Notice

The purchased products, services and features are stipulated by the contract made between Huawei Cloud and the customer. All or part of the products, services and features described in this document may not be within the purchase scope or the usage scope. Unless otherwise specified in the contract, all statements, information, and recommendations in this document are provided "AS IS" without warranties, guarantees or representations of any kind, either express or implied.

The information in this document is subject to change without notice. Every effort has been made in the preparation of this document to ensure accuracy of the contents, but all statements, information, and recommendations in this document do not constitute a warranty of any kind, express or implied.

Contents

1 Before You Start.....	1
2 API Overview.....	4
3 Selecting an API Version.....	7
4 Calling APIs.....	8
4.1 Making an API Request.....	8
4.2 Authentication.....	12
4.3 Response.....	13
5 APIs (V3).....	16
5.1 API Version.....	16
5.1.1 Querying API Versions.....	16
5.2 Quota.....	20
5.2.1 Querying Quotas.....	20
5.2.2 Querying Quota Usage.....	29
5.3 AZ.....	35
5.3.1 Querying AZs.....	36
5.4 Load Balancer Flavor.....	42
5.4.1 Querying Flavors.....	42
5.4.2 Viewing the Details of a Flavor.....	54
5.5 Reserved IP Address.....	62
5.5.1 Calculating the Number of Reserved IP Addresses.....	62
5.6 Load Balancer.....	75
5.6.1 Creating a Load Balancer.....	75
5.6.2 Batch Creating Load Balancers.....	120
5.6.3 Copying a Load Balancer.....	149
5.6.4 Querying Load Balancers.....	159
5.6.5 Viewing the Details of a Load Balancer.....	192
5.6.6 Updating a Load Balancer.....	208
5.6.7 Deleting a Load Balancer.....	238
5.6.8 Deleting a Load Balancer and Its Associated Resources.....	242
5.6.9 Deleting a Load Balancer and Its Associated Resources (Including EIPs).....	247
5.6.10 Batch Deleting Load Balancers.....	253
5.6.11 Querying the Status Tree of a Load Balancer.....	255

5.6.12 Querying the Topology of a Load Balancer.....	267
5.6.13 Querying the IP Addresses Used by a Load Balancer to Forward Internal Requests.....	281
5.6.14 Deploying a Load Balancer in Additional AZs.....	287
5.6.15 Removing a Load Balancer from AZs.....	304
5.6.16 Upgrading a Load Balancer.....	321
5.6.17 Configuring User-defined Domain Name Resolution for a Load Balancer.....	331
5.6.18 Configuring System-defined Domain Name Resolution for a Load Balancer.....	340
5.6.19 Querying the Domain Name Resolution Information of a Load Balancer.....	348
5.6.20 Enabling Domain Name Resolution for IP Addresses.....	351
5.6.21 Disabling Domain Name Resolution for IP Addresses.....	355
5.7 Certificate.....	359
5.7.1 Creating a Certificate.....	359
5.7.2 Querying Certificates.....	376
5.7.3 Querying the Details of a Certificate.....	392
5.7.4 Updating a Certificate.....	401
5.7.5 Deleting a Certificate.....	413
5.7.6 Batch Deleting Certificates.....	417
5.7.7 Enabling or Disabling the Private Key Feature.....	420
5.7.8 Querying Whether the Private Key Feature Is Enabled.....	424
5.8 Security Policy.....	429
5.8.1 Creating a Custom Security Policy.....	429
5.8.2 Querying Custom Security Policies.....	438
5.8.3 Querying the Details of a Custom Security Policy.....	447
5.8.4 Updating a Custom Security Policy.....	453
5.8.5 Deleting a Custom Security Policy.....	461
5.8.6 Querying System Security Policies.....	465
5.9 IP Address Group.....	471
5.9.1 Creating an IP Address Group.....	471
5.9.2 Querying IP Address Groups.....	480
5.9.3 Querying the Details of an IP Address Group.....	490
5.9.4 Updating an IP Address Group.....	496
5.9.5 Deleting an IP Address Group.....	504
5.9.6 Updating IP Addresses in an IP Address Group.....	508
5.9.7 Deleting IP Addresses from an IP Address Group.....	517
5.9.8 Querying the Listeners Associated with an IP Address Group.....	524
5.10 Listener.....	529
5.10.1 Adding a Listener.....	529
5.10.2 Copying a Listener.....	587
5.10.3 Querying Listeners.....	597
5.10.4 Viewing the Details of a Listener.....	631
5.10.5 Updating a Listener.....	653
5.10.6 Deleting a Listener.....	703

5.10.7 Deleting a Listener and Its Associated Resources.....	707
5.10.8 Batch Deleting Listeners.....	710
5.11 Backend Server Group.....	712
5.11.1 Creating a Backend Server Group.....	712
5.11.2 Querying Backend Server Groups.....	754
5.11.3 Querying the Details of a Backend Server Group.....	780
5.11.4 Updating a Backend Server Group.....	796
5.11.5 Deleting a Backend Server Group.....	827
5.11.6 Deleting a Backend Server Group and Associated Resources.....	831
5.11.7 Batch Deleting Backend Server Groups.....	835
5.12 Backend Server.....	837
5.12.1 Adding a Backend Server.....	837
5.12.2 Batch Adding Backend Servers.....	858
5.12.3 Querying Backend Servers in a Backend Server Group.....	874
5.12.4 Querying Backend Servers in a Project.....	893
5.12.5 Viewing the Details of a Backend Server.....	913
5.12.6 Updating a Backend Server.....	924
5.12.7 Batch Updating Backend Servers.....	939
5.12.8 Removing a Backend Server.....	954
5.12.9 Batch Removing Backend Servers.....	958
5.12.10 Creating a Backend Server Check Task.....	968
5.12.11 Querying the Results of a Backend Server Check Task.....	974
5.13 Health Check.....	983
5.13.1 Configuring a Health Check.....	983
5.13.2 Querying Health Checks.....	998
5.13.3 Viewing the Details of a Health Check.....	1012
5.13.4 Updating a Health Check.....	1019
5.13.5 Deleting a Health Check.....	1031
5.14 Forwarding Policy.....	1035
5.14.1 Adding a Forwarding Policy.....	1035
5.14.2 Querying Forwarding Policies.....	1083
5.14.3 Querying the Details of a Forwarding Policy.....	1107
5.14.4 Modifying a Forwarding Policy.....	1124
5.14.5 Deleting a Forwarding Policy.....	1171
5.14.6 Batch Modifying Forwarding Policy Priorities.....	1174
5.15 Forwarding Rule.....	1182
5.15.1 Adding a Forwarding Rule.....	1182
5.15.2 Querying Forwarding Rules.....	1200
5.15.3 Query Forwarding Rules.....	1215
5.15.4 Viewing the Details of a Forwarding Rule.....	1227
5.15.5 Updating a Forwarding Rule.....	1237
5.15.6 Deleting a Forwarding Rule.....	1255

5.16 Active/Standby Backend Server Group.....	1259
5.16.1 Creating an Active/Standby Backend Server Group.....	1259
5.16.2 Querying Active/Standby Backend Server Groups.....	1293
5.16.3 Viewing the Details of an Active/Standby Backend Server Group.....	1319
5.16.4 Deleting an Active/Standby Backend Server Group.....	1337
5.17 Log.....	1341
5.17.1 Creating a Log.....	1341
5.17.2 Querying Logs.....	1347
5.17.3 Viewing the Details of a Log.....	1356
5.17.4 Updating a Log.....	1361
5.17.5 Deleting a Log.....	1366
5.18 Asynchronous Task.....	1370
5.18.1 Querying the Asynchronous Tasks.....	1370
5.18.2 Querying the Status of an Asynchronous Task.....	1379
5.19 Feature Configuration.....	1385
5.19.1 Querying the Feature Configurations of ELB.....	1385
5.19.2 Querying the Feature Configurations of a Load Balancer.....	1391
5.20 Recycle Bin.....	1396
5.20.1 Querying Load Balancers in the Recycle Bin.....	1396
5.20.2 Querying the Recycle Bin Policy.....	1421
5.20.3 Enabling or Disabling Recycle Bin.....	1426
5.20.4 Updating the Recycle Bin Policy.....	1431
5.20.5 Restoring a Load Balancer from the Recycle Bin.....	1437
5.20.6 Permanently Deleting a Load Balancer from the Recycle Bin.....	1442
5.21 Tag Management.....	1446
5.21.1 Batch Adding or Deleting Load Balancer Tags.....	1446
5.21.2 Querying the Tags of All Load Balancers.....	1449
5.21.3 Querying All Tags of a Load Balancer.....	1450
5.21.4 Batch Adding or Deleting Listener Tags.....	1452
5.21.5 Querying the Tags of All Listeners.....	1455
5.21.6 Querying All Tags of a Listener.....	1457
6 APIs (V2).....	1459
6.1 Load Balancer.....	1459
6.1.1 Creating a Load Balancer.....	1459
6.1.2 Querying Load Balancers.....	1468
6.1.3 Querying Details of a Load Balancer.....	1476
6.1.4 Querying the Status Tree of a Load Balancer.....	1481
6.1.5 Updating a Load Balancer.....	1489
6.1.6 Deleting a Load Balancer.....	1496
6.2 Listener.....	1497
6.2.1 Adding a Listener.....	1497
6.2.2 Querying Details of a Listener.....	1511

6.2.3 Querying Listeners.....	1517
6.2.4 Updating a Listener.....	1528
6.2.5 Deleting a Listener.....	1540
6.3 Backend Server Group.....	1541
6.3.1 Adding a Backend Server Group.....	1541
6.3.2 Querying Backend Server Groups.....	1552
6.3.3 Querying Details of a Backend Server Group.....	1561
6.3.4 Updating a Backend Server Group.....	1567
6.3.5 Deleting a Backend Server Group.....	1576
6.4 Backend Server.....	1577
6.4.1 Adding a Backend Server.....	1577
6.4.2 Querying Backend Servers.....	1581
6.4.3 Querying Details of a Backend Server.....	1587
6.4.4 Updating a Backend Server.....	1590
6.4.5 Removing a Backend Server.....	1594
6.5 Health Check.....	1595
6.5.1 Configuring a Health Check.....	1595
6.5.2 Querying Health Checks.....	1602
6.5.3 Querying Health Check Details.....	1609
6.5.4 Updating a Health Check.....	1612
6.5.5 Deleting a Health Check.....	1618
6.6 Forwarding Policy.....	1619
6.6.1 Adding a Forwarding Policy.....	1619
6.6.2 Querying Forwarding Policies.....	1626
6.6.3 Querying Details of a Forwarding Policy.....	1632
6.6.4 Updating a Forwarding Policy.....	1635
6.6.5 Deleting a Forwarding Policy.....	1639
6.7 Forwarding Rule.....	1639
6.7.1 Adding a Forwarding Rule.....	1640
6.7.2 Querying Forwarding Rules.....	1645
6.7.3 Querying Details of a Forwarding Rule.....	1650
6.7.4 Updating a Forwarding Rule.....	1653
6.7.5 Deleting a Forwarding Rule.....	1657
6.8 Whitelist.....	1658
6.8.1 Adding a Whitelist.....	1658
6.8.2 Querying Details of a Whitelist.....	1661
6.8.3 Querying Whitelists.....	1662
6.8.4 Updating a Whitelist.....	1665
6.8.5 Deleting a Whitelist.....	1668
6.9 Certificate.....	1669
6.9.1 Creating a Certificate.....	1669
6.9.2 Querying Certificates.....	1675

6.9.3 Querying Details of a Certificate.....	1684
6.9.4 Updating a Certificate.....	1687
6.9.5 Deleting a Certificate.....	1694
7 APIs (OpenStack).....	1696
7.1 Tag.....	1696
7.1.1 Adding a Tag to a Load Balancer.....	1696
7.1.2 Batch Adding Load Balancer Tags.....	1698
7.1.3 Batch Deleting Load Balancer Tags.....	1700
7.1.4 Querying All Tags of a Load Balancer.....	1703
7.1.5 Querying the Tags of All Load Balancers.....	1704
7.1.6 Querying Load Balancers by Tag.....	1706
7.1.7 Deleting a Tag from a Load Balancer.....	1711
7.1.8 Adding a Tag to a Listener.....	1712
7.1.9 Batch Adding Tags to a Listener.....	1714
7.1.10 Batch Deleting Tags from a Listener.....	1716
7.1.11 Querying All Tags of a Listener.....	1718
7.1.12 Querying the Tags of All Listeners.....	1720
7.1.13 Querying Listeners by Tag.....	1722
7.1.14 Deleting a Tag from a Listener.....	1727
7.1.15 Status Codes.....	1728
8 Examples.....	1731
8.1 Creating a Dedicated Load Balancer and Binding a New EIP to It.....	1731
8.2 Adding a Listener to a Dedicated Load Balancer.....	1733
8.3 Deleting a Dedicated Load Balancer.....	1734
8.4 Creating a Public Network (Shared) Load Balancer.....	1737
8.5 Querying the ID of an ECS Used as a Backend Server.....	1742
9 Permissions and Supported Actions.....	1744
9.1 Introduction.....	1744
9.2 Supported Actions (V2).....	1745
9.2.1 Load Balancer.....	1745
9.2.2 Listener.....	1746
9.2.3 Backend Server Group.....	1747
9.2.4 Backend Server.....	1747
9.2.5 Health Check.....	1748
9.2.6 Forwarding Policy.....	1749
9.2.7 Forwarding Rule.....	1750
9.2.8 Whitelist.....	1750
9.2.9 SSL Certificate.....	1751
9.2.10 Quota.....	1752
9.2.11 Tag.....	1752
9.2.12 Precautions for API Permissions.....	1753

9.3 Supported Actions (V3).....	1754
9.3.1 Load Balancer.....	1754
9.3.2 Listener.....	1755
9.3.3 Backend Server Group.....	1755
9.3.4 Backend Server.....	1756
9.3.5 Health Check.....	1757
9.3.6 Forwarding Policy.....	1758
9.3.7 Forwarding Rule.....	1758
9.3.8 IP Address Group.....	1759
9.3.9 Certificate.....	1760
9.3.10 Security Policy.....	1761
9.3.11 Quota.....	1762
9.3.12 API Version.....	1763
9.3.13 Availability Zone.....	1763
9.3.14 Load Balancer Flavor.....	1763
9.3.15 Precautions for API Permissions.....	1763
10 Historical APIs.....	1765
10.1 Shared Load Balancer APIs (OpenStack) (Discarded).....	1765
10.1.1 Load Balancer.....	1765
10.1.1.1 Creating a Load Balancer.....	1765
10.1.1.2 Querying Load Balancers.....	1776
10.1.1.3 Querying Details of a Load Balancer.....	1782
10.1.1.4 Querying the Status Tree of a Load Balancer.....	1785
10.1.1.5 Updating a Load Balancer.....	1793
10.1.1.6 Deleting a Load Balancer.....	1797
10.1.2 Listener.....	1798
10.1.2.1 Adding a Listener.....	1798
10.1.2.2 Querying Listeners.....	1807
10.1.2.3 Querying Details of a Listener.....	1818
10.1.2.4 Updating a Listener.....	1821
10.1.2.5 Deleting a Listener.....	1828
10.1.3 Backend Server Group.....	1829
10.1.3.1 Adding a Backend Server Group.....	1829
10.1.3.2 Querying Backend Server Groups.....	1840
10.1.3.3 Querying Details of a Backend Server Group.....	1848
10.1.3.4 Updating a Backend Server Group.....	1853
10.1.3.5 Deleting a Backend Server Group.....	1861
10.1.4 Backend Server.....	1862
10.1.4.1 Adding a Backend Server.....	1862
10.1.4.2 Querying Backend Servers.....	1867
10.1.4.3 Querying Details of a Backend Server.....	1872
10.1.4.4 Updating a Backend Server.....	1875

10.1.4.5 Removing a Backend Server.....	1879
10.1.5 Health Check.....	1880
10.1.5.1 Configuring a Health Check.....	1880
10.1.5.2 Querying Health Checks.....	1887
10.1.5.3 Querying Details of a Health Check.....	1895
10.1.5.4 Updating a Health Check.....	1898
10.1.5.5 Deleting a Health Check.....	1904
10.1.6 Forwarding Policy.....	1905
10.1.6.1 Adding a Forwarding Policy.....	1905
10.1.6.2 Querying Forwarding Policies.....	1913
10.1.6.3 Querying Details of a Forwarding Policy.....	1920
10.1.6.4 Updating a Forwarding Policy.....	1922
10.1.6.5 Deleting a Forwarding Policy.....	1926
10.1.7 Forwarding Rule.....	1927
10.1.7.1 Adding a Forwarding Rule.....	1927
10.1.7.2 Querying Forwarding Rules.....	1933
10.1.7.3 Querying Details of a Forwarding Rule.....	1939
10.1.7.4 Updating a Forwarding Rule.....	1942
10.1.7.5 Deleting a Forwarding Rule.....	1946
10.1.8 Whitelist.....	1946
10.1.8.1 Adding a Whitelist.....	1946
10.1.8.2 Querying Whitelists.....	1949
10.1.8.3 Querying Details of a Whitelist.....	1952
10.1.8.4 Updating a Whitelist.....	1954
10.1.8.5 Deleting a Whitelist.....	1956
10.1.9 Certificate.....	1957
10.1.9.1 Creating a Certificate.....	1957
10.1.9.2 Querying Certificates.....	1962
10.1.9.3 Querying Details of a Certificate.....	1971
10.1.9.4 Updating a Certificate.....	1975
10.1.9.5 Deleting a Certificate.....	1980
10.2 Asynchronous Job Query (Discarded).....	1981
10.3 Querying Versions (Discarded).....	1983
10.4 Getting Started.....	1984
10.4.1 Creating a Load Balancer.....	1984
10.4.2 Obtaining a Token.....	1985
10.4.3 Creating a Load Balancer.....	1985
10.4.4 Creating a Public Network Load Balancer.....	1987
10.4.5 Adding a Listener.....	1991
10.4.6 Creating a Backend Server Group.....	1992
10.4.7 Adding Backend Servers.....	1994
10.4.8 Configuring a Health Check.....	1996

10.4.9 Adding a Forwarding Policy..... 1998

10.4.10 Adding a Forwarding Rule..... 2000

10.4.11 Adding a Whitelist..... 2001

10.4.12 Creating an SSL Certificate..... 2002

A Appendix.....2006

A.1 Error Codes..... 2006

A.2 Status Codes..... 2020

A.3 General Information About Shared Load Balancers.....2021

A.3.1 Querying Data in Pages..... 2021

A.3.2 Sequencing Query Results.....2023

A.3.3 Basic Workflow..... 2023

A.4 Obtaining a Project ID..... 2024

1 Before You Start

Welcome to *Elastic Load Balance API Reference*. ELB distributes incoming traffic across backend servers based on the routing rules you define. ELB expands the service capabilities of applications and improves their availability by eliminating single points of failure (SPOFs).

This document describes how to use application programming interfaces (APIs) to perform operations on load balancers and associated resources, such as creating, querying, deleting, and updating a load balancer. For details about all supported operations, see [API Overview](#).

If you plan to access load balancers and associated resources through an API, ensure that you are familiar with ELB concepts. For details, see [Service Overview](#).

ELB supports Representational State Transfer (REST) APIs, allowing you to call APIs using HTTPS. For details about API calling, see [Calling APIs](#).

Additionally, ELB offers software development kits (SDKs) for multiple programming languages. For how to use SDKs, see [Huawei Cloud SDKs](#).

Constraints

- The numbers of load balancers and associated resources that you can create are determined by your quotas. To view or increase the quota, see [What Is Quota?](#)
- For more constraints, see the description of each API.

Endpoints

An endpoint is the **request address** for calling an API. Endpoints vary depending on services and regions. For the endpoints of ELB, see [Regions and Endpoints](#).

Concepts

- Account
An account is created upon successful signing up. The account has full access permissions for all of its cloud services and resources. It can be used to reset user passwords and grant user permissions. The account is a payment entity, which should not be used directly to perform routine management. To ensure

account security, create Identity and Access Management (IAM) users and grant them permissions for routine management.

- User

An IAM user is created by an account in IAM to use cloud services. Each IAM user has its own identity credentials (password and access keys).

API authentication requires information such as the account name, username, and password.

- Region

Regions are divided based on geographical location and network latency. Public services, such as Elastic Cloud Server (ECS), Elastic Volume Service (EVS), Object Storage Service (OBS), Virtual Private Cloud (VPC), Elastic IP (EIP), and Image Management Service (IMS), are shared within the same region. Regions are classified into universal regions and dedicated regions. A universal region provides universal cloud services for common tenants. A dedicated region provides specific services for specific tenants.

For details, see [Region and AZ](#).

- AZ

An AZ comprises of one or more physical data centers equipped with independent ventilation, fire, water, and electricity facilities. Computing, network, storage, and other resources in an AZ are logically divided into multiple clusters. AZs within a region are interconnected using high-speed optical fibers to allow you to build cross-AZ high-availability systems.

- Project

A project corresponds to a region. Default projects are defined to group and physically isolate resources (including computing, storage, and network resources) across regions. Users can be granted permissions in a default project to access all resources under their accounts in the region associated with the project. If you need more refined access control, create subprojects under a default project and create resources in subprojects. Then you can assign users the permissions required to access only the resources in the specific subprojects.

Figure 1-1 Project isolation model

- Enterprise project

Enterprise projects group and manage resources across regions. Resources in different enterprise projects are logically isolated. An enterprise project can contain resources of multiple regions, and resources can be added to or removed from enterprise projects.

For details about enterprise projects and about how to obtain enterprise project IDs, see [Enterprise Management User Guide](#).

2 API Overview

A combination of these types of APIs allows you to use all functions provided by ELB. [Table 2-1](#) describes the APIs provided by ELB.

Table 2-1 ELB APIs

Type	Resource	Description
APIs (Dedicated load balancers)	Load balancer	Creates, updates, and deletes a load balancer, queries the details of a load balancer, lists load balancers, and queries the status tree for a load balancer.
	Certificate	Creates, modifies, and deletes a certificate, queries the details of a certificate, and lists certificates.
	Security policy	Adds, modifies, and deletes a security policy, queries the details of a security policy, and lists security policies.
	IP address group	Configures, modifies, and deletes an IP address group, queries the details of an IP address group, and lists IP address groups.
	Listener	Adds, modifies, and deletes a listener, queries the details of a listener, and lists listeners.
	Backend server group	Adds, modifies, and deletes a backend server group, queries the details of a backend server group, and lists backend server groups.
	Backend server	Adds, modifies, and deletes a backend server, queries the details of a backend server, and lists backend servers.
	Health check	Configures, modifies, and disables a health check, queries the details of a health check, and lists health checks.

Type	Resource	Description
	Forwarding policy	Adds, updates, and deletes a forwarding policy, queries the details of a forwarding policy, lists forwarding policies, and updates forwarding policy priorities.
	Forwarding rule	Adds, modifies, and deletes a forwarding rule, queries the details of a forwarding rule, and lists forwarding rules.
Shared load balancer APIs	Load balancer	Creates, updates, and deletes a load balancer, queries the details of a load balancer, lists load balancers, and queries the status tree for a load balancer.
	Listener	Adds, updates, and deletes a listener, queries the details of a listener, and lists listeners.
	Backend server group	Adds, updates, and deletes a backend server group, queries the details of a backend server group, and lists backend server groups.
	Backend server	Adds, updates, and removes a backend server, queries the details of a backend server, and lists backend servers.
	Health check	Configures, updates, and disables a health check, queries the details of a health check, and lists health checks.
	Forwarding policy	Adds, updates, and deletes a forwarding policy, queries the details of a forwarding policy, and lists forwarding policies.
	Forwarding rule	Adds, updates, and deletes a forwarding rule, queries the details of a forwarding rule, and lists forwarding rules.
	Whitelist	Creates, updates, and deletes a whitelist, queries the details of a whitelist, and lists whitelists.
	SSL certificate	Creates, modifies, deletes a certificate, queries the details of a certificate, and lists certificates.
Shared load balancer APIs (OpenStack)	Load balancer	Creates, updates, and deletes a load balancer, queries the details of a load balancer, lists load balancers, and queries the status tree for a load balancer.
	Listener	Adds, updates, and deletes a listener, queries the details of a listener, and lists listeners.

Type	Resource	Description
	Backend server group	Adds, updates, and deletes a backend server group, queries the details of a backend server group, and lists backend server groups.
	Backend server	Adds, updates, and removes a backend server, queries the details of a backend server, and lists backend servers.
	Health check	Configures, updates, and disables a health check, queries the details of a health check, and lists health checks.
	Forwarding policy	Adds, updates, and deletes a forwarding policy, queries the details of a forwarding policy, and lists forwarding policies.
	Forwarding rule	Adds, updates, and deletes a forwarding rule, queries the details of a forwarding rule, and lists forwarding rules.
	Whitelist	Creates, updates, and deletes a whitelist, queries the details of a whitelist, and lists whitelists.
	SSL certificate	Creates, modifies, deletes a certificate, queries the details of a certificate, and lists certificates.
	Tag	Adds a tag to and deletes a tag from a load balancer, batch adds and deletes load balancer tags, lists all tags of a load balancer, lists tags of all load balancers, queries load balancers by tag, adds a tag to and deletes a tag from a listener, batch adds and deletes listener tags, lists all tags of a listener, lists tags of all listeners, and queries listeners by tag.

3

Selecting an API Version

Elastic Load Balance (ELB) provides two versions of APIs: V2 and V3. For details about how to select an API version, see [Table 3-1](#). For details about the overall APIs and their functions, see [API Overview](#).

Table 3-1 ELB API versions

API Version	Description	Load Balancer Type
V3	- Can be used to perform all operations on dedicated load balancers. - Can be used to perform all operations on existing shared load balancers except for creating new ones.	Dedicated load balancers
V2	Can be used to perform all operations on shared load balancers.	Shared load balancers

4 Calling APIs

4.1 Making an API Request

This section describes the structure of a REST API request, and uses the IAM API for [creating an IAM user](#) as an example to demonstrate how to call an API.

Request URI

A request URI is in the following format:

{URI-scheme}://{Endpoint}/{resource-path}?{query-string}

Although a request URI is included in the request header, most programming languages or frameworks require the request URI to be transmitted separately.

Table 4-1 URI parameter description

Parameter	Description
URI-scheme	Protocol used to transmit requests. All APIs use HTTPS.
Endpoint	Domain name or IP address of the server bearing the REST service. The endpoint varies between services in different regions. It can be obtained from Regions and Endpoints . For example, the endpoint of IAM in region CN-Hong Kong is iam.ap-southeast-1.myhuaweicloud.com .
resource-path	Access path of an API for performing a specified operation. Obtain the path from the URI of an API. For example, the resource-path of the API used to obtain a user token is /v3/auth/tokens .
query-string	Query parameter, which is optional. Ensure that a question mark (?) is included before each query parameter that is in the format of <i>Parameter name=Parameter value</i> . For example, ?limit=10 indicates that a maximum of 10 data records will be displayed.

IAM is a global service. You can create an IAM user using the endpoint of IAM in any region. For example, to create an IAM user in the **CN-Hong Kong** region, obtain the endpoint of IAM (**iam.ap-southeast-1.myhuaweicloud.com**) for this region and the **resource-path** (**/v3.0/OS-USER/users**) in the URI of the API for **creating an IAM user**. Then construct the URI as follows:

```
https://iam.ap-southeast-1.myhuaweicloud.com/v3.0/OS-USER/users
```

Figure 4-1 Example URI

NOTE

To simplify the URI display in this document, each API is provided only with a **resource-path** and a request method. The **URI-scheme** of all APIs is **HTTPS**, and the endpoints of all APIs in the same region are identical.

Request Methods

The HTTP protocol defines the following request methods that can be used to send a request to the server.

Table 4-2 HTTP methods

Method	Description
GET	Requests the server to return specified resources.
PUT	Requests the server to update specified resources.
POST	Requests the server to add resources or perform special operations.
DELETE	Requests the server to delete specified resources, for example, an object.
HEAD	Same as GET except that the server must return only the response header.
PATCH	Requests the server to update partial content of a specified resource. If the resource does not exist, a new resource will be created.

For example, in the case of the API for **creating an IAM user**, the request method is **POST**. An example request is as follows:

```
POST https://iam.ap-southeast-1.myhuaweicloud.com/v3.0/OS-USER/users
```

Request Header

You can also add additional header fields to a request, such as the fields required by a specified URI or HTTP method. For example, to request for the authentication information, add **Content-Type**, which specifies the request body type.

Common request header fields are as follows.

Table 4-3 Common request header fields

Parameter	Description	Mandatory	Example Value
Host	Specifies the server domain name and port number of the resources being requested. The value can be obtained from the URL of the service API. The value is in the format of <i>Hostname:Port number</i> . If the port number is not specified, the default port is used. The default port number for https is 443 .	No This field is mandatory for AK/SK authentication.	code.test.com or code.test.com:443
Content-Type	Specifies the type (or format) of the message body. The default value application/json is recommended. Other values of this field will be provided for specific APIs if any.	Yes	application/json
Content-Length	Specifies the length of the request body. The unit is byte.	No	3495
X-Project-Id	Specifies the project ID. Obtain the project ID by following the instructions in Obtaining a Project ID .	No This field is mandatory for requests that use AK/SK authentication in the Dedicated Cloud (DeC) scenario or multi-project scenario.	e9993fc787d94b6c886cbaa340f9c0f4

Parameter	Description	Mandatory	Example Value
X-Auth-Token	Specifies the user token. It is a response to the API for obtaining a user token (This is the only API that does not require authentication). After the request is processed, the value of X-Subject-Token in the response header is the token value.	No This field is mandatory for token authentication.	The following is part of an example token: MIIPAgYJKoZlhvc NAQcCo...ggg1B BIINPXsidG9rZ

 NOTE

In addition to supporting authentication using tokens, APIs support authentication using AK/SK, which uses SDKs to sign a request. During the signature, the **Authorization** (signature authentication) and **X-Sdk-Date** (time when a request is sent) headers are automatically added in the request.

For more details, see "Authentication Using AK/SK" in [Authentication](#).

The following shows an example request of the API for [creating an IAM user](#) when AK/SK authentication is used:

```
POST https://iam.ap-southeast-1.myhuaweicloud.com/v3.0/OS-USER/users
Content-Type: application/json
X-Sdk-Date: 20240416T095341Z
Authorization: SDK-HMAC-SHA256 Access=*****, SignedHeaders=content-type;host;x-sdk-date,
Signature=*****
```

(Optional) Request Body

This part is optional. A request body is generally sent in a structured format (for example, JSON or XML), which is specified by **Content-Type** in the request header. It is used to transfer content other than the request header. If the request body contains full-width characters, these characters must be coded in UTF-8.

The request body varies depending on APIs. Certain APIs do not require the request body, such as the APIs requested using the GET and DELETE methods.

The following shows an example request (a request body included) of the API for [creating an IAM user](#). You can learn about request parameters and related description from this example. The bold parameters need to be replaced for a real request.

- **accountid**: account ID of an IAM user
- **username**: name of an IAM user
- **email**: email of an IAM user
- *********: login password of an IAM user

```
POST https://iam.ap-southeast-1.myhuaweicloud.com/v3.0/OS-USER/users
Content-Type: application/json
X-Sdk-Date: 20240416T095341Z
```

```
Authorization: SDK-HMAC-SHA256 Access=*****, SignedHeaders=content-type;host;x-sdk-date,  
Signature=*****
```

```
{  
  "user": {  
    "domain_id": "accountid",  
    "name": "username",  
    "password": "*****",  
    "email": "email",  
    "description": "IAM User Description"  
  }  
}
```

If all data required for the API request is available, you can send the request to call the API through [curl](#), [Postman](#), or coding.

4.2 Authentication

Requests for calling an API can be authenticated using either of the following methods:

- AK/SK authentication: Requests are encrypted using AK/SK pairs. AK/SK authentication is recommended because it is more secure than token authentication.
- Token authentication: Requests are authenticated using tokens.

AK/SK Authentication

NOTE

- AK/SK authentication supports API requests with a body not larger than 12 MB. For API requests with a larger body, token authentication is recommended.
- An AK/SK pair can either be permanent or temporary. If it is temporary, the **X-Security-Token** field must be included in the request header. The value is the security token of the temporary AK/SK pair.
- API Gateway checks the time format and compares the request time with the time when API Gateway received the request. If the time difference exceeds 15 minutes, API Gateway will reject the request. So, the local time on the client must be synchronized with the clock server to avoid a large offset in the value of **X-Sdk-Date** in the request header.

In AK/SK authentication, an AK/SK pair is used to sign requests and the signature is then added to the requests for authentication.

- AK: access key ID, which is a unique identifier used in conjunction with a secret access key to sign requests cryptographically.
- SK: secret access key, which is used in conjunction with an AK to sign requests cryptographically. It identifies a request sender and prevents the request from being modified.

In AK/SK authentication, you can use an AK/SK pair to sign requests based on the signature algorithm or using the signing SDK. For details about how to sign requests and use the signing SDK, see [API Request Signing Guide](#).

NOTE

The signing SDK is only used for signing requests and is different from the SDKs provided by services.

Token Authentication

NOTE

- A token remains valid for 24 hours after it is generated. You can cache a token and reuse it for authentication instead of generating a new one each time.
- Before using a token, ensure that it has sufficient time remaining before expiration. Using a near-expiry token may cause API call failures.

A token specifies temporary permissions in a computer system. During API authentication using a token, the token is added to requests to get permissions for calling the API. You can obtain a token by calling the [Obtaining a User Token](#) API.

IMS is a project-level service. When you call the API, set **auth.scope** in the request body to **project**.

```
{
  "auth": {
    "identity": {
      "methods": [
        "password"
      ],
      "password": {
        "user": {
          "name": "username", // IAM user name
          "password": $ADMIN_PASS, // IAM user password. You are advised to store it in ciphertext in
the configuration file or an environment variable and decrypt it when needed to ensure security.
          "domain": {
            "name": "domainname" // Name of the account that the IAM user belongs to
          }
        }
      }
    },
    "scope": {
      "project": {
        "name": "xxxxxxx" // Project name
      }
    }
  }
}
```

After a token is obtained, the **X-Auth-Token** header field must be added to requests to specify the token when calling other APIs. For example, if the token is **ABCDEFGH....**, **X-Auth-Token: ABCDEFGH....** can be added to a request as follows:

```
POST https://iam.ap-southeast-1.myhuaweicloud.com/v3.0/OS-USER/users
Content-Type: application/json
X-Auth-Token: ABCDEFGH....
```

4.3 Response

Status Code

After sending a request, you will receive a response, including a status code, response header, and response body.

A status code is a group of digits, ranging from 1xx to 5xx. It indicates the status of a request. For more information, see [Status Codes](#).

For example, if status code **201** is returned for calling the API used to **create an IAM user**, the request is successful.

Response Header

Similar to a request, a response also has a header, for example, **Content-Type**.

Figure 4-2 shows the response header for the API used to **create an IAM user**.

NOTE

For security purposes, you are advised to set the token in ciphertext in configuration files or environment variables and decrypt it when using it.

Figure 4-2 Header fields of the response to the request for creating an IAM user

```
"X-Frame-Options": "SAMEORIGIN",
"X-IAM-ETag-id": "2562365939-d8f6f12921974cb097338ac11fcec8a",
"Transfer-Encoding": "chunked",
"Strict-Transport-Security": "max-age=31536000; includeSubdomains;",
"Server": "api-gateway",
"X-Request-Id": "af2953f2bcc67a42325a69a19e6c32a2",
"X-Content-Type-Options": "nosniff",
"Connection": "keep-alive",
"X-Download-Options": "noopen",
"X-XSS-Protection": "1; mode=block;",
"X-IAM-Trace-Id": "token_ null_af2953f2bcc67a42325a69a19e6c32a2",
"Date": "Tue, 21 May 2024 09:03:40 GMT",
"Content-Type": "application/json; charset=utf8"
```

(Optional) Response Body

The body of a response is often returned in a structured format (for example, JSON or XML) as specified in the **Content-Type** header field. The response body transfers content except the response header.

The following shows part of the response body for the API used to **create an IAM user**.

```
{
  "user": {
    "id": "c131886aec...",
    "name": "IAMUser",
    "description": "IAM User Description",
    "areacode": "",
    "phone": "",
    "email": "***@***.com",
    "status": null,
    "enabled": true,
    "pwd_status": false,
    "access_mode": "default",
    "is_domain_owner": false,
    "xuser_id": "",
    "xuser_type": "",
    "password_expires_at": null,
    "create_time": "2024-05-21T09:03:41.000000",
    "domain_id": "d78cbac1.....",
    "xdomain_id": "30086000.....",
    "xdomain_type": ""
  }
}
```

```
    "default_project_id": null  
  }  
}
```

If an error occurs during API calling, an error code and a message will be displayed. The following shows an error response body.

```
{  
  "error_msg": "The request message format is invalid.",  
  "error_code": "IMG.0001"  
}
```

In the response body, **error_code** is an error code, and **error_msg** provides information about the error.

5 APIs (V3)

5.1 API Version

5.1.1 Querying API Versions

Function

This API is used to query all available ELB API versions. Generally, APIs of a later version (v3 is the latest version) support more features than those of an earlier version.

Note the following when using APIs of different versions:

- The API (POST /v3/{project_id}/elb/loadbalancers) cannot be used to create shared load balancers. To create a shared load balancer, you can call v2/v2.0 API, the API (/v3/{project_id}/elb/loadbalancers/batch-create) to batch create load balancers, or the API (/v3/{project_id}/elb/loadbalancers/{loadbalancer_id}/clone) to copy a load balancer.
- Other v3 APIs can be used to manage both dedicated and shared load balancers and their associated resources. For example, you can call the API (POST /v3/{project_id}/elb/listeners) to add a listener to a shared load balancer. However, some features of dedicated load balancers are not supported. For details, see each API description.

Calling Method

For details, see [Calling APIs](#).

URI

GET /versions

Request Parameters

None

Response Parameters

Status code: 200

Table 5-1 Response body parameters

Parameter	Type	Description
versions	Array of ApiVersionInfo objects	Definition: Lists the available API versions.

Table 5-2 ApiVersionInfo

Parameter	Type	Description
id	String	Definition: Specifies the API version. Range: The value can be v3 , v2 , or v2.0 in descending order.
status	String	Definition: Specifies the status of the API version. Range: • CURRENT: current version, which is the latest supported API version. • STABLE: stable version • DEPRECATED: discarded version

Example Requests

Querying API versions of a load balancer

```
GET https://{ELB_Endpoint}/versions
```

Example Responses

Status code: 200

Successful request.

```
{
  "versions": [ {
    "id": "v3",
    "status": "CURRENT"
  }, {
    "id": "v2",
    "status": "STABLE"
  }, {
    "id": "v2.0",
    "status": "STABLE"
  } ]
}
```

SDK Sample Code

The SDK sample code is as follows.

Java

```
package com.huaweicloud.sdk.test;

import com.huaweicloud.sdk.core.auth.ICredential;
import com.huaweicloud.sdk.core.auth.BasicCredentials;
import com.huaweicloud.sdk.core.exception.ConnectionException;
import com.huaweicloud.sdk.core.exception.RequestTimeoutException;
import com.huaweicloud.sdk.core.exception.ServiceResponseException;
import com.huaweicloud.sdk.elb.v3.region.ElbRegion;

    if err == nil {
        fmt.Printf("%v\n", response)
    } else {
        fmt.Println(err)
    }
}
```

More

For SDK sample code of more programming languages, see the Sample Code tab in [API Explorer](#). SDK sample code can be automatically generated.

Status Codes

Status Code	Description
200	Successful request.

Error Codes

See [Error Codes](#).

5.2 Quota

5.2.1 Querying Quotas

Function

This API is used to query the quotas of load balancers and related resources in a specific project. The API returns only the total quota, not the used quota. To query the used quota, you can call the API (GET /v3/{project_id}/elb/quotas/details) to query quota usage details.

Calling Method

For details, see [Calling APIs](#).

URI

GET /v3/{project_id}/elb/quotas

Table 5-3 Path Parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Definition: Specifies the project ID. For details about how to obtain a project ID, see Obtaining a Project ID . Constraints: N/A Range: The value can contain a maximum of 32 characters, including digits and lowercase letters. Default value: N/A

Request Parameters

Table 5-4 Request header parameters

Parameter	Mandatory	Type	Description
X-Auth-Token	Yes	String	Definition: Specifies the token used for IAM authentication. Constraints: N/A Range: N/A Default value: N/A

Response Parameters

Status code: 200

Table 5-5 Response body parameters

Parameter	Type	Description
request_id	String	Definition: Specifies the request ID. Range: The value is automatically generated, and can contain characters including digits, lowercase letters, and hyphens (-).
quota	Quota object	Definition: Specifies the quotas of load balancers and associated resources. Only the total quotas are returned. Remaining available quotas will not be returned.

Table 5-6 Quota

Parameter	Type	Description
project_id	String	Definition: Specifies the project ID. For details about how to obtain a project ID, see Obtaining a Project ID . Range: The value can contain a maximum of 32 characters, including digits and lowercase letters.

Parameter	Type	Description
loadbalancer	Integer	Definition: Specifies the load balancer quota. Range: • If the value is greater than or equal to 0, it indicates the current quota. • -1 indicates that the quota is not limited.
certificate	Integer	Definition: Specifies the certificate quota. Range: • If the value is greater than or equal to 0, it indicates the current quota. • -1 indicates that the quota is not limited.
listener	Integer	Definition: Specifies the listener quota. Range: • If the value is greater than or equal to 0, it indicates the current quota. • -1 indicates that the quota is not limited.
l7policy	Integer	Definition: Specifies the forwarding policy quota. Range: • If the value is greater than or equal to 0, it indicates the current quota. • -1 indicates that the quota is not limited.
condition_per_policy	Integer	Definition: Specifies the maximum number of forwarding conditions per forwarding policy. Range: • If the value is greater than or equal to 0, it indicates the current quota. • -1 indicates that the quota is not limited.

Parameter	Type	Description
pool	Integer	Definition: Specifies the backend server group quota. Range: • If the value is greater than or equal to 0, it indicates the current quota. • -1 indicates that the quota is not limited.
healthmonitor	Integer	Definition: Specifies the health check quota. Range: • If the value is greater than or equal to 0, it indicates the current quota. • -1 indicates that the quota is not limited.
member	Integer	Definition: Specifies the backend server quota. Range: • If the value is greater than or equal to 0, it indicates the current quota. • -1 indicates that the quota is not limited.
members_per_pool	Integer	Definition: Specifies the maximum number of backend servers in a backend server group. Range: • If the value is greater than or equal to 0, it indicates the current quota. • -1 indicates that the quota is not limited.
listeners_per_pool	Integer	Definition: Specifies the maximum number of listeners that can be associated with a backend server group. Range: • If the value is greater than or equal to 0, it indicates the current quota. • -1 indicates that the quota is not limited.

Parameter	Type	Description
ipgroup	Integer	Definition: Specifies the IP address group quota. Range: - If the value is greater than or equal to 0, it indicates the current quota. -1 indicates that the quota is not limited.
ipgroup_bindings	Integer	Definition: Specifies the maximum number of listeners that can be associated with an IP address group. Range: - If the value is greater than or equal to 0, it indicates the current quota. -1 indicates that the quota is not limited.
ipgroup_max_length	Integer	Definition: Specifies the maximum number of IP entries that can be added to an IP address group. Range: - If the value is greater than or equal to 0, it indicates the current quota. -1 indicates that the quota is not limited.
ipgroups_per_listener	Integer	Definition: Specifies the maximum number of IP address groups that can be associated with a listener. Range: - If the value is greater than or equal to 0, it indicates the current quota. -1 indicates that the quota is not limited.
security_policy	Integer	Definition: Specifies the custom security policy quota. Range: - If the value is greater than or equal to 0, it indicates the current quota. -1 indicates that the quota is not limited.

Parameter	Type	Description
listeners_per_load_balancer	Integer	Definition: Specifies the maximum number of listeners that can be associated with a load balancer. Range: • If the value is greater than or equal to 0, it indicates the current quota. • -1 indicates that the quota is not limited. NOTE The maximum number of listeners that can be added to each load balancer is not limited, but it is recommended that the listeners not exceed the default quota.
pools_per_l7policy	Integer	Definition: Specifies the maximum number of backend server groups that can be associated with a forwarding policy. Range: • If the value is greater than or equal to 0, it indicates the current quota. • -1 indicates that the quota is not limited.
l7policies_per_listener	Integer	Definition: Specifies the maximum number of forwarding policies that can be associated with a listener. Range: • If the value is greater than or equal to 0, it indicates the current quota. • -1 indicates that the quota is not limited.
free_instance_members_per_pool	Integer	Definition: Specifies the maximum number of backend servers that can be added to a backend server group for free. Range: • If the value is greater than or equal to 0, it indicates the current quota. • -1 indicates that the quota is not limited.

Parameter	Type	Description
free_instance_listeners_per_loadbalancer	Integer	Definition: Specifies the maximum number of listeners that can be associated with a load balancer for free. Range: - If the value is greater than or equal to 0, it indicates the current quota. -1 indicates that the quota is not limited.

