| az_affinity | No        | Array of strings | <b>Definition:</b> Specifies whether AZ affinity of a backend server group is enabled. The following is an example:<br>"az_affinity": {<br>"enable": "true"<br>}<br>Multiple values can be used for query in the format of <i>az_affinity=enable=true&amp;az_affinity=enable=false</i> .<br><b>Constraints:</b> N/A<br><b>Range:</b> N/A<br><b>Default value:</b> N/A |

## Request Parameters

**Table 5-463** Request header parameters

| Parameter    | Mandatory | Type   | Description                                                                                                                                      |
|--------------|-----------|--------|--------------------------------------------------------------------------------------------------------------------------------------------------|
| X-Auth-Token | Yes       | String | <b>Definition:</b> Specifies the token used for IAM authentication.<br><b>Constraints:</b> N/A<br><b>Range:</b> N/A<br><b>Default value:</b> N/A |

## Response Parameters

**Status code:** 200

**Table 5-464** Response body parameters

| Parameter  | Type                            | Description                                                                                                                                                                          |
|------------|---------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| request_id | String                          | <b>Definition:</b> Specifies the request ID.<br><b>Range:</b> The value is automatically generated, and can contain characters including digits, lowercase letters, and hyphens (-). |
| page_info  | <a href="#">PageInfo</a> object | <b>Definition:</b> Specifies the pagination information.                                                                                                                             |

| Parameter | Type                                  | Description                                         |
|-----------|---------------------------------------|-----------------------------------------------------|
| pools     | Array of <a href="#">Pool</a> objects | <b>Definition:</b> Lists the backend server groups. |

**Table 5-465** PageInfo

| Parameter       | Type    | Description                                                                                                                                                                                                                          |
|-----------------|---------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| previous_marker | String  | <b>Definition:</b> Specifies the ID of the first record in the pagination query result. If <b>page_reverse</b> is set to <b>true</b> , this parameter is used together to query resources on the previous page.<br><b>Range:</b> N/A |
| next_marker     | String  | <b>Definition:</b> Specifies the ID of the last record in the pagination query result. It is usually used to query resources on the next page.<br><b>Range:</b> N/A                                                                  |
| current_count   | Integer | <b>Definition:</b> Specifies the number of records returned on the current page.<br><b>Range:</b> N/A                                                                                                                                |

**Table 5-466** Pool

| Parameter        | Type                              | Description                                                                                                                                                    |
|------------------|-----------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| admin_state_up   | Boolean                           | <b>Definition:</b> Specifies the administrative status of the backend server group. The value can only be <b>true</b> .<br><b>Range:</b> <b>true</b> (enabled) |
| az_affinity      | <a href="#">AzAffinity</a> object | <b>Definition:</b> Specifies how AZ affinity is configured for the backend server group.                                                                       |
| description      | String                            | <b>Definition:</b> Provides supplementary information about the backend server group.<br><b>Range:</b> N/A                                                     |
| healthmonitor_id | String                            | <b>Definition:</b> Specifies the ID of the health check configured for the backend server group.<br><b>Range:</b> N/A                                          |

| Parameter     | Type                                             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| protocol                          | String                           | <b>Definition:</b> Specifies the protocol used by the backend server group to receive requests from the load balancer.<br><b>Constraints:</b> N/A<br><b>Range:</b> The value can be <b>TCP</b> , <b>UDP</b> , <b>IP</b> , <b>TLS</b> , <b>HTTP</b> , <b>HTTPS</b> , <b>GRPC</b> , or <b>QUIC</b> .                                                                                                                                                                               |
| session_persistence               | <b>SessionPersistence</b> object | <b>Definition:</b> Specifies the sticky session.                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| ip_version                        | String                           | <b>Definition:</b> Specifies the IP address version supported by the backend server group.<br><b>Range:</b> <ul style="list-style-type: none"><li>• Shared load balancers: The value is fixed at <b>v4</b>.</li><li>• Dedicated load balancers: The value can be <b>dualstack</b> or <b>v4</b>. If the protocol of the backend server group is TCP or UDP, the value is <b>dualstack</b>. If the protocol of the backend server group is HTTP, the value is <b>v4</b>.</li></ul> |
| slow_start                        | <b>SlowStart</b> object          | <b>Definition:</b> Specifies slow start details. After you enable slow start, new backend servers added to the backend server group are warmed up, and the number of requests they can receive increases linearly during the configured slow start duration.                                                                                                                                                                                                                     |
| member_deletion_protection_enable | Boolean                          | <b>Definition:</b> Whether to enable removal protection for the backend server. Once the option is enabled, backend servers cannot be removed from the backend server group.<br><b>Range:</b> <b>false</b> (disable this option) or <b>true</b> (enable this option).<br><b>NOTE</b><br>Disable deletion protection or removal protection for your resources before deregistering your account.                                                                                  |

| Parameter         | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-------------------|--------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| created_at        | String | <b>Definition:</b> Specifies the creation time.<br><b>Range:</b> The value must be a UTC time in the <i>yyyy-MM-dd'T'HH:mm:ss'Z'</i> format.<br><b>Note:</b> This parameter will not be returned for resources associated with existing dedicated load balancers and for resources associated with existing and new shared load balancers.                                                                                                                                      |
| updated_at        | String | <b>Definition:</b> Specifies the update time.<br><b>Range:</b> The value must be a UTC time in the <i>yyyy-MM-dd'T'HH:mm:ss'Z'</i> format.<br><b>Note:</b> This parameter will not be returned for resources associated with existing dedicated load balancers and for resources associated with existing and new shared load balancers.                                                                                                                                        |
| vpc_id            | String | <b>Definition:</b> Specifies the ID of the VPC where the backend server group works.<br><b>Range:</b> N/A                                                                                                                                                                                                                                                                                                                                                                       |
| type              | String | <b>Definition:</b> Specifies the backend server group type.<br><b>Range:</b> <ul style="list-style-type: none"><li>• <b>instance:</b> Any type of backend servers can be added. <b>vpc_id</b> is mandatory.</li><li>• <b>ip:</b> Only IP as backend servers can be added. <b>vpc_id</b> cannot be specified. <b>type</b> cannot be set to <b>ip</b> if the backend server group protocol is <b>IP</b>.</li><li>• <b>"":</b> Any type of backend servers can be added.</li></ul> |
| protection_status | String | <b>Definition:</b> Specifies the protection status.<br><b>Range:</b> <ul style="list-style-type: none"><li>• <b>nonProtection:</b> The resource is not protected.</li><li>• <b>consoleProtection:</b> Modification is not allowed on the console.</li></ul>                                                                                                                                                                                                                     |

| Parameter             | Type                          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-----------------------|-------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| protection_reason     | String                        | <b>Definition:</b> Specifies why modification protection is enabled.<br><b>Range:</b> The value can contain a maximum of 255 Unicode characters, excluding angle brackets (<>).                                                                                                                                                                                                                                                                          |
| any_port_enable       | Boolean                       | <b>Definition:</b> Specifies whether to enable <b>any_port_enable</b> for a backend server group. If this option is enabled, the listener routes the requests to the backend server over the same port as the frontend port. If this option is disabled, the listener routes the requests over the port specified by <b>protocol_port</b> .<br><b>Range:</b> <b>true</b> (enable this option) or <b>false</b> (disable this option)                      |
| connection_drain      | <b>ConnectionDrain</b> object | <b>Definition:</b> Specifies the configurations of deregistration delay. This parameter is only available for TCP, UDP, and QUIC backend server groups and TCP and UDP listeners.<br>This parameter takes effect when: <ul style="list-style-type: none"><li>• A backend server is removed from a backend server group.</li><li>• A backend server is detected unhealthy or health checks fail.</li><li>• The weight of a backend server is 0.</li></ul> |
| enterprise_project_id | String                        | <b>Definition:</b> Specifies the ID of the enterprise project.<br><b>Range:</b> <ul style="list-style-type: none"><li>• <b>0:</b> The resource belongs to the default enterprise project.</li><li>• A string in UUID format indicates a non-default enterprise project.</li></ul>                                                                                                                                                                        |
| pool_health           | <b>PoolHealth</b> object      | <b>Definition:</b> Specifies the configurations of the pool health feature.                                                                                                                                                                                                                                                                                                                                                                              |
| public_border_group   | String                        | <b>Definition:</b> Specifies the public border group.<br><b>Range:</b> <ul style="list-style-type: none"><li>• <b>center:</b> public border group of the central site</li><li>• Edge site name: public border group of an edge site</li></ul>                                                                                                                                                                                                            |

| Parameter              | Type                              | Description                                                                                             |
|------------------------|-----------------------------------|---------------------------------------------------------------------------------------------------------|
| quic_cid_hash_strategy | <b>QuicCidHashStrategy</b> object | <b>Definition:</b> Specifies multi-path distribution configuration based on destination connection IDs. |

Table 5-467 AzAffinity

| Parameter | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-----------|---------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| enable    | Boolean | <p><b>Definition:</b> Specifies whether to enable AZ affinity for the backend server group. If this parameter is set to <b>true</b>, ELB forwards traffic across the backend servers in the same AZ as the load balancer.</p> <p><b>Constraints:</b></p> <ul style="list-style-type: none"><li>• This parameter is available only for IP, TCP, and UDP backend server groups.</li><li>• This parameter is not available for backend server groups that are associated with TLS listeners.</li><li>• If the parameter is set to <b>true</b>, parameter <b>pool_health</b> will be ignored.</li></ul> <p><b>Range:</b> <b>false</b> (disable this option) or <b>true</b> (enable this option).</p> <p><b>Default value:</b> N/A</p> |

| Parameter                            | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|--------------------------------------|---------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| az_minimum_healthy_member_percentage | Integer | <p><b>Definition:</b> Specifies a percentage that is used to determine the health of an AZ. If the percentage of healthy servers in the AZ of the load balancer falls below the specified value, <b>az_unhealthy_fallback_strategy</b> is triggered.</p> <p><b>az_minimum_healthy_member_percentage</b> shows the percentage of backend servers that are healthy in a backend server group of an AZ. The number of healthy servers is rounded up. For example, in AZ A, if there are three backend servers in the backend server group and <b>az_minimum_healthy_member_percentage</b> is set to 66%, the number of healthy servers is rounded up to 2 (<math>3 \times 0.66 = 1.98</math>). If there are fewer than two healthy servers in AZ A, <b>az_unhealthy_fallback_strategy</b> is triggered. If <b>az_minimum_healthy_member_percentage</b> is set to 67%, the number of healthy servers is rounded up to 3 (<math>3 \times 0.67 = 2.01</math>). If there are fewer than three healthy servers in AZ A, <b>az_unhealthy_fallback_strategy</b> is triggered.</p> <p><b>Constraints:</b></p> <ul style="list-style-type: none"><li>• If <b>enable</b> is set to <b>true</b>, <b>az_minimum_healthy_member_percentage</b> and <b>az_minimum_healthy_member_count</b> cannot be set to -1 at the same time.</li><li>• If <b>enable</b> is set to <b>true</b>, either <b>az_minimum_healthy_member_percentage</b> or <b>az_minimum_healthy_member_count</b> must be set to -1.</li></ul> <p><b>Range:</b> an integer ranging from -1 to 100. An integer from 0 to 100 indicates the percentage of healthy servers in the AZ of the load balancer. -1 indicates that <b>az_minimum_healthy_member_count</b> takes effect.</p> <p><b>Default value:</b> N/A</p> |

| Parameter                       | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| Parameter | Type    | Description                                                                                                                                                                                                                                |
|-----------|---------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| enable    | Boolean | <b>Definition:</b> Specifies whether to enable <b>connection_drain</b> .<br><b>Constraints:</b> N/A<br><b>Range:</b> The value can be <b>true</b> (enable this option) or <b>false</b> (disable this option).<br><b>Default value:</b> N/A |
| timeout   | Integer | <b>Definition:</b> Specifies the deregistration delay timeout, in seconds.<br><b>Constraints:</b> N/A<br><b>Range:</b> 10 to 4000<br><b>Constraints:</b> N/A                                                                               |

**Table 5-474** PoolHealth

| Parameter                    | Type    | Description                                                                                                                                                                                                                                                                                                              |
|------------------------------|---------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| minimum_healthy_member_count | Integer | <b>Definition:</b> Specifies the number of healthy backend servers below which the backend server group is considered as unhealthy.<br><b>Range:</b> <ul style="list-style-type: none"><li>• <b>0</b> (default): <b>pool_health</b> does not take effect.</li><li>• <b>1</b>: <b>pool_health</b> takes effect.</li></ul> |

**Table 5-475** QuicCidHashStrategy

| Parameter | Type    | Description                                                                                                                                                                                                                                     |
|-----------|---------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| len       | Integer | <b>Definition:</b> Specifies the length of the hash factor in the connection ID.<br><b>Constraints:</b> This parameter is valid only when the load balancing algorithm is <b>QUIC_CID</b> .<br><b>Range:</b> 1 to 20<br><b>Default value:</b> 3 |

| Parameter | Type    | Description                                                                                                                                                                                                                                             |
|-----------|---------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| offset    | Integer | <b>Definition:</b> Specifies the start position in the connection ID as the hash factor.<br><b>Constraints:</b> This parameter is valid only when the load balancing algorithm is <b>QUIC_CID</b> .<br><b>Range:</b> 0 to 19<br><b>Default value:</b> 1 |

## Example Requests

Querying backend server groups

```
GET https://{ELB_Endpoint}/v3/99a3fff0d03c428eac3678da6a7d0f24/elb/pools?limit=2
```

## Example Responses

**Status code: 200**

Successful request.

 if err == nil {
 fmt.Printf("%+v\n", response)
 } else {
 fmt.Println(err)
 }
}
```

## More

For SDK sample code of more programming languages, see the Sample Code tab in [API Explorer](#). SDK sample code can be automatically generated.

## Status Codes

| Status Code | Description         |
|-------------|---------------------|
| 200         | Successful request. |

Error Codes

See [Error Codes](#).

5.11.3 Querying the Details of a Backend Server Group

Function

This API is used to view the details of a backend server group.

Calling Method

For details, see [Calling APIs](#).

URI

GET /v3/{project\_id}/elb/pools/{pool\_id}

Table 5-476 Path Parameters

| Parameter  | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                |
|------------|-----------|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

If the protocol of the backend server group is TCP or UDP, the value is <b>dualstack</b>. If the protocol of the backend server group is HTTP, the value is <b>v4</b>.</li></ul> |
| slow_start          | <b>SlowStart</b> object          | <b>Definition:</b> Specifies slow start details. After you enable slow start, new backend servers added to the backend server group are warmed up, and the number of requests they can receive increases linearly during the configured slow start duration.                                                                                                                                                                                                                     |

| Parameter                         | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                     |
|-----------------------------------|---------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| member_deletion_protection_enable | Boolean | <b>Definition:</b> Whether to enable removal protection for the backend server. Once the option is enabled, backend servers cannot be removed from the backend server group.<br><b>Range:</b> <b>false</b> (disable this option) or <b>true</b> (enable this option).<br><b>NOTE</b><br>Disable deletion protection or removal protection for your resources before deregistering your account. |
| created_at                        | String  | <b>Definition:</b> Specifies the creation time.<br><b>Range:</b> The value must be a UTC time in the <i>yyyy-MM-dd'T'HH:mm:ss'Z'</i> format.<br>Note: This parameter will not be returned for resources associated with existing dedicated load balancers and for resources associated with existing and new shared load balancers.                                                             |
| updated_at                        | String  | <b>Definition:</b> Specifies the update time.<br><b>Range:</b> The value must be a UTC time in the <i>yyyy-MM-dd'T'HH:mm:ss'Z'</i> format.<br>Note: This parameter will not be returned for resources associated with existing dedicated load balancers and for resources associated with existing and new shared load balancers.                                                               |
| vpc_id                            | String  | <b>Definition:</b> Specifies the ID of the VPC where the backend server group works.<br><b>Range:</b> N/A                                                                                                                                                                                                                                                                                       |

| Parameter         | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-------------------|---------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| type              | String  | <b>Definition:</b> Specifies the backend server group type.<br><b>Range:</b> <ul style="list-style-type: none"><li>• <b>instance:</b> Any type of backend servers can be added. <b>vpc_id</b> is mandatory.</li><li>• <b>ip:</b> Only IP as backend servers can be added. <b>vpc_id</b> cannot be specified. <b>type</b> cannot be set to <b>ip</b> if the backend server group protocol is <b>IP</b>.</li><li>• <b>"":</b> Any type of backend servers can be added.</li></ul> |
| protection_status | String  | <b>Definition:</b> Specifies the protection status.<br><b>Range:</b> <ul style="list-style-type: none"><li>• <b>nonProtection:</b> The resource is not protected.</li><li>• <b>consoleProtection:</b> Modification is not allowed on the console.</li></ul>                                                                                                                                                                                                                     |
| protection_reason | String  | <b>Definition:</b> Specifies why modification protection is enabled.<br><b>Range:</b> The value can contain a maximum of 255 Unicode characters, excluding angle brackets (<>).                                                                                                                                                                                                                                                                                                 |
| any_port_enable   | Boolean | <b>Definition:</b> Specifies whether to enable <b>any_port_enable</b> for a backend server group. If this option is enabled, the listener routes the requests to the backend server over the same port as the frontend port. If this option is disabled, the listener routes the requests over the port specified by <b>protocol_port</b> .<br><b>Range:</b> <b>true</b> (enable this option) or <b>false</b> (disable this option)                                             |

| Parameter              | Type                                       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|------------------------|--------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| connection_drain       | <a href="#">ConnectionDrain</a> object     | <b>Definition:</b> Specifies the configurations of deregistration delay. This parameter is only available for TCP, UDP, and QUIC backend server groups and TCP and UDP listeners.<br><br>This parameter takes effect when: <ul style="list-style-type: none"><li>• A backend server is removed from a backend server group.</li><li>• A backend server is detected unhealthy or health checks fail.</li><li>• The weight of a backend server is 0.</li></ul> |
| enterprise_project_id  | String                                     | <b>Definition:</b> Specifies the ID of the enterprise project.<br><b>Range:</b> <ul style="list-style-type: none"><li>• <b>0:</b> The resource belongs to the default enterprise project.</li><li>• A string in UUID format indicates a non-default enterprise project.</li></ul>                                                                                                                                                                            |
| pool_health            | <a href="#">PoolHealth</a> object          | <b>Definition:</b> Specifies the configurations of the pool health feature.                                                                                                                                                                                                                                                                                                                                                                                  |
| public_border_group    | String                                     | <b>Definition:</b> Specifies the public border group.<br><b>Range:</b> <ul style="list-style-type: none"><li>• <b>center:</b> public border group of the central site</li><li>• Edge site name: public border group of an edge site</li></ul>                                                                                                                                                                                                                |
| quic_cid_hash_strategy | <a href="#">QuicCidHashStrategy</a> object | <b>Definition:</b> Specifies multi-path distribution configuration based on destination connection IDs.                                                                                                                                                                                                                                                                                                                                                      |

**Table 5-480** AzAffinity

| Parameter | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| enable    | Boolean | <p><b>Definition:</b> Specifies whether to enable AZ affinity for the backend server group. If this parameter is set to <b>true</b>, ELB forwards traffic across the backend servers in the same AZ as the load balancer.</p> <p><b>Constraints:</b></p> <ul style="list-style-type: none"><li>• This parameter is available only for IP, TCP, and UDP backend server groups.</li><li>• This parameter is not available for backend server groups that are associated with TLS listeners.</li><li>• If the parameter is set to <b>true</b>, parameter <b>pool_health</b> will be ignored.</li></ul> <p><b>Range:</b> <b>false</b> (disable this option) or <b>true</b> (enable this option).</p> <p><b>Default value:</b> N/A</p> |

| Parameter                            | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|--------------------------------------|---------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| az_minimum_healthy_member_percentage | Integer | <p><b>Definition:</b> Specifies a percentage that is used to determine the health of an AZ. If the percentage of healthy servers in the AZ of the load balancer falls below the specified value, <b>az_unhealthy_fallback_strategy</b> is triggered.</p> <p><b>az_minimum_healthy_member_percentage</b> shows the percentage of backend servers that are healthy in a backend server group of an AZ. The number of healthy servers is rounded up. For example, in AZ A, if there are three backend servers in the backend server group and <b>az_minimum_healthy_member_percentage</b> is set to 66%, the number of healthy servers is rounded up to 2 (<math>3 \times 0.66 = 1.98</math>). If there are fewer than two healthy servers in AZ A, <b>az_unhealthy_fallback_strategy</b> is triggered. If <b>az_minimum_healthy_member_percentage</b> is set to 67%, the number of healthy servers is rounded up to 3 (<math>3 \times 0.67 = 2.01</math>). If there are fewer than three healthy servers in AZ A, <b>az_unhealthy_fallback_strategy</b> is triggered.</p> <p><b>Constraints:</b></p> <ul style="list-style-type: none"><li>• If <b>enable</b> is set to <b>true</b>, <b>az_minimum_healthy_member_percentage</b> and <b>az_minimum_healthy_member_count</b> cannot be set to -1 at the same time.</li><li>• If <b>enable</b> is set to <b>true</b>, either <b>az_minimum_healthy_member_percentage</b> or <b>az_minimum_healthy_member_count</b> must be set to -1.</li></ul> <p><b>Range:</b> an integer ranging from -1 to 100. An integer from 0 to 100 indicates the percentage of healthy servers in the AZ of the load balancer. -1 indicates that <b>az_minimum_healthy_member_count</b> takes effect.</p> <p><b>Default value:</b> N/A</p> |

|-----------|--------|-------------------------------------------------------|
| id        | String | Specifies the backend server ID.<br><b>Range:</b> N/A |

**Table 5-484** SessionPersistence

| Parameter           | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|---------------------|---------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| cookie_name         | String  | <b>Definition:</b> Specifies the cookie name.<br><b>Range:</b> The value can contain a maximum of 1,024 characters.                                                                                                                                                                                                                                                                                                                                                                                                        |
| type                | String  | <b>Definition:</b> Specifies the sticky session type.<br><b>Range:</b> SOURCE_IP, HTTP_COOKIE, or APP_COOKIE.                                                                                                                                                                                                                                                                                                                                                                                                              |
| persistence_timeout | Integer | <b>Definition:</b> Specifies the stickiness duration, in minutes. This parameter will not take effect when <b>type</b> is set to APP_COOKIE.<br><b>Range:</b> <ul style="list-style-type: none"><li>If the protocol of the backend server group is TCP, UDP, or QUIC, the value ranges from <b>1</b> to <b>60</b>, and the default value is <b>1</b>.</li><li>If the protocol of the backend server group is HTTP or HTTPS, the value ranges from <b>1</b> to <b>1440</b>, and the default value is <b>1440</b>.</li></ul> |

**Table 5-485** SlowStart

| Parameter | Type    | Description                                                                                                                                                                                                               |
|-----------|---------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| enable    | Boolean | <b>Definition:</b> Specifies whether to enable slow start.<br><b>Range:</b> <ul style="list-style-type: none"><li><b>true:</b> This option will be enabled.</li><li><b>false:</b> This option will be disabled.</li></ul> |
| duration  | Integer | <b>Definition:</b> Specifies the slow start duration, in seconds.<br><b>Range:</b> 30 to 1200                                                                                                                             |

**Table 5-486** ConnectionDrain

| Parameter | Type    | Description                                                                                                                                                                                                                                |
|-----------|---------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| enable    | Boolean | <b>Definition:</b> Specifies whether to enable <b>connection_drain</b> .<br><b>Constraints:</b> N/A<br><b>Range:</b> The value can be <b>true</b> (enable this option) or <b>false</b> (disable this option).<br><b>Default value:</b> N/A |
| timeout   | Integer | <b>Definition:</b> Specifies the deregistration delay timeout, in seconds.<br><b>Constraints:</b> N/A<br><b>Range:</b> 10 to 4000<br><b>Constraints:</b> N/A                                                                               |

**Table 5-487** PoolHealth

| Parameter                    | Type    | Description                                                                                                                                                                                                                                                                                                              |
|------------------------------|---------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| minimum_healthy_member_count | Integer | <b>Definition:</b> Specifies the number of healthy backend servers below which the backend server group is considered as unhealthy.<br><b>Range:</b> <ul style="list-style-type: none"><li>• <b>0</b> (default): <b>pool_health</b> does not take effect.</li><li>• <b>1</b>: <b>pool_health</b> takes effect.</li></ul> |

**Table 5-488** QuicCidHashStrategy

| Parameter | Type    | Description                                                                                                                                                                                                                                     |
|-----------|---------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| len       | Integer | <b>Definition:</b> Specifies the length of the hash factor in the connection ID.<br><b>Constraints:</b> This parameter is valid only when the load balancing algorithm is <b>QUIC_CID</b> .<br><b>Range:</b> 1 to 20<br><b>Default value:</b> 3 |

| Parameter | Type    | Description                                                                                                                                                                                                                                             |
|-----------|---------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| offset    | Integer | <b>Definition:</b> Specifies the start position in the connection ID as the hash factor.<br><b>Constraints:</b> This parameter is valid only when the load balancing algorithm is <b>QUIC_CID</b> .<br><b>Range:</b> 0 to 19<br><b>Default value:</b> 1 |

## Example Requests

Querying the details of a backend server group

```
GET https://{ELB_Endpoint}/v3/99a3fff0d03c428eac3678da6a7d0f24/elb/pools/36ce7086-a496-4666-9064-5ba0e6840c75
```

## Example Responses

**Status code: 200**

Successful request.

```

See [Error Codes](#).

## 5.11.4 Updating a Backend Server Group

### Function

This API is used to update a backend server group.

### Constraints

The backend server group can be updated only when the provisioning status of the associated load balancer is **ACTIVE**.

### Calling Method

For details, see [Calling APIs](#).

### URI

PUT /v3/{project\_id}/elb/pools/{pool\_id}

**Table 5-489** Path Parameters

| Parameter  | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                |

| enable    | No        | Boolean | <b>Definition:</b> Specifies whether to enable AZ affinity for the backend server group. If this parameter is set to <b>true</b> , ELB forwards traffic across the backend servers in the same AZ as the load balancer.<br><b>Constraints:</b> <ul style="list-style-type: none"><li>• AZ affinity cannot be enabled for a backend server group that has IP as backend servers whose <b>availability_zone</b> is not specified.</li><li>• AZ affinity cannot be enabled if the backend server is bound to a TLS listener.</li><li>• This parameter is available for backend server groups that are associated with IP, UDP, and TCP listeners.</li><li>• If the parameter is set to <b>true</b>, parameter <b>pool_health</b> will be ignored.</li></ul> <b>Range:</b> <b>false</b> (disable this option) or <b>true</b> (enable this option).<br><b>Default value:</b> N/A |

| Parameter                            | Mandatory | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|--------------------------------------|-----------|---------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| az_minimum_healthy_member_percentage | No        | Integer | <p><b>Definition:</b> Specifies a percentage that is used to determine the health of an AZ. If the percentage of healthy servers in the AZ of the load balancer falls below the specified value, <b>az_unhealthy_fallback_strategy</b> is triggered.</p> <p><b>az_minimum_healthy_member_percentage</b> shows the percentage of backend servers that are healthy in a backend server group of an AZ. The number of healthy servers is rounded up. For example, in AZ A, if there are three backend servers in the backend server group and <b>az_minimum_healthy_member_percentage</b> is set to 66%, the number of healthy servers is rounded up to 2 (<math>3 \times 0.66 = 1.98</math>). If there are fewer than two healthy servers in AZ A, <b>az_unhealthy_fallback_strategy</b> is triggered. If <b>az_minimum_healthy_member_percentage</b> is set to 67%, the number of healthy servers is rounded up to 3 (<math>3 \times 0.67 = 2.01</math>). If there are fewer than three healthy servers in AZ A, <b>az_unhealthy_fallback_strategy</b> is triggered.</p> <p><b>Constraints:</b></p> <ul style="list-style-type: none"><li>• If <b>enable</b> is set to <b>true</b>, <b>az_minimum_healthy_member_percentage</b> and <b>az_minimum_healthy_member_count</b> cannot be set to <b>-1</b> at the same time.</li><li>• If <b>enable</b> is set to <b>true</b>, either <b>az_minimum_healthy_member_percentage</b> or <b>az_minimum_healthy_member_count</b> must be set to <b>-1</b>.</li></ul> |

| Parameter                       | Mandatory | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

An integer from 0 to 100 indicates the percentage of healthy servers in the AZ of the load balancer. <b>-1</b> indicates that <b>az_minimum_healthy_member_count</b> takes effect.</p> <p><b>Default value:</b> N/A</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| az_minimum_healthy_member_count | No        | Integer | <p><b>Definition:</b> Specifies a number that is used to determine the health of an AZ. If the number of healthy servers in the AZ of the load balancer falls below the specified value, <b>az_unhealthy_fallback_strategy</b> is triggered.</p> <p><b>az_minimum_healthy_member_count</b> shows the number of healthy servers in a backend server group of an AZ.</p> <p><b>Constraints:</b></p> <ul style="list-style-type: none"><li>• If <b>enable</b> is set to <b>true</b>, <b>az_minimum_healthy_member_percentage</b> and <b>az_minimum_healthy_member_count</b> cannot be set to <b>-1</b> at the same time.</li><li>• If <b>enable</b> is set to <b>true</b>, either <b>az_minimum_healthy_member_percentage</b> or <b>az_minimum_healthy_member_count</b> must be set to <b>-1</b>.</li></ul> <p><b>Range:</b> an integer ranging from <b>-1</b> to <b>10000</b>. An integer from 0 to 10000 indicates the number of healthy servers in the AZ of the load balancer. <b>-1</b> indicates that <b>az_minimum_healthy_member_percentage</b> takes effect.</p> <p><b>Default value:</b> N/A</p> |

| Parameter                      | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|--------------------------------|-----------|--------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| az_unhealthy_fallback_strategy | No        | String | <p><b>Definition:</b> Specifies how traffic will be distributed across backend servers in an AZ if the percentage or number of healthy servers in the AZ of the load balancer falls below the specified value.</p> <p><b>Range:</b></p> <ul style="list-style-type: none"><li>• <b>forward_to_all_member_of_local_az:</b> forwards requests across all backend servers in the same AZ as the load balancer, even if some servers are unhealthy.</li><li>• <b>forward_to_healthy_member_of_remote_az:</b> forwards requests across healthy backend servers in different AZs from the load balancer.</li><li>• <b>forward_to_all_healthy_member:</b> forwards requests across healthy backend servers in all AZs.</li><li>• <b>forward_to_all_member:</b> forwards requests across all backend servers in all AZs, even if some servers are unhealthy.</li></ul> <p><b>Constraints:</b> N/A</p> <p><b>Default value:</b> forward_to_all_member_of_local_az</p> |

## Response Parameters

Status code: 200

**Table 5-499** Response body parameters

| Parameter  | Type               | Description                                                                                                                                                                          |
|------------|--------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| request_id | String             | <b>Definition:</b> Specifies the request ID.<br><b>Range:</b> The value is automatically generated, and can contain characters including digits, lowercase letters, and hyphens (-). |
| pool       | <b>Pool</b> object | <b>Definition:</b> Specifies the response parameters for updating a backend server group.                                                                                            |

