Notice

The purchased products, services and features are stipulated by the contract made between Huawei and the customer. All or part of the products, services and features described in this document may not be within the purchase scope or the usage scope. Unless otherwise specified in the contract, all statements, information, and recommendations in this document are provided "AS IS" without warranties, guarantees or representations of any kind, either express or implied.

The information in this document is subject to change without notice. Every effort has been made in the preparation of this document to ensure accuracy of the contents, but all statements, information, and recommendations in this document do not constitute a warranty of any kind, express or implied.

Security Declaration

Vulnerability

Huawei's regulations on product vulnerability management are subject to the *Vul. Response Process*. For details about this process, visit the following web page:

<https://www.huawei.com/en/psirt/vul-response-process>

For vulnerability information, enterprise customers can visit the following web page:

<https://securitybulletin.huawei.com/enterprise/en/security-advisory>

1.1 Overview.....	1
1.2 API Calling.....	1
1.3 Endpoints.....	1
1.4 Constraints.....	2
1.5 Basic Concepts.....	2
2 Overview.....	4
3 Calling APIs.....	6
3.1 Making an API Request.....	6
3.2 Authentication.....	10
3.3 Returned Values.....	12
4 Getting Started.....	14
4.1 Creating and Submitting a SQL Job.....	14
4.2 Creating and Submitting a Spark Job.....	16
4.3 Creating and Submitting a Flink Job.....	21
4.4 Creating and Using a Datasource Connection.....	24
5 Permission-related APIs.....	28
5.1 Granting Data Access Control to Users or Projects.....	28
5.2 Checking the Permissions Granted to a User.....	31
6 Global Variable-related APIs.....	35
6.1 Creating a Global Variable.....	35
6.2 Deleting a Global Variable.....	37
6.3 Modifying a Global Variable.....	39
6.4 Querying All Global Variables.....	41
7 APIs Related to Resource Tags.....	44
7.1 Batch Adding Resource Tags.....	44
7.2 Batch Deleting Resource Tags.....	47
7.3 Querying the Number of Resource Instances.....	51
7.4 Listing Resource Instances.....	55
7.5 Querying Tags of a Specified Resource Type.....	59
7.6 Querying Tags of a Specified Resource Instance.....	61

8 APIs Related to Enhanced Datasource Connections.....	66
8.1 Creating an Enhanced Datasource Connection.....	66
8.2 Deleting an Enhanced Datasource Connection.....	69
8.3 Listing Enhanced Datasource Connections.....	71
8.4 Querying an Enhanced Datasource Connection.....	76
8.5 Binding a Queue.....	80
8.6 Unbinding a Queue.....	82
8.7 Modifying Host Information.....	84
8.8 Querying Authorization of an Enhanced Datasource Connection.....	86
8.9 Creating a Route.....	88
8.10 Deleting a Route.....	90
9 Datasource Authentication-related APIs.....	92
9.1 Creating Datasource Authentication.....	92
9.2 Listing Datasource Authentications.....	94
9.3 Updating Datasource Authentication.....	97
9.4 Deleting Datasource Authentication.....	99
10 APIs Related to Elastic Resource Pools.....	101
10.1 Creating an Elastic Resource Pool.....	101
10.2 Querying All Elastic Resource Pools.....	105
10.3 Deleting an Elastic Resource Pool.....	109
10.4 Modifying Elastic Resource Pool Information.....	110
10.5 Querying All Queues in an Elastic Resource Pool.....	112
10.6 Associating a Queue with an Elastic Resource Pool.....	115
10.7 Viewing Scaling History of an Elastic Resource Pool.....	117
10.8 Modifying the Scaling Policy of a Queue Associated with an Elastic Resource Pool.....	120
11 Queue-related APIs (Recommended).....	124
11.1 Creating a Queue.....	124
11.2 Deleting a Queue.....	128
11.3 Querying All Queues.....	130
11.4 Viewing Details of a Queue.....	134
11.5 Restarting, Scaling Out, and Scaling In Queues.....	138
11.6 Creating an Address Connectivity Test Request.....	140
11.7 Querying Connectivity Test Details of a Specified Address.....	142
12 SQL Job-related APIs.....	145
12.1 Submitting a SQL Job (Recommended).....	145
12.2 Canceling a Job (Recommended).....	151
12.3 Querying All Jobs.....	152
12.4 Previewing SQL Job Query Results.....	157
12.5 Exporting Query Results.....	160
12.6 Querying Job Status.....	164
12.7 Querying Job Details.....	167

12.8 Checking SQL Syntax.....	171
12.9 Querying the Job Execution Progress.....	173
13 SQL Template-related APIs.....	178
13.1 Saving a SQL template.....	178
13.2 Checking All SQL Templates.....	180
13.3 Updating a SQL template.....	182
13.4 Deleting a SQL template.....	184
14 Flink Job-related APIs.....	186
14.1 Creating a SQL Job.....	186
14.2 Updating a SQL Job.....	192
14.3 Creating a Flink Jar job.....	197
14.4 Updating a Flink Jar Job.....	202
14.5 Running Jobs in Batches.....	207
14.6 Listing Jobs.....	209
14.7 Querying Job Details.....	218
14.8 Querying the Job Execution Plan.....	227
14.9 Stopping Jobs in Batches.....	229
14.10 Deleting a Job.....	231
14.11 Deleting Jobs in Batches.....	232
14.12 Exporting a Flink Job.....	234
14.13 Importing a Flink Job.....	236
14.14 Generating a Static Stream Graph for a Flink SQL Job.....	238
15 APIs Related to Flink Job Templates.....	244
15.1 Creating a Template.....	244
15.2 Updating a Template.....	247
15.3 Deleting a Template.....	249
15.4 Listing Templates.....	250
16 Flink Job Management APIs.....	254
16.1 Triggering Savepoints for Flink Jobs.....	254
16.2 Importing Savepoints for Flink Jobs.....	256
17 Spark Job-related APIs.....	259
17.1 Creating a Batch Processing Job.....	259
17.2 Listing Batch Processing Jobs.....	266
17.3 Querying Batch Job Details.....	270
17.4 Querying a Batch Job Status.....	273
17.5 Canceling a Batch Processing Job.....	274

18.3 Modifying a Job Template.....	285

18.4 Obtaining a Job Template..... 286

19 Permissions Policies and Supported Actions..... 289

20 Out-of-Date APIs..... 300

20.1 Agency-related APIs (Discarded)..... 300

20.1.1 Obtaining DLI Agency Information (Discarded)..... 300

20.1.2 Creating a DLI Agency (Discarded)..... 302

20.2 Package Group-related APIs (Discarded)..... 304

20.2.1 Uploading a Package Group (Discarded)..... 305

20.2.2 Listing Package Groups (Discarded)..... 309

20.2.3 Uploading a JAR Package Group (Discarded)..... 312

20.2.4 Uploading a PyFile Package Group (Discarded)..... 316

20.2.5 Uploading a File Package Group (Discarded)..... 319

20.2.6 Querying Resource Packages in a Group (Discarded)..... 323

20.2.7 Deleting a Resource Package from a Group (Discarded)..... 325

20.2.8 Changing the Owner of a Group or Resource Package (Discarded)..... 327

20.3 APIs Related to Spark Batch Processing (Discarded)..... 329

20.3.1 Querying Batch Job Logs (Discarded)..... 329

20.4 SQL Job-related APIs (Discarded)..... 331

20.4.1 Importing Data (Discarded)..... 331

20.4.2 Exporting Data (Discarded)..... 336

20.5 Resource-related APIs (Discarded)..... 339

20.5.1 Database-related APIs (Discarded)..... 340

20.5.1.1 Creating a Database (Discarded)..... 340

20.5.1.2 Deleting a Database (Discarded)..... 342

20.5.1.3 Querying All Databases (Discarded)..... 345

20.5.1.4 Modifying a Database Owner (Discarded)..... 348

20.5.2 Table-related APIs (Discarded)..... 350

20.5.2.1 Creating a Table (Discarded)..... 350

20.5.2.2 Deleting a Table (Discarded)..... 356

20.5.2.3 Querying All Tables (Discarded)..... 358

20.5.2.4 Describing Table Information (Discarded)..... 362

20.5.2.5 Previewing Table Content (Discarded)..... 366

20.5.2.6 Listing Partitions (Discarded)..... 368

20.6 Permission-related APIs (Discarded)..... 372

20.6.1 Granting Queue Permissions to a User (Discarded)..... 372

20.6.2 Querying Queue Users (Discarded)..... 375

20.6.3 Granting Data Permission to Users (Discarded)..... 377

20.6.4 Querying Database Users (Discarded)..... 381

20.6.5 Querying Table Users (Discarded)..... 383

20.6.6 Querying a User's Table Permissions (Discarded)..... 385

20.7 Queue-related APIs (Discarded)..... 387

20.7.1 Creating a Scheduled CU Change (Discarded)..... 387

20.7.2 Viewing a Scheduled CU Change (Discarded).....	390
20.7.3 Deleting Scheduled CU Changes in Batches (Discarded).....	393
20.7.4 Deleting a Scheduled CU Change (Discarded).....	395
20.7.5 Modifying a Scheduled CU Change (Discarded).....	397
20.8 Datasource Authentication-related APIs (Discarded).....	400
20.8.1 Creating Datasource Authentication (Discarded).....	400
20.8.2 Listing Datasource Authentication Information (Discarded).....	403
20.8.3 Updating Datasource Authentication (Discarded).....	405
20.8.4 Deleting Datasource Authentication (Discarded).....	407
20.9 APIs Related to Enhanced Datasource Connections (Discarded).....	408
20.9.1 Creating a Route (Discarded).....	409
20.9.2 Deleting a Route (Discarded).....	410
20.10 Template-related APIs (Discarded).....	412
20.10.1 Querying All Sample SQL Templates (Discarded).....	412
20.11 Table-related APIs (Discarded).....	414
20.11.1 Querying All Tables (Discarded).....	414
20.12 APIs Related to SQL Jobs (Discarded).....	417
20.12.1 Submitting a SQL Job (Discarded).....	417
20.12.2 Canceling a Job (Discarded).....	420
20.12.3 Querying the Job Execution Result-Method 1 (Discarded).....	421
20.12.4 Querying the Job Execution Result-Method 2 (Discarded).....	423
20.13 APIs Related to Data Upload (Discarded).....	425
20.13.1 Authenticating a Created Data Uploading Job (Discarded).....	426
20.14 Cluster-related APIs.....	427
20.14.1 Creating a Cluster (Discarded).....	427
20.14.2 Deleting a Cluster (Discarded).....	429
20.14.3 Querying Information of a Specified Cluster (Discarded).....	430
20.14.4 Querying All Cluster Information (Discarded).....	432
20.15 APIs Related to Flink Jobs (Discarded).....	434
20.15.1 Querying Job Monitoring Information (Discarded).....	434
20.15.2 Granting OBS Permissions to DLI.....	437
21 Public Parameters.....	440
21.1 Status Codes.....	440
21.2 Error Codes.....	444
21.3 Obtaining a Project ID.....	445
21.4 Obtaining an Account ID.....	447

1

Before You Start

1.1 Overview

Welcome to Data Lake Insight API Reference.

Data Lake Insight (DLI) is a serverless data processing and analysis service fully compatible with [Apache Spark](#), [Trino](#), and [Apache Flink](#) ecosystems. It frees you from managing any server. You can use stream analysis (with standard SQL), batch analysis (with Spark SQL), and interactive analysis (with Flink SQL) to query mainstream data formats without data ETL. DLI supports SQL statements and Spark applications for heterogeneous data sources, including CloudTable, RDS, GaussDB(DWS), CSS, OBS, custom databases on ECSs, and offline databases.

You can use APIs provided in this document to perform DLI operations, including queues, SQL jobs, Flink jobs, Spark jobs, and datasource connections. For details about all supported operations, see [Overview](#).

Before calling DLI APIs, get yourself familiar with DLI concepts. For details, see [What Is DLI?](#)

1.2 API Calling

DLI provides RESTful (Representational State Transfer) APIs, allowing you to use HTTPS to call them. For details, see [Making an API Request](#).

Unless otherwise specified, DLI APIs are synchronous. Specifically, **is_success**, indicating whether a request is successfully executed, is returned.

If the DLI API is asynchronous, run the API related to [Querying Job Status](#) according to the value of **job_id** in the response message to learn whether the API is successfully executed.

1.3 Endpoints

An endpoint is the **request address** for calling an API. Endpoints vary depending on services and regions. For the endpoints of all services, see [Regions and Endpoints](#).

The following table describes the endpoints of DLI. Select the endpoints based on your requirements.

Table 1-1 DLI endpoints

Region Name	Region	Endpoint
AF-Johannesburg	af-south-1	dli.af-south-1.myhuaweicloud.com
LA-Santiago	la-south-2	dli.la-south-2.myhuaweicloud.com
AP-Bangkok	ap-southeast-2	dli.ap-southeast-2.myhuaweicloud.com
CN-Hong Kong	ap-southeast-1	dli.ap-southeast-1.myhuaweicloud.com
AP-Singapore	ap-southeast-3	dli.ap-southeast-3.myhuaweicloud.com

1.4 Constraints

- The number of resources that you can create is determined by your quota. To view or increase the quota, see [How Do I Increase the Image Quota?](#)
- For more constraints, see the API descriptions.

1.5 Basic Concepts

Account

An account is created when a user registers a Huawei ID and enables Huawei Cloud services. The account has full access permissions for all of its cloud services and resources. It can be used to reset user passwords and grant user permissions. The account is a payment entity and should not be used to perform routine management. For security purposes, create IAM users and grant them permissions for routine management.

User

An IAM user is created by an account in IAM to use cloud services. Each IAM user has its own identity credentials (password and access keys).

The account name, username, and password will be required for API authentication.

Region

Regions are divided based on geographical location and network latency. Public services, such as Elastic Cloud Server (ECS), Elastic Volume Service (EVS), Object Storage Service (OBS), Virtual Private Cloud (VPC), Elastic IP (EIP), and Image Management Service (IMS), are shared within the same region. Regions are classified as common regions and dedicated regions. A common region provides common cloud services that should be made available to all tenants. A dedicated region provides services of a specific type or only for specific tenants.

For details, see [Region and AZ](#).

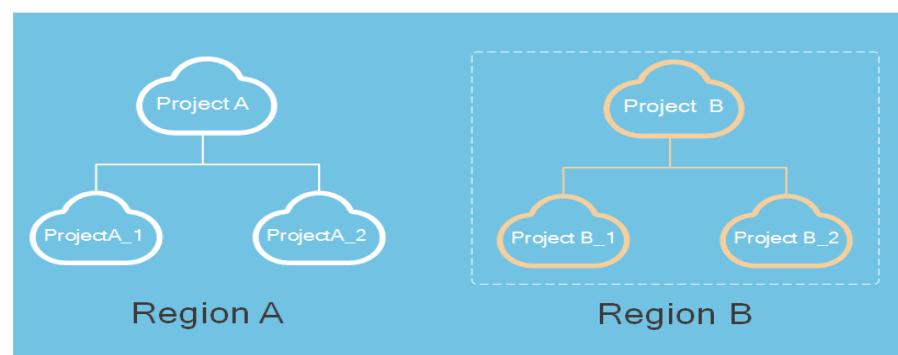

AZ

An AZ contains one or more physical data centers. Each AZ has independent cooling, fire extinguishing, moisture-proof, and electricity facilities. Within an AZ, computing, network, storage, and other resources are logically divided into multiple clusters. AZs within a region are interconnected using high-speed optical fibers to support cross-AZ high-availability systems.

Project

Projects group and isolate compute, storage, and network resources across physical regions. A default project is provided for each region, and subprojects can be created under each default project. Users can be granted permissions to access all resources in a specific project. If you need more refined access control, create subprojects under a default project and purchase resources in subprojects. Then you can assign users the permissions required to access only the resources in the specific subprojects.

Figure 1-1 Project isolating model

Enterprise Project

Enterprise projects group and manage resources across regions. Resources in enterprise projects are logically isolated from each other. An enterprise project can contain resources of multiple regions, and resources can be added to or removed from enterprise projects.

For details about how to obtain enterprise project IDs and features, see [Enterprise Management Service User Guide](#).

2 Overview

This section describes the APIs provided by DLI.

Table 2-1 DLI APIs

Type	Description
Permission-related APIs	You can assign permissions to queues, view queue users, assign data permissions, view database users, view table users, view table user permissions, and view the permissions of authorized users.
Global variable-related APIs	You can create, delete, modify, and query global variables.
APIs related to enhanced datasource connections	You can create, delete, and query enhanced datasource connections, as well as bind and unbind queues, modify host information, and query enhanced datasource connection permissions.
Datasource authentication-related APIs	You can create, update, and delete datasource authentication, and obtain the authentication list.
APIs related to elastic resource pools	You can create, modify, query, and delete elastic resource pools.
Queue-related APIs (recommended)	You can create, delete, and query all queues, modify the CIDR block of a queue, restart, scale up, and scale down queues, view detailed information about queues, create and query connectivity test requests for specific addresses, create, query, modify, and delete scheduled scaling plans for queues.
SQL job-related APIs	You can import and export data, submit SQL jobs, cancel jobs, query all jobs, preview job results, query job status, query job details, check SQL syntax, and export query results.
SQL template-related APIs	You can perform operations on templates, such as saving SQL templates and creating job templates.

Type	Description
Flink job-related APIs	You can authorize DLI to OBS, create and update SQL jobs and user-defined Flink jobs, run jobs in batches, query the job list, job details, job execution plans, and job monitoring information. You can also stop jobs in batches, delete and batch delete jobs, export and import Flink jobs, create static flow diagrams for Flink SQL jobs, create IEF message channels, report Flink job status and callback Flink job actions at the edge, and report IEF system events.
APIs related to Flink job templates	You can create, update, and delete a template, and query the template list.
APIs related to Spark jobs	Creating batch jobs, cancel batch jobs, querying batch job lists, querying batch job details, querying batch job status, and querying batch job logs.
APIs related to Spark job templates	You can perform operations on templates, such as saving SQL templates and creating job templates.

3 Calling APIs

3.1 Making an API Request

This section describes the structure of a REST API request, and uses the IAM service as an example to explain [how to obtain a user token](#) to call an API. The obtained token can then be used to authenticate the calling of other APIs.

Request URI

A request URI is in the following format:

{URI-scheme} :// {Endpoint} / {resource-path} ? {query-string}

Although a request URI is included in a request header, most programming languages or frameworks require the request URI to be separately transmitted, rather than being conveyed in a request message.

Table 3-1 Parameters in a URI

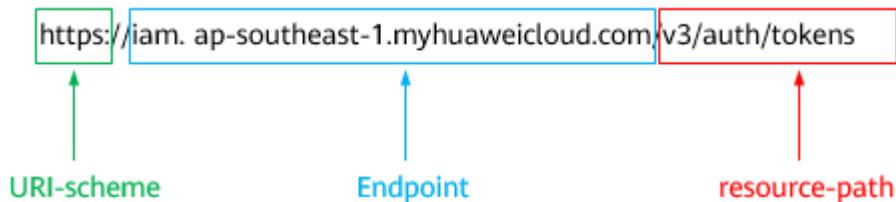

Parameter	Description
URI-scheme	Protocol used to transmit requests. All APIs use HTTPS.
Endpoint	Domain name or IP address of the server bearing the REST service. Endpoints vary depending on services and regions. For the endpoints of all services, see Regions and Endpoints . For example, the endpoint of IAM in region CN-Hong Kong is iam.ap-southeast-1.myhuaweicloud.com .
resource-path	Access path of an API for performing a specified operation. Obtain the value from the URI of an API. For example, the resource-path of the API used to obtain a user token is /v3/auth/tokens .

Parameter	Description
query-string	Query parameter, which is optional. Ensure that a question mark (?) is included before each query parameter that is in the format of <i>Parameter name=Parameter value</i> . For example, ? limit=10 indicates that a maximum of 10 data records will be displayed.

For example, to obtain an IAM token in the **CN-Hong Kong** region, obtain the endpoint of IAM (**iam.ap-southeast-1.myhuaweicloud.com**) for this region and the **resource-path** (/v3/auth/tokens) in the URI of the API used to [obtain a user token](#). Then, construct the URI as follows:

`https://iam.ap-southeast-1.myhuaweicloud.com/v3/auth/tokens`

Figure 3-1 Example URI

NOTE

To simplify the URI display, each API is provided with only a **resource-path** and a request method. This is because the **URI-scheme** value of all APIs is **HTTPS**, and the endpoints in a region are the same. Therefore, the two parts are omitted.

Request Methods

HTTP-based request methods, which are also called operations or actions, specify the type of operations that you are requesting.

Table 3-2 HTTP method

Request Method	Description
GET	Requests a server to return specified resources.
PUT	Requests the server to update specified resources.
POST	Requests the server to add resources or perform special operations.
DELETE	Requests the server to delete a specific resource, for example, an object.
HEAD	Same as GET except that the server must return only the response header.

Request Method	Description
PATCH	Requests a server to update part of specified resources. If the resource is unavailable, the PATCH method is used to create a resource.

For example, in the case of the API used to [obtain a user token](#), the request method is **POST**. The request is as follows:

```
POST https://iam.ap-southeast-1.myhuaweicloud.com/v3/auth/tokens
```

Request Header

You can also add additional fields to a request, such as the fields required by a specified URI or an HTTP method. For example, add **Content-Type** that defines a request body type to request for the authentication information.

[Table 3-3](#) lists common request header fields.

Table 3-3 Common request headers

Parameter	Description	Mandatory	Example
Host	Specifies the information about the requested server. The value can be obtained from the URL of the service API. The value is hostname[:port] . If the port number is not specified, the default port is used. The default port number for https is port 443 .	No This header field is mandatory if AK/SK authentication is in use.	code.test.com or code.test.com:443
Content-Type	Specifies the request body type or format. This field is mandatory and its default value is application/json. For other values, the description will be provided for specific APIs.	Yes	application/json

Parameter	Description	Mandatory	Example
Content-Length	Indicates the length of the request body. The unit is byte.	This field is mandatory for POST and PUT requests, but must be left blank for GET requests.	3495
X-Project-ID	Project ID. It is mandatory in multi-project scenarios to obtain tokens for different projects.	No	e9993fc787d94b6c886cbba340f9c0f4
X-Auth-Token	User token. User token is a response to the API for obtaining a user token (only this API does not require authentication).	This parameter is mandatory only for authentication using tokens.	The following is part of an example token: MIIPAgYJKoZIhvcNAQcCo...ggg1BBII NPXsidG9rZ
Authorization	Specifies the signature authentication information. The value can be obtained from the request signing result.	This header field is mandatory if AK/SK authentication is in use.	-
X-Sdk-Date	Specifies the time when the request is sent. The time is in <i>YYYYMMDD'T'HHMMS'Z'</i> format. The value is the current Greenwich Mean Time (GMT) of the system.	This header field is mandatory if AK/SK authentication is in use.	20150907T101459Z
X-Language	Request language.	No	en-us

NOTE

In addition to supporting token-based authentication, APIs also support authentication using access key ID/secret access key (AK/SK). During AK/SK-based authentication, an SDK is used to sign the request, and the **Authorization** (signature authentication) and **X-Sdk-Date** (time when the request is sent) header fields are automatically added to the request.

The API for **obtaining a user token** does not require authentication. Therefore, this API only requires adding the Content-Type field. The request with the added Content-Type header is as follows:

```
POST https://iam.ap-southeast-1.myhuaweicloud.com/v3/auth/tokens
Content-Type: application/json
```

Request Body

A request body is generally sent in a structured format. It corresponds to **Content-Type** in the request header and transfers data except for the request header.

The request body varies according to the APIs. Certain APIs do not require the request body, such as the GET and DELETE APIs.

For the API of [obtaining a user token](#), obtain the request parameters and parameter description from the API request. The following provides an example request with a body included. Replace **username**, **domainname**, ********* (login password), and **xxxxxxxxxxxxxx** (project ID) with the actual values. Obtain a project ID from [Regions and Endpoints](#).

NOTE

scope specifies where a token takes effect. In the following example, the token takes effect only on the resources specified by the project ID. In the following example, the token takes effect only for the resources in a specified project. For more information about this API, see [Obtaining a User Token](#).

```
POST https://iam.ap-southeast-1.myhuaweicloud.com/v3/auth/tokens
Content-Type: application/json
```

```
{
  "auth": {
    "identity": {
      "methods": [
        "password"
      ],
      "password": {
        "user": {
          "name": "username",
          "password": "*****",
          "domain": {
            "name": "domainname"
          }
        }
      }
    },
    "scope": {
      "project": {
        "name": "xxxxxxxxxxxxxx"
      }
    }
  }
}
```

If all data required by a request is available, you can send the request to call an API through [curl](#), [Postman](#), or coding. In the response to the IAM API used to obtain a user token, **x-subject-token** is the desired user token. Then, you can use the token to authenticate the calling of other APIs.

3.2 Authentication

API calling is authenticated using either of the following methods:

- Token authentication: Common requests are authenticated using Tokens.
- AK/SK authentication: Requests are encrypted using the access key ID and secret access key (AK/SK pair) to provide higher security. AK/SK authentication is recommended because it provides higher security than token authentication.

Token Authentication

A token specifies certain permissions in a computer system. Authentication using a token adds the token in a request as its header during API calling to obtain permissions to operate APIs through IAM.

NOTE

The validity period of a token is 24 hours. When using a token for authentication, cache it to prevent frequently calling the IAM API.

When calling the API to [obtain a user token](#), you must set **auth.scope** in the request body to **project**.

```
{  
    "auth": {  
        "identity": {  
            "methods": [  
                "password"  
            ],  
            "password": {  
                "user": {  
                    "name": "username",  
                    "password": "*****",  
                    "domain": {  
                        "name": "domainname"  
                    }  
                }  
            }  
        },  
        "scope": {  
            "project": {  
                "name": "xxxxxxx"  
            }  
        }  
    }  
}
```

After obtaining the token, add the **X-Auth-Token** header in a request to specify the token when calling other APIs. For example, if the token is **ABCDEFJ....**, add **X-Auth-Token: ABCDEFJ....** in a request as follows:

```
GET https://iam.ap-southeast-1.myhuaweicloud.com/v3/auth/projects  
Content-Type: application/json  
X-Auth-Token: ABCDEFJ....
```

AK/SK Authentication

In authentication using AK/SK, AK/SK is used to sign a request and add the signature in a request as its header for authentication.

NOTE

Authentication using AK/SK supports API requests with a body not larger than 12 MB. For API requests with a larger body, authentication using tokens is recommended.

- AK: access key ID, which is a unique identifier associated with a secret access key and is used in conjunction with a secret access key to sign requests cryptographically.
- SK: secret access key used in conjunction with an AK to sign requests cryptographically. It identifies a request sender and prevents the request from being modified.

In authentication using AK/SK, you can use AK/SK to sign requests based on the signature algorithm or use a dedicated signature SDK to sign the requests.

For details about how to sign requests and use the signing SDK, see [API Request Signing Guide](#).

NOTE

The signature SDK only supports signature, which is different from the SDKs provided by services.

3.3 Returned Values

Status Code

After sending a request, you will receive a response, including the status code, response header, and response body.

A status code is a group of digits ranging from 1xx to 5xx. It indicates the status of a response. For more information, see [Status Codes](#).

For example, if status code **201** is returned for calling the API used to [obtain a user token](#), the request is successful.

Response Header

A response header corresponds to a request header, for example, **Content-Type**.

Figure [Figure 3-2](#) shows the response header fields for the API that obtains a user token. The **x-subject-token** value is the desired user token. You can use the token to authenticate other API calls.

Figure 3-2 Header of the response to the request for obtaining a user token

```
connection → keep-alive
content-type → application/json
date → Tue, 12 Feb 2019 06:52:13 GMT
server → Web Server
strict-transport-security → max-age=31536000; includeSubdomains;
transfer-encoding → chunked
via → proxy A
x-content-type-options → nosniff
x-download-options → noopener
x-frame-options → SAMEORIGIN
x-iam-trace-id → 218d45ab-d674-4995-a3a-2d0255ba41b5
x-subject-token
→ MIIYXQYJKoZIhvNAQcC0IYTjCCGEoCAQExDTALBgIghkgBZQMEAgEwgharBqkqhkiG9w0BBwGgg hacBIIWmHsidG9rZW4iOnsiZXhwaXJlc19hdCI6ljlwMTktMDItMTNUMCfj3kJ56gqKnPvNRbW2eZ5eb78SZ0kqjACgkIqO1wi4JlGzrpdi8LGXK5bxldfq4lqHCYb8P4NaY0NYejcAgzjVeFIytLWT1GSO0zxKZmlQHQj82H8qHdgIZ09fuEbL5dMhdavj+33wElxHRC9187o+k9-
j+CMZSEB7bUGd5Uj6eRASX1jiPPEGA270g1FruooL6jqglFkNPQuFSOU8+uSstVwRtNfsC+qTp22Rkd5MCqFGQ8LcuUxC3a+9CMBnOintWW7oeRUvhVpxk8pxiX1wTEboXRzT6MUbpvGw-oPNFYxjCKnoH3HRozv0vN--n5d6Nbvg==

x-xss-protection → 1; mode=block;
```

Response Body

A response body is generally returned in a structured format, corresponding to the **Content-Type** in the response header, and is used to transfer content other than the response header.

The following shows part of the response body for the API to [obtain a user token](#). The following describes only part of the request body.

```
{  
  "token": {  
    "expires_at": "2019-02-13T06:52:13.855000Z",  
    "methods": [  
      "password"  
    ],  
    "catalog": [  
      {  
        "endpoints": [  
          {  
            "region_id": "az-01",  
.....
```

If an error occurs during API calling, the system returns an error code and a message to you. The following shows the format of an error response body:

```
{  
  "error_msg": "The format of message is error",  
  "error_code": "AS.0001"  
}
```

In the preceding information, **error_code** is an error code, and **error_msg** describes the error.

4 Getting Started

4.1 Creating and Submitting a SQL Job

Scenario

This section describes how to submit a SQL job to create a database and table and query data using APIs.

Involved APIs

- [Creating an Elastic Resource Pool](#)
- [Creating a Queue](#)
- [Submitting a SQL Job \(Recommended\)](#)

Procedure

1. Create an elastic resource pool named **elastic_pool_dli**.
 - API
 - URI format: POST /v3/{project_id}/elastic-resource-pools
 - Obtain the value of *{project_id}* by referring to [Obtaining a Project ID](#).
 - For details about the request parameters, see [Creating an Elastic Resource Pool](#).
 - Example request
 - Description: Create an elastic resource pool named **elastic_pool_dli** in the project whose ID is **48cc2c48765f481480c7db940d6409d1**.
 - Example URL: POST [https://\[endpoint\]/v3/48cc2c48765f481480c7db940d6409d1/elastic-resource-pools](https://[endpoint]/v3/48cc2c48765f481480c7db940d6409d1/elastic-resource-pools)
 - Body:

```
"elastic_resource_pool_name" : "elastic_pool_dli",
```

- ```
"description": "test",
"cidr_in_vpc": "172.16.0.0/14",
"charging_mode": "1",
"max_cu": 64,
"min_cu": 64
}
```
- Example response

```
{ "is_success": true, "message": "" }
```
  - 2. Create a queue named **queue1** in the elastic resource pool.
    - API
      - URI format: POST /v1.0/{project\_id}/queues
        - Obtain the value of *{project\_id}* by referring to [Obtaining a Project ID](#).
        - For details about the request parameters, see [Creating a Queue](#).
      - Example request
        - Description: Create an elastic resource pool named **queue1** in the project whose ID is **48cc2c48765f481480c7db940d6409d1**.
        - Example URL: POST <https://{{endpoint}}/v1.0/48cc2c48765f481480c7db940d6409d1/queues>
        - Body:

```
{ "queue_name": "queue1", "queue_type": "sql", "description": "test", "cu_count": 16, "enterprise_project_id": "elastic_pool_dli" }
```
      - Example response

```
{ "is_success": true, "message": "" }
```
    - 3. Submit a SQL job: Create the database **db1**, table **tb1**, insert data into the table, and query the data.
      - API
        - URI format: POST /v1.0/{project\_id}/jobs/submit-job
          - Obtain the value of *{project\_id}* by referring to [Obtaining a Project ID](#).
          - For details about the request parameters, see [Submitting a SQL Job \(Recommended\)](#).
        - Example request
          - Description: In the project whose ID is **48cc2c48765f481480c7db940d6409d1**, submit a SQL job, create the database **db1** and table **tb1**, insert data into the table, and query the data.

- Example URL: POST `https://{{endpoint}}/v1.0/48cc2c48765f481480c7db940d6409d1/jobs/submit-job`
- Create a database named **db1**.

```
{ "queue_name": "queue1", "sql": "create DATABASE db1"}
```
- Create a table named **tb1**.

```
{ "currentdb": "db1", "queue_name": "queue1", "sql": "create table\n my_table (id int, name string)"}
```
- Insert data into the **tb1** table.

```
{ "currentdb": "db1", "queue_name": "queue1", "sql": "insert into tb1 (id, name) values (1, 'Ann'), (2, 'Jane')"}
▪ Query data in the table.

```
{  "currentdb": "db1",  "queue_name": "queue1",  "sql": "select * from tb1 limit 10",}
```

```
- Example response

```
{ "is_success": true, "message": ""}
```

## 4.2 Creating and Submitting a Spark Job

### Scenario

This section describes how to create and submit Spark jobs using APIs.

### Notes and Constraints

- It takes 6 to 10 minutes to start a job using a new queue for the first time.

### Involved APIs

- **Creating an Elastic Resource Pool:** Create an elastic resource pool.
- **Creating a Queue:** Create queues within the elastic resource pool.
- **Uploading a Package Group (Discarded):** Upload the resource package required by the Spark job.
- **Querying Resource Packages in a Group (Discarded):** Check whether the uploaded resource package is correct.
- **Creating a Batch Processing Job:** Create and submit a Spark batch processing job.
- **Querying a Batch Job Status:** View the status of a batch processing job.

- **Querying Batch Job Logs (Discarded)**: View batch processing job logs.

## Procedure

1. Create an elastic resource pool named **elastic\_pool\_dli**.
  - API
    - URI format: POST /v3/{project\_id}/elastic-resource-pools
      - Obtain the value of *{project\_id}* by referring to [Obtaining a Project ID](#).
      - For details about the request parameters, see [Creating an Elastic Resource Pool](#).
    - Example request
      - Description: Create an elastic resource pool named **elastic\_pool\_dli** in the project whose ID is **48cc2c48765f481480c7db940d6409d1**.
      - Example URL: POST <https://{{endpoint}}/v3/48cc2c48765f481480c7db940d6409d1/elastic-resource-pools>
      - Body:

```
{"elastic_resource_pool_name": "elastic_pool_dli",
"description": "test",
"cidr_in_vpc": "172.16.0.0/14",
"charging_mode": "1",
"max_cu": 64,
"min_cu": 64}
```
    - Example response
      - ```
{"is_success": true,
"message": ""}
```
2. Create a queue named **queue1** in the elastic resource pool.
 - API
 - URI format: POST /v1.0/{project_id}/queues
 - Obtain the value of *{project_id}* by referring to [Obtaining a Project ID](#).
 - For details about the request parameters, see [Creating a Queue](#).
 - Example request
 - Description: Create an elastic resource pool named **queue1** in the project whose ID is **48cc2c48765f481480c7db940d6409d1**.
 - Example URL: POST <https://{{endpoint}}/v1.0/48cc2c48765f481480c7db940d6409d1/queues>
 - Body:

```
{"queue_name": "queue1",
"queue_type": "sql",
"description": "test",
"cu_count": 16}
```

```
        "enterprise_project_id": "elastic_pool_dli"
    }
```

- Example response

```
{
    "is_success": true,
    "message": ""
}
```

3. Upload a package group.

- API

URI format: POST /v2.0/{*project_id*}/resources

- Obtain the value of {*project_id*} from [Obtaining a Project ID](#).
- For details about the request parameters, see [Uploading a Package Group \(Discarded\)](#).

- Example request

- Description: Upload resources in the GATK group to the project whose ID is **48cc2c48765f481480c7db940d6409d1**.

- Example URL: POST <https://{{endpoint}}/v2.0/48cc2c48765f481480c7db940d6409d1/resources>

▪ Body:

```
{
    "paths": [
        "https://test.obs.xxx.com/txr_test/jars/spark-sdv-app.jar"
    ],
    "kind": "jar",
    "group": "gatk",
    "is_async": "true"
}
```

- Example response

```
{
    "group_name": "gatk",
    "status": "READY",
    "resources": [
        "spark-sdv-app.jar",
        "wordcount",
        "wordcount.py"
    ],
    "details": [
        {
            "create_time": 0,
            "update_time": 0,
            "resource_type": "jar",
            "resource_name": "spark-sdv-app.jar",
            "status": "READY",
            "underlying_name": "987e208d-d46e-4475-a8c0-a62f0275750b_spark-sdv-app.jar"
        },
        {
            "create_time": 0,
            "update_time": 0,
            "resource_type": "jar",
            "resource_name": "wordcount",
            "status": "READY",
            "underlying_name": "987e208d-d46e-4475-a8c0-a62f0275750b_wordcount"
        },
        {
            "create_time": 0,
            "update_time": 0,
            "resource_type": "jar",
            "resource_name": "wordcount.py",
            "status": "READY",
            "underlying_name": "987e208d-d46e-4475-a8c0-a62f0275750b_wordcount.py"
        }
    ]
}
```

```
        "status": "READY",
        "underlying_name": "987e208d-d46e-4475-a8c0-a62f0275750b_wordcount.py"
    },
    "create_time": 1551334579654,
    "update_time": 1551345369070
}
```

4. View resource packages in a group.

- API

URI format: GET /v2.0/{*project_id*}/resources/{*resource_name*}

- Obtain the value of {*project_id*} from [Obtaining a Project ID](#).
- For details about the query parameters, see [Creating a Table \(Discarded\)](#).

- Example request

- Description: Query the resource package named **luxor-router-1.1.1.jar** in the GATK group under the project whose ID is **48cc2c48765f481480c7db940d6409d1**.
- Example URL: GET <https://{{endpoint}}/v2.0/48cc2c48765f481480c7db940d6409d1/resources/luxor-router-1.1.1.jar?group=gatk>

▪ Body:
{}

- Example response

```
{
    "create_time": 1522055409139,
    "update_time": 1522228350501,
    "resource_type": "jar",
    "resource_name": "luxor-router-1.1.1.jar",
    "status": "uploading",
    "underlying_name": "7885d26e-c532-40f3-a755-c82c442f19b8_luxor-router-1.1.1.jar",
    "owner": "*****"
}
```

5. Create and submit a Spark batch processing job.

- API

URI format: POST /v2.0/{*project_id*}/batches

- Obtain the value of {*project_id*} from [Obtaining a Project ID](#).
- For details about the request parameters, see [Creating a Batch Processing Job](#).

- Example request

- Description: In the **48cc2c48765f481480c7db940d6409d1** project, create a batch processing job named **TestDemo4** in **queue1**.
- Example URL: POST <https://{{endpoint}}/v2.0/48cc2c48765f481480c7db940d6409d1/batches>

▪ Body:

```
{
    "sc_type": "A",
    "jars": [
```

```
"spark-examples_2.11-2.1.0.luxor.jar"
],
"driverMemory": "1G",
"driverCores": 1,
"executorMemory": "1G",
"executorCores": 1,
"numExecutors": 1,
"queue": "queue1",
"file":
"spark-examples_2.11-2.1.0.luxor.jar",
"className":
"org.apache.spark.examples.SparkPi",
"minRecoveryDelayTime": 10000,
"maxRetryTimes": 20
}
```

- Example response

```
{
  "id": "07a3e4e6-9a28-4e92-8d3f-9c538621a166",
  "appId": "",
  "name": "",
  "owner": "test1",
  "proxyUser": "",
  "state": "starting",
  "kind": "",
  "log": [],
  "sc_type": "CUSTOMIZED",
  "cluster_name": "aaa",
  "queue": "queue1",
  "create_time": 1607589874156,
  "update_time": 1607589874156
}
```

6. Query a batch job status.

- API

URI format: GET /v2.0/{*project_id*}/batches/{*batch_id*}/state

- Obtain the value of {*project_id*} from [Obtaining a Project ID](#).
- For details about the query parameters, see [Querying a Batch Job Status](#).

- Example request

- Description: Query the status of the batch processing job whose ID is **0a324461-d9d9-45da-a52a-3b3c7a3d809e** in the project whose ID is **48cc2c48765f481480c7db940d6409d1**.
- Example URL: GET <https://{{endpoint}}/v2.0/48cc2c48765f481480c7db940d6409d1/batches/0a324461-d9d9-45da-a52a-3b3c7a3d809e/state>
- Body:
{}
}

- Example response

```
{
  "id": "0a324461-d9d9-45da-a52a-3b3c7a3d809e",
  "state": "Success"
}
```

7. Query batch job logs.

- API

URI format: GET /v2.0/{*project_id*}/batches/{*batch_id*}/log

- Obtain the value of `{project_id}` from [Obtaining a Project ID](#).
- For details about the query parameters, see [Querying Batch Job Logs \(Discarded\)](#).
- Example request
 - Description: Query the background logs of the batch processing job `0a324461-d9d9-45da-a52a-3b3c7a3d809e` in the `48cc2c48765f481480c7db940d6409d1` project.
 - Example URL: GET `https://[{endpoint}] v2.0/48cc2c48765f481480c7db940d6409d1/batches/0a324461-d9d9-45da-a52a-3b3c7a3d809e/log`
 - Body:

```
{}
```
- Example response

```
{  
    "id": "0a324461-d9d9-45da-a52a-3b3c7a3d809e",  
    "from": 0,  
    "total": 3,  
    "log": [  
        "Detailed information about job logs"  
    ]  
}
```

4.3 Creating and Submitting a Flink Job

Scenario

This section describes how to create and run a user-defined Flink job using APIs.

Notes and Constraints

- It takes 6 to 10 minutes to start a job using a new queue for the first time.

Involved APIs

- [Creating an Elastic Resource Pool](#): Create an elastic resource pool.
- [Creating a Queue](#): Create queues within the elastic resource pool.
- [Uploading a Package Group \(Discarded\)](#): Upload the resource package required by the Flink custom job.
- [Querying Resource Packages in a Group \(Discarded\)](#): Check whether the uploaded resource package is correct.
- [Creating a Flink Jar job](#): Create a user-defined Flink job.
- [Running Jobs in Batches](#): Run a user-defined Flink job.

Procedure

1. Create an elastic resource pool named `elastic_pool_dli`.
 - API
 - URI format: POST `/v3/{project_id}/elastic-resource-pools`

- Obtain the value of *{project_id}* by referring to [Obtaining a Project ID](#).
 - For details about the request parameters, see [Creating an Elastic Resource Pool](#).
 - Example request
 - Description: Create an elastic resource pool named **elastic_pool_dli** in the project whose ID is **48cc2c48765f481480c7db940d6409d1**.
 - Example URL: POST `https://[endpoint]/v3/48cc2c48765f481480c7db940d6409d1/elastic-resource-pools`
 - Body:

```
{
  "elastic_resource_pool_name": "elastic_pool_dli",
  "description": "test",
  "cidr_in_vpc": "172.16.0.0/14",
  "charging_mode": "1",
  "max_cu": 64,
  "min_cu": 64
}
```
 - Example response

```
{
  "is_success": true,
  "message": ""
}
```
2. Create a queue named **queue1** in the elastic resource pool.
- API
 - URI format: POST `/v1.0/{project_id}/queues`
 - Obtain the value of *{project_id}* by referring to [Obtaining a Project ID](#).
 - For details about the request parameters, see [Creating a Queue](#).
 - Example request
 - Description: Create an elastic resource pool named **queue1** in the project whose ID is **48cc2c48765f481480c7db940d6409d1**.
 - Example URL: POST `https://[endpoint]/v1.0/48cc2c48765f481480c7db940d6409d1/queues`
 - Body:

```
{
  "queue_name": "queue1",
  "queue_type": "sql",
  "description": "test",
  "cu_count": 16,
  "enterprise_project_id": "elastic_pool_dli"
}
```
 - Example response

```
{
  "is_success": true,
  "message": ""
}
```

3. Upload the resource package of the user-defined Flink job. For details, see [3.](#)
4. Query resource packages in a group. For details, see [4.](#)
5. Create a custom flink job.
 - API

URI format: POST /v1.0/{*project_id*}/streaming/flink-jobs

 - Obtain the value of {*project_id*} from [Obtaining a Project ID](#).
 - For details about the request parameters, see [Creating a Database \(Discarded\)](#).
 - Example request
 - Description: Create a user-defined Flink job in the project whose ID is **48cc2c48765f481480c7db940d6409d1**.
 - Example URL: POST <https://{{endpoint}}/v1.0/48cc2c48765f481480c7db940d6409d1/streaming/flink-jobs>
 - Body:

```
{  
    "name": "test",  
    "desc": "job for test",  
    "queue_name": "queue1",  
    "manager_cu_number": 1,  
    "cu_number": 2,  
    "parallel_number": 1,  
    "tm_cus": 1,  
    "tm_slot_num": 1,  
    "log_enabled": true,  
    "obs_bucket": "bucketName",  
    "smn_topic": "topic",  
    "main_class": "org.apache.flink.examples.streaming.JavaQueueStream",  
    "restart_when_exception": false,  
    "entrypoint": "javaQueueStream.jar",  
    "entrypoint_args": "-windowSize 2000 -rate3",  
    "dependency_jars": [  
        "myGroup/test.jar",  
        "myGroup/test1.jar"  
    ],  
    "dependency_files": [  
        "myGroup/test.csv",  
        "myGroup/test1.csv"  
    ]  
}
```
 - Example response

```
{  
    "is_success": true,  
    "message": "A Flink job is created successfully.",  
    "job": {  
        "job_id": 138,  
        "status_name": "job_init",  
        "status_desc": ""  
    }  
}
```
6. Run jobs in batches.
 - API

URI format: POST /v1.0/{*project_id*}/streaming/jobs/run

 - Obtain the value of {*project_id*} from [Obtaining a Project ID](#).

- For details about the request parameters, see [Running Jobs in Batches](#).
- Example request
 - Description: Run the jobs whose **job_id** is **298765** and **298766** in the project whose ID is **48cc2c48765f481480c7db940d6409d1**.
 - Example URL: POST <https://{{endpoint}}/v1.0/48cc2c48765f481480c7db940d6409d1/streaming/jobs/run>
 - Body:

```
{  
    "job_ids": [131,130,138,137],  
    "resume_savepoint": true  
}
```
- Example response

```
[  
    {  
        "is_success": "true",  
        "message": "The request for submitting DLI jobs is delivered successfully."  
    },  
    {  
        "is_success": "true",  
        "message": "The request for submitting DLI jobs is delivered successfully."  
    },  
    {  
        "is_success": "true",  
        "message": "The request for submitting DLI jobs is delivered successfully."  
    },  
    {  
        "is_success": "true",  
        "message": "The request for submitting DLI jobs is delivered successfully."  
    }  
]
```

4.4 Creating and Using a Datasource Connection

Scenario

This section describes how to create an enhanced datasource connection using an API.

Notes and Constraints

- It takes 6 to 10 minutes to start a job using a new queue for the first time.
- Before creating an enhanced datasource connection, you need to obtain the ID of the VPC and the network ID of the subnet where the service is located.

Involved APIs

- [Creating an Elastic Resource Pool](#): Create an elastic resource pool.
- [Creating a Queue](#): Create queues within the elastic resource pool.
- [Creating an Enhanced Datasource Connection](#): Create an enhanced datasource connection.
- [Binding a Queue](#): Bind a queue.

- **Querying an Enhanced Datasource Connection:** Check whether an enhanced datasource connection is successfully created.

Procedure

1. Create an elastic resource pool named **elastic_pool_dli**.
 - API
 - URI format: POST /v3/{project_id}/elastic-resource-pools
 - Obtain the value of *{project_id}* by referring to [Obtaining a Project ID](#).
 - For details about the request parameters, see [Creating an Elastic Resource Pool](#).
 - Example request
 - Description: Create an elastic resource pool named **elastic_pool_dli** in the project whose ID is **48cc2c48765f481480c7db940d6409d1**.
 - Example URL: POST <https://{{endpoint}}/v3/48cc2c48765f481480c7db940d6409d1/elastic-resource-pools>
 - Body:

```
{
  "elastic_resource_pool_name": "elastic_pool_dli",
  "description": "test",
  "cidr_in_vpc": "172.16.0.0/14",
  "charging_mode": "1",
  "max_cu": 64,
  "min_cu": 64
}
```
 - Example response

```
{
  "is_success": true,
  "message": ""
}
```
2. Create a queue named **queue1** in the elastic resource pool.
 - API
 - URI format: POST /v1.0/{project_id}/queues
 - Obtain the value of *{project_id}* by referring to [Obtaining a Project ID](#).
 - For details about the request parameters, see [Creating a Queue](#).
 - Example request
 - Description: Create an elastic resource pool named **queue1** in the project whose ID is **48cc2c48765f481480c7db940d6409d1**.
 - Example URL: POST <https://{{endpoint}}/v1.0/48cc2c48765f481480c7db940d6409d1/queues>
 - Body:

```
{
  "queue_name": "queue1",
  "queue_type": "sql",
}
```

```
        "description": "test",
        "cu_count": 16,
        "enterprise_project_id": "elastic_pool_dli"
    }
```

- Example response

```
{
    "is_success": true,
    "message": ""
}
```

3. Create an enhanced datasource connection.

- API

URI format: POST /v2.0/{*project_id*}/datasource/enhanced-connections

- Obtain the value of {*project_id*} from [Obtaining a Project ID](#).
- For details about the request parameters, see [Creating an Enhanced Datasource Connection](#).

- Example request

- Description: Create an enhanced datasource connection named **test1** in project **48cc2c48765f481480c7db940d6409d1**.

- Example URL: POST <https://{{endpoint}}/v2.0/48cc2c48765f481480c7db940d6409d1/datasource/enhanced-connections>

- Body:

```
{
    "name": "test1",
    "dest_vpc_id": "22094d8f-c310-4621-913d-4c4d655d8495",
    "dest_network_id": "78f2562a-36e4-4b39-95b9-f5aab22e1281",
    "elastic_resource_pools": "elastic_pool_dli",
    "hosts": [
        {
            "ip": "192.168.0.1",
            "name": "ecs-97f8-0001"
        },
        {
            "ip": "192.168.0.2",
            "name": "ecs-97f8-0002"
        }
    ]
}
```

- Example response

```
{
    "is_success": true,
    "message": "",
    "connection_id": "2a620c33-5609-40c9-affd-2b6453071b0f"
}
```

4. (Optional) If no queue is bound when you create an enhanced datasource connection, you can use the [Binding a Queue](#) API to bind a queue.

5. Verify that the enhanced datasource connection is created successfully.

- API

URI format: GET /v2.0/{*project_id*}/datasource/enhanced-connections/{*connection_id*}

- Obtain the value of {*project_id*} from [Obtaining a Project ID](#).

- For details about the query parameters, see [Creating a Database \(Discarded\)](#).
- Example request
 - Description: Query an enhanced datasource connection whose ID is **2a620c33-5609-40c9-affd-2b6453071b0f** in project **48cc2c48765f481480c7db940d6409d1**.
 - Example URL: GET `https://{{endpoint}}/v2.0/48cc2c48765f481480c7db940d6409d1/datasource/enhanced-connections/2a620c33-5609-40c9-affd-2b6453071b0f`
 - Body:

```
{}
```
- Example response

```
{  
    "is_success": true,  
    "message": "",  
    "name": "test1",  
    "id": "2a620c33-5609-40c9-affd-2b6453071b0f",  
    "elastic_resource_pools": [  
        {  
            "status": "ACTIVE",  
            "name": "elastic_pool_dli",  
            "peer_id": "2a620c33-5609-40c9-affd-2b6453071b0f",  
            "err_msg": "",  
            "update_time": 1566889577861  
        }  
    ],  
    "dest_vpc_id": "22094d8f-c310-4621-913d-4c4d655d8495",  
    "dest_network_id": "78f2562a-36e4-4b39-95b9-f5aab22e1281",  
    "isPrvis": true,  
    "create_time": 1566888011125,  
    "status": "ACTIVE",  
    "hosts": [  
        {  
            "ip": "192.168.0.1",  
            "name": "ecs-97f8-0001"  
        },  
        {  
            "ip": "192.168.0.2",  
            "name": "ecs-97f8-0002"  
        }  
    ]  
}
```

5 Permission-related APIs

5.1 Granting Data Access Control to Users or Projects

Function

This API is used to grant data permissions for a database or data table to a specified user or project.

The user group containing the authorized user must have the **Tenant Guest** permission in the region where the user group belongs.

Permissions can only be granted to projects within the same region of the same tenant.

For details about the **Tenant Guest** permission and how to apply for the permission, see [System Permissions](#) and [Creating a User Group](#) in *Identity and Access Management User Guide*.

URI

- URI format
`PUT /v1.0/{project_id}/authorization`
- Parameter description

Table 5-1 URI parameter

Parameter	Mandatory	Type	Description
project_id	Yes	String	Project ID, which is used for resource isolation. For details about how to obtain its value, see Obtaining a Project ID .

Request

Table 5-2 Request parameters

Parameter	Mandatory	Type	Description
user_name	No	String	Name of the user who is granted, revoked, or updated permissions on a database or data table
grant_project_id	No	String	ID of the project that is granted permissions to access a database or data table. Once granted, the project administrator will have access to the database or data table.
action	Yes	String	Grants, revokes, or updates permissions. <ul style="list-style-type: none">● grant: Grants permissions.● revoke: Revokes permissions.● update: Updates permissions. NOTE Users can perform the update operation only when they have been granted the grant and revoke permissions.
privileges	Yes	Array of objects	Granted permissions. For details, see Table 5-3 .

Table 5-3 privileges parameters

Parameter	Mandatory	Type	Description
object	Yes	String	Data objects whose permissions are to be granted. If they are named: <ul style="list-style-type: none">● databases.Database name, all data in the database will be shared.● databases.Database name.tables.Table name, data in a specified table will be shared.● databases.Database name.tables.Table name.columns.Column name, data in a specified column will be shared.● edsconnections.Connection ID: grants the permission to use an enhanced datasource connection.

Parameter	Mandatory	Type	Description
privileges	Yes	Array of strings	<p>List of permissions to be granted, revoked, or updated</p> <p>NOTE If action is set to update and the update list is empty, the user's all permissions on the database or data table are revoked.</p>

Response

Table 5-4 Response parameters

Parameter	Mandatory	Type	Description
is_success	No	Boolean	Whether the request is successfully executed. Value true indicates that the request is successfully executed.
message	No	String	System prompt. If the execution succeeds, the message may be left blank.

Example Request

- Grant a project (ID: **0732e57c728025922f04c01273686950**) the permission to query data in the database **db1**, delete the data table **db1.tbl**, and query data in a specified column **db1.tbl.column1** of a data table.

```
{  
  "grant_project_id": "0732e57c728025922f04c01273686950",  
  "action": "grant",  
  "privileges": [  
    {  
      "object": "databases.db1.tables.tb2.columns.column1",  
      "privileges": ["SELECT"]  
    },  
    {  
      "object": "databases.db1.tables.tbl",  
      "privileges": ["DROP_TABLE"]  
    },  
    {  
      "object": "databases.db1",  
      "privileges": ["SELECT"]  
    }  
  ]  
}
```

- Grant the data query permission of the **dbtest** database to the **dlitest** user.

```
{  
  "action": "grant",  
  "privileges": [  
    {  
      "object": "databases.dbtest",  
      "privileges": [  
        "SELECT"  
      ]  
    }  
  ]  
}
```

```
        }
    ],
    "user_name": "dlitest"
}
```

Example Response

```
{
  "is_success": true,
  "message": ""
}
```

Status Codes

[Table 5-5](#) describes the status codes.

Table 5-5 Status codes

Status Code	Description
200	Authorization succeeds.
400	Request error.
500	Internal server error.

Error Codes

If an error occurs when this API is invoked, the system does not return the result similar to the preceding example, but returns the error code and error information. For details, see [Error Codes](#).

5.2 Checking the Permissions Granted to a User

Function

This API is used to check the permissions granted to a user.

URI

- URI format
GET /v1.0/{project_id}/authorization/privileges
- Parameter descriptions:

Table 5-6 URI parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Project ID, which is used for resource isolation. For details about how to obtain its value, see Obtaining a Project ID .

Table 5-7 query parameter description

Parameter	Mandatory	Type	Description
object	Yes	String	<p>Data object to be assigned, which corresponds to the object in API permission assignment.</p> <ul style="list-style-type: none">• jobs.flink.Flink job ID, data in the specified job will be queried.• groups.Package group name, data in the specified package group will be queried.• resources.Package name, data in the specified package will be queried. <p>NOTE When you view the packages in a group, the object format is resources.package group name/package name.</p>

 **NOTE**

The following is an example of the URL containing the **query** parameter:

GET /v1.0/{project_id}/authorization/privileges?object={object}

Request

None

Response

Table 5-8 Response parameters

Parameter	Mandatory	Type	Description
is_success	Yes	Boolean	Whether the request is successfully executed. Value true indicates that the request is successfully executed.
message	Yes	String	Indicates the system prompt. If execution succeeds, this parameter may be left blank.
object_name	No	String	Object name.
object_type	No	String	Object type.
privileges	No	Array of Object	Permission information. For details, see Table 5-9 .

Parameter	Mandatory	Type	Description
count	No	Integer	Total number of permissions.

Table 5-9 privileges parameters

Parameter	Mandatory	Type	Description
object	No	String	Data object whose permissions are to be granted, which corresponds to the object in the permission assignment API.
is_admin	No	Boolean	Whether the database user is an administrator.
user_name	No	String	Name of the user who has permission on the current database.
privileges	No	Array of Strings	Permission of the user on the database.

Example Request

None

Example Response

```
{  
    "is_success": true,  
    "message": "",  
    "object_name": "9561",  
    "object_type": "flink",  
    "count": 2,  
    "privileges": [  
        {  
            "user_name": "testuser1",  
            "is_admin": true,  
            "privileges": [  
                "ALL"  
            ]  
        },  
        {  
            "user_name": "user1",  
            "is_admin": false,  
            "privileges": [  
                "GET"  
            ]  
        }  
    ]  
}
```

Status Codes

Table 5-10 describes the status code.

Table 5-10 Status codes

Status Code	Description
200	Authorization succeeds.
400	Request error.
500	Internal service error.

Error Codes

If an error occurs when this API is invoked, the system does not return the result similar to the preceding example, but returns the error code and error information. For details, see [Error Codes](#).

Table 5-11 Error codes

Error Code	Error Message
DLI.0001	user input validation failed, object_type sql or saprk is not supported now

6 Global Variable-related APIs

6.1 Creating a Global Variable

Function

This API is used to create a global variable.

URI

- URI format
POST /v1.0/{project_id}/variables
- Parameter description

Table 6-1 URI parameter

Parameter	Mandatory	Type	Description
project_id	Yes	String	Project ID, which is used for resource isolation. For details about how to obtain its value, see Obtaining a Project ID .

Request

Table 6-2 Request parameters

Parameter	Mandatory	Type	Description
var_name	Yes	String	A global variable name can contain a maximum of 128 characters, including only digits, letters, and underscores (_), but cannot start with an underscore (_) or contain only digits.
var_value	Yes	String	Global variable value.
is_sensitive	No	Boolean	Whether to set a variable as a sensitive variable. The default value is false .

Response

Table 6-3 Response parameters

Parameter	Mandatory	Type	Description
is_success	No	Boolean	Indicates whether the request is successfully executed. Value true indicates that the request is successfully executed.
message	No	String	Message content.

Example Request

Create a global variable that is sensitive.

```
{  
    "var_name": "string",  
    "var_value": "string",  
    "is_sensitive": true  
}
```

Example Response

```
{  
    "is_success": true,  
    "message": "string"  
}
```

Status Codes

Table 6-4 describes status codes.

Table 6-4 Status codes

Status Code	Description
200	A variable is created successfully.
400	The input parameter is invalid.

Error Codes

If an error occurs when this API is invoked, the system does not return the result similar to the preceding example, but returns the error code and error information. For details, see [Error Codes](#).

Table 6-5 Error codes

Error Code	Error Message
DLI.0001	Parameter check errors occur.
DLI.0999	The object exists.

6.2 Deleting a Global Variable

Function

This API is used to delete a global variable.

Only the user who creates a global variable can delete the variable.

URI

- URI format
`DELETE /v1.0/{project_id}/variables/{var_name}`
- Parameter description

Table 6-6 URI parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Project ID, which is used for resource isolation. For details about how to obtain its value, see Obtaining a Project ID .

Parameter	Mandatory	Type	Description
var_name	Yes	String	A global variable name can contain a maximum of 128 characters, including only digits, letters, and underscores (_), but cannot start with an underscore (_) or contain only digits.

Request

None

Response

- Parameter description

Table 6-7 Response parameters

Parameter	Mandatory	Type	Description
is_success	No	Boolean	Whether the request is successfully executed. Value true indicates that the request is successfully executed.
message	No	String	System prompt. If execution succeeds, the parameter setting may be left blank.

Example Request

None

Example Response

```
{  
    "is_success": true,  
    "message": "string"  
}
```

Status Codes

[Table 6-8](#) describes status codes.

[Table 6-8](#) Status codes

Status Code	Description
200	A variable is deleted successfully.
400	The input parameter is invalid.

Error Codes

If an error occurs when this API is invoked, the system does not return the result similar to the preceding example, but returns the error code and error information. For details, see [Error Codes](#).

Table 6-9 Error codes

Error Code	Error Message
DLI.0001	Parameter check errors occur.
DLI.0999	Server-side errors occur.

6.3 Modifying a Global Variable

Function

This API is used to modify a global variable.

URI

- URI format
`PUT /v1.0/{project_id}/variables/{var_name}`
- Parameter description

Table 6-10 URI parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Project ID, which is used for resource isolation. For details about how to obtain its value, see Obtaining a Project ID .
var_name	Yes	String	A global variable name can contain a maximum of 128 characters, including only digits, letters, and underscores (_), but cannot start with an underscore (_) or contain only digits.

Request

Table 6-11 Request parameters

Parameter	Mandatory	Type	Description
var_value	Yes	String	Global variable value.

Response

Table 6-12 Response parameters

Parameter	Mandatory	Type	Description
is_success	No	Boolean	Indicates whether the request is successfully executed. Value true indicates that the request is successfully executed.
message	No	String	Message content.

Example Request

Change the value of a sensitive variable.

