID .

Request Parameters

Table 7-123 Request header parameters

Parameter	Mandatory	Type	Description
X-Auth-Token	Yes	String	IAM token, which is obtained by calling the IAM API for obtaining a user token (value of X-Subject-Token in the response header). This field is mandatory for authentication using tokens.
workspace	Yes	String	Workspace ID. For details about how to obtain the workspace ID, see Instance ID and Workspace ID .
X-Project-Id	No	String	Project ID. For details about how to obtain the project ID, see Project ID and Account ID . This parameter is mandatory for API requests that use AK/SK authentication in multi-project scenarios.
Content-Type	No	String	Default value: application/json;charset=UTF-8 This parameter is optional. If the body is available, this parameter is mandatory. If the body is unavailable, you do not need to set this parameter or verify it.

Table 7-124 Request body parameters

Parameter	Mandatory	Type	Description
ids	Yes	Array of strings	Attribute ID list, which is a string
stand_row_id	Yes	String	ID of the associated data standard, which is a string
table_id	Yes	String	Table ID, which is a string
biz_type	Yes	String	Table type. The default value is TABLE_MODEL. Options: <ul style="list-style-type: none"> • TABLE_MODEL: relationship model (logical model/ physical model) • AGGREGATION_LOGIC_TABLE: summary table • FACT_LOGIC_TABLE: fact table • DIMENSION: dimension • DIMENSION_LOGIC_TABLE: dimension table

Response Parameters

Status code: 200

Table 7-125 Response body parameters

Parameter	Type	Description
data	data object	data: unified outermost data structure of the returned result.

Table 7-126 data

Parameter	Type	Description
value	LinkAttributeAndElementVO object	Attribute ID list.

Table 7-127 LinkAttributeAndElementVO

Parameter	Type	Description
ids	Array of strings	Attribute ID list, which is a string
stand_row_id	String	ID of the associated data standard, which is a string
table_id	String	Table ID, which is a string
biz_type	String	Table type. The default value is TABLE_MODEL. Options: <ul style="list-style-type: none"> • TABLE_MODEL: relationship model (logical model/physical model) • AGGREGATION_LOGIC_TABLE: summary table • FACT_LOGIC_TABLE: fact table • DIMENSION: dimension • DIMENSION_LOGIC_TABLE: dimension table

Status code: 400

Table 7-128 Response body parameters

Parameter	Type	Description
error_code	String	Error code, for example, DS.6000, indicating that the request fails to be processed.
error_msg	String	Error message
data	Object	Returned data information.

Status code: 401

Table 7-129 Response body parameters

Parameter	Type	Description
error_code	String	Error code, for example, DS.6000, indicating that the request fails to be processed.
error_msg	String	Error message
data	Object	Returned data information.

Status code: 403

Table 7-130 Response body parameters

Parameter	Type	Description
error_code	String	Error code, for example, DS.6000, indicating that the request fails to be processed.
error_msg	String	Error message
data	Object	Returned data information.

Status code: 404

Table 7-131 Response body parameters

Parameter	Type	Description
error_code	String	Error code, for example, DS.6000, indicating that the request fails to be processed.
error_msg	String	Error message
data	Object	Returned data information.

Example Requests

Associate table attributes with data standards based on request parameters.

PUT https://{endpoint}/v2/{project_id}/design/standards/attribute

```
{
  "ids" : [ "1229920251374923780" ],
  "stand_row_id" : "1169318364674498561",
  "table_id" : "1229920251379118081",
  "biz_type" : "TABLE_MODEL"
}
```

Example Responses

Status code: 200

Success

```
{
  "data" : {
    "value" : {
      "ids" : [ "1229920251374923780" ],
      "stand_row_id" : "1169318364674498561",
      "table_id" : "1229920251379118081",

```

```
"biz_type" : "TABLE_MODEL"  
}  
}  
}
```

Status code: 400

BadRequest

```
{  
  "error_code" : "DS.60xx",  
  "error_msg" : "The user request is illegal."  
}
```

Status code: 401

Unauthorized

```
{  
  "error_code" : "DS.60xx",  
  "error_msg" : "User authentication failed."  
}
```

Status code: 403

Forbidden

404	Not Found

7.4 Data Sources

7.4.1 Obtaining Data Connection Information

Function

This API is used to obtain data connection information of a specified type.

Calling Method

For details, see [Calling APIs](#).

URI

GET /v2/{project_id}/design/atlas/data-warehouses

Table 7-132 Path Parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Project ID. For details about how to obtain the project ID, see Project ID and Account ID .

Table 7-133 Query Parameters

Parameter	Mandatory	Type	Description
force_refresh	No	Boolean	Indicates whether to query the latest.
dw_type	Yes	String	Data connection type.
limit	No	Integer	limit
offset	No	Integer	limit

Request Parameters

Table 7-134 Request header parameters

Parameter	Mandatory	Type	Description
X-Auth-Token	Yes	String	IAM token, which is obtained by calling the IAM API for obtaining a user token (value of X-Subject-Token in the response header). This field is mandatory for authentication using tokens.
workspace	Yes	String	Workspace ID. For details about how to obtain the workspace ID, see Instance ID and Workspace ID .
X-Project-Id	No	String	Project ID. For details about how to obtain the project ID, see Project ID and Account ID . This parameter is mandatory for API requests that use AK/SK authentication in multi-project scenarios.
Content-Type	No	String	Default value: application/json;charset=UTF-8 This parameter is optional. If the body is available, this parameter is mandatory. If the body is unavailable, you do not need to set this parameter or verify it.

Response Parameters

Status code: 200

Table 7-135 Response body parameters

Parameter	Type	Description
data	data object	data: unified outermost data structure of the returned result.

Table 7-136 data

Parameter	Type	Description
value	Array of DataConnectionVO objects	Data connection information array

Table 7-137 DataConnectionVO

Parameter	Type	Description
dw_name	String	Name of a data connection.
dw_id	String	Data connection ID.
display_name	String	Data connection name, which adapts to the existing implementation.
dw_type	String	Data connection type.

Status code: 400

Table 7-138 Response body parameters

Parameter	Type	Description
error_code	String	Error code, for example, DS.6000, indicating that the request fails to be processed.
error_msg	String	Error message
data	Object	Returned data information.

Status code: 401

Table 7-139 Response body parameters

Parameter	Type	Description
error_code	String	Error code, for example, DS.6000, indicating that the request fails to be processed.
error_msg	String	Error message
data	Object	Returned data information.

Status code: 403

Table 7-140 Response body parameters

Parameter	Type	Description
error_code	String	Error code, for example, DS.6000, indicating that the request fails to be processed.
error_msg	String	Error message
data	Object	Returned data information.

Example Requests

Obtain information about a DWS data connection.

```
GET https://{endpoint}/v2/{project_id}/design/atlas/data-warehouses?dw_type=DWS
```

Example Responses

Status code: 200

This operation succeeds, and the returned data is all DataConnectionVO entities of the specified type.

```
{
  "data" : {
    "value" : [ {
      "dw_id" : "c5daea963128457cb7579404da5a23c7",
      "dw_name" : "dws_test",
      "dw_type" : "DWS"
    } ]
  }
}
```

Status code: 400

BadRequest

```
{
  "error_code" : "DS.60xx",
  "error_msg" : "The user request is illegal."
}
```

Status Codes

Status Code	Description
200	This operation succeeds, and the returned data is all DataConnectionVO entities of the specified type.
400	BadRequest
401	Unauthorized
403	Forbidden

7.5 Process Architecture

7.5.1 Obtain all BPA directory trees.

Function

This API is used to obtain all directory trees.

Calling Method

For details, see [Calling APIs](#).

URI

GET /v2/{project_id}/design/biz/catalogs/tree

Table 7-141 Path Parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Project ID. For details about how to obtain the project ID, see Project ID and Account ID .

Request Parameters

Table 7-142 Request header parameters

Parameter	Mandatory	Type	Description
X-Auth-Token	Yes	String	IAM token, which is obtained by calling the IAM API for obtaining a user token (value of X-Subject-Token in the response header). This field is mandatory for authentication using tokens.
workspace	Yes	String	Workspace ID. For details about how to obtain the workspace ID, see Instance ID and Workspace ID .
X-Project-Id	No	String	Project ID. For details about how to obtain the project ID, see Project ID and Account ID . This parameter is mandatory for API requests that use AK/SK authentication in multi-project scenarios.
Content-Type	No	String	Default value: application/json;charset=UTF-8 This parameter is optional. If the body is available, this parameter is mandatory. If the body is unavailable, you do not need to set this parameter or verify it.

Response Parameters

Status code: 200

Table 7-143 Response body parameters

Parameter	Type	Description
data	data object	data: unified outermost data structure of the returned result.

Table 7-144 data

Parameter	Type	Description
value	Array of BizCatalogVO objects	value: unified outer data structure of the returned result.

Table 7-145 BizCatalogVO

Parameter	Type	Description
name	String	Workflow name
description	String	Description.
guid	String	ID in the corresponding asset.
owner	String	Owner of the instance.
parent_id	String	Parent directory ID. If no parent directory ID exists, the parent directory is the root directory. ID string
prev_id	String	ID of the previous node. If there is no previous node ID, the node is the first node. ID string
next_id	String	ID of the next node. If there is no next node ID, the node is the tail node. ID string
id	String	This parameter is left empty during creation and is mandatory during update. ID string
qualified_id	String	Authentication ID, which is automatically generated.
create_by	String	Creator.
update_by	String	Person who updates the information.

Parameter	Type	Description
create_time	String	Creation time, which is read-only. The format complies with RFC3339 and is accurate to seconds. The UTC time zone is yyyy-mm-ddTHH:MM:SSZ, for example, 1970-01-01T00:00:00Z.
update_time	String	Update time, which is read-only. The format complies with RFC3339 and is accurate to seconds. The UTC time zone is yyyy-mm-ddTHH:MM:SSZ, for example, 1970-01-01T00:00:00Z.
bizmetric_num	Integer	Number of service indicators, which is not transferred by the frontend.
children_num	Integer	Number of sub-processes, excluding sub-processes.
children	Array of BizCatalogVO objects	Lower-level subdirectory, which is read-only.

Status code: 400**Table 7-146** Response body parameters

Parameter	Type	Description
error_code	String	Error code, for example, DS.6000, indicating that the request fails to be processed.
error_msg	String	Error message
data	Object	Returned data information.

Status code: 401**Table 7-147** Response body parameters

Parameter	Type	Description
error_code	String	Error code, for example, DS.6000, indicating that the request fails to be processed.
error_msg	String	Error message
data	Object	Returned data information.

Status code: 403**Table 7-148** Response body parameters

Parameter	Type	Description
error_code	String	Error code, for example, DS.6000, indicating that the request fails to be processed.
error_msg	String	Error message
data	Object	Returned data information.

Status code: 404**Table 7-149** Response body parameters

Parameter	Type	Description
error_code	String	Error code, for example, DS.6000, indicating that the request fails to be processed.
error_msg	String	Error message
data	Object	Returned data information.

Example Requests

This API is used to obtain all directory trees.

```
PUT https://{endpoint}/v2/{project_id}/design/biz/catalogs/tree
```

Example Responses

Status code: 200

This operation succeeds, and the returned data is a directory with subdirectories.

7.5.2 Querying the BPA List

Function

This API is used to query the process architecture list.

Calling Method

For details, see [Calling APIs](#).

URI

GET /v2/{project_id}/design/biz/catalogs

Table 7-150 Path Parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Project ID. For details about how to obtain the project ID, see Project ID and Account ID .

Table 7-151 Query Parameters

Parameter	Mandatory	Type	Description
name	No	String	Fuzzy query by name or code.
create_by	No	String	Query by creator.
owner	No	String	Query by owner.
begin_time	No	String	Left boundary of time filtering. This parameter is used together with end_time. Only time range filtering is supported. Unilateral filtering is invalid. The format complies with RFC3339 and is accurate to seconds. The UTC time zone is yyyy-mm-ddTHH:MM:SSZ, for example, 1970-01-01T00:00:00Z.

Parameter	Mandatory	Type	Description
end_time	No	String	Right boundary for time filtering. This parameter is used together with begin_time to support only time range filtering. The format complies with RFC3339 and is accurate to seconds. The UTC time zone is yyyy-mm-ddTHH:MM:SSZ, for example, 1970-01-01T00:00:00Z.
limit	No	Integer	Number of records to be queried on each page, that is, Y records to be queried. The default value is 50, and the value range is [1,100].
offset	No	Integer	Start coordinate of the query, that is, the number of skipped data records. The value can only be 0 or an integer multiple of limit. If the value does not meet the requirement, the value is rounded down. The default value is 0.

Request Parameters

Table 7-152 Request header parameters

Parameter	Mandatory	Type	Description
X-Auth-Token	Yes	String	IAM token, which is obtained by calling the IAM API for obtaining a user token (value of X-Subject-Token in the response header). This field is mandatory for authentication using tokens.
workspace	Yes	String	Workspace ID. For details about how to obtain the workspace ID, see Instance ID and Workspace ID .

Parameter	Mandatory	Type	Description
X-Project-Id	No	String	Project ID. For details about how to obtain the project ID, see Project ID and Account ID . This parameter is mandatory for API requests that use AK/SK authentication in multi-project scenarios.
Content-Type	No	String	Default value: application/json;charset=UTF-8 This parameter is optional. If the body is available, this parameter is mandatory. If the body is unavailable, you do not need to set this parameter or verify it.

Response Parameters

Status code: 200

Table 7-153 Response body parameters

Parameter	Type	Description
data	data object	data: unified outermost data structure of the returned result.

Table 7-154 data

Parameter	Type	Description
value	value object	value: unified outer data structure of the returned result.

Table 7-155 value

Parameter	Type	Description
total	Integer	Total number.
records	Array of BizCatalogVO objects	BPA details.

Table 7-156 BizCatalogVO

Parameter	Type	Description
name	String	Workflow name
description	String	Description.
guid	String	ID in the corresponding asset.
owner	String	Owner of the instance.
parent_id	String	Parent directory ID. If no parent directory ID exists, the parent directory is the root directory. ID string
prev_id	String	ID of the previous node. If there is no previous node ID, the node is the first node. ID string
next_id	String	ID of the next node. If there is no next node ID, the node is the tail node. ID string
id	String	This parameter is left empty during creation and is mandatory during update. ID string
qualified_id	String	Authentication ID, which is automatically generated.
create_by	String	Creator.
update_by	String	Person who updates the information.
create_time	String	Creation time, which is read-only. The format complies with RFC3339 and is accurate to seconds. The UTC time zone is yyyy-mm-ddTHH:MM:SSZ, for example, 1970-01-01T00:00:00Z.
update_time	String	Update time, which is read-only. The format complies with RFC3339 and is accurate to seconds. The UTC time zone is yyyy-mm-ddTHH:MM:SSZ, for example, 1970-01-01T00:00:00Z.
bizmetric_num	Integer	Number of service indicators, which is not transferred by the frontend.
children_num	Integer	Number of sub-processes, excluding sub-processes.
children	Array of BizCatalogVO objects	Lower-level subdirectory, which is read-only.

Status code: 400**Table 7-157** Response body parameters

Parameter	Type	Description
error_code	String	Error code, for example, DS.6000, indicating that the request fails to be processed.
error_msg	String	Error message
data	Object	Returned data information.

Status code: 401**Table 7-158** Response body parameters

Parameter	Type	Description
error_code	String	Error code, for example, DS.6000, indicating that the request fails to be processed.
error_msg	String	Error message
data	Object	Returned data information.

Status code: 403**Table 7-159** Response body parameters

Parameter	Type	Description
error_code	String	Error code, for example, DS.6000, indicating that the request fails to be processed.
error_msg	String	Error message
data	Object	Returned data information.

Status code: 404

Table 7-160 Response body parameters

Parameter	Type	Description
error_code	String	Error code, for example, DS.6000, indicating that the request fails to be processed.
error_msg	String	Error message
data	Object	Returned data information.

Example Requests

This API is used to query the process list in the process design.

```
POST https://{endpoint}/v2/{project_id}/design/biz/catalogs
```

Example Responses

Status code: 200

This operation succeeds, and the returned data is a BizCatalogVO array and the total number of records.

```

401	Unauthorized
403	Forbidden
404	Not Found

7.5.3 Create BPA

Function

Create a process architecture.

Calling Method

For details, see [Calling APIs](#).

URI

POST /v2/{project_id}/design/biz/catalogs

Table 7-161 Path Parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Project ID. For details about how to obtain the project ID, see Project ID and Account ID .

Request Parameters

Table 7-162 Request header parameters

Parameter	Mandatory	Type	Description
X-Auth-Token	Yes	String	IAM token, which is obtained by calling the IAM API for obtaining a user token (value of X-Subject-Token in the response header). This field is mandatory for authentication using tokens.
workspace	Yes	String	Workspace ID. For details about how to obtain the workspace ID, see Instance ID and Workspace ID .
X-Project-Id	No	String	Project ID. For details about how to obtain the project ID, see Project ID and Account ID . This parameter is mandatory for API requests that use AK/SK authentication in multi-project scenarios.
Content-Type	No	String	Default value: application/json;charset=UTF-8 This parameter is optional. If the body is available, this parameter is mandatory. If the body is unavailable, you do not need to set this parameter or verify it.

Table 7-163 Request body parameters

Parameter	Mandatory	Type	Description
name	Yes	String	Workflow name
description	No	String	Description.
guid	No	String	ID in the corresponding asset.
owner	Yes	String	Owner of the instance.
parent_id	No	String	Parent directory ID. If no parent directory ID exists, the parent directory is the root directory. ID string
prev_id	No	String	ID of the previous node. If there is no previous node ID, the node is the first node. ID string
next_id	No	String	ID of the next node. If there is no next node ID, the node is the tail node. ID string
id	Yes	String	This parameter is left empty during creation and is mandatory during update. ID string
qualified_id	No	String	Authentication ID, which is automatically generated.
create_by	No	String	Creator.
update_by	No	String	Person who updates the information.
bizmetric_num	No	Integer	Number of service indicators, which is not transferred by the frontend.
children_num	No	Integer	Number of sub-processes, excluding sub-processes.

Response Parameters

Status code: 200

Table 7-164 Response body parameters

Parameter	Type	Description
data	data object	data: unified outermost data structure of the returned result.

Table 7-165 data

Parameter	Type	Description
value	BizCatalogVO object	BPA directory.

Table 7-166 BizCatalogVO

Parameter	Type	Description
name	String	Workflow name
description	String	Description.
guid	String	ID in the corresponding asset.
owner	String	Owner of the instance.
parent_id	String	Parent directory ID. If no parent directory ID exists, the parent directory is the root directory. ID string
prev_id	String	ID of the previous node. If there is no previous node ID, the node is the first node. ID string
next_id	String	ID of the next node. If there is no next node ID, the node is the tail node. ID string
id	String	This parameter is left empty during creation and is mandatory during update. ID string
qualified_id	String	Authentication ID, which is automatically generated.
create_by	String	Creator.
update_by	String	Person who updates the information.

Parameter	Type	Description
create_time	String	Creation time, which is read-only. The format complies with RFC3339 and is accurate to seconds. The UTC time zone is yyyy-mm-ddTHH:MM:SSZ, for example, 1970-01-01T00:00:00Z.
update_time	String	Update time, which is read-only. The format complies with RFC3339 and is accurate to seconds. The UTC time zone is yyyy-mm-ddTHH:MM:SSZ, for example, 1970-01-01T00:00:00Z.
bizmetric_num	Integer	Number of service indicators, which is not transferred by the frontend.
children_num	Integer	Number of sub-processes, excluding sub-processes.
children	Array of BizCatalogVO objects	Lower-level subdirectory, which is read-only.

Status code: 400**Table 7-167** Response body parameters

Parameter	Type	Description
error_code	String	Error code, for example, DS.6000, indicating that the request fails to be processed.
error_msg	String	Error message
data	Object	Returned data information.

Status code: 401**Table 7-168** Response body parameters

Parameter	Type	Description
error_code	String	Error code, for example, DS.6000, indicating that the request fails to be processed.
error_msg	String	Error message
data	Object	Returned data information.

Status code: 403

Table 7-169 Response body parameters

Parameter	Type	Description
error_code	String	Error code, for example, DS.6000, indicating that the request fails to be processed.
error_msg	String	Error message
data	Object	Returned data information.

Status code: 404

Table 7-170 Response body parameters

Parameter	Type	Description
error_code	String	Error code, for example, DS.6000, indicating that the request fails to be processed.
error_msg	String	Error message
data	Object	Returned data information.

Example Requests

Create a process architecture based on the input parameters.

```
POST https://{endpoint}/v2/{project_id}/design/biz/catalogs
{
  "id": "0",
  "name": "test_create_biz_catalog",
  "parent_id": null,
  "prev_id": "1200475693864079360",
  "owner": "{\"owners\": [\"test_uesr\"]}",
  "description": "this is a demo."
}
```

Example Responses

Status code: 200

Success. The returned data is BizCatalogVO.

```
{
  "data": {
    "value": {
      "name": "test_create_biz_catalog",
      "description": "this is a demo.",
      "guid": null,
      "owner": "{\"owners\": [\"test_uesr\"]}"
    }
  }
}
```

```
"parent_id" : null,
"prev_id" : "1200475693864079360",
"next_id" : null,
"id" : "1230473571248308224",
"qualified_id" : "1230473571248308224",
"create_by" : "test_uesr",
"update_by" : "test_uesr",
"create_time" : "2024-04-18T11:02:40.577+08:00",
"update_time" : "2024-04-18T11:02:40.577+08:00",
"bizmetric_num" : null,
"children_num" : null,
"children" : null
}
}
```

Status code: 400

BadRequest

```
{
  "error_code" : "DS.60xx",
  "error_msg" : "The user request is illegal."
}
```

Status code: 401

Unauthorized

```
{
  "error_code" : "DS.60xx",
  "error_msg" : "User authentication failed."
}
```

Status code: 403

Forbidden

```
{
  "error_code" : "DS.60xx",
  "error_msg" : "The user does not have permission to call this API."
}
```

Status code: 404

Not Found

```
{
  "error_code" : "DS.60xx",
  "error_msg" : "The User Request API does not exist."
}
```

data	Object	Returned data information.

Status code: 404

Table 7-180 Response body parameters

Parameter	Type	Description
error_code	String	Error code, for example, DS.6000, indicating that the request fails to be processed.
error_msg	String	Error message
data	Object	Returned data information.

Example Requests

Modify the process architecture based on the input parameters.

```
PUT https://{endpoint}/v2/{project_id}/design/biz/catalogs
{
  "name": "test_czh_l2_01",
  "parent_id": "1193123592125169667",
  "prev_id": null,
  "id": "1193132546607693824",
  "owner": "{\\"owners\\":[\\"test_uesr\\"]}",
  "description": "aaa"
}
```

Example Responses

Status code: 200

Success. The returned data is BizCatalogVO.

```
{
  "data": {
    "value": {
      "name": "test_czh_l2_01",
      "description": "aaa",
      "guid": null,
      "owner": "{\\"owners\\":[\\"test_uesr\\"]}"
    }
  }
}
```

```
"parent_id" : "1193123592125169667",
"prev_id" : null,
"next_id" : null,
"id" : "1193132546607693824",
"qualified_id" : null,
"create_by" : "test_uesr",
"update_by" : "test_uesr",
"create_time" : "2024-01-06T10:02:46+08:00",
"update_time" : "2024-04-18T11:47:07.035+08:00",
"bizmetric_num" : null,
"children_num" : null,
"children" : null
}
}
```

Status code: 400

BadRequest

```
{
  "error_code" : "DS.60xx",
  "error_msg" : "The user request is illegal."
}
```

Status code: 401

Unauthorized

```
{
  "error_code" : "DS.60xx",
  "error_msg" : "User authentication failed."
}
```

Status code: 403

Forbidden

```
{
  "error_code" : "DS.60xx",
  "error_msg" : "The user does not have permission to call this API."
}
```

Status code: 404

Not Found

```
{
  "error_code" : "DS.60xx",
  "error_msg" : "The User Request API does not exist."
}
```

Status Codes

Status Code	Description
200	Success. The returned data is BizCatalogVO.
400	BadRequest
401	Unauthorized
403	Forbidden
404	Not Found

7.5.5 Delete BPA

Function

Deleted the BPA.

Calling Method

For details, see [Calling APIs](#).

URI

DELETE /v2/{project_id}/design/biz/catalogs

Table 7-181 Path Parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Project ID. For details about how to obtain the project ID, see Project ID and Account ID .

Request Parameters

Table 7-182 Request header parameters

Parameter	Mandatory	Type	Description
X-Auth-Token	Yes	String	IAM token, which is obtained by calling the IAM API for obtaining a user token (value of X-Subject-Token in the response header). This field is mandatory for authentication using tokens.
workspace	Yes	String	Workspace ID. For details about how to obtain the workspace ID, see Instance ID and Workspace ID .
X-Project-Id	No	String	Project ID. For details about how to obtain the project ID, see Project ID and Account ID . This parameter is mandatory for API requests that use AK/SK authentication in multi-project scenarios.
Content-Type	No	String	Default value: application/json;charset=UTF-8 This parameter is optional. If the body is available, this parameter is mandatory. If the body is unavailable, you do not need to set this parameter or verify it.

Table 7-183 Request body parameters

Parameter	Mandatory	Type	Description
ids	Yes	Array of strings	ID list, which is a string
del_types	No	String	Deletion type. Enumerated values: <ul style="list-style-type: none"> • PHYSICAL_TABLE: whether to delete physical database tables. This parameter is valid only for tables that can be materialized. (If this parameter is set, physical database tables are deleted.)

Response Parameters

Status code: 200

Table 7-184 Response body parameters

Parameter	Type	Description
data	data object	Indicates the final deletion result, that is, the number of objects that are successfully deleted.

Table 7-185 data

Parameter	Type	Description
value	String	Number of successfully deleted objects

Status code: 400

Table 7-186 Response body parameters

Parameter	Type	Description
error_code	String	Error code, for example, DS.6000, indicating that the request fails to be processed.
error_msg	String	Error message

Parameter	Type	Description
data	Object	Returned data information.

Status code: 401**Table 7-187** Response body parameters

Parameter	Type	Description
error_code	String	Error code, for example, DS.6000, indicating that the request fails to be processed.
error_msg	String	Error message
data	Object	Returned data information.

Status code: 403**Table 7-188** Response body parameters

Parameter	Type	Description
error_code	String	Error code, for example, DS.6000, indicating that the request fails to be processed.
error_msg	String	Error message
data	Object	Returned data information.

Status code: 404**Table 7-189** Response body parameters

Parameter	Type	Description
error_code	String	Error code, for example, DS.6000, indicating that the request fails to be processed.
error_msg	String	Error message
data	Object	Returned data information.

Example Requests

This API deletes a process architecture based on the input parameters.

```
DELETE https://{endpoint}/v2/{project_id}/design/biz/catalogs
{
  "ids" : [ "1193132546607693824" ]
}
```

Example Responses

Status code: 200

This operation succeeds, and the returned data is the number of deleted data records.

```
{
  "data" : {
    "value" : 1
  }
}
```

Status code: 400

BadRequest

```
{
  "error_code" : "DS.60xx",
  "error_msg" : "The user request is illegal."
}
```

Status code: 401

Unauthorized

```
{
  "error_code" : "DS.60xx",
  "error_msg" : "User authentication failed."
}
```

Status code: 403

Forbidden

```
{
  "error_code" : "DS.60xx",
  "error_msg" : "The user does not have permission to call this API."
}
```

Status code: 404

Not Found

```
{
  "error_code" : "DS.60xx",
  "error_msg" : "The User Request API does not exist."
}
```

404	Not Found

7.5.6 Search for BPA Details

Function

Search for BPA details.

Calling Method

For details, see [Calling APIs](#).

URI

GET /v2/{project_id}/design/biz/catalogs/{id}

Table 7-190 Path Parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Project ID. For details about how to obtain the project ID, see Project ID and Account ID .
id	Yes	String	Entity ID, which is a string

Request Parameters

Table 7-191 Request header parameters

Parameter	Mandatory	Type	Description
X-Auth-Token	Yes	String	IAM token, which is obtained by calling the IAM API for obtaining a user token (value of X-Subject-Token in the response header). This field is mandatory for authentication using tokens.
workspace	Yes	String	Workspace ID. For details about how to obtain the workspace ID, see Instance ID and Workspace ID .
X-Project-Id	No	String	Project ID. For details about how to obtain the project ID, see Project ID and Account ID . This parameter is mandatory for API requests that use AK/SK authentication in multi-project scenarios.
Content-Type	No	String	Default value: application/json;charset=UTF-8 This parameter is optional. If the body is available, this parameter is mandatory. If the body is unavailable, you do not need to set this parameter or verify it.

Response Parameters

Status code: 200

Table 7-192 Response body parameters

Parameter	Type	Description
data	data object	data: unified outermost data structure of the returned result.

Table 7-193 data

Parameter	Type	Description
value	BizCatalogVO object	BPA directory.

Table 7-194 BizCatalogVO

Parameter	Type	Description
name	String	Workflow name
description	String	Description.
guid	String	ID in the corresponding asset.
owner	String	Owner of the instance.
parent_id	String	Parent directory ID. If no parent directory ID exists, the parent directory is the root directory. ID string
prev_id	String	ID of the previous node. If there is no previous node ID, the node is the first node. ID string
next_id	String	ID of the next node. If there is no next node ID, the node is the tail node. ID string
id	String	This parameter is left empty during creation and is mandatory during update. ID string
qualified_id	String	Authentication ID, which is automatically generated.
create_by	String	Creator.
update_by	String	Person who updates the information.

Parameter	Type	Description
create_time	String	Creation time, which is read-only. The format complies with RFC3339 and is accurate to seconds. The UTC time zone is yyyy-mm-ddTHH:MM:SSZ, for example, 1970-01-01T00:00:00Z.
update_time	String	Update time, which is read-only. The format complies with RFC3339 and is accurate to seconds. The UTC time zone is yyyy-mm-ddTHH:MM:SSZ, for example, 1970-01-01T00:00:00Z.
bizmetric_num	Integer	Number of service indicators, which is not transferred by the frontend.
children_num	Integer	Number of sub-processes, excluding sub-processes.
children	Array of BizCatalogVO objects	Lower-level subdirectory, which is read-only.

Status code: 400**Table 7-195** Response body parameters

Parameter	Type	Description
error_code	String	Error code, for example, DS.6000, indicating that the request fails to be processed.
error_msg	String	Error message
data	Object	Returned data information.

Status code: 401**Table 7-196** Response body parameters

Parameter	Type	Description
error_code	String	Error code, for example, DS.6000, indicating that the request fails to be processed.
error_msg	String	Error message
data	Object	Returned data information.

Status code: 403**Table 7-197** Response body parameters

Parameter	Type	Description
error_code	String	Error code, for example, DS.6000, indicating that the request fails to be processed.
error_msg	String	Error message
data	Object	Returned data information.

Status code: 404**Table 7-198** Response body parameters

Parameter	Type	Description
error_code	String	Error code, for example, DS.6000, indicating that the request fails to be processed.
error_msg	String	Error message
data	Object	Returned data information.

Example Requests

This API is used to query process details in process design based on the process ID.

```
GET https://{endpoint}/v2/{project_id}/design/biz/catalogs/904051952785162240
```

Example Responses

7.6 Data Standard Templates

7.6.1 Querying a Data Standard Template

Function

This API is used to query data standard templates in the current workspace.

Calling Method

For details, see [Calling APIs](#).

URI

GET /v2/{project_id}/design/standards/templates

Table 7-199 Path Parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Project ID. For details about how to obtain the project ID, see Project ID and Account ID .

Table 7-200 Query Parameters

Parameter	Mandatory	Type	Description
limit	No	Integer	Number of records to be queried on each page, that is, Y records to be queried. The default value is 50, and the value range is [1,100].

Parameter	Mandatory	Type	Description
offset	No	Integer	Start coordinate of the query, that is, the number of skipped data records. The value can only be 0 or an integer multiple of limit. If the value does not meet the requirement, the value is rounded down. The default value is 0.

Request Parameters

Table 7-201 Request header parameters

Parameter	Mandatory	Type	Description
X-Auth-Token	Yes	String	IAM token, which is obtained by calling the IAM API for obtaining a user token (value of X-Subject-Token in the response header). This field is mandatory for authentication using tokens.
workspace	Yes	String	Workspace ID. For details about how to obtain the workspace ID, see Instance ID and Workspace ID .
X-Project-Id	No	String	Project ID. For details about how to obtain the project ID, see Project ID and Account ID . This parameter is mandatory for API requests that use AK/SK authentication in multi-project scenarios.
Content-Type	No	String	Default value: application/json;charset=UTF-8 This parameter is optional. If the body is available, this parameter is mandatory. If the body is unavailable, you do not need to set this parameter or verify it.

Response Parameters

Status code: 200

Table 7-202 Response body parameters

Parameter	Type	Description
data	data object	Data returned by the API

Table 7-203 data

Parameter	Type	Description
value	value object	Result of querying the data standard template

Table 7-204 value

Parameter	Type	Description
allFields	Array of StandElementFieldVO objects	All attributes of the data standard. The set contains a single StandElementFieldVO object.
optional	Array of StandElementFieldVO objects	This parameter is optional. The set contains a single StandElementFieldVO object.
system_default	Array of StandElementFieldVO objects	System default item. The collection contains a single StandElementFieldVO object.
custom	Array of StandElementFieldVO objects	User-defined item. The collection contains a single StandElementFieldVO object.
hasTemplate	Boolean	Whether to use the template

Table 7-205 StandElementFieldVO

Parameter	Type	Description
fd_name	String	Attribute name.
fd_name_en	String	English name of an attribute.
description	String	Attribute description.
descriptionEn	String	Attribute description in English.

Parameter	Type	Description
label	String	Attribute tag.
disabled	Boolean	Disable or not.
id	String	Data standard ID, which is a string
actived	Boolean	Indicates whether to display the default item. The default item is displayed and cannot be modified. The value true indicates that the attribute is displayed when the data standard is used (the attribute can be operated during adding, modification, and query). The value false indicates that the attribute is not displayed when the data standard is used.
required	Boolean	Whether the header input parameter is mandatory. true: mandatory; false: optional.
searchable	Boolean	Indicates whether the content can be searched. The value true indicates that the data can be searched on the data standard list page, and the value false indicates that the data cannot be searched on the data standard list page.
optional_values	String	Allowed value.
field_type	Integer	Field type. The value 0 indicates a system field, and the value 1 indicates a customized field.
displayed_name	String	Frontend display name.
displayed_name_en	String	Frontend display name in English.
create_time	String	Creation time, which is read-only. The format complies with RFC3339 and is accurate to seconds. The UTC time zone is yyyy-mm-ddTHH:MM:SSZ, for example, 1970-01-01T00:00:00Z.
update_time	String	Update time, which is read-only. The format complies with RFC3339 and is accurate to seconds. The UTC time zone is yyyy-mm-ddTHH:MM:SSZ, for example, 1970-01-01T00:00:00Z.
create_by	String	Creator.

Parameter	Type	Description
update_by	String	Person who updates the information.

Status code: 400**Table 7-206** Response body parameters

Parameter	Type	Description
error_code	String	Error code, for example, DS.6000, indicating that the request fails to be processed.
error_msg	String	Error message
data	Object	Returned data information.

Status code: 401**Table 7-207** Response body parameters

Parameter	Type	Description
error_code	String	Error code, for example, DS.6000, indicating that the request fails to be processed.
error_msg	String	Error message
data	Object	Returned data information.

Status code: 403**Table 7-208** Response body parameters

Parameter	Type	Description
error_code	String	Error code, for example, DS.6000, indicating that the request fails to be processed.
error_msg	String	Error message
data	Object	Returned data information.

Status code: 404

Table 7-209 Response body parameters

Parameter	Type	Description
error_code	String	Error code, for example, DS.6000, indicating that the request fails to be processed.
error_msg	String	Error message
data	Object	Returned data information.

Example Requests

This API is used to query data standard templates in the current workspace.

```
GET https://{endpoint}/v2/{project_id}/design/standards/templates
```

Example Responses

Status code: 200

This operation succeeds, and the returned data is a StandElementFieldVO list.

        fmt.Println(err)
    }
}
```

More

For SDK sample code of more programming languages, see the Sample Code tab in [API Explorer](#). SDK sample code can be automatically generated.

Status Codes

Status Code	Description
200	This operation succeeds, and the returned data is a StandElementFieldVO list.
400	BadRequest
401	Unauthorized
403	Forbidden
404	Not Found

7.6.2 Creating a Data Standard Template

Function

Creates a customized item of the data standard template in the current workspace.

Calling Method

For details, see [Calling APIs](#).

URI

POST /v2/{project_id}/design/standards/templates

Table 7-210 Path Parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Project ID. For details about how to obtain the project ID, see Project ID and Account ID .

Request Parameters

Table 7-211 Request header parameters

Parameter	Mandatory	Type	Description
X-Auth-Token	Yes	String	IAM token, which is obtained by calling the IAM API for obtaining a user token (value of X-Subject-Token in the response header). This field is mandatory for authentication using tokens.
workspace	Yes	String	Workspace ID. For details about how to obtain the workspace ID, see Instance ID and Workspace ID .

Parameter	Mandatory	Type	Description
X-Project-Id	No	String	Project ID. For details about how to obtain the project ID, see Project ID and Account ID . This parameter is mandatory for API requests that use AK/SK authentication in multi-project scenarios.
Content-Type	No	String	Default value: application/json;charset=UTF-8 This parameter is optional. If the body is available, this parameter is mandatory. If the body is unavailable, you do not need to set this parameter or verify it.

Table 7-212 Request body parameters

Parameter	Mandatory	Type	Description
fd_name	Yes	String	Attribute name.
fd_name_en	No	String	English name of an attribute.
description	No	String	Attribute description.
descriptionEn	No	String	Attribute description in English.
label	No	String	Attribute tag.
disabled	No	Boolean	Disable or not.
id	No	String	Data standard ID, which is a string
actived	Yes	Boolean	Indicates whether to display the default item. The default item is displayed and cannot be modified. The value true indicates that the attribute is displayed when the data standard is used (the attribute can be operated during adding, modification, and query). The value false indicates that the attribute is not displayed when the data standard is used.

Parameter	Mandatory	Type	Description
required	No	Boolean	Whether the header input parameter is mandatory. true: mandatory; false: optional.
searchable	No	Boolean	Indicates whether the content can be searched. The value true indicates that the data can be searched on the data standard list page, and the value false indicates that the data cannot be searched on the data standard list page.
optional_values	No	String	Allowed value.
field_type	No	Integer	Field type. The value 0 indicates a system field, and the value 1 indicates a customized field.
displayed_name	No	String	Frontend display name.
displayed_name_en	No	String	Frontend display name in English.
create_by	No	String	Creator.
update_by	No	String	Person who updates the information.

Response Parameters

Status code: 200

Table 7-213 Response body parameters

Parameter	Type	Description
data	data object	data: unified outermost data structure of the returned result.

Table 7-214 data

Parameter	Type	Description
value	StandElementFieldVO object	value: unified outer data structure of the returned result.

Table 7-215 StandElementFieldVO

Parameter	Type	Description
fd_name	String	Attribute name.
fd_name_en	String	English name of an attribute.
description	String	Attribute description.
descriptionEn	String	Attribute description in English.
label	String	Attribute tag.
disabled	Boolean	Disable or not.
id	String	Data standard ID, which is a string
activated	Boolean	Indicates whether to display the default item. The default item is displayed and cannot be modified. The value true indicates that the attribute is displayed when the data standard is used (the attribute can be operated during adding, modification, and query). The value false indicates that the attribute is not displayed when the data standard is used.
required	Boolean	Whether the header input parameter is mandatory. true: mandatory; false: optional.
searchable	Boolean	Indicates whether the content can be searched. The value true indicates that the data can be searched on the data standard list page, and the value false indicates that the data cannot be searched on the data standard list page.
optional_values	String	Allowed value.
field_type	Integer	Field type. The value 0 indicates a system field, and the value 1 indicates a customized field.
displayed_name	String	Frontend display name.
displayed_name_en	String	Frontend display name in English.
create_time	String	Creation time, which is read-only. The format complies with RFC3339 and is accurate to seconds. The UTC time zone is yyyy-mm-ddTHH:MM:SSZ, for example, 1970-01-01T00:00:00Z.

Parameter	Type	Description
update_time	String	Update time, which is read-only. The format complies with RFC3339 and is accurate to seconds. The UTC time zone is yyyy-mm-ddTHH:MM:SSZ, for example, 1970-01-01T00:00:00Z.
create_by	String	Creator.
update_by	String	Person who updates the information.

Status code: 400**Table 7-216** Response body parameters

Parameter	Type	Description
error_code	String	Error code, for example, DS.6000, indicating that the request fails to be processed.
error_msg	String	Error message
data	Object	Returned data information.

Status code: 401**Table 7-217** Response body parameters

Parameter	Type	Description
error_code	String	Error code, for example, DS.6000, indicating that the request fails to be processed.
error_msg	String	Error message
data	Object	Returned data information.

Status code: 403**Table 7-218** Response body parameters

Parameter	Type	Description
error_code	String	Error code, for example, DS.6000, indicating that the request fails to be processed.

Parameter	Type	Description
error_msg	String	Error message
data	Object	Returned data information.

Status code: 404

Table 7-219 Response body parameters

Parameter	Type	Description
error_code	String	Error code, for example, DS.6000, indicating that the request fails to be processed.
error_msg	String	Error message
data	Object	Returned data information.

Example Requests

Creates a customized item of the data standard template in the current workspace.

POST https://{endpoint}/v2/{project_id}/design/standards/templates

```

Status Codes

Status Code	Description
200	Success
400	BadRequest
401	Unauthorized
403	Forbidden
404	Not Found

7.6.3 Modifying a Data Standard Template

Function

Modify the data standard template.

Calling Method

For details, see [Calling APIs](#).

URI

PUT /v2/{project_id}/design/standards/templates

Table 7-220 Path Parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Project ID. For details about how to obtain the project ID, see Project ID and Account ID .

Request Parameters

Table 7-221 Request header parameters

Parameter	Mandatory	Type	Description
X-Auth-Token	Yes	String	IAM token, which is obtained by calling the IAM API for obtaining a user token (value of X-Subject-Token in the response header). This field is mandatory for authentication using tokens.
workspace	Yes	String	Workspace ID. For details about how to obtain the workspace ID, see Instance ID and Workspace ID .
X-Project-Id	No	String	Project ID. For details about how to obtain the project ID, see Project ID and Account ID . This parameter is mandatory for API requests that use AK/SK authentication in multi-project scenarios.
Content-Type	No	String	Default value: application/json;charset=UTF-8 This parameter is optional. If the body is available, this parameter is mandatory. If the body is unavailable, you do not need to set this parameter or verify it.

Table 7-222 Request body parameters

Parameter	Mandatory	Type	Description
fd_name	Yes	String	Attribute name.
fd_name_en	No	String	English name of an attribute.
description	No	String	Attribute description.
descriptionEn	No	String	Attribute description in English.
label	No	String	Attribute tag.

Parameter	Mandatory	Type	Description
disabled	No	Boolean	Disable or not.
id	No	String	Data standard ID, which is a string
activated	Yes	Boolean	Indicates whether to display the default item. The default item is displayed and cannot be modified. The value true indicates that the attribute is displayed when the data standard is used (the attribute can be operated during adding, modification, and query). The value false indicates that the attribute is not displayed when the data standard is used.
required	No	Boolean	Whether the header input parameter is mandatory. true: mandatory; false: optional.
searchable	No	Boolean	Indicates whether the content can be searched. The value true indicates that the data can be searched on the data standard list page, and the value false indicates that the data cannot be searched on the data standard list page.
optional_values	No	String	Allowed value.
field_type	No	Integer	Field type. The value 0 indicates a system field, and the value 1 indicates a customized field.
displayed_name	No	String	Frontend display name.
displayed_name_en	No	String	Frontend display name in English.
create_by	No	String	Creator.
update_by	No	String	Person who updates the information.

Response Parameters

Status code: 200

Table 7-223 Response body parameters

Parameter	Type	Description
data	data object	data: unified outermost data structure of the returned result.

Table 7-224 data

Parameter	Type	Description
value	StandElementFieldVO object	value: unified outer data structure of the returned result.

Table 7-225 StandElementFieldVO

Parameter	Type	Description
fd_name	String	Attribute name.
fd_name_en	String	English name of an attribute.
description	String	Attribute description.
descriptionEn	String	Attribute description in English.
label	String	Attribute tag.
disabled	Boolean	Disable or not.
id	String	Data standard ID, which is a string
actived	Boolean	Indicates whether to display the default item. The default item is displayed and cannot be modified. The value true indicates that the attribute is displayed when the data standard is used (the attribute can be operated during adding, modification, and query). The value false indicates that the attribute is not displayed when the data standard is used.
required	Boolean	Whether the header input parameter is mandatory. true: mandatory; false: optional.

Parameter	Type	Description
searchable	Boolean	Indicates whether the content can be searched. The value true indicates that the data can be searched on the data standard list page, and the value false indicates that the data cannot be searched on the data standard list page.
optional_values	String	Allowed value.
field_type	Integer	Field type. The value 0 indicates a system field, and the value 1 indicates a customized field.
displayed_name	String	Frontend display name.
displayed_name_en	String	Frontend display name in English.
create_time	String	Creation time, which is read-only. The format complies with RFC3339 and is accurate to seconds. The UTC time zone is yyyy-mm-ddTHH:MM:SSZ, for example, 1970-01-01T00:00:00Z.
update_time	String	Update time, which is read-only. The format complies with RFC3339 and is accurate to seconds. The UTC time zone is yyyy-mm-ddTHH:MM:SSZ, for example, 1970-01-01T00:00:00Z.
create_by	String	Creator.
update_by	String	Person who updates the information.

Status code: 400**Table 7-226** Response body parameters

Parameter	Type	Description
error_code	String	Error code, for example, DS.6000, indicating that the request fails to be processed.
error_msg	String	Error message
data	Object	Returned data information.

Status code: 401

Table 7-227 Response body parameters

Parameter	Type	Description
error_code	String	Error code, for example, DS.6000, indicating that the request fails to be processed.
error_msg	String	Error message
data	Object	Returned data information.

Status code: 403

Table 7-228 Response body parameters

Parameter	Type	Description
error_code	String	Error code, for example, DS.6000, indicating that the request fails to be processed.
error_msg	String	Error message
data	Object	Returned data information.

Status code: 404

Table 7-229 Response body parameters

Parameter	Type	Description
error_code	String	Error code, for example, DS.6000, indicating that the request fails to be processed.
error_msg	String	Error message
data	Object	Returned data information.

Example Requests

Modify the data standard template in the current workspace.

```
PUT https://{endpoint}/v2/{project_id}/design/standards/templates
```

```
{
  "fd_name": "User-defined item 3",
  "fd_name_en": "CustomField33",
  "description": "User-defined item 3",
  "id": "1233446517415743488",
  "actived": true,
  "required": false,
```

```
"searchable" : false,  
"optional_values" : "",  
"field_type" : null,  
"displayed_name" : null,  
"displayed_name_en" : null,  
"create_time" : "2024-04-26T15:56:06.08+08:00",  
"update_time" : "2024-04-26T15:56:06.08+08:00",  
"create_by" : "test_uesr",  
"update_by" : "test_uesr"  
}
```

Example Responses

Status code: 200

Success

```
{  
  "data" : {  
    "value" : {  
      "fd_name" : "User-defined item 3",  
      "fd_name_en" : "CustomField33",  
      "description" : "User-defined item 3",  
      "id" : "1233446517415743488",  
      "activated" : true,  
      "required" : false,

Status Codes

Status Code	Description
200	Success
400	BadRequest
401	Unauthorized
403	Forbidden
404	Not Found

7.6.4 Deleting a Data Standard Template

Function

Delete a data standard template.

Calling Method

For details, see [Calling APIs](#).

URI

DELETE /v2/{project_id}/design/standards/templates

Table 7-230 Path Parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Project ID. For details about how to obtain the project ID, see Project ID and Account ID .

Table 7-231 Query Parameters

Parameter	Mandatory	Type	Description
ids	Yes	String	ID set of data standards to be deleted.