**Table 5-500** Pool

| Parameter        | Type                     | Description                                                                                                                                                    |
|------------------|--------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| admin_state_up   | Boolean                  | <b>Definition:</b> Specifies the administrative status of the backend server group. The value can only be <b>true</b> .<br><b>Range:</b> <b>true</b> (enabled) |
| az_affinity      | <b>AzAffinity</b> object | <b>Definition:</b> Specifies how AZ affinity is configured for the backend server group.                                                                       |
| description      | String                   | <b>Definition:</b> Provides supplementary information about the backend server group.<br><b>Range:</b> N/A                                                     |
| healthmonitor_id | String                   | <b>Definition:</b> Specifies the ID of the health check configured for the backend server group.<br><b>Range:</b> N/A                                          |
| id               | String                   | <b>Definition:</b> Specifies the backend server group ID.<br><b>Range:</b> N/A                                                                                 |

| Parameter     | Type                                             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|---------------|--------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| lb_algorithm  | String                                           | <b>Definition:</b> Specifies the load balancing algorithm used by the load balancer to route requests to backend servers in the associated backend server group.<br><b>Range:</b> <ul style="list-style-type: none"><li>• <b>ROUND_ROBIN:</b> weighted round robin</li><li>• <b>LEAST_CONNECTIONS:</b> weighted least connections</li><li>• <b>SOURCE_IP:</b> source IP hash</li><li>• <b>QUIC_CID:</b> connection ID</li><li>• <b>2_TUPLE_HASH:</b> 2-tuple hash that is only available for IP backend server groups</li><li>• <b>3_TUPLE_HASH:</b> 3-tuple hash that is only available for IP backend server groups</li><li>• <b>5_TUPLE_HASH:</b> 5-tuple hash that is only available for IP backend server groups</li><li>• If this parameter is not specified for an IP backend server group, <b>5_TUPLE_HASH</b> is used by default.</li></ul> |
| listeners     | Array of <a href="#">ListenerRef</a> objects     | <b>Definition:</b> Specifies the IDs of the listeners with which the backend server group is associated.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| loadbalancers | Array of <a href="#">LoadBalancerRef</a> objects | <b>Definition:</b> Specifies the IDs of the load balancers with which the backend server group is associated.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| members       | Array of <a href="#">MemberRef</a> objects       | <b>Definition:</b> Specifies the IDs of backend servers in the backend server group.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| name          | String                                           | <b>Definition:</b> Specifies the backend server group name.<br><b>Range:</b> N/A                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

|--------------------------------------|---------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| az_minimum_healthy_member_percentage | Integer | <p><b>Definition:</b> Specifies a percentage that is used to determine the health of an AZ. If the percentage of healthy servers in the AZ of the load balancer falls below the specified value, <b>az_unhealthy_fallback_strategy</b> is triggered.</p> <p><b>az_minimum_healthy_member_percentage</b> shows the percentage of backend servers that are healthy in a backend server group of an AZ. The number of healthy servers is rounded up. For example, in AZ A, if there are three backend servers in the backend server group and <b>az_minimum_healthy_member_percentage</b> is set to 66%, the number of healthy servers is rounded up to 2 (<math>3 \times 0.66 = 1.98</math>). If there are fewer than two healthy servers in AZ A, <b>az_unhealthy_fallback_strategy</b> is triggered. If <b>az_minimum_healthy_member_percentage</b> is set to 67%, the number of healthy servers is rounded up to 3 (<math>3 \times 0.67 = 2.01</math>). If there are fewer than three healthy servers in AZ A, <b>az_unhealthy_fallback_strategy</b> is triggered.</p> <p><b>Constraints:</b></p> <ul style="list-style-type: none"><li>• If <b>enable</b> is set to <b>true</b>, <b>az_minimum_healthy_member_percentage</b> and <b>az_minimum_healthy_member_count</b> cannot be set to -1 at the same time.</li><li>• If <b>enable</b> is set to <b>true</b>, either <b>az_minimum_healthy_member_percentage</b> or <b>az_minimum_healthy_member_count</b> must be set to -1.</li></ul> <p><b>Range:</b> an integer ranging from -1 to 100. An integer from 0 to 100 indicates the percentage of healthy servers in the AZ of the load balancer. -1 indicates that <b>az_minimum_healthy_member_count</b> takes effect.</p> <p><b>Default value:</b> N/A</p> |

| Parameter                       | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| cookie_name         | String  | <b>Definition:</b> Specifies the cookie name.<br><b>Range:</b> The value can contain a maximum of 1,024 characters.                                                                                                                                                                                                                                                                                                                                                                                                                |
| type                | String  | <b>Definition:</b> Specifies the sticky session type.<br><b>Range:</b> <b>SOURCE_IP</b> , <b>HTTP_COOKIE</b> , or <b>APP_COOKIE</b> .                                                                                                                                                                                                                                                                                                                                                                                              |
| persistence_timeout | Integer | <b>Definition:</b> Specifies the stickiness duration, in minutes. This parameter will not take effect when <b>type</b> is set to <b>APP_COOKIE</b> .<br><b>Range:</b> <ul style="list-style-type: none"><li>If the protocol of the backend server group is TCP, UDP, or QUIC, the value ranges from <b>1</b> to <b>60</b>, and the default value is <b>1</b>.</li><li>If the protocol of the backend server group is HTTP or HTTPS, the value ranges from <b>1</b> to <b>1440</b>, and the default value is <b>1440</b>.</li></ul> |

**Table 5-506** SlowStart

| Parameter | Type    | Description                                                                                                                                                                                                               |
|-----------|---------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| enable    | Boolean | <b>Definition:</b> Specifies whether to enable slow start.<br><b>Range:</b> <ul style="list-style-type: none"><li><b>true:</b> This option will be enabled.</li><li><b>false:</b> This option will be disabled.</li></ul> |
| duration  | Integer | <b>Definition:</b> Specifies the slow start duration, in seconds.<br><b>Range:</b> 30 to 1200                                                                                                                             |

**Table 5-507** ConnectionDrain

| Parameter | Type    | Description                                                                                                                                                                                                                                |
|-----------|---------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| enable    | Boolean | <b>Definition:</b> Specifies whether to enable <b>connection_drain</b> .<br><b>Constraints:</b> N/A<br><b>Range:</b> The value can be <b>true</b> (enable this option) or <b>false</b> (disable this option).<br><b>Default value:</b> N/A |
| timeout   | Integer | <b>Definition:</b> Specifies the deregistration delay timeout, in seconds.<br><b>Constraints:</b> N/A<br><b>Range:</b> 10 to 4000<br><b>Constraints:</b> N/A                                                                               |

**Table 5-508** PoolHealth

| Parameter                    | Type    | Description                                                                                                                                                                                                                                                                                                              |
|------------------------------|---------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| minimum_healthy_member_count | Integer | <b>Definition:</b> Specifies the number of healthy backend servers below which the backend server group is considered as unhealthy.<br><b>Range:</b> <ul style="list-style-type: none"><li>• <b>0</b> (default): <b>pool_health</b> does not take effect.</li><li>• <b>1</b>: <b>pool_health</b> takes effect.</li></ul> |

**Table 5-509** QuicCidHashStrategy

| Parameter | Type    | Description                                                                                                                                                                                                                                     |
|-----------|---------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| len       | Integer | <b>Definition:</b> Specifies the length of the hash factor in the connection ID.<br><b>Constraints:</b> This parameter is valid only when the load balancing algorithm is <b>QUIC_CID</b> .<br><b>Range:</b> 1 to 20<br><b>Default value:</b> 3 |

| Parameter | Type    | Description                                                                                                                                                                                                                                             |
|-----------|---------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| offset    | Integer | <b>Definition:</b> Specifies the start position in the connection ID as the hash factor.<br><b>Constraints:</b> This parameter is valid only when the load balancing algorithm is <b>QUIC_CID</b> .<br><b>Range:</b> 0 to 19<br><b>Default value:</b> 1 |

## Example Requests

Changing the load balancing algorithm of a backend server group

```
PUT https://{ELB_Endpoint}/v3/99a3fff0d03c428eac3678da6a7d0f24/elb/pools/36ce7086-a496-4666-9064-5ba0e6840c75
```

```
{
 "pool": {
 "name": "My pool.",
 "description": "My pool update",
 "lb_algorithm": "LEAST_CONNECTIONS"
 }
}
```

## Example Responses

**Status code: 200**

Successful request.

```

 } else {
 fmt.Println(err)
 }
}
```

## More

For SDK sample code of more programming languages, see the Sample Code tab in [API Explorer](#). SDK sample code can be automatically generated.

## Status Codes

| Status Code | Description         |
|-------------|---------------------|
| 200         | Successful request. |

## Error Codes

See [Error Codes](#).

## 5.11.5 Deleting a Backend Server Group

### Function

This API is used to delete a backend server group.

### Constraints

A backend server group can be deleted only after all servers are removed from the group, the health check configured for the group is deleted, and the group has no forwarding policies associated.

### Calling Method

For details, see [Calling APIs](#).

### URI

DELETE /v3/{project\_id}/elb/pools/{pool\_id}

**Table 5-510** Path Parameters

| Parameter  | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                |

See [Error Codes](#).

## 5.11.6 Deleting a Backend Server Group and Associated Resources

### Function

This API is used to delete a backend server group and associated resources, including backend servers and health checks.

### Constraints

Deleting a backend server group will also delete its associated resources, including backend servers and health checks. The backend server group cannot be associated with a forwarding policy, either.

### Calling Method

For details, see [Calling APIs](#).

### URI

DELETE /v3/{project\_id}/elb/pools/{pool\_id}/delete-cascade

|-----------|-----------|------------------|---------------------------------------------------------------|
| pools     | Yes       | Array of strings | Specifies the IDs of the backend server groups to be deleted. |

## Response Parameters

**Status code: 200**

**Table 5-517** Response body parameters

| Parameter | Type                                                  | Description                                                           |
|-----------|-------------------------------------------------------|-----------------------------------------------------------------------|
| pools     | Array of <a href="#">BatchDeletePoolsResp</a> objects | Specifies the response body for batch deleting backend server groups. |

**Table 5-518** BatchDeletePoolsResp

| Parameter  | Type   | Description                                                                                                                                                                                                   |
|------------|--------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| id         | String | Specifies the IDs of the backend server groups that are deleted.                                                                                                                                              |
| ret_status | String | Specifies the deletion result of the backend server group. <b>not found</b> indicates that the backend server group does not exist, and <b>successful</b> indicates that the backend server group is deleted. |
| ret_code   | String | Specifies the error code when the deletion fails.                                                                                                                                                             |

## Example Requests

Batch deleting backend server groups

```
POST https://{ELB_Endpoint}/v3/{project_id}/elb/pools/batch-delete
```

```
{
 "pools" : ["de3404aeb44f499893fb42a0b218a515", "de3404aeb44f499893fb42a0b218a123"]
}
```

## Example Responses

**Status code: 200**

Successful request.

```
{
 "pools": [{
 "id": "de3404aeb44f499893fb42a0b218a515",
 "ret_status": "successful"
 }, {
 "id": "de3404aeb44f499893fb42a0b218a515",
 "ret_status": "not found",
 "ret_code": "ELB.9903"
 }],
 "request_id": "98414965-856c-4be3-8a33-3e08432a222e"
}
```

## Status Codes

| Status Code | Description         |
|-------------|---------------------|
| 200         | Successful request. |

## Error Codes

See [Error Codes](#).

# 5.12 Backend Server

## 5.12.1 Adding a Backend Server

### Function

This API is used to add a backend server.

### Constraints

When you add backend servers, note the following:

- Two backend servers in the same backend server group must have different IP addresses and ports.
- If no subnets are specified during cloud server creation, IP as backend servers can be added. In this case, **address** must be set to an IPv4 address, the protocol of the backend server group must be TCP, HTTP, or HTTPS, and **IP as a Backend** must have been enabled for the load balancer.
- If a subnet is specified during cloud server creation, the subnet must be in the same VPC where the load balancer resides.
- If the backend server group supports IPv4/IPv6 dual stack, **address** can be an IPv4 address or an IPv6 address. If the backend server group supports only IPv4, **address** can only be an IPv4 address.
- If **type** of the backend server is set to **instance**, **address** must be a private IP address that is not used by any load balancer.

- If the backend server group protocol is IP, **protocol\_port** of the backend server must be **0** and IP as backend servers cannot be added.

## Calling Method

For details, see [Calling APIs](#).

## URI

POST /v3/{project\_id}/elb/pools/{pool\_id}/members

**Table 5-519** Path Parameters

| Parameter  | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                |
|------------|-----------|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

Requests are routed based on the load balancing algorithm configured for the backend server group and weights of backend servers.</p> <p>The larger the weight is, the higher proportion of requests the backend server receives. If the weight is set to 0, the backend server will not accept new requests.</p> <p><b>Range:</b> 0 to 100</p>                                                                                                                                                                          |

## Example Requests

- Example 1: Adding a backend server

```
POST https://{ELB_Endpoint}/v3/99a3fff0d03c428eac3678da6a7d0f24/elb/pools/36ce7086-a496-4666-9064-5ba0e6840c75/members
{
```

```
"member" : {
 "subnet_cidr_id" : "c09f620e-3492-4429-ac15-445d5dd9ca74",
 "protocol_port" : 89,
 "name" : "My member",
 "address" : "120.10.10.16"
}
```

- Example 2: Adding an IP address as a backend server

POST https://{ELB\_Endpoint}/v3/99a3fff0d03c428eac3678da6a7d0f24/elb/pools/36ce7086-a496-4666-9064-5ba0e6840c75/members

```
{
 "member" : {
 "protocol_port" : 89,
 "name" : "My member",
 "address" : "120.10.10.16"
 }
}
```

## Example Responses

**Status code: 201**

Successful request.

```
{
 "member" : {
 "name" : "My member",
 "weight" : 1,
 "admin_state_up" : false,
 "subnet_cidr_id" : "c09f620e-3492-4429-ac15-445d5dd9ca74",

}
```

## SDK Sample Code

The SDK sample code is as follows.

### Java

- Example 1: Adding a backend server

```
package com.huaweicloud.sdk.test;

import com.huaweicloud.sdk.core.auth.ICredential;
import com.huaweicloud.sdk.core.auth.BasicCredentials;
import com.huaweicloud.sdk.core.exception.ConnectionException;
import com.huaweicloud.sdk.core.exception.RequestTimeoutException;
import com.huaweicloud.sdk.core.exception.ServiceResponseException;
import com.huaweicloud.sdk.elb.v3.region.ElbRegion;
import com.huaweicloud.sdk.elb.v3.*;
import com.huaweicloud.sdk.elb.v3.model.*;
```

```
public class CreateMemberSolution {
 public static void main(String[] args) {
 // The AK and SK used for authentication are hard-coded or stored in plaintext, which has great
 // security risks. It is recommended that the AK and SK be stored in ciphertext in configuration files or
 // environment variables and decrypted during use to ensure security.
 // In this example, AK and SK are stored in environment variables for authentication. Before
 // running this example, set environment variables CLOUD_SDK_AK and CLOUD_SDK_SK in the local
 // environment
 String ak = System.getenv("CLOUD_SDK_AK");
 String sk = System.getenv("CLOUD_SDK_SK");
 String projectId = "{project_id}";

 ICredential auth = new BasicCredentials()
 .withProjectId(projectId)
 .withAk(ak)
 .withSk(sk);

 ElbClient client = ElbClient.newBuilder()
 .withCredential(auth)
 .withRegion(ElbRegion.valueOf("<YOUR REGION>"))
 .build();
 CreateMemberRequest request = new CreateMemberRequest();
 request.withPoolId("{pool_id}");
 CreateMemberRequestBody body = new CreateMemberRequestBody();
 CreateMemberOption memberbody = new CreateMemberOption();
 memberbody.withAddress("120.10.10.16")
 .withName("My member")
 .withProtocolPort(89)
 .withSubnetCidrId("c09f620e-3492-4429-ac15-445d5dd9ca74");
 body.withMember(memberbody);
 request.withBody(body);
 try {
 CreateMemberResponse response = client.createMember(request);
 System.out.println(response.toString());
 } catch (ConnectionException e) {
 e.printStackTrace();
 } catch (RequestTimeoutException e) {
 e.printStackTrace();
 } catch (ServiceResponseException e) {
 e.printStackTrace();
 System.out.println(e.getHttpStatusCode());
 System.out.println(e.getRequestId());
 System.out.println(e.getErrorCode());
 System.out.println(e.getErrorMsg());
 }
 }
}
```

- Example 2: Adding an IP address as a backend server

```
package com.huaweicloud.sdk.test;

import com.huaweicloud.sdk.core.auth.ICredential;
import com.huaweicloud.sdk.core.auth.BasicCredentials;
import com.huaweicloud.sdk.core.exception.ConnectionException;
import com.huaweicloud.sdk.core.exception.RequestTimeoutException;

```

## More

For SDK sample code of more programming languages, see the Sample Code tab in [API Explorer](#). SDK sample code can be automatically generated.

### Status Codes

| Status Code | Description         |
|-------------|---------------------|
| 201         | Successful request. |

### Error Codes

See [Error Codes](#).

## 5.12.2 Batch Adding Backend Servers

### Function

This API is used to add backend servers to the specified backend server group in batches. You can add up to 200 backend servers at a time to a backend server group.

### Calling Method

For details, see [Calling APIs](#).

### URI

POST /v3/{project\_id}/elb/pools/{pool\_id}/members/batch-add

Table 5-527 Path Parameters

| Parameter  | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                |
|------------|-----------|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| pool_id    | Yes       | String | <b>Definition:</b> Specifies the backend server group ID.<br><b>Constraints:</b> N/A<br><b>Range:</b> N/A<br><b>Default value:</b> N/A                                                                                                                                                                     |
| project_id | Yes       | String | <b>Definition:</b> Specifies the project ID. For details about how to obtain a project ID, see <a href="#">Obtaining a Project ID</a> .<br><b>Constraints:</b> N/A<br><b>Range:</b> The value can contain a maximum of 32 characters, including digits and lowercase letters.<br><b>Default value:</b> N/A |

## Request Parameters

**Table 5-528** Request header parameters

| Parameter    | Mandatory | Type   | Description                                                                                                                                      |
|--------------|-----------|--------|--------------------------------------------------------------------------------------------------------------------------------------------------|
| X-Auth-Token | Yes       | String | <b>Definition:</b> Specifies the token used for IAM authentication.<br><b>Constraints:</b> N/A<br><b>Range:</b> N/A<br><b>Default value:</b> N/A |

**Table 5-529** Request body parameters

| Parameter | Mandatory | Type                                                      | Description                                                                                                           |
|-----------|-----------|-----------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------|
| members   | Yes       | Array of <a href="#">BatchCreateMembersOption</a> objects | <b>Definition:</b> Specifies the request parameters for adding backend servers in batches.<br><b>Constraints:</b> N/A |

**Table 5-530** BatchCreateMembersOption

| Parameter         | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                                                                            |
|-------------------|-----------|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| name              | No        | String | <b>Definition:</b> Specifies the backend server name.<br><b>Constraints:</b> N/A<br><b>Range:</b> N/A<br><b>Default value:</b> N/A                                                                                                                                                                                                                                     |
| availability_zone | No        | String | <b>Definition:</b> Specifies the AZ of the backend server.<br><b>Constraints:</b> This parameter can be only set for IP as backend servers. If AZ affinity is enabled for the backend server group, this parameter must be set to a valid value for IP as backend servers.<br><b>Range:</b> AZs available for ECSs in the current region.<br><b>Default value:</b> N/A |

| Parameter     | Mandatory | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|---------------|-----------|---------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| address       | Yes       | String  | <b>Definition:</b> Specifies the IP address of the backend server. This IP address must be in the subnet specified by <b>subnet_cidr_id</b> , for example, 192.168.3.11.<br><b>Constraints:</b> If <b>subnet_cidr_id</b> is left blank, IP as backend servers will be added. In this case, the IP address must be an IPv4 address.<br><b>Range:</b> N/A<br><b>Default value:</b> N/A                                                            |
| protocol_port | Yes       | Integer | <b>Definition:</b> Specifies the port used by the backend server to receive requests.<br><b>Constraints:</b> <b>protocol_port</b> must be set to <b>0</b> for gateway load balancers with IP backend server groups associated.<br><b>Range:</b> N/A<br><b>Default value:</b> N/A<br><b>NOTE</b><br>This parameter can be left blank because it does not take effect if <b>any_port_enable</b> is set to <b>true</b> for a backend server group. |

| Parameter      | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

If the weight is set to 0, the backend server will not accept new requests.<br><br><b>Constraints:</b> This parameter is invalid when <b>lb_algorithm</b> is set to <b>SOURCE_IP</b> for the backend server group that contains the backend server.<br><br><b>Range:</b> 0 to 100<br><b>Default value:</b> 1 |

## Response Parameters

Status code: 201

**Table 5-531** Response body parameters

| Parameter  | Type                                | Description                                                                                                                                                                          |
|------------|-------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| request_id | String                              | <b>Definition:</b> Specifies the request ID.<br><b>Range:</b> The value is automatically generated, and can contain characters including digits, lowercase letters, and hyphens (-). |
| members    | Array of <b>BatchMember</b> objects | <b>Definition:</b> Specifies the backend servers.                                                                                                                                    |

**Table 5-532** BatchMember

| Parameter      | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|----------------|---------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| id             | String  | <b>Definition:</b> Specifies the backend server ID.<br><b>Range:</b> N/A<br><b>NOTE</b><br>The value of this parameter is not the ID of the server but an ID automatically generated for the backend server that is associated with the load balancer.                                                                                                                                                                                                                                                                                                                  |
| name           | String  | <b>Definition:</b> Specifies the backend server name.<br><b>Range:</b> N/A                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| project_id     | String  | Specifies the ID of the project where the backend server is used.<br><b>Range:</b> N/A                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| admin_state_up | Boolean | <b>Definition:</b> Specifies the administrative status of the backend server.<br><b>Range:</b> <b>true</b> or <b>false</b>                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| subnet_cidr_id | String  | <b>Definition:</b> Specifies the ID of the IPv4 or IPv6 subnet where the backend server resides. <b>neutron_subnet_id</b> defines IPv4 subnets, and <b>neutron_network_id</b> defines IPv6 subnets.<br>You can query parameter <b>neutron_subnet_id</b> in the response by calling the API (GET https://{VPC_Endpoint}/v1/{project_id}/subnets) to get the IPv4 subnet ID.<br>You can query parameter <b>neutron_network_id</b> in the response by calling the API (GET https://{VPC_Endpoint}/v1/{project_id}/subnets) to get the IPv6 subnet ID.<br><b>Range:</b> N/A |
| protocol_port  | Integer | <b>Definition:</b> Specifies the port used by the backend server to receive requests.<br><b>Range:</b> N/A<br><b>NOTE</b><br>This parameter can be left blank because it does not take effect if <b>any_port_enable</b> is set to <b>true</b> for a backend server group.                                                                                                                                                                                                                                                                                               |

| Parameter        | Type                                                 | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|------------------|------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| weight           | Integer                                              | <b>Definition:</b> Specifies the weight of the backend server. Requests are routed based on the load balancing algorithm configured for the backend server group and weights of backend servers. The larger the weight is, the higher proportion of requests the backend server receives. If the weight is set to 0, the backend server will not accept new requests.<br><b>Range:</b> 0 to 100<br><b>Default value:</b> N/A                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

For SDK sample code of more programming languages, see the Sample Code tab in [API Explorer](#). SDK sample code can be automatically generated.

## Status Codes

| Status Code | Description         |
|-------------|---------------------|
| 201         | Successful request. |

## Error Codes

See [Error Codes](#).

## 5.12.3 Querying Backend Servers in a Backend Server Group

### Function

This API is used to query all backend servers in a given backend server group.

### Constraints

This API has the following constraints:

- Parameters **marker**, **limit**, and **page\_reverse** are used for pagination query.
- Parameters **marker** and **page\_reverse** take effect only when they are used together with parameter **limit**.

### Calling Method

For details, see [Calling APIs](#).

### URI

GET /v3/{project\_id}/elb/pools/{pool\_id}/members

**Table 5-535** Path Parameters

| Parameter  | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                |
|------------|-----------|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| project_id | Yes       | String | <b>Definition:</b> Specifies the project ID. For details about how to obtain a project ID, see <a href="#">Obtaining a Project ID</a> .<br><b>Constraints:</b> N/A<br><b>Range:</b> The value can contain a maximum of 32 characters, including digits and lowercase letters.<br><b>Default value:</b> N/A |
| pool_id    | Yes       | String | <b>Definition:</b> Specifies the backend server group ID.<br><b>Constraints:</b> N/A<br><b>Range:</b> N/A<br><b>Default value:</b> N/A                                                                                                                                                                     |

**Table 5-536** Query Parameters

| Parameter | Mandatory | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                                    |
|-----------|-----------|---------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| marker    | No        | String  | <b>Definition:</b> Specifies the ID of the last record on the previous page.<br><b>Constraints:</b> <ul style="list-style-type: none"><li>• This parameter must be used together with <b>limit</b>.</li><li>• If the parameter is not specified, only resources on the first page are queried.</li><li>• This parameter cannot be left blank or set to an invalid ID.</li></ul> <b>Range:</b> N/A<br><b>Default value:</b> N/A |
| limit     | No        | Integer | <b>Definition:</b> Specifies the number of records returned on each page.<br><b>Constraints:</b> N/A<br><b>Range:</b> 0 to 2000<br><b>Default value:</b> 2000                                                                                                                                                                                                                                                                  |

| Parameter    | Mandatory | Type             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

## Request Parameters

**Table 5-537** Request header parameters

| Parameter    | Mandatory | Type   | Description                                                                                                                                      |
|--------------|-----------|--------|--------------------------------------------------------------------------------------------------------------------------------------------------|
| X-Auth-Token | Yes       | String | <b>Definition:</b> Specifies the token used for IAM authentication.<br><b>Constraints:</b> N/A<br><b>Range:</b> N/A<br><b>Default value:</b> N/A |

## Response Parameters

**Status code:** 200

**Table 5-538** Response body parameters

| Parameter  | Type                                    | Description                                                                                                                                                                          |
|------------|-----------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| request_id | String                                  | <b>Definition:</b> Specifies the request ID.<br><b>Range:</b> The value is automatically generated, and can contain characters including digits, lowercase letters, and hyphens (-). |
| page_info  | <a href="#">PageInfo</a> object         | <b>Definition:</b> Specifies the pagination information.                                                                                                                             |
| members    | Array of <a href="#">Member</a> objects | <b>Definition:</b> Specifies the backend servers.                                                                                                                                    |

**Table 5-539** PageInfo

| Parameter       | Type   | Description                                                                                                                                                                                                                          |
|-----------------|--------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| previous_marker | String | <b>Definition:</b> Specifies the ID of the first record in the pagination query result. If <b>page_reverse</b> is set to <b>true</b> , this parameter is used together to query resources on the previous page.<br><b>Range:</b> N/A |
| next_marker     | String | <b>Definition:</b> Specifies the ID of the last record in the pagination query result. It is usually used to query resources on the next page.<br><b>Range:</b> N/A                                                                  |

| Parameter     | Type    | Description                                                                                           |
|---------------|---------|-------------------------------------------------------------------------------------------------------|
| current_count | Integer | <b>Definition:</b> Specifies the number of records returned on the current page.<br><b>Range:</b> N/A |

**Table 5-540** Member

| Parameter         | Type    | Description                                                                                                                                                                                                                                            |
|-------------------|---------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| id                | String  | <b>Definition:</b> Specifies the backend server ID.<br><b>Range:</b> N/A<br><b>NOTE</b><br>The value of this parameter is not the ID of the server but an ID automatically generated for the backend server that is associated with the load balancer. |
| availability_zone | String  | <b>Definition:</b> Specifies the AZ where the backend server is running.<br><b>Range:</b> N/A                                                                                                                                                          |
| name              | String  | <b>Definition:</b> Specifies the backend server name.<br><b>Range:</b> N/A<br>Note: The name is not an ECS name.                                                                                                                                       |
| project_id        | String  | <b>Definition:</b> Specifies the project ID of the backend server.<br><b>Range:</b> N/A                                                                                                                                                                |
| admin_state_up    | Boolean | <b>Definition:</b> Specifies the administrative status of the backend server.<br><b>Range:</b> true or false                                                                                                                                           |

| Parameter      | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|----------------|---------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| subnet_cidr_id | String  | <p><b>Definition:</b> Specifies the ID of the IPv4 or IPv6 subnet where the backend server resides. <b>neutron_subnet_id</b> defines IPv4 subnets, and <b>neutron_network_id</b> defines IPv6 subnets.</p> <p>You can query parameter <b>neutron_subnet_id</b> in the response by calling the API (GET https://{VPC_Endpoint}/v1/{project_id}/subnets) to get the IPv4 subnet ID.</p> <p>You can query parameter <b>neutron_network_id</b> in the response by calling the API (GET https://{VPC_Endpoint}/v1/{project_id}/subnets) to get the IPv6 subnet ID.</p> <p><b>Range:</b> N/A</p> |
| protocol_port  | Integer | <p><b>Definition:</b> Specifies the port used by the backend server to receive requests.</p> <p><b>Range:</b> N/A</p> <p><b>NOTE</b></p> <p>This parameter can be left blank because it does not take effect if <b>any_port_enable</b> is set to <b>true</b> for a backend server group.</p>                                                                                                                                                                                                                                                                                               |
| weight         | Integer | <p><b>Definition:</b> Specifies the weight of the backend server. Requests are routed based on the load balancing algorithm configured for the backend server group and weights of backend servers.</p> <p>The larger the weight is, the higher proportion of requests the backend server receives. If the weight is set to 0, the backend server will not accept new requests.</p> <p><b>Range:</b> 0 to 100</p>                                                                                                                                                                          |
| address        | String  | <p><b>Definition:</b> Specifies the IP address of the backend server</p> <p><b>Range:</b> N/A</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| ip_version     | String  | <p><b>Definition:</b> Specifies the IP address version supported by the backend server. The version depends on the value of <b>address</b> returned by the system.</p> <p><b>Range:</b> v4 or v6</p>                                                                                                                                                                                                                                                                                                                                                                                       |

| Parameter        | Type                                        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

## Example Requests

Querying backend servers in a given backend server group

```
GET https://{ELB_Endpoint}/v3/99a3fff0d03c428eac3678da6a7d0f24/elb/pools/36ce7086-a496-4666-9064-5ba0e6840c75/members
```

## Example Responses

**Status code: 200**

Successful request.