```
{  
    "var_value": "string"  
}
```

Example Response

```
{  
    "is_success": true,  
    "message": "string"  
}
```

Status Codes

Table 6-13 describes status codes.

Table 6-13 Status codes

Status Code	Description
200	A variable is modified successfully.
400	The input parameter is invalid.

Error Codes

If an error occurs when this API is invoked, the system does not return the result similar to the preceding example, but returns the error code and error information. For details, see [Error Codes](#).

Table 6-14 Error codes

Error Code	Error Message
DLI.0001	Parameter check errors occur.
DLI.0999	Server-side errors occur.
DLI.12004	The job does not exist. Check the reason or create a job.

6.4 Querying All Global Variables

Function

This API is used to query information about all global variables in the current project.

URI

- URI format
GET /v1.0/{project_id}/variables
- Parameter description

Table 6-15 URI parameter

Parameter	Mandatory	Type	Description
project_id	Yes	String	Project ID, which is used for resource isolation. For details about how to obtain its value, see Obtaining a Project ID .

Table 6-16 query parameter description

Parameter	Mandatory	Type	Description
limit	No	Integer	Number of returned records displayed on each page. The default value is 100 .
offset	No	Integer	Offset. The default value is 0 .

Request

None

Response

Table 6-17 Response parameters

Parameter	Mandatory	Type	Description
is_success	No	Boolean	Whether the request is successfully executed. Value true indicates that the request is successfully executed.
message	No	String	System prompt. If execution succeeds, the parameter setting may be left blank.
count	No	Integer	Number of global variables.
global_vars	No	Array of objects	Global variable information. For details, see Table 6-18 .

Table 6-18 `global_vars` parameters

Parameter	Mandatory	Type	Description
id	No	Long	Global variable ID.
var_name	Yes	String	Global variable name.
var_value	Yes	String	Global variable value.
project_id	No	String	Project ID.
user_id	No	String	User ID.
user_name	No	String	Username
is_sensitive	No	Boolean	Whether to set a variable as a sensitive variable.
create_time	No	Long	Creation time
update_time	No	Long	Update time

Example Request

None

Example Response

```
{  
  "is_success": true,
```

```
"message": "string",
"count": 0,
"global_vars": [
  {
    "id": 0,
    "var_name": "string",
    "var_value": "string",
    "project_id": "string",
    "user_id": "string"
  }
]
```

Status Codes

Table 6-19 Status codes

Status Code	Description
200	All variables are queried successfully.
400	The input parameter is invalid.

Error Codes

If an error occurs when this API is invoked, the system does not return the result similar to the preceding example, but returns the error code and error information. For details, see [Error Codes](#).

Table 6-20 Error codes

Error Code	Error Message
DLI.0001	Parameter check errors occur.
DLI.0999	Server-side errors occur.

7 APIs Related to Resource Tags

7.1 Batch Adding Resource Tags

Function

This API is used to add resource tags in batches.

URI

POST /v3/{project_id}/{resource_type}/{resource_id}/tags/create

Table 7-1 URI parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Project ID, which is used for resource isolation. For details about how to obtain its value, see Obtaining a Project ID .
resource_type	Yes	String	Resource type. The options are: <ul style="list-style-type: none">• dli_queue: queue• dli_elastic_resource_pool: elastic resource pool• dli_enhanced_datasource: enhanced datasource connection• dli_database: database• dli_flink_job: Flink job

Parameter	Mandatory	Type	Description
resource_id	Yes	String	<p>Resource ID.</p> <p>Minimum length: 1 character</p> <p>Maximum length: 1,000 characters</p> <p>Obtain it as follows:</p> <ul style="list-style-type: none"> Queue ID: Obtain it by calling Querying All Queues. <code>queue_id</code> in the response indicates the queue ID. Elastic resource pool ID: Obtain it by calling Querying All Elastic Resource Pools. <code>resource_id</code> in the response indicates the elastic resource pool ID. Enhanced datasource connection ID: Obtain the Connection ID on the Enhanced tab of Data Connections page of the DLI management console. Database ID: name of the database that is passed in when adding a tag. You can view the database name on the Data Management > Databases and Tables page of the DLI console. Flink job ID: On the Job Management > Flink Jobs page of the DLI management console, click the name of a Flink job. On the displayed Flink job details page, obtain the Flink job ID.

Request Parameters

Table 7-2 Request body parameters

Parameter	Mandatory	Type	Description
tags	Yes	Array of tags objects	<p>Tag list. For details, see Table 7-3.</p> <ul style="list-style-type: none"> • A maximum of 20 tags can be added. • Only one tag value can be added to a tag key. • Each key within a resource must be unique, and the values within the same key cannot be duplicated.

Table 7-3 tags

Parameter	Mandatory	Type	Description
key	Yes	String	<p>Tag key.</p> <p>A tag key can contain a maximum of 128 characters. Only letters, digits, spaces, and special characters (_.:+@) are allowed, but the value cannot start or end with a space or start with <code>_sys_</code>.</p>
value	Yes	String	<p>Tag value.</p> <p>A tag value can contain a maximum of 255 characters. Only letters, numbers, spaces, and special characters (_.:+@) are allowed. The value cannot start or end with a space.</p> <p>The resource tag can be empty.</p>

Response Parameters

None

Example Request

```
{
  "tags": [
    {
      "key": "com.huawei.cloud.tag",
      "value": "123456"
    }
  ]
}
```

```
        "key":"key1",
        "value":"value1"
    },
    {
        "key":"key2",
        "value":"value2"
    }
]
```

Example Response

None

Status Codes

Status Code	Description
204	The modification is successful.
400	Request error.
500	Internal server error.

Error Codes

See [Error Codes](#).

7.2 Batch Deleting Resource Tags

Function

This API is used to delete tags from a specified instance in batches.

- This API is idempotent, meaning that if the tag to be deleted does not exist, the deletion is successful.
- A maximum of 20 tags can be deleted in a batch.
- Character set validation is not performed when deleting tags.
- The **tags** structure cannot be missing during deletion, and the **key** field cannot be empty or a null string.

URI

POST /v3/{project_id}/{resource_type}/{resource_id}/tags/delete

Table 7-4 URI parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Project ID, which is used for resource isolation. For details about how to obtain its value, see Obtaining a Project ID .
resource_type	Yes	String	Resource type. The options are: <ul style="list-style-type: none">• dli_queue: queue• dli_elastic_resource_pool: elastic resource pool• dli_enhanced_datasource: enhanced datasource connection• dli_database: database• dli_package_resource: resource package (built-in resource packages with a module ID specified are not supported)• dli_flink_job: Flink job

Parameter	Mandatory	Type	Description
resource_id	Yes	String	<p>Resource ID.</p> <p>Minimum length: 1 character</p> <p>Maximum length: 1,000 characters</p> <p>Obtain it as follows:</p> <ul style="list-style-type: none"> Queue ID: Obtain it by calling Querying All Queues. <code>queue_id</code> in the response indicates the queue ID. Elastic resource pool ID: Obtain it by calling Querying All Elastic Resource Pools. <code>resource_id</code> in the response indicates the elastic resource pool ID. Enhanced datasource connection ID: Obtain the Connection ID on the Enhanced tab of Data Connections page of the DLI management console. Database ID: name of the database that is passed in when adding a tag. You can view the database name on the Data Management > Databases and Tables page of the DLI console. Flink job ID: On the Job Management > Flink Jobs page of the DLI management console, click the name of a Flink job. On the displayed Flink job details page, obtain the Flink job ID.

Request Parameters

Table 7-5 Request body parameters

Parameter	Mandatory	Type	Description
tags	Yes	Array of tags objects	<p>Tag list. For details, see Table 7-6.</p> <ul style="list-style-type: none"> • A maximum of 20 tags can be added. • Only one tag value can be added to a tag key. • Each key within a resource must be unique, and the values within the same key cannot be duplicated.

Table 7-6 tags

Parameter	Mandatory	Type	Description
key	Yes	String	<p>Tag key.</p> <p>A tag key can contain a maximum of 128 characters. Only letters, digits, spaces, and special characters (_.:+@) are allowed, but the value cannot start or end with a space or start with <code>_sys_</code>.</p>
value	Yes	String	<p>Tag value.</p> <p>A tag value can contain a maximum of 255 characters. Only letters, numbers, spaces, and special characters (_.:+@) are allowed. The value cannot start or end with a space.</p>

Response Parameters

None

Example Request

```
{
  "tags": [
    {
      "key": "key1"
    },
    {
      "key": "key2"
    }
  ]
}
```

```
        "key":"key2",
        "value":"value2"
    }
}
```

Example Response

None

Status Codes

Status Code	Description
204	The modification is successful.
400	Request error.
500	Internal server error.

Error Codes

See [Error Codes](#).

7.3 Querying the Number of Resource Instances

Function

This API is used to query the number of resource instances.

URI

POST /v3/{project_id}/{resource_type}/resource-instances/count

Table 7-7 URI parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Project ID, which is used for resource isolation. For details about how to obtain its value, see Obtaining a Project ID .

Parameter	Mandatory	Type	Description
resource_type	Yes	String	<p>Resource type. The options are:</p> <ul style="list-style-type: none">• dli_queue: queue• dli_elastic_resource_pool: elastic resource pool• dli_enhanced_datasource: enhanced datasource connection• dli_database: database• dli_package_resource: resource package (built-in resource packages with a module ID specified are not supported)• dli_flink_job: Flink job

Request Parameters

Table 7-8 Request body parameters

Parameter	Mandatory	Type	Description
without_any_tag	No	Boolean	<p>Whether no tags are included. The default value is false.</p> <ul style="list-style-type: none">• true: No tags are included.• false: One or multiple tags are specified.
tags	No	Array of objects	<p>Tags. For details, see tags.</p> <ul style="list-style-type: none">• A maximum of 20 tags can be added.• Each key within a resource must be unique, and the values within the same key cannot be duplicated.• If left unset, the number of all resources is returned.
matches	No	Array of objects	<p>Search field. For details, see matches.</p>

Table 7-9 tags

Parameter	Mandatory	Type	Description
key	Yes	String	<p>Tag key.</p> <p>A tag key can contain a maximum of 128 characters. Only letters, digits, spaces, and special characters (_.:+@) are allowed, but the value cannot start or end with a space or start with <code>_sys_</code>.</p>
values	Yes	Array of strings	<p>List of tag values.</p> <p>A tag value can contain a maximum of 255 characters. Only letters, numbers, spaces, and special characters (_.:+@) are allowed. The value cannot start or end with a space.</p> <p>The value can be an empty array but cannot be left blank.</p> <p>If the values are null, it indicates any_value (querying any value). All values of a tag key are in the OR relationship.</p>

Table 7-10 matches

Parameter	Mandatory	Type	Description
key	Yes	String	<p>Tag key. Currently, only the option resource_name is available.</p> <p>resource_name: resource name.</p> <p>By default, a fuzzy search is performed based on the prefix of the resource name entered.</p>
value	Yes	String	Tag value. Enter a maximum of 255 characters.

Response Parameters

Table 7-11 Response parameters

Parameter	Mandatory	Type	Description
total_count	Yes	Integer	Total number of records.

Example Request

```
{  
    "tags": [  
        {  
            "key": "key1",  
            "values": [  
                "value1",  
                "value2"  
            ]  
        },  
        {  
            "key": "key2",  
            "values": [  
                "value1",  
                "value2"  
            ]  
        }  
    ],  
    "matches": [  
        {  
            "key": "resource_name",  
            "value": "resource1"  
        }  
    ],  
    "without_any_tag": "false"  
}
```

Example Response

```
{  
    "total_count": 1000  
}
```

Status Codes

Status Code	Description
200	The modification is successful.
400	Request error.
500	Internal server error.

Error Codes

See [Error Codes](#).

7.4 Listing Resource Instances

Function

This API is used to list resource instances.

URI

POST /v3/{project_id}/{resource_type}/resource-instances/filter

Table 7-12 URI parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Project ID, which is used for resource isolation. For details about how to obtain its value, see Obtaining a Project ID .
resource_type	Yes	String	Resource type. The options are: <ul style="list-style-type: none">• dli_queue: queue• dli_elastic_resource_pool: elastic resource pool• dli_enhanced_datasource: enhanced datasource connection• dli_database: database• dli_package_resource: resource package (built-in resource packages with a module ID specified are not supported)• dli_flink_job: Flink job

Table 7-13 Query parameters

Parameter	Mandatory	Type	Description
limit	No	Integer	Number of records displayed on each page. The default value is 1000 .
offset	No	Integer	Query result offset. The default value is 0 .

Request Parameters

Table 7-14 Request body parameters

Parameter	Mandatory	Type	Description
without_any_tag	No	Boolean	<p>Whether no tags are included. The default value is false.</p> <ul style="list-style-type: none"> • true: No tags are included. • false: One or multiple tags are specified.
tags	No	Array of objects	<p>Tags. For details, see tags.</p> <ul style="list-style-type: none"> • A maximum of 20 tags can be added. • Each key within a resource must be unique, and the values within the same key cannot be duplicated. • If left unset, the list of all resource instances is returned.
matches	No	Array of objects	<p>Search field. For details, see matches.</p>

Table 7-15 tags

Parameter	Mandatory	Type	Description
key	Yes	String	<p>Tag key.</p> <p>A tag key can contain a maximum of 128 characters. Only letters, digits, spaces, and special characters (_.:+@) are allowed, but the value cannot start or end with a space or start with <code>_sys_</code>.</p>

Parameter	Mandatory	Type	Description
values	Yes	Array of strings	<p>List of tag values.</p> <p>A tag value can contain a maximum of 255 characters. Only letters, numbers, spaces, and special characters (.:+@-) are allowed. The value cannot start or end with a space.</p> <p>The value can be an empty array but cannot be left blank.</p> <p>If the values are null, it indicates any_value (querying any value). All values of a tag key are in the OR relationship.</p>

Table 7-16 matches

Parameter	Mandatory	Type	Description
key	Yes	String	<p>Tag key. Currently, only the option resource_name is available.</p> <p>resource_name: resource name.</p> <p>By default, a fuzzy search is performed based on the prefix of the resource name entered.</p>
value	Yes	String	Tag value. Enter a maximum of 255 characters.

Response Parameters

Table 7-17 Response parameters

Parameter	Mandatory	Type	Description
resources	Yes	List<resource>	List of resource instances. For details, see Table 7-18 .
total_count	Yes	Integer	Total number of records.

Table 7-18 resource field data structure description

Parameter	Mandatory	Type	Description
resource_id	Yes	String	Resource ID.
resource_detail	Yes	Object	Resource details. This field is an extension field and is left blank by default.
tags	Yes	List<resource_tag>	Tag list, which is an empty array if there are no tags. For details, see Table 7-19 .
resource_name	Yes	String	Resource name, which is an empty string by default if the resource does not have a name. If the resource is an EIP, the IP address is returned.

Table 7-19 tags field data structure description

Parameter	Mandatory	Type	Description
key	Yes	String	Resource tag key.
value	Yes	String	Resource tag value.

Example Request

```
{  
    "tags": [  
        {  
            "key": "key1",  
            "values": [  
                "value1",  
                "value2"  
            ]  
        },  
        {  
            "key": "key2",  
            "values": [  
                "value1",  
                "value2"  
            ]  
        }  
    ],  
    "matches": [  
        {  
            "key": "resource_name",  
            "value": "resource1"  
        }  
    ],  
    "without_any_tag": "false"  
}
```

Example Response

```
{  
    "resources": [  
        {  
            "resource_detail": null,  
            "resource_id": "test1",  
            "resource_name": "resource1",  
            "tags": [  
                {  
                    "key": "key1",  
                    "value": "value1"  
                },  
                {  
                    "key": "key2",  
                    "value": "value1"  
                }  
            ]  
        },  
        {"total_count": 1000  
    }
```

Status Codes

Status Code	Description
200	The modification is successful.
400	Request error.
500	Internal server error.

Error Codes

See [Error Codes](#).

7.5 Querying Tags of a Specified Resource Type

Function

This API is used to query tags of a specified resource type, which refers to the collection of all resource tags within a specified project.

URI

GET /v3/{project_id}/{resource_type}/tags

Table 7-20 URI parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Project ID, which is used for resource isolation. For details about how to obtain its value, see Obtaining a Project ID .
resource_type	Yes	String	Resource type. The options are: <ul style="list-style-type: none">• dli_queue: queue• dli_elastic_resource_pool: elastic resource pool• dli_enhanced_datasource: enhanced datasource connection• dli_database: database• dli_package_resource: resource package (built-in resource packages with a module ID specified are not supported)• dli_flink_job: Flink job

Request Parameters

None

Response Parameters

Table 7-21 Response parameters

Parameter	Type	Description
tags	Array of objects	List of resource tags. For details, see Table 7-22 .

Table 7-22 tags field data structure description

Parameter	Type	Description
key	String	Resource tag key.
values	Array of strings	List of resource tag values.

Example Request

None

Example Response

```
{  
    "tags": [  
        {  
            "key": "key1",  
            "values": [  
                "value1",  
                "value2"  
            ]  
        },  
        {  
            "key": "key2",  
            "values": [  
                "value1",  
                "value2"  
            ]  
        }  
    ]  
}
```

Status Codes

Status Code	Description
200	The modification is successful.
400	Request error.
500	Internal server error.

Error Codes

See [Error Codes](#).

7.6 Querying Tags of a Specified Resource Instance

Function

This API is used to query tags of a specified resource instance.

URI

GET /v3/{project_id}/{resource_type}/{resource_id}/tags

Table 7-23 URI parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Project ID, which is used for resource isolation. For details about how to obtain its value, see Obtaining a Project ID .
resource_type	Yes	String	Resource type. The options are: <ul style="list-style-type: none">• dli_queue: queue• dli_elastic_resource_pool: elastic resource pool• dli_enhanced_datasource: enhanced datasource connection• dli_database: database• dli_package_resource: resource package (built-in resource packages with a module ID specified are not supported)• dli_flink_job: Flink job

Parameter	Mandatory	Type	Description
resource_id	Yes	String	<p>Resource ID.</p> <p>Minimum length: 1 character</p> <p>Maximum length: 1,000 characters</p> <p>Obtain it as follows:</p> <ul style="list-style-type: none">• Queue ID: Obtain it by calling Querying All Queues. <code>queue_id</code> in the response indicates the queue ID.• Elastic resource pool ID: Obtain it by calling Querying All Elastic Resource Pools. <code>resource_id</code> in the response indicates the elastic resource pool ID.• Enhanced datasource connection ID: Obtain the Connection ID on the Enhanced tab of Data Connections page of the DLI management console.• Database ID: name of the database that is passed in when adding a tag. You can view the database name on the Data Management > Databases and Tables page of the DLI console.• Flink job ID: On the Job Management > Flink Jobs page of the DLI management console, click the name of a Flink job. On the displayed Flink job details page, obtain the Flink job ID.

Table 7-24 Query parameters

Parameter	Mandatory	Type	Description
limit	No	Integer	Number of records displayed on each page. The default value is 1000 .

Parameter	Mandatory	Type	Description
offset	No	Integer	Query result offset. The default value is 0.

Request Parameters

None

Response Parameters

Table 7-25 Response parameters

Parameter	Type	Description
count	Integer	Number of tags.
tags	Array of objects	List of resource tags. For details, see Table 7-26 .

Table 7-26 tags field data structure description

Parameter	Type	Description
key	String	Resource tag key.
value	Array of strings	List of resource tag values.

Example Request

None

Example Response

```
{  
    "count": 2,  
    "tags": [  
        {  
            "key": "key1",  
            "value": "value1"  
        },  
        {  
            "key": "key2",  
            "value": "value3"  
        }  
    ]  
}
```

Status Codes

Status Code	Description
200	The modification is successful.
400	Request error.
500	Internal server error.

Error Codes

See [Error Codes](#).

8 APIs Related to Enhanced Datasource Connections

8.1 Creating an Enhanced Datasource Connection

Function

This API is used to create an enhanced datasource connection with other services.

NOTE

- For details about how to use the console interface, see [Enhanced Datasource Connections](#) in *Data Lake Insight User Guide*.
- Datasource connections cannot be created for the default queue.

URI

- URI format
POST /v2.0/{project_id}/datasource/enhanced-connections
- Parameter description

Table 8-1 URI parameter

Parameter	Mandatory	Type	Description
project_id	Yes	String	Project ID, which is used for resource isolation. For details about how to obtain its value, see Obtaining a Project ID .

Request Parameters

Table 8-2 Request parameters

Parameter	Mandatory	Type	Description
name	Yes	String	Name of the connection. <ul style="list-style-type: none">The name can contain only letters, digits, and underscores (_), and cannot be left empty.A maximum of 64 characters are allowed.
dest_vpc_id	Yes	String	The ID of the service VPC to be connected.
dest_network_id	Yes	String	The subnet ID of the to-be-connected service.
elastic_resource_pools	No	Array of Strings	List of elastic resource pools that need to use datasource resources.
queues	No	Array of Strings	This parameter is about to be taken offline with DLI queues. Use the elastic_resource_pools parameter instead. List of queue names that are available for datasource connections. NOTE Only dedicated queues are allowed to use the enhanced datasource connections.
routetable_id	No	String	Route table associated with the subnet of the service.
hosts	No	Array of objects	The user-defined host information. A maximum of 20,000 records are supported. For details, see hosts request parameters .
tags	No	Array of objects	Tags of datasource connections. For details, see Table 8-4 .

Table 8-3 hosts request parameters

Parameter	Mandatory	Type	Description
name	No	String	The user-defined host name. The value can consist of 128 characters, including digits, letters, underscores (_), hyphens (-), and periods (.). It must start with a letter.
ip	No	String	The IPv4 address of the host.

Table 8-4 tags parameter

Parameter	Mandatory	Type	Description
key	Yes	String	<p>Tag key.</p> <p>NOTE A tag key can contain a maximum of 128 characters. Only letters, digits, spaces, and special characters (_:=+-@) are allowed, but the value cannot start or end with a space or start with _sys_.</p>
value	Yes	String	<p>Tag key.</p> <p>NOTE A tag value can contain a maximum of 255 characters. Only letters, digits, spaces, and special characters (_:=+-@) are allowed. The value cannot start or end with a space.</p>

Response Parameters

Table 8-5 Response parameters

Parameter	Type	Description
is_success	Boolean	Indicates whether the request is successfully executed. Value true indicates that the request is successfully executed.
message	String	System prompt. If execution succeeds, the message may be left blank.
connection_id	String	Connection ID. Identifies the UUID of a datasource connection.

Example Request

Create an enhanced datasource connection for a queue and configure host information.

```
{  
  "name": "test",  
  "dest_vpc_id": "22094d8f-c310-4621-913d-4c4d655d8495",  
  "dest_network_id": "78f2562a-36e4-4b39-95b9-f5aab22e1281",  
  "elastic_resource_pools": [  
    "e1"  
  ],  
  "hosts": [  
    {  
      "ip": "192.168.0.1",  
      "name": "ecs-97f8-0001"  
    },  
    {  
      "ip": "192.168.0.2",  
      "name": "ecs-97f8-0002"  
    }  
  ]  
}
```

Example Response

```
{  
  "is_success": true,  
  "message": "Create peer connection for queues:{Resource pool list in the request parameter}",  
  "connection_id": "2a620c33-5609-40c9-affd-2b6453071b0f"  
}
```

Status Codes

[Table 8-6](#) describes the status code.

Table 8-6 Status codes

Status Code	Description
201	The job is created successfully.
400	Request error.
500	Internal service error.

Error Codes

If an error occurs when this API is invoked, the system does not return the result similar to the preceding example, but returns the error code and error information. For details, see [Error Codes](#).

8.2 Deleting an Enhanced Datasource Connection

Function

This API is used to delete an enhanced datasource connection.

 NOTE

The connection that is being created cannot be deleted.

URI

- URI format
DELETE /v2.0/{project_id}/datasource/enhanced-connections/{connection_id}
- Parameter description

Table 8-7 URI parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Project ID, which is used for resource isolation. For details about how to obtain its value, see Obtaining a Project ID .
connection_id	Yes	String	Connection ID. Identifies the UUID of a datasource connection. Set the value to the connection ID returned by Creating an Enhanced Datasource Connection .

Request

None

Response

Table 8-8 Response parameters

Parameter	Type	Description
is_success	Boolean	Indicates whether the request is successfully executed. Value true indicates that the request is successfully executed.
message	String	System message. Value Deleted indicates that the operation is successful.

Example Request

None

Example Response

```
{  
    "is_success": true,  
    "message": "Deleted"  
}
```

Status Codes

[Table 8-9](#) describes the status code.

Table 8-9 Status codes

Status Code	Description
200	Deletion succeeded.
400	Request error.
500	Internal service error.

Error Codes

If an error occurs when this API is invoked, the system does not return the result similar to the preceding example, but returns the error code and error information. For details, see [Error Codes](#).

8.3 Listing Enhanced Datasource Connections

Function

This API is used to list the created enhanced datasource connections.

URI

- URI format
GET /v2.0/{project_id}/datasource/enhanced-connections
- Parameter description

Table 8-10 URI parameter

Parameter	Mandatory	Type	Description
project_id	Yes	String	Project ID, which is used for resource isolation. For details about how to obtain its value, see Obtaining a Project ID .

Table 8-11 query parameter description

Parameter	Mandatory	Type	Description
limit	No	String	The maximum number of connections to be queried. The default value is 100 . If limit is set to 0 , all datasource connections are returned.
offset	No	String	The offset of the query result. The default value is 0 . Note that the connections are sorted by creation time.
status	No	String	Connection status. The options are as follows: <ul style="list-style-type: none">• Active: The connection has been activated.• DELETED: The connection has been deleted. NOTE The connection status is case insensitive.
name	No	String	Connection name
tags	No	String	List of tag names. The value is k=v for a single tag. Multiple tags are separated by commas (,). Example: tag1=v1,tag2=v2 .

 **NOTE**

The following is an example of the URL containing the **query** parameter:

```
GET /v2.0/{project_id}/datasource/enhanced-connections?  
limit={limit}&offset={offset}&status={status}&name={name}
```

Request Parameters

None

Response Parameters

Table 8-12 Response parameters

Parameter	Mandatory	Type	Description
is_success	No	Boolean	Indicates whether the request is successfully executed. Value true indicates that the request is successfully executed.

Parameter	Mandatory	Type	Description
message	No	String	System prompt. If execution succeeds, the parameter setting may be left blank.
connections	No	Array of objects	Datasource connection information list. For details, see Table 8-13 .
count	No	Integer	Number of returned datasource connections.

Table 8-13 connections parameters

Parameter	Mandatory	Type	Description
id	No	String	Connection ID. Identifies the UUID of a datasource connection.
name	No	String	User-defined connection name.
status	No	String	Connection status. The options are as follows: <ul style="list-style-type: none"> • Active: The connection has been activated. • DELETED: The connection has been deleted.
available_queue_info	No	Array of objects	For details about how to create a datasource connection for each queue, see Table 8-14 .
dest_vpc_id	No	String	The VPC ID of the connected service.
dest_network_id	No	String	Subnet ID of the connected service.
isPrivis	No	Boolean	Whether the project permissions have been granted for the enhanced datasource connection. If the datasource connection has the permissions, the value of this field is false . Otherwise, the value is true .
create_time	No	Long	Time when a link is created. The time is converted to a UTC timestamp.
hosts	No	Array of objects	User-defined host information. For details, see Table 8-16 .

Parameter	Mandatory	Type	Description
elastic_resource_pools	No	Array of objects	Information about the elastic resource pools for which you want to create VPC peering connections. For details, see Table 8-15 .

Table 8-14 available_queue_info parameter description

Parameter	Mandatory	Type	Description
peer_id	No	String	ID of a datasource connection.
status	No	String	Connection status. For details about the status code, see Table 8-17 .
name	No	String	Name of a queue.
err_msg	No	String	Detailed error message when the status is FAILED .
update_time	No	Long	Time when the available queue list was updated.

Table 8-15 elastic_resource_pools parameters

Parameter	Mandatory	Type	Description
peer_id	No	String	ID of a datasource connection.
status	No	String	Connection status. For details about the status code, see Table 8-17 .
name	No	String	Elastic resource pool name
err_msg	No	String	Detailed error message when the status is FAILED .
update_time	No	Long	Time when the available queue list was updated.

Table 8-16 hosts parameters

Parameter	Mandatory	Type	Description
name	No	String	Custom host name

Parameter	Mandatory	Type	Description
ip	No	String	IPv4 address of the host

Table 8-17 Connection status

Parameter	Definition	Description
CREATING	Creating	The datasource connection is being created.
ACTIVE	Active	The datasource connection has been created, and the connection to the destination address is normal.
FAILED	Failed	Failed to create a datasource connection.

Example Request

None

Example Response

```
{
  "is_success": true,
  "message": "",
  "count": 1,
  "connections": [
    {
      "name": "withvpc",
      "id": "4c693ecc-bab8-4113-a838-129cedc9a563",
      "available_queue_info": [
        {
          "status": "ACTIVE",
          "name": "resource_mode_1",
          "peer_id": "d2ae6628-fa37-4e04-806d-c59c497492d1",
          "err_msg": "",
          "update_time": 1566889577861
        }
      ],
      "dest_vpc_id": "22094d8f-c310-4621-913d-4c4d655d8495",
      "dest_network_id": "78f2562a-36e4-4b39-95b9-f5aab22e1281",
      "isPrivis": true,
      "create_time": 1566888011125,
      "status": "ACTIVE"
    }
  ]
}
```

Status Codes

[Table 8-18](#) describes the status code.

Table 8-18 Status codes

Status Code	Description
200	The query is successful.
400	Request error.
500	Internal service error.

Error Codes

If an error occurs when this API is invoked, the system does not return the result similar to the preceding example, but returns the error code and error information. For details, see [Error Codes](#).

8.4 Querying an Enhanced Datasource Connection

Function

This API is used to query a created enhanced datasource connection.

URI

- URI format
GET /v2.0/{project_id}/datasource/enhanced-connections/{connection_id}
- Parameter description

Table 8-19 URI parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Project ID, which is used for resource isolation. For details about how to obtain its value, see Obtaining a Project ID .
connection_id	Yes	String	Connection ID. Identifies the UUID of a datasource connection.

Request

None

Response

Table 8-20 Response parameters

Parameter	Mandatory	Type	Description
is_success	No	Boolean	Indicates whether the request is successfully executed. Value true indicates that the request is successfully executed.
message	No	String	System prompt. If execution succeeds, the parameter setting may be left blank.
id	No	String	Connection ID. Identifies the UUID of a datasource connection.
name	No	String	User-defined connection name.
status	No	String	Connection status. The options are as follows: <ul style="list-style-type: none">● Active: The connection has been activated.● DELETED: The connection has been deleted.
available_queue_info	No	Array of objects	For details about how to create a datasource connection for each queue, see Table 8-21 .
dest_vpc_id	No	String	The VPC ID of the connected service.
dest_network_id	No	String	Subnet ID of the connected service.
create_time	No	Long	Time when a link is created. The time is converted to a UTC timestamp.
hosts	No	Array of objects	User-defined host information. For details, see hosts parameter description .
elastic_resource_pools	No	Array of objects	For details about how to create a VPC peering connection for each elastic resource pool, see Table 8-24 .

Table 8-21 available_queue_info parameter description

Parameter	Mandatory	Type	Description
peer_id	No	String	ID of a datasource connection.
status	No	String	Connection status. For details about the status code, see Table 8-23 .
name	No	String	Name of a queue.
err_msg	No	String	Detailed error message when the status is FAILED.
update_time	No	Long	Time when the available queue list was updated.

Table 8-22 hosts parameter description

Parameter	Mandatory	Type	Description
name	No	String	The user-defined host name.
ip	No	String	The IPv4 address of the host.

Table 8-23 Connection status

Parameter	Definition	Description
CREATING	Creating	The datasource connection is being created.
ACTIVE	Active	The datasource connection has been created, and the connection to the destination address is normal.
FAILED	Failed	Failed to create a datasource connection.

Table 8-24 elastic_resource_pools parameters

Parameter	Mandatory	Type	Description
peer_id	No	String	ID of a datasource connection.
status	No	String	Connection status. For details about the status code, see Table 8-23 .

Parameter	Mandatory	Type	Description
name	No	String	Elastic resource pool name
err_msg	No	String	Detailed error message when the status is FAILED .
update_time	No	Long	Update time

Example Request

None

Example Response

```
{  
    "is_success": true,  
    "message": "",  
    "name": "withvpc",  
    "id": "4c693ecc-bab8-4113-a838-129cedc9a563",  
    "available_queue_info": [  
        {  
            "status": "ACTIVE",  
            "name": "resource_mode_1",  
            "peer_id": "d2ae6628-fa37-4e04-806d-c59c497492d1",  
            "err_msg": "",  
            "update_time": 1566889577861  
        }  
    ],  
    "dest_vpc_id": "22094d8f-c310-4621-913d-4c4d655d8495",  
    "dest_network_id": "78f2562a-36e4-4b39-95b9-f5aab22e1281",  
    "create_time": 1566888011125,  
    "status": "ACTIVE",  
    "hosts": [  
        {  
            "ip": "192.168.0.1",  
            "name": "ecs-97f8-0001"  
        },  
        {  
            "ip": "192.168.0.2",  
            "name": "ecs-97f8-0002"  
        }  
    ]  
}
```

Status Codes

[Table 8-25](#) describes the status code.

Table 8-25 Status codes

Status Code	Description
200	The query is successful.
400	Request error.

Status Code	Description
500	Internal service error.

Error Codes

If an error occurs when this API is invoked, the system does not return the result similar to the preceding example, but returns the error code and error information. For details, see [Error Codes](#).

8.5 Binding a Queue

Function

This API is used to bind a queue to a created enhanced datasource connection.

URI

- URI format
POST /v2.0/{project_id}/datasource/enhanced-connections/{connection_id}/associate-queue
- Parameter description

Table 8-26 URI parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Project ID, which is used for resource isolation. For details about how to obtain its value, see Obtaining a Project ID .
connection_id	Yes	String	Connection ID. Identifies the UUID of a datasource connection. Set the value to the connection ID returned by Creating an Enhanced Datasource Connection .

Request

Table 8-27 Request parameters

Parameter	Mandatory	Type	Description
queues	No	Array of Strings	List of queue names that are available for datasource connections.

Parameter	Mandatory	Type	Description
elastic_resource_pools	No	Array of Strings	Elastic resource pools you want to bind to the enhanced datasource connection.

Response

Table 8-28 Response parameters

Parameter	Type	Description
is_success	Boolean	Indicates whether the request is successfully executed. Value true indicates that the request is successfully executed.
message	String	System prompt. If execution succeeds, the message may be left blank.

Example Request

Bind created enhanced datasource connections to queues **q1** and **q2**.

```
{  
  "queues": [  
    "q1",  
    "q2"  
  ]  
}
```

Example Response

```
{  
  "is_success": true,  
  "message": "associated peer connection for queues: {q1,q2}."  
}
```

Status Codes

Table 8-29 describes the status code.

Table 8-29 Status codes

Status Code	Description
200	Resource bound succeeded.
400	Request error.
500	Internal service error.

Error Codes

If an error occurs when this API is invoked, the system does not return the result similar to the preceding example, but returns the error code and error information. For details, see [Error Codes](#).

8.6 Unbinding a Queue

Function

This API is used to unbind a queue from an enhanced datasource connection.

URI

- URI format
POST /v2.0/{project_id}/datasource/enhanced-connections/{connection_id}/disassociate-queue
- Parameter description

Table 8-30 URI parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Project ID, which is used for resource isolation. For details about how to obtain its value, see Obtaining a Project ID .
connection_id	Yes	String	Connection ID. Identifies the UUID of a datasource connection.

Request

Table 8-31 Request parameters

Parameter	Mandatory	Type	Description
queues	No	Array of String	List of queue names that are available for datasource connections.
elastic_resource_pools	No	Array of Strings	Elastic resource pools you want to unbind from the enhanced datasource connection.

Response

Table 8-32 Response parameters

Parameter	Type	Description
is_success	Boolean	Indicates whether the request is successfully executed. Value true indicates that the request is successfully executed.
message	String	System prompt. If execution succeeds, the message may be left blank.

Example Request

Unbind queues **q1** and **q2** from enhanced datasource connections.

```
{  
    "queues": [  
        "q1",  
        "q2"  
    ]  
}
```

Example Response

```
{  
    "is_success": true,  
    "message": "Disassociated peer connection for queues:{q1,q2}."  
}
```

Status Codes

[Table 8-33](#) describes the status code.

Table 8-33 Status codes

Status Codes	Description
200	Resource unbound succeeded.
400	Request error.
500	Internal service error.

Error Codes

If an error occurs when this API is invoked, the system does not return the result similar to the preceding example, but returns the error code and error information. For details, see [Error Codes](#).

8.7 Modifying Host Information

Function

This API is used to modify the host information of a connected datasource. Only full overwriting is supported.

URI

- URI format
`PUT /v2.0/{project_id}/datasource/enhanced-connections/{connection_id}`
- Parameter description

Table 8-34 URI parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Project ID, which is used for resource isolation. For details about how to obtain its value, see Obtaining a Project ID .
connection_id	Yes	String	Connection ID. Identifies the UUID of a datasource connection.

Request

Table 8-35 Request parameters

Parameter	Mandatory	Type	Description
hosts	Yes	Array of objects	The user-defined host information. A maximum of 20,000 records are supported. For details, see hosts request parameters . If this parameter is left blank, all configured host information will be deleted.

Table 8-36 hosts request parameters

Parameter	Man dato ry	Type	Description
name	No	String	The user-defined host name. The value can consist of 128 characters, including digits, letters, underscores (_), hyphens (-), and periods (.). It must start with a letter.
ip	No	String	The IPv4 address of the host.

Response

Table 8-37 Response parameters

Paramete r	Type	Description
is_success	Boolean	Indicates whether the request is successfully executed. Value true indicates that the request is successfully executed.
message	String	System prompt. If execution succeeds, the message may be left blank.

Example Request

Modify the host information of an enhanced datasource connection.

```
{  
  "hosts": [  
    {  
      "ip": "192.168.0.1",  
      "name": "ecs-97f8-0001"  
    },  
    {  
      "ip": "192.168.0.2",  
      "name": "ecs-97f8-0002"  
    }  
  ]  
}
```

Example Response

```
{  
  "is_success": true,  
  "message": ""  
}
```

Status Codes

Table 8-38 describes the status code.

Table 8-38 Status codes

Status Code	Description
200	The modification operations are successful.
400	Request error.
500	Internal service error.

Error Codes

If an error occurs when this API is invoked, the system does not return the result similar to the preceding example, but returns the error code and error information. For details, see [Error Codes](#).

8.8 Querying Authorization of an Enhanced Datasource Connection

Function

This API is used to query the authorization about an enhanced datasource connection.

URI

- URI format
GET /v2.0/{project_id}/datasource/enhanced-connections/{connection_id}/privileges
- Parameter description

Table 8-39 URI parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Project ID, which is used for resource isolation. For details about how to obtain its value, see Obtaining a Project ID .
connection_id	Yes	String	Connection ID. Identifies the UUID of a datasource connection.

Request

None

Response

Table 8-40 Response parameters

Parameter	Mandatory	Type	Description
is_success	No	Boolean	Whether the request is successfully executed. Value true indicates that the request is successfully executed.
message	No	String	System prompt. If execution succeeds, the parameter setting may be left blank.
connection_id	No	String	Enhanced datasource connection ID, which is used to identify the UUID of a datasource connection.
privileges	No	Array of Object	Datasource connection information about each authorized project. For details, see Table 8-41 .

Table 8-41 privileges parameters

Parameter	Mandatory	Type	Description
object	No	String	Object information during authorization.
applicant_project_id	No	String	ID of an authorized project.
privileges	No	Array of Strings	Authorization operation information.

Example Request

None

Example Response

```
{  
    "is_success": true,  
    "message": "",  
    "privileges": [  
        {  
            "object": "edsconnections.503fc86a-5e60-4349-92c2-7e399404fa8a",  
            "applicant_project_id": "330e068af1334c9782f4226acc00a2e2",  
            "privileges": ["BIND_QUEUE"]  
        }  
    ],  
    "connection_id": "503fc86a-5e60-4349-92c2-7e399404fa8a"  
}
```

Status Codes

[Table 8-42](#) describes status codes.

Table 8-42 Status codes

Status Code	Description
200	The query is successful.
400	The input parameter is invalid.

Error Codes

If an error occurs when this API is invoked, the system does not return the result similar to the preceding example, but returns the error code and error information. For details, see [Error Codes](#).

Table 8-43 Error codes

Error Code	Error Message
DLI.0001	Connection 503fc86a-5e60-4349-92c2-7e399404fa8a does not exist.

8.9 Creating a Route

Function

This API is used to create a datasource connection route.

URI

- URI format
POST /v3/{project_id}/datasource/enhanced-connections/{connection_id}/routes
- Parameter description

Table 8-44 URI parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Project ID, which is used for resource isolation. For details about how to obtain its value, see Obtaining a Project ID .

Parameter	Mandatory	Type	Description
connection_id	Yes	String	Datasource connection ID

Request

Table 8-45 Request parameters

Parameter	Mandatory	Type	Description
name	Yes	String	Route name. The value can contain 1 to 64 characters.
cidr	Yes	String	Route network range

Response

Table 8-46 Response parameters

Parameter	Type	Description
is_success	Boolean	Whether the request is successfully executed. Value true indicates that the request is successfully executed.
message	String	System prompt. If the execution succeeds, the message may be left blank.

Example Request

Create a route. Set the next-hop address of the enhanced datasource connection to **127.0.0.0**.

```
{  
    "name": "route",  
    "cidr": "127.0.0.0"  
}
```

Example Response

```
{  
    "is_success": true,  
    "message": ""  
}
```

Status Codes

Status Code	Description
200	OK

Error Codes

For details, see [Error Codes](#).

8.10 Deleting a Route

Function

This API is used to delete a datasource connection route.

URI

- URI format
`DELETE /v3/{project_id}/datasource/enhanced-connections/{connection_id}/routes/{name}`
- Parameter description

Table 8-47 URI parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Project ID, which is used for resource isolation. For details about how to obtain its value, see Obtaining a Project ID .
connection_id	Yes	String	Datasource connection ID
name	Yes	String	Route name

Request

None

Response

Table 8-48 Response parameters

Parameter	Type	Description
is_success	Boolean	Whether the request is successfully executed. Value true indicates that the request is successfully executed.
message	String	System prompt. If the execution succeeds, the message may be left blank.

Example Request

None

Example Response

```
{  
    "is_success": true,  
    "message": "Deleted"  
}
```

Status Codes

Status Code	Description
200	OK

Error Codes

For details, see [Error Codes](#).

9 Datasource Authentication-related APIs

9.1 Creating Datasource Authentication

Function

This API is used to create datasource authentication.

URI

- URI format
POST /v3/{project_id}/datasource/auth-infos
- Parameter description

Table 9-1 URI parameter

Parameter	Mandatory	Type	Description
project_id	Yes	String	Project ID, which is used for resource isolation. For details about how to obtain its value, see Obtaining a Project ID .

Request

Table 9-2 Request parameters

Parameter	Mandatory	Type	Description
auth_info_name	Yes	String	Authentication information name, which is unique in a project
user_name	No	String	Username

Parameter	Mandatory	Type	Description
password	No	String	Password
certificate_location	No	String	Path of the security cluster certificate. Currently, only OBS paths and CER files are supported.
datasource_type	Yes	String	Data source type. Available values are CSS , KRB , passwd , and Kafka_SSL .
krb5_conf	No	String	OBS path of the krb5 configuration file
keytab	No	String	OBS path of the keytab configuration file
truststore_location	No	String	OBS path of the truststore configuration file
truststore_password	No	String	Password of the truststore configuration file
keystore_location	No	String	OBS path of the keystore configuration file
keystore_password	No	String	Password of the keystore configuration file
key_password	No	String	Key password

Response

Table 9-3 Response parameters

Parameter	Type	Description
is_success	Boolean	Whether the request is successfully executed. Value true indicates that the request is successfully executed.
message	String	System prompt. If execution succeeds, the message may be left blank.

Example Request

Create CSS datasource authentication.

```
{  
    "auth_info_name": "test",  
    "user_name": "admin",  
    "password": "****",  
}
```

```
        "certificate_location": "obs://test/CloudSearchService.cer",
        "datasource_type": "CSS"
    }
```

Example Response

```
{
    "is_success": true,
    "message": "Upload success."
}
```

Status Codes

Status Code	Description
200	OK

Error Codes

For details, see [Error Codes](#).

9.2 Listing Datasource Authentications

Function

This API is used to list datasource authentications in a project.

URI

- URI format
GET /v3/{project_id}/datasource/auth-infos
- Parameter description

Table 9-4 URI parameter

Parameter	Mandatory	Type	Description
project_id	Yes	String	Project ID, which is used for resource isolation. For details about how to obtain its value, see Obtaining a Project ID .

Table 9-5 query parameter description

Parameter	Mandatory	Type	Description
limit	No	String	The maximum number of connections to be queried. The default value is 100 .
offset	No	String	The offset of the query result. The default value is 0 . Note that the connections are sorted by creation time.
auth_info_name	Yes	String	Authentication information name, which is unique in a project

Request

None

Response

Table 9-6 Response parameters

Parameter	Type	Description
is_success	Boolean	Whether the request is successfully executed. Value true indicates that the request is successfully executed.
message	String	System prompt. If execution succeeds, the message may be left blank.
count	int	Number of certificates
auth_infos	List	Authentication information list. For details, see Table 9-7 .

Table 9-7 auth_infos parameter description

Parameter	Type	Description
auth_info_name	String	Username for logging in to the security cluster
user_name	String	Password for logging in to the security cluster
certificate_location	String	OBS path of the certificate specified during authentication creation
datasource_type	String	Data source type

Parameter	Type	Description
create_time	Int	Timestamp when the authentication is created
update_time	Int	Timestamp when the authentication is updated
krb5_conf	String	OBS path of the krb5 configuration file
keytab	String	OBS path of the keytab configuration file
truststore_location	String	OBS path of the truststore configuration file
keystore_location	String	OBS path of the keystore configuration file
owner	String	Username

Example Request

None

Example Response

```
{  
    "count": 19,  
    "auth_infos": [  
        {  
            "auth_info_name": "lan2",  
            "datasource_type": "Kafka_SSL",  
            "create_time": 1578896427789,  
            "update_time": 1578898059677,  
            "owner": "ei_dlics_d00352221",  
            "truststore_location": "obs://lan-1/cer/truststore.jks",  
            "keystore_location": "obs://lan-1/cer/keystore.jks"  
        }, {  
            "auth_info_name": "lan3",  
            "datasource_type": "Kafka_SSL",  
            "create_time": 1578899029971,  
            "update_time": 1578901678150,  
            "owner": "ei_dlics_d00352221",  
            "truststore_location": "obs://lan-1/cer/truststore1.jks",  
            "keystore_location": "obs://lan-1/cer/keystore.jks"  
        }  
    ]  
}
```

Status Codes

Status Code	Description
200	OK

Error Codes

For details, see [Error Codes](#).

9.3 Updating Datasource Authentication

Function

This API is used to update authentication information.

URI

- URI format
PUT /v3/{project_id}/datasource/auth-infos
- Parameter description

Table 9-8 URI parameter

Parameter	Mandatory	Type	Description
project_id	Yes	String	Project ID, which is used for resource isolation. For details about how to obtain its value, see Obtaining a Project ID .

Request

Parameter	Mandatory	Type	Description
auth_info_name	Yes	String	Name of the updated datasource authentication
user_name	No	String	New username for logging in to the security cluster
password	No	String	New password for logging in to the security cluster
krb5_conf	No	String	OBS path of the krb5 configuration file
keytab	No	String	OBS path of the keytab configuration file
truststore_location	No	String	OBS path of the truststore configuration file
truststore_password	No	String	Password of the truststore configuration file

Parameter	Mandatory	Type	Description
keystore_location	No	String	OBS path of the keystore configuration file
keystore_password	No	String	Password of the keystore configuration file

Response

Table 9-9 Response parameters

Parameter	Type	Description
is_success	Boolean	Whether the request is successfully executed. Value true indicates that the request is successfully executed.
message	String	None

Example Request

Change the username and password for CSS datasource authentication.

```
{  
    "auth_info_name": "test001",  
    "user_name": "root",  
    "password": "*****"  
}
```

Example Response

```
{  
    "is_success": true,  
    "message": "Update success."  
}
```

Status Codes

Status Code	Description
200	OK

Error Codes

For details, see [Error Codes](#).

9.4 Deleting Datasource Authentication

Function

This API is used to delete datasource authentication.

URI

- URI format
DELETE /v3/{project_id}/datasource/auth-infos/{auth_info_name}
- Parameter description

Table 9-10 URI parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Project ID, which is used for resource isolation. For details about how to obtain its value, see Obtaining a Project ID .
auth_info_name	Yes	String	Name of the authentication information you want to delete

Response

Table 9-11 Response parameters

Parameter	Type	Description
is_success	Boolean	Whether the request is successfully executed. Value true indicates that the request is successfully executed.
message	String	None

Example Request

None

Example Response

```
{  
    "is_success": true,  
    "message": "Deleted success."  
}
```

Status Codes

Status Code	Description
200	OK

Error Codes

For details, see [Error Codes](#).

10 APIs Related to Elastic Resource Pools

10.1 Creating an Elastic Resource Pool

Function

This API is used to create elastic resource pools.

URI

- URI format
POST /v3/{project_id}/elastic-resource-pools
- Parameter description

Table 10-1 URI parameter

Parameter	Mandatory	Type	Description
project_id	Yes	String	Project ID, which is used for resource isolation. For how to obtain the project ID, see Obtaining a Project ID .

Request Parameters

Table 10-2 Request parameters

Parameter	Mandatory	Type	Description
elastic_resource_pool_name	Yes	String	<p>Name of a new elastic resource pool. Only digits, letters, and underscores (_) are allowed, but the value cannot contain only digits or start with an underscore (_). The value can contain 1 to 128 characters.</p> <p>NOTE If the name contains uppercase letters, the system automatically converts them to lowercase letters.</p>
description	No	String	Description. The value can contain a maximum of 256 characters.
cidr_in_vpc	No	String	VPC CIDR associated with the virtual cluster. If it is not specified, the default value 172.16.0.0/12 is used.
max_cu	Yes	Integer	<p>Maximum number of CUs. The value of this parameter must be greater than or equal to the sum of the maximum CUs allowed for any queue within the resource pool, and greater than the min_cu value.</p> <ul style="list-style-type: none"> • Standard edition: The minimum value is 64 CUs. • Basic edition: The minimum value is 16 CUs, and the maximum value is 64 CUs.

Parameter	Mandatory	Type	Description
min_cu	Yes	Integer	<p>Minimum number of CUs. The value of this parameter must be greater than or equal to the sum of the minimum CUs allowed for each queue in the resource pool. The minimum value is 64.</p> <ul style="list-style-type: none"> • Standard edition: The minimum value is 64 CUs. • Basic edition: The minimum value is 16 CUs, and the maximum value is 64 CUs.
charging_mode	No	Integer	Billing mode. The default value is 1 , which indicates the pay-per-use billing mode.
enterprise_project_id	No	String	Enterprise ID. If this parameter is left blank, the default value 0 is used.
tags	No	Array of objects	Queue tags for identifying cloud resources. A tag consists of a key and a value. For details, see Table 10-3 .
label	No	map	<p>Attribute field of the elastic resource pool.</p> <p>To purchase the basic version, set this parameter to {"spec": "basic"}.</p> <p>If not set, the default is the standard version.</p>

Table 10-3 tags parameters

Parameter	Mandatory	Type	Description
key	Yes	String	<p>Tag key</p> <p>NOTE</p> <p>A tag key can contain a maximum of 128 characters. Only letters, digits, spaces, and special characters (_:=+@) are allowed, but the key cannot start or end with a space or start with _sys_.</p>

Parameter	Mandatory	Type	Description
value	Yes	String	<p>Tag value</p> <p>NOTE</p> <p>A tag value can contain a maximum of 255 characters. Only letters, digits, spaces, and special characters (.:=-@) are allowed. The value cannot start or end with a space.</p>

Response Parameters

Table 10-4 Response parameters

Parameter	Mandatory	Type	Description
is_success	No	Boolean	Whether the request is successfully executed. Value true indicates that the request is successfully executed.
message	No	String	Message content, for example, Success to get tsdb list .
elastic_resource_pool_name	No	String	Elastic resource pool name, for example, elastic_pool_0623_02 .

Example Request

Create an elastic resource pool with maximum CUs of 684 and minimum CUs of 684.

```
{  
    "elastic_resource_pool_name" : "elastic_pool_0623_02",  
    "description" : "test",  
    "cidr_in_vpc" : "172.16.0.0/14",  
    "charging_mode" : "1",  
    "max_cu" : 684,  
    "min_cu" : 684  
}
```

Example Response

```
{  
    "is_success" : true,  
    "message" : "Success to get tsdb list",  
    "elastic_resource_pool_name" : "elastic_pool_0623_02"  
}
```

Status Codes

Status Code	Description
200	OK
400	Incorrect parameters. For example, creating an existing elastic resource pool.
403	Forbidden

Error Codes

If an error occurs when this API is invoked, the system does not return the result similar to the preceding example, but returns the error code and error information. For details, see [Error Codes](#).

10.2 Querying All Elastic Resource Pools

Function

This API is used to query all elastic resource pools.

URI

- URI format
GET /v3/{project_id}/elastic-resource-pools
- Parameter description

Table 10-5 URI parameter

Parameter	Mandatory	Type	Description
project_id	Yes	String	Project ID, which is used for resource isolation. For details about how to obtain its value, see Obtaining a Project ID .

Table 10-6 query parameters

Parameter	Mandatory	Type	Description
limit	No	Integer	Page size. The default value is 100 .
name	No	String	Fuzzy match based on the elastic resource pool name.

Parameter	Mandatory	Type	Description
offset	No	Integer	Offset. The default value is 0.
status	No	String	Status of the elastic resource pool. The options are: <ul style="list-style-type: none">• AVAILABLE• SCALING• CREATING• FAILED
tags	No	String	Query results are filtered by tag.

Request Parameters

None

Response Parameters

Table 10-7 Response parameters

Parameter	Mandatory	Type	Description
is_success	No	Boolean	Whether the request is successfully executed. Value true indicates that the request is successfully executed.
message	No	String	System prompt. If execution succeeds, the message may be left blank.
count	No	Long	Total number of records.
elastic_resource_pools	No	Array of objects	Elastic resource pool information. For details, see Table 10-8 .

Table 10-8 elastic_resource_pools parameters

Parameter	Mandatory	Type	Description
owner	No	String	Account used to create an elastic resource pool.

Parameter	Mandatory	Type	Description
elastic_resource_pool_name	No	String	Elastic resource pool name.
description	No	String	Elastic resource pool description information.
max_cu	No	Integer	Maximum number of CUs.
min_cu	No	Integer	Minimum number of CUs.
actual_cu	No	Integer	Actual number of CUs.
cidr_in_vpc	No	String	Subnet information of the elastic resource pool.
create_time	No	Long	Time when the elastic resource pool is created.
update_time	No	Long	Time when the elastic resource pool is updated.
current_cu	No	Integer	Number of current CUs.
status	No	String	Status of the elastic resource pool. Possible values are as follows: <ul style="list-style-type: none"> • AVAILABLE • SCALING • CREATING • FAILED
resource_id	No	String	Resource ID of the elastic resource pool.
fail_reason	No	String	Cause of the elastic resource pool creation failure.
enterprise_project_id	No	String	Enterprise project ID.
prepay_cu	No	Integer	Number of prepaid CUs.
charging_mode	No	Integer	Billing mode.
queues	No	Array of Strings	Information about the queue the elastic resource pool belongs to.
manager	No	String	Type of the elastic resource pool.
label	No	Map<string, string>	Label used to identify the elastic resource pool. Currently, only the developer label is supported. The value is "label": {"billing_spec_code":"developer"}.

Parameter	Mandatory	Type	Description
id	No	Long	ID of the elastic resource pool

Example Request

None

Example Response

```
{  
    "is_success": true,  
    "message": "",  
    "count": 2,  
    "elastic_resource_pools": [  
        {  
            "owner": "ei_dlics_d00352221",  
            "id": 1026,  
            "elastic_resource_pool_name": "elastic_pool_0622_10",  
            "description": "",  
            "max_cu": 0,  
            "min_cu": 0,  
            "actual_cu": 0,  
            "cidr_in_vpc": "172.16.0.0/12",  
            "create_time": 1624366266826,  
            "current_cu": 64,  
            "status": "AVAILABLE",  
            "resource_id": "ecc98d89-3fd1-4dec-b572-aa6e2ef82391",  
            "fail_reason": "",  
            "enterprise_project_id": "0",  
            "prepay_cu": 0,  
            "charging_mode": 1  
        },  
        {  
            "owner": "ei_dlics_d00352221",  
            "id": 1002,  
            "elastic_resource_pool_name": "elastic_pool_0622_0",  
            "description": "test",  
            "max_cu": 684,  
            "min_cu": 0,  
            "actual_cu": 0,  
            "cidr_in_vpc": "172.16.0.0/12",  
            "create_time": 1624353878084,  
            "status": "AVAILABLE",  
            "resource_id": "ecc98d89-3fd1-4dec-b572-aa6e2ef82391",  
            "fail_reason": "",  
            "enterprise_project_id": "0",  
            "prepay_cu": 0,  
            "charging_mode": 1  
        }  
    ]  
}
```

Status Codes

Status Code	Description
200	OK

Error Codes

If an error occurs when this API is invoked, the system does not return the result similar to the preceding example, but returns the error code and error information. For details, see [Error Codes](#).

10.3 Deleting an Elastic Resource Pool

Function

This API is used to delete an elastic resource pool.

URI

- URI format
`DELETE /v3/{project_id}/elastic-resource-pools/{elastic_resource_pool_name}`
- Parameter description

Table 10-9 URI parameters

Parameter	Mandatory	Type	Description
elastic_resource_pool_name	Yes	String	Elastic resource pool name.
project_id	Yes	String	Project ID, which is used for resource isolation. For details about how to obtain its value, see Obtaining a Project ID .

Request

None

Response

Table 10-10 Response parameters

Parameter	Mandatory	Type	Description
is_success	No	Boolean	Whether the request is successfully executed. Value true indicates that the request is successfully executed.
message	No	String	System prompt. If execution succeeds, the message may be left blank.

Example Request

None

Example Response

```
{  
    "is_success": true,  
    "message": ""  
}
```

Status Codes

Status Code	Description
200	OK

Error Codes

If an error occurs when this API is invoked, the system does not return the result similar to the preceding example, but returns the error code and error information. For details, see [Error Codes](#).

10.4 Modifying Elastic Resource Pool Information

Function

This API is used to modify elastic resource pool information.

URI

- URI format

PUT /v3/{project_id}/elastic-resource-pools/{elastic_resource_pool_name}

- Parameter description

Table 10-11 URI parameters

Parameter	Mandatory	Type	Description
elastic_resource_pool_name	Yes	String	Elastic resource pool name.
project_id	Yes	String	Project ID, which is used for resource isolation. For details about how to obtain its value, see Obtaining a Project ID .

Request Parameters

Table 10-12 Request parameters

Parameter	Mandatory	Type	Description
description	No	String	Description. The value can contain a maximum of 256 characters.
max_cu	No	Integer	Maximum CUs allowed for an elastic resource pool.
min_cu	No	Integer	Minimum CUs allowed for an elastic resource pool.

Response Parameters

Table 10-13 Response parameters

Parameter	Mandatory	Type	Description
is_success	No	Boolean	Whether the request is successfully executed. Value true indicates that the request is successfully executed.
message	No	String	System prompt. If execution succeeds, the message may be left blank.

Example Request

Modify the description, maximum CUs, and minimum CUs of the elastic resource pool. After the modification, the minimum CUs is **78** and the maximum CUs is **990**.

```
{  
  "description" : "test_update",  
  "min_cu" : 78,  
  "max_cu" : 990  
}
```

Example Response

```
{  
  "is_success" : true,  
  "message" : ""  
}
```

Status Codes

Status Code	Description
200	OK

Error Codes

If an error occurs when this API is invoked, the system does not return the result similar to the preceding example, but returns the error code and error information. For details, see [Error Codes](#).

10.5 Querying All Queues in an Elastic Resource Pool

Function

This API is used to query all queues in an elastic resource pool.

URI

- URI format
GET /v3/{project_id}/elastic-resource-pools/{elastic_resource_pool_name}/queues
- Parameter description

Table 10-14 URI parameters

Parameter	Mandatory	Type	Description
elastic_resource_pool_name	Yes	String	Elastic resource pool name.

Parameter	Mandatory	Type	Description
project_id	Yes	String	Project ID, which is used for resource isolation. For details about how to obtain its value, see Obtaining a Project ID .

Table 10-15 query parameters

Parameter	Mandatory	Type	Description
limit	No	Integer	Page size. The default value is 100 .
offset	No	Integer	Offset. The default value is 0 .
queue_name	No	String	You can filter data by queue name.

Request Parameters

None

Response Parameters

Table 10-16 Response parameters

Parameter	Mandatory	Type	Description
is_success	No	Boolean	Whether the request is successfully executed. Value true indicates that the request is successfully executed.
message	No	String	System prompt. If execution succeeds, the message may be left blank.
queues	No	Array of objects	Resource weight of all queues in the elastic resource pool. For details about the parameters, see Table 10-17 .
count	No	Long	Number of queues bound to the elastic resource pool.

Table 10-17 queues

Parameter	Mandatory	Type	Description
queue_name	No	String	Queue name.
enterprise_project_id	No	String	Enterprise project ID.
queue_type	No	String	Queue type.
queue_scaling_policies	No	Array of objects	Scaling policy. For details about the parameters, see priority_infos .
owner	No	String	Queue owner.
create_time	No	Long	Time when a queue is created.
engine	No	String	Queue engine type.

Table 10-18 queue_scaling_policies

Parameter	Mandatory	Type	Description
priority	No	Integer	The policy priority ranges from 1 to 100. The value 100 indicates the highest priority.
impact_start_time	No	String	Time when a policy takes effect.
impact_stop_time	No	String	Time when a policy expires.
min_cu	No	Integer	Minimum number of CUs.
max_cu	No	Integer	Maximum number of CUs.

Example Request

None

Example Response

```
{  
    "is_success": true,  
    "message": "",  
    "count": 1,  
    "queues": [  
        {
```

```
"queue_name": "lhm_sql",
"enterprise_project_id": "0",
"queue_type": "sql",
"queue_scaling_policies": [
  {
    "priority": 50,
    "impact_start_time": "00:00",
    "impact_stop_time": "24:00",
    "min_cu": 16,
    "max_cu": 16
  },
  {
    "priority": 100,
    "impact_start_time": "00:00",
    "impact_stop_time": "12:00",
    "min_cu": 32,
    "max_cu": 64
  },
  {
    "priority": 50,
    "impact_start_time": "12:00",
    "impact_stop_time": "24:00",
    "min_cu": 16,
    "max_cu": 32
  }
]
```

Status Codes

Status Code	Description
200	OK

Error Codes

If an error occurs when this API is invoked, the system does not return the result similar to the preceding example, but returns the error code and error information. For details, see [Error Codes](#).

10.6 Associating a Queue with an Elastic Resource Pool

Function

This API is used to associate a queue with an elastic resource pool.

URI

- URI format
POST /v3/{project_id}/elastic-resource-pools/{elastic_resource_pool_name}/queues
- Parameter description

Table 10-19 URI parameters

Parameter	Mandatory	Type	Description
elastic_resource_pool_name	Yes	String	Elastic resource pool name.
project_id	Yes	String	Project ID, which is used for resource isolation. For details about how to obtain its value, see Obtaining a Project ID .

Request

Table 10-20 Request parameter

Parameter	Mandatory	Type	Description
queue_name	Yes	String	Queue name.

Response

Table 10-21 Response parameters

Parameter	Mandatory	Type	Description
is_success	No	Boolean	Whether the request is successfully executed. Value true indicates that the request is successfully executed.
message	No	String	System prompt. If execution succeeds, the message may be left blank.

Example Request

Associate the **lhm_sql** queue with the elastic resource pool.

```
{  
    "queue_name" : "lhm_sql"  
}
```

Example Response

```
{  
    "is_success" : true,  
}
```

```
        "message" : ""  
    }
```

Status Codes

Status Code	Description
200	OK

Error Codes

If an error occurs when this API is invoked, the system does not return the result similar to the preceding example, but returns the error code and error information. For details, see [Error Codes](#).

10.7 Viewing Scaling History of an Elastic Resource Pool

Function

This API is used to view scaling history of an elastic resource pool.

URI

GET /v3/{project_id}/elastic-resource-pools/{elastic_resource_pool_name}/scale-records

Table 10-22 URI parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Project ID, which is used for resource isolation. For details about how to obtain its value, see Obtaining a Project ID .
elastic_resource_pool_name	Yes	String	Elastic resource pool name The value can contain 1 to 128 characters.

Table 10-23 query parameters

Parameter	Mandatory	Type	Description
start_time	No	Long	<p>Start time of the historical scaling records you want to query. The time must be 30 days earlier than the current time and earlier than the end_time. The value is a UNIX timestamp in milliseconds.</p> <ul style="list-style-type: none">• If start_time is left empty, data generated in the recent seven days before end_time will be queried. The end_time cannot be later than 30 days after the current time.• If both start_time and end_time are left empty, data generated in the recent 15 days before the current time will be queried.
end_time	No	Long	<p>End time of the historical scaling records. The value cannot be earlier than the start_time or later than the current time. The value is a UNIX timestamp in milliseconds.</p> <ul style="list-style-type: none">• If end_time is left empty, data generated since the start_time will be queried.• If both start_time and end_time are left empty, data generated in the recent 15 days before the current time will be queried.
status	No	String	<p>Scaling status Enumerated values:</p> <ul style="list-style-type: none">• success• fail
offset	No	Integer	<p>Offset Minimum value: 0</p>

Parameter	Mandatory	Type	Description
limit	No	Integer	Number of records displayed on a page Minimum value: 0 Maximum value: 100

Request

None

Response

Table 10-24 Response body parameters

Parameter	Type	Description
count	Integer	Number of elements in the array
items	Array of arrays	Data returned in the array For details, see Table 10-25 .

Table 10-25 items parameters

Parameter	Type	Description
max_cu	Integer	Maximum number of CUs
min_cu	Integer	Minimum number of CUs
current_cu	Integer	Scaled number of CUs
origin_cu	Integer	Original number of CUs
target_cu	Integer	Target number of CUs
record_time	Long	Operation completion time
status	String	Scaling status, which can be success or failure
fail_reason	String	Failure cause

Example Request

```
GET https://{endpoint}/v3/{project_id}/elastic-resource-pools/{elastic_resource_pool_name}/scale-records?  
start_time=1650784624000&end_time=1652625304002&status=&limit=20&offset=1
```

Example Response

The following is an example for a successful query:

```
{  
    "count": 1,  
    "items": [ {  
        "max_cu": 64,  
        "min_cu": 16,  
        "current_cu": 16,  
        "target_cu": 16,  
        "origin_cu": 16,  
        "record_time": 1650784624000,  
        "status": "fail",  
        "fail_reason": "Internal error, please contact technical support."  
    } ]  
}
```

Status Codes

Status Code	Description
200	OK

Error Codes

For details, see [Error Codes](#).

10.8 Modifying the Scaling Policy of a Queue Associated with an Elastic Resource Pool

Function

This API is used to modify the scaling policy of a queue associated with an elastic resource pool.

URI

- URI format
`PUT /v3/{project_id}/elastic-resource-pools/{elastic_resource_pool_name}/queues/{queue_name}`
- Parameter description

Table 10-26 URI parameters

Parameter	Mandatory	Type	Description
elastic_resource_pool_name	Yes	String	Elastic resource pool name.

Parameter	Mandatory	Type	Description
project_id	Yes	String	Project ID, which is used for resource isolation. For details about how to obtain its value, see Obtaining a Project ID .
queue_name	Yes	String	Name of a bound queue.

Request

Table 10-27 Request parameter

Parameter	Mandatory	Type	Description
queue_scaling_policies	Yes	Array of objects	Scaling policy of a queue in an elastic resource pool. A policy contains the period, priority, and CU range. There must be a default scaling policy (period [00:00, 24:00]) for each queue. For details about the parameters, see Table 10-28 .

Table 10-28 queue_scaling_policies

Parameter	Mandatory	Type	Description
impact_start_time	Yes	String	Time when a policy takes effect.
impact_stop_time	Yes	String	Time when a policy expires.
priority	Yes	Integer	Priority.
min_cu	Yes	Integer	Minimum number of CUs.
max_cu	Yes	Integer	Maximum number of CUs.

Response

Table 10-29 Response parameters

Parameter	Mandatory	Type	Description
is_success	No	Boolean	Whether the request is successfully executed. Value true indicates that the request is successfully executed.
message	No	String	System prompt. If execution succeeds, the message may be left blank.

Example Request

Modify the scaling policy of a queue associated with an elastic resource pool.