Request Parameters

Table 7-232 Request header parameters

Parameter	Mandatory	Type	Description
X-Auth-Token	Yes	String	IAM token, which is obtained by calling the IAM API for obtaining a user token (value of X-Subject-Token in the response header). This field is mandatory for authentication using tokens.
workspace	Yes	String	Workspace ID. For details about how to obtain the workspace ID, see Instance ID and Workspace ID .
X-Project-Id	No	String	Project ID. For details about how to obtain the project ID, see Project ID and Account ID . This parameter is mandatory for API requests that use AK/SK authentication in multi-project scenarios.
Content-Type	No	String	Default value: application/json;charset=UTF-8 This parameter is optional. If the body is available, this parameter is mandatory. If the body is unavailable, you do not need to set this parameter or verify it.

Response Parameters

Status code: 200

Table 7-233 Response body parameters

Parameter	Type	Description
data	data object	Indicates the final deletion result, that is, the number of objects that are successfully deleted.

Table 7-234 data

Parameter	Type	Description
value	String	Number of successfully deleted objects

Status code: 400**Table 7-235** Response body parameters

Parameter	Type	Description
error_code	String	Error code, for example, DS.6000, indicating that the request fails to be processed.
error_msg	String	Error message
data	Object	Returned data information.

Status code: 401**Table 7-236** Response body parameters

Parameter	Type	Description
error_code	String	Error code, for example, DS.6000, indicating that the request fails to be processed.
error_msg	String	Error message
data	Object	Returned data information.

Status code: 403

Table 7-237 Response body parameters

Parameter	Type	Description
error_code	String	Error code, for example, DS.6000, indicating that the request fails to be processed.
error_msg	String	Error message
data	Object	Returned data information.

Status code: 404

Table 7-238 Response body parameters

Parameter	Type	Description
error_code	String	Error code, for example, DS.6000, indicating that the request fails to be processed.
error_msg	String	Error message
data	Object	Returned data information.

Example Requests

Deletes a data standard template from the current workspace.

```
DELETE https://{endpoint}/v2/{project_id}/design/standards/templates
{
  "ids" : [ "1193132546607693824" ]
}
```

Example Responses

Status code: 200

This operation succeeds, and the returned data is the number of deleted data records.

```
{
  "data" : {
    "value" : "1"
  }
}
```

Status code: 400

BadRequest

```
{
  "error_code" : "DS.60xx",
  "error_msg" : "The user request is illegal."
}
```

Status code: 401

Unauthorized

```
{
  "error_code" : "DS.60xx",
  "error_msg" : "User authentication failed."
}
```

Status code: 403

Forbidden

```
{
  "error_code" : "DS.60xx",
  "error_msg" : "The user does not have permission to call this API."
}
```

Status code: 404

Not Found

```
{
  "error_code" : "DS.60xx",
  "error_msg" : "The User Request API does not exist."
}
```

SDK Sample Code

The SDK sample code is as follows.

7.6.5 Standard Template for Initializing Data

Function

Initialize the data standard template.

Calling Method

For details, see [Calling APIs](#).

URI

POST /v2/{project_id}/design/standards/templates/action

Table 7-239 Path Parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Project ID. For details about how to obtain the project ID, see Project ID and Account ID .

Table 7-240 Query Parameters

Parameter	Mandatory	Type	Description
action-id	Yes	String	If action-id is set to init, this parameter is a fixed parameter for initializing the data standard template.

Request Parameters

Table 7-241 Request header parameters

Parameter	Mandatory	Type	Description
X-Auth-Token	Yes	String	IAM token, which is obtained by calling the IAM API for obtaining a user token (value of X-Subject-Token in the response header). This field is mandatory for authentication using tokens.

Parameter	Mandatory	Type	Description
workspace	Yes	String	Workspace ID. For details about how to obtain the workspace ID, see Instance ID and Workspace ID .
X-Project-Id	No	String	Project ID. For details about how to obtain the project ID, see Project ID and Account ID . This parameter is mandatory for API requests that use AK/SK authentication in multi-project scenarios.
Content-Type	No	String	Default value: application/json;charset=UTF-8 This parameter is optional. If the body is available, this parameter is mandatory. If the body is unavailable, you do not need to set this parameter or verify it.

Response Parameters

Status code: 200

Table 7-242 Response body parameters

Parameter	Type	Description
data	data object	data: unified outermost data structure of the returned result.

Table 7-243 data

Parameter	Type	Description
value	Array of StandElementFieIdVO objects	Array of field details in the data standard template.

Table 7-244 StandElementFieldVO

Parameter	Type	Description
fd_name	String	Attribute name.
fd_name_en	String	English name of an attribute.
description	String	Attribute description.
descriptionEn	String	Attribute description in English.
label	String	Attribute tag.
disabled	Boolean	Disable or not.
id	String	Data standard ID, which is a string
activated	Boolean	Indicates whether to display the default item. The default item is displayed and cannot be modified. The value true indicates that the attribute is displayed when the data standard is used (the attribute can be operated during adding, modification, and query). The value false indicates that the attribute is not displayed when the data standard is used.
required	Boolean	Whether the header input parameter is mandatory. true: mandatory; false: optional.
searchable	Boolean	Indicates whether the content can be searched. The value true indicates that the data can be searched on the data standard list page, and the value false indicates that the data cannot be searched on the data standard list page.
optional_values	String	Allowed value.
field_type	Integer	Field type. The value 0 indicates a system field, and the value 1 indicates a customized field.
displayed_name	String	Frontend display name.
displayed_name_en	String	Frontend display name in English.
create_time	String	Creation time, which is read-only. The format complies with RFC3339 and is accurate to seconds. The UTC time zone is yyyy-mm-ddTHH:MM:SSZ, for example, 1970-01-01T00:00:00Z.

Parameter	Type	Description
update_time	String	Update time, which is read-only. The format complies with RFC3339 and is accurate to seconds. The UTC time zone is yyyy-mm-ddTHH:MM:SSZ, for example, 1970-01-01T00:00:00Z.
create_by	String	Creator.
update_by	String	Person who updates the information.

Status code: 400

Table 7-245 Response body parameters

Parameter	Type	Description
error_code	String	Error code, for example, DS.6000, indicating that the request fails to be processed.
error_msg	String	Error message
data	Object	Returned data information.

Status code: 401

Table 7-246 Response body parameters

Parameter	Type	Description
error_code	String	Error code, for example, DS.6000, indicating that the request fails to be processed.
error_msg	String	Error message
data	Object	Returned data information.

Status code: 403

Table 7-247 Response body parameters

Parameter	Type	Description
error_code	String	Error code, for example, DS.6000, indicating that the request fails to be processed.

Parameter	Type	Description
error_msg	String	Error message
data	Object	Returned data information.

Status code: 404

Table 7-248 Response body parameters

Parameter	Type	Description
error_code	String	Error code, for example, DS.6000, indicating that the request fails to be processed.
error_msg	String	Error message
data	Object	Returned data information.

Example Requests

Initialize the data standard template.

POST https://{endpoint}/v2/{project_id}/design/standards/templates/action?action-id=init

More

For SDK sample code of more programming languages, see the Sample Code tab in [API Explorer](#). SDK sample code can be automatically generated.

Status Codes

Status Code	Description
200	Success
400	BadRequest
401	Unauthorized
403	Forbidden
404	Not Found

7.7 Approval Management

7.7.1 Obtaining an Application

Function

Obtain the application.

Calling Method

For details, see [Calling APIs](#).

URI

GET /v2/{project_id}/design/approvals

Table 7-249 Path Parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Project ID. For details about how to obtain the project ID, see Project ID and Account ID .

Table 7-250 Query Parameters

Parameter	Mandatory	Type	Description
biz_id	No	String	Business definition ID, which is a string
name	No	String	Fuzzy query by name or code.
create_by	No	String	Query by creator.
approver	No	String	Query by reviewer.
approval_status	No	String	Application status. Options: <ul style="list-style-type: none"> • DEVELOPING: to be approved • FINISHED: approved
approval_status_detail	No	String	Application status. Options: <ul style="list-style-type: none"> • DEVELOPING: to be approved • APPROVED: approved • REJECT: rejected
approval_type	No	String	Service review type. Options: <ul style="list-style-type: none"> • PUBLISH: released • OFFLINE: offline

Parameter	Mandatory	Type	Description
biz_type	No	String	Query by service type. The options are ATOMIC_INDEX (atomic indicator), DERIVATIVE_INDEX (derivative indicator), DIMENSION (dimension), and TIME_CONDITION (time filter). DIMENSION_LOGIC_TABLE (dimension table), FACT_LOGIC_TABLE (fact table), AGGREGATION_LOGIC_TABLE (summary table), TABLE_MODEL (relational modeling table), CODE_TABLE (code table), STANDARD_ELEMENT (data standard), BIZ_METRIC (business metric), COMPOUND_METRIC (compound metric), SUBJECT (subject), ATOMIC_METRIC (atomic metric (new)), DERIVED_METRIC (Derivative (new)), COMPOSITE_METRIC (Compound (new))).
begin_time	No	String	Left boundary of time filtering. This parameter is used together with end_time. Only time range filtering is supported. Unilateral filtering is invalid. The format complies with RFC3339 and is accurate to seconds. The UTC time zone is yyyy-mm-ddTHH:MM:SSZ, for example, 1970-01-01T00:00:00Z.
end_time	No	String	Right boundary for time filtering. This parameter is used together with begin_time to support only time range filtering. The format complies with RFC3339 and is accurate to seconds. The UTC time zone is yyyy-mm-ddTHH:MM:SSZ, for example, 1970-01-01T00:00:00Z.

Parameter	Mandatory	Type	Description
limit	No	Integer	Number of records to be queried on each page, that is, Y records to be queried. The default value is 50, and the value range is [1,100].
offset	No	Integer	Start coordinate of the query, that is, the number of skipped data records. The value can only be 0 or an integer multiple of limit. If the value does not meet the requirement, the value is rounded down. The default value is 0.

Request Parameters

Table 7-251 Request header parameters

Parameter	Mandatory	Type	Description
X-Auth-Token	Yes	String	IAM token, which is obtained by calling the IAM API for obtaining a user token (value of X-Subject-Token in the response header). This field is mandatory for authentication using tokens.
workspace	Yes	String	Workspace ID. For details about how to obtain the workspace ID, see Instance ID and Workspace ID .
X-Project-Id	No	String	Project ID. For details about how to obtain the project ID, see Project ID and Account ID . This parameter is mandatory for API requests that use AK/SK authentication in multi-project scenarios.

Parameter	Mandatory	Type	Description
Content-Type	No	String	Default value: application/json;charset=UTF-8 This parameter is optional. If the body is available, this parameter is mandatory. If the body is unavailable, you do not need to set this parameter or verify it.

Response Parameters

Status code: 200

Table 7-252 Response body parameters

Parameter	Type	Description
data	data object	data: unified outermost data structure of the returned result.

Table 7-253 data

Parameter	Type	Description
value	value object	value: unified outer data structure of the returned result.

Table 7-254 value

Parameter	Type	Description
total	Integer	Total number.
records	Array of ApprovalVO objects	Number of queried application object (ApprovalVO) groups.

Table 7-255 ApprovalVO

Parameter	Type	Description
id	String	Application ID, which is a string

Parameter	Type	Description
tenant_id	String	Project ID. For details about how to obtain the project ID, see the API path parameter project_id.
name_ch	String	Chinese name of a service.
name_en	String	English name of a service.
biz_id	String	Business ID, which is a string

Parameter	Type	Description
biz_type	String	<p>Business entity type.</p> <p>Options:</p> <ul style="list-style-type: none"> • AGGREGATION_LOGIC_TABLE: summary table • ATOMIC_INDEX: atomic metric • ATOMIC_METRIC: atomic metric (new) • BIZ_CATALOG: process architecture directory • BIZ_METRIC: service indicator • CODE_TABLE: code table • COMMON_CONDITION: general filter • COMPOSITE_METRIC: Compound Metric (new) • COMPOUND_METRIC: compound metric • CONDITION_GROUP: restriction group • DEGENERATE_DIMENSION: degenerate dimension • DERIVATIVE_INDEX: derivative indicator • DERIVED_METRIC: derivative indicator (new) • DIMENSION: dimension • DIMENSION_ATTRIBUTE: dimension attribute • DIMENSION_HIERARCHIES: dimension level • DIMENSION_LOGIC_TABLE: dimension table • DIMENSION_TABLE_ATTRIBUTE: dimension attribute • DIRECTORY: directory • FACT_ATTRIBUTE: fact table attribute • FACT_DIMENSION: fact table dimension • FACT_LOGIC_TABLE: fact table • FACT_MEASURE: fact table measurement • FUNCTION: function

Parameter	Type	Description
		<ul style="list-style-type: none"> • INFO_ARCH: information architecture (used for modifying themes in batches) • MODEL: model • QUALITY_RULE: quality rule • SECRECY_LEVEL: security level • STANDARD_ELEMENT: data standard • STANDARD_ELEMENT_TEMPLATE: data standard template • SUBJECT: theme • Dimension attributes of SUMMARY_DIMENSION_ATTRIBUTE: summary tables • SUMMARY_INDEX: summary table indicator attribute • SUMMARY_TIME: time period attribute of the SDR table • TABLE_MODEL: relationship model (logical model/physical model) • TABLE_MODEL_ATTRIBUTE: relationship model attribute (logical model/physical model) • TABLE_MODEL_LOGIC: logical entity • TABLE_TYPE: table type • TAG: tag • TIME_CONDITION: time restriction
biz_info	String	Serialized service details. The type is string.
biz_info_obj	Object	Service details. The type is object.
biz_version	Integer	Service version.

Parameter	Type	Description
biz_status	String	Release status of an entity. This parameter is read-only and does not need to be set during creation and update. Options: <ul style="list-style-type: none"> • DRAFT: draft • PUBLISH_DEVELOPING: to be reviewed • PUBLISHED: released • OFFLINE_DEVELOPING: to be reviewed • OFFLINE: offline • REJECT: rejected
approval_status	String	Service approval status. This parameter is read-only. Options: <ul style="list-style-type: none"> • DEVELOPING: being reviewed • APPROVED: approved • REJECT: rejected • WITHDREW: approval cancellation
approval_type	String	Service review type. Options: <ul style="list-style-type: none"> • PUBLISH: released • OFFLINE: offline
submit_time	String	Submitted At
create_by	String	Creator.
l1	String	Chinese name of the subject area group. This parameter is read-only and does not need to be set when you create or update a subject area group.
l2	String	Chinese name of the subject area. This parameter is read-only and does not need to be set during creation and update.
l3	String	Chinese name of the business object. This parameter is read-only and does not need to be set during creation and update.
approval_time	String	Review time.

Parameter	Type	Description
approver	String	Reviewer.
email	String	Email address of the reviewer.
msg	String	Review information.
directory_path	String	Directory tree.

Status code: 400

Table 7-256 Response body parameters

Parameter	Type	Description
error_code	String	Error code, for example, DS.6000, indicating that the request fails to be processed.
error_msg	String	Error message
data	Object	Returned data information.

Status code: 401

Table 7-257 Response body parameters

Parameter	Type	Description
error_code	String	Error code, for example, DS.6000, indicating that the request fails to be processed.
error_msg	String	Error message
data	Object	Returned data information.

Status code: 403

Table 7-258 Response body parameters

Parameter	Type	Description
error_code	String	Error code, for example, DS.6000, indicating that the request fails to be processed.
error_msg	String	Error message

Parameter	Type	Description
data	Object	Returned data information.

Status code: 404

Table 7-259 Response body parameters

Parameter	Type	Description
error_code	String	Error code, for example, DS.6000, indicating that the request fails to be processed.
error_msg	String	Error message
data	Object	Returned data information.

Example Requests

Query information about applications in the Approving state by page.

```
GET https://{endpoint}/v2/{project_id}/design/approvals?
offset=1&limit=10&approval_status=DEVELOPING&is_approval_time=false
```

Example Responses

Status code: 200

This operation is successful. The returned data is the ApprovalVO array and the total number of records.

```

More

For SDK sample code of more programming languages, see the Sample Code tab in [API Explorer](#). SDK sample code can be automatically generated.

Status Codes

Status Code	Description
200	This operation is successful. The returned data is the ApprovalVO array and the total number of records.
400	BadRequest
401	Unauthorized
403	Forbidden
404	Not Found

7.7.2 Withdrawing an Application

Function

Withdraw the application.

Calling Method

For details, see [Calling APIs](#).

URI

PUT /v2/{project_id}/design/approvals

Table 7-260 Path Parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Project ID. For details about how to obtain the project ID, see Project ID and Account ID .

Table 7-261 Query Parameters

Parameter	Mandatory	Type	Description
ids	Yes	String	Application ID array.

Request Parameters

Table 7-262 Request header parameters

Parameter	Mandatory	Type	Description
X-Auth-Token	Yes	String	IAM token, which is obtained by calling the IAM API for obtaining a user token (value of X-Subject-Token in the response header). This field is mandatory for authentication using tokens.
workspace	Yes	String	Workspace ID. For details about how to obtain the workspace ID, see Instance ID and Workspace ID .
X-Project-Id	No	String	Project ID. For details about how to obtain the project ID, see Project ID and Account ID . This parameter is mandatory for API requests that use AK/SK authentication in multi-project scenarios.
Content-Type	No	String	Default value: application/json;charset=UTF-8 This parameter is optional. If the body is available, this parameter is mandatory. If the body is unavailable, you do not need to set this parameter or verify it.

Response Parameters

Status code: 200

Table 7-263 Response body parameters

Parameter	Type	Description
data	data object	Number of applications that are successfully withdrawn.

Table 7-264 data

Parameter	Type	Description
value	String	Number of objects whose applications are withdrawn.

Status code: 400**Table 7-265** Response body parameters

Parameter	Type	Description
error_code	String	Error code, for example, DS.6000, indicating that the request fails to be processed.
error_msg	String	Error message
data	Object	Returned data information.

Status code: 401**Table 7-266** Response body parameters

Parameter	Type	Description
error_code	String	Error code, for example, DS.6000, indicating that the request fails to be processed.
error_msg	String	Error message
data	Object	Returned data information.

Status code: 403

Table 7-267 Response body parameters

Parameter	Type	Description
error_code	String	Error code, for example, DS.6000, indicating that the request fails to be processed.
error_msg	String	Error message
data	Object	Returned data information.

Status code: 404**Table 7-268** Response body parameters

Parameter	Type	Description
error_code	String	Error code, for example, DS.6000, indicating that the request fails to be processed.
error_msg	String	Error message
data	Object	Returned data information.

Example Requests

This API is used to withdraw an application based on the application ID.

```
PUT https://{endpoint}/v2/{project_id}/design/approvals?ids=1230929439261609984
```

Example Responses

Status code: 200

This operation succeeds, and the returned data is the number of withdrawn approval records.

```
{  
  "data" : {  
    "value" : 1  
  }  
}
```

Status code: 400

BadRequest

```
{  
  "error_code" : "DS.60xx",  
  "error_msg" : "The user request is illegal."  
}
```

Status code: 401

Unauthorized

```
{
  "error_code": "DS.60xx",
  "error_msg": "User authentication failed."
}
```

Status code: 403

Forbidden

```
{
  "error_code": "DS.60xx",
  "error_msg": "The user does not have permission to call this API."
}
```

Status code: 404

Not Found

```
{
  "error_code": "DS.60xx",
  "error_msg": "The User Request API does not exist."
}
```

7.7.3 Application Processing

Function

Reject/Approve one or more action-id=reject/resolve.

Calling Method

For details, see [Calling APIs](#).

URI

PUT /v2/{project_id}/design/approvals/action

Table 7-269 Path Parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Project ID. For details about how to obtain the project ID, see Project ID and Account ID .

Table 7-270 Query Parameters

Parameter	Mandatory	Type	Description
action-id	Yes	String	Application processing result type. Options: <ul style="list-style-type: none">• reject: rejected• resolve: approved

Request Parameters

Table 7-271 Request header parameters

Parameter	Mandatory	Type	Description
X-Auth-Token	Yes	String	IAM token, which is obtained by calling the IAM API for obtaining a user token (value of X-Subject-Token in the response header). This field is mandatory for authentication using tokens.
workspace	Yes	String	Workspace ID. For details about how to obtain the workspace ID, see Instance ID and Workspace ID .
X-Project-Id	No	String	Project ID. For details about how to obtain the project ID, see Project ID and Account ID . This parameter is mandatory for API requests that use AK/SK authentication in multi-project scenarios.

Parameter	Mandatory	Type	Description
Content-Type	No	String	Default value: application/json;charset=UTF-8 This parameter is optional. If the body is available, this parameter is mandatory. If the body is unavailable, you do not need to set this parameter or verify it.

Table 7-272 Request body parameters

Parameter	Mandatory	Type	Description
ids	Yes	Array of strings	Application ID list, which is a string
msg	Yes	String	Approval order information, which is the approval opinion entered by the approver.

Response Parameters

Status code: 200

Table 7-273 Response body parameters

Parameter	Type	Description
data	data object	Number of applications that are successfully withdrawn.

Table 7-274 data

Parameter	Type	Description
value	BatchOperationVO object	Result of the approval operation.

Table 7-275 BatchOperationVO

Parameter	Type	Description
id	String	Batch approval ID, which is a string

Parameter	Type	Description
tenant_id	String	Project ID.
group_id	String	Group ID, which is a string
biz_name	String	Service name.
biz_id	String	Business ID, which is a string
operation_status	String	Operation result type enumeration. RUNNING(Running), SUCCESS(Operation succeeded), and FAILED(Operation failed). Options: <ul style="list-style-type: none">• RUNNING: The task is running.• SUCCESS: The operation is successful.• FAILED: The operation fails.
operation_type	String	Indicates the type.
biz_info	String	Service details.
create_by	String	Creator.
remark	String	Indicates the remark information.
total	Integer	Total number.
success	Integer	Number of successful operations.
failed	Integer	Indicates the number of failed operations.
rate	String	Indicates the current progress.
logs	String	Logs.
groups	Array of BatchOperationVO objects	Group information.

Status code: 400

Table 7-276 Response body parameters

Parameter	Type	Description
error_code	String	Error code, for example, DS.6000, indicating that the request fails to be processed.
error_msg	String	Error message

Parameter	Type	Description
data	Object	Returned data information.

Status code: 401**Table 7-277** Response body parameters

Parameter	Type	Description
error_code	String	Error code, for example, DS.6000, indicating that the request fails to be processed.
error_msg	String	Error message
data	Object	Returned data information.

Status code: 403**Table 7-278** Response body parameters

Parameter	Type	Description
error_code	String	Error code, for example, DS.6000, indicating that the request fails to be processed.
error_msg	String	Error message
data	Object	Returned data information.

Status code: 404**Table 7-279** Response body parameters

Parameter	Type	Description
error_code	String	Error code, for example, DS.6000, indicating that the request fails to be processed.
error_msg	String	Error message
data	Object	Returned data information.

Example Requests

Approve the physical table release.

```
PUT https://{endpoint}/v2/{project_id}/design/approvals/action?action-id=resolve&from=standard
{
  "ids" : [ "1214980984198561792" ],
  "msg" : "Agree!"
}
```

Example Responses

Status code: 200

Success: The returned data is the execution result.

```

7.7.4 Batch Publish

Function

Batch Release

Calling Method

For details, see [Calling APIs](#).

URI

POST /v2/{project_id}/design/approvals/batch-publish

Table 7-280 Path Parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Project ID. For details about how to obtain the project ID, see Project ID and Account ID .

Request Parameters

Table 7-281 Request header parameters

Parameter	Mandatory	Type	Description
X-Auth-Token	Yes	String	IAM token, which is obtained by calling the IAM API for obtaining a user token (value of X-Subject-Token in the response header). This field is mandatory for authentication using tokens.
workspace	Yes	String	Workspace ID. For details about how to obtain the workspace ID, see Instance ID and Workspace ID .
X-Project-Id	No	String	Project ID. For details about how to obtain the project ID, see Project ID and Account ID . This parameter is mandatory for API requests that use AK/SK authentication in multi-project scenarios.
Content-Type	No	String	Default value: application/json;charset=UTF-8 This parameter is optional. If the body is available, this parameter is mandatory. If the body is unavailable, you do not need to set this parameter or verify it.

Table 7-282 Request body parameters

Parameter	Mandatory	Type	Description
biz_infos	Yes	Array of BizInfoVO objects	Service information list.
approver_user_id	Yes	String	Approver ID.
approver_user_name	Yes	String	Approver name.

Parameter	Mandatory	Type	Description
email	No	String	Email address of the approver. This parameter is set only when the approver is created.
fast_approval	No	Boolean	Quick approval, which is an informal scenario and is used for quick experience. This function is provided only when the current user has the approval permission.
schedule_time	No	String	Job scheduling time. For example, 30_18, indicating 18:30.
env_type	No	String	Type of the development and production environment. Options: <ul style="list-style-type: none"> • INVALID_TYPE: invalid environment • DEV_TYPE: development environment • PROD_TYPE: production environment • DEV_PROD_TYPE: development and production environment

Table 7-283 BizInfoVO

Parameter	Mandatory	Type	Description
biz_id	Yes	String	Business ID, which is a string

Parameter	Mandatory	Type	Description
biz_type	Yes	String	<p>Business entity type.</p> <p>Options:</p> <ul style="list-style-type: none"> ● AGGREGATION_LOGIC_TABLE: summary table ● ATOMIC_INDEX: atomic metric ● ATOMIC_METRIC: atomic metric (new) ● BIZ_CATALOG: process architecture directory ● BIZ_METRIC: service indicator ● CODE_TABLE: code table ● COMMON_CONDITION: general filter ● COMPOSITE_METRIC: Compound Metric (new) ● COMPOUND_METRIC: compound metric ● CONDITION_GROUP: restriction group ● DEGENERATE_DIMENSION: degenerate dimension ● DERIVATIVE_INDEX: derivative indicator ● DERIVED_METRIC: derivative indicator (new) ● DIMENSION: dimension ● DIMENSION_ATTRIBUTE: dimension attribute ● DIMENSION_HIERARCHIES: dimension level ● DIMENSION_LOGIC_TABLE: dimension table ● DIMENSION_TABLE_ATTRIBUTE: dimension attribute ● DIRECTORY: directory ● FACT_ATTRIBUTE: fact table attribute ● FACT_DIMENSION: fact table dimension ● FACT_LOGIC_TABLE: fact table

Parameter	Mandatory	Type	Description
			<ul style="list-style-type: none"> ● FACT_MEASURE: fact table measurement ● FUNCTION: function ● INFO_ARCH: information architecture (used for modifying themes in batches) ● MODEL: model ● QUALITY_RULE: quality rule ● SECRECY_LEVEL: security level ● STANDARD_ELEMENT: data standard ● STANDARD_ELEMENT_TEMPLATE: data standard template ● SUBJECT: theme ● Dimension attributes of SUMMARY_DIMENSION_ATTRIBUTE: summary tables ● SUMMARY_INDEX: summary table indicator attribute ● SUMMARY_TIME: time period attribute of the SDR table ● TABLE_MODEL: relationship model (logical model/physical model) ● TABLE_MODEL_ATTRIBUTE: relationship model attribute (logical model/physical model) ● TABLE_MODEL_LOGIC: logical entity ● TABLE_TYPE: table type ● TAG: tag ● TIME_CONDITION: time restriction

Parameter	Mandatory	Type	Description
env_type	No	String	Type of the development and production environment. Options: <ul style="list-style-type: none"> INVALID_TYPE: invalid environment DEV_TYPE: development environment PROD_TYPE: production environment DEV_PROD_TYPE: development and production environment

Response Parameters

Status code: 200

Table 7-284 Response body parameters

Parameter	Type	Description
data	data object	Number of successful batch release results.

Table 7-285 data

Parameter	Type	Description
value	BatchOperationVO object	Batch release result.

Table 7-286 BatchOperationVO

Parameter	Type	Description
id	String	Batch approval ID, which is a string
tenant_id	String	Project ID.
group_id	String	Group ID, which is a string
biz_name	String	Service name.
biz_id	String	Business ID, which is a string

Parameter	Type	Description
operation_status	String	Operation result type enumeration. RUNNING(Running), SUCCESS(Operation succeeded), and FAILED(Operation failed). Options: <ul style="list-style-type: none"> • RUNNING: The task is running. • SUCCESS: The operation is successful. • FAILED: The operation fails.
operation_type	String	Indicates the type.
biz_info	String	Service details.
create_by	String	Creator.
remark	String	Indicates the remark information.
total	Integer	Total number.
success	Integer	Number of successful operations.
failed	Integer	Indicates the number of failed operations.
rate	String	Indicates the current progress.
logs	String	Logs.
groups	Array of BatchOperationVO objects	Group information.

Status code: 400

Table 7-287 Response body parameters

Parameter	Type	Description
error_code	String	Error code, for example, DS.6000, indicating that the request fails to be processed.
error_msg	String	Error message
data	Object	Returned data information.

Status code: 401

Table 7-288 Response body parameters

Parameter	Type	Description
error_code	String	Error code, for example, DS.6000, indicating that the request fails to be processed.
error_msg	String	Error message
data	Object	Returned data information.

Status code: 403

Table 7-289 Response body parameters

Parameter	Type	Description
error_code	String	Error code, for example, DS.6000, indicating that the request fails to be processed.
error_msg	String	Error message
data	Object	Returned data information.

Status code: 404

More

For SDK sample code of more programming languages, see the Sample Code tab in [API Explorer](#). SDK sample code can be automatically generated.

Status Codes

Status Code	Description
200	This operation succeeds, and the returned data is the BatchOperationVO object. The batch object is in the BatchOperationVO.group attribute.
400	BadRequest
401	Unauthorized
403	Forbidden
404	Not Found

7.7.5 Taking Services Offline in Batches

Function

Bring offline in batches.

Calling Method

For details, see [Calling APIs](#).

URI

POST /v2/{project_id}/design/approvals/batch-offline

Table 7-291 Path Parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Project ID. For details about how to obtain the project ID, see Project ID and Account ID .

Request Parameters

Table 7-292 Request header parameters

Parameter	Mandatory	Type	Description
X-Auth-Token	Yes	String	IAM token, which is obtained by calling the IAM API for obtaining a user token (value of X-Subject-Token in the response header). This field is mandatory for authentication using tokens.
workspace	Yes	String	Workspace ID. For details about how to obtain the workspace ID, see Instance ID and Workspace ID .
X-Project-Id	No	String	Project ID. For details about how to obtain the project ID, see Project ID and Account ID . This parameter is mandatory for API requests that use AK/SK authentication in multi-project scenarios.

Parameter	Mandatory	Type	Description
Content-Type	No	String	Default value: application/json;charset=UTF-8 This parameter is optional. If the body is available, this parameter is mandatory. If the body is unavailable, you do not need to set this parameter or verify it.

Table 7-293 Request body parameters

Parameter	Mandatory	Type	Description
biz_infos	Yes	Array of BizInfoVO objects	Service information list.
approver_user_id	Yes	String	Approver ID.
approver_user_name	Yes	String	Approver name.
email	No	String	Email address of the approver. This parameter is set only when the approver is created.
fast_approval	No	Boolean	Quick approval, which is an informal scenario and is used for quick experience. This function is provided only when the current user has the approval permission.
schedule_time	No	String	Job scheduling time. For example, 30_18, indicating 18:30.

Parameter	Mandatory	Type	Description
env_type	No	String	Type of the development and production environment. Options: <ul style="list-style-type: none">• INVALID_TYPE: invalid environment• DEV_TYPE: development environment• PROD_TYPE: production environment• DEV_PROD_TYPE: development and production environment

Table 7-294 BizInfoVO

Parameter	Mandatory	Type	Description
biz_id	Yes	String	Business ID, which is a string

Parameter	Mandatory	Type	Description
biz_type	Yes	String	<p>Business entity type.</p> <p>Options:</p> <ul style="list-style-type: none"> • AGGREGATION_LOGIC_TABLE: summary table • ATOMIC_INDEX: atomic metric • ATOMIC_METRIC: atomic metric (new) • BIZ_CATALOG: process architecture directory • BIZ_METRIC: service indicator • CODE_TABLE: code table • COMMON_CONDITION: general filter • COMPOSITE_METRIC: Compound Metric (new) • COMPOUND_METRIC: compound metric • CONDITION_GROUP: restriction group • DEGENERATE_DIMENSION: degenerate dimension • DERIVATIVE_INDEX: derivative indicator • DERIVED_METRIC: derivative indicator (new) • DIMENSION: dimension • DIMENSION_ATTRIBUTE: dimension attribute • DIMENSION_HIERARCHIES: dimension level • DIMENSION_LOGIC_TABLE: dimension table • DIMENSION_TABLE_ATTRIBUTE: dimension attribute • DIRECTORY: directory • FACT_ATTRIBUTE: fact table attribute • FACT_DIMENSION: fact table dimension • FACT_LOGIC_TABLE: fact table

Parameter	Mandatory	Type	Description
			<ul style="list-style-type: none"> ● FACT_MEASURE: fact table measurement ● FUNCTION: function ● INFO_ARCH: information architecture (used for modifying themes in batches) ● MODEL: model ● QUALITY_RULE: quality rule ● SECRECY_LEVEL: security level ● STANDARD_ELEMENT: data standard ● STANDARD_ELEMENT_TEMPLATE: data standard template ● SUBJECT: theme ● Dimension attributes of SUMMARY_DIMENSION_ATTRIBUTE: summary tables ● SUMMARY_INDEX: summary table indicator attribute ● SUMMARY_TIME: time period attribute of the SDR table ● TABLE_MODEL: relationship model (logical model/physical model) ● TABLE_MODEL_ATTRIBUTE: relationship model attribute (logical model/physical model) ● TABLE_MODEL_LOGIC: logical entity ● TABLE_TYPE: table type ● TAG: tag ● TIME_CONDITION: time restriction

Parameter	Mandatory	Type	Description
env_type	No	String	Type of the development and production environment. Options: <ul style="list-style-type: none"> INVALID_TYPE: invalid environment DEV_TYPE: development environment PROD_TYPE: production environment DEV_PROD_TYPE: development and production environment

Response Parameters

Status code: 200

Table 7-295 Response body parameters

Parameter	Type	Description
data	data object	Number of successful batch offline results.

Table 7-296 data

Parameter	Type	Description
value	BatchOperationVO object	Returned result of the batch offline operation.

Table 7-297 BatchOperationVO

Parameter	Type	Description
id	String	Batch approval ID, which is a string
tenant_id	String	Project ID.
group_id	String	Group ID, which is a string
biz_name	String	Service name.
biz_id	String	Business ID, which is a string

Parameter	Type	Description
operation_status	String	Operation result type enumeration. RUNNING(Running), SUCCESS(Operation succeeded), and FAILED(Operation failed). Options: <ul style="list-style-type: none"> • RUNNING: The task is running. • SUCCESS: The operation is successful. • FAILED: The operation fails.
operation_type	String	Indicates the type.
biz_info	String	Service details.
create_by	String	Creator.
remark	String	Indicates the remark information.
total	Integer	Total number.
success	Integer	Number of successful operations.
failed	Integer	Indicates the number of failed operations.
rate	String	Indicates the current progress.
logs	String	Logs.
groups	Array of BatchOperationVO objects	Group information.

Status code: 400

Table 7-298 Response body parameters

Parameter	Type	Description
error_code	String	Error code, for example, DS.6000, indicating that the request fails to be processed.
error_msg	String	Error message
data	Object	Returned data information.

Status code: 401

Table 7-299 Response body parameters

Parameter	Type	Description
error_code	String	Error code, for example, DS.6000, indicating that the request fails to be processed.
error_msg	String	Error message
data	Object	Returned data information.

Status code: 403

Table 7-300 Response body parameters

Parameter	Type	Description
error_code	String	Error code, for example, DS.6000, indicating that the request fails to be processed.
error_msg	String	Error message
data	Object	Returned data information.

Status code: 404

Table 7-301 Response body parameters

Parameter	Type	Description
error_code	String	Error code, for example, DS.6000, indicating that the request fails to be processed.
error_msg	String	Error message
data	Object	Returned data information.

Example Requests

Bring physical tables offline in batches based on parameters such as physical table IDs.

```
POST https://{endpoint}/v2/{project_id}/design/approvals/batch-offline?from=standard
{
  "biz_infos" : [ {
    "biz_id" : "1229920251379118081",
    "biz_type" : "TABLE_MODEL"
  }, {

```

```
"biz_id" : "1222853173564289024",
"biz_type" : "TABLE_MODEL"
}],
"approver_user_id" : "0833a573fe80d5401f6dc010a775569a",
"approver_user_name" : "test_uesr",
"email" : null,
"fast_approval" : true
}
```

Example Responses

Status code: 200

This operation succeeds, and the returned data is the BatchOperationVO object. The batch object is in the BatchOperationVO.group attribute.

Status Codes

Status Code	Description
200	This operation succeeds, and the returned data is the BatchOperationVO object. The batch object is in the BatchOperationVO.group attribute.
400	BadRequest
401	Unauthorized
403	Forbidden
404	Not Found

7.7.6 Create Approver

Function

Create an approver.

Calling Method

For details, see [Calling APIs](#).

URI

POST /v2/{project_id}/design/approvals/users

Table 7-302 Path Parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Project ID. For details about how to obtain the project ID, see Project ID and Account ID .

Request Parameters

Table 7-303 Request header parameters

Parameter	Mandatory	Type	Description
X-Auth-Token	Yes	String	IAM token, which is obtained by calling the IAM API for obtaining a user token (value of X-Subject-Token in the response header). This field is mandatory for authentication using tokens.
workspace	Yes	String	Workspace ID. For details about how to obtain the workspace ID, see Instance ID and Workspace ID .
X-Project-Id	No	String	Project ID. For details about how to obtain the project ID, see Project ID and Account ID . This parameter is mandatory for API requests that use AK/SK authentication in multi-project scenarios.

Parameter	Mandatory	Type	Description
Content-Type	No	String	Default value: application/json;charset=UTF-8 This parameter is optional. If the body is available, this parameter is mandatory. If the body is unavailable, you do not need to set this parameter or verify it.

Table 7-304 Request body parameters

Parameter	Mandatory	Type	Description
app_name	No	String	Name of the application that invokes the review system, which is customized by R&D engineers.
approver_name	Yes	String	Approver name.
user_id	Yes	String	Approver ID.
email	No	String	Indicates the email address.
phone_number	No	String	Phone number.
email_notify	No	Boolean	Email Notification.
sms_notify	No	Boolean	SMS notification.

Response Parameters

Status code: 200

Table 7-305 Response body parameters

Parameter	Type	Description
data	data object	data: unified outermost data structure of the returned result.

Table 7-306 data

Parameter	Type	Description
value	ApproverVO object	value: unified outer data structure of the returned result.

Table 7-307 ApproverVO

Parameter	Type	Description
id	String	Application ID, which is a string
approver_name	String	Approver name.
user_id	String	Approver ID.
user_name	String	Approver name.
email	String	Email information.
user_type	String	User type. Options: <ul style="list-style-type: none">• BIZ_METRIC_OWNER: business metric owner• APPROVER: approver• The owner of BIZ_METRIC_OWNER_AND_APPROVER: business metrics is the reviewer.
phone_number	String	Phone number.
create_by	String	Creator.
create_time	String	Creation time. The format complies with RFC3339 and is accurate to seconds. The UTC time zone is yyyy-mm-ddTHH:MM:SSZ, for example, 1970-01-01T00:00:00Z.
app_name	String	Name of the service system
topic_urn	String	SMN topic URN.
project_id	String	Project ID.

Status code: 400

Table 7-308 Response body parameters

Parameter	Type	Description
error_code	String	Error code, for example, DS.6000, indicating that the request fails to be processed.
error_msg	String	Error message
data	Object	Returned data information.

Status code: 401**Table 7-309** Response body parameters

Parameter	Type	Description
error_code	String	Error code, for example, DS.6000, indicating that the request fails to be processed.
error_msg	String	Error message
data	Object	Returned data information.

Status code: 403**Table 7-310** Response body parameters

Parameter	Type	Description
error_code	String	Error code, for example, DS.6000, indicating that the request fails to be processed.
error_msg	String	Error message
data	Object	Returned data information.

Status code: 404**Table 7-311** Response body parameters

Parameter	Type	Description
error_code	String	Error code, for example, DS.6000, indicating that the request fails to be processed.

Parameter	Type	Description
error_msg	String	Error message
data	Object	Returned data information.

Example Requests

Create an approver based on the request parameters.

POST https://{endpoint}/v2/{project_id}/design/approvals/users?from=standard

```
{
  "app_name": "dlg-ds",
  "approver_name": "test_uesr",
  "user_id": "0833a573fe80d5401f6dc010a775569a",
  "email": "88664488@hw.com",
  "phone_number": "17775558866",
  "email_notify": true,
  "sms_notify": true
}
```

Example Responses

Status code: 200

This operation is successful, and the returned data is ApproverVO.

```
{
  "data": {
    "value": {
      "id": "42821",
      "approver_name": "test_uesr",

7.7.7 Querying the Approver List

Function

This API queries the approver list.

Calling Method

For details, see [Calling APIs](#).

URI

GET /v2/{project_id}/design/approvals/users

Table 7-312 Path Parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Project ID. For details about how to obtain the project ID, see Project ID and Account ID .

Table 7-313 Query Parameters

Parameter	Mandatory	Type	Description
approver_name	No	String	Name of the reviewer.
limit	No	Integer	Number of records to be queried on each page, that is, Y records to be queried. The default value is 50, and the value range is [1,100].

Parameter	Mandatory	Type	Description
offset	No	Integer	Start coordinate of the query, that is, the number of skipped data records. The value can only be 0 or an integer multiple of limit. If the value does not meet the requirement, the value is rounded down. The default value is 0.

Request Parameters

Table 7-314 Request header parameters

Parameter	Mandatory	Type	Description
X-Auth-Token	Yes	String	IAM token, which is obtained by calling the IAM API for obtaining a user token (value of X-Subject-Token in the response header). This field is mandatory for authentication using tokens.
workspace	Yes	String	Workspace ID. For details about how to obtain the workspace ID, see Instance ID and Workspace ID .
X-Project-Id	No	String	Project ID. For details about how to obtain the project ID, see Project ID and Account ID . This parameter is mandatory for API requests that use AK/SK authentication in multi-project scenarios.
Content-Type	No	String	Default value: application/json;charset=UTF-8 This parameter is optional. If the body is available, this parameter is mandatory. If the body is unavailable, you do not need to set this parameter or verify it.

Response Parameters

Status code: 200

Table 7-315 Response body parameters

Parameter	Type	Description
data	data object	data: unified outermost data structure of the returned result.

Table 7-316 data

Parameter	Type	Description
value	value object	value: unified outer data structure of the returned result.

Table 7-317 value

Parameter	Type	Description
total	Integer	Total number.
records	Array of ApproverVO objects	Number of approver objects (ApproverVO) that are found.

Table 7-318 ApproverVO

Parameter	Type	Description
id	String	Application ID, which is a string
approver_name	String	Approver name.
user_id	String	Approver ID.
user_name	String	Approver name.
email	String	Email information.

Parameter	Type	Description
user_type	String	User type. Options: <ul style="list-style-type: none">• BIZ_METRIC_OWNER: business metric owner• APPROVER: approver• The owner of BIZ_METRIC_OWNER_AND_APPROVER: business metrics is the reviewer.
phone_number	String	Phone number.
create_by	String	Creator.
create_time	String	Creation time. The format complies with RFC3339 and is accurate to seconds. The UTC time zone is yyyy-mm-ddTHH:MM:SSZ, for example, 1970-01-01T00:00:00Z.
app_name	String	Name of the service system
topic_urn	String	SMN topic URN.
project_id	String	Project ID.

Status code: 400**Table 7-319** Response body parameters

Parameter	Type	Description
error_code	String	Error code, for example, DS.6000, indicating that the request fails to be processed.
error_msg	String	Error message
data	Object	Returned data information.

Status code: 401**Table 7-320** Response body parameters

Parameter	Type	Description
error_code	String	Error code, for example, DS.6000, indicating that the request fails to be processed.

Parameter	Type	Description
error_msg	String	Error message
data	Object	Returned data information.

Status code: 403

Table 7-321 Response body parameters

Parameter	Type	Description
error_code	String	Error code, for example, DS.6000, indicating that the request fails to be processed.
error_msg	String	Error message
data	Object	Returned data information.

Status code: 404

Table 7-322 Response body parameters

Parameter	Type	Description
error_code	String	Error code, for example, DS.6000, indicating that the request fails to be processed.
error_msg	String	Error message
data	Object	Returned data information.

More

For SDK sample code of more programming languages, see the Sample Code tab in [API Explorer](#). SDK sample code can be automatically generated.

Status Codes

Status Code	Description
200	This operation is successful, and the returned data is the ApproverVO list and number of ApproverVOs.
400	BadRequest
401	Unauthorized
403	Forbidden
404	Not Found

7.7.8 Delete Approver

Function

Delete an approver.

Calling Method

For details, see [Calling APIs](#).

URI

DELETE /v2/{project_id}/design/approvals/users

Table 7-323 Path Parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Project ID. For details about how to obtain the project ID, see Project ID and Account ID .

Table 7-324 Query Parameters

Parameter	Mandatory	Type	Description
approver_ids	Yes	String	Approver ID.

Request Parameters

Table 7-325 Request header parameters

Parameter	Mandatory	Type	Description
X-Auth-Token	Yes	String	IAM token, which is obtained by calling the IAM API for obtaining a user token (value of X-Subject-Token in the response header). This field is mandatory for authentication using tokens.
workspace	Yes	String	Workspace ID. For details about how to obtain the workspace ID, see Instance ID and Workspace ID .
X-Project-Id	No	String	Project ID. For details about how to obtain the project ID, see Project ID and Account ID . This parameter is mandatory for API requests that use AK/SK authentication in multi-project scenarios.
Content-Type	No	String	Default value: application/json;charset=UTF-8 This parameter is optional. If the body is available, this parameter is mandatory. If the body is unavailable, you do not need to set this parameter or verify it.

Response Parameters

Status code: 200**Table 7-326** Response body parameters

Parameter	Type	Description
data	data object	Indicates the final deletion result, that is, the number of objects that are successfully deleted.

Table 7-327 data

Parameter	Type	Description
value	String	Number of successfully deleted objects

Status code: 400**Table 7-328** Response body parameters

Parameter	Type	Description
error_code	String	Error code, for example, DS.6000, indicating that the request fails to be processed.
error_msg	String	Error message
data	Object	Returned data information.

Status code: 401**Table 7-329** Response body parameters

Parameter	Type	Description
error_code	String	Error code, for example, DS.6000, indicating that the request fails to be processed.
error_msg	String	Error message
data	Object	Returned data information.

Status code: 403**Table 7-330** Response body parameters

Parameter	Type	Description
error_code	String	Error code, for example, DS.6000, indicating that the request fails to be processed.
error_msg	String	Error message
data	Object	Returned data information.

Status code: 404**Table 7-331** Response body parameters

Parameter	Type	Description
error_code	String	Error code, for example, DS.6000, indicating that the request fails to be processed.
error_msg	String	Error message
data	Object	Returned data information.

Example Requests

This API deletes an approver based on the approver ID.