Example Requests

Querying the quotas of resources associated with a load balancer

```
GET https://{ELB_Endpoint}/v3/99a3fff0d03c428eac3678da6a7d0f24/elb/quotas
```

Example Responses

Status code: 200

Successful request.

```

See [Error Codes](#).

5.2.2 Querying Quota Usage

Function

This API is used to query the current and used quotas of resources related to a load balancer.

Calling Method

For details, see [Calling APIs](#).

URI

GET /v3/{project_id}/elb/quotas/details

Table 5-7 Path Parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Definition: Specifies the project ID. For details about how to obtain a project ID, see Obtaining a Project ID . Constraints: N/A Range: The value can contain a maximum of 32 characters, including digits and lowercase letters. Default value: N/A

Table 5-8 Query Parameters

Parameter	Mandatory	Type	Description
quota_key	No	Array of strings	Definition: Specifies the quota type. Multiple values can be used for query in the format of <i>quota_key=xxx&quota_key=xxx</i> . Constraints: N/A Range: loadbalancer, listener, ipgroup, pool, member, healthmonitor, l7policy, certificate, security_policy, listeners_per_loadbalancer, listeners_per_pool, members_per_pool, condition_per_policy, ipgroup_bindings, ipgroup_max_length, ipgroups_per_listener, pools_per_l7policy, l7policies_per_listener, free_instance_members_per_pool, or free_instance_listeners_per_loadbalancer Default value: N/A

Request Parameters

Table 5-9 Request header parameters

Parameter	Mandatory	Type	Description
X-Auth-Token	Yes	String	Definition: Specifies the token used for IAM authentication. Constraints: N/A Range: N/A Default value: N/A

Response Parameters

Status code: 200

Table 5-10 Response body parameters

Parameter	Type	Description
request_id	String	Definition: Specifies the request ID. Range: The value is automatically generated, and can contain characters including digits, lowercase letters, and hyphens (-).
quotas	Array of QuotaInfo objects	Definition: Specifies the resource quotas.

Table 5-11 QuotaInfo

Parameter	Type	Description
quota_key	String	Definition: Specifies the quota type. Range: loadbalancer, listener, ipgroup, pool, member, healthmonitor, l7policy, certificate, security_policy, listeners_per_loadbalancer, listeners_per_pool, members_per_pool, condition_per_policy, ipgroup_bindings, ipgroup_max_length, ipgroups_per_listener, pools_per_l7policy, l7policies_per_listener, free_instance_members_per_pool, or free_instance_listeners_per_loadbalancer
quota_limit	Integer	Definition: Specifies the total quota. Range: • If the value is greater than or equal to 0, it indicates the current quota. • -1 indicates that the quota is not limited.
used	Integer	Definition: Specifies the used quota. Range: greater than or equal to 0
unit	String	Definition: Specifies the quota unit. Range: count, indicating the number of resources

Example Requests

Querying the quota of a specific quota type

```
https://{ELB_Endpoint}/v3/06b9dc6cbf80d5952f18c0181a2f4654/elb/quotas/details?  
quota_key=members_per_pool&quota_key=loadbalancer
```

Example Responses

Status code: 200

Successful request.

Error Codes

See [Error Codes](#).

5.3 AZ

5.3.1 Querying AZs

Function

This API is used to query all available AZs when you create a load balancer.

Note the following when you create a load balancer:

- One set of AZs is returned by default. When you create a dedicated load balancer, you can select one or more AZs only in this set.
- If **loadbalancer_id** is specified, the set of AZs in the cluster where the load balancer resides is returned.
- In special scenarios, dedicated load balancers must be created in specific AZs. In the returned one or more sets of AZs, you can select as many AZs as you want as long as the selected AZs are in the same set. For example, if two sets **[az1,az2]** and **[az2,az3]** are returned, you can select **az1** and **az2** or **az2** and **az3**, but cannot select **az1** and **az3**.

Calling Method

For details, see [Calling APIs](#).

URI

GET /v3/{project_id}/elb/availability-zones

Table 5-12 Path Parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Definition: Specifies the project ID. For details about how to obtain a project ID, see Obtaining a Project ID . Constraints: N/A Range: The value can contain a maximum of 32 characters, including digits and lowercase letters. Default value: N/A

Table 5-13 Query Parameters

Parameter	Mandatory	Type	Description
public_border_group	No	String	Definition: Specifies the public border group. Constraints: N/A Range: • center: public border group of the central site • Edge site name: public border group of an edge site Default value: N/A
loadbalancer_id	No	String	Definition: Specifies the load balancer ID. Constraints: N/A Range: N/A Default value: N/A

Request Parameters

Table 5-14 Request header parameters

Parameter	Mandatory	Type	Description
X-Auth-Token	Yes	String	Definition: Specifies the token used for IAM authentication. Constraints: N/A Range: N/A Default value: N/A

Response Parameters

Status code: 200

Table 5-15 Response body parameters

Parameter	Type	Description
request_id	String	Definition: Specifies the request ID. Range: The value is automatically generated, and can contain characters including digits, lowercase letters, and hyphens (-).

Parameter	Type	Description
availability_zones	Array<Array<AvailabilityZone>>	Definition: Specifies the AZs that are available during load balancer creation. For example, in [az1,az2] and [az2,az3] sets, you can select az1 and az2 or az2 and az3, but cannot select az1 and az3. Range: N/A

Table 5-16 AvailabilityZone

Parameter	Type	Description
code	String	Definition: Specifies the AZ code. Range: N/A
state	String	Definition: Specifies the AZ status. Range: ACTIVE.
protocol	Array of strings	Definition: Specifies the type of the flavors that is not sold out. Range: L4 indicates network load balancers are not sold out. L7 indicates application load balancers are not sold out.
public_border_group	String	Definition: Specifies the public border group. Range: - center: public border group of the central site - Edge site name: public border group of an edge site
category	Integer	Definition: Specifies the AZ category code. This parameter is used to identify the type of an edge AZ. Range: 0 (central AZs), 21 (HomeZones AZs), and 41 (edge AZs)
spec_code	String	Definition: Specifies the code of the product in the edge AZ. The product code is used to query the price before purchasing a load balancer on the management console. Range: N/A

Example Requests

Querying AZs where a load balancer works

```
GET https://{ELB_Endpoint}/v3/060576782980d5762f9ec014dd2f1148/elb/availability-zones
```

200	Successful request.

Error Codes

See [Error Codes](#).

5.4 Load Balancer Flavor

5.4.1 Querying Flavors

Function

This API is used to query all available load balancer flavors in a specific region. You can specify these Layer 4 or Layer 7 flavors when creating a dedicated load balancer.

Constraints

This API has the following constraints:

- Parameters **marker**, **limit**, and **page_reverse** are used for pagination query.
- Parameters **marker** and **page_reverse** take effect only when they are used together with parameter **limit**.

Calling Method

For details, see [Calling APIs](#).

URI

GET /v3/{project_id}/elb/flavors

Table 5-17 Path Parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Definition: Specifies the project ID. For details about how to obtain a project ID, see Obtaining a Project ID . Constraints: N/A Range: The value can contain a maximum of 32 characters, including digits and lowercase letters. Default value: N/A

Table 5-18 Query Parameters

Parameter	Mandatory	Type	Description
marker	No	String	Definition: Specifies the ID of the last record on the previous page. Constraints: • This parameter must be used together with limit. • If the parameter is not specified, only resources on the first page are queried. • This parameter cannot be left blank or set to an invalid ID. Range: N/A Default value: N/A
limit	No	Integer	Definition: Specifies the number of records returned on each page. Constraints: N/A Range: 0 to 2000 Default value: 2000
page_reverse	No	Boolean	Definition: Specifies whether to use reverse query. Constraints: • This parameter must be used together with limit. • If page_reverse is set to true and you want to query the resources on the previous page, set the value of marker to the value of previous_marker. Range: • true: Query resources on the previous page. • false: Query resources on the next page. Default value: false

Parameter	Mandatory	Type	Description
id	No	Array of strings	Definition: Specifies the flavor ID. Multiple IDs can be used for query in the format of <i>id=xxx&id=xxx</i> . Constraints: N/A Range: N/A Default value: N/A
name	No	Array of strings	Definition: Specifies the flavor name. Multiple names can be used for query in the format of <i>name=xxx&name=xxx</i> . Constraints: N/A Range: N/A Default value: N/A
type	No	Array of strings	Definition: Specifies the flavor type. Range: • L4 indicates a Layer 4 flavor and L7 indicates a Layer 7 flavor. • gwlb indicates the flavor of a gateway load balancer. • L4_elastic indicates the minimum elastic flavor at Layer 4 and L7_elastic indicates the minimum elastic flavor at Layer 7. • L4_elastic_max indicates the maximum elastic flavor at Layer 4, gwlb_elastic_max indicates the maximum gateway elastic flavor, and L7_elastic_max indicates the maximum elastic flavor at Layer 7. Multiple types can be used for query in the format of <i>type=xxx&type=xxx</i> .

Parameter	Mandatory	Type	Description
shared	No	Boolean	Definition: Specifies whether to query the flavors available to all uses. Constraints: N/A Range: • true: Query the flavors available to all users. • false: Query the flavors only available to the current user. Default value: N/A
public_border_group	No	Array of strings	Definition: Specifies the public border group. Multiple public border groups can be queried in the format of <i>public_border_group=xxx&public_border_group=xxx</i> . Constraints: N/A Range: • center: public border group of the central site • Edge site name: public border group of an edge site Default value: N/A
category	No	Array of integers	Definition: Specifies the AZ category code. This parameter is used to identify the type of an edge AZ. Multiple categories can be used for query in the format of <i>category=xxx&category=xxx</i> . Constraints: N/A Range: 0 (central AZs), 21 (HomeZones AZs), and 41 (edge AZs) Default value: N/A

Parameter	Mandatory	Type	Description
list_all	No	Boolean	Definition: Whether to query all the maximum elastic flavors of a specific user. Constraints: N/A Range: • true: All the maximum elastic flavors defined by l4_elastic_max and l7_elastic_max are returned. • false: Only the largest elastic flavors will be returned. For Layer 4 load balancers, the flavor with highest cps value is returned. If the cps values are the same, the flavor with highest bandwidth value is returned. For Layer 7 load balancers, the flavor with highest https_cps value is returned. If the https_cps values are the same, the flavor with highest qps value is returned. Default value: N/A
flavor_sold_out	No	Boolean	Specifies whether load balancers of this flavor are unavailable. Constraints: N/A • true indicates load balancers of this flavor are unavailable. • false indicates load balancers of this flavor are available. Default value: N/A

Request Parameters

Table 5-19 Request header parameters

Parameter	Mandatory	Type	Description
X-Auth-Token	Yes	String	Definition: Specifies the token used for IAM authentication. Constraints: N/A Range: N/A Default value: N/A

Response Parameters

Status code: 200

Table 5-20 Response body parameters

Parameter	Type	Description
flavors	Array of Flavor objects	Definition: Specifies the flavor list.
page_info	PageInfo object	Definition: Specifies the pagination information.
request_id	String	Definition: Specifies the request ID. Range: The value is automatically generated, and can contain characters including digits, lowercase letters, and hyphens (-).

Table 5-21 Flavor

Parameter	Type	Description
id	String	Definition: Specifies the flavor ID. Range: N/A
info	FlavorInfo object	Definition: Specifies the flavor metrics. Range: N/A

Parameter	Type	Description
name	String	Definition: Specifies the flavor name. Range: Network load balancers have the following flavors: • L4_flavor.elb.s1.small: small I • L4_flavor.elb.s2.small: small II • L4_flavor.elb.s1.medium: medium I • L4_flavor.elb.s2.medium: medium II • L4_flavor.elb.s1.large: large I • L4_flavor.elb.s2.large: Large II • L4_flavor.elb.pro.max: elastic flavor at Layer 4 Application load balancers have the following flavors: • L7_flavor.elb.s1.small: small I • L7_flavor.elb.s2.small: small II • L7_flavor.elb.s1.medium: medium I • L7_flavor.elb.s2.medium: medium II • L7_flavor.elb.s1.large: large I • L7_flavor.elb.s2.large: Large II • L7_flavor.elb.s1.extra-large: extra-large I • L7_flavor.elb.s2.extra-large: extra-large II • L7_flavor.elb.pro.max: elastic flavor at Layer
shared	Boolean	Definition: Specifies whether the flavor is available to all users. Range: • true indicates that the flavor is available to all users. • false indicates that the flavor is available only to the current user.
project_id	String	Definition: Specifies the project ID. For details about how to obtain a project ID, see Obtaining a Project ID . Range: The value can contain a maximum of 32 characters, including digits and lowercase letters.

Parameter	Type	Description
type	String	Definition: Specifies the flavor type. Range: • L4 indicates a Layer 4 flavor and L7 indicates a Layer 7 flavor. • gwlb indicates the flavor of a gateway load balancer. • L4_elastic indicates the minimum elastic flavor at Layer 4 and L7_elastic indicates the minimum elastic flavor at Layer 7. This parameter has been discarded. Please do not use it. • L4_elastic_max indicates the maximum elastic flavor at Layer 4, gwlb_elastic_max indicates the maximum gateway elastic flavor, and L7_elastic_max indicates the maximum elastic flavor at Layer 7.
flavor_sold_out	Boolean	Definition: Specifies whether load balancers of this flavor cannot be purchased. Range: • true: • false:
public_border_group	String	Definition: Specifies the public border group. Range: • center: public border group of the central site • Edge site name: public border group of an edge site
category	Integer	Definition: Specifies the AZ category code. This parameter is used to identify the type of an edge AZ. Range: 0 (central AZs), 21 (HomeZones AZs), and 41 (edge AZs)

Table 5-22 FlavorInfo

Parameter	Type	Description
connection	Integer	Definition: Specifies the maximum number of concurrent connections per second. Unit: count Range: N/A
cps	Integer	Definition: Specifies the number of new connections per second. Unit: count Range: N/A
tls_connection	Integer	Definition: Specifies the maximum number of concurrent TLS connections per second. Unit: count Range: N/A
tls_cps	Integer	Definition: Specifies the maximum number of new TLS connections per second. Unit: count Range: N/A
qps	Integer	Definition: Specifies the number of queries per second (QPS). Unit: count. This parameter is available only for load balancers at Layer 7. Range: N/A
bandwidth	Integer	Definition: Specifies the bandwidth, in kbit/s. Range: N/A
lcu	Integer	Definition: Specifies the number of LCUs supported by the flavor. Unit: count Range: N/A NOTE An LCU measures the dimensions on which a dedicated load balancer routes the traffic. A higher value indicates better performance.
https_cps	Integer	Definition: Specifies the number of new HTTPS connections. This parameter is available only for load balancers at Layer 7. Unit: count Range: N/A

Table 5-23 PageInfo

Parameter	Type	Description
previous_marker	String	Definition: Specifies the ID of the first record in the pagination query result. If page_reverse is set to true , this parameter is used together to query resources on the previous page. Range: N/A
next_marker	String	Definition: Specifies the ID of the last record in the pagination query result. It is usually used to query resources on the next page. Range: N/A
current_count	Integer	Definition: Specifies the number of records returned on the current page. Range: N/A

Example Requests

Querying load balancer flavors

```
GET https://{ELB_Endpoint}/v3/057ef081eb00d2732fd1c01a9be75e6f/elb/flavors?
limit=2&marker=179568ef-5ba4-4ca0-8c5e-5d581db779b1
```

Example Responses

Status code: 200

Successful request.

5.4.2 Viewing the Details of a Flavor

Function

This API is used to view the details of a flavor.

Calling Method

For details, see [Calling APIs](#).

URI

GET /v3/{project_id}/elb/flavors/{flavor_id}

Table 5-24 Path Parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Definition: Specifies the project ID. For details about how to obtain a project ID, see Obtaining a Project ID . Constraints: N/A Range: The value can contain a maximum of 32 characters, including digits and lowercase letters. Default value: N/A
flavor_id	Yes	String	Definition: Specifies the flavor ID. Constraints: N/A Range: N/A Default value: N/A

Request Parameters

Table 5-25 Request header parameters

Parameter	Mandatory	Type	Description
X-Auth-Token	Yes	String	Definition: Specifies the token used for IAM authentication. Constraints: N/A Range: N/A Default value: N/A

Response Parameters

Status code: 200

Table 5-26 Response body parameters

Parameter	Type	Description
request_id	String	Definition: Specifies the request ID. Range: The value is automatically generated, and can contain characters including digits, lowercase letters, and hyphens (-).

Parameter	Type	Description
flavor	Flavor object	Definition: Specifies the flavor.

Table 5-27 Flavor

Parameter	Type	Description
id	String	Definition: Specifies the flavor ID. Range: N/A
info	FlavorInfo object	Definition: Specifies the flavor metrics. Range: N/A
name	String	Definition: Specifies the flavor name. Range: Network load balancers have the following flavors: • L4_flavor.elb.s1.small: small I • L4_flavor.elb.s2.small: small II • L4_flavor.elb.s1.medium: medium I • L4_flavor.elb.s2.medium: medium II • L4_flavor.elb.s1.large: large I • L4_flavor.elb.s2.large: Large II • L4_flavor.elb.pro.max: elastic flavor at Layer 4 Application load balancers have the following flavors: • L7_flavor.elb.s1.small: small I • L7_flavor.elb.s2.small: small II • L7_flavor.elb.s1.medium: medium I • L7_flavor.elb.s2.medium: medium II • L7_flavor.elb.s1.large: large I • L7_flavor.elb.s2.large: Large II • L7_flavor.elb.s1.extra-large: extra-large I • L7_flavor.elb.s2.extra-large: extra-large II • L7_flavor.elb.pro.max: elastic flavor at Layer

Parameter	Type	Description
shared	Boolean	Definition: Specifies whether the flavor is available to all users. Range: • true indicates that the flavor is available to all users. • false indicates that the flavor is available only to the current user.
project_id	String	Definition: Specifies the project ID. For details about how to obtain a project ID, see Obtaining a Project ID . Range: The value can contain a maximum of 32 characters, including digits and lowercase letters.
type	String	Definition: Specifies the flavor type. Range: • L4 indicates a Layer 4 flavor and L7 indicates a Layer 7 flavor. • gwlb indicates the flavor of a gateway load balancer. • L4_elastic indicates the minimum elastic flavor at Layer 4 and L7_elastic indicates the minimum elastic flavor at Layer 7. This parameter has been discarded. Please do not use it. • L4_elastic_max indicates the maximum elastic flavor at Layer 4, gwlb_elastic_max indicates the maximum gateway elastic flavor, and L7_elastic_max indicates the maximum elastic flavor at Layer 7.
flavor_sold_out	Boolean	Definition: Specifies whether load balancers of this flavor cannot be purchased. Range: • true: • false:

Parameter	Type	Description
public_border_group	String	Definition: Specifies the public border group. Range: • center: public border group of the central site • Edge site name: public border group of an edge site
category	Integer	Definition: Specifies the AZ category code. This parameter is used to identify the type of an edge AZ. Range: 0 (central AZs), 21 (HomeZones AZs), and 41 (edge AZs)

Table 5-28 FlavorInfo

Parameter	Type	Description
connection	Integer	Definition: Specifies the maximum number of concurrent connections per second. Unit: count Range: N/A
cps	Integer	Definition: Specifies the number of new connections per second. Unit: count Range: N/A
tls_connection	Integer	Definition: Specifies the maximum number of concurrent TLS connections per second. Unit: count Range: N/A
tls_cps	Integer	Definition: Specifies the maximum number of new TLS connections per second. Unit: count Range: N/A
qps	Integer	Definition: Specifies the number of queries per second (QPS). Unit: count. This parameter is available only for load balancers at Layer 7. Range: N/A
bandwidth	Integer	Definition: Specifies the bandwidth, in kbit/s. Range: N/A

Parameter	Type	Description
lcu	Integer	Definition: Specifies the number of LCUs supported by the flavor. Unit: count Range: N/A NOTE An LCU measures the dimensions on which a dedicated load balancer routes the traffic. A higher value indicates better performance.
https_cps	Integer	Definition: Specifies the number of new HTTPS connections. This parameter is available only for load balancers at Layer 7. Unit: count Range: N/A

Example Requests

Querying the details of a flavor

```
GET https://{ELB_Endpoint}/v3/{project_id}/elb/flavors/{flavor_id}
```

Example Responses

Status code: 200

Successful request.

```
{
  "flavor" : {
    "shared" : true,
    "project_id" : "8d53f081ea2444aa95e2bfa942ef6ee",

Status Codes

Status Code	Description
200	Successful request.

Error Codes

See [Error Codes](#).

5.5 Reserved IP Address

5.5.1 Calculating the Number of Reserved IP Addresses

Function

This API is used to calculate the number of reserved IP addresses in the following scenarios:

- To calculate the number of IP addresses required for creating a load balancer, specify **availability_zone_id** and optional parameters **l7_flavor_id**, **ip_target_enable**, and **ip_version**. Do not specify **loadbalancer_id**.
- To calculate the number of IP addresses required for adding the first Layer 7 listener to a load balancer, specify **loadbalancer_id** and do not specify other parameters.
- To calculate the number of IP addresses required for changing the flavors of a dedicated load balancer or enabling **IP as a Backend**, specify **loadbalancer_id** and **l7_flavor_id**, or specify **loadbalancer_id** and set **ip_target_enable** to **true**. You can specify **l7_flavor_id** and set **ip_target_enable** to **true** to calculate the number of IP addresses required for multiple changes.
- To calculate the number of IP addresses required for upgrading a shared load balancer, specify **loadbalancer_id** and **scene**, and do not specify other parameters.
- To calculate the number of IP addresses required for enabling **nat64_enable**, specify **nat64_enable** and **loadbalancer_id**, and do not specify other parameters.

Note:

- The number of reserved IP addresses in the query result is greater than that of the actually used IP addresses.
- The number of reserved IP addresses does not include those already assigned or in use.

Calling Method

For details, see [Calling APIs](#).

URI

GET /v3/{project_id}/elb/preoccupy-ip-num

Table 5-29 Path Parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Definition: Specifies the project ID. For details about how to obtain a project ID, see Obtaining a Project ID . Constraints: N/A Range: The value can contain a maximum of 32 characters, including digits and lowercase letters. Default value: N/A

Table 5-30 Query Parameters

Parameter	Mandatory	Type	Description
l7_flavor_id	No	String	Definition: Specifies the ID of the load balancer flavor at Layer 7. If this parameter is passed, the number of reserved IP addresses required for creating a dedicated load balancer with a Layer 7 flavor or for changing the Layer 7 flavor of a dedicated load balancer will be calculated. Constraints: This parameter can only be used for creating a dedicated load balancer with a Layer 7 flavor or changing the Layer 7 flavor of a dedicated load balancer Range: N/A Default value: N/A

Parameter	Mandatory	Type	Description
ip_target_enable	No	Boolean	Definition: Whether to enable IP as a Backend. Constraints: This parameter can only be used for creating a dedicated load balancer with IP as a Backend enabled or for enabling IP as a Backend for an existing dedicated load balancer. Range: • true: The number of reserved IP addresses required for creating a dedicated load balancer with IP as a Backend enabled or for enabling IP as a Backend for an existing dedicated load balancer will be calculated. • false: The number of reserved IP addresses required for creating a dedicated load balancer with IP as a Backend disabled will be calculated. • If this parameter is not passed, IP as a Backend is disabled. Default value: false
ip_version	No	Integer	Definition: Specifies the IP address version of the load balancer. The value can be 4 or 6. Constraints: This parameter can be used for creating a load balancer. Range: • 4: The number of reserved IPv4 addresses required for creating a load balancer will be calculated. • 6: The number of reserved IPv6 addresses required for creating a load balancer will be calculated. Default value: N/A

Parameter	Mandatory	Type	Description
loadbalancer_id	No	String	Definition: Specifies the load balancer ID. The number of reserved IP addresses required for changing the flavors of a load balancer or for adding the first Layer 7 listener to a load balancer will be calculated. Constraints: This parameter can be used for changing the flavors of a load balancer, enabling IP as a Backend for an existing load balancer, enabling or disabling nat64_enable, or adding the first Layer 7 listener to a load balancer. Range: N/A Default value: N/A
availability_zone_id	No	Array of strings	Definition: Calculates the number of reserved IP addresses required for creating a load balancer in the AZs specified by availability_zone_id. Constraints: • This parameter can only be used for creating a load balancer. • This parameter is invalid if loadbalancer_id is specified. Range: N/A Default value: N/A

Parameter	Mandatory	Type	Description
scene	No	String	Definition: Calculates the number of IP addresses required for upgrading a shared load balancer to a dedicated load balancer. Constraints: • This parameter can only be used for upgrading a shared load balancer to a dedicated load balancer. • Both this parameter and loadbalancer_id must be specified. Range: UPGRADE (upgrading a shared load balancer to a dedicated load balancer) Default value: N/A
nat64_enable	No	Boolean	Definition: Specifies whether to enable nat64_enable. If this parameter is specified, the system will calculate the number of reserved IP addresses required for creating a load balancer whose listeners have nat64_enable enabled or disabled, or for enabling or disabling nat64_enable for the listeners of a specific load balancer. Constraints: • This parameter can only be used for calculating the number of reserved IP addresses required for enabling nat64_enable for the listeners of a load balancer. Range: • true: Enable nat64_enable. • false: Disable nat64_enable. Default value: false

Request Parameters

Table 5-31 Request header parameters

Parameter	Mandatory	Type	Description
X-Auth-Token	Yes	String	Definition: Specifies the token used for IAM authentication. Constraints: N/A Range: N/A Default value: N/A

Response Parameters

Status code: 200

Table 5-32 Response body parameters

Parameter	Type	Description
preoccupy_ip	PreoccupyIp object	Definition: Specifies reserved IP address.
request_id	String	Definition: Specifies the request ID. Range: The value is automatically generated, and can contain characters including digits, lowercase letters, and hyphens (-).

Table 5-33 PreoccupyIp

Parameter	Type	Description
total	Integer	Definition: Specifies the number of preoccupied IP addresses. Range: an integer no less than 0

Example Requests

- Querying the number of reserved IP addresses required for changing the Layer 7 flavor of a dedicated load balancer

```
GET https://{ELB_Endpoint}/v3/060576782980d5762f9ec014dd2f1148/elb/preoccupy-ip-num?loadbalancer_id=aff4fc31-d635-4f59-a862-edadf32e407d&l7_flavor_id=0051bc4c-a562-4b7c-953b-a250b51d992b
```

```
{
  "preoccupy_ip" : {
    "total" : 6
  },
}
```

- ```
"request_id" : "8844e9a0-6a2d-44b7-aad9-15a7f75e4059"
}
```
- Querying the number of reserved IP addresses required for creating a dedicated load balancer that is deployed in two AZs and has **IP as a Backend** enabled  
  
GET https://{ELB\_Endpoint} /v3/060576782980d5762f9ec014dd2f1148/elb/preoccupy-ip-num?  
l7\_flavor\_id=8278944d-  
f92c-4393-82b2-6fb9cc1d7e53&availability\_zone\_id=az1&availability\_zone\_id=az2&ip\_target\_enable=true  
  
{  
 "preoccupy\_ip" : {  
 "total" : 20  
 },  
 "request\_id" : "63388ec8-fa3c-4c99-b9c8-d2c83b2a9a68"  
}
  - Querying the number of reserved IP addresses required for adding the first HTTP or HTTPS listener to a dedicated load balancer  
  
GET https://{ELB\_Endpoint} /v3/060576782980d5762f9ec014dd2f1148/elb/preoccupy-ip-num?  
loadbalancer\_id=aff4fc31-d635-4f59-a862-edadf32e407d  
  
{  
 "preoccupy\_ip" : {  
 "total" : 2  
 },  
 "request\_id" : "febfce48-318d-45ba-a9d9-855462123f3b"  
}

## Example Responses

**Status code: 200**

Successful request.

```
{
 "preoccupy_ip" : {
 "total" : 20
 },
 "request_id" : "63388ec8-fa3c-4c99-b9c8-d2c83b2a9a68"
}
```

## Error Codes

See [Error Codes](#).

# 5.6 Load Balancer

## 5.6.1 Creating a Load Balancer

### Function

This API is used to create a dedicated load balancer.

When you create a load balancer, note the following:

- Specify **vip\_subnet\_cidr\_id** if you want to bind a private IPv4 address to the load balancer.
- Specify **publicip** and either **vpc\_id** or **vip\_subnet\_cidr\_id** if you want to bind a new IPv4 EIP to the load balancer.
- Specify **publicip\_ids** and either **vpc\_id** or **vip\_subnet\_cidr\_id** if you want to bind an existing IPv4 EIP to the load balancer.
- Specify **ipv6\_vip\_virsubnet\_id** if you want to bind a private IPv6 address to the load balancer.
- Specify both **ipv6\_vip\_virsubnet\_id** and **ipv6\_bandwidth** if you want to bind a public IPv6 address to the load balancer.
- Specify **l4\_flavor\_id** if you want to create a network load balancer and **l7\_flavor\_id** to create an application load balancer. Specify both **l4\_flavor\_id** and **l7\_flavor\_id** if you want to create a load balancer that can work at both Layer 4 and Layer 7.
- If **prepaid\_options** is not specified, pay-per-use load balancers will be created, which are billed by fixed specifications or elastic specifications you have selected for **l4\_flavor\_id** and **l7\_flavor\_id** when creating the load balancer.
- If you want to create a gateway load balancer, note the following:
  - Set **loadbalancer\_type** to **gateway** and do not specify **vip\_address** and **ipv6\_vip\_address**.
- Specify either **vip\_subnet\_cidr\_id** or **ipv6\_subnet\_cidr\_id**, or both. If they are both specified, they must be the same subnet.
- You cannot bind an EIP to gateway load balancers.
- Specify **gw\_flavor\_id** if you need a given flavor.

## Constraints

There are some constraints when you create a load balancer:

- **vpc\_id**, **vip\_subnet\_cidr\_id**, and **ipv6\_vip\_virsubnet\_id** cannot be left blank at the same time.
- **ip\_target\_enable** specifies whether to enable **IP as a Backend**. If you set it to **true**, you can associate servers in a VPC connected through a VPC peering connection, in a VPC connected through a cloud connection, or in an on-premises data center at the other end of a Direct Connect or VPN connection, by using server IP addresses. If you set it to **false**, the load balancer and the backend servers must be in the same VPC.
- **admin\_state\_up** must be **true**.
- **provider** must be set to **vlb**.
- **elb\_virsubnet\_ids** indicates the subnets that support IPv4/IPv6 dual stack or only IPv4. If only IPv4 subnets are supported, **ipv6\_vip\_virsubnet\_id** must be left blank.
- You can unbind the EIP only on the ELB console. Locate the load balancer in the load balancer list and click **More > Unbind EIP** in the **Operation** column.
- **publicip\_ids** and **publicip** cannot be specified at the same time. Set either **publicip\_ids** to bind an existing EIP to the load balancer, or **publicip** to bind a new EIP to the load balancer, or neither of them.
- If you want to add the load balancer to an existing shared bandwidth, you must specify the ID of the shared bandwidth. If you want the load balancer to use a new dedicated bandwidth, **charge\_mode**, **share\_type**, and **size** are required.

## Calling Method

For details, see [Calling APIs](#).

## URI

POST /v3/{project\_id}/elb/loadbalancers

**Table 5-34** Path Parameters

| Parameter  | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                |

}
```

## More

For SDK sample code of more programming languages, see the Sample Code tab in [API Explorer](#). SDK sample code can be automatically generated.

## Status Codes

| Status Code | Description         |
|-------------|---------------------|
| 201         | Successful request. |

## Error Codes

See [Error Codes](#).

## 5.6.2 Batch Creating Load Balancers

### Function

This API is used to create dedicated or shared load balancers in batches.

When you create load balancers, note the following:

- Specify **vip\_subnet\_cidr\_id** if you want to bind private IPv4 addresses to the load balancers.
- Specify **publicip** and either **vpc\_id** or **vip\_subnet\_cidr\_id** if you want to bind new IPv4 EIPs to the load balancers.
- Specify **publicip\_ids** and either **vpc\_id** or **vip\_subnet\_cidr\_id** if you want to bind existing IPv4 EIPs to the load balancers.
- Specify **ipv6\_vip\_virsubnet\_id** if you want to bind private IPv6 addresses to the load balancers.
- Specify both **ipv6\_vip\_virsubnet\_id** and **ipv6\_bandwidth** if you want to bind public IPv6 addresses to the load balancers.

- Specify **l4\_flavor\_id** if you want to create network load balancers and **l7\_flavor\_id** to create application load balancers. Specify both **l4\_flavor\_id** and **l7\_flavor\_id** if you want to create load balancers that can work at both Layer 4 and Layer 7.
- Do not specify **publicip\_ids**, **vip\_address**, or **ipv6\_vip\_address** when creating load balancers in batches. You cannot bind existing private IPv4 addresses, IPv6 addresses, or public IP addresses to the load balancers.
- If **prepaid\_options** is not specified, pay-per-use load balancers will be created, which are billed by fixed specifications or elastic specifications you have selected for **l4\_flavor\_id** and **l7\_flavor\_id** when creating the load balancers.
- This is an asynchronous API, returning load balancer IDs and job IDs in its response body. You can use the job ID to query the load balancer creation progress.
- The rules for specifying parameters in the request body are different when you create dedicated and shared load balancers in batches. For details, see the description of each parameter in the request body.

## Constraints

There are some constraints when you create load balancers in batches:

- **vpc\_id**, **vip\_subnet\_cidr\_id**, and **ipv6\_vip\_virsubnet\_id** cannot be left blank at the same time.
- If the value of **number** is greater than 1, do not specify **publicip\_ids**, **vip\_address**, and **ipv6\_vip\_address**.
- **ip\_target\_enable** specifies whether to enable **IP as a Backend**. If you set it to **true**, you can associate servers in a VPC connected through a VPC peering connection, in a VPC connected through a cloud connection, or in an on-premises data center at the other end of a Direct Connect or VPN connection, by using server IP addresses. If you set it to **false**, the load balancer and the backend servers must be in the same VPC.
- **admin\_state\_up** must be **true**.
- **provider** must be set to **vlb**.
- **elb\_virsubnet\_ids** indicates the subnets that support IPv4/IPv6 dual stack or only IPv4. If only IPv4 subnets are supported, **ipv6\_vip\_virsubnet\_id** must be left blank.
- You can unbind the EIP only on the ELB console. Locate the load balancer in the load balancer list and click **More > Unbind EIP** in the **Operation** column.
- **publicip\_ids** and **publicip** cannot be specified at the same time. Set either **publicip\_ids** to bind an existing EIP to the load balancer, or **publicip** to bind a new EIP to the load balancer, or neither of them.
- If you want to add the load balancer to an existing shared bandwidth, you must specify the ID of the shared bandwidth. If you want the load balancer to use a new dedicated bandwidth, **charge\_mode**, **share\_type**, and **size** are required.
- You cannot bind an existing and unoccupied private IPv4 address, IPv6 address, or public IPv6 address to a load balancer.

## Calling Method

For details, see [Calling APIs](#).

## URI

POST /v3/{project\_id}/elb/loadbalancers/batch-create

**Table 5-58** Path Parameters

| Parameter  | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                |
|------------|-----------|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| project_id | Yes       | String | <b>Definition:</b> Specifies the project ID. For details about how to obtain a project ID, see <a href="#">Obtaining a Project ID</a> .<br><b>Constraints:</b> N/A<br><b>Range:</b> The value can contain a maximum of 32 characters, including digits and lowercase letters.<br><b>Default value:</b> N/A |

## Request Parameters

**Table 5-59** Request header parameters

| Parameter    | Mandatory | Type   | Description                                                                                                                                      |
|--------------|-----------|--------|--------------------------------------------------------------------------------------------------------------------------------------------------|
| X-Auth-Token | No        | String | <b>Definition:</b> Specifies the token used for IAM authentication.<br><b>Constraints:</b> N/A<br><b>Range:</b> N/A<br><b>Default value:</b> N/A |

| Parameter        | Type             | Description                                                                                                                                                                          |
|------------------|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| loadbalancer_ids | Array of strings | <b>Definition:</b> Specifies the IDs of the load balancers to be created in batches.<br><b>Range:</b> N/A                                                                            |
| job_id           | String           | <b>Definition:</b> Specifies task ID of the batch creation.<br><b>Range:</b> N/A                                                                                                     |
| request_id       | String           | <b>Definition:</b> Specifies the request ID.<br><b>Range:</b> The value is automatically generated, and can contain characters including digits, lowercase letters, and hyphens (-). |

## Example Requests

- Example 1: Creating three pay-per-use, dedicated load balancers and binding private IPv4 addresses to them

POST https://{ELB\_Endpoint}/v3/060576798a80d5762fafc01a9b5eedc7/elb/loadbalancers/batch-create

```
{
 "loadbalancer" : {
 "name" : "loadbalancer",
 "description" : "simple batch create lb",
 "vip_subnet_cidr_id" : "1992ec06-f364-4ae3-b936-6a8cc24633b7",
 "admin_state_up" : true,
 "availability_zone_list" : ["AZ1"],
 "number" : 3
 }
}
```

- Example 3: Creating three shared load balancers and binding private IPv4 addresses to them

POST https://{ELB\_Endpoint}/v3/060576798a80d5762fafc01a9b5eedc7/elb/loadbalancers/batch-create

```
{
 "loadbalancer" : {
 "name" : "loadbalancer",
 "description" : "simple batch create lb",
 "availability_zone_list" : ["AZ1"],
 "vip_subnet_cidr_id" : "1992ec06-f364-4ae3-b936-6a8cc24633b7",
 "admin_state_up" : true,
 "guaranteed" : false,
 "number" : 3
 }
}
```

## Example Responses

**Status code: 202**

Normal response

```
{
 "job_id" : "060576798a80d5762fafc01a9b5eedc7",

```

```
"loadbalancer_ids" : ["de7946ba-3b77-4119-8338-acc25eb05611", "ba27f70b-b52f-4a77-9220-
fd15726e50bd"],
"request_id" : "bf29597181cb81b30d19f1a0115a157d"
}
```

## SDK Sample Code

The SDK sample code is as follows.

### Java

- Example 1: Creating three pay-per-use, dedicated load balancers and binding private IPv4 addresses to them

```
package com.huaweicloud.sdk.test;

import com.huaweicloud.sdk.core.auth.ICredential;
import com.huaweicloud.sdk.core.auth.BasicCredentials;

See [Error Codes](#).

## 5.6.3 Copying a Load Balancer

### Function

This API is used to copy a load balancer.

### Calling Method

For details, see [Calling APIs](#).

### URI

POST /v3/{project\_id}/elb/loadbalancers/{loadbalancer\_id}/clone

**Table 5-68** Path Parameters

| Parameter       | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                |
|-----------------|-----------|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| project_id      | Yes       | String | <b>Definition:</b> Specifies the project ID. For details about how to obtain a project ID, see <a href="#">Obtaining a Project ID</a> .<br><b>Constraints:</b> N/A<br><b>Range:</b> The value can contain a maximum of 32 characters, including digits and lowercase letters.<br><b>Default value:</b> N/A |
| loadbalancer_id | Yes       | String | <b>Definition:</b> Specifies the load balancer ID.<br><b>Constraints:</b> N/A<br><b>Range:</b> N/A<br><b>Default value:</b> N/A                                                                                                                                                                            |

### Request Parameters

## Response Parameters

Status code: 200

Table 5-72 Response body parameters

| Parameter         | Type                                               | Description                                                                                                                                                                          |
|-------------------|----------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| loadbalancer_list | Array of <a href="#">loadbalancer_list</a> objects | <b>Definition:</b> Specifies the information about the new load balancer.<br><b>Range:</b> N/A                                                                                       |
| request_id        | String                                             | <b>Definition:</b> Specifies the request ID.<br><b>Range:</b> The value is automatically generated, and can contain characters including digits, lowercase letters, and hyphens (-). |
| job_id            | String                                             | <b>Definition:</b> Specifies the copy task ID.<br><b>Range:</b> N/A                                                                                                                  |

**Table 5-73** loadbalancer\_list

| Parameter | Type   | Description                                                                        |
|-----------|--------|------------------------------------------------------------------------------------|
| id        | String | <b>Definition:</b> Specifies the ID of the new load balancer.<br><b>Range:</b> N/A |

## Example Requests

Copying a load balancer

```
POST https://{ELB_Endpoint}/v3/{project_id}/elb/loadbalancers/{loadbalancer_id}/clone
{
 "target_loadbalancer_param": {
 "availability_zone_list": ["az1", "az2"],
 "vip_address": "1.1.1.1",
 "guaranteed": true
 }
}
```

## Example Responses

**Status code: 200**

Normal response

```
{
 "loadbalancer_list": [{
 "id": "00ac869a-16f2-4335-b40a-15f277604f18"
 }],
 "request_id": "53013c36-751b-4687-9819-cc0bb609468c",
 "job_id": "3ccae6c1-615c-48b4-82b5-abfcdcb82849"
}
```

## SDK Sample Code

The SDK sample code is as follows.

## Status Codes

| Status Code | Description     |
|-------------|-----------------|
| 200         | Normal response |

## Error Codes

See [Error Codes](#).

## 5.6.4 Querying Load Balancers

### Function

This API is used to query all load balancers.

### Constraints

This API has the following constraints:

- Parameters **marker**, **limit**, and **page\_reverse** are used for pagination query.
- Parameters **marker** and **page\_reverse** take effect only when they are used together with parameter **limit**.

### Calling Method

For details, see [Calling APIs](#).