 } else {
 fmt.Println(err)
 }
}
```

## More

For SDK sample code of more programming languages, see the Sample Code tab in [API Explorer](#). SDK sample code can be automatically generated.

## Status Codes

| Status Code | Description         |
|-------------|---------------------|
| 200         | Successful request. |

## Error Codes

See [Error Codes](#).

## 5.12.4 Querying Backend Servers in a Project

### Function

This API is used to query the backend servers under the current project.

### Constraints

This API has the following constraints:

- Parameters **marker**, **limit**, and **page\_reverse** are used for pagination query.
- Parameters **marker** and **page\_reverse** take effect only when they are used together with parameter **limit**.

### Calling Method

For details, see [Calling APIs](#).

### URI

GET /v3/{project\_id}/elb/members

**Table 5-543** Path Parameters

| Parameter  | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                |
|------------|-----------|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| project_id | Yes       | String | <b>Definition:</b> Specifies the project ID. For details about how to obtain a project ID, see <a href="#">Obtaining a Project ID</a> .<br><b>Constraints:</b> N/A<br><b>Range:</b> The value can contain a maximum of 32 characters, including digits and lowercase letters.<br><b>Default value:</b> N/A |

**Table 5-544** Query Parameters

| Parameter    | Mandatory | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|--------------|-----------|---------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| marker       | No        | String  | <b>Definition:</b> Specifies the ID of the last record on the previous page.<br><b>Constraints:</b> <ul style="list-style-type: none"><li>• This parameter must be used together with <b>limit</b>.</li><li>• If the parameter is not specified, only resources on the first page are queried.</li><li>• This parameter cannot be left blank or set to an invalid ID.</li></ul> <b>Range:</b> N/A<br><b>Default value:</b> N/A                                                                                                                                                               |
| limit        | No        | Integer | <b>Definition:</b> Specifies the number of records returned on each page.<br><b>Constraints:</b> N/A<br><b>Range:</b> 0 to 2000<br><b>Default value:</b> 2000                                                                                                                                                                                                                                                                                                                                                                                                                                |
| page_reverse | No        | Boolean | <b>Definition:</b> Specifies whether to use reverse query.<br><b>Constraints:</b> <ul style="list-style-type: none"><li>• This parameter must be used together with <b>limit</b>.</li><li>• If <b>page_reverse</b> is set to <b>true</b> and you want to query the resources on the previous page, set the value of <b>marker</b> to the value of <b>previous_marker</b>.</li></ul> <b>Range:</b> <ul style="list-style-type: none"><li>• <b>true:</b> Query resources on the previous page.</li><li>• <b>false:</b> Query resources on the next page.</li></ul> <b>Default value:</b> false |

| Parameter      | Mandatory | Type              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|----------------|-----------|-------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| name           | No        | Array of strings  | <b>Definition:</b> Specifies the backend server name.<br>Multiple names can be used for query in the format of <i>name=xxx&amp;name=xxx</i> .<br><b>Constraints:</b> N/A<br><b>Range:</b> N/A<br><b>Default value:</b> N/A                                                                                                                                                                                                                                                                                                                                               |
| weight         | No        | Array of integers | <b>Definition:</b> Specifies the weight of the backend server. Requests are routed to backend servers in the same backend server group based on their weights.<br>If the weight is set to 0, the backend server will not accept new requests.<br>This parameter is invalid when <b>lb_algorithm</b> is set to <b>SOURCE_IP</b> for the backend server group that contains the backend server.<br>Multiple weights can be used for query in the format of <i>weight=xxx&amp;weight=xxx</i> .<br><b>Constraints:</b> N/A<br><b>Range:</b> N/A<br><b>Default value:</b> N/A |
| admin_state_up | No        | Boolean           | <b>Definition:</b> Specifies the administrative status of the backend server.<br>Although this parameter can be used in the APIs for creating and updating backend servers, its actual value depends on whether ECSs exist. If ECSs exist, the value is <b>true</b> . Otherwise, the value is <b>false</b> .<br><b>Constraints:</b> N/A<br><b>Range:</b> <b>true</b> or <b>false</b><br><b>Default value:</b> N/A                                                                                                                                                        |

| Parameter      | Mandatory | Type              | Description                                                                                                                                                                                                                                                                                                                                                                                                              |
|----------------|-----------|-------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| subnet_cidr_id | No        | Array of strings  | <b>Definition:</b> Specifies the ID of the subnet where the backend server works. This subnet must be in the same VPC as the subnet of the load balancer associated with the backend server. Only IPv4 subnets are supported.<br><br>Multiple IDs can be used for query in the format of <i>subnet_cidr_id=xxx&amp;subnet_cidr_id=xxx</i> .<br><b>Constraints:</b> N/A<br><b>Range:</b> N/A<br><b>Default value:</b> N/A |
| address        | No        | Array of strings  | <b>Definition:</b> Specifies the IP address of the backend server. This IP address must be in the subnet specified by <b>subnet_cidr_id</b> , for example, 192.168.3.11.<br><br>Multiple IP addresses can be used for query in the format of <i>address=xxx&amp;address=xxx</i> .<br><b>Constraints:</b> N/A<br><b>Range:</b> N/A<br><b>Default value:</b> N/A                                                           |
| protocol_port  | No        | Array of integers | <b>Definition:</b> Specifies the port used by the backend servers.<br><br>Multiple ports can be used for query in the format of <i>protocol_port=xxx&amp;protocol_port=xxx</i> .<br><b>Constraints:</b> N/A<br><b>Range:</b> N/A<br><b>Default value:</b> N/A                                                                                                                                                            |

| Parameter | Mandatory | Type             | Description                                                                                                                                                                                                        |
|-----------|-----------|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| id        | No        | Array of strings | <b>Definition:</b> Specifies the backend server ID.<br>Multiple IDs can be used for query in the format of <i>id=xxx&amp;id=xxx</i> .<br><b>Constraints:</b> N/A<br><b>Range:</b> N/A<br><b>Default value:</b> N/A |

| Parameter        | Mandatory | Type             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|------------------|-----------|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| operating_status | No        | Array of strings | <p><b>Definition:</b> Specifies the operating status of the backend server.</p> <p>Multiple statuses can be used for query in the format of <i>operating_status=xxx&amp;operating_status=xxx</i>.</p> <p><b>Constraints:</b> N/A</p> <p><b>Range:</b></p> <ul style="list-style-type: none"><li>• <b>NO_MONITOR:</b> No health check is configured for the backend server group to which the backend server belongs.</li><li>• <b>INITIAL:</b> The backend server is initializing. Health check is configured for the backend server group, but no data has been reported yet.</li><li>• <b>ONLINE:</b> The backend server is running normally.</li><li>• <b>OFFLINE:</b> The backend server is detected unhealthy, or the cloud server used as the backend server is stopped or does not exist.</li><li>• <b>UNKNOWN:</b> The health check has not started yet, or no listener is associated with the backend server group, or the member IP address is not assigned to a cloud service instance (such as ECS, network interface, or supplementary network interface).</li></ul> <p><b>Default value:</b> N/A</p> |

| Parameter             | Mandatory | Type             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|-----------------------|-----------|------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| enterprise_project_id | No        | Array of strings | <p><b>Definition:</b> Specifies the ID of the enterprise project.</p> <p>Multiple values can be used for query in the format of <i>enterprise_project_id=xxx&amp;enterprise_project_id=xxx</i>.</p> <p><b>Constraints:</b></p> <ul style="list-style-type: none"><li>• If <b>enterprise_project_id</b> is not specified, resources in all enterprise projects are queried by default. Fine-grained authorization is performed. The <b>elb:members:list</b> permission must be assigned to the user group.</li><li>• If <b>enterprise_project_id</b> is specified, the value can be a specific enterprise project ID or <b>all_granted_eps</b>. If the value is a specific enterprise project ID, only resources in the enterprise project are queried. If the value is <b>all_granted_eps</b>, resources in the enterprise projects with the <b>elb:members:list</b> permission are queried.</li></ul> <p><b>Range:</b> N/A</p> <p><b>Default value:</b> N/A</p> |
| ip_version            | No        | Array of strings | <p><b>Definition:</b> Specifies the IP address version.</p> <p>Multiple versions can be used for query in the format of <i>ip_version=xxx&amp;ip_version=xxx</i>.</p> <p><b>Constraints:</b> N/A</p> <p><b>Range:</b> v4 or v6</p> <p><b>Default value:</b> N/A</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

## Request Parameters

**Table 5-545** Request header parameters

| Parameter    | Mandatory | Type   | Description                                                                                                                                      |
|--------------|-----------|--------|--------------------------------------------------------------------------------------------------------------------------------------------------|
| X-Auth-Token | Yes       | String | <b>Definition:</b> Specifies the token used for IAM authentication.<br><b>Constraints:</b> N/A<br><b>Range:</b> N/A<br><b>Default value:</b> N/A |

## Response Parameters

**Status code:** 200

**Table 5-546** Response body parameters

| Parameter  | Type                               | Description                                                                                                                                                                          |
|------------|------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| request_id | String                             | <b>Definition:</b> Specifies the request ID.<br><b>Range:</b> The value is automatically generated, and can contain characters including digits, lowercase letters, and hyphens (-). |
| page_info  | <b>PageInfo</b> object             | <b>Definition:</b> Specifies the pagination information.                                                                                                                             |
| members    | Array of <b>MemberInfo</b> objects | <b>Definition:</b> Specifies the backend servers.                                                                                                                                    |

**Table 5-547** PageInfo

| Parameter       | Type    | Description                                                                                                                                                                                                                          |
|-----------------|---------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| previous_marker | String  | <b>Definition:</b> Specifies the ID of the first record in the pagination query result. If <b>page_reverse</b> is set to <b>true</b> , this parameter is used together to query resources on the previous page.<br><b>Range:</b> N/A |
| next_marker     | String  | <b>Definition:</b> Specifies the ID of the last record in the pagination query result. It is usually used to query resources on the next page.<br><b>Range:</b> N/A                                                                  |
| current_count   | Integer | <b>Definition:</b> Specifies the number of records returned on the current page.<br><b>Range:</b> N/A                                                                                                                                |

**Table 5-548** MemberInfo

| Parameter | Type   | Description                                                                                                                                                                                                                                            |
|-----------|--------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| id        | String | <b>Definition:</b> Specifies the backend server ID.<br><b>Range:</b> N/A<br><b>NOTE</b><br>The value of this parameter is not the ID of the server but an ID automatically generated for the backend server that is associated with the load balancer. |

| Parameter         | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|-------------------|---------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| availability_zone | String  | Specifies the AZ where the backend server is running.<br><b>Range:</b> N/A                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| name              | String  | <b>Definition:</b> Specifies the backend server name.<br><b>Range:</b> N/A<br>Note: The name is not an ECS name.                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| project_id        | String  | Specifies the ID of the project where the backend server is used.<br><b>Range:</b> N/A                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| pool_id           | String  | <b>Definition:</b> Specifies the ID of the backend server group to which the backend server belongs.<br><b>Range:</b> N/A<br>This parameter is unsupported. Please do not use it.                                                                                                                                                                                                                                                                                                                                                                                       |
| admin_state_up    | Boolean | <b>Definition:</b> Specifies the administrative status of the backend server.<br>Although this parameter can be used in the APIs for creating and updating backend servers, its actual value depends on whether ECSs exist. If ECSs exist, the value is <b>true</b> . Otherwise, the value is <b>false</b> .<br><b>Range:</b> <b>true</b> or <b>false</b>                                                                                                                                                                                                               |
| subnet_cidr_id    | String  | <b>Definition:</b> Specifies the ID of the IPv4 or IPv6 subnet where the backend server resides. <b>neutron_subnet_id</b> defines IPv4 subnets, and <b>neutron_network_id</b> defines IPv6 subnets.<br>You can query parameter <b>neutron_subnet_id</b> in the response by calling the API (GET https://{VPC_Endpoint}/v1/{project_id}/subnets) to get the IPv4 subnet ID.<br>You can query parameter <b>neutron_network_id</b> in the response by calling the API (GET https://{VPC_Endpoint}/v1/{project_id}/subnets) to get the IPv6 subnet ID.<br><b>Range:</b> N/A |

| Parameter     | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|---------------|---------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| protocol_port | Integer | <b>Definition:</b> Specifies the port used by the backend server to receive requests.<br><b>Range:</b> N/A                                                                                                                                                                                                                                                                                                                                                                          |
| weight        | Integer | <b>Definition:</b> Specifies the weight of the backend server. Requests are routed based on the load balancing algorithm configured for the backend server group and weights of backend servers.<br>The larger the weight is, the higher proportion of requests the backend server receives. If the weight is set to 0, the backend server will not accept new requests.<br><b>Range:</b> 0 to 100                                                                                  |
| address       | String  | <b>Definition:</b> Specifies the IP address bound to the backend server.<br><b>Range:</b> <ul style="list-style-type: none"><li>• If <b>subnet_cidr_id</b> is left blank, IP as backend servers will be added. In this case, the IP address must be an IPv4 address.</li><li>• If <b>subnet_cidr_id</b> is not left blank, ECSs, BMSs, or supplementary network interfaces will be added as backend servers. It must be in the subnet specified by <b>subnet_cidr_id</b>.</li></ul> |
| ip_version    | String  | <b>Definition:</b> Specifies the IP address version supported by the backend server. The version depends on the value of <b>address</b> returned by the system.<br><b>Range:</b> v4 or v6                                                                                                                                                                                                                                                                                           |

| Parameter    | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

A maximum of five ranges are supported.</li></ul> |
| healthcheck_response | String | <b>Definition:</b> Specifies the returned HTTP status code in the response. This parameter will take effect only when <b>type</b> is set to <b>HTTP</b> , <b>HTTPS</b> , or <b>GRPC</b> . The status code cannot be <b>null</b> if <b>reason_code</b> is <b>RESPONSE_MISMATCH</b> .<br><b>Range:</b> <ul style="list-style-type: none"><li>• A specific status code. If <b>type</b> is set to <b>GRPC</b>, the status code ranges from 0 to 99. If <b>type</b> is set to other values, the status code ranges from 200 to 599. For example, the status code can be <b>0</b> or <b>200</b>.</li></ul>                                                                                                                                                                                                                                                                                                                                     |

## Example Requests

Querying all backend servers under the current project

```
GET https://{ELB_Endpoint}/v3/7a9941d34fc1497d8d0797429ecfd354/elb/members
```

## Example Responses

**Status code: 200**

Successful request.

 if err == nil {
 fmt.Printf("%+v\n", response)
 } else {
 fmt.Println(err)
 }
}
```

## More

For SDK sample code of more programming languages, see the Sample Code tab in [API Explorer](#). SDK sample code can be automatically generated.

## Status Codes

| Status Code | Description         |
|-------------|---------------------|
| 200         | Successful request. |

## Error Codes

See [Error Codes](#).

## 5.12.5 Viewing the Details of a Backend Server

### Function

This API is used to view the details of a backend server.

### Calling Method

For details, see [Calling APIs](#).

### URI

GET /v3/{project\_id}/elb/pools/{pool\_id}/members/{member\_id}

**Table 5-552** Path Parameters

| Parameter  | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                |
|------------|-----------|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

## Example Requests

Querying the details of a backend server

```
GET https://{ELB_Endpoint}/v3/99a3fff0d03c428eac3678da6a7d0f24/elb/pools/36ce7086-a496-4666-9064-5ba0e6840c75/members/1923923e-fe8a-484f-bdbc-e11559b1f48f
```

## Example Responses

**Status code: 200**

Successful request.

```

```

## More

For SDK sample code of more programming languages, see the Sample Code tab in [API Explorer](#). SDK sample code can be automatically generated.

## Status Codes

| Status Code | Description         |
|-------------|---------------------|
| 200         | Successful request. |

## Error Codes

See [Error Codes](#).

## 5.12.6 Updating a Backend Server

### Function

This API is used to update a backend server.

### Constraints

If the provisioning status of the associated load balancer is not **ACTIVE**, the backend server cannot be updated.

## Calling Method

For details, see [Calling APIs](#).

## URI

PUT /v3/{project\_id}/elb/pools/{pool\_id}/members/{member\_id}

**Table 5-558** Path Parameters

| Parameter  | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                                  |
|------------|-----------|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| member_id  | Yes       | String | <b>Definition:</b> Specifies the backend server ID.<br><b>Constraints:</b> N/A<br><b>Range:</b> N/A<br><b>Default value:</b> N/A<br><b>NOTE</b><br>The value of this parameter is not the ID of the server but an ID automatically generated for the backend server that has already been associated with the load balancer. |
| pool_id    | Yes       | String | <b>Definition:</b> Specifies the backend server group ID.<br><b>Constraints:</b> N/A<br><b>Range:</b> N/A<br><b>Default value:</b> N/A                                                                                                                                                                                       |
| project_id | Yes       | String | <b>Definition:</b> Specifies the project ID. For details about how to obtain a project ID, see <a href="#">Obtaining a Project ID</a> .<br><b>Constraints:</b> N/A<br><b>Range:</b> The value can contain a maximum of 32 characters, including digits and lowercase letters.<br><b>Default value:</b> N/A                   |

## Request Parameters

**Table 5-559** Request header parameters

| Parameter    | Mandatory | Type   | Description                                                                                                                                      |
|--------------|-----------|--------|--------------------------------------------------------------------------------------------------------------------------------------------------|
| X-Auth-Token | Yes       | String | <b>Definition:</b> Specifies the token used for IAM authentication.<br><b>Constraints:</b> N/A<br><b>Range:</b> N/A<br><b>Default value:</b> N/A |

**Table 5-560** Request body parameters

| Parameter | Mandatory | Type                                      | Description                                                                                     |
|-----------|-----------|-------------------------------------------|-------------------------------------------------------------------------------------------------|
| member    | Yes       | <a href="#">UpdateMemberOption</a> object | <b>Definition:</b> Request parameters for updating a backend server.<br><b>Constraints:</b> N/A |

**Table 5-561** UpdateMemberOption

| Parameter      | Mandatory | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|----------------|-----------|---------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| admin_state_up | No        | Boolean | <b>Definition:</b> Specifies the administrative status of the backend server.<br>Although this parameter can be used in the APIs for creating and updating backend servers, its actual value depends on whether ECSs exist. If ECSs exist, the value is <b>true</b> . Otherwise, the value is <b>false</b> .<br><b>Constraints:</b> Please do not specify this parameter.<br><b>Range:</b> <b>true</b> or <b>false</b><br><b>Default value:</b> N/A |

| Parameter         | Mandatory | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-------------------|-----------|---------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| availability_zone | No        | String  | <b>Definition:</b> Specifies the AZ of the backend server.<br><b>Constraints:</b> This parameter can be only updated for IP as backend servers. If AZ affinity is enabled for the backend server group, this parameter is mandatory for IP as backend servers and cannot be changed to "".<br><b>Range:</b> AZs available for ECSs in the current region.<br><b>Default value:</b> N/A                                                                                                                                                                                                            |
| name              | No        | String  | <b>Definition:</b> Specifies the backend server name.<br><b>Constraints:</b> N/A<br><b>Range:</b> N/A<br><b>Default value:</b> N/A                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| weight            | No        | Integer | <b>Definition:</b> Specifies the weight of the backend server. Requests are routed based on the load balancing algorithm configured for the backend server group and weights of backend servers.<br>The larger the weight is, the higher proportion of requests the backend server receives. If the weight is set to 0, the backend server will not accept new requests.<br><b>Constraints:</b> This parameter is invalid when <b>lb_algorithm</b> is set to <b>SOURCE_IP</b> for the backend server group that contains the backend server.<br><b>Range:</b> 0 to 100<br><b>Default value:</b> 1 |

| Parameter     | Mandatory | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                                   |
|---------------|-----------|---------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| protocol_port | No        | Integer | <b>Definition:</b> Specifies the port used by the backend server to receive requests.<br><b>Constraints:</b> <ul style="list-style-type: none"><li>This parameter cannot be updated if <b>any_port_enable</b> is set to <b>true</b> for a backend server group.</li><li><b>protocol_port</b> must be set to <b>0</b> for gateway load balancers with IP backend server groups associated.</li></ul> <b>Default value:</b> N/A |

## Response Parameters

Status code: 200

Table 5-562 Response body parameters

| Parameter  | Type                 | Description                                                                                                                                                                          |
|------------|----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| request_id | String               | <b>Definition:</b> Specifies the request ID.<br><b>Range:</b> The value is automatically generated, and can contain characters including digits, lowercase letters, and hyphens (-). |
| member     | <b>Member</b> object | <b>Definition:</b> Response parameters for updating a backend server.                                                                                                                |

Table 5-563 Member

| Parameter | Type   | Description                                                                                                                                                                                                                                            |
|-----------|--------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| id        | String | <b>Definition:</b> Specifies the backend server ID.<br><b>Range:</b> N/A<br><b>NOTE</b><br>The value of this parameter is not the ID of the server but an ID automatically generated for the backend server that is associated with the load balancer. |

| Parameter         | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|-------------------|---------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| availability_zone | String  | <b>Definition:</b> Specifies the AZ where the backend server is running.<br><b>Range:</b> N/A                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| name              | String  | <b>Definition:</b> Specifies the backend server name.<br><b>Range:</b> N/A<br>Note: The name is not an ECS name.                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| project_id        | String  | <b>Definition:</b> Specifies the project ID of the backend server.<br><b>Range:</b> N/A                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| admin_state_up    | Boolean | <b>Definition:</b> Specifies the administrative status of the backend server.<br><b>Range:</b> <b>true</b> or <b>false</b>                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| subnet_cidr_id    | String  | <b>Definition:</b> Specifies the ID of the IPv4 or IPv6 subnet where the backend server resides. <b>neutron_subnet_id</b> defines IPv4 subnets, and <b>neutron_network_id</b> defines IPv6 subnets.<br>You can query parameter <b>neutron_subnet_id</b> in the response by calling the API (GET https://{VPC_Endpoint}/v1/{project_id}/subnets) to get the IPv4 subnet ID.<br>You can query parameter <b>neutron_network_id</b> in the response by calling the API (GET https://{VPC_Endpoint}/v1/{project_id}/subnets) to get the IPv6 subnet ID.<br><b>Range:</b> N/A |
| protocol_port     | Integer | <b>Definition:</b> Specifies the port used by the backend server to receive requests.<br><b>Range:</b> N/A<br><b>NOTE</b><br>This parameter can be left blank because it does not take effect if <b>any_port_enable</b> is set to <b>true</b> for a backend server group.                                                                                                                                                                                                                                                                                               |

| Parameter  | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                     |
|------------|---------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| weight     | Integer | <b>Definition:</b> Specifies the weight of the backend server. Requests are routed based on the load balancing algorithm configured for the backend server group and weights of backend servers. The larger the weight is, the higher proportion of requests the backend server receives. If the weight is set to 0, the backend server will not accept new requests.<br><b>Range:</b> 0 to 100 |
| address    | String  | <b>Definition:</b> Specifies the IP address of the backend server<br><b>Range:</b> N/A                                                                                                                                                                                                                                                                                                          |
| ip_version | String  | <b>Definition:</b> Specifies the IP address version supported by the backend server. The version depends on the value of <b>address</b> returned by the system.<br><b>Range:</b> v4 or v6                                                                                                                                                                                                       |

| Parameter        | Type                                        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|------------------|---------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| operating_status | String                                      | <b>Definition:</b> Specifies the operating status of the backend server.<br><b>Range:</b> <ul style="list-style-type: none"><li>• <b>NO_MONITOR:</b> No health check is configured for the backend server group to which the backend server belongs.</li><li>• <b>INITIAL:</b> The backend server is initializing. Health check is configured for the backend server group, but no data has been reported yet.</li><li>• <b>ONLINE:</b> The backend server is running normally.</li><li>• <b>OFFLINE:</b> The backend server is detected unhealthy, or the cloud server used as the backend server is stopped or does not exist.</li><li>• <b>UNKNOWN:</b> The health check has not started yet, or no listener is associated with the backend server group, or the member IP address is not assigned to a cloud service instance (such as ECS, network interface, or supplementary network interface).</li></ul> Multiple statuses can be used for query in the format of <i>operating_status=xxx&amp;operating_status=xxx</i> . |
| status           | Array of <b>MemberStatus</b> objects        | <b>Definition:</b> Specifies the health status of the backend server.<br><b>Range:</b> N/A                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| reason           | <b>MemberHealthCheckFailedReason</b> object | <b>Definition:</b> Specifies why health check fails.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| created_at       | String                                      | <b>Definition:</b> Specifies the creation time. }
```

## SDK Sample Code

The SDK sample code is as follows.

### Java

Changing the weight of a backend server

```
package com.huaweicloud.sdk.test;

import com.huaweicloud.sdk.core.auth.ICredential;
import com.huaweicloud.sdk.core.auth.BasicCredentials;
import com.huaweicloud.sdk.core.exception.ConnectionException;
import com.huaweicloud.sdk.core.exception.RequestTimeoutException;
import com.huaweicloud.sdk.core.exception.ServiceResponseException;
import com.huaweicloud.sdk.elb.v3.region.ElbRegion;
import com.huaweicloud.sdk.elb.v3.*;
import com.huaweicloud.sdk.elb.v3.model.*;

public class UpdateMemberSolution {

 public static void main(String[] args) {
 // The AK and SK used for authentication are hard-coded or stored in plaintext, which has great
 // security risks. It is recommended that the AK and SK be stored in ciphertext in configuration files or
 // environment variables and decrypted during use to ensure security.
 // In this example, AK and SK are stored in environment variables for authentication. Before running
 // this example, set environment variables CLOUD_SDK_AK and CLOUD_SDK_SK in the local environment
 String ak = System.getenv("CLOUD_SDK_AK");
 String sk = System.getenv("CLOUD_SDK_SK");
 String projectId = "{project_id}";

 ICredential auth = new BasicCredentials()
 .withProjectId(projectId)
 .withAk(ak)
 .withSk(sk);
```

```
ElbClient client = ElbClient.newBuilder()
 .withCredential(auth)
 .withRegion(ElbRegion.valueOf("<YOUR REGION>"))
 .build();
UpdateMemberRequest request = new UpdateMemberRequest();
request.withMemberId("{member_id}");
request.withPoolId("{pool_id}");
UpdateMemberRequestBody body = new UpdateMemberRequestBody();
UpdateMemberOption memberbody = new UpdateMemberOption();
memberbody.withName("My member")
 .withWeight(10);
body.withMember(memberbody);
request.withBody(body);

## Go

### Changing the weight of a backend server

```
package main

import (
 "fmt"
 "github.com/huaweicloud/huaweicloud-sdk-go-v3/core/auth/basic"
 elb "github.com/huaweicloud/huaweicloud-sdk-go-v3/services/elb/v3"
 "github.com/huaweicloud/huaweicloud-sdk-go-v3/services/elb/v3/model"
 region "github.com/huaweicloud/huaweicloud-sdk-go-v3/services/elb/v3/region"
)

func main() {
 // The AK and SK used for authentication are hard-coded or stored in plaintext, which has great security
 // risks. It is recommended that the AK and SK be stored in ciphertext in configuration files or environment
 // variables and decrypted during use to ensure security.
 // In this example, AK and SK are stored in environment variables for authentication. Before running this
 // example, set environment variables CLOUD_SDK_AK and CLOUD_SDK_SK in the local environment
 ak := os.Getenv("CLOUD_SDK_AK")
 sk := os.Getenv("CLOUD_SDK_SK")
 projectId := "{project_id}"

 auth := basic.NewCredentialsBuilder().
 WithAk(ak).
 WithSk(sk).
 WithProjectId(projectId).
 Build()

 client := elb.NewElbClient(
 elb.ElbClientBuilder().
 WithRegion(region.ValueOf("<YOUR REGION>")).
 WithCredential(auth).
 Build())

 request := &model.UpdateMemberRequest{}
 request.MemberId = "{member_id}"
 request.PoolId = "{pool_id}"
 nameMember := "My member"
 weightMember := int32(10)
 memberbody := &model.UpdateMemberOption{
 Name: &nameMember,
 Weight: &weightMember,
 }
 request.Body = &model.UpdateMemberRequestBody{
 Member: memberbody,
 }
 response, err := client.UpdateMember(request)
 if err == nil {
 fmt.Printf("%+v\n", response)
 } else {
 fmt.Println(err)
 }
}
```

## More

For SDK sample code of more programming languages, see the Sample Code tab in [API Explorer](#). SDK sample code can be automatically generated.

## Status Codes

| Status Code | Description         |
|-------------|---------------------|
| 200         | Successful request. |

# 5.12.7 Batch Updating Backend Servers

## Function

This API is used to update backend servers in a given backend server group in batches. You can update up to 200 backend servers at a time from a backend server group.

## Calling Method

For details, see [Calling APIs](#).

## URI

POST /v3/{project\_id}/elb/pools/{pool\_id}/members/batch-update

**Table 5-566** Path Parameters

| Parameter | Mandatory | Type   | Description                                                                                                                            |
|-----------|-----------|--------|----------------------------------------------------------------------------------------------------------------------------------------|
| pool_id   | Yes       | String | <b>Definition:</b> Specifies the backend server group ID.<br><b>Constraints:</b> N/A<br><b>Range:</b> N/A<br><b>Default value:</b> N/A |

| Parameter  | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                |
|------------|-----------|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| project_id | Yes       | String | <b>Definition:</b> Specifies the project ID. For details about how to obtain a project ID, see <a href="#">Obtaining a Project ID</a> .<br><b>Constraints:</b> N/A<br><b>Range:</b> The value can contain a maximum of 32 characters, including digits and lowercase letters.<br><b>Default value:</b> N/A |

## Request Parameters

**Table 5-567** Request header parameters

| Parameter    | Mandatory | Type   | Description                                                                                                                                      |
|--------------|-----------|--------|--------------------------------------------------------------------------------------------------------------------------------------------------|
| X-Auth-Token | Yes       | String | <b>Definition:</b> Specifies the token used for IAM authentication.<br><b>Constraints:</b> N/A<br><b>Range:</b> N/A<br><b>Default value:</b> N/A |

**Table 5-568** Request body parameters

| Parameter | Mandatory | Type                                                      | Description                                                           |
|-----------|-----------|-----------------------------------------------------------|-----------------------------------------------------------------------|
| members   | Yes       | Array of <a href="#">BatchUpdateMembersOption</a> objects | <b>Definition:</b> Specifies the backend server.<br><b>Range:</b> N/A |

**Table 5-569** BatchUpdateMembersOption

| Parameter         | Mandatory | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                              |
|-------------------|-----------|---------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| id                | Yes       | String  | <b>Definition:</b> Specifies the backend server ID.<br><b>Constraints:</b> N/A<br><b>Range:</b> N/A<br><b>Default value:</b> N/A<br><b>NOTE</b><br>The value of this parameter is not the ID of the server but an ID automatically generated for the backend server that has already been associated with the load balancer.                                                                             |
| availability_zone | No        | String  | <b>Definition:</b> Specifies the AZ of the backend server.<br><b>Constraints:</b> This parameter can be only set for IP as backend servers. If AZ affinity is enabled for the backend server group, this parameter must be set to a valid value for IP as backend servers.<br><b>Range:</b> AZs available for ECSs in the current region.<br><b>Default value:</b> N/A                                   |
| admin_state_up    | No        | Boolean | Specifies the administrative status of the backend server.<br><b>Constraints:</b> Although this parameter can be used in the APIs for creating and updating backend servers, its actual value depends on whether ECSs exist. If ECSs exist, the value is <b>true</b> . Otherwise, the value is <b>false</b> .<br><b>Range:</b> N/A<br><b>Default value:</b> N/A<br>Please do not specify this parameter. |
| name              | No        | String  | <b>Definition:</b> Specifies the backend server name.<br><b>Constraints:</b> N/A<br><b>Range:</b> N/A<br><b>Default value:</b> N/A                                                                                                                                                                                                                                                                       |

| Parameter     | Mandatory | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|---------------|-----------|---------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| protocol_port | No        | Integer | <b>Definition:</b> Specifies the port used by the backend server to receive requests.<br><b>Constraints:</b> <ul style="list-style-type: none"><li>• This parameter cannot be updated if <b>any_port_enable</b> is set to <b>true</b> for a backend server group.</li><li>• <b>protocol_port</b> must be set to <b>0</b> for gateway load balancers with IP backend server groups associated.</li></ul> <b>Range:</b> 1-65535<br><b>Default value:</b> N/A                                              |
| weight        | No        | Integer | <b>Definition:</b> Specifies the weight of the backend server. Requests are routed based on the load balancing algorithm configured for the backend server group and weights of backend servers. If the weight is set to 0, the backend server will not accept new requests.<br><b>Constraints:</b> This parameter is invalid when <b>lb_algorithm</b> is set to <b>SOURCE_IP</b> for the backend server group that contains the backend server.<br><b>Range:</b> 0 to 100<br><b>Default value:</b> N/A |

## Response Parameters

Status code: 200

**Table 5-570** Response body parameters

| Parameter  | Type   | Description                                                                                                                                                                          |
|------------|--------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| request_id | String | <b>Definition:</b> Specifies the request ID.<br><b>Range:</b> The value is automatically generated, and can contain characters including digits, lowercase letters, and hyphens (-). |

| Parameter | Type                                               | Description                                       |
|-----------|----------------------------------------------------|---------------------------------------------------|
| members   | Array of <a href="#">BatchUpdateMember</a> objects | <b>Definition:</b> Specifies the backend servers. |

**Table 5-571** BatchUpdateMember

| Parameter      | Type    | Description                                                                                                                                                                                                                                                                                                    |
|----------------|---------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| id             | String  | <b>Definition:</b> Specifies the backend server ID.<br><b>Range:</b> N/A<br><b>NOTE</b><br>The value of this parameter is not the ID of the server but an ID automatically generated for the backend server that is associated with the load balancer.                                                         |

For SDK sample code of more programming languages, see the Sample Code tab in [API Explorer](#). SDK sample code can be automatically generated.

## Status Codes

| Status Code | Description         |
|-------------|---------------------|
| 200         | Successful request. |

## Error Codes

See [Error Codes](#).

## 5.12.8 Removing a Backend Server

### Function

This API is used to remove a backend server.

### Constraints

After you remove a backend server, new connections to this server will not be established. However, established persistent connections will be maintained.