```
DELETE https://{endpoint}/v2/{project_id}/design/approvals/users?approver_ids=38762
```

Example Responses

Status code: 400

BadRequest

```
{
  "error_code" : "DS.60xx",
  "error_msg" : "The user request is illegal."
}
```

Status code: 401

Unauthorized

```
{
  "error_code" : "DS.60xx",
  "error_msg" : "User authentication failed."
}
```

Status code: 403

Forbidden

```
{
  "error_code" : "DS.60xx",
  "error_msg" : "The user does not have permission to call this API."
}
```

Status code: 404

Not Found

```
{
  "error_code" : "DS.60xx",
  "error_msg" : "The User Request API does not exist."
}
```

404	Not Found

7.7.9 Deleting an Entity

Function

When a released entity is edited, an extension is generated. This API is used to delete the extension information of the entity.

Calling Method

For details, see [Calling APIs](#).

URI

DELETE /v2/{project_id}/design/approvals/business/{biz_id}

Table 7-332 Path Parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Project ID. For details about how to obtain the project ID, see Project ID and Account ID .
biz_id	Yes	String	ID of the entity to be deleted, which is a string

Table 7-333 Query Parameters

Parameter	Mandatory	Type	Description
biz_type	Yes	String	Entity type to be deleted. Options: <ul style="list-style-type: none">• ATOMIC_INDEX: atomic metric• DERIVATIVE_INDEX: derivative indicator• DIMENSION: dimension• FACT_LOGIC_TABLE: fact table• TABLE_MODEL: relationship modeling (logical entity/physical table)• STANDARD_ELEMENT: data standard• AGGREGATION_LOGIC_TABLE: summary table• CODE_TABLE: code table• BIZ_METRIC: service indicator• COMPOUND_METRIC: compound metric

Request Parameters

Table 7-334 Request header parameters

Parameter	Mandatory	Type	Description
X-Auth-Token	Yes	String	IAM token, which is obtained by calling the IAM API for obtaining a user token (value of X-Subject-Token in the response header). This field is mandatory for authentication using tokens.
workspace	Yes	String	Workspace ID. For details about how to obtain the workspace ID, see Instance ID and Workspace ID .

Parameter	Mandatory	Type	Description
X-Project-Id	No	String	Project ID. For details about how to obtain the project ID, see Project ID and Account ID . This parameter is mandatory for API requests that use AK/SK authentication in multi-project scenarios.
Content-Type	No	String	Default value: application/json;charset=UTF-8 This parameter is optional. If the body is available, this parameter is mandatory. If the body is unavailable, you do not need to set this parameter or verify it.

Response Parameters

Status code: 200

Table 7-335 Response body parameters

Parameter	Type	Description
data	data object	Indicates the final deletion result, that is, the number of objects that are successfully deleted.

Table 7-336 data

Parameter	Type	Description
value	String	Number of successfully deleted objects

Status code: 400

Table 7-337 Response body parameters

Parameter	Type	Description
error_code	String	Error code, for example, DS.6000, indicating that the request fails to be processed.

Parameter	Type	Description
error_msg	String	Error message
data	Object	Returned data information.

Status code: 401

Table 7-338 Response body parameters

Parameter	Type	Description
error_code	String	Error code, for example, DS.6000, indicating that the request fails to be processed.
error_msg	String	Error message
data	Object	Returned data information.

Status code: 403

Table 7-339 Response body parameters

Parameter	Type	Description
error_code	String	Error code, for example, DS.6000, indicating that the request fails to be processed.
error_msg	String	Error message
data	Object	Returned data information.

Example Requests

Delete the extended information about the table whose ID is 1217123755210469376 in ER modeling.

```
DELETE https://{endpoint}/v2/{project_id}/design/approvals/business/1217123755210469376?
biz_type=TABLE_MODEL
```

Example Responses

Status code: 200

Success. The returned data indicates the number of deleted data records. If the value is 1, the deletion is successful.

```
{
  "data" : {
```

```
"value" : 1
}
```

Status code: 400

BadRequest

```
{
  "error_code" : "DS.60xx",
  "error_msg" : "The user request is illegal."
}
```

Status code: 401

Unauthorized

```
{
  "error_code" : "DS.60xx",
  "error_msg" : "User authentication failed."
}
```

Status code: 403

Forbidden

```
{
  "error_code" : "DS.60xx",
  "error_msg" : "The user does not have permission to call this API."
}
```

Parameter	Type	Description
data	data object	Data returned by the API

Table 7-344 data

Parameter	Type	Description
value	PublishVersionVO object	Version information.

Table 7-345 PublishVersionVO

Parameter	Type	Description
id	String	Version ID, which is a string
version_name	String	Version name.
version_tag	String	Version flag, which is read-only.
description	String	Version description.

Parameter	Type	Description
biz_id	String	Business object ID, which is a string

Parameter	Type	Description
biz_type	String	<p>Business entity type.</p> <p>Options:</p> <ul style="list-style-type: none"> • AGGREGATION_LOGIC_TABLE: summary table • ATOMIC_INDEX: atomic metric • ATOMIC_METRIC: atomic metric (new) • BIZ_CATALOG: process architecture directory • BIZ_METRIC: service indicator • CODE_TABLE: code table • COMMON_CONDITION: general filter • COMPOSITE_METRIC: Compound Metric (new) • COMPOUND_METRIC: compound metric • CONDITION_GROUP: restriction group • DEGENERATE_DIMENSION: degenerate dimension • DERIVATIVE_INDEX: derivative indicator • DERIVED_METRIC: derivative indicator (new) • DIMENSION: dimension • DIMENSION_ATTRIBUTE: dimension attribute • DIMENSION_HIERARCHIES: dimension level • DIMENSION_LOGIC_TABLE: dimension table • DIMENSION_TABLE_ATTRIBUTE: dimension attribute • DIRECTORY: directory • FACT_ATTRIBUTE: fact table attribute • FACT_DIMENSION: fact table dimension • FACT_LOGIC_TABLE: fact table • FACT_MEASURE: fact table measurement • FUNCTION: function

Parameter	Type	Description
		<ul style="list-style-type: none"> • INFO_ARCH: information architecture (used for modifying themes in batches) • MODEL: model • QUALITY_RULE: quality rule • SECRECY_LEVEL: security level • STANDARD_ELEMENT: data standard • STANDARD_ELEMENT_TEMPLATE: data standard template • SUBJECT: theme • Dimension attributes of SUMMARY_DIMENSION_ATTRIBUTE: summary tables • SUMMARY_INDEX: summary table indicator attribute • SUMMARY_TIME: time period attribute of the SDR table • TABLE_MODEL: relationship model (logical model/physical model) • TABLE_MODEL_ATTRIBUTE: relationship model attribute (logical model/physical model) • TABLE_MODEL_LOGIC: logical entity • TABLE_TYPE: table type • TAG: tag • TIME_CONDITION: time restriction
biz_info	String	Service details. This parameter is read-only.
biz_info_vo	Object	Business object.
effect_objs	String	Impact information. This parameter is read-only.
change_props	String	Indicates the change information. This parameter is read-only.
sql_ddl	String	SQL script, which is read-only.

Parameter	Type	Description
physical_table	String	Synchronization status. Options: <ul style="list-style-type: none">• NO_NEED: not synchronized• CREATE_SUCCESS: The creation is successful.• CREATE_FAILED: Creation failed• UPDATE_SUCCESS: The update is successful.• UPDATE_FAILED: The update fails.• SUMMARY_SUCCESS: overall success• SUMMARY_FAILED: overall failure• RUNNING: overall running• OFFLINE: offline
dev_physical_table	String	Synchronization status. Options: <ul style="list-style-type: none">• NO_NEED: not synchronized• CREATE_SUCCESS: The creation is successful.• CREATE_FAILED: Creation failed• UPDATE_SUCCESS: The update is successful.• UPDATE_FAILED: The update fails.• SUMMARY_SUCCESS: overall success• SUMMARY_FAILED: overall failure• RUNNING: overall running• OFFLINE: offline

Parameter	Type	Description
technical_asset	String	<p>Synchronization status.</p> <p>Options:</p> <ul style="list-style-type: none"> • NO_NEED: not synchronized • CREATE_SUCCESS: The creation is successful. • CREATE_FAILED: Creation failed • UPDATE_SUCCESS: The update is successful. • UPDATE_FAILED: The update fails. • SUMMARY_SUCCESS: overall success • SUMMARY_FAILED: overall failure • RUNNING: overall running • OFFLINE: offline
business_asset	String	<p>Synchronization status.</p> <p>Options:</p> <ul style="list-style-type: none"> • NO_NEED: not synchronized • CREATE_SUCCESS: The creation is successful. • CREATE_FAILED: Creation failed • UPDATE_SUCCESS: The update is successful. • UPDATE_FAILED: The update fails. • SUMMARY_SUCCESS: overall success • SUMMARY_FAILED: overall failure • RUNNING: overall running • OFFLINE: offline

Parameter	Type	Description
meta_data_link	String	Synchronization status. Options: <ul style="list-style-type: none">• NO_NEED: not synchronized• CREATE_SUCCESS: The creation is successful.• CREATE_FAILED: Creation failed• UPDATE_SUCCESS: The update is successful.• UPDATE_FAILED: The update fails.• SUMMARY_SUCCESS: overall success• SUMMARY_FAILED: overall failure• RUNNING: overall running• OFFLINE: offline
data_quality	String	Synchronization status. Options: <ul style="list-style-type: none">• NO_NEED: not synchronized• CREATE_SUCCESS: The creation is successful.• CREATE_FAILED: Creation failed• UPDATE_SUCCESS: The update is successful.• UPDATE_FAILED: The update fails.• SUMMARY_SUCCESS: overall success• SUMMARY_FAILED: overall failure• RUNNING: overall running• OFFLINE: offline

Parameter	Type	Description
dlf_task	String	Synchronization status. Options: <ul style="list-style-type: none">• NO_NEED: not synchronized• CREATE_SUCCESS: The creation is successful.• CREATE_FAILED: Creation failed• UPDATE_SUCCESS: The update is successful.• UPDATE_FAILED: The update fails.• SUMMARY_SUCCESS: overall success• SUMMARY_FAILED: overall failure• RUNNING: overall running• OFFLINE: offline
materialization	String	Synchronization status. Options: <ul style="list-style-type: none">• NO_NEED: not synchronized• CREATE_SUCCESS: The creation is successful.• CREATE_FAILED: Creation failed• UPDATE_SUCCESS: The update is successful.• UPDATE_FAILED: The update fails.• SUMMARY_SUCCESS: overall success• SUMMARY_FAILED: overall failure• RUNNING: overall running• OFFLINE: offline

Parameter	Type	Description
publish_to_dlm	String	<p>Synchronization status.</p> <p>Options:</p> <ul style="list-style-type: none"> • NO_NEED: not synchronized • CREATE_SUCCESS: The creation is successful. • CREATE_FAILED: Creation failed • UPDATE_SUCCESS: The update is successful. • UPDATE_FAILED: The update fails. • SUMMARY_SUCCESS: overall success • SUMMARY_FAILED: overall failure • RUNNING: overall running • OFFLINE: offline
biz_metric	String	<p>Synchronization status.</p> <p>Options:</p> <ul style="list-style-type: none"> • NO_NEED: not synchronized • CREATE_SUCCESS: The creation is successful. • CREATE_FAILED: Creation failed • UPDATE_SUCCESS: The update is successful. • UPDATE_FAILED: The update fails. • SUMMARY_SUCCESS: overall success • SUMMARY_FAILED: overall failure • RUNNING: overall running • OFFLINE: offline

Parameter	Type	Description
summary_status	String	Synchronization status. Options: <ul style="list-style-type: none">• NO_NEED: not synchronized• CREATE_SUCCESS: The creation is successful.• CREATE_FAILED: Creation failed• UPDATE_SUCCESS: The update is successful.• UPDATE_FAILED: The update fails.• SUMMARY_SUCCESS: overall success• SUMMARY_FAILED: overall failure• RUNNING: overall running• OFFLINE: offline
is_current_version	Boolean	Indicates whether the version is the current version. This parameter is read-only.
create_time	String	Creation time, which is read-only. The format complies with RFC3339 and is accurate to seconds. The UTC time zone is yyyy-mm-ddTHH:MM:SSZ, for example, 1970-01-01T00:00:00Z.
create_by	String	Creator, which is read-only.

Status code: 400**Table 7-346** Response body parameters

Parameter	Type	Description
error_code	String	Error code, for example, DS.6000, indicating that the request fails to be processed.
error_msg	String	Error message
data	Object	Returned data information.

Status code: 401

Table 7-347 Response body parameters

Parameter	Type	Description
error_code	String	Error code, for example, DS.6000, indicating that the request fails to be processed.
error_msg	String	Error message
data	Object	Returned data information.

Status code: 403

Table 7-348 Response body parameters

Parameter	Type	Description
error_code	String	Error code, for example, DS.6000, indicating that the request fails to be processed.
error_msg	String	Error message
data	Object	Returned data information.

Example Requests

Obtain the difference between the released entity whose table ID is 1217123755210469376 and the extended information in ER modeling.

```
GET https://{endpoint}/v2/{project_id}/design/approvals/business/1217123755210469376/diff?biz_type=TABLE_MODEL
```

Example Responses

Status code: 200

This operation is successful. The returned data is a PublishVersionVO array and the total number of records.

```

More

For SDK sample code of more programming languages, see the Sample Code tab in [API Explorer](#). SDK sample code can be automatically generated.

Status Codes

Status Code	Description
200	This operation is successful. The returned data is a PublishVersionVO array and the total number of records.
400	BadRequest
401	Unauthorized
403	Forbidden

7.8 Subject Management

7.8.1 Searching for a Topic List

Function

Search for topics by name (fuzzy query is supported), creator, owner, status, and modification time.

Calling Method

For details, see [Calling APIs](#).

URI

GET /v2/{project_id}/design/subjects

Table 7-349 Path Parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Project ID. For details about how to obtain the project ID, see Project ID and Account ID .

Table 7-350 Query Parameters

Parameter	Mandatory	Type	Description
name	No	String	Fuzzy query by name or code.
create_by	No	String	Query by creator.
owner	No	String	Query by owner.
status	No	String	Specifies the service status. Options: <ul style="list-style-type: none">• DRAFT: draft• PUBLISH_DEVELOPING: to be approved• PUBLISHED: released• OFFLINE_DEVELOPING: to be approved• OFFLINE: offline• REJECT: rejected
begin_time	No	String	Left boundary of time filtering. This parameter is used together with end_time. Only time range filtering is supported. Unilateral filtering is invalid. The format complies with RFC3339 and is accurate to seconds. The UTC time zone is yyyy-mm-ddTHH:MM:SSZ, for example, 1970-01-01T00:00:00Z.
end_time	No	String	Right boundary for time filtering. This parameter is used together with begin_time to support only time range filtering. The format complies with RFC3339 and is accurate to seconds. The UTC time zone is yyyy-mm-ddTHH:MM:SSZ, for example, 1970-01-01T00:00:00Z.
limit	No	Integer	Number of records to be queried on each page, that is, Y records to be queried. The default value is 50, and the value range is [1,100].

Parameter	Mandatory	Type	Description
offset	No	Integer	Start coordinate of the query, that is, the number of skipped data records. The value can only be 0 or an integer multiple of limit. If the value does not meet the requirement, the value is rounded down. The default value is 0.
parent_id	No	String	Parent category ID. The root category does not have this ID. If this parameter is left empty, all categories are displayed. The value -1 indicates a category under the root category. ID string

Request Parameters

Table 7-351 Request header parameters

Parameter	Mandatory	Type	Description
X-Auth-Token	Yes	String	IAM token, which is obtained by calling the IAM API for obtaining a user token (value of X-Subject-Token in the response header). This field is mandatory for authentication using tokens.
workspace	Yes	String	Workspace ID. For details about how to obtain the workspace ID, see Instance ID and Workspace ID .
X-Project-Id	No	String	Project ID. For details about how to obtain the project ID, see Project ID and Account ID . This parameter is mandatory for API requests that use AK/SK authentication in multi-project scenarios.

Parameter	Mandatory	Type	Description
Content-Type	No	String	Default value: application/json;charset=UTF-8 This parameter is optional. If the body is available, this parameter is mandatory. If the body is unavailable, you do not need to set this parameter or verify it.

Response Parameters

Status code: 200

Table 7-352 Response body parameters

Parameter	Type	Description
data	data object	data: unified outermost data structure of the returned result.

Table 7-353 data

Parameter	Type	Description
value	value object	value: unified outer data structure of the returned result.

Table 7-354 value

Parameter	Type	Description
total	Integer	Total number.
records	Array of CatalogVO objects	Number of found application object (CatalogVO) groups.

Table 7-355 CatalogVO

Parameter	Type	Description
name_ch	String	Chinese name
name_en	String	English name.

Parameter	Type	Description
description	String	Description
qualified_name	String	File name extension.
guid	String	GUID, which is automatically generated.
code	String	Code.
alias	String	Alias
status	String	Release status of an entity. This parameter is read-only and does not need to be set during creation and update. Options: <ul style="list-style-type: none">• DRAFT: draft• PUBLISH_DEVELOPING: to be reviewed• PUBLISHED: released• OFFLINE_DEVELOPING: to be reviewed• OFFLINE: offline• REJECT: rejected
new_biz	BizVersionManag eVO object	Service version management. This parameter is read-only.
data_owner	String	Data owner.
data_owner_list	String	Data owner set.
data_department	String	Data domain.
path	String	Path information.
level	Integer	Level information.
ordinal	Integer	Sequence number.
owner	String	Owner of the instance.
parent_id	String	Parent directory ID, which is a string. If no parent directory ID exists, the parent directory is the root directory.
swap_order_id	String	ID of the target node at the same layer, which is a string
id	String	Subject ID, which is a string
qualified_id	String	Authentication ID, which is automatically generated.

Parameter	Type	Description
from_public	Boolean	Indicates whether the data is from the public layer.
create_by	String	Creator.
update_by	String	Person who updates the information.
create_time	String	Creation time, which is read-only. The format complies with RFC3339 and is accurate to seconds. The UTC time zone is yyyy-mm-ddTHH:MM:SSZ, for example, 1970-01-01T00:00:00Z.
update_time	String	Update time, which is read-only. The format complies with RFC3339 and is accurate to seconds. The UTC time zone is yyyy-mm-ddTHH:MM:SSZ, for example, 1970-01-01T00:00:00Z.
children_num	Integer	Number of subprocesses, excluding subprocesses. This parameter is not transferred from the front end.
children	Array of CatalogVO objects	Lower-level subdirectory, which is read-only.
self_defined_fields	Array of SelfDefinedField-VO objects	Customize Attribute Field:

Table 7-356 BizVersionManageVO

Parameter	Type	Description
id	String	Field ID, which is a string

Parameter	Type	Description
biz_type	String	<p>Business entity type.</p> <p>Options:</p> <ul style="list-style-type: none"> • AGGREGATION_LOGIC_TABLE: summary table • ATOMIC_INDEX: atomic metric • ATOMIC_METRIC: atomic metric (new) • BIZ_CATALOG: process architecture directory • BIZ_METRIC: service indicator • CODE_TABLE: code table • COMMON_CONDITION: general filter • COMPOSITE_METRIC: Compound Metric (new) • COMPOUND_METRIC: compound metric • CONDITION_GROUP: restriction group • DEGENERATE_DIMENSION: degenerate dimension • DERIVATIVE_INDEX: derivative indicator • DERIVED_METRIC: derivative indicator (new) • DIMENSION: dimension • DIMENSION_ATTRIBUTE: dimension attribute • DIMENSION_HIERARCHIES: dimension level • DIMENSION_LOGIC_TABLE: dimension table • DIMENSION_TABLE_ATTRIBUTE: dimension attribute • DIRECTORY: directory • FACT_ATTRIBUTE: fact table attribute • FACT_DIMENSION: fact table dimension • FACT_LOGIC_TABLE: fact table • FACT_MEASURE: fact table measurement • FUNCTION: function

Parameter	Type	Description
		<ul style="list-style-type: none">• INFO_ARCH: information architecture (used for modifying themes in batches)• MODEL: model• QUALITY_RULE: quality rule• SECRECY_LEVEL: security level• STANDARD_ELEMENT: data standard• STANDARD_ELEMENT_TEMPLATE: data standard template• SUBJECT: theme• Dimension attributes of SUMMARY_DIMENSION_ATTRIBUTE: summary tables• SUMMARY_INDEX: summary table indicator attribute• SUMMARY_TIME: time period attribute of the SDR table• TABLE_MODEL: relationship model (logical model/physical model)• TABLE_MODEL_ATTRIBUTE: relationship model attribute (logical model/physical model)• TABLE_MODEL_LOGIC: logical entity• TABLE_TYPE: table type• TAG: tag• TIME_CONDITION: time restriction
biz_id	String	Business ID, which is a string
biz_info	String	Business object information.

Parameter	Type	Description
status	String	Release status of an entity. This parameter is read-only and does not need to be set during creation and update. Options: <ul style="list-style-type: none"> • DRAFT: draft • PUBLISH_DEVELOPING: to be reviewed • PUBLISHED: released • OFFLINE_DEVELOPING: to be reviewed • OFFLINE: offline • REJECT: rejected
biz_version	Integer	Service version, which is read-only.
create_time	String	Creation time, which is read-only. The format complies with RFC3339 and is accurate to seconds. The UTC time zone is yyyy-mm-ddTHH:MM:SSZ, for example, 1970-01-01T00:00:00Z.
update_time	String	Update time, which is read-only. The format complies with RFC3339 and is accurate to seconds. The UTC time zone is yyyy-mm-ddTHH:MM:SSZ, for example, 1970-01-01T00:00:00Z.

Table 7-357 SelfDefinedFieldVO

Parameter	Type	Description
fd_name_ch	String	Chinese name of a user-defined item.
fd_name_en	String	English name of a customized item.
not_null	Boolean	Whether a parameter is mandatory.
fd_value	String	Attribute value

Status code: 400

Table 7-358 Response body parameters

Parameter	Type	Description
error_code	String	Error code, for example, DS.6000, indicating that the request fails to be processed.
error_msg	String	Error message
data	Object	Returned data information.

Status code: 401**Table 7-359** Response body parameters

Parameter	Type	Description
error_code	String	Error code, for example, DS.6000, indicating that the request fails to be processed.
error_msg	String	Error message
data	Object	Returned data information.

Status code: 403**Table 7-360** Response body parameters

Parameter	Type	Description
error_code	String	Error code, for example, DS.6000, indicating that the request fails to be processed.
error_msg	String	Error message
data	Object	Returned data information.

Status code: 404**Table 7-361** Response body parameters

Parameter	Type	Description
error_code	String	Error code, for example, DS.6000, indicating that the request fails to be processed.

Parameter	Type	Description
error_msg	String	Error message
data	Object	Returned data information.

Example Requests

Query the list of themes whose status is Draft and whose names contain test_.

```
GET https://{endpoint}/v2/{project_id}/design/subjects?name=test_&parent_id=-1&status=DRAFT
```

Example Responses

Status code: 200

This operation succeeds, and the returned data is a CatalogVO array and the total number of records.

```

More

For SDK sample code of more programming languages, see the Sample Code tab in [API Explorer](#). SDK sample code can be automatically generated.

Status Codes

Status Code	Description
200	This operation succeeds, and the returned data is a CatalogVO array and the total number of records.
400	BadRequest
401	Unauthorized
403	Forbidden
404	Not Found

7.8.2 Deleting a Topic

Function

Delete a topic.

Calling Method

For details, see [Calling APIs](#).

URI

DELETE /v2/{project_id}/design/subjects

Table 7-362 Path Parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Project ID. For details about how to obtain the project ID, see Project ID and Account ID .

Request Parameters

Table 7-363 Request header parameters

Parameter	Mandatory	Type	Description
X-Auth-Token	Yes	String	IAM token, which is obtained by calling the IAM API for obtaining a user token (value of X-Subject-Token in the response header). This field is mandatory for authentication using tokens.
workspace	Yes	String	Workspace ID. For details about how to obtain the workspace ID, see Instance ID and Workspace ID .
X-Project-Id	No	String	Project ID. For details about how to obtain the project ID, see Project ID and Account ID . This parameter is mandatory for API requests that use AK/SK authentication in multi-project scenarios.

Parameter	Mandatory	Type	Description
Content-Type	No	String	Default value: application/json;charset=UTF-8 This parameter is optional. If the body is available, this parameter is mandatory. If the body is unavailable, you do not need to set this parameter or verify it.

Table 7-364 Request body parameters

Parameter	Mandatory	Type	Description
ids	Yes	Array of strings	ID list, which is a string
del_types	No	String	Deletion type. Enumerated values: <ul style="list-style-type: none"> ● PHYSICAL_TABLE: whether to delete physical database tables. This parameter is valid only for tables that can be materialized. (If this parameter is set, physical database tables are deleted.)

Response Parameters

Status code: 200

Table 7-365 Response body parameters

Parameter	Type	Description
data	data object	Indicates the final deletion result, that is, the number of objects that are successfully deleted.

Table 7-366 data

Parameter	Type	Description
value	String	Number of successfully deleted objects

Status code: 400**Table 7-367** Response body parameters

Parameter	Type	Description
error_code	String	Error code, for example, DS.6000, indicating that the request fails to be processed.
error_msg	String	Error message
data	Object	Returned data information.

Status code: 401**Table 7-368** Response body parameters

Parameter	Type	Description
error_code	String	Error code, for example, DS.6000, indicating that the request fails to be processed.
error_msg	String	Error message
data	Object	Returned data information.

Status code: 403**Table 7-369** Response body parameters

Parameter	Type	Description
error_code	String	Error code, for example, DS.6000, indicating that the request fails to be processed.
error_msg	String	Error message
data	Object	Returned data information.

Status code: 404

Table 7-370 Response body parameters

Parameter	Type	Description
error_code	String	Error code, for example, DS.6000, indicating that the request fails to be processed.
error_msg	String	Error message
data	Object	Returned data information.

Example Requests

This API deletes theme information by ID.

```
DELETE https://{endpoint}/v2/{project_id}/design/subjects
```

Example Responses

Status code: 200

This operation succeeds, and the returned data is the number of deleted data records.

```
{  
  "value" : 2  
}
```

Status code: 400

BadRequest

```
{  
  "error_code" : "DS.60xx",  
  "error_msg" : "The user request is illegal."  
}
```

Status code: 401

Unauthorized

```
{  
  "error_code" : "DS.60xx",  
  "error_msg" : "User authentication failed."  
}
```

Status code: 403

Forbidden

```
{  
  "error_code" : "DS.60xx",  
  "error_msg" : "The user does not have permission to call this API."  
}
```

Status code: 404

Not Found

```
{  
  "error_code" : "DS.60xx",
```

```
"error_msg" : "The User Request API does not exist."
}
```

7.8.3 Creating a topic

Function

Creating a topic

Calling Method

For details, see [Calling APIs](#).

URI

POST /v2/{project_id}/design/subjects

Table 7-371 Path Parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Project ID. For details about how to obtain the project ID, see Project ID and Account ID .

Request Parameters

Table 7-372 Request header parameters

Parameter	Mandatory	Type	Description
X-Auth-Token	Yes	String	IAM token, which is obtained by calling the IAM API for obtaining a user token (value of X-Subject-Token in the response header). This field is mandatory for authentication using tokens.
workspace	Yes	String	Workspace ID. For details about how to obtain the workspace ID, see Instance ID and Workspace ID .
X-Project-Id	No	String	Project ID. For details about how to obtain the project ID, see Project ID and Account ID . This parameter is mandatory for API requests that use AK/SK authentication in multi-project scenarios.
Content-Type	No	String	Default value: application/json;charset=UTF-8 This parameter is optional. If the body is available, this parameter is mandatory. If the body is unavailable, you do not need to set this parameter or verify it.

Table 7-373 Request body parameters

Parameter	Mandatory	Type	Description
entity	Yes	CatalogEntityVO object	Catalog entity.

Table 7-374 CatalogEntityVO

Parameter	Mandatory	Type	Description
typeName	No	String	Type name. Set this parameter to BusinessCatalog (service layer).
attributes	Yes	CatalogAttributeVO object	Attribute List

Table 7-375 CatalogAttributeVO

Parameter	Mandatory	Type	Description
path	Yes	String	Path. Use slashes (/) to separate them, for example, Operation Domain/Cloud Academy/Cloud Academy Training Solution.
qualifiedName	Yes	String	Asset name.
level	Yes	String	Level to which a theme belongs.
name	Yes	String	Name.
nameEng	Yes	String	English name.
alias	No	String	Alias
description	Yes	String	Description.
dataOwner	Yes	String	Data subject.
owner	No	String	Owner of the instance.
dataOwnerList	Yes	Array of strings	List of data subjects.
createTime	No	String	Creation time. The format complies with RFC3339 and is accurate to seconds. The UTC time zone is yyyy-mm-ddTHH:MM:SSZ, for example, 1970-01-01T00:00:00Z.
createBy	No	String	Creator.

Parameter	Mandatory	Type	Description
updateTime	No	String	Update time. The format complies with RFC3339 and is accurate to seconds. The UTC time zone is yyyy-mm-ddTHH:MM:SSZ, for example, 1970-01-01T00:00:00Z.
updateBy	No	String	Person who updates the information.
parent	No	parent object	Parent node.
parentId	No	String	Parent node ID.
l1	No	Boolean	Indicates whether the layer is L1. Subject area group.
l2	No	Boolean	Indicates whether the layer is L2. Subject area.
l3	No	Boolean	Indicates whether the layer is L3. Business object.
ordinal	No	Integer	Sequence number. Topics are sorted in ascending order based on the ID.
tenantId	No	String	Specifies the tenant ID. For details about how to obtain the value, see the path parameter <code>project_id</code> of this API.
self_defined_fields	No	Array of SelfDefinedFieldVO objects	User-defined item. Customized attribute item of a theme.

Table 7-376 parent

Parameter	Mandatory	Type	Description
id	No	String	Parent node ID.

Table 7-377 SelfDefinedFieldVO

Parameter	Mandatory	Type	Description
fd_name_ch	No	String	Chinese name of a user-defined item.

Parameter	Mandatory	Type	Description
fd_name_en	No	String	English name of a customized item.
not_null	No	Boolean	Whether a parameter is mandatory.
fd_value	No	String	Attribute value

Response Parameters

Status code: 200

Table 7-378 Response body parameters

Parameter	Type	Description
data	data object	data: unified outermost data structure of the returned result.

Table 7-379 data

Parameter	Type	Description
value	CatalogVO object	value: unified outer data structure of the returned result.

Table 7-380 CatalogVO

Parameter	Type	Description
name_ch	String	Chinese name
name_en	String	English name.
description	String	Description
qualified_name	String	File name extension.
guid	String	GUID, which is automatically generated.
code	String	Code.
alias	String	Alias

Parameter	Type	Description
status	String	Release status of an entity. This parameter is read-only and does not need to be set during creation and update. Options: <ul style="list-style-type: none"> • DRAFT: draft • PUBLISH_DEVELOPING: to be reviewed • PUBLISHED: released • OFFLINE_DEVELOPING: to be reviewed • OFFLINE: offline • REJECT: rejected
new_biz	BizVersionManag eVO object	Service version management. This parameter is read-only.
data_owner	String	Data owner.
data_owner_list	String	Data owner set.
data_department	String	Data domain.
path	String	Path information.
level	Integer	Level information.
ordinal	Integer	Sequence number.
owner	String	Owner of the instance.
parent_id	String	Parent directory ID, which is a string. If no parent directory ID exists, the parent directory is the root directory.
swap_order_id	String	ID of the target node at the same layer, which is a string
id	String	Subject ID, which is a string
qualified_id	String	Authentication ID, which is automatically generated.
from_public	Boolean	Indicates whether the data is from the public layer.
create_by	String	Creator.
update_by	String	Person who updates the information.

Parameter	Type	Description
create_time	String	Creation time, which is read-only. The format complies with RFC3339 and is accurate to seconds. The UTC time zone is yyyy-mm-ddTHH:MM:SSZ, for example, 1970-01-01T00:00:00Z.
update_time	String	Update time, which is read-only. The format complies with RFC3339 and is accurate to seconds. The UTC time zone is yyyy-mm-ddTHH:MM:SSZ, for example, 1970-01-01T00:00:00Z.
children_num	Integer	Number of subprocesses, excluding subprocesses. This parameter is not transferred from the front end.
children	Array of CatalogVO objects	Lower-level subdirectory, which is read-only.
self_defined_fields	Array of SelfDefinedField-VO objects	Customize Attribute Field:

Table 7-381 BizVersionManageVO

Parameter	Type	Description
id	String	Field ID, which is a string

Parameter	Type	Description
biz_type	String	<p>Business entity type.</p> <p>Options:</p> <ul style="list-style-type: none"> • AGGREGATION_LOGIC_TABLE: summary table • ATOMIC_INDEX: atomic metric • ATOMIC_METRIC: atomic metric (new) • BIZ_CATALOG: process architecture directory • BIZ_METRIC: service indicator • CODE_TABLE: code table • COMMON_CONDITION: general filter • COMPOSITE_METRIC: Compound Metric (new) • COMPOUND_METRIC: compound metric • CONDITION_GROUP: restriction group • DEGENERATE_DIMENSION: degenerate dimension • DERIVATIVE_INDEX: derivative indicator • DERIVED_METRIC: derivative indicator (new) • DIMENSION: dimension • DIMENSION_ATTRIBUTE: dimension attribute • DIMENSION_HIERARCHIES: dimension level • DIMENSION_LOGIC_TABLE: dimension table • DIMENSION_TABLE_ATTRIBUTE: dimension attribute • DIRECTORY: directory • FACT_ATTRIBUTE: fact table attribute • FACT_DIMENSION: fact table dimension • FACT_LOGIC_TABLE: fact table • FACT_MEASURE: fact table measurement • FUNCTION: function

Parameter	Type	Description
		<ul style="list-style-type: none">• INFO_ARCH: information architecture (used for modifying themes in batches)• MODEL: model• QUALITY_RULE: quality rule• SECRECY_LEVEL: security level• STANDARD_ELEMENT: data standard• STANDARD_ELEMENT_TEMPLATE: data standard template• SUBJECT: theme• Dimension attributes of SUMMARY_DIMENSION_ATTRIBUTE: summary tables• SUMMARY_INDEX: summary table indicator attribute• SUMMARY_TIME: time period attribute of the SDR table• TABLE_MODEL: relationship model (logical model/physical model)• TABLE_MODEL_ATTRIBUTE: relationship model attribute (logical model/physical model)• TABLE_MODEL_LOGIC: logical entity• TABLE_TYPE: table type• TAG: tag• TIME_CONDITION: time restriction
biz_id	String	Business ID, which is a string
biz_info	String	Business object information.

Parameter	Type	Description
status	String	Release status of an entity. This parameter is read-only and does not need to be set during creation and update. Options: <ul style="list-style-type: none"> • DRAFT: draft • PUBLISH_DEVELOPING: to be reviewed • PUBLISHED: released • OFFLINE_DEVELOPING: to be reviewed • OFFLINE: offline • REJECT: rejected
biz_version	Integer	Service version, which is read-only.
create_time	String	Creation time, which is read-only. The format complies with RFC3339 and is accurate to seconds. The UTC time zone is yyyy-mm-ddTHH:MM:SSZ, for example, 1970-01-01T00:00:00Z.

Status Codes

Status Code	Description
200	This operation succeeds, and the returned data is entity details.
400	BadRequest
401	Unauthorized
403	Forbidden
404	Not Found

7.8.4 Changing a topic

Function

Modify a theme.

Calling Method

For details, see [Calling APIs](#).

URI

PUT /v2/{project_id}/design/subjects

Table 7-387 Path Parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Project ID. For details about how to obtain the project ID, see Project ID and Account ID .

Request Parameters

Table 7-388 Request header parameters

Parameter	Mandatory	Type	Description
X-Auth-Token	Yes	String	IAM token, which is obtained by calling the IAM API for obtaining a user token (value of X-Subject-Token in the response header). This field is mandatory for authentication using tokens.
workspace	Yes	String	Workspace ID. For details about how to obtain the workspace ID, see Instance ID and Workspace ID .
X-Project-Id	No	String	Project ID. For details about how to obtain the project ID, see Project ID and Account ID . This parameter is mandatory for API requests that use AK/SK authentication in multi-project scenarios.
Content-Type	No	String	Default value: application/json;charset=UTF-8 This parameter is optional. If the body is available, this parameter is mandatory. If the body is unavailable, you do not need to set this parameter or verify it.

Table 7-389 Request body parameters

Parameter	Mandatory	Type	Description
entity	Yes	CatalogEntityVO object	Catalog entity.

Table 7-390 CatalogEntityVO

Parameter	Mandatory	Type	Description
typeName	No	String	Type name. Set this parameter to BusinessCatalog (service layer).
attributes	Yes	CatalogAttributeVO object	Attribute List

Table 7-391 CatalogAttributeVO

Parameter	Mandatory	Type	Description
path	Yes	String	Path. Use slashes (/) to separate them, for example, Operation Domain/Cloud Academy/Cloud Academy Training Solution.
qualifiedName	Yes	String	Asset name.
level	Yes	String	Level to which a theme belongs.
name	Yes	String	Name.
nameEng	Yes	String	English name.
alias	No	String	Alias
description	Yes	String	Description.
dataOwner	Yes	String	Data subject.
owner	No	String	Owner of the instance.
dataOwnerList	Yes	Array of strings	List of data subjects.
createTime	No	String	Creation time. The format complies with RFC3339 and is accurate to seconds. The UTC time zone is yyyy-mm-ddTHH:MM:SSZ, for example, 1970-01-01T00:00:00Z.
createBy	No	String	Creator.

Parameter	Mandatory	Type	Description
updateTime	No	String	Update time. The format complies with RFC3339 and is accurate to seconds. The UTC time zone is yyyy-mm-ddTHH:MM:SSZ, for example, 1970-01-01T00:00:00Z.
updateBy	No	String	Person who updates the information.
parent	No	parent object	Parent node.
parentId	No	String	Parent node ID.
l1	No	Boolean	Indicates whether the layer is L1. Subject area group.
l2	No	Boolean	Indicates whether the layer is L2. Subject area.
l3	No	Boolean	Indicates whether the layer is L3. Business object.
ordinal	No	Integer	Sequence number. Topics are sorted in ascending order based on the ID.
tenantId	No	String	Specifies the tenant ID. For details about how to obtain the value, see the path parameter <code>project_id</code> of this API.
self_defined_fields	No	Array of SelfDefinedFieldVO objects	User-defined item. Customized attribute item of a theme.

Table 7-392 parent

Parameter	Mandatory	Type	Description
id	No	String	Parent node ID.

Table 7-393 SelfDefinedFieldVO

Parameter	Mandatory	Type	Description
fd_name_ch	No	String	Chinese name of a user-defined item.

Parameter	Mandatory	Type	Description
fd_name_en	No	String	English name of a customized item.
not_null	No	Boolean	Whether a parameter is mandatory.
fd_value	No	String	Attribute value

Response Parameters

Status code: 200

Table 7-394 Response body parameters

Parameter	Type	Description
data	data object	data: unified outermost data structure of the returned result.

Table 7-395 data

Parameter	Type	Description
value	CatalogVO object	value: unified outer data structure of the returned result.

Table 7-396 CatalogVO

Parameter	Type	Description
name_ch	String	Chinese name
name_en	String	English name.
description	String	Description
qualified_name	String	File name extension.
guid	String	GUID, which is automatically generated.
code	String	Code.
alias	String	Alias

Parameter	Type	Description
status	String	Release status of an entity. This parameter is read-only and does not need to be set during creation and update. Options: <ul style="list-style-type: none">• DRAFT: draft• PUBLISH_DEVELOPING: to be reviewed• PUBLISHED: released• OFFLINE_DEVELOPING: to be reviewed• OFFLINE: offline• REJECT: rejected
new_biz	BizVersionManag eVO object	Service version management. This parameter is read-only.
data_owner	String	Data owner.
data_owner_list	String	Data owner set.
data_department	String	Data domain.
path	String	Path information.
level	Integer	Level information.
ordinal	Integer	Sequence number.
owner	String	Owner of the instance.
parent_id	String	Parent directory ID, which is a string. If no parent directory ID exists, the parent directory is the root directory.
swap_order_id	String	ID of the target node at the same layer, which is a string
id	String	Subject ID, which is a string
qualified_id	String	Authentication ID, which is automatically generated.
from_public	Boolean	Indicates whether the data is from the public layer.
create_by	String	Creator.
update_by	String	Person who updates the information.

Parameter	Type	Description
create_time	String	Creation time, which is read-only. The format complies with RFC3339 and is accurate to seconds. The UTC time zone is yyyy-mm-ddTHH:MM:SSZ, for example, 1970-01-01T00:00:00Z.
update_time	String	Update time, which is read-only. The format complies with RFC3339 and is accurate to seconds. The UTC time zone is yyyy-mm-ddTHH:MM:SSZ, for example, 1970-01-01T00:00:00Z.
children_num	Integer	Number of subprocesses, excluding subprocesses. This parameter is not transferred from the front end.
children	Array of CatalogVO objects	Lower-level subdirectory, which is read-only.
self_defined_fields	Array of SelfDefinedField-VO objects	Customize Attribute Field:

Table 7-397 BizVersionManageVO

Parameter	Type	Description
id	String	Field ID, which is a string

Parameter	Type	Description
biz_type	String	<p>Business entity type.</p> <p>Options:</p> <ul style="list-style-type: none"> • AGGREGATION_LOGIC_TABLE: summary table • ATOMIC_INDEX: atomic metric • ATOMIC_METRIC: atomic metric (new) • BIZ_CATALOG: process architecture directory • BIZ_METRIC: service indicator • CODE_TABLE: code table • COMMON_CONDITION: general filter • COMPOSITE_METRIC: Compound Metric (new) • COMPOUND_METRIC: compound metric • CONDITION_GROUP: restriction group • DEGENERATE_DIMENSION: degenerate dimension • DERIVATIVE_INDEX: derivative indicator • DERIVED_METRIC: derivative indicator (new) • DIMENSION: dimension • DIMENSION_ATTRIBUTE: dimension attribute • DIMENSION_HIERARCHIES: dimension level • DIMENSION_LOGIC_TABLE: dimension table • DIMENSION_TABLE_ATTRIBUTE: dimension attribute • DIRECTORY: directory • FACT_ATTRIBUTE: fact table attribute • FACT_DIMENSION: fact table dimension • FACT_LOGIC_TABLE: fact table • FACT_MEASURE: fact table measurement • FUNCTION: function

Parameter	Type	Description
		<ul style="list-style-type: none"> • INFO_ARCH: information architecture (used for modifying themes in batches) • MODEL: model • QUALITY_RULE: quality rule • SECRECY_LEVEL: security level • STANDARD_ELEMENT: data standard • STANDARD_ELEMENT_TEMPLATE: data standard template • SUBJECT: theme • Dimension attributes of SUMMARY_DIMENSION_ATTRIBUTE: summary tables • SUMMARY_INDEX: summary table indicator attribute • SUMMARY_TIME: time period attribute of the SDR table • TABLE_MODEL: relationship model (logical model/physical model) • TABLE_MODEL_ATTRIBUTE: relationship model attribute (logical model/physical model) • TABLE_MODEL_LOGIC: logical entity • TABLE_TYPE: table type • TAG: tag • TIME_CONDITION: time restriction
biz_id	String	Business ID, which is a string
biz_info	String	Business object information.

Parameter	Type	Description
status	String	Release status of an entity. This parameter is read-only and does not need to be set during creation and update. Options: <ul style="list-style-type: none"> • DRAFT: draft • PUBLISH_DEVELOPING: to be reviewed • PUBLISHED: released • OFFLINE_DEVELOPING: to be reviewed • OFFLINE: offline • REJECT: rejected
biz_version	Integer	Service version, which is read-only.
create_time	String	Creation time, which is read-only. The format complies with RFC3339 and is accurate to seconds. The UTC time zone is yyyy-mm-ddTHH:MM:SSZ, for example, 1970-01-01T00:00:00Z.
update_time	String	Update time, which is read-only. The format complies with RFC3339 and is accurate to seconds. The UTC time zone is yyyy-mm-ddTHH:MM:SSZ, for example, 1970-01-01T00:00:00Z.

Table 7-398 SelfDefinedFieldVO

Parameter	Type	Description
fd_name_ch	String	Chinese name of a user-defined item.
fd_name_en	String	English name of a customized item.
not_null	Boolean	Whether a parameter is mandatory.
fd_value	String	Attribute value

Status code: 400

Table 7-399 Response body parameters

Parameter	Type	Description
error_code	String	Error code, for example, DS.6000, indicating that the request fails to be processed.
error_msg	String	Error message
data	Object	Returned data information.

Status code: 401**Table 7-400** Response body parameters

Parameter	Type	Description
error_code	String	Error code, for example, DS.6000, indicating that the request fails to be processed.
error_msg	String	Error message
data	Object	Returned data information.

Status code: 403**Table 7-401** Response body parameters

Parameter	Type	Description
error_code	String	Error code, for example, DS.6000, indicating that the request fails to be processed.
error_msg	String	Error message
data	Object	Returned data information.

Status code: 404**Table 7-402** Response body parameters

Parameter	Type	Description
error_code	String	Error code, for example, DS.6000, indicating that the request fails to be processed.

Parameter	Type	Description
error_msg	String	Error message
data	Object	Returned data information.

Example Requests

Modify the topic based on the request parameters.

```
PUT https://{endpoint}/v2/{project_id}/design/subjects
```

```
{
  "entity" : {
    "attributes" : {

```

More

For SDK sample code of more programming languages, see the Sample Code tab in [API Explorer](#). SDK sample code can be automatically generated.

Status Codes

Status Code	Description
200	This operation succeeds, and the returned data is entity details.
400	BadRequest
401	Unauthorized
403	Forbidden
404	Not Found

7.8.5 Obtaining Topic Tree Information

Function

Obtain the data asset subject tree information l1, l2, and l3.

Calling Method

For details, see [Calling APIs](#).

URI

GET /v2/{project_id}/design/subjects/business

Table 7-403 Path Parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Project ID. For details about how to obtain the project ID, see Project ID and Account ID .

Table 7-404 Query Parameters

Parameter	Mandatory	Type	Description
limit	No	Integer	Number of records to be queried on each page, that is, Y records to be queried. The default value is 50, and the value range is [1,100].

Parameter	Mandatory	Type	Description
offset	No	Integer	Start coordinate of the query, that is, the number of skipped data records. The value can only be 0 or an integer multiple of limit. If the value does not meet the requirement, the value is rounded down. The default value is 0.

Request Parameters

Table 7-405 Request header parameters

Parameter	Mandatory	Type	Description
X-Auth-Token	Yes	String	IAM token, which is obtained by calling the IAM API for obtaining a user token (value of X-Subject-Token in the response header). This field is mandatory for authentication using tokens.
workspace	Yes	String	Workspace ID. For details about how to obtain the workspace ID, see Instance ID and Workspace ID .
X-Project-Id	No	String	Project ID. For details about how to obtain the project ID, see Project ID and Account ID . This parameter is mandatory for API requests that use AK/SK authentication in multi-project scenarios.
Content-Type	No	String	Default value: application/json;charset=UTF-8 This parameter is optional. If the body is available, this parameter is mandatory. If the body is unavailable, you do not need to set this parameter or verify it.

Response Parameters

Status code: 200

Table 7-406 Response body parameters

Parameter	Type	Description
data	Object	Returned data information.

Status code: 400

Table 7-407 Response body parameters

Parameter	Type	Description
error_code	String	Error code, for example, DS.6000, indicating that the request fails to be processed.
error_msg	String	Error message
data	Object	Returned data information.

Status code: 401

Table 7-408 Response body parameters

Parameter	Type	Description
error_code	String	Error code, for example, DS.6000, indicating that the request fails to be processed.
error_msg	String	Error message
data	Object	Returned data information.

Status code: 403

Table 7-409 Response body parameters

Parameter	Type	Description
error_code	String	Error code, for example, DS.6000, indicating that the request fails to be processed.
error_msg	String	Error message

Parameter	Type	Description
data	Object	Returned data information.

Example Requests

Obtain the number of data asset topics l1, l2, and l3 in the current workspace.

```
GET https://{endpoint}/v2/{project_id}/design/subjects/business
```

Example Responses

Status code: 200

This operation succeeds, and the returned data is all L1, L2, and L3 entities.

```

More

For SDK sample code of more programming languages, see the Sample Code tab in [API Explorer](#). SDK sample code can be automatically generated.

Status Codes

Status Code	Description
200	This operation succeeds, and the returned data is all L1, L2, and L3 entities.
400	BadRequest
401	Unauthorized

Status Code	Description
403	Forbidden

7.8.6 Find Topic List (New)

Function

Search for a topic (new).

Calling Method

For details, see [Calling APIs](#).

URI

GET /v3/{project_id}/design/subjects

Table 7-410 Path Parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Project ID. For details about how to obtain the project ID, see Project ID and Account ID .

Table 7-411 Query Parameters

Parameter	Mandatory	Type	Description
name	No	String	Fuzzy query by name or code.
create_by	No	String	Query by creator.
owner	No	String	Query by owner.

Parameter	Mandatory	Type	Description
status	No	String	Specifies the service status. Options: <ul style="list-style-type: none"> • DRAFT: draft • PUBLISH_DEVELOPING: to be approved • PUBLISHED: released • OFFLINE_DEVELOPING: to be approved • OFFLINE: offline • REJECT: rejected
begin_time	No	String	Left boundary of time filtering. This parameter is used together with end_time. Only time range filtering is supported. Unilateral filtering is invalid. The format complies with RFC3339 and is accurate to seconds. The UTC time zone is yyyy-mm-ddTHH:MM:SSZ, for example, 1970-01-01T00:00:00Z.
end_time	No	String	Right boundary for time filtering. This parameter is used together with begin_time to support only time range filtering. The format complies with RFC3339 and is accurate to seconds. The UTC time zone is yyyy-mm-ddTHH:MM:SSZ, for example, 1970-01-01T00:00:00Z.
limit	No	Integer	Number of records to be queried on each page, that is, Y records to be queried. The default value is 50, and the value range is [1,100].
offset	No	Integer	Start coordinate of the query, that is, the number of skipped data records. The value can only be 0 or an integer multiple of limit. If the value does not meet the requirement, the value is rounded down. The default value is 0.