## URI

GET /v3/{project\_id}/elb/loadbalancers

**Table 5-74** Path Parameters

| Parameter  | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                |
|------------|-----------|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| project_id | Yes       | String | <b>Definition:</b> Specifies the project ID. For details about how to obtain a project ID, see <a href="#">Obtaining a Project ID</a> .<br><b>Constraints:</b> N/A<br><b>Range:</b> The value can contain a maximum of 32 characters, including digits and lowercase letters.<br><b>Default value:</b> N/A |

**Table 5-75** Query Parameters

| Parameter | Mandatory | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                                    |

**Table 5-85** AutoscalingRef

| Parameter        | Type    | Description                                                                                                                                                                                                                                              |
|------------------|---------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| enable           | Boolean | <b>Definition:</b> Specifies whether to enable elastic scaling for the load balancer.<br><b>Range:</b> <ul style="list-style-type: none"><li>• <b>true:</b> This option will be enabled.</li><li>• <b>false:</b> This option will be disabled.</li></ul> |
| min_l7_flavor_id | String  | <b>Definition:</b> Specifies the ID of the minimum elastic flavor at Layer 7.<br><b>Range:</b> N/A                                                                                                                                                       |

**Table 5-86** ProxyProtocolExtension

| Parameter        | Type                    | Description                                                                                                                 |
|------------------|-------------------------|-----------------------------------------------------------------------------------------------------------------------------|
| vip_address      | String                  | <b>Definition:</b> Specifies the IPv4 address.<br><b>Constraints:</b> N/A<br><b>Range:</b> N/A<br><b>Default value:</b> N/A |
| ipv6_vip_address | String                  | <b>Definition:</b> Specifies the IPv6 address.<br><b>Constraints:</b> N/A<br><b>Range:</b> N/A<br><b>Default value:</b> N/A |
| extension        | <b>Extension</b> object | <b>Definition:</b> Specifies the proxy protocol extension.<br><b>Constraints:</b> N/A                                       |

**Table 5-87** Extension

| Parameter | Type   | Description                                                                                                                    |
|-----------|--------|--------------------------------------------------------------------------------------------------------------------------------|
| ep_id     | String | <b>Definition:</b> Specifies the VPC endpoint ID.<br><b>Constraints:</b> N/A<br><b>Range:</b> N/A<br><b>Default value:</b> N/A |

| Parameter     | Type   | Description                                                                                                                            |
|---------------|--------|----------------------------------------------------------------------------------------------------------------------------------------|
| ep_service_id | String | <b>Definition:</b> Specifies the VPC endpoint service ID.<br><b>Constraints:</b> N/A<br><b>Range:</b> N/A<br><b>Default value:</b> N/A |

**Table 5-88** CustomQosLimit

| Parameter | Type                  | Description                                                                            |
|-----------|-----------------------|----------------------------------------------------------------------------------------|
| l4        | <b>L4Limit</b> object | <b>Definition:</b> Specifies the rate limit information of the ELB flavors at Layer 4. |
| l7        | <b>L7Limit</b> object | <b>Definition:</b> Specifies the rate limit information of the ELB flavors at Layer 7. |

**Table 5-89** L4Limit

| Parameter  | Type    | Description                                                                                                |
|------------|---------|------------------------------------------------------------------------------------------------------------|
| connection | Integer | <b>Definition:</b> Specifies the maximum number of concurrent connections at Layer 4.<br><b>Range:</b> N/A |
| cps        | Integer | <b>Definition:</b> Specifies the maximum number of new connections at Layer 4.<br><b>Range:</b> N/A        |

**Table 5-90** L7Limit

| Parameter  | Type    | Description                                                                                                |
|------------|---------|------------------------------------------------------------------------------------------------------------|
| connection | Integer | <b>Definition:</b> Specifies the maximum number of concurrent connections at Layer 7.<br><b>Range:</b> N/A |
| cps        | Integer | <b>Definition:</b> Specifies the maximum number of new connections at Layer 7.<br><b>Range:</b> N/A        |

**Table 5-91** PageInfo

| Parameter       | Type    | Description                                                                                                                                                                                                                          |
|-----------------|---------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| previous_marker | String  | <b>Definition:</b> Specifies the ID of the first record in the pagination query result. If <b>page_reverse</b> is set to <b>true</b> , this parameter is used together to query resources on the previous page.<br><b>Range:</b> N/A |
| next_marker     | String  | <b>Definition:</b> Specifies the ID of the last record in the pagination query result. It is usually used to query resources on the next page.<br><b>Range:</b> N/A                                                                  |
| current_count   | Integer | <b>Definition:</b> Specifies the number of records returned on the current page.<br><b>Range:</b> N/A                                                                                                                                |

## Example Requests

- Querying load balancers on each page

```
GET https://{ELB_Endpoint}/v3/b2782e6708b8475c993e6064bc456bf8/elb/loadbalancers?limit=2&marker=87627cb6-9ff1-4580-984f-cc564fa9fc34
```

- Querying load balancers using multiple IDs

```
GET https://{ELB_Endpoint}/v3/b2782e6708b8475c993e6064bc456bf8/elb/loadbalancers?id=87627cb6-9ff1-4580-984f-cc564fa9fc34&id=09e86f09-03fc-440e-8132-03f3e149e979
```

## Example Responses

**Status code: 200**

Successful request.

response, err := client.ListLoadBalancers(request)
if err == nil {
 fmt.Printf("%v\n", response)
} else {
 fmt.Println(err)
}
```

## More

For SDK sample code of more programming languages, see the Sample Code tab in [API Explorer](#). SDK sample code can be automatically generated.

## Status Codes

| Status Code | Description         |
|-------------|---------------------|
| 200         | Successful request. |

## Error Codes

See [Error Codes](#).

## 5.6.5 Viewing the Details of a Load Balancer

### Function

This API is used to view the details of a load balancer.

### Calling Method

For details, see [Calling APIs](#).

### URI

GET /v3/{project\_id}/elb/loadbalancers/{loadbalancer\_id}

**Table 5-92** Path Parameters

| Parameter       | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                |
|-----------------|-----------|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| project_id      | Yes       | String | <b>Definition:</b> Specifies the project ID. For details about how to obtain a project ID, see <a href="#">Obtaining a Project ID</a> .<br><b>Constraints:</b> N/A<br><b>Range:</b> The value can contain a maximum of 32 characters, including digits and lowercase letters.<br><b>Default value:</b> N/A |
| loadbalancer_id | Yes       | String | <b>Definition:</b> Specifies the load balancer ID.<br><b>Constraints:</b> N/A<br><b>Range:</b> N/A<br><b>Default value:</b> N/A                                                                                                                                                                            |

## Request Parameters

**Table 5-93** Request header parameters

| Parameter    | Mandatory | Type   | Description                                                                                                                                      |
|--------------|-----------|--------|--------------------------------------------------------------------------------------------------------------------------------------------------|
| X-Auth-Token | Yes       | String | <b>Definition:</b> Specifies the token used for IAM authentication.<br><b>Constraints:</b> N/A<br><b>Range:</b> N/A<br><b>Default value:</b> N/A |

## Response Parameters

**Status code:** 200

**Table 5-94** Response body parameters

| Parameter  | Type   | Description                                                                                                                                                                          |
|------------|--------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| request_id | String | <b>Definition:</b> Specifies the request ID.<br><b>Range:</b> The value is automatically generated, and can contain characters including digits, lowercase letters, and hyphens (-). |

| Parameter    | Type                                | Description                                                  |
|--------------|-------------------------------------|--------------------------------------------------------------|
| loadbalancer | <a href="#">LoadBalancer</a> object | <b>Definition:</b> Provides details about the load balancer. |

**Table 5-95** LoadBalancer

| Parameter           | Type                                         | Description                                                                                                                                                                                                                                  |

| Parameter                  | Type                                  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|----------------------------|---------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| deletion_protection_enable | Boolean                               | <b>Definition:</b> Specifies whether to enable deletion protection. This parameter is returned only when the deletion protection is enabled in the current region.<br><b>Range:</b> <ul style="list-style-type: none"><li>• <b>false:</b> This option will be disabled.</li><li>• <b>true:</b> This option will be enabled.</li></ul>                                                                                                                                          |
| autoscaling                | <a href="#">AutoscalingRef</a> object | <b>Definition:</b> Specifies information about elastic scaling. If elastic scaling is enabled, the load balancer flavors can be automatically adjusted based on incoming traffic.<br><b>NOTE</b><br>This parameter has been deprecated, but is retained for compatibility purposes. Using this parameter is not recommended. If this parameter is specified, the load balancer with minimum flavors will be created and you will be billed for the minimum flavors.            |
| public_border_group        | String                                | <b>Definition:</b> Specifies the public border group.<br><b>Range:</b> <ul style="list-style-type: none"><li>• <b>center:</b> public border group of the central site</li><li>• Edge site name: public border group of an edge site</li></ul>                                                                                                                                                                                                                                  |
| charge_mode                | String                                | <b>Definition:</b> Specifies the charge mode of the load balancer.<br><b>Range:</b> <ul style="list-style-type: none"><li>• <b>flavor:</b> billed by the fixed flavor you select.</li><li>• <b>lcu:</b> billed by how many LCUs you have used.</li><li>• <b>Null:</b> If it is a shared load balancer, it is free. If it is a dedicated load balancer, it will be billed by the fixed flavor you select.</li></ul> <p>This parameter is unsupported. Please do not use it.</p> |

| Parameter                 | Type                                                    | Description                                                                                                                                                                                                                                                                      |
|---------------------------|---------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| service_lb_mode           | String                                                  | <b>Definition:</b> Specifies load balancer mode.<br><b>Range:</b> <ul style="list-style-type: none"><li>• <b>lb</b>: Cross-tenant access is not supported.</li><li>• <b>ep</b>: Cross-tenant access is supported.</li></ul> This parameter is unsupported. Please do not use it. |
| instance_type             | String                                                  | <b>Definition:</b> Specifies the internal service to which the load balancer belongs.<br><b>Range:</b> N/A<br>This parameter is unsupported. Please do not use it.                                                                                                               |
| instance_id               | String                                                  | <b>Definition:</b> Specifies the ID of the instance with which the load balancer is associated.<br><b>Range:</b> N/A<br>This parameter is unsupported. Please do not use it.                                                                                                     |
| proxy_protocol_extensions | Array of <a href="#">ProxyProtocolExtension</a> objects | <b>Definition:</b> Specifies the proxy protocol extension.<br>This parameter is unsupported. Please do not use it.                                                                                                                                                               |
| waf_failure_action        | String                                                  | <b>Definition:</b> Specifies traffic distributing policies when the WAF is faulty.<br><b>Range:</b> <b>discard</b> indicates traffic will not be distributed. <b>forward</b> indicates traffic will be distributed to the default backend servers.                               |
| protection_status         | String                                                  | <b>Definition:</b> Specifies the protection status.<br><b>Range:</b> <ul style="list-style-type: none"><li>• <b>nonProtection</b>: The resource is not protected.</li><li>• <b>consoleProtection</b>: Modification is not allowed on the console.</li></ul>                      |

| Parameter         | Type                  | Description                                                                                                                                                                     |
|-------------------|-----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| protection_reason | String                | <b>Definition:</b> Specifies why modification protection is enabled.<br><b>Range:</b> The value can contain a maximum of 255 Unicode characters, excluding angle brackets (<>). |
| log_group_id      | String                | <b>Definition:</b> Specifies the ID of the log group that is associated with the load balancer.<br><b>Range:</b> N/A                                                            |
| log_topic_id      | String                | <b>Definition:</b> Specifies the ID of the log topic that is associated with the load balancer.<br><b>Range:</b> N/A                                                            |
| custom_qos_limit  | CustomQosLimit object | <b>Definition:</b> Specifies the rate limit information of the ELB flavors.<br>This parameter is unsupported. Please do not use it.                                             |

**Table 5-96** PoolRef

| Parameter | Type   | Description                                                                    |
|-----------|--------|--------------------------------------------------------------------------------|
| id        | String | <b>Definition:</b> Specifies the backend server group ID.<br><b>Range:</b> N/A |

**Table 5-97** ListenerRef

| Parameter | Type   | Description                                                        |
|-----------|--------|--------------------------------------------------------------------|
| id        | String | <b>Definition:</b> Specifies the listener ID.<br><b>Range:</b> N/A |

**Table 5-98** Tag

| Parameter | Type   | Description                                                    |
|-----------|--------|----------------------------------------------------------------|
| key       | String | <b>Definition:</b> Specifies the tag key.<br><b>Range:</b> N/A |

| Parameter | Type   | Description                                                      |
|-----------|--------|------------------------------------------------------------------|
| value     | String | <b>Definition:</b> Specifies the tag value.<br><b>Range:</b> N/A |

**Table 5-99** EipInfo

| Parameter   | Type    | Description                                                                                                                                                           |
|-------------|---------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| eip_id      | String  | <b>Definition:</b> Specifies the EIP ID.<br><b>Range:</b> N/A                                                                                                         |
| eip_address | String  | <b>Definition:</b> Specifies the EIP.<br><b>Range:</b> N/A                                                                                                            |

| ep_service_id | String | <b>Definition:</b> Specifies the VPC endpoint service ID.<br><b>Constraints:</b> N/A<br><b>Range:</b> N/A<br><b>Default value:</b> N/A |

**Table 5-105** CustomQoSLimit

| Parameter | Type                  | Description                                                                            |
|-----------|-----------------------|----------------------------------------------------------------------------------------|
| l4        | <b>L4Limit</b> object | <b>Definition:</b> Specifies the rate limit information of the ELB flavors at Layer 4. |
| l7        | <b>L7Limit</b> object | <b>Definition:</b> Specifies the rate limit information of the ELB flavors at Layer 7. |

**Table 5-106** L4Limit

| Parameter  | Type    | Description                                                                                                |
|------------|---------|------------------------------------------------------------------------------------------------------------|
| connection | Integer | <b>Definition:</b> Specifies the maximum number of concurrent connections at Layer 4.<br><b>Range:</b> N/A |
| cps        | Integer | <b>Definition:</b> Specifies the maximum number of new connections at Layer 4.<br><b>Range:</b> N/A        |

**Table 5-107** L7Limit

| Parameter  | Type    | Description                                                                                                |
|------------|---------|------------------------------------------------------------------------------------------------------------|
| connection | Integer | <b>Definition:</b> Specifies the maximum number of concurrent connections at Layer 7.<br><b>Range:</b> N/A |
| cps        | Integer | <b>Definition:</b> Specifies the maximum number of new connections at Layer 7.<br><b>Range:</b> N/A        |

## Example Requests

Querying the details of a given load balancer

```
GET https://{ELB_Endpoint}/v3/060576782980d5762f9ec014dd2f1148/elb/loadbalancers/3dbde7e5-c277-4ea3-a424-edd339357eff
```

## Example Responses

**Status code: 200**

Successful request.

}
}
```

## More

For SDK sample code of more programming languages, see the Sample Code tab in [API Explorer](#). SDK sample code can be automatically generated.

## Status Codes

| Status Code | Description         |
|-------------|---------------------|
| 200         | Successful request. |

## Error Codes

See [Error Codes](#).

## 5.6.6 Updating a Load Balancer

### Function

This API is used to update a load balancer.

### Calling Method

For details, see [Calling APIs](#).

### URI

PUT /v3/{project\_id}/elb/loadbalancers/{loadbalancer\_id}

**Table 5-108** Path Parameters

| Parameter       | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                |

## 5.6.8 Deleting a Load Balancer and Its Associated Resources

### Function

This API is used to delete a load balancer and its associated resources, including the listeners, backend server groups, and backend servers.

Note:

- If a load balancer has EIPs bound to it, the EIPs will be unbound from the load balancer.
- If deletion protection is enabled for the load balancer, the load balancer and its associated resources cannot be deleted.
- If deletion protection is enabled for any backend server group of the load balancer, the load balancer and its associated resources cannot be deleted.

- If modification protection is enabled for the load balancer, the load balancer and its associated resources can be deleted.
- Backend server groups are either disassociated from the load balancer if they are associated with other load balancers or deleted if they are not associated with other load balancers.
- When shared load balancers are deleted, their backend server groups will only be deleted.

## Calling Method

For details, see [Calling APIs](#).

## URI

DELETE /v3/{project\_id}/elb/loadbalancers/{loadbalancer\_id}/force-elb

## Error Codes

See [Error Codes](#).

## 5.6.9 Deleting a Load Balancer and Its Associated Resources (Including EIPs)

### Function

This API is used to delete a load balancer and its associated resources, including the listeners, backend server groups, backend servers, and EIPs.

Note: Backend server groups are either disassociated from the load balancer if they are associated with other load balancers or deleted if they are not associated with other load balancers.

### Calling Method

For details, see [Calling APIs](#).

### URI

POST /v3/{project\_id}/elb/loadbalancers/{loadbalancer\_id}/delete-cascade

**Table 5-133** Path Parameters

## Error Codes

See [Error Codes](#).

## 5.6.11 Querying the Status Tree of a Load Balancer

### Function

This API is used to query the status tree of a load balancer and to show information about all resources associated with the load balancer.

When **admin\_state\_up** is set to **false** and **operating\_status** to **OFFLINE** for a backend server, **DISABLE** is returned for **operating\_status** of the backend server in the response of this API.

### Calling Method

For details, see [Calling APIs](#).

### URI

GET /v3/{project\_id}/elb/loadbalancers/{loadbalancer\_id}/statuses

## Example Requests

Querying the status tree of a load balancer

```
GET https://{ELB_Endpoint}/v3/{project_id}/elb/loadbalancers/38278031-cfca-44be-81be-a412f618773b/statuses
```

## Example Responses

**Status code: 200**

Successful request.

```

## More

For SDK sample code of more programming languages, see the Sample Code tab in [API Explorer](#). SDK sample code can be automatically generated.

## Status Codes

| Status Code | Description         |
|-------------|---------------------|
| 200         | Successful request. |

## Error Codes

See [Error Codes](#).

## 5.6.12 Querying the Topology of a Load Balancer

### Function

This API is used to query the topology of a load balancer. The topology includes the load balancer and its listeners and backend server groups.

### Calling Method

For details, see [Calling APIs](#).

### URI

GET /v3/{project\_id}/elb/loadbalancers/{loadbalancer\_id}/topology

**Table 5-152** Path Parameters

| Parameter       | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                |

| port_ranges   | Array of <b>PortRange</b> objects | <b>Definition:</b> Specifies one or more port ranges, including the start and end port numbers. A maximum of 10 port ranges can be specified. Port ranges cannot overlap with each other.<br><b>NOTE</b><br>This parameter can be specified only when <b>protocol_port</b> is set to <b>0</b> or <b>protocol_port</b> is not specified. |

**Table 5-161** PortRange

| Parameter  | Type    | Description                                                                                                                          |
|------------|---------|--------------------------------------------------------------------------------------------------------------------------------------|
| start_port | Integer | <b>Definition:</b> Specifies the start port number.<br><b>Constraints:</b> N/A<br><b>Range:</b> 1-65535<br><b>Default value:</b> N/A |

| Parameter | Type    | Description                                                                                                                                                                                      |
|-----------|---------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| end_port  | Integer | <b>Definition:</b> Specifies the end port number.<br><b>Constraints:</b> The value must be greater than or equal to the start port number.<br><b>Range:</b> 1-65535<br><b>Default value:</b> N/A |

**Table 5-162** PoolNode

| Parameter    | Type   | Description                                                                                                 |
|--------------|--------|-------------------------------------------------------------------------------------------------------------|
| id           | String | <b>Definition:</b> Specifies the backend server group ID.<br><b>Range:</b> N/A                              |
| name         | String | <b>Definition:</b> Specifies the backend server group name.<br><b>Range:</b> N/A                            |
| protocol     | String | <b>Definition:</b> Specifies the backend server group protocol.<br><b>Range:</b> N/A                        |
| type         | String | <b>Definition:</b> Specifies the backend server group type.<br><b>Range:</b> N/A                            |
| lb_algorithm | String | <b>Definition:</b> Specifies the load balancing algorithm of the backend server group.<br><b>Range:</b> N/A |

**Table 5-163** TopologyEdge

| Parameter | Type   | Description                                                                      |
|-----------|--------|----------------------------------------------------------------------------------|
| source    | String | <b>Definition:</b> Specifies the ID of the source resource.<br><b>Range:</b> N/A |
| target    | String | <b>Definition:</b> Specifies the ID of the target resource.<br><b>Range:</b> N/A |

| Parameter   | Type   | Description                                                                        |
|-------------|--------|------------------------------------------------------------------------------------|
| source_type | String | <b>Definition:</b> Specifies the type of the source resource.<br><b>Range:</b> N/A |
| target_type | String | <b>Definition:</b> Specifies the type of the target resource.<br><b>Range:</b> N/A |
| label       | String | <b>Definition:</b> Specifies the edge label information.<br><b>Range:</b> N/A      |
| label_id    | String | <b>Definition:</b> Specifies the label ID.<br><b>Range:</b> N/A                    |

**Table 5-164** TopologyLabels

| Parameter  | Type                                         | Description                                                 |
|------------|----------------------------------------------|-------------------------------------------------------------|
| l7policies | Array of <a href="#">PolicyLabel</a> objects | <b>Definition:</b> Specifies the forwarding policy details. |

**Table 5-165** PolicyLabel

| Parameter      | Type    | Description                                                                                |
|----------------|---------|--------------------------------------------------------------------------------------------|
| id             | String  | <b>Definition:</b> Specifies the forwarding policy ID.<br><b>Range:</b> N/A                |
| name           | String  | <b>Definition:</b> Specifies the forwarding policy name.<br><b>Range:</b> N/A              |
| priority       | String  | <b>Definition:</b> Specifies the forwarding policy priority.<br><b>Range:</b> N/A          |
| action         | String  | <b>Definition:</b> Specifies the forwarding policy action.<br><b>Range:</b> N/A            |
| admin_state_up | Boolean | <b>Definition:</b> Specifies whether to enable the forwarding policy.<br><b>Range:</b> N/A |

| Parameter | Type                                    | Description                                    |
|-----------|-----------------------------------------|------------------------------------------------|
| rules     | Array of <a href="#">L7Rule</a> objects | <b>Definition:</b> Lists the forwarding rules. |

**Table 5-166** L7Rule

| Parameter      | Type    | Description                                                                                                                                                                                                                                                                                                       |
|----------------|---------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| admin_state_up | Boolean | <b>Definition:</b> Specifies the administrative status of the forwarding rule.<br><b>Range:</b> The value can only be <b>true</b> .<br>This parameter is unsupported. Please do not use it.                                                                                                                       |
| compare_type   | String  | <b>Definition:</b> Specifies how requests are matched with the forwarding rule.<br><b>Range:</b> If <b>type</b> is set to <b>HOST_NAME</b> , this parameter can only be set to <b>EQUAL_TO</b> . If <b>type</b> is set to <b>PATH</b> , the value can be <b>REGEX</b> , <b>STARTS_WITH</b> , or <b>EQUAL_TO</b> . |
| key            | String  | <b>Definition:</b> Specifies the key of the match content.<br><b>Range:</b> N/A                                                                                                                                                                                                                                   |
| project_id     | String  | <b>Definition:</b> Specifies the ID of the project where the forwarding rule is used.<br><b>Range:</b> N/A                                                                                                                                                                                                        |

| Parameter | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

## Example Requests

Querying the topology of a load balancer

```
GET https://{ELB_Endpoint}/v3/{project_id}/elb/loadbalancers/38278031-cfca-44be-81be-a412f618773b/topology
```

## Example Responses

**Status code: 200**

Successful request.

| 200         | Successful request. |

## Error Codes

See [Error Codes](#).

## 5.6.13 Querying the IP Addresses Used by a Load Balancer to Forward Internal Requests

### Function

This API is used to query the IP addresses used by a load balancer to forward requests within a private network.

### Calling Method

For details, see [Calling APIs](#).

### URI

GET /v3/{project\_id}/elb/loadbalancers/{loadbalancer\_id}/local-ports

**Table 5-168** Path Parameters

| Parameter  | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                |
|------------|-----------|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| project_id | Yes       | String | <b>Definition:</b> Specifies the project ID. For details about how to obtain a project ID, see <a href="#">Obtaining a Project ID</a> .<br><b>Constraints:</b> N/A<br><b>Range:</b> The value can contain a maximum of 32 characters, including digits and lowercase letters.<br><b>Default value:</b> N/A |

| Parameter       | Mandatory | Type   | Description                                                                                                                     |

| type         | String | <b>Definition:</b> Specifies the port type.<br><b>Range:</b> <ul style="list-style-type: none"><li>• <b>l4_hc:</b> port used for health checks during Layer 4 traffic forwarding using DNAT.</li><li>• <b>l4:</b> port used for Layer 4 health checks and traffic forwarding using FullNAT.</li><li>• <b>l7:</b> port used for Layer 7 health checks and service forwarding.</li></ul> |
| virsubnet_id | String | <b>Definition:</b> Specifies the network ID of the downstream subnet where the port is located.<br><b>Range:</b> N/A                                                                                                                                                                                                                                                                   |

## Example Requests

Querying the ports used by a load balancer

```
GET https://{ELB_Endpoint}/v3/{project_id}/elb/loadbalancers/38278031-cfca-44be-81be-a412f618773b/local-ports
```

## Example Responses

**Status code: 200**

Successful request.

```
{
 "ports": [{
 "port_id": "b796e55e-988a-429e-a132-9245beb046e5",
 "ip_address": "192.168.1.2",
 "ipv6_address": "2420:2023:410:151:49c:7163:342a:3e3",
 "type": "l4_hc",
 "virsubnet_id": "4507af92-719f-4878-9394-6a6a6ba1dcbb"
 }]
}
```

## SDK Sample Code

The SDK sample code is as follows.

### Java

```
package com.huaweicloud.sdk.test;

}
```

## More

For SDK sample code of more programming languages, see the Sample Code tab in [API Explorer](#). SDK sample code can be automatically generated.

## Status Codes

| Status Code | Description         |
|-------------|---------------------|
| 200         | Successful request. |

## Error Codes

See [Error Codes](#).

## 5.6.14 Deploying a Load Balancer in Additional AZs

### Function

This API is used to deploy a load balancer in additional AZs.

### Constraints

This API is only available for dedicated load balancers.

### Calling Method

For details, see [Calling APIs](#).

### URI

POST /v3/{project\_id}/elb/loadbalancers/{loadbalancer\_id}/availability-zone/batch-add

**Table 5-173** Path Parameters

| Parameter       | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                |

|----------------------------|---------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ip_target_enable           | Boolean | <p><b>Definition:</b> Specifies whether to add backend servers that are not in the load balancer's VPC.</p> <p>If you set it to <b>true</b>, you can associate servers in a VPC connected through a VPC peering connection, in a VPC connected through a cloud connection, or in an on-premises data center at the other end of a Direct Connect or VPN connection, by using server IP addresses.</p> <p><b>Range:</b></p> <ul style="list-style-type: none"><li>• <b>true:</b> This option will be enabled.</li><li>• <b>false:</b> This option will be disabled.</li></ul> |
| frozen_scene               | String  | <p><b>Definition:</b> Specifies the scenario where the load balancer is frozen.</p> <p>If there are multiple scenarios, separate them with commas (,).</p> <p><b>Range:</b></p> <ul style="list-style-type: none"><li>• <b>ILLEGAL:</b> The load balancer is frozen due to violation of laws and regulations.</li><li>• <b>VERIFY:</b> Your account has not completed real-name authentication.</li><li>• <b>PARTNER:</b> The load balancer is frozen by the partner.</li><li>• <b>ARREAR:</b> The load balancer is frozen due to arrears.</li></ul>                         |
| deletion_protection_enable | Boolean | <p><b>Definition:</b> Specifies whether to enable deletion protection. This parameter is returned only when the deletion protection is enabled in the current region.</p> <p><b>Range:</b></p> <ul style="list-style-type: none"><li>• <b>false:</b> This option will be disabled.</li><li>• <b>true:</b> This option will be enabled.</li></ul>                                                                                                                                                                                                                             |

| Parameter           | Type                                  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|---------------------|---------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| autoscaling         | <a href="#">AutoscalingRef</a> object | <b>Definition:</b> Specifies information about elastic scaling. If elastic scaling is enabled, the load balancer flavors can be automatically adjusted based on incoming traffic.<br><b>NOTE</b><br>This parameter has been deprecated, but is retained for compatibility purposes. Using this parameter is not recommended. If this parameter is specified, the load balancer with minimum flavors will be created and you will be billed for the minimum flavors.            |
| public_border_group | String                                | <b>Definition:</b> Specifies the public border group.<br><b>Range:</b> <ul style="list-style-type: none"><li>• <b>center:</b> public border group of the central site</li><li>• Edge site name: public border group of an edge site</li></ul>                                                                                                                                                                                                                                  |
| charge_mode         | String                                | <b>Definition:</b> Specifies the charge mode of the load balancer.<br><b>Range:</b> <ul style="list-style-type: none"><li>• <b>flavor:</b> billed by the fixed flavor you select.</li><li>• <b>lcu:</b> billed by how many LCUs you have used.</li><li>• <b>Null:</b> If it is a shared load balancer, it is free. If it is a dedicated load balancer, it will be billed by the fixed flavor you select.</li></ul> <p>This parameter is unsupported. Please do not use it.</p> |
| service_lb_mode     | String                                | <b>Definition:</b> Specifies load balancer mode.<br><b>Range:</b> <ul style="list-style-type: none"><li>• <b>lb:</b> Cross-tenant access is not supported.</li><li>• <b>ep:</b> Cross-tenant access is supported.</li></ul> <p>This parameter is unsupported. Please do not use it.</p>                                                                                                                                                                                        |

| Parameter                 | Type                                                    | Description                                                                                                                                                                                                                                                 |
|---------------------------|---------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| instance_type             | String                                                  | <b>Definition:</b> Specifies the internal service to which the load balancer belongs.<br><b>Range:</b> N/A<br>This parameter is unsupported. Please do not use it.                                                                                          |
| instance_id               | String                                                  | <b>Definition:</b> Specifies the ID of the instance with which the load balancer is associated.<br><b>Range:</b> N/A<br>This parameter is unsupported. Please do not use it.                                                                                |
| proxy_protocol_extensions | Array of <a href="#">ProxyProtocolExtension</a> objects | <b>Definition:</b> Specifies the proxy protocol extension.<br>This parameter is unsupported. Please do not use it.                                                                                                                                          |
| waf_failure_action        | String                                                  | <b>Definition:</b> Specifies traffic distributing policies when the WAF is faulty.<br><b>Range:</b> <b>discard</b> indicates traffic will not be distributed. <b>forward</b> indicates traffic will be distributed to the default backend servers.          |
| protection_status         | String                                                  | <b>Definition:</b> Specifies the protection status.<br><b>Range:</b> <ul style="list-style-type: none"><li>• <b>nonProtection:</b> The resource is not protected.</li><li>• <b>consoleProtection:</b> Modification is not allowed on the console.</li></ul> |
| protection_reason         | String                                                  | <b>Definition:</b> Specifies why modification protection is enabled.<br><b>Range:</b> The value can contain a maximum of 255 Unicode characters, excluding angle brackets (<>).                                                                             |
| log_group_id              | String                                                  | <b>Definition:</b> Specifies the ID of the log group that is associated with the load balancer.<br><b>Range:</b> N/A                                                                                                                                        |
| log_topic_id              | String                                                  | <b>Definition:</b> Specifies the ID of the log topic that is associated with the load balancer.<br><b>Range:</b> N/A                                                                                                                                        |

| Parameter        | Type                                  | Description                                                                                                                         |
|------------------|---------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------|
| custom_qos_limit | <a href="#">CustomQosLimit</a> object | <b>Definition:</b> Specifies the rate limit information of the ELB flavors.<br>This parameter is unsupported. Please do not use it. |

**Table 5-178** PoolRef

| Parameter | Type   | Description                                                                    |
|-----------|--------|--------------------------------------------------------------------------------|
| id        | String | <b>Definition:</b> Specifies the backend server group ID.<br><b>Range:</b> N/A |

**Table 5-179** ListenerRef

| Parameter | Type   | Description                                                        |
|-----------|--------|--------------------------------------------------------------------|
| id        | String | <b>Definition:</b> Specifies the listener ID.<br><b>Range:</b> N/A |

**Table 5-180** Tag

| Parameter | Type   | Description                                                      |
|-----------|--------|------------------------------------------------------------------|
| key       | String | <b>Definition:</b> Specifies the tag key.<br><b>Range:</b> N/A   |
| value     | String | <b>Definition:</b> Specifies the tag value.<br><b>Range:</b> N/A |

**Table 5-181** EipInfo

| Parameter   | Type   | Description                                                   |
|-------------|--------|---------------------------------------------------------------|
| eip_id      | String | <b>Definition:</b> Specifies the EIP ID.<br><b>Range:</b> N/A |
| eip_address | String | <b>Definition:</b> Specifies the EIP.<br><b>Range:</b> N/A    |

| Parameter  | Type    | Description                                                                                                                                                           |

 "az2",
 "az3",
}
request.Body = &model.BatchAddAvailableZonesRequestBody{
 AvailabilityZoneList: listAvailabilityZoneListbody,
}
response, err := client.BatchAddAvailableZones(request)
if err == nil {
 fmt.Printf("%+v\n", response)
} else {
 fmt.Println(err)
}
```

## More

For SDK sample code of more programming languages, see the Sample Code tab in [API Explorer](#). SDK sample code can be automatically generated.

## Status Codes

| Status Code | Description         |
|-------------|---------------------|
| 200         | Successful request. |

## Error Codes

See [Error Codes](#).

## 5.6.15 Removing a Load Balancer from AZs

### Function

This API is used to remove a load balancer from one or more AZs where it is working.

 **NOTE**

Removing a load balancer from an AZ may disconnect existing connections.

## Constraints

- This API is only available for dedicated load balancers.
- You cannot remove a load balancer from all AZs where it is working.

## Calling Method

For details, see [Calling APIs](#).

## URI

POST /v3/{project\_id}/elb/loadbalancers/{loadbalancer\_id}/availability-zone/batch-remove

**Table 5-190** Path Parameters

| Parameter       | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                |

| Parameter           | Type                                  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|---------------------|---------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| autoscaling         | <a href="#">AutoscalingRef</a> object | <b>Definition:</b> Specifies information about elastic scaling. If elastic scaling is enabled, the load balancer flavors can be automatically adjusted based on incoming traffic.<br><b>NOTE</b><br>This parameter has been deprecated, but is retained for compatibility purposes. Using this parameter is not recommended. If this parameter is specified, the load balancer with minimum flavors will be created and you will be billed for the minimum flavors.            |
| public_border_group | String                                | <b>Definition:</b> Specifies the public border group.<br><b>Range:</b> <ul style="list-style-type: none"><li>• <b>center:</b> public border group of the central site</li><li>• Edge site name: public border group of an edge site</li></ul>                                                                                                                                                                                                                                  |

## Example Requests

Removing a load balancer from AZs

```
POST https://{ELB_Endpoint}/v3/060576782980d5762f9ec014dd2f1148/elb/loadbalancers/
9b663cd9-61e4-483d-b91f-92fc337fecec/availability-zone/batch-remove

{
 "availability_zone_list" : ["az2", "az3"]
}
```

## Example Responses

**Status code: 200**

Successful request.

## More

For SDK sample code of more programming languages, see the Sample Code tab in [API Explorer](#). SDK sample code can be automatically generated.

## Status Codes

| Status Code | Description         |
|-------------|---------------------|
| 200         | Successful request. |

## Error Codes

See [Error Codes](#).

## 5.6.16 Upgrading a Load Balancer

### Function

This API is used to upgrade a shared load balancer to a dedicated load balancer. Shared load balancers can be upgraded to dedicated load balancers, but dedicated load balancers cannot be downgraded to shared load balancers.

## Calling Method

For details, see [Calling APIs](#).

## URI

POST /v3/{project\_id}/elb/loadbalancers/{loadbalancer\_id}/upgrade

**Table 5-207** Path Parameters

| Parameter       | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                |
|-----------------|-----------|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

Table 5-210 Response body parameters

| Parameter  | Type   | Description                                                                                                                                                                          |
|------------|--------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| request_id | String | <b>Definition:</b> Specifies the request ID.<br><b>Range:</b> The value is automatically generated, and can contain characters including digits, lowercase letters, and hyphens (-). |
| job_id     | String | <b>Definition:</b> Specifies the upgrade task ID.<br><b>Range:</b> N/A                                                                                                               |

## Example Requests

Upgrading a shared load balancer with **action** set to **start**

```
POST https://{ELB_Endpoint}/v3/060576798a80d5762fafc01a9b5eedc7/elb/loadbalancers/2c0b5b97-221b-4136-afc2-15d6570f31cb/upgrade
```

```
{
 "action": "start",
 "availability_zone_list": ["AZ1"],
 "elb_virsubnet_ids": ["5eddf5a-f45f-46d7-9f2b-70dc669feff9"],
 "l4_flavor_id": "f3c46bc2-1304-40b4-902b-cefae3858d17",
 "l7_flavor_id": "1b333094-bd31-4cb8-97e2-ea762fde3576"
}
```

## Example Responses

**Status code: 202**

Successful request.

```
{
 "request_id": "841e0da7-5835-4130-9a47-01688f34a154",
 "job_id": "062804a2-9e39-4dde-bd9b-271859ee312b"
}
```

## SDK Sample Code

The SDK sample code is as follows.

### Java

Upgrading a shared load balancer with **action** set to **start**

```
package com.huaweicloud.sdk.test;

import com.huaweicloud.sdk.core.auth.ICredential;
import com.huaweicloud.sdk.core.auth.BasicCredentials;
import com.huaweicloud.sdk.core.exception.ConnectionException;
import com.huaweicloud.sdk.core.exception.RequestTimeoutException;
import com.huaweicloud.sdk.core.exception.ServiceResponseException;
import com.huaweicloud.sdk.elb.v3.region.ElbRegion;
import com.huaweicloud.sdk.elb.v3.*;
import com.huaweicloud.sdk.elb.v3.model.*;

import java.util.List;
import java.util.ArrayList;

public class UpgradeLoadbalancerSolution {

 public static void main(String[] args) {
 // The AK and SK used for authentication are hard-coded or stored in plaintext, which has great
 // security risks. It is recommended that the AK and SK be stored in ciphertext in configuration files or
 // environment variables and decrypted during use to ensure security.
 // In this example, AK and SK are stored in environment variables for authentication. Before running
 // this example, set environment variables CLOUD_SDK_AK and CLOUD_SDK_SK in the local environment
 String ak = System.getenv("CLOUD_SDK_AK");
 String sk = System.getenv("CLOUD_SDK_SK");

Status Codes

| Status Code | Description         |
|-------------|---------------------|
| 202         | Successful request. |

Error Codes

See [Error Codes](#).

5.6.17 Configuring User-defined Domain Name Resolution for a Load Balancer

Function

This API is used to configure user-defined domain name resolution for a load balancer.

Calling Method

For details, see [Calling APIs](#).

URI

POST /v3/{project\_id}/elb/loadbalancers/{loadbalancer\_id}/dns/user-defined-config

Table 5-211 Path Parameters

| Parameter  | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                |
|------------|-----------|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| project_id | Yes       | String | <b>Definition:</b> Specifies the project ID. For details about how to obtain a project ID, see <a href="#">Obtaining a Project ID</a> .<br><b>Constraints:</b> N/A<br><b>Range:</b> The value can contain a maximum of 32 characters, including digits and lowercase letters.<br><b>Default value:</b> N/A |

| Parameter       | Mandatory | Type   | Description                     |
|-----------------|-----------|--------|---------------------------------|
| loadbalancer_id | Yes       | String | Specifies the load balancer ID. |

## Request Parameters

**Table 5-212** Request header parameters

| Parameter    | Mandatory | Type   | Description                                                                                                                                      |
|--------------|-----------|--------|--------------------------------------------------------------------------------------------------------------------------------------------------|
| X-Auth-Token | Yes       | String | <b>Definition:</b> Specifies the token used for IAM authentication.<br><b>Constraints:</b> N/A<br><b>Range:</b> N/A<br><b>Default value:</b> N/A |

**Table 5-213** Request body parameters

| Parameter    | Mandatory | Type                                   | Description                                                                                                                                                                                               |
|--------------|-----------|----------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| loadbalancer | Yes       | UserDefinedDnsConfigRequestBody object | <b>Definition:</b> Specifies the request parameters for configuring user-defined domain name resolution for a load balancer.<br><b>Constraints:</b> N/A<br><b>Range:</b> N/A<br><b>Default value:</b> N/A |

**Table 5-214** UserDefinedDnsConfigRequestBody

| Parameter                 | Mandatory | Type    | Description                                                                                                                                                                                                                                                                                                               |
|---------------------------|-----------|---------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| public_domain_name_enable | No        | Boolean | <b>Definition:</b> Specifies whether to enable public domain name resolution.<br><b>Constraints:</b> N/A<br><b>Range:</b> <ul style="list-style-type: none"><li>• <b>true:</b> Enable public domain name resolution.</li><li>• <b>false:</b> Disable public domain name resolution.</li></ul> <b>Default value:</b> false |

| Parameter                  | Mandatory | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                    |
|----------------------------|-----------|---------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| public_dns_zone_name       | No        | String  | <b>Definition:</b> Specifies the public zone that will be used to generate public domain names for the load balancer.<br><b>Constraints:</b> Public domain names can only be generated based on public zones. If public domain name resolution is enabled, this parameter cannot be left blank. The public zone you specified must exist on the DNS console.<br><b>Range:</b> N/A<br><b>Default value:</b> N/A |
| public_dns_record_set_ttl  | No        | Integer | <b>Definition:</b> Specifies the cache duration of the public record set on a local DNS server. The longer the duration is, the slower the update takes effect. If your service address changes frequently, set TTL to a smaller value. Otherwise, set TTL to a larger value.<br><b>Constraints:</b> N/A<br><b>Range:</b> 1 to 2147483647<br><b>Default value:</b> 300                                         |

| Parameter  | Type    | Description                                                                                                                                                           |
|------------|---------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ip_version | Integer | <b>Definition:</b> Specifies the IP address version.<br><b>Range:</b> <ul style="list-style-type: none"><li>• 4: IPv4 addresses</li><li>• 6: IPv6 addresses</li></ul> |

## Example Requests

Configuring user-defined domain name resolution for a load balancer

POST https://{ELB\_Endpoint}/v3/{project\_id}/elb/loadbalancers/{loadbalancer\_id}/dns/user-defined-config

```
{
 "loadbalancer": {
 "public_dns_zone_name": "jpp.com",
 "public_domain_name_enable": true,
 "public_dns_record_set_ttl": 233333,
 "private_dns_zone_name": "jpp-internal.com",
 "private_domain_name_enable": true,
 "private_dns_record_set_ttl": 9999999,
 "private_dns_zone_type": "private"
 }
}
```

## Example Responses

**Status code: 200**

Successful request.

```
{
 "loadbalancer": [{
 "vip_address": "192.168.20.87"
 }, {
 "ipv6_vip_address": "2001:db8:a583:682::10"
 }, {
 "eips": null,
 "eip_id": "26000000-0000-0000-0000-000000000001",
 "eip_address": "10.185.106.199",
 "ip_version": 4
 }, {
 "global_eips": null,
 "global_eip_id": "26000000-0000-0000-0000-000000000001",
 "global_eip_address": "2001:db8:a583:682::11",
 "ip_version": 6
 }, {

}]
}
```

## Status Codes

| Status Code | Description         |
|-------------|---------------------|
| 200         | Successful request. |

## Error Codes

See [Error Codes](#).

## 5.6.18 Configuring System-defined Domain Name Resolution for a Load Balancer

### Function

This API is used to configure system-defined domain name resolution for a load balancer.

### Calling Method

For details, see [Calling APIs](#).

### URI

POST /v3/{project\_id}/elb/loadbalancers/{loadbalancer\_id}/dns/system-default-config

**Table 5-219** Path Parameters

| Parameter  | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                |
|------------|-----------|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| project_id | Yes       | String | <b>Definition:</b> Specifies the project ID. For details about how to obtain a project ID, see <a href="#">Obtaining a Project ID</a> .<br><b>Constraints:</b> N/A<br><b>Range:</b> The value can contain a maximum of 32 characters, including digits and lowercase letters.<br><b>Default value:</b> N/A |

| Parameter       | Mandatory | Type   | Description                     |
|-----------------|-----------|--------|---------------------------------|
| loadbalancer_id | Yes       | String | Specifies the load balancer ID. |

## Request Parameters

**Table 5-220** Request header parameters

| Parameter    | Mandatory | Type   | Description                                                                                                                                      |
|--------------|-----------|--------|--------------------------------------------------------------------------------------------------------------------------------------------------|
| X-Auth-Token | Yes       | String | <b>Definition:</b> Specifies the token used for IAM authentication.<br><b>Constraints:</b> N/A<br><b>Range:</b> N/A<br><b>Default value:</b> N/A |

**Table 5-221** Request body parameters

| Parameter    | Mandatory | Type                                                     | Description                                                                                                                    |
|--------------|-----------|----------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------|
| loadbalancer | Yes       | <a href="#">SystemDefaultDnsConfigRequestBody</a> object | <b>Definition:</b> Specifies the request parameters for configuring system-defined domain name resolution for a load balancer. |

**Table 5-222** SystemDefaultDnsConfigRequestBody

| Parameter                 | Mandatory | Type    | Description                                                                                                                                                                                                                                                                                                                                                            |
|---------------------------|-----------|---------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| public_dns_record_set_ttl | No        | Integer | <b>Definition:</b> Specifies the cache duration of the public record set on a local DNS server. The longer the duration is, the slower the update takes effect. If your service address changes frequently, set TTL to a smaller value. Otherwise, set TTL to a larger value.<br><b>Constraints:</b> N/A<br><b>Range:</b> 1 to 2147483647<br><b>Default value:</b> 300 |

| Parameter                  | Mandatory | Type    | Description                                                                                                                                                                                                                                                                                                                                                             |
|----------------------------|-----------|---------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| private_domain_name_enable | No        | Boolean | <b>Definition:</b> Specifies whether to enable private domain name resolution.<br><b>Constraints:</b> N/A<br><b>Range:</b> <ul style="list-style-type: none"><li>• <b>true:</b> Enable private domain name resolution.</li><li>• <b>false:</b> Disable private domain name resolution.</li></ul> <b>Default value:</b> false                                            |
| public_domain_name_enable  | No        | Boolean | <b>Definition:</b> Specifies whether to enable public domain name resolution.<br><b>Constraints:</b> N/A<br><b>Range:</b> <ul style="list-style-type: none"><li>• <b>true:</b> Enable public domain name resolution.</li><li>• <b>false:</b> Disable public domain name resolution.</li></ul> <b>Default value:</b> false                                               |
| private_dns_record_set_ttl | No        | Integer | <b>Definition:</b> Specifies the cache duration of the private record set on a local DNS server. The longer the duration is, the slower the update takes effect. If your service address changes frequently, set TTL to a smaller value. Otherwise, set TTL to a larger value.<br><b>Constraints:</b> N/A<br><b>Range:</b> 1 to 2147483647<br><b>Default value:</b> 300 |

## Response Parameters

Status code: 200

**Table 5-223** Response body parameters

| Parameter    | Type                                         | Description                                                                                                      |
|--------------|----------------------------------------------|------------------------------------------------------------------------------------------------------------------|
| loadbalancer | <a href="#">DnsConfigResponseBody</a> object | <b>Definition:</b> Specifies the response parameters for configuring domain name resolution for a load balancer. |

**Table 5-224** DnsConfigResponseBody

| Parameter                 | Type                                           | Description                                                                                                                                                                                                                                                                                                                                                                                                                        |

## Example Requests

Configuring system-defined domain name resolution for a load balancer

POST https://{ELB\_Endpoint}/v3/{project\_id}/elb/loadbalancers/{loadbalancer\_id}/dns/system-default-config

```
{
 "loadbalancer": {
 "public_domain_name_enable": true,
 "public_dns_record_set_ttl": 233333,
 "private_domain_name_enable": true,
 "private_dns_record_set_ttl": 9999999
 }
}
```

## Example Responses

**Status code: 200**

Successful request.