```
{  
    "queue_scaling_policies" : [ {  
        "priority" : 100,  
        "impact_start_time" : "10:00",  
        "impact_stop_time" : "22:00",  
        "min_cu": "64",  
        "max_cu": "752"  
    }, {  
        "priority" : 50,  
        "impact_start_time" : "22:00",  
        "impact_stop_time" : "10:00",  
        "min_cu": "64",  
        "max_cu": "752"  
    } ]  
}
```

Example Response

```
{  
    "is_success" : true,  
    "message" : ""  
}
```

Status Codes

Status Code	Description
200	OK

Error Codes

If an error occurs when this API is invoked, the system does not return the result similar to the preceding example, but returns the error code and error information. For details, see [Error Codes](#).

11 Queue-related APIs (Recommended)

11.1 Creating a Queue

Function

This API is used to create a queue. The queue will be bound to specified compute resources.

NOTE

It takes 5 to 15 minutes to start a job using a new queue for the first time.

URI

- URI format
POST /v1.0/{project_id}/queues
- Parameter description

Table 11-1 URI parameter

Parameter	Mandatory	Type	Description
project_id	Yes	String	Project ID, which is used for resource isolation. For details about how to obtain its value, see Obtaining a Project ID .

Request

Table 11-2 Request parameters

Parameter	Mandatory	Type	Description
queue_name	Yes	String	Name of a newly created resource queue. The name can contain only digits, letters, and underscores (_), but cannot contain only digits or start with an underscore (_). Length range: 1 to 128 characters. NOTE The queue name is case-insensitive. The uppercase letters will be automatically converted to lowercase letters.
queue_type	No	String	Queue type. The options are as follows: <ul style="list-style-type: none">• sql: Queues used to run SQL jobs• general: Queues used to run Flink and Spark Jar jobs. NOTE If the type is not specified, the default value sql is used.
description	No	String	Description of a queue.
cu_count	Yes	Integer	Minimum number of CUs that are bound to a queue. Currently, the value can only be 16 , 64 , or 256 .
charging_mode	No	Integer	Billing mode of a queue. This value can only be set to 1 , indicating that the billing is based on the CUH used.
enterprise_project_id	No	String	Enterprise project ID. The value 0 indicates the default enterprise project. NOTE Users who have enabled Enterprise Management can set this parameter to bind a specified project.
platform	No	String	CPU architecture of compute resources. <ul style="list-style-type: none">• x86_64
resource_mode	No	Integer	Queue resource mode. The options are as follows: 0 : shared resource mode 1 : dedicated resource mode

Parameter	Mandatory	Type	Description
labels	No	Array of Strings	Tag information of the queue to be created. Currently, the tag information includes whether the queue is cross-AZ (JSON string). The value can only be 2, that is, a dual-AZ queue whose compute resources are distributed in two AZs is created.
feature	No	String	Type of image used by the queue. The options are: <ul style="list-style-type: none">● basic: basic type● ai: AI-enhanced (Only the SQL x86_64 dedicated queue supports this option.) The default value is basic . NOTE AI-enhanced means that the queue is loaded with an AI image that integrates algorithm packages related to AI on top of the basic image.
tags	No	Array of objects	Queue tags for identifying cloud resources. A tag consists of a key and tag value. For details, see Table 11-3 .
elastic_resource_pool_name	No	String	Name of the elastic resource pool to which the new queue belongs. The name can contain only digits, lowercase letters, and underscores (_), but cannot contain only digits or start with an underscore (_). The value can contain 1 to 128 characters. NOTE To add a queue to an elastic resource pool, resource_mode must be set to the dedicated resource mode. Otherwise, this parameter does not take effect.

Table 11-3 tags parameters

Parameter	Mandatory	Type	Description
Key	Yes	String	Tag key. NOTE A tag key can contain a maximum of 128 characters. Only letters, digits, spaces, and special characters (.:=-@) are allowed, but the value cannot start or end with a space or start with _sys_.

Parameter	Mandatory	Type	Description
value	Yes	String	<p>Tag value.</p> <p>NOTE A tag value can contain a maximum of 255 characters. Only letters, digits, spaces, and special characters (_:=+@) are allowed. The value cannot start or end with a space.</p>

Response

Table 11-4 Response parameters

Parameter	Mandatory	Type	Description
is_success	No	Boolean	Indicates whether the request is successfully executed. Value true indicates that the request is successfully executed.
message	No	String	System prompt. If execution succeeds, the parameter setting may be left blank.
queue_name	No	String	<p>Name of the created queue.</p> <p>NOTE The queue name is case-insensitive. The uppercase letters will be automatically converted to lowercase letters.</p>

Example Request

Create a dedicated general-purpose queue named **queue1**, with specifications of 16 CUs and compute resources distributed in two AZs.

```
{  
    "queue_name": "queue1",  
    "description": "test",  
    "cu_count": 16,  
    "resource_mode": 1,  
    "enterprise_project_id": "0",  
    "queue_type": "general",  
    "labels": ["multi_az=2"]  
}
```

Creating a queue in a specified elastic resource pool

```
{  
    "queue_name": "queue2",  
    "description": "test_esp",  
    "cu_count": 16,  
    "resource_mode": 1,  
    "enterprise_project_id": "0",  
    "queue_type": "general",  
    "labels": ["multi_az=2"],  
    "resource_pool": "pool1"  
}
```

```
        "elastic_resource_pool_name": "elastic_pool_0622_10"  
    }
```

Example Response

```
{  
    "is_success": true,  
    "message": "",  
    "queue_name": "queue1"  
}
```

Status Codes

[Table 11-5](#) describes the status code.

Table 11-5 Status codes

Status Code	Description
200	The job is created successfully.
400	Request error.
500	Internal service error.

Error Codes

If an error occurs when this API is invoked, the system does not return the result similar to the preceding example, but returns the error code and error information. For details, see [Error Codes](#).

11.2 Deleting a Queue

Function

This API is used to delete a specified queue.

NOTE

If a task is being executed in a specified queue, the queue cannot be deleted.

URI

- URI format
`DELETE /v1.0/{project_id}/queues/{queue_name}`
- Parameter description

Table 11-6 URI parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Project ID, which is used for resource isolation. For details about how to obtain its value, see Obtaining a Project ID .
queue_name	Yes	String	Name of a queue to be deleted.

Request

None

Response

Table 11-7 Response parameters

Parameter	Mandatory	Type	Description
is_success	No	Boolean	Whether the request is successfully executed. Value true indicates that the request is successfully executed.
message	No	String	System prompt. If execution succeeds, the parameter setting may be left blank.

Example Request

None

Example Response

```
{  
  "is_success": true,  
  "message": ""  
}
```

Status Codes

[Table 11-8](#) describes the status code.

Table 11-8 Status codes

Status Code	Description
200	Deletion succeeded.
400	Request error.

Status Code	Description
500	Internal service error.

Error Codes

If an error occurs when this API is invoked, the system does not return the result similar to the preceding example, but returns the error code and error information. For details, see [Error Codes](#).

11.3 Querying All Queues

Function

This API is used to list all queues under the project.

URI

- URI format
GET/v1.0/{project_id}/queues
- Parameter description

Table 11-9 URI parameter

Parameter	Mandatory	Type	Description
project_id	Yes	String	Project ID, which is used for resource isolation. For details about how to obtain its value, see Obtaining a Project ID .

Table 11-10 query parameter description

Parameter	Mandatory	Type	Description
queue_type	No	String	Type of the queue. The options are as follows: <ul style="list-style-type: none">sql: queues for SQL jobsgeneral: queues for Flink and Spark Jar jobsall: queues of all types If this parameter is not specified, the default value sql is used.

Parameter	Mandatory	Type	Description
with-priv	No	Boolean	Whether to return permission information.
with-charge-info	No	Boolean	Whether to return billing information.
page-size	No	Integer	Maximum number of lines displayed on each page. The default value is Integer.MAX_VALUE , indicating that all results are displayed on one page.
current-page	No	Integer	Current page number. The default value is 1 .
order	No	String	Filed based on which queues are ordered The default value is queue_name_asc (alphabetically ascending order on queue names). Other options are queue_name_desc (alphabetically descending order on queue names), cu_asc (ascending order on CUs), and cu_desc (descending order on CUs).
tags	No	String	Query results are filtered by tag.

Request Parameters

None

Response Parameters

Table 11-11 Response parameters

Parameter	Mandatory	Type	Description
is_success	No	Boolean	Indicates whether the request is successfully executed. Value true indicates that the request is successfully executed.
message	No	String	System prompt. If execution succeeds, the parameter setting may be left blank.
queues	No	Array of Object	Queue information For details, see Table 11-12 .

Table 11-12 queues parameters description

Parameter	Mandatory	Type	Description
queue_name	No	String	Name of a queue.
description	No	String	Queue description.
owner	No	String	User who creates a queue.
create_time	No	Long	Time when the queue is created. The timestamp is expressed in milliseconds.
queue_type	No	String	<p>Queue type.</p> <ul style="list-style-type: none">sqlgeneralall <p>If this parameter is not specified, the default value sql is used.</p>
cu_count	No	Integer	Number of compute units (CUs) bound to a queue, that is, the number of CUs in the current queue.
charging_mode	No	Integer	<p>Billing mode of a queue.</p> <ul style="list-style-type: none">Value 0 indicates the default queue. You will be charged based on the amount of data scanned.Value 1 indicates that queues are billed based on the used CUH.
resource_id	No	String	Resource ID of a queue.
enterprise_project_id	No	String	Enterprise project ID. 0 indicates the default enterprise project. NOTE Users who have enabled Enterprise Management can set this parameter to bind a specified project.
cidr_in_vpc	No	String	The VPC CIDR block of the queue. For example, 10.0.0.0/8-24, 172.16.0.0/12-24, and 192.168.0.0/16-24.
cidr_in_mgntsubnet	No	String	CIDR block of the management subnet
cidr_in_subnet	No	String	Subnet CIDR block
resource_mode	No	Integer	<p>Resource mode</p> <ul style="list-style-type: none">0: Shared queue1: Dedicated queue

Parameter	Mandatory	Type	Description
platform	No	String	CPU architecture of queue compute resources. <ul style="list-style-type: none">• x86_64
is_restarting	No	Boolean	Whether to restart the queue. The default value is false .
labels	No	String	Tag information of the queue to be created, including the JSON string indicating whether the queue is Dual-AZ. Currently, only the value 2 is supported, indicating that two queues are created.
feature	No	String	Type of image used by the queue. The options are as follows: <ul style="list-style-type: none">• basic: basic type• ai: AI-enhanced (Only the SQL x86_64 dedicated queue supports this option.) The default value is basic . NOTE AI-enhanced means that the queue is loaded with an AI image that integrates algorithm packages related to AI on top of the basic image.
resource_type	No	String	Type of the resource to which a queue belongs. <ul style="list-style-type: none">• vm: ECF cluster• container: container cluster (Kubernetes)
cu_spec	No	Integer	Specifications of a queue. For a yearly/monthly queue, this parameter indicates the CU value of the yearly/monthly part. For a pay-per-use queue, this parameter indicates the initial value when a user purchases a queue.
cu_scale_out_limit	No	Integer	Upper limit of the CU value for elastic scaling of the current queue.
cu_scale_in_limit	No	Integer	Lower limit of the CU value for elastic scaling of the current queue.
elastic_resource_pool_name	Yes	String	Name of the elastic resource pool

Example Request

None

Example Response

```
{  
    "is_success": "true",  
    "message": "",  
    "queues": [  
        {  
            "queue_name": "test",  
            "owner": "testuser",  
            "description": "",  
            "create_time": 1562221422671,  
            "queue_type": "spark",  
            "cu_count": 16,  
            "charging_mode": 2,  
            "resource_id": "26afb850-d3c9-42c1-81c0-583d1163e80f",  
            "enterprise_project_id": "0",  
            "cidr_in_vpc": "10.0.0.0/8",  
            "cidr_in_subnet": "10.0.0.0/24",  
            "cidr_in_mngtsubnet": "10.23.128.0/24",  
            "resource_mode": 1,  
            "platform": "x86_64",  
            "is_restarting": "false",  
            "labels": "multi_az=2",  
            "resource_type": "vm",  
            "cu_spec": 16  
        }  
    ]  
}
```

Status Codes

[Table 11-13](#) describes the status code.

Table 11-13 Status codes

Status Code	Description
200	The query is successful.
400	Request error.
500	Internal service error.

Error Codes

If an error occurs when this API is invoked, the system does not return the result similar to the preceding example, but returns the error code and error information. For details, see [Error Codes](#).

11.4 Viewing Details of a Queue

Function

This API is used to list details of a specific queue in a project.

URI

- URI format
GET /v1.0/{project_id}/queues/{queue_name}
- Parameter description

Table 11-14 URI parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Project ID, which is used for resource isolation. For details about how to obtain its value, see Obtaining a Project ID .
queue_name	Yes	String	Specifies the name of a queue to be queried. NOTE The queue name is case-insensitive. The uppercase letters will be automatically converted to lowercase letters.

Request Parameters

None

Response Parameters

Table 11-15 Response parameters

Parameter	Mandatory	Type	Description
is_success	No	Boolean	Indicates whether the request is successfully executed. Value true indicates that the request is successfully executed.
message	No	String	System prompt. If execution succeeds, the parameter setting may be left blank.
queueName	No	String	Name of a queue. NOTE The queue name is case-insensitive. The uppercase letters will be automatically converted to lowercase letters.
description	No	String	Queue description.
owner	No	String	User who creates a queue.

Parameter	Mandatory	Type	Description
create_time	No	Long	Time when the queue is created. The timestamp is expressed in milliseconds.
queueType	No	String	<p>Indicates the queue type.</p> <ul style="list-style-type: none">sqlgeneralall <p>If this parameter is not specified, the default value sql is used.</p>
cuCount	No	Integer	Number of compute units (CUs) bound to a queue, that is, the number of CUs in the current queue.
chargingMode	No	integer	<p>Billing mode of a queue.</p> <ul style="list-style-type: none">Value 0 indicates the default queue. You will be charged based on the amount of data scanned.Value 1 indicates that queues are billed based on the used CUH.
resource_id	No	String	Resource ID of a queue.
resource_mode	No	Integer	<p>Resource mode</p> <ul style="list-style-type: none">0: Shared queue1: Dedicated queue
enterprise_project_id	No	String	<p>Enterprise project ID.</p> <p>0 indicates the default enterprise project.</p> <p>NOTE Users who have enabled Enterprise Management can set this parameter to bind a specified project.</p>
resource_type	No	String	<p>Resource type.</p> <ul style="list-style-type: none">vm: ECF clustercontainer: container cluster (Kubernetes)
cu_spec	No	Integer	Specifications of a queue. For a yearly/monthly queue, this parameter indicates the CU value of the yearly/monthly part. For a pay-per-use queue, this parameter indicates the initial value when a user purchases a queue.
cu_scale_out_limit	No	Integer	Upper limit of the CU value for elastic scaling of the current queue.
cu_scale_in_limit	No	Integer	Lower limit of the CU value for elastic scaling of the current queue.

Parameter	Mandatory	Type	Description
elastic_resource_pool_name	No	String	Name of the elastic resource pool.

Example Request

None

Example Response

```
{  
    "is_success": true,  
    "message": "",  
    "owner": "testuser",  
    "description": "",  
    "queueName": "test",  
    "create_time": 1587613028851,  
    "queueType": "general",  
    "cuCount": 16,

    "resource_id": "03d51b88-db63-4611-b779-9a72ba0cf58b",  
    "resource_mode": 0,  
    "enterprise_project_id": "0",  
    "resource_type": "vm",  
    "cu_spec": 16  
}
```

Status Codes

[Table 11-16](#) describes the status code.

Table 11-16 Status codes

Status Code	Description
200	The query is successful.
400	Request error.
500	Internal service error.

Error Codes

If an error occurs when this API is invoked, the system does not return the result similar to the preceding example, but returns the error code and error information. For details, see [Error Codes](#).

11.5 Restarting, Scaling Out, and Scaling In Queues

Function

This API is used to restart, scale out, and scale in queues.

Only SQL queues in the **Available** status can be restarted. (The queue status is **Available** only after the SQL job is successfully executed.)

URI

- URI format
PUT /v1.0/{project_id}/queues/{queue_name}/action
- Parameter description

Table 11-17 URI parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Project ID, which is used for resource isolation. For details about how to obtain its value, see Obtaining a Project ID .
queue_name	Yes	String	Name of a queue.

Request

Table 11-18 Request parameters

Parameter	Mandatory	Type	Description
action	Yes	String	Operations to be performed: <ul style="list-style-type: none">• restart: Restart a service. Only queues for SQL jobs can be restarted.• scale_out: Scale out the queue• scale_in: Scale in the queue <p>NOTE Currently, only restart, scale_out, and scale_in operations are supported.</p>
force	No	Boolean	Specifies whether to forcibly restart the queue. This parameter is optional when action is set to restart . The default value is false .

Parameter	Mandatory	Type	Description
cu_count	No	Integer	Number of CUs to be scaled in or out. This parameter is optional when action is set to scale_out or scale_in . The value of cu_count must be a multiple of 16.

Response

Table 11-19 Response parameters

Parameter	Mandatory	Type	Description
is_success	No	Boolean	Indicates whether the request is successfully executed. Value true indicates that the request is successfully executed.
message	No	String	System prompt. If execution succeeds, the parameter setting may be left blank.
job_id	No	String	Specifies the job ID returned when force is set to true .
queue_name	No	String	Name of the queue to be scaled in or out.
result	No	Boolean	Indicates the scaling result.

Example Request

- Restart a queue.

```
{  
    "action": "restart",  
    "force": "false"  
}
```
- Increase the number of CUs of the queue to 16.

```
{  
    "action": "scale_out",  
    "cu_count": 16  
}
```

Example Response

- Set **force** to **false**.

```
{  
    "is_success": true,  
    "message": "Restart success"  
}
```
- Set **force** to **true**.

```
{  
    "is_success": true,  
    "message": "Scaling success"  
}
```

- ```
"message": "Submit restart job success, it need some time to cancel jobs, please wait for a while
and check job status",
 "job_id": "d90396c7-3a25-4944-ad1e-99c764d902e7"
}
● Scaling
{
 "queue_name": "myQueue",
 "result": true
}
```

## Status Codes

[Table 11-20](#) describes the status code.

**Table 11-20** Status codes

| Status Code | Description                  |
|-------------|------------------------------|
| 200         | The operation is successful. |
| 400         | Request error.               |
| 500         | Internal service error.      |

## Error Codes

If an error occurs when this API is invoked, the system does not return the result similar to the preceding example, but returns the error code and error information. For details, see [Error Codes](#).

**Table 11-21** Error codes

| Error Code | Error Message                                                                                |
|------------|----------------------------------------------------------------------------------------------|
| DLI.0015   | Token info for token is null, return.                                                        |
| DLI.0013   | X-Auth-Token is not defined in request. It is mandatory. Please define and send the request. |

# 11.6 Creating an Address Connectivity Test Request

## Function

This API is used to send an address connectivity test request to a specified queue and insert the test address into the table.

## URI

- URI format

POST /v1.0/{project\_id}/queues/{queue\_name}/connection-test

- Parameter description

**Table 11-22** URI parameters

| Parameter  | Mandatory | Type   | Description                                                                                                                               |
|------------|-----------|--------|-------------------------------------------------------------------------------------------------------------------------------------------|
| project_id | Yes       | String | Project ID, which is used for resource isolation. For details about how to obtain its value, see <a href="#">Obtaining a Project ID</a> . |
| queue_name | Yes       | String | Name of a queue.                                                                                                                          |

## Request

**Table 11-23** Request parameters

| Parameter | Mandatory | Type   | Description                                                         |
|-----------|-----------|--------|---------------------------------------------------------------------|
| address   | Yes       | String | Test address. The format is <i>IP address or domain name:port</i> . |

## Response

**Table 11-24** Response parameters

| Parameter  | Mandatory | Type    | Description                                                                                                                    |
|------------|-----------|---------|--------------------------------------------------------------------------------------------------------------------------------|
| is_success | Yes       | Boolean | Indicates whether the request is successfully executed. Value <b>true</b> indicates that the request is successfully executed. |
| message    | Yes       | String  | System prompt. If execution succeeds, the parameter setting may be left blank.                                                 |
| task_id    | Yes       | Integer | Request ID                                                                                                                     |

## Example Request

Test the connectivity between the queue and the address **iam.xxx.com:443**.

```
{
 "address": "iam.xxx.com:443"
}
```

## Example Response

```
{
 "is_success": true,
 "message": "check connectivity to address:iam.xxx.com with port: 443 successfully",
 "task_id": 9
}
```

## Status Codes

[Table 11-25](#) describes status codes.

**Table 11-25** Status codes

| Status Code | Description                      |
|-------------|----------------------------------|
| 200         | The job is created successfully. |
| 400         | Request failure.                 |
| 500         | Internal service error.          |

## Error Codes

If an error occurs when this API is invoked, the system does not return the result similar to the preceding example, but returns the error code and error information. For details, see [Error Codes](#).

# 11.7 Querying Connectivity Test Details of a Specified Address

## Function

This API is used to query the connectivity test result after the test is submitted.

## URI

- URI format  
GET /v1.0/{project\_id}/queues/{queue\_name}/connection-test/{task\_id}
- Parameter description

**Table 11-26** URI parameters

| Parameter  | Mandatory | Type   | Description                                                                                                                               |
|------------|-----------|--------|-------------------------------------------------------------------------------------------------------------------------------------------|
| project_id | Yes       | String | Project ID, which is used for resource isolation. For details about how to obtain its value, see <a href="#">Obtaining a Project ID</a> . |

| Parameter  | Mandatory | Type   | Description                                                                                             |
|------------|-----------|--------|---------------------------------------------------------------------------------------------------------|
| queue_name | Yes       | String | Name of a queue.                                                                                        |
| task_id    | Yes       | String | Job ID. You can call <a href="#">Creating an Address Connectivity Test Request</a> to obtain the value. |

## Request

None

## Response

**Table 11-27** Response parameters

| Parameter    | Mandatory | Type    | Description                                                                                                                    |
|--------------|-----------|---------|--------------------------------------------------------------------------------------------------------------------------------|
| is_success   | Yes       | Boolean | Indicates whether the request is successfully executed. Value <b>true</b> indicates that the request is successfully executed. |
| message      | Yes       | String  | System prompt. If execution succeeds, the parameter setting may be left blank.                                                 |
| connectivity | Yes       | String  | Indicates the connectivity test result.                                                                                        |

## Example Request

None

## Example Response

```
{
 "is_success": true,
 "message": "Get node connectivity status successfully for addressId:9",
 "connectivity": "REACHABLE"
}
```

## Status Codes

[Table 11-28](#) describes status codes.

**Table 11-28** Status codes

| Status Code | Description              |
|-------------|--------------------------|
| 200         | The query is successful. |
| 400         | Request failure.         |
| 500         | Internal service error.  |

## Error Codes

If an error occurs when this API is invoked, the system does not return the result similar to the preceding example, but returns the error code and error information. For details, see [Error Codes](#).

# 12 SQL Job-related APIs

## 12.1 Submitting a SQL Job (Recommended)

### Function

This API is used to submit jobs to a queue using SQL statements.

The job types support DDL, DCL, IMPORT, QUERY, and INSERT. The IMPORT function is the same as that described in [Importing Data \(Discarded\)](#). The difference lies in the implementation method.

Additionally, you can use other APIs to query and manage jobs. For details, see the following sections:

- [Querying Job Status](#)
- [Querying Job Details](#)
- [Querying the Job Execution Result-Method 2 \(Discarded\)](#)
- [Exporting Query Results](#)
- [Querying All Jobs](#)
- [Canceling a Job \(Recommended\)](#)

This API is synchronous if **job\_type** in the response message is **DCL**.

### URI

- URI format  
POST /v1.0/{project\_id}/jobs/submit-job
- Parameter description

**Table 12-1** URI parameter

| Parameter  | Mandatory | Type   | Description                                                                                                                               |
|------------|-----------|--------|-------------------------------------------------------------------------------------------------------------------------------------------|
| project_id | Yes       | String | Project ID, which is used for resource isolation. For details about how to obtain its value, see <a href="#">Obtaining a Project ID</a> . |

## Request Parameters

**Table 12-2** Request parameters

| Parameter       | Mandatory | Type             | Description                                                                                                                                                                               |
|-----------------|-----------|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| sql             | Yes       | String           | SQL statement that you want to execute.                                                                                                                                                   |
| currentdb       | No        | String           | Database where the SQL statement is executed. This parameter does not need to be configured during database creation.                                                                     |
| current_catalog | No        | String           | Default catalog of the table where the job is to be submitted. If not specified, the DLI catalog is used by default.                                                                      |
| queue_name      | No        | String           | Name of the queue to which a job to be submitted belongs. The name can contain only digits, letters, and underscores (_), but cannot contain only digits or start with an underscore (_). |
| conf            | No        | Array of Strings | You can set the configuration parameters for the SQL job in the form of <b>Key/Value</b> . For details about the supported configuration items, see <a href="#">Table 12-3</a> .          |
| tags            | No        | Array of objects | Label of a job. For details, see <a href="#">Table 12-4</a> .                                                                                                                             |
| engine_type     | No        | String           | Type of the engine that executes jobs.                                                                                                                                                    |

**Table 12-3** Configuration parameters description

| Parameter                         | Default Value | Description                                                                                                      |
|-----------------------------------|---------------|------------------------------------------------------------------------------------------------------------------|
| spark.sql.files.maxRecordsPerFile | 0             | Maximum number of records to be written into a single file. If the value is zero or negative, there is no limit. |

| Parameter                                   | Default Value | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|---------------------------------------------|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| spark.sql.autoBroadcastJoinThreshold        | 209715200     | <p>Maximum size of the table that displays all working nodes when a connection is executed. You can set this parameter to <b>-1</b> to disable the display.</p> <p><b>NOTE</b><br/>Currently, only the configuration unit metastore table that runs the <b>ANALYZE TABLE COMPUTE statistics noscan</b> command and the file-based data source table that directly calculates statistics based on data files are supported.</p>                                                                                                         |
| spark.sql.shuffle.partitions                | 200           | Default number of partitions used to filter data for join or aggregation.                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| spark.sql.dynamicPartitionOverwrite.enabled | false         | <p>Whether DLI overwrites the partitions where data will be written into during runtime. If you set this parameter to <b>false</b>, all partitions that meet the specified condition will be deleted before data overwrite starts. For example, if you set <b>false</b> and use <b>INSERT OVERWRITE</b> to write partition 2021-02 to a partitioned table that has the 2021-01 partition, this partition will be deleted.</p> <p>If you set this parameter to <b>true</b>, DLI does not delete partitions before overwrite starts.</p> |
| spark.sql.files.maxPartitionBytes           | 134217728     | Maximum number of bytes to be packed into a single partition when a file is read.                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| spark.sql.badRecordsPath                    | -             | Path of bad records.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| Parameter                                        | Default Value | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|--------------------------------------------------|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| spark.sql.legacy.correlated.scalar.query.enabled | false         | <ul style="list-style-type: none"><li>● <b>If set to true:</b><ul style="list-style-type: none"><li>- When there is no duplicate data in a subquery, executing a correlated subquery does not require deduplication from the subquery's result.</li><li>- If there is duplicate data in a subquery, executing a correlated subquery will result in an error. To resolve this, the subquery's result must be deduplicated using functions such as <b>max()</b> or <b>min()</b>.</li></ul></li><li>● <b>If set to false:</b> Regardless of whether there is duplicate data in a subquery, executing a correlated subquery requires deduplicating the subquery's result using functions such as <b>max()</b> or <b>min()</b>. Otherwise, an error will occur.</li></ul> |

**Table 12-4** tags parameters

| Parameter | Mandatory | Type   | Description                                                                                                                                                                                                                                            |
|-----------|-----------|--------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| key       | Yes       | String | <p>Tag key</p> <p><b>NOTE</b></p> <p>A tag key can contain a maximum of 128 characters. Only letters, digits, spaces, and special characters (_:=+@) are allowed, but the value cannot start or end with a space or start with <code>_sys_</code>.</p> |
| value     | Yes       | String | <p><b>NOTE</b></p> <p>A tag value can contain a maximum of 255 characters. Only letters, digits, spaces, and special characters (_:=+@) are allowed. The value cannot start or end with a space.</p>                                                   |

## Response Parameters

**Table 12-5** Response parameters

| Parameter  | Mandatory | Type             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|------------|-----------|------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| is_success | Yes       | Boolean          | Indicates whether the request is successfully sent. Value <b>true</b> indicates that the request is successfully sent.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| message    | Yes       | String           | System prompt. If execution succeeds, the parameter setting may be left blank.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| job_id     | Yes       | String           | ID of a job returned after a job is generated and submitted by using SQL statements. The job ID can be used to query the job status and results.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| job_type   | Yes       | String           | Job type. The options include: <ul style="list-style-type: none"><li>• <b>DDL</b></li><li>• <b>DCL</b></li><li>• <b>IMPORT</b></li><li>• <b>EXPORT</b></li><li>• <b>QUERY</b></li><li>• <b>INSERT</b></li></ul>                                                                                                                                                                                                                                                                                                                                                                                                                   |
| schema     | No        | Array of Map     | If the statement type is DDL, the column name and type of DDL are displayed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| rows       | No        | Array of objects | When the statement type is DDL and <b>dli.sql.sqlasync.enabled</b> is set to <b>false</b> , the execution results are returned directly. However, only a maximum of 1,000 rows can be returned. If there are more than 1,000 rows, obtain the results asynchronously. That is, when submitting the job, set <b>xxxx</b> to <b>true</b> , and then obtain the results from the job bucket configured by DLI. The path of the results on the job bucket can be obtained from the <b>result_path</b> in the return value of the ShowSqlJobStatus API. The full data of the results will be automatically exported to the job bucket. |
| job_mode   | No        | String           | Job execution mode. The options are as follows: <ul style="list-style-type: none"><li>• <b>async</b>: asynchronous</li><li>• <b>sync</b>: synchronous</li></ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

## Example Request

Submit a SQL job. The job execution database and queue are **db1** and **default**, respectively. Then, add the tags **workspace=space1** and **jobName=name1** for the job.

```
{
 "currentdb": "db1",
 "sql": "desc table1",
 "queue_name": "default",
 "conf": [
 "dli.sql.shuffle.partitions = 200"
],
 "tags": [
 {
 "key": "workspace",
 "value": "space1"
 },
 {
 "key": "jobName",
 "value": "name1"
 }
]
}
```

## Example Response

```
{
 "is_success": true,
 "message": "",
 "job_id": "8ecb0777-9c70-4529-9935-29ea0946039c",
 "job_type": "DDL",
 "job_mode": "sync",
 "schema": [
 {
 "col_name": "string"
 },
 {
 "data_type": "string"
 },
 {
 "comment": "string"
 }
],
 "rows": [
 [
 "c1",
 "int",
 null
],
 [
 "c2",
 "string",
 null
]
]
}
```

## Status Codes

[Table 12-6](#) describes the status code.

**Table 12-6** Status codes

| Status Code | Description             |
|-------------|-------------------------|
| 200         | Submitted successfully. |
| 400         | Request error.          |
| 500         | Internal service error. |

## Error Codes

If an error occurs when this API is invoked, the system does not return the result similar to the preceding example, but returns the error code and error information. For details, see [Error Codes](#).

## 12.2 Canceling a Job (Recommended)

### Function

This API is used to cancel a submitted job. If execution of a job completes or fails, this job cannot be canceled.

### URI

- URI format  
`DELETE /v1.0/{project_id}/jobs/{job_id}`
- Parameter description

**Table 12-7** URI parameters

| Parameter  | Mandatory | Type   | Description                                                                                                                               |
|------------|-----------|--------|-------------------------------------------------------------------------------------------------------------------------------------------|
| project_id | Yes       | String | Project ID, which is used for resource isolation. For details about how to obtain its value, see <a href="#">Obtaining a Project ID</a> . |
| job_id     | Yes       | String | Job ID. You can get the value by calling <a href="#">Submitting a SQL Job (Recommended)</a> .                                             |

### Request

None

## Response

**Table 12-8** Response parameters

| Parameter  | Mandatory | Type    | Description                                                                                                          |
|------------|-----------|---------|----------------------------------------------------------------------------------------------------------------------|
| is_success | No        | Boolean | Whether the request is successfully executed. Value <b>true</b> indicates that the request is successfully executed. |
| message    | No        | String  | System prompt. If execution succeeds, the parameter setting may be left blank.                                       |

## Example Request

None

## Example Response

```
{
 "is_success": true,
 "message": ""
}
```

## Status Codes

**Table 12-9** describes the status code.

**Table 12-9** Status codes

| Status Code | Description             |
|-------------|-------------------------|
| 200         | Canceled.               |
| 400         | Request error.          |
| 500         | Internal service error. |

## Error Codes

If an error occurs when this API is invoked, the system does not return the result similar to the preceding example, but returns the error code and error information. For details, see [Error Codes](#).

## 12.3 Querying All Jobs

### Function

This API is used to query information about all jobs in the current project.

## URI

- URI format  
GET /v1.0/{project\_id}/jobs
- Parameter description

**Table 12-10** URI parameter

| Parameter  | Mandatory | Type   | Description                                                                                                                      |
|------------|-----------|--------|----------------------------------------------------------------------------------------------------------------------------------|
| project_id | Yes       | String | Project ID, which is used for resource isolation. For how to obtain the project ID, see <a href="#">Obtaining a Project ID</a> . |

**Table 12-11** query parameter description

| Parameter    | Mandatory | Type    | Description                                                                                                                                                                                                                                                                                    |
|--------------|-----------|---------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| page-size    | No        | Integer | Maximum number of jobs displayed on each page. The value range is as follows: [1, 100]. The default value is <b>50</b> .                                                                                                                                                                       |
| current-page | No        | Integer | Current page number. The default value is <b>1</b> .                                                                                                                                                                                                                                           |
| start        | No        | Long    | Queries the jobs executed later than the time specified by this parameter. The time is a UNIX timestamp in milliseconds.                                                                                                                                                                       |
| end          | No        | Long    | Queries the jobs executed earlier than the time specified by this parameter. The time is a UNIX timestamp in milliseconds.                                                                                                                                                                     |
| job-type     | No        | String  | Type of a job to be queried. Job types include <b>DDL</b> , <b>DCL</b> , <b>IMPORT</b> , <b>EXPORT</b> , <b>QUERY</b> , <b>INSERT</b> , <b>DATA_MIGRATION</b> , <b>UPDATE</b> , <b>DELETE</b> , <b>RESTART_QUEUE</b> , and <b>SCALE_QUEUE</b> . To query all types of jobs, enter <b>ALL</b> . |
| job-status   | No        | String  | Status of the job to be queried.                                                                                                                                                                                                                                                               |
| job-id       | No        | String  | ID of the job to be queried. You can get the value by calling <a href="#">Submitting a SQL Job (Recommended)</a> .                                                                                                                                                                             |
| queue_name   | No        | String  | Specifies <b>queue_name</b> as the filter to query jobs running on the specified queue.                                                                                                                                                                                                        |

| Parameter   | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-------------|-----------|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| sql_pattern | No        | String | Specifies the SQL segment as the filter. It is case insensitive.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| order       | No        | String | Specifies the job sorting mode. The default value is <b>start_time_desc</b> (job submission time in descending order). Four sorting modes are supported: <b>duration_desc</b> (job running duration in descending order), <b>duration_asc</b> (job running duration in ascending order), <b>start_time_desc</b> (job submission time in descending order), and <b>start_time_asc</b> (job submission time in ascending order).                                                                                                                                                                                                                                                                                                                                              |
| engine-type | No        | String | Engine type.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| owner       | No        | String | User who submits a job.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| tags        | No        | String | <p>Queue tags for the search. You can specify multiple tags in <b>key=value</b> format.</p> <ul style="list-style-type: none"><li>Request with one specified tag<br/>For example, GET /v1.0/{project_id}/jobs?tags=k1%3Dv1<br/>In this example, = needs to be escaped to %3D, k1 indicates the tag key, and v1 indicates the tag value.</li><li>Request with more than one tag<br/>Separate tags with commas (,) and convert the commas (,) to %2C, for example, GET /v1.0/{project_id}/jobs?.tags=k1%3Dv1%2Ck2%3Dv2.<br/>The equal sign (=) is escaped to %3D. k1 indicates a tag key, and v1 indicates the tag value. k2 indicates another tag key, and v2 indicates the tag value.<br/>Currently, only fuzzy query is supported. Exact query is not supported.</li></ul> |

### NOTE

The following is an example of the URL containing the **query** parameter:

```
GET /v1.0/{project_id}/jobs?page-size={size}¤t-page={page_number}&start={start_time}&end={end_time}&job-type={QUERY}&queue_name={test}&order={duration_desc}
```

## Request Parameters

None

## Response Parameters

**Table 12-12** Response parameters

| Parameter  | Mandatory | Type             | Description                                                                                                                    |
|------------|-----------|------------------|--------------------------------------------------------------------------------------------------------------------------------|
| is_success | Yes       | Boolean          | Indicates whether the request is successfully executed. Value <b>true</b> indicates that the request is successfully executed. |
| message    | Yes       | String           | System prompt. If execution succeeds, the parameter setting may be left blank.                                                 |
| job_count  | Yes       | Integer          | Indicates the total number of jobs.                                                                                            |
| jobs       | Yes       | Array of objects | Indicates the information about a job. For details, see <a href="#">Table 12-13</a> .                                          |

**Table 12-13** **jobs** parameters

| Parameter       | Mandatory | Type   | Description                                                                                                             |
|-----------------|-----------|--------|-------------------------------------------------------------------------------------------------------------------------|
| job_id          | Yes       | String | Job ID.                                                                                                                 |
| job_type        | Yes       | String | Type of a job.                                                                                                          |
| queue_name      | Yes       | String | Queue to which a job is submitted.                                                                                      |
| owner           | Yes       | String | User who submits a job.                                                                                                 |
| start_time      | Yes       | Long   | Time when a job is started. The timestamp is expressed in milliseconds.                                                 |
| duration        | Yes       | Long   | Job running duration (unit: millisecond).                                                                               |
| status          | Yes       | String | Status of a job, including <b>LAUNCHING</b> , <b>RUNNING</b> , <b>FINISHED</b> , <b>FAILED</b> , and <b>CANCELLED</b> . |
| input_row_count | No        | Long   | Number of records scanned during the Insert job execution.                                                              |
| bad_row_count   | No        | Long   | Number of error records scanned during the Insert job execution.                                                        |
| input_size      | Yes       | Long   | Size of scanned files during job execution.                                                                             |

| Parameter          | Mandatory | Type             | Description                                                                                                                                    |
|--------------------|-----------|------------------|------------------------------------------------------------------------------------------------------------------------------------------------|
| result_count       | Yes       | Integer          | Total number of records returned by the current job or total number of records inserted by the Insert job.                                     |
| database_name      | No        | String           | Name of the database where the target table resides. <b>database_name</b> is valid only for jobs of the <b>Import</b> and <b>Export</b> types. |
| table_name         | No        | String           | Name of the target table. <b>table_name</b> is valid only for jobs of the <b>Import</b> and <b>Export</b> types.                               |
| with_column_header | No        | Boolean          | Import jobs, which record whether the imported data contains column names.                                                                     |
| detail             | Yes       | String           | JSON string of related columns queried using SQL statements.                                                                                   |
| statement          | Yes       | String           | SQL statements of a job.                                                                                                                       |
| message            | No        | String           | System prompt.                                                                                                                                 |
| end_time           | No        | Long             | Job end time. The timestamp is in milliseconds.                                                                                                |
| tags               | No        | Array of objects | Job tags. For details, see <a href="#">Table 12-14</a> .                                                                                       |
| output_byte        | No        | String           | Number of output bytes of a job.                                                                                                               |
| cpu_cost           | No        | String           | Total CPU used by a job.                                                                                                                       |

**Table 12-14** tags parameters

| Parameter | Mandatory | Type   | Description |
|-----------|-----------|--------|-------------|
| key       | Yes       | String | Tag key     |
| value     | Yes       | String | Tag value   |

## Example Request

None

## Example Response

```
{
 "is_success": true,
 "message": "",
}
```

```
"job_count": 1,
"jobs": [
 {
 "detail": "{\"type\":\"struct\",\"fields\":[{\"name\":\"name\",\"type\":\"string\",\"nullable\":true,\"metadata\":{}},{\"name\":\"age\",\"type\":\"integer\",\"nullable\":true,\"metadata\":{}}]},\n \"duration\": 17731,
 \"end_time\": 1502349821460,
 \"input_size\": 0,
 \"job_id\": \"37286cc7-0508-4ffd-b636-951c8a5c75de\",
 \"job_type\": \"QUERY\",
 \"message\": '',
 \"owner\": \"tenant1\",
 \"queue_name\": \"queue1\",
 \"result_count\": 3,
 \"start_time\": 1502349803729,
 \"statement\": \"select * from t_json_002\",
 \"status\": \"FINISHED\",
 \"with_column_header\": false
 }
]
```

## Status Codes

[Table 12-15](#) describes the status code.

**Table 12-15** Status codes

| Status Code | Description              |
|-------------|--------------------------|
| 200         | The query is successful. |
| 400         | Request error.           |
| 500         | Internal service error.  |

## Error Codes

If an error occurs when this API is invoked, the system does not return the result similar to the preceding example, but returns the error code and error information. For details, see [Error Codes](#).

## 12.4 Previewing SQL Job Query Results

### Function

This API is used to view the job execution result after a job is executed using SQL query statements. Currently, you can only query execution results of jobs of the **QUERY** type.

This API can be used to view only the first 1000 result records and does not support pagination query. To view all query results, you need to export the query results first. For details, see [Exporting Query Results](#).

## URI

- URI format  
GET /v1.0/{project\_id}/jobs/{job\_id}/preview
- Parameter description

**Table 12-16** URI parameters

| Parameter  | Mandatory | Type   | Description                                                                                                                               |
|------------|-----------|--------|-------------------------------------------------------------------------------------------------------------------------------------------|
| project_id | Yes       | String | Project ID, which is used for resource isolation. For details about how to obtain its value, see <a href="#">Obtaining a Project ID</a> . |
| job_id     | Yes       | String | Job ID                                                                                                                                    |

**Table 12-17** query parameter description

| Parameter  | Mandatory | Type   | Description                                                                                                                  |
|------------|-----------|--------|------------------------------------------------------------------------------------------------------------------------------|
| page-size  | No        | Long   | Number of result rows. The value ranges from 1 to 1000. The default rate limit is <b>1000</b> .                              |
| queue-name | No        | String | Name of the execution queue for obtaining job results. If this parameter is not specified, the default system queue is used. |

### NOTE

The following is an example of the URL containing the **query** parameter:

GET /v1.0/{project\_id}/jobs/{job\_id}/preview?query=page-size={size}&queue-name={queue\_name}

## Request

None

## Response

**Table 12-18** Response parameters

| Parameter  | Mandatory | Type             | Description                                                                                                                                                                                                                                                                                          |
|------------|-----------|------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| is_success | No        | Boolean          | Whether the request is successfully executed. Value <b>true</b> indicates that the request is successfully executed.                                                                                                                                                                                 |
| message    | No        | String           | System prompt. If execution succeeds, the parameter setting may be left blank.                                                                                                                                                                                                                       |
| job_id     | No        | String           | Job ID You can get the value by calling <a href="#">Submitting a SQL Job (Recommended)</a> .                                                                                                                                                                                                         |
| job_type   | No        | String           | Job type, including <b>DDL</b> , <b>DCL</b> , <b>IMPORT</b> , <b>EXPORT</b> , <b>QUERY</b> , <b>INSERT</b> , <b>DATA_MIGRATION</b> , <b>UPDATE</b> , <b>DELETE</b> , <b>RESTART_QUEUE</b> and <b>SCALE_QUEUE</b> . Currently, you can only query execution results of jobs of the <b>QUERY</b> type. |
| row_count  | No        | Integer          | Total number of job results.                                                                                                                                                                                                                                                                         |
| input_size | No        | Long             | Amount of data scanned during job execution.                                                                                                                                                                                                                                                         |
| schema     | No        | Array of Map     | Name and type of the job result column.                                                                                                                                                                                                                                                              |
| rows       | No        | Array of objects | Job results set.                                                                                                                                                                                                                                                                                     |

```

## Status Codes

[Table 12-19](#) describes the status code.

**Table 12-19** Status codes

| Status Code | Description              |
|-------------|--------------------------|
| 200         | The query is successful. |
| 400         | Request error.           |
| 500         | Internal service error.  |

## Error Codes

If an error occurs when this API is invoked, the system does not return the result similar to the preceding example, but returns the error code and error information. For details, see [Error Codes](#).

# 12.5 Exporting Query Results

## Function

This API is used to export results returned from the query using SQL statements to OBS. Only the query result of **QUERY** jobs can be exported.

- This API is asynchronous.
- Currently, data can be exported only to OBS, and the OBS path must be specified to the folder level. The OBS path cannot contain commas (,). The OBS bucket name cannot end with the regular expression format ".[0-9]+(.\*)". Specifically, if the bucket name contains dots (.), the last dot (.) cannot be followed by a digit, for example, "\*\*.12abc" and "\*\*.12".

## URI

- URI format  
POST /v1.0/{project\_id}/jobs/{job\_id}/export-result
- Parameter description

**Table 12-20** URI parameters

| Parameter  | Mandatory | Type   | Description                                                                                                                               |
|------------|-----------|--------|-------------------------------------------------------------------------------------------------------------------------------------------|
| project_id | Yes       | String | Project ID, which is used for resource isolation. For details about how to obtain its value, see <a href="#">Obtaining a Project ID</a> . |
| job_id     | Yes       | String | Job ID.                                                                                                                                   |

## Request

**Table 12-21** Request parameters

| Parameter   | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|-------------|-----------|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| data_path   | Yes       | String | Path for storing the exported data. Currently, data can be stored only on OBS. The OBS path cannot contain folders, for example, the <b>path</b> folder in the sample request.                                                                                                                                                                                                                                                                                                                                                                 |
| compress    | No        | String | Compression format of exported data. Currently, <b>gzip</b> , <b>bzip2</b> , and <b>deflate</b> are supported. The default value is <b>none</b> , indicating that data is not compressed.                                                                                                                                                                                                                                                                                                                                                      |
| data_type   | Yes       | String | Storage format of exported data. Currently, only CSV and JSON are supported.                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| queue_name  | No        | String | Name of the queue that is specified to execute a task. If no queue is specified, the default queue is used.                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| export_mode | No        | String | Export mode. The parameter value can be <b>ErrorIfExists</b> or <b>Overwrite</b> . If <b>export_mode</b> is not specified, this parameter is set to <b>ErrorIfExists</b> by default. <ul style="list-style-type: none"><li>● <b>ErrorIfExists:</b> Ensure that the specified export directory does not exist. If the specified export directory exists, an error is reported and the export operation cannot be performed.</li><li>● <b>Overwrite:</b> If you add new files to a specific directory, existing files will be deleted.</li></ul> |

| Parameter          | Mandatory | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|--------------------|-----------|---------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| with_column_header | No        | Boolean | <p>Whether to export column names when exporting CSV and JSON data.</p> <ul style="list-style-type: none"><li>• If this parameter is set to <b>true</b>, the column names are exported.</li><li>• If this parameter is set to <b>false</b>, the column names are not exported.</li><li>• If this parameter is left blank, the default value <b>false</b> is used.</li></ul>                                                                                                                                       |
| limit_num          | No        | Integer | <p>Number of data records to be exported. The default value is <b>0</b>, indicating that all data records are exported.</p>                                                                                                                                                                                                                                                                                                                                                                                       |
| encoding_type      | No        | String  | <p>Encoding format of the data to be exported. The default value is <b>utf-8</b>.</p> <p>The options include:</p> <ul style="list-style-type: none"><li>• utf-8</li><li>• gb2312</li><li>• gbk</li></ul>                                                                                                                                                                                                                                                                                                          |
| quote_char         | No        | String  | <p>User-defined quote character.</p> <p>The default value is double quotes ("").</p> <p>This parameter is available and can be set only when <b>Data Format</b> is <b>csv</b>.</p> <p>Quotation characters are used to identify the beginning and end of text fields when exporting job results, and are used to separate fields.</p> <p>Only one character can be set.</p> <p>This is mainly used to handle data that contains spaces, special characters, or characters that are the same as the delimiter.</p> |

| Parameter   | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|-------------|-----------|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| escape_char | No        | String | <p>User-defined escape character.<br/>The default value is a backslash (\).<br/>This parameter is available and can be set only when <b>Data Format</b> is <b>csv</b>.<br/>If special characters, such as quotation marks, need to be included in the exported results, they can be represented using escape characters (backslash \).<br/>Only one character can be set.<br/>Common scenarios for using escape characters are:</p> <ul style="list-style-type: none"><li>• If there is a third quotation mark between two quotation marks, add an escape character before the third quotation mark to avoid the field content being split.</li><li>• If there is already an escape character in the data content, add another escape character before the existing one to avoid the original character being used as an escape character.</li></ul> |

## Response

**Table 12-22** Response parameters

| Parameter  | Mandatory | Type    | Description                                                                                                                                                     |
|------------|-----------|---------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| is_success | Yes       | Boolean | Indicates whether the request is successfully sent. Value <b>true</b> indicates that the request is successfully sent.                                          |
| message    | Yes       | String  | System prompt. If execution succeeds, the parameter setting may be left blank.                                                                                  |
| job_id     | No        | String  | ID of a job returned after a job is generated and submitted by using SQL statements. The job ID can be used to query the job status and results.                |
| job_mode   | No        | String  | Job execution mode. The options are as follows: <ul style="list-style-type: none"><li>• <b>async</b>: asynchronous</li><li>• <b>sync</b>: synchronous</li></ul> |

## Example Request

Export query results of SQL statements to OBS and stores the results in JSON format.

```
{
 "data_path": "obs://obs-bucket1/path",
 "data_type": "json",
 "compress": "gzip",
 "with_column_header": "true",
 "queue_name": "queue2",
 "limit_num": 10
}
```

## Example Response

```
{
 "is_success": true,
 "message": "",
 "job_id": "37a40ef9-86f5-42e6-b4c6-8febec89cc20",
 "job_mode": "async"
}
```

## Status Codes

[Table 12-23](#) describes the status code.

**Table 12-23** Status codes

| Status Code | Description             |
|-------------|-------------------------|
| 200         | Export successful.      |
| 400         | Request error.          |
| 500         | Internal service error. |

## Error Codes

If an error occurs when this API is invoked, the system does not return the result similar to the preceding example, but returns the error code and error information. For details, see [Error Codes](#).

## 12.6 Querying Job Status

### Function

This API is used to query the status of a submitted job.

### URI

- URI format  
GET /v1.0/{project\_id}/jobs/{job\_id}/status
- Parameter description

**Table 12-24** URI parameters

| Parameter  | Mandatory | Type   | Description                                                                                                                               |
|------------|-----------|--------|-------------------------------------------------------------------------------------------------------------------------------------------|
| project_id | Yes       | String | Project ID, which is used for resource isolation. For details about how to obtain its value, see <a href="#">Obtaining a Project ID</a> . |
| job_id     | Yes       | String | Job ID.                                                                                                                                   |

## Request

None

## Response

**Table 12-25** Response parameters

| Parameter  | Type    | Description                                                                                                                                                                                                            |
|------------|---------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| is_success | Boolean | Whether the request is successfully executed. Value <b>true</b> indicates that the request is successfully executed.                                                                                                   |
| message    | String  | System prompt. If execution succeeds, this parameter is left blank.                                                                                                                                                    |
| job_id     | String  | Job ID. You can get the value by calling <a href="#">Submitting a SQL Job (Recommended)</a> .                                                                                                                          |
| job_type   | String  | Type of a job, Includes <b>DDL</b> , <b>DCL</b> , <b>IMPORT</b> , <b>EXPORT</b> , <b>QUERY</b> , <b>INSERT</b> , <b>DATA_MIGRATION</b> , <b>UPDATE</b> , <b>DELETE</b> , <b>RESTART_QUEUE</b> and <b>SCALE_QUEUE</b> . |
| job_mode   | String  | Job execution mode. The options are as follows: <ul style="list-style-type: none"><li>• <b>async</b>: asynchronous</li><li>• <b>sync</b>: synchronous</li></ul>                                                        |
| queue_name | String  | Name of the queue where the job is submitted.                                                                                                                                                                          |
| owner      | String  | User who submits a job.                                                                                                                                                                                                |
| start_time | Long    | Time when a job is started. The timestamp is in milliseconds.                                                                                                                                                          |
| duration   | Long    | Job running duration (unit: millisecond).                                                                                                                                                                              |
| status     | String  | Status of a job, including <b>RUNNING</b> , <b>SCALING</b> , <b>LAUNCHING</b> , <b>FINISHED</b> , <b>FAILED</b> , and <b>CANCELLED</b> .                                                                               |

| Parameter       | Type             | Description                                                                                                                                            |
|-----------------|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| input_row_count | Long             | Number of records scanned during the Insert job execution.                                                                                             |
| bad_row_count   | Long             | Number of error records scanned during the Insert job execution.                                                                                       |
| input_size      | Long             | Size of scanned files during job execution (unit: byte).                                                                                               |
| result_count    | Integer          | Total number of records returned by the current job or total number of records inserted by the Insert job.                                             |
| database_name   | String           | Name of the database where the target table resides. <b>database_name</b> is valid only for jobs of the <b>IMPORT EXPORT</b> , and <b>QUERY</b> types. |
| table_name      | String           | Name of the target table. <b>table_name</b> is valid only for jobs of the <b>IMPORT EXPORT</b> , and <b>QUERY</b> types.                               |
| detail          | String           | JSON string for information about related columns.                                                                                                     |
| statement       | String           | SQL statements of a job.                                                                                                                               |
| tags            | Array of objects | Job tags. For details, see <a href="#">Table 12-26</a> .                                                                                               |
| user_conf       | String           | JSON string of related columns queried using SQL statements.                                                                                           |
| result_format   | String           | Storage format of job results. Currently, only CSV is supported.                                                                                       |
| result_path     | String           | OBS path of job results.                                                                                                                               |

**Table 12-26** tags parameters

| Parameter | Mandatory | Type   | Description |
|-----------|-----------|--------|-------------|
| key       | Yes       | String | Tag key     |
| value     | Yes       | String | Tag value   |

## Example Request

None

## Example Response

```
{
 "is_success": true,
 "message": "",
 "job_id": "208b08d4-0dc2-4dd7-8879-ddd4c020d7aa",
 "job_type": "QUERY",
 "job_mode": "async",
 "queue_name": "default",
 "owner": "test",
 "start_time": 1509335108918,
 "duration": 2523,
 "status": "FINISHED",
 "input_size": 22,
 "result_count": 4,
 "database_name": "dbtest",
 "table_name": "tbtest",
 "detail": "{\"type\":\"struct\",\"fields\":[{\"name\":\"id\",\"type\":\"integer\",\"nullable\":true,\"metadata\":{}},{\"name\":\"name\",\"type\":\"string\",\"nullable\":true,\"metadata\":{}}]}",

```

## Status Codes

[Table 12-27](#) describes the status code.

**Table 12-27** Status codes

| Status Code | Description              |
|-------------|--------------------------|
| 200         | The query is successful. |
| 400         | Request error.           |
| 500         | Internal service error.  |

## Error Codes

If an error occurs when this API is invoked, the system does not return the result similar to the preceding example, but returns the error code and error information. For details, see [Error Codes](#).

## 12.7 Querying Job Details

### Function

This API is used to query details about jobs, including **databasename**, **tablename**, **file size**, and **export mode**.

### URI

- URI format  
GET/v1.0/{project\_id}/jobs/{job\_id}/detail
- Parameter description

**Table 12-28** URI parameters

| Parameter  | Mandatory | Type   | Description                                                                                                                               |
|------------|-----------|--------|-------------------------------------------------------------------------------------------------------------------------------------------|
| project_id | Yes       | String | Project ID, which is used for resource isolation. For details about how to obtain its value, see <a href="#">Obtaining a Project ID</a> . |
| job_id     | Yes       | String | Job ID. You can get the value by calling <a href="#">Submitting a SQL Job (Recommended)</a> .                                             |

## Request

## Response

**Table 12-29** Response parameters

| Parameter   | Mandatory | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-------------|-----------|---------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| is_success  | Yes       | Boolean | Whether the request is successfully executed. Value <b>true</b> indicates that the request is successfully executed.                                                                                                                                                                                                                                                                                                                                                                            |
| message     | Yes       | String  | System prompt. If execution succeeds, the parameter setting may be left blank.                                                                                                                                                                                                                                                                                                                                                                                                                  |
| job_id      | Yes       | String  | Job ID.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| owner       | Yes       | String  | User who submits a job.                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| start_time  | Yes       | Long    | Time when a job is started. The timestamp is in milliseconds.                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| duration    | Yes       | Long    | Duration for executing the job (unit: millisecond).                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| export_mode | No        | String  | Specified export mode during data export and query result saving.<br>Available values are <b>ErrorIfExists</b> and <b>Overwrite</b> . <ul style="list-style-type: none"><li>• <b>ErrorIfExists</b>: Ensure that the specified export directory does not exist. If the specified export directory exists, an error is reported and the export operation cannot be performed.</li><li>• <b>Overwrite</b>: If you add new files to a specific directory, existing files will be deleted.</li></ul> |

| Parameter          | Mandatory | Type             | Description                                                                               |
|--------------------|-----------|------------------|-------------------------------------------------------------------------------------------|
| data_path          | Yes       | String           | Path to imported or exported files.                                                       |
| data_type          | Yes       | String           | Type of data to be imported or exported. Currently, only CSV and JSON are supported.      |
| database_name      | Yes       | String           | Name of the database where the table, where data is imported or exported, resides.        |
| table_name         | Yes       | String           | Name of the table where data is imported or exported.                                     |
| with_column_header | No        | Boolean          | Whether the imported data contains the column name during the execution of an import job. |
| delimiter          | No        | String           | User-defined data delimiter set when the import job is executed.                          |
| quote_char         | No        | String           | User-defined quotation character set when the import job is executed.                     |
| escape_char        | No        | String           | User-defined escape character set when the import job is executed.                        |
| date_format        | No        | String           | Table date format specified when the import job is executed.                              |
| timestamp_format   | No        | String           | Table time format specified when the import job is executed.                              |
| compress           | No        | String           | Compression mode specified when the export job is executed.                               |
| tags               | No        | Array of objects | Job tags. For details, see <a href="#">Table 12-30</a> .                                  |

**Table 12-30** tags parameter

| Parameter | Mandatory | Type   | Description |
|-----------|-----------|--------|-------------|
| key       | Yes       | String | Tag key     |
| value     | Yes       | String | Tag value   |

## Example Request

None

## Example Response

- Querying jobs of the **Import** type

```
{
 "is_success": true,
 "message": "",
 "data_path": "obs://DLI/computeCharging/test.csv",
 "data_type": "json",
 "database_name": "iam_exist",
 "date_format": "yyyy-MM-dd",
 "delimiter": ",",
 "duration": 1623,
 "escape_char": "\\\",
 "job_id": "a85d7298-ecef-47f9-bb31-499d2099d112",
 "owner": "iam_exist",
 "quote_char": "\\"",
 "start_time": 1517385246111,
 "table_name": "DLI_table20",
 "timestamp_format": "yyyy-MM-dd HH:mm:ss",
 "with_column_header": false
}
```

- Query jobs of the **Export** type

```
{
 "is_success": true,
 "message": "",
 "compress": "none",
 "data_path": "obs://xxx/dli/path6",
 "data_type": "json",
 "database_name": "submitjob",
 "duration": 4142,
 "export_mode": "Overwrite",
 "job_id": "b89fcfb2-de6a-4c6c-b9b2-21f08a2eb85e",
 "owner": "test",
 "start_time": 1524107798024,
 "table_name": "autotest"
}
```

## Status Codes

[Table 12-31](#) describes the status code.

**Table 12-31** Status codes

| Status Code | Description              |
|-------------|--------------------------|
| 200         | The query is successful. |
| 400         | Request error.           |
| 500         | Internal service error.  |

## Error Codes

If an error occurs when this API is invoked, the system does not return the result similar to the preceding example, but returns the error code and error information. For details, see [Error Codes](#).

## 12.8 Checking SQL Syntax

### Function

This API is used to check the SQL syntax.

### URI

- URI format  
POST /v1.0/{project\_id}/jobs/check-sql
- Parameter description

**Table 12-32** URI parameter

| Parameter  | Mandatory | Type   | Description                                                                                                                               |
|------------|-----------|--------|-------------------------------------------------------------------------------------------------------------------------------------------|
| project_id | Yes       | String | Project ID, which is used for resource isolation. For details about how to obtain its value, see <a href="#">Obtaining a Project ID</a> . |

### Request

**Table 12-33** Request parameters

| Parameter  | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                       |
|------------|-----------|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| sql        | Yes       | String | SQL statement that you want to execute.                                                                                                                                                                                                                                                                                                                                                                                           |
| current db | No        | String | Database where the SQL statement is executed.<br><b>NOTE</b> <ul style="list-style-type: none"><li>• If the SQL statement contains <b>db_name</b>, for example, <code>select * from db1.t1</code>, you do not need to set this parameter.</li><li>• If the SQL statement does not contain <b>db_name</b>, the semantics check will fail when you do not set this parameter or set this parameter to an incorrect value.</li></ul> |

## Response

**Table 12-34** Response parameters

| Parameter  | Mandatory | Type    | Description                                                                                                                                  |
|------------|-----------|---------|----------------------------------------------------------------------------------------------------------------------------------------------|
| is_success | No        | Boolean | Indicates whether the request is successfully executed. Value <b>true</b> indicates that the request is successfully executed.               |
| message    | No        | String  | System prompt. If execution succeeds, the parameter setting may be left blank.                                                               |
| job_type   | No        | String  | Type of a job. Job types include the following: <b>DDL</b> , <b>DCL</b> , <b>IMPORT</b> , <b>EXPORT</b> , <b>QUERY</b> , and <b>INSERT</b> . |

## Example Request

Check the syntax of the SQL statement **select \* from t1**.

```
{
 "currentdb": "db1",
 "sql": "select * from t1"
}
```

## Example Response

```
{
 "is_success": true,
 "message": "the sql is ok",
 "job_type": "QUERY"
}
```

## Status Codes

[Table 12-35](#) describes the status code.

**Table 12-35** Status codes

| Status Code | Description                |
|-------------|----------------------------|
| 200         | The request is successful. |
| 400         | Request error.             |
| 500         | Internal service error.    |

## Error Codes

If an error occurs when this API is invoked, the system does not return the result similar to the preceding example, but returns the error code and error information. For details, see [Error Codes](#).

## 12.9 Querying the Job Execution Progress

### Function

This API is used to obtain the job execution progress. If a job is being executed, information about its subjobs can be obtained. If a job has just started or has ended, information about its subjobs cannot be obtained.

### URI

- URI format  
GET /v1/{project\_id}/jobs/{job\_id}/progress
- Parameter description

**Table 12-36** URI parameters

| Parameter  | Mandatory | Type   | Description                                                                                                                               |
|------------|-----------|--------|-------------------------------------------------------------------------------------------------------------------------------------------|
| project_id | Yes       | String | Project ID, which is used for resource isolation. For details about how to obtain its value, see <a href="#">Obtaining a Project ID</a> . |
| job_id     | Yes       | String | Job ID                                                                                                                                    |

### Request

None

### Response

**Table 12-37** Response parameters

| Parameter  | Mandatory | Type    | Description                                                                                                                                      |
|------------|-----------|---------|--------------------------------------------------------------------------------------------------------------------------------------------------|
| is_success | Yes       | Boolean | Indicates whether the request is successfully sent. Value <b>true</b> indicates that the request is successfully sent.                           |
| message    | Yes       | String  | System prompt. If execution succeeds, the parameter setting may be left blank.                                                                   |
| job_id     | No        | String  | ID of a job returned after a job is generated and submitted by using SQL statements. The job ID can be used to query the job status and results. |
| status     | Yes       | String  | Job status. The status can be <b>RUNNING</b> , <b>SCALING</b> , <b>LAUNCHING</b> , <b>FINISHED</b> , <b>FAILED</b> , or <b>CANCELLED</b> .       |

| Parameter  | Mandatory | Type            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|------------|-----------|-----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| sub_job_id | No        | Integer         | ID of a subjob that is running. If the subjob is not running or it is already finished, the subjob ID may be empty.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| progress   | No        | Double          | Progress of a running subjob or the entire job. The value can only be a rough estimate of the subjob progress and does not indicate the detailed job progress. <ul style="list-style-type: none"><li>• If the job is just started or being submitted, the progress is displayed as <b>0</b>. If the job execution is complete, the progress is displayed as <b>1</b>. In this case, progress indicates the running progress of the entire job. Because no subjob is running, <b>sub_job_id</b> is not displayed.</li><li>• If a subjob is running, the running progress of the subjob is displayed. The calculation method of progress is as follows: Number of completed tasks of the subjob/Total number of tasks of the subjob. In this case, progress indicates the running progress of the subjob, and <b>sub_job_id</b> indicates the subjob ID.</li></ul> |
| sub_jobs   | No        | Array of Object | Details about a subjob of a running job. A job may contain multiple subjobs. For details, see <a href="#">Table 12-38</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

**Table 12-38** Parameters in the **sub\_jobs** field

| Parameter       | Mandatory | Type    | Description                                                                                               |
|-----------------|-----------|---------|-----------------------------------------------------------------------------------------------------------|
| id              | No        | Integer | Subjob ID, corresponding to <b>jobId</b> of the open-source spark JobData.                                |
| name            | No        | String  | Subjob name, corresponding to the <b>name</b> of the open-source spark JobData.                           |
| description     | No        | String  | Description of a subjob, corresponding to the <b>description</b> of the open-source spark JobData.        |
| submission_time | No        | String  | Submission time of a subjob, corresponding to the <b>submissionTime</b> of open-source Spark JobData.     |
| completion_time | No        | String  | Completion time of a subjob, corresponding to the <b>completionTime</b> of the open-source Spark JobData. |

| Parameter             | Mandatory | Type             | Description                                                                                                                           |
|-----------------------|-----------|------------------|---------------------------------------------------------------------------------------------------------------------------------------|
| stage_ids             | No        | Array of Integer | Stage ID of the subjob, corresponding to the <b>stageIds</b> of the open-source spark JobData.                                        |
| job_group             | No        | String           | ID of a DLI job, corresponding to the <b>jobGroup</b> of open-source Spark JobData.                                                   |
| status                | No        | String           | Subjob status, corresponding to the <b>status</b> of open-source spark JobData.                                                       |
| num_tasks             | No        | Integer          | Number of subjobs, corresponding to <b>numTasks</b> of the open-source Spark JobData.                                                 |
| num_active_tasks      | No        | Integer          | Number of running tasks in a subjob, corresponding to <b>numActiveTasks</b> of the open-source Spark JobData.                         |
| num_completed_tasks   | No        | Integer          | Number of tasks that have been completed in a subjob, corresponding to <b>numCompletedTasks</b> of open-source Spark JobData.         |
| num_skipped_tasks     | No        | Integer          | Number of tasks skipped in a subjob, corresponding to <b>numSkippedTasks</b> of open-source Spark JobData.                            |
| num_failed_tasks      | No        | Integer          | Number of subtasks that fail to be skipped, corresponding to <b>numFailedTasks</b> of open-source Spark JobData.                      |
| num_killed_tasks      | No        | Integer          | Number of tasks killed in the subjob, corresponding to <b>numKilledTasks</b> of the open-source Spark JobData.                        |
| num_completed_indices | No        | Integer          | Subjob completion index, corresponding to the <b>numCompletedIndices</b> of the open-source Spark JobData.                            |
| num_active_stages     | No        | Integer          | Number of stages that are running in the subjob, corresponding to <b>numActiveStages</b> of the open-source Spark JobData.            |
| num_completed_stages  | No        | Integer          | Number of stages that have been completed in the subjob, corresponding to <b>numCompletedStages</b> of the open-source Spark JobData. |
| num_skipped_stages    | No        | Integer          | Number of stages skipped in the subjob, corresponding to <b>numSkippedStages</b> of the open-source Spark JobData.                    |

| Parameter            | Mandatory | Type                | Description                                                                                                         |
|----------------------|-----------|---------------------|---------------------------------------------------------------------------------------------------------------------|
| num_failed_stages    | No        | Integer             | Number of failed stages in a subjob, corresponding to <b>numFailedStages</b> of the open-source Spark JobData.      |
| killed_tasks_summary | No        | Map<string,integer> | Summary of the killed tasks in the subjob, corresponding to <b>killedTasksSummary</b> of open-source spark JobData. |

## Example Request

None

## Example Response

## Status Codes

[Table 12-39](#) describes the status code.