Parameter	Mandatory	Type	Description
parent_id	No	String	Parent category ID. The root category does not have this ID. If this parameter is left empty, all categories are displayed. The value -1 indicates a category under the root category. ID string

Request Parameters

Table 7-412 Request header parameters

Parameter	Mandatory	Type	Description
X-Auth-Token	Yes	String	IAM token, which is obtained by calling the IAM API for obtaining a user token (value of X-Subject-Token in the response header). This field is mandatory for authentication using tokens.
workspace	Yes	String	Workspace ID. For details about how to obtain the workspace ID, see Instance ID and Workspace ID .
X-Project-Id	No	String	Project ID. For details about how to obtain the project ID, see Project ID and Account ID . This parameter is mandatory for API requests that use AK/SK authentication in multi-project scenarios.
Content-Type	No	String	Default value: application/json;charset=UTF-8 This parameter is optional. If the body is available, this parameter is mandatory. If the body is unavailable, you do not need to set this parameter or verify it.

Response Parameters

Status code: 200

Table 7-413 Response body parameters

Parameter	Type	Description
data	data object	data: unified outermost data structure of the returned result.

Table 7-414 data

Parameter	Type	Description
value	value object	value: unified outer data structure of the returned result.

Table 7-415 value

Parameter	Type	Description
total	Integer	Total number.
records	Array of CatalogVO objects	CatalogVO information.

Table 7-416 CatalogVO

Parameter	Type	Description
name_ch	String	Chinese name
name_en	String	English name.
description	String	Description
qualified_name	String	File name extension.
guid	String	GUID, which is automatically generated.
code	String	Code.
alias	String	Alias

Parameter	Type	Description
status	String	Release status of an entity. This parameter is read-only and does not need to be set during creation and update. Options: <ul style="list-style-type: none"> • DRAFT: draft • PUBLISH_DEVELOPING: to be reviewed • PUBLISHED: released • OFFLINE_DEVELOPING: to be reviewed • OFFLINE: offline • REJECT: rejected
new_biz	BizVersionManag eVO object	Service version management. This parameter is read-only.
data_owner	String	Data owner.
data_owner_list	String	Data owner set.
data_department	String	Data domain.
path	String	Path information.
level	Integer	Level information.
ordinal	Integer	Sequence number.
owner	String	Owner of the instance.
parent_id	String	Parent directory ID, which is a string. If no parent directory ID exists, the parent directory is the root directory.
swap_order_id	String	ID of the target node at the same layer, which is a string
id	String	Subject ID, which is a string
qualified_id	String	Authentication ID, which is automatically generated.
from_public	Boolean	Indicates whether the data is from the public layer.
create_by	String	Creator.
update_by	String	Person who updates the information.

Parameter	Type	Description
create_time	String	Creation time, which is read-only. The format complies with RFC3339 and is accurate to seconds. The UTC time zone is yyyy-mm-ddTHH:MM:SSZ, for example, 1970-01-01T00:00:00Z.
update_time	String	Update time, which is read-only. The format complies with RFC3339 and is accurate to seconds. The UTC time zone is yyyy-mm-ddTHH:MM:SSZ, for example, 1970-01-01T00:00:00Z.
children_num	Integer	Number of subprocesses, excluding subprocesses. This parameter is not transferred from the front end.
children	Array of CatalogVO objects	Lower-level subdirectory, which is read-only.
self_defined_fields	Array of SelfDefinedField-VO objects	Customize Attribute Field:

Table 7-417 BizVersionManageVO

Parameter	Type	Description
id	String	Field ID, which is a string

Parameter	Type	Description
biz_type	String	<p>Business entity type.</p> <p>Options:</p> <ul style="list-style-type: none"> • AGGREGATION_LOGIC_TABLE: summary table • ATOMIC_INDEX: atomic metric • ATOMIC_METRIC: atomic metric (new) • BIZ_CATALOG: process architecture directory • BIZ_METRIC: service indicator • CODE_TABLE: code table • COMMON_CONDITION: general filter • COMPOSITE_METRIC: Compound Metric (new) • COMPOUND_METRIC: compound metric • CONDITION_GROUP: restriction group • DEGENERATE_DIMENSION: degenerate dimension • DERIVATIVE_INDEX: derivative indicator • DERIVED_METRIC: derivative indicator (new) • DIMENSION: dimension • DIMENSION_ATTRIBUTE: dimension attribute • DIMENSION_HIERARCHIES: dimension level • DIMENSION_LOGIC_TABLE: dimension table • DIMENSION_TABLE_ATTRIBUTE: dimension attribute • DIRECTORY: directory • FACT_ATTRIBUTE: fact table attribute • FACT_DIMENSION: fact table dimension • FACT_LOGIC_TABLE: fact table • FACT_MEASURE: fact table measurement • FUNCTION: function

Parameter	Type	Description
		<ul style="list-style-type: none"> • INFO_ARCH: information architecture (used for modifying themes in batches) • MODEL: model • QUALITY_RULE: quality rule • SECRECY_LEVEL: security level • STANDARD_ELEMENT: data standard • STANDARD_ELEMENT_TEMPLATE: data standard template • SUBJECT: theme • Dimension attributes of SUMMARY_DIMENSION_ATTRIBUTE: summary tables • SUMMARY_INDEX: summary table indicator attribute • SUMMARY_TIME: time period attribute of the SDR table • TABLE_MODEL: relationship model (logical model/physical model) • TABLE_MODEL_ATTRIBUTE: relationship model attribute (logical model/physical model) • TABLE_MODEL_LOGIC: logical entity • TABLE_TYPE: table type • TAG: tag • TIME_CONDITION: time restriction
biz_id	String	Business ID, which is a string
biz_info	String	Business object information.

Parameter	Type	Description
status	String	Release status of an entity. This parameter is read-only and does not need to be set during creation and update. Options: <ul style="list-style-type: none"> • DRAFT: draft • PUBLISH_DEVELOPING: to be reviewed • PUBLISHED: released • OFFLINE_DEVELOPING: to be reviewed • OFFLINE: offline • REJECT: rejected
biz_version	Integer	Service version, which is read-only.
create_time	String	Creation time, which is read-only. The format complies with RFC3339 and is accurate to seconds. The UTC time zone is yyyy-mm-ddTHH:MM:SSZ, for example, 1970-01-01T00:00:00Z.
update_time	String	Update time, which is read-only. The format complies with RFC3339 and is accurate to seconds. The UTC time zone is yyyy-mm-ddTHH:MM:SSZ, for example, 1970-01-01T00:00:00Z.

Table 7-418 SelfDefinedFieldVO

Parameter	Type	Description
fd_name_ch	String	Chinese name of a user-defined item.
fd_name_en	String	English name of a customized item.
not_null	Boolean	Whether a parameter is mandatory.
fd_value	String	Attribute value

Status code: 400

Table 7-419 Response body parameters

Parameter	Type	Description
error_code	String	Error code, for example, DS.6000, indicating that the request fails to be processed.
error_msg	String	Error message
data	Object	Returned data information.

Status code: 401**Table 7-420** Response body parameters

Parameter	Type	Description
error_code	String	Error code, for example, DS.6000, indicating that the request fails to be processed.
error_msg	String	Error message
data	Object	Returned data information.

Status code: 403**Table 7-421** Response body parameters

Parameter	Type	Description
error_code	String	Error code, for example, DS.6000, indicating that the request fails to be processed.
error_msg	String	Error message
data	Object	Returned data information.

Status code: 404**Table 7-422** Response body parameters

Parameter	Type	Description
error_code	String	Error code, for example, DS.6000, indicating that the request fails to be processed.

Parameter	Type	Description
error_msg	String	Error message
data	Object	Returned data information.

Example Requests

Search for all topics.

```
GET https://{endpoint}/v2/{project_id}/design/subjects?parent_id=-1
```

Example Responses

Status code: 200

This operation succeeds, and the returned data is a CatalogVO array and the total number of records.

Status Codes

Status Code	Description
200	This operation succeeds, and the returned data is a CatalogVO array and the total number of records.
400	BadRequest
401	Unauthorized
403	Forbidden
404	Not Found

7.8.7 Deleting a Theme (New)

Function

Delete a theme (new).

Calling Method

For details, see [Calling APIs](#).

URI

DELETE /v3/{project_id}/design/subjects

Table 7-423 Path Parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Project ID. For details about how to obtain the project ID, see Project ID and Account ID .

Request Parameters

Table 7-424 Request header parameters

Parameter	Mandatory	Type	Description
X-Auth-Token	Yes	String	IAM token, which is obtained by calling the IAM API for obtaining a user token (value of X-Subject-Token in the response header). This field is mandatory for authentication using tokens.
workspace	Yes	String	Workspace ID. For details about how to obtain the workspace ID, see Instance ID and Workspace ID .
X-Project-Id	No	String	Project ID. For details about how to obtain the project ID, see Project ID and Account ID . This parameter is mandatory for API requests that use AK/SK authentication in multi-project scenarios.

Parameter	Mandatory	Type	Description
Content-Type	No	String	Default value: application/json;charset=UTF-8 This parameter is optional. If the body is available, this parameter is mandatory. If the body is unavailable, you do not need to set this parameter or verify it.

Table 7-425 Request body parameters

Parameter	Mandatory	Type	Description
ids	Yes	Array of strings	ID list, which is a string
del_types	No	String	Deletion type. Enumerated values: <ul style="list-style-type: none"> • PHYSICAL_TABLE: whether to delete physical database tables. This parameter is valid only for tables that can be materialized. (If this parameter is set, physical database tables are deleted.)

Response Parameters

Status code: 200

Table 7-426 Response body parameters

Parameter	Type	Description
data	data object	Indicates the final deletion result, that is, the number of objects that are successfully deleted.

Table 7-427 data

Parameter	Type	Description
value	String	Number of successfully deleted objects

Status code: 400**Table 7-428** Response body parameters

Parameter	Type	Description
error_code	String	Error code, for example, DS.6000, indicating that the request fails to be processed.
error_msg	String	Error message
data	Object	Returned data information.

Status code: 401**Table 7-429** Response body parameters

Parameter	Type	Description
error_code	String	Error code, for example, DS.6000, indicating that the request fails to be processed.
error_msg	String	Error message
data	Object	Returned data information.

Status code: 403**Table 7-430** Response body parameters

Parameter	Type	Description
error_code	String	Error code, for example, DS.6000, indicating that the request fails to be processed.
error_msg	String	Error message
data	Object	Returned data information.

Status code: 404

Table 7-431 Response body parameters

Parameter	Type	Description
error_code	String	Error code, for example, DS.6000, indicating that the request fails to be processed.
error_msg	String	Error message
data	Object	Returned data information.

Example Requests

Delete a theme (new).

```
DELETE https://{endpoint}/v2/{project_id}/design/subjects
```

```
{

Table 7-434 Request body parameters

Parameter	Mandatory	Type	Description
id	No	String	ID, which is a string. This parameter is mandatory for update and can be left empty for creation.
name_ch	Yes	String	Chinese name
name_en	Yes	String	English name.
description	No	String	Description, which is mandatory for the business object.
alias	No	String	Alias
data_owner	No	String	Data owner department.
data_owner_list	Yes	String	Data owner. Array format: ["user_1","user_2"].
level	Yes	Integer	Indicates the level. The value ranges from 1 to 7.
parent_id	No	String	Upper-layer subject ID, which is a string. This parameter is left empty for the first layer.
self_defined_fields	No	Array of SelfDefinedFieldVO objects	User-defined item. Customized attribute of a theme.

Table 7-435 SelfDefinedFieldVO

Parameter	Mandatory	Type	Description
fd_name_ch	No	String	Chinese name of a user-defined item.

Parameter	Mandatory	Type	Description
fd_name_en	No	String	English name of a customized item.
not_null	No	Boolean	Whether a parameter is mandatory.
fd_value	No	String	Attribute value

Response Parameters

Status code: 200

Table 7-436 Response body parameters

Parameter	Type	Description
data	data object	data: unified outermost data structure of the returned result.

Table 7-437 data

Parameter	Type	Description
value	CatalogVO object	CatalogVO information.

Table 7-438 CatalogVO

Parameter	Type	Description
name_ch	String	Chinese name
name_en	String	English name.
description	String	Description
qualified_name	String	File name extension.
guid	String	GUID, which is automatically generated.
code	String	Code.
alias	String	Alias

Parameter	Type	Description
status	String	Release status of an entity. This parameter is read-only and does not need to be set during creation and update. Options: <ul style="list-style-type: none">• DRAFT: draft• PUBLISH_DEVELOPING: to be reviewed• PUBLISHED: released• OFFLINE_DEVELOPING: to be reviewed• OFFLINE: offline• REJECT: rejected
new_biz	BizVersionManag eVO object	Service version management. This parameter is read-only.
data_owner	String	Data owner.
data_owner_list	String	Data owner set.
data_department	String	Data domain.
path	String	Path information.
level	Integer	Level information.
ordinal	Integer	Sequence number.
owner	String	Owner of the instance.
parent_id	String	Parent directory ID, which is a string. If no parent directory ID exists, the parent directory is the root directory.
swap_order_id	String	ID of the target node at the same layer, which is a string
id	String	Subject ID, which is a string
qualified_id	String	Authentication ID, which is automatically generated.
from_public	Boolean	Indicates whether the data is from the public layer.
create_by	String	Creator.
update_by	String	Person who updates the information.

Parameter	Type	Description
create_time	String	Creation time, which is read-only. The format complies with RFC3339 and is accurate to seconds. The UTC time zone is yyyy-mm-ddTHH:MM:SSZ, for example, 1970-01-01T00:00:00Z.
update_time	String	Update time, which is read-only. The format complies with RFC3339 and is accurate to seconds. The UTC time zone is yyyy-mm-ddTHH:MM:SSZ, for example, 1970-01-01T00:00:00Z.
children_num	Integer	Number of subprocesses, excluding subprocesses. This parameter is not transferred from the front end.
children	Array of CatalogVO objects	Lower-level subdirectory, which is read-only.
self_defined_fields	Array of SelfDefinedField-VO objects	Customize Attribute Field:

Table 7-439 BizVersionManageVO

Function

Modify Theme (New).

Calling Method

For details, see [Calling APIs](#).

URI

PUT /v3/{project_id}/design/subjects

Table 7-445 Path Parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Project ID. For details about how to obtain the project ID, see Project ID and Account ID .

Request Parameters

Table 7-446 Request header parameters

Parameter	Mandatory	Type	Description
X-Auth-Token	Yes	String	IAM token, which is obtained by calling the IAM API for obtaining a user token (value of X-Subject-Token in the response header). This field is mandatory for authentication using tokens.
workspace	Yes	String	Workspace ID. For details about how to obtain the workspace ID, see Instance ID and Workspace ID .
X-Project-Id	No	String	Project ID. For details about how to obtain the project ID, see Project ID and Account ID . This parameter is mandatory for API requests that use AK/SK authentication in multi-project scenarios.
Content-Type	No	String	Default value: application/json;charset=UTF-8 This parameter is optional. If the body is available, this parameter is mandatory. If the body is unavailable, you do not need to set this parameter or verify it.

Table 7-447 Request body parameters

Parameter	Mandatory	Type	Description
id	No	String	ID, which is a string. This parameter is mandatory for update and can be left empty for creation.
name_ch	Yes	String	Chinese name
name_en	Yes	String	English name.

Parameter	Mandatory	Type	Description
description	No	String	Description, which is mandatory for the business object.
alias	No	String	Alias
data_owner	No	String	Data owner department.
data_owner_list	Yes	String	Data owner. Array format: ["user_1","user_2"].
level	Yes	Integer	Indicates the level. The value ranges from 1 to 7.
parent_id	No	String	Upper-layer subject ID, which is a string. This parameter is left empty for the first layer.
self_defined_fields	No	Array of SelfDefinedFieldVO objects	User-defined item. Customized attribute of a theme.

Table 7-448 SelfDefinedFieldVO

Parameter	Mandatory	Type	Description
fd_name_ch	No	String	Chinese name of a user-defined item.
fd_name_en	No	String	English name of a customized item.
not_null	No	Boolean	Whether a parameter is mandatory.
fd_value	No	String	Attribute value

Status Codes

Status Code	Description
200	This operation is successful, and the returned data is CatalogVO details.
400	BadRequest
401	Unauthorized
403	Forbidden
404	Not Found

7.9 Subject Levels

7.9.1 Obtains the topic level.

Function

Obtains the topic level.

Calling Method

For details, see [Calling APIs](#).

URI

GET /v2/{project_id}/design/subject-levels

Table 7-458 Path Parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Project ID. For details about how to obtain the project ID, see Project ID and Account ID .

Table 7-459 Query Parameters

Parameter	Mandatory	Type	Description
limit	No	Integer	Number of records to be queried on each page, that is, Y records to be queried. The default value is 50, and the value range is [1,100].
offset	No	Integer	Start coordinate of the query, that is, the number of skipped data records. The value can only be 0 or an integer multiple of limit. If the value does not meet the requirement, the value is rounded down. The default value is 0.

Request Parameters

Table 7-460 Request header parameters

Parameter	Mandatory	Type	Description
X-Auth-Token	Yes	String	IAM token, which is obtained by calling the IAM API for obtaining a user token (value of X-Subject-Token in the response header). This field is mandatory for authentication using tokens.
workspace	Yes	String	Workspace ID. For details about how to obtain the workspace ID, see Instance ID and Workspace ID .

Parameter	Mandatory	Type	Description
X-Project-Id	No	String	Project ID. For details about how to obtain the project ID, see Project ID and Account ID . This parameter is mandatory for API requests that use AK/SK authentication in multi-project scenarios.
Content-Type	No	String	Default value: application/json;charset=UTF-8 This parameter is optional. If the body is available, this parameter is mandatory. If the body is unavailable, you do not need to set this parameter or verify it.

Response Parameters

Status code: 200

Table 7-461 Response body parameters

Parameter	Type	Description
data	data object	data: unified outermost data structure of the returned result.

Table 7-462 data

Parameter	Type	Description
value	Array of CatalogLevelVO objects	value: unified outer data structure of the returned result.

Table 7-463 CatalogLevelVO

Parameter	Type	Description
id	String	ID, which is a string
level	Integer	Indicates the level. The value ranges from 1 to 7.

Parameter	Type	Description
name_ch	String	Chinese name
name_en	String	English name.

Status code: 400**Table 7-464** Response body parameters

Parameter	Type	Description
error_code	String	Error code, for example, DS.6000, indicating that the request fails to be processed.
error_msg	String	Error message
data	Object	Returned data information.

Status code: 401**Table 7-465** Response body parameters

Parameter	Type	Description
error_code	String	Error code, for example, DS.6000, indicating that the request fails to be processed.
error_msg	String	Error message
data	Object	Returned data information.

Status code: 403**Table 7-466** Response body parameters

Parameter	Type	Description
error_code	String	Error code, for example, DS.6000, indicating that the request fails to be processed.
error_msg	String	Error message
data	Object	Returned data information.

Status code: 404**Table 7-467** Response body parameters

Parameter	Type	Description
error_code	String	Error code, for example, DS.6000, indicating that the request fails to be processed.
error_msg	String	Error message
data	Object	Returned data information.

Example Requests

This API is used to obtain the level information of a topic in the current workspace.

```
GET https://{endpoint}/v2/{project_id}/design/subject-levels
```

Example Responses**Status code: 200**

This operation succeeds, and the hierarchy list is returned.

More

For SDK sample code of more programming languages, see the Sample Code tab in [API Explorer](#). SDK sample code can be automatically generated.

Status Codes

Status Code	Description
200	This operation succeeds, and the returned data is CatalogLevelVOList.
400	BadRequest
401	Unauthorized
403	Forbidden
404	Not Found

7.10 Catalog Management

7.10.1 Obtains all directories.

Function

Obtains all directories (data standards and code tables).

Calling Method

For details, see [Calling APIs](#).

URI

GET /v2/{project_id}/design/directories

Table 7-480 Path Parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Project ID. For details about how to obtain the project ID, see Project ID and Account ID .

Table 7-481 Query Parameters

Parameter	Mandatory	Type	Description
limit	No	Integer	Number of records to be queried on each page, that is, Y records to be queried. The default value is 50, and the value range is [1,100].
offset	No	Integer	Start coordinate of the query, that is, the number of skipped data records. The value can only be 0 or an integer multiple of limit. If the value does not meet the requirement, the value is rounded down. The default value is 0.
type	Yes	String	Obtain the data in the directory. If there are subdirectories, obtain the data in all subdirectories. Options: <ul style="list-style-type: none"> • CODE: code table directory • STANDARD_ELEMENT: data standard directory

Request Parameters

Table 7-482 Request header parameters

Parameter	Mandatory	Type	Description
X-Auth-Token	Yes	String	IAM token, which is obtained by calling the IAM API for obtaining a user token (value of X-Subject-Token in the response header). This field is mandatory for authentication using tokens.
workspace	Yes	String	Workspace ID. For details about how to obtain the workspace ID, see Instance ID and Workspace ID .

Parameter	Mandatory	Type	Description
X-Project-Id	No	String	Project ID. For details about how to obtain the project ID, see Project ID and Account ID . This parameter is mandatory for API requests that use AK/SK authentication in multi-project scenarios.
Content-Type	No	String	Default value: application/json;charset=UTF-8 This parameter is optional. If the body is available, this parameter is mandatory. If the body is unavailable, you do not need to set this parameter or verify it.

Response Parameters

Status code: 200

Table 7-483 Response body parameters

Parameter	Type	Description
data	data object	data: unified outermost data structure of the returned result.

Table 7-484 data

Parameter	Type	Description
value	Array of DirectoryVO objects	value: unified outer data structure of the returned result.

Table 7-485 DirectoryVO

Parameter	Type	Description
name	String	Catalog name.
description	String	Description.

Parameter	Type	Description
type	String	Directory type Options: <ul style="list-style-type: none">• STANDARD_ELEMENT: data standard• CODE: code table
id	String	ID. This parameter is optional for creation but mandatory for update. ID string
parent_id	String	Parent directory ID. The value null is transferred at the first layer. ID string
prev_id	String	ID of the previous node. Transfer null for the first node. ID string
root_id	String	Root node ID, which is read-only ID string
qualified_name	String	Asset name of a catalog. This parameter is read-only.
from_public	Boolean	Indicates whether the data is from the public layer. This parameter is read-only.
create_time	String	Creation time, which is read-only. The format complies with RFC3339 and is accurate to seconds. The UTC time zone is yyyy-mm-ddTHH:MM:SSZ, for example, 1970-01-01T00:00:00Z.
update_time	String	Update time, which is read-only. The format complies with RFC3339 and is accurate to seconds. The UTC time zone is yyyy-mm-ddTHH:MM:SSZ, for example, 1970-01-01T00:00:00Z.
create_by	String	Creator, which is read-only.
update_by	String	Updater, which is read-only.
ref_id	String	Associated subject ID, which is a string
children	Array of DirectoryVO objects	Subdirectory.

Status code: 400

Table 7-486 Response body parameters

Parameter	Type	Description
error_code	String	Error code, for example, DS.6000, indicating that the request fails to be processed.
error_msg	String	Error message
data	Object	Returned data information.

Status code: 401

Table 7-487 Response body parameters

Parameter	Type	Description
error_code	String	Error code, for example, DS.6000, indicating that the request fails to be processed.
error_msg	String	Error message
data	Object	Returned data information.

Status code: 403

Table 7-488 Response body parameters

Parameter	Type	Description
error_code	String	Error code, for example, DS.6000, indicating that the request fails to be processed.
error_msg	String	Error message
data	Object	Returned data information.

Example Requests

Obtains all directories of the data standard based on the directory type.

GET https://{endpoint}/v2/{project_id}/design/directories?type=STANDARD_ELEMENT

Example Responses

Status code: 200

This operation succeeds, and the returned data is a directory with subdirectories.

Status Codes

Status Code	Description
200	This operation succeeds, and the returned data is a directory with subdirectories.
400	BadRequest
401	Unauthorized
403	Forbidden

7.10.2 Create a Directory

Function

Create directories (data standards and code tables).

Calling Method

For details, see [Calling APIs](#).

URI

POST /v2/{project_id}/design/directories

Table 7-489 Path Parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Project ID. For details about how to obtain the project ID, see Project ID and Account ID .

Request Parameters

Table 7-490 Request header parameters

Parameter	Mandatory	Type	Description
X-Auth-Token	Yes	String	IAM token, which is obtained by calling the IAM API for obtaining a user token (value of X-Subject-Token in the response header). This field is mandatory for authentication using tokens.
workspace	Yes	String	Workspace ID. For details about how to obtain the workspace ID, see Instance ID and Workspace ID .
X-Project-Id	No	String	Project ID. For details about how to obtain the project ID, see Project ID and Account ID . This parameter is mandatory for API requests that use AK/SK authentication in multi-project scenarios.
Content-Type	No	String	Default value: application/json;charset=UTF-8 This parameter is optional. If the body is available, this parameter is mandatory. If the body is unavailable, you do not need to set this parameter or verify it.

Table 7-491 Request body parameters

Parameter	Mandatory	Type	Description
name	Yes	String	Catalog name.
description	No	String	Description.
type	Yes	String	Directory type Options: <ul style="list-style-type: none"> STANDARD_ELEMENT: data standard CODE: code table

Parameter	Mandatory	Type	Description
id	No	String	ID. This parameter is optional for creation but mandatory for update. ID string
parent_id	Yes	String	Parent directory ID. The value null is transferred at the first layer. ID string
prev_id	Yes	String	ID of the previous node. Transfer null for the first node. ID string
ref_id	No	String	Associated subject ID, which is a string
children	No	Array of DirectoryVO objects	Subdirectory.

Response Parameters

Status code: 200

Table 7-492 Response body parameters

Parameter	Type	Description
data	data object	data: unified outermost data structure of the returned result.

Table 7-493 data

Parameter	Type	Description
value	DirectoryVO object	value: unified outer data structure of the returned result.

Table 7-494 DirectoryVO

Parameter	Type	Description
name	String	Catalog name.
description	String	Description.

Parameter	Type	Description
type	String	Directory type Options: <ul style="list-style-type: none">• STANDARD_ELEMENT: data standard• CODE: code table
id	String	ID. This parameter is optional for creation but mandatory for update. ID string
parent_id	String	Parent directory ID. The value null is transferred at the first layer. ID string
prev_id	String	ID of the previous node. Transfer null for the first node. ID string
root_id	String	Root node ID, which is read-only ID string
qualified_name	String	Asset name of a catalog. This parameter is read-only.
from_public	Boolean	Indicates whether the data is from the public layer. This parameter is read-only.
create_time	String	Creation time, which is read-only. The format complies with RFC3339 and is accurate to seconds. The UTC time zone is yyyy-mm-ddTHH:MM:SSZ, for example, 1970-01-01T00:00:00Z.
update_time	String	Update time, which is read-only. The format complies with RFC3339 and is accurate to seconds. The UTC time zone is yyyy-mm-ddTHH:MM:SSZ, for example, 1970-01-01T00:00:00Z.
create_by	String	Creator, which is read-only.
update_by	String	Updater, which is read-only.
ref_id	String	Associated subject ID, which is a string
children	Array of DirectoryVO objects	Subdirectory.

Status code: 400

Table 7-495 Response body parameters

Parameter	Type	Description
error_code	String	Error code, for example, DS.6000, indicating that the request fails to be processed.
error_msg	String	Error message
data	Object	Returned data information.

Status code: 401

Table 7-496 Response body parameters

Parameter	Type	Description
error_code	String	Error code, for example, DS.6000, indicating that the request fails to be processed.
error_msg	String	Error message
data	Object	Returned data information.

Status code: 403

Table 7-497 Response body parameters

Parameter	Type	Description
error_code	String	Error code, for example, DS.6000, indicating that the request fails to be processed.
error_msg	String	Error message
data	Object	Returned data information.

Example Requests

Create a directory based on the request parameters.

```
POST https://{endpoint}/v2/{project_id}/design/directories?type=STANDARD_ELEMENT
{
  "name": "Online payment",
  "parent_id": "1169318103583268864",
  "prev_id": "1169318103583268864",
  "type": "STANDARD_ELEMENT"
}
```

Example Responses

Status code: 200

This operation succeeds, and the returned data is DirectoryVO.

```
{
  "data" : {
    "value" : {
      "name" : "Online payment",
      "description" : null,
      "type" : "STANDARD_ELEMENT",
      "id" : "1231215227505364992",
      "parent_id" : "1169318103583268864",
      "prev_id" : null,
      "root_id" : "1169318103583268864",
      "qualified_name" : "Payment Method. Online Payment",
      "create_time" : "2024-04-20T12:09:45.11+08:00",
      "update_time" : "2024-04-20T12:09:45.11+08:00",
      "from_public" : null,
      "create_by" : "test_uesr",
      "update_by" : "test_uesr",
      "ref_id" : null,
      "children" : null
    }
  }
}
```

Status code: 400

BadRequest

```
{
  "error_code" : "DS.60xx",
  "error_msg" : "The user request is illegal."
}
```

Status code: 401

Unauthorized

```
{
  "error_code" : "DS.60xx",
  "error_msg" : "User authentication failed."
}
```

Status code: 403

Forbidden

```
{
  "error_code" : "DS.60xx",

For SDK sample code of more programming languages, see the Sample Code tab in [API Explorer](#). SDK sample code can be automatically generated.

Status Codes

Status Code	Description
200	This operation succeeds, and the returned data is DirectoryVO.
400	BadRequest
401	Unauthorized
403	Forbidden

7.10.4 Deleting a Directory

Function

Delete directories (data standards and code tables).

Calling Method

For details, see [Calling APIs](#).

URI

DELETE /v2/{project_id}/design/directories

Table 7-507 Path Parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Project ID. For details about how to obtain the project ID, see Project ID and Account ID .

Table 7-508 Query Parameters

Parameter	Mandatory	Type	Description
ids	Yes	Array of strings	Array of entity IDs, which is a string

Request Parameters

Table 7-509 Request header parameters

Parameter	Mandatory	Type	Description
X-Auth-Token	Yes	String	IAM token, which is obtained by calling the IAM API for obtaining a user token (value of X-Subject-Token in the response header). This field is mandatory for authentication using tokens.
workspace	Yes	String	Workspace ID. For details about how to obtain the workspace ID, see Instance ID and Workspace ID .
X-Project-Id	No	String	Project ID. For details about how to obtain the project ID, see Project ID and Account ID . This parameter is mandatory for API requests that use AK/SK authentication in multi-project scenarios.

Parameter	Mandatory	Type	Description
Content-Type	No	String	Default value: application/json;charset=UTF-8 This parameter is optional. If the body is available, this parameter is mandatory. If the body is unavailable, you do not need to set this parameter or verify it.

Response Parameters

Status code: 200

Table 7-510 Response body parameters

Parameter	Type	Description
data	data object	Indicates the final deletion result, that is, the number of objects that are successfully deleted.

Table 7-511 data

Parameter	Type	Description
value	String	Number of successfully deleted objects

Status code: 400

Table 7-512 Response body parameters

Parameter	Type	Description
error_code	String	Error code, for example, DS.6000, indicating that the request fails to be processed.
error_msg	String	Error message
data	Object	Returned data information.

Status code: 401

Table 7-513 Response body parameters

Parameter	Type	Description
error_code	String	Error code, for example, DS.6000, indicating that the request fails to be processed.
error_msg	String	Error message
data	Object	Returned data information.

Status code: 403

Table 7-514 Response body parameters

Parameter	Type	Description
error_code	String	Error code, for example, DS.6000, indicating that the request fails to be processed.
error_msg	String	Error message
data	Object	Returned data information.

Example Requests

Modify the directory based on the request parameters.

```
DELETE https://{endpoint}/v2/{project_id}/design/directories?ids=1231215227505364992
```

Example Responses

Status code: 400

BadRequest

```
{
  "error_code" : "DS.60xx",
  "error_msg" : "The user request is illegal."
}
```

Status code: 401

Unauthorized

```
{
  "error_code" : "DS.60xx",
  "error_msg" : "User authentication failed."
}
```

Status code: 403

Forbidden

```
{
  "error_code" : "DS.60xx",
```

```
"error_msg" : "The user does not have permission to call this API."  
}
```

7.11 Atomic Metrics

7.11.1 Searching for Atomic Metrics

Function

You can search for atomic metrics by Chinese and English names, creator, reviewer, status, and modification time. Fuzzy search is supported.

Calling Method

For details, see [Calling APIs](#).

URI

GET /v2/{project_id}/design/atomic-indexs

Table 7-515 Path Parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Project ID. For details about how to obtain the project ID, see Project ID and Account ID .

Table 7-516 Query Parameters

Parameter	Mandatory	Type	Description
name	No	String	Fuzzy query by name or code.
create_by	No	String	Query by creator.
approver	No	String	Query by reviewer.
status	No	String	Specifies the service status. Options: <ul style="list-style-type: none">• DRAFT: draft• PUBLISH_DEVELOPING: to be approved• PUBLISHED: released• OFFLINE_DEVELOPING: to be approved• OFFLINE: offline• REJECT: rejected
begin_time	No	String	Left boundary of time filtering. This parameter is used together with end_time. Only time range filtering is supported. Unilateral filtering is invalid. The format complies with RFC3339 and is accurate to seconds. The UTC time zone is yyyy-mm-ddTHH:MM:SSZ, for example, 1970-01-01T00:00:00Z.
end_time	No	String	Right boundary for time filtering. This parameter is used together with begin_time to support only time range filtering. The format complies with RFC3339 and is accurate to seconds. The UTC time zone is yyyy-mm-ddTHH:MM:SSZ, for example, 1970-01-01T00:00:00Z.
l3_id	No	String	ID of business object l3, which is a string
table_id	No	String	ID of the associated table, which is a string

Parameter	Mandatory	Type	Description
limit	No	Integer	Number of records to be queried on each page, that is, Y records to be queried. The default value is 50, and the value range is [1,100].
offset	No	Integer	Start coordinate of the query, that is, the number of skipped data records. The value can only be 0 or an integer multiple of limit. If the value does not meet the requirement, the value is rounded down. The default value is 0.

Request Parameters

Table 7-517 Request header parameters

Parameter	Mandatory	Type	Description
X-Auth-Token	Yes	String	IAM token, which is obtained by calling the IAM API for obtaining a user token (value of X-Subject-Token in the response header). This field is mandatory for authentication using tokens.
workspace	Yes	String	Workspace ID. For details about how to obtain the workspace ID, see Instance ID and Workspace ID .
X-Project-Id	No	String	Project ID. For details about how to obtain the project ID, see Project ID and Account ID . This parameter is mandatory for API requests that use AK/SK authentication in multi-project scenarios.

Parameter	Mandatory	Type	Description
Content-Type	No	String	Default value: application/json;charset=UTF-8 This parameter is optional. If the body is available, this parameter is mandatory. If the body is unavailable, you do not need to set this parameter or verify it.

Response Parameters

Status code: 200

Table 7-518 Response body parameters

Parameter	Type	Description
data	data object	Returned data.

Table 7-519 data

Parameter	Type	Description
value	value object	Returned data information.

Table 7-520 value

Parameter	Type	Description
records	Array of AtomicIndexVO objects	AtomicIndexVO array.
total	Integer	Total number.

Table 7-521 AtomicIndexVO

Parameter	Type	Description
id	String	ID, which is a string
name_en	String	Indicates the English name of an atomic metric.

Parameter	Type	Description
name_ch	String	Indicates the English name of an atomic metric.
description	String	Description.
create_by	String	Creator.
cal_exp	String	Calculation expression, for example, 'sum(\${fact_column_id})', where fact_column_id indicates the ID of the referenced field in the fact table
cal_fn_ids	Array of strings	Reference function ID, which is a string
l1_id	String	Subject area group ID, which is a read-only string
l2_id	String	Subject area ID. This parameter is read-only and does not need to be set during creation and update.
l3_id	String	Business object GUID, which is a string
table_id	String	Fact table ID, which is a string
tb_name	String	Name of a fact table.
dw_type	String	Data connection type, which corresponds to the type of the data warehouse where the table is located. The value can be DWS, MRS_HIVE, POSTGRESQL, MRS_SPARK, CLICKHOUSE, MYSQL, ORACLE, or DORIS.
field_ids	Array of strings	Field ID, which is a string
field_names	Array of strings	Field name.
status	String	Release status of an entity. This parameter is read-only and does not need to be set during creation and update. Options: <ul style="list-style-type: none"> ● DRAFT: draft ● PUBLISH_DEVELOPING: to be reviewed ● PUBLISHED: released ● OFFLINE_DEVELOPING: to be reviewed ● OFFLINE: offline ● REJECT: rejected

Parameter	Type	Description
biz_type	String	<p>Business entity type.</p> <p>Options:</p> <ul style="list-style-type: none"> • AGGREGATION_LOGIC_TABLE: summary table • ATOMIC_INDEX: atomic metric • ATOMIC_METRIC: atomic metric (new) • BIZ_CATALOG: process architecture directory • BIZ_METRIC: service indicator • CODE_TABLE: code table • COMMON_CONDITION: general filter • COMPOSITE_METRIC: Compound Metric (new) • COMPOUND_METRIC: compound metric • CONDITION_GROUP: restriction group • DEGENERATE_DIMENSION: degenerate dimension • DERIVATIVE_INDEX: derivative indicator • DERIVED_METRIC: derivative indicator (new) • DIMENSION: dimension • DIMENSION_ATTRIBUTE: dimension attribute • DIMENSION_HIERARCHIES: dimension level • DIMENSION_LOGIC_TABLE: dimension table • DIMENSION_TABLE_ATTRIBUTE: dimension attribute • DIRECTORY: directory • FACT_ATTRIBUTE: fact table attribute • FACT_DIMENSION: fact table dimension • FACT_LOGIC_TABLE: fact table • FACT_MEASURE: fact table measurement • FUNCTION: function

Parameter	Type	Description
		<ul style="list-style-type: none"> • INFO_ARCH: information architecture (used for modifying themes in batches) • MODEL: model • QUALITY_RULE: quality rule • SECRECY_LEVEL: security level • STANDARD_ELEMENT: data standard • STANDARD_ELEMENT_TEMPLATE: data standard template • SUBJECT: theme • Dimension attributes of SUMMARY_DIMENSION_ATTRIBUTE: summary tables • SUMMARY_INDEX: summary table indicator attribute • SUMMARY_TIME: time period attribute of the SDR table • TABLE_MODEL: relationship model (logical model/physical model) • TABLE_MODEL_ATTRIBUTE: relationship model attribute (logical model/physical model) • TABLE_MODEL_LOGIC: logical entity • TABLE_TYPE: table type • TAG: tag • TIME_CONDITION: time restriction
create_time	String	Creation time, which is read-only. The format complies with RFC3339 and is accurate to seconds. The UTC time zone is yyyy-mm-ddTHH:MM:SSZ, for example, 1970-01-01T00:00:00Z.
update_time	String	Update time, which is read-only. The format complies with RFC3339 and is accurate to seconds. The UTC time zone is yyyy-mm-ddTHH:MM:SSZ, for example, 1970-01-01T00:00:00Z.
l1	String	Chinese name of the subject area group. This parameter is read-only and does not need to be set when you create or update a subject area group.

Parameter	Type	Description
l2	String	Chinese name of the subject area. This parameter is read-only and does not need to be set during creation and update.
l3	String	Chinese name of the business object. This parameter is read-only and does not need to be set during creation and update.
approval_info	ApprovalVO object	Approval information. This parameter is read-only. Latest review information about a business object, including the business details, reviewer information, and review time.
new_biz	BizVersionManag eVO object	Service version management. This parameter is read-only.

Table 7-522 ApprovalVO

Parameter	Type	Description
id	String	Application ID, which is a string
tenant_id	String	Project ID. For details about how to obtain the project ID, see the API path parameter project_id.
name_ch	String	Chinese name of a service.
name_en	String	English name of a service.
biz_id	String	Business ID, which is a string

Parameter	Type	Description
biz_type	String	<p>Business entity type.</p> <p>Options:</p> <ul style="list-style-type: none"> • AGGREGATION_LOGIC_TABLE: summary table • ATOMIC_INDEX: atomic metric • ATOMIC_METRIC: atomic metric (new) • BIZ_CATALOG: process architecture directory • BIZ_METRIC: service indicator • CODE_TABLE: code table • COMMON_CONDITION: general filter • COMPOSITE_METRIC: Compound Metric (new) • COMPOUND_METRIC: compound metric • CONDITION_GROUP: restriction group • DEGENERATE_DIMENSION: degenerate dimension • DERIVATIVE_INDEX: derivative indicator • DERIVED_METRIC: derivative indicator (new) • DIMENSION: dimension • DIMENSION_ATTRIBUTE: dimension attribute • DIMENSION_HIERARCHIES: dimension level • DIMENSION_LOGIC_TABLE: dimension table • DIMENSION_TABLE_ATTRIBUTE: dimension attribute • DIRECTORY: directory • FACT_ATTRIBUTE: fact table attribute • FACT_DIMENSION: fact table dimension • FACT_LOGIC_TABLE: fact table • FACT_MEASURE: fact table measurement • FUNCTION: function

error_msg	String	Error message
data	Object	Returned data information.

Status code: 403

Table 7-526 Response body parameters

Parameter	Type	Description
error_code	String	Error code, for example, DS.6000, indicating that the request fails to be processed.
error_msg	String	Error message
data	Object	Returned data information.

Example Requests

Query the first 10 atomic metrics whose names contain test_a.

```
GET https://{endpoint}/v2/{project_id}/design/atomic-indexs?offset=1&limit=10&name=test_a
```

Example Responses

Status code: 200

This operation succeeds, and the returned data is an AtomicIndexVO array and the total number of records.

More

For SDK sample code of more programming languages, see the Sample Code tab in [API Explorer](#). SDK sample code can be automatically generated.

Status Codes

Status Code	Description
200	This operation succeeds, and the returned data is an AtomicIndexVO array and the total number of records.
400	BadRequest
401	Unauthorized
403	Forbidden

7.11.2 Creating Atomic Metrics

Function

Create an atomic metric.

Calling Method

For details, see [Calling APIs](#).

URI

POST /v2/{project_id}/design/atomic-indexs

Table 7-527 Path Parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Project ID. For details about how to obtain the project ID, see Project ID and Account ID .

Request Parameters

Table 7-528 Request header parameters

Parameter	Mandatory	Type	Description
X-Auth-Token	Yes	String	IAM token, which is obtained by calling the IAM API for obtaining a user token (value of X-Subject-Token in the response header). This field is mandatory for authentication using tokens.
workspace	Yes	String	Workspace ID. For details about how to obtain the workspace ID, see Instance ID and Workspace ID .
X-Project-Id	No	String	Project ID. For details about how to obtain the project ID, see Project ID and Account ID . This parameter is mandatory for API requests that use AK/SK authentication in multi-project scenarios.
Content-Type	No	String	Default value: application/json;charset=UTF-8 This parameter is optional. If the body is available, this parameter is mandatory. If the body is unavailable, you do not need to set this parameter or verify it.

Table 7-529 Request body parameters

Parameter	Mandatory	Type	Description
id	No	String	ID, which is a string
name_en	Yes	String	Indicates the English name of an atomic metric.
name_ch	Yes	String	Indicates the English name of an atomic metric.
description	No	String	Description.
create_by	No	String	Creator.

Parameter	Mandatory	Type	Description
cal_exp	Yes	String	Calculation expression, for example, 'sum({fact_column_id})', where fact_column_id indicates the ID of the referenced field in the fact table
cal_fn_ids	No	Array of strings	Reference function ID, which is a string
l2_id	No	String	Subject area ID. This parameter is read-only and does not need to be set during creation and update.
l3_id	Yes	String	Business object GUID, which is a string
table_id	Yes	String	Fact table ID, which is a string
tb_name	No	String	Name of a fact table.
field_ids	Yes	Array of strings	Field ID, which is a string
field_names	No	Array of strings	Field name.
status	No	String	Release status of an entity. This parameter is read-only and does not need to be set during creation and update. Options: <ul style="list-style-type: none">● DRAFT: draft● PUBLISH_DEVELOPING: to be reviewed● PUBLISHED: released● OFFLINE_DEVELOPING: to be reviewed● OFFLINE: offline● REJECT: rejected

table_id	String	Fact table ID, which is a string
tb_name	String	Name of a fact table.
dw_type	String	Data connection type, which corresponds to the type of the data warehouse where the table is located. The value can be DWS , MRS_HIVE , POSTGRESQL , MRS_SPARK , CLICKHOUSE , MYSQL , ORACLE , or DORIS .
field_ids	Array of strings	Field ID, which is a string
field_names	Array of strings	Field name.
status	String	Release status of an entity. This parameter is read-only and does not need to be set during creation and update. Options: <ul style="list-style-type: none">• DRAFT: draft• PUBLISH_DEVELOPING: to be reviewed• PUBLISHED: released• OFFLINE_DEVELOPING: to be reviewed• OFFLINE: offline• REJECT: rejected

Parameter	Type	Description
biz_type	String	<p>Business entity type.</p> <p>Options:</p> <ul style="list-style-type: none"> • AGGREGATION_LOGIC_TABLE: summary table • ATOMIC_INDEX: atomic metric • ATOMIC_METRIC: atomic metric (new) • BIZ_CATALOG: process architecture directory • BIZ_METRIC: service indicator • CODE_TABLE: code table • COMMON_CONDITION: general filter • COMPOSITE_METRIC: Compound Metric (new) • COMPOUND_METRIC: compound metric • CONDITION_GROUP: restriction group • DEGENERATE_DIMENSION: degenerate dimension • DERIVATIVE_INDEX: derivative indicator • DERIVED_METRIC: derivative indicator (new) • DIMENSION: dimension • DIMENSION_ATTRIBUTE: dimension attribute • DIMENSION_HIERARCHIES: dimension level • DIMENSION_LOGIC_TABLE: dimension table • DIMENSION_TABLE_ATTRIBUTE: dimension attribute • DIRECTORY: directory • FACT_ATTRIBUTE: fact table attribute • FACT_DIMENSION: fact table dimension • FACT_LOGIC_TABLE: fact table • FACT_MEASURE: fact table measurement • FUNCTION: function

Parameter	Type	Description
		<ul style="list-style-type: none"> • INFO_ARCH: information architecture (used for modifying themes in batches) • MODEL: model • QUALITY_RULE: quality rule • SECRECY_LEVEL: security level • STANDARD_ELEMENT: data standard • STANDARD_ELEMENT_TEMPLATE: data standard template • SUBJECT: theme • Dimension attributes of SUMMARY_DIMENSION_ATTRIBUTE: summary tables • SUMMARY_INDEX: summary table indicator attribute • SUMMARY_TIME: time period attribute of the SDR table • TABLE_MODEL: relationship model (logical model/physical model) • TABLE_MODEL_ATTRIBUTE: relationship model attribute (logical model/physical model) • TABLE_MODEL_LOGIC: logical entity • TABLE_TYPE: table type • TAG: tag • TIME_CONDITION: time restriction
create_time	String	Creation time, which is read-only. The format complies with RFC3339 and is accurate to seconds. The UTC time zone is yyyy-mm-ddTHH:MM:SSZ, for example, 1970-01-01T00:00:00Z.
update_time	String	Update time, which is read-only. The format complies with RFC3339 and is accurate to seconds. The UTC time zone is yyyy-mm-ddTHH:MM:SSZ, for example, 1970-01-01T00:00:00Z.
l1	String	Chinese name of the subject area group. This parameter is read-only and does not need to be set when you create or update a subject area group.

Parameter	Type	Description
l2	String	Chinese name of the subject area. This parameter is read-only and does not need to be set during creation and update.
l3	String	Chinese name of the business object. This parameter is read-only and does not need to be set during creation and update.
approval_info	ApprovalVO object	Approval information. This parameter is read-only. Latest review information about a business object, including the business details, reviewer information, and review time.
new_biz	BizVersionManag eVO object	Service version management. This parameter is read-only.