### Calling Method

For details, see [Calling APIs](#).

### URI

DELETE /v3/{project\_id}/elb/pools/{pool\_id}/members/{member\_id}

## More

For SDK sample code of more programming languages, see the Sample Code tab in [API Explorer](#). SDK sample code can be automatically generated.

## Status Codes

| Status Code | Description         |
|-------------|---------------------|
| 200         | Successful request. |

## Error Codes

See [Error Codes](#).

## 5.12.10 Creating a Backend Server Check Task

### Function

This API is used to create a task for checking the configurations, network ACL rules, and security group rules of a backend server.

### Calling Method

For details, see [Calling APIs](#).

### URI

POST /v3/{project\_id}/elb/members/{member\_id}/health-check

**Table 5-582** Path Parameters

| Parameter  | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                |

 } else {
 fmt.Println(err)
 }
}
```

## More

For SDK sample code of more programming languages, see the Sample Code tab in [API Explorer](#). SDK sample code can be automatically generated.

## Status Codes

| Status Code | Description         |
|-------------|---------------------|
| 201         | Successful request. |

## Error Codes

See [Error Codes](#).

## 5.12.11 Querying the Results of a Backend Server Check Task

### Function

This API is used to query the results of a backend server check task.

### Calling Method

For details, see [Calling APIs](#).

### URI

GET /v3/{project\_id}/elb/members/check/jobs/{job\_id}

**Table 5-588** Path Parameters

| Parameter  | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                |
|------------|-----------|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| project_id | Yes       | String | <b>Definition:</b> Specifies the project ID. For details about how to obtain a project ID, see <a href="#">Obtaining a Project ID</a> .<br><b>Constraints:</b> N/A<br><b>Range:</b> The value can contain a maximum of 32 characters, including digits and lowercase letters.<br><b>Default value:</b> N/A |
| job_id     | Yes       | String | <b>Definition:</b> Specifies the task ID returned by the API for creating a backend server check task.                                                                                                                                                                                                     |

## Request Parameters

**Table 5-589** Request header parameters

| Parameter    | Mandatory | Type   | Description                                                                                                                                      |
|--------------|-----------|--------|--------------------------------------------------------------------------------------------------------------------------------------------------|
| X-Auth-Token | Yes       | String | <b>Definition:</b> Specifies the token used for IAM authentication.<br><b>Constraints:</b> N/A<br><b>Range:</b> N/A<br><b>Default value:</b> N/A |

## Response Parameters

**Status code:** 200

**Table 5-590** Response body parameters

| Parameter    | Type                                      | Description                                                                                                                                                                          |
|--------------|-------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| member_check | <a href="#">MemberCheckJobInfo</a> object | <b>Definition:</b> Specifies the information about the backend server check task.                                                                                                    |
| request_id   | String                                    | <b>Definition:</b> Specifies the request ID.<br><b>Range:</b> The value is automatically generated, and can contain characters including digits, lowercase letters, and hyphens (-). |

| acl            | <b>MemberCheckJobResultGroup</b> object | <b>Definition:</b> Specifies the network ACL rule check.<br><b>Range:</b> N/A    |
| security_group | <b>MemberCheckJobResultGroup</b> object | <b>Definition:</b> Specifies the security group rule check.<br><b>Range:</b> N/A |

**Table 5-593** MemberCheckJobResultGroup

| Parameter    | Type                                                      | Description                                                                                                                                                                  |
|--------------|-----------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| check_result | Boolean                                                   | <b>Definition:</b> Specifies the check result. <b>true</b> indicates that the check is passed, and <b>false</b> indicates that the check is not passed.<br><b>Range:</b> N/A |
| check_items  | Array of <a href="#">MemberCheckJobResultItem</a> objects | <b>Definition:</b> Specifies the summary of grouped check items.                                                                                                             |
| check_status | String                                                    | <b>Definition:</b> Specifies the result of a backend server check task. The value can be <b>processed</b> , <b>processing</b> , or <b>failed</b> .<br><b>Range:</b> N/A      |

**Table 5-594** MemberCheckJobResultItem

| Parameter       | Type   | Description                                                                                                                                  |
|-----------------|--------|----------------------------------------------------------------------------------------------------------------------------------------------|
| name            | String | <b>Definition:</b> Specifies the check item name.<br><b>Range:</b> N/A                                                                       |
| reason          | String | <b>Definition:</b> Specifies the exception cause.<br><b>Range:</b> N/A                                                                       |
| severity        | String | <b>Definition:</b> Specifies the exception severity, which can be <b>Major</b> (severe) or <b>Tips</b> (informational).<br><b>Range:</b> N/A |
| subject         | String | <b>Definition:</b> Specifies the check type. <b>config</b> indicates configuration check.<br><b>Range:</b> N/A                               |
| job_id          | String | <b>Definition:</b> Specifies the task ID.<br><b>Range:</b> N/A                                                                               |
| reason_template | String | <b>Definition:</b> Specifies the exception reason template.<br><b>Range:</b> N/A                                                             |

| Parameter     | Type             | Description                                                                                                                                                              |
|---------------|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| reason_params | Array of strings | <b>Definition:</b> Specifies the exception variables, which is used to dynamically generate exception causes based on the exception cause template.<br><b>Range:</b> N/A |

## Example Requests

Querying the results of a backend server check task

```
POST https://{ELB_Endpoint}/v3/04dd36f964000fe22f9ac00bc85b1a1d/elb/members/check/jobs/04a9bc65-b75b-478d-b4d6-e693bb61dd35
```

## Example Responses

**Status code: 200**

Successful request.

}
}
```

## More

For SDK sample code of more programming languages, see the Sample Code tab in [API Explorer](#). SDK sample code can be automatically generated.

## Status Codes

| Status Code | Description         |
|-------------|---------------------|
| 200         | Successful request. |

## Error Codes

See [Error Codes](#).

# 5.13 Health Check

## 5.13.1 Configuring a Health Check

### Function

This API is used to configure a health check.

### Constraints

This API has the following constraints:

- The security groups must have rules that allow traffic to 100.125.0.0/16.
- If you want to use UDP for health checks, ensure that the protocol of the backend server group is UDP.

### Calling Method

For details, see [Calling APIs](#).

### URI

POST /v3/{project\_id}/elb/healthmonitors

**Table 5-595** Path Parameters

| Parameter  | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                |
|------------|-----------|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| project_id | Yes       | String | <b>Definition:</b> Specifies the project ID. For details about how to obtain a project ID, see <a href="#">Obtaining a Project ID</a> .<br><b>Constraints:</b> N/A<br><b>Range:</b> The value can contain a maximum of 32 characters, including digits and lowercase letters.<br><b>Default value:</b> N/A |

## Request Parameters

**Table 5-596** Request header parameters

| Parameter    | Mandatory | Type   | Description                                                                                                                                      |
|--------------|-----------|--------|--------------------------------------------------------------------------------------------------------------------------------------------------|
| X-Auth-Token | Yes       | String | <b>Definition:</b> Specifies the token used for IAM authentication.<br><b>Constraints:</b> N/A<br><b>Range:</b> N/A<br><b>Default value:</b> N/A |

**Table 5-597** Request body parameters

| Parameter     | Mandatory | Type                                              | Description                                                                                                    |
|---------------|-----------|---------------------------------------------------|----------------------------------------------------------------------------------------------------------------|
| healthmonitor | Yes       | <a href="#">CreateHealthMonitorOptions</a> object | <b>Definition:</b> Specifies the request parameters for configuring a health check.<br><b>Constraints:</b> N/A |

**Table 5-598** CreateHealthMonitorOption

| Parameter      | Mandatory | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|----------------|-----------|---------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| admin_state_up | No        | Boolean | <b>Definition:</b> Specifies the administrative status of the health check.<br><b>Constraints:</b> N/A<br><b>Range:</b> <ul style="list-style-type: none"><li>• <b>true:</b> The health check function is enabled.</li><li>• <b>false:</b> The health check function is disabled.</li></ul> <b>Default value:</b> true                                                                                                                                                                                                               |
| delay          | Yes       | Integer | <b>Definition:</b> Specifies the interval between health checks, in seconds.<br><b>Constraints:</b> N/A<br><b>Range:</b> 1 to 50<br><b>Default value:</b> N/A                                                                                                                                                                                                                                                                                                                                                                        |
| domain_name    | No        | String  | <b>Definition:</b> Specifies the domain name that HTTP requests are sent to during the health check.<br><b>Constraints:</b> This parameter is available only when <b>type</b> is set to <b>HTTP</b> or <b>HTTPS</b> .<br><b>Range:</b> The value can contain only digits, letters, hyphens (-), and periods (.) and must start with a digit or letter.<br><b>Default value:</b> The value is left blank by default, indicating that the virtual IP address of the load balancer is used as the destination address of HTTP requests. |

| Parameter        | Mandatory | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|------------------|-----------|---------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

| url_path     | String                                   | <b>Definition:</b> Specifies the HTTP request path for the health check. The value must start with a slash (/), and the default value is /.<br><b>Range:</b> The value can contain letters, digits, hyphens (-), slashes (/), periods (.), percentage signs (%), question marks (?), pound signs (#), ampersand signs (&), and the extended character set: _~!()*[]@\$^'+. |

| Parameter  | Type   | Description                                                                                                                                                                                                                                                                                                                             |
|------------|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| created_at | String | <b>Definition:</b> Specifies the creation time.<br><b>Range:</b> The value must be a UTC time in the format of <i>yyyy-MM-dd'T'HH:mm:ss'Z'</i> .<br>Note: This parameter will not be returned for resources associated with existing dedicated load balancers and for resources associated with existing and new shared load balancers. |
| updated_at | String | <b>Definition:</b> Specifies the update time.<br><b>Range:</b> The value must be a UTC time in the format of <i>yyyy-MM-dd'T'HH:mm:ss'Z'</i> .<br>Note: This parameter will not be returned for resources associated with existing dedicated load balancers and for resources associated with existing and new shared load balancers.   |

**Table 5-601** PoolRef

| Parameter | Type   | Description                                                                    |
|-----------|--------|--------------------------------------------------------------------------------|
| id        | String | <b>Definition:</b> Specifies the backend server group ID.<br><b>Range:</b> N/A |

## Example Requests

Configuring a health check for an HTTP backend server group

```
POST https://{ELB_Endpoint}/v3/99a3fff0d03c428eac3678da6a7d0f24/elb/healthmonitors
```

```
{
 "healthmonitor" : {
 "name" : "My Healthmonitor",
 "max_retries" : 3,
 "pool_id" : "488acc50-6bcf-423d-8f0a-0f4184f5b8a0",
 "type" : "HTTP",
 "timeout" : 30,
 "delay" : 1
 }
}
```

## Example Responses

**Status code: 201**

Successful request.

```
{
 "request_id": "0e837340-f1bd-4037-8f61-9923d0f0b19e",
 "healthmonitor": {
 "name": "elbv3_l2_2024_08_08_16_55_06",

## More

For SDK sample code of more programming languages, see the Sample Code tab in [API Explorer](#). SDK sample code can be automatically generated.

## Status Codes

| Status Code | Description         |
|-------------|---------------------|
| 201         | Successful request. |

## Error Codes

See [Error Codes](#).

## 5.13.2 Querying Health Checks

### Function

This API is used to query all health checks.

### Constraints

This API has the following constraints:

- Parameters **marker**, **limit**, and **page\_reverse** are used for pagination query.
- Parameters **marker** and **page\_reverse** take effect only when they are used together with parameter **limit**.

## Calling Method

For details, see [Calling APIs](#).

## URI

GET /v3/{project\_id}/elb/healthmonitors

**Table 5-602** Path Parameters

| Parameter  | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                |

## Request Parameters

**Table 5-604** Request header parameters

| Parameter    | Mandatory | Type   | Description                                                                                                                                      |
|--------------|-----------|--------|--------------------------------------------------------------------------------------------------------------------------------------------------|
| X-Auth-Token | Yes       | String | <b>Definition:</b> Specifies the token used for IAM authentication.<br><b>Constraints:</b> N/A<br><b>Range:</b> N/A<br><b>Default value:</b> N/A |

## Response Parameters

**Status code:** 200**Table 5-605** Response body parameters

| Parameter      | Type                                  | Description                                                                                                                                                                          |
|----------------|---------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| request_id     | String                                | <b>Definition:</b> Specifies the request ID.<br><b>Range:</b> The value is automatically generated, and can contain characters including digits, lowercase letters, and hyphens (-). |
| page_info      | <b>PageInfo</b> object                | <b>Definition:</b> Specifies the pagination information.                                                                                                                             |
| healthmonitors | Array of <b>HealthMonitor</b> objects | <b>Definition:</b> Specifies the health check.                                                                                                                                       |

**Table 5-606** PageInfo

| Parameter       | Type   | Description                                                                                                                                                                                                                          |
|-----------------|--------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| previous_marker | String | <b>Definition:</b> Specifies the ID of the first record in the pagination query result. If <b>page_reverse</b> is set to <b>true</b> , this parameter is used together to query resources on the previous page.<br><b>Range:</b> N/A |

| Parameter     | Type    | Description                                                                                                                                                         |
|---------------|---------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| next_marker   | String  | <b>Definition:</b> Specifies the ID of the last record in the pagination query result. It is usually used to query resources on the next page.<br><b>Range:</b> N/A |
| current_count | Integer | <b>Definition:</b> Specifies the number of records returned on the current page.<br><b>Range:</b> N/A                                                               |

**Table 5-607** HealthMonitor

| Parameter      | Type    | Description                                                                                                                                                                                                                                                                                          |
|----------------|---------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| admin_state_up | Boolean | <b>Definition:</b> Specifies the administrative status of the health check.<br><b>Range:</b> <ul style="list-style-type: none"><li>• <b>true:</b> The health check function is enabled.</li><li>• <b>false:</b> The health check function is disabled.</li></ul>                                     |
| delay          | Integer | <b>Definition:</b> Specifies the interval between health checks, in seconds.<br><b>Range:</b> 1 to 50                                                                                                                                                                                                |
| domain_name    | String  | <b>Definition:</b> Specifies the domain name that HTTP requests are sent to during the health check.<br><b>Range:</b> The value can contain only digits, letters, hyphens (-), and periods (.) and must start with a digit or letter.                                                                |
| expected_codes | String  | <b>Definition:</b> Specifies the expected HTTP status code.<br><b>Range:</b> <ul style="list-style-type: none"><li>• A specific value, for example, 200</li><li>• A list of values that are separated with commas (,), for example, 200, 202</li><li>• A value range, for example, 200-204</li></ul> |
| http_method    | String  | <b>Definition:</b> Specifies the HTTP method.<br><b>Range:</b> GET, HEAD, or POST                                                                                                                                                                                                                    |

| Parameter        | Type                                     | Description                                                                                                                                                                                   |
|------------------|------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| id               | String                                   | Specifies the health check ID.<br><b>Default value:</b> N/A                                                                                                                                   |
| max_retries      | Integer                                  | <b>Definition:</b> Specifies the number of consecutive health checks when the health check result of a backend server changes from <b>OFFLINE</b> to <b>ONLINE</b> .<br><b>Range:</b> 1 to 10 |
| max_retries_down | Integer                                  | <b>Definition:</b> Specifies the number of consecutive health checks when the health check result of a backend server changes from <b>ONLINE</b> to <b>OFFLINE</b> .<br><b>Range:</b> 1 to 10 |
| monitor_port     | Integer                                  | <b>Definition:</b> Specifies the health check port.<br><b>Range:</b> 1 to 65535, or <b>null</b> (the port of a backend server will be used by default).                                       |
| name             | String                                   | <b>Definition:</b> Specifies the health check name.<br><b>Range:</b> N/A                                                                                                                      |
| pools            | Array of <a href="#">PoolRef</a> objects | Specifies the IDs of the backend server groups for which the health check is configured. Only one ID will be returned.<br><b>Range:</b> N/A                                                   |
| project_id       | String                                   | <b>Definition:</b> Specifies the project ID.<br><b>Range:</b> N/A                                                                                                                             |
| timeout          | Integer                                  | <b>Definition:</b> Specifies the maximum time required for waiting for a response from the health check, in seconds.<br><b>Range:</b> N/A                                                     |
| type             | String                                   | <b>Definition:</b> Specifies the health check protocol.<br><b>Range:</b> The value can be <b>TCP</b> , <b>UDP_CONNECT</b> , <b>HTTP</b> , <b>HTTPS</b> , <b>GRPC</b> , or <b>TLS</b> .        |

| Parameter  | Type   | Description                                                                                                                                                                                                                                                                                                                                                                |
|------------|--------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| url_path   | String | <b>Definition:</b> Specifies the HTTP request path for the health check. The value must start with a slash (/), and the default value is /.<br><b>Range:</b> The value can contain letters, digits, hyphens (-), slashes (/), periods (.), percentage signs (%), question marks (?), pound signs (#), ampersand signs (&), and the extended character set: _~!()*[]@\$^'+. |
| created_at | String | <b>Definition:</b> Specifies the creation time.<br><b>Range:</b> The value must be a UTC time in the format of <i>yyyy-MM-dd'T'HH:mm:ss'Z'</i> .<br>Note: This parameter will not be returned for resources associated with existing dedicated load balancers and for resources associated with existing and new shared load balancers.                                    |
| updated_at | String | <b>Definition:</b> Specifies the update time.<br><b>Range:</b> The value must be a UTC time in the format of <i>yyyy-MM-dd'T'HH:mm:ss'Z'</i> .<br>Note: This parameter will not be returned for resources associated with existing dedicated load balancers and for resources associated with existing and new shared load balancers.                                      |

**Table 5-608** PoolRef

| Parameter | Type   | Description                                                                    |
|-----------|--------|--------------------------------------------------------------------------------|
| id        | String | <b>Definition:</b> Specifies the backend server group ID.<br><b>Range:</b> N/A |

## Example Requests

### Querying health checks

```
GET https://{ELB_Endpoint}/v3/99a3fff0d03c428eac3678da6a7d0f24/elb/healthmonitors
```

## Example Responses

**Status code: 200**

Successful request.

 } else {
 fmt.Println(err)
 }
}
```

## More

For SDK sample code of more programming languages, see the Sample Code tab in [API Explorer](#). SDK sample code can be automatically generated.

## Status Codes

| Status Code | Description         |
|-------------|---------------------|
| 200         | Successful request. |

## Error Codes

See [Error Codes](#).

## 5.13.3 Viewing the Details of a Health Check

### Function

This API is used to view the details of a health check.

### Calling Method

For details, see [Calling APIs](#).

### URI

GET /v3/{project\_id}/elb/healthmonitors/{healthmonitor\_id}

**Table 5-609** Path Parameters

| Parameter        | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                |
|------------------|-----------|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| project_id       | Yes       | String | <b>Definition:</b> Specifies the project ID. For details about how to obtain a project ID, see <a href="#">Obtaining a Project ID</a> .<br><b>Constraints:</b> N/A<br><b>Range:</b> The value can contain a maximum of 32 characters, including digits and lowercase letters.<br><b>Default value:</b> N/A |
| healthmonitor_id | Yes       | String | <b>Definition:</b> Specifies the health check ID.<br><b>Constraints:</b> N/A<br><b>Range:</b> N/A<br><b>Default value:</b> N/A                                                                                                                                                                             |

## Request Parameters

**Table 5-610** Request header parameters

| Parameter    | Mandatory | Type   | Description                                                                                                                                      |
|--------------|-----------|--------|--------------------------------------------------------------------------------------------------------------------------------------------------|
| X-Auth-Token | Yes       | String | <b>Definition:</b> Specifies the token used for IAM authentication.<br><b>Constraints:</b> N/A<br><b>Range:</b> N/A<br><b>Default value:</b> N/A |

## Response Parameters

**Status code: 200****Table 5-611** Response body parameters

| Parameter     | Type                        | Description                                                                                                                                                                          |
|---------------|-----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| request_id    | String                      | <b>Definition:</b> Specifies the request ID.<br><b>Range:</b> The value is automatically generated, and can contain characters including digits, lowercase letters, and hyphens (-). |
| healthmonitor | <b>HealthMonitor</b> object | <b>Definition:</b> Specifies the health check.                                                                                                                                       |

**Table 5-612** HealthMonitor

| Parameter      | Type    | Description                                                                                                                                                                                                                                                  |
|----------------|---------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| admin_state_up | Boolean | <b>Definition:</b> Specifies the administrative status of the health check.<br><b>Range:</b> <ul style="list-style-type: none"><li><b>true:</b> The health check function is enabled.</li><li><b>false:</b> The health check function is disabled.</li></ul> |
| delay          | Integer | <b>Definition:</b> Specifies the interval between health checks, in seconds.<br><b>Range:</b> 1 to 50                                                                                                                                                        |

| Parameter        | Type    | Description                                                                                                                                                                                                                                                                                          |
|------------------|---------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| domain_name      | String  | <b>Definition:</b> Specifies the domain name that HTTP requests are sent to during the health check.<br><b>Range:</b> The value can contain only digits, letters, hyphens (-), and periods (.) and must start with a digit or letter.                                                                |
| expected_codes   | String  | <b>Definition:</b> Specifies the expected HTTP status code.<br><b>Range:</b> <ul style="list-style-type: none"><li>• A specific value, for example, 200</li><li>• A list of values that are separated with commas (,), for example, 200, 202</li><li>• A value range, for example, 200-204</li></ul> |
| http_method      | String  | <b>Definition:</b> Specifies the HTTP method.<br><b>Range:</b> GET, HEAD, or POST                                                                                                                                                                                                                    |
| id               | String  | Specifies the health check ID.<br><b>Default value:</b> N/A                                                                                                                                                                                                                                          |
| max_retries      | Integer | <b>Definition:</b> Specifies the number of consecutive health checks when the health check result of a backend server changes from <b>OFFLINE</b> to <b>ONLINE</b> .<br><b>Range:</b> 1 to 10                                                                                                        |
| max_retries_down | Integer | <b>Definition:</b> Specifies the number of consecutive health checks when the health check result of a backend server changes from <b>ONLINE</b> to <b>OFFLINE</b> .<br><b>Range:</b> 1 to 10                                                                                                        |
| monitor_port     | Integer | <b>Definition:</b> Specifies the health check port.<br><b>Range:</b> 1 to 65535, or <b>null</b> (the port of a backend server will be used by default).                                                                                                                                              |
| name             | String  | <b>Definition:</b> Specifies the health check name.<br><b>Range:</b> N/A                                                                                                                                                                                                                             |

| Parameter  | Type                                     | Description                                                                                                                                                                                                                                                                                                                                                                             |
|------------|------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| pools      | Array of <a href="#">PoolRef</a> objects | Specifies the IDs of the backend server groups for which the health check is configured. Only one ID will be returned.<br><b>Range:</b> N/A                                                                                                                                                                                                                                             |
| project_id | String                                   | <b>Definition:</b> Specifies the project ID.<br><b>Range:</b> N/A                                                                                                                                                                                                                                                                                                                       |
| timeout    | Integer                                  | <b>Definition:</b> Specifies the maximum time required for waiting for a response from the health check, in seconds.<br><b>Range:</b> N/A                                                                                                                                                                                                                                               |
| type       | String                                   | <b>Definition:</b> Specifies the health check protocol.<br><b>Range:</b> The value can be <b>TCP</b> , <b>UDP_CONNECT</b> , <b>HTTP</b> , <b>HTTPS</b> , <b>GRPC</b> , or <b>TLS</b> .                                                                                                                                                                                                  |
| url_path   | String                                   | <b>Definition:</b> Specifies the HTTP request path for the health check. The value must start with a slash (/), and the default value is /.<br><b>Range:</b> The value can contain letters, digits, hyphens (-), slashes (/), periods (.), percentage signs (%), question marks (?), pound signs (#), ampersand signs (&), and the extended character set: <code>_~!()*[]@\$^'+.</code> |
| created_at | String                                   | <b>Definition:</b> Specifies the creation time.<br><b>Range:</b> The value must be a UTC time in the format of <code>yyyy-MM-dd'T'HH:mm:ss'Z'</code> .<br>Note: This parameter will not be returned for resources associated with existing dedicated load balancers and for resources associated with existing and new shared load balancers.                                           |

| Parameter  | Type   | Description                                                                                                                                                                                                                                                                                                                               |
|------------|--------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| updated_at | String | <b>Definition:</b> Specifies the update time.<br><b>Range:</b> The value must be a UTC time in the format of <i>yyyy-MM-dd'T'HH:mm:ss'Z'</i> .<br><br>Note: This parameter will not be returned for resources associated with existing dedicated load balancers and for resources associated with existing and new shared load balancers. |

Table 5-613 PoolRef

| Parameter | Type   | Description                                                                    |
|-----------|--------|--------------------------------------------------------------------------------|
| id        | String | <b>Definition:</b> Specifies the backend server group ID.<br><b>Range:</b> N/A |

Example Requests

Querying the details of a health check

```
GET https://{ELB_Endpoint}/v3/99a3fff0d03c428eac3678da6a7d0f24/elb/healthmonitors/c2b210b2-60c4-449d-91e2-9e9ea1dd7441
```