**Table 12-39** Status codes

| Status Code | Description              |
|-------------|--------------------------|
| 200         | The query is successful. |

| Status Code | Description    |
|-------------|----------------|
| 400         | Request error. |

## Error Codes

If an error occurs when this API is invoked, the system does not return the result similar to the preceding example, but returns the error code and error information. For details, see [Error Codes](#).

**Table 12-40** Error codes

| Error Code | Error Message                                              |
|------------|------------------------------------------------------------|
| DLI.0999   | The queue backend version is too old or the queue is busy. |

# 13 SQL Template-related APIs

## 13.1 Saving a SQL template

### Function

This API is used to store specified SQL statements for future reuse.

### URI

- URI format  
POST /v1.0/{project\_id}/sqls
- Parameter description

**Table 13-1** URI parameter

| Parameter  | Mandatory | Type   | Description                                                                                                                               |
|------------|-----------|--------|-------------------------------------------------------------------------------------------------------------------------------------------|
| project_id | Yes       | String | Project ID, which is used for resource isolation. For details about how to obtain its value, see <a href="#">Obtaining a Project ID</a> . |

### Request

**Table 13-2** Parameters

| Parameter | Mandatory | Type   | Description       |
|-----------|-----------|--------|-------------------|
| sql       | Yes       | String | New SQL template. |

| Parameter   | Mandatory | Type   | Description                                                                                |
|-------------|-----------|--------|--------------------------------------------------------------------------------------------|
| sql_name    | Yes       | String | Name of the SQL template you want to save. The name must be unique in the current project. |
| description | No        | String | Description of the SQL template. The value can be an empty string.                         |
| group       | No        | String | Name of the template group                                                                 |

## Response

**Table 13-3 Parameters**

| Parameter  | Type    | Description                                                                                                                         |
|------------|---------|-------------------------------------------------------------------------------------------------------------------------------------|
| is_success | Boolean | Whether the request is successful                                                                                                   |
| message    | String  | System prompt. If execution succeeds, the message may be left blank. If the execution fails, the value is the cause of the failure. |
| sql_id     | String  | ID of the SQL template                                                                                                              |
| group      | String  | Name of the template group                                                                                                          |

## Example Request

Create a SQL template.

```
{
 "sql": "select * from t1",
 "sql_name": "sql1",
 "description": "use to select t1",
 "group": ""
}
```

## Example Response

```
{
 "is_success": true,
 "message": "",
 "sql_id": "1994b029-3f76-4281-9e35-e370cb4ee26d1501998934432"
}
```

## Status Codes

| Status Code | Description |
|-------------|-------------|
| 200         | OK          |

## Error Codes

For details, see [Error Codes](#).

## 13.2 Checking All SQL Templates

### Function

This API is used to check all SQL templates saved by a user.

### URI

- URI format  
GET /v1.0/{project\_id}/sqls
- Parameter description

**Table 13-4** URI parameter

| Parameter  | Mandatory | Type   | Description                                                                                                                               |
|------------|-----------|--------|-------------------------------------------------------------------------------------------------------------------------------------------|
| project_id | Yes       | String | Project ID, which is used for resource isolation. For details about how to obtain its value, see <a href="#">Obtaining a Project ID</a> . |

**Table 13-5** query parameters

| Parameter | Mandatory | Type   | Description                   |
|-----------|-----------|--------|-------------------------------|
| keyword   | No        | String | Keyword of SQL template names |

### Request

None

## Response

**Table 13-6** Response parameters

| Parameter  | Type            | Description                                                                                                                              |
|------------|-----------------|------------------------------------------------------------------------------------------------------------------------------------------|
| is_success | Boolean         | Whether the request is successful.                                                                                                       |
| message    | String          | System prompt. If execution succeeds, the message may be left blank. If the execution fails, the value will be the cause of the failure. |
| sql_count  | Int             | Total number of SQL templates                                                                                                            |
| sqls       | Array of Object | SQL template information. For details, see <a href="#">Table 13-7</a> .                                                                  |

**Table 13-7** sqls parameters

| Parameter   | Type   | Description                    |
|-------------|--------|--------------------------------|
| sql_id      | String | SQL template ID                |
| sql_name    | String | Name of an SQL template        |
| sql         | String | SQL template text              |
| description | String | Description of an SQL template |
| owner       | String | Creator of the SQL template    |
| group       | String | Name of the template group     |

## Example Request

None

## Example Response

```
{
 "is_success": true,
 "message": "",
 "sql_count": 1,
 "sqls": [
 {

## 13.3 Updating a SQL template

### Function

This API is used to update an SQL template.

### URI

- URI format  
`PUT /v1.0/{project_id}/sqls/{sql_id}`
- Parameter description

**Table 13-8** URI parameters

| Parameter  | Mandatory | Type   | Description                                                                                                                               |
|------------|-----------|--------|-------------------------------------------------------------------------------------------------------------------------------------------|
| project_id | Yes       | String | Project ID, which is used for resource isolation. For details about how to obtain its value, see <a href="#">Obtaining a Project ID</a> . |
| sql_id     | Yes       | String | SQL template ID                                                                                                                           |

### Request

**Table 13-9** Request parameters

| Parameter | Mandatory | Type   | Description                                                                       |
|-----------|-----------|--------|-----------------------------------------------------------------------------------|
| sql       | No        | String | Updated SQL template text.                                                        |
| sql_name  | No        | String | Name of the updated SQL template. The name must be unique in the current project. |

| Parameter   | Mandatory | Type   | Description                                                       |
|-------------|-----------|--------|-------------------------------------------------------------------|
| description | No        | String | Description of an SQL template. This parameter can be left blank. |
| group       | No        | String | SQL template group information.                                   |

## Response

**Table 13-10** Response parameters

| Parameter  | Type    | Description                                                                                                                              |
|------------|---------|------------------------------------------------------------------------------------------------------------------------------------------|
| is_success | Boolean | Whether the request is successful.                                                                                                       |
| message    | String  | System prompt. If execution succeeds, the message may be left blank. If the execution fails, the value will be the cause of the failure. |

## Example Request

Update information about the SQL template, including the SQL statements, template name, template description, and template group information.

```
{
 "sql": "select * from t1",
 "sql_name": "sql1",
 "description": "use to select t1",
 "group": ""
}
```

## Example Response

```
{
 "is_success": true,
 "message": ""
}
```

## Status Codes

| Status Code | Description |
|-------------|-------------|
| 200         | OK          |

## Error Codes

For details, see [Error Codes](#).

## 13.4 Deleting a SQL template

### Function

This API is used to delete SQL templates in batches.

### URI

- URI format  
POST /v1.0/{project\_id}/sqls-deletion
- Parameter description

**Table 13-11** URI parameter

| Parameter  | Mandatory | Type   | Description                                                                                                                               |
|------------|-----------|--------|-------------------------------------------------------------------------------------------------------------------------------------------|
| project_id | Yes       | String | Project ID, which is used for resource isolation. For details about how to obtain its value, see <a href="#">Obtaining a Project ID</a> . |

### Request

**Table 13-12** Request parameter

| Parameter | Mandatory | Type          | Description                              |
|-----------|-----------|---------------|------------------------------------------|
| sql_ids   | Yes       | Array<String> | IDs of SQL templates you want to delete. |

### Response

**Table 13-13** Response parameters

| Parameter  | Type    | Description                                                                                                                              |
|------------|---------|------------------------------------------------------------------------------------------------------------------------------------------|
| is_success | Boolean | Whether the request is successful.                                                                                                       |
| message    | String  | System prompt. If execution succeeds, the message may be left blank. If the execution fails, the value will be the cause of the failure. |

## Example Request

Delete the SQL template whose ID is **27b79c50-4ac6-4050-8b81-8f0dbd7be184**.

```
{
 "sql_ids": ["27b79c50-4ac6-4050-8b81-8f0dbd7be184"]
}
```

## Example Response

```
{
 "is_success": true,
 "message": ""
}
```

## Status Codes

| Status Code | Description |
|-------------|-------------|
| 200         | OK          |

## Error Codes

For details, see [Error Codes](#).

# 14 Flink Job-related APIs

## 14.1 Creating a SQL Job

### Function

This API is used to create a Flink streaming SQL job.

### URI

- URI format  
POST /v1.0/{project\_id}/streaming/sql-jobs
- Parameter description

**Table 14-1** URI parameter

| Parameter  | Mandatory | Type   | Description                                                                                                                               |
|------------|-----------|--------|-------------------------------------------------------------------------------------------------------------------------------------------|
| project_id | Yes       | String | Project ID, which is used for resource isolation. For details about how to obtain its value, see <a href="#">Obtaining a Project ID</a> . |

### Request

**Table 14-2** Request parameters

| Parameter | Mandatory | Type   | Description                                                |
|-----------|-----------|--------|------------------------------------------------------------|
| name      | Yes       | String | Name of the job. The value can contain 1 to 57 characters. |
| desc      | No        | String | Job description. Length range: 0 to 512 characters.        |

| Parameter   | Mandatory | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                             |
|-------------|-----------|---------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| template_id | No        | Integer | Template ID.<br>If both <b>template_id</b> and <b>sql_body</b> are specified, <b>sql_body</b> is used. If <b>template_id</b> is specified but <b>sql_body</b> is not, fill <b>sql_body</b> with the <b>template_id</b> value.                                                                                                                                                                                           |
| queue_name  | No        | String  | Name of a queue. The value can contain 0 to 128 characters.                                                                                                                                                                                                                                                                                                                                                             |
| sql_body    | No        | String  | Stream SQL statement, which includes at least the following three parts: source, query, and sink. Length range: 1,024 x 1,024 characters.                                                                                                                                                                                                                                                                               |
| run_mode    | No        | String  | Job running mode. The options are as follows: <ul style="list-style-type: none"><li>• <b>shared_cluster</b>: indicates that the job is running on a shared cluster.</li><li>• <b>exclusive_cluster</b>: indicates that the job is running on an exclusive cluster.</li><li>• <b>edge_node</b>: indicates that the job is running on an edge node.</li></ul> The default value is <b>shared_cluster</b> .                |
| cu_number   | No        | Integer | Number of CUs selected for a job. The default value is 2.<br>Sum of the number of compute units and job manager CUs of DLI. CU is also the billing unit of DLI. One CU equals one vCPU and 4 GB of memory. The value is the number of CUs required for job running and cannot exceed the number of CUs in the bound queue. For details about how to set the number of CUs of JobManager, see <b>manager_cu_number</b> . |

| Parameter           | Mandatory | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|---------------------|-----------|---------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| parallel_number     | No        | Integer | <p>Number of parallel jobs set by a user. The default value is <b>1</b>.</p> <p>Number of Flink SQL jobs that run at the same time. Properly increasing the number of parallel threads improves the overall computing capability of the job. However, the switchover overhead caused by the increase of threads must be considered. This value cannot be greater than four times the compute units (number of CUs minus the number of JobManager CUs).</p> <p>For details about how to set the number of JobManager CUs, see <a href="#">manager_cu_number</a>.</p> |
| checkpoint_enabled  | No        | Boolean | <p>Whether to enable the automatic job snapshot function.</p> <ul style="list-style-type: none"><li>• <b>true</b>: indicates to enable the automatic job snapshot function.</li><li>• <b>false</b>: indicates to disable the automatic job snapshot function.</li><li>• Default value: <b>false</b></li></ul>                                                                                                                                                                                                                                                       |
| checkpoint_mode     | No        | Integer | <p>Snapshot mode. There are two options:</p> <ul style="list-style-type: none"><li>• <b>1: ExactlyOnce</b>, indicates that data is processed only once.</li><li>• <b>2: AtLeastOnce</b>, indicates that data is processed at least once.</li></ul> <p>The default value is <b>1</b>.</p>                                                                                                                                                                                                                                                                            |
| checkpoint_interval | No        | Integer | Snapshot interval. The unit is second. The default value is <b>10</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| obs_bucket          | No        | String  | <p>OBS bucket where users are authorized to save the snapshot. This parameter is valid only when <b>checkpoint_enabled</b> is set to <b>true</b>.</p> <p>OBS bucket where users are authorized to save the snapshot. This parameter is valid only when <b>log_enabled</b> is set to <b>true</b>.</p>                                                                                                                                                                                                                                                                |
| log_enabled         | No        | Boolean | Whether to enable the function of uploading job logs to users' OBS buckets. The default value is <b>false</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| smn_topic           | No        | String  | SMN topic. If a job fails, the system will send a message to users subscribed to the SMN topic.                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| Parameter              | Mandatory | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|------------------------|-----------|---------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| restart_when_exception | No        | Boolean | Whether to enable the function of automatically restarting a job upon job exceptions. The default value is <b>false</b> .                                                                                                                                                                                                                                                                                                                                                    |
| idle_state_retenion    | No        | Integer | Retention time of the idle state. The unit is second. The default value is <b>3600</b> .                                                                                                                                                                                                                                                                                                                                                                                     |
| job_type               | No        | String  | <p>Job type. The options include <b>flink_sql_job</b> and <b>flink_opensource_sql_job</b>.<br/>The default value is <b>flink_opensource_sql_job</b>.</p> <ul style="list-style-type: none"><li>• If <b>run_mode</b> is set to <b>exclusive_cluster</b>, <b>job_type</b> must be set to <b>flink_sql_job</b> or <b>flink_opensource_sql_job</b>.</li><li>• If <b>run_mode</b> is set to <b>shared_cluster</b>, <b>job_type</b> must be set to <b>flink_sql_job</b>.</li></ul> |
| dirty_data_strategy    | No        | String  | <p>Dirty data policy of a job.</p> <ul style="list-style-type: none"><li>• <b>2:obsDir</b>: Save. <b>obsDir</b> specifies the path for storing dirty data.</li><li>• <b>1</b>: Trigger a job exception</li><li>• <b>0</b>: Ignore</li></ul> <p>The default value is <b>0</b>.</p>                                                                                                                                                                                            |
| udf_jar_url            | No        | String  | Name of the resource package that has been uploaded to the DLI resource management system. The UDF Jar file of the SQL job is specified by this parameter.                                                                                                                                                                                                                                                                                                                   |
| manager_cu_number      | No        | Integer | Number of CUs in the JobManager selected for a job. The default value is <b>1</b> .                                                                                                                                                                                                                                                                                                                                                                                          |
| tm_cus                 | No        | Integer | Number of CUs for each TaskManager. The default value is <b>1</b> .                                                                                                                                                                                                                                                                                                                                                                                                          |
| tm_slot_num            | No        | Integer | Number of slots in each TaskManager. The default value is <b>(parallel_number*tm_cus)/(cu_number-manager_cu_number)</b> .                                                                                                                                                                                                                                                                                                                                                    |
| resume_checkpoint      | No        | Boolean | Whether the abnormal restart is recovered from the checkpoint.                                                                                                                                                                                                                                                                                                                                                                                                               |
| resume_max_num         | No        | Integer | Maximum number of retry times upon exceptions. The unit is times/hour. Value range: -1 or greater than 0. The default value is <b>-1</b> , indicating that the number of times is unlimited.                                                                                                                                                                                                                                                                                 |

| Parameter      | Mandatory | Type             | Description                                                             |
|----------------|-----------|------------------|-------------------------------------------------------------------------|
| tags           | No        | Array of objects | Label of a Flink SQL job. For details, see <a href="#">Table 14-3</a> . |
| runtime_config | No        | String           | Customizes optimization parameters when a Flink job is running.         |
| flink_version  | No        | String           | Flink version.                                                          |

**Table 14-3** tags parameters

| Parameter | Mandatory | Type   | Description                                                                                                                                                                                                              |
|-----------|-----------|--------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| key       | Yes       | String | Tag key<br><b>NOTE</b><br>A tag key can contain a maximum of 128 characters. Only letters, digits, spaces, and special characters (_:=+@) are allowed, but the key cannot start or end with a space or start with _sys_. |
| value     | Yes       | String | Tag value<br><b>NOTE</b><br>A tag value can contain a maximum of 255 characters. Only letters, digits, spaces, and special characters (_:=+@) are allowed. The value cannot start or end with a space.                   |

## Response

**Table 14-4** Response parameters

| Parameter  | Mandatory | Type   | Description                                                                                                                    |
|------------|-----------|--------|--------------------------------------------------------------------------------------------------------------------------------|
| is_success | No        | String | Indicates whether the request is successfully executed. Value <b>true</b> indicates that the request is successfully executed. |
| message    | No        | String | Message content.                                                                                                               |
| job        | No        | Object | Information about the job status. For details, see <a href="#">Table 14-5</a> .                                                |

**Table 14-5** job parameters

| Parameter   | Mandatory | Type   | Description                                                                                                               |
|-------------|-----------|--------|---------------------------------------------------------------------------------------------------------------------------|
| job_id      | Yes       | Long   | Job ID.                                                                                                                   |
| status_name | No        | String | Name of job status. For details, see the description of the <b>status</b> field in <a href="#">Querying Job Details</a> . |
| status_desc | No        | String | Status description. Causes and suggestions for the abnormal status.                                                       |

## Example Request

Use the template whose ID is **100000** to create a Flink SQL job named **myjob**. The job runs in dedicated mode on the **testQueue** queue.

```
{
 "name": "myjob",
 "desc": "This is a job used for counting characters.",
 "template_id": 100000,
 "queue_name": "testQueue",
 "sql_body": "select * from source_table",
 "run_mode": "exclusive_cluster",
 "cu_number": 2,
 "parallel_number": 1,
 "checkpoint_enabled": false,
 "checkpoint_mode": "exactly_once",
 "checkpoint_interval": 0,
 "obs_bucket": "my_obs_bucket",
 "log_enabled": false,
 "restart_when_exception": false,
 "idle_state_retention": 3600,
 "job_type": "flink_sql_job",
 "dirty_data_strategy": "0",
 "udf_jar_url": "group/test.jar"
}
```

## Example Response

```
{
 "is_success": "true",
 "message": "A DLI job is created successfully.",
 "job": {
 "job_id": 148,
 "status_name": "job_init",
 "status_desc": ""
 }
}
```

## Status Codes

[Table 14-6](#) describes status codes.

**Table 14-6** Status codes

| Status Code | Description                      |
|-------------|----------------------------------|
| 200         | The job is created successfully. |
| 400         | The input parameter is invalid.  |

## Error Codes

If an error occurs when this API is invoked, the system does not return the result similar to the preceding example, but returns the error code and error information. For details, see [Error Codes](#).

## 14.2 Updating a SQL Job

### Function

This API is used to modify a Flink SQL job.

### URI

- URI format  
`PUT /v1.0/{project_id}/streaming/sql-jobs/{job_id}`
- Parameter description

**Table 14-7** URI parameters

| Parameter  | Mandatory | Type   | Description                                                                                                                               |
|------------|-----------|--------|-------------------------------------------------------------------------------------------------------------------------------------------|
| project_id | Yes       | String | Project ID, which is used for resource isolation. For details about how to obtain its value, see <a href="#">Obtaining a Project ID</a> . |
| job_id     | Yes       | Long   | Job ID. Refer to <a href="#">Creating a SQL Job</a> to obtain the value.                                                                  |

### Request

**Table 14-8** Request parameters

| Parameter | Mandatory | Type   | Description                                      |
|-----------|-----------|--------|--------------------------------------------------|
| name      | No        | String | Name of a job. Length range: 0 to 57 characters. |

| Parameter          | Mandatory | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                              |
|--------------------|-----------|---------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| desc               | No        | String  | Job description. Length range: 0 to 512 characters.                                                                                                                                                                                                                                                                                                                                                      |
| queue_name         | No        | String  | Name of a queue. The value can contain 0 to 128 characters.                                                                                                                                                                                                                                                                                                                                              |
| sql_body           | No        | String  | Stream SQL statement, which includes at least the following three parts: source, query, and sink. Length range: 0 to 1024x1024 characters.                                                                                                                                                                                                                                                               |
| run_mode           | No        | String  | Job running mode. The options are as follows: <ul style="list-style-type: none"><li>• <b>shared_cluster</b>: indicates that the job is running on a shared cluster.</li><li>• <b>exclusive_cluster</b>: indicates that the job is running on an exclusive cluster.</li><li>• <b>edge_node</b>: indicates that the job is running on an edge node.</li></ul> The default value is <b>shared_cluster</b> . |
| cu_number          | No        | Integer | Number of CUs selected for a job. The default value is <b>2</b> .                                                                                                                                                                                                                                                                                                                                        |
| parallel_number    | No        | Integer | Number of parallel jobs set by a user. The default value is <b>1</b> .                                                                                                                                                                                                                                                                                                                                   |
| checkpoint_enabled | No        | Boolean | Whether to enable the automatic job snapshot function. <ul style="list-style-type: none"><li>• <b>true</b>: indicates to enable the automatic job snapshot function.</li><li>• <b>false</b>: indicates to disable the automatic job snapshot function.</li><li>• Default value: <b>false</b></li></ul>                                                                                                   |
| checkpoint_mode    | No        | Integer | Snapshot mode. There are two options: <ul style="list-style-type: none"><li>• <b>1: ExactlyOnce</b>, indicates that data is processed only once.</li><li>• <b>2: at_least_once</b>, indicates that data is processed at least once.</li></ul> The default value is <b>1</b> .                                                                                                                            |

| Parameter              | Mandatory | Type             | Description                                                                                                                                                                                                                                                                                 |
|------------------------|-----------|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| checkpoint_interval    | No        | Integer          | Snapshot interval. The unit is second. The default value is <b>10</b> .                                                                                                                                                                                                                     |
| obs_bucket             | No        | String           | OBS bucket where users are authorized to save the snapshot. This parameter is valid only when <b>checkpoint_enabled</b> is set to <b>true</b> .<br>OBS bucket where users are authorized to save the snapshot. This parameter is valid only when <b>log_enabled</b> is set to <b>true</b> . |
| log_enabled            | No        | Boolean          | Whether to enable the function of uploading job logs to users' OBS buckets. The default value is <b>false</b> .                                                                                                                                                                             |
| smn_topic              | No        | String           | SMN topic. If a job fails, the system will send a message to users subscribed to the SMN topic.                                                                                                                                                                                             |
| restart_when_exception | No        | Boolean          | Whether to enable the function of automatically restarting a job upon job exceptions. The default value is <b>false</b> .                                                                                                                                                                   |
| idle_state_retention   | No        | Integer          | Expiration time, in seconds. The default value is <b>3600</b> .                                                                                                                                                                                                                             |
| edge_group_ids         | No        | Array of Strings | List of edge computing group IDs. Use commas (,) to separate multiple IDs.                                                                                                                                                                                                                  |
| dirty_data_strategy    | No        | String           | Dirty data policy of a job. <ul style="list-style-type: none"><li>• <b>2:obsDir</b>: Save. <b>obsDir</b> specifies the path for storing dirty data.</li><li>• <b>1</b>: Trigger a job exception</li><li>• <b>0</b>: Ignore</li></ul> The default value is <b>0</b> .                        |
| udf_jar_url            | No        | String           | Name of the resource package that has been uploaded to the DLI resource management system. The UDF Jar file of the SQL job is specified by this parameter.                                                                                                                                  |
| manager_cu_number      | No        | Integer          | Number of CUs in the JobManager selected for a job. The default value is <b>1</b> .                                                                                                                                                                                                         |

| Parameter               | Mandatory | Type    | Description                                                                                                                                                                                                                                                                                                                                                               |
|-------------------------|-----------|---------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| tm_cus                  | No        | Integer | Number of CUs for each TaskManager. The default value is <b>1</b> .                                                                                                                                                                                                                                                                                                       |
| tm_slot_num             | No        | Integer | Number of slots in each TaskManager. The default value is <b>(parallel_number*tm_cus)/(cu_number-manager_cu_number)</b> .                                                                                                                                                                                                                                                 |
| operator_config         | No        | String  | Degree of parallelism (DOP) of an operator.                                                                                                                                                                                                                                                                                                                               |
| resume_checkpoint       | No        | Boolean | Whether the abnormal restart is recovered from the checkpoint.                                                                                                                                                                                                                                                                                                            |
| resume_max_num          | No        | Integer | Maximum number of retry times upon exceptions. The unit is times/hour. Value range: -1 or greater than 0. The default value is <b>-1</b> , indicating that the number of times is unlimited.                                                                                                                                                                              |
| static_estimator_config | No        | String  | Traffic or hit ratio of each operator, which is a string in JSON format. Example:<br><pre>{"operator_list": [{"id":"0a448493b4782967b150582570326227","rate_factor":0.55}, {"id":"6d2677a0ecc3fd8df0b72ec675edf8f4","rate_factor":1}, {"id":"ea632d67b7d595e5b851708ae9ad79d6","rate_factor":0.55}, {"id":"bc764cd8ddf7a0cff126f51c16239658","output_rate":2000}]} </pre> |
| runtime_config          | No        | String  | Customizes optimization parameters when a Flink job is running.                                                                                                                                                                                                                                                                                                           |
| flink_version           | No        | String  | Flink version. Currently, only 1.10 and 1.12 are supported.                                                                                                                                                                                                                                                                                                               |

## Response

**Table 14-9** Response parameters

| Parameter  | Mandatory | Type   | Description                                                                                                                    |
|------------|-----------|--------|--------------------------------------------------------------------------------------------------------------------------------|
| is_success | No        | String | Indicates whether the request is successfully executed. Value <b>true</b> indicates that the request is successfully executed. |
| message    | No        | String | Message content.                                                                                                               |
| job        | No        | Object | Information about job update. For details, see <a href="#">Table 14-10</a> .                                                   |

**Table 14-10** job parameter

| Parameter   | Mandatory | Type | Description                                |
|-------------|-----------|------|--------------------------------------------|
| update_time | No        | Long | Job update time, expressed by milliseconds |

## Example Request

Update an existing SQL job. The updated job is named **myjob** and runs on **testQueue** in shared mode.

```
{
 "name": "myjob",
 "desc": "My first job",
 "queue_name": "testQueue",
 "sql_body": "select * from source_table",
 "run_mode": "shared_cluster",
 "cu_number": 4,
 "parallel_number": 4,
 "checkpoint_enabled": false,
 "checkpoint_mode": "exactly_once",
 "checkpoint_interval": 10,
 "obs_bucket": "",
 "log_enabled": false,
 "smn_topic": "",
 "restart_when_exception": false,
 "idle_state_retention": 3600,
 "edge_group_ids": [
 "62de1e1c-066e-48a8-a79d-f461a31b2ee1",
 "2eb00f85-99f2-4144-bcb7-d39ff47f9002"
],
 "dirty_data_strategy": "0",
 "udf_jar_url": "group/test.jar"
}
```

## Example Response

```
{
 "is_success": "true",
}
```

```
"message": "The job is updated successfully.",
"job": {
 "update_time": 1578905682534
}
```

## Status Codes

[Table 14-11](#) describes status codes.

**Table 14-11** Status codes

| Status Code | Description                      |
|-------------|----------------------------------|
| 200         | The job is updated successfully. |
| 400         | The input parameter is invalid.  |

## Error Codes

If an error occurs when this API is invoked, the system does not return the result similar to the preceding example, but returns the error code and error information. For details, see [Error Codes](#).

## 14.3 Creating a Flink Jar job

### Function

This API is used to create custom jobs, which currently support the JAR format and run in dedicated queues.

### URI

- URI format  
POST /v1.0/{project\_id}/streaming/flink-jobs
- Parameter description

**Table 14-12** URI parameter

| Parameter  | Mandatory | Type   | Description                                                                                                                               |
|------------|-----------|--------|-------------------------------------------------------------------------------------------------------------------------------------------|
| project_id | Yes       | String | Project ID, which is used for resource isolation. For details about how to obtain its value, see <a href="#">Obtaining a Project ID</a> . |

## Request

**Table 14-13** Parameter description

| Parameter              | Mandatory | Type    | Description                                                                                                                                                                                                                                               |
|------------------------|-----------|---------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| name                   | Yes       | String  | Name of the job. The value can contain 1 to 57 characters.                                                                                                                                                                                                |
| desc                   | No        | String  | Job description. Length range: 0 to 512 characters.                                                                                                                                                                                                       |
| queue_name             | No        | String  | Name of a queue. The value can contain 0 to 128 characters.                                                                                                                                                                                               |
| cu_number              | No        | Integer | Number of CUs selected for a job.                                                                                                                                                                                                                         |
| manager_cu_number      | No        | Integer | Number of CUs on the management node selected by the user for a job, which corresponds to the number of Flink job managers. The default value is 1.                                                                                                       |
| parallel_number        | No        | Integer | Number of parallel operations selected for a job.                                                                                                                                                                                                         |
| log_enabled            | No        | Boolean | Whether to enable the job log function. <ul style="list-style-type: none"><li>• <b>true</b>: indicates to enable the job log function.</li><li>• <b>false</b>: indicates to disable the job log function.</li><li>• Default value: <b>false</b></li></ul> |
| obs_bucket             | No        | String  | OBS bucket where users are authorized to save logs when <b>log_enabled</b> is set to <b>true</b> .                                                                                                                                                        |
| smn_topic              | No        | String  | SMN topic. If a job fails, the system will send a message to users subscribed to the SMN topic.                                                                                                                                                           |
| main_class             | No        | String  | Job entry class.                                                                                                                                                                                                                                          |
| entrypoint_args        | No        | String  | Job entry parameter. Multiple parameters are separated by spaces.                                                                                                                                                                                         |
| restart_when_exception | No        | Boolean | Whether to enable the function of restart upon exceptions. The default value is <b>false</b> .                                                                                                                                                            |

| Parameter        | Mandatory | Type             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|------------------|-----------|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| entrypoint       | No        | String           | Name of the package that has been uploaded to the DLI resource management system. This parameter is used to customize the JAR file where the job main class is located.                                                                                                                                                                                                                                                                                                                                                                                        |
| dependency_jars  | No        | Array of Strings | Name of the package that has been uploaded to the DLI resource management system. This parameter is used to customize other dependency packages.<br><br>Example: <b>myGroup/test.jar,myGroup/test1.jar</b> .                                                                                                                                                                                                                                                                                                                                                   |
| dependency_files | No        | Array of Strings | Name of the resource package that has been uploaded to the DLI resource management system. This parameter is used to customize dependency files.<br><br>Example: <b>myGroup/test.csv,myGroup/test1.csv</b> .<br><br>You can add the following content to the application to access the corresponding dependency file: In the command, <b>fileName</b> indicates the name of the file to be accessed, and <b>ClassName</b> indicates the name of the class that needs to access the file.<br>ClassName.class.getClassLoader().getResource("user Data/fileName") |
| tm_cus           | No        | Integer          | Number of CUs for each TaskManager. The default value is <b>1</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| tm_slot_num      | No        | Integer          | Number of slots in each TaskManager. The default value is <b>(parallel_number*tm_cus)/(cu_number-manager_cu_number)</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| feature          | No        | String           | Job feature. Type of the Flink image used by a job. <ul style="list-style-type: none"><li>• <b>basic</b>: indicates that the basic Flink image provided by DLI is used.</li><li>• <b>custom</b>: indicates that the user-defined Flink image is used.</li></ul>                                                                                                                                                                                                                                                                                                |

| Parameter         | Mandatory | Type             | Description                                                                                                                                                                                                                                                                                                                                                                      |
|-------------------|-----------|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| flink_version     | No        | String           | Flink version. This parameter is valid only when <b>feature</b> is set to <b>basic</b> . You can use this parameter with the <b>feature</b> parameter to specify the version of the DLI basic Flink image used for job running.                                                                                                                                                  |
| image             | No        | String           | Custom image. The format is <b>Organization name/Image name:Image version</b> .<br>This parameter is valid only when <b>feature</b> is set to <b>custom</b> . You can use this parameter with the <b>feature</b> parameter to specify a user-defined Flink image for job running. For details about how to use custom images, see <a href="#">Data Lake Insight User Guide</a> . |
| resume_checkpoint | No        | Boolean          | Whether the abnormal restart is recovered from the checkpoint.                                                                                                                                                                                                                                                                                                                   |
| resume_max_num    | No        | Integer          | Maximum number of retry times upon exceptions. The unit is times/hour. Value range: -1 or greater than 0. The default value is <b>-1</b> , indicating that the number of times is unlimited.                                                                                                                                                                                     |
| checkpoint_path   | No        | String           | Storage address of the checkpoint in the JAR file of the user. The path must be unique.                                                                                                                                                                                                                                                                                          |
| tags              | No        | Array of objects | Label of a Flink JAR job. For details, see <a href="#">Table 14-14</a> .                                                                                                                                                                                                                                                                                                         |
| runtime_config    | No        | String           | Customizes optimization parameters when a Flink job is running.                                                                                                                                                                                                                                                                                                                  |

**Table 14-14** tags parameter

| Parameter | Mandatory | Type   | Description                                                                                                                                                                                                                         |
|-----------|-----------|--------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| key       | Yes       | String | Tag key.<br><b>NOTE</b><br>A tag key can contain a maximum of 128 characters. Only letters, digits, spaces, and special characters (_:=+@) are allowed, but the value cannot start or end with a space or start with <b>_sys_</b> . |

| Parameter | Mandatory | Type   | Description                                                                                                                                                                                                       |
|-----------|-----------|--------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| value     | Yes       | String | <p>Tag key.</p> <p><b>NOTE</b><br/>A tag value can contain a maximum of 255 characters. Only letters, digits, spaces, and special characters (_:=+@) are allowed. The value cannot start or end with a space.</p> |

## Response

**Table 14-15** Response parameters

| Parameter  | Mandatory | Type   | Description                                                                                                                    |
|------------|-----------|--------|--------------------------------------------------------------------------------------------------------------------------------|
| is_success | No        | String | Indicates whether the request is successfully executed. Value <b>true</b> indicates that the request is successfully executed. |
| message    | No        | String | Message content.                                                                                                               |
| job        | No        | Object | Information about the job status. For details, see <a href="#">Table 14-16</a> .                                               |

**Table 14-16** job parameters

| Parameter   | Mandatory | Type   | Description                                                         |
|-------------|-----------|--------|---------------------------------------------------------------------|
| job_id      | Yes       | Long   | Job ID.                                                             |
| status_name | No        | String | Name of job status.                                                 |
| status_desc | No        | String | Status description. Causes and suggestions for the abnormal status. |

## Example Request

Create a Flink Jar job named **test**, set the job to be executed on **testQueue**, set the number of CUs used by the job, and enable the job log function.

```
{
 "name": "test",
 "desc": "job for test",
 "queue_name": "testQueue",
 "manager_cu_number": 1,
 "cu_number": 2,
 "parallel_number": 1,
}
```

```
"tm_cus": 1,
"tm_slot_num": 1,
"log_enabled": true,
"obs_bucket": "bucketName",
"smn_topic": "topic",
"main_class": "org.apache.flink.examples.streaming.JavaQueueStream",
"restart_when_exception": false,
"entrypoint": "javaQueueStream.jar",
"entrypoint_args": "-windowSize 2000 -rate 3",
"dependency_jars": [
 "myGroup/test.jar",
 "myGroup/test1.jar"
],
"dependency_files": [
 "myGroup/test.csv",
 "myGroup/test1.csv"
]
}
```

## Example Response

```
{
 "is_success": true,
 "message": "A Flink job is created successfully.",
 "job": {
 "job_id": 138,
 "status_name": "job_init",
 "status_desc": ""
 }
}
```

## Status Codes

[Table 14-17](#) describes status codes.

**Table 14-17** Status codes

| Status Code | Description                                   |
|-------------|-----------------------------------------------|
| 200         | The custom Flink job is created successfully. |
| 400         | The input parameter is invalid.               |

## Error Codes

If an error occurs when this API is invoked, the system does not return the result similar to the preceding example, but returns the error code and error information. For details, see [Error Codes](#).

## 14.4 Updating a Flink Jar Job

### Function

This API is used to update custom jobs, which currently support the JAR format and run in dedicated queues.

## URI

- URI format  
PUT /v1.0/{*project\_id*}/streaming/flink-jobs/{*job\_id*}
- Parameter description

**Table 14-18** URI parameters

| Parameter  | Mandatory | Type   | Description                                                                                                                               |
|------------|-----------|--------|-------------------------------------------------------------------------------------------------------------------------------------------|
| project_id | Yes       | String | Project ID, which is used for resource isolation. For details about how to obtain its value, see <a href="#">Obtaining a Project ID</a> . |
| job_id     | Yes       | Long   | Job ID. Refer to <a href="#">Creating a Flink Jar job</a> to obtain the value.                                                            |

## Request

**Table 14-19** Parameter description

| Parameter         | Mandatory | Type    | Description                                                                                                                                                                                                                                               |
|-------------------|-----------|---------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| name              | No        | String  | Name of the job. Length range: 0 to 57 characters.                                                                                                                                                                                                        |
| desc              | No        | String  | Job description. Length range: 0 to 512 characters.                                                                                                                                                                                                       |
| queue_name        | No        | String  | Name of a queue. Length range: 1 to 128 characters.                                                                                                                                                                                                       |
| cu_number         | No        | Integer | Number of CUs selected for a job. The default value is <b>2</b> .                                                                                                                                                                                         |
| manager_cu_number | No        | Integer | Number of CUs on the management node selected by the user for a job, which corresponds to the number of Flink job managers. The default value is <b>1</b> .                                                                                               |
| parallel_number   | No        | Integer | Number of parallel operations selected for a job. The default value is <b>1</b> .                                                                                                                                                                         |
| log_enabled       | No        | Boolean | Whether to enable the job log function. <ul style="list-style-type: none"><li>• <b>true</b>: indicates to enable the job log function.</li><li>• <b>false</b>: indicates to disable the job log function.</li><li>• Default value: <b>false</b></li></ul> |

| Parameter              | Mandatory | Type             | Description                                                                                                                                                                                                                                                     |
|------------------------|-----------|------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| obs_bucket             | No        | String           | OBS bucket where users are authorized to save logs when <b>log_enabled</b> is set to <b>true</b> .                                                                                                                                                              |
| smn_topic              | No        | String           | SMN topic. If a job fails, the system will send a message to users subscribed to the SMN topic.                                                                                                                                                                 |
| main_class             | No        | String           | Job entry class.                                                                                                                                                                                                                                                |
| entrypoint_args        | No        | String           | Job entry parameter. Multiple parameters are separated by spaces.                                                                                                                                                                                               |
| restart_when_exception | No        | Boolean          | Whether to enable the function of restart upon exceptions. The default value is <b>false</b> .                                                                                                                                                                  |
| entrypoint             | No        | String           | Name of the package that has been uploaded to the DLI resource management system. This parameter is used to customize the JAR file where the job main class is located.                                                                                         |
| dependency_jars        | No        | Array of Strings | Name of the package that has been uploaded to the DLI resource management system. This parameter is used to customize other dependency packages.<br>Example: <b>myGroup/test.jar,myGroup/test1.jar</b> .                                                        |
| dependency_files       | No        | Array of Strings | Name of the resource package that has been uploaded to the DLI resource management system. This parameter is used to customize dependency files.<br>Example: <b>myGroup/test.csv,myGroup/test1.csv</b> .                                                        |
| tm_cus                 | No        | Integer          | Number of CUs for each TaskManager. The default value is <b>1</b> .                                                                                                                                                                                             |
| tm_slot_num            | No        | Integer          | Number of slots in each TaskManager. The default value is <b>(parallel_number*tm_cus)/(cu_number-manager_cu_number)</b> .                                                                                                                                       |
| feature                | No        | String           | Job feature. Type of the Flink image used by a job. <ul style="list-style-type: none"><li>• <b>basic</b>: indicates that the basic Flink image provided by DLI is used.</li><li>• <b>custom</b>: indicates that the user-defined Flink image is used.</li></ul> |

| Parameter         | Mandatory | Type    | Description                                                                                                                                                                                                                                                                                                                                                                      |
|-------------------|-----------|---------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| flink_version     | No        | String  | Flink version. This parameter is valid only when <b>feature</b> is set to <b>basic</b> . You can use this parameter with the <b>feature</b> parameter to specify the version of the DLI basic Flink image used for job running.                                                                                                                                                  |
| image             | No        | String  | Custom image. The format is <b>Organization name/Image name:Image version</b> .<br>This parameter is valid only when <b>feature</b> is set to <b>custom</b> . You can use this parameter with the <b>feature</b> parameter to specify a user-defined Flink image for job running. For details about how to use custom images, see <a href="#">Data Lake Insight User Guide</a> . |
| resume_checkpoint | No        | Boolean | Whether the abnormal restart is recovered from the checkpoint.                                                                                                                                                                                                                                                                                                                   |
| resume_max_num    | No        | Integer | Maximum number of retry times upon exceptions. The unit is times/hour. Value range: -1 or greater than 0. The default value is -1, indicating that the number of times is unlimited.                                                                                                                                                                                             |
| checkpoint_path   | No        | String  | Storage address of the checkpoint in the JAR file of the user. The path must be unique.                                                                                                                                                                                                                                                                                          |
| runtime_config    | No        | String  | Customizes optimization parameters when a Flink job is running.                                                                                                                                                                                                                                                                                                                  |
| job_type          | No        | String  | Job types.                                                                                                                                                                                                                                                                                                                                                                       |

## Response

**Table 14-20** Response parameters

| Parameter  | Mandatory | Type   | Description                                                                                                          |
|------------|-----------|--------|----------------------------------------------------------------------------------------------------------------------|
| is_success | No        | String | Whether the request is successfully executed. Value <b>true</b> indicates that the request is successfully executed. |
| message    | No        | String | Message content.                                                                                                     |
| job        | No        | object | Information about job update. For details, see <a href="#">Table 14-21</a> .                                         |

**Table 14-21 job parameters**

| Parameter   | Mandatory | Type | Description                                          |
|-------------|-----------|------|------------------------------------------------------|
| update_time | No        | Long | Time when a job is updated. The unit is millisecond. |

## Example Request

Update the Flink Jar job information. After the update, the job name is **test1**, the job execution queue is **testQueue**, and the job log function is disabled.

```
{
 "name": "test1",
 "desc": "job for test",
 "job_type": "flink_jar_job",
 "queue_name": "testQueue",
 "manager_cu_number": 1,
 "cu_number": 2,
 "parallel_number": 1,
 "log_enabled": false,
 "main_class": "org.apache.flink.examples.streaming.JavaQueueStream",
 "restart_when_exception": false,
 "entrypoint": "FemaleInfoCollec.jar",
 "dependency_jars": [
 "myGroup/test.jar",
 "myGroup/test1.jar"
],
 "dependency_files": [
 "myGroup/test.csv",
 "myGroup/test1.csv"
]
}
```

## Example Response

```
{
 "is_success": true,
 "message": "The Flink job is updated successfully.",
 "job": {
 "update_time": 1516952770835
 }
}
```

## Status Codes

**Table 14-22** describes status codes.

**Table 14-22** Status codes

| Status Code | Description                                   |
|-------------|-----------------------------------------------|
| 200         | The custom Flink job is updated successfully. |
| 400         | The input parameter is invalid.               |

## Error Codes

If an error occurs when this API is invoked, the system does not return the result similar to the preceding example, but returns the error code and error information. For details, see [Error Codes](#).

# 14.5 Running Jobs in Batches

## Function

This API is used to trigger batch job running.

## URI

- URI format  
POST /v1.0/{project\_id}/streaming/jobs/run
- Parameter description

**Table 14-23** URI parameter

| Parameter  | Mandatory | Type   | Description                                                                                                                               |
|------------|-----------|--------|-------------------------------------------------------------------------------------------------------------------------------------------|
| project_id | Yes       | String | Project ID, which is used for resource isolation. For details about how to obtain its value, see <a href="#">Obtaining a Project ID</a> . |

## Request

**Table 14-24** Request parameters

| Parameter        | Mandatory | Type          | Description                                                                                                                                                                                                                                                                                                                                                                  |
|------------------|-----------|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| job_ids          | Yes       | Array of Long | Batch job ID. You can obtain the job ID by calling the API for creating a job or the API for querying a job.                                                                                                                                                                                                                                                                 |
| resume_savepoint | No        | Boolean       | <p>Whether to restore a job from the latest savepoint.</p> <ul style="list-style-type: none"><li>If <b>resume_savepoint</b> is set to <b>true</b>, the job is restored from the latest savepoint.</li><li>If <b>resume_savepoint</b> is set to <b>false</b>, the job is started normally, not from a specific savepoint.</li></ul> <p>The default value is <b>false</b>.</p> |

## Response

**Table 14-25** Response parameter

| Parameter      | Mandatory | Type             | Description                                                                                 |
|----------------|-----------|------------------|---------------------------------------------------------------------------------------------|
| Array elements | No        | Array of objects | The response message returned is as follows: For details, see <a href="#">Table 14-26</a> . |

**Table 14-26** Array element parameters

| Parameter  | Mandatory | Type   | Description                                                                                                          |
|------------|-----------|--------|----------------------------------------------------------------------------------------------------------------------|
| is_success | No        | String | Whether the request is successfully executed. Value <b>true</b> indicates that the request is successfully executed. |
| message    | No        | String | Message content.                                                                                                     |

## Example Request

Run the jobs whose IDs are **131**, **130**, **138**, and **137** and allow the jobs to be restored from their latest savepoints.

```
{
 "job_ids": [131,130,138,137],
 "resume_savepoint": true
}
```

## Example Response

```
[
 {
 "is_success": "true",
 "message": "The request for submitting DLI jobs is delivered successfully."
 },
 {
 "is_success": "true",
 "message": "The request for submitting DLI jobs is delivered successfully."
 },
 {
 "is_success": "true",
 "message": "The request for submitting DLI jobs is delivered successfully."
 },
 {
 "is_success": "true",
 "message": "The request for submitting DLI jobs is delivered successfully."
 }
]
```

## Status Codes

[Table 14-27](#) describes status codes.

**Table 14-27** Status codes

| Status Code | Description                           |
|-------------|---------------------------------------|
| 200         | Jobs are successfully run in batches. |
| 400         | The input parameter is invalid.       |

## Error Codes

If an error occurs when this API is invoked, the system does not return the result similar to the preceding example, but returns the error code and error information. For details, see [Error Codes](#).

## 14.6 Listing Jobs

### Function

This API is used to list the current user's jobs. You can set the job ID as the ID and query jobs whose IDs are greater than or less than the ID. You can also query jobs in specific status, for example, in running status or other. By default, all jobs are queried.

### URI

- URI format  
GET /v1.0/{project\_id}/streaming/jobs
- Parameter description

**Table 14-28** URI parameter

| Parameter  | Mandatory | Type   | Description                                                                                                                               |
|------------|-----------|--------|-------------------------------------------------------------------------------------------------------------------------------------------|
| project_id | Yes       | String | Project ID, which is used for resource isolation. For details about how to obtain its value, see <a href="#">Obtaining a Project ID</a> . |

**Table 14-29** query parameter description

| Parameter | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-----------|-----------|--------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| job_type  | No        | String | <p>Job type.</p> <ul style="list-style-type: none"><li>• <b>flink_sql_job</b>: Flink SQL job</li><li>• <b>flink_opensource_sql_job</b>: Flink OpenSource SQL job</li><li>• <b>flink_jar_job</b>: User-defined Flink job</li></ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| status    | No        | String | <p>Job status code.</p> <p>Available job statuses are as follows:</p> <ul style="list-style-type: none"><li>• <b>job_init</b>: The job is in the draft status.</li><li>• <b>job_submitting</b>: The job is being submitted.</li><li>• <b>job_submit_fail</b>: The job fails to be submitted.</li><li>• <b>job_running</b>: The job is running. The job stops running due to an exception.)</li><li>• <b>job_downloading</b>: The job is being downloaded.</li><li>• <b>job_idle</b>: The job is idle.</li><li>• <b>job_cancelling</b>: The job is being stopped.</li><li>• <b>job_cancel_success</b>: The job has been stopped.</li><li>• <b>job_cancel_fail</b>: The job fails to be stopped.</li><li>• <b>job_savepointing</b>: The savepoint is being created.</li><li>• <b>job_arrearage_stopped</b>: The job is stopped because the account is in arrears. (The billing ends. The job is stopped because the user account is in arrears.)</li><li>• <b>job_arrearage_recovering</b>: The recharged job is being restored. (The account in arrears is recharged, and the job is being restored).</li><li>• <b>job_finish</b>: The job is completed.</li></ul> |

| Parameter   | Mandatory | Type    | Description                                                                                                                                                                                                        |
|-------------|-----------|---------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| queue_name  | No        | String  | Name of a queue.                                                                                                                                                                                                   |
| order       | No        | String  | Sorting style of the query results. <ul style="list-style-type: none"><li>• <b>asc</b>: by time in ascending order</li><li>• <b>desc</b>: by time in descending order</li></ul> The default value is <b>desc</b> . |
| limit       | No        | Integer | Number of returned data records. The default value is <b>10</b> and the maximum value is <b>100</b> .                                                                                                              |
| name        | No        | String  | Name of the job. Length range: 0 to 57 characters.                                                                                                                                                                 |
| offset      | No        | Integer | Job offset.                                                                                                                                                                                                        |
| show_detail | No        | Boolean | Whether to return job details. The default value is <b>false</b> . If this parameter is set to <b>true</b> , the job details are returned. For details, see <a href="#">Querying Job Details</a> .                 |
| user_name   | No        | String  | Username, which can be used as a filter.                                                                                                                                                                           |
| tags        | No        | String  | Specifies a label for filtering.                                                                                                                                                                                   |

## Request

None

## Response

**Table 14-30** Response parameters

| Parameter  | Mandatory | Type   | Description                                                                                                          |
|------------|-----------|--------|----------------------------------------------------------------------------------------------------------------------|
| is_success | No        | String | Whether the request is successfully executed. Value <b>true</b> indicates that the request is successfully executed. |
| message    | No        | String | System prompt. If execution succeeds, the parameter setting may be left blank.                                       |
| job_list   | No        | Object | Information about a job list. For details, see <a href="#">Table 14-31</a> .                                         |

**Table 14-31** job\_list parameters

| Parameter   | Mandatory | Type             | Description                                                             |
|-------------|-----------|------------------|-------------------------------------------------------------------------|
| total_count | No        | Integer          | Number of records in the query result.                                  |
| jobs        | No        | Array of objects | Information about a job. For details, see <a href="#">Table 14-32</a> . |

**Table 14-32** Jobs parameters

| Parameter   | Mandatory | Type   | Description                                                                                                                                                                                                                 |
|-------------|-----------|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| job_id      | No        | Long   | Job ID.                                                                                                                                                                                                                     |
| name        | No        | String | Name of the job. Length range: 0 to 57 characters.                                                                                                                                                                          |
| desc        | No        | String | Job description. Length range: 0 to 512 characters.                                                                                                                                                                         |
| user_name   | No        | String | Username. This parameter is valid only when <b>show_detail</b> is set to <b>false</b> .                                                                                                                                     |
| job_type    | No        | String | Job type. <ul style="list-style-type: none"><li>• <b>flink_sql_job</b>: Flink SQL job</li><li>• <b>flink_opensource_sql_job</b>: Flink open-source SQL job</li><li>• <b>flink_jar_job</b>: User-defined Flink job</li></ul> |
| status      | No        | String | Job status.                                                                                                                                                                                                                 |
| status_desc | No        | String | Description of job status.                                                                                                                                                                                                  |
| create_time | No        | Long   | Time when a job is created.                                                                                                                                                                                                 |
| start_time  | No        | Long   | Time when a job is started. The value <b>0</b> indicates that the process is not started.                                                                                                                                   |
| duration    | No        | Long   | Running duration of a job. Unit: ms. This parameter is valid only when <b>show_detail</b> is set to <b>false</b> .                                                                                                          |
| root_id     | No        | Long   | Parent job ID. This parameter is valid only when <b>show_detail</b> is set to <b>false</b> .                                                                                                                                |

| Parameter            | Mandatory | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|----------------------|-----------|---------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| graph_editor_enabled | No        | Boolean | Whether the flow diagram can be edited. Value <b>true</b> indicates that the flow diagram can be edited, and <b>false</b> indicates that the flow diagram cannot be edited.                                                                                                                                                                                                                                                                                                                                                        |
| has_savepoint        | No        | Boolean | Whether a job has a savepoint. Value <b>true</b> indicates that the job has a savepoint, and <b>false</b> indicates that the job does not have a savepoint.                                                                                                                                                                                                                                                                                                                                                                        |
| user_id              | No        | String  | ID of the user who creates the job. This parameter is valid only when <b>show_detail</b> is set to <b>true</b> .                                                                                                                                                                                                                                                                                                                                                                                                                   |
| project_id           | No        | String  | ID of the project to which a job belongs. This parameter is valid only when <b>show_detail</b> is set to <b>true</b> .                                                                                                                                                                                                                                                                                                                                                                                                             |
| sql_body             | No        | String  | Stream SQL statement. This parameter is valid only when <b>show_detail</b> is set to <b>false</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                |
| run_mode             | No        | String  | Job running mode. The options are as follows: The value can be <b>shared_cluster</b> , <b>exclusive_cluster</b> , or <b>edge_node</b> . This parameter is valid only when <b>show_detail</b> is set to <b>true</b> . <ul style="list-style-type: none"><li>• <b>shared_cluster</b>: indicates that the job is running on a shared cluster.</li><li>• <b>exclusive_cluster</b>: indicates that the job is running on an exclusive cluster.</li><li>• <b>edge_node</b>: indicates that the job is running on an edge node.</li></ul> |
| job_config           | No        | Object  | Job configuration. This parameter is valid only when <b>show_detail</b> is set to <b>false</b> . For details, see <a href="#">Table 14-33</a> .                                                                                                                                                                                                                                                                                                                                                                                    |
| main_class           | No        | String  | Main class of a JAR package. This parameter is valid only when <b>show_detail</b> is set to <b>false</b> .                                                                                                                                                                                                                                                                                                                                                                                                                         |
| entrypoint_args      | No        | String  | Job running parameter of the JAR file. Multiple parameters are separated by spaces. This parameter is valid only when <b>show_detail</b> is set to <b>true</b> .                                                                                                                                                                                                                                                                                                                                                                   |
| execution_graph      | No        | String  | Job execution plan. This parameter is valid only when <b>show_detail</b> is set to <b>false</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| update_time          | No        | Long    | Time when a job is updated. This parameter is valid only when <b>show_detail</b> is set to <b>false</b> .                                                                                                                                                                                                                                                                                                                                                                                                                          |

| Parameter      | Mandatory | Type             | Description                                                                |
|----------------|-----------|------------------|----------------------------------------------------------------------------|
| queue_name     | No        | String           | Queue name                                                                 |
| edge_group_ids | No        | Array of Strings | List of edge computing group IDs. Use commas (,) to separate multiple IDs. |
| restart_times  | No        | Integer          | Number of restart times                                                    |
| savepoint_path | No        | String           | Path for storing manually generated checkpoints                            |

**Table 14-33 job\_config parameters**

| Parameter           | Mandatory | Type    | Description                                                                                                                                                                                                                                                                         |
|---------------------|-----------|---------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| checkpoint_enabled  | No        | Boolean | Whether to enable the automatic job snapshot function. <ul style="list-style-type: none"><li>• <b>true</b>: The automatic job snapshot function is enabled.</li><li>• <b>false</b>: The automatic job snapshot function is disabled.</li></ul> The default value is <b>false</b> .  |
| checkpoint_mode     | No        | String  | Snapshot mode. There are two options: <ul style="list-style-type: none"><li>• <b>exactly_once</b>: indicates that data is processed only once.</li><li>• <b>at_least_once</b>: indicates that data is processed at least once.</li></ul> The default value is <b>exactly_once</b> . |
| checkpoint_interval | No        | Integer | Snapshot interval. The unit is second. The default value is <b>10</b> .                                                                                                                                                                                                             |
| log_enabled         | No        | Boolean | Whether to enable the log storage function. The default value is <b>false</b> .                                                                                                                                                                                                     |
| obs_bucket          | No        | String  | Name of an OBS bucket.                                                                                                                                                                                                                                                              |
| smn_topic           | No        | String  | SMN topic name. If a job fails, the system will send a message to users subscribed to the SMN topic.                                                                                                                                                                                |
| root_id             | No        | Integer | Parent job ID.                                                                                                                                                                                                                                                                      |

| Parameter              | Man<br>dato<br>ry | Type                | Description                                                                                                                                                                                                                                    |
|------------------------|-------------------|---------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| edge_group_ids         | No                | Array of<br>Strings | List of edge computing group IDs. Use commas (,) to separate multiple IDs.                                                                                                                                                                     |
| manager_cu_number      | No                | Integer             | Number of CUs of the management unit. The default value is 1.                                                                                                                                                                                  |
| cu_number              | No                | Integer             | Number of CUs selected for a job. This parameter is valid only when <b>show_detail</b> is set to <b>true</b> . <ul style="list-style-type: none"><li>• Minimum value: 2</li><li>• Maximum value: 400</li></ul> The default value is 2.         |
| parallel_number        | No                | Integer             | Number of concurrent jobs set by a user. This parameter is valid only when <b>show_detail</b> is set to <b>true</b> . <ul style="list-style-type: none"><li>• Minimum value: 1</li><li>• Maximum value: 2000</li></ul> The default value is 1. |
| restart_when_exception | No                | Boolean             | Whether to enable the function of restart upon exceptions.                                                                                                                                                                                     |
| idle_state_retention   | No                | Integer             | Expiration time.                                                                                                                                                                                                                               |
| udf_jar_url            | No                | String              | Name of the package that has been uploaded to the DLI resource management system. The <b>UDF Jar</b> file of the SQL job is uploaded through this parameter.                                                                                   |
| dirty_data_strategy    | No                | String              | Dirty data policy of a job. <ul style="list-style-type: none"><li>• 2:<b>obsDir</b>: Save. <b>obsDir</b> specifies the path for storing dirty data.</li><li>• 1: Trigger a job exception</li><li>• 0: Ignore</li></ul>                         |
| entrypoint             | No                | String              | Name of the package that has been uploaded to the DLI resource management system. This parameter is used to customize the JAR file where the job main class is located.                                                                        |
| dependency_jars        | No                | Array of<br>Strings | Name of the package that has been uploaded to the DLI resource management system. This parameter is used to customize other dependency packages.                                                                                               |

|----------------------|-------------------|------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| dependency_files     | No                | Array of Strings | Name of the resource package that has been uploaded to the DLI resource management system. This parameter is used to customize dependency files.                                                                                                                                                                                                                                        |
| executor_number      | No                | Integer          | Number of compute nodes in a job.                                                                                                                                                                                                                                                                                                                                                       |
| executor_cu_number   | No                | Integer          | Number of CUs in a compute node.                                                                                                                                                                                                                                                                                                                                                        |
| resume_checkpoint    | No                | Boolean          | Whether to restore data from the latest checkpoint when the system automatically restarts upon an exception. The default value is <b>false</b> .                                                                                                                                                                                                                                        |
| runtime_config       | No                | String           | Customizes optimization parameters when a Flink job is running.                                                                                                                                                                                                                                                                                                                         |
| graph_editor_enabled | No                | Boolean          | Whether to enable flow diagram editing. The default value is <b>false</b> .                                                                                                                                                                                                                                                                                                             |
| graph_editor_data    | No                | String           | Edited stream graph data. The default value is <b>null</b> .                                                                                                                                                                                                                                                                                                                            |
| resume_max_num       | No                | Integer          | Maximum retry attempts. <b>-1</b> indicates there is no upper limit.                                                                                                                                                                                                                                                                                                                    |
| checkpoint_path      | No                | String           | Path for saving the checkpoint.                                                                                                                                                                                                                                                                                                                                                         |
| config_url           | No                | String           | OBS path of the <b>config</b> package uploaded by the user.                                                                                                                                                                                                                                                                                                                             |
| tm_cus               | No                | int              | Number of CUs per TaskManager node.                                                                                                                                                                                                                                                                                                                                                     |
| tm_slot_num          | No                | int              | Number of slots per TaskManager node.                                                                                                                                                                                                                                                                                                                                                   |
| image                | No                | String           | Custom image. The format is <b>Organization name/Image name:Image version</b> .<br>This parameter is valid only when <b>feature</b> is set to <b>custom</b> . You can use this parameter with the <b>feature</b> parameter to specify a user-defined Flink image for job running. For details about how to use custom images, see <a href="#"><b>Data Lake Insight User Guide</b></a> . |

| Parameter               | Man<br>dato<br>ry | Type    | Description                                                                                                                                                                                                                                                                  |
|-------------------------|-------------------|---------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| feature                 | No                | String  | User-defined job feature. Type of the Flink image used by a job. <ul style="list-style-type: none"><li>• <b>basic</b>: indicates that the basic Flink image provided by DLI is used.</li><li>• <b>custom</b>: indicates that the user-defined Flink image is used.</li></ul> |
| flink_version           | No                | String  | Flink version. This parameter is valid only when <b>feature</b> is set to <b>basic</b> . You can use this parameter with the <b>feature</b> parameter to specify the version of the DLI basic Flink image used for job running.                                              |
| operator_config         | No                | String  | Operator's parallelism degree. The operator ID and degree of parallelism are displayed in JSON format.                                                                                                                                                                       |
| static_estimator_config | No                | String  | Estimation of static flow diagram resources.                                                                                                                                                                                                                                 |
| real_cu_number          | No                | Integer | Number of actually used CUs. The default value is <b>0</b> , indicating that the value of <b>cu_number</b> is used.                                                                                                                                                          |

## Example Request

None

## Example Response