Table 7-535 ApprovalVO

Parameter	Type	Description
id	String	Application ID, which is a string
tenant_id	String	Project ID. For details about how to obtain the project ID, see the API path parameter project_id.
name_ch	String	Chinese name of a service.
name_en	String	English name of a service.
biz_id	String	Business ID, which is a string

Parameter	Type	Description
biz_type	String	<p>Business entity type.</p> <p>Options:</p> <ul style="list-style-type: none"> • AGGREGATION_LOGIC_TABLE: summary table • ATOMIC_INDEX: atomic metric • ATOMIC_METRIC: atomic metric (new) • BIZ_CATALOG: process architecture directory • BIZ_METRIC: service indicator • CODE_TABLE: code table • COMMON_CONDITION: general filter • COMPOSITE_METRIC: Compound Metric (new) • COMPOUND_METRIC: compound metric • CONDITION_GROUP: restriction group • DEGENERATE_DIMENSION: degenerate dimension • DERIVATIVE_INDEX: derivative indicator • DERIVED_METRIC: derivative indicator (new) • DIMENSION: dimension • DIMENSION_ATTRIBUTE: dimension attribute • DIMENSION_HIERARCHIES: dimension level • DIMENSION_LOGIC_TABLE: dimension table • DIMENSION_TABLE_ATTRIBUTE: dimension attribute • DIRECTORY: directory • FACT_ATTRIBUTE: fact table attribute • FACT_DIMENSION: fact table dimension • FACT_LOGIC_TABLE: fact table • FACT_MEASURE: fact table measurement • FUNCTION: function

		<ul style="list-style-type: none"> • INFO_ARCH: information architecture (used for modifying themes in batches) • MODEL: model • QUALITY_RULE: quality rule • SECRECY_LEVEL: security level • STANDARD_ELEMENT: data standard • STANDARD_ELEMENT_TEMPLATE: data standard template • SUBJECT: theme • Dimension attributes of SUMMARY_DIMENSION_ATTRIBUTE: summary tables • SUMMARY_INDEX: summary table indicator attribute • SUMMARY_TIME: time period attribute of the SDR table • TABLE_MODEL: relationship model (logical model/physical model) • TABLE_MODEL_ATTRIBUTE: relationship model attribute (logical model/physical model) • TABLE_MODEL_LOGIC: logical entity • TABLE_TYPE: table type • TAG: tag • TIME_CONDITION: time restriction
biz_info	String	Serialized service details. The type is string.
biz_info_obj	Object	Service details. The type is object.
biz_version	Integer	Service version.

Parameter	Type	Description
biz_status	String	Release status of an entity. This parameter is read-only and does not need to be set during creation and update. Options: <ul style="list-style-type: none"> • DRAFT: draft • PUBLISH_DEVELOPING: to be reviewed • PUBLISHED: released • OFFLINE_DEVELOPING: to be reviewed • OFFLINE: offline • REJECT: rejected
approval_status	String	Service approval status. This parameter is read-only. Options: <ul style="list-style-type: none"> • DEVELOPING: being reviewed • APPROVED: approved • REJECT: rejected • WITHDREW: approval cancellation
approval_type	String	Service review type. Options: <ul style="list-style-type: none"> • PUBLISH: released • OFFLINE: offline
submit_time	String	Submitted At
create_by	String	Creator.
l1	String	Chinese name of the subject area group. This parameter is read-only and does not need to be set when you create or update a subject area group.
l2	String	Chinese name of the subject area. This parameter is read-only and does not need to be set during creation and update.
l3	String	Chinese name of the business object. This parameter is read-only and does not need to be set during creation and update.
approval_time	String	Review time.

Parameter	Type	Description
approver	String	Reviewer.
email	String	Email address of the reviewer.
msg	String	Review information.
directory_path	String	Directory tree.

Table 7-536 BizVersionManageVO

Parameter	Type	Description
id	String	Field ID, which is a string

Parameter	Type	Description
biz_type	String	<p>Business entity type.</p> <p>Options:</p> <ul style="list-style-type: none"> • AGGREGATION_LOGIC_TABLE: summary table • ATOMIC_INDEX: atomic metric • ATOMIC_METRIC: atomic metric (new) • BIZ_CATALOG: process architecture directory • BIZ_METRIC: service indicator • CODE_TABLE: code table • COMMON_CONDITION: general filter • COMPOSITE_METRIC: Compound Metric (new) • COMPOUND_METRIC: compound metric • CONDITION_GROUP: restriction group • DEGENERATE_DIMENSION: degenerate dimension • DERIVATIVE_INDEX: derivative indicator • DERIVED_METRIC: derivative indicator (new) • DIMENSION: dimension • DIMENSION_ATTRIBUTE: dimension attribute • DIMENSION_HIERARCHIES: dimension level • DIMENSION_LOGIC_TABLE: dimension table • DIMENSION_TABLE_ATTRIBUTE: dimension attribute • DIRECTORY: directory • FACT_ATTRIBUTE: fact table attribute • FACT_DIMENSION: fact table dimension • FACT_LOGIC_TABLE: fact table • FACT_MEASURE: fact table measurement • FUNCTION: function

biz_id	String	Business ID, which is a string
biz_info	String	Business object information.

Parameter	Type	Description
status	String	Release status of an entity. This parameter is read-only and does not need to be set during creation and update. Options: <ul style="list-style-type: none"> • DRAFT: draft • PUBLISH_DEVELOPING: to be reviewed • PUBLISHED: released • OFFLINE_DEVELOPING: to be reviewed • OFFLINE: offline • REJECT: rejected
biz_version	Integer	Service version, which is read-only.
create_time	String	Creation time, which is read-only. The format complies with RFC3339 and is accurate to seconds. The UTC time zone is yyyy-mm-ddTHH:MM:SSZ, for example, 1970-01-01T00:00:00Z.
update_time	String	Update time, which is read-only. The format complies with RFC3339 and is accurate to seconds. The UTC time zone is yyyy-mm-ddTHH:MM:SSZ, for example, 1970-01-01T00:00:00Z.

Status code: 400

Table 7-537 Response body parameters

Parameter	Type	Description
error_code	String	Error code, for example, DS.6000, indicating that the request fails to be processed.
error_msg	String	Error message
data	Object	Returned data information.

Status code: 401

Table 7-538 Response body parameters

Parameter	Type	Description
error_code	String	Error code, for example, DS.6000, indicating that the request fails to be processed.
error_msg	String	Error message
data	Object	Returned data information.

Status code: 403

Table 7-539 Response body parameters

Parameter	Type	Description
error_code	String	Error code, for example, DS.6000, indicating that the request fails to be processed.
error_msg	String	Error message
data	Object	Returned data information.

Example Requests

Create an atomic metric based on the following parameters:

```
POST https://{endpoint}/v2/{project_id}/design/atomic-indexs
```

```
{
  "id" : 0,
  "name_ch" : "test_create_atomic_index",
  "name_en" : "test_create_atomic_index",
  "table_id" : "1215358267694411776",
  "cal_exp" : "max(${1215358267774103552})",
  "l3_id" : "1080855591154495488",
  "field_ids" : [ "1215358267774103552" ],
  "biz_type" : "FACT_LOGIC_TABLE",
  "description" : "None"
}
```

Example Responses

Status code: 200

This operation succeeds, and the returned data is AtomicIndexVO.

```
{
  "data" : {
    "value" : {
      "id" : "1227990857618227200",
      "name_en" : "test_create_atomic_index",
      "name_ch" : "test_create_atomic_index",
      "description" : "None",

```

```
"create_by" : "test_uesr",
"cal_exp" : "max(${1215358267774103552})",
"cal_fn_ids" : null,
"l1_id" : null,
"l2_id" : null,

"field_ids" : [ "1215358267774103552" ],
"field_names" : null,
"status" : "DRAFT",
"biz_type" : "FACT_LOGIC_TABLE",
"create_time" : "2024-04-11T14:37:15.423+08:00",
"update_time" : "2024-04-11T14:37:15.423+08:00",
"l1" : null,
"l2" : null,
"l3" : null,
"approval_info" : null,
"new_biz" : null
}
}
```

Status code: 400

BadRequest

```
{
  "error_code" : "DS.60xx",
  "error_msg" : "The user request is illegal."
}
```

Status code: 401

Unauthorized

```
{
  "error_code" : "DS.60xx",
  "error_msg" : "User authentication failed."
}
```

Status code: 403

Forbidden

```
{
  "error_code" : "DS.60xx",
  "error_msg" : "The user does not have permission to call this API."
}
```

SDK Sample Code

The SDK sample code is as follows.

Java

Create an atomic metric based on the following parameters:

```
package com.huaweicloud.sdk.test;

import com.huaweicloud.sdk.core.auth.ICredential;
import com.huaweicloud.sdk.core.auth.BasicCredentials;
import com.huaweicloud.sdk.core.exception.ConnectionException;
import com.huaweicloud.sdk.core.exception.RequestTimeoutException;
import com.huaweicloud.sdk.core.exception.ServiceResponseException;
import com.huaweicloud.sdk.dataartsstudio.v1.region.DataArtsStudioRegion;
```

```
import com.huaweicloud.sdk.dataartsstudio.v1.*;
import com.huaweicloud.sdk.dataartsstudio.v1.model.*;

import java.util.List;
import java.util.ArrayList;

public class CreateDesignAtomicIndexSolution {

    public static void main(String[] args) {
        // The AK and SK used for authentication are hard-coded or stored in plaintext, which has great
        // security risks. It is recommended that the AK and SK be stored in ciphertext in configuration files or
        // environment variables and decrypted during use to ensure security.
        // In this example, AK and SK are stored in environment variables for authentication. Before running
        // this example, set environment variables CLOUD_SDK_AK and CLOUD_SDK_SK in the local environment
        String ak = System.getenv("CLOUD_SDK_AK");
        String sk = System.getenv("CLOUD_SDK_SK");
        String projectId = "{project_id}";

        ICredential auth = new BasicCredentials()
            .withProjectId(projectId)
            .withAk(ak)
            .withSk(sk);

        DataArtsStudioClient client = DataArtsStudioClient.newBuilder()
            .withCredential(auth)
            .withRegion(DataArtsStudioRegion.valueOf("<YOUR REGION>"))
            .build();
        CreateDesignAtomicIndexRequest request = new CreateDesignAtomicIndexRequest();
        AtomicIndexVO body = new AtomicIndexVO();
        List<String> listbodyFieldIds = new ArrayList<>();
        listbodyFieldIds.add("1215358267774103552");
        body.withBizType(AtomicIndexVO.BizTypeEnum.fromValue("FACT_LOGIC_TABLE"));
        body.withFieldIds(listbodyFieldIds);
        body.withTableId("1215358267694411776");
        body.withL3Id("1080855591154495488");
        body.withCalExp("max(${1215358267774103552})");
        body.withDescription("None");
        body.withNameCh("test_create_atomic_index");
        body.withNameEn("test_create_atomic_index");
        body.withId("0");
        request.withBody(body);
        try {
            CreateDesignAtomicIndexResponse response = client.createDesignAtomicIndex(request);
            System.out.println(response.toString());
        } catch (ConnectionException e) {

}
response, err := client.CreateDesignAtomicIndex(request)
if err == nil {
    fmt.Printf("%v\n", response)
} else {
    fmt.Println(err)
}
}
```

More

For SDK sample code of more programming languages, see the Sample Code tab in [API Explorer](#). SDK sample code can be automatically generated.

Status Codes

Status Code	Description
200	This operation succeeds, and the returned data is AtomicIndexVO.
400	BadRequest
401	Unauthorized
403	Forbidden

7.11.3 Updating an Atomic Metric

Function

This API is used to update a single atomic metric.

Calling Method

For details, see [Calling APIs](#).

URI

PUT /v2/{project_id}/design/atomic-indexs

Table 7-540 Path Parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Project ID. For details about how to obtain the project ID, see Project ID and Account ID .

Request Parameters

Table 7-541 Request header parameters

Parameter	Mandatory	Type	Description
X-Auth-Token	Yes	String	IAM token, which is obtained by calling the IAM API for obtaining a user token (value of X-Subject-Token in the response header). This field is mandatory for authentication using tokens.
workspace	Yes	String	Workspace ID. For details about how to obtain the workspace ID, see Instance ID and Workspace ID .
X-Project-Id	No	String	Project ID. For details about how to obtain the project ID, see Project ID and Account ID . This parameter is mandatory for API requests that use AK/SK authentication in multi-project scenarios.

Parameter	Mandatory	Type	Description
Content-Type	No	String	Default value: application/json;charset=UTF-8 This parameter is optional. If the body is available, this parameter is mandatory. If the body is unavailable, you do not need to set this parameter or verify it.

Table 7-542 Request body parameters

Parameter	Mandatory	Type	Description
id	No	String	ID, which is a string
name_en	Yes	String	Indicates the English name of an atomic metric.
name_ch	Yes	String	Indicates the English name of an atomic metric.
description	No	String	Description.
create_by	No	String	Creator.
cal_exp	Yes	String	Calculation expression, for example, 'sum(\${fact_column_id})', where fact_column_id indicates the ID of the referenced field in the fact table
cal_fn_ids	No	Array of strings	Reference function ID, which is a string
l2_id	No	String	Subject area ID. This parameter is read-only and does not need to be set during creation and update.
l3_id	Yes	String	Business object GUID, which is a string
table_id	Yes	String	Fact table ID, which is a string
tb_name	No	String	Name of a fact table.
field_ids	Yes	Array of strings	Field ID, which is a string
field_names	No	Array of strings	Field name.

Parameter	Mandatory	Type	Description
status	No	String	<p>Release status of an entity. This parameter is read-only and does not need to be set during creation and update.</p> <p>Options:</p> <ul style="list-style-type: none"> ● DRAFT: draft ● PUBLISH_DEVELOPING: to be reviewed ● PUBLISHED: released ● OFFLINE_DEVELOPING: to be reviewed ● OFFLINE: offline ● REJECT: rejected

Parameter	Mandatory	Type	Description
biz_type	No	String	<p>Business entity type.</p> <p>Options:</p> <ul style="list-style-type: none"> ● AGGREGATION_LOGIC_TABLE: summary table ● ATOMIC_INDEX: atomic metric ● ATOMIC_METRIC: atomic metric (new) ● BIZ_CATALOG: process architecture directory ● BIZ_METRIC: service indicator ● CODE_TABLE: code table ● COMMON_CONDITION: general filter ● COMPOSITE_METRIC: Compound Metric (new) ● COMPOUND_METRIC: compound metric ● CONDITION_GROUP: restriction group ● DEGENERATE_DIMENSION: degenerate dimension ● DERIVATIVE_INDEX: derivative indicator ● DERIVED_METRIC: derivative indicator (new) ● DIMENSION: dimension ● DIMENSION_ATTRIBUTE: dimension attribute ● DIMENSION_HIERARCHIES: dimension level ● DIMENSION_LOGIC_TABLE: dimension table ● DIMENSION_TABLE_ATTRIBUTE: dimension attribute ● DIRECTORY: directory ● FACT_ATTRIBUTE: fact table attribute ● FACT_DIMENSION: fact table dimension ● FACT_LOGIC_TABLE: fact table

Parameter	Mandatory	Type	Description
			<ul style="list-style-type: none"> ● FACT_MEASURE: fact table measurement ● FUNCTION: function ● INFO_ARCH: information architecture (used for modifying themes in batches) ● MODEL: model ● QUALITY_RULE: quality rule ● SECRECY_LEVEL: security level ● STANDARD_ELEMENT: data standard ● STANDARD_ELEMENT_TEMPLATE: data standard template ● SUBJECT: theme ● Dimension attributes of SUMMARY_DIMENSION_ATTRIBUTE: summary tables ● SUMMARY_INDEX: summary table indicator attribute ● SUMMARY_TIME: time period attribute of the SDR table ● TABLE_MODEL: relationship model (logical model/physical model) ● TABLE_MODEL_ATTRIBUTE: relationship model attribute (logical model/physical model) ● TABLE_MODEL_LOGIC: logical entity ● TABLE_TYPE: table type ● TAG: tag ● TIME_CONDITION: time restriction
l1	No	String	Chinese name of the subject area group. This parameter is read-only and does not need to be set when you create or update a subject area group.

Parameter	Mandatory	Type	Description
l2	No	String	Chinese name of the subject area. This parameter is read-only and does not need to be set during creation and update.
l3	No	String	Chinese name of the business object. This parameter is read-only and does not need to be set during creation and update.
approval_info	No	ApprovalVO object	Approval information. This parameter is read-only. Latest review information about a business object, including the business details, reviewer information, and review time.
new_biz	No	BizVersionManagementVO object	Service version management. This parameter is read-only.

Table 7-543 ApprovalVO

Parameter	Mandatory	Type	Description
id	No	String	Application ID, which is a string
tenant_id	No	String	Project ID. For details about how to obtain the project ID, see the API path parameter <code>project_id</code> .
name_ch	No	String	Chinese name of a service.
name_en	No	String	English name of a service.
biz_id	No	String	Business ID, which is a string

Parameter	Mandatory	Type	Description
biz_type	No	String	<p>Business entity type.</p> <p>Options:</p> <ul style="list-style-type: none"> • AGGREGATION_LOGIC_TABLE: summary table • ATOMIC_INDEX: atomic metric • ATOMIC_METRIC: atomic metric (new) • BIZ_CATALOG: process architecture directory • BIZ_METRIC: service indicator • CODE_TABLE: code table • COMMON_CONDITION: general filter • COMPOSITE_METRIC: Compound Metric (new) • COMPOUND_METRIC: compound metric • CONDITION_GROUP: restriction group • DEGENERATE_DIMENSION: degenerate dimension • DERIVATIVE_INDEX: derivative indicator • DERIVED_METRIC: derivative indicator (new) • DIMENSION: dimension • DIMENSION_ATTRIBUTE: dimension attribute • DIMENSION_HIERARCHIES: dimension level • DIMENSION_LOGIC_TABLE: dimension table • DIMENSION_TABLE_ATTRIBUTE: dimension attribute • DIRECTORY: directory • FACT_ATTRIBUTE: fact table attribute • FACT_DIMENSION: fact table dimension • FACT_LOGIC_TABLE: fact table

Parameter	Mandatory	Type	Description
			<ul style="list-style-type: none"> • FACT_MEASURE: fact table measurement • FUNCTION: function • INFO_ARCH: information architecture (used for modifying themes in batches) • MODEL: model • QUALITY_RULE: quality rule • SECRECY_LEVEL: security level • STANDARD_ELEMENT: data standard • STANDARD_ELEMENT_TEMPLATE: data standard template • SUBJECT: theme • Dimension attributes of SUMMARY_DIMENSION_ATTRIBUTE: summary tables • SUMMARY_INDEX: summary table indicator attribute • SUMMARY_TIME: time period attribute of the SDR table • TABLE_MODEL: relationship model (logical model/physical model) • TABLE_MODEL_ATTRIBUTE: relationship model attribute (logical model/physical model) • TABLE_MODEL_LOGIC: logical entity • TABLE_TYPE: table type • TAG: tag • TIME_CONDITION: time restriction
biz_info	No	String	Serialized service details. The type is string.
biz_info_obj	No	Object	Service details. The type is object.

Parameter	Mandatory	Type	Description
biz_version	No	Integer	Service version.
biz_status	No	String	Release status of an entity. This parameter is read-only and does not need to be set during creation and update. Options: <ul style="list-style-type: none"> • DRAFT: draft • PUBLISH_DEVELOPING: to be reviewed • PUBLISHED: released • OFFLINE_DEVELOPING: to be reviewed • OFFLINE: offline • REJECT: rejected
approval_status	No	String	Service approval status. This parameter is read-only. Options: <ul style="list-style-type: none"> • DEVELOPING: being reviewed • APPROVED: approved • REJECT: rejected • WITHDREW: approval cancellation
approval_type	No	String	Service review type. Options: <ul style="list-style-type: none"> • PUBLISH: released • OFFLINE: offline
submit_time	No	String	Submitted At
create_by	No	String	Creator.
l1	No	String	Chinese name of the subject area group. This parameter is read-only and does not need to be set when you create or update a subject area group.
l2	No	String	Chinese name of the subject area. This parameter is read-only and does not need to be set during creation and update.

Parameter	Mandatory	Type	Description
l3	No	String	Chinese name of the business object. This parameter is read-only and does not need to be set during creation and update.
approval_time	No	String	Review time.
approver	No	String	Reviewer.
email	No	String	Email address of the reviewer.
msg	No	String	Review information.
directory_path	No	String	Directory tree.

Response Parameters

Status code: 200

Table 7-545 Response body parameters

Parameter	Type	Description
data	data object	Returned data.

Table 7-546 data

Parameter	Type	Description
value	AtomicIndexVO object	Returned data information.

Table 7-547 AtomicIndexVO

Parameter	Type	Description
id	String	ID, which is a string
name_en	String	Indicates the English name of an atomic metric.
name_ch	String	Indicates the English name of an atomic metric.
description	String	Description.

Parameter	Type	Description
create_by	String	Creator.
cal_exp	String	Calculation expression, for example, 'sum(\${fact_column_id})', where fact_column_id indicates the ID of the referenced field in the fact table
cal_fn_ids	Array of strings	Reference function ID, which is a string
l1_id	String	Subject area group ID, which is a read-only string
l2_id	String	Subject area ID. This parameter is read-only and does not need to be set during creation and update.
l3_id	String	Business object GUID, which is a string
table_id	String	Fact table ID, which is a string
tb_name	String	Name of a fact table.
dw_type	String	Data connection type, which corresponds to the type of the data warehouse where the table is located. The value can be DWS , MRS_HIVE , POSTGRESQL , MRS_SPARK , CLICKHOUSE , MYSQL , ORACLE , or DORIS .
field_ids	Array of strings	Field ID, which is a string
field_names	Array of strings	Field name.
status	String	Release status of an entity. This parameter is read-only and does not need to be set during creation and update. Options: <ul style="list-style-type: none"> • DRAFT: draft • PUBLISH_DEVELOPING: to be reviewed • PUBLISHED: released • OFFLINE_DEVELOPING: to be reviewed • OFFLINE: offline • REJECT: rejected

Parameter	Type	Description
biz_type	String	<p>Business entity type.</p> <p>Options:</p> <ul style="list-style-type: none"> • AGGREGATION_LOGIC_TABLE: summary table • ATOMIC_INDEX: atomic metric • ATOMIC_METRIC: atomic metric (new) • BIZ_CATALOG: process architecture directory • BIZ_METRIC: service indicator • CODE_TABLE: code table • COMMON_CONDITION: general filter • COMPOSITE_METRIC: Compound Metric (new) • COMPOUND_METRIC: compound metric • CONDITION_GROUP: restriction group • DEGENERATE_DIMENSION: degenerate dimension • DERIVATIVE_INDEX: derivative indicator • DERIVED_METRIC: derivative indicator (new) • DIMENSION: dimension • DIMENSION_ATTRIBUTE: dimension attribute • DIMENSION_HIERARCHIES: dimension level • DIMENSION_LOGIC_TABLE: dimension table • DIMENSION_TABLE_ATTRIBUTE: dimension attribute • DIRECTORY: directory • FACT_ATTRIBUTE: fact table attribute • FACT_DIMENSION: fact table dimension • FACT_LOGIC_TABLE: fact table • FACT_MEASURE: fact table measurement • FUNCTION: function

Parameter	Type	Description
		<ul style="list-style-type: none"> • INFO_ARCH: information architecture (used for modifying themes in batches) • MODEL: model • QUALITY_RULE: quality rule • SECRECY_LEVEL: security level • STANDARD_ELEMENT: data standard • STANDARD_ELEMENT_TEMPLATE: data standard template • SUBJECT: theme • Dimension attributes of SUMMARY_DIMENSION_ATTRIBUTE: summary tables • SUMMARY_INDEX: summary table indicator attribute • SUMMARY_TIME: time period attribute of the SDR table • TABLE_MODEL: relationship model (logical model/physical model) • TABLE_MODEL_ATTRIBUTE: relationship model attribute (logical model/physical model) • TABLE_MODEL_LOGIC: logical entity • TABLE_TYPE: table type • TAG: tag • TIME_CONDITION: time restriction
create_time	String	Creation time, which is read-only. The format complies with RFC3339 and is accurate to seconds. The UTC time zone is yyyy-mm-ddTHH:MM:SSZ, for example, 1970-01-01T00:00:00Z.
update_time	String	Update time, which is read-only. The format complies with RFC3339 and is accurate to seconds. The UTC time zone is yyyy-mm-ddTHH:MM:SSZ, for example, 1970-01-01T00:00:00Z.
l1	String	Chinese name of the subject area group. This parameter is read-only and does not need to be set when you create or update a subject area group.

Parameter	Type	Description
l2	String	Chinese name of the subject area. This parameter is read-only and does not need to be set during creation and update.
l3	String	Chinese name of the business object. This parameter is read-only and does not need to be set during creation and update.
approval_info	ApprovalVO object	Approval information. This parameter is read-only. Latest review information about a business object, including the business details, reviewer information, and review time.
new_biz	BizVersionManag eVO object	Service version management. This parameter is read-only.

Table 7-548 ApprovalVO

Parameter	Type	Description
id	String	Application ID, which is a string
tenant_id	String	Project ID. For details about how to obtain the project ID, see the API path parameter project_id.
name_ch	String	Chinese name of a service.
name_en	String	English name of a service.
biz_id	String	Business ID, which is a string

Parameter	Type	Description
biz_type	String	<p>Business entity type.</p> <p>Options:</p> <ul style="list-style-type: none"> • AGGREGATION_LOGIC_TABLE: summary table • ATOMIC_INDEX: atomic metric • ATOMIC_METRIC: atomic metric (new) • BIZ_CATALOG: process architecture directory • BIZ_METRIC: service indicator • CODE_TABLE: code table • COMMON_CONDITION: general filter • COMPOSITE_METRIC: Compound Metric (new) • COMPOUND_METRIC: compound metric • CONDITION_GROUP: restriction group • DEGENERATE_DIMENSION: degenerate dimension • DERIVATIVE_INDEX: derivative indicator • DERIVED_METRIC: derivative indicator (new) • DIMENSION: dimension • DIMENSION_ATTRIBUTE: dimension attribute • DIMENSION_HIERARCHIES: dimension level • DIMENSION_LOGIC_TABLE: dimension table • DIMENSION_TABLE_ATTRIBUTE: dimension attribute • DIRECTORY: directory • FACT_ATTRIBUTE: fact table attribute • FACT_DIMENSION: fact table dimension • FACT_LOGIC_TABLE: fact table • FACT_MEASURE: fact table measurement • FUNCTION: function

Status Codes

Status Code	Description
200	This operation succeeds, and the returned data is AtomicIndexVO.
400	BadRequest
401	Unauthorized
403	Forbidden

7.11.4 Deleting Atomic Metrics

Function

Delete atomic metrics in batches.

Calling Method

For details, see [Calling APIs](#).

URI

DELETE /v2/{project_id}/design/atomic-indexs

Table 7-553 Path Parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Project ID. For details about how to obtain the project ID, see Project ID and Account ID .

Request Parameters

Table 7-554 Request header parameters

Parameter	Mandatory	Type	Description
X-Auth-Token	Yes	String	IAM token, which is obtained by calling the IAM API for obtaining a user token (value of X-Subject-Token in the response header). This field is mandatory for authentication using tokens.
workspace	Yes	String	Workspace ID. For details about how to obtain the workspace ID, see Instance ID and Workspace ID .
X-Project-Id	No	String	Project ID. For details about how to obtain the project ID, see Project ID and Account ID . This parameter is mandatory for API requests that use AK/SK authentication in multi-project scenarios.

Parameter	Mandatory	Type	Description
Content-Type	No	String	Default value: application/json;charset=UTF-8 This parameter is optional. If the body is available, this parameter is mandatory. If the body is unavailable, you do not need to set this parameter or verify it.

Table 7-555 Request body parameters

Parameter	Mandatory	Type	Description
ids	Yes	Array of strings	ID list, which is a string
del_types	No	String	Deletion type. Enumerated values: <ul style="list-style-type: none"> ● PHYSICAL_TABLE: whether to delete physical database tables. This parameter is valid only for tables that can be materialized. (If this parameter is set, physical database tables are deleted.)

Response Parameters

Status code: 200

Table 7-556 Response body parameters

Parameter	Type	Description
data	data object	Indicates the final deletion result, that is, the number of objects that are successfully deleted.

Table 7-557 data

Parameter	Type	Description
value	String	Number of successfully deleted objects

Status code: 400**Table 7-558** Response body parameters

Parameter	Type	Description
error_code	String	Error code, for example, DS.6000, indicating that the request fails to be processed.
error_msg	String	Error message
data	Object	Returned data information.

Status code: 401**Table 7-559** Response body parameters

Parameter	Type	Description
error_code	String	Error code, for example, DS.6000, indicating that the request fails to be processed.
error_msg	String	Error message
data	Object	Returned data information.

Status code: 403**Table 7-560** Response body parameters

Parameter	Type	Description
error_code	String	Error code, for example, DS.6000, indicating that the request fails to be processed.
error_msg	String	Error message
data	Object	Returned data information.

Example Requests

This API is used to delete atomic metrics based on the input parameters. Only atomic metrics in the Draft, Offline, or Rejected state can be deleted.

```
DELETE https://{endpoint}/v2/{project_id}/design/atomic-idxs
{
```

```
"ids" : [ "1227990857618227200" ]  
}
```

Example Responses

Status code: 200

This operation succeeds, and the returned data is the number of deleted data records.

```
{  
  "value" : 1  
}
```

Status code: 400

BadRequest

```
{  
  "error_code" : "DS.60xx",  
  "error_msg" : "The user request is illegal."  
}
```

Status code: 401

Unauthorized

```
{  
  "error_code" : "DS.60xx",  
  "error_msg" : "User authentication failed."  
}
```

Status code: 403

Forbidden

```
{  
  "error_code" : "DS.60xx",  
  "error_msg" : "The user does not have permission to call this API."  
}
```

7.11.5 Viewing Atomic Metric Details

Function

This API is used to obtain atomic metric details by ID.

Calling Method

For details, see [Calling APIs](#).

URI

GET /v2/{project_id}/design/atomic-indexs/{id}

Table 7-561 Path Parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Project ID. For details about how to obtain the project ID, see Project ID and Account ID .
id	Yes	String	Entity ID, which is a string

Table 7-562 Query Parameters

Parameter	Mandatory	Type	Description
latest	No	Boolean	Indicates whether to query the latest.

Request Parameters

Table 7-563 Request header parameters

Parameter	Mandatory	Type	Description
X-Auth-Token	Yes	String	IAM token, which is obtained by calling the IAM API for obtaining a user token (value of X-Subject-Token in the response header). This field is mandatory for authentication using tokens.
workspace	Yes	String	Workspace ID. For details about how to obtain the workspace ID, see Instance ID and Workspace ID .
X-Project-Id	No	String	Project ID. For details about how to obtain the project ID, see Project ID and Account ID . This parameter is mandatory for API requests that use AK/SK authentication in multi-project scenarios.
Content-Type	No	String	Default value: application/json;charset=UTF-8 This parameter is optional. If the body is available, this parameter is mandatory. If the body is unavailable, you do not need to set this parameter or verify it.

Response Parameters

Status code: 200

Table 7-564 Response body parameters

Parameter	Type	Description
data	data object	Returned data.

Table 7-565 data

Parameter	Type	Description
value	AtomicIndexVO object	Returned data information.

Table 7-566 AtomicIndexVO

Parameter	Type	Description
id	String	ID, which is a string
name_en	String	Indicates the English name of an atomic metric.
name_ch	String	Indicates the English name of an atomic metric.
description	String	Description.
create_by	String	Creator.
cal_exp	String	Calculation expression, for example, 'sum(\${fact_column_id})', where fact_column_id indicates the ID of the referenced field in the fact table
cal_fn_ids	Array of strings	Reference function ID, which is a string
l1_id	String	Subject area group ID, which is a read-only string
l2_id	String	Subject area ID. This parameter is read-only and does not need to be set during creation and update.
l3_id	String	Business object GUID, which is a string
table_id	String	Fact table ID, which is a string
tb_name	String	Name of a fact table.

Parameter	Type	Description
dw_type	String	Data connection type, which corresponds to the type of the data warehouse where the table is located. The value can be DWS , MRS_HIVE , POSTGRESQL , MRS_SPARK , CLICKHOUSE , MYSQL , ORACLE , or DORIS .
field_ids	Array of strings	Field ID, which is a string
field_names	Array of strings	Field name.
status	String	Release status of an entity. This parameter is read-only and does not need to be set during creation and update. Options: <ul style="list-style-type: none">• DRAFT: draft• PUBLISH_DEVELOPING: to be reviewed• PUBLISHED: released• OFFLINE_DEVELOPING: to be reviewed• OFFLINE: offline• REJECT: rejected

Parameter	Type	Description

Example Requests

This API is used to obtain atomic metric details based on the atomic metric ID.

```
GET https://{endpoint}/v2/{project_id}/design/atomic-indexs/1193149872312823808
```

Example Responses

Status code: 200

This operation is successful, and the returned data is AtomicIndexVO details.

```
{
  "data" : {

}
```

More

For SDK sample code of more programming languages, see the Sample Code tab in [API Explorer](#). SDK sample code can be automatically generated.

Status Codes

Status Code	Description
200	This operation is successful, and the returned data is AtomicIndexVO details.
400	BadRequest
401	Unauthorized
403	Forbidden

7.12 Derivative Metrics

7.12.1 Searching for Derivative Indicators

Function

Search for derivative metrics by name, creator, reviewer, status, modification time, and l3Id.

Calling Method

For details, see [Calling APIs](#).

URI

GET /v2/{project_id}/design/derivative-indexs

Table 7-572 Path Parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Project ID. For details about how to obtain the project ID, see Project ID and Account ID .

Table 7-573 Query Parameters

Parameter	Mandatory	Type	Description
name	No	String	Fuzzy query by name or code.
create_by	No	String	Query by creator.
approver	No	String	Query by reviewer.
status	No	String	Specifies the service status. Options: <ul style="list-style-type: none">• DRAFT: draft• PUBLISH_DEVELOPING: to be approved• PUBLISHED: released• OFFLINE_DEVELOPING: to be approved• OFFLINE: offline• REJECT: rejected
dimension_id	No	String	ID of the dimension based on which dimension attributes are queried. The ID is a string.
dimension_group	No	String	Query dimension attributes based on the dimension granularity.
atomic_index_id	No	String	ID of the atomic metric based on which dimension attributes are queried. The ID is a string.
all_metrics	No	Boolean	Indicates whether to query compound metrics.
dw_type	No	String	Data Connection Type
l3_id	No	String	ID of business object l3, which is a string
begin_time	No	String	Left boundary of time filtering. This parameter is used together with end_time. Only time range filtering is supported. Unilateral filtering is invalid. The format complies with RFC3339 and is accurate to seconds. The UTC time zone is yyyy-mm-ddTHH:MM:SSZ, for example, 1970-01-01T00:00:00Z.

Parameter	Mandatory	Type	Description
end_time	No	String	Right boundary for time filtering. This parameter is used together with begin_time to support only time range filtering. The format complies with RFC3339 and is accurate to seconds. The UTC time zone is yyyy-mm-ddTHH:MM:SSZ, for example, 1970-01-01T00:00:00Z.
limit	No	Integer	Number of records to be queried on each page, that is, Y records to be queried. The default value is 50, and the value range is [1,100].
offset	No	Integer	Start coordinate of the query, that is, the number of skipped data records. The value can only be 0 or an integer multiple of limit. If the value does not meet the requirement, the value is rounded down. The default value is 0.

Request Parameters

Table 7-574 Request header parameters

Parameter	Mandatory	Type	Description
X-Auth-Token	Yes	String	IAM token, which is obtained by calling the IAM API for obtaining a user token (value of X-Subject-Token in the response header). This field is mandatory for authentication using tokens.
workspace	Yes	String	Workspace ID. For details about how to obtain the workspace ID, see Instance ID and Workspace ID .

Parameter	Mandatory	Type	Description
X-Project-Id	No	String	Project ID. For details about how to obtain the project ID, see Project ID and Account ID . This parameter is mandatory for API requests that use AK/SK authentication in multi-project scenarios.
Content-Type	No	String	Default value: application/json;charset=UTF-8 This parameter is optional. If the body is available, this parameter is mandatory. If the body is unavailable, you do not need to set this parameter or verify it.

Response Parameters

Status code: 200

Table 7-575 Response body parameters

Parameter	Type	Description
data	data object	Returned data.

Table 7-576 data

Parameter	Type	Description
value	value object	Returned data information.

Table 7-577 value

Parameter	Type	Description
records	Array of DerivativeIndex-VO objects	DerivativeIndexVO array.
total	Integer	Total number.

Table 7-578 DerivativeIndexVO

Parameter	Type	Description
id	String	Derivative metric ID, which is a string. This parameter is mandatory for update.
name_en	String	Derivative metric name in English
name_ch	String	Derivative metric name
description	String	Description, which is read-only.
create_by	String	Creator.
data_type	String	Field type
l1_id	String	Subject area group ID, which is a read-only string
l2_id	String	Subject area ID. This parameter is read-only and does not need to be set during creation and update.
l3_id	String	Business object GUID, which is a string
status	String	Release status of an entity. This parameter is read-only and does not need to be set during creation and update. Options: <ul style="list-style-type: none">• DRAFT: draft• PUBLISH_DEVELOPING: to be reviewed• PUBLISHED: released• OFFLINE_DEVELOPING: to be reviewed• OFFLINE: offline• REJECT: rejected
atomic_index_id	String	Atomic metric ID, which is a string
time_condition_id	String	Time filter ID, which is a string
time_field_id	String	ID of the field associated with the time filter, which is a string
time_field_name	String	Name of the field associated with the time filter. This parameter is read-only.
common_conditions	Array of CommonConditionVO objects	General filter information.

Parameter	Type	Description
dimension_groups	Array of DerivativeIndex-DimensionVO objects	Statistical dimension, which cannot be changed during update
monitor	MetricMonitorVO object	Monitor metrics.
atomic_index	AtomicIndexVO object	Atomic metric information, including the name and unit. This parameter is read-only.
time_condition_name	String	Time filter name. This parameter is read-only.
create_time	String	Creation time, which is read-only. The format complies with RFC3339 and is accurate to seconds. The UTC time zone is yyyy-mm-ddTHH:MM:SSZ, for example, 1970-01-01T00:00:00Z.
update_time	String	Update time, which is read-only. The format complies with RFC3339 and is accurate to seconds. The UTC time zone is yyyy-mm-ddTHH:MM:SSZ, for example, 1970-01-01T00:00:00Z.
l1	String	Chinese name of the subject area group. This parameter is read-only and does not need to be set when you create or update a subject area group.
l2	String	Chinese name of the subject area. This parameter is read-only and does not need to be set during creation and update.
l3	String	Chinese name of the business object. This parameter is read-only and does not need to be set during creation and update.
summary_table_id	String	Summary table ID, which is a read-only string
approval_info	ApprovalVO object	Approval information. This parameter is read-only. Latest review information about a business object, including the business details, reviewer information, and review time.
new_biz	BizVersionManagementVO object	Service version management. This parameter is read-only.

Table 7-579 CommonConditionVO

Parameter	Type	Description
name	String	Name.
field_ids	Array of strings	Field ID, in the format table_id.field_id.
field_names	Array of strings	Field name information. Format: Table name.Field name.
cal_exp	String	Calculation expression, for example, '\$ {table_id.column_id} > 1', where table_id indicates the ID of the table to which the referenced field belongs and column_id indicates the ID of the referenced field.
cal_fn_ids	Array of strings	Reference function ID, which is a string
front_configs	String	Frontend expression configuration, which is used for front-end data restoration.
id	String	General filter ID, which is a read-only string

Table 7-580 DerivativeIndexDimensionVO

Parameter	Type	Description
group_id	String	Dimension group ID.
role	String	Dimension role.
dimension_id	String	Dimension ID, which is a string
hierarchies_id	String	Dimension level ID, which is a string
ordinal	Integer	Sequence number, which is read-only.
group_name	String	Name of a dimension group.
group_code	String	Dimension group code.

Parameter	Type	Description
biz_type	String	<p>Business entity type.</p> <p>Options:</p> <ul style="list-style-type: none"> • AGGREGATION_LOGIC_TABLE: summary table • ATOMIC_INDEX: atomic metric • ATOMIC_METRIC: atomic metric (new) • BIZ_CATALOG: process architecture directory • BIZ_METRIC: service indicator • CODE_TABLE: code table • COMMON_CONDITION: general filter • COMPOSITE_METRIC: Compound Metric (new) • COMPOUND_METRIC: compound metric • CONDITION_GROUP: restriction group • DEGENERATE_DIMENSION: degenerate dimension • DERIVATIVE_INDEX: derivative indicator • DERIVED_METRIC: derivative indicator (new) • DIMENSION: dimension • DIMENSION_ATTRIBUTE: dimension attribute • DIMENSION_HIERARCHIES: dimension level • DIMENSION_LOGIC_TABLE: dimension table • DIMENSION_TABLE_ATTRIBUTE: dimension attribute • DIRECTORY: directory • FACT_ATTRIBUTE: fact table attribute • FACT_DIMENSION: fact table dimension • FACT_LOGIC_TABLE: fact table • FACT_MEASURE: fact table measurement • FUNCTION: function

Parameter	Type	Description
		<ul style="list-style-type: none"> • INFO_ARCH: information architecture (used for modifying themes in batches) • MODEL: model • QUALITY_RULE: quality rule • SECRECY_LEVEL: security level • STANDARD_ELEMENT: data standard • STANDARD_ELEMENT_TEMPLATE: data standard template • SUBJECT: theme • Dimension attributes of SUMMARY_DIMENSION_ATTRIBUTE: summary tables • SUMMARY_INDEX: summary table indicator attribute • SUMMARY_TIME: time period attribute of the SDR table • TABLE_MODEL: relationship model (logical model/physical model) • TABLE_MODEL_ATTRIBUTE: relationship model attribute (logical model/physical model) • TABLE_MODEL_LOGIC: logical entity • TABLE_TYPE: table type • TAG: tag • TIME_CONDITION: time restriction
hierarchies	Array of DimensionHierarchiesVO objects	Level attribute, which is read-only.
l1	String	Chinese name of the subject area group. This parameter is read-only and does not need to be set when you create or update a subject area group.
l2	String	Chinese name of the subject area. This parameter is read-only and does not need to be set during creation and update.
l3	String	Chinese name of the business object. This parameter is read-only and does not need to be set during creation and update.

Parameter	Type	Description
l1_id	String	Subject area group ID, which is a read-only string
l2_id	String	Subject area ID. This parameter is read-only and does not need to be set during creation and update.
l3_id	String	Business object ID, which is a read-only string
dw_type	String	Data connection type.
id	String	Level ID, which is a read-only string

Table 7-581 DimensionHierarchiesVO

Parameter	Type	Description
id	String	ID, which is a string
name	String	Level name.
attrs	Array of HierarchiesAttrVO objects	Attributes contained in a hierarchy.
create_time	String	Creation time, which is read-only. The format complies with RFC3339 and is accurate to seconds. The UTC time zone is yyyy-mm-ddTHH:MM:SSZ, for example, 1970-01-01T00:00:00Z.
update_time	String	Update time, which is read-only. The format complies with RFC3339 and is accurate to seconds. The UTC time zone is yyyy-mm-ddTHH:MM:SSZ, for example, 1970-01-01T00:00:00Z.
create_by	String	Creator.
update_by	String	Person who updates the information.

Table 7-582 HierarchiesAttrVO

Parameter	Type	Description
id	String	ID, which is a string
hierarchies_id	String	Level ID, which is a string
attr_id	String	Attribute ID, which is a string

Parameter	Type	Description
level	Integer	Indicates the layer.
attr_name_en	String	Referenced attribute code.
attr_name_ch	String	Referenced attribute name, which is read-only.
detail_attr_ids	Array of strings	Details attribute ID, which is a string
detail_attr_name_ens	Array of strings	Details attribute in English.
detail_attr_name_chs	Array of strings	Details attribute in Chinese, which is read-only.
attr	DimensionAttributeVO object	Referenced attribute field, which is read-only.
detail_attrs	Array of DimensionAttributeVO objects	Details field, which is read-only.

Table 7-583 DimensionAttributeVO

Parameter	Type	Description
id	String	ID, which is a string
dimension_id	String	Dimension ID, which is a read-only string
code_table_field_id	String	Lookup table attribute ID, which is a string
name_en	String	Field name.
name_ch	String	Service attribute.
description	String	Description.
create_by	String	Creator.
data_type	String	Field type
domain_type	String	Domain to which a field type belongs. Options: <ul style="list-style-type: none"> • NUMBER: number • STRING: character type • DATETIME: date type • BLOB: large object (BLOB) • OTHER: other types

Parameter	Type	Description
data_type_extend	String	Extended field of the data type.
is_primary_key	Boolean	Indicates whether a key is a primary key.
is_biz_primary	Boolean	Indicates whether it is a service primary key.
is_partition_key	Boolean	Indicates whether to partition.
ordinal	Integer	Sequence number.
not_null	Boolean	Indicates whether the value is empty.
stand_row_id	String	ID of the associated data standard, which is a string
stand_row_name	String	Name of the associated data standard. This parameter is read-only.
quality_infos	Array of QualityInfoVO objects	Quality information, which is read-only.
secrecy_levels	Array of SecrecyLevelVO objects	Confidentiality
status	String	Release status of an entity. This parameter is read-only and does not need to be set during creation and update. Options: <ul style="list-style-type: none">• DRAFT: draft• PUBLISH_DEVELOPING: to be reviewed• PUBLISHED: released• OFFLINE_DEVELOPING: to be reviewed• OFFLINE: offline• REJECT: rejected
create_time	String	Creation time, which is read-only. The format complies with RFC3339 and is accurate to seconds. The UTC time zone is yyyy-mm-ddTHH:MM:SSZ, for example, 1970-01-01T00:00:00Z.

Parameter	Type	Description
update_time	String	Update time, which is read-only. The format complies with RFC3339 and is accurate to seconds. The UTC time zone is yyyy-mm-ddTHH:MM:SSZ, for example, 1970-01-01T00:00:00Z.
alias	String	Alias
self_defined_fields	Array of SelfDefinedField-VO objects	User-defined item.

Table 7-584 QualityInfoVO

Parameter	Type	Description
id	String	ID, which is a string
table_id	String	Table ID, which is a read-only string
attr_id	String	Attribute ID, which is a read-only string

Parameter	Type	Description
biz_type	String	<p>Business entity type.</p> <p>Options:</p> <ul style="list-style-type: none"> • AGGREGATION_LOGIC_TABLE: summary table • ATOMIC_INDEX: atomic metric • ATOMIC_METRIC: atomic metric (new) • BIZ_CATALOG: process architecture directory • BIZ_METRIC: service indicator • CODE_TABLE: code table • COMMON_CONDITION: general filter • COMPOSITE_METRIC: Compound Metric (new) • COMPOUND_METRIC: compound metric • CONDITION_GROUP: restriction group • DEGENERATE_DIMENSION: degenerate dimension • DERIVATIVE_INDEX: derivative indicator • DERIVED_METRIC: derivative indicator (new) • DIMENSION: dimension • DIMENSION_ATTRIBUTE: dimension attribute • DIMENSION_HIERARCHIES: dimension level • DIMENSION_LOGIC_TABLE: dimension table • DIMENSION_TABLE_ATTRIBUTE: dimension attribute • DIRECTORY: directory • FACT_ATTRIBUTE: fact table attribute • FACT_DIMENSION: fact table dimension • FACT_LOGIC_TABLE: fact table • FACT_MEASURE: fact table measurement • FUNCTION: function

Parameter	Type	Description
		<ul style="list-style-type: none"> • INFO_ARCH: information architecture (used for modifying themes in batches) • MODEL: model • QUALITY_RULE: quality rule • SECRECY_LEVEL: security level • STANDARD_ELEMENT: data standard • STANDARD_ELEMENT_TEMPLATE: data standard template • SUBJECT: theme • Dimension attributes of SUMMARY_DIMENSION_ATTRIBUTE: summary tables • SUMMARY_INDEX: summary table indicator attribute • SUMMARY_TIME: time period attribute of the SDR table • TABLE_MODEL: relationship model (logical model/physical model) • TABLE_MODEL_ATTRIBUTE: relationship model attribute (logical model/physical model) • TABLE_MODEL_LOGIC: logical entity • TABLE_TYPE: table type • TAG: tag • TIME_CONDITION: time restriction
data_quality_id	String	Quality ID, which is a string
show_control	Integer	Indicates whether to display the regular expression.
data_quality_name	String	Quality name.
alert_conf	String	Configure alarms.
expression	String	Regular expression configuration in regular expression-related validation rules.
extend_info	String	Indicates the extension information.
from_standard	Boolean	Indicates whether the data comes from the data standard quality configuration. This parameter is read-only.