```
{
 "loadbalancer": [{
 "vip_address": "192.168.20.87"
 }, {
 "ipv6_vip_address": "2001:db8:a583:682::10"
 }, {
 "eips": null,
 "eip_id": "26000000-0000-0000-0000-000000000001",
 "eip_address": "10.185.106.199",
 "ip_version": 4
 }, {
 "global_eips": null,
 "global_eip_id": "26000000-0000-0000-0000-000000000001",
 "global_eip_address": "2001:db8:a583:682::11",

}]
}
```

## Status Codes

| Status Code | Description         |
|-------------|---------------------|
| 200         | Successful request. |

## Error Codes

See [Error Codes](#).

## 5.6.19 Querying the Domain Name Resolution Information of a Load Balancer

### Function

This API is used to query the domain name resolution information of a load balancer.

Note: If neither public nor private domain name resolution is enabled for the load balancer, an empty list is returned.

### Calling Method

For details, see [Calling APIs](#).

### URI

GET /v3/{project\_id}/elb/loadbalancers/{loadbalancer\_id}/dns/ips

**Table 5-227** Path Parameters

| Parameter  | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                |
|------------|-----------|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| project_id | Yes       | String | <b>Definition:</b> Specifies the project ID. For details about how to obtain a project ID, see <a href="#">Obtaining a Project ID</a> .<br><b>Constraints:</b> N/A<br><b>Range:</b> The value can contain a maximum of 32 characters, including digits and lowercase letters.<br><b>Default value:</b> N/A |

| Parameter       | Mandatory | Type   | Description                     |
|-----------------|-----------|--------|---------------------------------|
| loadbalancer_id | Yes       | String | Specifies the load balancer ID. |

## Request Parameters

**Table 5-228** Request header parameters

| Parameter    | Mandatory | Type   | Description                                                                                                                                      |
|--------------|-----------|--------|--------------------------------------------------------------------------------------------------------------------------------------------------|
| X-Auth-Token | Yes       | String | <b>Definition:</b> Specifies the token used for IAM authentication.<br><b>Constraints:</b> N/A<br><b>Range:</b> N/A<br><b>Default value:</b> N/A |

## Response Parameters

**Status code:** 200

**Table 5-229** Response body parameters

| Parameter | Type                                           | Description                                                          |
|-----------|------------------------------------------------|----------------------------------------------------------------------|
| ips       | Array of <a href="#">DnsIpResponse</a> objects | Specifies the domain name resolution information of a load balancer. |

**Table 5-230** DnsIpResponse

| Parameter | Type    | Description                                                                                                                                                                                                                                                                                                 |
|-----------|---------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| id        | String  | Specifies the ID of domain name resolution configured for the IP address.                                                                                                                                                                                                                                   |
| enable    | Boolean | <b>Definition:</b> Specifies whether domain name resolution is enabled for the IP address.<br><b>Range:</b> <ul style="list-style-type: none"><li><b>true:</b> Domain name resolution is enabled for the IP address.</li><li><b>false:</b> Domain name resolution is disabled for the IP address.</li></ul> |

| Parameter   | Type   | Description                                                                                                                                                                                                                                                                                                                   |
|-------------|--------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ip_address  | String | <b>Definition:</b> Specifies the IP address. It can be an IPv4 or IPv6 address.<br><b>Constraints:</b> The IP address must be a private or public IP address of the load balancer.                                                                                                                                            |
| type        | String | <b>Definition:</b> Specifies the IP address type.<br><b>Range:</b> <ul style="list-style-type: none"><li>• <b>vip</b>: private IP address</li><li>• <b>eip</b>: public IP address</li></ul>                                                                                                                                   |
| domain_name | String | <b>Definition:</b> Specifies the domain name that the IP address is mapped to.<br><b>Constraints:</b> <ul style="list-style-type: none"><li>• If the IP address is a private IP address, the value is a private domain name.</li><li>• If the IP address is a public IP address, the value is a public domain name.</li></ul> |
| created_at  | String | Specifies the creation time. The value must be a UTC time in the format of <i>yyyy-MM-dd'T'HH:mm:ss'Z'</i> .                                                                                                                                                                                                                  |
| updated_at  | String | Specifies the update time. The value must be a UTC time in the format of <i>yyyy-MM-dd'T'HH:mm:ss'Z'</i> .                                                                                                                                                                                                                    |

## Example Requests

Querying the domain name resolution information of a load balancer

```
GET https://{ELB_Endpoint}/v3/{project_id}/elb/loadbalancers/38278031-cfca-44be-81be-a412f618773b/dns/ips
```

## Example Responses

**Status code: 200**

Successful request.

```
{
 "ips": [{

| Parameter  | Type    | Description                                                                                                                                                                                                                                                                                                     |
|------------|---------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| id         | String  | Specifies the ID of domain name resolution configured for the IP address.                                                                                                                                                                                                                                       |
| enable     | Boolean | <b>Definition:</b> Specifies whether domain name resolution is enabled for the IP address.<br><b>Range:</b> <ul style="list-style-type: none"><li>• <b>true:</b> Domain name resolution is enabled for the IP address.</li><li>• <b>false:</b> Domain name resolution is disabled for the IP address.</li></ul> |
| ip_address | String  | <b>Definition:</b> Specifies the IP address. It can be an IPv4 or IPv6 address.<br><b>Constraints:</b> The IP address must be a private or public IP address of the load balancer.                                                                                                                              |

| Parameter   | Type   | Description                                                                                                                                                                                                                                                                                                                   |
|-------------|--------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| type        | String | <b>Definition:</b> Specifies the IP address type.<br><b>Range:</b> <ul style="list-style-type: none"><li>• <b>vip</b>: private IP address</li><li>• <b>eip</b>: public IP address</li></ul>                                                                                                                                   |
| domain_name | String | <b>Definition:</b> Specifies the domain name that the IP address is mapped to.<br><b>Constraints:</b> <ul style="list-style-type: none"><li>• If the IP address is a private IP address, the value is a private domain name.</li><li>• If the IP address is a public IP address, the value is a public domain name.</li></ul> |
| created_at  | String | Specifies the creation time. The value must be a UTC time in the format of <i>yyyy-MM-dd'T'HH:mm:ss'Z'</i> .                                                                                                                                                                                                                  |
| updated_at  | String | Specifies the update time. The value must be a UTC time in the format of <i>yyyy-MM-dd'T'HH:mm:ss'Z'</i> .                                                                                                                                                                                                                    |

## Example Requests

Enabling domain name resolution for IP addresses

POST https://{ELB\_Endpoint}/v3/{project\_id}/elb/loadbalancers/{loadbalancer\_id}/dns/ips/batch-enable

```
{
 "ips": [{
 "ip_address": "192.168.20.87"
 }, {
 "ip_address": "2001:db8:a583:682::10"
 }]
}
```

## Example Responses

**Status code: 200**

Successful request.

```
{
 "ips": [{
 "enable": true,
 "type": "vip",
 "ip_address": "192.168.20.87",
 "domain_name": "10000000-0000-0000-0000-000000000001-internal.elb.zuneitest.private.com",
 "id": "10000000-0000-0000-0000-000000000001"
 }, {
 "enable": true,
 "type": "eip",

```

```
"ip_address" : "2001:db8:a583:682::10",
"domain_name" : "10000000-0000-0000-0000-000000000001.elb.zuneit.test.public.com",
"id" : "10000000-0000-0000-0000-000000000002"
}]
}
```

## Status Codes

| Status Code | Description         |
|-------------|---------------------|
| 200         | Successful request. |

## Error Codes

See [Error Codes](#).

## 5.6.21 Disabling Domain Name Resolution for IP Addresses

### Function

This API is used to disable domain name resolution for IP addresses.

### Calling Method

For details, see [Calling APIs](#).

### URI

POST /v3/{project\_id}/elb/loadbalancers/{loadbalancer\_id}/dns/ips/batch-disable

**Table 5-238** Path Parameters

| Parameter       | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                |
|-----------------|-----------|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| project_id      | Yes       | String | <b>Definition:</b> Specifies the project ID. For details about how to obtain a project ID, see <a href="#">Obtaining a Project ID</a> .<br><b>Constraints:</b> N/A<br><b>Range:</b> The value can contain a maximum of 32 characters, including digits and lowercase letters.<br><b>Default value:</b> N/A |
| loadbalancer_id | Yes       | String | Specifies the load balancer ID.                                                                                                                                                                                                                                                                            |

## Request Parameters

**Table 5-239** Request header parameters

| Parameter    | Mandatory | Type   | Description                                                                                                                                      |
|--------------|-----------|--------|--------------------------------------------------------------------------------------------------------------------------------------------------|
| X-Auth-Token | Yes       | String | <b>Definition:</b> Specifies the token used for IAM authentication.<br><b>Constraints:</b> N/A<br><b>Range:</b> N/A<br><b>Default value:</b> N/A |

**Table 5-240** Request body parameters

| Parameter | Mandatory | Type                          | Description                                                                                                                                                                |

| updated_at  | String | Specifies the update time. The value must be a UTC time in the format of <i>yyyy-MM-dd'T'HH:mm:ss'Z'</i> .                                                                                                                                                                                                                    |

## Example Requests

Disabling domain name resolution for IP addresses

POST https://{ELB\_Endpoint}/v3/{project\_id}/elb/loadbalancers/{loadbalancer\_id}/dns/ips/batch-disable

```
{
 "ips": [{
 "ip_address": "192.168.20.87"
 }, {
 "ip_address": "2001:db8:a583:682::10"
 }]
}
```

## Example Responses

**Status code: 200**

Successful request.

```
{
 "ips": [{
 "enable": false,
 "type": "vip",
 "ip_address": "192.168.20.87",
 "domain_name": "10000000-0000-0000-0000-000000000001-internal.elb.zuneit.test.private.com",
 "id": "10000000-0000-0000-0000-000000000001"
 }, {
 "enable": false,
 "type": "eip",

```

```
"ip_address" : "2001:db8:a583:682::10",
"domain_name" : "10000000-0000-0000-0000-000000000001.elb.zuneit.test.public.com",
"id" : "10000000-0000-0000-0000-000000000002"
}]
}
```

## Status Codes

| Status Code | Description         |
|-------------|---------------------|
| 200         | Successful request. |

## Error Codes

See [Error Codes](#).

# Certificate

## 5.7.1 Creating a Certificate

### Function

This API is used to add a certificate for an HTTPS, TLS, or QUIC listener. You can use a certificate from Cloud Certificate & Manager (CCM) or use your own certificate.

### Calling Method

For details, see [Calling APIs](#).

### URI

POST /v3/{project\_id}/elb/certificates

## Request Parameters

**Table 5-246** Request header parameters

| Parameter    | Mandatory | Type   | Description                                                                                                                                      |
|--------------|-----------|--------|--------------------------------------------------------------------------------------------------------------------------------------------------|
| X-Auth-Token | Yes       | String | <b>Definition:</b> Specifies the token used for IAM authentication.<br><b>Constraints:</b> N/A<br><b>Range:</b> N/A<br><b>Default value:</b> N/A |

**Table 5-247** Request body parameters

| Parameter   | Mandatory | Type                           | Description                                                                                        |
|-------------|-----------|--------------------------------|----------------------------------------------------------------------------------------------------|
| certificate | Yes       | CreateCertificateOption object | <b>Definition:</b> Specifies the parameters for creating a certificate.<br><b>Constraints:</b> N/A |

**Table 5-248** CreateCertificateOption

| Parameter      | Mandatory | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                   |
|----------------|-----------|---------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| admin_state_up | No        | Boolean | <b>Definition:</b> Specifies the administrative status of the certificate. This parameter does not take effect whether it is set to <b>true</b> or <b>false</b> .<br><b>Constraints:</b> N/A<br><b>Range:</b> <ul style="list-style-type: none"><li>• <b>true:</b> The certificate is available.</li><li>• <b>false:</b> The certificate is unavailable.</li></ul> <b>Default value:</b> true |

| Parameter   | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                                  |
|-------------|-----------|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| certificate | No        | String | <b>Definition:</b> Specifies the certificate content.<br>It supports certificate chains with a maximum of 11 layers (including certificates and certificate chains).<br><b>Constraints:</b> N/A<br><b>Range:</b> The value must be PEM encoded, and can contain a maximum of 65,536 characters.<br><b>Default value:</b> N/A |
| description | No        | String | <b>Definition:</b> Provides supplementary information about the certificate.<br><b>Constraints:</b> N/A<br><b>Range:</b> 0 to 255 characters.<br><b>Default value:</b> N/A                                                                                                                                                   |

| Parameter | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-----------|-----------|--------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| domain    | No        | String | <p><b>Definition:</b> Specifies the domain names used by the server certificate.</p> <p><b>Constraints:</b> This parameter will take effect only when <b>type</b> is set to <b>server</b>. (For other types of certificates, this parameter can be specified but does not take effect.)</p> <p><b>Range:</b> The value can contain 0 to 10,000 characters and consists of multiple common domain names or wildcard domain names separated by commas. A maximum of 100 domain names are allowed.</p> <ul style="list-style-type: none"><li>• A common domain name consists of several labels separated by periods (.). Each label can contain a maximum of 63 characters, including letters, digits, and hyphens (-), and must start and end with a letter or digit. Example: www.test.com.</li><li>• A wildcard domain name is a domain name that starts with *. Example: *.test.com</li></ul> <p><b>Default value:</b> N/A</p> |
| name      | No        | String | <p><b>Definition:</b> Specifies the certificate name.</p> <p><b>Constraints:</b> N/A</p> <p><b>Range:</b> 0 to 255 characters.</p> <p><b>Default value:</b> N/A</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| Parameter   | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|-------------|-----------|--------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| private_key | No        | String | <p><b>Definition:</b> Specifies the private key of the server certificate.</p> <p><b>Constraints:</b></p> <ul style="list-style-type: none"><li>• This parameter is valid and mandatory only when <b>type</b> is set to <b>server</b> or <b>server_sm</b>.</li><li>• This parameter will be ignored if <b>type</b> is set to other values. The value must be PEM encoded and will not take effect.</li></ul> <p><b>Range:</b> The value must be PEM encoded, and can contain a maximum of 8,192 characters.</p> <p><b>Default value:</b> N/A</p> |
| project_id  | No        | String | <p><b>Definition:</b> Specifies the project ID. For details about how to obtain a project ID, see <a href="#">Obtaining a Project ID</a>.</p> <p><b>Constraints:</b> N/A</p> <p><b>Range:</b> The value can contain a maximum of 32 characters, including digits and lowercase letters.</p> <p><b>Default value:</b> N/A</p> <p><b>NOTE</b><br/>This parameter is invalid. The project ID in the URL is used.</p>                                                                                                                                |
| type        | No        | String | <p><b>Definition:</b> Specifies the certificate type.</p> <p><b>Constraints:</b> N/A</p> <p><b>Range:</b></p> <ul style="list-style-type: none"><li>• <b>server</b>: server certificates</li><li>• <b>client</b> CA certificates</li><li>• <b>server_sm</b>: server SM certificates</li></ul> <p><b>Default value:</b> <b>server</b></p>                                                                                                                                                                                                         |

| Parameter             | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                            |
|-----------------------|-----------|--------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| enterprise_project_id | No        | String | <b>Definition:</b> Specifies the ID of the enterprise project. If no enterprise project ID is specified during resource creation, 0 is returned, indicating that the resource belongs to the default enterprise project.<br><b>Constraints:</b> The enterprise project ID cannot be "", 0, or an enterprise project ID that does not exist.<br><b>Range:</b> N/A<br><b>Default value:</b> 0                                            |
| enc_certificate       | No        | String | <b>Definition:</b> Specifies the content of the server SM certificate.<br>It supports certificate chains with a maximum of 11 layers (including certificates and certificate chains).<br><b>Constraints:</b> This parameter is supported and mandatory only when <b>type</b> is set to <b>server_sm</b> .<br><b>Range:</b> The value must be PEM encoded, and can contain a maximum of 65,536 characters.<br><b>Default value:</b> N/A |
| enc_private_key       | No        | String | <b>Definition:</b> Specifies the private key of the server SM certificate.<br><b>Constraints:</b> This parameter is supported and mandatory only when <b>type</b> is set to <b>server_sm</b> .<br><b>Range:</b> The value must be PEM encoded, and can contain a maximum of 8,192 characters.<br><b>Default value:</b> N/A                                                                                                             |

| Parameter          | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|--------------------|-----------|--------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| scm_certificate_id | No        | String | <b>Definition:</b> Specifies the ID of the certificate managed on Cloud Certificate & Manager (CCM).<br><b>Constraints:</b> The system records only the certificate ID but does not verify its existence on CCM. In addition, you need to update the content of the corresponding certificate on CCM to the related parameters ( <b>certificate</b> , <b>private_key</b> , <b>enc_certificate</b> , and <b>enc_private_key</b> ) of the current API.<br><b>Range:</b> N/A<br><b>Default value:</b> N/A |
| source             | No        | String | <b>Definition:</b> Specifies the source of the certificate.<br><b>Constraints:</b> none<br><b>Range:</b> <ul style="list-style-type: none"><li>• <b>scm:</b> certificates from CCM</li><li>• If this parameter is left blank, self-signed certificates will be used.</li></ul> <b>Default value:</b> <b>scm</b> if <b>scm_certificate_id</b> is not empty. Otherwise, this parameter is left blank by default.                                                                                         |
| protection_status  | No        | String | <b>Definition:</b> Specifies the protection status.<br><b>Constraints:</b> N/A<br><b>Range:</b> <ul style="list-style-type: none"><li>• <b>nonProtection:</b> The resource is not protected.</li><li>• <b>consoleProtection:</b> Modification is not allowed on the console.</li></ul> <b>Default value:</b> <b>nonProtection</b>                                                                                                                                                                      |

| Parameter         | Mandatory | Type   | Description                                                                                                                                                                                                                                   |
|-------------------|-----------|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| protection_reason | No        | String | <b>Definition:</b> Specifies why modification protection is enabled.<br><b>Constraints:</b> This parameter is valid only when <b>protection_status</b> is set to <b>consoleProtection</b> .<br><b>Range:</b> N/A<br><b>Default value:</b> N/A |

## Response Parameters

Status code: 201

**Table 5-249** Response body parameters

| Parameter   | Type                          | Description                                                                                                                                                                          |
|-------------|-------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| request_id  | String                        | <b>Definition:</b> Specifies the request ID.<br><b>Range:</b> The value is automatically generated, and can contain characters including digits, lowercase letters, and hyphens (-). |
| certificate | <b>CertificateInfo</b> object | Specifies the certificate.                                                                                                                                                           |

**Table 5-250** CertificateInfo

| Parameter      | Type    | Description                                                                                                                                                                                                                                                                                                                             |
|----------------|---------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| admin_state_up | Boolean | <b>Definition:</b> Specifies the administrative status of the certificate. This parameter does not take effect whether it is set to <b>true</b> or <b>false</b> .<br><b>Range:</b> <ul style="list-style-type: none"><li>• <b>true:</b> The certificate is available.</li><li>• <b>false:</b> The certificate is unavailable.</li></ul> |

| Parameter   | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|-------------|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| certificate | String | <b>Definition:</b> Specifies the certificate content.<br><br>It supports certificate chains with a maximum of 11 layers (including certificates and certificate chains).<br><b>Range:</b> The value must be PEM encoded, and can contain a maximum of 65,536 characters.                                                                                                                                                                                                                                                                                                                                                                                                     |
| description | String | <b>Definition:</b> Provides supplementary information about the certificate.<br><b>Range:</b> 0 to 255 characters.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| domain      | String | <b>Definition:</b> Specifies the domain names used by the server certificate.<br><b>Range:</b> The value can contain 0 to 10,000 characters and consists of multiple common domain names or wildcard domain names separated by commas. A maximum of 100 domain names are allowed. <ul style="list-style-type: none"><li>• A common domain name consists of several labels separated by periods (.). Each label can contain a maximum of 63 characters, including letters, digits, and hyphens (-), and must start and end with a letter or digit. Example: www.test.com.</li><li>• A wildcard domain name is a domain name that starts with *. Example: *.test.com</li></ul> |
| id          | String | <b>Definition:</b> Specifies the certificate ID.<br><b>Range:</b> The value consists of 32 digits and lowercase letters.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| name        | String | <b>Definition:</b> Specifies the certificate name.<br><b>Range:</b> 0 to 255 characters.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| private_key | String | <b>Definition:</b> Specifies the private key of the server certificate.<br><b>Range:</b> The value must be PEM encoded, and can contain a maximum of 8,192 characters.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| Parameter          | Type   | Description                                                                                                                                                                                                                                                                          |
|--------------------|--------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

## SDK Sample Code

The SDK sample code is as follows.

### Java

Creating a server certificate and specifying the private key used by the HTTPS listener

```
package com.huaweicloud.sdk.test;

import com.huaweicloud.sdk.core.auth.ICredential;
import com.huaweicloud.sdk.core.auth.BasicCredentials;
import com.huaweicloud.sdk.core.exception.ConnectionException;
import com.huaweicloud.sdk.core.exception.RequestTimeoutException;
import com.huaweicloud.sdk.core.exception.ServiceResponseException;
import com.huaweicloud.sdk.elb.v3.region.ElbRegion;
```

```
import com.huaweicloud.sdk.elb.v3.*;
import com.huaweicloud.sdk.elb.v3.model.*;

public class CreateCertificateSolution {

 public static void main(String[] args) {
 // The AK and SK used for authentication are hard-coded or stored in plaintext, which has great
 // security risks. It is recommended that the AK and SK be stored in ciphertext in configuration files or
 // environment variables and decrypted during use to ensure security.
 // In this example, AK and SK are stored in environment variables for authentication. Before running
 // this example, set environment variables CLOUD_SDK_AK and CLOUD_SDK_SK in the local environment
 String ak = System.getenv("CLOUD_SDK_AK");
 String sk = System.getenv("CLOUD_SDK_SK");
 String projectId = "{project_id}";

 ICredential auth = new BasicCredentials()
 .withProjectId(projectId)
 .withAk(ak)
 .withSk(sk);

 ElbClient client = ElbClient.newBuilder()
 .withCredential(auth)
 .withRegion(ElbRegion.valueOf("<YOUR REGION>"))
 .build();
 CreateCertificateRequest request = new CreateCertificateRequest();
 CreateCertificateRequestBody body = new CreateCertificateRequestBody();
 CreateCertificateOption certificatebody = new CreateCertificateOption();
 certificatebody.withCertificate("-----BEGIN CERTIFICATE-----

## Python

Creating a server certificate and specifying the private key used by the HTTPS listener

```
coding: utf-8

import os
from huaweicloudsdkcore.auth.credentials import BasicCredentials
from huaweicloudskelb.v3.region.elb_region import ElbRegion
from huaweicloudsdkcore.exceptions import exceptions
from huaweicloudskelb.v3 import *

if __name__ == "__main__":
 # The AK and SK used for authentication are hard-coded or stored in plaintext, which has great security
 # risks. It is recommended that the AK and SK be stored in ciphertext in configuration files or environment
 # variables and decrypted during use to ensure security.
 # In this example, AK and SK are stored in environment variables for authentication. Before running this
 # example, set environment variables CLOUD_SDK_AK and CLOUD_SDK_SK in the local environment
 ak = os.environ["CLOUD_SDK_AK"]
 sk = os.environ["CLOUD_SDK_SK"]
 projectId = "{project_id}"

 credentials = BasicCredentials(ak, sk, projectId)

 client = ElbClient.new_builder() \
 .with_credentials(credentials) \
 .with_region(ElbRegion.value_of("<YOUR REGION>")) \
 .build()

## Go

Creating a server certificate and specifying the private key used by the HTTPS listener

```
package main
```

```
import (
```

```
 "fmt"
```

```
 "github.com/huaweicloud/huaweicloud-sdk-go-v3/core/auth/basic"
```

```
 elb "github.com/huaweicloud/huaweicloud-sdk-go-v3/services/elb/v3"
```

```
 "github.com/huaweicloud/huaweicloud-sdk-go-v3/services/elb/v3/model"
```

```
 region "github.com/huaweicloud/huaweicloud-sdk-go-v3/services/elb/v3/region"
```

```
)
```

```
func main() {
```

```
 // The AK and SK used for authentication are hard-coded or stored in plaintext, which has great security
 risks. It is recommended that the AK and SK be stored in ciphertext in configuration files or environment
 variables and decrypted during use to ensure security.
```

```
// In this example, AK and SK are stored in environment variables for authentication. Before running this
example, set environment variables CLOUD_SDK_AK and CLOUD_SDK_SK in the local environment
ak := os.Getenv("CLOUD_SDK_AK")
sk := os.Getenv("CLOUD_SDK_SK")
projectId := "{project_id}"

auth := basic.NewCredentialsBuilder().
 WithAk(ak).
 WithSk(sk).
 WithProjectId(projectId).
 Build()

client := elb.NewElbClient(
 elb.ElClientBuilder().
 WithRegion(region.ValueOf("<YOUR REGION>")).
 WithCredential(auth).
 Build())

## More

For SDK sample code of more programming languages, see the Sample Code tab in [API Explorer](#). SDK sample code can be automatically generated.

## Status Codes

| Status Code | Description         |
|-------------|---------------------|
| 201         | Successful request. |

## Error Codes

See [Error Codes](#).

## 5.7.2 Querying Certificates

### Function

This API is used to query the certificates used by the load balancer.

### Constraints

This API has the following constraints:

- Parameters **marker**, **limit**, and **page\_reverse** are used for pagination query.
- Parameters **marker** and **page\_reverse** take effect only when they are used together with parameter **limit**.

### Calling Method

For details, see [Calling APIs](#).

### URI

GET /v3/{project\_id}/elb/certificates

**Table 5-251** Path Parameters

| Parameter  | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                |
|------------|-----------|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

## Request Parameters

**Table 5-253** Request header parameters

| Parameter    | Mandatory | Type   | Description                                                                                                                                      |
|--------------|-----------|--------|--------------------------------------------------------------------------------------------------------------------------------------------------|
| X-Auth-Token | Yes       | String | <b>Definition:</b> Specifies the token used for IAM authentication.<br><b>Constraints:</b> N/A<br><b>Range:</b> N/A<br><b>Default value:</b> N/A |

## Response Parameters

**Status code:** 200**Table 5-254** Response body parameters

| Parameter    | Type                                    | Description                                                                                                                                                                          |
|--------------|-----------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| request_id   | String                                  | <b>Definition:</b> Specifies the request ID.<br><b>Range:</b> The value is automatically generated, and can contain characters including digits, lowercase letters, and hyphens (-). |
| page_info    | <b>PageInfo</b> object                  | <b>Definition:</b> Specifies the pagination information.                                                                                                                             |
| certificates | Array of <b>CertificateInfo</b> objects | <b>Definition:</b> Lists the certificates.                                                                                                                                           |

**Table 5-255** PageInfo

| Parameter       | Type   | Description                                                                                                                                                                                                                          |
|-----------------|--------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| previous_marker | String | <b>Definition:</b> Specifies the ID of the first record in the pagination query result. If <b>page_reverse</b> is set to <b>true</b> , this parameter is used together to query resources on the previous page.<br><b>Range:</b> N/A |

| Parameter     | Type    | Description                                                                                                                                                         |
|---------------|---------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| next_marker   | String  | <b>Definition:</b> Specifies the ID of the last record in the pagination query result. It is usually used to query resources on the next page.<br><b>Range:</b> N/A |
| current_count | Integer | <b>Definition:</b> Specifies the number of records returned on the current page.<br><b>Range:</b> N/A                                                               |

**Table 5-256** CertificateInfo

| Parameter      | Type    | Description                                                                                                                                                                                                                                                                                                                             |
|----------------|---------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| admin_state_up | Boolean | <b>Definition:</b> Specifies the administrative status of the certificate. This parameter does not take effect whether it is set to <b>true</b> or <b>false</b> .<br><b>Range:</b> <ul style="list-style-type: none"><li>• <b>true:</b> The certificate is available.</li><li>• <b>false:</b> The certificate is unavailable.</li></ul> |
| certificate    | String  | <b>Definition:</b> Specifies the certificate content.<br>It supports certificate chains with a maximum of 11 layers (including certificates and certificate chains).<br><b>Range:</b> The value must be PEM encoded, and can contain a maximum of 65,536 characters.                                                                    |
| description    | String  | <b>Definition:</b> Provides supplementary information about the certificate.<br><b>Range:</b> 0 to 255 characters.                                                                                                                                                                                                                      |

| Parameter   | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|-------------|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| domain      | String | <b>Definition:</b> Specifies the domain names used by the server certificate.<br><b>Range:</b> The value can contain 0 to 10,000 characters and consists of multiple common domain names or wildcard domain names separated by commas. A maximum of 100 domain names are allowed. <ul style="list-style-type: none"><li>• A common domain name consists of several labels separated by periods (.). Each label can contain a maximum of 63 characters, including letters, digits, and hyphens (-), and must start and end with a letter or digit. Example: www.test.com.</li><li>• A wildcard domain name is a domain name that starts with *. Example: *.test.com</li></ul> |
| id          | String | <b>Definition:</b> Specifies the certificate ID.<br><b>Range:</b> The value consists of 32 digits and lowercase letters.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| name        | String | <b>Definition:</b> Specifies the certificate name.<br><b>Range:</b> 0 to 255 characters.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| private_key | String | <b>Definition:</b> Specifies the private key of the server certificate.<br><b>Range:</b> The value must be PEM encoded, and can contain a maximum of 8,192 characters.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| type        | String | <b>Definition:</b> Specifies the certificate type.<br><b>Range:</b> <ul style="list-style-type: none"><li>• <b>server:</b> server certificates</li><li>• <b>client</b> CA certificates</li><li>• <b>server_sm:</b> server SM certificates</li></ul>                                                                                                                                                                                                                                                                                                                                                                                                                          |
| created_at  | String | <b>Definition:</b> Specifies the creation time.<br><b>Range:</b> The value must be a UTC time in the <i>yyyy-MM-dd'T'HH:mm:ss'Z'</i> format.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| Parameter                 | Type             | Description                                                                                                                                                                                                                                                                          |
|---------------------------|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| updated_at                | String           | <b>Definition:</b> Specifies the update time.<br><b>Range:</b> The value must be a UTC time in the <i>yyyy-MM-dd'T'HH:mm:ss'Z'</i> format.                                                                                                                                           |
| expire_time               | String           | <b>Definition:</b> Specifies the time when the certificate expires.<br><b>Range:</b> The value must be a UTC time in the <i>yyyy-MM-dd'T'HH:mm:ss'Z'</i> format.                                                                                                                     |
| project_id                | String           | <b>Definition:</b> Specifies the project ID. For details about how to obtain a project ID, see <a href="#">Obtaining a Project ID</a> .<br><b>Range:</b> The value can contain a maximum of 32 characters, including digits and lowercase letters.                                   |
| enc_certificate           | String           | <b>Definition:</b> Specifies the content of the server SM certificate.<br>It supports certificate chains with a maximum of 11 layers (including certificates and certificate chains).<br><b>Range:</b> The value must be PEM encoded, and can contain a maximum of 65536 characters. |
| enc_private_key           | String           | <b>Definition:</b> Specifies the private key of the server SM certificate.<br><b>Range:</b> The value must be PEM encoded, and can contain a maximum of 8,192 characters.                                                                                                            |
| scm_certificate_id        | String           | <b>Definition:</b> Specifies the ID of the certificate managed on Cloud Certificate & Manager (CCM).<br><b>Range:</b> N/A                                                                                                                                                            |
| common_name               | String           | <b>Definition:</b> Specifies the primary domain name of the certificate.<br><b>Range:</b> N/A                                                                                                                                                                                        |
| fingerprint               | String           | <b>Definition:</b> Specifies the fingerprint of the certificate.<br><b>Range:</b> N/A                                                                                                                                                                                                |
| subject_alternative_names | Array of strings | <b>Definition:</b> Specifies all the domain names of the certificate.<br><b>Range:</b> N/A                                                                                                                                                                                           |

| Parameter             | Type   | Description                                                                                                                                                                                                                                                                       |
|-----------------------|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| source                | String | <b>Definition:</b> Specifies the source of the certificate.<br><b>Range:</b> <ul style="list-style-type: none"><li>• <b>scm:</b> certificates from CCM</li><li>• If this parameter is left blank, self-signed certificates will be used.</li></ul>                                |
| protection_status     | String | <b>Definition:</b> Specifies the protection status.<br><b>Range:</b> <ul style="list-style-type: none"><li>• <b>nonProtection:</b> The resource is not protected.</li><li>• <b>consoleProtection:</b> Modification is not allowed on the console.</li></ul>                       |
| protection_reason     | String | <b>Definition:</b> Specifies why modification protection is enabled.<br><b>Range:</b> N/A                                                                                                                                                                                         |
| enterprise_project_id | String | <b>Definition:</b> Specifies the ID of the enterprise project.<br><b>Range:</b> <ul style="list-style-type: none"><li>• <b>0:</b> The resource belongs to the default enterprise project.</li><li>• A string in UUID format indicates a non-default enterprise project.</li></ul> |

## Example Requests

Querying certificates

```
GET https://{ELB_Endpoint}/v3/{project_id}/elb/certificates
```

## Example Responses

**Status code: 200**

Successful request.

 } else {
 fmt.Println(err)
 }
}
```

## More

For SDK sample code of more programming languages, see the Sample Code tab in [API Explorer](#). SDK sample code can be automatically generated.

## Status Codes

| Status Code | Description         |
|-------------|---------------------|
| 200         | Successful request. |

## Error Codes

See [Error Codes](#).

## 5.7.3 Querying the Details of a Certificate

### Function

This API is used to query the details of a certificate used by the load balancer.

## Calling Method

For details, see [Calling APIs](#).

## URI

GET /v3/{project\_id}/elb/certificates/{certificate\_id}

**Table 5-257** Path Parameters

| Parameter      | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                |

## Example Requests

Querying the details of a certificate

```
GET https://{ELB_Endpoint}/v3/99a3fff0d03c428eac3678da6a7d0f24/elb/certificates/
5494a835d88f40ff940554992f2f04d4
```

## Example Responses

**Status code: 200**

Successful request.

## SDK Sample Code

The SDK sample code is as follows.

### Java

```
package com.huaweicloud.sdk.test;

import com.huaweicloud.sdk.core.auth.ICredential;
import com.huaweicloud.sdk.core.auth.BasicCredentials;
import com.huaweicloud.sdk.core.exception.ConnectionException;
import com.huaweicloud.sdk.core.exception.RequestTimeoutException;
import com.huaweicloud.sdk.core.exception.ServiceResponseException;
import com.huaweicloud.sdk.elb.v3.region.ElbRegion;
```

```
import com.huaweicloud.sdk.elb.v3.*;
import com.huaweicloud.sdk.elb.v3.model.*;

public class ShowCertificateSolution {

 public static void main(String[] args) {
 // The AK and SK used for authentication are hard-coded or stored in plaintext, which has great
 // security risks. It is recommended that the AK and SK be stored in ciphertext in configuration files or
 // environment variables and decrypted during use to ensure security.
 // In this example, AK and SK are stored in environment variables for authentication. Before running
 // this example, set environment variables CLOUD_SDK_AK and CLOUD_SDK_SK in the local environment
 String ak = System.getenv("CLOUD_SDK_AK");
 String sk = System.getenv("CLOUD_SDK_SK");
 String projectId = "{project_id}";

 ICredential auth = new BasicCredentials()
 .withProjectId(projectId)
 .withAk(ak)
 .withSk(sk);

 ElbClient client = ElbClient.newBuilder()
 .withCredential(auth)
 .withRegion(ElbRegion.valueOf("<YOUR REGION>"))
 .build();
 ShowCertificateRequest request = new ShowCertificateRequest();
 request.withCertificateId("{certificate_id}");
 try {
 ShowCertificateResponse response = client.showCertificate(request);
 System.out.println(response.toString());
 } catch (ConnectionException e) {
 e.printStackTrace();

 elb.ElbClientBuilder().
 WithRegion(region.ValueOf("<YOUR REGION>")).
 WithCredential(auth).
 Build())

 request := &model.ShowCertificateRequest{}
 request.CertificateId = "{certificate_id}"
 response, err := client.ShowCertificate(request)
 if err == nil {
 fmt.Printf("%+v\n", response)
 } else {
 fmt.Println(err)
 }
}
```

## More

For SDK sample code of more programming languages, see the Sample Code tab in [API Explorer](#). SDK sample code can be automatically generated.

## Status Codes

| Status Code | Description         |
|-------------|---------------------|
| 200         | Successful request. |

## Error Codes

See [Error Codes](#).

## 5.7.4 Updating a Certificate

### Function

This API is used to update a certificate used by the load balancer. You can update the certificate content and private key, but not the certificate type.

Note: Updating a certificate will affect the associated listeners.

### Constraints

If a certificate with a domain name is used by a listener, the domain name cannot be updated to an empty string (""), and the system returns the 409 Conflict status code.

### Calling Method

For details, see [Calling APIs](#).

### URI

PUT /v3/{project\_id}/elb/certificates/{certificate\_id}

**Table 5-261** Path Parameters

| Parameter      | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                |
|----------------|-----------|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| certificate_id | Yes       | String | Specifies a certificate ID.                                                                                                                                                                                                                                                                                |
| project_id     | Yes       | String | <b>Definition:</b> Specifies the project ID. For details about how to obtain a project ID, see <a href="#">Obtaining a Project ID</a> .<br><b>Constraints:</b> N/A<br><b>Range:</b> The value can contain a maximum of 32 characters, including digits and lowercase letters.<br><b>Default value:</b> N/A |

## Request Parameters

**Table 5-262** Request header parameters

| Parameter    | Mandatory | Type   | Description                                                                                                                                      |
|--------------|-----------|--------|--------------------------------------------------------------------------------------------------------------------------------------------------|
| X-Auth-Token | Yes       | String | <b>Definition:</b> Specifies the token used for IAM authentication.<br><b>Constraints:</b> N/A<br><b>Range:</b> N/A<br><b>Default value:</b> N/A |

**Table 5-263** Request body parameters

| Parameter   | Mandatory | Type                                           | Description                                                                                        |
|-------------|-----------|------------------------------------------------|----------------------------------------------------------------------------------------------------|
| certificate | Yes       | <a href="#">UpdateCertificateOption</a> object | <b>Definition:</b> Specifies the parameters for updating a certificate.<br><b>Constraints:</b> N/A |

**Table 5-264** UpdateCertificateOption

| Parameter   | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                                 |
|-------------|-----------|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| certificate | No        | String | <b>Definition:</b> Specifies the certificate content.<br>It supports certificate chains with a maximum of 11 layers (including certificates and certificate chains).<br><b>Constraints:</b> N/A<br><b>Range:</b> The value must be PEM encoded, and can contain a maximum of 65536 characters.<br><b>Default value:</b> N/A |
| description | No        | String | <b>Definition:</b> Provides supplementary information about the certificate.<br><b>Constraints:</b> N/A<br><b>Range:</b> 0 to 255 characters.<br><b>Default value:</b> N/A                                                                                                                                                  |

| Parameter   | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| Parameter          | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|--------------------|-----------|--------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| enc_certificate    | No        | String | <b>Definition:</b> Specifies the content of the server SM certificate.<br><br>It supports certificate chains with a maximum of 11 layers (including certificates and certificate chains).<br><b>Constraints:</b> This parameter is supported only when <b>type</b> is set to <b>server_sm</b> .<br><b>Range:</b> The value must be PEM encoded, and can contain a maximum of 65,536 characters.<br><b>Default value:</b> N/A                                                                           |
| enc_private_key    | No        | String | <b>Definition:</b> Specifies the private key of the server SM certificate.<br><b>Constraints:</b> This parameter is supported only when <b>type</b> is set to <b>server_sm</b> .<br><b>Range:</b> The value must be PEM encoded, and can contain a maximum of 8,192 characters.<br><b>Default value:</b> N/A                                                                                                                                                                                           |
| scm_certificate_id | No        | String | <b>Definition:</b> Specifies the ID of the certificate managed on Cloud Certificate & Manager (CCM).<br><b>Constraints:</b> The system records only the certificate ID but does not verify its existence on CCM. In addition, you need to update the content of the corresponding certificate on CCM to the related parameters ( <b>certificate</b> , <b>private_key</b> , <b>enc_certificate</b> , and <b>enc_private_key</b> ) of the current API.<br><b>Range:</b> N/A<br><b>Default value:</b> N/A |

| Parameter         | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                      |
|-------------------|-----------|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| source            | No        | String | <b>Definition:</b> Specifies the source of the certificate.<br><b>Constraints:</b> none<br><b>Range:</b> <ul style="list-style-type: none"><li>• <b>scm:</b> certificates from CCM</li><li>• If this parameter is left blank, self-signed certificates will be used.</li></ul> <b>Default value:</b> N/A         |
| protection_status | No        | String | <b>Definition:</b> Specifies the protection status.<br><b>Constraints:</b> N/A<br><b>Range:</b> <ul style="list-style-type: none"><li>• <b>nonProtection:</b> The resource is not protected.</li><li>• <b>consoleProtection:</b> Modification is not allowed on the console.</li></ul> <b>Default value:</b> N/A |
| protection_reason | No        | String | <b>Definition:</b> Specifies why modification protection is enabled.<br><b>Constraints:</b> This parameter is valid only when <b>protection_status</b> is set to <b>consoleProtection</b> .<br><b>Range:</b> N/A<br><b>Default value:</b> N/A                                                                    |

## Response Parameters

Status code: 200

Table 5-265 Response body parameters

| Parameter  | Type   | Description                                                                                                                                                                          |
|------------|--------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| request_id | String | <b>Definition:</b> Specifies the request ID.<br><b>Range:</b> The value is automatically generated, and can contain characters including digits, lowercase letters, and hyphens (-). |

| Parameter   | Type                                   | Description                                                                                                |
|-------------|----------------------------------------|------------------------------------------------------------------------------------------------------------|
| certificate | <a href="#">CertificateInfo</a> object | <b>Definition:</b> Specifies the certificate information. The certificate is defined by the sub-parameter. |

Table 5-266 CertificateInfo

| Parameter      | Type    | Description                                                                                                                                                                                                                                                                                                                             |
|----------------|---------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| admin_state_up | Boolean | <b>Definition:</b> Specifies the administrative status of the certificate. This parameter does not take effect whether it is set to <b>true</b> or <b>false</b> .<br><b>Range:</b> <ul style="list-style-type: none"><li>• <b>true:</b> The certificate is available.</li><li>• <b>false:</b> The certificate is unavailable.</li></ul> |
| certificate    | String  | <b>Definition:</b> Specifies the certificate content.<br>It supports certificate chains with a maximum of 11 layers (including certificates and certificate chains).<br><b>Range:</b> The value must be PEM encoded, and can contain a maximum of 65,536 characters.                                                                    |
| description    | String  | <b>Definition:</b> Provides supplementary information about the certificate.<br><b>Range:</b> 0 to 255 characters.                                                                                                                                                                                                                      |

| Parameter   | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|-------------|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| domain      | String | <b>Definition:</b> Specifies the domain names used by the server certificate.<br><b>Range:</b> The value can contain 0 to 10,000 characters and consists of multiple common domain names or wildcard domain names separated by commas. A maximum of 100 domain names are allowed. <ul style="list-style-type: none"><li>• A common domain name consists of several labels separated by periods (.). Each label can contain a maximum of 63 characters, including letters, digits, and hyphens (-), and must start and end with a letter or digit. Example: www.test.com.</li><li>• A wildcard domain name is a domain name that starts with *. Example: *.test.com</li></ul> |
| id          | String | <b>Definition:</b> Specifies the certificate ID.<br><b>Range:</b> The value consists of 32 digits and lowercase letters.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| name        | String | <b>Definition:</b> Specifies the certificate name.<br><b>Range:</b> 0 to 255 characters.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| private_key | String | <b>Definition:</b> Specifies the private key of the server certificate.<br><b>Range:</b> The value must be PEM encoded, and can contain a maximum of 8,192 characters.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| type        | String | <b>Definition:</b> Specifies the certificate type.<br><b>Range:</b> <ul style="list-style-type: none"><li>• <b>server:</b> server certificates</li><li>• <b>client</b> CA certificates</li><li>• <b>server_sm:</b> server SM certificates</li></ul>                                                                                                                                                                                                                                                                                                                                                                                                                          |
| created_at  | String | <b>Definition:</b> Specifies the creation time.<br><b>Range:</b> The value must be a UTC time in the <i>yyyy-MM-dd'T'HH:mm:ss'Z'</i> format.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| Parameter                 | Type             | Description                                                                                                                                                                                                                                                                          |
|---------------------------|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| updated_at                | String           | <b>Definition:</b> Specifies the update time.<br><b>Range:</b> The value must be a UTC time in the <i>yyyy-MM-dd'T'HH:mm:ss'Z'</i> format.                                                                                                                                           |
| expire_time               | String           | <b>Definition:</b> Specifies the time when the certificate expires.<br><b>Range:</b> The value must be a UTC time in the <i>yyyy-MM-dd'T'HH:mm:ss'Z'</i> format.                                                                                                                     |
| project_id                | String           | <b>Definition:</b> Specifies the project ID. For details about how to obtain a project ID, see <a href="#">Obtaining a Project ID</a> .<br><b>Range:</b> The value can contain a maximum of 32 characters, including digits and lowercase letters.                                   |
| enc_certificate           | String           | <b>Definition:</b> Specifies the content of the server SM certificate.<br>It supports certificate chains with a maximum of 11 layers (including certificates and certificate chains).<br><b>Range:</b> The value must be PEM encoded, and can contain a maximum of 65536 characters. |
| enc_private_key           | String           | <b>Definition:</b> Specifies the private key of the server SM certificate.<br><b>Range:</b> The value must be PEM encoded, and can contain a maximum of 8,192 characters.                                                                                                            |

 fmt.Printf("%+v\n", response)
} else {
 fmt.Println(err)
}
```

## More

For SDK sample code of more programming languages, see the Sample Code tab in [API Explorer](#). SDK sample code can be automatically generated.

## Status Codes

| Status Code | Description         |
|-------------|---------------------|
| 200         | Successful request. |

## Error Codes

See [Error Codes](#).

## 5.7.5 Deleting a Certificate

### Function

This API is used to delete a certificate. If you delete a certificate from CCM, the certificate will only be deleted from the ELB console, but not from the CCM console. To delete a certificate associated with a listener, you need to unbind the certificate from the listener first.

### Constraints

If the certificate is used by a listener, the certificate cannot be deleted, and the 409 Conflict error code will be displayed.

### Calling Method

For details, see [Calling APIs](#).

## URI

DELETE /v3/{project\_id}/elb/certificates/{certificate\_id}

**Table 5-267** Path Parameters

| Parameter      | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                |

 "ret_status" : "successful"
 }],
 "request_id" : "98414965-856c-4be3-8a33-3e08432a222e"
}
```

## Status Codes

| Status Code | Description         |
|-------------|---------------------|
| 200         | Successful request. |

## Error Codes

See [Error Codes](#).