```
{
 "is_success": "true",
 "message": "Querying of the job list succeeds.",
 "job_list": {
 "total_count": 26,
 "jobs": [
 {
 "job_id": 146,
 "name": "aaaaaa",
 "desc": "",
 "user_name": "",
 "job_type": "flink_sql_job",
 "status": "job_init",
 "status_desc": "",
 "create_time": 1578892414688,
 "duration": 0,
 "root_id": -1,
 "graph_editor_enabled": false,
 "has_savepoint": false
 }
]
 }
}
```

## Status Codes

[Table 14-34](#) describes the status code.

**Table 14-34** Status codes

| Status Code | Description                     |
|-------------|---------------------------------|
| 200         | Job list query succeeds.        |
| 400         | The input parameter is invalid. |

## Error Codes

If an error occurs when this API is invoked, the system does not return the result similar to the preceding example, but returns the error code and error information. For details, see [Error Codes](#).

# 14.7 Querying Job Details

## Function

This API is used to query details of a job.

## URI

- URI format  
GET /v1.0/{project\_id}/streaming/jobs/{job\_id}
- Parameter description

**Table 14-35** URI parameters

| Parameter  | Mandatory | Type   | Description                                                                                                                               |
|------------|-----------|--------|-------------------------------------------------------------------------------------------------------------------------------------------|
| project_id | Yes       | String | Project ID, which is used for resource isolation. For details about how to obtain its value, see <a href="#">Obtaining a Project ID</a> . |
| job_id     | Yes       | String | Job ID.                                                                                                                                   |

## Request

None

## Response

**Table 14-36** Response parameters

| Parameter  | Mandatory | Type   | Description                                                                                                                    |
|------------|-----------|--------|--------------------------------------------------------------------------------------------------------------------------------|
| is_success | No        | String | Indicates whether the request is successfully executed. Value <b>true</b> indicates that the request is successfully executed. |
| message    | No        | String | System prompt. If execution succeeds, the parameter setting may be left blank.                                                 |
| job_detail | No        | Object | Job details. For details, see <a href="#">Table 14-37</a> .                                                                    |

**Table 14-37** job\_detail parameters

| Parameter | Mandatory | Type   | Description                                                                                                                                                                                                                |
|-----------|-----------|--------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| job_id    | No        | Long   | Job ID.                                                                                                                                                                                                                    |
| name      | No        | String | Name of the job. Length range: 0 to 57 characters.                                                                                                                                                                         |
| desc      | No        | String | Job description. Length range: 0 to 512 characters.                                                                                                                                                                        |

| savepoint_path       | No        | String           | Path for storing manually generated checkpoints.                                                                                                                                                                                                                                                                                                            |
| run_mode             | No        | String           | Job running mode. The options are as follows: <ul style="list-style-type: none"><li>• <b>shared_cluster</b>: indicates that the job is running on a shared cluster.</li><li>• <b>exclusive_cluster</b>: indicates that the job is running on an exclusive cluster.</li><li>• <b>edge_node</b>: indicates that the job is running on an edge node.</li></ul> |
| job_config           | No        | Object           | Job configurations. Refer to <a href="#">Table 14-38</a> for details.                                                                                                                                                                                                                                                                                       |
| main_class           | No        | String           | Main class of a JAR package, for example, <b>org.apache.spark.examples.streaming.JavaQueueStream</b> .                                                                                                                                                                                                                                                      |
| entrypoint_args      | No        | String           | Running parameter of a JAR package job. Multiple parameters are separated by spaces.                                                                                                                                                                                                                                                                        |
| execution_graph      | No        | String           | Job execution plan.                                                                                                                                                                                                                                                                                                                                         |
| update_time          | No        | Long             | Time when a job is updated.                                                                                                                                                                                                                                                                                                                                 |
| user_name            | No        | String           | Username. This parameter is valid only when <b>show_detail</b> is set to <b>false</b> .                                                                                                                                                                                                                                                                     |
| duration             | No        | Long             | Running duration of a job. Unit: ms. This parameter is valid only when <b>show_detail</b> is set to <b>false</b> .                                                                                                                                                                                                                                          |
| root_id              | No        | Long             | Parent job ID. This parameter is valid only when <b>show_detail</b> is set to <b>false</b> .                                                                                                                                                                                                                                                                |
| graph_editor_enabled | No        | Boolean          | Whether the stream graph of a job can be edited. Value <b>true</b> indicates that the flow diagram can be edited, and <b>false</b> indicates that the flow diagram cannot be edited.                                                                                                                                                                        |
| has_savepoint        | No        | Boolean          | Whether savepointing is enabled for the job. Value <b>true</b> indicates that the job has a savepoint, and <b>false</b> indicates that the job does not have a savepoint.                                                                                                                                                                                   |
| edge_group_ids       | No        | Array of Strings | List of edge computing group IDs. Use commas (,) to separate multiple IDs.                                                                                                                                                                                                                                                                                  |
| restart_times        | No        | Integer          | Number of restart times                                                                                                                                                                                                                                                                                                                                     |

**Table 14-38 job\_config parameters**

| Parameter            | Man<br>dato<br>ry | Type             | Description                                                                                                                                                                                                                                                                                      |
|----------------------|-------------------|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| checkpoint_enabled   | No                | Boolean          | <p>Whether to enable the automatic job snapshot function.</p> <ul style="list-style-type: none"><li>• <b>true</b>: The automatic job snapshot function is enabled.</li><li>• <b>false</b>: The automatic job snapshot function is disabled.</li></ul> <p>The default value is <b>false</b>.</p>  |
| checkpoint_interval  | No                | Integer          | Snapshot interval. The unit is second. The default value is <b>10</b> .                                                                                                                                                                                                                          |
| checkpoint_mode      | No                | String           | <p>Snapshot mode. There are two options:</p> <ul style="list-style-type: none"><li>• <b>exactly_once</b>: indicates that data is processed only once.</li><li>• <b>at_least_once</b>: indicates that data is processed at least once.</li></ul> <p>The default value is <b>exactly_once</b>.</p> |
| log_enabled          | No                | Boolean          | <p>Whether to enable the log storage function.</p> <p>The default value is <b>false</b>.</p>                                                                                                                                                                                                     |
| obs_bucket           | No                | String           | Name of an OBS bucket.                                                                                                                                                                                                                                                                           |
| root_id              | No                | Integer          | Parent job ID.                                                                                                                                                                                                                                                                                   |
| edge_group_ids       | No                | Array of Strings | List of edge computing group IDs. Use commas (,) to separate multiple IDs.                                                                                                                                                                                                                       |
| manager_cu_number    | No                | Integer          | Number of CUs of the management unit. The default value is <b>1</b> .                                                                                                                                                                                                                            |
| graph_editor_enabled | No                | Boolean          | <p>Whether to enable flow diagram editing.</p> <p>The default value is <b>false</b>.</p>                                                                                                                                                                                                         |
| graph_editor_data    | No                | String           | Data of flow diagram editing. The default value is <b>null</b> .                                                                                                                                                                                                                                 |
| executor_number      | No                | Integer          | Number of compute nodes in a job.                                                                                                                                                                                                                                                                |
| executor_cu_number   | No                | Integer          | Number of CUs in a compute node.                                                                                                                                                                                                                                                                 |

| Parameter              | Man<br>dato<br>ry | Type    | Description                                                                                                                                                                                                                                                                      |
|------------------------|-------------------|---------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| cu_number              | No                | Integer | <p>Number of CUs selected for a job. This parameter is valid only when <b>show_detail</b> is set to <b>true</b>.</p> <ul style="list-style-type: none"><li>• Minimum value: <b>2</b></li><li>• Maximum value: <b>400</b></li></ul> <p>The default value is <b>2</b>.</p>         |
| parallel_number        | No                | Integer | <p>Number of concurrent jobs set by a user. This parameter is valid only when <b>show_detail</b> is set to <b>true</b>.</p> <ul style="list-style-type: none"><li>• Minimum value: <b>1</b></li><li>• Maximum value: <b>2000</b></li></ul> <p>The default value is <b>1</b>.</p> |
| smn_topic              | No                | String  | SMN topic name. If a job fails, the system will send a message to users subscribed to this SMN topic.                                                                                                                                                                            |
| restart_when_exception | No                | Boolean | Whether to enable the function of restart upon exceptions.                                                                                                                                                                                                                       |
| resume_checkpoint      | No                | Boolean | Whether to restore data from the latest checkpoint when the system automatically restarts upon an exception. The default value is <b>false</b> .                                                                                                                                 |
| resume_max_num         | No                | Integer | Maximum retry attempts. <b>-1</b> indicates there is no upper limit.                                                                                                                                                                                                             |
| checkpoint_path        | No                | String  | Path for saving the checkpoint.                                                                                                                                                                                                                                                  |
| idle_state_retention   | No                | Integer | Expiration time.                                                                                                                                                                                                                                                                 |
| config_url             | No                | String  | OBS path of the <b>config</b> package uploaded by the user.                                                                                                                                                                                                                      |
| udf_jar_url            | No                | String  | Name of the package that has been uploaded to the DLI resource management system. The <b>UDF Jar</b> file of the SQL job is uploaded through this parameter.                                                                                                                     |
| dirty_data_strategy    | No                | String  | <p>Dirty data policy of a job.</p> <ul style="list-style-type: none"><li>• <b>2:obsDir</b>: Save. <b>obsDir</b> specifies the path for storing dirty data.</li><li>• <b>1</b>: Trigger a job exception</li><li>• <b>0</b>: Ignore</li></ul>                                      |

| Parameter               | Man<br>dato<br>ry | Type             | Description                                                                                                                                                                                                                                                                       |
|-------------------------|-------------------|------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| entrypoint              | No                | String           | Name of the package that has been uploaded to the DLI resource management system. This parameter is used to customize the JAR file where the job main class is located.                                                                                                           |
| dependency_jars         | No                | Array of Strings | Name of the package that has been uploaded to the DLI resource management system. This parameter is used to customize other dependency packages.                                                                                                                                  |
| dependency_files        | No                | Array of Strings | Name of the resource package that has been uploaded to the DLI resource management system. This parameter is used to customize dependency files.                                                                                                                                  |
| tm_cus                  | No                | int              | Number of CUs per TaskManager node.                                                                                                                                                                                                                                               |
| tm_slot_num             | No                | int              | Number of slots per TaskManager node.                                                                                                                                                                                                                                             |
| image                   | No                | String           | Custom image. The format is <b>Organization name/Image name:Image version</b> .<br>This parameter is valid only when <b>feature</b> is set to <b>custom</b> . You can use this parameter with the <b>feature</b> parameter to specify a user-defined Flink image for job running. |
| feature                 | No                | String           | User-defined job feature. Type of the Flink image used by a job. <ul style="list-style-type: none"><li>• <b>basic</b>: indicates that the basic Flink image provided by DLI is used.</li><li>• <b>custom</b>: indicates that the user-defined Flink image is used.</li></ul>      |
| flink_version           | No                | String           | Flink version. This parameter is valid only when <b>feature</b> is set to <b>basic</b> . You can use this parameter with the <b>feature</b> parameter to specify the version of the DLI basic Flink image used for job running.                                                   |
| operator_config         | No                | String           | Operator's parallelism degree. The operator ID and degree of parallelism are displayed in JSON format.                                                                                                                                                                            |
| static_estimator_config | No                | String           | Estimation of static flow diagram resources.                                                                                                                                                                                                                                      |
| runtime_config          | No                | String           | Customizes optimization parameters when a Flink job is running.                                                                                                                                                                                                                   |

| Parameter      | Man<br>dato<br>ry | Type    | Description                                                                                                         |
|----------------|-------------------|---------|---------------------------------------------------------------------------------------------------------------------|
| real_cu_number | No                | Integer | Number of actually used CUs. The default value is <b>0</b> , indicating that the value of <b>cu_number</b> is used. |

## Example Request

None

## Example Response

- The following example takes the **flink\_jar\_job** type as an example:

```
{
 "is_success": "true",
 "message": "Job detail query succeeds.",
 "job_detail": {
 "job_id": 104,
 "user_id": "011c99a26ae84a1bb963a75e7637d3fd",
 "queue_name": "flinktest",
 "project_id": "330e068af1334c9782f4226acc00a2e2",
 "name": "jptest",
 "desc": "",
 "sql_body": "",
 "run_mode": "exclusive_cluster",
 "job_type": "flink_jar_job",
 "job_config": {

```

## Status Codes

[Table 14-39](#) describes the status code.

**Table 14-39** Status codes

| Status Code | Description                         |
|-------------|-------------------------------------|
| 200         | Querying details of a job succeeds. |
| 400         | The input parameter is invalid.     |

## Error Codes

If an error occurs when this API is invoked, the system does not return the result similar to the preceding example, but returns the error code and error information. For details, see [Error Codes](#).

# 14.8 Querying the Job Execution Plan

## Function

This API is used to query a job execution plan.

## URI

- URI format  
GET /v1.0/{project\_id}/streaming/jobs/{job\_id}/execute-graph
- Parameter description

**Table 14-40** URI parameters

| Parameter  | Mandatory | Type   | Description                                                                                                                               |
|------------|-----------|--------|-------------------------------------------------------------------------------------------------------------------------------------------|
| project_id | Yes       | String | Project ID, which is used for resource isolation. For details about how to obtain its value, see <a href="#">Obtaining a Project ID</a> . |
| job_id     | Yes       | Long   | Job ID.                                                                                                                                   |

## Request

None

## Response

**Table 14-41** Response parameters

| Parameter     | Mandatory | Type   | Description                                                                                   |
|---------------|-----------|--------|-----------------------------------------------------------------------------------------------|
| is_success    | No        | String | Whether the request is successful.                                                            |
| message       | No        | String | Message content.                                                                              |
| execute_graph | No        | Object | Response parameter for querying a job plan.<br>For details, see <a href="#">Table 14-42</a> . |

**Table 14-42 execute\_graph** parameters

| Parameter   | Mandatory | Type    | Description                   |
|-------------|-----------|---------|-------------------------------|
| jid         | No        | String  | ID of a Flink job.            |
| name        | No        | String  | Name of a Flink job.          |
| isStoppable | No        | Boolean | Whether a job can be stopped. |
| state       | No        | String  | Execution status of a job.    |
| start-time  | No        | Long    | Time when a job is started.   |
| end-time    | No        | Long    | Time when a job is stopped.   |
| duration    | No        | Long    | Running duration of a job.    |

## Example Request

None

## Example Response

```
{
 "is_success": "true",
 "message": "Querying the job execution graph succeeds.",
 "execute_graph": {
 "jid": "4e966f43f2c90b0e1bf3188ecf55504b",
 "name": "",
 "isStoppable": false,
 "state": "RUNNING",
 "start-time": 1578904488436,
 "end-time": -1,
 "duration": 516274
 }
}
```

## Status Codes

**Table 14-43** Status codes

| Status Code | Description                               |
|-------------|-------------------------------------------|
| 200         | Querying the job execution plan succeeds. |
| 400         | The input parameter is invalid.           |

## Error Codes

If an error occurs when this API is invoked, the system does not return the result similar to the preceding example, but returns the error code and error information. For details, see [Error Codes](#).

# 14.9 Stopping Jobs in Batches

## Function

This API is used to stop running jobs in batches.

## URI

- URI format  
POST /v1.0/{project\_id}/streaming/jobs/stop
- Parameter description

**Table 14-44** URI parameter

| Parameter  | Mandatory | Type   | Description                                                                                                                               |
|------------|-----------|--------|-------------------------------------------------------------------------------------------------------------------------------------------|
| project_id | Yes       | String | Project ID, which is used for resource isolation. For details about how to obtain its value, see <a href="#">Obtaining a Project ID</a> . |

## Request

**Table 14-45** Request parameters

| Parameter | Mandatory | Type          | Description |
|-----------|-----------|---------------|-------------|
| job_ids   | Yes       | Array of Long | Job ID.     |

| Parameter         | Mandatory | Type    | Description                                                                                                                                                                                                                                                                                                                                                         |
|-------------------|-----------|---------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| trigger_savepoint | No        | Boolean | <p>Whether to create a savepoint for a job to store the job status information before stopping it. The data type is Boolean.</p> <ul style="list-style-type: none"><li>• If this parameter is set to <b>true</b>, a savepoint is created.</li><li>• If this parameter is set to <b>false</b>, no savepoint is created. The default value is <b>false</b>.</li></ul> |

## Response

**Table 14-46** Response parameters

| Parameter      | Mandatory | Type             | Description                                                                                 |
|----------------|-----------|------------------|---------------------------------------------------------------------------------------------|
| Array elements | No        | Array of objects | The response message returned is as follows: For details, see <a href="#">Table 14-47</a> . |

**Table 14-47** Array element parameters

| Parameter  | Mandatory | Type   | Description                                                                                                          |
|------------|-----------|--------|----------------------------------------------------------------------------------------------------------------------|
| is_success | No        | String | Whether the request is successfully executed. Value <b>true</b> indicates that the request is successfully executed. |
| message    | No        | String | Message content                                                                                                      |

## Example Request

Stop the jobs whose IDs are **128** and **137**.

```
{
 "job_ids": [128, 137],
 "trigger_savepoint": false
}
```

## Example Response

```
[{"is_success": "true",
 "message": "The request for stopping DLI jobs is delivered successfully."}]
```

## Status Codes

[Table 14-48](#) describes status codes.

**Table 14-48** Status codes

| Status Code | Description                                         |
|-------------|-----------------------------------------------------|
| 200         | The request of stopping a job is sent successfully. |
| 400         | The input parameter is invalid.                     |

## Error Codes

If an error occurs when this API is invoked, the system does not return the result similar to the preceding example, but returns the error code and error information. For details, see [Error Codes](#).

## 14.10 Deleting a Job

### Function

This API is used to delete a Flink job at any state.

The job records will not be deleted.

### URI

- URI format  
`DELETE /v1.0/{project_id}/streaming/jobs/{job_id}`
- Parameter description

**Table 14-49** URI parameters

| Parameter  | Mandatory | Type   | Description                                                                                                                               |
|------------|-----------|--------|-------------------------------------------------------------------------------------------------------------------------------------------|
| project_id | Yes       | String | Project ID, which is used for resource isolation. For details about how to obtain its value, see <a href="#">Obtaining a Project ID</a> . |
| job_id     | Yes       | Long   | Job ID.                                                                                                                                   |

### Request

None

## Response

**Table 14-50** Response parameters

| Parameter  | Mandatory | Type   | Description                                                                                                          |
|------------|-----------|--------|----------------------------------------------------------------------------------------------------------------------|
| is_success | No        | String | Whether the request is successfully executed. Value <b>true</b> indicates that the request is successfully executed. |
| message    | No        | String | System prompt. If execution succeeds, the parameter setting may be left blank.                                       |

## Example Request

None

## Example Response

```
{
 "is_success": "true",
 "message": "The job is deleted successfully.",
}
```

## Status Codes

[Table 14-51](#) describes status codes.

**Table 14-51** Status codes

| Status Code | Description                      |
|-------------|----------------------------------|
| 200         | The job is deleted successfully. |
| 400         | The input parameter is invalid.  |

## Error Codes

If an error occurs when this API is invoked, the system does not return the result similar to the preceding example, but returns the error code and error information. For details, see [Error Codes](#).

## 14.11 Deleting Jobs in Batches

### Function

This API is used to batch delete jobs at any state.

## URI

- URI format  
POST /v1.0/{project\_id}/streaming/jobs/delete
- Parameter description

**Table 14-52** URI parameter

| Parameter  | Mandatory | Type   | Description                                                                                                                               |
|------------|-----------|--------|-------------------------------------------------------------------------------------------------------------------------------------------|
| project_id | Yes       | String | Project ID, which is used for resource isolation. For details about how to obtain its value, see <a href="#">Obtaining a Project ID</a> . |

## Request

**Table 14-53** Request parameter

| Parameter | Mandatory | Type   | Description |
|-----------|-----------|--------|-------------|
| job_ids   | Yes       | [Long] | Job ID.     |

## Response

**Table 14-54** Response parameters

| Parameter      | Mandatory | Type             | Description                                                               |
|----------------|-----------|------------------|---------------------------------------------------------------------------|
| Array elements | No        | Array of Objects | Returned response message. For details, see <a href="#">Table 14-55</a> . |

**Table 14-55** Array element parameters

| Parameter  | Mandatory | Type   | Description                                                                                                          |
|------------|-----------|--------|----------------------------------------------------------------------------------------------------------------------|
| is_success | No        | String | Whether the request is successfully executed. Value <b>true</b> indicates that the request is successfully executed. |
| message    | No        | String | Message content.                                                                                                     |

## Example Request

Delete the jobs whose IDs are **12** and **232**.

```
{
 "job_ids": [12,232]
}
```

## Example Response

```
[{
 "is_success": "true",
 "message": "The job is deleted successfully.",
}]
```

## Status Codes

[Table 14-56](#) describes status codes.

**Table 14-56** Status codes

| Status Code | Description                      |
|-------------|----------------------------------|
| 200         | The job is deleted successfully. |
| 400         | The input parameter is invalid.  |

## Error Codes

If an error occurs when this API is invoked, the system does not return the result similar to the preceding example, but returns the error code and error information. For details, see [Error Codes](#).

## 14.12 Exporting a Flink Job

### Function

This API is used to export Flink job data.

### URI

- URI format  
POST /v1.0/{project\_id}/streaming/jobs/export
- Parameter description

**Table 14-57** URI parameter

| Parameter  | Mandatory | Type   | Description                                                                                                                               |
|------------|-----------|--------|-------------------------------------------------------------------------------------------------------------------------------------------|
| project_id | Yes       | String | Project ID, which is used for resource isolation. For details about how to obtain its value, see <a href="#">Obtaining a Project ID</a> . |

## Request

**Table 14-58** Request parameters

| Parameter    | Mandatory | Type           | Description                                                                                                                                                                                            |
|--------------|-----------|----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| obs_dir      | Yes       | String         | OBS path for storing exported job files.                                                                                                                                                               |
| is_selected  | Yes       | Boolean        | Whether to export a specified job.                                                                                                                                                                     |
| job_selected | No        | Array of Longs | This parameter indicates the ID set of jobs to be exported if <b>is_selected</b> is set to <b>true</b> .<br><b>NOTE</b><br>This parameter is mandatory when <b>is_selected</b> is set to <b>true</b> . |

## Response

**Table 14-59** Response parameters

| Parameter  | Mandatory | Type             | Description                                                                                                                    |
|------------|-----------|------------------|--------------------------------------------------------------------------------------------------------------------------------|
| is_success | No        | String           | Indicates whether the request is successfully executed. Value <b>true</b> indicates that the request is successfully executed. |
| message    | No        | String           | System prompt. If execution succeeds, the parameter setting may be left blank.                                                 |
| zip_file   | No        | Array of Strings | Name of the ZIP package containing exported jobs. The ZIP package is stored on OBS.                                            |

## Example Request

Export the job whose ID is **100** to OBS.

```
{
 "obs_dir": "obs-test",
```

```
 "is_selected": true,
 "job_selected": [100]
 }
```

## Example Response

```
{
 "is_success": true,
 "message": "The job is exported successfully.",
 "zip_file": ["obs-test/aggregate_1582677879475.zip"]
}
```

## Status Codes

[Table 14-60](#) describes status codes.

**Table 14-60** Status codes

| Status Code | Description                       |
|-------------|-----------------------------------|
| 200         | The job is exported successfully. |
| 400         | The input parameter is invalid.   |

## Error Codes

If an error occurs when this API is invoked, the system does not return the result similar to the preceding example, but returns the error code and error information. For details, see [Error Codes](#).

## 14.13 Importing a Flink Job

### Function

This API is used to import Flink job data.

### URI

- URI format  
POST /v1.0/{project\_id}/streaming/jobs/import
- Parameter description

**Table 14-61** URI parameter

| Parameter  | Mandatory | Type   | Description                                                                                                                                  |
|------------|-----------|--------|----------------------------------------------------------------------------------------------------------------------------------------------|
| project_id | Yes       | String | Project ID, which is used for resource isolation.<br>For details about how to obtain its value, see <a href="#">Obtaining a Project ID</a> . |

## Request

**Table 14-62** Request parameters

| Parameter | Mandatory | Type    | Description                                                                                                                                                              |
|-----------|-----------|---------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| zip_file  | Yes       | String  | Path of the job ZIP file imported from OBS. You can enter a folder path to import all ZIP files in the folder.<br><b>NOTE</b><br>The folder can contain only .zip files. |
| is_cover  | No        | Boolean | Whether to overwrite an existing job if the name of the imported job is the same as that of the existing job in the service.                                             |

## Response

**Table 14-63** Response parameters

| Parameter   | Mandatory | Type             | Description                                                                                                                    |
|-------------|-----------|------------------|--------------------------------------------------------------------------------------------------------------------------------|
| is_success  | No        | String           | Indicates whether the request is successfully executed. Value <b>true</b> indicates that the request is successfully executed. |
| message     | No        | String           | System prompt. If execution succeeds, the parameter setting may be left blank.                                                 |
| job_mapping | No        | Array of objects | Information about the imported job. For details, see <a href="#">Table 14-64</a> .                                             |

**Table 14-64** job\_mapping parameter description

| Parameter  | Mandatory | Type   | Description                                                                                                                                                                         |
|------------|-----------|--------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| old_job_id | No        | Long   | ID of a job before being imported.                                                                                                                                                  |
| new_job_id | No        | Long   | ID of a job after being imported. If <b>is_cover</b> is set to <b>false</b> and a job with the same name exists in the service, the returned value of this parameter is <b>-1</b> . |
| remark     | No        | String | Results about an imported job.                                                                                                                                                      |

## Example Request

Whether to overwrite the existing job if the name of the imported job is the same as that of an existing job when Flink job data is imported from OBS.

```
{
 "zip_file": "test/gggregate_1582677879475.zip",
 "is_cover": true
}
```

## Example Response

```
{
 "is_success": true,
 "message": "The job is imported successfully.",
 "job_mapping": [
 {
 "old_job_id": "100",
 "new_job_id": "200",
 "remark": "Job successfully created"
 }
]
}
```

## Status Codes

[Table 14-65](#) describes status codes.

**Table 14-65** Status codes

| Status Code | Description                       |
|-------------|-----------------------------------|
| 200         | The job is imported successfully. |
| 400         | The input parameter is invalid.   |

## Error Codes

If an error occurs when this API is invoked, the system does not return the result similar to the preceding example, but returns the error code and error information. For details, see [Error Codes](#).

## 14.14 Generating a Static Stream Graph for a Flink SQL Job

### Function

This API is used to generate a static stream graph for a Flink SQL job.

Flink 1.15 does not support the generation of static stream graphs.

### URI

- URI format

POST /v3/{project\_id}/streaming/jobs/{job\_id}/gen-graph

- Parameter description

**Table 14-66** URI parameter

| Parameter  | Mandatory | Type   | Description                                                                                                                               |
|------------|-----------|--------|-------------------------------------------------------------------------------------------------------------------------------------------|
| project_id | Yes       | String | Project ID, which is used for resource isolation. For details about how to obtain its value, see <a href="#">Obtaining a Project ID</a> . |

## Request

**Table 14-67** Request parameters

| Parameter         | Mandatory | Type    | Description                                                                                                                                                                                                                                                                                                                                                                           |
|-------------------|-----------|---------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| sql_body          | Yes       | String  | SQL                                                                                                                                                                                                                                                                                                                                                                                   |
| cu_number         | No        | Integer | Total number of CUs used by the job configured on the job editing page, which should match the actual number of CUs used. The actual number of CUs used is determined by the number of parallel operators.<br><br>Total number of CUs used by the job = Number of manager CUs + (Total number of concurrent operators / Number of slots of a TaskManager) x Number of TaskManager CUs |
| manager_cu_number | No        | Integer | Number of CUs of the management unit.                                                                                                                                                                                                                                                                                                                                                 |
| parallel_number   | No        | Integer | Maximum degree of parallelism. Concurrent tasks of each job operator. Appropriately increasing the value will improve the overall computing performance of a job. Considering switchover overheads due to increasing threads, the maximum value is four times the number of CUs. One to two times the number of CUs is the optimal.                                                   |
| tm_cus            | No        | Integer | Number of CUs in a taskManager.                                                                                                                                                                                                                                                                                                                                                       |
| tm_slot_num       | No        | Integer | Number of slots in a taskManager.                                                                                                                                                                                                                                                                                                                                                     |

| Parameter               | Mandatory | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|-------------------------|-----------|---------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| operator_config         | No        | String  | <p>Operator configurations.</p> <p>You can call this API to obtain the operator ID. That is, the ID in <b>operator_list</b> contained in <b>stream_graph</b> in the response message is the operator ID.</p>                                                                                                                                                                                                                                                                                                                                                                  |
| static_estimator        | No        | Boolean | <p>Whether to estimate static resources.</p> <p>If this parameter is set to <b>true</b>, resources used by the job are estimated based on the operator ID and traffic.</p>                                                                                                                                                                                                                                                                                                                                                                                                    |
| static_estimator_config | No        | String  | <p>Traffic or hit ratio of each operator, which is a string in JSON format.</p> <p>This parameter is mandatory when <b>static_estimator</b> is set to <b>true</b>. During the configuration, the operator ID and operator traffic configuration are required.</p> <ul style="list-style-type: none"><li>• You can call this API to obtain the operator ID. That is, the ID in <b>operator_list</b> contained in <b>stream_graph</b> in the response message is the operator ID.</li><li>• The operator traffic is estimated based on the actual service conditions.</li></ul> |
| job_type                | No        | String  | <p>Job types.</p> <p>Only <b>flink_opensource_sql_job</b> is supported.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| graph_type              | No        | String  | <p>Stream graph type. Currently, the following two types of stream graphs are supported:</p> <ul style="list-style-type: none"><li>• <b>simple_graph</b>: Simplified stream graph</li><li>• <b>job_graph</b>: Static stream graph</li></ul>                                                                                                                                                                                                                                                                                                                                   |
| flink_version           | No        | String  | Flink version. Currently, only 1.10 and 1.12 are supported.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

## Response

**Table 14-68** Response parameters

| Parameter    | Mandatory | Type    | Description                                                                                                                    |
|--------------|-----------|---------|--------------------------------------------------------------------------------------------------------------------------------|
| is_success   | Yes       | Boolean | Indicates whether the request is successfully executed. Value <b>true</b> indicates that the request is successfully executed. |
| message      | Yes       | String  | System prompt. If execution succeeds, the message may be left blank.                                                           |
| error_code   | Yes       | String  | Error codes.                                                                                                                   |
| stream_graph | Yes       | String  | Description of a static stream graph.                                                                                          |

## Example Request

Generate a static stream graph for a Flink SQL job.

```
{
 "job_type": "flink_opensource_sql_job",
 "graph_type": "job_graph",
 "sql_body": "create table orders(\r\n name string,\r\n num int\r\n) with (\r\n connector = 'datagen',\r\n rows-per-second = '1', --Generates a data record per second.\r\n fields.name.kind = 'random', --Specify a random generator for the user_id field.\r\n fields.name.length = '5' --Limit the length of user_id to 3.\r\n);\r\n CREATE TABLE sink_table (\r\n name string,\r\n num int\r\n) WITH (\r\n connector = 'print'\r\n);\r\n INSERT into sink_table SELECT * FROM orders;",
 "cu_number": 2,
 "manager_cu_number": 1,
 "parallel_number": 2,
 "tm_cus": 1,
 "tm_slot_num": 0,
 "operator_config": "",
 "static_estimator": true,
 "flink_version": "1.12",
 "static_estimator_config": "{\"operator_list\": [{\"id\" : \"0a448493b4782967b150582570326227\", \"output_rate\":1000}, {\"id\" : \"bc764cd8ddf7a0cff126f51c16239658\", \"output_rate\":1000}]}"}
}
```

## Example Response

```
{
 "message": "",
 "is_success": true,
 "error_code": "",
 "stream_graph": "{\n \"jid\" : \"44334c4259f6714bddef1ac525364052\",

## Status Codes

[Table 14-69](#) describes status codes.

**Table 14-69** Status codes

| Status Code | Description                     |
|-------------|---------------------------------|
| 200         | The operation is successful.    |
| 400         | The input parameter is invalid. |

## Error Codes

If an error occurs when this API is invoked, the system does not return the result similar to the preceding example, but returns the error code and error information. For details, see [Error Codes](#).

# 15 APIs Related to Flink Job Templates

## 15.1 Creating a Template

### Function

This API is used to create a user template for the DLI service. A maximum of 100 user templates can be created.

### URI

- URI format  
POST /v1.0/{project\_id}/streaming/job-templates
- Parameter description

**Table 15-1** URI parameter

| Parameter  | Mandatory | Type   | Description                                                                                                                               |
|------------|-----------|--------|-------------------------------------------------------------------------------------------------------------------------------------------|
| project_id | Yes       | String | Project ID, which is used for resource isolation. For details about how to obtain its value, see <a href="#">Obtaining a Project ID</a> . |

### Request

**Table 15-2** Request parameters

| Parameter | Mandatory | Type   | Description                                              |
|-----------|-----------|--------|----------------------------------------------------------|
| name      | Yes       | String | Template name. The value can contain 1 to 64 characters. |

| Parameter | Mandatory | Type             | Description                                                                                                                                                       |
|-----------|-----------|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| desc      | No        | String           | Template description. Length range: 0 to 512 characters.                                                                                                          |
| sql_body  | No        | String           | Stream SQL statement, which includes at least the following three parts: source, query, and sink. Length range: 0 to 2,048 characters.                            |
| tags      | No        | Array of objects | Label of a Flink job template. For details, see <a href="#">Table 15-3</a> .                                                                                      |
| job_type  | No        | String           | Flink job template type. The default value is <b>flink_sql_job</b> . You can only set this parameter to <b>flink_sql_job</b> or <b>flink_opensource_sql_job</b> . |

**Table 15-3** tags parameter

| Parameter | Mandatory | Type   | Description                                                                                                                                                                                                                                     |
|-----------|-----------|--------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| key       | Yes       | String | <p>Tag key.</p> <p><b>NOTE</b><br/>A tag key can contain a maximum of 128 characters. Only letters, digits, spaces, and special characters (_:=+-@) are allowed, but the value cannot start or end with a space or start with <b>_sys_</b>.</p> |
| value     | Yes       | String | <p>Tag key.</p> <p><b>NOTE</b><br/>A tag value can contain a maximum of 255 characters. Only letters, digits, spaces, and special characters (_:=+-@) are allowed. The value cannot start or end with a space.</p>                              |

## Response

**Table 15-4** Response parameters

| Parameter  | Mandatory | Type    | Description                                  |
|------------|-----------|---------|----------------------------------------------|
| is_success | No        | Boolean | Indicates whether the request is successful. |
| message    | No        | String  | Message content.                             |

| Parameter | Mandatory | Type   | Description                                                                 |
|-----------|-----------|--------|-----------------------------------------------------------------------------|
| template  | No        | Object | Information about job update. For details, see <a href="#">Table 15-5</a> . |

**Table 15-5 template** parameters

| Parameter   | Mandatory | Type   | Description                        |
|-------------|-----------|--------|------------------------------------|
| template_id | No        | Long   | Template ID.                       |
| name        | No        | String | Template name.                     |
| desc        | No        | String | Template description.              |
| create_time | No        | Long   | Time when the template is created. |
| job_type    | No        | String | Job template type                  |

## Example Request

Create a job template named **simple\_stream\_sql**.

```
{
 "name": "simple_stream_sql",
 "desc": "Example of quick start",
 "sql_body": "select * from source_table",
 "job_type": "flink_sql_job"
}
```

## Example Response

```
{
 "is_success": true,
 "message": "A template is created successfully.",
 "template": {
 "template_id": 0,
 "name": "IoT_example",
 "desc": "Example of quick start",
 "create_time": 1516952710040,
 "job_type": "flink_opensource_sql_job"
 }
}
```

## Status Codes

[Table 15-6](#) describes status codes.

**Table 15-6** Status codes

| Status Code | Description                         |
|-------------|-------------------------------------|
| 200         | A template is created successfully. |
| 400         | The input parameter is invalid.     |

## Error Codes

If an error occurs when this API is invoked, the system does not return the result similar to the preceding example, but returns the error code and error information. For details, see [Error Codes](#).

## 15.2 Updating a Template

### Function

This API is used to update existing templates in DLI.

### URI

- URI format  
`PUT /v1.0/{project_id}/streaming/job-templates/{template_id}`
- Parameter description

**Table 15-7** URI parameters

| Parameter   | Mandatory | Type   | Description                                                                                                                               |
|-------------|-----------|--------|-------------------------------------------------------------------------------------------------------------------------------------------|
| project_id  | Yes       | String | Project ID, which is used for resource isolation. For details about how to obtain its value, see <a href="#">Obtaining a Project ID</a> . |
| template_id | Yes       | String | Template ID.                                                                                                                              |

### Request

**Table 15-8** Request parameters

| Parameter | Mandatory | Type   | Description                                              |
|-----------|-----------|--------|----------------------------------------------------------|
| name      | No        | String | Template name. Length range: 0 to 57 characters.         |
| desc      | No        | String | Template description. Length range: 0 to 512 characters. |

| Parameter | Mandatory | Type   | Description                                                                                                                                  |
|-----------|-----------|--------|----------------------------------------------------------------------------------------------------------------------------------------------|
| sql_body  | No        | String | Stream SQL statement, which includes at least the following three parts: source, query, and sink. Length range: 0 to 1024 x 1024 characters. |

## Response

**Table 15-9** Response parameters

| Parameter  | Mandatory | Type    | Description                                                                                                                    |
|------------|-----------|---------|--------------------------------------------------------------------------------------------------------------------------------|
| is_success | No        | Boolean | Indicates whether the request is successfully executed. Value <b>true</b> indicates that the request is successfully executed. |
| message    | No        | String  | System prompt. If execution succeeds, the parameter setting may be left blank.                                                 |

## Example Request

Update job template information, including the template name, template description, and template SQL statements.

```
{
 "name": "simple_stream_sql",
 "desc": "Example of quick start",
 "sql_body": "select * from source_table"
}
```

## Example Response

```
{
 "is_success": "true",
 "message": "The template is updated successfully."
}
```

## Status Codes

**Table 15-10** describes status codes.

**Table 15-10** Status codes

| Status Code | Description                         |
|-------------|-------------------------------------|
| 200         | A template is updated successfully. |
| 400         | The input parameter is invalid.     |

## Error Codes

If an error occurs when this API is invoked, the system does not return the result similar to the preceding example, but returns the error code and error information. For details, see [Error Codes](#).

# 15.3 Deleting a Template

## Function

This API is used to delete a template. A template used by jobs can also be deleted.

## URI

- URI format  
`DELETE /v1.0/{project_id}/streaming/job-templates/{template_id}`
- Parameter description

**Table 15-11** URI parameters

| Parameter   | Mandatory | Type   | Description                                                                                                                               |
|-------------|-----------|--------|-------------------------------------------------------------------------------------------------------------------------------------------|
| project_id  | Yes       | String | Project ID, which is used for resource isolation. For details about how to obtain its value, see <a href="#">Obtaining a Project ID</a> . |
| template_id | Yes       | String | Template ID.                                                                                                                              |

## Request

None

## Response

- Parameter description

**Table 15-12** Response parameters

| Parameter  | Mandatory | Type    | Description                                                                                  |
|------------|-----------|---------|----------------------------------------------------------------------------------------------|
| is_success | No        | Boolean | Indicates whether the response is successful. Value <b>true</b> indicates success.           |
| message    | No        | String  | Message content.                                                                             |
| template   | No        | Object  | Information about the template to be deleted. For details, see <a href="#">Table 15-13</a> . |

**Table 15-13 template parameters**

| Parameter   | Mandatory | Type | Description  |
|-------------|-----------|------|--------------|
| template_id | No        | Long | Template ID. |

## Example Request

None

## Example Response

```
{
 "is_success": "true",
 "message": "The template is deleted successfully.",
 "template": {
 "template_id": 2
 }
}
```

## Status Codes

[Table 15-14](#) describes status codes.

**Table 15-14 Status codes**

| Status Code | Description                         |
|-------------|-------------------------------------|
| 200         | A template is deleted successfully. |
| 400         | The input parameter is invalid.     |

## Error Codes

If an error occurs when this API is invoked, the system does not return the result similar to the preceding example, but returns the error code and error information. For details, see [Error Codes](#).

## 15.4 Listing Templates

### Function

This API is used to list job templates. Currently, only custom templates can be queried.

## URI

- URI format  
GET /v1.0/{project\_id}/streaming/job-templates
- Parameter description

**Table 15-15** URI parameter

| Parameter  | Mandatory | Type   | Description                                                                                                                               |
|------------|-----------|--------|-------------------------------------------------------------------------------------------------------------------------------------------|
| project_id | Yes       | String | Project ID, which is used for resource isolation. For details about how to obtain its value, see <a href="#">Obtaining a Project ID</a> . |

**Table 15-16** query parameter description

| Parameter | Mandatory | Type    | Description                                                                                                                                                                                                                                                              |
|-----------|-----------|---------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| name      | No        | String  | Template name. Fuzzy query by name is supported.                                                                                                                                                                                                                         |
| tags      | No        | String  | List of tag names. The value is <b>k=v</b> for a single tag. Multiple tags are separated by commas (,). Example: <b>tag1=v1,tag2=v2</b> .                                                                                                                                |
| offset    | No        | Long    | Job offset.                                                                                                                                                                                                                                                              |
| limit     | No        | Integer | Number of returned data records. The default value is <b>10</b> .                                                                                                                                                                                                        |
| order     | No        | String  | Sorting style of the query results. <ul style="list-style-type: none"><li>• <b>asc</b>: The query results are displayed in ascending order.</li><li>• <b>desc</b>: The query results are displayed in the descending order.</li></ul> The default value is <b>desc</b> . |

## Response

**Table 15-17** Response parameters

| Parameter     | Mandatory | Type    | Description                                                                         |
|---------------|-----------|---------|-------------------------------------------------------------------------------------|
| is_success    | No        | Boolean | Indicates whether the request is successful.                                        |
| message       | No        | String  | Message content.                                                                    |
| template_list | No        | Object  | Information about the template list. For details, see <a href="#">Table 15-18</a> . |

**Table 15-18** template\_list parameters

| Parameter   | Mandatory | Type             | Description                                                                           |
|-------------|-----------|------------------|---------------------------------------------------------------------------------------|
| total_count | No        | Integer          | Total number of templates.                                                            |
| templates   | No        | Array of objects | Detailed information about a template. For details, see <a href="#">Table 15-19</a> . |

**Table 15-19** templates parameters

| Parameter   | Mandatory | Type    | Description                                                                                       |
|-------------|-----------|---------|---------------------------------------------------------------------------------------------------|
| template_id | No        | Integer | Template ID.                                                                                      |
| name        | No        | String  | Template name.                                                                                    |
| desc        | No        | String  | Template description.                                                                             |
| create_time | No        | Long    | Time when the template is created.                                                                |
| update_time | No        | Long    | Time when the template is updated.                                                                |
| sql_body    | No        | String  | Stream SQL statement. Contains at least the <b>source</b> , <b>query</b> , and <b>sink</b> parts. |
| job_type    | No        | String  | Job template type.                                                                                |

## Example Request

None

## Example Response

```
{
 "is_success": "true",
 "message": "The template list is obtained successfully.",
 "template_list": {
 "total_count": 2,
 "templates": [
 {
 "template_id": 2,
 "name": "updatetest",
 "desc": "Example of quick start",
 "create_time": 1578748092000,
 "update_time": 1578748092000,
 "sql_body": "select * from source_table",
 "job_type": "flink_sql_job"
 },
 {
 "template_id": 1,
 "name": "we",
 "desc": "qwe",
 "create_time": 1577951045000,
 "update_time": 1577951045000,
 "sql_body": ""
 }
]
 }
}
```

## Status Codes

[Table 15-20](#) describes status codes.

**Table 15-20** Status codes

| Status Code | Description                     |
|-------------|---------------------------------|
| 200         | Template list query succeeds.   |
| 400         | The input parameter is invalid. |

## Error Codes

If an error occurs when this API is invoked, the system does not return the result similar to the preceding example, but returns the error code and error information. For details, see [Error Codes](#).

# 16 Flink Job Management APIs

## 16.1 Triggering Savepoints for Flink Jobs

### Function

This API is used to trigger savepoints for Flink jobs.

### URI

POST /v1.0/{project\_id}/streaming/jobs/{job\_id}/savepoint

**Table 16-1** URI parameters

| Parameter  | Mandatory | Type   | Description                                                                                                                      |
|------------|-----------|--------|----------------------------------------------------------------------------------------------------------------------------------|
| job_id     | Yes       | String | ID of a Flink job                                                                                                                |
| project_id | Yes       | String | Project ID, which is used for resource isolation. For how to obtain the project ID, see <a href="#">Obtaining a Project ID</a> . |

### Request Parameters

**Table 16-2** Request body parameters

| Parameter | Mandatory | Type   | Description                                           |
|-----------|-----------|--------|-------------------------------------------------------|
| action    | Yes       | String | Operation type<br>Enumerated value:<br><b>TRIGGER</b> |

| Parameter      | Mandatory | Type   | Description                                                                                                                          |
|----------------|-----------|--------|--------------------------------------------------------------------------------------------------------------------------------------|
| savepoint_path | Yes       | String | Savepoint path. Make sure you have authorized operations on OBS before using it.<br>Example: <b>obs://bucket-name/dir/savepoint/</b> |

## Response Parameters

Status code: 200

**Table 16-3** Response body parameters

| Parameter  | Type    | Description                                                                                                    |
|------------|---------|----------------------------------------------------------------------------------------------------------------|
| is_success | Boolean | Whether the request is successfully executed. <b>true</b> indicates that the request is successfully executed. |
| message    | String  | System prompt. If the execution succeeds, this parameter may be left blank.                                    |

Status code: 400

**Table 16-4** Response body parameters

| Parameter  | Type   | Description   |
|------------|--------|---------------|
| error_code | String | Error code    |
| error_msg  | String | Error message |

Status code: 500

**Table 16-5** Response body parameters

| Parameter  | Type   | Description   |
|------------|--------|---------------|
| error_code | String | Error code    |
| error_msg  | String | Error message |

## Example Request

Trigger savepoints for a Flink job.

```
{
 "action": "TRIGGER",
}
```

```
 "savepoint_path": "obs://bucket-name/dir/savepoint"
 }
```

## Example Response

```
{
 "is_success": true,
 "message": "{\"is_success\":\"true\",\"message\":\"api.msg.deal_savepoint_success\"}"
}
```

## Status Codes

| Status Code | Description                     |
|-------------|---------------------------------|
| 200         | The modification is successful. |
| 400         | Request error.                  |
| 500         | Internal server error.          |

## Error Codes

See [Error Codes](#).

## 16.2 Importing Savepoints for Flink Jobs

### Function

This API is used to import savepoints for Flink jobs.

### URI

POST /v1.0/{project\_id}/streaming/jobs/{job\_id}/import-savepoint

**Table 16-6** URI parameters

| Parameter  | Mandatory | Type   | Description                                                                                                                      |
|------------|-----------|--------|----------------------------------------------------------------------------------------------------------------------------------|
| job_id     | Yes       | String | ID of a Flink job                                                                                                                |
| project_id | Yes       | String | Project ID, which is used for resource isolation. For how to obtain the project ID, see <a href="#">Obtaining a Project ID</a> . |

## Request Parameters

**Table 16-7** Request body parameters

| Parameter      | Mandatory | Type   | Description                                             |
|----------------|-----------|--------|---------------------------------------------------------|
| job_id         | Yes       | Long   | ID of a Flink job                                       |
| savepoint_path | Yes       | String | Savepoint path<br>Example: <b>obs://bucket-name/dir</b> |

## Response Parameters

**Status code: 200**

**Table 16-8** Response body parameters

| Parameter  | Type    | Description                                                                                                    |
|------------|---------|----------------------------------------------------------------------------------------------------------------|
| is_success | Boolean | Whether the request is successfully executed. <b>true</b> indicates that the request is successfully executed. |
| message    | String  | System prompt. If the execution succeeds, this parameter may be left blank.                                    |

**Status code: 400**

**Table 16-9** Response body parameters

| Parameter  | Type   | Description   |
|------------|--------|---------------|
| error_code | String | Error code    |
| error_msg  | String | Error message |

**Status code: 500**

**Table 16-10** Response body parameters

| Parameter  | Type   | Description   |
|------------|--------|---------------|
| error_code | String | Error code    |
| error_msg  | String | Error message |

## Example Request

```
{
 "job_id": 137228,
 "savepoint_path": "obs://bucket-name/dir/savepoint/"
}
```

## Example Response

```
{
 "is_success": true,
 "message": "The job is updated successfully."
}
```

## Status Codes

| Status Code | Description                     |
|-------------|---------------------------------|
| 200         | The modification is successful. |
| 400         | Request error.                  |
| 500         | Internal server error.          |

## Error Codes

See [Error Codes](#).

# 17 Spark Job-related APIs

## 17.1 Creating a Batch Processing Job

### Function

This API is used to create a batch processing job in a queue.

### URI

- URI format  
POST /v2.0/{project\_id}/batches
- Parameter description

**Table 17-1** URI parameter

| Parameter  | Mandatory | Type   | Description                                                                                                                               |
|------------|-----------|--------|-------------------------------------------------------------------------------------------------------------------------------------------|
| project_id | Yes       | String | Project ID, which is used for resource isolation. For details about how to obtain its value, see <a href="#">Obtaining a Project ID</a> . |

### Request Parameters

**Table 17-2** Request parameters

| Parameter | Mandatory | Type   | Description                                                                                                                                                                                               |
|-----------|-----------|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| file      | Yes       | String | Name of the package that is of the JAR or pyFile type and has been uploaded to the DLI resource management system. You can also specify an OBS path, for example, <b>obs://Bucket name/Package name</b> . |

| Parameter    | Mandatory | Type             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|--------------|-----------|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| className    | Yes       | String           | Java/Spark main class of the batch processing job.                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| queue        | No        | String           | <p>Queue name. Set this parameter to the name of the created DLI queue. The queue must be of the general-purpose type.</p> <p><b>NOTE</b></p> <ul style="list-style-type: none"><li>• This parameter is compatible with the <b>cluster_name</b> parameter. That is, if <b>cluster_name</b> is used to specify a queue, the queue is still valid.</li><li>• You are advised to use the <b>queue</b> parameter. The <b>queue</b> and <b>cluster_name</b> parameters cannot coexist.</li></ul> |
| cluster_name | No        | String           | <p>Queue name. Set this parameter to the created DLI queue name.</p> <p><b>NOTE</b></p> <p>You are advised to use the <b>queue</b> parameter. The <b>queue</b> and <b>cluster_name</b> parameters cannot coexist.</p>                                                                                                                                                                                                                                                                       |
| args         | No        | Array of Strings | Input parameters of the main class, that is, application parameters.                                                                                                                                                                                                                                                                                                                                                                                                                        |
| sc_type      | No        | String           | Compute resource type. Currently, resource types A, B, and C are available. If this parameter is not specified, the minimum configuration (type A) is used. For details about resource types, see <a href="#">Table 17-3</a> .                                                                                                                                                                                                                                                              |
| jars         | No        | Array of Strings | Name of the package that is of the JAR type and has been uploaded to the DLI resource management system. You can also specify an OBS path, for example, <b>obs://Bucket name/Package name</b> .                                                                                                                                                                                                                                                                                             |
| pyFiles      | No        | Array of Strings | Name of the package that is of the PyFile type and has been uploaded to the DLI resource management system. You can also specify an OBS path, for example, <b>obs://Bucket name/Package name</b> .                                                                                                                                                                                                                                                                                          |
| files        | No        | Array of Strings | Name of the package that is of the file type and has been uploaded to the DLI resource management system. You can also specify an OBS path, for example, <b>obs://Bucket name/Package name</b> .                                                                                                                                                                                                                                                                                            |

| Parameter    | Mandatory | Type             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| modules      | No        | Array of Strings | Name of the dependent system resource module. You can view the module name using the API related to <a href="#">Querying Resource Packages in a Group (Discarded)</a> .<br><br>DLI provides dependencies for executing datasource jobs. The following table lists the dependency modules corresponding to different services. <ul style="list-style-type: none"><li>• CloudTable/MRS HBase: sys.datasource.hbase</li><li>• CloudTable/MRS OpenTSDB: sys.datasource.opentsdb</li><li>• RDS MySQL: sys.datasource.rds</li><li>• RDS Postgre: preset</li><li>• DWS: preset</li><li>• CSS: sys.datasource.css</li></ul> |
| resources    | No        | Array of objects | JSON object list, including the name and type of the JSON package that has been uploaded to the queue. For details, see <a href="#">Table 17-4</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| groups       | No        | Array of objects | JSON object list, including the package group resource. For details about the format, see the request example. If the type of the <b>name</b> in <b>resources</b> is not verified, the package with the name exists in the group. For details, see <a href="#">Table 17-5</a> .                                                                                                                                                                                                                                                                                                                                     |
| conf         | No        | Object           | <b>Batch</b> configuration item. For details, see <a href="#">Spark Configuration</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| name         | No        | String           | Batch processing task name. The value contains a maximum of 128 characters.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| driverMemory | No        | String           | Driver memory of the Spark application, for example, <b>2 GB</b> and <b>2048 MB</b> . This configuration item replaces the default parameter in <b>sc_type</b> . The unit must be provided. Otherwise, the startup fails.                                                                                                                                                                                                                                                                                                                                                                                           |
| driverCores  | No        | Integer          | Number of CPU cores of the Spark application driver. This configuration item replaces the default parameter in <b>sc_type</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| Parameter       | Mandatory | Type    | Description                                                                                                                                                                                                                                                                                                                                                                             |
|-----------------|-----------|---------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| executorMemory  | No        | String  | Executor memory of the Spark application, for example, <b>2 GB</b> and <b>2048 MB</b> . This configuration item replaces the default parameter in <b>sc_type</b> . The unit must be provided. Otherwise, the startup fails.                                                                                                                                                             |
| executorCores   | No        | Integer | Number of CPU cores of each Executor in the Spark application. This configuration item replaces the default parameter in <b>sc_type</b> .                                                                                                                                                                                                                                               |
| numExecutors    | No        | Integer | Number of Executors in a Spark application. This configuration item replaces the default parameter in <b>sc_type</b> .                                                                                                                                                                                                                                                                  |
| obs_bucket      | No        | String  | OBS bucket for storing the Spark jobs. Set this parameter when you need to save jobs.                                                                                                                                                                                                                                                                                                   |
| auto_recovery   | No        | Boolean | Whether to enable the retry function. If enabled, Spark jobs will be automatically retried after an exception occurs. The default value is <b>false</b> .                                                                                                                                                                                                                               |
| max_retry_times | No        | Integer | Maximum retry times. The maximum value is <b>100</b> , and the default value is <b>20</b> .                                                                                                                                                                                                                                                                                             |
| feature         | No        | String  | Job feature. Type of the Spark image used by a job. <ul style="list-style-type: none"><li>• <b>custom</b>: indicates that the user-defined Spark image is used.</li></ul>                                                                                                                                                                                                               |
| spark_version   | No        | String  | Version of the Spark component <ul style="list-style-type: none"><li>• If the in-use Spark version is 2.3.2, this parameter is not required.</li></ul>                                                                                                                                                                                                                                  |
| image           | No        | String  | Custom image. The format is <b>Organization name/Image name:Image version</b> .<br>This parameter is valid only when <b>feature</b> is set to <b>custom</b> . You can use this parameter with the <b>feature</b> parameter to specify a user-defined Spark image for job running. For details about how to use custom images, see <a href="#"><b>Data Lake Insight User Guide</b></a> . |
| catalog_name    | No        | String  | To access metadata, set this parameter to <b>dli</b> .                                                                                                                                                                                                                                                                                                                                  |

**Table 17-3** Resource types

| Resource Type | Physical Resource          | driverCores | executorCores | driverMemory | executorMemory | numExecutor |
|---------------|----------------------------|-------------|---------------|--------------|----------------|-------------|
| A             | 8 vCPUs,<br>32-GB memory   | 2           | 1             | 7 GB         | 4 GB           | 6           |
| B             | 16 vCPUs,<br>64-GB memory  | 2           | 2             | 7 GB         | 8 GB           | 7           |
| C             | 32 vCPUs,<br>128-GB memory | 4           | 2             | 15 GB        | 8 GB           | 14          |

**Table 17-4** resources parameters

| Parameter | Mandatory | Type   | Description                                                                                          |
|-----------|-----------|--------|------------------------------------------------------------------------------------------------------|
| name      | No        | String | Resource name You can also specify an OBS path, for example, <b>obs://Bucket name/Package name</b> . |
| type      | No        | String | Resource type.                                                                                       |

**Table 17-5** groups parameters

| Parameter | Mandatory | Type             | Description                                                       |
|-----------|-----------|------------------|-------------------------------------------------------------------|
| name      | No        | String           | User group name                                                   |
| resources | No        | Array of objects | User group resource For details, see <a href="#">Table 17-4</a> . |

## Response Parameters

**Table 17-6** Response parameters

| Parameter    | Mandatory | Type             | Description                                                                                                                                                                                                                                                                                                                                                                                                                   |
|--------------|-----------|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| id           | No        | String           | ID of a batch processing job.                                                                                                                                                                                                                                                                                                                                                                                                 |
| appId        | No        | String           | Back-end application ID of a batch processing job.                                                                                                                                                                                                                                                                                                                                                                            |
| name         | No        | String           | Batch processing task name. The value contains a maximum of 128 characters.                                                                                                                                                                                                                                                                                                                                                   |
| owner        | No        | String           | Owner of a batch processing job.                                                                                                                                                                                                                                                                                                                                                                                              |
| proxyUser    | No        | String           | Proxy user (resource tenant) to which a batch processing job belongs.                                                                                                                                                                                                                                                                                                                                                         |
| state        | No        | String           | Status of a batch processing job. For details, see <a href="#">Table 17-7</a> .                                                                                                                                                                                                                                                                                                                                               |
| kind         | No        | String           | Type of a batch processing job. Only Spark parameters are supported.                                                                                                                                                                                                                                                                                                                                                          |
| log          | No        | Array of strings | Last 10 records of the current batch processing job.                                                                                                                                                                                                                                                                                                                                                                          |
| sc_type      | No        | String           | Type of a computing resource. If the computing resource type is customized, value <b>CUSTOMIZED</b> is returned.                                                                                                                                                                                                                                                                                                              |
| cluster_name | No        | String           | Queue where a batch processing job is located.                                                                                                                                                                                                                                                                                                                                                                                |
| queue        | Yes       | String           | Queue name. Set this parameter to the name of the created DLI queue.<br><b>NOTE</b> <ul style="list-style-type: none"><li>This parameter is compatible with the <b>cluster_name</b> parameter. That is, if <b>cluster_name</b> is used to specify a queue, the queue is still valid.</li><li>You are advised to use the <b>queue</b> parameter. The <b>queue</b> and <b>cluster_name</b> parameters cannot coexist.</li></ul> |
| image        | No        | String           | Custom image. The format is <b>Organization name/Image name:Image version</b> .<br>This parameter is valid only when <b>feature</b> is set to <b>custom</b> . You can use this parameter with the <b>feature</b> parameter to specify a user-defined Spark image for job running. For details about how to use custom images, see <a href="#">Data Lake Insight User Guide</a> .                                              |

| Parameter   | Mandatory | Type | Description                                                                              |
|-------------|-----------|------|------------------------------------------------------------------------------------------|
| create_time | No        | Long | Time when a batch processing job is created. The timestamp is expressed in milliseconds. |
| update_time | No        | Long | Time when a batch processing job is updated. The timestamp is expressed in milliseconds. |
| duration    | No        | Long | Job running duration (unit: millisecond)                                                 |

**Table 17-7** Batch processing job statuses

| Parameter  | Type   | Description                                        |
|------------|--------|----------------------------------------------------|
| starting   | String | The batch processing job is being started.         |
| running    | String | The batch processing job is executing a task.      |
| dead       | String | The batch processing job has exited.               |
| success    | String | The batch processing job is successfully executed. |
| recovering | String | The batch processing job is being restored.        |

## Example Request

Create a Spark job. Set the Spark main class of the job to **org.apache.spark.examples.SparkPi**, specify the program package to **batchTest/spark-examples\_2.11-2.1.0.luxor.jar**, and load the program package whose type is **jar** and the resource package whose type is **files**.

```
{
 "file": "batchTest/spark-examples_2.11-2.1.0.luxor.jar",
 "className": "org.apache.spark.examples.SparkPi",
 "sc_type": "A",
 "jars": ["demo-1.0.0.jar"],
 "files": ["count.txt"],
 "resources": [
 {"name": "groupTest/testJar.jar", "type": "jar"},
 {"name": "kafka-clients-0.10.0.0.jar", "type": "jar"}],
 "groups": [
 {"name": "groupTestJar", "resources": [{"name": "testJar.jar", "type": "jar"}, {"name": "testJar1.jar", "type": "jar"}]},
 {"name": "batchTest", "resources": [{"name": "luxor.jar", "type": "jar"}]}],
 "queue": " test",
 "name": "TestDemo4",
 "feature": "basic",
 "spark_version": "2.3.2"
}
```

### NOTE

The **batchTest/spark-examples\_2.11-2.1.0.luxor.jar** file has been uploaded through API involved in [Uploading a Package Group \(Discarded\)](#).

## Example Response

```
{
 "id": "07a3e4e6-9a28-4e92-8d3f-9c538621a166",
 "appId": "",
 "name": "",
 "owner": "test1",
 "proxyUser": "",
 "state": "starting",
 "kind": "",
 "log": [],
 "sc_type": "CUSTOMIZED",
 "cluster_name": "aaa",
 "queue": "aaa",
 "create_time": 1607589874156,
 "update_time": 1607589874156
}
```

## Status Codes

[Table 17-8](#) describes the status code.

**Table 17-8** Status code

| Status Code | Description                      |
|-------------|----------------------------------|
| 200         | The job is created successfully. |
| 400         | Request error.                   |
| 500         | Internal service error.          |

## Error Codes

If an error occurs when this API is invoked, the system does not return the result similar to the preceding example, but returns the error code and error information. For details, see [Error Codes](#).

## 17.2 Listing Batch Processing Jobs

### Function

This API is used to list batch processing jobs in a queue of a project.

### URI

- URI format  
GET /v2.0/{project\_id}/batches
- Parameter description

**Table 17-9** URI parameter

| Parameter  | Mandatory | Type   | Description                                                                                                                               |
|------------|-----------|--------|-------------------------------------------------------------------------------------------------------------------------------------------|
| project_id | Yes       | String | Project ID, which is used for resource isolation. For details about how to obtain its value, see <a href="#">Obtaining a Project ID</a> . |

**Table 17-10** query parameter description

| Parameter    | Mandatory | Type    | Description                                                                                                                                                                                          |
|--------------|-----------|---------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| job_name     | No        | String  | Name of a batch processing job.                                                                                                                                                                      |
| job-id       | No        | String  | This API is used to query a batch job based on the job ID.                                                                                                                                           |
| cluster_name | No        | String  | DLI queue name. If this parameter is left blank, the names of all batch processing jobs in the current project are obtained. You are advised to specify this parameter, instead of leaving it blank. |
| queue_name   | No        | String  | DLI queue name. You can query batch jobs based on the queue name. This method is recommended.                                                                                                        |
| from         | No        | Integer | Index number of the start batch processing job. By default, the index number starts from 0.                                                                                                          |
| size         | No        | Integer | Number of batch processing jobs to be queried                                                                                                                                                        |
| state        | No        | String  | Query batch jobs by job status.                                                                                                                                                                      |
| owner        | No        | String  | User who submits a job.                                                                                                                                                                              |

## Response

**Table 17-11** Response parameters

| Parameter | Mandatory | Type    | Description                                     |
|-----------|-----------|---------|-------------------------------------------------|
| from      | No        | Integer | Index number of the start batch processing job. |

| Parameter   | Mandatory | Type             | Description                                                           |
|-------------|-----------|------------------|-----------------------------------------------------------------------|
| total       | No        | Integer          | Total number of batch processing jobs.                                |
| sessions    | No        | Array of objects | Batch job information. For details, see <a href="#">Table 17-12</a> . |
| create_time | No        | Long             | Time when a batch processing job is created.                          |

**Table 17-12** sessions parameters

| Parameter    | Mandatory | Type             | Description                                                                                                      |
|--------------|-----------|------------------|------------------------------------------------------------------------------------------------------------------|
| duration     | No        | Long             | Job running duration (unit: millisecond)                                                                         |
| id           | No        | String           | ID of a batch processing job.                                                                                    |
| state        | No        | String           | Status of a batch processing job                                                                                 |
| apld         | No        | String           | Back-end application ID of a batch processing job                                                                |
| log          | No        | Array of Strings | Last 10 records of the current batch processing job                                                              |
| sc_type      | No        | String           | Type of a computing resource. If the computing resource type is customized, value <b>CUSTOMIZED</b> is returned. |
| cluster_name | No        | String           | Queue where a batch processing job is located.                                                                   |
| create_time  | No        | Long             | Time when a batch processing job is created. The timestamp is in milliseconds.                                   |
| name         | No        | String           | Name of a batch processing job.                                                                                  |
| owner        | No        | String           | Owner of a batch processing job.                                                                                 |
| proxyUser    | No        | String           | Proxy user (resource tenant) to which a batch processing job belongs.                                            |
| kind         | No        | String           | Type of a batch processing job. Only Spark parameters are supported.                                             |
| queue        | No        | String           | Queue where a batch processing job is located.                                                                   |

| Parameter   | Mandatory | Type   | Description                                                                                                                                                                                                                                                                       |
|-------------|-----------|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| image       | No        | String | Custom image. The format is <b>Organization name/Image name:Image version</b> .<br>This parameter is valid only when <b>feature</b> is set to <b>custom</b> . You can use this parameter with the <b>feature</b> parameter to specify a user-defined Spark image for job running. |
| req_body    | No        | String | Request parameter details.                                                                                                                                                                                                                                                        |
| update_time | No        | Long   | Time when a batch processing job is updated. The timestamp is in milliseconds.                                                                                                                                                                                                    |

```

## Status Codes

[Table 17-13](#) describes the status code.

**Table 17-13** Status codes

| Status Code | Description              |
|-------------|--------------------------|
| 200         | The query is successful. |
| 400         | Request error.           |
| 500         | Internal service error.  |

## Error Codes

If an error occurs when this API is invoked, the system does not return the result similar to the preceding example, but returns the error code and error information. For details, see [Error Codes](#).

## 17.3 Querying Batch Job Details

### Function

This API is used to query details about a batch processing job based on the job ID.

### URI

- URI format  
GET /v2.0/{project\_id}/batches/{batch\_id}
- Parameter description

**Table 17-14** URI parameters

| Parameter  | Mandatory | Type   | Description                                                                                                                               |
|------------|-----------|--------|-------------------------------------------------------------------------------------------------------------------------------------------|
| project_id | Yes       | String | Project ID, which is used for resource isolation. For details about how to obtain its value, see <a href="#">Obtaining a Project ID</a> . |
| batch_id   | Yes       | String | ID of a batch processing job.                                                                                                             |

### Request

### Response

**Table 17-15** Response parameters

| Parameter | Mandatory | Type   | Description                                        |
|-----------|-----------|--------|----------------------------------------------------|
| id        | No        | String | ID of a batch processing job.                      |
| appId     | No        | String | Back-end application ID of a batch processing job. |
| name      | No        | String | Name of a batch processing job.                    |
| owner     | No        | String | Owner of a batch processing job.                   |

| Parameter     | Mandatory | Type             | Description                                                                                                                                                                                                                                                                                                                               |
|---------------|-----------|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| proxyUser     | No        | String           | Proxy user (resource tenant) to which a batch processing job belongs.                                                                                                                                                                                                                                                                     |
| state         | No        | String           | Status of a batch processing job. For details, see <a href="#">Table 17-7</a> in <a href="#">Creating a Batch Processing Job</a> .                                                                                                                                                                                                        |
| kind          | No        | String           | Type of a batch processing job. Only Spark parameters are supported.                                                                                                                                                                                                                                                                      |
| log           | No        | Array of Strings | Last 10 records of the current batch processing job.                                                                                                                                                                                                                                                                                      |
| sc_type       | No        | String           | Type of a computing resource. If the computing resource type is customized, value <b>CUSTOMIZED</b> is returned.                                                                                                                                                                                                                          |
| cluster_name  | No        | String           | Queue where a batch processing job is located.                                                                                                                                                                                                                                                                                            |
| queue         | No        | String           | Queue where a batch processing job is located.                                                                                                                                                                                                                                                                                            |
| create_time   | No        | Long             | Time when a batch processing job is created. The timestamp is expressed in milliseconds.                                                                                                                                                                                                                                                  |
| update_time   | No        | Long             | Time when a batch processing job is updated. The timestamp is expressed in milliseconds.                                                                                                                                                                                                                                                  |
| feature       | No        | String           | Job feature. Type of the Spark image used by a job. <ul style="list-style-type: none"><li>• <b>basic</b>: indicates that the basic Spark image provided by DLI is used.</li><li>• <b>custom</b>: indicates that the user-defined Spark image is used.</li><li>• <b>ai</b>: indicates that the AI image provided by DLI is used.</li></ul> |
| spark_version | No        | String           | Version of the Spark component used by a job. Set this parameter when <b>feature</b> is set to <b>basic</b> or <b>ai</b> . If this parameter is not set, the default Spark component version 2.3.2 is used.                                                                                                                               |

| Parameter | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                                                                                             |
|-----------|-----------|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| image     | No        | String | Custom image. The format is <b>Organization name/Image name:Image version</b> .<br>This parameter is valid only when <b>feature</b> is set to <b>custom</b> . You can use this parameter with the <b>feature</b> parameter to specify a user-defined Spark image for job running. For details about how to use custom images, see <a href="#"><b>Data Lake Insight User Guide</b></a> . |
| req_body  | No        | String | Request parameter details.                                                                                                                                                                                                                                                                                                                                                              |

## Example Request

None

## Example Response

```
{
 "id": "0a324461-d9d9-45da-a52a-3b3c7a3d809e",

}
```

## Status Codes

[\*\*Table 17-16\*\*](#) describes the status code.

**Table 17-16** Status codes

| Status Code | Description              |
|-------------|--------------------------|
| 200         | The query is successful. |
| 400         | Request error.           |
| 500         | Internal service error.  |

## Error Codes

If an error occurs when this API is invoked, the system does not return the result similar to the preceding example, but returns the error code and error information. For details, see [Error Codes](#).

# 17.4 Querying a Batch Job Status

## Function

This API is used to obtain the execution status of a batch processing job.

## URI

- URI format  
GET /v2.0/{project\_id}/batches/{batch\_id}/state
- Parameter description

**Table 17-17** URI parameters

| Parameter  | Mandatory | Description                                                                                                                               |
|------------|-----------|-------------------------------------------------------------------------------------------------------------------------------------------|
| project_id | Yes       | Project ID, which is used for resource isolation. For details about how to obtain its value, see <a href="#">Obtaining a Project ID</a> . |
| batch_id   | Yes       | ID of a batch processing job.                                                                                                             |

## Request

None

## Response

**Table 17-18** Response parameters

| Parameter | Mandatory | Type   | Description                                                                                                                        |
|-----------|-----------|--------|------------------------------------------------------------------------------------------------------------------------------------|
| id        | No        | String | ID of a batch processing job, which is in the universal unique identifier (UUID) format.                                           |
| state     | No        | String | Status of a batch processing job. For details, see <a href="#">Table 17-7</a> in <a href="#">Creating a Batch Processing Job</a> . |

## Example Request

None

## Example Response

```
{"id":"0a324461-d9d9-45da-a52a-3b3c7a3d809e","state":"Success"}
```

## Status Codes

[Table 17-19](#) describes the status code.

**Table 17-19** Status codes

| Status Code | Description              |
|-------------|--------------------------|
| 200         | The query is successful. |
| 400         | Request error.           |
| 500         | Internal service error.  |

## Error Codes

If an error occurs when this API is invoked, the system does not return the result similar to the preceding example, but returns the error code and error information. For details, see [Error Codes](#).

## 17.5 Canceling a Batch Processing Job

### Function

This API is used to cancel a batch processing job.

#### NOTE

Batch processing jobs in the **Successful** or **Failed** state cannot be canceled.

### URI

- URI format  
`DELETE /v2.0/{project_id}/batches/{batch_id}`
- Parameter description

**Table 17-20** URI parameters

| Parameter  | Mandatory | Type   | Description                                                                                                                               |
|------------|-----------|--------|-------------------------------------------------------------------------------------------------------------------------------------------|
| project_id | Yes       | String | Project ID, which is used for resource isolation. For details about how to obtain its value, see <a href="#">Obtaining a Project ID</a> . |
| batch_id   | Yes       | String | ID of a batch processing job. Set the value to the job ID obtained in <a href="#">Creating a Batch Processing Job</a> .                   |

## Request

None

## Response

**Table 17-21** Response parameter

| Parameter | Mandatory | Type   | Description                                                                             |
|-----------|-----------|--------|-----------------------------------------------------------------------------------------|
| msg       | No        | String | If the batch processing job is successfully canceled, value <b>deleted</b> is returned. |

## Example Request

None

## Example Response

```
{
 "msg": "deleted"
}
```

## Status Codes

[Table 17-22](#) describes the status code.

**Table 17-22** Status codes

| Status Code | Description         |
|-------------|---------------------|
| 200         | Deletion succeeded. |
| 400         | Request error.      |

| Status Code | Description             |
|-------------|-------------------------|
| 500         | Internal service error. |

## Error Codes

If an error occurs when this API is invoked, the system does not return the result similar to the preceding example, but returns the error code and error information. For details, see [Error Codes](#).

# 18 APIs Related to Spark Job Templates

## 18.1 Creating a Job Template

### Function

This API is used to create a job template.

### URI

- URI format  
POST /v3/{project\_id}/templates
- Parameter description

**Table 18-1** URI parameter

| Parameter  | Mandatory | Type   | Description                                                                                                                               |
|------------|-----------|--------|-------------------------------------------------------------------------------------------------------------------------------------------|
| project_id | Yes       | String | Project ID, which is used for resource isolation. For details about how to obtain its value, see <a href="#">Obtaining a Project ID</a> . |

## Request

**Table 18-2** Parameters

| Parameter   | Mandatory | Type   | Description                                                                                                                                                       |
|-------------|-----------|--------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| type        | Yes       | String | Template type. Available values are as follows: <ul style="list-style-type: none"><li>• <b>SQL</b>: SQL template</li><li>• <b>SPARK</b>: Spark template</li></ul> |
| name        | Yes       | String | Template name                                                                                                                                                     |
| body        | Yes       | String | Template content                                                                                                                                                  |
| group       | No        | String | Template group name                                                                                                                                               |
| description | No        | String | Description of the template                                                                                                                                       |
| language    | No        | String | Language                                                                                                                                                          |

## Response

**Table 18-3** Parameters

| Parameter | Type   | Description |
|-----------|--------|-------------|
| id        | String | Template ID |

## Example Request

Create a SQL job template whose content is **test sql**.