Parameter	Type	Description
result_description	String	Result description.
create_by	String	Creator, which is read-only.
update_by	String	Updater, which is read-only.
create_time	String	Creation time, which is read-only. The format complies with RFC3339 and is accurate to seconds. The UTC time zone is yyyy-mm-ddTHH:MM:SSZ, for example, 1970-01-01T00:00:00Z.
update_time	String	Update time, which is read-only. The format complies with RFC3339 and is accurate to seconds. The UTC time zone is yyyy-mm-ddTHH:MM:SSZ, for example, 1970-01-01T00:00:00Z.

Table 7-585 SecrecyLevelVO

Parameter	Type	Description
id	String	Security level ID, which is a string
uuid	String	Data security primary key.
name	String	Confidentiality name.
slevel	Integer	Confidentiality level.
description	String	Confidentiality description.
create_by	String	Creator.
update_by	String	Person who updates the information.
create_time	String	Creation time, which is read-only. The format complies with RFC3339 and is accurate to seconds. The UTC time zone is yyyy-mm-ddTHH:MM:SSZ, for example, 1970-01-01T00:00:00Z.
update_time	String	Update time, which is read-only. The format complies with RFC3339 and is accurate to seconds. The UTC time zone is yyyy-mm-ddTHH:MM:SSZ, for example, 1970-01-01T00:00:00Z.
new_biz	BizVersionManag eVO object	Service version management. This parameter is read-only.

Table 7-586 SelfDefinedFieldVO

Parameter	Type	Description
fd_name_ch	String	Chinese name of a user-defined item.
fd_name_en	String	English name of a customized item.
not_null	Boolean	Whether a parameter is mandatory.
fd_value	String	Attribute value

Table 7-587 MetricMonitorVO

Parameter	Type	Description
id	String	ID, which is a string
other_metric_ids	Array of strings	ID of another metric, which is a string
other_metric_names	Array of strings	Name of another indicator. This parameter is read-only.
other_compound_metric_ids	Array of strings	ID of another composite index.
other_compound_metric_names	Array of strings	Name of another compound metric.
expression	String	Alarm expression.
metric_id	String	Mount pointer ID, which is a string
front_configs	String	Frontend expression configuration, which is used for front-end data restoration.

Parameter	Type	Description
metric_type	String	<p>Business entity type.</p> <p>Options:</p> <ul style="list-style-type: none"> • AGGREGATION_LOGIC_TABLE: summary table • ATOMIC_INDEX: atomic metric • ATOMIC_METRIC: atomic metric (new) • BIZ_CATALOG: process architecture directory • BIZ_METRIC: service indicator • CODE_TABLE: code table • COMMON_CONDITION: general filter • COMPOSITE_METRIC: Compound Metric (new) • COMPOUND_METRIC: compound metric • CONDITION_GROUP: restriction group • DEGENERATE_DIMENSION: degenerate dimension • DERIVATIVE_INDEX: derivative indicator • DERIVED_METRIC: derivative indicator (new) • DIMENSION: dimension • DIMENSION_ATTRIBUTE: dimension attribute • DIMENSION_HIERARCHIES: dimension level • DIMENSION_LOGIC_TABLE: dimension table • DIMENSION_TABLE_ATTRIBUTE: dimension attribute • DIRECTORY: directory • FACT_ATTRIBUTE: fact table attribute • FACT_DIMENSION: fact table dimension • FACT_LOGIC_TABLE: fact table • FACT_MEASURE: fact table measurement • FUNCTION: function

Parameter	Type	Description
		<ul style="list-style-type: none"> • INFO_ARCH: information architecture (used for modifying themes in batches) • MODEL: model • QUALITY_RULE: quality rule • SECRECY_LEVEL: security level • STANDARD_ELEMENT: data standard • STANDARD_ELEMENT_TEMPLATE: data standard template • SUBJECT: theme • Dimension attributes of SUMMARY_DIMENSION_ATTRIBUTE: summary tables • SUMMARY_INDEX: summary table indicator attribute • SUMMARY_TIME: time period attribute of the SDR table • TABLE_MODEL: relationship model (logical model/physical model) • TABLE_MODEL_ATTRIBUTE: relationship model attribute (logical model/physical model) • TABLE_MODEL_LOGIC: logical entity • TABLE_TYPE: table type • TAG: tag • TIME_CONDITION: time restriction

Table 7-588 AtomicIndexVO

Parameter	Type	Description
id	String	ID, which is a string
name_en	String	Indicates the English name of an atomic metric.
name_ch	String	Indicates the Chinese name of an atomic metric.
description	String	Description.
create_by	String	Creator.

Parameter	Type	Description
cal_exp	String	Calculation expression, for example, 'sum(\${fact_column_id})', where fact_column_id indicates the ID of the referenced field in the fact table
cal_fn_ids	Array of strings	Reference function ID, which is a string
l1_id	String	Subject area group ID, which is a read-only string
l2_id	String	Subject area ID. This parameter is read-only and does not need to be set during creation and update.
l3_id	String	Business object GUID, which is a string
table_id	String	Fact table ID, which is a string
tb_name	String	Name of a fact table.
dw_type	String	Data connection type, which corresponds to the type of the data warehouse where the table is located. The value can be DWS, MRS_HIVE, POSTGRESQL, MRS_SPARK, CLICKHOUSE, MYSQL, ORACLE, or DORIS.
field_ids	Array of strings	Field ID, which is a string
field_names	Array of strings	Field name.
status	String	Release status of an entity. This parameter is read-only and does not need to be set during creation and update. Options: <ul style="list-style-type: none"> ● DRAFT: draft ● PUBLISH_DEVELOPING: to be reviewed ● PUBLISHED: released ● OFFLINE_DEVELOPING: to be reviewed ● OFFLINE: offline ● REJECT: rejected

Parameter	Type	Description
biz_type	String	<p>Business entity type.</p> <p>Options:</p> <ul style="list-style-type: none"> • AGGREGATION_LOGIC_TABLE: summary table • ATOMIC_INDEX: atomic metric • ATOMIC_METRIC: atomic metric (new) • BIZ_CATALOG: process architecture directory • BIZ_METRIC: service indicator • CODE_TABLE: code table • COMMON_CONDITION: general filter • COMPOSITE_METRIC: Compound Metric (new) • COMPOUND_METRIC: compound metric • CONDITION_GROUP: restriction group • DEGENERATE_DIMENSION: degenerate dimension • DERIVATIVE_INDEX: derivative indicator • DERIVED_METRIC: derivative indicator (new) • DIMENSION: dimension • DIMENSION_ATTRIBUTE: dimension attribute • DIMENSION_HIERARCHIES: dimension level • DIMENSION_LOGIC_TABLE: dimension table • DIMENSION_TABLE_ATTRIBUTE: dimension attribute • DIRECTORY: directory • FACT_ATTRIBUTE: fact table attribute • FACT_DIMENSION: fact table dimension • FACT_LOGIC_TABLE: fact table • FACT_MEASURE: fact table measurement • FUNCTION: function

Parameter	Type	Description
		<ul style="list-style-type: none"> • INFO_ARCH: information architecture (used for modifying themes in batches) • MODEL: model • QUALITY_RULE: quality rule • SECRECY_LEVEL: security level • STANDARD_ELEMENT: data standard • STANDARD_ELEMENT_TEMPLATE: data standard template • SUBJECT: theme • Dimension attributes of SUMMARY_DIMENSION_ATTRIBUTE: summary tables • SUMMARY_INDEX: summary table indicator attribute • SUMMARY_TIME: time period attribute of the SDR table • TABLE_MODEL: relationship model (logical model/physical model) • TABLE_MODEL_ATTRIBUTE: relationship model attribute (logical model/physical model) • TABLE_MODEL_LOGIC: logical entity • TABLE_TYPE: table type • TAG: tag • TIME_CONDITION: time restriction
create_time	String	Creation time, which is read-only. The format complies with RFC3339 and is accurate to seconds. The UTC time zone is yyyy-mm-ddTHH:MM:SSZ, for example, 1970-01-01T00:00:00Z.
update_time	String	Update time, which is read-only. The format complies with RFC3339 and is accurate to seconds. The UTC time zone is yyyy-mm-ddTHH:MM:SSZ, for example, 1970-01-01T00:00:00Z.
l1	String	Chinese name of the subject area group. This parameter is read-only and does not need to be set when you create or update a subject area group.

Parameter	Type	Description
l2	String	Chinese name of the subject area. This parameter is read-only and does not need to be set during creation and update.
l3	String	Chinese name of the business object. This parameter is read-only and does not need to be set during creation and update.
approval_info	ApprovalVO object	Approval information. This parameter is read-only. Latest review information about a business object, including the business details, reviewer information, and review time.
new_biz	BizVersionManag eVO object	Service version management. This parameter is read-only.

Table 7-589 ApprovalVO

Parameter	Type	Description
id	String	Application ID, which is a string
tenant_id	String	Project ID. For details about how to obtain the project ID, see the API path parameter project_id.
name_ch	String	Chinese name of a service.
name_en	String	English name of a service.
biz_id	String	Business ID, which is a string

Parameter	Type	Description
biz_type	String	<p>Business entity type.</p> <p>Options:</p> <ul style="list-style-type: none"> • AGGREGATION_LOGIC_TABLE: summary table • ATOMIC_INDEX: atomic metric • ATOMIC_METRIC: atomic metric (new) • BIZ_CATALOG: process architecture directory • BIZ_METRIC: service indicator • CODE_TABLE: code table • COMMON_CONDITION: general filter • COMPOSITE_METRIC: Compound Metric (new) • COMPOUND_METRIC: compound metric • CONDITION_GROUP: restriction group • DEGENERATE_DIMENSION: degenerate dimension • DERIVATIVE_INDEX: derivative indicator • DERIVED_METRIC: derivative indicator (new) • DIMENSION: dimension • DIMENSION_ATTRIBUTE: dimension attribute • DIMENSION_HIERARCHIES: dimension level • DIMENSION_LOGIC_TABLE: dimension table • DIMENSION_TABLE_ATTRIBUTE: dimension attribute • DIRECTORY: directory • FACT_ATTRIBUTE: fact table attribute • FACT_DIMENSION: fact table dimension • FACT_LOGIC_TABLE: fact table • FACT_MEASURE: fact table measurement • FUNCTION: function

Parameter	Type	Description
		<ul style="list-style-type: none"> • INFO_ARCH: information architecture (used for modifying themes in batches) • MODEL: model • QUALITY_RULE: quality rule • SECRECY_LEVEL: security level • STANDARD_ELEMENT: data standard • STANDARD_ELEMENT_TEMPLATE: data standard template • SUBJECT: theme • Dimension attributes of SUMMARY_DIMENSION_ATTRIBUTE: summary tables • SUMMARY_INDEX: summary table indicator attribute • SUMMARY_TIME: time period attribute of the SDR table • TABLE_MODEL: relationship model (logical model/physical model) • TABLE_MODEL_ATTRIBUTE: relationship model attribute (logical model/physical model) • TABLE_MODEL_LOGIC: logical entity • TABLE_TYPE: table type • TAG: tag • TIME_CONDITION: time restriction
biz_info	String	Serialized service details. The type is string.
biz_info_obj	Object	Service details. The type is object.
biz_version	Integer	Service version.

Parameter	Type	Description
biz_status	String	Release status of an entity. This parameter is read-only and does not need to be set during creation and update. Options: <ul style="list-style-type: none"> • DRAFT: draft • PUBLISH_DEVELOPING: to be reviewed • PUBLISHED: released • OFFLINE_DEVELOPING: to be reviewed • OFFLINE: offline • REJECT: rejected
approval_status	String	Service approval status. This parameter is read-only. Options: <ul style="list-style-type: none"> • DEVELOPING: being reviewed • APPROVED: approved • REJECT: rejected • WITHDREW: approval cancellation
approval_type	String	Service review type. Options: <ul style="list-style-type: none"> • PUBLISH: released • OFFLINE: offline
submit_time	String	Submitted At
create_by	String	Creator.
l1	String	Chinese name of the subject area group. This parameter is read-only and does not need to be set when you create or update a subject area group.
l2	String	Chinese name of the subject area. This parameter is read-only and does not need to be set during creation and update.
l3	String	Chinese name of the business object. This parameter is read-only and does not need to be set during creation and update.
approval_time	String	Review time.

Parameter	Type	Description
approver	String	Reviewer.
email	String	Email address of the reviewer.
msg	String	Review information.
directory_path	String	Directory tree.

Table 7-590 BizVersionManageVO

Parameter	Type	Description
id	String	Field ID, which is a string

Parameter	Type	Description

error_msg	String	Error message
data	Object	Returned data information.

Status code: 403

Table 7-593 Response body parameters

Parameter	Type	Description
error_code	String	Error code, for example, DS.6000, indicating that the request fails to be processed.
error_msg	String	Error message
data	Object	Returned data information.

Example Requests

This API is used to query derivative metrics in pagination mode based on request parameters.

```
GET https://{endpoint}/v2/{project_id}/design/derivative-indexs?offset=1&limit=10
```

Example Responses

Status code: 200

This operation succeeds, and the returned data is a DerivativeIndexVO array and the total number of records.

```

More

For SDK sample code of more programming languages, see the Sample Code tab in [API Explorer](#). SDK sample code can be automatically generated.

Status Codes

Status Code	Description
200	This operation succeeds, and the returned data is a DerivativeIndex-VO array and the total number of records.
400	BadRequest
401	Unauthorized
403	Forbidden

7.12.2 Creating a Derivative Metric

Function

This API is used to create a derivative metric.

Calling Method

For details, see [Calling APIs](#).

URI

POST /v2/{project_id}/design/derivative-indexs

Table 7-594 Path Parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Project ID. For details about how to obtain the project ID, see Project ID and Account ID .

Request Parameters

Table 7-595 Request body parameters

Parameter	Mandatory	Type	Description
[items]	Yes	Array of DerivativeIndexVO objects	Parameter information of a Derivative metric, in array format.

Table 7-596 DerivativeIndexVO

Parameter	Mandatory	Type	Description
id	No	String	Derivative metric ID, which is a string. This parameter is mandatory for update.
name_en	Yes	String	Derivative metric name in English
name_ch	Yes	String	Derivative metric name
create_by	No	String	Creator.

Parameter	Mandatory	Type	Description
data_type	No	String	Field type
l2_id	No	String	Subject area ID. This parameter is read-only and does not need to be set during creation and update.
l3_id	Yes	String	Business object GUID, which is a string
status	No	String	Release status of an entity. This parameter is read-only and does not need to be set during creation and update. Options: <ul style="list-style-type: none"> • DRAFT: draft • PUBLISH_DEVELOPING: to be reviewed • PUBLISHED: released • OFFLINE_DEVELOPING: to be reviewed • OFFLINE: offline • REJECT: rejected
atomic_index_id	Yes	String	Atomic metric ID, which is a string
time_condition_id	No	String	Time filter ID, which is a string
time_field_id	No	String	ID of the field associated with the time filter, which is a string
common_conditions	No	Array of CommonConditionVO objects	General filter information.
dimension_groups	No	Array of DerivativeIndexDimensionVO objects	Statistical dimension, which cannot be changed during update
monitor	No	MetricMonitorVO object	Monitor metrics.

Parameter	Mandatory	Type	Description
l1	No	String	Chinese name of the subject area group. This parameter is read-only and does not need to be set when you create or update a subject area group.
l2	No	String	Chinese name of the subject area. This parameter is read-only and does not need to be set during creation and update.
l3	No	String	Chinese name of the business object. This parameter is read-only and does not need to be set during creation and update.
approval_info	No	ApprovalVO object	Approval information. This parameter is read-only. Latest review information about a business object, including the business details, reviewer information, and review time.
new_biz	No	BizVersionManagementVO object	Service version management. This parameter is read-only.

Table 7-597 CommonConditionVO

Parameter	Mandatory	Type	Description
name	Yes	String	Name.
field_ids	Yes	Array of strings	Field ID, in the format table_id.field_id.
field_names	No	Array of strings	Field name information. Format: Table name.Field name.
cal_exp	Yes	String	Calculation expression, for example, '\$ {table_id.column_id} > 1', where table_id indicates the ID of the table to which the referenced field belongs and column_id indicates the ID of the referenced field.

Parameter	Mandatory	Type	Description
cal_fn_ids	Yes	Array of strings	Reference function ID, which is a string
front_configs	No	String	Frontend expression configuration, which is used for front-end data restoration.

Table 7-598 DerivativeIndexDimensionVO

Parameter	Mandatory	Type	Description
group_id	Yes	String	Dimension group ID.
role	No	String	Dimension role.
dimension_id	No	String	Dimension ID, which is a string
hierarchies_id	No	String	Dimension level ID, which is a string
group_name	No	String	Name of a dimension group.
group_code	No	String	Dimension group code.

Parameter	Mandatory	Type	Description
biz_type	Yes	String	<p>Business entity type.</p> <p>Options:</p> <ul style="list-style-type: none"> ● AGGREGATION_LOGIC_TABLE: summary table ● ATOMIC_INDEX: atomic metric ● ATOMIC_METRIC: atomic metric (new) ● BIZ_CATALOG: process architecture directory ● BIZ_METRIC: service indicator ● CODE_TABLE: code table ● COMMON_CONDITION: general filter ● COMPOSITE_METRIC: Compound Metric (new) ● COMPOUND_METRIC: compound metric ● CONDITION_GROUP: restriction group ● DEGENERATE_DIMENSION: degenerate dimension ● DERIVATIVE_INDEX: derivative indicator ● DERIVED_METRIC: derivative indicator (new) ● DIMENSION: dimension ● DIMENSION_ATTRIBUTE: dimension attribute ● DIMENSION_HIERARCHIES: dimension level ● DIMENSION_LOGIC_TABLE: dimension table ● DIMENSION_TABLE_ATTRIBUTE: dimension attribute ● DIRECTORY: directory ● FACT_ATTRIBUTE: fact table attribute ● FACT_DIMENSION: fact table dimension ● FACT_LOGIC_TABLE: fact table

Parameter	Mandatory	Type	Description
			<ul style="list-style-type: none"> ● FACT_MEASURE: fact table measurement ● FUNCTION: function ● INFO_ARCH: information architecture (used for modifying themes in batches) ● MODEL: model ● QUALITY_RULE: quality rule ● SECRECY_LEVEL: security level ● STANDARD_ELEMENT: data standard ● STANDARD_ELEMENT_TEMPLATE: data standard template ● SUBJECT: theme ● Dimension attributes of SUMMARY_DIMENSION_ATTRIBUTE: summary tables ● SUMMARY_INDEX: summary table indicator attribute ● SUMMARY_TIME: time period attribute of the SDR table ● TABLE_MODEL: relationship model (logical model/physical model) ● TABLE_MODEL_ATTRIBUTE: relationship model attribute (logical model/physical model) ● TABLE_MODEL_LOGIC: logical entity ● TABLE_TYPE: table type ● TAG: tag ● TIME_CONDITION: time restriction
l2_id	No	String	Subject area ID. This parameter is read-only and does not need to be set during creation and update.
dw_type	No	String	Data connection type.

Table 7-599 MetricMonitorVO

Parameter	Mandatory	Type	Description
id	No	String	ID, which is a string
other_metric_ids	No	Array of strings	ID of another metric, which is a string
other_compond_metric_ids	No	Array of strings	ID of another composite index.
expression	No	String	Alarm expression.
metric_id	No	String	Mount pointer ID, which is a string
front_configs	No	String	Frontend expression configuration, which is used for front-end data restoration.

Parameter	Mandatory	Type	Description
metric_type	No	String	<p>Business entity type.</p> <p>Options:</p> <ul style="list-style-type: none"> ● AGGREGATION_LOGIC_TABLE: summary table ● ATOMIC_INDEX: atomic metric ● ATOMIC_METRIC: atomic metric (new) ● BIZ_CATALOG: process architecture directory ● BIZ_METRIC: service indicator ● CODE_TABLE: code table ● COMMON_CONDITION: general filter ● COMPOSITE_METRIC: Compound Metric (new) ● COMPOUND_METRIC: compound metric ● CONDITION_GROUP: restriction group ● DEGENERATE_DIMENSION: degenerate dimension ● DERIVATIVE_INDEX: derivative indicator ● DERIVED_METRIC: derivative indicator (new) ● DIMENSION: dimension ● DIMENSION_ATTRIBUTE: dimension attribute ● DIMENSION_HIERARCHIES: dimension level ● DIMENSION_LOGIC_TABLE: dimension table ● DIMENSION_TABLE_ATTRIBUTE: dimension attribute ● DIRECTORY: directory ● FACT_ATTRIBUTE: fact table attribute ● FACT_DIMENSION: fact table dimension ● FACT_LOGIC_TABLE: fact table

Parameter	Mandatory	Type	Description
			<ul style="list-style-type: none"> ● FACT_MEASURE: fact table measurement ● FUNCTION: function ● INFO_ARCH: information architecture (used for modifying themes in batches) ● MODEL: model ● QUALITY_RULE: quality rule ● SECRECY_LEVEL: security level ● STANDARD_ELEMENT: data standard ● STANDARD_ELEMENT_TEMPLATE: data standard template ● SUBJECT: theme ● Dimension attributes of SUMMARY_DIMENSION_ATTRIBUTE: summary tables ● SUMMARY_INDEX: summary table indicator attribute ● SUMMARY_TIME: time period attribute of the SDR table ● TABLE_MODEL: relationship model (logical model/physical model) ● TABLE_MODEL_ATTRIBUTE: relationship model attribute (logical model/physical model) ● TABLE_MODEL_LOGIC: logical entity ● TABLE_TYPE: table type ● TAG: tag ● TIME_CONDITION: time restriction

Table 7-600 ApprovalVO

Parameter	Mandatory	Type	Description
id	No	String	Application ID, which is a string
tenant_id	No	String	Project ID. For details about how to obtain the project ID, see the API path parameter <code>project_id</code> .
name_ch	No	String	Chinese name of a service.
name_en	No	String	English name of a service.
biz_id	No	String	Business ID, which is a string

Parameter	Mandatory	Type	Description
biz_type	No	String	<p>Business entity type.</p> <p>Options:</p> <ul style="list-style-type: none"> ● AGGREGATION_LOGIC_TABLE: summary table ● ATOMIC_INDEX: atomic metric ● ATOMIC_METRIC: atomic metric (new) ● BIZ_CATALOG: process architecture directory ● BIZ_METRIC: service indicator ● CODE_TABLE: code table ● COMMON_CONDITION: general filter ● COMPOSITE_METRIC: Compound Metric (new) ● COMPOUND_METRIC: compound metric ● CONDITION_GROUP: restriction group ● DEGENERATE_DIMENSION: degenerate dimension ● DERIVATIVE_INDEX: derivative indicator ● DERIVED_METRIC: derivative indicator (new) ● DIMENSION: dimension ● DIMENSION_ATTRIBUTE: dimension attribute ● DIMENSION_HIERARCHIES: dimension level ● DIMENSION_LOGIC_TABLE: dimension table ● DIMENSION_TABLE_ATTRIBUTE: dimension attribute ● DIRECTORY: directory ● FACT_ATTRIBUTE: fact table attribute ● FACT_DIMENSION: fact table dimension ● FACT_LOGIC_TABLE: fact table

Parameter	Mandatory	Type	Description
			<ul style="list-style-type: none"> • FACT_MEASURE: fact table measurement • FUNCTION: function • INFO_ARCH: information architecture (used for modifying themes in batches) • MODEL: model • QUALITY_RULE: quality rule • SECRECY_LEVEL: security level • STANDARD_ELEMENT: data standard • STANDARD_ELEMENT_TEMPLATE: data standard template • SUBJECT: theme • Dimension attributes of SUMMARY_DIMENSION_ATTRIBUTE: summary tables • SUMMARY_INDEX: summary table indicator attribute • SUMMARY_TIME: time period attribute of the SDR table • TABLE_MODEL: relationship model (logical model/physical model) • TABLE_MODEL_ATTRIBUTE: relationship model attribute (logical model/physical model) • TABLE_MODEL_LOGIC: logical entity • TABLE_TYPE: table type • TAG: tag • TIME_CONDITION: time restriction
biz_info	No	String	Serialized service details. The type is string.
biz_info_obj	No	Object	Service details. The type is object.

Parameter	Mandatory	Type	Description
biz_version	No	Integer	Service version.
biz_status	No	String	Release status of an entity. This parameter is read-only and does not need to be set during creation and update. Options: <ul style="list-style-type: none"> • DRAFT: draft • PUBLISH_DEVELOPING: to be reviewed • PUBLISHED: released • OFFLINE_DEVELOPING: to be reviewed • OFFLINE: offline • REJECT: rejected
approval_status	No	String	Service approval status. This parameter is read-only. Options: <ul style="list-style-type: none"> • DEVELOPING: being reviewed • APPROVED: approved • REJECT: rejected • WITHDREW: approval cancellation
approval_type	No	String	Service review type. Options: <ul style="list-style-type: none"> • PUBLISH: released • OFFLINE: offline
submit_time	No	String	Submitted At
create_by	No	String	Creator.
l1	No	String	Chinese name of the subject area group. This parameter is read-only and does not need to be set when you create or update a subject area group.
l2	No	String	Chinese name of the subject area. This parameter is read-only and does not need to be set during creation and update.

Parameter	Mandatory	Type	Description
l3	No	String	Chinese name of the business object. This parameter is read-only and does not need to be set during creation and update.
approval_time	No	String	Review time.
approver	No	String	Reviewer.
email	No	String	Email address of the reviewer.
msg	No	String	Review information.
directory_path	No	String	Directory tree.

Table 7-601 BizVersionManageVO

Parameter	Mandatory	Type	Description
id	No	String	Field ID, which is a string

Parameter	Mandatory	Type	Description
biz_type	No	String	<p>Business entity type.</p> <p>Options:</p> <ul style="list-style-type: none"> • AGGREGATION_LOGIC_TABLE: summary table • ATOMIC_INDEX: atomic metric • ATOMIC_METRIC: atomic metric (new) • BIZ_CATALOG: process architecture directory • BIZ_METRIC: service indicator • CODE_TABLE: code table • COMMON_CONDITION: general filter • COMPOSITE_METRIC: Compound Metric (new) • COMPOUND_METRIC: compound metric • CONDITION_GROUP: restriction group • DEGENERATE_DIMENSION: degenerate dimension • DERIVATIVE_INDEX: derivative indicator • DERIVED_METRIC: derivative indicator (new) • DIMENSION: dimension • DIMENSION_ATTRIBUTE: dimension attribute • DIMENSION_HIERARCHIES: dimension level • DIMENSION_LOGIC_TABLE: dimension table • DIMENSION_TABLE_ATTRIBUTE: dimension attribute • DIRECTORY: directory • FACT_ATTRIBUTE: fact table attribute • FACT_DIMENSION: fact table dimension • FACT_LOGIC_TABLE: fact table

biz_id	No	String	Business ID, which is a string
biz_info	No	String	Business object information.

Parameter	Mandatory	Type	Description
status	No	String	Release status of an entity. This parameter is read-only and does not need to be set during creation and update. Options: <ul style="list-style-type: none"> • DRAFT: draft • PUBLISH_DEVELOPING: to be reviewed • PUBLISHED: released • OFFLINE_DEVELOPING: to be reviewed • OFFLINE: offline • REJECT: rejected

Response Parameters

Status code: 200

Table 7-602 Response body parameters

Parameter	Type	Description
data	data object	Number of successfully created derivative metrics

Table 7-603 data

Parameter	Type	Description
value	BatchOperationVO object	Result of creating a derivative metric

Table 7-604 BatchOperationVO

Parameter	Type	Description
id	String	Batch approval ID, which is a string
tenant_id	String	Project ID.
group_id	String	Group ID, which is a string
biz_name	String	Service name.

Parameter	Type	Description
biz_id	String	Business ID, which is a string
operation_status	String	Operation result type enumeration. RUNNING(Running), SUCCESS(Operation succeeded), and FAILED(Operation failed). Options: <ul style="list-style-type: none"> • RUNNING: The task is running. • SUCCESS: The operation is successful. • FAILED: The operation fails.
operation_type	String	Indicates the type.
biz_info	String	Service details.
create_by	String	Creator.
remark	String	Indicates the remark information.
total	Integer	Total number.
success	Integer	Number of successful operations.
failed	Integer	Indicates the number of failed operations.
rate	String	Indicates the current progress.
logs	String	Logs.
groups	Array of BatchOperationVO objects	Group information.

Status code: 400

Table 7-605 Response body parameters

Parameter	Type	Description
error_code	String	Error code, for example, DS.6000, indicating that the request fails to be processed.
error_msg	String	Error message
data	Object	Returned data information.

Status code: 401

Table 7-606 Response body parameters

Parameter	Type	Description
error_code	String	Error code, for example, DS.6000, indicating that the request fails to be processed.
error_msg	String	Error message
data	Object	Returned data information.

Status code: 403

Table 7-607 Response body parameters

Parameter	Type	Description
error_code	String	Error code, for example, DS.6000, indicating that the request fails to be processed.
error_msg	String	Error message
data	Object	Returned data information.

Example Requests

Create a derivative metric based on request parameters.

More

For SDK sample code of more programming languages, see the Sample Code tab in [API Explorer](#). SDK sample code can be automatically generated.

Status Codes

Status Code	Description
200	The operation succeeds. BatchOperationVO is returned.
400	BadRequest
401	Unauthorized
403	Forbidden

7.12.3 Updating a Derivative Metric

Function

This API is used to update a derivative metric.

Calling Method

For details, see [Calling APIs](#).

URI

PUT /v2/{project_id}/design/derivative-indexs

Table 7-608 Path Parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Project ID. For details about how to obtain the project ID, see Project ID and Account ID .

Request Parameters

Table 7-609 Request body parameters

Parameter	Mandatory	Type	Description
id	No	String	Derivative metric ID, which is a string. This parameter is mandatory for update.
name_en	Yes	String	Derivative metric name in English
name_ch	Yes	String	Derivative metric name
create_by	No	String	Creator.
data_type	No	String	Field type
l2_id	No	String	Subject area ID. This parameter is read-only and does not need to be set during creation and update.
l3_id	Yes	String	Business object GUID, which is a string

Parameter	Mandatory	Type	Description
status	No	String	Release status of an entity. This parameter is read-only and does not need to be set during creation and update. Options: <ul style="list-style-type: none"> • DRAFT: draft • PUBLISH_DEVELOPING: to be reviewed • PUBLISHED: released • OFFLINE_DEVELOPING: to be reviewed • OFFLINE: offline • REJECT: rejected
atomic_index_id	Yes	String	Atomic metric ID, which is a string
time_condition_id	No	String	Time filter ID, which is a string
time_field_id	No	String	ID of the field associated with the time filter, which is a string
common_conditions	No	Array of CommonConditionVO objects	General filter information.
dimension_groups	No	Array of DerivativeIndexDimensionVO objects	Statistical dimension, which cannot be changed during update
monitor	No	MetricMonitorVO object	Monitor metrics.
l1	No	String	Chinese name of the subject area group. This parameter is read-only and does not need to be set when you create or update a subject area group.
l2	No	String	Chinese name of the subject area. This parameter is read-only and does not need to be set during creation and update.

Parameter	Mandatory	Type	Description
l3	No	String	Chinese name of the business object. This parameter is read-only and does not need to be set during creation and update.
approval_info	No	ApprovalVO object	Approval information. This parameter is read-only. Latest review information about a business object, including the business details, reviewer information, and review time.
new_biz	No	BizVersionManagementVO object	Service version management. This parameter is read-only.

Table 7-610 CommonConditionVO

Parameter	Mandatory	Type	Description
name	Yes	String	Name.
field_ids	Yes	Array of strings	Field ID, in the format table_id.field_id.
field_names	No	Array of strings	Field name information. Format: Table name.Field name.
cal_exp	Yes	String	Calculation expression, for example, '\$ {table_id.column_id} > 1', where table_id indicates the ID of the table to which the referenced field belongs and column_id indicates the ID of the referenced field.
cal_fn_ids	Yes	Array of strings	Reference function ID, which is a string
front_configs	No	String	Frontend expression configuration, which is used for front-end data restoration.

Table 7-611 DerivativeIndexDimensionVO

Parameter	Mandatory	Type	Description
group_id	Yes	String	Dimension group ID.
role	No	String	Dimension role.
dimension_id	No	String	Dimension ID, which is a string
hierarchies_id	No	String	Dimension level ID, which is a string
group_name	No	String	Name of a dimension group.
group_code	No	String	Dimension group code.

Parameter	Mandatory	Type	Description
biz_type	Yes	String	<p>Business entity type.</p> <p>Options:</p> <ul style="list-style-type: none"> • AGGREGATION_LOGIC_TABLE: summary table • ATOMIC_INDEX: atomic metric • ATOMIC_METRIC: atomic metric (new) • BIZ_CATALOG: process architecture directory • BIZ_METRIC: service indicator • CODE_TABLE: code table • COMMON_CONDITION: general filter • COMPOSITE_METRIC: Compound Metric (new) • COMPOUND_METRIC: compound metric • CONDITION_GROUP: restriction group • DEGENERATE_DIMENSION: degenerate dimension • DERIVATIVE_INDEX: derivative indicator • DERIVED_METRIC: derivative indicator (new) • DIMENSION: dimension • DIMENSION_ATTRIBUTE: dimension attribute • DIMENSION_HIERARCHIES: dimension level • DIMENSION_LOGIC_TABLE: dimension table • DIMENSION_TABLE_ATTRIBUTE: dimension attribute • DIRECTORY: directory • FACT_ATTRIBUTE: fact table attribute • FACT_DIMENSION: fact table dimension • FACT_LOGIC_TABLE: fact table

Parameter	Mandatory	Type	Description
			<ul style="list-style-type: none"> • FACT_MEASURE: fact table measurement • FUNCTION: function • INFO_ARCH: information architecture (used for modifying themes in batches) • MODEL: model • QUALITY_RULE: quality rule • SECRECY_LEVEL: security level • STANDARD_ELEMENT: data standard • STANDARD_ELEMENT_TEMPLATE: data standard template • SUBJECT: theme • Dimension attributes of SUMMARY_DIMENSION_ATTRIBUTE: summary tables • SUMMARY_INDEX: summary table indicator attribute • SUMMARY_TIME: time period attribute of the SDR table • TABLE_MODEL: relationship model (logical model/physical model) • TABLE_MODEL_ATTRIBUTE: relationship model attribute (logical model/physical model) • TABLE_MODEL_LOGIC: logical entity • TABLE_TYPE: table type • TAG: tag • TIME_CONDITION: time restriction
l2_id	No	String	Subject area ID. This parameter is read-only and does not need to be set during creation and update.
dw_type	No	String	Data connection type.

Table 7-612 MetricMonitorVO

Parameter	Mandatory	Type	Description
id	No	String	ID, which is a string
other_metric_ids	No	Array of strings	ID of another metric, which is a string
other_compond_metric_ids	No	Array of strings	ID of another composite index.
expression	No	String	Alarm expression.
metric_id	No	String	Mount pointer ID, which is a string
front_configs	No	String	Frontend expression configuration, which is used for front-end data restoration.

Parameter	Mandatory	Type	Description
metric_type	No	String	<p>Business entity type.</p> <p>Options:</p> <ul style="list-style-type: none"> ● AGGREGATION_LOGIC_TABLE: summary table ● ATOMIC_INDEX: atomic metric ● ATOMIC_METRIC: atomic metric (new) ● BIZ_CATALOG: process architecture directory ● BIZ_METRIC: service indicator ● CODE_TABLE: code table ● COMMON_CONDITION: general filter ● COMPOSITE_METRIC: Compound Metric (new) ● COMPOUND_METRIC: compound metric ● CONDITION_GROUP: restriction group ● DEGENERATE_DIMENSION: degenerate dimension ● DERIVATIVE_INDEX: derivative indicator ● DERIVED_METRIC: derivative indicator (new) ● DIMENSION: dimension ● DIMENSION_ATTRIBUTE: dimension attribute ● DIMENSION_HIERARCHIES: dimension level ● DIMENSION_LOGIC_TABLE: dimension table ● DIMENSION_TABLE_ATTRIBUTE: dimension attribute ● DIRECTORY: directory ● FACT_ATTRIBUTE: fact table attribute ● FACT_DIMENSION: fact table dimension ● FACT_LOGIC_TABLE: fact table

biz_info	No	String	Serialized service details. The type is string.
biz_info_obj	No	Object	Service details. The type is object.

Parameter	Mandatory	Type	Description
biz_version	No	Integer	Service version.
biz_status	No	String	Release status of an entity. This parameter is read-only and does not need to be set during creation and update. Options: <ul style="list-style-type: none"> • DRAFT: draft • PUBLISH_DEVELOPING: to be reviewed • PUBLISHED: released • OFFLINE_DEVELOPING: to be reviewed • OFFLINE: offline • REJECT: rejected
approval_status	No	String	Service approval status. This parameter is read-only. Options: <ul style="list-style-type: none"> • DEVELOPING: being reviewed • APPROVED: approved • REJECT: rejected • WITHDREW: approval cancellation
approval_type	No	String	Service review type. Options: <ul style="list-style-type: none"> • PUBLISH: released • OFFLINE: offline
submit_time	No	String	Submitted At
create_by	No	String	Creator.
l1	No	String	Chinese name of the subject area group. This parameter is read-only and does not need to be set when you create or update a subject area group.
l2	No	String	Chinese name of the subject area. This parameter is read-only and does not need to be set during creation and update.

Parameter	Mandatory	Type	Description
l3	No	String	Chinese name of the business object. This parameter is read-only and does not need to be set during creation and update.
approval_time	No	String	Review time.
approver	No	String	Reviewer.
email	No	String	Email address of the reviewer.
msg	No	String	Review information.
directory_path	No	String	Directory tree.

Table 7-614 BizVersionManageVO

Parameter	Mandatory	Type	Description
id	No	String	Field ID, which is a string

Parameter	Mandatory	Type	Description
biz_type	No	String	<p>Business entity type.</p> <p>Options:</p> <ul style="list-style-type: none"> • AGGREGATION_LOGIC_TABLE: summary table • ATOMIC_INDEX: atomic metric • ATOMIC_METRIC: atomic metric (new) • BIZ_CATALOG: process architecture directory • BIZ_METRIC: service indicator • CODE_TABLE: code table • COMMON_CONDITION: general filter • COMPOSITE_METRIC: Compound Metric (new) • COMPOUND_METRIC: compound metric • CONDITION_GROUP: restriction group • DEGENERATE_DIMENSION: degenerate dimension • DERIVATIVE_INDEX: derivative indicator • DERIVED_METRIC: derivative indicator (new) • DIMENSION: dimension • DIMENSION_ATTRIBUTE: dimension attribute • DIMENSION_HIERARCHIES: dimension level • DIMENSION_LOGIC_TABLE: dimension table • DIMENSION_TABLE_ATTRIBUTE: dimension attribute • DIRECTORY: directory • FACT_ATTRIBUTE: fact table attribute • FACT_DIMENSION: fact table dimension • FACT_LOGIC_TABLE: fact table

biz_id	No	String	Business ID, which is a string
biz_info	No	String	Business object information.

Parameter	Mandatory	Type	Description
status	No	String	Release status of an entity. This parameter is read-only and does not need to be set during creation and update. Options: <ul style="list-style-type: none"> • DRAFT: draft • PUBLISH_DEVELOPING: to be reviewed • PUBLISHED: released • OFFLINE_DEVELOPING: to be reviewed • OFFLINE: offline • REJECT: rejected

Response Parameters

Status code: 200

Table 7-615 Response body parameters

Parameter	Type	Description
data	data object	Number of successfully updated derivative metrics

Table 7-616 data

Parameter	Type	Description
value	DerivativeIndexVO object	Result of updating derivative metrics

Table 7-617 DerivativeIndexVO

Parameter	Type	Description
id	String	Derivative metric ID, which is a string. This parameter is mandatory for update.
name_en	String	Derivative metric name in English
name_ch	String	Derivative metric name

Parameter	Type	Description
description	String	Description, which is read-only.
create_by	String	Creator.
data_type	String	Field type
l1_id	String	Subject area group ID, which is a read-only string
l2_id	String	Subject area ID. This parameter is read-only and does not need to be set during creation and update.
l3_id	String	Business object GUID, which is a string
status	String	Release status of an entity. This parameter is read-only and does not need to be set during creation and update. Options: <ul style="list-style-type: none"> • DRAFT: draft • PUBLISH_DEVELOPING: to be reviewed • PUBLISHED: released • OFFLINE_DEVELOPING: to be reviewed • OFFLINE: offline • REJECT: rejected
atomic_index_id	String	Atomic metric ID, which is a string
time_condition_id	String	Time filter ID, which is a string
time_field_id	String	ID of the field associated with the time filter, which is a string
time_field_name	String	Name of the field associated with the time filter. This parameter is read-only.
common_conditions	Array of CommonConditionVO objects	General filter information.
dimension_groups	Array of DerivativeIndex-DimensionVO objects	Statistical dimension, which cannot be changed during update
monitor	MetricMonitorVO object	Monitor metrics.

Parameter	Type	Description
atomic_index	AtomicIndexVO object	Atomic metric information, including the name and unit. This parameter is read-only.
time_condition_name	String	Time filter name. This parameter is read-only.
create_time	String	Creation time, which is read-only. The format complies with RFC3339 and is accurate to seconds. The UTC time zone is yyyy-mm-ddTHH:MM:SSZ, for example, 1970-01-01T00:00:00Z.
update_time	String	Update time, which is read-only. The format complies with RFC3339 and is accurate to seconds. The UTC time zone is yyyy-mm-ddTHH:MM:SSZ, for example, 1970-01-01T00:00:00Z.
l1	String	Chinese name of the subject area group. This parameter is read-only and does not need to be set when you create or update a subject area group.
l2	String	Chinese name of the subject area. This parameter is read-only and does not need to be set during creation and update.
l3	String	Chinese name of the business object. This parameter is read-only and does not need to be set during creation and update.
summary_table_id	String	Summary table ID, which is a read-only string
approval_info	ApprovalVO object	Approval information. This parameter is read-only. Latest review information about a business object, including the business details, reviewer information, and review time.
new_biz	BizVersionManageVO object	Service version management. This parameter is read-only.

Table 7-618 CommonConditionVO

Parameter	Type	Description
name	String	Name.

Parameter	Type	Description
field_ids	Array of strings	Field ID, in the format table_id.field_id.
field_names	Array of strings	Field name information. Format: Table name.Field name.
cal_exp	String	Calculation expression, for example, '{table_id.column_id} > 1', where table_id indicates the ID of the table to which the referenced field belongs and column_id indicates the ID of the referenced field.
cal_fn_ids	Array of strings	Reference function ID, which is a string
front_configs	String	Frontend expression configuration, which is used for front-end data restoration.
id	String	General filter ID, which is a read-only string

Table 7-619 DerivativeIndexDimensionVO

Parameter	Type	Description
group_id	String	Dimension group ID.
role	String	Dimension role.
dimension_id	String	Dimension ID, which is a string
hierarchies_id	String	Dimension level ID, which is a string
ordinal	Integer	Sequence number, which is read-only.
group_name	String	Name of a dimension group.
group_code	String	Dimension group code.

Parameter	Type	Description
biz_type	String	<p>Business entity type.</p> <p>Options:</p> <ul style="list-style-type: none"> • AGGREGATION_LOGIC_TABLE: summary table • ATOMIC_INDEX: atomic metric • ATOMIC_METRIC: atomic metric (new) • BIZ_CATALOG: process architecture directory • BIZ_METRIC: service indicator • CODE_TABLE: code table • COMMON_CONDITION: general filter • COMPOSITE_METRIC: Compound Metric (new) • COMPOUND_METRIC: compound metric • CONDITION_GROUP: restriction group • DEGENERATE_DIMENSION: degenerate dimension • DERIVATIVE_INDEX: derivative indicator • DERIVED_METRIC: derivative indicator (new) • DIMENSION: dimension • DIMENSION_ATTRIBUTE: dimension attribute • DIMENSION_HIERARCHIES: dimension level • DIMENSION_LOGIC_TABLE: dimension table • DIMENSION_TABLE_ATTRIBUTE: dimension attribute • DIRECTORY: directory • FACT_ATTRIBUTE: fact table attribute • FACT_DIMENSION: fact table dimension • FACT_LOGIC_TABLE: fact table • FACT_MEASURE: fact table measurement • FUNCTION: function

Parameter	Type	Description
		<ul style="list-style-type: none"> • INFO_ARCH: information architecture (used for modifying themes in batches) • MODEL: model • QUALITY_RULE: quality rule • SECRECY_LEVEL: security level • STANDARD_ELEMENT: data standard • STANDARD_ELEMENT_TEMPLATE: data standard template • SUBJECT: theme • Dimension attributes of SUMMARY_DIMENSION_ATTRIBUTE: summary tables • SUMMARY_INDEX: summary table indicator attribute • SUMMARY_TIME: time period attribute of the SDR table • TABLE_MODEL: relationship model (logical model/physical model) • TABLE_MODEL_ATTRIBUTE: relationship model attribute (logical model/physical model) • TABLE_MODEL_LOGIC: logical entity • TABLE_TYPE: table type • TAG: tag • TIME_CONDITION: time restriction
hierarchies	Array of DimensionHierarchiesVO objects	Level attribute, which is read-only.
l1	String	Chinese name of the subject area group. This parameter is read-only and does not need to be set when you create or update a subject area group.
l2	String	Chinese name of the subject area. This parameter is read-only and does not need to be set during creation and update.
l3	String	Chinese name of the business object. This parameter is read-only and does not need to be set during creation and update.

Parameter	Type	Description
l1_id	String	Subject area group ID, which is a read-only string
l2_id	String	Subject area ID. This parameter is read-only and does not need to be set during creation and update.
l3_id	String	Business object ID, which is a read-only string
dw_type	String	Data connection type.
id	String	Level ID, which is a read-only string

Table 7-620 DimensionHierarchiesVO

Parameter	Type	Description
id	String	ID, which is a string
name	String	Level name.
attrs	Array of HierarchiesAttrVO objects	Attributes contained in a hierarchy.
create_time	String	Creation time, which is read-only. The format complies with RFC3339 and is accurate to seconds. The UTC time zone is yyyy-mm-ddTHH:MM:SSZ, for example, 1970-01-01T00:00:00Z.
update_time	String	Update time, which is read-only. The format complies with RFC3339 and is accurate to seconds. The UTC time zone is yyyy-mm-ddTHH:MM:SSZ, for example, 1970-01-01T00:00:00Z.
create_by	String	Creator.
update_by	String	Person who updates the information.

Table 7-621 HierarchiesAttrVO

Parameter	Type	Description
id	String	ID, which is a string
hierarchies_id	String	Level ID, which is a string
attr_id	String	Attribute ID, which is a string

Parameter	Type	Description
level	Integer	Indicates the layer.
attr_name_en	String	Referenced attribute code.
attr_name_ch	String	Referenced attribute name, which is read-only.
detail_attr_ids	Array of strings	Details attribute ID, which is a string
detail_attr_name_ens	Array of strings	Details attribute in English.
detail_attr_name_chs	Array of strings	Details attribute in Chinese, which is read-only.
attr	DimensionAttributeVO object	Referenced attribute field, which is read-only.
detail_attrs	Array of DimensionAttributeVO objects	Details field, which is read-only.

Table 7-622 DimensionAttributeVO

Parameter	Type	Description
id	String	ID, which is a string
dimension_id	String	Dimension ID, which is a read-only string
code_table_field_id	String	Lookup table attribute ID, which is a string
name_en	String	Field name.
name_ch	String	Service attribute.
description	String	Description.
create_by	String	Creator.
data_type	String	Field type
domain_type	String	Domain to which a field type belongs. Options: <ul style="list-style-type: none">• NUMBER: number• STRING: character type• DATETIME: date type• BLOB: large object (BLOB)• OTHER: other types

Parameter	Type	Description
data_type_extend	String	Extended field of the data type.
is_primary_key	Boolean	Indicates whether a key is a primary key.
is_biz_primary	Boolean	Indicates whether it is a service primary key.
is_partition_key	Boolean	Indicates whether to partition.
ordinal	Integer	Sequence number.
not_null	Boolean	Indicates whether the value is empty.
stand_row_id	String	ID of the associated data standard, which is a string
stand_row_name	String	Name of the associated data standard. This parameter is read-only.
quality_infos	Array of QualityInfoVO objects	Quality information, which is read-only.
secrecy_levels	Array of SecrecyLevelVO objects	Confidentiality
status	String	Release status of an entity. This parameter is read-only and does not need to be set during creation and update. Options: <ul style="list-style-type: none">• DRAFT: draft• PUBLISH_DEVELOPING: to be reviewed• PUBLISHED: released• OFFLINE_DEVELOPING: to be reviewed• OFFLINE: offline• REJECT: rejected
create_time	String	Creation time, which is read-only. The format complies with RFC3339 and is accurate to seconds. The UTC time zone is yyyy-mm-ddTHH:MM:SSZ, for example, 1970-01-01T00:00:00Z.

Parameter	Type	Description
update_time	String	Update time, which is read-only. The format complies with RFC3339 and is accurate to seconds. The UTC time zone is yyyy-mm-ddTHH:MM:SSZ, for example, 1970-01-01T00:00:00Z.
alias	String	Alias
self_defined_fields	Array of SelfDefinedField-VO objects	User-defined item.

Table 7-623 QualityInfoVO

Parameter	Type	Description
id	String	ID, which is a string
table_id	String	Table ID, which is a read-only string
attr_id	String	Attribute ID, which is a read-only string

Parameter	Type	Description
biz_type	String	<p>Business entity type.</p> <p>Options:</p> <ul style="list-style-type: none"> • AGGREGATION_LOGIC_TABLE: summary table • ATOMIC_INDEX: atomic metric • ATOMIC_METRIC: atomic metric (new) • BIZ_CATALOG: process architecture directory • BIZ_METRIC: service indicator • CODE_TABLE: code table • COMMON_CONDITION: general filter • COMPOSITE_METRIC: Compound Metric (new) • COMPOUND_METRIC: compound metric • CONDITION_GROUP: restriction group • DEGENERATE_DIMENSION: degenerate dimension • DERIVATIVE_INDEX: derivative indicator • DERIVED_METRIC: derivative indicator (new) • DIMENSION: dimension • DIMENSION_ATTRIBUTE: dimension attribute • DIMENSION_HIERARCHIES: dimension level • DIMENSION_LOGIC_TABLE: dimension table • DIMENSION_TABLE_ATTRIBUTE: dimension attribute • DIRECTORY: directory • FACT_ATTRIBUTE: fact table attribute • FACT_DIMENSION: fact table dimension • FACT_LOGIC_TABLE: fact table • FACT_MEASURE: fact table measurement • FUNCTION: function

Parameter	Type	Description
		<ul style="list-style-type: none"> • INFO_ARCH: information architecture (used for modifying themes in batches) • MODEL: model • QUALITY_RULE: quality rule • SECRECY_LEVEL: security level • STANDARD_ELEMENT: data standard • STANDARD_ELEMENT_TEMPLATE: data standard template • SUBJECT: theme • Dimension attributes of SUMMARY_DIMENSION_ATTRIBUTE: summary tables • SUMMARY_INDEX: summary table indicator attribute • SUMMARY_TIME: time period attribute of the SDR table • TABLE_MODEL: relationship model (logical model/physical model) • TABLE_MODEL_ATTRIBUTE: relationship model attribute (logical model/physical model) • TABLE_MODEL_LOGIC: logical entity • TABLE_TYPE: table type • TAG: tag • TIME_CONDITION: time restriction
data_quality_id	String	Quality ID, which is a string
show_control	Integer	Indicates whether to display the regular expression.
data_quality_name	String	Quality name.
alert_conf	String	Configure alarms.
expression	String	Regular expression configuration in regular expression-related validation rules.
extend_info	String	Indicates the extension information.
from_standard	Boolean	Indicates whether the data comes from the data standard quality configuration. This parameter is read-only.

Parameter	Type	Description
result_description	String	Result description.
create_by	String	Creator, which is read-only.
update_by	String	Updater, which is read-only.
create_time	String	Creation time, which is read-only. The format complies with RFC3339 and is accurate to seconds. The UTC time zone is yyyy-mm-ddTHH:MM:SSZ, for example, 1970-01-01T00:00:00Z.
update_time	String	Update time, which is read-only. The format complies with RFC3339 and is accurate to seconds. The UTC time zone is yyyy-mm-ddTHH:MM:SSZ, for example, 1970-01-01T00:00:00Z.

Table 7-624 SecrecyLevelVO

Parameter	Type	Description
id	String	Security level ID, which is a string
uuid	String	Data security primary key.
name	String	Confidentiality name.
slevel	Integer	Confidentiality level.
description	String	Confidentiality description.
create_by	String	Creator.
update_by	String	Person who updates the information.
create_time	String	Creation time, which is read-only. The format complies with RFC3339 and is accurate to seconds. The UTC time zone is yyyy-mm-ddTHH:MM:SSZ, for example, 1970-01-01T00:00:00Z.
update_time	String	Update time, which is read-only. The format complies with RFC3339 and is accurate to seconds. The UTC time zone is yyyy-mm-ddTHH:MM:SSZ, for example, 1970-01-01T00:00:00Z.
new_biz	BizVersionManag eVO object	Service version management. This parameter is read-only.

Table 7-625 SelfDefinedFieldVO

Parameter	Type	Description
fd_name_ch	String	Chinese name of a user-defined item.
fd_name_en	String	English name of a customized item.
not_null	Boolean	Whether a parameter is mandatory.
fd_value	String	Attribute value

Table 7-626 MetricMonitorVO

Parameter	Type	Description
id	String	ID, which is a string
other_metric_ids	Array of strings	ID of another metric, which is a string
other_metric_names	Array of strings	Name of another indicator. This parameter is read-only.
other_compound_metric_ids	Array of strings	ID of another composite index.
other_compound_metric_names	Array of strings	Name of another compound metric.
expression	String	Alarm expression.
metric_id	String	Mount pointer ID, which is a string
front_configs	String	Frontend expression configuration, which is used for front-end data restoration.

Parameter	Type	Description
metric_type	String	<p>Business entity type.</p> <p>Options:</p> <ul style="list-style-type: none"> • AGGREGATION_LOGIC_TABLE: summary table • ATOMIC_INDEX: atomic metric • ATOMIC_METRIC: atomic metric (new) • BIZ_CATALOG: process architecture directory • BIZ_METRIC: service indicator • CODE_TABLE: code table • COMMON_CONDITION: general filter • COMPOSITE_METRIC: Compound Metric (new) • COMPOUND_METRIC: compound metric • CONDITION_GROUP: restriction group • DEGENERATE_DIMENSION: degenerate dimension • DERIVATIVE_INDEX: derivative indicator • DERIVED_METRIC: derivative indicator (new) • DIMENSION: dimension • DIMENSION_ATTRIBUTE: dimension attribute • DIMENSION_HIERARCHIES: dimension level • DIMENSION_LOGIC_TABLE: dimension table • DIMENSION_TABLE_ATTRIBUTE: dimension attribute • DIRECTORY: directory • FACT_ATTRIBUTE: fact table attribute • FACT_DIMENSION: fact table dimension • FACT_LOGIC_TABLE: fact table • FACT_MEASURE: fact table measurement • FUNCTION: function

Parameter	Type	Description
		<ul style="list-style-type: none"> • INFO_ARCH: information architecture (used for modifying themes in batches) • MODEL: model • QUALITY_RULE: quality rule • SECRECY_LEVEL: security level • STANDARD_ELEMENT: data standard • STANDARD_ELEMENT_TEMPLATE: data standard template • SUBJECT: theme • Dimension attributes of SUMMARY_DIMENSION_ATTRIBUTE: summary tables • SUMMARY_INDEX: summary table indicator attribute • SUMMARY_TIME: time period attribute of the SDR table • TABLE_MODEL: relationship model (logical model/physical model) • TABLE_MODEL_ATTRIBUTE: relationship model attribute (logical model/physical model) • TABLE_MODEL_LOGIC: logical entity • TABLE_TYPE: table type • TAG: tag • TIME_CONDITION: time restriction

Table 7-627 AtomicIndexVO

Parameter	Type	Description
id	String	ID, which is a string
name_en	String	Indicates the English name of an atomic metric.
name_ch	String	Indicates the Chinese name of an atomic metric.
description	String	Description.
create_by	String	Creator.

Parameter	Type	Description
cal_exp	String	Calculation expression, for example, 'sum(\${fact_column_id})', where fact_column_id indicates the ID of the referenced field in the fact table
cal_fn_ids	Array of strings	Reference function ID, which is a string
l1_id	String	Subject area group ID, which is a read-only string
l2_id	String	Subject area ID. This parameter is read-only and does not need to be set during creation and update.
l3_id	String	Business object GUID, which is a string
table_id	String	Fact table ID, which is a string
tb_name	String	Name of a fact table.
dw_type	String	Data connection type, which corresponds to the type of the data warehouse where the table is located. The value can be DWS, MRS_HIVE, POSTGRESQL, MRS_SPARK, CLICKHOUSE, MYSQL, ORACLE, or DORIS.
field_ids	Array of strings	Field ID, which is a string
field_names	Array of strings	Field name.
status	String	Release status of an entity. This parameter is read-only and does not need to be set during creation and update. Options: <ul style="list-style-type: none"> ● DRAFT: draft ● PUBLISH_DEVELOPING: to be reviewed ● PUBLISHED: released ● OFFLINE_DEVELOPING: to be reviewed ● OFFLINE: offline ● REJECT: rejected

Parameter	Type	Description
biz_type	String	<p>Business entity type.</p> <p>Options:</p> <ul style="list-style-type: none"> • AGGREGATION_LOGIC_TABLE: summary table • ATOMIC_INDEX: atomic metric • ATOMIC_METRIC: atomic metric (new) • BIZ_CATALOG: process architecture directory • BIZ_METRIC: service indicator • CODE_TABLE: code table • COMMON_CONDITION: general filter • COMPOSITE_METRIC: Compound Metric (new) • COMPOUND_METRIC: compound metric • CONDITION_GROUP: restriction group • DEGENERATE_DIMENSION: degenerate dimension • DERIVATIVE_INDEX: derivative indicator • DERIVED_METRIC: derivative indicator (new) • DIMENSION: dimension • DIMENSION_ATTRIBUTE: dimension attribute • DIMENSION_HIERARCHIES: dimension level • DIMENSION_LOGIC_TABLE: dimension table • DIMENSION_TABLE_ATTRIBUTE: dimension attribute • DIRECTORY: directory • FACT_ATTRIBUTE: fact table attribute • FACT_DIMENSION: fact table dimension • FACT_LOGIC_TABLE: fact table • FACT_MEASURE: fact table measurement • FUNCTION: function

Parameter	Type	Description
		<ul style="list-style-type: none"> • INFO_ARCH: information architecture (used for modifying themes in batches) • MODEL: model • QUALITY_RULE: quality rule • SECRECY_LEVEL: security level • STANDARD_ELEMENT: data standard • STANDARD_ELEMENT_TEMPLATE: data standard template • SUBJECT: theme • Dimension attributes of SUMMARY_DIMENSION_ATTRIBUTE: summary tables • SUMMARY_INDEX: summary table indicator attribute • SUMMARY_TIME: time period attribute of the SDR table • TABLE_MODEL: relationship model (logical model/physical model) • TABLE_MODEL_ATTRIBUTE: relationship model attribute (logical model/physical model) • TABLE_MODEL_LOGIC: logical entity • TABLE_TYPE: table type • TAG: tag • TIME_CONDITION: time restriction
create_time	String	Creation time, which is read-only. The format complies with RFC3339 and is accurate to seconds. The UTC time zone is yyyy-mm-ddTHH:MM:SSZ, for example, 1970-01-01T00:00:00Z.
update_time	String	Update time, which is read-only. The format complies with RFC3339 and is accurate to seconds. The UTC time zone is yyyy-mm-ddTHH:MM:SSZ, for example, 1970-01-01T00:00:00Z.
l1	String	Chinese name of the subject area group. This parameter is read-only and does not need to be set when you create or update a subject area group.

Parameter	Type	Description
l2	String	Chinese name of the subject area. This parameter is read-only and does not need to be set during creation and update.
l3	String	Chinese name of the business object. This parameter is read-only and does not need to be set during creation and update.
approval_info	ApprovalVO object	Approval information. This parameter is read-only. Latest review information about a business object, including the business details, reviewer information, and review time.
new_biz	BizVersionManag eVO object	Service version management. This parameter is read-only.

Table 7-628 ApprovalVO

Parameter	Type	Description
id	String	Application ID, which is a string
tenant_id	String	Project ID. For details about how to obtain the project ID, see the API path parameter project_id.
name_ch	String	Chinese name of a service.
name_en	String	English name of a service.
biz_id	String	Business ID, which is a string

Parameter	Type	Description
biz_type	String	<p>Business entity type.</p> <p>Options:</p> <ul style="list-style-type: none"> • AGGREGATION_LOGIC_TABLE: summary table • ATOMIC_INDEX: atomic metric • ATOMIC_METRIC: atomic metric (new) • BIZ_CATALOG: process architecture directory • BIZ_METRIC: service indicator • CODE_TABLE: code table • COMMON_CONDITION: general filter • COMPOSITE_METRIC: Compound Metric (new) • COMPOUND_METRIC: compound metric • CONDITION_GROUP: restriction group • DEGENERATE_DIMENSION: degenerate dimension • DERIVATIVE_INDEX: derivative indicator • DERIVED_METRIC: derivative indicator (new) • DIMENSION: dimension • DIMENSION_ATTRIBUTE: dimension attribute • DIMENSION_HIERARCHIES: dimension level • DIMENSION_LOGIC_TABLE: dimension table • DIMENSION_TABLE_ATTRIBUTE: dimension attribute • DIRECTORY: directory • FACT_ATTRIBUTE: fact table attribute • FACT_DIMENSION: fact table dimension • FACT_LOGIC_TABLE: fact table • FACT_MEASURE: fact table measurement • FUNCTION: function

Parameter	Type	Description
		<ul style="list-style-type: none"> • INFO_ARCH: information architecture (used for modifying themes in batches) • MODEL: model • QUALITY_RULE: quality rule • SECRECY_LEVEL: security level • STANDARD_ELEMENT: data standard • STANDARD_ELEMENT_TEMPLATE: data standard template • SUBJECT: theme • Dimension attributes of SUMMARY_DIMENSION_ATTRIBUTE: summary tables • SUMMARY_INDEX: summary table indicator attribute • SUMMARY_TIME: time period attribute of the SDR table • TABLE_MODEL: relationship model (logical model/physical model) • TABLE_MODEL_ATTRIBUTE: relationship model attribute (logical model/physical model) • TABLE_MODEL_LOGIC: logical entity • TABLE_TYPE: table type • TAG: tag • TIME_CONDITION: time restriction
biz_info	String	Serialized service details. The type is string.
biz_info_obj	Object	Service details. The type is object.
biz_version	Integer	Service version.

Parameter	Type	Description
biz_status	String	Release status of an entity. This parameter is read-only and does not need to be set during creation and update. Options: <ul style="list-style-type: none"> • DRAFT: draft • PUBLISH_DEVELOPING: to be reviewed • PUBLISHED: released • OFFLINE_DEVELOPING: to be reviewed • OFFLINE: offline • REJECT: rejected
approval_status	String	Service approval status. This parameter is read-only. Options: <ul style="list-style-type: none"> • DEVELOPING: being reviewed • APPROVED: approved • REJECT: rejected • WITHDREW: approval cancellation
approval_type	String	Service review type. Options: <ul style="list-style-type: none"> • PUBLISH: released • OFFLINE: offline
submit_time	String	Submitted At
create_by	String	Creator.
l1	String	Chinese name of the subject area group. This parameter is read-only and does not need to be set when you create or update a subject area group.
l2	String	Chinese name of the subject area. This parameter is read-only and does not need to be set during creation and update.
l3	String	Chinese name of the business object. This parameter is read-only and does not need to be set during creation and update.
approval_time	String	Review time.

Parameter	Type	Description
approver	String	Reviewer.
email	String	Email address of the reviewer.
msg	String	Review information.
directory_path	String	Directory tree.

Table 7-629 BizVersionManageVO

Parameter	Type	Description
id	String	Field ID, which is a string

Parameter	Type	Description
biz_type	String	<p>Business entity type.</p> <p>Options:</p> <ul style="list-style-type: none"> • AGGREGATION_LOGIC_TABLE: summary table • ATOMIC_INDEX: atomic metric • ATOMIC_METRIC: atomic metric (new) • BIZ_CATALOG: process architecture directory • BIZ_METRIC: service indicator • CODE_TABLE: code table • COMMON_CONDITION: general filter • COMPOSITE_METRIC: Compound Metric (new) • COMPOUND_METRIC: compound metric • CONDITION_GROUP: restriction group • DEGENERATE_DIMENSION: degenerate dimension • DERIVATIVE_INDEX: derivative indicator • DERIVED_METRIC: derivative indicator (new) • DIMENSION: dimension • DIMENSION_ATTRIBUTE: dimension attribute • DIMENSION_HIERARCHIES: dimension level • DIMENSION_LOGIC_TABLE: dimension table • DIMENSION_TABLE_ATTRIBUTE: dimension attribute • DIRECTORY: directory • FACT_ATTRIBUTE: fact table attribute • FACT_DIMENSION: fact table dimension • FACT_LOGIC_TABLE: fact table • FACT_MEASURE: fact table measurement • FUNCTION: function

Parameter	Type	Description
		<ul style="list-style-type: none">• INFO_ARCH: information architecture (used for modifying themes in batches)• MODEL: model• QUALITY_RULE: quality rule• SECRECY_LEVEL: security level• STANDARD_ELEMENT: data standard• STANDARD_ELEMENT_TEMPLATE: data standard template• SUBJECT: theme• Dimension attributes of SUMMARY_DIMENSION_ATTRIBUTE: summary tables• SUMMARY_INDEX: summary table indicator attribute• SUMMARY_TIME: time period attribute of the SDR table• TABLE_MODEL: relationship model (logical model/physical model)• TABLE_MODEL_ATTRIBUTE: relationship model attribute (logical model/physical model)• TABLE_MODEL_LOGIC: logical entity• TABLE_TYPE: table type• TAG: tag• TIME_CONDITION: time restriction
biz_id	String	Business ID, which is a string
biz_info	String	Business object information.

Parameter	Type	Description
status	String	Release status of an entity. This parameter is read-only and does not need to be set during creation and update. Options: <ul style="list-style-type: none"> • DRAFT: draft • PUBLISH_DEVELOPING: to be reviewed • PUBLISHED: released • OFFLINE_DEVELOPING: to be reviewed • OFFLINE: offline • REJECT: rejected
biz_version	Integer	Service version, which is read-only.
create_time	String	Creation time, which is read-only. The format complies with RFC3339 and is accurate to seconds. The UTC time zone is yyyy-mm-ddTHH:MM:SSZ, for example, 1970-01-01T00:00:00Z.
update_time	String	Update time, which is read-only. The format complies with RFC3339 and is accurate to seconds. The UTC time zone is yyyy-mm-ddTHH:MM:SSZ, for example, 1970-01-01T00:00:00Z.

Status code: 400

Table 7-630 Response body parameters

Parameter	Type	Description
error_code	String	Error code, for example, DS.6000, indicating that the request fails to be processed.
error_msg	String	Error message
data	Object	Returned data information.

Status code: 401

Table 7-631 Response body parameters

Parameter	Type	Description
error_code	String	Error code, for example, DS.6000, indicating that the request fails to be processed.
error_msg	String	Error message
data	Object	Returned data information.

Status code: 403

Table 7-632 Response body parameters

Parameter	Type	Description
error_code	String	Error code, for example, DS.6000, indicating that the request fails to be processed.
error_msg	String	Error message
data	Object	Returned data information.

More

For SDK sample code of more programming languages, see the Sample Code tab in [API Explorer](#). SDK sample code can be automatically generated.

Status Codes

Status Code	Description
200	The operation succeeds. DerivativeIndexVO is returned.
400	BadRequest
401	Unauthorized
403	Forbidden

7.12.4 Deleting Derivative Metrics

Function

This API is used to delete derivative metrics with specified IDs.

Calling Method

For details, see [Calling APIs](#).

URI

DELETE /v2/{project_id}/design/derivative-idxs

Table 7-633 Path Parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Project ID. For details about how to obtain the project ID, see Project ID and Account ID .

Request Parameters

Table 7-634 Request body parameters

Parameter	Mandatory	Type	Description
ids	Yes	Array of strings	ID list, which is a string

Parameter	Mandatory	Type	Description
del_types	No	String	Deletion type. Enumerated values: <ul style="list-style-type: none"> PHYSICAL_TABLE: whether to delete physical database tables. This parameter is valid only for tables that can be materialized. (If this parameter is set, physical database tables are deleted.)

Response Parameters

Status code: 200

Table 7-635 Response body parameters

Parameter	Type	Description
data	data object	Indicates the final deletion result, that is, the number of objects that are successfully deleted.

Table 7-636 data

Parameter	Type	Description
value	String	Number of successfully deleted objects

Status code: 400

Table 7-637 Response body parameters

Parameter	Type	Description
error_code	String	Error code, for example, DS.6000, indicating that the request fails to be processed.
error_msg	String	Error message
data	Object	Returned data information.

Status code: 401

Table 7-638 Response body parameters

Parameter	Type	Description
error_code	String	Error code, for example, DS.6000, indicating that the request fails to be processed.
error_msg	String	Error message
data	Object	Returned data information.

Status code: 403

Table 7-639 Response body parameters

Parameter	Type	Description
error_code	String	Error code, for example, DS.6000, indicating that the request fails to be processed.
error_msg	String	Error message
data	Object	Returned data information.

Example Requests

Delete derivative metrics based on the input parameters. Only derivative metrics in the draft, offline, or rejected state can be deleted.