Example Responses

Status code: 200

Successful request.

```

## More

For SDK sample code of more programming languages, see the Sample Code tab in [API Explorer](#). SDK sample code can be automatically generated.

## Status Codes

| Status Code | Description         |
|-------------|---------------------|
| 200         | Successful request. |

## Error Codes

See [Error Codes](#).

## 5.13.4 Updating a Health Check

### Function

This API is used to update a health check.

### Constraints

The health check can be updated only when the provisioning status of the associated load balancer is **ACTIVE**.

### Calling Method

For details, see [Calling APIs](#).

### URI

PUT /v3/{project\_id}/elb/healthmonitors/{healthmonitor\_id}

**Table 5-614** Path Parameters

| Parameter        | Mandatory | Type   | Description                                                                                                                    |
|------------------|-----------|--------|--------------------------------------------------------------------------------------------------------------------------------|
| healthmonitor_id | Yes       | String | <b>Definition:</b> Specifies the health check ID.<br><b>Constraints:</b> N/A<br><b>Range:</b> N/A<br><b>Default value:</b> N/A |

| Parameter  | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                |
|------------|-----------|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| project_id | Yes       | String | <b>Definition:</b> Specifies the project ID. For details about how to obtain a project ID, see <a href="#">Obtaining a Project ID</a> .<br><b>Constraints:</b> N/A<br><b>Range:</b> The value can contain a maximum of 32 characters, including digits and lowercase letters.<br><b>Default value:</b> N/A |

## Request Parameters

**Table 5-615** Request header parameters

| Parameter    | Mandatory | Type   | Description                                                                                                                                      |
|--------------|-----------|--------|--------------------------------------------------------------------------------------------------------------------------------------------------|
| X-Auth-Token | Yes       | String | <b>Definition:</b> Specifies the token used for IAM authentication.<br><b>Constraints:</b> N/A<br><b>Range:</b> N/A<br><b>Default value:</b> N/A |

**Table 5-616** Request body parameters

| Parameter     | Mandatory | Type                                             | Description                                                               |
|---------------|-----------|--------------------------------------------------|---------------------------------------------------------------------------|
| healthmonitor | Yes       | <a href="#">UpdateHealthMonitorOption</a> object | <b>Definition:</b> Specifies the health check.<br><b>Constraints:</b> N/A |

**Table 5-617** UpdateHealthMonitorOption

| Parameter      | Mandatory | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|----------------|-----------|---------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| admin_state_up | No        | Boolean | <b>Definition:</b> Specifies the administrative status of the health check.<br><b>Constraints:</b> N/A<br><b>Range:</b> <ul style="list-style-type: none"><li>• <b>true:</b> The health check function is enabled.</li><li>• <b>false:</b> The health check function is disabled.</li></ul> <b>Default value:</b> N/A                                                                                                                                                                                                                                                                  |
| delay          | No        | Integer | <b>Definition:</b> Specifies the interval between health checks, in seconds.<br><b>Constraints:</b> N/A<br><b>Range:</b> 1 to 50<br><b>Default value:</b> N/A                                                                                                                                                                                                                                                                                                                                                                                                                          |
| domain_name    | No        | String  | <b>Definition:</b> Specifies the domain name that HTTP requests are sent to during the health check.<br><b>Constraints:</b> This parameter is available only when <b>type</b> is set to <b>HTTP</b> or <b>HTTPS</b> .<br><b>Range:</b> The value can contain only digits, letters, hyphens (-), and periods (.) and must start with a digit or letter. The value cannot be left blank, but can be specified as null or cannot be passed, indicating that the virtual IP address of the load balancer is used as the destination address of HTTP requests.<br><b>Default value:</b> N/A |

| Parameter        | Mandatory | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|------------------|-----------|---------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

## Response Parameters

**Status code:** 200

**Table 5-618** Response body parameters

| Parameter     | Type                        | Description                                                                                                                                                                          |
|---------------|-----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| request_id    | String                      | <b>Definition:</b> Specifies the request ID.<br><b>Range:</b> The value is automatically generated, and can contain characters including digits, lowercase letters, and hyphens (-). |
| healthmonitor | <b>HealthMonitor</b> object | <b>Definition:</b> Specifies the health check.                                                                                                                                       |

**Table 5-619** HealthMonitor

| Parameter      | Type    | Description                                                                                                                                                                                                                                                      |
|----------------|---------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| admin_state_up | Boolean | <b>Definition:</b> Specifies the administrative status of the health check.<br><b>Range:</b> <ul style="list-style-type: none"><li>• <b>true:</b> The health check function is enabled.</li><li>• <b>false:</b> The health check function is disabled.</li></ul> |
| delay          | Integer | <b>Definition:</b> Specifies the interval between health checks, in seconds.<br><b>Range:</b> 1 to 50                                                                                                                                                            |
| domain_name    | String  | <b>Definition:</b> Specifies the domain name that HTTP requests are sent to during the health check.<br><b>Range:</b> The value can contain only digits, letters, hyphens (-), and periods (.) and must start with a digit or letter.                            |

| Parameter        | Type                                     | Description                                                                                                                                                                                                                                                                                          |
|------------------|------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| expected_codes   | String                                   | <b>Definition:</b> Specifies the expected HTTP status code.<br><b>Range:</b> <ul style="list-style-type: none"><li>• A specific value, for example, 200</li><li>• A list of values that are separated with commas (,), for example, 200, 202</li><li>• A value range, for example, 200-204</li></ul> |
| http_method      | String                                   | <b>Definition:</b> Specifies the HTTP method.<br><b>Range:</b> GET, HEAD, or POST                                                                                                                                                                                                                    |
| id               | String                                   | Specifies the health check ID.<br><b>Default value:</b> N/A                                                                                                                                                                                                                                          |
| max_retries      | Integer                                  | <b>Definition:</b> Specifies the number of consecutive health checks when the health check result of a backend server changes from <b>OFFLINE</b> to <b>ONLINE</b> .<br><b>Range:</b> 1 to 10                                                                                                        |
| max_retries_down | Integer                                  | <b>Definition:</b> Specifies the number of consecutive health checks when the health check result of a backend server changes from <b>ONLINE</b> to <b>OFFLINE</b> .<br><b>Range:</b> 1 to 10                                                                                                        |
| monitor_port     | Integer                                  | <b>Definition:</b> Specifies the health check port.<br><b>Range:</b> 1 to 65535, or <b>null</b> (the port of a backend server will be used by default).                                                                                                                                              |
| name             | String                                   | <b>Definition:</b> Specifies the health check name.<br><b>Range:</b> N/A                                                                                                                                                                                                                             |
| pools            | Array of <a href="#">PoolRef</a> objects | Specifies the IDs of the backend server groups for which the health check is configured. Only one ID will be returned.<br><b>Range:</b> N/A                                                                                                                                                          |
| project_id       | String                                   | <b>Definition:</b> Specifies the project ID.<br><b>Range:</b> N/A                                                                                                                                                                                                                                    |

| Parameter  | Type    | Description                                                                                                                                                                                                                                                                                                                                                                |
|------------|---------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| timeout    | Integer | <b>Definition:</b> Specifies the maximum time required for waiting for a response from the health check, in seconds.<br><b>Range:</b> N/A                                                                                                                                                                                                                                  |
| type       | String  | <b>Definition:</b> Specifies the health check protocol.<br><b>Range:</b> The value can be <b>TCP</b> , <b>UDP_CONNECT</b> , <b>HTTP</b> , <b>HTTPS</b> , <b>GRPC</b> , or <b>TLS</b> .                                                                                                                                                                                     |
| url_path   | String  | <b>Definition:</b> Specifies the HTTP request path for the health check. The value must start with a slash (/), and the default value is /.<br><b>Range:</b> The value can contain letters, digits, hyphens (-), slashes (/), periods (.), percentage signs (%), question marks (?), pound signs (#), ampersand signs (&), and the extended character set: _~!()*[]@\$^'+. |
| created_at | String  | <b>Definition:</b> Specifies the creation time.<br><b>Range:</b> The value must be a UTC time in the format of <i>yyyy-MM-dd'T'HH:mm:ss'Z'</i> .<br>Note: This parameter will not be returned for resources associated with existing dedicated load balancers and for resources associated with existing and new shared load balancers.                                    |
| updated_at | String  | <b>Definition:</b> Specifies the update time.<br><b>Range:</b> The value must be a UTC time in the format of <i>yyyy-MM-dd'T'HH:mm:ss'Z'</i> .<br>Note: This parameter will not be returned for resources associated with existing dedicated load balancers and for resources associated with existing and new shared load balancers.                                      |

## More

For SDK sample code of more programming languages, see the Sample Code tab in [API Explorer](#). SDK sample code can be automatically generated.

## Status Codes

| Status Code | Description         |
|-------------|---------------------|
| 200         | Successful request. |

## Error Codes

See [Error Codes](#).

## 5.13.5 Deleting a Health Check

### Function

This API is used to delete a health check.

### Constraints

The health check can be deleted only when the provisioning status of the associated load balancer is **ACTIVE**.

### Calling Method

For details, see [Calling APIs](#).

URI

DELETE /v3/{project\_id}/elb/healthmonitors/{healthmonitor\_id}

Table 5-621 Path Parameters

| Parameter        | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                |

| redirect_pools_config                | Array of <a href="#">RedirectPoolsConfig</a> objects    | <b>Definition:</b> Specifies the backend server groups that the requests are forwarded to. This parameter takes effect only when <b>enhance_l7policy_enable</b> is set to <b>true</b> . If this parameter is specified and <b>enhance_l7policy_enable</b> is set to <b>false</b> , an error will be returned.                       |
| redirect_pools_sticky_session_config | <a href="#">RedirectPoolsStickySessionConfig</a> object | <b>Definition:</b> Specifies whether to enable sticky session for backend server groups configured for a forwarding policy. The load balancer generates a cookie after it receives a request from a client. All subsequent requests with the same cookie are routed to the same backend server group.                               |
| redirect_pools_extend_config         | <a href="#">RedirectPoolsExtendConfig</a> object        | <b>Definition:</b> Specifies the backend server group that requests are forwarded to.                                                                                                                                                                                                                                               |
| fixed_response_config                | <a href="#">FixedResponseConfig</a> object              | <b>Definition:</b> Specifies the configuration of the page that will be returned.                                                                                                                                                                                                                                                   |
| created_at                           | String                                                  | <b>Definition:</b> Specifies the creation time.<br><b>Range:</b> The value must be a UTC time in the <i>yyyy-MM-dd'T'HH:mm:ss'Z'</i> format.<br>Note: This parameter will not be returned for resources associated with existing dedicated load balancers and for resources associated with existing and new shared load balancers. |

| Parameter             | Type   | Description                                                                                                                                                                                                                                                                                                                           |
|-----------------------|--------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| updated_at            | String | <b>Definition:</b> Specifies the update time.<br><b>Range:</b> The value must be a UTC time in the <i>yyyy-MM-dd'T'HH:mm:ss'Z'</i> format.<br><br>Note: This parameter will not be returned for resources associated with existing dedicated load balancers and for resources associated with existing and new shared load balancers. |
| enterprise_project_id | String | <b>Definition:</b> Specifies the enterprise project ID.<br><b>Range:</b> N/A                                                                                                                                                                                                                                                          |

**Table 5-644** RuleRef

| Parameter | Type   | Description                                                               |
|-----------|--------|---------------------------------------------------------------------------|
| id        | String | <b>Definition:</b> Specifies the forwarding rule ID.<br><b>Range:</b> N/A |

**Table 5-645** RedirectUrlConfig

| Parameter | Type   | Description                                                                                                                                                                                                                                |
|-----------|--------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| protocol  | String | <b>Definition:</b> Specifies the protocol for redirection.<br><b>Range:</b> <ul style="list-style-type: none"><li>• HTTP</li><li>• HTTPS</li><li>• <b>\${protocol}</b>: indicates that the protocol in the request will be used.</li></ul> |
| host      | String | <b>Definition:</b> Specifies the name of the host that requests are redirected to.<br><b>Range:</b> The value can contain only letters, digits, hyphens (-), and periods (.) and must start with a letter or digit.                        |
| port      | String | <b>Definition:</b> Specifies the port that requests are redirected to.<br><b>Range:</b> N/A                                                                                                                                                |

| Parameter             | Type                                       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-----------------------|--------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| path                  | String                                     | <b>Definition:</b> Specifies the path that requests are redirected to.<br><b>Range:</b> The value can contain only letters, digits, and special characters: <code>_~';@^-%#&amp;\$.*+?;=!: \\V()[]{} </code> and must start with a slash (/).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| query                 | String                                     | <b>Definition:</b> Specifies the query string set in the URL for redirection. The following is an example:<br>In the URL <b>https://www.example.com:8080/elb?type=loadbalancer</b> , if this parameter is set to <b>`\${query}&amp;name=my_name`</b> , the URL will be redirected to <b>https://www.example.com:8080/elb?type=loadbalancer&amp;name=my_name</b> . In the example, <b>`\${query}`</b> indicates <b>type=loadbalancer</b> .<br><b>Range:</b> The value can contain only letters, digits, and the special characters: <code>!\$&amp;'()*+,-./:;=?@^_` </code> . The letters are case-sensitive. <code>\$1</code> , <code>\$2</code> , <code>\$3</code> , and all the way to <code>\$9</code> match the wildcard asterisk (*) in the requested URL. |
| status_code           | String                                     | <b>Definition:</b> Specifies the status code returned after the requests are redirected.<br><b>Range:</b> <ul style="list-style-type: none"><li>• 301</li><li>• 302</li><li>• 303</li><li>• 307</li><li>• 308</li></ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| insert_headers_config | <a href="#">InsertHeadersConfig</a> object | <b>Definition:</b> Specifies the headers you want to write into the request that matches the forwarding rule.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| remove_headers_config | <a href="#">RemoveHeadersConfig</a> object | <b>Definition:</b> Specifies the headers you want to remove from the request that matches the forwarding rule.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

**Table 5-646** RedirectPoolsConfig

| Parameter | Type    | Description                                                                                                                                                                                                                                                                                                                                          |
|-----------|---------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| pool_id   | String  | <b>Definition:</b> Specifies the backend server group ID.<br><b>Range:</b> N/A                                                                                                                                                                                                                                                                       |
| weight    | Integer | <b>Definition:</b> Specifies the weight of the backend server group. Requests are routed to backend server groups based on their weights. The larger the weight is, the higher proportion of requests the backend server group receives. If the weight is set to 0, the backend server group will not accept new requests.<br><b>Range:</b> 0 to 100 |

**Table 5-647** RedirectPoolsStickySessionConfig

| Parameter | Type    | Description                                                                                                                                                                                                    |
|-----------|---------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| enable    | Boolean | <b>Definition:</b> Specifies whether to enable sticky session for backend server groups configured in a forwarding policy.<br><b>Default value:</b> <b>false</b> , indicating that sticky session is disabled. |
| timeout   | Integer | <b>Definition:</b> Specifies the stickiness duration, in minutes.<br><b>Range:</b> 1 to 1440                                                                                                                   |

**Table 5-648** RedirectPoolsExtendConfig

| Parameter          | Type                                    | Description                                                                                                                                                                                      |
|--------------------|-----------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| rewrite_url_enable | Boolean                                 | <b>Definition:</b> Specifies whether to set <b>rewrite_url_enable</b> to <b>true</b> .<br><b>Range:</b> The value can be <b>true</b> (enable this option) or <b>false</b> (disable this option). |
| rewrite_url_config | <a href="#">RewriteUrlConfig</a> object | <b>Definition:</b> Specifies the URL for the backend server group that requests are forwarded to.                                                                                                |

| Parameter             | Type                                       | Description                                                                                                    |
|-----------------------|--------------------------------------------|----------------------------------------------------------------------------------------------------------------|
| insert_headers_config | <a href="#">InsertHeadersConfig</a> object | <b>Definition:</b> Specifies the headers you want to write into the request that matches the forwarding rule.  |
| remove_headers_config | <a href="#">RemoveHeadersConfig</a> object | <b>Definition:</b> Specifies the headers you want to remove from the request that matches the forwarding rule. |
| traffic_limit_config  | <a href="#">TrafficLimitConfig</a> object  | <b>Definition:</b> Specifies how requests are limited.                                                         |
| cors_config           | <a href="#">CorsConfig</a> object          | <b>Definition:</b> Specifies the CORS configurations.                                                          |
| traffic_mirror_config | <a href="#">TrafficMirrorConfig</a> object | <b>Definition:</b> Specifies the traffic mirroring configuration.                                              |

**Table 5-649** RewriteUrlConfig

| Parameter | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|-----------|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| host      | String | <b>Definition:</b> Specifies the domain name of the host that requests are redirected to.<br><br><b>Range:</b> The value can contain letters, digits, hyphens (-), and periods (.), and must start with a letter or digit.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| path      | String | <b>Definition:</b> Specifies the path that requests are redirected to. \$1, \$2, \$3, and all the way to \$9 match the wildcard asterisk (*) in the request URL. If the number of regular expression match groups is less than the specified number, <b>\${path}</b> is empty. If the dollar sign (\$) is followed by a letter, the matching result is empty until the next special character appears, for example, <b>\$abc#123</b> , and the matching result is <b>#123</b> . If the dollar sign (\$) is followed by a special character, for example, <b>\$#</b> , the matching result is <b>\$#</b> .<br><br><b>Range:</b> The value must start with a slash (/) and can contain only letters, digits, and special characters: _~';@^-%#&\$.+?,=!: /() |

| Parameter | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-----------|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| query     | String | <b>Definition:</b> Specifies the query string set in the URL for redirection. \$1, \$2, \$3, and all the way to \$9 match the wildcard asterisk (*) in the request URL. If the number of regular expression match groups is less than the specified number, <b>\${path}</b> is empty. If the dollar sign (\$) is followed by a letter, the matching result is empty until the next special character appears, for example, <b>\$abc#123</b> , and the matching result is <b>#123</b> . If the dollar sign (\$) is followed by a special character, for example, <b>\$#</b> , the matching result is <b>\$#</b> .<br><b>Range:</b> The value can contain only letters, digits, and the special characters: !\$&'()+,-./:;=?@^_`. The letters are case-sensitive. |

**Table 5-650** CorsConfig

| Parameter     | Type             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|---------------|------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| allow_origin  | Array of strings | <b>Definition:</b> Specifies the origins that are allowed to access cross-origin resources through a browser. The origin can be a wildcard (*) or one or more URLs.<br><b>Constraints:</b> <ul style="list-style-type: none"><li>Each URL must start with <b>http://</b> or <b>https://</b>, followed by a valid domain name or level-1 wildcard domain name, for example, <b>http://*.test.abc.example.com</b>.</li><li>It is optional to include a port number (ranging from 1 to 65535) in the URL.</li></ul> |
| allow_methods | Array of strings | <b>Definition:</b> Specifies the HTTP methods that the specified URLs can use to access cross-origin resources.<br><b>Range:</b> N/A                                                                                                                                                                                                                                                                                                                                                                             |
| allow_headers | Array of strings | <b>Definition:</b> Specifies the request headers that can be carried in CORS requests.<br><b>Range:</b> N/A                                                                                                                                                                                                                                                                                                                                                                                                      |

| Parameter         | Type             | Description                                                                                                                                                                                                                               |
|-------------------|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| expose_headers    | Array of strings | <b>Definition:</b> Specifies the headers that can be exposed.<br><b>Range:</b> N/A                                                                                                                                                        |
| allow_credentials | Boolean          | <b>Definition:</b> Specifies whether to allow credentials in CORS requests.<br><b>Range:</b> <ul style="list-style-type: none"><li>• <b>true:</b> Credentials are allowed.</li><li>• <b>false:</b> Credentials are not allowed.</li></ul> |
| max_age           | Long             | <b>Definition:</b> Specifies the maximum duration a preflight request can be cached, in seconds.<br><b>Range:</b> -1 to 172800                                                                                                            |

**Table 5-651** TrafficMirrorConfig

| Parameter                  | Type             | Description                                                                                                         |
|----------------------------|------------------|---------------------------------------------------------------------------------------------------------------------|
| target_ids                 | Array of strings | <b>Definition:</b> Specifies the IDs of the backend server groups that traffic is mirrored to.<br><b>Range:</b> N/A |
| mirror_request_body_enable | Boolean          | Specifies whether to include the mirror request body. The default value is <b>true</b> .<br><b>Range:</b> N/A       |

**Table 5-652** FixedResponseConfig

| Parameter    | Type   | Description                                                                                                                                                                                                                                    |
|--------------|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| status_code  | String | <b>Definition:</b> Specifies the HTTP status code.<br><b>Range:</b> 200-299, 400-499, 500-599                                                                                                                                                  |
| content_type | String | <b>Definition:</b> Specifies the format of the returned body.<br><b>Range:</b> <ul style="list-style-type: none"><li>• text/plain</li><li>• text/css</li><li>• text/html</li><li>• application/javascript</li><li>• application/json</li></ul> |

| Parameter             | Type                                       | Description                                                                                                    |
|-----------------------|--------------------------------------------|----------------------------------------------------------------------------------------------------------------|
| message_body          | String                                     | <b>Definition:</b> Specifies the content of the response message body.<br><b>Range:</b> N/A                    |
| insert_headers_config | <a href="#">InsertHeadersConfig</a> object | <b>Definition:</b> Specifies the headers you want to write into the request that matches the forwarding rule.  |
| remove_headers_config | <a href="#">RemoveHeadersConfig</a> object | <b>Definition:</b> Specifies the headers you want to remove from the request that matches the forwarding rule. |
| traffic_limit_config  | <a href="#">TrafficLimitConfig</a> object  | <b>Definition:</b> Specifies how requests are limited.                                                         |

**Table 5-653** InsertHeadersConfig

| Parameter | Type                                                | Description                                                                                               |
|-----------|-----------------------------------------------------|-----------------------------------------------------------------------------------------------------------|
| configs   | Array of <a href="#">InsertHeaderConfig</a> objects | <b>Definition:</b> Specifies the request and response headers you want to add.<br><b>Constraints:</b> N/A |

**Table 5-654** InsertHeaderConfig

| Parameter | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-----------|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| key       | String | <b>Definition:</b> Specifies the key of the request and response headers.<br><b>Constraints:</b> The following cannot be used as a key.<br>connection, upgrade, content-length, transfer-encoding, keep-alive, te, host, cookie, remoteip, authority, x-forwarded-host, x-forwarded-for, x-forwarded-for-port, x-forwarded-tls-certificate-id, x-forwarded-tls-protocol, x-forwarded-tls-cipher, x-forwarded-elb-ip, x-forwarded-port, x-forwarded-elb-id, x-forwarded-elb-vip, x-real-ip, x-forwarded-proto, x-nuwa-trace-ne-in, or x-nuwa-trace-ne-out<br><b>Range:</b> The value can contain 1 to 40 characters, including letters (case-insensitive), digits, hyphens (-), and underscores (_). |

## More

For SDK sample code of more programming languages, see the Sample Code tab in [API Explorer](#). SDK sample code can be automatically generated.

## Status Codes

| Status Code | Description         |
|-------------|---------------------|
| 201         | Successful request. |

## Error Codes

See [Error Codes](#).

## 5.14.2 Querying Forwarding Policies

### Function

This API is used to query all forwarding policies.

## Constraints

This API has the following constraints:

- Parameters **marker**, **limit**, and **page\_reverse** are used for pagination query.
- Parameters **marker** and **page\_reverse** take effect only when they are used together with parameter **limit**.

## Calling Method

For details, see [Calling APIs](#).

## URI

GET /v3/{project\_id}/elb/l7policies

**Table 5-658** Path Parameters

| Parameter  | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                |

**Table 5-659** Query Parameters

| Parameter    | Mandatory | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|--------------|-----------|---------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| marker       | No        | String  | <b>Definition:</b> Specifies the ID of the last record on the previous page.<br><b>Constraints:</b> <ul style="list-style-type: none"><li>• This parameter must be used together with <b>limit</b>.</li><li>• If the parameter is not specified, only resources on the first page are queried.</li><li>• This parameter cannot be left blank or set to an invalid ID.</li></ul> <b>Range:</b> N/A<br><b>Default value:</b> N/A                                                                                                                                                               |
| limit        | No        | Integer | <b>Definition:</b> Specifies the number of records returned on each page.<br><b>Constraints:</b> N/A<br><b>Range:</b> 0 to 2000<br><b>Default value:</b> 2000                                                                                                                                                                                                                                                                                                                                                                                                                                |
| page_reverse | No        | Boolean | <b>Definition:</b> Specifies whether to use reverse query.<br><b>Constraints:</b> <ul style="list-style-type: none"><li>• This parameter must be used together with <b>limit</b>.</li><li>• If <b>page_reverse</b> is set to <b>true</b> and you want to query the resources on the previous page, set the value of <b>marker</b> to the value of <b>previous_marker</b>.</li></ul> <b>Range:</b> <ul style="list-style-type: none"><li>• <b>true:</b> Query resources on the previous page.</li><li>• <b>false:</b> Query resources on the next page.</li></ul> <b>Default value:</b> false |

| Parameter             | Mandatory | Type             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|-----------------------|-----------|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| enterprise_project_id | No        | Array of strings | <p><b>Definition:</b> Specifies the ID of the enterprise project.</p> <p>Multiple values can be used for query in the format of: <i>enterprise_project_id=xxx&amp;enterprise_project_id=xxx</i>.</p> <p><b>Constraints:</b></p> <ul style="list-style-type: none"><li>• If <b>enterprise_project_id</b> is not specified, resources in all enterprise projects are queried by default. Fine-grained authorization is performed. The <b>elb:l7policies:list</b> permission must be assigned to the user group.</li><li>• If <b>enterprise_project_id</b> is specified, the value can be a specific enterprise project ID or <b>all_granted_eps</b>. If the value is a specific enterprise project ID, only resources in the enterprise project are queried. If the value is <b>all_granted_eps</b>, resources in the enterprise projects with the <b>elb:l7policies:list</b> permission are queried.</li></ul> <p><b>Range:</b> N/A</p> <p><b>Default value:</b> N/A</p> |
| id                    | No        | Array of strings | <p><b>Definition:</b> Specifies the forwarding policy ID.</p> <p>Multiple IDs can be used for query in the format of <i>id=xxx&amp;id=xxx</i>.</p> <p><b>Constraints:</b> N/A</p> <p><b>Range:</b> N/A</p> <p><b>Default value:</b> N/A</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| Parameter      | Mandatory | Type             | Description                                                                                                                                                                                                                                                                          |
|----------------|-----------|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| name           | No        | Array of strings | <b>Definition:</b> Specifies the forwarding policy name.<br>Multiple names can be used for query in the format of <i>name=xxx&amp;name=xxx</i> .<br><b>Constraints:</b> N/A<br><b>Range:</b> N/A<br><b>Default value:</b> N/A                                                        |
| description    | No        | Array of strings | <b>Definition:</b> Provides supplementary information about the forwarding policy.<br>Multiple descriptions can be used for query in the format of <i>description=xxx&amp;description=xxx</i> .<br><b>Constraints:</b> N/A<br><b>Range:</b> N/A<br><b>Default value:</b> N/A         |
| admin_state_up | No        | Boolean          | <b>Definition:</b> Specifies the administrative status of the forwarding policy.<br><b>Constraints:</b> N/A<br><b>Range:</b> N/A<br><b>Default value:</b> N/A                                                                                                                        |
| listener_id    | No        | Array of strings | <b>Definition:</b> Specifies the ID of the listener with which the forwarding policy is associated.<br>Multiple IDs can be used for query in the format of <i>listener_id=xxx&amp;listener_id=xxx</i> .<br><b>Constraints:</b> N/A<br><b>Range:</b> N/A<br><b>Default value:</b> N/A |

| Parameter    | Mandatory | Type              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|--------------|-----------|-------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| position     | No        | Array of integers | <b>Definition:</b> Specifies the priority of the forwarding policy.<br>Multiple priorities can be used for query in the format of <i>position=xxx&amp;position=xxx</i> .<br><b>Constraints:</b> N/A<br><b>Range:</b> N/A<br><b>Default value:</b> N/A                                                                                                                                                                                                                                                                                                                                                       |
| action       | No        | Array of strings  | <b>Definition:</b> Specifies the action of the forwarding policy.<br>Multiple actions can be used for query in the format of <i>action=xxx&amp;action=xxx</i> .<br><b>Constraints:</b> N/A<br><b>Range:</b> <ul style="list-style-type: none"><li>● <b>REDIRECT_TO_POOL:</b> Requests are forwarded to another backend server group.</li><li>● <b>REDIRECT_TO_LISTENER:</b> Requests are redirected to an HTTPS listener.</li><li>● <b>REDIRECT_TO_URL:</b> Requests are redirected to another URL.</li><li>● <b>FIXED_RESPONSE:</b> A fixed response body is returned.</li></ul> <b>Default value:</b> N/A |
| redirect_url | No        | Array of strings  | <b>Definition:</b> Specifies the URL to which requests will be forwarded.<br>Multiple URLs can be used for query in the format of <i>redirect_url=xxx&amp;redirect_url=xx</i> .<br><b>Constraints:</b> N/A<br><b>Range:</b> N/A<br><b>Default value:</b> N/A<br>This parameter is unsupported. Please do not use it.                                                                                                                                                                                                                                                                                        |

| Parameter            | Mandatory | Type             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|----------------------|-----------|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| redirect_pool_id     | No        | Array of strings | <b>Definition:</b> Specifies the ID of the backend server group to which requests will be forwarded.<br><br>Multiple IDs can be used for query in the format of <i>redirect_pool_id=xxx&amp;redirect_pool_id=xxx</i> .<br><b>Constraints:</b> N/A<br><b>Range:</b> N/A<br><b>Default value:</b> N/A                                                                                                                                                                                                                                         |

| provisioning_status  | No        | Array of strings | <b>Definition:</b> Specifies the provisioning status of the forwarding policy.<br><br>Multiple provisioning statuses can be used for query in the format of <i>provisioning_status=xxx&amp;provisioning_status=xxx</i> .<br><b>Constraints:</b> N/A<br><b>Range:</b> <ul style="list-style-type: none"><li>● <b>ACTIVE:</b> The forwarding policy is provisioned successfully.</li><li>● <b>ERROR:</b> The forwarding policy has the same rule as another forwarding policy added to the same listener.</li></ul> <b>Default value:</b> N/A |

| Parameter         | Mandatory | Type              | Description                                                                                                                                                                                                                                                                                                                                                  |
|-------------------|-----------|-------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| display_all_rules | No        | Boolean           | <b>Definition:</b> Specifies whether to display details about the forwarding rules in the forwarding policy.<br><b>Constraints:</b> N/A<br><b>Range:</b> <ul style="list-style-type: none"><li>• <b>true:</b> Details about the forwarding rules are displayed.</li><li>• <b>false:</b> Only the rule IDs are displayed.</li></ul> <b>Default value:</b> N/A |
| priority          | No        | Array of integers | <b>Definition:</b> Specifies the priority of the forwarding policy. A smaller value indicates a higher priority.<br>Multiple priorities can be used for query in the format of <i>priority=xxx&amp;priority=xxx</i> .<br><b>Constraints:</b> N/A<br><b>Range:</b> N/A<br><b>Default value:</b> N/A                                                           |

## Request Parameters

**Table 5-660** Request header parameters

| Parameter    | Mandatory | Type   | Description                                                                                                                                      |
|--------------|-----------|--------|--------------------------------------------------------------------------------------------------------------------------------------------------|
| X-Auth-Token | Yes       | String | <b>Definition:</b> Specifies the token used for IAM authentication.<br><b>Constraints:</b> N/A<br><b>Range:</b> N/A<br><b>Default value:</b> N/A |

## Response Parameters

**Status code:** 200

**Table 5-661** Response body parameters

| Parameter  | Type                                      | Description                                                                                                                                                                          |
|------------|-------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| request_id | String                                    | <b>Definition:</b> Specifies the request ID.<br><b>Range:</b> The value is automatically generated, and can contain characters including digits, lowercase letters, and hyphens (-). |
| page_info  | <a href="#">PageInfo</a> object           | <b>Definition:</b> Specifies the pagination information.                                                                                                                             |
| l7policies | Array of <a href="#">L7Policy</a> objects | <b>Definition:</b> Lists the forwarding policies.                                                                                                                                    |

**Table 5-662** PageInfo

| Parameter       | Type    | Description                                                                                                                                                                                                                          |
|-----------------|---------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| previous_marker | String  | <b>Definition:</b> Specifies the ID of the first record in the pagination query result. If <b>page_reverse</b> is set to <b>true</b> , this parameter is used together to query resources on the previous page.<br><b>Range:</b> N/A |
| next_marker     | String  | <b>Definition:</b> Specifies the ID of the last record in the pagination query result. It is usually used to query resources on the next page.<br><b>Range:</b> N/A                                                                  |
| current_count   | Integer | <b>Definition:</b> Specifies the number of records returned on the current page.<br><b>Range:</b> N/A                                                                                                                                |

**Table 5-663** L7Policy

| Parameter      | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|----------------|---------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| action         | String  | <b>Definition:</b> Specifies the action of the forwarding policy.<br><b>Range:</b> <ul style="list-style-type: none"><li>• <b>REDIRECT_TO_POOL:</b> Requests are forwarded to another backend server group.</li><li>• <b>REDIRECT_TO_LISTENER:</b> Requests are redirected to an HTTPS listener.</li><li>• <b>REDIRECT_TO_URL:</b> Requests are redirected to another URL.</li><li>• <b>FIXED_RESPONSE:</b> A fixed response body is returned.</li></ul> |
| admin_state_up | Boolean | <b>Definition:</b> Specifies the administrative status of the forwarding policy.<br><b>Range:</b> The value can only be <b>true</b> .                                                                                                                                                                                                                                                                                                                    |
| description    | String  | <b>Definition:</b> Provides supplementary information about the forwarding policy.<br><b>Range:</b> N/A                                                                                                                                                                                                                                                                                                                                                  |
| id             | String  | <b>Definition:</b> Specifies the forwarding policy ID.<br><b>Range:</b> N/A                                                                                                                                                                                                                                                                                                                                                                              |
| listener_id    | String  | <b>Definition:</b> Specifies the ID of the listener with which the forwarding policy is associated.<br><b>Range:</b> N/A                                                                                                                                                                                                                                                                                                                                 |
| name           | String  | <b>Definition:</b> Specifies the forwarding policy name.<br><b>Range:</b> N/A                                                                                                                                                                                                                                                                                                                                                                            |
| position       | Integer | <b>Definition:</b> Specifies the priority of the forwarding policy. The priority cannot be updated.<br><br>This parameter is unsupported. | Parameter                            | Type                                                    | Description                                                                                                                                                                                                                                                                                                                             |
|--------------------------------------|---------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| redirect_pools_config                | Array of <a href="#">RedirectPoolsConfig</a> objects    | <b>Definition:</b> Specifies the backend server groups that the requests are forwarded to. This parameter takes effect only when <b>enhance_l7policy_enable</b> is set to <b>true</b> . If this parameter is specified and <b>enhance_l7policy_enable</b> is set to <b>false</b> , an error will be returned.                           |
| redirect_pools_sticky_session_config | <a href="#">RedirectPoolsStickySessionConfig</a> object | <b>Definition:</b> Specifies whether to enable sticky session for backend server groups configured for a forwarding policy. The load balancer generates a cookie after it receives a request from a client. All subsequent requests with the same cookie are routed to the same backend server group.                                   |
| redirect_pools_extend_config         | <a href="#">RedirectPoolsExtendConfig</a> object        | <b>Definition:</b> Specifies the backend server group that requests are forwarded to.                                                                                                                                                                                                                                                   |
| fixed_response_config                | <a href="#">FixedResponseConfig</a> object              | <b>Definition:</b> Specifies the configuration of the page that will be returned.                                                                                                                                                                                                                                                       |
| created_at                           | String                                                  | <b>Definition:</b> Specifies the creation time.<br><b>Range:</b> The value must be a UTC time in the <i>yyyy-MM-dd'T'HH:mm:ss'Z'</i> format.<br><br>Note: This parameter will not be returned for resources associated with existing dedicated load balancers and for resources associated with existing and new shared load balancers. |
| updated_at                           | String                                                  | <b>Definition:</b> Specifies the update time.<br><b>Range:</b> The value must be a UTC time in the <i>yyyy-MM-dd'T'HH:mm:ss'Z'</i> format.<br><br>Note: This parameter will not be returned for resources associated with existing dedicated load balancers and for resources associated with existing and new shared load balancers.   |
| enterprise_project_id                | String                                                  | <b>Definition:</b> Specifies the enterprise project ID.<br><b>Range:</b> N/A                                                                                                                                                                                                                                                            |

**Table 5-664** RuleRef

| Parameter | Type   | Description                                                               |
|-----------|--------|---------------------------------------------------------------------------|
| id        | String | <b>Definition:</b> Specifies the forwarding rule ID.<br><b>Range:</b> N/A |

**Table 5-665** RedirectUrlConfig

| Parameter | Type   | Description                                                                                                                                                                                                                                     |
|-----------|--------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| protocol  | String | <b>Definition:</b> Specifies the protocol for redirection.<br><b>Range:</b> <ul style="list-style-type: none"><li>• HTTP</li><li>• HTTPS</li><li>• <b>\${protocol}</b>: indicates that the protocol in the request will be used.</li></ul>      |
| host      | String | <b>Definition:</b> Specifies the name of the host that requests are redirected to.<br><b>Range:</b> The value can contain only letters, digits, hyphens (-), and periods (.) and must start with a letter or digit.                             |
| port      | String | <b>Definition:</b> Specifies the port that requests are redirected to.<br><b>Range:</b> N/A                                                                                                                                                     |
| path      | String | <b>Definition:</b> Specifies the path that requests are redirected to.<br><b>Range:</b> The value can contain only letters, digits, and special characters: <code>_~!';@^-%#&amp;\$. *+?,=!: \/() [] {}</code> and must start with a slash (/). |

| Parameter             | Type                                       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|-----------------------|--------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| query                 | String                                     | <b>Definition:</b> Specifies the query string set in the URL for redirection. The following is an example:<br><br>In the URL <b>https://www.example.com:8080/elb?type=loadbalancer</b> , if this parameter is set to <b>\${query}&amp;name=my_name</b> , the URL will be redirected to <b>https://www.example.com:8080/elb?type=loadbalancer&amp;name=my_name</b> . In the example, <b>\${query}</b> indicates <b>type=loadbalancer</b> .<br><br><b>Range:</b> The value can contain only letters, digits, and the special characters: <b>!\$&amp;'()*+,-./:;=?@^_`</b> . The letters are case-sensitive. <b>\$1</b> , <b>\$2</b> , <b>\$3</b> , and all the way to <b>\$9</b> match the wildcard asterisk ( <b>*</b> ) in the requested URL. |
| status_code           | String                                     | <b>Definition:</b> Specifies the status code returned after the requests are redirected.<br><br><b>Range:</b> <ul style="list-style-type: none"><li>• <b>301</b></li><li>• <b>302</b></li><li>• <b>303</b></li><li>• <b>307</b></li><li>• <b>308</b></li></ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| insert_headers_config | <a href="#">InsertHeadersConfig</a> object | <b>Definition:</b> Specifies the headers you want to write into the request that matches the forwarding rule.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| remove_headers_config | <a href="#">RemoveHeadersConfig</a> object | <b>Definition:</b> Specifies the headers you want to remove from the request that matches the forwarding rule.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

**Table 5-666** RedirectPoolsConfig

| Parameter | Type   | Description                                                                        |
|-----------|--------|------------------------------------------------------------------------------------|
| pool_id   | String | <b>Definition:</b> Specifies the backend server group ID.<br><br><b>Range:</b> N/A |

| Parameter | Type    | Description                                                                                                                                                                                                                                                                                                                                          |
|-----------|---------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| weight    | Integer | <b>Definition:</b> Specifies the weight of the backend server group. Requests are routed to backend server groups based on their weights. The larger the weight is, the higher proportion of requests the backend server group receives. If the weight is set to 0, the backend server group will not accept new requests.<br><b>Range:</b> 0 to 100 |

**Table 5-667** RedirectPoolsStickySessionConfig

| Parameter | Type    | Description                                                                                                                                                                                                    |
|-----------|---------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| enable    | Boolean | <b>Definition:</b> Specifies whether to enable sticky session for backend server groups configured in a forwarding policy.<br><b>Default value:</b> <b>false</b> , indicating that sticky session is disabled. |
| timeout   | Integer | <b>Definition:</b> Specifies the stickiness duration, in minutes.<br><b>Range:</b> 1 to 1440                                                                                                                   |

**Table 5-668** RedirectPoolsExtendConfig

| Parameter             | Type                                       | Description                                                                                                                                                                                      |
|-----------------------|--------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| rewrite_url_enable    | Boolean                                    | <b>Definition:</b> Specifies whether to set <b>rewrite_url_enable</b> to <b>true</b> .<br><b>Range:</b> The value can be <b>true</b> (enable this option) or <b>false</b> (disable this option). |
| rewrite_url_config    | <a href="#">RewriteUrlConfig</a> object    | <b>Definition:</b> Specifies the URL for the backend server group that requests are forwarded to.                                                                                                |
| insert_headers_config | <a href="#">InsertHeadersConfig</a> object | <b>Definition:</b> Specifies the headers you want to write into the request that matches the forwarding rule.                                                                                    |
| remove_headers_config | <a href="#">RemoveHeadersConfig</a> object | <b>Definition:</b> Specifies the headers you want to remove from the request that matches the forwarding rule.                                                                                   |

| Parameter             | Type                                       | Description                                                       |
|-----------------------|--------------------------------------------|-------------------------------------------------------------------|
| traffic_limit_config  | <a href="#">TrafficLimitConfig</a> object  | <b>Definition:</b> Specifies how requests are limited.            |
| cors_config           | <a href="#">CorsConfig</a> object          | <b>Definition:</b> Specifies the CORS configurations.             |
| traffic_mirror_config | <a href="#">TrafficMirrorConfig</a> object | <b>Definition:</b> Specifies the traffic mirroring configuration. |

**Table 5-669** RewriteUrlConfig

| Parameter | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|-----------|--------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| host      | String | <b>Definition:</b> Specifies the domain name of the host that requests are redirected to.<br><b>Range:</b> The value can contain letters, digits, hyphens (-), and periods (.), and must start with a letter or digit.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| path      | String | <b>Definition:</b> Specifies the path that requests are redirected to. \$1, \$2, \$3, and all the way to \$9 match the wildcard asterisk (*) in the request URL. If the number of regular expression match groups is less than the specified number, <b>\${path}</b> is empty. If the dollar sign (\$) is followed by a letter, the matching result is empty until the next special character appears, for example, <b>\$abc#123</b> , and the matching result is <b>#123</b> . If the dollar sign (\$) is followed by a special character, for example, <b>\$#</b> , the matching result is <b>\$#</b> .<br><b>Range:</b> The value must start with a slash (/) and can contain only letters, digits, and special characters: _~';@^-%#&\$.+?,=!: /() |

| Parameter | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-----------|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| query     | String | <b>Definition:</b> Specifies the query string set in the URL for redirection. \$1, \$2, \$3, and all the way to \$9 match the wildcard asterisk (*) in the request URL. If the number of regular expression match groups is less than the specified number, <b>\${path}</b> is empty. If the dollar sign (\$) is followed by a letter, the matching result is empty until the next special character appears, for example, <b>\$abc#123</b> , and the matching result is <b>#123</b> . If the dollar sign (\$) is followed by a special character, for example, <b>\$#</b> , the matching result is <b>\$#</b> .<br><b>Range:</b> The value can contain only letters, digits, and the special characters: !\$&'()+,-./:;=?@^_`. The letters are case-sensitive. |

**Table 5-670** CorsConfig

| Parameter     | Type             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|---------------|------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| allow_origin  | Array of strings | <b>Definition:</b> Specifies the origins that are allowed to access cross-origin resources through a browser. The origin can be a wildcard (*) or one or more URLs.<br><b>Constraints:</b> <ul style="list-style-type: none"><li>Each URL must start with <b>http://</b> or <b>https://</b>, followed by a valid domain name or level-1 wildcard domain name, for example, <b>http://*.test.abc.example.com</b>.</li><li>It is optional to include a port number (ranging from 1 to 65535) in the URL.</li></ul> |
| allow_methods | Array of strings | <b>Definition:</b> Specifies the HTTP methods that the specified URLs can use to access cross-origin resources.<br><b>Range:</b> N/A                                                                                                                                                                                                                                                                                                                                                                             |
| allow_headers | Array of strings | <b>Definition:</b> Specifies the request headers that can be carried in CORS requests.<br><b>Range:</b> N/A                                                                                                                                                                                                                                                                                                                                                                                                      |

| Parameter         | Type             | Description                                                                                                                                                                                                                               |
|-------------------|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| expose_headers    | Array of strings | <b>Definition:</b> Specifies the headers that can be exposed.<br><b>Range:</b> N/A                                                                                                                                                        |
| allow_credentials | Boolean          | <b>Definition:</b> Specifies whether to allow credentials in CORS requests.<br><b>Range:</b> <ul style="list-style-type: none"><li>• <b>true:</b> Credentials are allowed.</li><li>• <b>false:</b> Credentials are not allowed.</li></ul> |
| max_age           | Long             | <b>Definition:</b> Specifies the maximum duration a preflight request can be cached, in seconds.<br><b>Range:</b> -1 to 172800                                                                                                            |

**Table 5-671** TrafficMirrorConfig

| Parameter                  | Type             | Description                                                                                                         |
|----------------------------|------------------|---------------------------------------------------------------------------------------------------------------------|
| target_ids                 | Array of strings | <b>Definition:</b> Specifies the IDs of the backend server groups that traffic is mirrored to.<br><b>Range:</b> N/A |
| mirror_request_body_enable | Boolean          | Specifies whether to include the mirror request body. The default value is <b>true</b> .<br><b>Range:</b> N/A       |

**Table 5-672** FixedResponseConfig

| Parameter    | Type   | Description                                                                                                                                                                                                                                    |
|--------------|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| status_code  | String | <b>Definition:</b> Specifies the HTTP status code.<br><b>Range:</b> 200-299, 400-499, 500-599                                                                                                                                                  |
| content_type | String | <b>Definition:</b> Specifies the format of the returned body.<br><b>Range:</b> <ul style="list-style-type: none"><li>• text/plain</li><li>• text/css</li><li>• text/html</li><li>• application/javascript</li><li>• application/json</li></ul> |

| Parameter             | Type                                       | Description                                                                                                    |
|-----------------------|--------------------------------------------|----------------------------------------------------------------------------------------------------------------|
| message_body          | String                                     | <b>Definition:</b> Specifies the content of the response message body.<br><b>Range:</b> N/A                    |
| insert_headers_config | <a href="#">InsertHeadersConfig</a> object | <b>Definition:</b> Specifies the headers you want to write into the request that matches the forwarding rule.  |
| remove_headers_config | <a href="#">RemoveHeadersConfig</a> object | <b>Definition:</b> Specifies the headers you want to remove from the request that matches the forwarding rule. |
| traffic_limit_config  | <a href="#">TrafficLimitConfig</a> object  | <b>Definition:</b> Specifies how requests are limited.                                                         |

**Table 5-673** InsertHeadersConfig

| Parameter | Type                                                | Description                                                                                               |
|-----------|-----------------------------------------------------|-----------------------------------------------------------------------------------------------------------|
| configs   | Array of <a href="#">InsertHeaderConfig</a> objects | <b>Definition:</b> Specifies the request and response headers you want to add.<br><b>Constraints:</b> N/A |

**Table 5-674** InsertHeaderConfig

| Parameter | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-----------|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| key       | String | <b>Definition:</b> Specifies the key of the request and response headers.<br><b>Constraints:</b> The following cannot be used as a key.<br>connection, upgrade, content-length, transfer-encoding, keep-alive, te, host, cookie, remoteip, authority, x-forwarded-host, x-forwarded-for, x-forwarded-for-port, x-forwarded-tls-certificate-id, x-forwarded-tls-protocol, x-forwarded-tls-cipher, x-forwarded-elb-ip, x-forwarded-port, x-forwarded-elb-id, x-forwarded-elb-vip, x-real-ip, x-forwarded-proto, x-nuwa-trace-ne-in, or x-nuwa-trace-ne-out<br><b>Range:</b> The value can contain 1 to 40 characters, including letters (case-insensitive), digits, hyphens (-), and underscores (_). |

| Parameter  | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|------------|--------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| value_type | String | <b>Definition:</b> Specifies the value type of the request and response headers.<br><b>Range:</b> <b>USER_DEFINED</b> , <b>REFERENCE_HEADER</b> , or <b>SYSTEM_DEFINED</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| value      | String | <b>Definition:</b> Specifies the value of the request and response headers.<br><b>Range:</b> The value can contain 1 to 128 characters. ASCII codes 32 through 127 printable characters, asterisks (*), and question marks (?) are also supported. The value cannot start or end with a space and cannot be any of the following: connection, upgrade, content-length, transfer-encoding, keep-alive, te, host, cookie, remoteip, authority, transparent, x-forwarded-host, x-forwarded-for, x-forwarded-for-port, x-forwarded-tls-certificate-id, x-forwarded-tls-protocol, x-forwarded-tls-cipher, x-forwarded-port, x-real-ip, x-forwarded-proto, x-forwarded-elb-ip, x-forwarded-elb-id, x-forwarded-elb-vip, x-nuwa-trace-ne-in, or x-nuwa-trace-ne-out. |

**Table 5-675** RemoveHeadersConfig

**Table 5-677** TrafficLimitConfig

| Parameter         | Type    | Description                                                                                                                                                                                                                                                                                                              |
|-------------------|---------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| qps               | Integer | <p><b>Definition:</b> Specifies the maximum number of queries per second (QPS).</p> <p><b>Range:</b> 0 to 100000. Unit: count/s. <b>0</b> indicates that QPS is not limited.</p>                                                                                                                                         |
| per_source_ip_qps | Integer | <p><b>Definition:</b> Specifies the maximum number of queries per second (QPS) from a source IP address (single client).</p> <p><b>Range:</b> 0 to 100000. Unit: count/s. <b>0</b> indicates that QPS is not limited.</p>                                                                                                |
| burst             | Integer | <p><b>Definition:</b> Specifies the allowed burst queries if the number of queries exceeds the value specified for <b>qps</b>. If the number of burst queries exceeds the value specified for <b>burst</b>, 503 Service Unavailable will be returned to the client.</p> <p><b>Range:</b> 0 to 100000. Unit: count/s.</p> |

## Example Requests

Querying forwarding policies