```
{
 "type": "SQL",
 "name": "test",
 "description": "",
 "body": "test aql",
 "group": ""
}
```

## Example Response

```
{
 "id": "85aad9e5-3766-46c2-b3c0-16c2832e52e8"
}
```

## Status Codes

| Status Code | Description |
|-------------|-------------|
| 200         | OK          |

## Error Codes

For details, see [Error Codes](#).

## 18.2 Listing Job Templates

### Function

This API is used to list job templates.

### URI

- URI format  
GET /v3/{project\_id}/templates?type=spark
- Parameter description

**Table 18-4** URI parameter

| Parameter  | Mandatory | Type   | Description                                                                                                                               |
|------------|-----------|--------|-------------------------------------------------------------------------------------------------------------------------------------------|
| project_id | Yes       | String | Project ID, which is used for resource isolation. For details about how to obtain its value, see <a href="#">Obtaining a Project ID</a> . |

**Table 18-5** query parameters

| Parameter | Mandatory | Type   | Description                                                                                                                                                |
|-----------|-----------|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------|
| type      | Yes       | String | Template type.<br>Available values: <ul style="list-style-type: none"><li>• SPARK: Spark template</li></ul> Currently, only Spark templates are supported. |
| keyword   | No        | String | Keyword used for searching for template names. Fuzzy match is supported.                                                                                   |

| Parameter    | Mandatory | Type    | Description                                                                                             |
|--------------|-----------|---------|---------------------------------------------------------------------------------------------------------|
| page-size    | No        | Integer | Maximum number of lines displayed on each page. Value range: [1, 100]. The default value is <b>50</b> . |
| current-page | No        | Integer | Current page number. The default value is <b>1</b> .                                                    |

## Request

None

## Response

**Table 18-6** Parameters

| Parameter  | Type             | Description                                                                                                          |
|------------|------------------|----------------------------------------------------------------------------------------------------------------------|
| is_success | Boolean          | Whether the request is successfully executed. Value <b>true</b> indicates that the request is successfully executed. |
| message    | String           | System prompt. If execution succeeds, the message may be left blank.                                                 |
| count      | Integer          | Number of returned templates                                                                                         |
| templates  | Array of objects | Template information list. For details, see <a href="#">Table 18-7</a> .                                             |

**Table 18-7** templates parameters

| Parameter   | Type   | Description                                                     |
|-------------|--------|-----------------------------------------------------------------|
| type        | String | Template type                                                   |
| id          | String | Template ID                                                     |
| name        | String | Template name                                                   |
| body        | Object | Template content. For details, see <a href="#">Table 18-8</a> . |
| group       | String | Template group                                                  |
| description | String | Description of the template                                     |
| language    | String | Language                                                        |

| Parameter | Type   | Description             |
|-----------|--------|-------------------------|
| owner     | String | Creator of the template |

**Table 18-8 body parameters**

| Parameter    | Type             | Description                                                                                                                                                                                                                    |
|--------------|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| file         | String           | Name of the package that is of the JAR or pyFile type and has been uploaded to the DLI resource management system. You can also specify an OBS path, for example, <b>obs://Bucket name/Package name</b> .                      |
| className    | String           | Java/Spark main class of the template.                                                                                                                                                                                         |
| cluster_name | String           | Queue name. Set this parameter to the created DLI queue name.<br><b>NOTE</b><br>You are advised to use the <b>queue</b> parameter. The <b>queue</b> and <b>cluster_name</b> parameters cannot coexist.                         |
| args         | Array of Strings | Input parameters of the main class, that is, application parameters.                                                                                                                                                           |
| sc_type      | String           | Compute resource type. Currently, resource types A, B, and C are available. If this parameter is not specified, the minimum configuration (type A) is used. For details about resource types, see <a href="#">Table 17-3</a> . |
| jars         | Array of Strings | Name of the package that is of the JAR type and has been uploaded to the DLI resource management system. You can also specify an OBS path, for example, <b>obs://Bucket name/Package name</b> .                                |
| pyFiles      | Array of Strings | Name of the package that is of the PyFile type and has been uploaded to the DLI resource management system. You can also specify an OBS path, for example, <b>obs://Bucket name/Package name</b> .                             |

| Parameter | Type             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|-----------|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| files     | Array of Strings | Name of the package that is of the file type and has been uploaded to the DLI resource management system. You can also specify an OBS path, for example, <code>obs://Bucket name/Package name</code> .                                                                                                                                                                                                                                                                                                                                                                                                                    |
| modules   | Array of Strings | <p>Name of the dependent system resource module. You can view the module name using the API related to <a href="#">Querying Resource Packages in a Group (Discarded)</a>.</p> <p>DLI provides dependencies for executing datasource jobs. The following table lists the dependency modules corresponding to different services.</p> <ul style="list-style-type: none"><li>• CloudTable/MRS HBase: sys.datasource.hbase</li><li>• CloudTable/MRS OpenTSDB: sys.datasource.opentsdb</li><li>• RDS MySQL: sys.datasource.rds</li><li>• RDS Postgre: preset</li><li>• DWS: preset</li><li>• CSS: sys.datasource.css</li></ul> |
| resources | Array of objects | JSON object list, including the name and type of the JSON package that has been uploaded to the queue. For details, see <a href="#">Table 17-4</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| groups    | Array of objects | JSON object list, including the package group resource. For details about the format, see the request example. If the type of the <b>name</b> in <b>resources</b> is not verified, the package with the name exists in the group. For details, see <a href="#">Table 17-5</a> .                                                                                                                                                                                                                                                                                                                                           |
| conf      | Object           | <b>Batch</b> configuration item. For details, see <a href="#">Spark Configuration</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| name      | String           | Batch processing task name. The value contains a maximum of 128 characters.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| Parameter       | Type    | Description                                                                                                                                                                                                                                                                                                                               |
|-----------------|---------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| driverMemory    | String  | Driver memory of the Spark application, for example, <b>2 GB</b> and <b>2048 MB</b> . This configuration item replaces the default parameter in <b>sc_type</b> . The unit must be provided. Otherwise, the startup fails.                                                                                                                 |
| driverCores     | Integer | Number of CPU cores of the Spark application driver. This configuration item replaces the default parameter in <b>sc_type</b> .                                                                                                                                                                                                           |
| executorMemory  | String  | Executor memory of the Spark application, for example, <b>2 GB</b> and <b>2048 MB</b> . This configuration item replaces the default parameter in <b>sc_type</b> . The unit must be provided. Otherwise, the startup fails.                                                                                                               |
| executorCores   | Integer | Number of CPU cores of each Executor in the Spark application. This configuration item replaces the default parameter in <b>sc_type</b> .                                                                                                                                                                                                 |
| numExecutors    | Integer | Number of Executors in a Spark application. This configuration item replaces the default parameter in <b>sc_type</b> .                                                                                                                                                                                                                    |
| obs_bucket      | String  | OBS bucket for storing the Spark jobs. Set this parameter when you need to save jobs.                                                                                                                                                                                                                                                     |
| auto_recovery   | Boolean | Whether to enable the retry function. If enabled, Spark jobs will be automatically retried after an exception occurs. The default value is <b>false</b> .                                                                                                                                                                                 |
| max_retry_times | Integer | Maximum retry times. The maximum value is <b>100</b> , and the default value is <b>20</b> .                                                                                                                                                                                                                                               |
| feature         | String  | Job feature. Type of the Spark image used by a job. <ul style="list-style-type: none"><li>• <b>basic</b>: indicates that the basic Spark image provided by DLI is used.</li><li>• <b>custom</b>: indicates that the user-defined Spark image is used.</li><li>• <b>ai</b>: indicates that the AI image provided by DLI is used.</li></ul> |

| Parameter     | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|---------------|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| spark_version | String | Version of the Spark component <ul style="list-style-type: none"><li>If the in-use Spark version is 2.3.2, this parameter is not required.</li><li>If the current Spark version is 2.3.3, this parameter is required when <b>feature</b> is <b>basic</b> or <b>ai</b>. If this parameter is not set, the default Spark version 2.3.2 is used.</li></ul>                                                                                                                      |
| image         | String | Custom image. The format is <b>Organization name/Image name:Image version</b> .                                                                                                                                                                                                                                                                                                                                                                                              |
| queue         | String | Queue name. Set this parameter to the name of the created DLI queue. The queue must be of the general-purpose type.<br><b>NOTE</b> <ul style="list-style-type: none"><li>This parameter is compatible with the <b>cluster_name</b> parameter. That is, if <b>cluster_name</b> is used to specify a queue, the queue is still valid.</li><li>You are advised to use the <b>queue</b> parameter. The <b>queue</b> and <b>cluster_name</b> parameters cannot coexist.</li></ul> |
| catalog_name  | String | To access metadata, set this parameter to <b>dli</b> .                                                                                                                                                                                                                                                                                                                                                                                                                       |

# 18.3 Modifying a Job Template

## Function

This API is used to modify a job template.

## URI

- URI format  
`PUT /v3/{project_id}/templates/{template_id}`
- Parameter description

**Table 18-9** URI parameters

| Parameter   | Mandatory | Type   | Description                                                                                                                               |
|-------------|-----------|--------|-------------------------------------------------------------------------------------------------------------------------------------------|
| project_id  | Yes       | String | Project ID, which is used for resource isolation. For details about how to obtain its value, see <a href="#">Obtaining a Project ID</a> . |
| template_id | Yes       | String | Template ID.                                                                                                                              |

## Request

**Table 18-10** Parameters

| Parameter   | Mandatory | Type   | Description                 |
|-------------|-----------|--------|-----------------------------|
| name        | Yes       | String | Template name               |
| body        | Yes       | String | Template content            |
| group       | No        | String | Template group              |
| description | No        | String | Description of the template |

## Response

**Table 18-11** Parameters

| Parameter  | Type    | Description                                                                                                          |
|------------|---------|----------------------------------------------------------------------------------------------------------------------|
| is_success | Boolean | Whether the request is successfully executed. Value <b>true</b> indicates that the request is successfully executed. |
| message    | String  | System prompt. If execution succeeds, the message may be left blank.                                                 |

## Example Request

Modify the name and content of a job template.

```
{
 "name": "test1",
 "body": "ss"
}
```

## Example Response

```
{
 "is_success": true,
 "message": ""
}
```

## Status Codes

| Status Code | Description |
|-------------|-------------|
| 200         | OK          |

## 18.4 Obtaining a Job Template

### Function

This API is used to obtain a job template.

## URI

- URI format  
GET /v3/{project\_id}/templates/{template\_id}
- Parameter description

**Table 18-12** URI parameters

| Parameter   | Mandatory | Type   | Description                                                                                                                               |
|-------------|-----------|--------|-------------------------------------------------------------------------------------------------------------------------------------------|
| project_id  | Yes       | String | Project ID, which is used for resource isolation. For details about how to obtain its value, see <a href="#">Obtaining a Project ID</a> . |
| template_id | Yes       | String | Template ID.                                                                                                                              |

## Request

None

## Response

**Table 18-13** Parameters

| Parameter   | Type   | Description                                                    |
|-------------|--------|----------------------------------------------------------------|
| type        | String | Template type                                                  |
| id          | String | Template ID                                                    |
| name        | String | Template name                                                  |
| body        | Object | Template content For details, see <a href="#">Table 18-8</a> . |
| group       | String | Template group                                                 |
| description | String | Description of the template                                    |
| language    | String | Language                                                       |
| owner       | String | Creator of the template                                        |

## Example Request

None

## Example Response

```
{
 "name": "test2",
```

```
"body": {
 "auto_recovery": false,
 "max_retry_times": 20,
},
"group": "",
"description": "",
"type": "SPARK",
"id": "3c92c202-b17c-4ed7-b353-ea08629dd671"
}
```

## Status Codes

| Status Code | Description |
|-------------|-------------|
| 200         | OK          |

## Error Codes

For details, see [Error Codes](#).

# 19 Permissions Policies and Supported Actions

This section describes fine-grained permissions management for your DLI. If your Huawei Cloud account does not need individual IAM users, then you may skip this section.

By default, new IAM users do not have permissions assigned. You need to add them to one or more groups, and attach permissions policies or roles to these groups. Users inherit permissions from the groups to which they are added. After authorization, the user can perform specified operations on MRS based on the permissions.

Based on the authorization precision, permissions are classified into **roles** and **policies**.

- Roles are a type of coarse-grained authorization mechanism that defines permissions related to user responsibilities.
- Policies define API-based permissions for operations on specific resources under certain conditions, allowing for more fine-grained, secure access control of cloud resources.

## NOTE

Policy-based authorization is useful if you want to allow or deny the access to an API.

An account has all the permissions required to call all APIs, but IAM users must be assigned the required permissions. The permissions required for calling an API are determined by the actions supported by the API. Only users who have been granted permissions allowing the actions can call the API successfully. For example, if an IAM user needs to create buckets using an API, the user must have been granted permissions that allow the **dli:queue:create\_queue** action.

## Supported Actions

VBS provides system-defined policies that can be directly used in IAM. You can also create custom policies and use them to supplement system-defined policies, implementing more refined access control. Operations supported by policies are specific to APIs. The following are common concepts related to policies:

- Permissions: Allow or deny operations on specified resources under specific conditions.
- APIs: RESTful APIs that can be called in a custom policy.
- Actions: added to a custom policy to control permissions for specific operations.
- Related actions: Actions on which a specific action depends to take effect. When assigning permissions for the action to a user, you also need to assign permissions for the related actions.
- IAM or enterprise projects: Type of projects for which an action will take effect. Policies that contain actions supporting both IAM and enterprise projects can be assigned to user groups and take effect in both IAM and Enterprise Management. Policies that only contain actions supporting IAM projects can be assigned to user groups and only take effect for IAM. Such policies will not take effect if they are assigned to user groups in Enterprise Project.

For details about the differences between IAM and enterprise projects, see [Differences Between IAM and Enterprise Management](#).

#### NOTE

The check mark (✓) indicates that an action takes effect. The cross mark (✗) indicates that an action does not take effect.

DLI supports the following actions that can be defined in custom policies:

**Table 19-1 Actions**

| Permission                               | API                                              | Actions                  | IAM Project (Project) | Enterprise Project (Enterprise Project) |
|------------------------------------------|--------------------------------------------------|--------------------------|-----------------------|-----------------------------------------|
| Creating a queue                         | POST /v1.0/{project_id}/queues                   | dli:queue:create Queue   | ✓                     | ✓                                       |
| Deleting a queue                         | DELETE /v1.0/{project_id}/queues/{queue_name}    | dli:queue:dropQueue      | ✓                     | ✓                                       |
| Submitting a job                         | POST /v1.0/{project_id}/jobs/submit-job          | dli:queue:submit Job     | ✓                     | ✗                                       |
| Cancelling a job                         | DELETE /v1.0/{project_id}/jobs/{job_id}          | dli:queue:cancelJob      | ✓                     | ✗                                       |
| Viewing queue permissions of other users | GET /v1.0/{project_id}/queues/{queue_name}/users | dli:queue:showPrivileges | ✓                     | ✗                                       |

| Permission                                        | API                                                             | Actions                                 | IAM Project (Project) | Enterprise Project (Enterprise Project) |
|---------------------------------------------------|-----------------------------------------------------------------|-----------------------------------------|-----------------------|-----------------------------------------|
| Restarting a queue                                | PUT /v1.0/{project_id}/queues/{queue_name}/action               | dli:queue:restart                       | ✓                     | ✗                                       |
| Scaling out/in a queue                            | PUT /v1.0/{project_id}/queues/{queue_name}/action               | dli:queue:scaleQueue                    | ✓                     | ✗                                       |
| Granting elastic resource pool permissions        | PUT /v1.0/{project_id}/user-authorization                       | dli:elasticresourcepool:grantPrivilege  | ✓                     | ✗                                       |
| Revoking elastic resource pool permissions        | PUT /v1.0/{project_id}/user-authorization                       | dli:elasticresourcepool:revokePrivilege | ✓                     | ✗                                       |

# 20 Out-of-Date APIs

## 20.1 Agency-related APIs (Discarded)

### 20.1.1 Obtaining DLI Agency Information (Discarded)

#### Function

This API is used to obtain the agency information of a DLI user.

This API has been discarded and is not recommended.

#### URI

- URI format  
GET /v2/{project\_id}/agency
- Parameter description

**Table 20-1** URI parameter

| Parameter  | Mandatory | Type   | Description                                                                                                                               |
|------------|-----------|--------|-------------------------------------------------------------------------------------------------------------------------------------------|
| project_id | Yes       | String | Project ID, which is used for resource isolation. For details about how to obtain its value, see <a href="#">Obtaining a Project ID</a> . |

#### Request

None

## Response

**Table 20-2** Response parameters

| Parameter     | Man<br>dato<br>ry | Type                       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|---------------|-------------------|----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| is_success    | No                | Boole<br>an                | Indicates whether the request is successfully executed. Value <b>true</b> indicates that the request is successfully executed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| message       | No                | String                     | System prompt. If execution succeeds, the parameter setting may be left blank.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| version       | No                | String                     | Agency version information.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| current_roles | No                | Array<br>of<br>String<br>s | Role. The supported values are as follows:<br><b>obs_adm</b> : Administrator permissions for accessing and using the Object Storage Service.<br><b>dis_adm</b> : Administrator permissions for using Data Ingestion Service data as the data source<br><b>ctable_adm</b> : Administrator permissions for accessing and using the CloudTable service<br><b>vpc_netadm</b> : Administrator permissions for using the Virtual Private Cloud service<br><b>smn_adm</b> : Administrator permissions for using the Simple Message Notification service<br><b>te_admin</b> : Tenant Administrator permissions |

## Example Request

None

## Example Response

```
{
 "is_success": true,
 "message": "",
 "version": "v2",
 "current_roles": [
 "ctable_adm",
 "vpc_netadm",
 "tef_adm",
 "dis_adm",
 "smn_adm",
 "obs_adm"
]
}
```

## Status Codes

**Table 20-3** describes status codes.

**Table 20-3** Status codes

| Status Code | Description                         |
|-------------|-------------------------------------|
| 200         | The agency information is obtained. |
| 400         | Request failure.                    |
| 404         | Not found.                          |
| 500         | Internal service error.             |

## Error Codes

If an error occurs when this API is invoked, the system does not return the result similar to the preceding example, but returns the error code and error information. For details, see [Error Codes](#).

**Table 20-4** Error codes

| Error Code | Error Message              |
|------------|----------------------------|
| DLI.0002   | The object does not exist. |
| DLI.0999   | An internal error occurre  |

## 20.1.2 Creating a DLI Agency (Discarded)

### Function

This API is used to create an agency for a DLI user.

This API has been discarded and is not recommended.

### URI

- URI format  
POST /v2/{project\_id}/agency
- Parameter description

**Table 20-5** URI parameter

| Parameter  | Mandatory | Type   | Description                                                                                                                               |
|------------|-----------|--------|-------------------------------------------------------------------------------------------------------------------------------------------|
| project_id | Yes       | String | Project ID, which is used for resource isolation. For details about how to obtain its value, see <a href="#">Obtaining a Project ID</a> . |

## Request

**Table 20-6** Request parameters

| Parameter | Mandatory | Type             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|-----------|-----------|------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| roles     | Yes       | Array of Strings | <p>Role.</p> <p>Currently, only <b>obs_adm</b>, <b>dis_adm</b>, <b>ctable_adm</b>, <b>vpc_netadm</b>, <b>smn_adm</b>, and <b>te_admin</b> are supported.</p> <ul style="list-style-type: none"><li>• <b>obs_adm</b>: Administrator permissions for accessing and using the Object Storage Service.</li><li>• <b>dis_adm</b>: Administrator permissions for using Data Ingestion Service data as the data source</li><li>• <b>ctable_adm</b>: Administrator permissions for accessing and using the CloudTable service</li><li>• <b>vpc_netadm</b>: Administrator permissions for using the Virtual Private Cloud service</li><li>• <b>smn_adm</b>: Administrator permissions for using the Simple Message Notification service</li><li>• <b>te_admin</b>: Tenant Administrator permissions</li></ul> |

## Response

**Table 20-7** Response parameters

| Parameter  | Mandatory | Type    | Description                                                                                                                    |
|------------|-----------|---------|--------------------------------------------------------------------------------------------------------------------------------|
| is_success | No        | Boolean | Indicates whether the request is successfully executed. Value <b>true</b> indicates that the request is successfully executed. |

| Parameter | Mandatory | Type   | Description                                                                    |
|-----------|-----------|--------|--------------------------------------------------------------------------------|
| message   | No        | String | System prompt. If execution succeeds, the parameter setting may be left blank. |

## Example Request

Create a DLI user agency. The agency has the following permissions: **CloudTable Administrator** for accessing and using CloudTable, **VPC Administrator** for using VPC, **DIS Administrator** for accessing and using DIS, **SMN Administrator** for using SMN, and accessing and using OBS.

```
{
 "roles": [
 "ctable_adm",
 "vpc_netadm",
 "dis_adm",
 "smn_adm",
 "obs_adm"
]
}
```

## Example Response

```
{
 "is_success": true,
 "message": ""
}
```

## Status Codes

[Table 20-8](#) describes status codes.

**Table 20-8** Status codes

| Status Code | Description                      |
|-------------|----------------------------------|
| 200         | The job is created successfully. |
| 400         | Request failure.                 |

## Error Codes

If an error occurs when this API is invoked, the system does not return the result similar to the preceding example, but returns the error code and error information. For details, see [Error Codes](#).

## 20.2 Package Group-related APIs (Discarded)

## 20.2.1 Uploading a Package Group (Discarded)

### Function

This API is used to upload a package group to a **project**. The function is similar to creating a package on the management console.

This API has been discarded and is not recommended.

### URI

- URI format  
POST /v2.0/{project\_id}/resources
- Parameter description

**Table 20-9** URI parameter

| Parameter  | Mandatory | Type   | Description                                                                                                                               |
|------------|-----------|--------|-------------------------------------------------------------------------------------------------------------------------------------------|
| project_id | Yes       | String | Project ID, which is used for resource isolation. For details about how to obtain its value, see <a href="#">Obtaining a Project ID</a> . |

### Request

**Table 20-10** Request parameters

| Parameter | Mandatory | Type             | Description                                                                                                                                                                                                                                                                                                                                                                                  |
|-----------|-----------|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| paths     | Yes       | Array of Strings | List of OBS object paths. The OBS object path refers to the OBS object URL.                                                                                                                                                                                                                                                                                                                  |
| kind      | Yes       | String           | File type of a package group. <ul style="list-style-type: none"><li>• <b>jar</b>: JAR file</li><li>• <b>pyFile</b>: User Python file</li><li>• <b>file</b>: User file</li><li>• <b>modelFile</b>: User AI model file</li></ul> <p><b>NOTE</b><br/>If the same group of packages to be uploaded contains different file types, select <b>file</b> as the type of the file to be uploaded.</p> |
| group     | Yes       | String           | Name of the group to be created.                                                                                                                                                                                                                                                                                                                                                             |

| Parameter | Mandatory | Type             | Description                                                                                                                                                                                                        |
|-----------|-----------|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| is_async  | No        | Boolean          | Whether to upload resource packages in asynchronous mode. The default value is <b>false</b> , indicating that the asynchronous mode is not used. You are advised to upload resource packages in asynchronous mode. |
| tags      | No        | Array of objects | Resource tag. For details, see <a href="#">Table 20-11</a> .                                                                                                                                                       |

**Table 20-11** tags parameter

| Parameter | Mandatory | Type   | Description                                                                                                                                                                                                                  |
|-----------|-----------|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| key       | Yes       | String | Tag key.<br><b>NOTE</b><br>A tag key can contain a maximum of 128 characters. Only letters, digits, spaces, and special characters (_:=+-@) are allowed, but the value cannot start or end with a space or start with _sys_. |
| value     | Yes       | String | <b>NOTE</b><br>A tag value can contain a maximum of 255 characters. Only letters, digits, spaces, and special characters (_:=+-@) are allowed. The value cannot start or end with a space.                                   |

## Response

**Table 20-12** Response parameters

| Parameter   | Mandatory | Type             | Description                                                                            |
|-------------|-----------|------------------|----------------------------------------------------------------------------------------|
| group_name  | No        | String           | Group name.                                                                            |
| status      | No        | String           | Status of a package group to be uploaded.                                              |
| resources   | No        | Array of strings | List of names of resource packages contained in the group.                             |
| details     | No        | Array of body    | Details about a group resource package. For details, see <a href="#">Table 20-13</a> . |
| create_time | No        | Long             | UNIX timestamp when a package group is uploaded.                                       |

| Parameter   | Mandatory | Type    | Description                                                                                                                                                                                                        |
|-------------|-----------|---------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| update_time | No        | Long    | UNIX timestamp when a package group is updated.                                                                                                                                                                    |
| is_async    | No        | Boolean | Whether to upload resource packages in asynchronous mode. The default value is <b>false</b> , indicating that the asynchronous mode is not used. You are advised to upload resource packages in asynchronous mode. |
| owner       | No        | String  | Owner of a resource package.                                                                                                                                                                                       |

**Table 20-13** details parameter description

| Parameter       | Mandatory | Type    | Description                                                                                                                                                                                                                                                                                                 |
|-----------------|-----------|---------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| create_time     | Yes       | Long    | UNIX time when a resource package is uploaded. The timestamp is in milliseconds.                                                                                                                                                                                                                            |
| update_time     | No        | Long    | UNIX time when the uploaded resource package is uploaded. The timestamp is in milliseconds.                                                                                                                                                                                                                 |
| resource_type   | Yes       | String  | Resource type.                                                                                                                                                                                                                                                                                              |
| resource_name   | No        | String  | Resource name.                                                                                                                                                                                                                                                                                              |
| status          | No        | String  | <ul style="list-style-type: none"><li>Value <b>UPLOADING</b> indicates that the resource package group is being uploaded.</li><li>Value <b>READY</b> indicates that the resource package has been uploaded.</li><li>Value <b>FAILED</b> indicates that the resource package fails to be uploaded.</li></ul> |
| underlying_name | No        | String  | Name of the resource packages in a queue.                                                                                                                                                                                                                                                                   |
| is_async        | No        | Boolean | Whether to upload resource packages in asynchronous mode. The default value is <b>false</b> , indicating that the asynchronous mode is not used. You are advised to upload resource packages in asynchronous mode.                                                                                          |

## Example Request

Upload a JAR file from OBS to DLI and name the group **gatk**.

```
{
 "paths": [
 "https://xkftest.obs.xxx.com/txr_test/jars/spark-sdv-app.jar",
 "https://xkftest.obs.xxx.com/txr_test/jars/wordcount",
 "https://xkftest.obs.xxx.com/txr_test/jars/wordcount.py"
],
 "kind": "jar",
 "group": "gatk",
 "is_async": "true"
}
```

## Example Response

```
{
 "group_name": "gatk",
 "status": "READY",
 "resources": [
 "spark-sdv-app.jar",
 "wordcount",
 "wordcount.py"
],
 "details": [
 {
 "create_time": 0,
 "update_time": 0,
 "resource_type": "jar",
 "resource_name": "spark-sdv-app.jar",
 "status": "READY",
 "underlying_name": "987e208d-d46e-4475-a8c0-a62f0275750b_spark-sdv-app.jar"
 },
 {
 "create_time": 0,
 "update_time": 0,
 "resource_type": "jar",
 "resource_name": "wordcount",
 "status": "READY",
 "underlying_name": "987e208d-d46e-4475-a8c0-a62f0275750b_wordcount"
 },
 {
 "create_time": 0,
 "update_time": 0,
 "resource_type": "jar",
 "resource_name": "wordcount.py",
 "status": "READY",
 "underlying_name": "987e208d-d46e-4475-a8c0-a62f0275750b_wordcount.py"
 }
],
 "create_time": 1551334579654,
 "update_time": 1551345369070
}
```

## Status Codes

[Table 20-14](#) describes the status code.

**Table 20-14** Status codes

| Status Code | Description                        |
|-------------|------------------------------------|
| 201         | The file is successfully uploaded. |
| 400         | Request error.                     |
| 500         | Internal service error.            |

## Error Codes

If an error occurs when this API is invoked, the system does not return the result similar to the preceding example, but returns the error code and error information. For details, see [Error Codes](#).

### 20.2.2 Listing Package Groups (Discarded)

#### Function

This API is used to query all resources in a project, including groups.

This API has been discarded and is not recommended.

#### URI

- URI format  
GET /v2.0/{project\_id}/resources
- Parameter description

**Table 20-15** URI parameter

| Parameter  | Mandatory | Type   | Description                                                                                                                               |
|------------|-----------|--------|-------------------------------------------------------------------------------------------------------------------------------------------|
| project_id | Yes       | String | Project ID, which is used for resource isolation. For details about how to obtain its value, see <a href="#">Obtaining a Project ID</a> . |

**Table 20-16** query parameter description

| Parameter | Mandatory | Type   | Description                                                                                                                                                                                                                                           |
|-----------|-----------|--------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| kind      | No        | String | Specifies the file type. The options are as follows: <ul style="list-style-type: none"><li>• <b>jar</b>: JAR file</li><li>• <b>pyFile</b>: User Python file</li><li>• <b>file</b>: User file</li><li>• <b>modelFile</b>: User AI model file</li></ul> |
| tags      | No        | String | Specifies a label for filtering.                                                                                                                                                                                                                      |

#### Request

None

## Response

**Table 20-17** Response parameters

| Parameter | Mandatory | Type             | Description                                                                                              |
|-----------|-----------|------------------|----------------------------------------------------------------------------------------------------------|
| resources | No        | Array of objects | List of names of uploaded user resources. For details about resources, see <a href="#">Table 20-18</a> . |
| modules   | No        | Array of objects | List of built-in resource groups. For details about the groups, see <a href="#">Table 20-19</a> .        |
| groups    | No        | Array of objects | Uploaded package groups of a user.                                                                       |
| total     | Yes       | Integer          | Total number of returned resource packages.                                                              |

**Table 20-18** resources parameters

| Parameter       | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                           |
|-----------------|-----------|--------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| create_time     | No        | Long   | UNIX timestamp when a resource package is uploaded.                                                                                                                                                                                                                                                   |
| update_time     | No        | Long   | UNIX timestamp when the uploaded resource package is uploaded.                                                                                                                                                                                                                                        |
| resource_type   | No        | String | Resource type.                                                                                                                                                                                                                                                                                        |
| resource_name   | No        | String | Resource name.                                                                                                                                                                                                                                                                                        |
| status          | No        | String | <ul style="list-style-type: none"><li>Value <b>UPLOADING</b> indicates that the resource package is being uploaded.</li><li>Value <b>READY</b> indicates that the resource package has been uploaded.</li><li>Value <b>FAILED</b> indicates that the resource package fails to be uploaded.</li></ul> |
| underlying_name | No        | String | Name of the resource package in the queue.                                                                                                                                                                                                                                                            |
| owner           | No        | String | Owner of the resource package.                                                                                                                                                                                                                                                                        |

**Table 20-19** modules parameters

| Parameter   | Mandatory | Type             | Description                                                                                                                                                                                                                                                                                  |

## Status Codes

[Table 20-20](#) describes the status code.

**Table 20-20** Status codes

| Status Code | Description              |
|-------------|--------------------------|
| 200         | The query is successful. |
| 400         | Request error.           |
| 500         | Internal service error.  |

## Error Codes

If an error occurs when this API is invoked, the system does not return the result similar to the preceding example, but returns the error code and error information. For details, see [Error Codes](#).

### 20.2.3 Uploading a JAR Package Group (Discarded)

#### Function

This API is used to upload a group of JAR packages to a **project**.

When a resource group with the same name is uploaded, the new group overwrites the old group.

 NOTE

This API has been discarded and is not recommended.

## URI

- URI format  
POST /v2.0/{project\_id}/resources/jars
- Parameter description

**Table 20-21** URI parameter

| Parameter  | Mandatory | Type   | Description                                                                                                                               |
|------------|-----------|--------|-------------------------------------------------------------------------------------------------------------------------------------------|
| project_id | Yes       | String | Project ID, which is used for resource isolation. For details about how to obtain its value, see <a href="#">Obtaining a Project ID</a> . |

## Request

**Table 20-22** Request parameters

| Parameter | Mandatory | Type             | Description                                                                 |
|-----------|-----------|------------------|-----------------------------------------------------------------------------|
| paths     | Yes       | Array of Strings | List of OBS object paths. The OBS object path refers to the OBS object URL. |
| group     | Yes       | String           | Name of a package group.                                                    |

## Response

**Table 20-23** Response parameters

| Parameter  | Mandatory | Type             | Description                                                                            |
|------------|-----------|------------------|----------------------------------------------------------------------------------------|
| group_name | No        | String           | Group name.                                                                            |
| status     | No        | String           | Status of a package group to be uploaded.                                              |
| resources  | No        | Array of strings | List of names of resource packages contained in the group.                             |
| details    | No        | Array of body    | Details about a group resource package. For details, see <a href="#">Table 20-24</a> . |

| Parameter   | Mandatory | Type    | Description                                                                                                                                                                                                        |
|-------------|-----------|---------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| create_time | No        | Long    | UNIX timestamp when a package group is uploaded.                                                                                                                                                                   |
| update_time | No        | Long    | UNIX timestamp when a package group is updated.                                                                                                                                                                    |
| is_async    | No        | Boolean | Whether to upload resource packages in asynchronous mode. The default value is <b>false</b> , indicating that the asynchronous mode is not used. You are advised to upload resource packages in asynchronous mode. |
| owner       | No        | String  | Owner of a resource package.                                                                                                                                                                                       |

| status          | No        | String  | <ul style="list-style-type: none"><li>Value <b>UPLOADING</b> indicates that the resource package group is being uploaded.</li><li>Value <b>READY</b> indicates that the resource package has been uploaded.</li><li>Value <b>FAILED</b> indicates that the resource package fails to be uploaded.</li></ul> |
| underlying_name | No        | String  | Name of the resource packages in a queue.                                                                                                                                                                                                                                                                   |
| is_async        | No        | Boolean | Indicates whether to upload a resource package asynchronously.                                                                                                                                                                                                                                              |

## Example Request

Upload a JAR file from OBS to DLI and name the group **gatk**.

```
{
 "paths": [
 "https://test.obs.xxx.com/test_dli.jar"
],
 "group": "gatk"
}
```

## Example Response

```
{
 "group_name": "gatk",
 "status": "READY",
 "resources": [
 "test_dli.jar"
],
 "details": [
 {
 "create_time": 1608804435312,
 "update_time": 1608804435312,
 "resource_type": "jar",
 "resource_name": "test_dli.jar",
 "status": "READY",
 "underlying_name": "test_dli.jar"
 }
],
 "create_time": 1521532893736,
 "update_time": 1521552364503,
 "is_async": false
}
```

## Status Codes

[Table 20-25](#) describes the status code.

**Table 20-25** Status codes

| Status Code | Description             |
|-------------|-------------------------|
| 201         | Upload succeeded.       |
| 400         | Request error.          |
| 500         | Internal service error. |

## Error Codes

If an error occurs when this API is invoked, the system does not return the result similar to the preceding example, but returns the error code and error information. For details, see [Error Codes](#).

## 20.2.4 Uploading a PyFile Package Group (Discarded)

### Function

This API is used to upload a group of **PyFile** packages to a **project**. When a group with the same name as the PyFile package is uploaded, the new group overwrites the old group.

This API has been discarded and is not recommended.

### URI

- URI format  
POST /v2.0/{project\_id}/resources/pyfiles
- Parameter description

**Table 20-26** URI parameter

| Parameter  | Mandatory | Type   | Description                                                                                                                               |
|------------|-----------|--------|-------------------------------------------------------------------------------------------------------------------------------------------|
| project_id | Yes       | String | Project ID, which is used for resource isolation. For details about how to obtain its value, see <a href="#">Obtaining a Project ID</a> . |

## Request

| Parameter   | Mandatory | Type             | Description                                                                                                                                                                                                        |
|-------------|-----------|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| group_name  | No        | String           | Group name.                                                                                                                                                                                                        |
| status      | No        | String           | Status of a package group to be uploaded.                                                                                                                                                                          |
| resources   | No        | Array of strings | List of names of resource packages contained in the group.                                                                                                                                                         |
| details     | No        | Array of body    | Details about a group resource package. For details, see <a href="#">Table 20-29</a> .                                                                                                                             |
| create_time | No        | Long             | UNIX timestamp when a package group is uploaded.                                                                                                                                                                   |
| update_time | No        | Long             | UNIX timestamp when a package group is updated.                                                                                                                                                                    |
| is_async    | No        | Boolean          | Whether to upload resource packages in asynchronous mode. The default value is <b>false</b> , indicating that the asynchronous mode is not used. You are advised to upload resource packages in asynchronous mode. |
| owner       | No        | String           | Owner of a resource package.                                                                                                                                                                                       |
| description | No        | String           | Description of a resource module.                                                                                                                                                                                  |
| module_name | No        | String           | Name of a resource module.                                                                                                                                                                                         |

| Parameter   | Mandatory | Type   | Description                                                                                                                                                                       |
|-------------|-----------|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| module_type | No        | String | Type of a resource module. <ul style="list-style-type: none"><li>• <b>jar</b>: User JAR file</li><li>• <b>pyFile</b>: User Python file</li><li>• <b>file</b>: User file</li></ul> |

**Table 20-29** details parameter description

| Parameter       | Mandatory | Type    | Description                                                                                                                                                                                                                                                                                                       |
|-----------------|-----------|---------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| create_time     | No        | Long    | UNIX time when a resource package is uploaded. The timestamp is in milliseconds.                                                                                                                                                                                                                                  |
| update_time     | No        | Long    | UNIX time when the uploaded resource package is uploaded. The timestamp is in milliseconds.                                                                                                                                                                                                                       |
| resource_type   | No        | String  | Resource type. Set this parameter to <b>pyFile</b> .                                                                                                                                                                                                                                                              |
| resource_name   | No        | String  | Resource name.                                                                                                                                                                                                                                                                                                    |
| status          | No        | String  | <ul style="list-style-type: none"><li>• Value <b>UPLOADING</b> indicates that the resource package group is being uploaded.</li><li>• Value <b>READY</b> indicates that the resource package has been uploaded.</li><li>• Value <b>FAILED</b> indicates that the resource package fails to be uploaded.</li></ul> |
| underlying_name | No        | String  | Name of the resource packages in a queue.                                                                                                                                                                                                                                                                         |
| is_async        | No        | Boolean | Indicates whether to upload a resource package asynchronously.                                                                                                                                                                                                                                                    |

## Example Request

Upload a Python file from OBS to DLI and name the group **gatk**.

```
{
 "paths": [
 "https://test.obs.xxx.com/dli_tf.py"
],
 "group": "gatk"
}
```

## Example Response

```
{
 "group_name": "gatk",
 "status": "READY",
 "resources": [
 "dli_tf.py"
],
 "details": [
 {
 "create_time": 1608804435312,
 "update_time": 1608804435312,
 "resource_type": "pyFile",
 "resource_name": "dli_tf.py",
 "status": "READY",
 "underlying_name": "dli_tf.py"
 }
],
 "create_time": 1521532893736,
 "update_time": 1521552364503,
 "is_async": false
}
```

## Status Codes

[Table 20-30](#) describes the status code.

**Table 20-30** Status codes

| Status Code | Description             |
|-------------|-------------------------|
| 201         | Upload succeeded.       |
| 400         | Request error.          |
| 500         | Internal service error. |

## Error Codes

If an error occurs when this API is invoked, the system does not return the result similar to the preceding example, but returns the error code and error information. For details, see [Error Codes](#).

## 20.2.5 Uploading a File Package Group (Discarded)

### Function

This API is used to upload a group of **File** packages to a **project**. When the **File** package group with the same name is uploaded, the new group overwrites the old group.

This API has been discarded and is not recommended.

## URI

- URI format  
POST /v2.0/{project\_id}/resources/files
- Parameter description

**Table 20-31** URI parameter

| Parameter  | Mandatory | Type   | Description                                                                                                                               |
|------------|-----------|--------|-------------------------------------------------------------------------------------------------------------------------------------------|
| project_id | Yes       | String | Project ID, which is used for resource isolation. For details about how to obtain its value, see <a href="#">Obtaining a Project ID</a> . |

## Request

**Table 20-32** Request parameters

| Parameter | Mandatory | Type             | Description                                                                 |
|-----------|-----------|------------------|-----------------------------------------------------------------------------|
| paths     | Yes       | Array of Strings | List of OBS object paths. The OBS object path refers to the OBS object URL. |
| group     | Yes       | String           | Name of a package group.                                                    |

## Response

**Table 20-33** Response parameters

| Parameter   | Mandatory | Type             | Description                                                                            |
|-------------|-----------|------------------|----------------------------------------------------------------------------------------|
| group_name  | No        | String           | Group name.                                                                            |
| status      | No        | String           | Status of a package group to be uploaded.                                              |
| resources   | No        | Array of strings | List of names of resource packages contained in the group.                             |
| details     | No        | Array of body    | Details about a group resource package. For details, see <a href="#">Table 20-34</a> . |
| create_time | No        | Long             | UNIX timestamp when a package group is uploaded.                                       |
| update_time | No        | Long             | UNIX timestamp when a package group is updated.                                        |

| Parameter   | Mandatory | Type    | Description                                                                                                                                                                                                        |
|-------------|-----------|---------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| is_async    | No        | Boolean | Whether to upload resource packages in asynchronous mode. The default value is <b>false</b> , indicating that the asynchronous mode is not used. You are advised to upload resource packages in asynchronous mode. |
| owner       | No        | String  | Owner of a resource package.                                                                                                                                                                                       |
| description | No        | String  | Description of a resource module.                                                                                                                                                                                  |
| module_name | No        | String  | Name of a resource module.                                                                                                                                                                                         |
| module_type | No        | String  | Type of a resource module. <ul style="list-style-type: none"><li>• <b>jar</b>: User JAR file</li><li>• <b>pyFile</b>: User Python file</li><li>• <b>file</b>: User file</li></ul>                                  |

**Table 20-34** details parameter description

| Parameter       | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                       |
|-----------------|-----------|--------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| create_time     | No        | Long   | UNIX time when a resource package is uploaded. The timestamp is expressed in milliseconds.                                                                                                                                                                                                                        |
| update_time     | No        | Long   | UNIX time when the uploaded resource package is uploaded. The timestamp is expressed in milliseconds.                                                                                                                                                                                                             |
| resource_type   | No        | String | Resource type. Set this parameter to <b>file</b> .                                                                                                                                                                                                                                                                |
| resource_name   | No        | String | Resource name.                                                                                                                                                                                                                                                                                                    |
| status          | No        | String | <ul style="list-style-type: none"><li>• Value <b>UPLOADING</b> indicates that the resource package group is being uploaded.</li><li>• Value <b>READY</b> indicates that the resource package has been uploaded.</li><li>• Value <b>FAILED</b> indicates that the resource package fails to be uploaded.</li></ul> |
| underlying_name | No        | String | Name of the resource packages in a queue.                                                                                                                                                                                                                                                                         |

| Parameter | Mandatory | Type    | Description                                                    |
|-----------|-----------|---------|----------------------------------------------------------------|
| is_async  | No        | Boolean | Indicates whether to upload a resource package asynchronously. |

## Example Request

Upload a file from OBS to DLI and name the group **gatk**.

```
{
 "paths": [
 "https://test.obs.xxx.com/test_dli.jar",
 "https://test.obs.xxx.com/dli_tf.py"
],
 "group": "gatk"
}
```

## Example Response

```
{
 "group_name": "gatk",
 "status": "READY",
 "resources": [
 "test_dli.jar",
 "dli_tf.py"
],
 "details": [
 {
 "create_time": 1608804435312,
 "update_time": 1608804435312,
 "resource_type": "file",
 "resource_name": "test_dli.jar",
 "status": "READY",
 "underlying_name": "test_dli.jar"
 },
 {
 "create_time": 1608804435312,
 "update_time": 1608804435312,
 "resource_type": "file",
 "resource_name": "dli_tf.py",
 "status": "READY",
 "underlying_name": "dli_tf.py"
 }
],
 "create_time": 1521532893736,
 "update_time": 1521552364503,
 "is_async": false
}
```

## Status Codes

[Table 20-35](#) describes the status code.

**Table 20-35** Status codes

| Status Code | Description       |
|-------------|-------------------|
| 201         | Upload succeeded. |

| Status Code | Description             |
|-------------|-------------------------|
| 400         | Request error.          |
| 500         | Internal service error. |

## Error Codes

If an error occurs when this API is invoked, the system does not return the result similar to the preceding example, but returns the error code and error information. For details, see [Error Codes](#).

## 20.2.6 Querying Resource Packages in a Group (Discarded)

### Function

This API is used to query resource information of a package group in a [Project](#).

#### NOTE

This API has been discarded and is not recommended.

### URI

- URI format  
GET /v2.0/{project\_id}/resources/{resource\_name}
- Parameter description

**Table 20-36** URI parameters

| Parameter     | Mandatory | Type   | Description                                                                                                                               |
|---------------|-----------|--------|-------------------------------------------------------------------------------------------------------------------------------------------|
| project_id    | Yes       | String | Project ID, which is used for resource isolation. For details about how to obtain its value, see <a href="#">Obtaining a Project ID</a> . |
| resource_name | Yes       | String | Name of the resource package that is uploaded.                                                                                            |

**Table 20-37** query parameter description

| Parameter | Mandatory | Type   | Description                                                               |
|-----------|-----------|--------|---------------------------------------------------------------------------|
| group     | No        | String | Name of the package group returned when the resource package is uploaded. |

 NOTE

The following is an example of the URL containing the **query** parameter:

GET /v2.0/{project\_id}/resources/{resource\_name}?group={group}

## Request

None

## Response

**Table 20-38** Response parameters

| Parameter       | Type   | Description                                                                                                                                                                                                                                                                                                 |
|-----------------|--------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| create_time     | Long   | UNIX time when a resource package is uploaded. The timestamp is expressed in milliseconds.                                                                                                                                                                                                                  |
| update_time     | Long   | UNIX time when the uploaded resource package is uploaded. The timestamp is expressed in milliseconds.                                                                                                                                                                                                       |
| resource_type   | String | Resource type.                                                                                                                                                                                                                                                                                              |
| resource_name   | String | Resource name.                                                                                                                                                                                                                                                                                              |
| status          | String | <ul style="list-style-type: none"><li>Value <b>UPLOADING</b> indicates that the resource package group is being uploaded.</li><li>Value <b>READY</b> indicates that the resource package has been uploaded.</li><li>Value <b>FAILED</b> indicates that the resource package fails to be uploaded.</li></ul> |
| underlying_name | String | Name of the resource packages in a queue.                                                                                                                                                                                                                                                                   |
| owner           | String | Owner of a resource package.                                                                                                                                                                                                                                                                                |

## Example Request

None

## Example Response

```
{
 "create_time": 1522055409139,
 "update_time": 1522228350501,
 "resource_type": "jar",
 "resource_name": "luxor-ommanager-dist.tar.gz",
 "status": "uploading",
 "underlying_name": "7885d26e-c532-40f3-a755-c82c442f19b8_luxor-ommanager-dist.tar.gz"
}
```

## Status Codes

[Table 20-39](#) describes the status code.

**Table 20-39** Status codes

| Status Codes | Description              |
|--------------|--------------------------|
| 200          | The query is successful. |
| 400          | Request error.           |
| 500          | Internal service error.  |

## Error Codes

If an error occurs when this API is invoked, the system does not return the result similar to the preceding example, but returns the error code and error information. For details, see [Error Codes](#).

## 20.2.7 Deleting a Resource Package from a Group (Discarded)

### Function

This API is used to delete resource packages in a group in a **Project**.

This API has been discarded and is not recommended.

### URI

- URI format  
`DELETE /v2.0/{project_id}/resources/{resource_name}`
- Parameter description

**Table 20-40** URI parameters

| Parameter     | Mandatory | Type   | Description                                                                                                                               |
|---------------|-----------|--------|-------------------------------------------------------------------------------------------------------------------------------------------|
| project_id    | Yes       | String | Project ID, which is used for resource isolation. For details about how to obtain its value, see <a href="#">Obtaining a Project ID</a> . |
| resource_name | Yes       | String | Name of the resource package that is uploaded.                                                                                            |

**Table 20-41** query parameter description

| Parameter | Mandatory | Type   | Description                                                               |
|-----------|-----------|--------|---------------------------------------------------------------------------|
| group     | No        | String | Name of the package group returned when the resource package is uploaded. |

 NOTE

The following is an example of the URL containing the **query** parameter:

DELETE /v2.0/{project\_id}/resources/{resource\_name}?group={group}

## Request

None

## Response

- Code 200 is returned if you successfully delete a resource package.
- Code 404 is returned if you initiate a request to delete a resource package that does not exist.

## Example Request

None

## Example Response

None

## Status Codes

[Table 20-42](#) describes the status code.

**Table 20-42** Status codes

| Status Code | Description         |
|-------------|---------------------|
| 200         | Deletion succeeded. |
| 404         | Not found.          |

## Error Codes

If an error occurs when this API is invoked, the system does not return the result similar to the preceding example, but returns the error code and error information. For details, see [Error Codes](#).

## 20.2.8 Changing the Owner of a Group or Resource Package (Discarded)

### Function

This API is used to change the owner of a program package.

This API has been discarded and is not recommended.

### URI

- URI format  
PUT /v2.0/{project\_id}/resources/owner
- Parameter description

**Table 20-43** URI parameter

| Parameter  | Mandatory | Type   | Description                                                                                                                               |
|------------|-----------|--------|-------------------------------------------------------------------------------------------------------------------------------------------|
| project_id | Yes       | String | Project ID, which is used for resource isolation. For details about how to obtain its value, see <a href="#">Obtaining a Project ID</a> . |

### Request

**Table 20-44** Request parameters

| Parameter  | Mandatory | Type   | Description                                                                                                                                         |
|------------|-----------|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------|
| new_owner  | Yes       | String | New username. The name contains 5 to 32 characters, including only digits, letters, underscores (_), and hyphens (-). It cannot start with a digit. |
| group_name | Yes       | String | Group name. The name contains a maximum of 64 characters. Only digits, letters, periods (.), underscores (_), and hyphens (-) are allowed.          |

| Parameter     | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                                                                    |
|---------------|-----------|--------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| resource_name | No        | String | <p>Package name. The name can contain only digits, letters, underscores (_), exclamation marks (!), hyphens (-), and periods (.), but cannot start with a period. The length (including the file name extension) cannot exceed 128 characters.</p> <p><b>This parameter is mandatory if you want to change the owner of a resource package in a group.</b></p> |

#### NOTE

**group\_name** and **resource\_name** can be used independently or together.

- To change the owner of a group, use **group\_name**.
- To change the owner of a resource package, use **resource\_name**.
- To change the owner of a resource package in a group, use **group\_name** and **resource\_name** at the same time.

## Response

**Table 20-45** Response parameters

| Parameter  | Mandatory | Type    | Description                                                                                                          |
|------------|-----------|---------|----------------------------------------------------------------------------------------------------------------------|
| is_success | No        | Boolean | Whether the request is successfully executed. Value <b>true</b> indicates that the request is successfully executed. |
| message    | No        | String  | System prompt. If execution succeeds, the parameter setting may be left blank.                                       |

## Example Request

Change the group name of the program package to **groupName** and the user name to **scuser1**.

```
{
 "new_owner": "scuser1",
 "group_name": "groupName"
}
```

## Example Response

```
{
 "is_success": "true",
 "message": ""
}
```

## Status Codes

[Table 20-46](#) describes the status code.

**Table 20-46** Status codes

| Status Code | Description                                 |
|-------------|---------------------------------------------|
| 200         | The modification operations are successful. |
| 404         | Request error.                              |

## Error Codes

If an error occurs when this API is invoked, the system does not return the result similar to the preceding example, but returns the error code and error information. For details, see [Error Codes](#).

**Table 20-47** Error codes

| Error Code | Error Message                  |
|------------|--------------------------------|
| DLI.0002   | No such user. userName:ssssss. |

## 20.3 APIs Related to Spark Batch Processing (Discarded)

### 20.3.1 Querying Batch Job Logs (Discarded)

#### Function

This API is used to query the back-end logs of batch processing jobs.

This API has been discarded and is not recommended.

#### URI

- URI format  
GET /v2.0/{project\_id}/batches/{batch\_id}/log
- Parameter description

**Table 20-48** URI parameters

| Parameter  | Mandatory | Type   | Description                                                                                                                               |
|------------|-----------|--------|-------------------------------------------------------------------------------------------------------------------------------------------|
| project_id | Yes       | String | Project ID, which is used for resource isolation. For details about how to obtain its value, see <a href="#">Obtaining a Project ID</a> . |
| batch_id   | Yes       | String | ID of a batch processing job.                                                                                                             |

**Table 20-49** Request parameters

| Parameter | Mandatory | Type    | Description                                                                                                                                                                                                                                                                                                                                    |
|-----------|-----------|---------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| from      | No        | Integer | Start line of the log to be displayed. By default, the last 100 lines of the log are displayed. If a log file contains fewer than 100 lines, line 0 is the start line.                                                                                                                                                                         |
| size      | No        | Integer | Number of logs to be queried.                                                                                                                                                                                                                                                                                                                  |
| type      | No        | String  | If <b>type</b> is set to <b>driver</b> , the Spark Driver log is generated.                                                                                                                                                                                                                                                                    |
| index     | No        | Integer | When a submitted job is retried, multiple driver logs are generated. This parameter specifies the <b>index</b> number of the specified driver log. The default value is <b>0</b> . This parameter must be used together with the <b>type</b> parameter. If only <b>index</b> is specified, the default value of <b>type</b> is <b>driver</b> . |

## Request

None

## Response

**Table 20-50** Response parameters

| Parameter | Mandatory | Type    | Description                       |
|-----------|-----------|---------|-----------------------------------|
| id        | No        | String  | ID of a batch processing job.     |
| from      | No        | Integer | Start index of a log.             |
| total     | No        | Long    | Total number of records in a log. |

| Parameter | Mandatory | Type             | Description                              |
|-----------|-----------|------------------|------------------------------------------|
| log       | No        | Array of Strings | Log of the current batch processing job. |

## Example Request

None

## Example Response

```
{
 "id": "0a324461-d9d9-45da-a52a-3b3c7a3d809e",
 "from": 0,
 "total": 3,
 "log": [
 "Detailed information about job logs"
]
}
```

## Status Codes

[Table 20-51](#) describes the status code.

**Table 20-51** Status codes

| Status Code | Description              |
|-------------|--------------------------|
| 200         | The query is successful. |
| 400         | Request error.           |
| 500         | Internal service error.  |

## Error Codes

If an error occurs when this API is invoked, the system does not return the result similar to the preceding example, but returns the error code and error information. For details, see [Error Codes](#).

## 20.4 SQL Job-related APIs (Discarded)

### 20.4.1 Importing Data (Discarded)

#### Function

This API is used to import data from a file to a DLI or OBS table. Currently, only OBS data can be imported to a DLI or OBS table.

 NOTE

- This API has been discarded and is not recommended.
- This API is asynchronous.
- When importing data, you can select an existing OBS bucket path or create an OBS bucket path, but only one OBS bucket path can be specified.
- If you need to create an OBS bucket, ensure that the bucket name complies with the following naming rules:
  - The name must be globally unique in OBS.
  - The name must contain 3 to 63 characters. Only lowercase letters, digits, hyphens (-), and periods (.) are allowed.
  - The name cannot start or end with a period (.) or hyphen (-), and cannot contain two consecutive periods (.) or contain a period (.) and a hyphen (-) adjacent to each other.
  - The name cannot be an IP address.
  - If the name contains any period (.), the security certificate verification may be triggered when you access the bucket or objects in the bucket.
  - If the type of a column in the source file to be imported does not match that of the target table, the query result of the row will be null.
  - Two or more concurrent tasks of importing data to the same table are not allowed.

## URI

- URI format  
POST /v1.0/{project\_id}/jobs/import-table
- Parameter description

**Table 20-52** URI parameter

| Parameter  | Mandatory | Type   | Description                                                                                                                               |
|------------|-----------|--------|-------------------------------------------------------------------------------------------------------------------------------------------|
| project_id | Yes       | String | Project ID, which is used for resource isolation. For details about how to obtain its value, see <a href="#">Obtaining a Project ID</a> . |

## Request

**Table 20-53** Request parameters

| Parameter | Mandatory | Type   | Description                                                                |
|-----------|-----------|--------|----------------------------------------------------------------------------|
| data_path | Yes       | String | Path to the data to be imported. Currently, only OBS data can be imported. |

| Parameter          | Mandatory | Type    | Description                                                                                                                                                                                                                                      |
|--------------------|-----------|---------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| data_type          | Yes       | String  | Type of the data to be imported. Currently, data types of CSV, Parquet, ORC, JSON, and Avro are supported.<br><b>NOTE</b><br>Data in <b>Avro</b> format generated by Hive tables cannot be imported.                                             |
| database_name      | Yes       | String  | Name of the database where the table to which data is imported resides.                                                                                                                                                                          |
| table_name         | Yes       | String  | Name of the table to which data is imported.                                                                                                                                                                                                     |
| with_column_header | No        | Boolean | Whether the first line of the imported data contains column names, that is, headers. The default value is <b>false</b> , indicating that column names are not contained. This parameter can be specified when CSV data is imported.              |
| delimiter          | No        | String  | User-defined data delimiter. The default value is a comma (,). This parameter can be specified when CSV data is imported.                                                                                                                        |
| quote_char         | No        | String  | User-defined quotation character. The default value is double quotation marks (""). This parameter can be specified when CSV data is imported.                                                                                                   |
| escape_char        | No        | String  | User-defined escape character. The default value is a backslash (\). This parameter can be specified when CSV data is imported.                                                                                                                  |
| date_format        | No        | String  | Specified date format. The default value is <b>yyyy-MM-dd</b> . For details about the characters involved in the date format, see <a href="#">Table 20-54</a> . This parameter can be specified when data in the CSV or JSON format is imported. |
| bad_records_path   | No        | String  | <b>Bad records</b> storage directory during job execution. After configuring this item, the <b>bad records</b> is not imported into the target table.                                                                                            |
| timestamp_format   | No        | String  | Specified time format. The default value is <b>yyyy-MM-dd HH:mm:ss</b> . For definitions about characters in the time format, see <a href="#">Table 20-54</a> . This parameter can be specified when data in the CSV or JSON format is imported. |
| queue_name         | No        | String  | Name of the queue that is specified to execute a task. If no queue is specified, the default queue is used.                                                                                                                                      |

| Parameter      | Mandatory | Type             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|----------------|-----------|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| overwrite      | No        | Boolean          | Whether to overwrite data. The default value is <b>false</b> , indicating appending write. If the value is <b>true</b> , it indicates overwriting.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| partition_spec | No        | Object           | <p>Partition to which data is to be imported.</p> <ul style="list-style-type: none"><li>If this parameter is not set, the entire table data is dynamically imported. The imported data must contain the data in the partition column.</li><li>If this parameter is set and all partition information is configured during data import, data is imported to the specified partition. The imported data cannot contain data in the partition column.</li><li>If not all partition information is configured during data import, the imported data must contain all non-specified partition data. Otherwise, abnormal values such as <b>null</b> exist in the partition field column of non-specified data after data import.</li></ul> |
| conf           | No        | Array of Strings | <p>User-defined parameter that applies to the job. Currently, <b>dli.sql.dynamicPartitionOverwrite.enabled</b> can be set to <b>false</b> by default. If it is set to <b>true</b>, data in a specified partition is overwritten. If it is set to <b>false</b>, data in the entire DataSource table is dynamically overwritten.</p> <p><b>NOTE</b><br/>For dynamic overwrite of Hive partition tables, only the involved partition data can be overwritten. The entire table data cannot be overwritten.</p>                                                                                                                                                                                                                          |

**Table 20-54** Definition of characters involved in the date and time patterns

| Character | Date or Time Element  | Example                      |
|-----------|-----------------------|------------------------------|
| G         | Epoch ID              | AD                           |
| y         | Year                  | 1996; 96                     |
| M         | Month                 | July; Jul; 07                |
| w         | Which week in a year  | 27 (Week 27 in the year)     |
| W         | Which week in a month | 2 (Second week in the month) |

| Character | Date or Time Element | Example                               |
|-----------|----------------------|---------------------------------------|
| D         | Which day in a year  | 189 (Day 189 in the year)             |
| d         | Which day in a month | 10 (Day 10 in the month)              |
| u         | Which day in a week  | 1 (Monday), ..., 7 (Sunday)           |
| a         | am/pm flag           | pm (Afternoon)                        |
| H         | Hour time (0-23)     | 2                                     |
| h         | Hour time (1-12)     | 12                                    |
| m         | Minute time          | 30                                    |
| s         | Second time          | 55                                    |
| S         | Which milliseconds   | 978                                   |
| z         | Time zone            | Pacific Standard Time; PST; GMT-08:00 |

## Response

**Table 20-55** Response parameters

| Parameter  | Mandatory | Type    | Description                                                                                                                                                     |
|------------|-----------|---------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| is_success | No        | Boolean | Indicates whether the request is successfully sent. Value <b>true</b> indicates that the request is successfully sent.                                          |
| message    | No        | String  | System prompt. If execution succeeds, the parameter setting may be left blank.                                                                                  |
| job_id     | No        | String  | ID of a job returned after a job is generated and submitted by using SQL statements. The job ID can be used to query the job status and results.                |
| job_mode   | No        | String  | Job execution mode. The options are as follows: <ul style="list-style-type: none"><li>• <b>async</b>: asynchronous</li><li>• <b>sync</b>: synchronous</li></ul> |

## Example Request

Import the CSV data stored on OBS to **db2.t2**.

```
{
 "data_path": "obs://home/data1/DLI/t1.csv",
 "data_type": "csv",
 "database_name": "db2",
 "table_name": "t2",
 "with_column_header": false,
 "delimiter": ",",
 "quote_char": "",
 "escape_char": "",
 "date_format": "yyyy-MM-dd",
 "timestamp_format": "yyyy-MM-dd'T'HH:mm:ss.SSSZZ",
 "queue_name": "queue2",
 "overwrite": false,
 "partition_spec":{
 "column1": "2020-01-01",
 "column2": "columnPartValue"
 }
}
```

## Example Response

```
{
 "is_success": true,
 "message": "import data to table t2 started",
 "job_id": "6b29eb77-4c16-4e74-838a-2cf7959e9202",
 "job_mode": "async"
}
```

## Status Codes

[Table 20-56](#) describes the status code.

**Table 20-56** Status codes

| Status Code | Description             |
|-------------|-------------------------|
| 200         | Import succeeded.       |
| 400         | Request error.          |
| 500         | Internal service error. |

## Error Codes

If an error occurs when this API is invoked, the system does not return the result similar to the preceding example, but returns the error code and error information. For details, see [Error Codes](#).

## 20.4.2 Exporting Data (Discarded)

### Function

This API is used to export data from a DLI table to a file.

- This API is asynchronous.
- Currently, data can be exported only from a DLI table to OBS, and the OBS path must be specified to the folder level. The OBS path cannot contain commas (,). The OBS bucket name cannot end with the regular expression format **[0-9]+(.\*)**. Specifically, if the bucket name contains dots (.), the last dot (.) cannot be followed by a digit, for example, **\*\*.12abc** and **\*\*.12**.
- Data can be exported across accounts. That is, after account B authorizes account A, account A can export data to the OBS path of account B if account A has the permission to read the metadata and permission information about the OBS bucket of account B and read and write the path.

#### NOTE

This API has been discarded and is not recommended.

## URI

- URI format  
POST /v1.0/{project\_id}/jobs/export-table
- Parameter description

**Table 20-57** URI parameter

| Parameter  | Mandatory | Type   | Description                                                                                                                               |
|------------|-----------|--------|-------------------------------------------------------------------------------------------------------------------------------------------|
| project_id | Yes       | String | Project ID, which is used for resource isolation. For details about how to obtain its value, see <a href="#">Obtaining a Project ID</a> . |

## Request

**Table 20-58** Request parameters

| Parameter     | Mandatory | Type   | Description                                                                                                                                                                                                                                         |
|---------------|-----------|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| data_path     | Yes       | String | Path for storing the exported data. Currently, data can be stored only on OBS. If <b>export_mode</b> is set to <b>errorIfExists</b> , the OBS path cannot contain the specified folder, for example, the <b>test</b> folder in the example request. |
| data_type     | Yes       | String | Type of data to be exported. Currently, only CSV and JSON are supported.                                                                                                                                                                            |
| database_name | Yes       | String | Name of the database where the table from which data is exported resides.                                                                                                                                                                           |
| table_name    | Yes       | String | Name of the table from which data is exported.                                                                                                                                                                                                      |

| Parameter          | Mandatory | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|--------------------|-----------|---------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| compress           | Yes       | String  | Compression mode for exported data. Currently, the compression modes <b>gzip</b> , <b>bzip2</b> , and <b>deflate</b> are supported. If you do not want to compress data, enter <b>none</b> .                                                                                                                                                                                                                                                                                                                                                   |
| queue_name         | No        | String  | Name of the queue that is specified to execute a task. If no queue is specified, the default queue is used.                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| export_mode        | No        | String  | Export mode. The parameter value can be <b>ErrorIfExists</b> or <b>Overwrite</b> . If <b>export_mode</b> is not specified, this parameter is set to <b>ErrorIfExists</b> by default. <ul style="list-style-type: none"><li>• <b>ErrorIfExists</b>: Ensure that the specified export directory does not exist. If the specified export directory exists, an error is reported and the export operation cannot be performed.</li><li>• <b>Overwrite</b>: If you add new files to a specific directory, existing files will be deleted.</li></ul> |
| with_column_header | No        | Boolean | Whether to export column names when exporting CSV and JSON data. <ul style="list-style-type: none"><li>• If this parameter is set to <b>true</b>, the column names are exported.</li><li>• If this parameter is set to <b>false</b>, the column names are not exported.</li><li>• If this parameter is left blank, the default value <b>false</b> is used.</li></ul>                                                                                                                                                                           |

## Response

**Table 20-59** Response parameters

| Parameter  | Mandatory | Type    | Description                                                                                                                                      |
|------------|-----------|---------|--------------------------------------------------------------------------------------------------------------------------------------------------|
| is_success | No        | Boolean | Whether the request is successfully sent. Value <b>true</b> indicates that the request is successfully sent.                                     |
| message    | No        | String  | System prompt. If execution succeeds, the parameter setting may be left blank.                                                                   |
| job_id     | No        | String  | ID of a job returned after a job is generated and submitted by using SQL statements. The job ID can be used to query the job status and results. |

| Parameter | Mandatory | Type   | Description                                                                                                                                                     |
|-----------|-----------|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| job_mode  | No        | String | Job execution mode. The options are as follows: <ul style="list-style-type: none"><li>• <b>async</b>: asynchronous</li><li>• <b>sync</b>: synchronous</li></ul> |

## Example Request

Export data from **db2.t2** to OBS and store the data in JSON format.