```
DELETE https://{endpoint}/v2/{project_id}/design/derivative-idxs
{
  "ids" : [ "1227990857618227200" ]
}
```

Example Responses

Status code: 200

The operation succeeds, and the number of deleted derivative metrics is returned.

```
{
  "value" : 1
}
```

Status code: 400

BadRequest

```
{
  "error_code" : "DS.60xx",
  "error_msg" : "The user request is illegal."
}
```

Status code: 401

Unauthorized

```
{
  "error_code" : "DS.60xx",
  "error_msg" : "User authentication failed."
}
```

Status code: 403

Forbidden

```
{
  "error_code" : "DS.60xx",
  "error_msg" : "The user does not have permission to call this API."
}
```

SDK Sample Code

The SDK sample code is as follows.

Java

Delete derivative metrics based on the input parameters. Only derivative metrics in the draft, offline, or rejected state can be deleted.

7.12.5 Viewing Derivative Indicator Details

Function

This API is used to obtain derivative details by ID.

Calling Method

For details, see [Calling APIs](#).

URI

GET /v2/{project_id}/design/derivative-indexes/{id}

Table 7-640 Path Parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Project ID. For details about how to obtain the project ID, see Project ID and Account ID .
id	Yes	String	Entity ID, which is a string

Table 7-641 Query Parameters

Parameter	Mandatory	Type	Description
latest	No	Boolean	Indicates whether to query the latest.

Request Parameters

Table 7-642 Request header parameters

Parameter	Mandatory	Type	Description
X-Auth-Token	Yes	String	IAM token, which is obtained by calling the IAM API for obtaining a user token (value of X-Subject-Token in the response header). This field is mandatory for authentication using tokens.
workspace	Yes	String	Workspace ID. For details about how to obtain the workspace ID, see Instance ID and Workspace ID .
X-Project-Id	No	String	Project ID. For details about how to obtain the project ID, see Project ID and Account ID . This parameter is mandatory for API requests that use AK/SK authentication in multi-project scenarios.
Content-Type	No	String	Default value: application/json;charset=UTF-8 This parameter is optional. If the body is available, this parameter is mandatory. If the body is unavailable, you do not need to set this parameter or verify it.

Response Parameters

Status code: 200**Table 7-643** Response body parameters

Parameter	Type	Description
data	data object	Returned data.

Table 7-644 data

Parameter	Type	Description
value	DerivativeIndex-VO object	Returned data information.

Table 7-645 DerivativeIndexVO

Parameter	Type	Description
id	String	Derivative metric ID, which is a string. This parameter is mandatory for update.
name_en	String	Derivative metric name in English
name_ch	String	Derivative metric name
description	String	Description, which is read-only.
create_by	String	Creator.
data_type	String	Field type
l1_id	String	Subject area group ID, which is a read-only string
l2_id	String	Subject area ID. This parameter is read-only and does not need to be set during creation and update.
l3_id	String	Business object GUID, which is a string
status	String	Release status of an entity. This parameter is read-only and does not need to be set during creation and update. Options: <ul style="list-style-type: none"> • DRAFT: draft • PUBLISH_DEVELOPING: to be reviewed • PUBLISHED: released • OFFLINE_DEVELOPING: to be reviewed • OFFLINE: offline • REJECT: rejected
atomic_index_id	String	Atomic metric ID, which is a string
time_condition_id	String	Time filter ID, which is a string

Parameter	Type	Description
time_field_id	String	ID of the field associated with the time filter, which is a string
time_field_name	String	Name of the field associated with the time filter. This parameter is read-only.
common_conditions	Array of CommonConditionVO objects	General filter information.
dimension_groups	Array of DerivativeIndex-DimensionVO objects	Statistical dimension, which cannot be changed during update
monitor	MetricMonitorVO object	Monitor metrics.
atomic_index	AtomicIndexVO object	Atomic metric information, including the name and unit. This parameter is read-only.
time_condition_name	String	Time filter name. This parameter is read-only.
create_time	String	Creation time, which is read-only. The format complies with RFC3339 and is accurate to seconds. The UTC time zone is yyyy-mm-ddTHH:MM:SSZ, for example, 1970-01-01T00:00:00Z.
update_time	String	Update time, which is read-only. The format complies with RFC3339 and is accurate to seconds. The UTC time zone is yyyy-mm-ddTHH:MM:SSZ, for example, 1970-01-01T00:00:00Z.
l1	String	Chinese name of the subject area group. This parameter is read-only and does not need to be set when you create or update a subject area group.
l2	String	Chinese name of the subject area. This parameter is read-only and does not need to be set during creation and update.
l3	String	Chinese name of the business object. This parameter is read-only and does not need to be set during creation and update.
summary_table_id	String	Summary table ID, which is a read-only string

Parameter	Type	Description
approval_info	ApprovalVO object	Approval information. This parameter is read-only. Latest review information about a business object, including the business details, reviewer information, and review time.
new_biz	BizVersionManageVO object	Service version management. This parameter is read-only.

Table 7-646 CommonConditionVO

Parameter	Type	Description
name	String	Name.
field_ids	Array of strings	Field ID, in the format table_id.field_id.
field_names	Array of strings	Field name information. Format: Table name.Field name.
cal_exp	String	Calculation expression, for example, '\$ {table_id.column_id} > 1', where table_id indicates the ID of the table to which the referenced field belongs and column_id indicates the ID of the referenced field.
cal_fn_ids	Array of strings	Reference function ID, which is a string
front_configs	String	Frontend expression configuration, which is used for front-end data restoration.
id	String	General filter ID, which is a read-only string

Table 7-647 DerivativeIndexDimensionVO

Parameter	Type	Description
group_id	String	Dimension group ID.
role	String	Dimension role.
dimension_id	String	Dimension ID, which is a string
hierarchies_id	String	Dimension level ID, which is a string
ordinal	Integer	Sequence number, which is read-only.
group_name	String	Name of a dimension group.

Parameter	Type	Description
group_code	String	Dimension group code.

Parameter	Type	Description
biz_type	String	<p>Business entity type.</p> <p>Options:</p> <ul style="list-style-type: none"> • AGGREGATION_LOGIC_TABLE: summary table • ATOMIC_INDEX: atomic metric • ATOMIC_METRIC: atomic metric (new) • BIZ_CATALOG: process architecture directory • BIZ_METRIC: service indicator • CODE_TABLE: code table • COMMON_CONDITION: general filter • COMPOSITE_METRIC: Compound Metric (new) • COMPOUND_METRIC: compound metric • CONDITION_GROUP: restriction group • DEGENERATE_DIMENSION: degenerate dimension • DERIVATIVE_INDEX: derivative indicator • DERIVED_METRIC: derivative indicator (new) • DIMENSION: dimension • DIMENSION_ATTRIBUTE: dimension attribute • DIMENSION_HIERARCHIES: dimension level • DIMENSION_LOGIC_TABLE: dimension table • DIMENSION_TABLE_ATTRIBUTE: dimension attribute • DIRECTORY: directory • FACT_ATTRIBUTE: fact table attribute • FACT_DIMENSION: fact table dimension • FACT_LOGIC_TABLE: fact table • FACT_MEASURE: fact table measurement • FUNCTION: function

Parameter	Type	Description
		<ul style="list-style-type: none"> • INFO_ARCH: information architecture (used for modifying themes in batches) • MODEL: model • QUALITY_RULE: quality rule • SECRECY_LEVEL: security level • STANDARD_ELEMENT: data standard • STANDARD_ELEMENT_TEMPLATE: data standard template • SUBJECT: theme • Dimension attributes of SUMMARY_DIMENSION_ATTRIBUTE: summary tables • SUMMARY_INDEX: summary table indicator attribute • SUMMARY_TIME: time period attribute of the SDR table • TABLE_MODEL: relationship model (logical model/physical model) • TABLE_MODEL_ATTRIBUTE: relationship model attribute (logical model/physical model) • TABLE_MODEL_LOGIC: logical entity • TABLE_TYPE: table type • TAG: tag • TIME_CONDITION: time restriction
hierarchies	Array of DimensionHierarchiesVO objects	Level attribute, which is read-only.
l1	String	Chinese name of the subject area group. This parameter is read-only and does not need to be set when you create or update a subject area group.
l2	String	Chinese name of the subject area. This parameter is read-only and does not need to be set during creation and update.
l3	String	Chinese name of the business object. This parameter is read-only and does not need to be set during creation and update.

Parameter	Type	Description
l1_id	String	Subject area group ID, which is a read-only string
l2_id	String	Subject area ID. This parameter is read-only and does not need to be set during creation and update.
l3_id	String	Business object ID, which is a read-only string
dw_type	String	Data connection type.
id	String	Level ID, which is a read-only string

Table 7-648 DimensionHierarchiesVO

Parameter	Type	Description
id	String	ID, which is a string
name	String	Level name.
attrs	Array of HierarchiesAttrVO objects	Attributes contained in a hierarchy.
create_time	String	Creation time, which is read-only. The format complies with RFC3339 and is accurate to seconds. The UTC time zone is yyyy-mm-ddTHH:MM:SSZ, for example, 1970-01-01T00:00:00Z.
update_time	String	Update time, which is read-only. The format complies with RFC3339 and is accurate to seconds. The UTC time zone is yyyy-mm-ddTHH:MM:SSZ, for example, 1970-01-01T00:00:00Z.
create_by	String	Creator.
update_by	String	Person who updates the information.

Table 7-649 HierarchiesAttrVO

Parameter	Type	Description
id	String	ID, which is a string
hierarchies_id	String	Level ID, which is a string
attr_id	String	Attribute ID, which is a string

Parameter	Type	Description
level	Integer	Indicates the layer.
attr_name_en	String	Referenced attribute code.
attr_name_ch	String	Referenced attribute name, which is read-only.
detail_attr_ids	Array of strings	Details attribute ID, which is a string
detail_attr_name_ens	Array of strings	Details attribute in English.
detail_attr_name_chs	Array of strings	Details attribute in Chinese, which is read-only.
attr	DimensionAttributeVO object	Referenced attribute field, which is read-only.
detail_attrs	Array of DimensionAttributeVO objects	Details field, which is read-only.

Table 7-650 DimensionAttributeVO

Parameter	Type	Description
id	String	ID, which is a string
dimension_id	String	Dimension ID, which is a read-only string
code_table_field_id	String	Lookup table attribute ID, which is a string
name_en	String	Field name.
name_ch	String	Service attribute.
description	String	Description.
create_by	String	Creator.
data_type	String	Field type
domain_type	String	Domain to which a field type belongs. Options: <ul style="list-style-type: none">• NUMBER: number• STRING: character type• DATETIME: date type• BLOB: large object (BLOB)• OTHER: other types

Parameter	Type	Description
data_type_extend	String	Extended field of the data type.
is_primary_key	Boolean	Indicates whether a key is a primary key.
is_biz_primary	Boolean	Indicates whether it is a service primary key.
is_partition_key	Boolean	Indicates whether to partition.
ordinal	Integer	Sequence number.
not_null	Boolean	Indicates whether the value is empty.
stand_row_id	String	ID of the associated data standard, which is a string
stand_row_name	String	Name of the associated data standard. This parameter is read-only.
quality_infos	Array of QualityInfoVO objects	Quality information, which is read-only.
secrecy_levels	Array of SecrecyLevelVO objects	Confidentiality
status	String	Release status of an entity. This parameter is read-only and does not need to be set during creation and update. Options: <ul style="list-style-type: none">• DRAFT: draft• PUBLISH_DEVELOPING: to be reviewed• PUBLISHED: released• OFFLINE_DEVELOPING: to be reviewed• OFFLINE: offline• REJECT: rejected
create_time	String	Creation time, which is read-only. The format complies with RFC3339 and is accurate to seconds. The UTC time zone is yyyy-mm-ddTHH:MM:SSZ, for example, 1970-01-01T00:00:00Z.

Parameter	Type	Description
update_time	String	Update time, which is read-only. The format complies with RFC3339 and is accurate to seconds. The UTC time zone is yyyy-mm-ddTHH:MM:SSZ, for example, 1970-01-01T00:00:00Z.
alias	String	Alias
self_defined_fields	Array of SelfDefinedField-VO objects	User-defined item.

Table 7-651 QualityInfoVO

Parameter	Type	Description
id	String	ID, which is a string
table_id	String	Table ID, which is a read-only string
attr_id	String	Attribute ID, which is a read-only string

Parameter	Type	Description
biz_type	String	<p>Business entity type.</p> <p>Options:</p> <ul style="list-style-type: none"> • AGGREGATION_LOGIC_TABLE: summary table • ATOMIC_INDEX: atomic metric • ATOMIC_METRIC: atomic metric (new) • BIZ_CATALOG: process architecture directory • BIZ_METRIC: service indicator • CODE_TABLE: code table • COMMON_CONDITION: general filter • COMPOSITE_METRIC: Compound Metric (new) • COMPOUND_METRIC: compound metric • CONDITION_GROUP: restriction group • DEGENERATE_DIMENSION: degenerate dimension • DERIVATIVE_INDEX: derivative indicator • DERIVED_METRIC: derivative indicator (new) • DIMENSION: dimension • DIMENSION_ATTRIBUTE: dimension attribute • DIMENSION_HIERARCHIES: dimension level • DIMENSION_LOGIC_TABLE: dimension table • DIMENSION_TABLE_ATTRIBUTE: dimension attribute • DIRECTORY: directory • FACT_ATTRIBUTE: fact table attribute • FACT_DIMENSION: fact table dimension • FACT_LOGIC_TABLE: fact table • FACT_MEASURE: fact table measurement • FUNCTION: function

Parameter	Type	Description

data_quality_id	String	Quality ID, which is a string
show_control	Integer	Indicates whether to display the regular expression.
data_quality_name	String	Quality name.
alert_conf	String	Configure alarms.
expression	String	Regular expression configuration in regular expression-related validation rules.
extend_info	String	Indicates the extension information.
from_standard	Boolean	Indicates whether the data comes from the data standard quality configuration. This parameter is read-only.

Parameter	Type	Description
result_description	String	Result description.
create_by	String	Creator, which is read-only.
update_by	String	Updater, which is read-only.
create_time	String	Creation time, which is read-only. The format complies with RFC3339 and is accurate to seconds. The UTC time zone is yyyy-mm-ddTHH:MM:SSZ, for example, 1970-01-01T00:00:00Z.
update_time	String	Update time, which is read-only. The format complies with RFC3339 and is accurate to seconds. The UTC time zone is yyyy-mm-ddTHH:MM:SSZ, for example, 1970-01-01T00:00:00Z.

Table 7-652 SecrecyLevelVO

Parameter	Type	Description
id	String	Security level ID, which is a string
uuid	String	Data security primary key.
name	String	Confidentiality name.
slevel	Integer	Confidentiality level.
description	String	Confidentiality description.
create_by	String	Creator.
update_by	String	Person who updates the information.
create_time	String	Creation time, which is read-only. The format complies with RFC3339 and is accurate to seconds. The UTC time zone is yyyy-mm-ddTHH:MM:SSZ, for example, 1970-01-01T00:00:00Z.
update_time	String	Update time, which is read-only. The format complies with RFC3339 and is accurate to seconds. The UTC time zone is yyyy-mm-ddTHH:MM:SSZ, for example, 1970-01-01T00:00:00Z.
new_biz	BizVersionManag eVO object	Service version management. This parameter is read-only.

Table 7-653 SelfDefinedFieldVO

Parameter	Type	Description
fd_name_ch	String	Chinese name of a user-defined item.
fd_name_en	String	English name of a customized item.
not_null	Boolean	Whether a parameter is mandatory.
fd_value	String	Attribute value

Table 7-654 MetricMonitorVO

Parameter	Type	Description
id	String	ID, which is a string
other_metric_ids	Array of strings	ID of another metric, which is a string
other_metric_names	Array of strings	Name of another indicator. This parameter is read-only.
other_compound_metric_ids	Array of strings	ID of another composite index.
other_compound_metric_names	Array of strings	Name of another compound metric.
expression	String	Alarm expression.
metric_id	String	Mount pointer ID, which is a string
front_configs	String	Frontend expression configuration, which is used for front-end data restoration.

Parameter	Type	Description
metric_type	String	<p>Business entity type.</p> <p>Options:</p> <ul style="list-style-type: none"> • AGGREGATION_LOGIC_TABLE: summary table • ATOMIC_INDEX: atomic metric • ATOMIC_METRIC: atomic metric (new) • BIZ_CATALOG: process architecture directory • BIZ_METRIC: service indicator • CODE_TABLE: code table • COMMON_CONDITION: general filter • COMPOSITE_METRIC: Compound Metric (new) • COMPOUND_METRIC: compound metric • CONDITION_GROUP: restriction group • DEGENERATE_DIMENSION: degenerate dimension • DERIVATIVE_INDEX: derivative indicator • DERIVED_METRIC: derivative indicator (new) • DIMENSION: dimension • DIMENSION_ATTRIBUTE: dimension attribute • DIMENSION_HIERARCHIES: dimension level • DIMENSION_LOGIC_TABLE: dimension table • DIMENSION_TABLE_ATTRIBUTE: dimension attribute • DIRECTORY: directory • FACT_ATTRIBUTE: fact table attribute • FACT_DIMENSION: fact table dimension • FACT_LOGIC_TABLE: fact table • FACT_MEASURE: fact table measurement • FUNCTION: function

Parameter	Type	Description
		<ul style="list-style-type: none"> • INFO_ARCH: information architecture (used for modifying themes in batches) • MODEL: model • QUALITY_RULE: quality rule • SECRECY_LEVEL: security level • STANDARD_ELEMENT: data standard • STANDARD_ELEMENT_TEMPLATE: data standard template • SUBJECT: theme • Dimension attributes of SUMMARY_DIMENSION_ATTRIBUTE: summary tables • SUMMARY_INDEX: summary table indicator attribute • SUMMARY_TIME: time period attribute of the SDR table • TABLE_MODEL: relationship model (logical model/physical model) • TABLE_MODEL_ATTRIBUTE: relationship model attribute (logical model/physical model) • TABLE_MODEL_LOGIC: logical entity • TABLE_TYPE: table type • TAG: tag • TIME_CONDITION: time restriction

Table 7-655 AtomicIndexVO

Parameter	Type	Description
id	String	ID, which is a string
name_en	String	Indicates the English name of an atomic metric.
name_ch	String	Indicates the Chinese name of an atomic metric.
description	String	Description.
create_by	String	Creator.

Parameter	Type	Description
cal_exp	String	Calculation expression, for example, 'sum(\${fact_column_id})', where fact_column_id indicates the ID of the referenced field in the fact table
cal_fn_ids	Array of strings	Reference function ID, which is a string
l1_id	String	Subject area group ID, which is a read-only string
l2_id	String	Subject area ID. This parameter is read-only and does not need to be set during creation and update.
l3_id	String	Business object GUID, which is a string
table_id	String	Fact table ID, which is a string
tb_name	String	Name of a fact table.
dw_type	String	Data connection type, which corresponds to the type of the data warehouse where the table is located. The value can be DWS, MRS_HIVE, POSTGRESQL, MRS_SPARK, CLICKHOUSE, MYSQL, ORACLE, or DORIS.
field_ids	Array of strings	Field ID, which is a string
field_names	Array of strings	Field name.
status	String	Release status of an entity. This parameter is read-only and does not need to be set during creation and update. Options: <ul style="list-style-type: none"> ● DRAFT: draft ● PUBLISH_DEVELOPING: to be reviewed ● PUBLISHED: released ● OFFLINE_DEVELOPING: to be reviewed ● OFFLINE: offline ● REJECT: rejected

Parameter	Type	Description
biz_type	String	<p>Business entity type.</p> <p>Options:</p> <ul style="list-style-type: none"> • AGGREGATION_LOGIC_TABLE: summary table • ATOMIC_INDEX: atomic metric • ATOMIC_METRIC: atomic metric (new) • BIZ_CATALOG: process architecture directory • BIZ_METRIC: service indicator • CODE_TABLE: code table • COMMON_CONDITION: general filter • COMPOSITE_METRIC: Compound Metric (new) • COMPOUND_METRIC: compound metric • CONDITION_GROUP: restriction group • DEGENERATE_DIMENSION: degenerate dimension • DERIVATIVE_INDEX: derivative indicator • DERIVED_METRIC: derivative indicator (new) • DIMENSION: dimension • DIMENSION_ATTRIBUTE: dimension attribute • DIMENSION_HIERARCHIES: dimension level • DIMENSION_LOGIC_TABLE: dimension table • DIMENSION_TABLE_ATTRIBUTE: dimension attribute • DIRECTORY: directory • FACT_ATTRIBUTE: fact table attribute • FACT_DIMENSION: fact table dimension • FACT_LOGIC_TABLE: fact table • FACT_MEASURE: fact table measurement • FUNCTION: function

Parameter	Type	Description
		<ul style="list-style-type: none"> • INFO_ARCH: information architecture (used for modifying themes in batches) • MODEL: model • QUALITY_RULE: quality rule • SECRECY_LEVEL: security level • STANDARD_ELEMENT: data standard • STANDARD_ELEMENT_TEMPLATE: data standard template • SUBJECT: theme • Dimension attributes of SUMMARY_DIMENSION_ATTRIBUTE: summary tables • SUMMARY_INDEX: summary table indicator attribute • SUMMARY_TIME: time period attribute of the SDR table • TABLE_MODEL: relationship model (logical model/physical model) • TABLE_MODEL_ATTRIBUTE: relationship model attribute (logical model/physical model) • TABLE_MODEL_LOGIC: logical entity • TABLE_TYPE: table type • TAG: tag • TIME_CONDITION: time restriction
create_time	String	Creation time, which is read-only. The format complies with RFC3339 and is accurate to seconds. The UTC time zone is yyyy-mm-ddTHH:MM:SSZ, for example, 1970-01-01T00:00:00Z.
update_time	String	Update time, which is read-only. The format complies with RFC3339 and is accurate to seconds. The UTC time zone is yyyy-mm-ddTHH:MM:SSZ, for example, 1970-01-01T00:00:00Z.
l1	String	Chinese name of the subject area group. This parameter is read-only and does not need to be set when you create or update a subject area group.

Parameter	Type	Description
l2	String	Chinese name of the subject area. This parameter is read-only and does not need to be set during creation and update.
l3	String	Chinese name of the business object. This parameter is read-only and does not need to be set during creation and update.
approval_info	ApprovalVO object	Approval information. This parameter is read-only. Latest review information about a business object, including the business details, reviewer information, and review time.
new_biz	BizVersionManag eVO object	Service version management. This parameter is read-only.

Table 7-656 ApprovalVO

Parameter	Type	Description
id	String	Application ID, which is a string
tenant_id	String	Project ID. For details about how to obtain the project ID, see the API path parameter project_id.
name_ch	String	Chinese name of a service.
name_en	String	English name of a service.
biz_id	String	Business ID, which is a string

Parameter	Type	Description
biz_type	String	<p>Business entity type.</p> <p>Options:</p> <ul style="list-style-type: none"> • AGGREGATION_LOGIC_TABLE: summary table • ATOMIC_INDEX: atomic metric • ATOMIC_METRIC: atomic metric (new) • BIZ_CATALOG: process architecture directory • BIZ_METRIC: service indicator • CODE_TABLE: code table • COMMON_CONDITION: general filter • COMPOSITE_METRIC: Compound Metric (new) • COMPOUND_METRIC: compound metric • CONDITION_GROUP: restriction group • DEGENERATE_DIMENSION: degenerate dimension • DERIVATIVE_INDEX: derivative indicator • DERIVED_METRIC: derivative indicator (new) • DIMENSION: dimension • DIMENSION_ATTRIBUTE: dimension attribute • DIMENSION_HIERARCHIES: dimension level • DIMENSION_LOGIC_TABLE: dimension table • DIMENSION_TABLE_ATTRIBUTE: dimension attribute • DIRECTORY: directory • FACT_ATTRIBUTE: fact table attribute • FACT_DIMENSION: fact table dimension • FACT_LOGIC_TABLE: fact table • FACT_MEASURE: fact table measurement • FUNCTION: function

Parameter	Type	Description
		<ul style="list-style-type: none"> • INFO_ARCH: information architecture (used for modifying themes in batches) • MODEL: model • QUALITY_RULE: quality rule • SECRECY_LEVEL: security level • STANDARD_ELEMENT: data standard • STANDARD_ELEMENT_TEMPLATE: data standard template • SUBJECT: theme • Dimension attributes of SUMMARY_DIMENSION_ATTRIBUTE: summary tables • SUMMARY_INDEX: summary table indicator attribute • SUMMARY_TIME: time period attribute of the SDR table • TABLE_MODEL: relationship model (logical model/physical model) • TABLE_MODEL_ATTRIBUTE: relationship model attribute (logical model/physical model) • TABLE_MODEL_LOGIC: logical entity • TABLE_TYPE: table type • TAG: tag • TIME_CONDITION: time restriction
biz_info	String	Serialized service details. The type is string.
biz_info_obj	Object	Service details. The type is object.
biz_version	Integer	Service version.

Parameter	Type	Description
biz_status	String	Release status of an entity. This parameter is read-only and does not need to be set during creation and update. Options: <ul style="list-style-type: none"> • DRAFT: draft • PUBLISH_DEVELOPING: to be reviewed • PUBLISHED: released • OFFLINE_DEVELOPING: to be reviewed • OFFLINE: offline • REJECT: rejected
approval_status	String	Service approval status. This parameter is read-only. Options: <ul style="list-style-type: none"> • DEVELOPING: being reviewed • APPROVED: approved • REJECT: rejected • WITHDREW: approval cancellation
approval_type	String	Service review type. Options: <ul style="list-style-type: none"> • PUBLISH: released • OFFLINE: offline
submit_time	String	Submitted At
create_by	String	Creator.
l1	String	Chinese name of the subject area group. This parameter is read-only and does not need to be set when you create or update a subject area group.
l2	String	Chinese name of the subject area. This parameter is read-only and does not need to be set during creation and update.
l3	String	Chinese name of the business object. This parameter is read-only and does not need to be set during creation and update.
approval_time	String	Review time.

Parameter	Type	Description
approver	String	Reviewer.
email	String	Email address of the reviewer.
msg	String	Review information.
directory_path	String	Directory tree.

Table 7-657 BizVersionManageVO

Parameter	Type	Description
id	String	Field ID, which is a string

Parameter	Type	Description
biz_type	String	<p>Business entity type.</p> <p>Options:</p> <ul style="list-style-type: none"> • AGGREGATION_LOGIC_TABLE: summary table • ATOMIC_INDEX: atomic metric • ATOMIC_METRIC: atomic metric (new) • BIZ_CATALOG: process architecture directory • BIZ_METRIC: service indicator • CODE_TABLE: code table • COMMON_CONDITION: general filter • COMPOSITE_METRIC: Compound Metric (new) • COMPOUND_METRIC: compound metric • CONDITION_GROUP: restriction group • DEGENERATE_DIMENSION: degenerate dimension • DERIVATIVE_INDEX: derivative indicator • DERIVED_METRIC: derivative indicator (new) • DIMENSION: dimension • DIMENSION_ATTRIBUTE: dimension attribute • DIMENSION_HIERARCHIES: dimension level • DIMENSION_LOGIC_TABLE: dimension table • DIMENSION_TABLE_ATTRIBUTE: dimension attribute • DIRECTORY: directory • FACT_ATTRIBUTE: fact table attribute • FACT_DIMENSION: fact table dimension • FACT_LOGIC_TABLE: fact table • FACT_MEASURE: fact table measurement • FUNCTION: function

Parameter	Type	Description
		<ul style="list-style-type: none"> • INFO_ARCH: information architecture (used for modifying themes in batches) • MODEL: model • QUALITY_RULE: quality rule • SECRECY_LEVEL: security level • STANDARD_ELEMENT: data standard • STANDARD_ELEMENT_TEMPLATE: data standard template • SUBJECT: theme • Dimension attributes of SUMMARY_DIMENSION_ATTRIBUTE: summary tables • SUMMARY_INDEX: summary table indicator attribute • SUMMARY_TIME: time period attribute of the SDR table • TABLE_MODEL: relationship model (logical model/physical model) • TABLE_MODEL_ATTRIBUTE: relationship model attribute (logical model/physical model) • TABLE_MODEL_LOGIC: logical entity • TABLE_TYPE: table type • TAG: tag • TIME_CONDITION: time restriction
biz_id	String	Business ID, which is a string
biz_info	String	Business object information.

Parameter	Type	Description
status	String	Release status of an entity. This parameter is read-only and does not need to be set during creation and update. Options: <ul style="list-style-type: none"> • DRAFT: draft • PUBLISH_DEVELOPING: to be reviewed • PUBLISHED: released • OFFLINE_DEVELOPING: to be reviewed • OFFLINE: offline • REJECT: rejected
biz_version	Integer	Service version, which is read-only.
create_time	String	Creation time, which is read-only. The format complies with RFC3339 and is accurate to seconds. The UTC time zone is yyyy-mm-ddTHH:MM:SSZ, for example, 1970-01-01T00:00:00Z.
update_time	String	Update time, which is read-only. The format complies with RFC3339 and is accurate to seconds. The UTC time zone is yyyy-mm-ddTHH:MM:SSZ, for example, 1970-01-01T00:00:00Z.

Status code: 400

Table 7-658 Response body parameters

Parameter	Type	Description
error_code	String	Error code, for example, DS.6000, indicating that the request fails to be processed.
error_msg	String	Error message
data	Object	Returned data information.

Status code: 401

Table 7-659 Response body parameters

Parameter	Type	Description
error_code	String	Error code, for example, DS.6000, indicating that the request fails to be processed.
error_msg	String	Error message
data	Object	Returned data information.

Status code: 403

Table 7-660 Response body parameters

Parameter	Type	Description
error_code	String	Error code, for example, DS.6000, indicating that the request fails to be processed.
error_msg	String	Error message
data	Object	Returned data information.

Example Requests

This API is used to obtain details about a derivative indicator based on the derivative indicator ID.

GET https://{endpoint}/v2/{project_id}/design/derivative-indexs/1181167466668310528

Example Responses

Status code: 200

This operation is successful, and the returned data is DerivativeIndexVO details.

Status Codes

Status Code	Description
200	This operation is successful, and the returned data is DerivativeIndexVO details.
400	BadRequest
401	Unauthorized
403	Forbidden

7.13 Compound Metrics

7.13.1 Searching for a Composite Metric

Function

Search for compound metric information by name, creator, reviewer, status, modification time, and l3Id.

Calling Method

For details, see [Calling APIs](#).

URI

GET /v2/{project_id}/design/compound-metrics

Table 7-661 Path Parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Project ID. For details about how to obtain the project ID, see Project ID and Account ID .

Table 7-662 Query Parameters

Parameter	Mandatory	Type	Description
name	No	String	Fuzzy query by name or code.
create_by	No	String	Query by creator.
approver	No	String	Query by reviewer.
status	No	String	Specifies the service status. Options: <ul style="list-style-type: none">• DRAFT: draft• PUBLISH_DEVELOPING: to be approved• PUBLISHED: released• OFFLINE_DEVELOPING: to be approved• OFFLINE: offline• REJECT: rejected

Parameter	Mandatory	Type	Description
dimension_group	No	String	Query dimension attributes based on the dimension granularity.
atomic_index_id	No	String	ID of the atomic metric based on which dimension attributes are queried. The ID is a string.
l3_id	No	String	ID of business object l3, which is a string
begin_time	No	String	Left boundary of time filtering. This parameter is used together with end_time. Only time range filtering is supported. Unilateral filtering is invalid. The format complies with RFC3339 and is accurate to seconds. The UTC time zone is yyyy-mm-ddTHH:MM:SSZ, for example, 1970-01-01T00:00:00Z.
end_time	No	String	Right boundary for time filtering. This parameter is used together with begin_time to support only time range filtering. The format complies with RFC3339 and is accurate to seconds. The UTC time zone is yyyy-mm-ddTHH:MM:SSZ, for example, 1970-01-01T00:00:00Z.
limit	No	Integer	Number of records to be queried on each page, that is, Y records to be queried. The default value is 50, and the value range is [1,100].
offset	No	Integer	Start coordinate of the query, that is, the number of skipped data records. The value can only be 0 or an integer multiple of limit. If the value does not meet the requirement, the value is rounded down. The default value is 0.

Request Parameters

Table 7-663 Request header parameters

Parameter	Mandatory	Type	Description
X-Auth-Token	Yes	String	IAM token, which is obtained by calling the IAM API for obtaining a user token (value of X-Subject-Token in the response header). This field is mandatory for authentication using tokens.
workspace	Yes	String	Workspace ID. For details about how to obtain the workspace ID, see Instance ID and Workspace ID .
X-Project-Id	No	String	Project ID. For details about how to obtain the project ID, see Project ID and Account ID . This parameter is mandatory for API requests that use AK/SK authentication in multi-project scenarios.
Content-Type	No	String	Default value: application/json;charset=UTF-8 This parameter is optional. If the body is available, this parameter is mandatory. If the body is unavailable, you do not need to set this parameter or verify it.

Response Parameters

Status code: 200**Table 7-664** Response body parameters

Parameter	Type	Description
data	data object	Returned data.

Table 7-665 data

Parameter	Type	Description
value	value object	Returned data information.

Table 7-666 value

Parameter	Type	Description
records	Array of CompoundMetricVO objects	CompoundMetricVO array.
total	Integer	Total number.

Table 7-667 CompoundMetricVO

Parameter	Type	Description
id	String	Compound metric ID, which is a string. This parameter is mandatory for update.
name_en	String	Compound metric name in English
name_ch	String	Compound metric name
description	String	Description
dimension_group	String	Statistical dimension ID, which cannot be changed during update
group_name	String	Granularity name, which is read-only.
group_code	String	Granularity code, which is read-only.
compound_type	String	Compound metric type Enumerated values: <ul style="list-style-type: none"> • EXPRESSION: expression • PERIODICITY_VALUED_COMPARISON: rate of growth compared to the previous period • INTERVAL_VALUED_COMPARISON: rate of growth compared to the same period last year

Parameter	Type	Description
comparison_type	String	Parallel comparison configuration. This parameter is mandatory when compound metric type is parallel growth rate. Enumerated values: <ul style="list-style-type: none"> • YEAR_TO_YEAR • MONTH_TO_MONTH • WEEK_TO_WEEK
metric_ids	Array of strings	Derivative metric. This parameter is mandatory when the compound metric type is PERIODICITY_VALUED_COMPARISON or INTERVAL_VALUED_COMPARISON .
metric_names	Array of strings	Indicates the indicator name.
compound_metric_ids	Array of strings	Compound metric information, which is an ID string
compound_metric_names	Array of strings	Compound metric name
cal_fn_ids	Array of strings	Reference function ID, which is a string
cal_exp	String	Calculation expression. This parameter is mandatory when the compound metric type is set to expression. It is in <code>\${index_id} + \${compound#index_id}</code> format, where <code>index_id</code> indicates the ID of the referenced derivative indicator and <code>compound#index_id</code> indicates the ID of the referenced composite indicator.
l1_id	String	Subject area group ID, which is a read-only string
l2_id	String	Subject area ID. This parameter is read-only and does not need to be set during creation and update.
l3_id	String	Business object ID, which is a string
data_type	String	Field type
create_by	String	Creator.
update_by	String	Person who updates the information.

Parameter	Type	Description
status	String	Release status of an entity. This parameter is read-only and does not need to be set during creation and update. Options: <ul style="list-style-type: none"> • DRAFT: draft • PUBLISH_DEVELOPING: to be reviewed • PUBLISHED: released • OFFLINE_DEVELOPING: to be reviewed • OFFLINE: offline • REJECT: rejected
create_time	String	Creation time, which is read-only. The format complies with RFC3339 and is accurate to seconds. The UTC time zone is yyyy-mm-ddTHH:MM:SSZ, for example, 1970-01-01T00:00:00Z.
update_time	String	Update time, which is read-only. The format complies with RFC3339 and is accurate to seconds. The UTC time zone is yyyy-mm-ddTHH:MM:SSZ, for example, 1970-01-01T00:00:00Z.
approval_info	ApprovalVO object	Approval information. This parameter is read-only. Latest review information about a business object, including the business details, reviewer information, and review time.
new_biz	BizVersionManag eVO object	Service version management. This parameter is read-only.
monitor	MetricMonitorV O object	Indicates the metric monitoring information.
l1	String	Chinese name of the subject area group. This parameter is read-only and does not need to be set when you create or update a subject area group.
l2	String	Chinese name of the subject area. This parameter is read-only and does not need to be set during creation and update.

Parameter	Type	Description
l3	String	Chinese name of the business object. This parameter is read-only and does not need to be set during creation and update.
summary_table_id	String	Summary table ID, which is a read-only string

Table 7-668 ApprovalVO

Parameter	Type	Description
id	String	Application ID, which is a string
tenant_id	String	Project ID. For details about how to obtain the project ID, see the API path parameter <code>project_id</code> .
name_ch	String	Chinese name of a service.
name_en	String	English name of a service.
biz_id	String	Business ID, which is a string

Parameter	Type	Description
biz_type	String	<p>Business entity type.</p> <p>Options:</p> <ul style="list-style-type: none"> • AGGREGATION_LOGIC_TABLE: summary table • ATOMIC_INDEX: atomic metric • ATOMIC_METRIC: atomic metric (new) • BIZ_CATALOG: process architecture directory • BIZ_METRIC: service indicator • CODE_TABLE: code table • COMMON_CONDITION: general filter • COMPOSITE_METRIC: Compound Metric (new) • COMPOUND_METRIC: compound metric • CONDITION_GROUP: restriction group • DEGENERATE_DIMENSION: degenerate dimension • DERIVATIVE_INDEX: derivative indicator • DERIVED_METRIC: derivative indicator (new) • DIMENSION: dimension • DIMENSION_ATTRIBUTE: dimension attribute • DIMENSION_HIERARCHIES: dimension level • DIMENSION_LOGIC_TABLE: dimension table • DIMENSION_TABLE_ATTRIBUTE: dimension attribute • DIRECTORY: directory • FACT_ATTRIBUTE: fact table attribute • FACT_DIMENSION: fact table dimension • FACT_LOGIC_TABLE: fact table • FACT_MEASURE: fact table measurement • FUNCTION: function