```
GET https://{ELB_Endpoint}/v3/99a3fff0d03c428eac3678da6a7d0f24/elb/l7policies?display_all_rules=true
```

## Example Responses

**Status code: 200**

Successful request.

 }
}
```

## More

For SDK sample code of more programming languages, see the Sample Code tab in [API Explorer](#). SDK sample code can be automatically generated.

## Status Codes

| Status Code | Description         |
|-------------|---------------------|
| 200         | Successful request. |

## Error Codes

See [Error Codes](#).

## 5.14.3 Querying the Details of a Forwarding Policy

### Function

This API is used to view the details of a forwarding policy.

### Calling Method

For details, see [Calling APIs](#).

## URI

GET /v3/{project\_id}/elb/l7policies/{l7policy\_id}

**Table 5-678** Path Parameters

| Parameter   | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                |

| l7policy   | <b>L7Policy</b> object | <b>Definition:</b> Specifies the forwarding policy.                                                                                                                                  |

**Table 5-681** L7Policy

| Parameter      | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|----------------|---------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| action         | String  | <b>Definition:</b> Specifies the action of the forwarding policy.<br><b>Range:</b> <ul style="list-style-type: none"><li>• <b>REDIRECT_TO_POOL:</b> Requests are forwarded to another backend server group.</li><li>• <b>REDIRECT_TO_LISTENER:</b> Requests are redirected to an HTTPS listener.</li><li>• <b>REDIRECT_TO_URL:</b> Requests are redirected to another URL.</li><li>• <b>FIXED_RESPONSE:</b> A fixed response body is returned.</li></ul> |
| admin_state_up | Boolean | <b>Definition:</b> Specifies the administrative status of the forwarding policy.<br><b>Range:</b> The value can only be <b>true</b> .                                                                                                                                                                                                                                                                                                                    |
| description    | String  | <b>Definition:</b> Provides supplementary information about the forwarding policy.<br><b>Range:</b> N/A                                                                                                                                                                                                                                                                                                                                                  |
| id             | String  | <b>Definition:</b> Specifies the forwarding policy ID.<br><b>Range:</b> N/A                                                                                                                                                                                                                                                                                                                                                                              |
| listener_id    | String  | <b>Definition:</b> Specifies the ID of the listener with which the forwarding policy is associated.<br><b>Range:</b> N/A                                                                                                                                                                                                                                                                                                                                 |

| Parameter            | Type    | Description                                                                                                                                                                                                                                                                                                                                                                |
|----------------------|---------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| name                 | String  | <b>Definition:</b> Specifies the forwarding policy name.<br><b>Range:</b> N/A                                                                                                                                                                                                                                                                                              |
| position             | Integer | <b>Definition:</b> Specifies the priority of the forwarding policy. The priority cannot be updated.<br><br>This parameter is unsupported. Please do not use it.                                                                                                                                                                                                            |
| priority             | Integer | <b>Definition:</b> Specifies the priority of the forwarding policy. A smaller value indicates a higher priority.<br><b>Range:</b> <ul style="list-style-type: none"><li>• If <b>action</b> is set to <b>REDIRECT_TO_LISTENER</b>, the priority ranges from 0 to 10,000.</li><li>• If <b>action</b> is set to other values, the priority ranges from 1 to 10,000.</li></ul> |
| project_id           | String  | <b>Definition:</b> Specifies the ID of the project where the forwarding policy is used.<br><b>Range:</b> N/A                                                                                                                                                                                                                                                               |
| provisioning_status  | String  | <b>Definition:</b> Specifies the provisioning status of the forwarding policy.<br><b>Range:</b> <ul style="list-style-type: none"><li>• <b>ACTIVE</b> (default): The forwarding policy is provisioned successfully.</li><li>• <b>ERROR</b>: The forwarding policy has the same rule as another forwarding policy added to the same listener.</li></ul>                     |
| redirect_pool_id     | String  | <b>Definition:</b> Specifies the ID of the backend server group to which requests will be forwarded.<br><b>Range:</b> N/A                                                                                                                                                                                                                                                  |
| redirect_listener_id | String  | <b>Definition:</b> Specifies the ID of the listener to which requests are redirected.<br><b>Range:</b> N/A                                                                                                                                                                                                                                                                 |

| Parameter                            | Type                                                    | Description                                                                                                                                                                                                                                                                                                                         |
|--------------------------------------|---------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| redirect_url                         | String                                                  | <b>Definition:</b> Specifies the URL to which requests will be forwarded.<br><b>Range:</b> The value must be in the format of <i>protocol://host:port/path?query</i> .<br>This parameter is unsupported. Please do not use it.                                                                                                      |
| rules                                | Array of <a href="#">RuleRef</a> objects                | <b>Definition:</b> Lists the forwarding rules in the forwarding policy.                                                                                                                                                                                                                                                             |
| redirect_url_config                  | <a href="#">RedirectUrlConfig</a> object                | <b>Definition:</b> Specifies the URL to which requests are forwarded.                                                                                                                                                                                                                                                               |
| redirect_pools_config                | Array of <a href="#">RedirectPoolsConfig</a> objects    | <b>Definition:</b> Specifies the backend server groups that the requests are forwarded to. This parameter takes effect only when <b>enhance_l7policy_enable</b> is set to <b>true</b> . If this parameter is specified and <b>enhance_l7policy_enable</b> is set to <b>false</b> , an error will be returned.                       |
| redirect_pools_sticky_session_config | <a href="#">RedirectPoolsStickySessionConfig</a> object | <b>Definition:</b> Specifies whether to enable sticky session for backend server groups configured for a forwarding policy. The load balancer generates a cookie after it receives a request from a client. All subsequent requests with the same cookie are routed to the same backend server group.                               |
| redirect_pools_extend_config         | <a href="#">RedirectPoolsExtendConfig</a> object        | <b>Definition:</b> Specifies the backend server group that requests are forwarded to.                                                                                                                                                                                                                                               |
| fixed_response_config                | <a href="#">FixedResponseConfig</a> object              | <b>Definition:</b> Specifies the configuration of the page that will be returned.                                                                                                                                                                                                                                                   |
| created_at                           | String                                                  | <b>Definition:</b> Specifies the creation time.<br><b>Range:</b> The value must be a UTC time in the <i>yyyy-MM-dd'T'HH:mm:ss'Z'</i> format.<br>Note: This parameter will not be returned for resources associated with existing dedicated load balancers and for resources associated with existing and new shared load balancers. |

| Parameter             | Type   | Description                                                                                                                                                                                                                                                                                                                           |
|-----------------------|--------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| updated_at            | String | <b>Definition:</b> Specifies the update time.<br><b>Range:</b> The value must be a UTC time in the <i>yyyy-MM-dd'T'HH:mm:ss'Z'</i> format.<br><br>Note: This parameter will not be returned for resources associated with existing dedicated load balancers and for resources associated with existing and new shared load balancers. |
| enterprise_project_id | String | <b>Definition:</b> Specifies the enterprise project ID.<br><b>Range:</b> N/A                                                                                                                                                                                                                                                          |

**Table 5-682** RuleRef

| Parameter | Type   | Description                                                               |
|-----------|--------|---------------------------------------------------------------------------|
| id        | String | <b>Definition:</b> Specifies the forwarding rule ID.<br><b>Range:</b> N/A |

**Table 5-683** RedirectUrlConfig

| Parameter | Type   | Description                                                                                                                                                                                                                                |
|-----------|--------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| protocol  | String | <b>Definition:</b> Specifies the protocol for redirection.<br><b>Range:</b> <ul style="list-style-type: none"><li>• HTTP</li><li>• HTTPS</li><li>• <b>\${protocol}</b>: indicates that the protocol in the request will be used.</li></ul> |
| host      | String | <b>Definition:</b> Specifies the name of the host that requests are redirected to.<br><b>Range:</b> The value can contain only letters, digits, hyphens (-), and periods (.) and must start with a letter or digit.                        |
| port      | String | <b>Definition:</b> Specifies the port that requests are redirected to.<br><b>Range:</b> N/A                                                                                                                                                |

| Parameter             | Type                              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|-----------------------|-----------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| path                  | String                            | <b>Definition:</b> Specifies the path that requests are redirected to.<br><b>Range:</b> The value can contain only letters, digits, and special characters: <code>_~';@^-%#&amp;\$. *+?,=!: \\V()[]{} </code> and must start with a slash (/).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| query                 | String                            | <b>Definition:</b> Specifies the query string set in the URL for redirection. The following is an example:<br>In the URL <b>https://www.example.com:8080/elb?type=loadbalancer</b> , if this parameter is set to <b>\${query}&amp;name=my_name</b> , the URL will be redirected to <b>https://www.example.com:8080/elb?type=loadbalancer&amp;name=my_name</b> . In the example, <b>\${query}</b> indicates <b>type=loadbalancer</b> .<br><b>Range:</b> The value can contain only letters, digits, and the special characters: <code>!\$&amp;'()*+,-./:;=?@^_` </code> . The letters are case-sensitive. <code>\$1, \$2, \$3, </code> and all the way to <code>\$9 </code> match the wildcard asterisk (*) in the requested URL. |
| status_code           | String                            | <b>Definition:</b> Specifies the status code returned after the requests are redirected.<br><b>Range:</b> <ul style="list-style-type: none"><li>• 301</li><li>• 302</li><li>• 303</li><li>• 307</li><li>• 308</li></ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| insert_headers_config | <b>InsertHeadersConfig</b> object | <b>Definition:</b> Specifies the headers you want to write into the request that matches the forwarding rule.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| remove_headers_config | <b>RemoveHeadersConfig</b> object | <b>Definition:</b> Specifies the headers you want to remove from the request that matches the forwarding rule.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

**Table 5-684** RedirectPoolsConfig

| Parameter | Type    | Description                                                                                                                                                                                                                                                                                                                                          |
|-----------|---------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| pool_id   | String  | <b>Definition:</b> Specifies the backend server group ID.<br><b>Range:</b> N/A                                                                                                                                                                                                                                                                       |
| weight    | Integer | <b>Definition:</b> Specifies the weight of the backend server group. Requests are routed to backend server groups based on their weights. The larger the weight is, the higher proportion of requests the backend server group receives. If the weight is set to 0, the backend server group will not accept new requests.<br><b>Range:</b> 0 to 100 |

**Table 5-685** RedirectPoolsStickySessionConfig

| Parameter | Type    | Description                                                                                                                                                                                                    |
|-----------|---------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| enable    | Boolean | <b>Definition:</b> Specifies whether to enable sticky session for backend server groups configured in a forwarding policy.<br><b>Default value:</b> <b>false</b> , indicating that sticky session is disabled. |
| timeout   | Integer | <b>Definition:</b> Specifies the stickiness duration, in minutes.<br><b>Range:</b> 1 to 1440                                                                                                                   |

**Table 5-686** RedirectPoolsExtendConfig

| Parameter          | Type                                    | Description                                                                                                                                                                                      |
|--------------------|-----------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| rewrite_url_enable | Boolean                                 | <b>Definition:</b> Specifies whether to set <b>rewrite_url_enable</b> to <b>true</b> .<br><b>Range:</b> The value can be <b>true</b> (enable this option) or <b>false</b> (disable this option). |
| rewrite_url_config | <a href="#">RewriteUrlConfig</a> object | <b>Definition:</b> Specifies the URL for the backend server group that requests are forwarded to.                                                                                                |

| Parameter             | Type                                       | Description                                                                                                    |
|-----------------------|--------------------------------------------|----------------------------------------------------------------------------------------------------------------|
| insert_headers_config | <a href="#">InsertHeadersConfig</a> object | <b>Definition:</b> Specifies the headers you want to write into the request that matches the forwarding rule.  |
| remove_headers_config | <a href="#">RemoveHeadersConfig</a> object | <b>Definition:</b> Specifies the headers you want to remove from the request that matches the forwarding rule. |
| traffic_limit_config  | <a href="#">TrafficLimitConfig</a> object  | <b>Definition:</b> Specifies how requests are limited.                                                         |
| cors_config           | <a href="#">CorsConfig</a> object          | <b>Definition:</b> Specifies the CORS configurations.                                                          |
| traffic_mirror_config | <a href="#">TrafficMirrorConfig</a> object | <b>Definition:</b> Specifies the traffic mirroring configuration.                                              |

**Table 5-687** RewriteUrlConfig

| Parameter | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|-----------|--------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| host      | String | <b>Definition:</b> Specifies the domain name of the host that requests are redirected to.<br><br><b>Range:</b> The value can contain letters, digits, hyphens (-), and periods (.), and must start with a letter or digit.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| path      | String | <b>Definition:</b> Specifies the path that requests are redirected to. \$1, \$2, \$3, and all the way to \$9 match the wildcard asterisk (*) in the request URL. If the number of regular expression match groups is less than the specified number, <b>\${path}</b> is empty. If the dollar sign (\$) is followed by a letter, the matching result is empty until the next special character appears, for example, <b>\$abc#123</b> , and the matching result is <b>#123</b> . If the dollar sign (\$) is followed by a special character, for example, <b>\$#</b> , the matching result is <b>\$#</b> .<br><br><b>Range:</b> The value must start with a slash (/) and can contain only letters, digits, and special characters: <code>_~';@^-%#&amp;\$.+?,:! /()</code> |

| Parameter | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-----------|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| query     | String | <b>Definition:</b> Specifies the query string set in the URL for redirection. \$1, \$2, \$3, and all the way to \$9 match the wildcard asterisk (*) in the request URL. If the number of regular expression match groups is less than the specified number, <b>\${path}</b> is empty. If the dollar sign (\$) is followed by a letter, the matching result is empty until the next special character appears, for example, <b>\$abc#123</b> , and the matching result is <b>#123</b> . If the dollar sign (\$) is followed by a special character, for example, <b>\$#</b> , the matching result is <b>\$#</b> .<br><b>Range:</b> The value can contain only letters, digits, and the special characters: !\$&'()+,-./:;=?@^_`. The letters are case-sensitive. |

**Table 5-694** RemoveHeaderConfig

| Parameter | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|-----------|--------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| key       | String | <p><b>Definition:</b> Specifies the key of the request and response headers you want to remove.</p> <p><b>Constraints:</b> The following cannot be used as a key.</p> <p>connection, upgrade, content-length, transfer-encoding, keep-alive, te, host, cookie, remoteip, authority, x-forwarded-host, x-forwarded-for, x-forwarded-for-port, x-forwarded-tls-certificate-id, x-forwarded-tls-protocol, x-forwarded-tls-cipher, x-forwarded-elb-ip, x-forwarded-port, x-forwarded-elb-id, x-forwarded-elb-vip, x-real-ip, x-forwarded-proto, x-nuwa-trace-ne-in, or x-nuwa-trace-ne-out</p> <p><b>Range:</b> The value can contain 1 to 40 characters, including letters (case-insensitive), digits, hyphens (-), and underscores (_).</p> |

**Table 5-695** TrafficLimitConfig

| Parameter         | Type    | Description                                                                                                                                                                                                                                                                                                              |
|-------------------|---------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| qps               | Integer | <p><b>Definition:</b> Specifies the maximum number of queries per second (QPS).</p> <p><b>Range:</b> 0 to 100000. Unit: count/s. <b>0</b> indicates that QPS is not limited.</p>                                                                                                                                         |
| per_source_ip_qps | Integer | <p><b>Definition:</b> Specifies the maximum number of queries per second (QPS) from a source IP address (single client).</p> <p><b>Range:</b> 0 to 100000. Unit: count/s. <b>0</b> indicates that QPS is not limited.</p>                                                                                                |
| burst             | Integer | <p><b>Definition:</b> Specifies the allowed burst queries if the number of queries exceeds the value specified for <b>qps</b>. If the number of burst queries exceeds the value specified for <b>burst</b>, 503 Service Unavailable will be returned to the client.</p> <p><b>Range:</b> 0 to 100000. Unit: count/s.</p> |

## Example Requests

Querying the details of a forwarding policy

```
GET https://{ELB_Endpoint}/v3/99a3fff0d03c428eac3678da6a7d0f24/elb/l7policies/cf4360fd-8631-41ff-a6f5-b72c35da74be
```

## Example Responses

**Status code: 200**

Successful request.

```
{

```

```
}
}
```

More

For SDK sample code of more programming languages, see the Sample Code tab in [API Explorer](#). SDK sample code can be automatically generated.

Status Codes

| Status Code | Description         |
|-------------|---------------------|
| 200         | Successful request. |

Error Codes

See [Error Codes](#).

5.14.4 Modifying a Forwarding Policy

Function

This API is used to update a forwarding policy.

Calling Method

For details, see [Calling APIs](#).