```
{
 "data_path": "obs://home/data1/DLI/test",
 "data_type": "json",
 "database_name": "db2",
 "table_name": "t2",
 "compress": "gzip",
 "with_column_header": "true",
 "queue_name": "queue2"
}
```

## Example Response

```
{
 "is_success": true,
 "message": "export all data from table db2.t2 to path obs://home/data1/DLI/test started",
 "job_id": "828d4044-3d39-449b-b32c-957f7cfadfc9",
 "job_mode": "async"
}
```

## Status Codes

[Table 20-60](#) describes the status code.

**Table 20-60** Status codes

| Status Code | Description             |
|-------------|-------------------------|
| 200         | Export successful.      |
| 400         | Request error.          |
| 500         | Internal service error. |

## Error Codes

If an error occurs when this API is invoked, the system does not return the result similar to the preceding example, but returns the error code and error information. For details, see [Error Codes](#).

## 20.5 Resource-related APIs (Discarded)

## 20.5.1 Database-related APIs (Discarded)

### 20.5.1.1 Creating a Database (Discarded)

#### Function

This API is used to add a database.

This API has been discarded and is not recommended.

#### URI

- URI format  
POST /v1.0/{project\_id}/databases
- Parameter description

**Table 20-61** URI parameter

| Parameter  | Mandatory | Type   | Description                                                                                                                               |
|------------|-----------|--------|-------------------------------------------------------------------------------------------------------------------------------------------|
| project_id | Yes       | String | Project ID, which is used for resource isolation. For details about how to obtain its value, see <a href="#">Obtaining a Project ID</a> . |

#### Request

**Table 20-62** Request parameters

| Parameter     | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|---------------|-----------|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| database_name | Yes       | String | <p>Name of the created database.</p> <ul style="list-style-type: none"><li>• The database name can contain only digits, letters, and underscores (_), but cannot contain only digits or start with an underscore (_).</li><li>• The database name is case insensitive and cannot be left blank.</li><li>• The length of the database name cannot exceed 128 characters.</li></ul> <p><b>NOTE</b><br/>The <b>default</b> database is a built-in database. You cannot create a database named <b>default</b>.</p> |
| description   | No        | String | Information about the created database.                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| Parameter             | Mandatory | Type             | Description                                                                                                                                                                                                        |
|-----------------------|-----------|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| enterprise_project_id | No        | String           | <p>Enterprise project ID. The value <b>0</b> indicates the default enterprise project.</p> <p><b>NOTE</b><br/>Users who have enabled Enterprise Management can set this parameter to bind a specified project.</p> |
| tags                  | No        | Array of objects | Database tag. For details, see <a href="#">Table 20-63</a> .                                                                                                                                                       |

**Table 20-63** tags parameters

| Parameter | Mandatory | Type   | Description                                                                                                                                                                                                                                     |
|-----------|-----------|--------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Key       | Yes       | String | <p>Tag key.</p> <p><b>NOTE</b><br/>A tag key can contain a maximum of 128 characters. Only letters, digits, spaces, and special characters (_:=+-@) are allowed, but the value cannot start or end with a space or start with <b>_sys_</b>.</p> |
| value     | Yes       | String | <p>Tag key.</p> <p><b>NOTE</b><br/>A tag value can contain a maximum of 255 characters. Only letters, digits, spaces, and special characters (_:=+-@) are allowed. The value cannot start or end with a space.</p>                              |

## Response

**Table 20-64** Response parameters

| Parameter  | Mandatory | Type    | Description                                                                                                          |
|------------|-----------|---------|----------------------------------------------------------------------------------------------------------------------|
| is_success | No        | Boolean | Whether the request is successfully executed. Value <b>true</b> indicates that the request is successfully executed. |
| message    | No        | String  | System prompt. If execution succeeds, the parameter setting may be left blank.                                       |

## Example Request

Create a test database named **db1**.

```
{
 "database_name": "db1",
 "description": "this is for test"
}
```

## Example Response

```
{
 "is_success": true,
 "message": ""
}
```

## Status Codes

[Table 20-65](#) describes the status code.

**Table 20-65** Status codes

| Status Code | Description                      |
|-------------|----------------------------------|
| 200         | The job is created successfully. |
| 400         | Request error.                   |
| 500         | Internal service error.          |

## Error Codes

If an error occurs when this API is invoked, the system does not return the result similar to the preceding example, but returns the error code and error information. For details, see [Error Codes](#).

### 20.5.1.2 Deleting a Database (Discarded)

#### Function

This API is used to delete an empty database. If there are tables in the database to be deleted, delete all tables first. For details about the API used to delete tables, see [Deleting a Table \(Discarded\)](#).

This API has been discarded and is not recommended.

#### URI

- URI format  
`DELETE /v1.0/{project_id}/databases/{database_name}`
- Parameter description

**Table 20-66** URI parameters

| Parameter     | Mandatory | Type   | Description                                                                                                                               |
|---------------|-----------|--------|-------------------------------------------------------------------------------------------------------------------------------------------|
| project_id    | Yes       | String | Project ID, which is used for resource isolation. For details about how to obtain its value, see <a href="#">Obtaining a Project ID</a> . |
| database_name | Yes       | String | Name of the database to be deleted.                                                                                                       |

**Table 20-67** query parameter description

| Parameter | Mandatory | Type    | Description                                                                                                                                 |
|-----------|-----------|---------|---------------------------------------------------------------------------------------------------------------------------------------------|
| cascade   | No        | Boolean | Specifies whether to forcibly delete the database. The value can be <b>true</b> or <b>false</b> . Default value: <b>false</b> .             |
| async     | No        | Boolean | Specifies whether to delete the database in asynchronous mode. The value can be <b>true</b> or <b>false</b> . Default value: <b>false</b> . |

 **NOTE**

The following is an example of the URL containing the **query** parameter:

```
DELETE /v1.0/{project_id}/databases/{database_name}?
cascade={is_cascade}&async={is_async}
```

## Request

None

## Response

**Table 20-68** Response parameters

| Parameter  | Mandatory | Type    | Description                                                                                                          |
|------------|-----------|---------|----------------------------------------------------------------------------------------------------------------------|
| is_success | No        | Boolean | Whether the request is successfully executed. Value <b>true</b> indicates that the request is successfully executed. |
| message    | No        | String  | System prompt. If execution succeeds, the parameter setting may be left blank.                                       |

| Parameter | Mandatory | Type   | Description                                                                                                                                                                       |
|-----------|-----------|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| job_id    | No        | String | Returned job ID, which can be used to obtain the job status and result.                                                                                                           |
| job_type  | No        | String | Type of a job. The options are as follows: <ul style="list-style-type: none"><li>• DDL</li><li>• DCL</li><li>• IMPORT</li><li>• EXPORT</li><li>• QUERY</li><li>• INSERT</li></ul> |
| job_mode  | No        | String | Job execution mode. The options are as follows: <ul style="list-style-type: none"><li>• <b>async</b>: asynchronous</li><li>• <b>sync</b>: synchronous</li></ul>                   |

## Example Request

None

## Example Response

- The following is an example of a successful response in synchronous mode:

```
{
 "is_success": true,
 "message": "",
 "job_mode": "sync"
}
```

- The following is an example of a successful response in asynchronous mode:

```
{
 "is_success": true,
 "message": "",
 "job_id": "208b08d4-0dc2-4dd7-8879-ddd4c020d7aa",
 "job_type": "DDL",
 "job_mode": "async"
}
```

### NOTE

- If the database is deleted asynchronously, you can view the current job status by calling the API for querying job status. For details, see [Querying Job Status](#).
- If **cascade** is set to **true**, all tables in the database will be deleted. Exercise caution when performing this operation.

## Status Codes

[Table 20-69](#) describes the status code.

**Table 20-69** Status codes

| Status Code | Description             |
|-------------|-------------------------|
| 200         | Deletion succeeded.     |
| 400         | Request error.          |
| 500         | Internal service error. |

## Error Codes

If an error occurs when this API is invoked, the system does not return the result similar to the preceding example, but returns the error code and error information. For details, see [Error Codes](#).

### 20.5.1.3 Querying All Databases (Discarded)

#### Function

This API is used to query the information about all the databases.

#### NOTE

This API has been discarded and is not recommended.

#### URI

- URI format  
GET /v1.0/{project\_id}/databases
- Parameter description

**Table 20-70** URI parameter

| Parameter  | Mandatory | Type   | Description                                                                                                                               |
|------------|-----------|--------|-------------------------------------------------------------------------------------------------------------------------------------------|
| project_id | Yes       | String | Project ID, which is used for resource isolation. For details about how to obtain its value, see <a href="#">Obtaining a Project ID</a> . |

**Table 20-71** query parameter description

| Parameter | Mandatory | Type    | Description                                                                                                                                 |
|-----------|-----------|---------|---------------------------------------------------------------------------------------------------------------------------------------------|
| with-priv | No        | Boolean | Specifies whether to display the permission information. The value can be <b>true</b> or <b>false</b> . The default value is <b>false</b> . |

| Parameter | Mandatory | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-----------|-----------|---------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| offset    | No        | Integer | The value should be no less than <b>0</b> . The default value is <b>0</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| limit     | No        | Integer | Number of returned data records. The value must be greater than or equal to <b>0</b> . By default, all data records are returned.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| keyword   | No        | String  | Database name filtering keyword. Fuzzy match is used to obtain all databases whose names contain the keyword.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| tags      | No        | String  | <p>Database tags. The format is <b>key=value</b>.</p> <ul style="list-style-type: none"><li>Request with one specified tag<br/>GET /v1.0/{project_id}/databases?<br/>offset=0&amp;limit=10&amp;with-priv=true&amp;tags=k1%3Dv1<br/>The equal sign (=) is escaped to <b>%3D</b>, <b>k1</b> indicates the tag key, and <b>v1</b> indicates the tag value.</li><li>Request with more than one tag<br/>Use commas (,) to separate tags. The commas (,) must be escaped to <b>%2C</b>. For example:<br/>GET /v1.0/{project_id}/databases?<br/>offset=0&amp;limit=10&amp;with-priv=true&amp;tags=k1%3Dv1%2Ck2%3Dv2<br/>The equal sign (=) is escaped to <b>%3D</b>. <b>k1</b> indicates a tag key, and <b>v1</b> indicates the tag value. <b>k2</b> indicates another tag key, and <b>v2</b> indicates the tag value.</li></ul> <p>Currently, only fuzzy query is supported. Exact query is not supported.</p> |

#### NOTE

The following is an example of the URL containing the **query** parameter:

```
GET /v1.0/{project_id}/databases?with-priv={is_with_priv}&offset={offsetValue}&limit={limitValue}&keyword={keywordValue}&tags={tagsValue}
```

## Request

None

## Response

**Table 20-72** Response parameters

| Parameter      | Mandatory | Type             | Description                                                                                                                    |
|----------------|-----------|------------------|--------------------------------------------------------------------------------------------------------------------------------|
| is_success     | No        | Boolean          | Indicates whether the request is successfully executed. Value <b>true</b> indicates that the request is successfully executed. |
| message        | No        | String           | System prompt. If execution succeeds, the parameter setting may be left blank.                                                 |
| database_count | No        | Integer          | Total number of databases.                                                                                                     |
| databases      | No        | Array of objects | Database information. For details, see <a href="#">Table 20-73</a> .                                                           |

**Table 20-73** databases parameters

| Parameter             | Mandatory | Type    | Description                                                                                                                                                                                            |
|-----------------------|-----------|---------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| database_name         | No        | String  | Name of a database.                                                                                                                                                                                    |

| table_number          | No        | Integer | Number of tables in a database.                                                                                                                                                                        |
| description           | No        | String  | Information about a database.                                                                                                                                                                          |
| enterprise_project_id | Yes       | String  | Enterprise project ID. The value <b>0</b> indicates the default enterprise project.<br><b>NOTE</b><br>Users who have enabled Enterprise Management can set this parameter to bind a specified project. |
| resource_id           | Yes       | String  | Resource ID.                                                                                                                                                                                           |

## Example Request

None

## Example Response

```
{
 "is_success": true,
 "message": "",
 "database_count": 1,
 "databases": [
```

```
{
 "database_name": "db2",
 "description": "this is for test",
 "owner": "tenant1",
 "table_number": 15
}
]
}
```

## Status Codes

[Table 20-74](#) describes the status code.

**Table 20-74** Status codes

| Status Code | Description              |
|-------------|--------------------------|
| 200         | The query is successful. |
| 400         | Request error.           |
| 500         | Internal service error.  |

## Error Codes

If an error occurs when this API is invoked, the system does not return the result similar to the preceding example, but returns the error code and error information. For details, see [Error Codes](#).

### 20.5.1.4 Modifying a Database Owner (Discarded)

#### Function

This API is used to modify the owner of a database.

This API has been discarded and is not recommended.

#### URI

- URI format  
PUT /v1.0/{project\_id}/databases/{database\_name}/owner
- Parameter description

**Table 20-75** URI parameters

| Parameter     | Mandatory | Type   | Description                                                                                                                               |
|---------------|-----------|--------|-------------------------------------------------------------------------------------------------------------------------------------------|
| project_id    | Yes       | String | Project ID, which is used for resource isolation. For details about how to obtain its value, see <a href="#">Obtaining a Project ID</a> . |
| database_name | Yes       | String | Name of a database.                                                                                                                       |

## Request

**Table 20-76** Request parameters

| Parameter | Mandatory | Type   | Description                                                                   |
|-----------|-----------|--------|-------------------------------------------------------------------------------|
| new_owner | Yes       | String | Name of the new owner. The new user must be a sub-user of the current tenant. |

## Response

**Table 20-77** Response parameters

| Parameter  | Mandatory | Type    | Description                                                                                                                    |
|------------|-----------|---------|--------------------------------------------------------------------------------------------------------------------------------|
| is_success | No        | Boolean | Indicates whether the request is successfully executed. Value <b>true</b> indicates that the request is successfully executed. |
| message    | No        | String  | System prompt. If execution succeeds, the parameter setting may be left blank.                                                 |

## Example Request

Change the owner of the database to **scuser1**.

```
{
 "new_owner": "scuser1"
}
```

## Example Response

```
{
 "is_success": true,
}
```

```
 "message": ""
 }
```

## Status Codes

[Table 20-78](#) describes the status code.

**Table 20-78** Status codes

| Status Code | Description                                 |
|-------------|---------------------------------------------|
| 200         | The modification operations are successful. |
| 400         | Request error.                              |
| 500         | Internal service error.                     |

## Error Codes

If an error occurs when this API is invoked, the system does not return the result similar to the preceding example, but returns the error code and error information. For details, see [Error Codes](#).

## 20.5.2 Table-related APIs (Discarded)

### 20.5.2.1 Creating a Table (Discarded)

#### Function

This API is used to create a table. This API is a synchronous API.

This API has been discarded and is not recommended.

#### URI

- URI format  
POST /v1.0/{project\_id}/databases/{database\_name}/tables
- Parameter description

**Table 20-79** URI parameters

| Parameter  | Mandatory | Type   | Description                                                                                                                               |
|------------|-----------|--------|-------------------------------------------------------------------------------------------------------------------------------------------|
| project_id | Yes       | String | Project ID, which is used for resource isolation. For details about how to obtain its value, see <a href="#">Obtaining a Project ID</a> . |

| Parameter     | Mandatory | Type   | Description                                       |
|---------------|-----------|--------|---------------------------------------------------|
| database_name | Yes       | String | Name of the database where the new table resides. |

## Request

**Table 20-80** Request parameters

| Parameter        | Mandatory | Type             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|------------------|-----------|------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| table_name       | Yes       | String           | <p>Name of the created table.</p> <ul style="list-style-type: none"><li>• The table name can contain only digits, letters, and underscores (_), but cannot contain only digits or start with an underscore (_).</li><li>• The table name is case insensitive and cannot be left unspecified.</li><li>• The table name can contain the dollar sign (\$). Example: \$test</li><li>• The length of the database name cannot exceed 128 characters.</li></ul> |
| data_location    | Yes       | String           | <p>Location where data is stored. The options are as follows:</p> <ul style="list-style-type: none"><li>• OBS: OBS table</li><li>• DLI: DLI table</li><li>• VIEW: VIEW table</li></ul>                                                                                                                                                                                                                                                                    |
| description      | No        | String           | Information about the new table.                                                                                                                                                                                                                                                                                                                                                                                                                          |
| columns          | Yes       | Array of Objects | <p>Columns of the new table. For details about column parameters, see <a href="#">Table 20-82</a>. This parameter is optional when <b>data_location</b> is <b>VIEW</b>.</p>                                                                                                                                                                                                                                                                               |
| select_statement | No        | String           | <p>Query statement required for creating a view. The database to which the table belongs needs to be specified in the query statement, in the format of <i>database.table</i>. This parameter is mandatory when <b>data_location</b> is <b>VIEW</b>.</p>                                                                                                                                                                                                  |
| data_type        | No        | String           | <p>Type of the data to be added to the OBS table. The options are as follows: Parquet, ORC, CSV, JSON, and Avro.</p> <p><b>NOTE</b><br/>This parameter is mandatory for an OBS table.</p>                                                                                                                                                                                                                                                                 |

| Parameter          | Mandatory | Type             | Description                                                                                                                                                                                                                                                                                                                      |
|--------------------|-----------|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| data_path          | No        | String           | <p>Storage path of data in the new OBS table, which must be a path on OBS and must begin with <b>obs</b>.</p> <p><b>NOTE</b><br/>This parameter is mandatory for an OBS table.<br/>Do not set this parameter to the OBS root directory. Otherwise, all data in the root directory will be cleared when you clear table data.</p> |
| with_column_header | No        | Boolean          | Whether the table header is included in the OBS table data. Only data in CSV files has this attribute. This parameter is mandatory when <b>data_location</b> is <b>OBS</b> .                                                                                                                                                     |
| delimiter          | No        | String           | User-defined data delimiter. Only data in CSV files has this attribute. This parameter is mandatory when <b>data_location</b> is <b>OBS</b> .                                                                                                                                                                                    |
| quote_char         | No        | String           | User-defined reference character. Double quotation marks ("") are used by default. Only data in CSV files has this attribute. This parameter is mandatory when <b>data_location</b> is <b>OBS</b> .                                                                                                                              |
| escape_char        | No        | String           | User-defined escape character. Backslashes (\) are used by default. Only data in CSV files has this attribute. This parameter is mandatory when <b>data_location</b> is <b>OBS</b> .                                                                                                                                             |
| date_format        | No        | String           | User-defined date type. <b>yyyy-MM-dd</b> is used by default. For details about the characters involved in the date format, see <a href="#">Table 20-54</a> . Only data in CSV and JSON files has this attribute. This parameter is mandatory when <b>data_location</b> is <b>OBS</b> .                                          |
| timestamp_format   | No        | String           | User-defined timestamp type. <b>yyyy-MM-dd HH:mm:ss</b> is used by default. For definitions about characters in the timestamp format, see <a href="#">Table 20-54</a> . Only data in CSV and JSON files has this attribute. This parameter is mandatory when <b>data_location</b> is <b>OBS</b> .                                |
| tags               | No        | Array of objects | Database tag. For details about this object, see <a href="#">tags parameters</a> .                                                                                                                                                                                                                                               |

**Table 20-81** tags parameters

| Parameter | Mandatory | Type   | Description                                                                                                                                                                                                                              |
|-----------|-----------|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| key       | Yes       | String | Tag key<br><b>NOTE</b><br>A tag key can contain a maximum of 128 characters. Only letters, digits, spaces, and special characters (_:=+@) are allowed, but the value cannot start or end with a space or start with <code>_sys_</code> . |
| value     | Yes       | String | Tag value<br><b>NOTE</b><br>A tag value can contain a maximum of 255 characters. Only letters, digits, spaces, and special characters (_:=+@) are allowed. The value cannot start or end with a space.                                   |

**Table 20-82** columns parameters

| Parameter           | Mandatory | Type    | Description                                                                                                                                                                                                                                                                                                                                                   |
|---------------------|-----------|---------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| column_name         | Yes       | String  | Name of a column.                                                                                                                                                                                                                                                                                                                                             |
| type                | Yes       | String  | Data type of a column.                                                                                                                                                                                                                                                                                                                                        |
| description         | No        | String  | Description of a column.                                                                                                                                                                                                                                                                                                                                      |
| is_partition_column | No        | Boolean | Whether the column is a partition column. The value <b>true</b> indicates a partition column, and the value <b>false</b> indicates a non-partition column. The default value is <b>false</b> .<br><b>NOTE</b><br>When creating a partition table, ensure that at least one column in the table is a non-partition column. For details, see "Request example". |

## Response

**Table 20-83** Response parameters

| Parameter  | Mandatory | Type    | Description                                                                                                          |
|------------|-----------|---------|----------------------------------------------------------------------------------------------------------------------|
| is_success | No        | Boolean | Whether the request is successfully executed. Value <b>true</b> indicates that the request is successfully executed. |

| Parameter | Mandatory | Type   | Description                                                                    |
|-----------|-----------|--------|--------------------------------------------------------------------------------|
| message   | No        | String | System prompt. If execution succeeds, the parameter setting may be left blank. |

## Example Request

- Create a table whose **data\_location** is **OBS** and data format of CSV.

```
{
 "table_name": "tb1",
 "data_location": "OBS",
 "description": "",
 "data_type": "csv",
 "data_path": "obs://obs/path1",
 "columns": [
 {
 "column_name": "column1",
 "type": "string",
 "description": "",
 "is_partition_column": true
 },
 {
 "column_name": "column2",
 "type": "string",
 "description": "",
 "is_partition_column": false
 }
],
 "with_column_header": true,
 "delimiter": ",",
 "quote_char": "\"",
 "escape_char": "\\",
 "date_format": "yyyy-MM-dd",
 "timestamp_format": "yyyy-MM-dd HH:mm:ss"
}
```

### NOTE

The values of **date\_format** and **timestamp\_format** must be the same as the time format in the imported CSV file.

- Create a table whose **data\_location** is **DLI**.

```
{
 "table_name": "tb2",
 "data_location": "DLI",
 "columns": [
 {
 "column_name": "column1",
 "type": "string",
 "description": "",
 "is_partition_column": true
 },
 {
 "column_name": "column2",
 "type": "string",
 "description": "",
 "is_partition_column": false
 }
],
 "tags": [
]}
```

- ```
        "key": "quarterly",
        "value": "Q3"
    },
    {
        "key": "author",
        "value": "user"
    }
]
}

● Create a table whose data_location is VIEW.
```
- ```
{
 "table_name": "tb3",
 "data_location": "VIEW",
 "columns": [
 {
 "column_name": "column1",
 "type": "string",
 "description": "",
 "is_partition_column": true
 },
 {
 "column_name": "column2",
 "type": "string",
 "description": "",
 "is_partition_column": false
 }
],
 "select_statement": "select * from db1.tb1"
}
```

## Example Response

```
{
 "is_success": true,
 "message": ""
}
```

## Status Codes

[Table 20-84](#) describes the status code.

**Table 20-84** Status codes

| Status Code | Description                      |
|-------------|----------------------------------|
| 200         | The job is created successfully. |
| 400         | Request error.                   |
| 500         | Internal service error.          |

## Error Codes

If an error occurs when this API is invoked, the system does not return the result similar to the preceding example, but returns the error code and error information. For details, see [Error Codes](#).

## 20.5.2.2 Deleting a Table (Discarded)

### Function

This API is used to delete a specified table.

This API has been discarded and is not recommended.

### URI

- URI format  
`DELETE /v1.0/{project_id}/databases/{database_name}/tables/{table_name}`
- Parameter description

**Table 20-85** URI parameters

| Parameter     | Mandatory | Type   | Description                                                                                                                               |
|---------------|-----------|--------|-------------------------------------------------------------------------------------------------------------------------------------------|
| project_id    | Yes       | String | Project ID, which is used for resource isolation. For details about how to obtain its value, see <a href="#">Obtaining a Project ID</a> . |
| database_name | Yes       | String | Name of the database where the table to be deleted resides.                                                                               |
| table_name    | Yes       | String | Name of the table to be deleted.                                                                                                          |

**Table 20-86** query parameter description

| Parameter | Mandatory | Type    | Description                                                                                                                                 |
|-----------|-----------|---------|---------------------------------------------------------------------------------------------------------------------------------------------|
| async     | No        | Boolean | Specifies whether to delete the database in asynchronous mode. The value can be <b>true</b> or <b>false</b> . Default value: <b>false</b> . |

The following is an example of the URL containing the **query** parameter:

`DELETE /v1.0/{project_id}/databases/{database_name}/tables/{table_name}?async={is_async}`

### Request

None

## Response

**Table 20-87** Response parameters

| Parameter  | Mandatory | Type    | Description                                                                                                                                                     |
|------------|-----------|---------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| is_success | No        | Boolean | Indicates whether the request is successfully executed. Value <b>true</b> indicates that the request is successfully executed.                                  |
| message    | No        | String  | System prompt. If execution succeeds, the parameter setting may be left blank.                                                                                  |
| job_mode   | No        | String  | Job execution mode. The options are as follows: <ul style="list-style-type: none"><li>• <b>async</b>: asynchronous</li><li>• <b>sync</b>: synchronous</li></ul> |

## Example Request

None

## Example Response

```
{
 "is_success": true,
 "message": ""
}
```

## Status Codes

[Table 20-88](#) describes the status code.

**Table 20-88** Status codes

| Status Code | Description             |
|-------------|-------------------------|
| 200         | Deletion succeeded.     |
| 400         | Request error.          |
| 500         | Internal service error. |

## Error Codes

If an error occurs when this API is invoked, the system does not return the result similar to the preceding example, but returns the error code and error information. For details, see [Error Codes](#).

### 20.5.2.3 Querying All Tables (Discarded)

#### Function

This API is used to query information about tables that meet the filtering criteria or all the tables in the specified database.

This API has been discarded and is not recommended.

#### URI

- URI format

GET /v1.0/{project\_id}/databases/{database\_name}/tables

- Parameter description

**Table 20-89** URI parameters

| Parameter     | Mandatory | Type   | Description                                                                                                                               |
|---------------|-----------|--------|-------------------------------------------------------------------------------------------------------------------------------------------|
| project_id    | Yes       | String | Project ID, which is used for resource isolation. For details about how to obtain its value, see <a href="#">Obtaining a Project ID</a> . |
| database_name | Yes       | String | Name of the database where the table resides.                                                                                             |

**Table 20-90** query parameter description

| Parameter    | Mandatory | Type    | Description                                                                                                       |
|--------------|-----------|---------|-------------------------------------------------------------------------------------------------------------------|
| keyword      | No        | String  | Keywords used to filter table names.                                                                              |
| with-detail  | No        | Boolean | Whether to obtain detailed information about tables (such as owner and size). The default value is <b>false</b> . |
| page-size    | No        | Integer | Paging size. The minimum value is <b>1</b> and the maximum value is <b>100</b> .                                  |
| current-page | No        | Integer | Current page number. The minimum value is <b>1</b> .                                                              |
| with-priv    | No        | Boolean | Whether to return permission information.                                                                         |

| Parameter         | Mandatory | Type    | Description                                                                                                                                                                                                                                                                                                  |
|-------------------|-----------|---------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| table-type        | No        | String  | Database table type. The options are as follows: <ul style="list-style-type: none"><li>• <b>MANAGED_TABLE</b>: DLI table</li><li>• <b>EXTERNAL_TABLE</b>: OBS table</li><li>• <b>VIRTUAL_VIEW</b>: view</li></ul>                                                                                            |
| datasource-type   | No        | String  | Data source type. The options are as follows: <ul style="list-style-type: none"><li>• CloudTable</li><li>• CSS</li><li>• DLI</li><li>• GaussDB(DWS)</li><li>• Geomesa</li><li>• HBase</li><li>• JDBC</li><li>• Mongo</li><li>• OBS</li><li>• ODPS</li><li>• OpenTSDB</li><li>• Redis</li><li>• RDS</li></ul> |
| without-tablemeta | No        | Boolean | Whether to obtain the metadata of a table. The default value is <b>false</b> . If this parameter is set to <b>true</b> , the response speed can be greatly improved.                                                                                                                                         |

#### NOTE

The following is an example of the URL containing the **query** parameter:

GET /v1.0/{project\_id}/databases/{database\_name}/tables?keyword=tb&with-detail=true

## Request

None

## Response

**Table 20-91** Response parameters

| Parameter   | Mandatory | Type             | Description                                                                                                          |
|-------------|-----------|------------------|----------------------------------------------------------------------------------------------------------------------|
| is_success  | Yes       | Boolean          | Whether the request is successfully executed. Value <b>true</b> indicates that the request is successfully executed. |
| message     | Yes       | String           | System prompt. If execution succeeds, the parameter setting may be left blank.                                       |
| table_count | Yes       | Integer          | Total number of tables.                                                                                              |
| tables      | Yes       | Array of objects | Table information. For details, see <a href="#">Table 20-92</a> .                                                    |

**Table 20-92** tables parameters

| Parameter        | Mandatory | Type   | Description                                                                                                                                                                      |
|------------------|-----------|--------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| create_time      | Yes       | Long   | Time when a table is created. The timestamp is expressed in milliseconds.                                                                                                        |
| data_type        | No        | String | Type of the data to be added to the OBS table. The options are as follows: Parquet, ORC, CSV, JSON, and Avro.<br><b>NOTE</b><br>This parameter is available only for OBS tables. |
| data_location    | Yes       | String | Data storage location, which can be DLI or OBS.                                                                                                                                  |
| last_access_time | Yes       | Long   | Time when the table was last updated. The timestamp is expressed in milliseconds.                                                                                                |
| location         | No        | String | Storage path on the OBS table.<br><b>NOTE</b><br>This parameter is available only for OBS tables.                                                                                |
| owner            | Yes       | String | Table owner.                                                                                                                                                                     |
| table_name       | Yes       | String | Name of a table.                                                                                                                                                                 |
| table_size       | Yes       | Long   | Size of a DLI table. Set parameter to <b>0</b> for non-DLI tables. The unit is byte.                                                                                             |

| Parameter         | Mandatory | Type             | Description                                                                                                                                                                                           |
|-------------------|-----------|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| table_type        | Yes       | String           | Type of a table. <ul style="list-style-type: none"><li>• <b>EXTERNAL</b>: Indicates an OBS table.</li><li>• <b>MANAGED</b>: Indicates a DLI table.</li><li>• <b>VIEW</b>: Indicates a view.</li></ul> |
| partition_columns | No        | Array of Strings | Partition field. This parameter is valid only for OBS partition tables.                                                                                                                               |
| page-size         | No        | Integer          | Paging size. The minimum value is <b>1</b> and the maximum value is <b>100</b> .                                                                                                                      |
| current-page      | No        | Integer          | Current page number. The minimum value is <b>1</b> .                                                                                                                                                  |

#### NOTE

If **with-detail** is set to **false** in the URI, only values of tables-related parameters **data\_location**, **table\_name**, and **table\_type** are returned.

## Example Request

None

## Example Response

```
{
 "is_success": true,
 "message": "",
 "table_count": 1,
 "tables": [
 { "create_time":1517364268000,
 "data_location":"OBS",
 "data_type":"csv",
 "last_access_time":1517364268000,
 "location":"obs://DLI/sqldata/data.txt",
 "owner":"test",
 "partition_columns": ["a0"],
 "table_name":"obs_t",
 "table_size":0,
 "table_type":"EXTERNAL"
 }
]
}
```

## Status Codes

[Table 20-93](#) describes the status code.

**Table 20-93** Status codes

| Status Code | Description              |
|-------------|--------------------------|
| 200         | The query is successful. |
| 400         | Request error.           |
| 500         | Internal service error.  |

## Error Codes

If an error occurs when this API is invoked, the system does not return the result similar to the preceding example, but returns the error code and error information. For details, see [Error Codes](#).

### 20.5.2.4 Describing Table Information (Discarded)

#### Function

This API is used to describe metadata information in the specified table.

This API has been discarded and is not recommended.

#### URI

- URI format  
GET /v1.0/{project\_id}/databases/{database\_name}/tables/{table\_name}
- Parameter description

**Table 20-94** URI parameters

| Parameter     | Mandatory | Type   | Description                                                                                                                               |
|---------------|-----------|--------|-------------------------------------------------------------------------------------------------------------------------------------------|
| project_id    | Yes       | String | Project ID, which is used for resource isolation. For details about how to obtain its value, see <a href="#">Obtaining a Project ID</a> . |
| database_name | Yes       | String | Name of the database where the target table resides.                                                                                      |
| table_name    | Yes       | String | Name of the target table.                                                                                                                 |

#### Request

None

## Response

**Table 20-95** Response parameters

| Parameter          | Mandatory | Type             | Description                                                                                                                                                                                              |
|--------------------|-----------|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| is_success         | Yes       | Boolean          | Indicates whether the request is successfully executed. Value <b>true</b> indicates that the request is successfully executed.                                                                           |
| message            | Yes       | String           | System prompt. If execution succeeds, the parameter setting may be left blank.                                                                                                                           |
| column_count       | Yes       | Integer          | Total number of columns in the table.                                                                                                                                                                    |
| columns            | Yes       | Array of objects | Column information, including the column name, type, and description. For details, see <a href="#">Table 20-96</a> .                                                                                     |
| table_type         | Yes       | String           | Table type. The options are as follows:<br><b>MANAGED</b> : DLI table<br><b>EXTERNAL</b> : OBS table<br><b>VIEW</b> : view                                                                               |
| data_type          | No        | String           | Data type, including <b>CSV</b> , <b>Parquet</b> , <b>ORC</b> , <b>JSON</b> , and <b>Avro</b> .                                                                                                          |
| data_location      | No        | String           | Path for storing data, which is an OBS path.                                                                                                                                                             |
| storage_properties | No        | Array of objects | Storage attribute, which is in the format of <b>key/value</b> and includes parameters <b>delimiter</b> , <b>escape</b> , <b>quote</b> , <b>header</b> , <b>dateformat</b> , and <b>timestampformat</b> . |
| table_comment      | No        | String           | Table comment.                                                                                                                                                                                           |
| create_table_sql   | No        | String           | Statement used to create a table.                                                                                                                                                                        |

**Table 20-96** columns parameters

| Parameter   | Mandatory | Type   | Description              |
|-------------|-----------|--------|--------------------------|
| column_name | Yes       | String | Column name.             |
| description | Yes       | String | Description of a column. |

| Parameter           | Mandatory | Type    | Description                                                                                                                                                                                                                                    |
|---------------------|-----------|---------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| type                | Yes       | String  | Data type of a column.                                                                                                                                                                                                                         |
| is_partition_column | Yes       | Boolean | Indicates whether the column is a partition column. The value <b>true</b> indicates that the column is a partition column, and the value <b>false</b> indicates that the column is not a partition column. The default value is <b>false</b> . |

## Example Request

None

## Example Response

- **MANAGED** type table

```

## Status Codes

[Table 20-97](#) describes the status code.

**Table 20-97** Status codes

| Status Code | Description                  |
|-------------|------------------------------|
| 200         | The operation is successful. |
| 400         | Request error.               |
| 500         | Internal service error.      |

## Error Codes

If an error occurs when this API is invoked, the system does not return the result similar to the preceding example, but returns the error code and error information. For details, see [Error Codes](#).

### 20.5.2.5 Previewing Table Content (Discarded)

#### Function

This API is used to preview the first 10 rows in a table.

This API has been discarded and is not recommended.

#### URI

- URI format  
GET /v1.0/{project\_id}/databases/{database\_name}/tables/{table\_name}/preview
- Parameter description

**Table 20-98** URI parameters

| Parameter     | Mandatory | Type   | Description                                                                                                                               |
|---------------|-----------|--------|-------------------------------------------------------------------------------------------------------------------------------------------|
| project_id    | Yes       | String | Project ID, which is used for resource isolation. For details about how to obtain its value, see <a href="#">Obtaining a Project ID</a> . |
| database_name | Yes       | String | Name of the database where the table to be previewed resides.                                                                             |
| table_name    | Yes       | String | Name of the table to be previewed.                                                                                                        |

**Table 20-99** query parameter description

| Parameter | Mandatory | Type   | Description                                                                                           |
|-----------|-----------|--------|-------------------------------------------------------------------------------------------------------|
| mode      | No        | String | Preview table mode. The options are <b>SYNC</b> and <b>ASYNC</b> . The default value is <b>SYNC</b> . |

 NOTE

The following is an example of the URL containing the **query** parameter:

```
GET /v1.0/{project_id}/databases/{database_name}/tables/{table_name}/preview?
mode={previewMode}
```

## Request

None

## Response

**Table 20-100** Response parameters

| Parameter  | Mandatory | Type             | Description                                                                                                          |
|------------|-----------|------------------|----------------------------------------------------------------------------------------------------------------------|
| is_success | No        | Boolean          | Whether the request is successfully executed. Value <b>true</b> indicates that the request is successfully executed. |
| message    | No        | String           | System prompt. If execution succeeds, the parameter setting may be left blank.                                       |
| schema     | No        | Array of Map     | Column name and type of a table.                                                                                     |
| rows       | No        | Array of objects | Previewed table content.                                                                                             |

## Example Request

None

## Example Response

The following is an example of a successful response in synchronous mode:

```
{
 "is_success": true,
 "message": "",
 "schema": [
 {
 "id": "int"
]
}
```

```
 },
 {
 "name": "string"
 },
 {
 "address": "string"
 }
],
 "rows": [
 [
 [
 "1",
 "John",
 "xxx"
],
 [
 "2",
 "Lily",
 "xxx"
]
]
]
}
```

#### NOTE

In asynchronous request mode, a job ID is returned. You can obtain the preview information based on the job ID.

## Status Codes

[Table 20-101](#) describes the status code.

**Table 20-101** Status codes

| Status Code | Description              |
|-------------|--------------------------|
| 200         | The query is successful. |
| 400         | Request error.           |
| 500         | Internal service error.  |

## Error Codes

If an error occurs when this API is invoked, the system does not return the result similar to the preceding example, but returns the error code and error information. For details, see [Error Codes](#).

### 20.5.2.6 Listing Partitions (Discarded)

#### Function

This API is used to list partitions.

#### NOTE

This API has been discarded and is not recommended.

## URI

- URI format  
GET /v1.0/{project\_id}/databases/{database\_name}/tables/{table\_name}/partitions
- Parameter description

**Table 20-102** URI parameters

| Parameter     | Mandatory | Type   | Description                                                                                                                               |
|---------------|-----------|--------|-------------------------------------------------------------------------------------------------------------------------------------------|
| project_id    | Yes       | String | Project ID, which is used for resource isolation. For details about how to obtain its value, see <a href="#">Obtaining a Project ID</a> . |
| database_name | Yes       | String | Name of a database.                                                                                                                       |
| table_name    | Yes       | String | Name of a table.                                                                                                                          |

**Table 20-103** query parameter description

| Parameter | Mandatory | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-----------|-----------|---------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| limit     | No        | Integer | Number of returned records displayed on each page. The default value is <b>100</b> .                                                                                                                                                                                                                                                                                                                                                                        |
| offset    | No        | Integer | Offset.                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| filter    | No        | String  | Filtering condition. Currently, only the = condition is supported. For example, <b>name=name1</b> indicates that the data whose name is <b>name1</b> in the partition is filtered. <b>name</b> indicates the name of the partition column, and <b>name1</b> indicates the value of the partition column. The key and value are case insensitive.<br><br>Example: GET /v1.0/{project_id}/databases/{database_name}/tables/{table_name}/partitions?part=part2 |

## Response

**Table 20-104** Response parameters

| Parameter  | Mandatory | Type    | Description                                                                                                          |
|------------|-----------|---------|----------------------------------------------------------------------------------------------------------------------|
| is_success | No        | Boolean | Whether the request is successfully executed. Value <b>true</b> indicates that the request is successfully executed. |
| message    | No        | String  | System prompt. If execution succeeds, the parameter setting may be left blank.                                       |
| partitions | No        | Object  | Partition information. For details, see <a href="#">Table 20-105</a> .                                               |

**Table 20-105** partitions parameter description

| Parameter       | Mandatory | Type             | Description                                                         |
|-----------------|-----------|------------------|---------------------------------------------------------------------|
| total_count     | Yes       | Long             | Total number of partitions.                                         |
| partition_infos | Yes       | Array of objects | List of partitions. For details, see <a href="#">Table 20-106</a> . |

**Table 20-106** partition\_infos parameter description

| Parameter        | Mandatory | Type             | Description                                                |
|------------------|-----------|------------------|------------------------------------------------------------|
| partition_name   | Yes       | String           | Partition name.                                            |
| create_time      | Yes       | Long             | Time when a partition is created.                          |
| last_access_time | Yes       | Long             | Last update time.                                          |
| locations        | No        | Array of Strings | Path. This parameter is displayed only for non-DLI tables. |
| last_ddl_time    | No        | Long             | Execution time of the last DDL statement, in seconds.      |
| num_rows         | No        | Long             | Total rows in the partition.                               |
| num_files        | No        | Long             | Number of files in a partition.                            |
| total_size       | No        | Long             | Total size of data in the partition, in bytes.             |

## Status Codes

**Table 20-107** describes the status code.

**Table 20-107** Status codes

| Status Code | Description                  |
|-------------|------------------------------|
| 200         | The operation is successful. |
| 400         | Request error.               |
| 500         | Internal service error.      |

## Error Codes

If an error occurs when this API is invoked, the system does not return the result similar to the preceding example, but returns the error code and error information. For details, see [Error Codes](#).

# 20.6 Permission-related APIs (Discarded)

## 20.6.1 Granting Queue Permissions to a User (Discarded)

### Function

This API is used to share a specific queue with other users. You can grant users with the permission to use the specified queue or revoke the permission.

The user group the user belongs to must have the **Tenant Guest** permission in the region where the user group belongs.

For details about the **Tenant Guest** permission and how to apply for the permission, see [System Permissions](#) and [Creating a User Group](#) in *Identity and Access Management User Guide*.

This API has been discarded and is not recommended.

### URI

- URI format  
PUT /v1.0/{project\_id}/queues/user-authorization
- Parameter description

**Table 20-108** URI parameter

| Parameter  | Mandatory | Type   | Description                                                                                                                               |
|------------|-----------|--------|-------------------------------------------------------------------------------------------------------------------------------------------|
| project_id | Yes       | String | Project ID, which is used for resource isolation. For details about how to obtain its value, see <a href="#">Obtaining a Project ID</a> . |

## Request

**Table 20-109** Request parameters

| Parameter  | Mandatory | Type             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|------------|-----------|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| queue_name | Yes       | String           | Name of a queue. Example value: <b>queue1</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| user_name  | Yes       | String           | Name of the user who is granted with usage permission on a queue or whose queue usage permission is revoked or updated. Example value: <b>tenant2</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| action     | Yes       | String           | Grants or revokes the permission. The parameter value can be <b>grant</b> , <b>revoke</b> , or <b>update</b> . Users can perform the <b>update</b> operation only when they have been granted with the <b>grant</b> and <b>revoke</b> permissions. Example value: <b>grant</b> . <ul style="list-style-type: none"><li>• <b>grant</b>: Indicates to grant users with permissions.</li><li>• <b>revoke</b>: Indicates to revoke permissions.</li><li>• <b>update</b>: Indicates to clear all the original permissions and assign the permissions in the provided permission array.</li></ul>                                                                                                                                                                                                                                                     |
| privileges | Yes       | Array of Strings | List of permissions to be granted, revoked, or updated. The following permissions are supported: Example value: [DROP_QUEUE, SUBMIT_JOB]. <ul style="list-style-type: none"><li>• <b>SUBMIT_JOB</b>: indicates to submit a job.</li><li>• <b>CANCEL_JOB</b>: indicates to cancel a job.</li><li>• <b>DROP_QUEUE</b>: indicates to delete a queue.</li><li>• <b>GRANT_PRIVILEGE</b>: indicates to assign a permission.</li><li>• <b>REVOKE_PRIVILEGE</b>: indicates to revoke a permission.</li><li>• <b>SHOW_PRIVILEGES</b>: indicates to view the permissions of other users</li><li>• <b>RESTART</b>: indicates to restart the queue.</li><li>• <b>SCALE_QUEUE</b>: indicates to change the queue specifications.</li></ul> <p><b>NOTE</b><br/>If the update list is empty, all permissions of the queue granted to the user are revoked.</p> |

## Response

**Table 20-110** Response parameters

| Parameter  | Mandatory | Type    | Description                                                                                                                                                 |
|------------|-----------|---------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|
| is_success | No        | Boolean | Indicates whether the request is successfully executed. Value <b>true</b> indicates that the request is successfully executed. Example value: <b>true</b> . |
| message    | No        | String  | System prompt. If execution succeeds, the parameter setting may be left blank. Example value: left blank.                                                   |

## Example Request

Grant a user the permission to submit jobs on queue1 and delete queue1.

```
{
 "queue_name": "queue1",
 "user_name": "tenant2",
 "action": "grant",
 "privileges" : ["DROP_QUEUE", "SUBMIT_JOB"]
}
```

## Example Response

```
{
 "is_success": true,
 "message": ""
}
```

## Status Codes

**Table 20-111** describes the status code.

**Table 20-111** Status codes

| Status Codes | Description             |
|--------------|-------------------------|
| 200          | Authorization succeeds. |
| 400          | Request error.          |
| 500          | Internal service error. |

## Error Codes

If an error occurs when this API is invoked, the system does not return the result similar to the preceding example, but returns the error code and error information. For details, see [Error Codes](#).

## 20.6.2 Querying Queue Users (Discarded)

### Function

This API is used to query names of all users who can use a specified queue.

#### NOTE

This API has been discarded and is not recommended.

### URI

- URI format  
GET /v1.0/{project\_id}/queues/{queue\_name}/users
- Parameter description

**Table 20-112** URI parameters

| Parameter  | Mandatory | Type   | Description                                                                                                                               |
|------------|-----------|--------|-------------------------------------------------------------------------------------------------------------------------------------------|
| project_id | Yes       | String | Project ID, which is used for resource isolation. For details about how to obtain its value, see <a href="#">Obtaining a Project ID</a> . |
| queue_name | Yes       | String | Name of a queue.                                                                                                                          |

**Table 20-113** query parameter description

| Parameter | Mandatory | Type    | Description                                                |
|-----------|-----------|---------|------------------------------------------------------------|
| limit     | Yes       | Integer | Number of records to be displayed of the page-based query. |
| offset    | Yes       | Integer | Specifies the offset of the page-based query.              |

### Request

None

## Response

**Table 20-114** Response parameters

| Parameter  | Mandatory | Type            | Description                                                                                                                                                    |
|------------|-----------|-----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| is_success | No        | Boolean         | Whether the request is successfully executed. Value <b>true</b> indicates that the request is successfully executed. Example value: <b>true</b> .              |
| message    | No        | String          | System prompt. If execution succeeds, the parameter setting may be left blank. Example value: left blank.                                                      |
| queue_name | No        | String          | Name of a queue. Example value: <b>queue1</b> .                                                                                                                |
| privileges | No        | Array of Object | Users who are granted with the permission to use this queue and the permission array to which users belong.<br>For details, see <a href="#">Table 20-115</a> . |
| count      | No        | Long            | Total number of users                                                                                                                                          |

**Table 20-115** privileges parameters

| Parameter  | Mandatory | Type             | Description                                                                             |
|------------|-----------|------------------|-----------------------------------------------------------------------------------------|
| is_admin   | No        | Boolean          | Whether the database user is an administrator. Example value: <b>false</b> .            |
| user_name  | No        | String           | Name of the user who has permission on the current queue. Example value: <b>user2</b> . |
| privileges | No        | Array of Strings | Permission of the user on the queue. Example value: [ <b>SUBMIT_JOB</b> ].              |

## Example Request

None

## Example Response

```
{
 "is_success": true,
 "message": "",
 "count": 2,
 "privileges": [
 {
 "user_name": "user2",
 "queue_name": "queue1",
 "privileges": ["SUBMIT_JOB"]
 }
]
}
```

```
"is_admin": true,
"privileges": [
 "ALL"
],
"user_name": "tenant1"
},
{
 "is_admin": false,
 "privileges": [
 "SUBMIT_JOB"
],
 "user_name": "user2"
}
],
"queue_name": "queue1"
}
```

## Status Codes

[Table 20-116](#) describes the status code.

**Table 20-116** Status codes

| Status Code | Description             |
|-------------|-------------------------|
| 200         | Authorization succeeds. |
| 400         | Request error.          |
| 500         | Internal service error. |

## Error Codes

If an error occurs when this API is invoked, the system does not return the result similar to the preceding example, but returns the error code and error information. For details, see [Error Codes](#).

### 20.6.3 Granting Data Permission to Users (Discarded)

#### Function

This API is used to grant database or table data usage permission to specified users.

The user group containing the authorized user must have the **Tenant Guest** permission in the region where the user group belongs.

For details about the **Tenant Guest** permission and how to apply for the permission, see [System Permissions](#) and [Creating a User Group](#) in *Identity and Access Management User Guide*.

This API has been discarded and is not recommended.

## URI

- URI format  
PUT /v1.0/{project\_id}/user-authorization
- Parameter description

**Table 20-117** URI parameter

| Parameter  | Mandatory | Type   | Description                                                                                                                               |
|------------|-----------|--------|-------------------------------------------------------------------------------------------------------------------------------------------|
| project_id | Yes       | String | Project ID, which is used for resource isolation. For details about how to obtain its value, see <a href="#">Obtaining a Project ID</a> . |

## Request

**Table 20-118** Request parameters

| Parameter  | Mandatory | Type             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|------------|-----------|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| user_name  | Yes       | String           | Name of the user who is granted with usage permission on a queue or whose queue usage permission is revoked or updated. Example value: <b>user2</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| action     | Yes       | String           | Grants or revokes the permission. The parameter value can be <b>grant</b> , <b>revoke</b> , or <b>update</b> . Example value: <b>grant</b> . <ul style="list-style-type: none"><li>• <b>grant</b>: Indicates to grant users with permissions.</li><li>• <b>revoke</b>: Indicates to revoke permissions.</li><li>• <b>update</b>: Indicates to clear all the original permissions and assign the permissions in the provided permission array.</li></ul> <p><b>NOTE</b><br/>Users can perform the <b>update</b> operation only when they have been granted with the <b>grant</b> and <b>revoke</b> permissions.</p> |
| privileges | Yes       | Array of objects | Permission granting information. For details, see <a href="#">Table 20-119</a> . Example value:<br>[ {"object": "databases.db1.tables.tb2.columns.column1", "privileges": ["SELECT"]}, {"object": "databases.db1.tables.tbl", "privileges": [ "DROP_TABLE"]}                                                                                                                                                                                                                                                                                                                                                       |

**Table 20-119** privileges parameters

| Parameter  | Mandatory | Type             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|------------|-----------|------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| object     | Yes       | String           | <p>Data objects to be assigned. If they are named:</p> <ul style="list-style-type: none"><li>• <b>databases.Database name</b>, data in the entire database will be shared.</li><li>• <b>databases.Database name.tables.Table name</b>, data in the specified table will be shared.</li><li>• <b>databases.Database name.tables.Table name.columns.Column name</b>, data in the specified column will be shared.</li><li>• <b>jobs.flink.Flink job ID</b>, data the specified job will be shared.</li><li>• <b>groups.Package group name</b>, data in the specified package group will be shared.</li><li>• <b>resources.Package name</b>, data in the specified package will be shared.</li></ul> <p>Example value:<br/><b>databases.db1.tables.tb2.columns.column1</b>.</p> |
| privileges | Yes       | Array of Strings | <p>List of permissions to be granted, revoked, or updated. For details about available permissions, see <a href="#">Data Permission List</a>. Example value: <b>[SELECT]</b>.</p> <p><b>NOTE</b><br/>If <b>Action</b> is <b>Update</b> and the update list is empty, all permissions of the user in the database or table are revoked.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                   |

## Response

**Table 20-120** Response parameters

| Parameter  | Mandatory | Type    | Description                                                                                                                                       |
|------------|-----------|---------|---------------------------------------------------------------------------------------------------------------------------------------------------|
| is_success | No        | Boolean | Whether the request is successfully executed. Value <b>true</b> indicates that the request is successfully executed. Example value: <b>true</b> . |
| message    | No        | String  | System prompt. If execution succeeds, the parameter setting may be left blank. Example value: left blank.                                         |

## Example Request

Grant **user2** the permission to query data in the database **db1**, delete the data table **db1.tbl**, and query data in a specified column **db1.tbl.column1** of a data table.

```
{
 "user_name": "user2",
 "action": "grant",
 "privileges": [
 {
 "object": "databases.db1.tables.tb2.columns.column1",
 "privileges": [
 "SELECT"
]
 },
 {
 "object": "databases.db1.tables.tbl",
 "privileges": [
 "DROP_TABLE"
]
 },
 {
 "object": "databases.db1",
 "privileges": [
 "SELECT"
]
 }
]
}
```

## Example Response

```
{
 "is_success": true,
 "message": ""
}
```

## Status Codes

[Table 20-121](#) describes the status code.

**Table 20-121** Status codes

| Status Code | Description             |
|-------------|-------------------------|
| 200         | Authorization succeeds. |
| 400         | Request error.          |
| 500         | Internal service error. |

## Error Codes

If an error occurs when this API is invoked, the system does not return the result similar to the preceding example, but returns the error code and error information. For details, see [Error Codes](#).

## 20.6.4 Querying Database Users (Discarded)

### Function

This API is used query names of all users who have permission to use or access the database.

This API has been discarded and is not recommended.

### URI

- URI format  
GET /v1.0/{project\_id}/databases/{database\_name}/users
- Parameter description

**Table 20-122** URI parameters

| Parameter     | Mandatory | Description                                                                                                                               |
|---------------|-----------|-------------------------------------------------------------------------------------------------------------------------------------------|
| project_id    | Yes       | Project ID, which is used for resource isolation. For details about how to obtain its value, see <a href="#">Obtaining a Project ID</a> . |
| database_name | Yes       | Name of the database to be queried.                                                                                                       |

### Request

None

### Response

**Table 20-123** Response parameters

| Parameter     | Mandatory | Type    | Description                                                                                                                                       |
|---------------|-----------|---------|---------------------------------------------------------------------------------------------------------------------------------------------------|
| is_success    | No        | Boolean | Whether the request is successfully executed. Value <b>true</b> indicates that the request is successfully executed. Example value: <b>true</b> . |
| message       | No        | String  | System prompt. If execution succeeds, the parameter setting may be left blank. Example value: left blank.                                         |
| database_name | No        | String  | Name of the database to be queried. Example value: <b>dsstest</b> .                                                                               |

| Parameter  | Mandatory | Type             | Description                                                             |
|------------|-----------|------------------|-------------------------------------------------------------------------|
| privileges | No        | Array of objects | Permission information. For details, see <a href="#">Table 20-124</a> . |

**Table 20-124 privileges parameters**

| Parameter  | Mandatory | Type             | Description                                                                                                                                          |
|------------|-----------|------------------|------------------------------------------------------------------------------------------------------------------------------------------------------|
| is_admin   | No        | Boolean          | Whether the database user is an administrator. Example value: <b>true</b> .                                                                          |
| user_name  | No        | String           | Name of the user who has permission on the current database. Example value: <b>test</b> .                                                            |
| privileges | No        | Array of Strings | Permission of the user on the database. For details, see <a href="#">Data Permissions List</a> . Example value: <b>[ALTER_TABLE_ADD_PARTITION]</b> . |

## Example Request

None

## Example Response

```
{
 "is_success": true,
 "message": "",
 "database_name": "dsstest",
 "privileges": [
 {
 "is_admin": true,
 "privileges": [
 "ALL"
],
 "user_name": "test"
 },
 {
 "is_admin": false,
 "privileges": [
 "ALTER_TABLE_ADD_PARTITION"
],
 "user_name": "scuser1"
 },
 {
 "is_admin": false,
 "privileges": [
 "CREATE_TABLE"
],
 "user_name": "scuser2"
 }
]
}
```

**NOTE**

If an error occurs when this API is invoked, the system does not return the result similar to the preceding example, but returns the error code and error information. For details, see [Error Codes](#).

## 20.6.5 Querying Table Users (Discarded)

### Function

This API is used to query users who have permission to access the specified table or column in the table.

**NOTE**

This API has been discarded and is not recommended.

### URI

- URI format  
GET /v1.0/{project\_id}/databases/{database\_name}/tables/{table\_name}/users
- Parameter description

**Table 20-125** URI parameters

| Parameter     | Mandatory | Description                                                                                                                               |
|---------------|-----------|-------------------------------------------------------------------------------------------------------------------------------------------|
| project_id    | Yes       | Project ID, which is used for resource isolation. For details about how to obtain its value, see <a href="#">Obtaining a Project ID</a> . |
| database_name | Yes       | Name of the database where the table to be queried resides.                                                                               |
| table_name    | Yes       | Name of a table that is to be queried.                                                                                                    |

### Response

**Table 20-126** Response parameters

| Parameter  | Mandatory | Type    | Description                                                                                                          |
|------------|-----------|---------|----------------------------------------------------------------------------------------------------------------------|
| is_success | No        | Boolean | Whether the request is successfully executed. Value <b>true</b> indicates that the request is successfully executed. |

| Parameter  | Man<br>dato<br>ry | Type               | Description                                                                    |
|------------|-------------------|--------------------|--------------------------------------------------------------------------------|
| message    | No                | String             | System prompt. If execution succeeds, the parameter setting may be left blank. |
| privileges | No                | Array<br><Objects> | Permission information. For details, see <a href="#">Table 20-127</a> .        |

**Table 20-127 privileges parameters**

| Parameter  | Man<br>dato<br>ry | Type          | Description                                                                                                                                                                                                                                                                                                                                                                   |
|------------|-------------------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| is_admin   | No                | Boolean       | Determines whether a user is an administrator. The value <b>false</b> indicates that the user is not an administrator, and the value <b>true</b> indicates that the user is an administrator.                                                                                                                                                                                 |
| object     | No                | String        | Objects on which a user has permission. <ul style="list-style-type: none"><li>• If the object is in the format of <b>databases.Database name.tables.Table name</b>, the user has permission on the database.</li><li>• If the object is in the format of <b>databases.Database name.tables.Table namecolumns.Column name</b>, the user has permission on the table.</li></ul> |
| privileges | No                | Array<String> | Permission of the user on the object.                                                                                                                                                                                                                                                                                                                                         |
| user_name  | No                | String        | Name of the user who has the permission.                                                                                                                                                                                                                                                                                                                                      |

 }
```

#### 📖 NOTE

If an error occurs when this API is invoked, the system does not return the result similar to the preceding example, but returns the error code and error information. For details, see [Error Codes](#).

## 20.6.6 Querying a User's Table Permissions (Discarded)

### Function

This API is used to query the permission of a specified user on a table.

#### 📖 NOTE

This API has been discarded and is not recommended.

### URI

- URI format  
GET /v1.0/{project\_id}/databases/{database\_name}/tables/{table\_name}/users/{user\_name}
- Parameter description

**Table 20-128** URI parameters

| Parameter     | Mandatory | Type   | Description                                                                                                                               |
|---------------|-----------|--------|-------------------------------------------------------------------------------------------------------------------------------------------|
| project_id    | Yes       | String | Project ID, which is used for resource isolation. For details about how to obtain its value, see <a href="#">Obtaining a Project ID</a> . |
| database_name | Yes       | String | Name of the database where the table to be queried resides.                                                                               |
| table_name    | Yes       | String | Name of a table that is to be queried.                                                                                                    |
| user_name     | Yes       | String | Name of the user whose permission is to be queried.                                                                                       |

## Example Request

None

## Example Response

{  
  "is\_success": true,

```
"message": "",
"privileges": [
 {
 "object": "databases.dsstest.tables.obs_2312",
 "privileges": [
 "DESCRIBE_TABLE"
]
 },
 {
 "object": "databases.dsstest.tables.obs_2312.columns.id",
 "privileges": [
 "SELECT"
]
 }
],
"user_name": "scuser1"
}
```

## Status Codes

[Table 20-131](#) describes the status code.

**Table 20-131** Status codes

| Status Code | Description             |
|-------------|-------------------------|
| 200         | Authorization succeeds. |
| 400         | Request error.          |
| 500         | Internal service error. |

## Error Codes

If an error occurs when this API is invoked, the system does not return the result similar to the preceding example, but returns the error code and error information. For details, see [Error Codes](#).

## 20.7 Queue-related APIs (Discarded)

### 20.7.1 Creating a Scheduled CU Change (Discarded)

#### Function

This API is used to create a scheduled CU change, that is, to create a scheduled CU change for a specified queue.

This API has been discarded and is not recommended.

#### URI

- URI format

POST /v1/{project\_id}/queues/{queue\_name}/plans

- Parameter description

**Table 20-132** URI parameters

| Parameter  | Mandatory | Type   | Description                                                                                                                                                                                                                                  |
|------------|-----------|--------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| project_id | Yes       | String | Project ID, which is used for resource isolation. For details about how to obtain its value, see <a href="#">Obtaining a Project ID</a> .                                                                                                    |
| queue_name | Yes       | String | Name of the queue for which you want to set a scheduled scaling plan. The name can contain only digits, letters, and underscores (_), but cannot contain only digits or start with an underscore (_). The name contains 1 to 128 characters. |

## Request

**Table 20-133** Request parameters

| Parameter        | Mandatory | Type             | Description                                                                                                                                                                                                                                                                                                                                                                                  |
|------------------|-----------|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| plan_name        | Yes       | String           | Name of a CU change. The name can contain only digits, letters, and underscores (_), but cannot contain only digits or start with an underscore (_).                                                                                                                                                                                                                                         |
| target_cu        | Yes       | Integer          | Target value of the CU in the scheduled CU change.                                                                                                                                                                                                                                                                                                                                           |
| start_hour       | Yes       | Integer          | Specifies the start hour of the scheduled CU change.                                                                                                                                                                                                                                                                                                                                         |
| start_minute     | Yes       | Integer          | Specifies the start minute of a scheduled CU change.                                                                                                                                                                                                                                                                                                                                         |
| repeat_day       | Yes       | Array of strings | Specifies the repetition period of a scheduled CU change. You can select one or more days from Monday to Sunday, or do not select any day. If this parameter is not specified, the scheduled CU change will be executed at the time specified by <b>start_hour: start_minute</b> after the current time. Example:<br><code>"repeat_day": ["MONDAY", "TUESDAY", "WEDNESDAY", "SUNDAY"]</code> |
| valid_date_begin | No        | Long             | Start time of the validity period (13-digit timestamp)                                                                                                                                                                                                                                                                                                                                       |

| Parameter      | Mandatory | Type    | Description                                                                                                                         |
|----------------|-----------|---------|-------------------------------------------------------------------------------------------------------------------------------------|
| valid_date_end | No        | Long    | End time of the validity period (13-digit timestamp)                                                                                |
| activate       | No        | Boolean | Indicates whether the scheduled CU change is activated. The default value is <b>true</b> , indicating that the change is activated. |

## Response

**Table 20-134** Response parameters

| Parameter  | Mandatory | Type    | Description                                                                                                                    |
|------------|-----------|---------|--------------------------------------------------------------------------------------------------------------------------------|
| is_success | No        | Boolean | Indicates whether the request is successfully executed. Value <b>true</b> indicates that the request is successfully executed. |
| message    | No        | String  | System prompt. If execution succeeds, the parameter setting may be left blank.                                                 |

## Example Request

Create a scaling plan named **plan\_A** for the queue. According to the plan, the queue is scaled out at 20:30 on Monday, Tuesday, Wednesday, and Sunday, to 64 CUs.