Parameter	Type	Description
		<ul style="list-style-type: none"> • INFO_ARCH: information architecture (used for modifying themes in batches) • MODEL: model • QUALITY_RULE: quality rule • SECRECY_LEVEL: security level • STANDARD_ELEMENT: data standard • STANDARD_ELEMENT_TEMPLATE: data standard template • SUBJECT: theme • Dimension attributes of SUMMARY_DIMENSION_ATTRIBUTE: summary tables • SUMMARY_INDEX: summary table indicator attribute • SUMMARY_TIME: time period attribute of the SDR table • TABLE_MODEL: relationship model (logical model/physical model) • TABLE_MODEL_ATTRIBUTE: relationship model attribute (logical model/physical model) • TABLE_MODEL_LOGIC: logical entity • TABLE_TYPE: table type • TAG: tag • TIME_CONDITION: time restriction
biz_info	String	Serialized service details. The type is string.
biz_info_obj	Object	Service details. The type is object.
biz_version	Integer	Service version.

Parameter	Type	Description
biz_status	String	Release status of an entity. This parameter is read-only and does not need to be set during creation and update. Options: <ul style="list-style-type: none"> • DRAFT: draft • PUBLISH_DEVELOPING: to be reviewed • PUBLISHED: released • OFFLINE_DEVELOPING: to be reviewed • OFFLINE: offline • REJECT: rejected
approval_status	String	Service approval status. This parameter is read-only. Options: <ul style="list-style-type: none"> • DEVELOPING: being reviewed • APPROVED: approved • REJECT: rejected • WITHDREW: approval cancellation
approval_type	String	Service review type. Options: <ul style="list-style-type: none"> • PUBLISH: released • OFFLINE: offline
submit_time	String	Submitted At
create_by	String	Creator.
l1	String	Chinese name of the subject area group. This parameter is read-only and does not need to be set when you create or update a subject area group.
l2	String	Chinese name of the subject area. This parameter is read-only and does not need to be set during creation and update.
l3	String	Chinese name of the business object. This parameter is read-only and does not need to be set during creation and update.
approval_time	String	Review time.

Parameter	Type	Description
approver	String	Reviewer.
email	String	Email address of the reviewer.
msg	String	Review information.
directory_path	String	Directory tree.

Table 7-669 BizVersionManageVO

Parameter	Type	Description
id	String	Field ID, which is a string

Parameter	Type	Description
biz_type	String	<p>Business entity type.</p> <p>Options:</p> <ul style="list-style-type: none"> • AGGREGATION_LOGIC_TABLE: summary table • ATOMIC_INDEX: atomic metric • ATOMIC_METRIC: atomic metric (new) • BIZ_CATALOG: process architecture directory • BIZ_METRIC: service indicator • CODE_TABLE: code table • COMMON_CONDITION: general filter • COMPOSITE_METRIC: Compound Metric (new) • COMPOUND_METRIC: compound metric • CONDITION_GROUP: restriction group • DEGENERATE_DIMENSION: degenerate dimension • DERIVATIVE_INDEX: derivative indicator • DERIVED_METRIC: derivative indicator (new) • DIMENSION: dimension • DIMENSION_ATTRIBUTE: dimension attribute • DIMENSION_HIERARCHIES: dimension level • DIMENSION_LOGIC_TABLE: dimension table • DIMENSION_TABLE_ATTRIBUTE: dimension attribute • DIRECTORY: directory • FACT_ATTRIBUTE: fact table attribute • FACT_DIMENSION: fact table dimension • FACT_LOGIC_TABLE: fact table • FACT_MEASURE: fact table measurement • FUNCTION: function

Parameter	Type	Description
		<ul style="list-style-type: none"> • INFO_ARCH: information architecture (used for modifying themes in batches) • MODEL: model • QUALITY_RULE: quality rule • SECRECY_LEVEL: security level • STANDARD_ELEMENT: data standard • STANDARD_ELEMENT_TEMPLATE: data standard template • SUBJECT: theme • Dimension attributes of SUMMARY_DIMENSION_ATTRIBUTE: summary tables • SUMMARY_INDEX: summary table indicator attribute • SUMMARY_TIME: time period attribute of the SDR table • TABLE_MODEL: relationship model (logical model/physical model) • TABLE_MODEL_ATTRIBUTE: relationship model attribute (logical model/physical model) • TABLE_MODEL_LOGIC: logical entity • TABLE_TYPE: table type • TAG: tag • TIME_CONDITION: time restriction
biz_id	String	Business ID, which is a string
biz_info	String	Business object information.

Parameter	Type	Description
status	String	Release status of an entity. This parameter is read-only and does not need to be set during creation and update. Options: <ul style="list-style-type: none"> • DRAFT: draft • PUBLISH_DEVELOPING: to be reviewed • PUBLISHED: released • OFFLINE_DEVELOPING: to be reviewed • OFFLINE: offline • REJECT: rejected
biz_version	Integer	Service version, which is read-only.
create_time	String	Creation time, which is read-only. The format complies with RFC3339 and is accurate to seconds. The UTC time zone is yyyy-mm-ddTHH:MM:SSZ, for example, 1970-01-01T00:00:00Z.
update_time	String	Update time, which is read-only. The format complies with RFC3339 and is accurate to seconds. The UTC time zone is yyyy-mm-ddTHH:MM:SSZ, for example, 1970-01-01T00:00:00Z.

Table 7-670 MetricMonitorVO

Parameter	Type	Description
id	String	ID, which is a string
other_metric_ids	Array of strings	ID of another metric, which is a string
other_metric_names	Array of strings	Name of another indicator. This parameter is read-only.
other_compound_metric_ids	Array of strings	ID of another composite index.
other_compound_metric_names	Array of strings	Name of another compound metric.
expression	String	Alarm expression.
metric_id	String	Mount pointer ID, which is a string

Parameter	Type	Description
front_configs	String	Frontend expression configuration, which is used for front-end data restoration.

Parameter	Type	Description
metric_type	String	<p>Business entity type.</p> <p>Options:</p> <ul style="list-style-type: none"> • AGGREGATION_LOGIC_TABLE: summary table • ATOMIC_INDEX: atomic metric • ATOMIC_METRIC: atomic metric (new) • BIZ_CATALOG: process architecture directory • BIZ_METRIC: service indicator • CODE_TABLE: code table • COMMON_CONDITION: general filter • COMPOSITE_METRIC: Compound Metric (new) • COMPOUND_METRIC: compound metric • CONDITION_GROUP: restriction group • DEGENERATE_DIMENSION: degenerate dimension • DERIVATIVE_INDEX: derivative indicator • DERIVED_METRIC: derivative indicator (new) • DIMENSION: dimension • DIMENSION_ATTRIBUTE: dimension attribute • DIMENSION_HIERARCHIES: dimension level • DIMENSION_LOGIC_TABLE: dimension table • DIMENSION_TABLE_ATTRIBUTE: dimension attribute • DIRECTORY: directory • FACT_ATTRIBUTE: fact table attribute • FACT_DIMENSION: fact table dimension • FACT_LOGIC_TABLE: fact table • FACT_MEASURE: fact table measurement • FUNCTION: function

		<ul style="list-style-type: none"> • INFO_ARCH: information architecture (used for modifying themes in batches) • MODEL: model • QUALITY_RULE: quality rule • SECRECY_LEVEL: security level • STANDARD_ELEMENT: data standard • STANDARD_ELEMENT_TEMPLATE: data standard template • SUBJECT: theme • Dimension attributes of SUMMARY_DIMENSION_ATTRIBUTE: summary tables • SUMMARY_INDEX: summary table indicator attribute • SUMMARY_TIME: time period attribute of the SDR table • TABLE_MODEL: relationship model (logical model/physical model) • TABLE_MODEL_ATTRIBUTE: relationship model attribute (logical model/physical model) • TABLE_MODEL_LOGIC: logical entity • TABLE_TYPE: table type • TAG: tag • TIME_CONDITION: time restriction

Status code: 400

Table 7-671 Response body parameters

Parameter	Type	Description
error_code	String	Error code, for example, DS.6000, indicating that the request fails to be processed.
error_msg	String	Error message
data	Object	Returned data information.

Status code: 401

Table 7-672 Response body parameters

Parameter	Type	Description
error_code	String	Error code, for example, DS.6000, indicating that the request fails to be processed.
error_msg	String	Error message
data	Object	Returned data information.

Status code: 403

Table 7-673 Response body parameters

Parameter	Type	Description
error_code	String	Error code, for example, DS.6000, indicating that the request fails to be processed.
error_msg	String	Error message
data	Object	Returned data information.

Example Requests

This API is used to query the composite metric list in pagination mode based on search criteria.

GET https://{endpoint}/v2/{project_id}/design/compound-metrics?offset=1&limit=10&name=com_

Example Responses

Status code: 200

This operation succeeds, and the returned data is a CompoundMetricVO array and the total number of records.

More

For SDK sample code of more programming languages, see the Sample Code tab in [API Explorer](#). SDK sample code can be automatically generated.

Status Codes

Status Code	Description
200	This operation succeeds, and the returned data is a CompoundMetricVO array and the total number of records.
400	BadRequest
401	Unauthorized
403	Forbidden

7.13.2 Creating a Compound Metric

Function

This API is used to create a compound metric.

Calling Method

For details, see [Calling APIs](#).

URI

POST /v2/{project_id}/design/compound-metrics

Table 7-674 Path Parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Project ID. For details about how to obtain the project ID, see Project ID and Account ID .

Request Parameters

Table 7-675 Request body parameters

Parameter	Mandatory	Type	Description
id	No	String	Compound metric ID, which is a string. This parameter is mandatory for update.
name_en	Yes	String	Compound metric name in English
name_ch	Yes	String	Compound metric name
description	No	String	Description
dimension_group	Yes	String	Statistical dimension ID, which cannot be changed during update
compound_type	Yes	String	Compound metric type Enumerated values: <ul style="list-style-type: none"> ● EXPRESSION: expression ● PERIODICITY_VALUED_COMPARISON: rate of growth compared to the previous period ● INTERVAL_VALUED_COMPARISON: rate of growth compared to the same period last year
comparison_type	No	String	Parallel comparison configuration. This parameter is mandatory when compound metric type is parallel growth rate. Enumerated values: <ul style="list-style-type: none"> ● YEAR_TO_YEAR ● MONTH_TO_MONTH ● WEEK_TO_WEEK
metric_ids	No	Array of strings	Derivative metric. This parameter is mandatory when the compound metric type is PERIODICITY_VALUED_COMPARISON or INTERVAL_VALUED_COMPARISON .
metric_names	No	Array of strings	Indicates the indicator name.

Parameter	Mandatory	Type	Description
compound_metric_ids	No	Array of strings	Compound metric information, which is an ID string
compound_metric_names	No	Array of strings	Compound metric name
cal_fn_ids	No	Array of strings	Reference function ID, which is a string
cal_exp	No	String	Calculation expression. This parameter is mandatory when the compound metric type is set to expression. It is in $\{index_id\} + \{compound\#index_id\}$ format, where <code>index_id</code> indicates the ID of the referenced derivative indicator and <code>compound#index_id</code> indicates the ID of the referenced composite indicator.
l2_id	No	String	Subject area ID. This parameter is read-only and does not need to be set during creation and update.
l3_id	Yes	String	Business object ID, which is a string
data_type	Yes	String	Field type
create_by	No	String	Creator.
update_by	No	String	Person who updates the information.
status	No	String	Release status of an entity. This parameter is read-only and does not need to be set during creation and update. Options: <ul style="list-style-type: none"> ● DRAFT: draft ● PUBLISH_DEVELOPING: to be reviewed ● PUBLISHED: released ● OFFLINE_DEVELOPING: to be reviewed ● OFFLINE: offline ● REJECT: rejected

Parameter	Mandatory	Type	Description
approval_info	No	ApprovalVO object	Approval information. This parameter is read-only. Latest review information about a business object, including the business details, reviewer information, and review time.
new_biz	No	BizVersionManageVO object	Service version management. This parameter is read-only.
monitor	No	MetricMonitorVO object	Indicates the metric monitoring information.
l1	No	String	Chinese name of the subject area group. This parameter is read-only and does not need to be set when you create or update a subject area group.
l2	No	String	Chinese name of the subject area. This parameter is read-only and does not need to be set during creation and update.
l3	No	String	Chinese name of the business object. This parameter is read-only and does not need to be set during creation and update.

Table 7-676 ApprovalVO

Parameter	Mandatory	Type	Description
id	No	String	Application ID, which is a string
tenant_id	No	String	Project ID. For details about how to obtain the project ID, see the API path parameter <code>project_id</code> .
name_ch	No	String	Chinese name of a service.
name_en	No	String	English name of a service.
biz_id	No	String	Business ID, which is a string

Parameter	Mandatory	Type	Description
biz_type	No	String	<p>Business entity type.</p> <p>Options:</p> <ul style="list-style-type: none"> ● AGGREGATION_LOGIC_TABLE: summary table ● ATOMIC_INDEX: atomic metric ● ATOMIC_METRIC: atomic metric (new) ● BIZ_CATALOG: process architecture directory ● BIZ_METRIC: service indicator ● CODE_TABLE: code table ● COMMON_CONDITION: general filter ● COMPOSITE_METRIC: Compound Metric (new) ● COMPOUND_METRIC: compound metric ● CONDITION_GROUP: restriction group ● DEGENERATE_DIMENSION: degenerate dimension ● DERIVATIVE_INDEX: derivative indicator ● DERIVED_METRIC: derivative indicator (new) ● DIMENSION: dimension ● DIMENSION_ATTRIBUTE: dimension attribute ● DIMENSION_HIERARCHIES: dimension level ● DIMENSION_LOGIC_TABLE: dimension table ● DIMENSION_TABLE_ATTRIBUTE: dimension attribute ● DIRECTORY: directory ● FACT_ATTRIBUTE: fact table attribute ● FACT_DIMENSION: fact table dimension ● FACT_LOGIC_TABLE: fact table

Parameter	Mandatory	Type	Description
			<ul style="list-style-type: none"> ● FACT_MEASURE: fact table measurement ● FUNCTION: function ● INFO_ARCH: information architecture (used for modifying themes in batches) ● MODEL: model ● QUALITY_RULE: quality rule ● SECRECY_LEVEL: security level ● STANDARD_ELEMENT: data standard ● STANDARD_ELEMENT_TEMPLATE: data standard template ● SUBJECT: theme ● Dimension attributes of SUMMARY_DIMENSION_ATTRIBUTE: summary tables ● SUMMARY_INDEX: summary table indicator attribute ● SUMMARY_TIME: time period attribute of the SDR table ● TABLE_MODEL: relationship model (logical model/physical model) ● TABLE_MODEL_ATTRIBUTE: relationship model attribute (logical model/physical model) ● TABLE_MODEL_LOGIC: logical entity ● TABLE_TYPE: table type ● TAG: tag ● TIME_CONDITION: time restriction
biz_info	No	String	Serialized service details. The type is string.
biz_info_obj	No	Object	Service details. The type is object.

Parameter	Mandatory	Type	Description
biz_version	No	Integer	Service version.
biz_status	No	String	Release status of an entity. This parameter is read-only and does not need to be set during creation and update. Options: <ul style="list-style-type: none"> • DRAFT: draft • PUBLISH_DEVELOPING: to be reviewed • PUBLISHED: released • OFFLINE_DEVELOPING: to be reviewed • OFFLINE: offline • REJECT: rejected
approval_status	No	String	Service approval status. This parameter is read-only. Options: <ul style="list-style-type: none"> • DEVELOPING: being reviewed • APPROVED: approved • REJECT: rejected • WITHDREW: approval cancellation
approval_type	No	String	Service review type. Options: <ul style="list-style-type: none"> • PUBLISH: released • OFFLINE: offline
submit_time	No	String	Submitted At
create_by	No	String	Creator.
l1	No	String	Chinese name of the subject area group. This parameter is read-only and does not need to be set when you create or update a subject area group.
l2	No	String	Chinese name of the subject area. This parameter is read-only and does not need to be set during creation and update.

Parameter	Mandatory	Type	Description
l3	No	String	Chinese name of the business object. This parameter is read-only and does not need to be set during creation and update.
approval_time	No	String	Review time.
approver	No	String	Reviewer.
email	No	String	Email address of the reviewer.
msg	No	String	Review information.
directory_path	No	String	Directory tree.

Response Parameters

Status code: 200

Table 7-679 Response body parameters

Parameter	Type	Description
data	data object	Number of successfully created compound metrics

Table 7-680 data

Parameter	Type	Description
value	CompoundMetricVO object	Result of creating a compound metric

Table 7-681 CompoundMetricVO

Parameter	Type	Description
id	String	Compound metric ID, which is a string. This parameter is mandatory for update.
name_en	String	Compound metric name in English
name_ch	String	Compound metric name
description	String	Description
dimension_group	String	Statistical dimension ID, which cannot be changed during update
group_name	String	Granularity name, which is read-only.
group_code	String	Granularity code, which is read-only.
compound_type	String	Compound metric type Enumerated values: <ul style="list-style-type: none">● EXPRESSION: expression● PERIODICITY_VALUED_COMPARISON: rate of growth compared to the previous period● INTERVAL_VALUED_COMPARISON: rate of growth compared to the same period last year

Parameter	Type	Description
comparison_type	String	Parallel comparison configuration. This parameter is mandatory when compound metric type is parallel growth rate. Enumerated values: <ul style="list-style-type: none"> • YEAR_TO_YEAR • MONTH_TO_MONTH • WEEK_TO_WEEK
metric_ids	Array of strings	Derivative metric. This parameter is mandatory when the compound metric type is PERIODICITY_VALUED_COMPARISON or INTERVAL_VALUED_COMPARISON .
metric_names	Array of strings	Indicates the indicator name.
compound_metric_ids	Array of strings	Compound metric information, which is an ID string
compound_metric_names	Array of strings	Compound metric name
cal_fn_ids	Array of strings	Reference function ID, which is a string
cal_exp	String	Calculation expression. This parameter is mandatory when the compound metric type is set to expression. It is in <code>\${index_id} + \${compound#index_id}</code> format, where <code>index_id</code> indicates the ID of the referenced derivative indicator and <code>compound#index_id</code> indicates the ID of the referenced composite indicator.
l1_id	String	Subject area group ID, which is a read-only string
l2_id	String	Subject area ID. This parameter is read-only and does not need to be set during creation and update.
l3_id	String	Business object ID, which is a string
data_type	String	Field type
create_by	String	Creator.
update_by	String	Person who updates the information.

Parameter	Type	Description
status	String	Release status of an entity. This parameter is read-only and does not need to be set during creation and update. Options: <ul style="list-style-type: none"> • DRAFT: draft • PUBLISH_DEVELOPING: to be reviewed • PUBLISHED: released • OFFLINE_DEVELOPING: to be reviewed • OFFLINE: offline • REJECT: rejected
create_time	String	Creation time, which is read-only. The format complies with RFC3339 and is accurate to seconds. The UTC time zone is yyyy-mm-ddTHH:MM:SSZ, for example, 1970-01-01T00:00:00Z.
update_time	String	Update time, which is read-only. The format complies with RFC3339 and is accurate to seconds. The UTC time zone is yyyy-mm-ddTHH:MM:SSZ, for example, 1970-01-01T00:00:00Z.
approval_info	ApprovalVO object	Approval information. This parameter is read-only. Latest review information about a business object, including the business details, reviewer information, and review time.
new_biz	BizVersionManag eVO object	Service version management. This parameter is read-only.
monitor	MetricMonitorV O object	Indicates the metric monitoring information.
l1	String	Chinese name of the subject area group. This parameter is read-only and does not need to be set when you create or update a subject area group.
l2	String	Chinese name of the subject area. This parameter is read-only and does not need to be set during creation and update.

Parameter	Type	Description
l3	String	Chinese name of the business object. This parameter is read-only and does not need to be set during creation and update.
summary_table_id	String	Summary table ID, which is a read-only string

Table 7-682 ApprovalVO

Parameter	Type	Description
id	String	Application ID, which is a string
tenant_id	String	Project ID. For details about how to obtain the project ID, see the API path parameter <code>project_id</code> .
name_ch	String	Chinese name of a service.
name_en	String	English name of a service.
biz_id	String	Business ID, which is a string

Parameter	Type	Description
biz_type	String	<p>Business entity type.</p> <p>Options:</p> <ul style="list-style-type: none"> • AGGREGATION_LOGIC_TABLE: summary table • ATOMIC_INDEX: atomic metric • ATOMIC_METRIC: atomic metric (new) • BIZ_CATALOG: process architecture directory • BIZ_METRIC: service indicator • CODE_TABLE: code table • COMMON_CONDITION: general filter • COMPOSITE_METRIC: Compound Metric (new) • COMPOUND_METRIC: compound metric • CONDITION_GROUP: restriction group • DEGENERATE_DIMENSION: degenerate dimension • DERIVATIVE_INDEX: derivative indicator • DERIVED_METRIC: derivative indicator (new) • DIMENSION: dimension • DIMENSION_ATTRIBUTE: dimension attribute • DIMENSION_HIERARCHIES: dimension level • DIMENSION_LOGIC_TABLE: dimension table • DIMENSION_TABLE_ATTRIBUTE: dimension attribute • DIRECTORY: directory • FACT_ATTRIBUTE: fact table attribute • FACT_DIMENSION: fact table dimension • FACT_LOGIC_TABLE: fact table • FACT_MEASURE: fact table measurement • FUNCTION: function

Parameter	Type	Description
		<ul style="list-style-type: none"> • INFO_ARCH: information architecture (used for modifying themes in batches) • MODEL: model • QUALITY_RULE: quality rule • SECRECY_LEVEL: security level • STANDARD_ELEMENT: data standard • STANDARD_ELEMENT_TEMPLATE: data standard template • SUBJECT: theme • Dimension attributes of SUMMARY_DIMENSION_ATTRIBUTE: summary tables • SUMMARY_INDEX: summary table indicator attribute • SUMMARY_TIME: time period attribute of the SDR table • TABLE_MODEL: relationship model (logical model/physical model) • TABLE_MODEL_ATTRIBUTE: relationship model attribute (logical model/physical model) • TABLE_MODEL_LOGIC: logical entity • TABLE_TYPE: table type • TAG: tag • TIME_CONDITION: time restriction
biz_info	String	Serialized service details. The type is string.
biz_info_obj	Object	Service details. The type is object.
biz_version	Integer	Service version.

Parameter	Type	Description
biz_status	String	Release status of an entity. This parameter is read-only and does not need to be set during creation and update. Options: <ul style="list-style-type: none"> • DRAFT: draft • PUBLISH_DEVELOPING: to be reviewed • PUBLISHED: released • OFFLINE_DEVELOPING: to be reviewed • OFFLINE: offline • REJECT: rejected
approval_status	String	Service approval status. This parameter is read-only. Options: <ul style="list-style-type: none"> • DEVELOPING: being reviewed • APPROVED: approved • REJECT: rejected • WITHDREW: approval cancellation
approval_type	String	Service review type. Options: <ul style="list-style-type: none"> • PUBLISH: released • OFFLINE: offline
submit_time	String	Submitted At
create_by	String	Creator.
l1	String	Chinese name of the subject area group. This parameter is read-only and does not need to be set when you create or update a subject area group.
l2	String	Chinese name of the subject area. This parameter is read-only and does not need to be set during creation and update.
l3	String	Chinese name of the business object. This parameter is read-only and does not need to be set during creation and update.
approval_time	String	Review time.

Parameter	Type	Description
approver	String	Reviewer.
email	String	Email address of the reviewer.
msg	String	Review information.
directory_path	String	Directory tree.

Parameter	Type	Description
error_code	String	Error code, for example, DS.6000, indicating that the request fails to be processed.
error_msg	String	Error message
data	Object	Returned data information.

Example Requests

Create a compound metric based on the following parameters.

POST https://{endpoint}/v2/{project_id}/design/compound-metrics

```
{
  "id" : 0,
  "name_ch" : "Test a compound metric.",
  "name_en" : "test_compound_index",
  "l3_id" : "1169309252771299328",
  "dimension_group" : "1169322847009742848",
  "data_type" : "STRING",
  "compound_type" : "EXPRESSION",
  "monitor" : {
    "id" : null,
    "other_metric_ids" : [ ],
    "other_compound_metric_ids" : [ ],
    "expression" : "",
    "metric_id" : null,
    "metric_type" : "COMPOUND_METRIC"
  },
  "description" : "",
  "metric_ids" : [ "1300493917942329344", "1268168163686780928", "1181167466668310528" ],
  "compound_metric_ids" : [ ],
  "cal_exp" : "${1300493917942329344}+${1268168163686780928}+${1181167466668310528}"
}
```

Example Responses

Status code: 200

The operation succeeds, and **CompoundMetricVO** is returned.

```

SDK Sample Code

The SDK sample code is as follows.

Java

Create a compound metric based on the following parameters.

```
package com.huaweicloud.sdk.test;

import com.huaweicloud.sdk.core.auth.ICredential;
import com.huaweicloud.sdk.core.auth.BasicCredentials;
import com.huaweicloud.sdk.core.exception.ConnectionException;
import com.huaweicloud.sdk.core.exception.RequestTimeoutException;
import com.huaweicloud.sdk.core.exception.ServiceResponseException;
import com.huaweicloud.sdk.dataartsstudio.v1.region.DataArtsStudioRegion;
import com.huaweicloud.sdk.dataartsstudio.v1.*;
import com.huaweicloud.sdk.dataartsstudio.v1.model.*;

import java.util.List;
import java.util.ArrayList;

public class CreateDesignCompoundMetricSolution {

    public static void main(String[] args) {
        // The AK and SK used for authentication are hard-coded or stored in plaintext, which has great
        // security risks. It is recommended that the AK and SK be stored in ciphertext in configuration files or
        // environment variables and decrypted during use to ensure security.
        // In this example, AK and SK are stored in environment variables for authentication. Before running
        // this example, set environment variables CLOUD_SDK_AK and CLOUD_SDK_SK in the local environment
        String ak = System.getenv("CLOUD_SDK_AK");
        String sk = System.getenv("CLOUD_SDK_SK");
        String projectId = "{project_id}";

        ICredential auth = new BasicCredentials()
            .withProjectId(projectId)
            .withAk(ak)
            .withSk(sk);

        DataArtsStudioClient client = DataArtsStudioClient.newBuilder()

    fmt.Println(err)
  }
}
```

More

For SDK sample code of more programming languages, see the Sample Code tab in [API Explorer](#). SDK sample code can be automatically generated.

Status Codes

Status Code	Description
200	The operation succeeds, and CompoundMetricVO is returned.
400	BadRequest
401	Unauthorized
403	Forbidden

7.13.3 Updating a Compound Metric

Function

This API is used to update a compound metric.

Calling Method

For details, see [Calling APIs](#).

URI

PUT /v2/{project_id}/design/compound-metrics

Table 7-688 Path Parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Project ID. For details about how to obtain the project ID, see Project ID and Account ID .

Request Parameters

Table 7-689 Request body parameters

Parameter	Mandatory	Type	Description
id	No	String	Compound metric ID, which is a string. This parameter is mandatory for update.
name_en	Yes	String	Compound metric name in English
name_ch	Yes	String	Compound metric name
description	No	String	Description
dimension_group	Yes	String	Statistical dimension ID, which cannot be changed during update
compound_type	Yes	String	Compound metric type Enumerated values: <ul style="list-style-type: none"> ● EXPRESSION: expression ● PERIODICITY_VALUED_COMPARISON: rate of growth compared to the previous period ● INTERVAL_VALUED_COMPARISON: rate of growth compared to the same period last year
comparison_type	No	String	Parallel comparison configuration. This parameter is mandatory when compound metric type is parallel growth rate. Enumerated values: <ul style="list-style-type: none"> ● YEAR_TO_YEAR ● MONTH_TO_MONTH ● WEEK_TO_WEEK
metric_ids	No	Array of strings	Derivative metric. This parameter is mandatory when the compound metric type is PERIODICITY_VALUED_COMPARISON or INTERVAL_VALUED_COMPARISON .
metric_names	No	Array of strings	Indicates the indicator name.

Parameter	Mandatory	Type	Description
compound_metric_ids	No	Array of strings	Compound metric information, which is an ID string
compound_metric_names	No	Array of strings	Compound metric name
cal_fn_ids	No	Array of strings	Reference function ID, which is a string
cal_exp	No	String	Calculation expression. This parameter is mandatory when the compound metric type is set to expression. It is in $\{index_id\} + \{compound\#index_id\}$ format, where <code>index_id</code> indicates the ID of the referenced derivative indicator and <code>compound#index_id</code> indicates the ID of the referenced composite indicator.
l2_id	No	String	Subject area ID. This parameter is read-only and does not need to be set during creation and update.
l3_id	Yes	String	Business object ID, which is a string
data_type	Yes	String	Field type
create_by	No	String	Creator.
update_by	No	String	Person who updates the information.
status	No	String	Release status of an entity. This parameter is read-only and does not need to be set during creation and update. Options: <ul style="list-style-type: none"> ● DRAFT: draft ● PUBLISH_DEVELOPING: to be reviewed ● PUBLISHED: released ● OFFLINE_DEVELOPING: to be reviewed ● OFFLINE: offline ● REJECT: rejected

Parameter	Mandatory	Type	Description
approval_info	No	ApprovalVO object	Approval information. This parameter is read-only. Latest review information about a business object, including the business details, reviewer information, and review time.
new_biz	No	BizVersionMa nageVO object	Service version management. This parameter is read-only.
monitor	No	MetricMonit orVO object	Indicates the metric monitoring information.
l1	No	String	Chinese name of the subject area group. This parameter is read-only and does not need to be set when you create or update a subject area group.
l2	No	String	Chinese name of the subject area. This parameter is read-only and does not need to be set during creation and update.
l3	No	String	Chinese name of the business object. This parameter is read-only and does not need to be set during creation and update.

Table 7-690 ApprovalVO

Parameter	Mandatory	Type	Description
id	No	String	Application ID, which is a string
tenant_id	No	String	Project ID. For details about how to obtain the project ID, see the API path parameter <code>project_id</code> .
name_ch	No	String	Chinese name of a service.
name_en	No	String	English name of a service.
biz_id	No	String	Business ID, which is a string

Parameter	Mandatory	Type	Description
biz_type	No	String	<p>Business entity type.</p> <p>Options:</p> <ul style="list-style-type: none"> ● AGGREGATION_LOGIC_TABLE: summary table ● ATOMIC_INDEX: atomic metric ● ATOMIC_METRIC: atomic metric (new) ● BIZ_CATALOG: process architecture directory ● BIZ_METRIC: service indicator ● CODE_TABLE: code table ● COMMON_CONDITION: general filter ● COMPOSITE_METRIC: Compound Metric (new) ● COMPOUND_METRIC: compound metric ● CONDITION_GROUP: restriction group ● DEGENERATE_DIMENSION: degenerate dimension ● DERIVATIVE_INDEX: derivative indicator ● DERIVED_METRIC: derivative indicator (new) ● DIMENSION: dimension ● DIMENSION_ATTRIBUTE: dimension attribute ● DIMENSION_HIERARCHIES: dimension level ● DIMENSION_LOGIC_TABLE: dimension table ● DIMENSION_TABLE_ATTRIBUTE: dimension attribute ● DIRECTORY: directory ● FACT_ATTRIBUTE: fact table attribute ● FACT_DIMENSION: fact table dimension ● FACT_LOGIC_TABLE: fact table

Parameter	Mandatory	Type	Description
			<ul style="list-style-type: none"> • FACT_MEASURE: fact table measurement • FUNCTION: function • INFO_ARCH: information architecture (used for modifying themes in batches) • MODEL: model • QUALITY_RULE: quality rule • SECRECY_LEVEL: security level • STANDARD_ELEMENT: data standard • STANDARD_ELEMENT_TEMPLATE: data standard template • SUBJECT: theme • Dimension attributes of SUMMARY_DIMENSION_ATTRIBUTE: summary tables • SUMMARY_INDEX: summary table indicator attribute • SUMMARY_TIME: time period attribute of the SDR table • TABLE_MODEL: relationship model (logical model/physical model) • TABLE_MODEL_ATTRIBUTE: relationship model attribute (logical model/physical model) • TABLE_MODEL_LOGIC: logical entity • TABLE_TYPE: table type • TAG: tag • TIME_CONDITION: time restriction
biz_info	No	String	Serialized service details. The type is string.
biz_info_obj	No	Object	Service details. The type is object.

Parameter	Mandatory	Type	Description
biz_version	No	Integer	Service version.
biz_status	No	String	Release status of an entity. This parameter is read-only and does not need to be set during creation and update. Options: <ul style="list-style-type: none"> • DRAFT: draft • PUBLISH_DEVELOPING: to be reviewed • PUBLISHED: released • OFFLINE_DEVELOPING: to be reviewed • OFFLINE: offline • REJECT: rejected
approval_status	No	String	Service approval status. This parameter is read-only. Options: <ul style="list-style-type: none"> • DEVELOPING: being reviewed • APPROVED: approved • REJECT: rejected • WITHDREW: approval cancellation
approval_type	No	String	Service review type. Options: <ul style="list-style-type: none"> • PUBLISH: released • OFFLINE: offline
submit_time	No	String	Submitted At
create_by	No	String	Creator.
l1	No	String	Chinese name of the subject area group. This parameter is read-only and does not need to be set when you create or update a subject area group.
l2	No	String	Chinese name of the subject area. This parameter is read-only and does not need to be set during creation and update.

Parameter	Mandatory	Type	Description
l3	No	String	Chinese name of the business object. This parameter is read-only and does not need to be set during creation and update.
approval_time	No	String	Review time.
approver	No	String	Reviewer.
email	No	String	Email address of the reviewer.
msg	No	String	Review information.
directory_path	No	String	Directory tree.

Table 7-691 BizVersionManageVO

Parameter	Mandatory	Type	Description

			<ul style="list-style-type: none"> ● FACT_MEASURE: fact table measurement ● FUNCTION: function ● INFO_ARCH: information architecture (used for modifying themes in batches) ● MODEL: model ● QUALITY_RULE: quality rule ● SECRECY_LEVEL: security level ● STANDARD_ELEMENT: data standard ● STANDARD_ELEMENT_TEMPLATE: data standard template ● SUBJECT: theme ● Dimension attributes of SUMMARY_DIMENSION_ATTRIBUTE: summary tables ● SUMMARY_INDEX: summary table indicator attribute ● SUMMARY_TIME: time period attribute of the SDR table ● TABLE_MODEL: relationship model (logical model/physical model) ● TABLE_MODEL_ATTRIBUTE: relationship model attribute (logical model/physical model) ● TABLE_MODEL_LOGIC: logical entity ● TABLE_TYPE: table type ● TAG: tag ● TIME_CONDITION: time restriction

Response Parameters

Status code: 200

Table 7-693 Response body parameters

Parameter	Type	Description
data	data object	Number of successfully updated compound metrics

Table 7-694 data

Parameter	Type	Description
value	CompoundMetricVO object	Result of updating compound metrics

Table 7-695 CompoundMetricVO

Parameter	Type	Description
id	String	Compound metric ID, which is a string. This parameter is mandatory for update.
name_en	String	Compound metric name in English
name_ch	String	Compound metric name
description	String	Description
dimension_group	String	Statistical dimension ID, which cannot be changed during update
group_name	String	Granularity name, which is read-only.
group_code	String	Granularity code, which is read-only.
compound_type	String	Compound metric type Enumerated values: <ul style="list-style-type: none">● EXPRESSION: expression● PERIODICITY_VALUED_COMPARISON: rate of growth compared to the previous period● INTERVAL_VALUED_COMPARISON: rate of growth compared to the same period last year

Parameter	Type	Description
comparison_type	String	Parallel comparison configuration. This parameter is mandatory when compound metric type is parallel growth rate. Enumerated values: <ul style="list-style-type: none"> • YEAR_TO_YEAR • MONTH_TO_MONTH • WEEK_TO_WEEK
metric_ids	Array of strings	Derivative metric. This parameter is mandatory when the compound metric type is PERIODICITY_VALUED_COMPARISON or INTERVAL_VALUED_COMPARISON .
metric_names	Array of strings	Indicates the indicator name.
compound_metric_ids	Array of strings	Compound metric information, which is an ID string
compound_metric_names	Array of strings	Compound metric name
cal_fn_ids	Array of strings	Reference function ID, which is a string
cal_exp	String	Calculation expression. This parameter is mandatory when the compound metric type is set to expression. It is in <code>\${index_id} + \${compound#index_id}</code> format, where <code>index_id</code> indicates the ID of the referenced derivative indicator and <code>compound#index_id</code> indicates the ID of the referenced composite indicator.
l1_id	String	Subject area group ID, which is a read-only string
l2_id	String	Subject area ID. This parameter is read-only and does not need to be set during creation and update.
l3_id	String	Business object ID, which is a string
data_type	String	Field type
create_by	String	Creator.
update_by	String	Person who updates the information.

Parameter	Type	Description
status	String	Release status of an entity. This parameter is read-only and does not need to be set during creation and update. Options: <ul style="list-style-type: none"> • DRAFT: draft • PUBLISH_DEVELOPING: to be reviewed • PUBLISHED: released • OFFLINE_DEVELOPING: to be reviewed • OFFLINE: offline • REJECT: rejected
create_time	String	Creation time, which is read-only. The format complies with RFC3339 and is accurate to seconds. The UTC time zone is yyyy-mm-ddTHH:MM:SSZ, for example, 1970-01-01T00:00:00Z.
update_time	String	Update time, which is read-only. The format complies with RFC3339 and is accurate to seconds. The UTC time zone is yyyy-mm-ddTHH:MM:SSZ, for example, 1970-01-01T00:00:00Z.