## 5.7.7 Enabling or Disabling the Private Key Feature

### Function

This API is used to enable or disable **private\_key\_echo**. **private\_key\_echo** defines whether to include **private\_key** and **enc\_private\_key** in the response to each certificate API. If **private\_key\_echo** is set to **true**, the private key is returned when APIs are called to create a certificate, update a certificate, query the certificate details, and query the certificate list. If **private\_key\_echo** is set to **false**, the private key is anonymized as **\*\*\*\*\*** and returned. The **private\_key\_echo** setting applies to the whole tenant project. It is enabled by default.

### Calling Method

For details, see [Calling APIs](#).

### URI

POST /v3/{project\_id}/elb/certificates/settings/private-key-echo

**Table 5-274** Path Parameters

| Parameter  | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                |

See [Error Codes](#).

## 5.7.8 Querying Whether the Private Key Feature Is Enabled

### Function

This API is used to query whether **private\_key\_echo** is set to **true** or **false**. This parameter defines whether to include **private\_key** and **enc\_private\_key** in the

response to each certificate API. If **private\_key\_echo** is set to **true**, the private key is returned. If set to **false**, the private key is anonymized as **\*\*\*\*\*** and returned. The **private\_key\_echo** setting applies to the whole tenant project. It is enabled by default.

## Calling Method

For details, see [Calling APIs](#).

## URI

GET /v3/{project\_id}/elb/certificates/settings/private-key-echo

| Parameter        | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                                         |
|------------------|---------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| request_id       | String  | <b>Definition:</b> Specifies the request ID.<br><b>Range:</b> The value is automatically generated, and can contain characters including digits, lowercase letters, and hyphens (-).                                                                                                                                                                                                                                                |
| private_key_echo | Boolean | Specifies whether <b>private_key_echo</b> is enabled.<br><b>Range:</b> <ul style="list-style-type: none"><li>• <b>true:</b> The private key is displayed in the responses of the APIs for querying, adding, and updating a certificate, as well as the API for querying the certificate list.</li><li>• <b>false:</b> The private key is not displayed in the responses of all certificate APIs, but anonymized as *****.</li></ul> |

## Example Requests

Querying whether the private key feature is enabled

```
GET https://{ELB_Endpoint}/v3/{project_id}/elb/certificates/settings/private-key-echo
```

## Example Responses

**Status code: 200**

Successful request.

```
{
 "private_key_echo" : true,
 "request_id" : "98414965-856c-4be3-8a33-3e08432a222e"
}
```

## SDK Sample Code

The SDK sample code is as follows.

### Java

```
package com.huaweicloud.sdk.test;

import com.huaweicloud.sdk.core.auth.ICredential;
import com.huaweicloud.sdk.core.auth.BasicCredentials;
import com.huaweicloud.sdk.core.exception.ConnectionException;
import com.huaweicloud.sdk.core.exception.RequestTimeoutException;
import com.huaweicloud.sdk.core.exception.ServiceResponseException;
import com.huaweicloud.sdk.elb.v3.region.ElbRegion;
import com.huaweicloud.sdk.elb.v3.*;
import com.huaweicloud.sdk.elb.v3.model.*;
```

```
public class ShowCertificatePrivateKeyEchoSolution {

 public static void main(String[] args) {
 // The AK and SK used for authentication are hard-coded or stored in plaintext, which has great
 security risks. It is recommended that the AK and SK be stored in ciphertext in configuration files or
 environment variables and decrypted during use to ensure security.
 // In this example, AK and SK are stored in environment variables for authentication. Before running
 this example, set environment variables CLOUD_SDK_AK and CLOUD_SDK_SK in the local environment
 String ak = System.getenv("CLOUD_SDK_AK");
 String sk = System.getenv("CLOUD_SDK_SK");
 String projectId = "{project_id}";

 ICredential auth = new BasicCredentials()
 .withProjectId(projectId)
 .withAk(ak)
 .withSk(sk);

 ElbClient client = ElbClient.newBuilder()
 .withCredential(auth)
 .withRegion(ElbRegion.valueOf("<YOUR REGION>"))
 .build();
 ShowCertificatePrivateKeyEchoRequest request = new ShowCertificatePrivateKeyEchoRequest();
 try {
 ShowCertificatePrivateKeyEchoResponse response = client.showCertificatePrivateKeyEcho(request);

 fmt.Printf("%+v\n", response)
 } else {
 fmt.Println(err)
 }
}
```

## More

For SDK sample code of more programming languages, see the Sample Code tab in [API Explorer](#). SDK sample code can be automatically generated.

## Status Codes

| Status Code | Description         |
|-------------|---------------------|
| 200         | Successful request. |

## Error Codes

See [Error Codes](#).

# 5.8 Security Policy

## 5.8.1 Creating a Custom Security Policy

### Function

This API is used to create a custom security policy. If you need a custom security policy, you need to specify **security\_policy\_id** when you add an HTTPS or TLS listener to your load balancer.

### Calling Method

For details, see [Calling APIs](#).

### URI

POST /v3/{project\_id}/elb/security-policies

**Table 5-281** Path Parameters

| Parameter  | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                |
|------------|-----------|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| project_id | Yes       | String | <b>Definition:</b> Specifies the project ID. For details about how to obtain a project ID, see <a href="#">Obtaining a Project ID</a> .<br><b>Constraints:</b> N/A<br><b>Range:</b> The value can contain a maximum of 32 characters, including digits and lowercase letters.<br><b>Default value:</b> N/A |

## Request Parameters

**Table 5-282** Request header parameters

| Parameter    | Mandatory | Type   | Description                                                                                                                                      |
|--------------|-----------|--------|--------------------------------------------------------------------------------------------------------------------------------------------------|
| X-Auth-Token | Yes       | String | <b>Definition:</b> Specifies the token used for IAM authentication.<br><b>Constraints:</b> N/A<br><b>Range:</b> N/A<br><b>Default value:</b> N/A |

**Table 5-283** Request body parameters

| Parameter       | Mandatory | Type                              | Description                                                                                                   |
|-----------------|-----------|-----------------------------------|---------------------------------------------------------------------------------------------------------------|
| security_policy | Yes       | CreateSecurityPolicyOption object | <b>Definition:</b> Specifies the parameters for creating a custom security policy.<br><b>Constraints:</b> N/A |

**Table 5-284** CreateSecurityPolicyOption

| Parameter   | Mandatory | Type   | Description                                                                                                                                                               |
|-------------|-----------|--------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| name        | No        | String | <b>Definition:</b> Specifies the name of the custom security policy.<br><b>Constraints:</b> N/A<br><b>Range:</b> 0 to 255 characters.<br><b>Default value:</b> N/A        |
| description | No        | String | <b>Definition:</b> Specifies the description of the custom security policy.<br><b>Constraints:</b> N/A<br><b>Range:</b> 0 to 255 characters.<br><b>Default value:</b> N/A |

| Parameter             | Mandatory | Type             | Description                                                                                                                                                                                                                                                                                                                                                                                 |

```

## More

For SDK sample code of more programming languages, see the Sample Code tab in [API Explorer](#). SDK sample code can be automatically generated.

## Status Codes

| Status Code | Description         |
|-------------|---------------------|
| 201         | Successful request. |

## Error Codes

See [Error Codes](#).

## 5.8.2 Querying Custom Security Policies

### Function

This API is used to query custom security policies.

### Constraints

This API has the following constraints:

- Parameters **marker**, **limit**, and **page\_reverse** are used for pagination query.
- Parameters **marker** and **page\_reverse** take effect only when they are used together with parameter **limit**.

### Calling Method

For details, see [Calling APIs](#).

### URI

GET /v3/{project\_id}/elb/security-policies

**Table 5-288** Path Parameters

| Parameter  | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                |

| enterprise_project_id | String                                       | <b>Definition:</b> Specifies the ID of the enterprise project.<br><b>Range:</b> <ul style="list-style-type: none"><li>• <b>0:</b> The resource belongs to the default enterprise project.</li><li>• A string in UUID format indicates a non-default enterprise project.</li></ul> |
| created_at            | String                                       | <b>Definition:</b> Specifies the creation time.<br><b>Range:</b> The value must be a UTC time in the <i>yyyy-MM-dd'T'HH:mm:ss'Z'</i> format.                                                                                                                                      |
| updated_at            | String                                       | <b>Definition:</b> Specifies the update time.<br><b>Range:</b> The value must be a UTC time in the <i>yyyy-MM-dd'T'HH:mm:ss'Z'</i> format.                                                                                                                                        |

**Table 5-293** ListenerRef

| Parameter | Type   | Description                                                        |
|-----------|--------|--------------------------------------------------------------------|
| id        | String | <b>Definition:</b> Specifies the listener ID.<br><b>Range:</b> N/A |

**Table 5-294** PageInfo

| Parameter       | Type    | Description                                                                                                                                                                                                                          |
|-----------------|---------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| previous_marker | String  | <b>Definition:</b> Specifies the ID of the first record in the pagination query result. If <b>page_reverse</b> is set to <b>true</b> , this parameter is used together to query resources on the previous page.<br><b>Range:</b> N/A |
| next_marker     | String  | <b>Definition:</b> Specifies the ID of the last record in the pagination query result. It is usually used to query resources on the next page.<br><b>Range:</b> N/A                                                                  |
| current_count   | Integer | <b>Definition:</b> Specifies the number of records returned on the current page.<br><b>Range:</b> N/A                                                                                                                                |

## Example Requests

Querying custom security policies on each page

```
GET https://{ELB_Endpoint}/v3/7a9941d34fc1497d8d0797429ecfd354/elb/security-policies?limit=2
```

## Example Responses

**Status code: 200**

Successful request.

} else {
 fmt.Println(err)
}
}
```

## More

For SDK sample code of more programming languages, see the Sample Code tab in [API Explorer](#). SDK sample code can be automatically generated.

## Status Codes

| Status Code | Description         |
|-------------|---------------------|
| 200         | Successful request. |

## Error Codes

See [Error Codes](#).

## 5.8.3 Querying the Details of a Custom Security Policy

### Function

This API is used to query the details of a custom security policy.

### Calling Method

For details, see [Calling APIs](#).

### URI

GET /v3/{project\_id}/elb/security-policies/{security\_policy\_id}

**Table 5-295** Path Parameters

| Parameter          | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                |
|--------------------|-----------|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| project_id         | Yes       | String | <b>Definition:</b> Specifies the project ID. For details about how to obtain a project ID, see <a href="#">Obtaining a Project ID</a> .<br><b>Constraints:</b> N/A<br><b>Range:</b> The value can contain a maximum of 32 characters, including digits and lowercase letters.<br><b>Default value:</b> N/A |
| security_policy_id | Yes       | String | Specifies the ID of the custom security policy.                                                                                                                                                                                                                                                            |

## Request Parameters

**Table 5-296** Request header parameters

| Parameter    | Mandatory | Type   | Description                                                                                                                                      |
|--------------|-----------|--------|--------------------------------------------------------------------------------------------------------------------------------------------------|
| X-Auth-Token | Yes       | String | <b>Definition:</b> Specifies the token used for IAM authentication.<br><b>Constraints:</b> N/A<br><b>Range:</b> N/A<br><b>Default value:</b> N/A |

## Response Parameters

**Status code: 200**

**Table 5-297** Response body parameters

| Parameter       | Type                                  | Description                                                                                                                                                                          |
|-----------------|---------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| security_policy | <a href="#">SecurityPolicy</a> object | <b>Definition:</b> Specifies the custom security policy information.                                                                                                                 |
| request_id      | String                                | <b>Definition:</b> Specifies the request ID.<br><b>Range:</b> The value is automatically generated, and can contain characters including digits, lowercase letters, and hyphens (-). |

## Example Requests

Querying the details of a custom security policy

```
GET https://{ELB_Endpoint}/v3/7a9941d34fc1497d8d0797429ecfd354/elb/security-policies/
c73e0138-9bdc-40fb-951e-6a1598266ccd
```

## Example Responses

**Status code: 200**

Successful request.

## SDK Sample Code

The SDK sample code is as follows.

### Java

```
package com.huaweicloud.sdk.test;

import com.huaweicloud.sdk.core.auth.ICredential;
import com.huaweicloud.sdk.core.auth.BasicCredentials;
import com.huaweicloud.sdk.core.exception.ConnectionException;
import com.huaweicloud.sdk.core.exception.RequestTimeoutException;
import com.huaweicloud.sdk.core.exception.ServiceResponseException;
import com.huaweicloud.sdk.elb.v3.region.ElbRegion;
import com.huaweicloud.sdk.elb.v3.*;
import com.huaweicloud.sdk.elb.v3.model.*;
```

```
public class ShowSecurityPolicySolution {

 public static void main(String[] args) {
 // The AK and SK used for authentication are hard-coded or stored in plaintext, which has great
 security risks. It is recommended that the AK and SK be stored in ciphertext in configuration files or
 environment variables and decrypted during use to ensure security.
 // In this example, AK and SK are stored in environment variables for authentication. Before running
 this example, set environment variables CLOUD_SDK_AK and CLOUD_SDK_SK in the local environment
 String ak = System.getenv("CLOUD_SDK_AK");
 String sk = System.getenv("CLOUD_SDK_SK");
 String projectId = "{project_id}";

 ICredential auth = new BasicCredentials()
 .withProjectId(projectId)
 .withAk(ak)
 .withSk(sk);

 ElbClient client = ElbClient.newBuilder()
 .withCredential(auth)
 .withRegion(ElbRegion.valueOf("<YOUR_REGION>"))
 .build();
 ShowSecurityPolicyRequest request = new ShowSecurityPolicyRequest();
 request.withSecurityPolicyId("{security_policy_id}");
 try {
 ShowSecurityPolicyResponse response = client.showSecurityPolicy(request);
 System.out.println(response.toString());
 } catch (ConnectionException e) {
 e.printStackTrace();
 } catch (RequestTimeoutException e) {
 e.printStackTrace();
 } catch (ServiceResponseException e) {
 e.printStackTrace();
 System.out.println(e.getHttpStatusCode());
 System.out.println(e.getRequestId());
 System.out.println(e.getErrorCode());
 System.out.println(e.getErrorMsg());
 }
 }
}
```

## Python

```
coding: utf-8

}
```

## More

For SDK sample code of more programming languages, see the Sample Code tab in [API Explorer](#). SDK sample code can be automatically generated.

## Status Codes

| Status Code | Description         |
|-------------|---------------------|
| 200         | Successful request. |

## Error Codes

See [Error Codes](#).

## 5.8.4 Updating a Custom Security Policy

### Function

This API is used to update a custom security policy.

### Constraints

If **protocols** or **ciphers** is updated, the modification takes effect immediately on all listeners that use the custom security policy. Updating other fields does not affect the listeners.

### Calling Method

For details, see [Calling APIs](#).

### URI

PUT /v3/{project\_id}/elb/security-policies/{security\_policy\_id}

**Table 5-300** Path Parameters

| Parameter          | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                |

## More

For SDK sample code of more programming languages, see the Sample Code tab in [API Explorer](#). SDK sample code can be automatically generated.

## Status Codes

| Status Code | Description         |
|-------------|---------------------|
| 200         | Successful request. |

## Error Codes

See [Error Codes](#).

## 5.8.5 Deleting a Custom Security Policy

### Function

This API is used to delete a custom security policy.

### Constraints

A custom security policy that has been used by a listener cannot be deleted.

### Calling Method

For details, see [Calling APIs](#).

## URI

DELETE /v3/{project\_id}/elb/security-policies/{security\_policy\_id}

 fmt.Printf("%+v\n", response)
} else {
 fmt.Println(err)
}
```

## More

For SDK sample code of more programming languages, see the Sample Code tab in [API Explorer](#). SDK sample code can be automatically generated.

## Status Codes

| Status Code | Description         |
|-------------|---------------------|
| 204         | Successful request. |

## Error Codes

See [Error Codes](#).

## 5.8.6 Querying System Security Policies

### Function

This API is used to query system security policies.

System security policies are available to all users and cannot be created or modified.

### Calling Method

For details, see [Calling APIs](#).

### URI

GET /v3/{project\_id}/elb/system-security-policies

**Table 5-309** Path Parameters

| Parameter  | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                |
|------------|-----------|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| project_id | Yes       | String | <b>Definition:</b> Specifies the project ID. For details about how to obtain a project ID, see <a href="#">Obtaining a Project ID</a> .<br><b>Constraints:</b> N/A<br><b>Range:</b> The value can contain a maximum of 32 characters, including digits and lowercase letters.<br><b>Default value:</b> N/A |

## Request Parameters

**Table 5-310** Request header parameters

| Parameter    | Mandatory | Type   | Description                                                                                                                                      |
|--------------|-----------|--------|--------------------------------------------------------------------------------------------------------------------------------------------------|
| X-Auth-Token | Yes       | String | <b>Definition:</b> Specifies the token used for IAM authentication.<br><b>Constraints:</b> N/A<br><b>Range:</b> N/A<br><b>Default value:</b> N/A |

## Response Parameters

**Status code:** 200

**Table 5-311** Response body parameters

| Parameter                | Type                                                  | Description                                                                                                                                                                          |
|--------------------------|-------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

}
```

## More

For SDK sample code of more programming languages, see the Sample Code tab in [API Explorer](#). SDK sample code can be automatically generated.

## Status Codes

| Status Code | Description         |
|-------------|---------------------|
| 200         | Successful request. |

## Error Codes

See [Error Codes](#).

# 5.9 IP Address Group

## 5.9.1 Creating an IP Address Group

### Function

This API is used to create an IP address group. You can associate the IP address group with a listener to control access to this listener.

Each IP address group can contain IP addresses, IP address ranges, and CIDR blocks. Each IP address range must be in the format of *ip-ip*, for example, 10.12.3.1-10.12.3.10. Both IPv4 and IPv6 addresses are supported.

Note: 0.0.0.0 will be considered the same as 0.0.0.0/32. If you enter both 0.0.0.0 and 0.0.0.0/32, either one will be kept. 0:0:0:0:0:0:1 will be considered the same as ::1 and ::1/128. If you enter 0:0:0:0:0:0:1, ::1, and ::1/128, only one will be kept.

### Calling Method

For details, see [Calling APIs](#).

### URI

POST /v3/{project\_id}/elb/ipgroups

**Table 5-313** Path Parameters

| Parameter  | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                |
|------------|-----------|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| project_id | Yes       | String | <b>Definition:</b> Specifies the project ID. For details about how to obtain a project ID, see <a href="#">Obtaining a Project ID</a> .<br><b>Constraints:</b> N/A<br><b>Range:</b> The value can contain a maximum of 32 characters, including digits and lowercase letters.<br><b>Default value:</b> N/A |

## Request Parameters

**Table 5-314** Request header parameters

| Parameter    | Mandatory | Type   | Description                                                                                                                                      |
|--------------|-----------|--------|--------------------------------------------------------------------------------------------------------------------------------------------------|
| X-Auth-Token | Yes       | String | <b>Definition:</b> Specifies the token used for IAM authentication.<br><b>Constraints:</b> N/A<br><b>Range:</b> N/A<br><b>Default value:</b> N/A |

**Table 5-315** Request body parameters

| Parameter | Mandatory | Type                                       | Description                                                                                                      |
|-----------|-----------|--------------------------------------------|------------------------------------------------------------------------------------------------------------------|
| ipgroup   | Yes       | <a href="#">CreateIpGroupOption</a> object | <b>Definition:</b> Specifies the request parameters for creating an IP address group.<br><b>Constraints:</b> N/A |

**Table 5-316** CreateIpGroupOption

| Parameter   | Mandatory | Type                                                 | Description                                                                                                                                                                                                                                                                                                                                                                                |
|-------------|-----------|------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| project_id  | No        | String                                               | <b>Definition:</b> Specifies the project ID. For details about how to obtain a project ID, see <a href="#">Obtaining a Project ID</a> .<br><b>Constraints:</b> N/A<br><b>Range:</b> The value can contain a maximum of 32 characters, including digits and lowercase letters.<br><b>Default value:</b> N/A<br><b>NOTE</b><br>This parameter is invalid. The project ID in the URL is used. |
| description | No        | String                                               | <b>Definition:</b> Provides supplementary information about an IP address group.<br><b>Constraints:</b> N/A<br><b>Range:</b> 0 to 255 characters.<br><b>Default value:</b> N/A                                                                                                                                                                                                             |
| name        | No        | String                                               | <b>Definition:</b> Specifies the name of an IP address group.<br><b>Constraints:</b> N/A<br><b>Range:</b> 0 to 255 characters.<br><b>Default value:</b> N/A                                                                                                                                                                                                                                |
| ip_list     | Yes       | Array of <a href="#">CreateIpGroupOption</a> objects | <b>Definition:</b> Specifies entries in the IP address group. Both IPv4 and IPv6 entries are supported.<br><b>Constraints:</b> N/A                                                                                                                                                                                                                                                         |

| Parameter             | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                 |
|-----------------------|-----------|--------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| enterprise_project_id | No        | String | <b>Definition:</b> Specifies the ID of the enterprise project. If no enterprise project ID is specified during resource creation, 0 is returned, indicating that the resource belongs to the default enterprise project.<br><b>Constraints:</b> The enterprise project ID cannot be "", 0, or an enterprise project ID that does not exist.<br><b>Range:</b> N/A<br><b>Default value:</b> 0 |

**Table 5-317** CreateIpGroupIpOption

| Parameter   | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                    |
|-------------|-----------|--------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ip          | Yes       | String | <b>Definition:</b> Specifies the IP entries in the IP address group.<br><b>Constraints:</b> N/A<br><b>Range:</b> Each entry can be an IP address, IP address range, or CIDR block. Each IP address range must be in the format of <i>ip-ip</i> , for example, 192.168.1.2-192.168.2.253 or 2001:0DB8:02de::0e12-2001:0DB8:02de::0e13. Both IPv4 and IPv6 addresses are supported.<br><b>Default value:</b> N/A |
| description | No        | String | <b>Definition:</b> Specifies remarks about the IP address group.<br><b>Constraints:</b> N/A<br><b>Range:</b> 0 to 255 characters.<br><b>Default value:</b> N/A                                                                                                                                                                                                                                                 |

## Response Parameters

Status code: 201

**Table 5-318** Response body parameters

| Parameter  | Type                  | Description                                                                                                                                                                          |
|------------|-----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ipgroup    | <b>IpGroup</b> object | <b>Definition:</b> Specifies the response body for creating an IP address group.                                                                                                     |
| request_id | String                | <b>Definition:</b> Specifies the request ID.<br><b>Range:</b> The value is automatically generated, and can contain characters including digits, lowercase letters, and hyphens (-). |

**Table 5-319** IpGroup

| Parameter             | Type                                | Description                                                                                                                                                                                                                                                                       |
|-----------------------|-------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| id                    | String                              | <b>Definition:</b> Specifies the ID of an IP address group.<br><b>Range:</b> N/A                                                                                                                                                                                                  |
| name                  | String                              | <b>Definition:</b> Specifies the name of an IP address group.<br><b>Range:</b> N/A                                                                                                                                                                                                |
| description           | String                              | <b>Definition:</b> Provides supplementary information about an IP address group.<br><b>Range:</b> N/A                                                                                                                                                                             |
| ip_list               | Array of <b>IpInfo</b> objects      | <b>Definition:</b> Specifies IP addresses in an IP address group. [] indicates any IP address.                                                                                                                                                                                    |
| listeners             | Array of <b>ListenerRef</b> objects | <b>Definition:</b> Specifies the IDs of listeners with which the IP address group is associated.                                                                                                                                                                                  |
| project_id            | String                              | <b>Definition:</b> Specifies the project ID of the IP address group.<br><b>Range:</b> N/A                                                                                                                                                                                         |
| enterprise_project_id | String                              | <b>Definition:</b> Specifies the ID of the enterprise project.<br><b>Range:</b> <ul style="list-style-type: none"><li>• <b>0:</b> The resource belongs to the default enterprise project.</li><li>• A string in UUID format indicates a non-default enterprise project.</li></ul> |

| Parameter  | Type   | Description                                                                                                                                                               |
|------------|--------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| created_at | String | <b>Definition:</b> Specifies the time when the IP address group was created.<br><b>Range:</b> The value must be a UTC time in the <i>yyyy-MM-dd'T'HH:mm:ss'Z'</i> format. |
| updated_at | String | <b>Definition:</b> Specifies the time when the IP address group was updated.<br><b>Range:</b> The value must be a UTC time in the <i>yyyy-MM-dd'T'HH:mm:ss'Z'</i> format. |

**Table 5-320** IpInfo

| Parameter   | Type   | Description                                                                                                                                                                                                                                                                                            |
|-------------|--------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ip          | String | <b>Definition:</b> Specifies the IP entries in the IP address group.<br><b>Range:</b> Each IP address range must be in the format of <i>ip-ip</i> , for example, 192.168.1.2-192.168.2.253 or 2001:0DB8:02de::0e12-2001:0DB8:02de::0e13. The end IP address must be greater than the start IP address. |
| description | String | <b>Definition:</b> Provides remarks about the IP address group.<br><b>Range:</b> 0 to 255 characters.                                                                                                                                                                                                  |

**Table 5-321** ListenerRef

| Parameter | Type   | Description                                                        |
|-----------|--------|--------------------------------------------------------------------|
| id        | String | <b>Definition:</b> Specifies the listener ID.<br><b>Range:</b> N/A |

## Example Requests

Creating an IP address group and specifying IP addresses

```
POST https://{ELB_Endpoint}/v3/45977fa2dbd7482098dd68d0d8970117/elb/ipgroups
{
 "ipgroup": {
 "name": "test_ipg",
 "ip_list": [{
 "ip": "192.168.1.123"
 }
]
}
```

```
 }, {
 "ip" : "192.168.3.0/24",
 "description" : "test_ip"
 }, {
 "ip" : "2001:0DB8:02de:0000:0000:0000:0000:0e13"
 }
]
}
```

## Example Responses

### Status code: 201

Normal response to POST requests.

## SDK Sample Code

The SDK sample code is as follows.

### Java

Creating an IP address group and specifying IP addresses

```
package com.huaweicloud.sdk.test;

import com.huaweicloud.sdk.core.auth.ICredential;
import com.huaweicloud.sdk.core.auth.BasicCredentials;
import com.huaweicloud.sdk.core.exception.ConnectionException;
import com.huaweicloud.sdk.core.exception.RequestTimeoutException;
import com.huaweicloud.sdk.core.exception.ServiceResponseException;
import com.huaweicloud.sdk.elb.v3.region.ElbRegion;
import com.huaweicloud.sdk.elb.v3.*;
import com.huaweicloud.sdk.elb.v3.model.*;

import java.util.List;
import java.util.ArrayList;

public class CreateIpGroupSolution {
 public static void main(String[] args) {
 // The AK and SK used for authentication are hard-coded or stored in plaintext, which has great
 security risks. It is recommended that the AK and SK be stored in ciphertext in configuration files or
 environment variables and decrypted during use to ensure security.
 }
}
```

```
// In this example, AK and SK are stored in environment variables for authentication. Before running
this example, set environment variables CLOUD_SDK_AK and CLOUD_SDK_SK in the local environment
String ak = System.getenv("CLOUD_SDK_AK");
String sk = System.getenv("CLOUD_SDK_SK");
String projectId = "{project_id}";

ICredential auth = new BasicCredentials()
 .withProjectId(projectId)
 .withAk(ak)
 .withSk(sk);

ElbClient client = ElbClient.newBuilder()
 .withCredential(auth)
 .withRegion(ElbRegion.valueOf("<YOUR REGION>"))
 .build();
CreateIpGroupRequest request = new CreateIpGroupRequest();
CreateIpGroupRequestBody body = new CreateIpGroupRequestBody();
List<CreateIpGroupOption> listIpGroupList = new ArrayList<>();
listIpGroupList.add(
 new CreateIpGroupOption()
 .withIp("192.168.1.123")
);
listIpGroupList.add(
 new CreateIpGroupOption()
 .withIp("192.168.3.0/24")
 .withDescription("test_ip")
);
listIpGroupList.add(
 new CreateIpGroupOption()
 .withIp("2001:0DB8:02de:0000:0000:0000:0000:0e13")
);
CreateIpGroupOption ipgroupbody = new CreateIpGroupOption();
ipgroupbody.setName("test_ipg")
 .withIpList(listIpGroupList);
body.withIpGroup(ipgroupbody);
request.withBody(body);
try {
 CreateIpGroupResponse response = client.createIpGroup(request);
 System.out.println(response.toString());
} catch (ConnectionException e) {
 e.printStackTrace();
} catch (RequestTimeoutException e) {
 e.printStackTrace();
} catch (ServiceResponseException e) {
 e.printStackTrace();
 System.out.println(e.getStatusCode());
 System.out.println(e.getRequestId());
 System.out.println(e.getErrorCode());
 System.out.println(e.getErrorMsg());
}
}
```

## Python

### Creating an IP address group and specifying IP addresses

```
coding: utf-8

import os
from huaweicloudsdkcore.auth.credentials import BasicCredentials
from huaweicloudskelb.v3.region.elb_region import ElbRegion
from huaweicloudsdkcore.exceptions import exceptions
from huaweicloudskelb.v3 import *

if __name__ == "__main__":
 # The AK and SK used for authentication are hard-coded or stored in plaintext, which has great security
 risks. It is recommended that the AK and SK be stored in ciphertext in configuration files or environment
 variables and decrypted during use to ensure security.
```

```
In this example, AK and SK are stored in environment variables for authentication. Before running this
example, set environment variables CLOUD_SDK_AK and CLOUD_SDK_SK in the local environment
ak = os.environ["CLOUD_SDK_AK"]
sk = os.environ["CLOUD_SDK_SK"]
projectId = "{project_id}"

credentials = BasicCredentials(ak, sk, projectId)

client = ElbClient.new_builder() \
 .with_credentials(credentials) \
 .with_region(ElbRegion.value_of("<YOUR REGION>")) \
 .build()

try:
 request = CreateIpGroupRequest()
 listIpListIpGroup = [
 CreateIpGroupIpOption(
 ip="192.168.1.123"
),
 CreateIpGroupIpOption(
 ip="192.168.3.0/24",
 description="test_ip"
),
 CreateIpGroupIpOption(
 ip="2001:0DB8:02de:0000:0000:0000:0000:0e13"
)
]
 ipGroupBody = CreateIpGroupOption(
 name="test_ipg",
 ip_list=listIpListIpGroup
)
 request.body = CreateIpGroupRequestBody(
 ipGroup=ipGroupBody
)
 response = client.create_ip_group(request)
 print(response)
except exceptions.ClientRequestException as e:
 print(e.status_code)
 print(e.request_id)
 print(e.error_code)
 print(e.error_msg)
```

## Go

### Creating an IP address group and specifying IP addresses

```
package main

import (
 "fmt"
 "github.com/huaweicloud/huaweicloud-sdk-go-v3/core/auth/basic"
 elb "github.com/huaweicloud/huaweicloud-sdk-go-v3/services/elb/v3"
 "github.com/huaweicloud/huaweicloud-sdk-go-v3/services/elb/v3/model"
 region "github.com/huaweicloud/huaweicloud-sdk-go-v3/services/elb/v3/region"
)

func main() {
 // The AK and SK used for authentication are hard-coded or stored in plaintext, which has great security
 risks. It is recommended that the AK and SK be stored in ciphertext in configuration files or environment
 variables and decrypted during use to ensure security.
 // In this example, AK and SK are stored in environment variables for authentication. Before running this
 example, set environment variables CLOUD_SDK_AK and CLOUD_SDK_SK in the local environment
 ak := os.Getenv("CLOUD_SDK_AK")
 sk := os.Getenv("CLOUD_SDK_SK")
 projectId := "{project_id}"

 auth := basic.NewCredentialsBuilder().
 WithAk(ak).
 WithSk(sk).
```

```
WithProjectId(projectId).
Build()

client := elb.NewElbClient(
 elb.ElbClientBuilder().
 WithRegion(region.ValueOf("<YOUR REGION>")).
 WithCredential(auth).
 Build())

request := &model.CreateIpGroupRequest{}
descriptionIpList:= "test_ip"
var listIpListIpGroup = []model.CreateIpGroupIpOption{
 {
 Ip: "192.168.1.123",
 },
 {
 Ip: "192.168.3.0/24",
 Description: &descriptionIpList,
 },
 {
 Ip: "2001:0DB8:02de:0000:0000:0000:0000:0e13",
 },
}
nameIpGroup:= "test_ipg"
ipGroupbody := &model.CreateIpGroupOption{
 Name: &nameIpGroup,
 IpList: listIpListIpGroup,
}
request.Body = &model.CreateIpGroupRequestBody{
 IpGroup: ipGroupbody,
}
response, err := client.CreateIpGroup(request)
if err == nil {
 fmt.Printf("%+v\n", response)
} else {
 fmt.Println(err)
}
```

## More

For SDK sample code of more programming languages, see the Sample Code tab in [API Explorer](#). SDK sample code can be automatically generated.

## Status Codes

| Status Code | Description                       |
|-------------|-----------------------------------|
| 201         | Normal response to POST requests. |

## Error Codes

See [Error Codes](#).

## 5.9.2 Querying IP Address Groups

### Function

This API is used to query IP address groups.

## Constraints

This API has the following constraints:

- Parameters **marker**, **limit**, and **page\_reverse** are used for pagination query.
- Parameters **marker** and **page\_reverse** take effect only when they are used together with parameter **limit**.

## Calling Method

For details, see [Calling APIs](#).

## URI

GET /v3/{project\_id}/elb/ipgroups

**Table 5-322** Path Parameters

| Parameter  | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                |
|------------|-----------|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| project_id | Yes       | String | <b>Definition:</b> Specifies the project ID. For details about how to obtain a project ID, see <a href="#">Obtaining a Project ID</a> .<br><b>Constraints:</b> N/A<br><b>Range:</b> The value can contain a maximum of 32 characters, including digits and lowercase letters.<br><b>Default value:</b> N/A |

**Table 5-323** Query Parameters

| Parameter    | Mandatory | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

## Response Parameters

Status code: 200

**Table 5-325** Response body parameters

| Parameter  | Type                            | Description                                                                                                                                                                          |
|------------|---------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ipgroups   | Array of <b>IpGroup</b> objects | <b>Definition:</b> Lists the returned IP address groups.                                                                                                                             |
| request_id | String                          | <b>Definition:</b> Specifies the request ID.<br><b>Range:</b> The value is automatically generated, and can contain characters including digits, lowercase letters, and hyphens (-). |
| page_info  | <b>PageInfo</b> object          | <b>Definition:</b> Specifies the pagination information.                                                                                                                             |

**Table 5-326** IpGroup

| Parameter   | Type                                | Description                                                                                           |
|-------------|-------------------------------------|-------------------------------------------------------------------------------------------------------|
| id          | String                              | <b>Definition:</b> Specifies the ID of an IP address group.<br><b>Range:</b> N/A                      |
| name        | String                              | <b>Definition:</b> Specifies the name of an IP address group.<br><b>Range:</b> N/A                    |
| description | String                              | <b>Definition:</b> Provides supplementary information about an IP address group.<br><b>Range:</b> N/A |
| ip_list     | Array of <b>IpInfo</b> objects      | <b>Definition:</b> Specifies IP addresses in an IP address group. [] indicates any IP address.        |
| listeners   | Array of <b>ListenerRef</b> objects | <b>Definition:</b> Specifies the IDs of listeners with which the IP address group is associated.      |
| project_id  | String                              | <b>Definition:</b> Specifies the project ID of the IP address group.<br><b>Range:</b> N/A             |

| Parameter             | Type   | Description                                                                                                                                                                                                                                                                |
|-----------------------|--------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| enterprise_project_id | String | <b>Definition:</b> Specifies the ID of the enterprise project.<br><b>Range:</b> <ul style="list-style-type: none"><li>• 0: The resource belongs to the default enterprise project.</li><li>• A string in UUID format indicates a non-default enterprise project.</li></ul> |
| created_at            | String | <b>Definition:</b> Specifies the time when the IP address group was created.<br><b>Range:</b> The value must be a UTC time in the <i>yyyy-MM-dd'T'HH:mm:ss'Z'</i> format.                                                                                                  |
| updated_at            | String | <b>Definition:</b> Specifies the time when the IP address group was updated.<br><b>Range:</b> The value must be a UTC time in the <i>yyyy-MM-dd'T'HH:mm:ss'Z'</i> format.                                                                                                  |

**Table 5-327** IpInfo

| Parameter   | Type   | Description                                                                                                                                                                                                                                                                                            |
|-------------|--------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ip          | String | <b>Definition:</b> Specifies the IP entries in the IP address group.<br><b>Range:</b> Each IP address range must be in the format of <i>ip-ip</i> , for example, 192.168.1.2-192.168.2.253 or 2001:0DB8:02de::0e12-2001:0DB8:02de::0e13. The end IP address must be greater than the start IP address. |
| description | String | <b>Definition:</b> Provides remarks about the IP address group.<br><b>Range:</b> 0 to 255 characters.                                                                                                                                                                                                  |

**Table 5-328** ListenerRef

| Parameter | Type   | Description                                                        |
|-----------|--------|--------------------------------------------------------------------|
| id        | String | <b>Definition:</b> Specifies the listener ID.<br><b>Range:</b> N/A |

**Table 5-329** PageInfo

| Parameter       | Type    | Description                                                                                                                                                                                                                          |
|-----------------|---------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| previous_marker | String  | <b>Definition:</b> Specifies the ID of the first record in the pagination query result. If <b>page_reverse</b> is set to <b>true</b> , this parameter is used together to query resources on the previous page.<br><b>Range:</b> N/A |
| next_marker     | String  | <b>Definition:</b> Specifies the ID of the last record in the pagination query result. It is usually used to query resources on the next page.<br><b>Range:</b> N/A                                                                  |
| current_count   | Integer | <b>Definition:</b> Specifies the number of records returned on the current page.<br><b>Range:</b> N/A                                                                                                                                |

## Example Requests

Querying IP address groups on each page

```
GET https://{ELB_Endpoint}/v3/45977fa2dbd7482098dd68d0d8970117/elb/ipgroups?limit=1
```

## Example Responses

**Status code: 200**

Successful request.

```
{

```

```
if err == nil {
 fmt.Printf("%+v\n", response)
} else {
 fmt.Println(err)
}
}
```

## More

For SDK sample code of more programming languages, see the Sample Code tab in [API Explorer](#). SDK sample code can be automatically generated.

## Status Codes

| Status Code | Description         |
|-------------|---------------------|
| 200         | Successful request. |

## Error Codes

See [Error Codes](#).

## 5.9.3 Querying the Details of an IP Address Group

### Function

This API is used to view the details of an IP address group.

### Calling Method

For details, see [Calling APIs](#).

### URI

GET /v3/{project\_id}/elb/ipgroups/{ipgroup\_id}

**Table 5-330** Path Parameters

| Parameter  | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                |
|------------|-----------|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| project_id | Yes       | String | <b>Definition:</b> Specifies the project ID. For details about how to obtain a project ID, see <a href="#">Obtaining a Project ID</a> .<br><b>Constraints:</b> N/A<br><b>Range:</b> The value can contain a maximum of 32 characters, including digits and lowercase letters.<br><b>Default value:</b> N/A |

| Parameter  | Mandatory | Type   | Description                                                 |
|------------|-----------|--------|-------------------------------------------------------------|
| ipgroup_id | Yes       | String | <b>Definition:</b> Specifies the ID of an IP address group. |

## Request Parameters

**Table 5-331** Request header parameters

| Parameter    | Mandatory | Type   | Description                                                                                                                                      |
|--------------|-----------|--------|--------------------------------------------------------------------------------------------------------------------------------------------------|
| X-Auth-Token | Yes       | String | <b>Definition:</b> Specifies the token used for IAM authentication.<br><b>Constraints:</b> N/A<br><b>Range:</b> N/A<br><b>Default value:</b> N/A |

## Response Parameters

**Status code:** 200

**Table 5-332** Response body parameters

| Parameter  | Type                  | Description                                                                                                                                                                          |

**Table 5-334** IpInfo

| Parameter | Type   | Description                                                                                                                                                                                                                                                                                            |
|-----------|--------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ip        | String | <b>Definition:</b> Specifies the IP entries in the IP address group.<br><b>Range:</b> Each IP address range must be in the format of <i>ip-ip</i> , for example, 192.168.1.2-192.168.2.253 or 2001:0DB8:02de::0e12-2001:0DB8:02de::0e13. The end IP address must be greater than the start IP address. |

| Parameter   | Type   | Description                                                                                           |
|-------------|--------|-------------------------------------------------------------------------------------------------------|
| description | String | <b>Definition:</b> Provides remarks about the IP address group.<br><b>Range:</b> 0 to 255 characters. |

**Table 5-335** ListenerRef

| Parameter | Type   | Description                                                        |
|-----------|--------|--------------------------------------------------------------------|
| id        | String | <b>Definition:</b> Specifies the listener ID.<br><b>Range:</b> N/A |

## Example Requests

Querying the details of an IP address group

```
GET https://{ELB_Endpoint}/v3/45977fa2dbd7482098dd68d0d8970117/elb/ipgroups/
8722e0e0-9cc9-4490-9660-8c9a5732fbb0
```

## Example Responses

**Status code: 200**

Successful request.

 fmt.Printf("%+v\n", response)
 } else {
 fmt.Println(err)
 }
}
```

## More

For SDK sample code of more programming languages, see the Sample Code tab in [API Explorer](#). SDK sample code can be automatically generated.

## Status Codes

| Status Code | Description         |
|-------------|---------------------|
| 200         | Successful request. |

## Error Codes

See [Error Codes](#).

## 5.9.4 Updating an IP Address Group

### Function

This API is used to update an IP address group. All IP entries in the IP address group will be overwritten, and those that are not included in the **ip\_list** parameter in the request body will be removed.

Each IP address group can contain single IP addresses, IP address ranges, and CIDR blocks. Both IPv4 and IPv6 addresses are supported. Each IP address range must be in the format of *ip-ip*, for example, 10.12.3.1-10.12.3.10.

Note:

- 0.0.0.0 will be considered the same as 0.0.0.0/32. If you enter both 0.0.0.0 and 0.0.0.0/32, either one will be kept. 0:0:0:0:0:0:1 will be considered the same as ::1 and ::1/128. If you enter 0:0:0:0:0:0:1, ::1, and ::1/128, only one will be kept.
- Updating the entries defined by **ip\_list** will affect all associated listeners.

### Calling Method

For details, see [Calling APIs](#).

### URI

PUT /v3/{project\_id}/elb/ipgroups/{ipgroup\_id}

**Table 5-336** Path Parameters

| Parameter  | Mandatory | Type   | Description                                                                                                                                             |
|------------|-----------|--------|---------------------------------------------------------------------------------------------------------------------------------------------------------|
| ipgroup_id | Yes       | String | <b>Definition:</b> Specifies the ID of the IP address group to be updated.<br><b>Constraints:</b> N/A<br><b>Range:</b> N/A<br><b>Default value:</b> N/A |

| Parameter  | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                |

|------------|--------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| created_at | String | <b>Definition:</b> Specifies the time when the IP address group was created.<br><b>Range:</b> The value must be a UTC time in the <i>yyyy-MM-dd'T'HH:mm:ss'Z'</i> format. |
| updated_at | String | <b>Definition:</b> Specifies the time when the IP address group was updated.<br><b>Range:</b> The value must be a UTC time in the <i>yyyy-MM-dd'T'HH:mm:ss'Z'</i> format. |

**Table 5-343** IpInfo

| Parameter   | Type   | Description                                                                                                                                                                                                                                                                                            |
|-------------|--------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ip          | String | <b>Definition:</b> Specifies the IP entries in the IP address group.<br><b>Range:</b> Each IP address range must be in the format of <i>ip-ip</i> , for example, 192.168.1.2-192.168.2.253 or 2001:0DB8:02de::0e12-2001:0DB8:02de::0e13. The end IP address must be greater than the start IP address. |
| description | String | <b>Definition:</b> Provides remarks about the IP address group.<br><b>Range:</b> 0 to 255 characters.                                                                                                                                                                                                  |

**Table 5-344** ListenerRef

| Parameter | Type   | Description                                                        |
|-----------|--------|--------------------------------------------------------------------|
| id        | String | <b>Definition:</b> Specifies the listener ID.<br><b>Range:</b> N/A |

## Example Requests

Changing all the IP addresses in an IP address group

```
PUT https://{ELB_Endpoint}/v3/45977fa2dbd7482098dd68d0d8970117/elb/ipgroups/
8722e0e0-9cc9-4490-9660-8c9a5732fbb0
```

```
{
 "ipgroup" : {
 "name" : "test_ipg",
 "ip_list" : [{
```

```
"ip" : "192.168.1.123"
}, {
 "ip" : "192.168.3.0/24",
 "description" : "test_ip"
}]
}
```

## Example Responses

**Status code: 200**

Successful request.