URI

PUT /v3/{project\_id}/elb/l7policies/{l7policy\_id}

Table 5-696 Path Parameters

| Parameter   | Mandatory | Type   | Description                                                                                                                         |
|-------------|-----------|--------|-------------------------------------------------------------------------------------------------------------------------------------|

| l7policy   | <b>L7Policy</b> object | <b>Definition:</b> Specifies the forwarding policy.                                                                                                                                  |

**Table 5-716** L7Policy

| Parameter      | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|----------------|---------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| action         | String  | <b>Definition:</b> Specifies the action of the forwarding policy.<br><b>Range:</b> <ul style="list-style-type: none"><li>• <b>REDIRECT_TO_POOL:</b> Requests are forwarded to another backend server group.</li><li>• <b>REDIRECT_TO_LISTENER:</b> Requests are redirected to an HTTPS listener.</li><li>• <b>REDIRECT_TO_URL:</b> Requests are redirected to another URL.</li><li>• <b>FIXED_RESPONSE:</b> A fixed response body is returned.</li></ul> |
| admin_state_up | Boolean | <b>Definition:</b> Specifies the administrative status of the forwarding policy.<br><b>Range:</b> The value can only be <b>true</b> .                                                                                                                                                                                                                                                                                                                    |
| description    | String  | <b>Definition:</b> Provides supplementary information about the forwarding policy.<br><b>Range:</b> N/A                                                                                                                                                                                                                                                                                                                                                  |
| id             | String  | <b>Definition:</b> Specifies the forwarding policy ID.<br><b>Range:</b> N/A                                                                                                                                                                                                                                                                                                                                                                              |

| Parameter            | Type    | Description                                                                                                                                                                                                                                                                                                                                                                |
|----------------------|---------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| listener_id          | String  | <b>Definition:</b> Specifies the ID of the listener with which the forwarding policy is associated.<br><b>Range:</b> N/A                                                                                                                                                                                                                                                   |
| name                 | String  | <b>Definition:</b> Specifies the forwarding policy name.<br><b>Range:</b> N/A                                                                                                                                                                                                                                                                                              |
| position             | Integer | <b>Definition:</b> Specifies the priority of the forwarding policy. The priority cannot be updated.<br>This parameter is unsupported. Please do not use it.                                                                                                                                                                                                                |
| priority             | Integer | <b>Definition:</b> Specifies the priority of the forwarding policy. A smaller value indicates a higher priority.<br><b>Range:</b> <ul style="list-style-type: none"><li>• If <b>action</b> is set to <b>REDIRECT_TO_LISTENER</b>, the priority ranges from 0 to 10,000.</li><li>• If <b>action</b> is set to other values, the priority ranges from 1 to 10,000.</li></ul> |
| project_id           | String  | <b>Definition:</b> Specifies the ID of the project where the forwarding policy is used.<br><b>Range:</b> N/A                                                                                                                                                                                                                                                               |
| provisioning_status  | String  | <b>Definition:</b> Specifies the provisioning status of the forwarding policy.<br><b>Range:</b> <ul style="list-style-type: none"><li>• <b>ACTIVE</b> (default): The forwarding policy is provisioned successfully.</li><li>• <b>ERROR</b>: The forwarding policy has the same rule as another forwarding policy added to the same listener.</li></ul>                     |
| redirect_pool_id     | String  | <b>Definition:</b> Specifies the ID of the backend server group to which requests will be forwarded.<br><b>Range:</b> N/A                                                                                                                                                                                                                                                  |
| redirect_listener_id | String  | <b>Definition:</b> Specifies the ID of the listener to which requests are redirected.<br><b>Range:</b> N/A                                                                                                                                                                                                                                                                 |

| Parameter                            | Type                                                    | Description                                                                                                                                                                                                                                                                                                                         |
|--------------------------------------|---------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| redirect_url                         | String                                                  | <b>Definition:</b> Specifies the URL to which requests will be forwarded.<br><b>Range:</b> The value must be in the format of <i>protocol://host:port/path?query</i> .<br>This parameter is unsupported. Please do not use it.                                                                                                      |
| rules                                | Array of <a href="#">RuleRef</a> objects                | <b>Definition:</b> Lists the forwarding rules in the forwarding policy.                                                                                                                                                                                                                                                             |
| redirect_url_config                  | <a href="#">RedirectUrlConfig</a> object                | <b>Definition:</b> Specifies the URL to which requests are forwarded.                                                                                                                                                                                                                                                               |
| redirect_pools_config                | Array of <a href="#">RedirectPoolsConfig</a> objects    | <b>Definition:</b> Specifies the backend server groups that the requests are forwarded to. This parameter takes effect only when <b>enhance_l7policy_enable</b> is set to <b>true</b> . If this parameter is specified and <b>enhance_l7policy_enable</b> is set to <b>false</b> , an error will be returned.                       |
| redirect_pools_sticky_session_config | <a href="#">RedirectPoolsStickySessionConfig</a> object | <b>Definition:</b> Specifies whether to enable sticky session for backend server groups configured for a forwarding policy. The load balancer generates a cookie after it receives a request from a client. All subsequent requests with the same cookie are routed to the same backend server group.                               |
| redirect_pools_extend_config         | <a href="#">RedirectPoolsExtendConfig</a> object        | <b>Definition:</b> Specifies the backend server group that requests are forwarded to.                                                                                                                                                                                                                                               |
| fixed_response_config                | <a href="#">FixedResponseConfig</a> object              | <b>Definition:</b> Specifies the configuration of the page that will be returned.                                                                                                                                                                                                                                                   |
| created_at                           | String                                                  | <b>Definition:</b> Specifies the creation time.<br><b>Range:</b> The value must be a UTC time in the <i>yyyy-MM-dd'T'HH:mm:ss'Z'</i> format.<br>Note: This parameter will not be returned for resources associated with existing dedicated load balancers and for resources associated with existing and new shared load balancers. |

| Parameter             | Type   | Description                                                                                                                                                                                                                                                                                                                           |
|-----------------------|--------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| updated_at            | String | <b>Definition:</b> Specifies the update time.<br><b>Range:</b> The value must be a UTC time in the <i>yyyy-MM-dd'T'HH:mm:ss'Z'</i> format.<br><br>Note: This parameter will not be returned for resources associated with existing dedicated load balancers and for resources associated with existing and new shared load balancers. |
| enterprise_project_id | String | <b>Definition:</b> Specifies the enterprise project ID.<br><b>Range:</b> N/A                                                                                                                                                                                                                                                          |

**Table 5-717** RuleRef

| Parameter | Type   | Description                                                               |
|-----------|--------|---------------------------------------------------------------------------|
| id        | String | <b>Definition:</b> Specifies the forwarding rule ID.<br><b>Range:</b> N/A |

**Table 5-718** RedirectUrlConfig

| Parameter | Type   | Description                                                                                                                                                                                                                                |
|-----------|--------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| protocol  | String | <b>Definition:</b> Specifies the protocol for redirection.<br><b>Range:</b> <ul style="list-style-type: none"><li>• HTTP</li><li>• HTTPS</li><li>• <b>\${protocol}</b>: indicates that the protocol in the request will be used.</li></ul> |
| host      | String | <b>Definition:</b> Specifies the name of the host that requests are redirected to.<br><b>Range:</b> The value can contain only letters, digits, hyphens (-), and periods (.) and must start with a letter or digit.                        |
| port      | String | <b>Definition:</b> Specifies the port that requests are redirected to.<br><b>Range:</b> N/A                                                                                                                                                |

| Parameter             | Type                              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-----------------------|-----------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| path                  | String                            | <b>Definition:</b> Specifies the path that requests are redirected to.<br><b>Range:</b> The value can contain only letters, digits, and special characters: <code>_~';@^-%#&amp;\$.*+?;=!: \\V()[]{} </code> and must start with a slash (/).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| query                 | String                            | <b>Definition:</b> Specifies the query string set in the URL for redirection. The following is an example:<br>In the URL <b>https://www.example.com:8080/elb?type=loadbalancer</b> , if this parameter is set to <b>`\${query}&amp;name=my_name`</b> , the URL will be redirected to <b>https://www.example.com:8080/elb?type=loadbalancer&amp;name=my_name</b> . In the example, <b>`\${query}`</b> indicates <b>type=loadbalancer</b> .<br><b>Range:</b> The value can contain only letters, digits, and the special characters: <code>!\$&amp;'()*+,-./:;=?@^_` </code> . The letters are case-sensitive. <code>\$1</code> , <code>\$2</code> , <code>\$3</code> , and all the way to <code>\$9</code> match the wildcard asterisk (*) in the requested URL. |
| status_code           | String                            | <b>Definition:</b> Specifies the status code returned after the requests are redirected.<br><b>Range:</b> <ul style="list-style-type: none"><li>• 301</li><li>• 302</li><li>• 303</li><li>• 307</li><li>• 308</li></ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| insert_headers_config | <b>InsertHeadersConfig</b> object | <b>Definition:</b> Specifies the headers you want to write into the request that matches the forwarding rule.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| remove_headers_config | <b>RemoveHeadersConfig</b> object | <b>Definition:</b> Specifies the headers you want to remove from the request that matches the forwarding rule.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

**Table 5-719** RedirectPoolsConfig

| Parameter | Type    | Description                                                                                                                                                                                                                                                                                                                                          |
|-----------|---------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| pool_id   | String  | <b>Definition:</b> Specifies the backend server group ID.<br><b>Range:</b> N/A                                                                                                                                                                                                                                                                       |
| weight    | Integer | <b>Definition:</b> Specifies the weight of the backend server group. Requests are routed to backend server groups based on their weights. The larger the weight is, the higher proportion of requests the backend server group receives. If the weight is set to 0, the backend server group will not accept new requests.<br><b>Range:</b> 0 to 100 |

**Table 5-720** RedirectPoolsStickySessionConfig

| Parameter | Type    | Description                                                                                                                                                                                                    |
|-----------|---------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| enable    | Boolean | <b>Definition:</b> Specifies whether to enable sticky session for backend server groups configured in a forwarding policy.<br><b>Default value:</b> <b>false</b> , indicating that sticky session is disabled. |
| timeout   | Integer | <b>Definition:</b> Specifies the stickiness duration, in minutes.<br><b>Range:</b> 1 to 1440                                                                                                                   |

**Table 5-721** RedirectPoolsExtendConfig

| Parameter          | Type                           | Description                                                                                                                                                                                      |
|--------------------|--------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| rewrite_url_enable | Boolean                        | <b>Definition:</b> Specifies whether to set <b>rewrite_url_enable</b> to <b>true</b> .<br><b>Range:</b> The value can be <b>true</b> (enable this option) or <b>false</b> (disable this option). |
| rewrite_url_config | <b>RewriteUrlConfig</b> object | <b>Definition:</b> Specifies the URL for the backend server group that requests are forwarded to.                                                                                                |

| Parameter             | Type                                       | Description                                                                                                    |
|-----------------------|--------------------------------------------|----------------------------------------------------------------------------------------------------------------|
| insert_headers_config | <a href="#">InsertHeadersConfig</a> object | <b>Definition:</b> Specifies the headers you want to write into the request that matches the forwarding rule.  |
| remove_headers_config | <a href="#">RemoveHeadersConfig</a> object | <b>Definition:</b> Specifies the headers you want to remove from the request that matches the forwarding rule. |
| traffic_limit_config  | <a href="#">TrafficLimitConfig</a> object  | <b>Definition:</b> Specifies how requests are limited.                                                         |
| cors_config           | <a href="#">CorsConfig</a> object          | <b>Definition:</b> Specifies the CORS configurations.                                                          |
| traffic_mirror_config | <a href="#">TrafficMirrorConfig</a> object | <b>Definition:</b> Specifies the traffic mirroring configuration.                                              |

**Table 5-722** RewriteUrlConfig

| Parameter | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|-----------|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| host      | String | <b>Definition:</b> Specifies the domain name of the host that requests are redirected to.<br><br><b>Range:</b> The value can contain letters, digits, hyphens (-), and periods (.), and must start with a letter or digit.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| path      | String | <b>Definition:</b> Specifies the path that requests are redirected to. \$1, \$2, \$3, and all the way to \$9 match the wildcard asterisk (*) in the request URL. If the number of regular expression match groups is less than the specified number, <b>\${path}</b> is empty. If the dollar sign (\$) is followed by a letter, the matching result is empty until the next special character appears, for example, <b>\$abc#123</b> , and the matching result is <b>#123</b> . If the dollar sign (\$) is followed by a special character, for example, <b>\$#</b> , the matching result is <b>\$#</b> .<br><br><b>Range:</b> The value must start with a slash (/) and can contain only letters, digits, and special characters: _~';@^-%#&\$.+?,:! /() |

| Parameter | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-----------|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| query     | String | <b>Definition:</b> Specifies the query string set in the URL for redirection. \$1, \$2, \$3, and all the way to \$9 match the wildcard asterisk (*) in the request URL. If the number of regular expression match groups is less than the specified number, <b>\${path}</b> is empty. If the dollar sign (\$) is followed by a letter, the matching result is empty until the next special character appears, for example, <b>\$abc#123</b> , and the matching result is <b>#123</b> . If the dollar sign (\$) is followed by a special character, for example, <b>\$#</b> , the matching result is <b>\$#</b> .<br><b>Range:</b> The value can contain only letters, digits, and the special characters: !\$&'()+,-./:;=?@^_`. The letters are case-sensitive. |

## 5.14.6 Batch Modifying Forwarding Policy Priorities

### Function

This API is used to batch modify the priorities of forwarding policies.

### Constraints

This API is only used to update the priorities of forwarding policies added to a listener of a dedicated load balancer when **action** is set to **REDIRECT\_TO\_POOL**.

### Calling Method

For details, see [Calling APIs](#).

## URI

POST /v3/{project\_id}/elb/l7policies/batch-update-priority

| Parameter    | Mandatory | Type   | Description                                                                                                                                      |
|--------------|-----------|--------|--------------------------------------------------------------------------------------------------------------------------------------------------|
| X-Auth-Token | Yes       | String | <b>Definition:</b> Specifies the token used for IAM authentication.<br><b>Constraints:</b> N/A<br><b>Range:</b> N/A<br><b>Default value:</b> N/A |

**Table 5-735** Request body parameters

| Parameter  | Mandatory | Type                                                            | Description                                                                                                                                   |
|------------|-----------|-----------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------|
| l7policies | No        | Array of <a href="#">BatchUpdatePriorityRequestBody</a> objects | <b>Definition:</b> Specifies the request parameters for updating the priorities of forwarding policies in batches.<br><b>Constraints:</b> N/A |

Table 5-736 BatchUpdatePriorityRequestBody

| Parameter | Mandatory | Type   | Description                                                                                                                                              |
|-----------|-----------|--------|----------------------------------------------------------------------------------------------------------------------------------------------------------|
| id        | Yes       | String | <b>Definition:</b> Specifies the ID of the forwarding policy to be updated.<br><b>Constraints:</b> N/A<br><b>Range:</b> N/A<br><b>Default value:</b> N/A |

| Parameter | Mandatory | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|-----------|-----------|---------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| priority  | Yes       | Integer | <p><b>Definition:</b> Specifies the priority of the forwarding policy. A smaller value indicates a higher priority.</p> <p><b>Constraints:</b></p> <ul style="list-style-type: none"><li>• The priority must be unique for forwarding policies of the same listener.</li><li>• This parameter takes effect only when <b>enhance_l7policy_enable</b> is set to <b>true</b>. If this parameter is passed and <b>enhance_l7policy_enable</b> is set to <b>false</b>, an error will be returned.</li><li>• If <b>enhance_l7policy_enable</b> is set to <b>false</b>, forwarding policies are automatically prioritized based on the original policy sorting logic. The priorities of domain names are independent from each other. For the same domain name, the priorities are sorted in the order of exact match (<b>EQUAL_TO</b>), prefix match (<b>STARTS_WITH</b>), and regular expression match (<b>REGEX</b>). If the matching types are the same, the longer the path is, the higher the priority is. If a forwarding policy contains only a domain name without a path specified, the path is /, and prefix match is used by default.</li><li>• This parameter is unsupported for shared load balancers.</li></ul> <p><b>Range:</b></p> <ul style="list-style-type: none"><li>• If <b>action</b> is set to <b>REDIRECT_TO_LISTENER</b>, the priority ranges from 0 to 10,000.</li></ul> |

| Parameter | Mandatory | Type | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

|           |           |      | <ul style="list-style-type: none"><li>• If <b>action</b> is set to other values, the priority ranges from 1 to 10,000.</li></ul> <p><b>Default value:</b></p> <ul style="list-style-type: none"><li>• If this parameter is not passed and <b>enhance_l7policy_enable</b> is set to <b>false</b>, the priority of the new forwarding policy is 1.</li><li>• If <b>action</b> is set to <b>REDIRECT_TO_LISTENER</b>, the priority of the new forwarding policy is <b>0</b>.</li><li>• If <b>action</b> is set to other values, the priority of the new forwarding policy will be a sum of 1 and the highest priority of existing forwarding policy in the same listener by default.<ul style="list-style-type: none"><li>– If there is no forwarding policy, the priority of a new forwarding policy will be 1 by default.</li><li>– If the priority of an existing forwarding policy is the maximum value (10,000), the forwarding policy will fail to be created because the maximum value will be exceeded. In this case, specify a value or adjust the priorities of existing forwarding policies.</li></ul></li></ul> |

## Response Parameters

Status code: 202

**Table 5-737** Response body parameters

| Parameter  | Type   | Description                                                             |
|------------|--------|-------------------------------------------------------------------------|
| request_id | String | <b>Definition:</b> Specifies the request ID.<br><b>Constraints:</b> N/A |

## Example Requests

Batch modifying the priorities of forwarding policies

```
POST https://{ELB_Endpoint}/v3/060576782980d5762f9ec014dd2f1148/elb/l7policies/batch-update-priority
{
 "l7policies" : [{
 "id" : "1fe93e12-6e07-47a9-8f81-3346c015601d",
 "priority" : 11
 }]
}
```

## Example Responses

**Status code: 202**

Created

```
{
 "request_id" : "e5c07525-1470-47b6-9b0c-567527a036aa"
}
```

## SDK Sample Code

The SDK sample code is as follows.

See [Error Codes](#).

# 5.15 Forwarding Rule

## 5.15.1 Adding a Forwarding Rule

### Function

This API is used to add a forwarding rule.

### Constraints

The forwarding rule cannot be created when **action** is set to **REDIRECT\_TO\_LISTENER**.

### Calling Method

For details, see [Calling APIs](#).

### URI

POST /v3/{project\_id}/elb/l7policies/{l7policy\_id}/rules

**Table 5-738** Path Parameters

| Parameter   | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                |

## Example Requests

Creating a forwarding rule and setting **type** to **PATH**

POST https://{ELB\_Endpoint}/v3/{99a3fff0d03c428eac3678da6a7d0f24}/elb/l7policies/cf4360fd-8631-41ff-a6f5-b72c35da74be/rules

```
{
 "rule": {
 "compare_type": "EQUAL_TO",
 "type": "PATH",
 "value": "/bbb.html"
 }
}
```

## Example Responses

**Status code: 201**

Successful request.

```
{
 "rule": {
 "compare_type": "EQUAL_TO",
 "provisioning_status": "ACTIVE",
 "project_id": "99a3fff0d03c428eac3678da6a7d0f24",
 "invert": false,
 "admin_state_up": true,
 "value": "/bbb.html",
 "key": null,
 }
}
```

```
"type" : "PATH",
"id" : "84f4fcae-9c15-4e19-a99f-72c0b08fd3d7"
},
"request_id" : "3639f1b7-f04b-496e-9218-ec5a9e493f69"
}
```

## SDK Sample Code

The SDK sample code is as follows.

### Java

#### Creating a forwarding rule and setting **type** to **PATH**

```
package com.huaweicloud.sdk.test;

import com.huaweicloud.sdk.core.auth.ICredential;
import com.huaweicloud.sdk.core.auth.BasicCredentials;
import com.huaweicloud.sdk.core.exception.ConnectionException;
import com.huaweicloud.sdk.core.exception.RequestTimeoutException;
import com.huaweicloud.sdk.core.exception.ServiceResponseException;
import com.huaweicloud.sdk.elb.v3.region.ElbRegion;
import com.huaweicloud.sdk.elb.v3.*;
import com.huaweicloud.sdk.elb.v3.model.*;

public class CreateL7RuleSolution {

 public static void main(String[] args) {
 // The AK and SK used for authentication are hard-coded or stored in plaintext, which has great
 // security risks. It is recommended that the AK and SK be stored in ciphertext in configuration files or
 // environment variables and decrypted during use to ensure security.
 // In this example, AK and SK are stored in environment variables for authentication. Before running
 // this example, set environment variables CLOUD_SDK_AK and CLOUD_SDK_SK in the local environment
 String ak = System.getenv("CLOUD_SDK_AK");
 String sk = System.getenv("CLOUD_SDK_SK");

 response, err := client.CreateL7Rule(request)
 if err == nil {
 fmt.Printf("%+v\n", response)
 } else {
 fmt.Println(err)
 }
}
```

## More

For SDK sample code of more programming languages, see the Sample Code tab in [API Explorer](#). SDK sample code can be automatically generated.

## Status Codes

| Status Code | Description         |
|-------------|---------------------|
| 201         | Successful request. |

## Error Codes

See [Error Codes](#).

## 5.15.2 Querying Forwarding Rules

### Function

This API is used to query all forwarding rules.

## Constraints

This API has the following constraints:

- Parameters **marker**, **limit**, and **page\_reverse** are used for pagination query.
- Parameters **marker** and **page\_reverse** take effect only when they are used together with parameter **limit**.

## Calling Method

For details, see [Calling APIs](#).

## URI

GET /v3/{project\_id}/elb/l7policies/{l7policy\_id}/rules

**Table 5-746** Path Parameters

| Parameter   | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                |

The value is an IPv4 or IPv6 CIDR block, for example, 192.168.0.2/32 or 2049::49/64.</li></ul> <p><b>Default value:</b> N/A</p> |

## Example Requests

Querying forwarding rules

```
GET https://{ELB_Endpoint}/v3/{99a3fff0d03c428eac3678da6a7d0f24}/elb/l7policies/cf4360fd-8631-41ff-a6f5-b72c35da74be/rules
```

## Example Responses

**Status code: 200**

Successful request.

```
{
 "rules": [{
 "compare_type": "STARTS_WITH",
 "provisioning_status": "ACTIVE",
 "project_id": "99a3fff0d03c428eac3678da6a7d0f24",
 "invert": false,
 "admin_state_up": true,
 "value": "/ccc.html",
 "key": null,
 "type": "PATH",
 "id": "84f4fcae-9c15-4e19-a99f-72c0b08fd3d7"
 }],
 "page_info": {
 "previous_marker": "84f4fcae-9c15-4e19-a99f-72c0b08fd3d7",
 "current_count": 1
 },
}
```

```
"request_id" : "ae4dbd7d-9271-4040-98b6-3bfe45bb15ee"
}
```

## SDK Sample Code

The SDK sample code is as follows.

### Java

```
package com.huaweicloud.sdk.test;

import com.huaweicloud.sdk.core.auth.ICredential;
import com.huaweicloud.sdk.core.auth.BasicCredentials;
import com.huaweicloud.sdk.core.exception.ConnectionException;

```

```
if err == nil {
 fmt.Printf("%+v\n", response)
} else {
 fmt.Println(err)
}
```

## More

For SDK sample code of more programming languages, see the Sample Code tab in [API Explorer](#). SDK sample code can be automatically generated.

## Status Codes

| Status Code | Description         |
|-------------|---------------------|
| 200         | Successful request. |

## Error Codes

See [Error Codes](#).

## 5.15.3 Query Forwarding Rules

### Function

This API is used to query the forwarding rules under a project.

### Constraints

This API has the following constraints:

- Parameters **marker**, **limit**, and **page\_reverse** are used for pagination query.
- Parameters **marker** and **page\_reverse** take effect only when they are used together with parameter **limit**.

### Calling Method

For details, see [Calling APIs](#).

### URI

GET /v3/{project\_id}/elb/l7policies/rules

**Table 5-753** Path Parameters

| Parameter  | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                |

| Parameter | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-----------|--------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| value     | String | <p><b>Definition:</b> Specifies the value of the match item.</p> <p><b>Constraints:</b> The value of each condition in a forwarding rule must be unique.</p> <p><b>Range:</b></p> <ul style="list-style-type: none"><li>• If <b>type</b> is set to <b>HOST_NAME</b>, <b>key</b> is always an empty string and <b>value</b> indicates the domain name. Each value can contain 1 to 128 characters, including letters, digits, hyphens (-), periods (.), and asterisks (*), and must start with a letter, digit, or asterisk (*). If you want to use a wildcard domain name, enter an asterisk (*) as the leftmost label of the domain name.</li><li>• If <b>type</b> is set to <b>PATH</b>, <b>key</b> is always an empty string and <b>value</b> indicates the request path, which can contain 1 to 128 characters. If <b>compare_type</b> is set to <b>STARTS_WITH</b> or <b>EQUAL_TO</b> for a forwarding rule, the value must start with a slash (/) and can contain only letters, digits, and special characters: _~';@^-%#&amp;\$.*+?,:! \()/[]{}.</li><li>• If <b>type</b> is set to <b>HEADER</b>, <b>key</b> indicates the name of the HTTP header parameter, and <b>value</b> indicates the value of the request header parameter. The value can contain 1 to 128 characters. Asterisks (*) and question marks (?) are allowed, but spaces and double quotation marks are not allowed. An asterisk can match zero or more characters, and a question mark can match one character.</li><li>• If <b>type</b> is set to <b>QUERY_STRING</b>, <b>key</b> indicates the name of the query parameter, and <b>value</b> indicates the value of the query parameter. The value is case sensitive and can contain 1 to 128 characters. Spaces, square brackets ([ ]), curly brackets ({}), angle</li></ul> |

| Parameter | Type | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-----------|------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|           |      | <p>brackets (&lt; &gt;), backslashes (\), double quotation marks (" "), pound signs (#), ampersands (&amp;), vertical bars ( ), percent signs (%), and tildes (~) are not allowed. Asterisks (*) and question marks (?) are allowed. An asterisk can match zero or more characters, and a question mark can match one character.</p> <ul style="list-style-type: none"><li>• If <b>type</b> is set to <b>METHOD</b>, <b>key</b> is always an empty string and <b>value</b> indicates the HTTP method. The value can be <b>GET</b>, <b>PUT</b>, <b>POST</b>, <b>DELETE</b>, <b>PATCH</b>, <b>HEAD</b>, or <b>OPTIONS</b>.</li><li>• If <b>type</b> is set to <b>SOURCE_IP</b>, <b>key</b> is always an empty string and <b>value</b> indicates the source IP address of the request. The value is an IPv4 or IPv6 CIDR block, for example, 192.168.0.2/32 or 2049::49/64.</li></ul> <p><b>Default value:</b> N/A</p> |

## Example Requests

Querying forwarding rules

```
GET https://{ELB_Endpoint}/v3/{99a3fff0d03c428eac3678da6a7d0f24}/elb/l7policies/rules
```

## Example Responses

**Status code: 200**

Successful request.

```
{

```

Status Codes

| Status Code | Description         |
|-------------|---------------------|
| 200         | Successful request. |

Error Codes

See [Error Codes](#).

5.15.4 Viewing the Details of a Forwarding Rule

Function

This API is used to view the details of a forwarding rule.

Calling Method

For details, see [Calling APIs](#).

URI

GET /v3/{project\_id}/elb/l7policies/{l7policy\_id}/rules/{l7rule\_id}

Table 5-760 Path Parameters

| Parameter   | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                |

## Example Requests

Querying the details of a given forwarding rule

```
GET https://{ELB_Endpoint}/v3/{99a3fff0d03c428eac3678da6a7d0f24}/elb/l7policies/cf4360fd-8631-41ff-a6f5-b72c35da74be/rules/84f4fcae-9c15-4e19-a99f-72c0b08fd3d7
```

## Example Responses

**Status code: 200**

OK

```
{
 "rule" : {
 "compare_type" : "STARTS_WITH",
 "provisioning_status" : "ACTIVE",
 "project_id" : "99a3fff0d03c428eac3678da6a7d0f24",
 "invert" : false,
 "admin_state_up" : true,
 "value" : "/ccc.html",
 "key" : null,
 "type" : "PATH",
 "id" : "84f4fcae-9c15-4e19-a99f-72c0b08fd3d7"
 },
 "request_id" : "0d799435-259e-459f-b2bc-0beee06f6a77"
}
```

## SDK Sample Code

The SDK sample code is as follows.

### Java

```
package com.huaweicloud.sdk.test;

See [Error Codes](#).

# 5.15.5 Updating a Forwarding Rule

## Function

This API is used to update a forwarding rule.

## Calling Method

For details, see [Calling APIs](#).

## URI

PUT /v3/{project\_id}/elb/l7policies/{l7policy\_id}/rules/{l7rule\_id}

**Table 5-765** Path Parameters

## Example Requests

### Modifying a forwarding rule

PUT https://{ELB\_Endpoint}/v3/{99a3fff0d03c428eac3678da6a7d0f24}/elb/l7policies/cf4360fd-8631-41ff-a6f5-b72c35da74be/rules/84f4fcae-9c15-4e19-a99f-72c0b08fd3d7

```
{
 "rule" : {
 "compare_type" : "STARTS_WITH",
 "value" : "/ccc.html"
 }
}
```

## Example Responses

### Status code: 200

Successful request.

```
{
 "rule" : {
 "compare_type" : "STARTS_WITH",
 "provisioning_status" : "ACTIVE",
 "project_id" : "99a3fff0d03c428eac3678da6a7d0f24",
 "invert" : false,
 "admin_state_up" : true,
 "value" : "/ccc.html",
 "key" : null,
 "type" : "PATH",
 }
}
```

```
"id" : "84f4fcae-9c15-4e19-a99f-72c0b08fd3d7"
},
"request_id" : "133096f9-e754-430d-a2c2-e61fe1190aa8"
}
```

## SDK Sample Code

The SDK sample code is as follows.

### Java

#### Modifying a forwarding rule

```
package com.huaweicloud.sdk.test;

## 5.16 Active/Standby Backend Server Group

### 5.16.1 Creating an Active/Standby Backend Server Group

#### Function

This API is used to create an active/standby backend server group.

#### Constraints

Note the following when you create a backend server group:

- If **session\_persistence** is specified, **cookie\_name** is available only when **type** is set to **APP\_COOKIE**.
- If **listener\_id** is specified, the listener must have no backend server group associated.

#### Calling Method

For details, see [Calling APIs](#).

#### URI

POST /v3/{project\_id}/elb/master-slave-pools

| Parameter        | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|------------------|--------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| listener_id      | String | <b>Definition:</b> Specifies the ID of the listener associated with the backend server.<br><b>Range:</b> N/A                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| operating_status | String | <b>Definition:</b> Specifies the operating status of the backend server.<br><b>Range:</b> <ul style="list-style-type: none"><li>• <b>ONLINE:</b> The backend server is running normally.</li><li>• <b>NO_MONITOR:</b> No health check is configured for the backend server group to which the backend server belongs.</li><li>• <b>OFFLINE:</b> The cloud server used as the backend server is stopped or does not exist.</li><li>• <b>INITIAL:</b> Initial status of the backend server when health check is enabled.</li><li>• <b>UNKNOWN:</b> The backend server group is not associated with a listener or the backend server is not associated with an ECS.</li></ul> |

**Table 5-791** SessionPersistence

| Parameter   | Type   | Description                                                                                                                           |
|-------------|--------|---------------------------------------------------------------------------------------------------------------------------------------|
| cookie_name | String | <b>Definition:</b> Specifies the cookie name.<br><b>Range:</b> The value can contain a maximum of 1,024 characters.                   |
| type        | String | <b>Definition:</b> Specifies the sticky session type.<br><b>Range:</b> <b>SOURCE_IP</b> , <b>HTTP_COOKIE</b> , or <b>APP_COOKIE</b> . |

| Parameter           | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|---------------------|---------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| persistence_timeout | Integer | <b>Definition:</b> Specifies the stickiness duration, in minutes. This parameter will not take effect when <b>type</b> is set to <b>APP_COOKIE</b> .<br><b>Range:</b> <ul style="list-style-type: none"><li>If the protocol of the backend server group is TCP, UDP, or QUIC, the value ranges from <b>1</b> to <b>60</b>, and the default value is <b>1</b>.</li><li>If the protocol of the backend server group is HTTP or HTTPS, the value ranges from <b>1</b> to <b>1440</b>, and the default value is <b>1440</b>.</li></ul> |

**Table 5-792** MasterSlaveHealthMonitor

| Parameter      | Type    | Description                                                                                                                                                                                                                                                                                    |
|----------------|---------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| admin_state_up | Boolean | <b>Definition:</b> Specifies the administrative status of the health check.<br><b>Range:</b> <ul style="list-style-type: none"><li><b>true:</b> The health check function is enabled.</li><li><b>false:</b> The health check function is disabled.</li></ul>                                   |
| delay          | Integer | <b>Definition:</b> Specifies the interval between health checks, in seconds.<br><b>Range:</b> <b>1</b> to <b>50</b>                                                                                                                                                                            |
| domain_name    | String  | <b>Definition:</b> Specifies the domain name that HTTP requests are sent to during the health check.<br><b>Range:</b> The value can contain only digits, letters, hyphens (-), and periods (.) and must start with a digit or letter.                                                          |
| expected_codes | String  | <b>Definition:</b> Specifies the expected HTTP status code.<br><b>Range:</b> <ul style="list-style-type: none"><li>A specific value, for example, 200</li><li>A list of values that are separated with commas (,), for example, 200, 202</li><li>A value range, for example, 200-204</li></ul> |

| Parameter        | Type    | Description                                                                                                                                                                                                                                                                                                                                                                 |
|------------------|---------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| http_method      | String  | <b>Definition:</b> Specifies the HTTP method.<br><b>Range:</b> GET, HEAD, or POST                                                                                                                                                                                                                                                                                           |
| id               | String  | Specifies the health check ID.<br><b>Default value:</b> N/A                                                                                                                                                                                                                                                                                                                 |
| max_retries      | Integer | <b>Definition:</b> Specifies the number of consecutive health checks when the health check result of a backend server changes from <b>OFFLINE</b> to <b>ONLINE</b> .<br><b>Range:</b> 1 to 10                                                                                                                                                                               |
| max_retries_down | Integer | <b>Definition:</b> Specifies the number of consecutive health checks when the health check result of a backend server changes from <b>ONLINE</b> to <b>OFFLINE</b> .<br><b>Range:</b> 1 to 10                                                                                                                                                                               |
| monitor_port     | Integer | Specifies the port used for the health check.<br><b>Range:</b> 1 to 65535                                                                                                                                                                                                                                                                                                   |
| name             | String  | <b>Definition:</b> Specifies the health check name.<br><b>Range:</b> N/A                                                                                                                                                                                                                                                                                                    |
| timeout          | Integer | <b>Definition:</b> Specifies the maximum time required for waiting for a response from the health check, in seconds.<br><b>Range:</b> N/A                                                                                                                                                                                                                                   |
| type             | String  | <b>Definition:</b> Specifies the health check protocol.<br><b>Range:</b> The value can be <b>TCP</b> , <b>UDP_CONNECT</b> , <b>HTTP</b> , or <b>HTTPS</b> .                                                                                                                                                                                                                 |
| url_path         | String  | <b>Definition:</b> Specifies the HTTP request path for the health check. The value must start with a slash (/), and the default value is /.<br><b>Range:</b> The value can contain letters, digits, hyphens (-), slashes (/), periods (.), percentage signs (%), question marks (?), pound signs (#), ampersand signs (&), and the extended character set: _~!()*[]@\$^',+. |

**Table 5-793** ConnectionDrain

| Parameter | Type    | Description                                                                                                                                                                                                                                |
|-----------|---------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| enable    | Boolean | <b>Definition:</b> Specifies whether to enable <b>connection_drain</b> .<br><b>Constraints:</b> N/A<br><b>Range:</b> The value can be <b>true</b> (enable this option) or <b>false</b> (disable this option).<br><b>Default value:</b> N/A |
| timeout   | Integer | <b>Definition:</b> Specifies the deregistration delay timeout, in seconds.<br><b>Constraints:</b> N/A<br><b>Range:</b> 10 to 4000<br><b>Constraints:</b> N/A                                                                               |

**Table 5-794** QuicCidHashStrategy

| Parameter | Type    | Description                                                                                                                                                                                                                                             |
|-----------|---------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| len       | Integer | <b>Definition:</b> Specifies the length of the hash factor in the connection ID.<br><b>Constraints:</b> This parameter is valid only when the load balancing algorithm is <b>QUIC_CID</b> .<br><b>Range:</b> 1 to 20<br><b>Default value:</b> 3         |
| offset    | Integer | <b>Definition:</b> Specifies the start position in the connection ID as the hash factor.<br><b>Constraints:</b> This parameter is valid only when the load balancing algorithm is <b>QUIC_CID</b> .<br><b>Range:</b> 0 to 19<br><b>Default value:</b> 1 |

## More

For SDK sample code of more programming languages, see the Sample Code tab in [API Explorer](#). SDK sample code can be automatically generated.