```
{
 "plan_name": "plan_A",
 "target_cu": 64,
 "start_hour": 20,
 "start_minute": 30,
 "repeat_day": [
 "MONDAY",
 "TUESDAY",
 "WEDNESDAY",
 "SUNDAY"
],
 "valid_date_begin": 1590949800000,
 "valid_date_end": 1591727400000,
 "activate": true
}
```

## Example Response

```
{
 "is_success": true,
 "message": ""
}
```

## Status Codes

**Table 20-135** describes status codes.

**Table 20-135** Status codes

| Status Code | Description                               |
|-------------|-------------------------------------------|
| 200         | Scheduled CU change created successfully. |
| 400         | Request failure.                          |
| 500         | Internal service error.                   |

## Error Codes

If an error occurs when this API is invoked, the system does not return the result similar to the preceding example, but returns the error code and error information. For details, see [Error Codes](#).

**Table 20-136** Error codes

| Error Code | Error Message                                                                                                          |
|------------|------------------------------------------------------------------------------------------------------------------------|
| DLI.0999   | Queue plans create failed. The plan plan_A can not generate a scale plan, please check all time settings for the plan. |

## 20.7.2 Viewing a Scheduled CU Change (Discarded)

### Function

This API is used to query the scheduled CU changes and list the changes of a specified queue.

This API has been discarded and is not recommended.

### URI

- URI format  
GET /v1/{project\_id}/queues/{queue\_name}/plans
- Parameter description

**Table 20-137** URI parameters

| Parameter  | Mandatory | Type   | Description                                                                                                                                                   |
|------------|-----------|--------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|
| project_id | Yes       | String | Project ID, which is used for resource isolation. For details about how to obtain its value, see <a href="#">Obtaining a Project ID</a> .                     |
| queue_name | Yes       | String | Name of the queue for which the scheduled CU change is to be deleted. The name contains 1 to 128 characters. Use commas (,) to separate multiple queue names. |

## Request

None

## Response

**Table 20-138** Response parameters

| Parameter  | Mandatory | Type             | Description                                                                                                                    |
|------------|-----------|------------------|--------------------------------------------------------------------------------------------------------------------------------|
| is_success | No        | Boolean          | Indicates whether the request is successfully executed. Value <b>true</b> indicates that the request is successfully executed. |
| message    | No        | String           | System prompt. If execution succeeds, the parameter setting may be left blank.                                                 |
| plans      | No        | Array of objects | Scheduled scaling plan information. For details, see <a href="#">Table 20-139</a> .                                            |

**Table 20-139** plans parameters

| Parameter  | Mandatory | Type    | Description                                                                                                                                          |
|------------|-----------|---------|------------------------------------------------------------------------------------------------------------------------------------------------------|
| id         | No        | Long    | ID of a scheduled CU change.                                                                                                                         |
| plan_name  | No        | String  | Name of a CU change. The name can contain only digits, letters, and underscores (_), but cannot contain only digits or start with an underscore (_). |
| target_cu  | No        | Integer | Target value of the CU in the scheduled CU change.                                                                                                   |
| start_hour | No        | Integer | Start hour of a queue scaling plan, in the 24-hour format.                                                                                           |

| Parameter         | Mandatory | Type             | Description                                                                                                                                                                                                                                                                                                                                                                                |
|-------------------|-----------|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| start_minute      | No        | Integer          | Specifies the start minute of a scheduled CU change.                                                                                                                                                                                                                                                                                                                                       |
| repeat_day        | Yes       | Array of strings | Specifies the repetition period of a scheduled CU change. You can select one or more days from Monday to Sunday, or do not select any day. If this parameter is not specified, the scheduled CU change will be executed at the time specified by <b>start_hour</b> : <b>start_minute</b> after the current time.<br>Example:<br>"repeat_day": ["MONDAY", "TUESDAY", "WEDNESDAY", "SUNDAY"] |
| valid_date_begin  | No        | Long             | Start time of the validity period (13-digit timestamp)                                                                                                                                                                                                                                                                                                                                     |
| valid_date_end    | No        | Long             | End time of the validity period (13-digit timestamp)                                                                                                                                                                                                                                                                                                                                       |
| activate          | No        | Boolean          | Indicates whether the scheduled CU change is activated. The default value is <b>true</b> , indicating that the change is activated.                                                                                                                                                                                                                                                        |
| last_execute_time | No        | Long             | Time when the scaling plan was last executed.                                                                                                                                                                                                                                                                                                                                              |

## Status Codes

[Table 20-140](#) describes status codes.

**Table 20-140** Status codes

| Status Code | Description              |
|-------------|--------------------------|
| 200         | The query is successful. |
| 400         | Request failure.         |
| 500         | Internal service error.  |

## Error Codes

If an error occurs when this API is invoked, the system does not return the result similar to the preceding example, but returns the error code and error information. For details, see [Error Codes](#).

**Table 20-141** Error codes

| Error Code | Error Message                   |
|------------|---------------------------------|
| DLI.0008   | There is no queue named queue1. |

## 20.7.3 Deleting Scheduled CU Changes in Batches (Discarded)

### Function

This API is used to delete scheduled CU changes in batches.

This API has been discarded and is not recommended.

## URI

- URI format  
POST /v1/{project\_id}/queues/{queue\_name}/plans/batch-delete
- Parameter description

**Table 20-142** URI parameters

| Parameter  | Mandatory | Type   | Description                                                                                                                                                   |
|------------|-----------|--------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|
| project_id | Yes       | String | Project ID, which is used for resource isolation. For details about how to obtain its value, see <a href="#">Obtaining a Project ID</a> .                     |
| queue_name | Yes       | String | Name of the queue for which the scheduled CU change is to be deleted. The name contains 1 to 128 characters. Use commas (,) to separate multiple queue names. |

## Request

**Table 20-143** Request parameters

| Parameter | Mandatory | Type          | Description                                                                                                                                                   |
|-----------|-----------|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|
| plan_ids  | Yes       | Array of Long | Scaling policy IDs of the queues you want to delete. For details, see <a href="#">Viewing a Scheduled CU Change (Discarded)</a> . Example: "plan_ids": [8,10] |

## Response

**Table 20-144** Response parameters

| Parameter  | Mandatory | Type    | Description                                                                                                                    |
|------------|-----------|---------|--------------------------------------------------------------------------------------------------------------------------------|
| is_success | No        | Boolean | Indicates whether the request is successfully executed. Value <b>true</b> indicates that the request is successfully executed. |
| message    | No        | String  | System prompt. If execution succeeds, the parameter setting may be left blank.                                                 |

## Example Request

Delete the scaling plans whose IDs are 3 and 4.

```
{
 "plan_ids": [3,4]
}
```

## Example Response

```
{
 "is_success": true,
 "message": ""
}
```

## Status Codes

[Table 20-145](#) describes status codes.

**Table 20-145** Status codes

| Status Code | Description             |
|-------------|-------------------------|
| 200         | Deletion succeeded.     |
| 400         | Request failure.        |
| 500         | Internal service error. |

## Error Codes

If an error occurs when this API is invoked, the system does not return the result similar to the preceding example, but returns the error code and error information. For details, see [Error Codes](#).

**Table 20-146** Error codes

| Error Code | Error Message                        |
|------------|--------------------------------------|
| DLI.0002   | The plans with id 8, 9 do not exist. |

## 20.7.4 Deleting a Scheduled CU Change (Discarded)

### Function

This API is used to delete a scheduled CU change for a queue with a specified ID.

This API has been discarded and is not recommended.

## URI

- URI format  
DELETE /v1/{project\_id}/queues/{queue\_name}/plans/{plan\_id}
- Parameter description

**Table 20-147** URI parameters

| Parameter  | Mandatory | Type   | Description                                                                                                                                                   |
|------------|-----------|--------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|
| project_id | Yes       | String | Project ID, which is used for resource isolation. For details about how to obtain its value, see <a href="#">Obtaining a Project ID</a> .                     |
| queue_name | Yes       | String | Name of the queue for which the scheduled CU change is to be deleted. The name contains 1 to 128 characters. Use commas (,) to separate multiple queue names. |
| plan_id    | Yes       | Long   | ID of scheduled CU change to be deleted. For details about how to obtain the IDs, see <a href="#">Viewing a Scheduled CU Change (Discarded)</a> .             |

## Request

None

## Response

|------------|-----------|---------|--------------------------------------------------------------------------------------------------------------------------------|
| is_success | No        | Boolean | Indicates whether the request is successfully executed. Value <b>true</b> indicates that the request is successfully executed. |
| message    | No        | String  | System prompt. If execution succeeds, the parameter setting may be left blank.                                                 |

## Example Request

None

## Example Response

```
{
 "is_success": true,
}
```

```
 "message": ""
 }
```

## Status Codes

[Table 20-149](#) describes status codes.

**Table 20-149** Status codes

| Status Code | Description                            |
|-------------|----------------------------------------|
| 200         | The directory is successfully deleted. |
| 400         | Request failure.                       |
| 500         | Internal service error.                |

## Error Codes

If an error occurs when this API is invoked, the system does not return the result similar to the preceding example, but returns the error code and error information. For details, see [Error Codes](#).

**Table 20-150** Error codes

| Error Code | Error Message                      |
|------------|------------------------------------|
| DLI.0002   | The plan with id 8 does not exist. |

## 20.7.5 Modifying a Scheduled CU Change (Discarded)

### Function

This API is used to modify a scheduled CU change for a queue with a specified ID.

This API has been discarded and is not recommended.

### URI

- URI format  
`PUT /v1/{project_id}/queues/{queue_name}/plans/{plan_id}`
- Parameter description

**Table 20-151** URI parameters

| Parameter  | Mandatory | Type   | Description                                                                                                                                                                                 |
|------------|-----------|--------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| project_id | Yes       | String | Project ID, which is used for resource isolation. For details about how to obtain its value, see <a href="#">Obtaining a Project ID</a> .                                                   |
| queue_name | Yes       | String | Name of the queue for which the scheduled CU change is to be modified. The name contains 1 to 128 characters. Use commas (,) to separate multiple queue names.                              |
| plan_id    | Yes       | String | ID of scheduled CU change to be modified. Use commas (,) to separate multiple IDs. For details about how to obtain the IDs, see <a href="#">Viewing a Scheduled CU Change (Discarded)</a> . |

## Request

**Table 20-152** Request parameters

| Parameter        | Mandatory | Type             | Description                                                                                                                                                                                                                                                                                                                                                                                  |
|------------------|-----------|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| plan_name        | Yes       | String           | Name of a CU change. The name can contain only digits, letters, and underscores (_), but cannot contain only digits or start with an underscore (_).                                                                                                                                                                                                                                         |
| target_cu        | Yes       | Integer          | Target value of the CU in the scheduled CU change.                                                                                                                                                                                                                                                                                                                                           |
| start_hour       | Yes       | Integer          | Specifies the start hour of the scheduled CU change.                                                                                                                                                                                                                                                                                                                                         |
| start_minute     | Yes       | Integer          | Specifies the start minute of a scheduled CU change.                                                                                                                                                                                                                                                                                                                                         |
| repeat_day       | Yes       | Array of strings | Specifies the repetition period of a scheduled CU change. You can select one or more days from Monday to Sunday, or do not select any day. If this parameter is not specified, the scheduled CU change will be executed at the time specified by <b>start_hour: start_minute</b> after the current time. Example:<br><code>"repeat_day": ["MONDAY", "TUESDAY", "WEDNESDAY", "SUNDAY"]</code> |
| valid_date_begin | No        | Long             | Start time of the validity period (13-digit timestamp)                                                                                                                                                                                                                                                                                                                                       |

| Parameter      | Mandatory | Type    | Description                                                                                                                         |
|----------------|-----------|---------|-------------------------------------------------------------------------------------------------------------------------------------|
| valid_date_end | No        | Long    | End time of the validity period (13-digit timestamp)                                                                                |
| activate       | No        | Boolean | Indicates whether the scheduled CU change is activated. The default value is <b>true</b> , indicating that the change is activated. |

## Response

**Table 20-153** Response parameters

| Parameter  | Mandatory | Type    | Description                                                                                                                                                    |
|------------|-----------|---------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| is_success | No        | Boolean | Indicates whether the request is successfully executed. Value <b>true</b> indicates that the request is successfully executed.                                 |
| message    | No        | String  | System prompt. If execution succeeds, the parameter setting may be left blank.                                                                                 |
| queue_name | No        | String  | Name of the queue for which the scheduled CU change is to be modified. The name contains 1 to 128 characters. Use commas (,) to separate multiple queue names. |
| plan_id    | No        | Integer | ID of scheduled CU change to be modified. Use commas (,) to separate multiple IDs.                                                                             |

## Example Request

Modify the scaling plan named **plan\_A**. After the modification, the number of CUs of the queue is scaled to 64 at 19:30 on Thursday and Friday, and the scaling plan is not activated.

```
{
 "plan_name": "plan_A",
 "target_cu": 64,
 "start_hour": 19,
 "start_minute": 30,
 "repeat_day": ["THURSDAY", "FRIDAY"],
 "activate": false
}
```

## Example Response

```
{
 "is_success": true,
 "message": "",
 "queue_name": "queue1",
 "plan_id": 12345678901234567890123456789012
}
```

```
 "plan_id": 3
 }
```

## Status Codes

[Table 20-154](#) describes status codes.

**Table 20-154** Status codes

| Status Code | Description                                 |
|-------------|---------------------------------------------|
| 200         | The modification operations are successful. |
| 400         | Request failure.                            |
| 500         | Internal service error.                     |

## Error Codes

If an error occurs when this API is invoked, the system does not return the result similar to the preceding example, but returns the error code and error information. For details, see [Error Codes](#).

**Table 20-155** Error codes

| Error Code   | Error Message                                                                                                          |
|--------------|------------------------------------------------------------------------------------------------------------------------|
| DLI.09<br>99 | Queue plans create failed. The plan plan_A can not generate a scale plan, please check all time settings for the plan. |

## 20.8 Datasource Authentication-related APIs (Discarded)

### 20.8.1 Creating Datasource Authentication (Discarded)

#### Function

This API is used to create datasource authentication.

This API has been discarded and is not recommended. Instead, it is recommended to use [Creating Datasource Authentication](#).

## URI

- URI format  
POST /v2.0/{project\_id}/datasource/auth-infos
- Parameter description

**Table 20-156** URI parameter

| Parameter  | Mandatory | Type   | Description                                                                                                                               |
|------------|-----------|--------|-------------------------------------------------------------------------------------------------------------------------------------------|
| project_id | Yes       | String | Project ID, which is used for resource isolation. For details about how to obtain its value, see <a href="#">Obtaining a Project ID</a> . |

## Request

**Table 20-157** Parameters

| Parameter            | Mandatory | Type   | Description                                                                                             |
|----------------------|-----------|--------|---------------------------------------------------------------------------------------------------------|
| auth_info_name       | Yes       | String | Authentication information name, which is unique in a project.                                          |
| user_name            | No        | String | Username                                                                                                |
| password             | No        | String | Password                                                                                                |
| certificate_location | No        | String | Path of the security cluster certificate. Currently, only OBS paths and CER files are supported.        |
| datasource_type      | Yes       | String | Data source type. Available values are <b>CSS</b> , <b>KRB</b> , <b>passwd</b> , and <b>Kafka_SSL</b> . |
| krb5_conf            | No        | String | OBS path of the <b>krb5</b> configuration file                                                          |
| keytab               | No        | String | OBS path of the <b>keytab</b> configuration file                                                        |
| truststore_location  | No        | String | OBS path of the <b>truststore</b> configuration file                                                    |
| truststore_password  | No        | String | Password of the <b>truststore</b> configuration file                                                    |
| keystore_location    | No        | String | OBS path of the <b>keystore</b> configuration file                                                      |

| Parameter         | Mandatory | Type   | Description                                        |
|-------------------|-----------|--------|----------------------------------------------------|
| keystore_password | No        | String | Password of the <b>keystore</b> configuration file |
| key_password      | No        | String | Key password                                       |

## Response

**Table 20-158 Parameters**

| Parameter  | Type    | Description                                                                                                          |
|------------|---------|----------------------------------------------------------------------------------------------------------------------|
| is_success | Boolean | Whether the request is successfully executed. Value <b>true</b> indicates that the request is successfully executed. |
| message    | String  | System prompt. If execution succeeds, the message may be left blank.                                                 |

## Example Request

Create a CSS datasource authentication.

```
{
 "auth_info_name": "test",
 "user_name": "admin",
 "password": "****",
 "certificate_location": "obs://test/CloudSearchService.cer",
 "datasource_type": "CSS"
}
```

## Example Response

```
{
 "is_success": true,
 "message": "Upload success."
}
```

## Status Codes

| Status Code | Description |
|-------------|-------------|
| 200         | OK          |

## Error Codes

For details, see [Error Codes](#).

## 20.8.2 Listing Datasource Authentication Information (Discarded)

### Function

This API is used to list the datasource authentication information in a project.

This API has been discarded and is not recommended. Instead, it is recommended to use [Listing Datasource Authentications](#).

### URI

- URI format  
GET /v2.0/{project\_id}/datasource/auth-infos
- Parameter description

**Table 20-159** URI parameter

| Parameter  | Mandatory | Type   | Description                                                                                                                               |
|------------|-----------|--------|-------------------------------------------------------------------------------------------------------------------------------------------|
| project_id | Yes       | String | Project ID, which is used for resource isolation. For details about how to obtain its value, see <a href="#">Obtaining a Project ID</a> . |

**Table 20-160** query parameters

| Parameter      | Mandatory | Type   | Description                                                                                                            |
|----------------|-----------|--------|------------------------------------------------------------------------------------------------------------------------|
| limit          | No        | String | The maximum number of connections to be queried. The default value is <b>100</b> .                                     |
| offset         | No        | String | The offset of the query result. The default value is <b>0</b> . Note that the connections are sorted by creation time. |
| auth_info_name | Yes       | String | Authentication information name, which is unique in a project.                                                         |

### Request

None

## Response

**Table 20-161** Parameters

| Parameter  | Type    | Description                                                                                                          |
|------------|---------|----------------------------------------------------------------------------------------------------------------------|
| is_success | Boolean | Whether the request is successfully executed. Value <b>true</b> indicates that the request is successfully executed. |
| message    | String  | System prompt. If execution succeeds, the message may be left blank.                                                 |
| count      | int     | Number of certificates                                                                                               |
| auth_infos | List    | Authentication information list. For details, see <a href="#">Table 20-162</a> .                                     |

**Table 20-162** auth\_infos parameters

| Parameter            | Type   | Description                                                          |
|----------------------|--------|----------------------------------------------------------------------|
| auth_info_name       | String | Username for logging in to the security cluster                      |
| user_name            | String | Password for logging in to the security cluster                      |
| certificate_location | String | OBS path of the certificate specified during authentication creation |
| datasource_type      | String | Data source type                                                     |
| create_time          | Int    | Timestamp when the authentication is created                         |
| update_time          | Int    | Timestamp when the authentication is updated                         |
| krb5_conf            | String | OBS path of the <b>krb5</b> configuration file                       |
| keytab               | String | OBS path of the <b>keytab</b> configuration file                     |
| truststore_location  | String | OBS path of the <b>truststore</b> configuration file                 |
| keystore_location    | String | OBS path of the <b>keystore</b> configuration file                   |
| owner                | String | Username                                                             |

## 20.8.3 Updating Datasource Authentication (Discarded)

### Function

This API is used to update authentication information.

This API has been discarded and is not recommended. Instead, it is recommended to use [Updating Datasource Authentication](#).

### URI

- URI format  
`PUT /v2.0/{project_id}/datasource/auth-infos`
- Parameter description

**Table 20-163** URI parameter

| Parameter  | Mandatory | Type   | Description                                                                                                                               |
|------------|-----------|--------|-------------------------------------------------------------------------------------------------------------------------------------------|
| project_id | Yes       | String | Project ID, which is used for resource isolation. For details about how to obtain its value, see <a href="#">Obtaining a Project ID</a> . |

## Request

| Parameter           | Mandatory | Type   | Description                                          |
|---------------------|-----------|--------|------------------------------------------------------|
| auth_info_name      | Yes       | String | Name of the updated datasource authentication.       |
| user_name           | No        | String | New username for logging in to the security cluster  |
| password            | No        | String | New password for logging in to the security cluster  |
| krb5_conf           | No        | String | OBS path of the <b>krb5</b> configuration file       |
| keytab              | No        | String | OBS path of the <b>keytab</b> configuration file     |
| truststore_location | No        | String | OBS path of the <b>truststore</b> configuration file |
| truststore_password | No        | String | Password of the <b>truststore</b> configuration file |
| keystore_location   | No        | String | OBS path of the <b>keystore</b> configuration file   |
| keystore_password   | No        | String | Password of the <b>keystore</b> configuration file   |

## Response

**Table 20-164** Parameters

| Parameter  | Type    | Description                                                                                                          |
|------------|---------|----------------------------------------------------------------------------------------------------------------------|
| is_success | Boolean | Whether the request is successfully executed. Value <b>true</b> indicates that the request is successfully executed. |
| message    | String  | None                                                                                                                 |

## Example Request

Change the name of datasource authentication to **rds3**.

```
{
 "auth_info_name": "rds3"
}
```

## Example Response

```
{
 "is_success": true,
 "message": "Update success."
}
```

## Status Codes

## 20.9 APIs Related to Enhanced Datasource Connections (Discarded)

## 20.9.1 Creating a Route (Discarded)

### Function

This API is used to create a datasource connection route.

This API has been discarded and is not recommended. Instead, it is recommended to use [Creating a Route](#).

### URI

- URI format  
`POST /v2.0/{project_id}/datasource/enhanced-connections/{connection_id}/routes`
- Parameter description

**Table 20-167** URI parameters

| Parameter     | Mandatory | Type   | Description                                                                                                                               |
|---------------|-----------|--------|-------------------------------------------------------------------------------------------------------------------------------------------|
| project_id    | Yes       | String | Project ID, which is used for resource isolation. For details about how to obtain its value, see <a href="#">Obtaining a Project ID</a> . |
| connection_id | Yes       | String | Datasource connection ID                                                                                                                  |

### Request

**Table 20-168** Parameters

| Parameter | Mandatory | Type   | Description                                           |
|-----------|-----------|--------|-------------------------------------------------------|
| name      | Yes       | String | Route name. The value can contain 1 to 64 characters. |
| cidr      | Yes       | String | Route network range                                   |

## Response

**Table 20-169** Parameters

| Parameter  | Type    | Description                                                                                                          |
|------------|---------|----------------------------------------------------------------------------------------------------------------------|
| is_success | Boolean | Whether the request is successfully executed. Value <b>true</b> indicates that the request is successfully executed. |
| message    | String  | System prompt. If execution succeeds, the message may be left blank.                                                 |

## Example Request

Create a route. Set the next-hop address of the enhanced datasource connection to **127.0.0.0**.

```
{
 "name": "route",
 "cidr": "127.0.0.0"
}
```

## Example Response

```
{
 "is_success": true,
 "message": ""
}
```

## Status Codes

| Status Code | Description |
|-------------|-------------|
| 200         | OK          |

## Error Codes

For details, see [Error Codes](#).

## 20.9.2 Deleting a Route (Discarded)

### Function

This API is used to delete a datasource connection route.

#### NOTE

This API has been discarded and is not recommended. Instead, it is recommended to use [Deleting a Route](#).

## URI

## 20.11 Table-related APIs (Discarded)

### 20.11.1 Querying All Tables (Discarded)

#### Function

This API is used to query information about tables that meet the filtering criteria or all the tables in the specified database.

#### NOTE

This API has been discarded and is not recommended.

#### URI

- URI format  
`GET /v1.0/{project_id}/databases/{database_name}?keyword=tb&with-detail=true`
- Parameter description

**Table 20-175** URI parameters

| Parameter  | Mandatory | Description                                                                                                                               |
|------------|-----------|-------------------------------------------------------------------------------------------------------------------------------------------|
| project_id | Yes       | Project ID, which is used for resource isolation. For details about how to obtain its value, see <a href="#">Obtaining a Project ID</a> . |

| Parameter     | Mandatory | Description                                                                   |
|---------------|-----------|-------------------------------------------------------------------------------|
| database_name | Yes       | Name of the database where the table resides.                                 |
| keyword       | No        | Keywords used to filter table names.                                          |
| with-detail   | No        | Whether to obtain detailed information about tables (such as owner and size). |

## Request

None

## Response

**Table 20-176** Response parameters

| Parameter   | Mandatory | Type             | Description                                                                                                          |
|-------------|-----------|------------------|----------------------------------------------------------------------------------------------------------------------|
| is_success  | Yes       | Boolean          | Whether the request is successfully executed. Value <b>true</b> indicates that the request is successfully executed. |
| message     | Yes       | String           | System prompt. If execution succeeds, the parameter setting may be left blank.                                       |
| table_count | Yes       | Integer          | Total number of tables.                                                                                              |
| tables      | Yes       | Array of objects | Table information. For details, see <a href="#">Table 20-177</a> .                                                   |

**Table 20-177** tables parameters

| Parameter     | Mandatory | Type   | Description                                                                                                                                                                   |
|---------------|-----------|--------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| create_time   | Yes       | Long   | Time when a table is created. The timestamp is expressed in milliseconds.                                                                                                     |
| data_type     | No        | String | Type of data in the OBS table. Currently, the parameter value can be <b>parquet</b> , <b>ORC</b> , <b>CSV</b> , or <b>JSON</b> . This parameter is valid only for OBS tables. |
| data_location | Yes       | String | Data storage location. OBS tables, DLI tables, and views are available.                                                                                                       |

| Parameter         | Mandatory | Type             | Description                                                                                                                                                                                           |
|-------------------|-----------|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| last_access_time  | Yes       | Long             | Time when the table was last updated. The timestamp is expressed in milliseconds.                                                                                                                     |
| location          | No        | String           | Storage path on the OBS table.                                                                                                                                                                        |
| owner             | Yes       | String           | Table owner.                                                                                                                                                                                          |
| table_name        | Yes       | String           | Name of a table.                                                                                                                                                                                      |
| table_size        | Yes       | Long             | Size of a DLI table. Set this parameter to <b>0</b> for non-DLI tables.                                                                                                                               |
| table_type        | Yes       | String           | Type of a table. <ul style="list-style-type: none"><li>• <b>EXTERNAL:</b> Indicates an OBS table.</li><li>• <b>MANAGED:</b> Indicates a DLI table.</li><li>• <b>VIEW:</b> Indicates a view.</li></ul> |
| partition_columns | No        | Array of Strings | Partition field. This parameter is valid only for OBS partition tables.                                                                                                                               |

#### NOTE

If **with-detail** is set to **false** in the URI, only values of parameters **data\_location**, **table\_name**, and **table\_type** are returned.

## Example

- Example request  
None
- Example response (successful request)

```
{
 "is_success": true,
 "message": "",
 "table_count": 1,
 "tables": [
 { "create_time":1517364268000,
 "data_location":"OBS",
 "data_type":"csv",
 "last_access_time":1517364268000,
 "location":"obs://DLI/sqldata/data.txt",
 "owner":"test",
 "partition_columns": ["a0"],
 "table_name":"obs_t",
 "table_size":0,
 "table_type":"EXTERNAL"
 }
]
}
```

#### NOTE

If an error occurs when this API is invoked, the system does not return the result similar to the preceding example, but returns the error code and error information. For details, see [Error Codes](#).

## 20.12 APIs Related to SQL Jobs (Discarded)

### 20.12.1 Submitting a SQL Job (Discarded)

#### Function

This API is used to submit jobs to a queue using SQL statements.

#### NOTE

This API has been discarded and is not recommended.

The job types support DDL, DCL, IMPORT, EXPORT, QUERY, and INSERT. Functions of IMPORT and EXPORT are the same as those described in [Importing Data \(Discarded\)](#) and [Exporting Data \(Discarded\)](#). The difference lies in the implementation method.

Additionally, you can use other APIs to query and manage jobs. For details, see the following sections:

- [Querying Job Status](#)
- [Querying Job Details](#)
- [Querying the Job Execution Result-Method 1 \(Discarded\)](#)
- [Exporting Query Results](#)
- [Querying All Jobs](#)
- [Canceling a Job \(Discarded\)](#)

#### NOTE

- This API is synchronous if **job\_type** in the response message is **DCL**.
- Information described in this section has been disused. You are advised to view the information described in [Submitting a SQL Job \(Recommended\)](#).

#### URI

- URI format

POST /v1.0/{project\_id}/queues/{queue\_name}/jobs/submit-job

- Parameter description

**Table 20-178** URI parameters

| Parameter  | Mandatory | Description                                                                                                                               |
|------------|-----------|-------------------------------------------------------------------------------------------------------------------------------------------|
| project_id | Yes       | Project ID, which is used for resource isolation. For details about how to obtain its value, see <a href="#">Obtaining a Project ID</a> . |

| Parameter  | Mandatory | Description                                                                                  |
|------------|-----------|----------------------------------------------------------------------------------------------|
| queue_name | Yes       | Current queue name. Resources of the queue are used for computing if SQL requires resources. |

## Request

**Table 20-179** Request parameters

| Parameter  | Mandatory | Type             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|------------|-----------|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| sql        | Yes       | String           | SQL statement that you want to execute.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| current db | No        | String           | Database where the SQL statement is executed. This parameter does not need to be configured during database creation.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| conf       | No        | Array of objects | User-defined parameter that applies to the job. Currently, the following configuration items are supported: <ul style="list-style-type: none"><li>● <b>dli.sql.join.preferSortMergeJoin</b> (specifies whether SortMergeJoin is preferred)</li><li>● <b>dli.sql.autoBroadcastJoinThreshold</b> (specifies the data volume threshold to use BroadcastJoin. If the data volume exceeds the threshold, BroadcastJoin will be automatically enabled.)</li><li>● <b>dli.sql.caseSensitive</b> (specifies whether SQL statements are case-sensitive)</li><li>● <b>dli.sql.shuffle.partitions</b> (specifies the number of partitions during shuffling)</li><li>● <b>dli.sql.cbo.enabled</b> (specifies whether to enable the CBO optimization policy)</li><li>● <b>dli.sql.cbo.joinReorder.enabled</b> (specifies whether join reordering is allowed when CBO optimization is enabled)</li></ul> |

## Response

**Table 20-180** Response parameters

| Parameter  | Mandatory | Type             | Description                                                                                                                                                                             |
|------------|-----------|------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| is_success | Yes       | Boolean          | If <b>job_type</b> is set to <b>DCL</b> , this parameter indicates whether the request is successfully executed. Value <b>true</b> indicates that the request is successfully executed. |
| message    | Yes       | String           | System prompt. If execution succeeds, the parameter setting may be left blank.                                                                                                          |
| job_id     | Yes       | String           | ID of a job returned after a job is generated and submitted by using SQL statements. The job ID can be used to query the job status and results.                                        |
| job_type   | Yes       | String           | Type of a job. Job types include the following: <ul style="list-style-type: none"><li>• DDL</li><li>• DCL</li><li>• IMPORT</li><li>• EXPORT</li><li>• QUERY</li><li>• INSERT</li></ul>  |
| schema     | No        | Array of Map     | If the statement type is DDL, the column name and type of DDL are displayed.                                                                                                            |
| rows       | No        | Array of objects | When the statement type is DDL, results of the DDL are displayed.                                                                                                                       |

## Example

- Example request

```
{
 "currentdb": "db1",
 "sql": "desc table1",
 "conf": [
 "dli.sql.shuffle.partitions = 200"
]
}
```

- Example response (successful request)

```
{
 "is_success": true,
 "message": "",
 "job_id": "8ecb0777-9c70-4529-9935-29ea0946039c",
 "job_type": "DDL",
 "schema": [
 {
 "col_name": "string"
 }
]
}
```

```
 },
 {
 "data_type": "string"
 },
 {
 "comment": "string"
 }
],
 "rows": [
 [
 [
 "c1",
 "int",
 null
],
 [
 "c2",
 "string",
 null
]
]
]
 }
```

#### NOTE

If an error occurs when this API is invoked, the system does not return the result similar to the preceding example, but returns the error code and error information. For details, see [Error Codes](#).

## 20.12.2 Canceling a Job (Discarded)

### Function

This API is used to cancel a submitted job. If execution of a job completes or fails, this job cannot be canceled.

#### NOTE

This API has been discarded and is not recommended.

### URI

- URI format  
`DELETE /v1.0/{project_id}/queues/{queue_name}/jobs/{job_id}`
- Parameter description

**Table 20-181** URI parameters

| Parameter  | Mandatory | Description                                                                                                                               |
|------------|-----------|-------------------------------------------------------------------------------------------------------------------------------------------|
| project_id | Yes       | Project ID, which is used for resource isolation. For details about how to obtain its value, see <a href="#">Obtaining a Project ID</a> . |
| queue_name | Yes       | Name of the queue where the job to be canceled resides.                                                                                   |
| job_id     | Yes       | Job ID.                                                                                                                                   |

## Request

None

## Response

**Table 20-182** Response parameters

| Parameter  | Mandatory | Type    | Description                                                                                                                    |
|------------|-----------|---------|--------------------------------------------------------------------------------------------------------------------------------|
| is_success | No        | Boolean | Indicates whether the request is successfully executed. Value <b>true</b> indicates that the request is successfully executed. |
| message    | No        | String  | System prompt. If execution succeeds, the parameter setting may be left blank.                                                 |

## Example

- Example request  
None
- Example response (successful request)

```
{
 "is_success": true,
 "message": ""
}
```

### NOTE

If an error occurs when this API is invoked, the system does not return the result similar to the preceding example, but returns the error code and error information. For details, see [Error Codes](#).

## 20.12.3 Querying the Job Execution Result-Method 1 (Discarded)

### Function

This API is used to view the job execution result after a job is executed using SQL query statements. Currently, you can only query execution results of jobs of the **QUERY** type.

### NOTE

- This API has been discarded and is not recommended.
- You can view the first 1000 result records only. To view all result records, export them first. For details, see [Exporting Query Results](#).

### URI

- URI format

GET/v1.0/{project\_id}/queues/{queue\_name}/jobs/{job\_id}?page-size=*size*&current-page=*page\_number*

- Parameter description

**Table 20-183** URI parameters

| Parameter    | Mandatory | Description                                                                                                                               |
|--------------|-----------|-------------------------------------------------------------------------------------------------------------------------------------------|
| project_id   | Yes       | Project ID, which is used for resource isolation. For details about how to obtain its value, see <a href="#">Obtaining a Project ID</a> . |
| queue_name   | Yes       | Current queue name. SQL uses resources of the current queue for computing.                                                                |
| job_id       | Yes       | Job ID.                                                                                                                                   |
| page-size    | No        | Maximum number of lines displayed on each page. The value range is as follows: [1, 100]. The default value is <b>50</b> .                 |
| current-page | No        | Current page number. The default value is <b>1</b> .                                                                                      |

## Request

None

## Response

**Table 20-184** Response parameters

| Parameter  | Mandatory | Type    | Description                                                                                                                                                                                        |
|------------|-----------|---------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| is_success | No        | Boolean | Whether the request is successfully executed. Value <b>true</b> indicates that the request is successfully executed.                                                                               |
| message    | No        | String  | System prompt. If execution succeeds, the parameter setting may be left blank.                                                                                                                     |
| job_id     | No        | String  | Job ID.                                                                                                                                                                                            |
| job_type   | No        | String  | Job type, including <b>DDL</b> , <b>DCL</b> , <b>IMPORT</b> , <b>EXPORT</b> , <b>QUERY</b> , and <b>INSERT</b> . Currently, you can only query execution results of jobs of the <b>QUERY</b> type. |
| row_count  | No        | Integer | Total number of job results.                                                                                                                                                                       |

| Parameter  | Mandatory | Type             | Description                                  |
|------------|-----------|------------------|----------------------------------------------|
| input_size | No        | Long             | Amount of data scanned during job execution. |
| schema     | No        | Array of Map     | Name and type of the job result column.      |
| rows       | No        | Array of objects | Job results set.                             |

## Example

- Example request  
None
- Example response (successful request)

```
{
 "is_success": true,
 "message": "",
 "job_id": "ead0b276-8ed4-4eb5-b520-58f1511e7033",
 "job_type": "QUERY",
 "row_count": 1,
 "input_size": 74,
 "schema": [
 {
 "c1": "int"
 },
 {
 "c2": "string"
 }
],
 "rows": [
 [
 23,
 "sda"
]
]
}
```

### NOTE

If an error occurs when this API is invoked, the system does not return the result similar to the preceding example, but returns the error code and error information. For details, see [Error Codes](#).

## 20.12.4 Querying the Job Execution Result-Method 2 (Discarded)

### Function

This API is used to view the job execution result after a job is executed using SQL query statements. Currently, you can only query execution results of jobs of the **QUERY** type.

You can view the first 1000 result records only. To view all result records, export them first. For details, see [Exporting Query Results](#).

 NOTE

This API has been discarded and is not recommended.

## URI

- URI format  
GET/v1.0/{project\_id}/jobs/{job\_id}?page-size={size}&current-page={page\_number}&queue-name={queue\_name}
- Parameter description

**Table 20-185** URI parameters

| Parameter    | Mandatory | Description                                                                                                                               |
|--------------|-----------|-------------------------------------------------------------------------------------------------------------------------------------------|
| project_id   | Yes       | Project ID, which is used for resource isolation. For details about how to obtain its value, see <a href="#">Obtaining a Project ID</a> . |
| job_id       | Yes       | Job ID.                                                                                                                                   |
| page-size    | No        | Maximum number of lines displayed on each page. The value range is as follows: [1, 100]. The default value is <b>50</b> .                 |
| current-page | No        | Current page number. The default value is <b>1</b> .                                                                                      |
| queue-name   | No        | Name of the execution queue for obtaining job results. If this parameter is not specified, the default system queue is used.              |

## Request

None

## Response

**Table 20-186** Response parameters

| Parameter  | Mandatory | Type    | Description                                                                                                          |
|------------|-----------|---------|----------------------------------------------------------------------------------------------------------------------|
| is_success | No        | Boolean | Whether the request is successfully executed. Value <b>true</b> indicates that the request is successfully executed. |
| message    | No        | String  | System prompt. If execution succeeds, the parameter setting may be left blank.                                       |
| job_id     | No        | String  | Job ID.                                                                                                              |

| Parameter  | Mandatory | Type             | Description                                                                                                                                                                                                                                                                                          |
|------------|-----------|------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| job_type   | No        | String           | Job type, including <b>DDL</b> , <b>DCL</b> , <b>IMPORT</b> , <b>EXPORT</b> , <b>QUERY</b> , <b>INSERT</b> , <b>DATA_MIGRATION</b> , <b>UPDATE</b> , <b>DELETE</b> , <b>RESTART_QUEUE</b> and <b>SCALE_QUEUE</b> . Currently, you can only query execution results of jobs of the <b>QUERY</b> type. |
| row_count  | No        | Integer          | Total number of job results.                                                                                                                                                                                                                                                                         |
| input_size | No        | Long             | Amount of data scanned during job execution.                                                                                                                                                                                                                                                         |
| schema     | No        | Array of Map     | Name and type of the job result column.                                                                                                                                                                                                                                                              |
| rows       | No        | Array of objects | Job results set.                                                                                                                                                                                                                                                                                     |

## Example

- Example request  
None
- Example response (successful request)

```
{
 "is_success": true,
 "message": "",
 "job_id": "ead0b276-8ed4-4eb5-b520-58f1511e7033",
 "job_type": "QUERY",
 "row_count": 1,
 "input_size": 74,
 "schema": [
 {
 "c1": "int"
 },
 {
 "c2": "string"
 }
],
 "rows": [
 [
 23,
 "sda"
]
]
}
```

### NOTE

If an error occurs when this API is invoked, the system does not return the result similar to the preceding example, but returns the error code and error information. For details, see [Error Codes](#).

## 20.13 APIs Related to Data Upload (Discarded)

## 20.13.1 Authenticating a Created Data Uploading Job (Discarded)

### Function

This API is used to check whether a created data uploading job is valid and, if valid, authorize the job to upload data to DLI.

This API has been discarded and is not recommended.

### URI

- URI format  
POST /v1.0/{project\_id}/uploader/authentication
- Parameter description

**Table 20-187** URI parameter

| Parameter  | Mandatory | Description                                                                                                                               |
|------------|-----------|-------------------------------------------------------------------------------------------------------------------------------------------|
| project_id | Yes       | Project ID, which is used for resource isolation. For details about how to obtain its value, see <a href="#">Obtaining a Project ID</a> . |

### Request

**Table 20-188** Request parameters

| Parameter | Mandatory | Type   | Description                                             |
|-----------|-----------|--------|---------------------------------------------------------|
| job_id    | Yes       | String | Job ID, which is used to identify a data uploading job. |

### Response

**Table 20-189** Response parameters

| Parameter  | Type    | Description                                                                                                                    |
|------------|---------|--------------------------------------------------------------------------------------------------------------------------------|
| is_success | Boolean | Indicates whether the request is successfully executed. Value <b>true</b> indicates that the request is successfully executed. |

| Parameter | Type             | Description                                                                    |
|-----------|------------------|--------------------------------------------------------------------------------|
| message   | String           | System prompt. If execution succeeds, the parameter setting may be left blank. |
| mask      | Array of strings | Authorization mask information.                                                |

## Example

- Example request

```
{
 "job_id": "6b29eb77-4c16-4e74-838a-2cf7959e9203"
}
```
- Example response (successful request)

```
{
 "is_success": "true",
 "message": "check upload id success",
 "mask": [
 "mask_str_01",
 "mask_str_02"
]
}
```

### NOTE

If an error occurs when this API is invoked, the system does not return the result similar to the preceding example, but returns the error code and error information. For details, see [Error Codes](#).

## 20.14 Cluster-related APIs

### 20.14.1 Creating a Cluster (Discarded)

#### Function

This API is used to create a cluster. The cluster will be bound to specified compute resources.

### NOTE

This API has been discarded and is not recommended.

#### URI

- URI format  
POST /v2.0/{project\_id}/clusters
- Parameter description

**Table 20-190** URI parameter

| Parameter  | Mandatory | Description                                                                                                                               |
|------------|-----------|-------------------------------------------------------------------------------------------------------------------------------------------|
| project_id | Yes       | Project ID, which is used for resource isolation. For details about how to obtain its value, see <a href="#">Obtaining a Project ID</a> . |

## Request

In addition to the common request header parameters involved in cluster creation, the special request header parameters described in [Table 20-191](#) are also involved.

**Table 20-191** Header description

| Parameter    | Mandatory | Description                                         |
|--------------|-----------|-----------------------------------------------------|
| X-Auth-Token | Yes       | User token obtained from IAM.                       |
| Accept       | Yes       | The default value is <b>application/json</b> .      |
| Content-Type | Yes       | The value is specified to <b>application/json</b> . |
| charset      | Yes       | The encoding format is specified to <b>UTF8</b> .   |

[Table 20-192](#) describes the request parameters.

**Table 20-192** Request parameters

| Parameter          | Mandatory | Type    | Description                                                                                                                                                                    |
|--------------------|-----------|---------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| cluster_name       | Yes       | String  | Name of a new cluster. The name can contain only digits, letters, and underscores (_), but cannot contain only digits or start with an underscore (_).                         |
| description        | No        | String  | Description of a cluster.                                                                                                                                                      |
| cu_count           | Yes       | Integer | Number of compute units (units to be billed) bound to a cluster. You can select 16 CUs, 64 CUs, or 256 CUs. If you need a larger quota, contact the DLI service administrator. |
| cidr_in_vpc        | No        | String  | VPC CIDR block                                                                                                                                                                 |
| cidr_in_mngtsubnet | No        | String  | CIDR block of the management subnet                                                                                                                                            |

| Parameter      | Mandatory | Type   | Description               |
|----------------|-----------|--------|---------------------------|
| cidr_in_subnet | No        | String | Special subnet CIDR block |

## Response

- Return code  
Code 201 is returned if the operation is successful.
- Response parameter  
None

## Example

- Example request

```
{ "cluster_name": "cluster1", "description": "test cluster", "cu_count": 16}
```
- Example response (successful request)  
None

 NOTE

If an error occurs when this API is invoked, the system does not return the result similar to the preceding example, but returns the error code and error information. For details, see [Error Codes](#).

## 20.14.2 Deleting a Cluster (Discarded)

### Function

This API is used to delete a specified cluster.

 NOTE

This API has been discarded and is not recommended.

### URI

- URI format  
`DELETE /v2.0/{project_id}/clusters/{cluster_name}`
- Parameter description

**Table 20-193** URI parameters

| Parameter    | Mandatory | Description                                                                                                                               |
|--------------|-----------|-------------------------------------------------------------------------------------------------------------------------------------------|
| project_id   | Yes       | Project ID, which is used for resource isolation. For details about how to obtain its value, see <a href="#">Obtaining a Project ID</a> . |
| cluster_name | Yes       | Cluster name.                                                                                                                             |

## Request

None

## Response

- Return code  
Code 200 is returned if the operation is successful.
- Response parameters  
None

## Example

- Example request  
None
- Example response (successful request)  
None

 **NOTE**

If an error occurs when this API is invoked, the system does not return the result similar to the preceding example, but returns the error code and error information. For details, see [Error Codes](#).

## 20.14.3 Querying Information of a Specified Cluster (Discarded)

### Function

This API is used to query information about a specified cluster, including the name, description, and number of bound computing resources.

 **NOTE**

This API has been discarded and is not recommended.

### URI

- URI format  
`GET /v2.0/{project_id}/clusters/{cluster_name}`

- Parameter description

**Table 20-194** URI parameters

| Parameter    | Mandatory | Description                                                                                                                               |
|--------------|-----------|-------------------------------------------------------------------------------------------------------------------------------------------|
| project_id   | Yes       | Project ID, which is used for resource isolation. For details about how to obtain its value, see <a href="#">Obtaining a Project ID</a> . |
| cluster_name | Yes       | Cluster name                                                                                                                              |

## Request

None

## Response

- Return code  
Code 200 is returned if the operation is successful.
- Response parameters  
[Table 20-195](#) describes the response parameters.

**Table 20-195** Response parameters

| Parameter     | Mandatory | Type    | Description                                                                                                      |
|---------------|-----------|---------|------------------------------------------------------------------------------------------------------------------|
| create_time   | Yes       | Long    | Time when a cluster is created. The timestamp is expressed in milliseconds.                                      |
| description   | No        | String  | Description of a cluster.                                                                                        |
| cu_count      | Yes       | Integer | Number of CUs that are bound to a cluster.                                                                       |
| owner         | Yes       | String  | User who creates the cluster.                                                                                    |
| cluster_name  | Yes       | String  | Cluster name                                                                                                     |
| status        | Yes       | String  | Cluster status. For details, see <a href="#">Table 20-196</a> .                                                  |
| resource_mode | Yes       | Integer | Cluster type. <ul style="list-style-type: none"><li>• 0: Shared cluster</li><li>• 1: Dedicated cluster</li></ul> |

**Table 20-196** Cluster status

| Parameter  | Description                                                                                                                                                             |
|------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CREATING   | The cluster is being created and is unavailable now.                                                                                                                    |
| AVAILABLE  | The cluster is available.                                                                                                                                               |
| SUSPENDED  | The cluster is suspended because it is not used for a long time. You can reactivate the cluster by using the <a href="#">Creating a Batch Processing Job</a> interface. |
| RECOVERING | The cluster is being recovered from the suspending state. The cluster is available again after its status changes to <b>AVAILABLE</b> .                                 |

## Example

- Example request  
None
- Example response (successful request)

```
{
 "create_time": 1508143955000,
 "cu_count": 16,
 "description": "test",
 "owner": "tenant1",
 "cluster_name": "cluster1",
 "status": "AVAILABLE",
 "resource_mode": 0
}
```

### NOTE

If an error occurs when this API is invoked, the system does not return the result similar to the preceding example, but returns the error code and error information. For details, see [Error Codes](#).

## 20.14.4 Querying All Cluster Information (Discarded)

### Function

This API is used to list all clusters under the project.

### NOTE

This API has been discarded and is not recommended.

### URI

- URI format  
GET/v2.0/{project\_id}/clusters
- Parameter description

**Table 20-197** URI parameter

| Parameter  | Mandatory | Description                                                                                                                               |
|------------|-----------|-------------------------------------------------------------------------------------------------------------------------------------------|
| project_id | Yes       | Project ID, which is used for resource isolation. For details about how to obtain its value, see <a href="#">Obtaining a Project ID</a> . |

## Request

None

## Response

- Return code  
Code 200 is returned if the operation is successful.
- Response parameters

**Table 20-198** Response parameters

| Parameter     | Mandatory | Type    | Description                                                                                                  |
|---------------|-----------|---------|--------------------------------------------------------------------------------------------------------------|
| create_time   | Yes       | Long    | Time when a cluster is created                                                                               |
| description   | No        | String  | Description of a cluster.                                                                                    |
| cu_count      | Yes       | Integer | Number of CUs that are bound to a cluster.                                                                   |
| owner         | Yes       | String  | User who creates the cluster.                                                                                |
| cluster_name  | Yes       | String  | Cluster name                                                                                                 |
| status        | Yes       | String  | Cluster status. For details, see <a href="#">Table 20-196</a> .                                              |
| resource_mode | Yes       | Integer | Cluster type. <ul style="list-style-type: none"><li>0: Shared cluster</li><li>1: Dedicated cluster</li></ul> |

## Example

- Example request  
None
- Example response (successful request)

```
{
 "clusters": [
 {
 "create_time": 1508143955000,
 "cu_count": 16,
 "description": "A shared cluster for data processing.",
 "owner": "user123",
 "resource_mode": 0,
 "status": "Normal"
 }
]
}
```

```
 "description": "test",
 "owner": "tenant1",
 "cluster_name": "cluster1",
 "status": "AVAILABLE",
 "resource_mode": 0
 }
]
```

 NOTE

If an error occurs when this API is invoked, the system does not return the result similar to the preceding example, but returns the error code and error information. For details, see [Error Codes](#).

## 20.15 APIs Related to Flink Jobs (Discarded)

### 20.15.1 Querying Job Monitoring Information (Discarded)

#### Function

This API is used to query job monitoring information. You can query monitoring information about multiple jobs at the same time.

 NOTE

This API has been discarded and is not recommended.

#### URI

- URI format  
POST /v1.0/{project\_id}/streaming/jobs/metrics
- Parameter description

**Table 20-199** URI parameter

| Parameter  | Mandatory | Type   | Description                                                                                                                               |
|------------|-----------|--------|-------------------------------------------------------------------------------------------------------------------------------------------|
| project_id | Yes       | String | Project ID, which is used for resource isolation. For details about how to obtain its value, see <a href="#">Obtaining a Project ID</a> . |

#### Request

**Table 20-200** Request parameter

| Parameter | Mandatory | Type          | Description      |
|-----------|-----------|---------------|------------------|
| job_ids   | Yes       | Array of Long | List of job IDs. |

## Response

**Table 20-201** Response parameters

| Parameter  | Mandatory | Type    | Description                                                                   |
|------------|-----------|---------|-------------------------------------------------------------------------------|
| is_success | No        | Boolean | Indicates whether the request is successful.                                  |
| message    | No        | String  | Message content.                                                              |
| metrics    | No        | Object  | Information about a job list. For details, see <a href="#">Table 20-202</a> . |

**Table 20-202** payload parameters

| Parameter | Mandatory | Type             | Description                                                                            |
|-----------|-----------|------------------|----------------------------------------------------------------------------------------|
| jobs      | No        | Array of objects | Monitoring information about all jobs. For details, see <a href="#">Table 20-203</a> . |

**Table 20-203** jobs parameters

| Parameter | Mandatory | Type   | Description                                                                                              |
|-----------|-----------|--------|----------------------------------------------------------------------------------------------------------|
| job_id    | No        | Long   | Job ID.                                                                                                  |
| metrics   | No        | Object | All input and output monitoring information about a job. For details, see <a href="#">Table 20-204</a> . |

**Table 20-204** metrics parameters

| Parameter       | Mandatory | Type             | Description                                                         |
|-----------------|-----------|------------------|---------------------------------------------------------------------|
| sources         | No        | Array of objects | All source streams. For details, see <a href="#">Table 20-205</a> . |
| sinks           | No        | Array of objects | All sink streams. For details, see <a href="#">Table 20-205</a> .   |
| total_read_rate | No        | Double           | Total read rate.                                                    |

| Parameter        | Mandatory | Type   | Description       |
|------------------|-----------|--------|-------------------|
| total_write_rate | No        | Double | Total write rate. |

**Table 20-205 source/sinks parameters**

| Parameter         | Mandatory | Type   | Description                        |
|-------------------|-----------|--------|------------------------------------|
| name              | No        | String | Name of the source or sink stream. |
| records           | No        | Long   | Total number of records.           |
| corrupted_records | No        | Long   | Number of dirty data records.      |

## Example

- Example request

```
{
 "job_ids": [298765, 298766]
}
```

- Example response

```
{
 "is_success": true,
 "message": "Message content",
 "metrics": {
 "jobs": [
 {
 "job_id": 0,
 "metrics": {
 "sources": [
 {
 "name": "Source: KafKa_6070_KAFKA_SOURCE",
 "records": 0,
 "corrupted_records": 0
 }
],
 "sinks": [
 {
 "name": "Source: KafKa_6070_KAFKA_SOURCE",
 "records": 0,
 "corrupted_records": 0
 }
],
 "total_read_rate": 100,
 "total_write_rate": 100
 }
 }
]
 }
}
```

## Status Codes

**Table 20-206** Status codes

| Status Code | Description                                       |
|-------------|---------------------------------------------------|
| 200         | The query of job monitoring information succeeds. |
| 400         | The input parameter is invalid.                   |

## Error Codes

If an error occurs when this API is invoked, the system does not return the result similar to the preceding example, but returns the error code and error information. For details, see [Error Codes](#).

## 20.15.2 Granting OBS Permissions to DLI

### Function

This API is used to grant DLI the permission to access OBS buckets for saving job checkpoints and run logs.

This API has been discarded and is not recommended.

### URI

- URI format  
POST /v1.0/{project\_id}/dli/obs-authorize
- Parameter description

**Table 20-207** URI parameter

| Parameter  | Mandatory | Type   | Description                                                                                                                               |
|------------|-----------|--------|-------------------------------------------------------------------------------------------------------------------------------------------|
| project_id | Yes       | String | Project ID, which is used for resource isolation. For details about how to obtain its value, see <a href="#">Obtaining a Project ID</a> . |

## Request

**Table 20-208** Request parameter

| Parameter   | Mandatory | Type             | Description          |
|-------------|-----------|------------------|----------------------|
| obs_buckets | Yes       | Array of Strings | List of OBS buckets. |

## Response

**Table 20-209** Response parameters

| Parameter  | Mandatory | Type    | Description                                                                                                          |
|------------|-----------|---------|----------------------------------------------------------------------------------------------------------------------|
| is_success | No        | Boolean | Whether the request is successfully executed. Value <b>true</b> indicates that the request is successfully executed. |
| message    | No        | String  | Message content.                                                                                                     |

## Example Request

Grant DLI the permission to access the OBS bucket **bucket1** so that DLI can save job checkpoints and run logs to the bucket.

```
{
 "obs_buckets": [
 "bucket1"
]
}
```

## Example Response

```
{
 "is_success": "true",
 "message": "The following OBS bucket is authorized successfully, bucket1."
}
```

## Status Codes

**Table 20-210** describes the status code.

**Table 20-210** Status codes

| Status Code | Description             |
|-------------|-------------------------|
| 200         | Authorization succeeds. |

| Status Code | Description    |
|-------------|----------------|
| 400         | Request error. |

## Error Codes

If an error occurs when this API is invoked, the system does not return the result similar to the preceding example, but returns the error code and error information. For details, see [Error Codes](#).

# 21 Public Parameters

## 21.1 Status Codes

[Table 21-1](#) describes status codes.

**Table 21-1** Status codes

| Status Code | Message                       | Description                                                                                                                                                                             |
|-------------|-------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 100         | Continue                      | The client should continue with its request. This interim response is used to inform the client that part of the request has been received and has not yet been rejected by the server. |
| 101         | Switching Protocols           | The protocol should be switched. The protocol can only be switched to a newer protocol. For example, the current HTTP protocol is switched to a later version of HTTP.                  |
| 200         | Success                       | The request has been fulfilled. This indicates that the server has provided the requested web page.                                                                                     |
| 201         | Created                       | The request is successful and the server has created a new resource.                                                                                                                    |
| 202         | Accepted                      | The request has been accepted, but the processing has not been completed.                                                                                                               |
| 203         | Non-Authoritative Information | Unauthorized information. The request is successful.                                                                                                                                    |

| Status Code | Message           | Description                                                                                                                                                                                                                       |
|-------------|-------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 204         | NoContent         | The server has successfully processed the request, but does not return any content.<br>The status code is returned in response to an HTTP OPTIONS request.                                                                        |
| 205         | Reset Content     | The server has successfully processed the request, but does not return any content.                                                                                                                                               |
| 206         | Partial Content   | The server has successfully processed the partial GET request.                                                                                                                                                                    |
| 300         | Multiple Choices  | There are multiple options for the location of the requested resource. The response contains a list of resource characteristics and addresses from which a user terminal (such as a browser) can choose the most appropriate one. |
| 301         | Moved Permanently | The requested resource has been assigned a new permanent URI, and the new URI is contained in the response.                                                                                                                       |
| 302         | Found             | The requested resource resides temporarily under a different URI.                                                                                                                                                                 |
| 303         | See Other         | The response to the request can be found under a different URI, and should be retrieved using a GET or POST method.                                                                                                               |
| 304         | Not Modified      | The requested resource has not been modified. In such a case, there is no need to retransmit the resource since the client still has a previously-downloaded copy.                                                                |
| 305         | Use Proxy         | The requested resource is available only through a proxy.                                                                                                                                                                         |
| 306         | Unused            | The HTTP status code is no longer used.                                                                                                                                                                                           |
| 400         | BadRequest        | Invalid request.<br>The client should not repeat the request without modifications.                                                                                                                                               |
| 401         | Unauthorized      | This status code is returned after the client provides the authentication information, indicating that the authentication information is incorrect or invalid.                                                                    |
| 402         | Payment Required  | This status code is reserved for future use.                                                                                                                                                                                      |

| Status Code | Message                       | Description                                                                                                                                                                                                                                                                           |
|-------------|-------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 403         | Forbidden                     | <p>The server has received the request and understood it, but the server is refusing to respond to it.</p> <p>The client should modify the request instead of re-initiating it.</p>                                                                                                   |
| 404         | NotFound                      | <p>The requested resource cannot be found.</p> <p>The client should not repeat the request without modifications.</p>                                                                                                                                                                 |
| 405         | MethodNotAllowed              | <p>A request method is not supported for the requested resource.</p> <p>The client should not repeat the request without modifications.</p>                                                                                                                                           |
| 406         | Not Acceptable                | <p>The server could not fulfill the request according to the content characteristics of the request.</p>                                                                                                                                                                              |
| 407         | Proxy Authentication Required | <p>This code is similar to 401, but indicates that the client must first authenticate itself with the proxy.</p>                                                                                                                                                                      |
| 408         | Request Time-out              | <p>The server has timed out waiting for the request.</p> <p>The client may repeat the request without modifications at any time later.</p>                                                                                                                                            |
| 409         | Conflict                      | <p>The request could not be processed due to a conflict in the request.</p> <p>This status code indicates that the resource that the client is attempting to create already exists, or that the request has failed to be processed because of the update of the conflict request.</p> |
| 410         | Gone                          | <p>The requested resource cannot be found.</p> <p>The status code indicates that the requested resource has been deleted permanently.</p>                                                                                                                                             |
| 411         | Length Required               | <p>The server is refusing to process the request without a defined <b>Content-Length</b>.</p>                                                                                                                                                                                         |
| 412         | Precondition Failed           | <p>The server does not meet one of the preconditions that the requester puts on the request.</p>                                                                                                                                                                                      |

| Status Code | Message                         | Description                                                                                                                                                                                                                                                                                                                                                                    |
|-------------|---------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 413         | Request Entity Too Large        | The server is refusing to process a request because the request entity is too large for the server to process. The server may disable the connection to prevent the client from sending requests consecutively. If the server is only temporarily unable to process the request, the response will contain a <b>Retry-After</b> header field.                                  |
| 414         | Request-URI Too Large           | The Request-URI is too long for the server to process.                                                                                                                                                                                                                                                                                                                         |
| 415         | Unsupported Media Type          | The server does not support the media type in the request.                                                                                                                                                                                                                                                                                                                     |
| 416         | Requested range not satisfiable | The requested range is invalid.                                                                                                                                                                                                                                                                                                                                                |
| 417         | Expectation Failed              | The server has failed to meet the requirements of the <b>Expect</b> request-header field.                                                                                                                                                                                                                                                                                      |
| 422         | UnprocessableEntity             | The request was well-formed but was unable to be followed due to semantic errors.                                                                                                                                                                                                                                                                                              |
| 429         | TooManyRequests                 | The client sends excessive requests to the server within a given time (exceeding the limit on the access frequency of the client), or the server receives excessive requests within a given time (beyond its processing capability). In this case, the client should resend the request after the time specified in the <b>Retry-After</b> header of the response has elapsed. |
| 500         | InternalServerError             | The server is able to receive the request but unable to understand it.                                                                                                                                                                                                                                                                                                         |
| 501         | Not Implemented                 | The server does not support the requested function.                                                                                                                                                                                                                                                                                                                            |
| 502         | Bad Gateway                     | The server was acting as a gateway or proxy and received an invalid request from the remote server.                                                                                                                                                                                                                                                                            |
| 503         | ServiceUnavailable              | The requested service is invalid.<br>The client should not repeat the request without modifications.                                                                                                                                                                                                                                                                           |
| 504         | ServerTimeout                   | The request cannot be fulfilled within a given time. This status code is returned to the client only when the <b>Timeout</b> parameter is specified in the request.                                                                                                                                                                                                            |

| Status Code | Message                    | Description                                                                |
|-------------|----------------------------|----------------------------------------------------------------------------|
| 505         | HTTP Version not supported | The server does not support the HTTP protocol version used in the request. |

## 21.2 Error Codes

If an error occurs in API calling, no result is returned. Identify the cause of error based on the error codes of each API. If an error occurs in API calling, HTTP status code 4xx or 5xx is returned. The response body contains the specific error code and information. If you are unable to identify the cause of an error, contact technical personnel and provide the error code so that we can help you solve the problem as soon as possible.

### Format of an Error Response Body

If an error occurs during API calling, the system returns an error code and a message to you. The following shows the format of an error response body:

```
{
 "error_msg": "The format of message is error",
 "error_code": "DLI.0001"
}
```

In the preceding information, **error\_code** is an error code, and **error\_msg** describes the error.

**Table 21-2** Exceptions

| Parameter  | Parameter Type | Description                                               |
|------------|----------------|-----------------------------------------------------------|
| error_code | String         | Error code. For details, see <a href="#">Table 21-3</a> . |
| error_msg  | String         | Error details.                                            |

### Error Code Description

If an error code starting with **APIGW** is returned after you call an API, rectify the fault by referring to the instructions provided in [Error Codes](#).

**Table 21-3** Error codes

| Status Code | Error Code | Error Message                 |
|-------------|------------|-------------------------------|
| 400         | DLI.0001   | Parameter check errors occur. |
| 400         | DLI.0002   | The object does not exist.    |

| Status Code | Error Code | Error Message                        |
|-------------|------------|--------------------------------------|
| 400         | DLI.0003   | SQL permission verification fails.   |
| 400         | DLI.0004   | SQL syntax parsing errors occur.     |
| 400         | DLI.0005   | SQL semantics parsing errors occur.  |
| 400         | DLI.0006   | The object exists.                   |
| 400         | DLI.0007   | The operation is not supported.      |
| 400         | DLI.0008   | Metadata errors occur.               |
| 400         | DLI.0009   | System restrictions.                 |
| 400         | DLI.0011   | The file permission check fails.     |
| 400         | DLI.0012   | Resource objects are unavailable.    |
| 401         | DLI.0013   | User authentication errors occur.    |
| 401         | DLI.0014   | Service authentication errors occur. |
| 400         | DLI.0015   | Token parsing error.                 |
| 400         | DLI.0016   | The identity and role are incorrect. |
| 400         | DLI.0018   | Data conversion errors occur.        |
| 400         | DLI.0019   | The task times out.                  |
| 400         | DLI.0100   | The result expires.                  |
| 404         | DLI.0023   | No related resources were found.     |
| 400         | DLI.0999   | Server-side errors occur.            |
| 400         | DLI.1028   | The quota is insufficient.           |

## Example

If no queue named **testqueue** exists, the following error message is displayed when you submit a job submission request:

```
{
 "error_code": "DLI.0002",
 "error_msg": "There is no queue named testqueue"
}
```

## 21.3 Obtaining a Project ID

### Scenario

A project ID is required for some URLs when an API is called. Obtain a project ID using either of the following methods:

- [Obtain the Project ID by Calling an API](#)
- [Obtain the Project ID from the Console](#)

## Obtaining a Project ID by Calling an API

You can obtain a project ID by calling the API used to [Querying Project Information](#).

The API for obtaining a project ID is **GET https://{{Endpoint}}/v3/projects**.  
**{Endpoint}** indicates the endpoint of IAM, which can be obtained from [Regions and Endpoints](#).

```
{
 "projects": [
 {
 "domain_id": "65382450e8f64ac0870cd180d14e684b",
 "is_domain": false,
 "parent_id": "65382450e8f64ac0870cd180d14e684b",
 "name": "project_name",
 "description": "",
 "links": {
 "next": null,
 "previous": null,
 "self": "https://www.example.com/v3/projects/a4a5d4098fb4474fa22cd05f897d6b99"
 },
 "id": "a4a5d4098fb4474fa22cd05f897d6b99",
 "enabled": true
 }
],
 "links": {
 "next": null,
 "previous": null,
 "self": "https://www.example.com/v3/projects"
 }
}
```

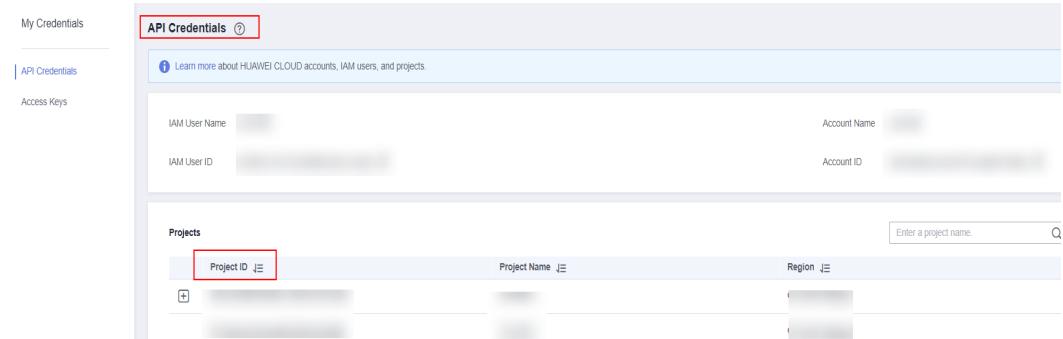

## Obtaining a Project ID from the Management Console

To obtain a project ID from the Console, perform the following operations:

1. Log in to the management console.
2. Hover the mouse pointer over the username in the upper right corner and choose **My Credentials** from the drop-down list.

On the **Projects** tab of the **API Credentials** page, view project IDs.

**Figure 21-1** Viewing the project ID

## 21.4 Obtaining an Account ID

An account ID (domain-id) is required for some URLs when an API is called. To obtain an account ID, perform the following operations:

1. Log in to the management console.
2. Hover the cursor on the username in the upper right corner and select **My Credentials** from the drop-down list.
3. On the **API Credentials** page, view **Account ID**.

**Figure 21-2** Obtaining an account ID