```
{
 "ipgroup" : {
 "description" : "",
 "id" : "8722e0e0-9cc9-4490-9660-8c9a5732fbb0",

}
```

## SDK Sample Code

The SDK sample code is as follows.

### Java

Changing all the IP addresses in an IP address group

```
package com.huaweicloud.sdk.test;

import com.huaweicloud.sdk.core.auth.ICredential;
import com.huaweicloud.sdk.core.auth.BasicCredentials;
import com.huaweicloud.sdk.core.exception.ConnectionException;
import com.huaweicloud.sdk.core.exception.RequestTimeoutException;
import com.huaweicloud.sdk.core.exception.ServiceResponseException;
import com.huaweicloud.sdk.elb.v3.region.ElbRegion;
import com.huaweicloud.sdk.elb.v3.*;
import com.huaweicloud.sdk.elb.v3.model.*;

import java.util.List;
import java.util.ArrayList;

public class UpdatelpGroupSolution {

 public static void main(String[] args) {
 // The AK and SK used for authentication are hard-coded or stored in plaintext, which has great
 // security risks. It is recommended that the AK and SK be stored in ciphertext in configuration files or
 // environment variables and decrypted during use to ensure security.
 // In this example, AK and SK are stored in environment variables for authentication. Before running
```

this example, set environment variables CLOUD\_SDK\_AK and CLOUD\_SDK\_SK in the local environment

```
String ak = System.getenv("CLOUD_SDK_AK");
String sk = System.getenv("CLOUD_SDK_SK");
String projectId = "{project_id}";

ICredential auth = new BasicCredentials()
 .withProjectId(projectId)
 .withAk(ak)
 .withSk(sk);

ElbClient client = ElbClient.newBuilder()
 .withCredential(auth)
 .withRegion(ElbRegion.valueOf("<YOUR REGION>"))
 .build();
UpdateIpGroupRequest request = new UpdateIpGroupRequest();
request.withIpgroupId("{ipgroup_id}");
UpdateIpGroupRequestBody body = new UpdateIpGroupRequestBody();
List<UpdateIpGroupIpOption> listIpGroupIpList = new ArrayList<>();
listIpGroupIpList.add(
 new UpdateIpGroupIpOption()
 .withIp("192.168.1.123")
);
listIpGroupIpList.add(
 new UpdateIpGroupIpOption()
 .withIp("192.168.3.0/24")
 .withDescription("test_ip")
);
UpdateIpGroupOption ipgroupbody = new UpdateIpGroupOption();
ipgroupbody.withName("test_ipg")
 .withIpList(listIpGroupIpList);
body.withIpGroup(ipgroupbody);
request.withBody(body);
try {
 UpdateIpGroupResponse response = client.updateIpGroup(request);
 System.out.println(response.toString());
} catch (ConnectionException e) {
 e.printStackTrace();
} catch (RequestTimeoutException e) {
 e.printStackTrace();
} catch (ServiceResponseException e) {
 e.printStackTrace();
 System.out.println(e.getHttpStatusCode());
 System.out.println(e.getRequestId());
 System.out.println(e.getErrorCode());
 System.out.println(e.getErrorMsg());
}
}
```

## Python

### Changing all the IP addresses in an IP address group

response, err := client.UpdateIpGroup(request)
if err == nil {
 fmt.Printf("%+v\n", response)
} else {
 fmt.Println(err)
}
```

## More

For SDK sample code of more programming languages, see the Sample Code tab in [API Explorer](#). SDK sample code can be automatically generated.

## Status Codes

| Status Code | Description         |
|-------------|---------------------|
| 200         | Successful request. |

## Error Codes

See [Error Codes](#).

## 5.9.5 Deleting an IP Address Group

### Function

This API is used to delete an IP address group. An IP address group that has been associated with a listener cannot be deleted. You need to disassociate the IP address group first.

### Calling Method

For details, see [Calling APIs](#).

## URI

DELETE /v3/{project\_id}/elb/ipgroups/{ipgroup\_id}

**Table 5-345** Path Parameters

| Parameter  | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                |
|------------|-----------|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

} else {
 fmt.Println(err)
}
```

## More

For SDK sample code of more programming languages, see the Sample Code tab in [API Explorer](#). SDK sample code can be automatically generated.

## Status Codes

| Status Code | Description                              |
|-------------|------------------------------------------|
| 204         | Normal response to the DELETE operation. |

## Error Codes

See [Error Codes](#).

## 5.9.6 Updating IP Addresses in an IP Address Group

### Function

This API is used to add IP addresses to an IP address group, or update the descriptions of existing IP addresses. This API cannot be used to delete IP addresses.

Note:

- 0.0.0.0 will be considered the same as 0.0.0.0/32. If you enter both 0.0.0.0 and 0.0.0.0/32, either one will be kept. 0:0:0:0:0:0:1 will be considered the same as ::1 and ::1/128. If you enter 0:0:0:0:0:0:1, ::1, and ::1/128, only one will be kept.
- Updating the entries defined by **ip\_list** will affect all associated listeners.

### Calling Method

For details, see [Calling APIs](#).

### URI

POST /v3/{project\_id}/elb/ipgroups/{ipgroup\_id}/iplist/create-or-update

**Table 5-347** Path Parameters

| Parameter  | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                |

For SDK sample code of more programming languages, see the Sample Code tab in [API Explorer](#). SDK sample code can be automatically generated.

## Status Codes

| Status Code | Description         |
|-------------|---------------------|
| 200         | Successful request. |

## Error Codes

See [Error Codes](#).

## 5.9.7 Deleting IP Addresses from an IP Address Group

### Function

This API is used to delete IP addresses from an IP address group.

Note: Deleting IP addresses from an IP address group will affect all associated listeners.

### Calling Method

For details, see [Calling APIs](#).

### URI

POST /v3/{project\_id}/elb/ipgroups/{ipgroup\_id}/iplist/batch-delete

**Table 5-356** Path Parameters

| Parameter  | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                |

## Error Codes

See [Error Codes](#).

## 5.9.8 Querying the Listeners Associated with an IP Address Group

### Function

This API is used to query the listeners associated with an IP address group.

### Calling Method

For details, see [Calling APIs](#).

## URI

GET /v3/{project\_id}/elb/ipgroups/{ipgroup\_id}/related-listeners

**Table 5-365** Path Parameters

| Parameter  | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                |
|------------|-----------|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| project_id | Yes       | String | <b>Definition:</b> Specifies the project ID. For details about how to obtain a project ID, see <a href="#">Obtaining a Project ID</a> .<br><b>Constraints:</b> N/A<br><b>Range:</b> The value can contain a maximum of 32 characters, including digits and lowercase letters.<br><b>Default value:</b> N/A |
| ipgroup_id | Yes       | String | <b>Definition:</b> Specifies the ID of an IP address group.<br><b>Constraints:</b> N/A<br><b>Range:</b> N/A<br><b>Default value:</b> N/A                                                                                                                                                                   |

## Request Parameters

**Table 5-366** Request header parameters

| Parameter    | Mandatory | Type   | Description                                                                                                                                      |
|--------------|-----------|--------|--------------------------------------------------------------------------------------------------------------------------------------------------|
| X-Auth-Token | Yes       | String | <b>Definition:</b> Specifies the token used for IAM authentication.<br><b>Constraints:</b> N/A<br><b>Range:</b> N/A<br><b>Default value:</b> N/A |

## Response Parameters

**Status code:** 200

**Table 5-367** Response body parameters

| Parameter | Type                                         | Description                                                                                 |
|-----------|----------------------------------------------|---------------------------------------------------------------------------------------------|
| listeners | Array of <a href="#">ListenerRef</a> objects | <b>Definition:</b> Specifies the IDs of all listeners associated with the IP address group. |

**Table 5-368** ListenerRef

| Parameter | Type   | Description                                                        |
|-----------|--------|--------------------------------------------------------------------|
| id        | String | <b>Definition:</b> Specifies the listener ID.<br><b>Range:</b> N/A |

## Example Requests

Querying the listeners associated with an IP address group

```
GET https://{ELB_Endpoint}/v3/45977fa2dbd7482098dd68d0d8970117/elb/ipgroups/8722e0e0-9cc9-4490-9660-8c9a5732fbb0/related-listeners
```

## Example Responses

**Status code: 200**

Successful request.

```
{
 "listeners": [{
 "id": "10000000-0000-0000-0000-000000000001"
 }, {
 "id": "10000000-0000-0000-0000-000000000002"
 }, {
 "id": "10000000-0000-0000-0000-000000000003"
 }]
}
```

## SDK Sample Code

The SDK sample code is as follows.

### Java

```
package com.huaweicloud.sdk.test;

| 200         | Successful request. |

## Error Codes

See [Error Codes](#).

## 5.10 Listener

### 5.10.1 Adding a Listener

#### Function

This API is used to add a listener to a shared or dedicated load balancer.

#### Constraints

When adding a listener, note the following:

- For load balancing at Layer 4, the listener protocol can be TCP, UDP, or TLS.
- For load balancing at Layer 7, the listener protocol can be HTTP, HTTPS or QUIC.
- For load balancing both at Layer 4 and Layer 7, the listener protocol can be TCP, UDP, TLS, HTTP, HTTPS, or QUIC.
- When adding a listener to a gateway load balancer, the listener protocol can only be IP.

#### Calling Method

For details, see [Calling APIs](#).

#### URI

POST /v3/{project\_id}/elb/listeners

**Table 5-369** Path Parameters

| Parameter  | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                |

| protection_reason | No        | String                            | <b>Definition:</b> Specifies why modification protection is enabled.<br><b>Constraints:</b> This parameter is valid only when <b>protection_status</b> is set to <b>consoleProtection</b> .<br><b>Range:</b> The value can contain a maximum of 255 Unicode characters, excluding angle brackets (<>).<br><b>Default value:</b> N/A                                                                                                                                  |
| gzip_enable       | No        | Boolean                           | <b>Definition:</b> Specifies whether to enable <b>gzip_enable</b> for a load balancer.<br><b>Constraints:</b> This parameter can be configured only for HTTP, HTTPS, and QUIC listeners.<br><b>Range:</b> The value can be <b>true</b> (enable this option) or <b>false</b> (disable this option).<br><b>Default value:</b> <b>false</b>                                                                                                                             |
| port_ranges       | No        | Array of <b>PortRange</b> objects | <b>Definition:</b> Specifies one or more port ranges, including the start and end port numbers. A maximum of 10 port ranges can be specified. Port ranges cannot overlap with each other.<br><b>Constraints:</b> <ul style="list-style-type: none"><li>• This parameter can be specified only when <b>protocol_port</b> is set to <b>0</b> or <b>protocol_port</b> is not specified.</li><li>• This parameter is available for TCP, UDP, or TLS listeners.</li></ul> |

| Parameter             | Mandatory | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                |
|-----------------------|-----------|---------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ssl_early_data_enable | No        | Boolean | <b>Definition:</b> Specifies whether to enable zero round trip time resumption (0-RTT) for listeners.<br><b>Constraints:</b> This option can be configured only for HTTPS listeners and depends on the TLS 1.3 security policy protocols. If <b>ssl_early_data</b> is set to <b>true</b> , there may be replay attacks.<br><b>Range:</b> <b>true</b> or <b>false</b><br><b>Default value:</b> <b>false</b> |
| cps                   | No        | Integer | <b>Definition:</b> Specifies the maximum number of new connections that a listener can handle per second.<br><b>Constraints:</b> If the value is greater than the number defined in the load balancer flavors, the latter is used as the limit.<br><b>Range:</b> 0 to 1000000<br><b>Default value:</b> <b>0</b> , indicating that the number is not limited.                                               |
| connection            | No        | Integer | <b>Definition:</b> Specifies the maximum number of concurrent connections that a listener can handle per second.<br><b>Constraints:</b> If the value is greater than the number defined in the load balancer flavors, the latter is used as the limit.<br><b>Range:</b> 0 to 1000000<br><b>Default value:</b> <b>0</b> , indicating that the number is not limited.                                        |

| Parameter    | Mandatory | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|--------------|-----------|---------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| nat64_enable | No        | Boolean | <b>Definition:</b> Specifies whether to translate between IPv4 and IPv6 addresses. This option allows a client to access IPv4 or IPv6 backend servers by accessing the IPv4 or IPv6 address of a load balancer.<br><b>Constraints:</b> This option can only be enabled for TCP and UDP listeners. <b>nat64_enable</b> is mutually exclusive with <b>transparent_client_ip_enable</b> .<br><b>Range:</b> <ul style="list-style-type: none"><li>• <b>true:</b> Enable <b>nat64_enable</b>.</li><li>• <b>false:</b> Disable <b>nat64_enable</b>.</li></ul> <b>Default value:</b> false |

**Table 5-373** ListenerInsertHeaders

| Parameter            | Mandatory | Type    | Description                                                                                                                                                                                       |
|----------------------|-----------|---------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| X-Forwarded-ELB-IP   | No        | Boolean | <b>Definition:</b> If <b>X-Forwarded-ELB-IP</b> is set to <b>true</b> , the load balancer EIP will be stored in the <b>X-Forwarded-ELB-IP</b> header and passed to backend servers.               |
| X-Forwarded-Port     | No        | Boolean | <b>Definition:</b> If <b>X-Forwarded-Port</b> is set to <b>true</b> , the listening port of the load balancer will be stored in the <b>X-Forwarded-Port</b> header and passed to backend servers. |
| X-Forwarded-For-Port | No        | Boolean | <b>Definition:</b> If <b>X-Forwarded-For-Port</b> is set to <b>true</b> , the source port of the client will be stored in the HTTP header and passed to backend servers.                          |
| X-Forwarded-Host     | No        | Boolean | <b>Definition:</b> If <b>X-Forwarded-Host</b> is set to <b>true</b> , the client host can be stored in the <b>X-Forwarded-Host</b> header and passed to backend servers.                          |

| Parameter                      | Mandatory | Type    | Description                                                                                                                                                                                                                  |
|--------------------------------|-----------|---------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| X-Forwarded-Proto              | No        | Boolean | <b>Definition:</b> If <b>X-Forwarded-Proto</b> is set to <b>true</b> , the listener protocol of the load balancer can be stored in the <b>X-Forwarded-Proto</b> header and passed to backend servers.                        |
| X-Real-IP                      | No        | Boolean | <b>Definition:</b> If <b>X-Real-IP</b> is set to <b>true</b> , the client IP address can be stored in the <b>X-Real-IP</b> header and passed to backend servers.                                                             |
| X-Forwarded-ELB-ID             | No        | Boolean | <b>Definition:</b> If <b>X-Forwarded-ELB-ID</b> is set to <b>true</b> , the load balancer ID can be stored in the <b>X-Forwarded-ELB-ID</b> header and passed to backend servers.                                            |
| X-Forwarded-TLS-Certificate-ID | No        | Boolean | <b>Definition:</b> If <b>X-Forwarded-TLS-Certificate-ID</b> is set to <b>true</b> , the certificate ID of the load balancer can be stored in the <b>X-Forwarded-TLS-Certificate-ID</b> header and passed to backend servers. |
| X-Forwarded-TLS-Protocol       | No        | Boolean | <b>Definition:</b> If <b>X-Forwarded-TLS-Protocol</b> is set to <b>true</b> , the algorithm protocol of the load balancer can be stored in the <b>X-Forwarded-TLS-Protocol</b> header and passed to backend servers.         |
| X-Forwarded-TLS-Cipher         | No        | Boolean | <b>Definition:</b> If <b>X-Forwarded-TLS-Cipher</b> is set to <b>true</b> , the algorithm suite of the load balancer can be stored in the <b>X-Forwarded-TLS-Cipher</b> header and passed to backend servers.                |

| Parameter                      | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                |

| enable_ipgroup | No        | Boolean | <b>Definition:</b> Specifies whether to enable access control.<br><b>Constraints:</b> N/A<br><b>Range:</b> <ul style="list-style-type: none"><li><b>true</b> (default): Enable access control.</li><li><b>false</b>: Disable access control.</li></ul> <b>Default value:</b> N/A                                                                                                                                                                                                                                  |
| type           | No        | String  | <b>Definition:</b> Specifies how access to the listener is controlled.<br><b>Constraints:</b> N/A<br><b>Range:</b> <ul style="list-style-type: none"><li><b>white</b>: A whitelist will be configured. Only IP addresses in the whitelist can access the listener.</li><li><b>black</b>: A blacklist will be configured. IP addresses in the blacklist are not allowed to access the listener.</li></ul> <b>Default value:</b> white                                                                              |

**Table 5-376** CreateListenerQuicConfigOption

| Parameter           | Mandatory | Type    | Description                                                                                                                                                                                                                                                                                                                                           |
|---------------------|-----------|---------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| quic_listener_id    | Yes       | String  | <b>Definition:</b> Specifies the ID of the QUIC listener.<br><b>Constraints:</b> The listener specified by <b>quic_listener_id</b> must exist. The listener protocol must be <b>QUIC</b> and cannot be set to <b>null</b> . Otherwise, it will conflict with <b>enable_quic_upgrade</b> .<br><b>Range:</b> N/A<br><b>Default value:</b> N/A           |
| enable_quic_upgrade | No        | Boolean | <b>Definition:</b> Specifies whether to enable QUIC upgrade. If this option is enabled, HTTPS listeners will be upgraded to QUIC listeners.<br><b>Constraints:</b> N/A<br><b>Range:</b> <ul style="list-style-type: none"><li>• <b>True:</b> Enable QUIC upgrade.</li><li>• <b>False:</b> Disable QUIC upgrade.</li></ul> <b>Default value:</b> false |

**Table 5-377** PortRange

| Parameter  | Mandatory | Type    | Description                                                                                                                                                                                      |
|------------|-----------|---------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| start_port | No        | Integer | <b>Definition:</b> Specifies the start port number.<br><b>Constraints:</b> N/A<br><b>Range:</b> 1-65535<br><b>Default value:</b> N/A                                                             |
| end_port   | No        | Integer | <b>Definition:</b> Specifies the end port number.<br><b>Constraints:</b> The value must be greater than or equal to the start port number.<br><b>Range:</b> 1-65535<br><b>Default value:</b> N/A |

## Response Parameters

Status code: 201

**Table 5-378** Response body parameters

| Parameter  | Type                   | Description                                                                                                                                                                          |
|------------|------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| request_id | String                 | <b>Definition:</b> Specifies the request ID.<br><b>Range:</b> The value is automatically generated, and can contain characters including digits, lowercase letters, and hyphens (-). |
| listener   | <b>Listener</b> object | <b>Definition:</b> Specifies the listener.                                                                                                                                           |

**Table 5-379** Listener

| Parameter                   | Type    | Description                                                                                                                                                                                                          |
|-----------------------------|---------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| admin_state_up              | Boolean | <b>Definition:</b> Specifies the administrative status of the listener.<br><b>Default value:</b> true                                                                                                                |
| client_ca_tls_container_ref | String  | <b>Definition:</b> Specifies the ID of the CA certificate used by the listener. This parameter is available only when <b>type</b> is set to <b>client</b> .<br><b>Default value:</b> N/A                             |
| connection_limit            | Integer | <b>Definition:</b> Specifies the maximum number of connections that the listener can establish with backend servers.<br><b>Range:</b> an integer greater than or equal to -1                                         |
| created_at                  | String  | <b>Definition:</b> Specifies the time when the listener was created.<br><b>Range:</b> N/A<br>The value must be in the format of <i>yyyy-MM-dd'T'HH:mm:ss'Z'</i> , for example, 2021-07-30T12:03:44Z.                 |
| default_pool_id             | String  | <b>Definition:</b> Specifies the ID of the default backend server group of the listener. If there is no matched forwarding policy, requests will be routed to the default backend server group.<br><b>Range:</b> N/A |

| Parameter                 | Type                                             | Description                                                                                                                                                                                                                                                |
|---------------------------|--------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| default_tls_container_ref | String                                           | <b>Definition:</b> Specifies the ID of the server certificate used by the listener.<br><b>Default value:</b> N/A                                                                                                                                           |
| description               | String                                           | <b>Definition:</b> Provides supplementary information about the listener.<br><b>Range:</b> N/A                                                                                                                                                             |
| http2_enable              | Boolean                                          | <b>Definition:</b> Specifies whether to allow clients to use HTTP/2 to communicate with the load balancer for higher access performance.<br>However, the load balancer still uses HTTP/1.x to forward requests to the backend server.<br><b>Range:</b> N/A |
| id                        | String                                           | <b>Definition:</b> Specifies the listener ID.<br><b>Range:</b> N/A                                                                                                                                                                                         |
| insert_headers            | <a href="#">ListenerInsertHeaders</a> object     | <b>Definition:</b> Specifies the HTTP headers that can transmit required information to backend servers. For example, you can use the <b>X-Forwarded-ELB-IP</b> header to transmit the load balancer EIP to backend servers.                               |
| loadbalancers             | Array of <a href="#">LoadBalancerRef</a> objects | <b>Definition:</b> Specifies the ID of the load balancer that the listener is added to. A listener can be associated with only one load balancer.                                                                                                          |
| name                      | String                                           | <b>Definition:</b> Specifies the name of the listener. If you leave the listener name empty, you cannot locate it in the listener list and view its details.<br><b>Range:</b> N/A                                                                          |
| project_id                | String                                           | <b>Definition:</b> Specifies the ID of the project that the listener belongs to.<br><b>Range:</b> N/A                                                                                                                                                      |
| enterprise_project_id     | String                                           | <b>Definition:</b> Specifies the enterprise project ID.<br><b>Range:</b> N/A                                                                                                                                                                               |

| Parameter          | Type                                 | Description                                                                                                                                                                                                                                                                       |
|--------------------|--------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| protocol           | String                               | <b>Definition:</b> Specifies the protocol of the listener.<br><b>Range:</b> TCP, UDP, HTTP, HTTPS, TERMINATED_HTTPS, QUIC, IP, or TLS. IP is only available for listeners that will be added to gateway load balancers.                                                           |
| protocol_port      | Integer                              | <b>Definition:</b> Specifies the port used by the listener.<br><b>Default value:</b> N/A                                                                                                                                                                                          |
| sni_container_refs | Array of strings                     | <b>Definition:</b> Specifies the IDs of SNI certificates (server certificates with domain names) used by the listener.<br><b>Range:</b> N/A                                                                                                                                       |
| sni_match_algo     | String                               | <b>Definition:</b> Specifies how wildcard domain name matches with the SNI certificates used by the listener.<br><b>Range:</b> <b>longest_suffix</b> indicates longest suffix match. <b>wildcard</b> indicates wildcard match.                                                    |
| tags               | Array of <a href="#">Tag</a> objects | <b>Definition:</b> Lists the tags.                                                                                                                                                                                                                                                |
| updated_at         | String                               | <b>Definition:</b> Specifies the time when the listener was updated.<br><b>Range:</b> The value must be in the format of <i>yyyy-MM-dd'T'HH:mm:ss'Z'</i> , for example, 2021-07-30T12:03:44Z.                                                                                     |
| tls_ciphers_policy | String                               | <b>Definition:</b> Specifies the security policy used by the listener.<br><b>Range:</b> tls-1-0-inherit, tls-1-0, tls-1-1, tls-1-2, tls-1-2-strict, tls-1-2-fs, tls-1-0-with-1-3, tls-1-2-fs-with-1-3, hybrid-policy-1-0, or tls-1-2-strict-no-cbc. The default value is tls-1-2. |
| security_policy_id | String                               | <b>Definition:</b> Specifies the ID of the custom security policy.<br><b>Range:</b> N/A                                                                                                                                                                                           |

| Parameter           | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|---------------------|---------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| enable_member_retry | Boolean | <b>Definition:</b> Specifies whether to enable health check retries for backend servers.<br><b>Range:</b> <b>true</b> indicates health check retries will be enabled. <b>false</b> indicates health check retries will be disabled.                                                                                                                                                                                                                                                                                                           |
| keepalive_timeout   | Integer | <b>Definition:</b> Specifies the idle timeout duration, in seconds. If the load balancer receives no requests within the idle timeout duration, it will disconnect the connection with the client and establish a new connection when there is a new request.<br><b>Range:</b> <ul style="list-style-type: none"><li>For TCP and IP listeners, the value ranges from 10s to 4000s. The default value is 300s.</li><li>For HTTP, HTTPS, and TERMINATED_HTTPS listeners, the value ranges from 0s to 4000s. The default value is 60s.</li></ul> |
| client_timeout      | Integer | <b>Definition:</b> Specifies the timeout duration for waiting for a response from a client, in seconds. There are two situations: <ul style="list-style-type: none"><li>If the client fails to send a request header to the load balancer within the timeout duration, the request will be interrupted.</li><li>If the interval between two consecutive request bodies reaching the load balancer is greater than the timeout duration, the connection will be disconnected.</li></ul> <b>Range:</b> 1-300                                    |
| member_timeout      | Integer | <b>Definition:</b> Specifies the timeout duration for waiting for a response from a backend server, in seconds. If the backend server fails to respond after the timeout duration elapses, the load balancer will stop waiting and return HTTP 504 Gateway Timeout to the client.<br><b>Range:</b> 1-300                                                                                                                                                                                                                                      |

| Parameter                    | Type                                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

|-----------------------|-----------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| gzip_enable           | Boolean                           | <b>Definition:</b> Specifies whether to enable <b>gzip_enable</b> for a load balancer.<br><b>Range:</b> The value can be <b>true</b> (enable this option) or <b>false</b> (disable this option).                                                                                                                             |
| port_ranges           | Array of <b>PortRange</b> objects | <b>Definition:</b> Specifies one or more port ranges, including the start and end ports.                                                                                                                                                                                                                                     |
| ssl_early_data_enable | Boolean                           | <b>Definition:</b> Specifies whether to enable zero round trip time resumption (0-RTT) for listeners.<br><b>Constraints:</b> This option can be configured only for HTTPS listeners and depends on the TLS 1.3 security policy protocols.                                                                                    |
| cps                   | Integer                           | <b>Definition:</b> Specifies the maximum number of new connections that a listener can handle per second. If the value is greater than the number defined in the load balancer flavors, the latter is used as the limit.<br><b>Range:</b> 0 to 1000000                                                                       |
| connection            | Integer                           | <b>Definition:</b> Specifies the maximum number of concurrent connections that a listener can handle per second. If the value is greater than the number defined in the load balancer flavors, the latter is used as the limit.<br><b>Range:</b> 0 to 1000000                                                                |
| nat64_enable          | Boolean                           | <b>Definition:</b> Specifies whether to translate between IPv4 and IPv6 addresses. This option allows a client to access IPv4 or IPv6 backend servers by accessing the IPv4 or IPv6 address of a load balancer.<br><b>Range:</b><br><b>true:</b> Enable <b>nat64_enable</b> .<br><b>false:</b> Disable <b>nat64_enable</b> . |

**Table 5-380** ListenerInsertHeaders

| Parameter                      | Type    | Description                                                                                                                                                                                                                  |
|--------------------------------|---------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| X-Forwarded-ELB-IP             | Boolean | <b>Definition:</b> If <b>X-Forwarded-ELB-IP</b> is set to <b>true</b> , the load balancer EIP will be stored in the <b>X-Forwarded-ELB-IP</b> header and passed to backend servers.                                          |
| X-Forwarded-Port               | Boolean | <b>Definition:</b> If <b>X-Forwarded-Port</b> is set to <b>true</b> , the listening port of the load balancer will be stored in the <b>X-Forwarded-Port</b> header and passed to backend servers.                            |
| X-Forwarded-For-Port           | Boolean | <b>Definition:</b> If <b>X-Forwarded-For-Port</b> is set to <b>true</b> , the source port of the client will be stored in the HTTP header and passed to backend servers.                                                     |
| X-Forwarded-Host               | Boolean | <b>Definition:</b> If <b>X-Forwarded-Host</b> is set to <b>true</b> , the client host can be stored in the <b>X-Forwarded-Host</b> header and passed to backend servers.                                                     |
| X-Forwarded-Proto              | Boolean | <b>Definition:</b> If <b>X-Forwarded-Proto</b> is set to <b>true</b> , the listener protocol of the load balancer can be stored in the <b>X-Forwarded-Proto</b> header and passed to backend servers.                        |
| X-Real-IP                      | Boolean | <b>Definition:</b> If <b>X-Real-IP</b> is set to <b>true</b> , the client IP address can be stored in the <b>X-Real-IP</b> header and passed to backend servers.                                                             |
| X-Forwarded-ELB-ID             | Boolean | <b>Definition:</b> If <b>X-Forwarded-ELB-ID</b> is set to <b>true</b> , the load balancer ID can be stored in the <b>X-Forwarded-ELB-ID</b> header and passed to backend servers.                                            |
| X-Forwarded-TLS-Certificate-ID | Boolean | <b>Definition:</b> If <b>X-Forwarded-TLS-Certificate-ID</b> is set to <b>true</b> , the certificate ID of the load balancer can be stored in the <b>X-Forwarded-TLS-Certificate-ID</b> header and passed to backend servers. |
| X-Forwarded-TLS-Protocol       | Boolean | <b>Definition:</b> If <b>X-Forwarded-TLS-Protocol</b> is set to <b>true</b> , the algorithm protocol of the load balancer can be stored in the <b>X-Forwarded-TLS-Protocol</b> header and passed to backend servers.         |

| Parameter                      | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                              |
|--------------------------------|---------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| X-Forwarded-TLS-Cipher         | Boolean | <b>Definition:</b> If <b>X-Forwarded-TLS-Cipher</b> is set to <b>true</b> , the algorithm suite of the load balancer can be stored in the <b>X-Forwarded-TLS-Cipher</b> header and passed to backend servers.                                                                                                                                                                                                            |
| X-Forwarded-TLS-Protocol-alias | String  | <b>Definition:</b> Specifies the name of the X-Forwarded-TLS-Protocol header.<br><b>Constraints:</b> This parameter takes effect only if <b>X-Forwarded-TLS-Protocol</b> is set to <b>true</b> . This parameter is available only for HTTPS, TERMINATED_HTTPS, and QUIC listeners.<br><b>Range:</b> 1 to 40 characters. Only letters, hyphens (-), underscores (_), and digits are allowed.<br><b>Default value:</b> N/A |
| X-Forwarded-TLS-Cipher-alias   | String  | <b>Definition:</b> Specifies the name of the X-Forwarded-TLS-Cipher header.<br><b>Constraints:</b> This parameter takes effect only if <b>X-Forwarded-TLS-Cipher</b> is set to <b>true</b> . |----------------------------|---------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| X-Forwarded-Tls-Ja4-enable | Boolean | <b>Definition:</b> Specifies whether to transfer the Ja4 fingerprint of the client that accesses the load balancer through the X-Forwarded-Tls-Ja4 header.<br><b>Constraints:</b> This parameter is available only for HTTPS, TERMINATED_HTTPS, and QUIC listeners.<br><b>Range:</b> true or false<br><b>Default value:</b> false                                                                                     |
| X-Forwarded-Tls-Ja4-alias  | String  | <b>Definition:</b> Specifies the name of the X-Forwarded-Tls-Ja4 header.<br><b>Constraints:</b> This parameter takes effect only if <b>X-Forwarded-Tls-Ja4-enable</b> is set to <b>true</b> . This parameter is available only for HTTPS, TERMINATED_HTTPS, and QUIC listeners.<br><b>Range:</b> 1 to 40 characters. Only letters, hyphens (-), underscores (_), and digits are allowed.<br><b>Default value:</b> N/A |

**Table 5-381** LoadBalancerRef

| Parameter | Type   | Description                                                             |
|-----------|--------|-------------------------------------------------------------------------|
| id        | String | <b>Definition:</b> Specifies the load balancer ID.<br><b>Range:</b> N/A |

**Table 5-382** Tag

| Parameter | Type   | Description                                                      |
|-----------|--------|------------------------------------------------------------------|
| key       | String | <b>Definition:</b> Specifies the tag key.<br><b>Range:</b> N/A   |
| value     | String | <b>Definition:</b> Specifies the tag value.<br><b>Range:</b> N/A |

**Table 5-383** ListenerIpGroup

| Parameter      | Type    | Description                                                                                                                                                                                                                                                                                                                                                                       |
|----------------|---------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ipgroup_id     | String  | <b>Definition:</b> Specifies the ID of the IP address group associated with the listener.<br><br>This parameter is mandatory during creation and is optional during update.<br><b>Constraints:</b><br>The specified IP address group must exist, and the value cannot be <b>null</b> . Otherwise, the IP address group conflicts with <b>enable_ipgroup</b> .                     |
| enable_ipgroup | Boolean | <b>Definition:</b> Specifies whether access control is enabled.<br><br>A listener with access control enabled can be directly deleted.<br><b>Range:</b> <ul style="list-style-type: none"><li>• <b>true:</b> Access control is enabled.</li><li>• <b>false:</b> Access control is disabled.</li></ul>                                                                             |
| type           | String  | <b>Definition:</b> Specifies how access to the listener is controlled.<br><b>Range:</b> <ul style="list-style-type: none"><li>• <b>white:</b> A whitelist will be configured. Only IP addresses in the whitelist can access the listener.</li><li>• <b>black:</b> A blacklist will be configured. IP addresses in the blacklist are not allowed to access the listener.</li></ul> |

**Table 5-384** ListenerQuicConfig

| Parameter           | Type    | Description                                                                                                                                                                                                                                                                                    |
|---------------------|---------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| quic_listener_id    | String  | <b>Definition:</b> Specifies the ID of the QUIC listener.<br><b>Range:</b> N/A                                                                                                                                                                                                                 |
| enable_quic_upgrade | Boolean | <b>Definition:</b> Specifies whether to enable QUIC upgrade. If this option is enabled, HTTPS listeners will be upgraded to QUIC listeners.<br><b>Range:</b> <ul style="list-style-type: none"><li>• <b>True:</b> Enable QUIC upgrade.</li><li>• <b>False:</b> Disable QUIC upgrade.</li></ul> |

**Table 5-385** PortRange

| Parameter  | Type    | Description                                                                                                                                                                                      |
|------------|---------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| start_port | Integer | <b>Definition:</b> Specifies the start port number.<br><b>Constraints:</b> N/A<br><b>Range:</b> 1-65535<br><b>Default value:</b> N/A                                                             |
| end_port   | Integer | <b>Definition:</b> Specifies the end port number.<br><b>Constraints:</b> The value must be greater than or equal to the start port number.<br><b>Range:</b> 1-65535<br><b>Default value:</b> N/A |

## Example Requests

- Example 1: Adding a TCP listener

POST https://{ELB\_Endpoint}/v3/99a3fff0d03c428eac3678da6a7d0f24/elb/listeners

```
{
 "listener": {
 "protocol_port": 80,
 "protocol": "TCP",
 "loadbalancer_id": "098b2f68-af1c-41a9-8efd-69958722af62",
 "name": "My listener",
 "admin_state_up": true,
 "insert_headers": {
 "X-Forwarded-ELB-IP": true
 }
 }
}
```

- Example 2: Adding an HTTPS listener

POST https://{ELB\_Endpoint}/v3/99a3fff0d03c428eac3678da6a7d0f24/elb/listeners

```
{
 "listener": {
 "protocol_port": 90,
 "protocol": "HTTPS",
 "loadbalancer_id": "098b2f68-af1c-41a9-8efd-69958722af62",
 "name": "My listener",
 "admin_state_up": true,
 "ipgroup": {
 "ipgroup_id": "0416b6f1-877f-4a51-987e-978b3f083542",
 "type": "black"
 },
 "security_policy_id": "8722e0e0-9cc9-4490-9660-8c9a5732fbb0",
 "default_tls_container_ref": "233a325e5e3e4ce8beeb320aa714cc12"
 }
}
```

## Example Responses

**Status code: 201**

Successful request.

```
{
 "listener" : {

## Go

- Example 1: Adding a TCP listener

```
package main

import (
 "fmt"
 "github.com/huaweicloud/huaweicloud-sdk-go-v3/core/auth/basic"
 elb "github.com/huaweicloud/huaweicloud-sdk-go-v3/services/elb/v3"
 "github.com/huaweicloud/huaweicloud-sdk-go-v3/services/elb/v3/model"
 region "github.com/huaweicloud/huaweicloud-sdk-go-v3/services/elb/v3/region"
)

func main() {
 // The AK and SK used for authentication are hard-coded or stored in plaintext, which has great
```

security risks. It is recommended that the AK and SK be stored in ciphertext in configuration files or environment variables and decrypted during use to ensure security.

// In this example, AK and SK are stored in environment variables for authentication. Before running this example, set environment variables CLOUD\_SDK\_AK and CLOUD\_SDK\_SK in the local environment

```
ak := os.Getenv("CLOUD_SDK_AK")
sk := os.Getenv("CLOUD_SDK_SK")
projectId := "{project_id}"

auth := basic.NewCredentialsBuilder().
 WithAk(ak).
 WithSk(sk).
 WithProjectId(projectId).
 Build()

client := elb.NewElbClient(
 elb.ElClientBuilder().
 WithRegion(region.ValueOf("<YOUR REGION>")).
 WithCredential(auth).
 Build())

request := &model.CreateListenerRequest{}
xForwardedELBIPInsertHeaders:= true
insertHeadersListener := &model.ListenerInsertHeaders{
 XForwardedELBIP: &xForwardedELBIPInsertHeaders,
}
adminStateUpListener:= true
nameListener:= "My listener"
protocolPortListener:= int32(80)
listenerbody := &model.CreateListenerOption{
 AdminStateUp: &adminStateUpListener,
 InsertHeaders: insertHeadersListener,
 LoadbalancerId: "098b2f68-af1c-41a9-8efd-69958722af62",
 Name: &nameListener,
 Protocol: "TCP",
 ProtocolPort: &protocolPortListener,
}
request.Body = &model.CreateListenerRequestBody{
 Listener: listenerbody,
}
response, err := client.CreateListener(request)
if err == nil {
 fmt.Printf("%+v\n", response)
} else {
 fmt.Println(err)
}
}
```

- Example 2: Adding an HTTPS listener

package main

```
import (
 "fmt"
 "github.com/huaweicloud/huaweicloud-sdk-go-v3/core/auth/basic"
 elb "github.com/huaweicloud/huaweicloud-sdk-go-v3/services/elb/v3"
 "github.com/huaweicloud/huaweicloud-sdk-go-v3/services/elb/v3/model"
 region "github.com/huaweicloud/huaweicloud-sdk-go-v3/services/elb/v3/region"
)
```

func main() {  
 // The AK and SK used for authentication are hard-coded or stored in plaintext, which has great security risks. It is recommended that the AK and SK be stored in ciphertext in configuration files or environment variables and decrypted during use to ensure security.

// In this example, AK and SK are stored in environment variables for authentication. Before running this example, set environment variables CLOUD\_SDK\_AK and CLOUD\_SDK\_SK in the local environment

```
ak := os.Getenv("CLOUD_SDK_AK")
sk := os.Getenv("CLOUD_SDK_SK")
projectId := "{project_id}"
```

```
auth := basic.NewCredentialsBuilder().
 WithAk(ak).
 WithSk(sk).
 WithProjectId(projectId).
 Build()

client := elb.NewElbClient(
 elb.ElbClientBuilder().
 WithRegion(region.ValueOf("<YOUR REGION>")).
 WithCredential(auth).
 Build())

request := &model.CreateListenerRequest{}
typelPgroupp := model.GetCreateListenerIpGroupOptionTypeEnum().BLACK
ipgroupListener := &model.CreateListenerIpGroupOption{
 IpgroupId: "0416b6f1-877f-4a51-987e-978b3f083542",

}
adminStateUpListener:= true
defaultTlsContainerRefListener:= "233a325e5e3e4ce8beeb320aa714cc12"
nameListener:= "My listener"
protocolPortListener:= int32(90)
securityPolicyIdListener:= "8722e0e0-9cc9-4490-9660-8c9a5732fbb0"
listenerbody := &model.CreateListenerOption{
 AdminStateUp: &adminStateUpListener,
 DefaultTlsContainerRef: &defaultTlsContainerRefListener,
 LoadbalancerId: "098b2f68-af1c-41a9-8efd-69958722af62",
 Name: &nameListener,
 Protocol: "HTTPS",
 ProtocolPort: &protocolPortListener,
 SecurityPolicyId: &securityPolicyIdListener,
 Ipgroup: ipgroupListener,
}
request.Body = &model.CreateListenerRequestBody{
 Listener: listenerbody,
}
response, err := client.CreateListener(request)
if err == nil {
 fmt.Printf("%v\n", response)
} else {
 fmt.Println(err)
}
}
```

- Example 3: Adding an IP listener to a gateway load balancer

```
package main

import (
 "fmt"
 "github.com/huaweicloud/huaweicloud-sdk-go-v3/core/auth/basic"
 elb "github.com/huaweicloud/huaweicloud-sdk-go-v3/services/elb/v3"
 "github.com/huaweicloud/huaweicloud-sdk-go-v3/services/elb/v3/model"
 region "github.com/huaweicloud/huaweicloud-sdk-go-v3/services/elb/v3/region"
)

func main() {
 // The AK and SK used for authentication are hard-coded or stored in plaintext, which has great
 // security risks. It is recommended that the AK and SK be stored in ciphertext in configuration files or
 // environment variables and decrypted during use to ensure security.
 // In this example, AK and SK are stored in environment variables for authentication. Before
 // running this example, set environment variables CLOUD_SDK_AK and CLOUD_SDK_SK in the local
 // environment
 ak := os.Getenv("CLOUD_SDK_AK")
 sk := os.Getenv("CLOUD_SDK_SK")
 projectId := "{project_id}"

 auth := basic.NewCredentialsBuilder().
 WithAk(ak).
 WithSk(sk).
 WithProjectId(projectId).
```

```
Build()

client := elb.NewElbClient(
 elb.ElbClientBuilder().
 WithRegion(region.ValueOf("<YOUR REGION>")).
 WithCredential(auth).
 Build())

request := &model.CreateListenerRequest{}
typelpgroup:= model.GetCreateListenerIpGroupOptionTypeEnum().BLACK
ipgroupListener := &model.CreateListenerIpGroupOption{
 IpgroupId: "0416b6f1-877f-4a51-987e-978b3f083542",
 Type: &typelpgroup,
}
adminStateUpListener:= true
nameListener:= "My IP listener"
listenerbody := &model.CreateListenerOption{
 AdminStateUp: &adminStateUpListener,
 LoadbalancerId: "098b2f68-af1c-41a9-8efd-69958722af62",
 Name: &nameListener,
 Protocol: "IP",
 Ipgroup: ipgroupListener,
}
request.Body = &model.CreateListenerRequestBody{
 Listener: listenerbody,
}
response, err := client.CreateListener(request)
if err == nil {
 fmt.Printf("%+v\n", response)
} else {
 fmt.Println(err)
}
}
```

## More

For SDK sample code of more programming languages, see the Sample Code tab in [API Explorer](#). SDK sample code can be automatically generated.

## Status Codes

| Status Code | Description         |
|-------------|---------------------|
| 201         | Successful request. |

## Error Codes

See [Error Codes](#).

## 5.10.2 Copying a Listener

### Function

This API is used to copy a listener from a load balancer to another in the same VPC.

Note the following when copying a listener:

- You can only copy a listener from a load balancer to another in the same VPC.
- Listeners of gateway load balancers cannot be copied, and listeners of other types of load balancers cannot be copied to gateway load balancers.
- You can only copy a listener from a load balancer to another of the same type.
- The original listener cannot have more than 1,000 backend servers and 100 forwarding policies.
- The source and destination load balancers cannot be frozen or migrated.
- If **quic\_config** of the original listener is configured, **quic\_config** of the new listener will be null.
- If a redirection is configured for the original listener, this forwarding policy will not be copied.

## Calling Method

For details, see [Calling APIs](#).

## URI

POST /v3/{project\_id}/elb/listeners/{listener\_id}/clone

**Table 5-386** Path Parameters

| Parameter   | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                |
|-------------|-----------|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| project_id  | Yes       | String | <b>Definition:</b> Specifies the project ID. For details about how to obtain a project ID, see <a href="#">Obtaining a Project ID</a> .<br><b>Constraints:</b> N/A<br><b>Range:</b> The value can contain a maximum of 32 characters, including digits and lowercase letters.<br><b>Default value:</b> N/A |
| listener_id | Yes       | String | <b>Definition:</b> Specifies the ID of the listener to be copied.<br><b>Constraints:</b> N/A<br><b>Range:</b> The ID must be in UUID format and can contain up to 36 characters.<br><b>Default value:</b> N/A                                                                                              |

## Request Parameters

**Table 5-387** Request header parameters

| Parameter    | Mandatory | Type   | Description                                                                                                                                      |
|--------------|-----------|--------|--------------------------------------------------------------------------------------------------------------------------------------------------|
| X-Auth-Token | Yes       | String | <b>Definition:</b> Specifies the token used for IAM authentication.<br><b>Constraints:</b> N/A<br><b>Range:</b> N/A<br><b>Default value:</b> N/A |

**Table 5-388** Request body parameters

| Parameter              | Mandatory | Type                                                 | Description                                                                                     |
|------------------------|-----------|------------------------------------------------------|-------------------------------------------------------------------------------------------------|
| target_listener_params | Yes       | Array of <a href="#">CloneListenerOption</a> objects | <b>Definition:</b> Specifies the configurations of the new listener.<br><b>Constraints:</b> N/A |

**Table 5-389** CloneListenerOption

| Parameter | Mandatory | Type   | Description                                                                                                                                                                                                                                                     |

## Response Parameters

**Status code: 200**

**Table 5-392** Response body parameters

| Parameter     | Type                                               | Description                                                                                                                                                                                                                                    |
|---------------|----------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| listener_list | Array of <a href="#">CloneListenerResp</a> objects | <b>Definition:</b> Specifies the information about the new listener.                                                                                                                                                                           |
| request_id    | String                                             | <b>Definition:</b> Specifies the request ID.<br><b>Range:</b> The value is automatically generated, and can contain characters including digits, lowercase letters, and hyphens (-).                                                           |
| job_id        | String                                             | <b>Definition:</b> Specifies the ID of the listener copy task. You can query the task details by calling the API (GET /v3/{project_id}/elb/jobs/{job_id}).<br><b>Range:</b> The ID must be in UUID format and can contain up to 36 characters. |

**Table 5-393** CloneListenerResp

| Parameter       | Type                                          | Description                                                                                                                                               |
|-----------------|-----------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------|
| id              | String                                        | <b>Definition:</b> Specifies the ID of the new listener.<br><b>Range:</b> The ID must be in UUID format and can contain up to 36 characters.              |
| loadbalancer_id | String                                        | <b>Definition:</b> Specifies the ID of the destination load balancer.<br><b>Range:</b> The ID must be in UUID format and can contain up to 36 characters. |
| protocol_port   | Integer                                       | <b>Definition:</b> Specifies the port used by the new listener.<br><b>Range:</b> 1 to 65535                                                               |
| port_ranges     | Array of <a href="#">ResPortRange</a> objects | <b>Definition:</b> Specifies one or more port ranges, including the start and end ports.                                                                  |

Table 5-394 ResPortRange

| Parameter  | Type    | Description                                                              |
|------------|---------|--------------------------------------------------------------------------|
| start_port | Integer | <b>Definition:</b> Specifies the start port.<br><b>Range:</b> 1 to 65535 |
| end_port   | Integer | <b>Definition:</b> Specifies the end port.<br><b>Range:</b> 1 to 65535   |

Example Requests

Copying a listener

```
POST https://{ELB_Endpoint}/v3/{project_id}/elb/listeners/{listener_id}/clone

{
 "target_listener_params": [{
 "name": "xx-clone",
 "loadbalancer_id": "fb624475-734a-470a-85ed-bd8828bae924",
 "protocol_port": 425,
 "reuse_pool": false
 }]
}
```

Example Responses

Status code: 200

Successful request.

```
{
 "request_id": "11750ade-148f-4498-bd7a-e07190a1f5fe",
 "job_id": "aa132002-c0a8-473b-82b4-69fd2d6f87d2",
 "listener_list": [{
 "id": "81fdfab0-35c0-476e-96df-e00797076843",
 "loadbalancer_id": "fb624475-734a-470a-85ed-bd8828bae924",
 "protocol_port": 425,
 "port_ranges": null
 }]
}
```

Status Codes

| Status Code | Description         |
|-------------|---------------------|
| 200         | Successful request. |

Error Codes

See [Error Codes](#).

### 5.10.3 Querying Listeners

#### Function

This API is used to query listeners.

#### Constraints

This API has the following constraints:

- Parameters **marker**, **limit**, and **page\_reverse** are used for pagination query.
- Parameters **marker** and **page\_reverse** take effect only when they are used together with parameter **limit**.

#### Calling Method

For details, see [Calling APIs](#).

#### URI

GET /v3/{project\_id}/elb/listeners

Table 5-395 Path Parameters

| Parameter  | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                |
|------------|-----------|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| project_id | Yes       | String | <b>Definition:</b> Specifies the project ID. For details about how to obtain a project ID, see <a href="#">Obtaining a Project ID</a> .<br><b>Constraints:</b> N/A<br><b>Range:</b> The value can contain a maximum of 32 characters, including digits and lowercase letters.<br><b>Default value:</b> N/A |

Table 5-396 Query Parameters

| Parameter | Mandatory | Type    | Description                                                                                                                                                   |
|-----------|-----------|---------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|
| limit     | No        | Integer | <b>Definition:</b> Specifies the number of records returned on each page.<br><b>Constraints:</b> N/A<br><b>Range:</b> 0 to 2000<br><b>Default value:</b> 2000 |

| Parameter     | Mandatory | Type             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| member_timeout | No        | Array of integers | <p><b>Definition:</b> Specifies the timeout duration for waiting for a response from a backend server, in seconds. If the backend server fails to respond after the timeout duration elapses, the load balancer will stop waiting and return HTTP 504 Gateway Timeout to the client.</p> <p>Multiple durations can be used for query in the format of<br/><i>member_timeout=xxx&amp;member_timeout=xxx.</i></p> <p><b>Constraints:</b> N/A<br/><b>Range:</b> N/A<br/><b>Default value:</b> N/A</p>                                                                                                                                                                                                          |
| client_timeout | No        | Array of integers | <p><b>Definition:</b> Specifies the timeout duration for waiting for a response from a client, in seconds. There are two situations:</p> <ul style="list-style-type: none"><li>• If the client fails to send a request header to the load balancer within the timeout duration, the request will be interrupted.</li><li>• If the interval between two consecutive request bodies reaching the load balancer is greater than the timeout duration, the connection will be disconnected.</li></ul> <p>Multiple durations can be used for query in the format of<br/><i>client_timeout=xxx&amp;client_timeout=xxx.</i></p> <p><b>Constraints:</b> N/A<br/><b>Range:</b> N/A<br/><b>Default value:</b> N/A</p> |

| Parameter                    | Mandatory | Type              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|------------------------------|-----------|-------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| keepalive_timeout            | No        | Array of integers | <b>Definition:</b> Specifies the idle timeout duration, in seconds. If the load balancer receives no requests within the idle timeout duration, it will disconnect the connection with the client and establish a new connection when there is a new request.<br>Multiple durations can be used for query in the format of <i>keepalive_timeout=xxx&amp;keepalive_timeout=xxx</i> .<br><b>Constraints:</b> N/A<br><b>Range:</b> N/A<br><b>Default value:</b> N/A |
| transparent_client_ip_enable | No        | Boolean           | <b>Definition:</b> Specifies whether to pass source IP addresses of the clients to backend servers. This parameter is only available for TCP or UDP listeners of shared load balancers.<br><b>Constraints:</b> N/A<br><b>Range:</b> The value can be <b>true</b> (enable this option) or <b>false</b> (disable this option).<br><b>Default value:</b> N/A                                                                                                        |
| proxy_protocol_enable        | No        | Boolean           | <b>Definition:</b> Specifies whether to enable the ProxyProtocol option to pass the source IP addresses of the clients to backend servers.<br><b>Constraints:</b> N/A<br><b>Range:</b> The value can be <b>true</b> (enable this option) or <b>false</b> (disable this option).<br><b>Default value:</b> N/A                                                                                                                                                     |

| Parameter               | Mandatory | Type             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|-------------------------|-----------|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| enhance_l7policy_enable | No        | Boolean          | <b>Definition:</b> Specifies whether to enable advanced forwarding. If you enable this function, you can configure more flexible forwarding policies and rules.<br><b>Constraints:</b> N/A<br><b>Range:</b> The value can be <b>true</b> (enable this option) or <b>false</b> (disable this option).<br><b>Default value:</b> N/A                                                                                                            |
| member_instance_id      | No        | Array of strings | <b>Definition:</b> Specifies the backend server ID. This is a query parameter and will not be included in the response. Multiple IDs can be used for query in the format of <i>member_instance_id=xxx&amp;member_instance_id=xxx</i> .<br><b>Constraints:</b> N/A<br><b>Range:</b> N/A<br><b>Default value:</b> N/A                                                                                                                          |
| protection_status       | No        | Array of strings | <b>Definition:</b> Specifies the protection status. Multiple statuses can be used for query in the format of <i>protection_status=xxx&amp;protection_status=xxx</i> .<br><b>Constraints:</b> N/A<br><b>Range:</b> <ul style="list-style-type: none"><li>• <b>nonProtection:</b> The resource is not protected.</li><li>• <b>consoleProtection:</b> Modification is not allowed on the console.</li></ul> <b>Default value:</b> nonProtection |

| Parameter             | Mandatory | Type    | Description                                                                                                                                                                                                                                                             |
|-----------------------|-----------|---------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ssl_early_data_enable | No        | Boolean | <b>Definition:</b> Specifies whether to enable zero round trip time resumption (0-RTT) for listeners.<br><b>Constraints:</b> N/A<br><b>Range:</b> The value can be <b>true</b> (enable this option) or <b>false</b> (disable this option).<br><b>Default value:</b> N/A |
| nat64_enable          | No        | Boolean | <b>Definition:</b> Specifies whether to set <b>nat64_enable</b> to <b>true</b> .<br><b>Constraints:</b> N/A<br><b>Range:</b> The value can be <b>true</b> (enable this option) or <b>false</b> (disable this option).<br><b>Default value:</b> N/A                      |

## Request Parameters

**Table 5-397** Request header parameters

| Parameter    | Mandatory | Type   | Description                                                                                                                                      |
|--------------|-----------|--------|--------------------------------------------------------------------------------------------------------------------------------------------------|
| X-Auth-Token | Yes       | String | <b>Definition:</b> Specifies the token used for IAM authentication.<br><b>Constraints:</b> N/A<br><b>Range:</b> N/A<br><b>Default value:</b> N/A |

## Response Parameters

**Status code:** 200

**Table 5-398** Response body parameters

| Parameter  | Type   | Description                                                                                                                                                                          |
|------------|--------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| request_id | String | <b>Definition:</b> Specifies the request ID.<br><b>Range:</b> The value is automatically generated, and can contain characters including digits, lowercase letters, and hyphens (-). |

| Parameter | Type                                      | Description                                              |
|-----------|-------------------------------------------|----------------------------------------------------------|
| page_info | <a href="#">PageInfo</a> object           | <b>Definition:</b> Specifies the pagination information. |
| listeners | Array of <a href="#">Listener</a> objects | <b>Definition:</b> Lists the listeners.                  |

**Table 5-399** PageInfo

| Parameter       | Type    | Description                                                                                                                                                                                                                          |
|-----------------|---------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| previous_marker | String  | <b>Definition:</b> Specifies the ID of the first record in the pagination query result. If <b>page_reverse</b> is set to <b>true</b> , this parameter is used together to query resources on the previous page.<br><b>Range:</b> N/A |
| next_marker     | String  | <b>Definition:</b> Specifies the ID of the last record in the pagination query result. It is usually used to query resources on the next page.<br><b>Range:</b> N/A                                                                  |
| current_count   | Integer | <b>Definition:</b> Specifies the number of records returned on the current page.<br><b>Range:</b> N/A                                                                                                                                |

**Table 5-400** Listener

| Parameter                   | Type    | Description                                                                                                                                                                              |
|-----------------------------|---------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| admin_state_up              | Boolean | <b>Definition:</b> Specifies the administrative status of the listener.<br><b>Default value:</b> true                                                                                    |
| client_ca_tls_container_ref | String  | <b>Definition:</b> Specifies the ID of the CA certificate used by the listener. This parameter is available only when <b>type</b> is set to <b>client</b> .<br><b>Default value:</b> N/A |
| connection_limit            | Integer | <b>Definition:</b> Specifies the maximum number of connections that the listener can establish with backend servers.<br><b>Range:</b> an integer greater than or equal to -1             |

| Parameter                 | Type                                             | Description                                                                                                                                                                                                                                                |
|---------------------------|--------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| created_at                | String                                           | <b>Definition:</b> Specifies the time when the listener was created.<br><b>Range:</b> N/A<br>The value must be in the format of <i>yyyy-MM-dd'T'HH:mm:ss'Z'</i> , for example, 2021-07-30T12:03:44Z.                                                       |
| default_pool_id           | String                                           | <b>Definition:</b> Specifies the ID of the default backend server group of the listener. If there is no matched forwarding policy, requests will be routed to the default backend server group.<br><b>Range:</b> N/A                                       |
| default_tls_container_ref | String                                           | <b>Definition:</b> Specifies the ID of the server certificate used by the listener.<br><b>Default value:</b> N/A                                                                                                                                           |
| description               | String                                           | <b>Definition:</b> Provides supplementary information about the listener.<br><b>Range:</b> N/A                                                                                                                                                             |
| http2_enable              | Boolean                                          | <b>Definition:</b> Specifies whether to allow clients to use HTTP/2 to communicate with the load balancer for higher access performance.<br>However, the load balancer still uses HTTP/1.x to forward requests to the backend server.<br><b>Range:</b> N/A |
| id                        | String                                           | <b>Definition:</b> Specifies the listener ID.<br><b>Range:</b> N/A                                                                                                                                                                                         |
| insert_headers            | <a href="#">ListenerInsertHeaders</a> object     | <b>Definition:</b> Specifies the HTTP headers that can transmit required information to backend servers. For example, you can use the <b>X-Forwarded-ELB-IP</b> header to transmit the load balancer EIP to backend servers.                               |
| loadbalancers             | Array of <a href="#">LoadBalancerRef</a> objects | <b>Definition:</b> Specifies the ID of the load balancer that the listener is added to. A listener can be associated with only one load balancer.                                                                                                          |

| Parameter             | Type                        | Description                                                                                                                                                                                                                    |
|-----------------------|-----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| name                  | String                      | <b>Definition:</b> Specifies the name of the listener. If you leave the listener name empty, you cannot locate it in the listener list and view its details.<br><b>Range:</b> N/A                                              |
| project_id            | String                      | <b>Definition:</b> Specifies the ID of the project that the listener belongs to.<br><b>Range:</b> N/A                                                                                                                          |
| enterprise_project_id | String                      | <b>Definition:</b> Specifies the enterprise project ID.<br><b>Range:</b> N/A                                                                                                                                                   |
| protocol              | String                      | <b>Definition:</b> Specifies the protocol of the listener.<br><b>Range:</b> TCP, UDP, HTTP, HTTPS, TERMINATED_HTTPS, QUIC, IP, or TLS. IP is only available for listeners that will be added to gateway load balancers.        |
| protocol_port         | Integer                     | <b>Definition:</b> Specifies the port used by the listener.<br><b>Default value:</b> N/A                                                                                                                                       |
| sni_container_refs    | Array of strings            | <b>Definition:</b> Specifies the IDs of SNI certificates (server certificates with domain names) used by the listener.<br><b>Range:</b> N/A                                                                                    |
| sni_match_algo        | String                      | <b>Definition:</b> Specifies how wildcard domain name matches with the SNI certificates used by the listener.<br><b>Range:</b> <b>longest_suffix</b> indicates longest suffix match. <b>wildcard</b> indicates wildcard match. |
| tags                  | Array of <b>Tag</b> objects | <b>Definition:</b> Lists the tags.                                                                                                                                                                                             |
| updated_at            | String                      | <b>Definition:</b> Specifies the time when the listener was updated.<br><b>Range:</b> The value must be in the format of <i>yyyy-MM-dd'T'HH:mm:ss'Z'</i> , for example, 2021-07-30T12:03:44Z.                                  |

| Parameter           | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|---------------------|---------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| tls_ciphers_policy  | String  | <b>Definition:</b> Specifies the security policy used by the listener.<br><b>Range:</b> tls-1-0-inherit, tls-1-0, tls-1-1, tls-1-2, tls-1-2-strict, tls-1-2-fs, tls-1-0-with-1-3, tls-1-2-fs-with-1-3, hybrid-policy-1-0, or tls-1-2-strict-no-cbc. The default value is tls-1-2.                                                                                                                                                                                                                                                                 |
| security_policy_id  | String  | <b>Definition:</b> Specifies the ID of the custom security policy.<br><b>Range:</b> N/A                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| enable_member_retry | Boolean | <b>Definition:</b> Specifies whether to enable health check retries for backend servers.<br><b>Range:</b> <b>true</b> indicates health check retries will be enabled. <b>false</b> indicates health check retries will be disabled.                                                                                                                                                                                                                                                                                                               |
| keepalive_timeout   | Integer | <b>Definition:</b> Specifies the idle timeout duration, in seconds. If the load balancer receives no requests within the idle timeout duration, it will disconnect the connection with the client and establish a new connection when there is a new request.<br><b>Range:</b> <ul style="list-style-type: none"><li>• For TCP and IP listeners, the value ranges from 10s to 4000s. The default value is 300s.</li><li>• For HTTP, HTTPS, and TERMINATED_HTTPS listeners, the value ranges from 0s to 4000s. The default value is 60s.</li></ul> |
| client_timeout      | Integer | <b>Definition:</b> Specifies the timeout duration for waiting for a response from a client, in seconds. There are two situations: <ul style="list-style-type: none"><li>• If the client fails to send a request header to the load balancer within the timeout duration, the request will be interrupted.</li><li>• If the interval between two consecutive request bodies reaching the load balancer is greater than the timeout duration, the connection will be disconnected.</li></ul> <b>Range:</b> 1-300                                    |

| Parameter                    | Type                                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|------------------------------|----------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| member_timeout               | Integer                                | <b>Definition:</b> Specifies the timeout duration for waiting for a response from a backend server, in seconds. If the backend server fails to respond after the timeout duration elapses, the load balancer will stop waiting and return HTTP 504 Gateway Timeout to the client.<br><b>Range:</b> 1-300                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| ipgroup                      | <a href="#">ListenerIpGroup</a> object | <b>Definition:</b> Specifies the IP address group associated with the listener.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| transparent_client_ip_enable | Boolean                                | <b>Definition:</b> Specifies whether to pass source IP addresses of the clients to backend servers. If it is enabled, the source IP addresses of the clients will be passed to the backend server.<br>This parameter applies only to TCP/UDP listeners added to a shared load balancer.<br><b>Range:</b> <ul style="list-style-type: none"><li>• TCP or UDP listeners of shared load balancers: The value can be <b>true</b> or <b>false</b>, and the default value is <b>false</b> if this parameter is not passed.</li><li>• HTTP or HTTPS listeners of shared load balancers: The value can only be <b>true</b>, and the default value is <b>true</b> if this parameter is not passed.</li><li>• All listeners of dedicated load balancers: The value can only be <b>true</b>, and the default value is <b>true</b> if this parameter is not passed.</li></ul> |
| proxy_protocol_enable        | Boolean                                | <b>Definition:</b> Specifies whether to enable ProxyProtocol to pass the source IP addresses of the clients to backend servers. This parameter is available only for TLS listeners and does not take effect for other types of listeners.<br><b>Range:</b> The value can be <b>true</b> (enable this option) or <b>false</b> (disable this option).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| Parameter               | Type                                      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|-------------------------|-------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| enhance_l7policy_enable | Boolean                                   | <p><b>Definition:</b> Specifies whether to enable advanced forwarding. If advanced forwarding is enabled, more flexible forwarding policies and rules are supported.</p> <p>The following scenarios are supported:</p> <ul style="list-style-type: none"><li>• <b>action</b> can be set to <b>REDIRECT_TO_URL</b> (requests will be redirected to another URL) or <b>Fixed_RESPONSE</b> (a fixed response body will be returned to clients).</li><li>• Parameters <b>priority</b>, <b>redirect_url_config</b>, and <b>fixed_response_config</b> can be specified in a forwarding policy.</li><li>• <b>type</b> can be set to <b>METHOD</b>, <b>HEADER</b>, <b>QUERY_STRING</b>, or <b>SOURCE_IP</b> for a forwarding rule.</li><li>• If <b>type</b> is set to <b>HOST_NAME</b> for a forwarding rule, the value of the forwarding rule supports wildcard asterisks (*).</li><li>• Parameter <b>conditions</b> can be specified for forwarding rules.</li></ul> <p><b>Range:</b> The value can be <b>true</b> (enable this option) or <b>false</b> (disable this option).</p> |
| quic_config             | <a href="#">ListenerQuicConfig</a> object | <p><b>Definition:</b> Specifies the QUIC configuration for the current listener.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| protection_status       | String                                    | <p><b>Definition:</b> Specifies the protection status.</p> <p><b>Range:</b></p> <ul style="list-style-type: none"><li>• <b>nonProtection:</b> The resource is not protected.</li><li>• <b>consoleProtection:</b> Modification is not allowed on the console.</li></ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| Parameter             | Type                              | Description                                                                                                                                                                                                                                                                                                                  |
|-----------------------|-----------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| gzip_enable           | Boolean                           | <b>Definition:</b> Specifies whether to enable <b>gzip_enable</b> for a load balancer.<br><b>Range:</b> The value can be <b>true</b> (enable this option) or <b>false</b> (disable this option).                                                                                                                             |
| port_ranges           | Array of <b>PortRange</b> objects | <b>Definition:</b> Specifies one or more port ranges, including the start and end ports.                                                                                                                                                                                                                                     |
| ssl_early_data_enable | Boolean                           | <b>Definition:</b> Specifies whether to enable zero round trip time resumption (0-RTT) for listeners.<br><b>Constraints:</b> This option can be configured only for HTTPS listeners and depends on the TLS 1.3 security policy protocols.                                                                                    |
| cps                   | Integer                           | <b>Definition:</b> Specifies the maximum number of new connections that a listener can handle per second. If the value is greater than the number defined in the load balancer flavors, the latter is used as the limit.<br><b>Range:</b> 0 to 1000000                                                                       |
| connection            | Integer                           | <b>Definition:</b> Specifies the maximum number of concurrent connections that a listener can handle per second. If the value is greater than the number defined in the load balancer flavors, the latter is used as the limit.<br><b>Range:</b> 0 to 1000000                                                                |
| nat64_enable          | Boolean                           | <b>Definition:</b> Specifies whether to translate between IPv4 and IPv6 addresses. This option allows a client to access IPv4 or IPv6 backend servers by accessing the IPv4 or IPv6 address of a load balancer.<br><b>Range:</b><br><b>true:</b> Enable <b>nat64_enable</b> .<br><b>false:</b> Disable <b>nat64_enable</b> . |

**Table 5-401** ListenerInsertHeaders

| Parameter                      | Type    | Description                                                                                                                                                                                                                  |
|--------------------------------|---------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| X-Forwarded-ELB-IP             | Boolean | <b>Definition:</b> If <b>X-Forwarded-ELB-IP</b> is set to <b>true</b> , the load balancer EIP will be stored in the <b>X-Forwarded-ELB-IP</b> header and passed to backend servers.                                          |
| X-Forwarded-Port               | Boolean | <b>Definition:</b> If <b>X-Forwarded-Port</b> is set to <b>true</b> , the listening port of the load balancer will be stored in the <b>X-Forwarded-Port</b> header and passed to backend servers.                            |
| X-Forwarded-For-Port           | Boolean | <b>Definition:</b> If <b>X-Forwarded-For-Port</b> is set to <b>true</b> , the source port of the client will be stored in the HTTP header and passed to backend servers.                                                     |
| X-Forwarded-Host               | Boolean | <b>Definition:</b> If <b>X-Forwarded-Host</b> is set to <b>true</b> , the client host can be stored in the <b>X-Forwarded-Host</b> header and passed to backend servers.                                                     |
| X-Forwarded-Proto              | Boolean | <b>Definition:</b> If <b>X-Forwarded-Proto</b> is set to <b>true</b> , the listener protocol of the load balancer can be stored in the <b>X-Forwarded-Proto</b> header and passed to backend servers.                        |
| X-Real-IP                      | Boolean | <b>Definition:</b> If <b>X-Real-IP</b> is set to <b>true</b> , the client IP address can be stored in the <b>X-Real-IP</b> header and passed to backend servers.                                                             |
| X-Forwarded-ELB-ID             | Boolean | <b>Definition:</b> If <b>X-Forwarded-ELB-ID</b> is set to <b>true</b> , the load balancer ID can be stored in the <b>X-Forwarded-ELB-ID</b> header and passed to backend servers.                                            |
| X-Forwarded-TLS-Certificate-ID | Boolean | <b>Definition:</b> If <b>X-Forwarded-TLS-Certificate-ID</b> is set to <b>true</b> , the certificate ID of the load balancer can be stored in the <b>X-Forwarded-TLS-Certificate-ID</b> header and passed to backend servers. |
| X-Forwarded-TLS-Protocol       | Boolean | <b>Definition:</b> If <b>X-Forwarded-TLS-Protocol</b> is set to <b>true</b> , the algorithm protocol of the load balancer can be stored in the <b>X-Forwarded-TLS-Protocol</b> header and passed to backend servers.         |

| Parameter                      | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                              |

| Parameter                  | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                           |
|----------------------------|---------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| X-Forwarded-Tls-Ja4-enable | Boolean | <b>Definition:</b> Specifies whether to transfer the Ja4 fingerprint of the client that accesses the load balancer through the X-Forwarded-Tls-Ja4 header.<br><b>Constraints:</b> This parameter is available only for HTTPS, TERMINATED_HTTPS, and QUIC listeners.<br><b>Range:</b> true or false<br><b>Default value:</b> false                                                                                     |
| X-Forwarded-Tls-Ja4-alias  | String  | <b>Definition:</b> Specifies the name of the X-Forwarded-Tls-Ja4 header.<br><b>Constraints:</b> This parameter takes effect only if <b>X-Forwarded-Tls-Ja4-enable</b> is set to <b>true</b> . This parameter is available only for HTTPS, TERMINATED_HTTPS, and QUIC listeners.<br><b>Range:</b> 1 to 40 characters. Only letters, hyphens (-), underscores (_), and digits are allowed.<br><b>Default value:</b> N/A |

**Table 5-402** LoadBalancerRef

| Parameter | Type   | Description                                                             |
|-----------|--------|-------------------------------------------------------------------------|
| id        | String | <b>Definition:</b> Specifies the load balancer ID.<br><b>Range:</b> N/A |

**Table 5-403** Tag

| Parameter | Type   | Description                                                      |
|-----------|--------|------------------------------------------------------------------|
| key       | String | <b>Definition:</b> Specifies the tag key.<br><b>Range:</b> N/A   |
| value     | String | <b>Definition:</b> Specifies the tag value.<br><b>Range:</b> N/A |

**Table 5-404** ListenerIpGroup

| Parameter      | Type    | Description                                                                                                                                                                                                                                                                                                                                                                       |
|----------------|---------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ipgroup_id     | String  | <b>Definition:</b> Specifies the ID of the IP address group associated with the listener.<br><br>This parameter is mandatory during creation and is optional during update.<br><b>Constraints:</b><br>The specified IP address group must exist, and the value cannot be <b>null</b> . Otherwise, the IP address group conflicts with <b>enable_ipgroup</b> .                     |
| enable_ipgroup | Boolean | <b>Definition:</b> Specifies whether access control is enabled.<br><br>A listener with access control enabled can be directly deleted.<br><b>Range:</b> <ul style="list-style-type: none"><li>• <b>true:</b> Access control is enabled.</li><li>• <b>false:</b> Access control is disabled.</li></ul>                                                                             |
| type           | String  | <b>Definition:</b> Specifies how access to the listener is controlled.<br><b>Range:</b> <ul style="list-style-type: none"><li>• <b>white:</b> A whitelist will be configured. Only IP addresses in the whitelist can access the listener.</li><li>• <b>black:</b> A blacklist will be configured. IP addresses in the blacklist are not allowed to access the listener.</li></ul> |

**Table 5-405** ListenerQuicConfig

| Parameter           | Type    | Description                                                                                                                                                                                                                                                                                    |
|---------------------|---------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| quic_listener_id    | String  | <b>Definition:</b> Specifies the ID of the QUIC listener.<br><b>Range:</b> N/A                                                                                                                                                                                                                 |
| enable_quic_upgrade | Boolean | <b>Definition:</b> Specifies whether to enable QUIC upgrade. If this option is enabled, HTTPS listeners will be upgraded to QUIC listeners.<br><b>Range:</b> <ul style="list-style-type: none"><li>• <b>True:</b> Enable QUIC upgrade.</li><li>• <b>False:</b> Disable QUIC upgrade.</li></ul> |

**Table 5-406** PortRange

| Parameter  | Type    | Description                                                                                                                                                                                      |
|------------|---------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| start_port | Integer | <b>Definition:</b> Specifies the start port number.<br><b>Constraints:</b> N/A<br><b>Range:</b> 1-65535<br><b>Default value:</b> N/A                                                             |
| end_port   | Integer | <b>Definition:</b> Specifies the end port number.<br><b>Constraints:</b> The value must be greater than or equal to the start port number.<br><b>Range:</b> 1-65535<br><b>Default value:</b> N/A |

## Example Requests

Querying the listeners on each page

```
GET https://{ELB_Endpoint}/v3/99a3fff0d03c428eac3678da6a7d0f24/elb/listeners?
limit=2&marker=0r31747a-b139-492f-2749-2df0b1c87193
```

## Example Responses

**Status code: 200**

Successful request.

```

 }
}
```

## More

For SDK sample code of more programming languages, see the Sample Code tab in [API Explorer](#). SDK sample code can be automatically generated.

## Status Codes

| Status Code | Description         |
|-------------|---------------------|
| 200         | Successful request. |

## Error Codes

See [Error Codes](#).

## 5.10.4 Viewing the Details of a Listener

### Function

This API is used to view the details of a listener.

### Calling Method

For details, see [Calling APIs](#).

### URI

GET /v3/{project\_id}/elb/listeners/{listener\_id}

**Table 5-407** Path Parameters

| Parameter   | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                |
|-------------|-----------|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| project_id  | Yes       | String | <b>Definition:</b> Specifies the project ID. For details about how to obtain a project ID, see <a href="#">Obtaining a Project ID</a> .<br><b>Constraints:</b> N/A<br><b>Range:</b> The value can contain a maximum of 32 characters, including digits and lowercase letters.<br><b>Default value:</b> N/A |
| listener_id | Yes       | String | <b>Definition:</b> Specifies the listener ID.<br><b>Constraints:</b> N/A<br><b>Range:</b> N/A<br><b>Default value:</b> N/A                                                                                                                                                                                 |

### Request Parameters

**Table 5-408** Request header parameters

| Parameter    | Mandatory | Type   | Description                                                                                                                                      |
|--------------|-----------|--------|--------------------------------------------------------------------------------------------------------------------------------------------------|
| X-Auth-Token | Yes       | String | <b>Definition:</b> Specifies the token used for IAM authentication.<br><b>Constraints:</b> N/A<br><b>Range:</b> N/A<br><b>Default value:</b> N/A |

## Response Parameters

Status code: 200

**Table 5-409** Response body parameters

| Parameter  | Type                   | Description                                                                                                                                                                          |
|------------|------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| request_id | String                 | <b>Definition:</b> Specifies the request ID.<br><b>Range:</b> The value is automatically generated, and can contain characters including digits, lowercase letters, and hyphens (-). |
| listener   | <b>Listener</b> object | <b>Definition:</b> Specifies the listener.                                                                                                                                           |

**Table 5-410** Listener

| Parameter                   | Type    | Description                                                                                                                                                                                                          |
|-----------------------------|---------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| admin_state_up              | Boolean | <b>Definition:</b> Specifies the administrative status of the listener.<br><b>Default value:</b> true                                                                                                                |
| client_ca_tls_container_ref | String  | <b>Definition:</b> Specifies the ID of the CA certificate used by the listener. This parameter is available only when <b>type</b> is set to <b>client</b> .<br><b>Default value:</b> N/A                             |
| connection_limit            | Integer | <b>Definition:</b> Specifies the maximum number of connections that the listener can establish with backend servers.<br><b>Range:</b> an integer greater than or equal to -1                                         |
| created_at                  | String  | <b>Definition:</b> Specifies the time when the listener was created.<br><b>Range:</b> N/A<br>The value must be in the format of <i>yyyy-MM-dd'T'HH:mm:ss'Z'</i> , for example, 2021-07-30T12:03:44Z.                 |
| default_pool_id             | String  | <b>Definition:</b> Specifies the ID of the default backend server group of the listener. If there is no matched forwarding policy, requests will be routed to the default backend server group.<br><b>Range:</b> N/A |

| Parameter                 | Type                                             | Description                                                                                                                                                                                                                                                |
|---------------------------|--------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| default_tls_container_ref | String                                           | <b>Definition:</b> Specifies the ID of the server certificate used by the listener.<br><b>Default value:</b> N/A                                                                                                                                           |
| description               | String                                           | <b>Definition:</b> Provides supplementary information about the listener.<br><b>Range:</b> N/A                                                                                                                                                             |
| http2_enable              | Boolean                                          | <b>Definition:</b> Specifies whether to allow clients to use HTTP/2 to communicate with the load balancer for higher access performance.<br>However, the load balancer still uses HTTP/1.x to forward requests to the backend server.<br><b>Range:</b> N/A |
| id                        | String                                           | <b>Definition:</b> Specifies the listener ID.<br><b>Range:</b> N/A                                                                                                                                                                                         |
| insert_headers            | <a href="#">ListenerInsertHeaders</a> object     | <b>Definition:</b> Specifies the HTTP headers that can transmit required information to backend servers. For example, you can use the <b>X-Forwarded-ELB-IP</b> header to transmit the load balancer EIP to backend servers.                               |
| loadbalancers             | Array of <a href="#">LoadBalancerRef</a> objects | <b>Definition:</b> Specifies the ID of the load balancer that the listener is added to. A listener can be associated with only one load balancer.                                                                                                          |
| name                      | String                                           | <b>Definition:</b> Specifies the name of the listener. If you leave the listener name empty, you cannot locate it in the listener list and view its details.<br><b>Range:</b> N/A                                                                          |
| project_id                | String                                           | <b>Definition:</b> Specifies the ID of the project that the listener belongs to.<br><b>Range:</b> N/A                                                                                                                                                      |
| enterprise_project_id     | String                                           | <b>Definition:</b> Specifies the enterprise project ID.<br><b>Range:</b> N/A                                                                                                                                                                               |

| Parameter          | Type                                 | Description                                                                                                                                                                                                                                                                       |
|--------------------|--------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| protocol           | String                               | <b>Definition:</b> Specifies the protocol of the listener.<br><b>Range:</b> TCP, UDP, HTTP, HTTPS, TERMINATED_HTTPS, QUIC, IP, or TLS. IP is only available for listeners that will be added to gateway load balancers.                                                           |
| protocol_port      | Integer                              | <b>Definition:</b> Specifies the port used by the listener.<br><b>Default value:</b> N/A                                                                                                                                                                                          |
| sni_container_refs | Array of strings                     | <b>Definition:</b> Specifies the IDs of SNI certificates (server certificates with domain names) used by the listener.<br><b>Range:</b> N/A                                                                                                                                       |
| sni_match_algo     | String                               | <b>Definition:</b> Specifies how wildcard domain name matches with the SNI certificates used by the listener.<br><b>Range:</b> <b>longest_suffix</b> indicates longest suffix match. <b>wildcard</b> indicates wildcard match.                                                    |
| tags               | Array of <a href="#">Tag</a> objects | <b>Definition:</b> Lists the tags.                                                                                                                                                                                                                                                |
| updated_at         | String                               | <b>Definition:</b> Specifies the time when the listener was updated.<br><b>Range:</b> The value must be in the format of <i>yyyy-MM-dd'T'HH:mm:ss'Z'</i> , for example, 2021-07-30T12:03:44Z.                                                                                     |
| tls_ciphers_policy | String                               | <b>Definition:</b> Specifies the security policy used by the listener.<br><b>Range:</b> tls-1-0-inherit, tls-1-0, tls-1-1, tls-1-2, tls-1-2-strict, tls-1-2-fs, tls-1-0-with-1-3, tls-1-2-fs-with-1-3, hybrid-policy-1-0, or tls-1-2-strict-no-cbc. The default value is tls-1-2. |
| security_policy_id | String                               | <b>Definition:</b> Specifies the ID of the custom security policy.<br><b>Range:</b> N/A                                                                                                                                                                                           |

| Parameter           | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|---------------------|---------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| enable_member_retry | Boolean | <b>Definition:</b> Specifies whether to enable health check retries for backend servers.<br><b>Range:</b> <b>true</b> indicates health check retries will be enabled. <b>false</b> indicates health check retries will be disabled.                                                                                                                                                                                                                                                                                                               |
| keepalive_timeout   | Integer | <b>Definition:</b> Specifies the idle timeout duration, in seconds. If the load balancer receives no requests within the idle timeout duration, it will disconnect the connection with the client and establish a new connection when there is a new request.<br><b>Range:</b> <ul style="list-style-type: none"><li>• For TCP and IP listeners, the value ranges from 10s to 4000s. The default value is 300s.</li><li>• For HTTP, HTTPS, and TERMINATED_HTTPS listeners, the value ranges from 0s to 4000s. The default value is 60s.</li></ul> |
| client_timeout      | Integer | <b>Definition:</b> Specifies the timeout duration for waiting for a response from a client, in seconds. There are two situations: <ul style="list-style-type: none"><li>• If the client fails to send a request header to the load balancer within the timeout duration, the request will be interrupted.</li><li>• If the interval between two consecutive request bodies reaching the load balancer is greater than the timeout duration, the connection will be disconnected.</li></ul> <b>Range:</b> 1-300                                    |
| member_timeout      | Integer | <b>Definition:</b> Specifies the timeout duration for waiting for a response from a backend server, in seconds. If the backend server fails to respond after the timeout duration elapses, the load balancer will stop waiting and return HTTP 504 Gateway Timeout to the client.<br><b>Range:</b> 1-300                                                                                                                                                                                                                                          |

| gzip_enable           | Boolean                           | <b>Definition:</b> Specifies whether to enable <b>gzip_enable</b> for a load balancer.<br><b>Range:</b> The value can be <b>true</b> (enable this option) or <b>false</b> (disable this option).                                                                                                                             |
| port_ranges           | Array of <b>PortRange</b> objects | <b>Definition:</b> Specifies one or more port ranges, including the start and end ports.                                                                                                                                                                                                                                     |
| ssl_early_data_enable | Boolean                           | <b>Definition:</b> Specifies whether to enable zero round trip time resumption (0-RTT) for listeners.<br><b>Constraints:</b> This option can be configured only for HTTPS listeners and depends on the TLS 1.3 security policy protocols.                                                                                    |
| cps                   | Integer                           | <b>Definition:</b> Specifies the maximum number of new connections that a listener can handle per second. If the value is greater than the number defined in the load balancer flavors, the latter is used as the limit.<br><b>Range:</b> 0 to 1000000                                                                       |
| connection            | Integer                           | <b>Definition:</b> Specifies the maximum number of concurrent connections that a listener can handle per second. If the value is greater than the number defined in the load balancer flavors, the latter is used as the limit.<br><b>Range:</b> 0 to 1000000                                                                |
| nat64_enable          | Boolean                           | <b>Definition:</b> Specifies whether to translate between IPv4 and IPv6 addresses. This option allows a client to access IPv4 or IPv6 backend servers by accessing the IPv4 or IPv6 address of a load balancer.<br><b>Range:</b><br><b>true:</b> Enable <b>nat64_enable</b> .<br><b>false:</b> Disable <b>nat64_enable</b> . |

**Table 5-411** ListenerInsertHeaders

| Parameter                      | Type    | Description                                                                                                                                                                                                                  |
|--------------------------------|---------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| X-Forwarded-ELB-IP             | Boolean | <b>Definition:</b> If <b>X-Forwarded-ELB-IP</b> is set to <b>true</b> , the load balancer EIP will be stored in the <b>X-Forwarded-ELB-IP</b> header and passed to backend servers.                                          |
| X-Forwarded-Port               | Boolean | <b>Definition:</b> If <b>X-Forwarded-Port</b> is set to <b>true</b> , the listening port of the load balancer will be stored in the <b>X-Forwarded-Port</b> header and passed to backend servers.                            |
| X-Forwarded-For-Port           | Boolean | <b>Definition:</b> If <b>X-Forwarded-For-Port</b> is set to <b>true</b> , the source port of the client will be stored in the HTTP header and passed to backend servers.                                                     |
| X-Forwarded-Host               | Boolean | <b>Definition:</b> If <b>X-Forwarded-Host</b> is set to <b>true</b> , the client host can be stored in the <b>X-Forwarded-Host</b> header and passed to backend servers.                                                     |
| X-Forwarded-Proto              | Boolean | <b>Definition:</b> If <b>X-Forwarded-Proto</b> is set to <b>true</b> , the listener protocol of the load balancer can be stored in the <b>X-Forwarded-Proto</b> header and passed to backend servers.                        |
| X-Real-IP                      | Boolean | <b>Definition:</b> If <b>X-Real-IP</b> is set to <b>true</b> , the client IP address can be stored in the <b>X-Real-IP</b> header and passed to backend servers.                                                             |
| X-Forwarded-ELB-ID             | Boolean | <b>Definition:</b> If <b>X-Forwarded-ELB-ID</b> is set to <b>true</b> , the load balancer ID can be stored in the <b>X-Forwarded-ELB-ID</b> header and passed to backend servers.                                            |
| X-Forwarded-TLS-Certificate-ID | Boolean | <b>Definition:</b> If <b>X-Forwarded-TLS-Certificate-ID</b> is set to <b>true</b> , the certificate ID of the load balancer can be stored in the <b>X-Forwarded-TLS-Certificate-ID</b> header and passed to backend servers. |
| X-Forwarded-TLS-Protocol       | Boolean | <b>Definition:</b> If <b>X-Forwarded-TLS-Protocol</b> is set to <b>true</b> , the algorithm protocol of the load balancer can be stored in the <b>X-Forwarded-TLS-Protocol</b> header and passed to backend servers.         |

| Parameter                      | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                              |
|--------------------------------|---------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| X-Forwarded-TLS-Cipher         | Boolean | <b>Definition:</b> If <b>X-Forwarded-TLS-Cipher</b> is set to <b>true</b> , the algorithm suite of the load balancer can be stored in the <b>X-Forwarded-TLS-Cipher</b> header and passed to backend servers.                                                                                                                                                                                                            |
| X-Forwarded-TLS-Protocol-alias | String  | <b>Definition:</b> Specifies the name of the X-Forwarded-TLS-Protocol header.<br><b>Constraints:</b> This parameter takes effect only if <b>X-Forwarded-TLS-Protocol</b> is set to <b>true</b> . This parameter is available only for HTTPS, TERMINATED_HTTPS, and QUIC listeners.<br><b>Range:</b> 1 to 40 characters. Only letters, hyphens (-), underscores (_), and digits are allowed.<br><b>Default value:</b> N/A |
| X-Forwarded-TLS-Cipher-alias   | String  | <b>Definition:</b> Specifies the name of the X-Forwarded-TLS-Cipher header.<br><b>Constraints:</b> This parameter takes effect only if <b>X-Forwarded-TLS-Cipher</b> is set to <b>true</b> . This parameter is available only for HTTPS, TERMINATED_HTTPS, and QUIC listeners.<br><b>Range:</b> 1 to 40 characters. Only letters, hyphens (-), underscores (_), and digits are allowed.<br><b>Default value:</b> N/A     |

| Parameter                               | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-----------------------------------------|---------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| X-Forwarded-For-Processing-Mode         | String  | <p><b>Definition:</b> Specifies how the X-Forwarded-For header will be handled.</p> <ul style="list-style-type: none"><li>• <b>append:</b> The IP address of the last hop will be included in the X-Forwarded-For header and sent to the backend server.</li><li>• <b>remove:</b> The X-Forwarded-For header will be deleted before the request is sent to the backend server, regardless of whether the request carries the X-Forwarded-For header.</li><li>• <b>preserve:</b> The existing X-Forwarded-For header will be retained in the request.</li></ul> <p><b>Constraints:</b> This parameter is available only for HTTP, HTTPS, TERMINATED_HTTPS, and QUIC listeners.</p> <p><b>Range:</b> <b>append</b>, <b>remove</b>, or <b>preserve</b></p> <p><b>Default value:</b> <b>append</b></p> |
| X-Forwarded-Clientcert-subjectdn-enable | Boolean | <p><b>Definition:</b> Specifies whether to transfer the owner information of the client certificate that accesses the load balancer through the X-Forwarded-Clientcert-subjectdn header.</p> <p><b>Constraints:</b> This parameter is available only for HTTPS, TERMINATED_HTTPS, and QUIC listeners.</p> <p><b>Range:</b> <b>true</b> or <b>false</b></p> <p><b>Default value:</b> <b>false</b></p>                                                                                                                                                                                                                                                                                                                                                                                               |

| Parameter                  | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                           |
|----------------------------|---------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| X-Forwarded-Tls-Ja4-enable | Boolean | <b>Definition:</b> Specifies whether to transfer the Ja4 fingerprint of the client that accesses the load balancer through the X-Forwarded-Tls-Ja4 header.<br><b>Constraints:</b> This parameter is available only for HTTPS, TERMINATED_HTTPS, and QUIC listeners.<br><b>Range:</b> true or false<br><b>Default value:</b> false                                                                                     |
| X-Forwarded-Tls-Ja4-alias  | String  | <b>Definition:</b> Specifies the name of the X-Forwarded-Tls-Ja4 header.<br><b>Constraints:</b> This parameter takes effect only if <b>X-Forwarded-Tls-Ja4-enable</b> is set to <b>true</b> . This parameter is available only for HTTPS, TERMINATED_HTTPS, and QUIC listeners.<br><b>Range:</b> 1 to 40 characters. Only letters, hyphens (-), underscores (_), and digits are allowed.<br><b>Default value:</b> N/A |

**Table 5-412** LoadBalancerRef

| Parameter | Type   | Description                                                             |
|-----------|--------|-------------------------------------------------------------------------|
| id        | String | <b>Definition:</b> Specifies the load balancer ID.<br><b>Range:</b> N/A |

**Table 5-413** Tag

| Parameter | Type   | Description                                                      |
|-----------|--------|------------------------------------------------------------------|
| key       | String | <b>Definition:</b> Specifies the tag key.<br><b>Range:</b> N/A   |
| value     | String | <b>Definition:</b> Specifies the tag value.<br><b>Range:</b> N/A |

**Table 5-414** ListenerIpGroup

| Parameter      | Type    | Description                                                                                                                                                                                                                                                                                                                                                                       |
|----------------|---------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ipgroup_id     | String  | <b>Definition:</b> Specifies the ID of the IP address group associated with the listener.<br><br>This parameter is mandatory during creation and is optional during update.<br><b>Constraints:</b><br>The specified IP address group must exist, and the value cannot be <b>null</b> . Otherwise, the IP address group conflicts with <b>enable_ipgroup</b> .                     |
| enable_ipgroup | Boolean | <b>Definition:</b> Specifies whether access control is enabled.<br><br>A listener with access control enabled can be directly deleted.<br><b>Range:</b> <ul style="list-style-type: none"><li>• <b>true:</b> Access control is enabled.</li><li>• <b>false:</b> Access control is disabled.</li></ul>                                                                             |
| type           | String  | <b>Definition:</b> Specifies how access to the listener is controlled.<br><b>Range:</b> <ul style="list-style-type: none"><li>• <b>white:</b> A whitelist will be configured. Only IP addresses in the whitelist can access the listener.</li><li>• <b>black:</b> A blacklist will be configured. IP addresses in the blacklist are not allowed to access the listener.</li></ul> |

**Table 5-415** ListenerQuicConfig

| Parameter           | Type    | Description                                                                                                                                                                                                                                                                                    |
|---------------------|---------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| quic_listener_id    | String  | <b>Definition:</b> Specifies the ID of the QUIC listener.<br><b>Range:</b> N/A                                                                                                                                                                                                                 |
| enable_quic_upgrade | Boolean | <b>Definition:</b> Specifies whether to enable QUIC upgrade. If this option is enabled, HTTPS listeners will be upgraded to QUIC listeners.<br><b>Range:</b> <ul style="list-style-type: none"><li>• <b>True:</b> Enable QUIC upgrade.</li><li>• <b>False:</b> Disable QUIC upgrade.</li></ul> |

**Table 5-416** PortRange

| Parameter  | Type    | Description                                                                                                                                                                                      |
|------------|---------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| start_port | Integer | <b>Definition:</b> Specifies the start port number.<br><b>Constraints:</b> N/A<br><b>Range:</b> 1-65535<br><b>Default value:</b> N/A                                                             |
| end_port   | Integer | <b>Definition:</b> Specifies the end port number.<br><b>Constraints:</b> The value must be greater than or equal to the start port number.<br><b>Range:</b> 1-65535<br><b>Default value:</b> N/A |

## Example Requests

Viewing the details of a listener

```
GET https://{ELB_Endpoint}/v3/99a3fff0d03c428eac3678da6a7d0f24/elb/listeners/0b11747a-b139-492f-9692-2df0b1c87193
```

## Example Responses

**Status code: 200**

Successful request.

## Status Codes

| Status Code | Description         |
|-------------|---------------------|
| 200         | Successful request. |

## Error Codes

See [Error Codes](#).

## 5.10.5 Updating a Listener

### Function

This API is used to update a listener.

### Constraints

If the provisioning status of the load balancer that the listener is added to is not **ACTIVE**, the listener cannot be updated.

### Calling Method

For details, see [Calling APIs](#).

### URI

PUT /v3/{project\_id}/elb/listeners/{listener\_id}

**Table 5-417** Path Parameters

| Parameter   | Mandatory | Type   | Description                |
|-------------|-----------|--------|----------------------------|
| listener_id | Yes       | String | Specifies the listener ID. |

| Parameter  | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                |
|------------|-----------|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| project_id | Yes       | String | <b>Definition:</b> Specifies the project ID. For details about how to obtain a project ID, see <a href="#">Obtaining a Project ID</a> .<br><b>Constraints:</b> N/A<br><b>Range:</b> The value can contain a maximum of 32 characters, including digits and lowercase letters.<br><b>Default value:</b> N/A |

## Request Parameters

**Table 5-418** Request header parameters

| Parameter    | Mandatory | Type   | Description                                                                                                                                      |
|--------------|-----------|--------|--------------------------------------------------------------------------------------------------------------------------------------------------|
| X-Auth-Token | Yes       | String | <b>Definition:</b> Specifies the token used for IAM authentication.<br><b>Constraints:</b> N/A<br><b>Range:</b> N/A<br><b>Default value:</b> N/A |

**Table 5-419** Request body parameters

| Parameter | Mandatory | Type                                        | Description                                                                                             |
|-----------|-----------|---------------------------------------------|---------------------------------------------------------------------------------------------------------|
| listener  | Yes       | <a href="#">UpdateListenerOption</a> object | <b>Definition:</b> Specifies the request parameters for updating a listener.<br><b>Constraints:</b> N/A |

**Table 5-420** UpdateListenerOption

| Parameter                   | Mandatory | Type    | Description                                                                                                                                                                                                                                                                                                                                                       |
|-----------------------------|-----------|---------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| admin_state_up              | No        | Boolean | <b>Definition:</b> Specifies the administrative status of the listener.<br><b>Constraints:</b> The value can only be updated to <b>true</b> .<br><b>Range:</b> N/A<br><b>Default value:</b> N/A                                                                                                                                                                   |

This parameter is available only for HTTPS, TERMINATED_HTTPS, and QUIC listeners.</p> <p><b>Range:</b> 1 to 40 characters. Only letters, hyphens (-), underscores (_), and digits are allowed.</p> <p><b>Default value:</b> N/A</p> |

| Parameter                  | Mandatory | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                                  |
|----------------------------|-----------|---------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| X-Forwarded-Tls-Sni-enable | No        | Boolean | <b>Definition:</b> Specifies whether to transfer the domain name of the SNI certificate accessed by the client through the <b>X-Forwarded-Tls-Sni</b> header.<br><b>Constraints:</b> This parameter is available only for HTTPS, TERMINATED_HTTPS, and QUIC listeners.<br><b>Range:</b> true or false<br><b>Default value:</b> false                                                                                         |
| X-Forwarded-Tls-Sni-alias  | No        | String  | <b>Definition:</b> Specifies the name of the <b>X-Forwarded-Tls-Sni</b> header.<br><b>Constraints:</b> This parameter takes effect only if <b>X-Forwarded-Tls-Sni-enable</b> is set to <b>true</b> . This parameter is available only for HTTPS, TERMINATED_HTTPS, and QUIC listeners.<br><b>Range:</b> 1 to 40 characters. Only letters, hyphens (-), underscores (_), and digits are allowed.<br><b>Default value:</b> N/A |
| X-Forwarded-Tls-Ja3-enable | No        | Boolean | <b>Definition:</b> Specifies whether to transfer the Ja3 fingerprint of the client that accesses the load balancer through the <b>X-Forwarded-Tls-Ja3</b> header.<br><b>Constraints:</b> This parameter is available only for HTTPS, TERMINATED_HTTPS, and QUIC listeners.<br><b>Range:</b> true or false<br><b>Default value:</b> false                                                                                     |

| Parameter                  | Mandatory | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|----------------------------|-----------|---------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| X-Forwarded-Tls-Ja3-alias  | No        | String  | <p><b>Definition:</b> Specifies the name of the <b>X-Forwarded-Tls-Ja3</b> header.</p> <p><b>Constraints:</b> This parameter takes effect only if <b>X-Forwarded-Tls-Ja3-enable</b> is set to <b>true</b>. This parameter is available only for HTTPS, TERMINATED_HTTPS, and QUIC listeners.</p> <p><b>Range:</b> 1 to 40 characters. Only letters, hyphens (-), underscores (_), and digits are allowed.</p> <p><b>Default value:</b> N/A</p> |
| X-Forwarded-Tls-Ja4-enable | No        | Boolean | <p><b>Definition:</b> Specifies whether to transfer the Ja4 fingerprint of the client that accesses the load balancer through the X-Forwarded-Tls-Ja4 header.</p> <p><b>Constraints:</b> This parameter is available only for HTTPS, TERMINATED_HTTPS, and QUIC listeners.</p> <p><b>Range:</b> <b>true</b> or <b>false</b></p> <p><b>Default value:</b> <b>false</b></p>                                                                      |
| X-Forwarded-Tls-Ja4-alias  | No        | String  | <p><b>Definition:</b> Specifies the name of the X-Forwarded-Tls-Ja4 header.</p> <p><b>Constraints:</b> This parameter takes effect only if <b>X-Forwarded-Tls-Ja4-enable</b> is set to <b>true</b>. This parameter is available only for HTTPS, TERMINATED_HTTPS, and QUIC listeners.</p> <p><b>Range:</b> 1 to 40 characters. Only letters, hyphens (-), underscores (_), and digits are allowed.</p> <p><b>Default value:</b> N/A</p>        |

**Table 5-422** UpdateListenerIpGroupOption

| Parameter      | Mandatory | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                                            |
|----------------|-----------|---------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ipgroup_id     | No        | String  | <b>Definition:</b> Specifies the ID of the IP address group associated with the listener. This parameter is mandatory during creation and is optional during update.<br><b>Constraints:</b> The specified IP address group must exist, and the value cannot be <b>null</b> . Otherwise, the IP address group conflicts with <b>enable_ipgroup</b> .<br><b>Range:</b> N/A<br><b>Default value:</b> N/A                                  |
| enable_ipgroup | No        | Boolean | <b>Definition:</b> Specifies whether to enable access control. A listener with access control enabled can be directly deleted.<br><b>Constraints:</b> N/A<br><b>Range:</b> <ul style="list-style-type: none"><li>• <b>true:</b> Enable access control.</li><li>• <b>false:</b> Disable access control.</li></ul> <b>Default value:</b> N/A                                                                                             |
| type           | No        | String  | <b>Definition:</b> Specifies how access to the listener is controlled.<br><b>Constraints:</b> N/A<br><b>Range:</b> <ul style="list-style-type: none"><li>• <b>white:</b> A whitelist will be configured. Only IP addresses in the whitelist can access the listener.</li><li>• <b>black:</b> A blacklist will be configured. IP addresses in the blacklist are not allowed to access the listener.</li></ul> <b>Default value:</b> N/A |

**Table 5-423** UpdateListenerQuicConfigOption

| Parameter           | Mandatory | Type    | Description                                                                                                                                                                                                                                                                                                                                         |
|---------------------|-----------|---------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| quic_listener_id    | No        | String  | <b>Definition:</b> Specifies the ID of the QUIC listener.<br><b>Constraints:</b> The listener specified by <b>quic_listener_id</b> must exist. The listener protocol must be <b>QUIC</b> and cannot be set to <b>null</b> . Otherwise, it will conflict with <b>enable_quic_upgrade</b> .<br><b>Range:</b> N/A<br><b>Default value:</b> N/A         |
| enable_quic_upgrade | No        | Boolean | <b>Definition:</b> Specifies whether to enable QUIC upgrade. If this option is enabled, HTTPS listeners will be upgraded to QUIC listeners.<br><b>Constraints:</b> N/A<br><b>Range:</b> <ul style="list-style-type: none"><li>• <b>True:</b> Enable QUIC upgrade.</li><li>• <b>False:</b> Disable QUIC upgrade.</li></ul> <b>Default value:</b> N/A |

## Response Parameters

**Status code:** 200

**Table 5-424** Response body parameters

| Parameter  | Type                   | Description                                                                                                                                                                          |
|------------|------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| request_id | String                 | <b>Definition:</b> Specifies the request ID.<br><b>Range:</b> The value is automatically generated, and can contain characters including digits, lowercase letters, and hyphens (-). |
| listener   | <b>Listener</b> object | <b>Definition:</b> Specifies the listener information.<br><b>Constraints:</b> N/A                                                                                                    |

**Table 5-425** Listener

| Parameter                   | Type    | Description                                                                                                                                                                                                                                                |
|-----------------------------|---------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| admin_state_up              | Boolean | <b>Definition:</b> Specifies the administrative status of the listener.<br><b>Default value:</b> true                                                                                                                                                      |
| client_ca_tls_container_ref | String  | <b>Definition:</b> Specifies the ID of the CA certificate used by the listener. This parameter is available only when <b>type</b> is set to <b>client</b> .<br><b>Default value:</b> N/A                                                                   |
| connection_limit            | Integer | <b>Definition:</b> Specifies the maximum number of connections that the listener can establish with backend servers.<br><b>Range:</b> an integer greater than or equal to -1                                                                               |
| created_at                  | String  | <b>Definition:</b> Specifies the time when the listener was created.<br><b>Range:</b> N/A<br>The value must be in the format of <i>yyyy-MM-dd'T'HH:mm:ss'Z'</i> , for example, 2021-07-30T12:03:44Z.                                                       |
| default_pool_id             | String  | <b>Definition:</b> Specifies the ID of the default backend server group of the listener. If there is no matched forwarding policy, requests will be routed to the default backend server group.<br><b>Range:</b> N/A                                       |
| default_tls_container_ref   | String  | <b>Definition:</b> Specifies the ID of the server certificate used by the listener.<br><b>Default value:</b> N/A                                                                                                                                           |
| description                 | String  | <b>Definition:</b> Provides supplementary information about the listener.<br><b>Range:</b> N/A                                                                                                                                                             |
| http2_enable                | Boolean | <b>Definition:</b> Specifies whether to allow clients to use HTTP/2 to communicate with the load balancer for higher access performance.<br>However, the load balancer still uses HTTP/1.x to forward requests to the backend server.<br><b>Range:</b> N/A |

| Parameter             | Type                                             | Description                                                                                                                                                                                                                  |
|-----------------------|--------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| id                    | String                                           | <b>Definition:</b> Specifies the listener ID.<br><b>Range:</b> N/A                                                                                                                                                           |
| insert_headers        | <a href="#">ListenerInsertHeaders</a> object     | <b>Definition:</b> Specifies the HTTP headers that can transmit required information to backend servers. For example, you can use the <b>X-Forwarded-ELB-IP</b> header to transmit the load balancer EIP to backend servers. |
| loadbalancers         | Array of <a href="#">LoadBalancerRef</a> objects | <b>Definition:</b> Specifies the ID of the load balancer that the listener is added to. A listener can be associated with only one load balancer.                                                                            |
| name                  | String                                           | <b>Definition:</b> Specifies the name of the listener. If you leave the listener name empty, you cannot locate it in the listener list and view its details.<br><b>Range:</b> N/A                                            |
| project_id            | String                                           | <b>Definition:</b> Specifies the ID of the project that the listener belongs to.<br><b>Range:</b> N/A                                                                                                                        |
| enterprise_project_id | String                                           | <b>Definition:</b> Specifies the enterprise project ID.<br><b>Range:</b> N/A                                                                                                                                                 |
| protocol              | String                                           | <b>Definition:</b> Specifies the protocol of the listener.<br><b>Range:</b> TCP, UDP, HTTP, HTTPS, TERMINATED_HTTPS, QUIC, IP, or TLS. IP is only available for listeners that will be added to gateway load balancers.      |
| protocol_port         | Integer                                          | <b>Definition:</b> Specifies the port used by the listener.<br><b>Default value:</b> N/A                                                                                                                                     |
| sni_container_refs    | Array of strings                                 | <b>Definition:</b> Specifies the IDs of SNI certificates (server certificates with domain names) used by the listener.<br><b>Range:</b> N/A                                                                                  |

| Parameter           | Type                                 | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|---------------------|--------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| sni_match_algo      | String                               | <b>Definition:</b> Specifies how wildcard domain name matches with the SNI certificates used by the listener.<br><b>Range:</b> <b>longest_suffix</b> indicates longest suffix match. <b>wildcard</b> indicates wildcard match.                                                                                                                                                                                                                                                                                                                    |
| tags                | Array of <a href="#">Tag</a> objects | <b>Definition:</b> Lists the tags.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| updated_at          | String                               | <b>Definition:</b> Specifies the time when the listener was updated.<br><b>Range:</b> The value must be in the format of <i>yyyy-MM-dd'THH:mm:ss'Z'</i> , for example, 2021-07-30T12:03:44Z.                                                                                                                                                                                                                                                                                                                                                      |
| tls_ciphers_policy  | String                               | <b>Definition:</b> Specifies the security policy used by the listener.<br><b>Range:</b> tls-1-0-inherit, tls-1-0, tls-1-1, tls-1-2, tls-1-2-strict, tls-1-2-fs, tls-1-0-with-1-3, tls-1-2-fs-with-1-3, hybrid-policy-1-0, or tls-1-2-strict-no-cbc. The default value is tls-1-2.                                                                                                                                                                                                                                                                 |
| security_policy_id  | String                               | <b>Definition:</b> Specifies the ID of the custom security policy.<br><b>Range:</b> N/A                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| enable_member_retry | Boolean                              | <b>Definition:</b> Specifies whether to enable health check retries for backend servers.<br><b>Range:</b> <b>true</b> indicates health check retries will be enabled. <b>false</b> indicates health check retries will be disabled.                                                                                                                                                                                                                                                                                                               |
| keepalive_timeout   | Integer                              | <b>Definition:</b> Specifies the idle timeout duration, in seconds. If the load balancer receives no requests within the idle timeout duration, it will disconnect the connection with the client and establish a new connection when there is a new request.<br><b>Range:</b> <ul style="list-style-type: none"><li>• For TCP and IP listeners, the value ranges from 10s to 4000s. The default value is 300s.</li><li>• For HTTP, HTTPS, and TERMINATED_HTTPS listeners, the value ranges from 0s to 4000s. The default value is 60s.</li></ul> |

| Parameter      | Type                                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|----------------|----------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| client_timeout | Integer                                | <b>Definition:</b> Specifies the timeout duration for waiting for a response from a client, in seconds. There are two situations: <ul style="list-style-type: none"><li>• If the client fails to send a request header to the load balancer within the timeout duration, the request will be interrupted.</li><li>• If the interval between two consecutive request bodies reaching the load balancer is greater than the timeout duration, the connection will be disconnected.</li></ul> <b>Range:</b> 1-300 |
| member_timeout | Integer                                | <b>Definition:</b> Specifies the timeout duration for waiting for a response from a backend server, in seconds. If the backend server fails to respond after the timeout duration elapses, the load balancer will stop waiting and return HTTP 504 Gateway Timeout to the client.<br><b>Range:</b> 1-300                                                                                                                                                                                                       |
| ipgroup        | <a href="#">ListenerIpGroup</a> object | <b>Definition:</b> Specifies the IP address group associated with the listener.                                                                                                                                                                                                                                                                                                                                                                                                                                |

| Parameter                    | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| enhance_l7policy_enable | Boolean                                   | <p><b>Definition:</b> Specifies whether to enable advanced forwarding. If advanced forwarding is enabled, more flexible forwarding policies and rules are supported.</p> <p>The following scenarios are supported:</p> <ul style="list-style-type: none"><li>• <b>action</b> can be set to <b>REDIRECT_TO_URL</b> (requests will be redirected to another URL) or <b>Fixed_RESPONSE</b> (a fixed response body will be returned to clients).</li><li>• Parameters <b>priority</b>, <b>redirect_url_config</b>, and <b>fixed_response_config</b> can be specified in a forwarding policy.</li><li>• <b>type</b> can be set to <b>METHOD</b>, <b>HEADER</b>, <b>QUERY_STRING</b>, or <b>SOURCE_IP</b> for a forwarding rule.</li><li>• If <b>type</b> is set to <b>HOST_NAME</b> for a forwarding rule, the value of the forwarding rule supports wildcard asterisks (*).</li><li>• Parameter <b>conditions</b> can be specified for forwarding rules.</li></ul> <p><b>Range:</b> The value can be <b>true</b> (enable this option) or <b>false</b> (disable this option).</p> |
| quic_config             | <a href="#">ListenerQuicConfig</a> object | <p><b>Definition:</b> Specifies the QUIC configuration for the current listener.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| protection_status       | String                                    | <p><b>Definition:</b> Specifies the protection status.</p> <p><b>Range:</b></p> <ul style="list-style-type: none"><li>• <b>nonProtection</b>: The resource is not protected.</li><li>• <b>consoleProtection</b>: Modification is not allowed on the console.</li></ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| protection_reason       | String                                    | <p><b>Definition:</b> Specifies why modification protection is enabled.</p> <p><b>Range:</b> The value can contain a maximum of 255 Unicode characters, excluding angle brackets (&lt;&gt;).</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| Parameter             | Type                              | Description                                                                                                                                                                                                                                                                                                                  |
|-----------------------|-----------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| gzip_enable           | Boolean                           | <b>Definition:</b> Specifies whether to enable <b>gzip_enable</b> for a load balancer.<br><b>Range:</b> The value can be <b>true</b> (enable this option) or <b>false</b> (disable this option).                                                                                                                             |
| port_ranges           | Array of <b>PortRange</b> objects | <b>Definition:</b> Specifies one or more port ranges, including the start and end ports.                                                                                                                                                                                                                                     |
| ssl_early_data_enable | Boolean                           | <b>Definition:</b> Specifies whether to enable zero round trip time resumption (0-RTT) for listeners.<br><b>Constraints:</b> This option can be configured only for HTTPS listeners and depends on the TLS 1.3 security policy protocols.                                                                                    |
| cps                   | Integer                           | <b>Definition:</b> Specifies the maximum number of new connections that a listener can handle per second. If the value is greater than the number defined in the load balancer flavors, the latter is used as the limit.<br><b>Range:</b> 0 to 1000000                                                                       |
| connection            | Integer                           | <b>Definition:</b> Specifies the maximum number of concurrent connections that a listener can handle per second. If the value is greater than the number defined in the load balancer flavors, the latter is used as the limit.<br><b>Range:</b> 0 to 1000000                                                                |
| nat64_enable          | Boolean                           | <b>Definition:</b> Specifies whether to translate between IPv4 and IPv6 addresses. This option allows a client to access IPv4 or IPv6 backend servers by accessing the IPv4 or IPv6 address of a load balancer.<br><b>Range:</b><br><b>true:</b> Enable <b>nat64_enable</b> .<br><b>false:</b> Disable <b>nat64_enable</b> . |

**Table 5-426** ListenerInsertHeaders

| Parameter                      | Type    | Description                                                                                                                                                                                                                  |
|--------------------------------|---------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| X-Forwarded-ELB-IP             | Boolean | <b>Definition:</b> If <b>X-Forwarded-ELB-IP</b> is set to <b>true</b> , the load balancer EIP will be stored in the <b>X-Forwarded-ELB-IP</b> header and passed to backend servers.                                          |
| X-Forwarded-Port               | Boolean | <b>Definition:</b> If <b>X-Forwarded-Port</b> is set to <b>true</b> , the listening port of the load balancer will be stored in the <b>X-Forwarded-Port</b> header and passed to backend servers.                            |
| X-Forwarded-For-Port           | Boolean | <b>Definition:</b> If <b>X-Forwarded-For-Port</b> is set to <b>true</b> , the source port of the client will be stored in the HTTP header and passed to backend servers.                                                     |
| X-Forwarded-Host               | Boolean | <b>Definition:</b> If <b>X-Forwarded-Host</b> is set to <b>true</b> , the client host can be stored in the <b>X-Forwarded-Host</b> header and passed to backend servers.                                                     |
| X-Forwarded-Proto              | Boolean | <b>Definition:</b> If <b>X-Forwarded-Proto</b> is set to <b>true</b> , the listener protocol of the load balancer can be stored in the <b>X-Forwarded-Proto</b> header and passed to backend servers.                        |
| X-Real-IP                      | Boolean | <b>Definition:</b> If <b>X-Real-IP</b> is set to <b>true</b> , the client IP address can be stored in the <b>X-Real-IP</b> header and passed to backend servers.                                                             |
| X-Forwarded-ELB-ID             | Boolean | <b>Definition:</b> If <b>X-Forwarded-ELB-ID</b> is set to <b>true</b> , the load balancer ID can be stored in the <b>X-Forwarded-ELB-ID</b> header and passed to backend servers.                                            |
| X-Forwarded-TLS-Certificate-ID | Boolean | <b>Definition:</b> If <b>X-Forwarded-TLS-Certificate-ID</b> is set to <b>true</b> , the certificate ID of the load balancer can be stored in the <b>X-Forwarded-TLS-Certificate-ID</b> header and passed to backend servers. |
| X-Forwarded-TLS-Protocol       | Boolean | <b>Definition:</b> If <b>X-Forwarded-TLS-Protocol</b> is set to <b>true</b> , the algorithm protocol of the load balancer can be stored in the <b>X-Forwarded-TLS-Protocol</b> header and passed to backend servers.         |

| Parameter                      | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                              |
|--------------------------------|---------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| X-Forwarded-TLS-Cipher         | Boolean | <b>Definition:</b> If <b>X-Forwarded-TLS-Cipher</b> is set to <b>true</b> , the algorithm suite of the load balancer can be stored in the <b>X-Forwarded-TLS-Cipher</b> header and passed to backend servers.                                                                                                                                                                                                            |
| X-Forwarded-TLS-Protocol-alias | String  | <b>Definition:</b> Specifies the name of the X-Forwarded-TLS-Protocol header.<br><b>Constraints:</b> This parameter takes effect only if <b>X-Forwarded-TLS-Protocol</b> is set to <b>true</b> . This parameter is available only for HTTPS, TERMINATED_HTTPS, and QUIC listeners.<br><b>Range:</b> 1 to 40 characters. Only letters, hyphens (-), underscores (_), and digits are allowed.<br><b>Default value:</b> N/A |
| X-Forwarded-TLS-Cipher-alias   | String  | <b>Definition:</b> Specifies the name of the X-Forwarded-TLS-Cipher header.<br><b>Constraints:</b> This parameter takes effect only if <b>X-Forwarded-TLS-Cipher</b> is set to <b>true</b> . **Table 5-429** ListenerIpGroup

| Parameter      | Type    | Description                                                                                                                                                                                                                                                                                                                                                                       |
|----------------|---------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ipgroup_id     | String  | <b>Definition:</b> Specifies the ID of the IP address group associated with the listener.<br><br>This parameter is mandatory during creation and is optional during update.<br><b>Constraints:</b><br>The specified IP address group must exist, and the value cannot be <b>null</b> . Otherwise, the IP address group conflicts with <b>enable_ipgroup</b> .                     |
| enable_ipgroup | Boolean | <b>Definition:</b> Specifies whether access control is enabled.<br><br>A listener with access control enabled can be directly deleted.<br><b>Range:</b> <ul style="list-style-type: none"><li>• <b>true:</b> Access control is enabled.</li><li>• <b>false:</b> Access control is disabled.</li></ul>                                                                             |
| type           | String  | <b>Definition:</b> Specifies how access to the listener is controlled.<br><b>Range:</b> <ul style="list-style-type: none"><li>• <b>white:</b> A whitelist will be configured. Only IP addresses in the whitelist can access the listener.</li><li>• <b>black:</b> A blacklist will be configured. IP addresses in the blacklist are not allowed to access the listener.</li></ul> |

**Table 5-430** ListenerQuicConfig

| Parameter           | Type    | Description                                                                                                                                                                                                                                                                                    |
|---------------------|---------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| quic_listener_id    | String  | <b>Definition:</b> Specifies the ID of the QUIC listener.<br><b>Range:</b> N/A                                                                                                                                                                                                                 |
| enable_quic_upgrade | Boolean | <b>Definition:</b> Specifies whether to enable QUIC upgrade. If this option is enabled, HTTPS listeners will be upgraded to QUIC listeners.<br><b>Range:</b> <ul style="list-style-type: none"><li>• <b>True:</b> Enable QUIC upgrade.</li><li>• <b>False:</b> Disable QUIC upgrade.</li></ul> |

**Table 5-431** PortRange

| Parameter  | Type    | Description                                                                                                                                                                                      |
|------------|---------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| start_port | Integer | <b>Definition:</b> Specifies the start port number.<br><b>Constraints:</b> N/A<br><b>Range:</b> 1-65535<br><b>Default value:</b> N/A                                                             |
| end_port   | Integer | <b>Definition:</b> Specifies the end port number.<br><b>Constraints:</b> The value must be greater than or equal to the start port number.<br><b>Range:</b> 1-65535<br><b>Default value:</b> N/A |

## Example Requests

Modifying the name and description of a listener and enabling the HTTP/2 option

```
PUT https://{ELB_Endpoint}/v3/99a3fff0d03c428eac3678da6a7d0f24/elb/listeners/0b11747a-b139-492f-9692-2df0b1c87193
```

```
{
 "listener" : {
 "description" : "My listener update.",
 "name" : "My listener",
 "http2_enable" : true
 }
}
```

## Example Responses

**Status code: 200**

Successful request.

 }
}
```

## More

For SDK sample code of more programming languages, see the Sample Code tab in [API Explorer](#). SDK sample code can be automatically generated.

## Status Codes

| Status Code | Description         |
|-------------|---------------------|
| 200         | Successful request. |

## Error Codes

See [Error Codes](#).

## 5.10.6 Deleting a Listener

### Function

This API is used to delete a listener.

### Constraints

Before you delete a listener, delete associated backend server groups or remove all backend servers in the default backend server group, and delete all forwarding policies.

### Calling Method

For details, see [Calling APIs](#).

### URI

DELETE /v3/{project\_id}/elb/listeners/{listener\_id}

**Table 5-432** Path Parameters

| Parameter   | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                |
|-------------|-----------|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| project_id  | Yes       | String | <b>Definition:</b> Specifies the project ID. For details about how to obtain a project ID, see <a href="#">Obtaining a Project ID</a> .<br><b>Constraints:</b> N/A<br><b>Range:</b> The value can contain a maximum of 32 characters, including digits and lowercase letters.<br><b>Default value:</b> N/A |
| listener_id | Yes       | String | Specifies the listener ID.                                                                                                                                                                                                                                                                                 |

## Request Parameters

## 5.10.7 Deleting a Listener and Its Associated Resources

### Function

This API is used to delete a listener and its associated resources, including the forwarding policies and backend server groups.

### Calling Method

For details, see [Calling APIs](#).

### URI

DELETE /v3/{project\_id}/elb/listeners/{listener\_id}/force

**Table 5-434** Path Parameters

| Parameter   | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                |
|-------------|-----------|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| project_id  | Yes       | String | <b>Definition:</b> Specifies the project ID. For details about how to obtain a project ID, see <a href="#">Obtaining a Project ID</a> .<br><b>Constraints:</b> N/A<br><b>Range:</b> The value can contain a maximum of 32 characters, including digits and lowercase letters.<br><b>Default value:</b> N/A |
| listener_id | Yes       | String | Specifies the listener ID.                                                                                                                                                                                                                                                                                 |

### Request Parameters

**Table 5-435** Request header parameters

| Parameter    | Mandatory | Type   | Description                                                                                                                                      |
|--------------|-----------|--------|--------------------------------------------------------------------------------------------------------------------------------------------------|
| X-Auth-Token | Yes       | String | <b>Definition:</b> Specifies the token used for IAM authentication.<br><b>Constraints:</b> N/A<br><b>Range:</b> N/A<br><b>Default value:</b> N/A |

### Response Parameters

**Status code: 204**

Successful request.

None

## Example Requests

Deleting a listener and its associated resources

```
DELETE https://{ELB_Endpoint}/v3/99a3fff0d03c428eac3678da6a7d0f24/elb/listeners/0b11747a-b139-492f-9692-2df0b1c87193/force
```

## Example Responses

None

## SDK Sample Code

The SDK sample code is as follows.

### Java

```

| 202         | Successful request. |

## Error Codes

See [Error Codes](#).

# 5.11 Backend Server Group

## 5.11.1 Creating a Backend Server Group

### Function

This API is used to create a backend server group.

## Constraints

Note the following when you create a backend server group:

- If **session\_persistence** is specified, **cookie\_name** is available only when **type** is set to **APP\_COOKIE**.
- If **listener\_id** is specified, the listener must have no backend server group associated.

## Calling Method

For details, see [Calling APIs](#).

## URI

POST /v3/{project\_id}/elb/pools

|--------------------------------------|-----------|---------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| az_minimum_healthy_member_percentage | No        | Integer | <p><b>Definition:</b> Specifies a percentage that is used to determine the health of an AZ. If the percentage of healthy servers in the AZ of the load balancer falls below the specified value, <b>az_unhealthy_fallback_strategy</b> is triggered.</p> <p><b>az_minimum_healthy_member_percentage</b> shows the percentage of backend servers that are healthy in a backend server group of an AZ. The number of healthy servers is rounded up. For example, in AZ A, if there are three backend servers in the backend server group and <b>az_minimum_healthy_member_percentage</b> is set to 66%, the number of healthy servers is rounded up to 2 (<math>3 \times 0.66 = 1.98</math>). If there are fewer than two healthy servers in AZ A, <b>az_unhealthy_fallback_strategy</b> is triggered. If <b>az_minimum_healthy_member_percentage</b> is set to 67%, the number of healthy servers is rounded up to 3 (<math>3 \times 0.67 = 2.01</math>). If there are fewer than three healthy servers in AZ A, <b>az_unhealthy_fallback_strategy</b> is triggered.</p> <p><b>Constraints:</b></p> <ul style="list-style-type: none"><li>• If <b>enable</b> is set to <b>true</b>, <b>az_minimum_healthy_member_percentage</b> and <b>az_minimum_healthy_member_count</b> cannot be set to <b>-1</b> at the same time.</li><li>• If <b>enable</b> is set to <b>true</b>, either <b>az_minimum_healthy_member_percentage</b> or <b>az_minimum_healthy_member_count</b> must be set to <b>-1</b>.</li></ul> |

| Parameter                       | Mandatory | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| enable    | Boolean | <p><b>Definition:</b> Specifies whether to enable AZ affinity for the backend server group. If this parameter is set to <b>true</b>, ELB forwards traffic across the backend servers in the same AZ as the load balancer.</p> <p><b>Constraints:</b></p> <ul style="list-style-type: none"><li>• This parameter is available only for IP, TCP, and UDP backend server groups.</li><li>• This parameter is not available for backend server groups that are associated with TLS listeners.</li><li>• If the parameter is set to <b>true</b>, parameter <b>pool_health</b> will be ignored.</li></ul> <p><b>Range:</b> <b>false</b> (disable this option) or <b>true</b> (enable this option).</p> <p><b>Default value:</b> N/A</p> |

| Parameter                            | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|--------------------------------------|---------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| az_minimum_healthy_member_percentage | Integer | <p><b>Definition:</b> Specifies a percentage that is used to determine the health of an AZ. If the percentage of healthy servers in the AZ of the load balancer falls below the specified value, <b>az_unhealthy_fallback_strategy</b> is triggered.</p> <p><b>az_minimum_healthy_member_percentage</b> shows the percentage of backend servers that are healthy in a backend server group of an AZ. The number of healthy servers is rounded up. For example, in AZ A, if there are three backend servers in the backend server group and <b>az_minimum_healthy_member_percentage</b> is set to 66%, the number of healthy servers is rounded up to 2 (<math>3 \times 0.66 = 1.98</math>). If there are fewer than two healthy servers in AZ A, <b>az_unhealthy_fallback_strategy</b> is triggered. If <b>az_minimum_healthy_member_percentage</b> is set to 67%, the number of healthy servers is rounded up to 3 (<math>3 \times 0.67 = 2.01</math>). If there are fewer than three healthy servers in AZ A, <b>az_unhealthy_fallback_strategy</b> is triggered.</p> <p><b>Constraints:</b></p> <ul style="list-style-type: none"><li>• If <b>enable</b> is set to <b>true</b>, <b>az_minimum_healthy_member_percentage</b> and <b>az_minimum_healthy_member_count</b> cannot be set to -1 at the same time.</li><li>• If <b>enable</b> is set to <b>true</b>, either <b>az_minimum_healthy_member_percentage</b> or <b>az_minimum_healthy_member_count</b> must be set to -1.</li></ul> <p><b>Range:</b> an integer ranging from -1 to 100. An integer from 0 to 100 indicates the percentage of healthy servers in the AZ of the load balancer. -1 indicates that <b>az_minimum_healthy_member_count</b> takes effect.</p> <p><b>Default value:</b> N/A</p> |

| Parameter                       | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| cookie_name         | String  | <b>Definition:</b> Specifies the cookie name.<br><b>Range:</b> The value can contain a maximum of 1,024 characters.                                                                                                                                                                                                                                                                                                                                                                                                        |
| type                | String  | <b>Definition:</b> Specifies the sticky session type.<br><b>Range:</b> SOURCE_IP, HTTP_COOKIE, or APP_COOKIE.                                                                                                                                                                                                                                                                                                                                                                                                              |
| persistence_timeout | Integer | <b>Definition:</b> Specifies the stickiness duration, in minutes. This parameter will not take effect when <b>type</b> is set to APP_COOKIE.<br><b>Range:</b> <ul style="list-style-type: none"><li>If the protocol of the backend server group is TCP, UDP, or QUIC, the value ranges from <b>1</b> to <b>60</b>, and the default value is <b>1</b>.</li><li>If the protocol of the backend server group is HTTP or HTTPS, the value ranges from <b>1</b> to <b>1440</b>, and the default value is <b>1440</b>.</li></ul> |

**Table 5-457** SlowStart

| Parameter | Type    | Description                                                                                                                                                                                                               |
|-----------|---------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| enable    | Boolean | <b>Definition:</b> Specifies whether to enable slow start.<br><b>Range:</b> <ul style="list-style-type: none"><li><b>true:</b> This option will be enabled.</li><li><b>false:</b> This option will be disabled.</li></ul> |
| duration  | Integer | <b>Definition:</b> Specifies the slow start duration, in seconds.<br><b>Range:</b> 30 to 1200                                                                                                                             |

**Table 5-458** ConnectionDrain

| Parameter | Type    | Description                                                                                                                                                                                                                                |
|-----------|---------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| enable    | Boolean | <b>Definition:</b> Specifies whether to enable <b>connection_drain</b> .<br><b>Constraints:</b> N/A<br><b>Range:</b> The value can be <b>true</b> (enable this option) or <b>false</b> (disable this option).<br><b>Default value:</b> N/A |
| timeout   | Integer | <b>Definition:</b> Specifies the deregistration delay timeout, in seconds.<br><b>Constraints:</b> N/A<br><b>Range:</b> 10 to 4000<br><b>Constraints:</b> N/A                                                                               |

**Table 5-459** PoolHealth

| Parameter                    | Type    | Description                                                                                                                                                                                                                                                                                                              |
|------------------------------|---------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| minimum_healthy_member_count | Integer | <b>Definition:</b> Specifies the number of healthy backend servers below which the backend server group is considered as unhealthy.<br><b>Range:</b> <ul style="list-style-type: none"><li>• <b>0</b> (default): <b>pool_health</b> does not take effect.</li><li>• <b>1</b>: <b>pool_health</b> takes effect.</li></ul> |

**Table 5-460** QuicCidHashStrategy

| Parameter | Type    | Description                                                                                                                                                                                                                                     |
|-----------|---------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| len       | Integer | <b>Definition:</b> Specifies the length of the hash factor in the connection ID.<br><b>Constraints:</b> This parameter is valid only when the load balancing algorithm is <b>QUIC_CID</b> .<br><b>Range:</b> 1 to 20<br><b>Default value:</b> 3 |

| Parameter | Type    | Description                                                                                                                                                                                                                                             |
|-----------|---------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| offset    | Integer | <b>Definition:</b> Specifies the start position in the connection ID as the hash factor.<br><b>Constraints:</b> This parameter is valid only when the load balancing algorithm is <b>QUIC_CID</b> .<br><b>Range:</b> 0 to 19<br><b>Default value:</b> 1 |

## Example Requests

- Creating a backend server group and setting its backend protocol to TCP

POST https://{ELB\_Endpoint}/v3/99a3fff0d03c428eac3678da6a7d0f24/elb/pools

```
{
 "pool" : {
 "name" : "My pool",
 "lb_algorithm" : "LEAST_CONNECTIONS",

## SDK Sample Code

The SDK sample code is as follows.

### Java

- Creating a backend server group and setting its backend protocol to TCP

```
package com.huaweicloud.sdk.test;

import com.huaweicloud.sdk.core.auth.ICredential;
import com.huaweicloud.sdk.core.auth.BasicCredentials;
import com.huaweicloud.sdk.core.exception.ConnectionException;
import com.huaweicloud.sdk.core.exception.RequestTimeoutException;
import com.huaweicloud.sdk.core.exception.ServiceResponseException;
import com.huaweicloud.sdk.elb.v3.region.ElbRegion;
import com.huaweicloud.sdk.elb.v3.*;
import com.huaweicloud.sdk.elb.v3.model.*;

public class CreatePoolSolution {

 public static void main(String[] args) {
 // The AK and SK used for authentication are hard-coded or stored in plaintext, which has great
 // security risks. It is recommended that the AK and SK be stored in ciphertext in configuration files or
 // environment variables and decrypted during use to ensure security.
 // In this example, AK and SK are stored in environment variables for authentication. Before
 // running this example, set environment variables CLOUD_SDK_AK and CLOUD_SDK_SK in the local
 // environment
 String ak = System.getenv("CLOUD_SDK_AK");
 String sk = System.getenv("CLOUD_SDK_SK");
 String projectId = "{project_id}";
```

```
ICredential auth = new BasicCredentials()
 .withProjectId(projectId)
 .withAk(ak)
 .withSk(sk);

ElbClient client = ElbClient.newBuilder()
 .withCredential(auth)
 .withRegion(ElbRegion.valueOf("<YOUR REGION>"))
 .build();
CreatePoolRequest request = new CreatePoolRequest();
CreatePoolRequestBody body = new CreatePoolRequestBody();
CreatePoolOption poolbody = new CreatePoolOption();
poolbody.withLbAlgorithm("LEAST_CONNECTIONS")
 .withListenerId("0b11747a-b139-492f-9692-2df0b1c87193")
 .withName("My pool")
 .withProtocol("TCP")
 .withMemberDeletionProtectionEnable(false);
body.withPool(poolbody);
request.withBody(body);
try {
 CreatePoolResponse response = client.createPool(request);
 System.out.println(response.toString());
} catch (ConnectionException e) {
 e.printStackTrace();
} catch (RequestTimeoutException e) {
 e.printStackTrace();
} catch (ServiceResponseException e) {
 e.printStackTrace();
 System.out.println(e.getHttpStatusCode());
 System.out.println(e.getRequestId());
 System.out.println(e.getErrorCode());
 System.out.println(e.getErrorMsg());
}
}
```

- Creating a backend server group and setting its backend protocol to HTTP

```
package com.huaweicloud.sdk.test;
```

```
import com.huaweicloud.sdk.core.auth.ICredential;
import com.huaweicloud.sdk.core.auth.BasicCredentials;
import com.huaweicloud.sdk.core.exception.ConnectionException;
import com.huaweicloud.sdk.core.exception.RequestTimeoutException;
import com.huaweicloud.sdk.core.exception.ServiceResponseException;
import com.huaweicloud.sdk.elb.v3.region.ElbRegion;
import com.huaweicloud.sdk.elb.v3.*;
import com.huaweicloud.sdk.elb.v3.model.*;
```

```
public class CreatePoolSolution {
```

```
 public static void main(String[] args) {
 // The AK and SK used for authentication are hard-coded or stored in plaintext, which has great
 security risks. It is recommended that the AK and SK be stored in ciphertext in configuration files or
 environment variables and decrypted during use to ensure security.
 // In this example, AK and SK are stored in environment variables for authentication. Before
 running this example, set environment variables CLOUD_SDK_AK and CLOUD_SDK_SK in the local
 environment
```

```
 String ak = System.getenv("CLOUD_SDK_AK");
 String sk = System.getenv("CLOUD_SDK_SK");
 String projectId = "{project_id}";
```

## More

For SDK sample code of more programming languages, see the Sample Code tab in [API Explorer](#). SDK sample code can be automatically generated.

## Status Codes

| Status Code | Description         |
|-------------|---------------------|
| 201         | Successful request. |

## Error Codes

See [Error Codes](#).

## 5.11.2 Querying Backend Server Groups

### Function

This API is used to query all backend server groups.

### Constraints

This API has the following constraints:

- Parameters **marker**, **limit**, and **page\_reverse** are used for pagination query.
- Parameters **marker** and **page\_reverse** take effect only when they are used together with parameter **limit**.

### Calling Method

For details, see [Calling APIs](#).

### URI

GET /v3/{project\_id}/elb/pools

**Table 5-461** Path Parameters

| Parameter  | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                |
|------------|-----------|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