## Status Codes

| Status Code | Description         |
|-------------|---------------------|
| 201         | Successful request. |

## Error Codes

See [Error Codes](#).

## 5.16.2 Querying Active/Standby Backend Server Groups

### Function

This API is used to query all active/standby backend server groups.

### Constraints

This API has the following constraints:

- Parameters **marker**, **limit**, and **page\_reverse** are used for pagination query.
- Parameters **marker** and **page\_reverse** take effect only when they are used together with parameter **limit**.

### Calling Method

For details, see [Calling APIs](#).

### URI

GET /v3/{project\_id}/elb/master-slave-pools

**Table 5-795** Path Parameters

| Parameter  | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                |
|------------|-----------|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| project_id | Yes       | String | <b>Definition:</b> Specifies the project ID. For details about how to obtain a project ID, see <a href="#">Obtaining a Project ID</a> .<br><b>Constraints:</b> N/A<br><b>Range:</b> The value can contain a maximum of 32 characters, including digits and lowercase letters.<br><b>Default value:</b> N/A |

**Table 5-796** Query Parameters

| Parameter | Mandatory | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                                    |

| Parameter      | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                          |
|----------------|---------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| id             | String  | Specifies the backend server ID.<br><b>Range:</b> N/A                                                                                                                                                                                                                                                                                                                                                                |
| name           | String  | <b>Definition:</b> Specifies the backend server name.<br><b>Range:</b> N/A                                                                                                                                                                                                                                                                                                                                           |
| admin_state_up | Boolean | <b>Definition:</b> Specifies the administrative status of the backend server.<br>Although this parameter can be used in the APIs for creating and updating backend servers, its actual value depends on whether ECSs exist. If ECSs exist, the value is <b>true</b> . Otherwise, the value is <b>false</b> .<br><b>Range:</b> <b>true</b> or <b>false</b>                                                            |
| subnet_cidr_id | String  | Specifies the ID of the IPv4 or IPv6 subnet where the backend server works.<br>If <b>ip_target_enable</b> is set to <b>true</b> , this parameter can be left blank, indicating that an IP as backend server will be added. In this case, IP as backend servers must use private IPv4 addresses, and the protocol of the backend server group must be TCP, UDP, TLS, HTTP, HTTPS, QUIC, or GRPC.<br><b>Range:</b> N/A |
| protocol_port  | Integer | <b>Definition:</b> Specifies the port used by the backend server to receive requests.<br><b>NOTE</b><br>This parameter can be left blank because it does not take effect if <b>any_port_enable</b> is set to <b>true</b> for a backend server group.                                                                                                                                                                 |
| address        | String  | <b>Definition:</b> Specifies the IP address of the backend server<br><b>Range:</b> N/A                                                                                                                                                                                                                                                                                                                               |
| ip_version     | String  | <b>Definition:</b> Specifies the IP address version supported by the backend server. The version depends on the value of <b>address</b> returned by the system.<br><b>Range:</b> <b>v4</b> or <b>v6</b>                                                                                                                                                                                                              |

| Parameter        | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|------------------|--------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| device_owner     | String | <p><b>Definition:</b> Specifies whether the backend server is associated with an ECS.</p> <p><b>Range:</b></p> <ul style="list-style-type: none"><li>• If this parameter is left blank, the backend server is not associated with an ECS.</li><li>• If the value is <b>compute:{az_name}</b>, the backend server is associated with an ECS. <b>{az_name}</b> indicates the AZ where the ECS resides.</li><li>• If the value is <b>compute:subeni</b>, supplementary network interfaces are added as backend servers.</li></ul> <p>This parameter is unsupported. Please do not use it.</p>                                                                                                                                                       |
| device_id        | String | <p><b>Definition:</b> Specifies the ID of the ECS with which the backend server is associated. If this parameter is left blank, the backend server is not associated with an ECS.</p> <p><b>Range:</b> N/A</p> <p>This parameter is unsupported. Please do not use it.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| operating_status | String | <p><b>Definition:</b> Specifies the operating status of the backend server if <b>listener_id</b> under <b>status</b> is not specified.</p> <p><b>Range:</b></p> <ul style="list-style-type: none"><li>• <b>ONLINE:</b> The backend server is running normally.</li><li>• <b>NO_MONITOR:</b> No health check is configured for the backend server group to which the backend server belongs.</li><li>• <b>OFFLINE:</b> The cloud server used as the backend server is stopped or does not exist.</li><li>• <b>INITIAL:</b> Initial status of the backend server when health check is enabled.</li><li>• <b>UNKNOWN:</b> The backend server group is not associated with a listener or the backend server is not associated with an ECS.</li></ul> |

| Parameter   | Type                                                 | Description                                                                                                                                                                                                                                                              |
|-------------|------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| reason      | <a href="#">MemberHealthCheckFailedReason</a> object | <b>Definition:</b> Specifies why the health check fails.                                                                                                                                                                                                                 |
| member_type | String                                               | <b>Definition:</b> Specifies the type of the backend server.<br><b>Range:</b> <ul style="list-style-type: none"><li>• <b>ip:</b> IP as backend servers</li><li>• <b>instance:</b> ECSs used as backend servers</li></ul>                                                 |
| instance_id | String                                               | <b>Definition:</b> Specifies the ID of the instance associated with the backend server. If this parameter is left blank, the backend server is not a real device. It may be an IP address.<br><b>Range:</b> N/A                                                          |
| role        | String                                               | <b>Definition:</b> Specifies the type of the backend server.<br><b>Range:</b> N/A                                                                                                                                                                                        |
| status      | Array of <a href="#">ListenerMemberInfo</a> objects  | <b>Definition:</b> Specifies the health status of the backend server if <b>listener_id</b> under <b>status</b> is specified. If <b>listener_id</b> under <b>status</b> is not specified, <b>operating_status</b> of <b>member</b> takes precedence.<br><b>Range:</b> N/A |

| delay          | Integer | <b>Definition:</b> Specifies the interval between health checks, in seconds.<br><b>Range:</b> <b>1</b> to <b>50</b>                                                                                                                                                                            |
| domain_name    | String  | <b>Definition:</b> Specifies the domain name that HTTP requests are sent to during the health check.<br><b>Range:</b> The value can contain only digits, letters, hyphens (-), and periods (.) and must start with a digit or letter.                                                          |
| expected_codes | String  | <b>Definition:</b> Specifies the expected HTTP status code.<br><b>Range:</b> <ul style="list-style-type: none"><li>A specific value, for example, 200</li><li>A list of values that are separated with commas (,), for example, 200, 202</li><li>A value range, for example, 200-204</li></ul> |

| Parameter        | Type    | Description                                                                                                                                                                                                                                                                                                                                                                |
|------------------|---------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| http_method      | String  | <b>Definition:</b> Specifies the HTTP method.<br><b>Range:</b> GET, HEAD, or POST                                                                                                                                                                                                                                                                                          |
| id               | String  | Specifies the health check ID.<br><b>Default value:</b> N/A                                                                                                                                                                                                                                                                                                                |
| max_retries      | Integer | <b>Definition:</b> Specifies the number of consecutive health checks when the health check result of a backend server changes from <b>OFFLINE</b> to <b>ONLINE</b> .<br><b>Range:</b> 1 to 10                                                                                                                                                                              |
| max_retries_down | Integer | <b>Definition:</b> Specifies the number of consecutive health checks when the health check result of a backend server changes from <b>ONLINE</b> to <b>OFFLINE</b> .<br><b>Range:</b> 1 to 10                                                                                                                                                                              |
| monitor_port     | Integer | Specifies the port used for the health check.<br><b>Range:</b> 1 to 65535                                                                                                                                                                                                                                                                                                  |
| name             | String  | <b>Definition:</b> Specifies the health check name.<br><b>Range:</b> N/A                                                                                                                                                                                                                                                                                                   |
| timeout          | Integer | <b>Definition:</b> Specifies the maximum time required for waiting for a response from the health check, in seconds.<br><b>Range:</b> N/A                                                                                                                                                                                                                                  |
| type             | String  | <b>Definition:</b> Specifies the health check protocol.<br><b>Range:</b> The value can be TCP, UDP_CONNECT, HTTP, or HTTPS.                                                                                                                                                                                                                                                |
| url_path         | String  | <b>Definition:</b> Specifies the HTTP request path for the health check. The value must start with a slash (/), and the default value is /.<br><b>Range:</b> The value can contain letters, digits, hyphens (-), slashes (/), periods (.), percentage signs (%), question marks (?), pound signs (#), ampersand signs (&), and the extended character set: _~!()*[]@\$^'+. |

**Table 5-808** ConnectionDrain

| Parameter | Type    | Description                                                                                                                                                                                                                                |
|-----------|---------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| enable    | Boolean | <b>Definition:</b> Specifies whether to enable <b>connection_drain</b> .<br><b>Constraints:</b> N/A<br><b>Range:</b> The value can be <b>true</b> (enable this option) or <b>false</b> (disable this option).<br><b>Default value:</b> N/A |
| timeout   | Integer | <b>Definition:</b> Specifies the deregistration delay timeout, in seconds.<br><b>Constraints:</b> N/A<br><b>Range:</b> 10 to 4000<br><b>Constraints:</b> N/A                                                                               |

**Table 5-809** QuicCidHashStrategy

| Parameter | Type    | Description                                                                                                                                                                                                                                             |
|-----------|---------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| len       | Integer | <b>Definition:</b> Specifies the length of the hash factor in the connection ID.<br><b>Constraints:</b> This parameter is valid only when the load balancing algorithm is <b>QUIC_CID</b> .<br><b>Range:</b> 1 to 20<br><b>Default value:</b> 3         |
| offset    | Integer | <b>Definition:</b> Specifies the start position in the connection ID as the hash factor.<br><b>Constraints:</b> This parameter is valid only when the load balancing algorithm is <b>QUIC_CID</b> .<br><b>Range:</b> 0 to 19<br><b>Default value:</b> 1 |

## Example Requests

```
GET https://{ELB_Endpoint}/v3/99a3fff0d03c428eac3678da6a7d0f24/elb/master-slave-pools?limit=2
```

## Example Responses

**Status code: 200**

Successful request.

```

## More

For SDK sample code of more programming languages, see the Sample Code tab in [API Explorer](#). SDK sample code can be automatically generated.

## Status Codes

| Status Code | Description         |
|-------------|---------------------|
| 200         | Successful request. |

## Error Codes

See [Error Codes](#).

## 5.16.3 Viewing the Details of an Active/Standby Backend Server Group

### Function

This API is used to view the details of an active/standby backend server group.

### Calling Method

For details, see [Calling APIs](#).

### URI

GET /v3/{project\_id}/elb/master-slave-pools/{pool\_id}

**Table 5-810** Path Parameters

| Parameter  | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                |

**Table 5-814** ListenerRef

| Parameter | Type   | Description                                                        |
|-----------|--------|--------------------------------------------------------------------|
| id        | String | <b>Definition:</b> Specifies the listener ID.<br><b>Range:</b> N/A |

**Table 5-815** LoadBalancerRef

| Parameter | Type   | Description                                                             |
|-----------|--------|-------------------------------------------------------------------------|
| id        | String | <b>Definition:</b> Specifies the load balancer ID.<br><b>Range:</b> N/A |

**Table 5-816** MasterSlaveMember

| Parameter | Type   | Description                                                                |
|-----------|--------|----------------------------------------------------------------------------|
| id        | String | Specifies the backend server ID.<br><b>Range:</b> N/A                      |
| name      | String | <b>Definition:</b> Specifies the backend server name.<br><b>Range:</b> N/A |

| Parameter      | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                              |
|----------------|---------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| admin_state_up | Boolean | <b>Definition:</b> Specifies the administrative status of the backend server.<br><br>Although this parameter can be used in the APIs for creating and updating backend servers, its actual value depends on whether ECSs exist. If ECSs exist, the value is <b>true</b> . Otherwise, the value is <b>false</b> .<br><b>Range:</b> <b>true</b> or <b>false</b>                                                            |
| subnet_cidr_id | String  | Specifies the ID of the IPv4 or IPv6 subnet where the backend server works.<br><br>If <b>ip_target_enable</b> is set to <b>true</b> , this parameter can be left blank, indicating that an IP as backend server will be added. In this case, IP as backend servers must use private IPv4 addresses, and the protocol of the backend server group must be TCP, UDP, TLS, HTTP, HTTPS, QUIC, or GRPC.<br><b>Range:</b> N/A |
| protocol_port  | Integer | <b>Definition:</b> Specifies the port used by the backend server to receive requests.<br><b>NOTE</b><br>This parameter can be left blank because it does not take effect if <b>any_port_enable</b> is set to <b>true</b> for a backend server group.                                                                                                                                                                     |
| address        | String  | <b>Definition:</b> Specifies the IP address of the backend server<br><b>Range:</b> N/A                                                                                                                                                                                                                                                                                                                                   |
| ip_version     | String  | <b>Definition:</b> Specifies the IP address version supported by the backend server. The version depends on the value of <b>address</b> returned by the system.<br><b>Range:</b> <b>v4</b> or <b>v6</b>                                                                                                                                                                                                                  |

| Parameter        | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|------------------|--------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| device_owner     | String | <p><b>Definition:</b> Specifies whether the backend server is associated with an ECS.</p> <p><b>Range:</b></p> <ul style="list-style-type: none"><li>• If this parameter is left blank, the backend server is not associated with an ECS.</li><li>• If the value is <b>compute:{az_name}</b>, the backend server is associated with an ECS. <b>{az_name}</b> indicates the AZ where the ECS resides.</li><li>• If the value is <b>compute:subeni</b>, supplementary network interfaces are added as backend servers.</li></ul> <p>This parameter is unsupported. **Table 5-818** ListenerMemberInfo

| Parameter        | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|------------------|--------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| listener_id      | String | <b>Definition:</b> Specifies the ID of the listener associated with the backend server.<br><b>Range:</b> N/A                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| operating_status | String | <b>Definition:</b> Specifies the operating status of the backend server.<br><b>Range:</b> <ul style="list-style-type: none"><li>• <b>ONLINE:</b> The backend server is running normally.</li><li>• <b>NO_MONITOR:</b> No health check is configured for the backend server group to which the backend server belongs.</li><li>• <b>OFFLINE:</b> The cloud server used as the backend server is stopped or does not exist.</li><li>• <b>INITIAL:</b> Initial status of the backend server when health check is enabled.</li><li>• <b>UNKNOWN:</b> The backend server group is not associated with a listener or the backend server is not associated with an ECS.</li></ul> |

**Table 5-819** SessionPersistence

| Parameter   | Type   | Description                                                                                                                           |
|-------------|--------|---------------------------------------------------------------------------------------------------------------------------------------|
| cookie_name | String | <b>Definition:</b> Specifies the cookie name.<br><b>Range:</b> The value can contain a maximum of 1,024 characters.                   |
| type        | String | <b>Definition:</b> Specifies the sticky session type.<br><b>Range:</b> <b>SOURCE_IP</b> , <b>HTTP_COOKIE</b> , or <b>APP_COOKIE</b> . |

| Parameter           | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|---------------------|---------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| persistence_timeout | Integer | <b>Definition:</b> Specifies the stickiness duration, in minutes. This parameter will not take effect when <b>type</b> is set to <b>APP_COOKIE</b> .<br><b>Range:</b> <ul style="list-style-type: none"><li>If the protocol of the backend server group is TCP, UDP, or QUIC, the value ranges from <b>1</b> to <b>60</b>, and the default value is <b>1</b>.</li><li>If the protocol of the backend server group is HTTP or HTTPS, the value ranges from <b>1</b> to <b>1440</b>, and the default value is <b>1440</b>.</li></ul> |

**Table 5-820** MasterSlaveHealthMonitor

| Parameter      | Type    | Description                                                                                                                                                                                                                                                                                    |
|----------------|---------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| admin_state_up | Boolean | <b>Definition:</b> Specifies the administrative status of the health check.<br><b>Range:</b> <ul style="list-style-type: none"><li><b>true:</b> The health check function is enabled.</li><li><b>false:</b> The health check function is disabled.</li></ul>                                   |
| delay          | Integer | <b>Definition:</b> Specifies the interval between health checks, in seconds.<br><b>Range:</b> <b>1</b> to <b>50</b>                                                                                                                                                                            |
| domain_name    | String  | <b>Definition:</b> Specifies the domain name that HTTP requests are sent to during the health check.<br><b>Range:</b> The value can contain only digits, letters, hyphens (-), and periods (.) and must start with a digit or letter.                                                          |
| expected_codes | String  | <b>Definition:</b> Specifies the expected HTTP status code.<br><b>Range:</b> <ul style="list-style-type: none"><li>A specific value, for example, 200</li><li>A list of values that are separated with commas (,), for example, 200, 202</li><li>A value range, for example, 200-204</li></ul> |

| Parameter        | Type    | Description                                                                                                                                                                                                                                                                                                                                                                 |
|------------------|---------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| http_method      | String  | <b>Definition:</b> Specifies the HTTP method.<br><b>Range:</b> GET, HEAD, or POST                                                                                                                                                                                                                                                                                           |
| id               | String  | Specifies the health check ID.<br><b>Default value:</b> N/A                                                                                                                                                                                                                                                                                                                 |
| max_retries      | Integer | <b>Definition:</b> Specifies the number of consecutive health checks when the health check result of a backend server changes from <b>OFFLINE</b> to <b>ONLINE</b> .<br><b>Range:</b> 1 to 10                                                                                                                                                                               |
| max_retries_down | Integer | <b>Definition:</b> Specifies the number of consecutive health checks when the health check result of a backend server changes from <b>ONLINE</b> to <b>OFFLINE</b> .<br><b>Range:</b> 1 to 10                                                                                                                                                                               |
| monitor_port     | Integer | Specifies the port used for the health check.<br><b>Range:</b> 1 to 65535                                                                                                                                                                                                                                                                                                   |
| name             | String  | <b>Definition:</b> Specifies the health check name.<br><b>Range:</b> N/A                                                                                                                                                                                                                                                                                                    |
| timeout          | Integer | <b>Definition:</b> Specifies the maximum time required for waiting for a response from the health check, in seconds.<br><b>Range:</b> N/A                                                                                                                                                                                                                                   |
| type             | String  | <b>Definition:</b> Specifies the health check protocol.<br><b>Range:</b> The value can be <b>TCP</b> , <b>UDP_CONNECT</b> , <b>HTTP</b> , or <b>HTTPS</b> .                                                                                                                                                                                                                 |
| url_path         | String  | <b>Definition:</b> Specifies the HTTP request path for the health check. The value must start with a slash (/), and the default value is /.<br><b>Range:</b> The value can contain letters, digits, hyphens (-), slashes (/), periods (.), percentage signs (%), question marks (?), pound signs (#), ampersand signs (&), and the extended character set: _~!()*[]@\$%^'+. |

**Table 5-821** ConnectionDrain

| Parameter | Type    | Description                                                                                                                                                                                                                                |
|-----------|---------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| enable    | Boolean | <b>Definition:</b> Specifies whether to enable <b>connection_drain</b> .<br><b>Constraints:</b> N/A<br><b>Range:</b> The value can be <b>true</b> (enable this option) or <b>false</b> (disable this option).<br><b>Default value:</b> N/A |
| timeout   | Integer | <b>Definition:</b> Specifies the deregistration delay timeout, in seconds.<br><b>Constraints:</b> N/A<br><b>Range:</b> 10 to 4000<br><b>Constraints:</b> N/A                                                                               |

**Table 5-822** QuicCidHashStrategy

| Parameter | Type    | Description                                                                                                                                                                                                                                             |
|-----------|---------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| len       | Integer | <b>Definition:</b> Specifies the length of the hash factor in the connection ID.<br><b>Constraints:</b> This parameter is valid only when the load balancing algorithm is <b>QUIC_CID</b> .<br><b>Range:</b> 1 to 20<br><b>Default value:</b> 3         |
| offset    | Integer | <b>Definition:</b> Specifies the start position in the connection ID as the hash factor.<br><b>Constraints:</b> This parameter is valid only when the load balancing algorithm is <b>QUIC_CID</b> .<br><b>Range:</b> 0 to 19<br><b>Default value:</b> 1 |

## Example Requests

```
GET https://{ELB_Endpoint}/v3/99a3fff0d03c428eac3678da6a7d0f24/elb/master-slave-pools/36ce7086-a496-4666-9064-5ba0e6840c75
```

## Example Responses

**Status code: 200**

Successful request.

## 5.16.4 Deleting an Active/Standby Backend Server Group

### Function

This API is used to delete an active/standby backend server group.

### Constraints

Deleting an active/standby backend server group will also delete all its backend servers and health checks.

### Calling Method

For details, see [Calling APIs](#).

### URI

DELETE /v3/{project\_id}/elb/master-slave-pools/{pool\_id}

**Table 5-823** Path Parameters

| Parameter  | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                |
|------------|-----------|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

 "github.com/huaweicloud/huaweicloud-sdk-go-v3/services/elb/v3/model"
 region "github.com/huaweicloud/huaweicloud-sdk-go-v3/services/elb/v3/region"
)

func main() {
 // The AK and SK used for authentication are hard-coded or stored in plaintext, which has great security
 risks. It is recommended that the AK and SK be stored in ciphertext in configuration files or environment
 variables and decrypted during use to ensure security.
 // In this example, AK and SK are stored in environment variables for authentication. Before running this
 example, set environment variables CLOUD_SDK_AK and CLOUD_SDK_SK in the local environment
 ak := os.Getenv("CLOUD_SDK_AK")
 sk := os.Getenv("CLOUD_SDK_SK")
 projectId := "{project_id}"

 auth := basic.NewCredentialsBuilder().
 WithAk(ak).
 WithSk(sk).
 WithProjectId(projectId).
 Build()

 client := elb.NewElbClient(
 elb.ElClientBuilder().
 WithRegion(region.ValueOf("<YOUR REGION>")).
```

```
WithCredential(auth).
Build())

request := &model.CreateLogtankRequest{}
logtankbody := &model.CreateLogtankOption{
 LoadbalancerId: "47ecc304-3f1a-4cc6-9c1c-72add483b9ce",
 LogGroupId: "7733882e-f7fa-4fb0-a460-0605c48a2280",
 LogTopicId: "5b9b8370-a1fc-4c59-a509-483a673c8a94",
}
request.Body = &model.CreateLogtankRequestBody{
 Logtank: logtankbody,
}
response, err := client.CreateLogtank(request)
if err == nil {
 fmt.Printf("%+v\n", response)
} else {
 fmt.Println(err)
}
```

## More

For SDK sample code of more programming languages, see the Sample Code tab in [API Explorer](#). SDK sample code can be automatically generated.

## Status Codes

| Status Code | Description |
|-------------|-------------|
| 201         | Created     |

## Error Codes

See [Error Codes](#).

## 5.17.2 Querying Logs

### Function

This API is used to query logs.

### Constraints

This API has the following constraints:

- Parameters **marker**, **limit**, and **page\_reverse** are used for pagination query.
- Parameters **marker** and **page\_reverse** take effect only when they are used together with parameter **limit**.

### Calling Method

For details, see [Calling APIs](#).

## URI

GET /v3/{project\_id}/elb/logtanks

```

## More

For SDK sample code of more programming languages, see the Sample Code tab in [API Explorer](#). SDK sample code can be automatically generated.

## Status Codes

| Status Code | Description |
|-------------|-------------|
| 200         | OK          |

## Error Codes

See [Error Codes](#).

## 5.17.4 Updating a Log

### Function

This API is used to update a log.

### Calling Method

For details, see [Calling APIs](#).

### URI

PUT /v3/{project\_id}/elb/logtanks/{logtank\_id}

**Table 5-841** Path Parameters

| Parameter  | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                |

## Request Parameters

None

## Response Parameters

**Status code:** 200

**Table 5-851** Response body parameters

| Parameter | Type                                     | Description                                              |
|-----------|------------------------------------------|----------------------------------------------------------|
| jobs      | Array of <a href="#">MainJob</a> objects | <b>Definition:</b> Specifies the task list.              |
| page_info | <a href="#">PageInfo</a> object          | <b>Definition:</b> Specifies the pagination information. |

| Parameter  | Type   | Description                                                                                                                                                                          |
|------------|--------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| request_id | String | <b>Definition:</b> Specifies the request ID.<br><b>Range:</b> The value is automatically generated, and can contain characters including digits, lowercase letters, and hyphens (-). |

**Table 5-852** MainJob

| Parameter   | Type                           | Description                                    |
|-------------|--------------------------------|------------------------------------------------|
| status      | String                         | Specifies the task status.                     |
| begin_time  | String                         | Specifies the time when the task was started.  |
| end_time    | String                         | Specifies the time when the task was ended.    |
| job_id      | String                         | Specifies the task ID.                         |
| job_type    | String                         | Specifies the task type.                       |
| error_code  | String                         | Specifies the task error code.                 |
| error_msg   | String                         | Specifies the task error message.              |
| project_id  | String                         | Specifies the project ID.                      |
| resource_id | String                         | <b>Definition:</b> Specifies the resource ID.  |
| sub_jobs    | Array of <b>SubJob</b> objects | <b>Definition:</b> Specifies the subtask list. |

**Table 5-853** SubJob

| Parameter  | Type   | Description                                   |
|------------|--------|-----------------------------------------------|
| status     | String | Specifies the task status.                    |
| begin_time | String | Specifies the time when the task was started. |
| end_time   | String | Specifies the time when the task was ended.   |
| job_id     | String | Specifies the task ID.                        |
| job_type   | String | Specifies the task type.                      |
| error_code | String | Specifies the task error code.                |

| Parameter   | Type                                         | Description                                                             |
|-------------|----------------------------------------------|-------------------------------------------------------------------------|
| error_msg   | String                                       | Specifies the task error message.                                       |
| project_id  | String                                       | Specifies the project ID.                                               |
| resource_id | String                                       | <b>Definition:</b> Specifies the resource ID.                           |
| entities    | Array of <a href="#">JobEntities</a> objects | <b>Definition:</b> Specifies the resource to be processed in a subtask. |

**Table 5-854** JobEntities

| Parameter     | Type   | Description                                                                                           |
|---------------|--------|-------------------------------------------------------------------------------------------------------|
| resource_id   | String | <b>Definition:</b> Specifies the ID of the resource associated with a subtask.<br><b>Range:</b> N/A   |
| resource_type | String | <b>Definition:</b> Specifies the type of the resource associated with a subtask.<br><b>Range:</b> N/A |

**Table 5-855** PageInfo

| Parameter       | Type    | Description                                                                                                                                                                                                                          |
|-----------------|---------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| previous_marker | String  | <b>Definition:</b> Specifies the ID of the first record in the pagination query result. If <b>page_reverse</b> is set to <b>true</b> , this parameter is used together to query resources on the previous page.<br><b>Range:</b> N/A |
| next_marker     | String  | <b>Definition:</b> Specifies the ID of the last record in the pagination query result. It is usually used to query resources on the next page.<br><b>Range:</b> N/A                                                                  |
| current_count   | Integer | <b>Definition:</b> Specifies the number of records returned on the current page.<br><b>Range:</b> N/A                                                                                                                                |

## Example Requests

```
https://{ELB_Endpoint}/v3/7b7705dce1e847b08b3b16dda67fec24/elb/jobs
```

## Example Responses

Status code: 200

Query succeeded.

 response, err := client.ListJobs(request)
 if err == nil {
 fmt.Printf("%+v\n", response)
 } else {
 fmt.Println(err)
 }
}
```

## More

For SDK sample code of more programming languages, see the Sample Code tab in [API Explorer](#). SDK sample code can be automatically generated.

## Status Codes

| Status Code | Description      |
|-------------|------------------|
| 200         | Query succeeded. |

## Error Codes

See [Error Codes](#).

## 5.18.2 Querying the Status of an Asynchronous Task

### Function

This API is used to query the status of an asynchronous task like copying or upgrading a load balancer.

### Calling Method

For details, see [Calling APIs](#).

### URI

GET /v3/{project\_id}/elb/jobs/{job\_id}

**Table 5-856** Path Parameters

| Parameter  | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                |
|------------|-----------|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

For details about how to obtain a project ID, see <a href="#">Obtaining a Project ID</a> .<br><b>Constraints:</b> N/A<br><b>Range:</b> The value can contain a maximum of 32 characters, including digits and lowercase letters.<br><b>Default value:</b> N/A |
| job_id     | Yes       | String | Specifies the task ID.                                                                                                                                                                                                                                                                                     |

## Request Parameters

None

## Response Parameters

Status code: 200

**Table 5-857** Response body parameters

| Parameter  | Type                  | Description                                                                                                                                                                          |
|------------|-----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| job        | <b>MainJob</b> object | <b>Definition:</b> Specifies the information about the asynchronous tasks such as copy tasks.                                                                                        |
| request_id | String                | <b>Definition:</b> Specifies the request ID.<br><b>Range:</b> The value is automatically generated, and can contain characters including digits, lowercase letters, and hyphens (-). |

**Table 5-858** MainJob

| Parameter   | Type                           | Description                                    |
|-------------|--------------------------------|------------------------------------------------|
| status      | String                         | Specifies the task status.                     |
| begin_time  | String                         | Specifies the time when the task was started.  |
| end_time    | String                         | Specifies the time when the task was ended.    |
| job_id      | String                         | Specifies the task ID.                         |
| job_type    | String                         | Specifies the task type.                       |
| error_code  | String                         | Specifies the task error code.                 |
| error_msg   | String                         | Specifies the task error message.              |
| project_id  | String                         | Specifies the project ID.                      |
| resource_id | String                         | <b>Definition:</b> Specifies the resource ID.  |
| sub_jobs    | Array of <b>SubJob</b> objects | <b>Definition:</b> Specifies the subtask list. |

Table 5-859 SubJob

| Parameter   | Type                                         | Description                                                             |
|-------------|----------------------------------------------|-------------------------------------------------------------------------|
| status      | String                                       | Specifies the task status.                                              |
| begin_time  | String                                       | Specifies the time when the task was started.                           |
| end_time    | String                                       | Specifies the time when the task was ended.                             |
| job_id      | String                                       | Specifies the task ID.                                                  |
| job_type    | String                                       | Specifies the task type.                                                |
| error_code  | String                                       | Specifies the task error code.                                          |
| error_msg   | String                                       | Specifies the task error message.                                       |
| project_id  | String                                       | Specifies the project ID.                                               |
| resource_id | String                                       | <b>Definition:</b> Specifies the resource ID.                           |
| entities    | Array of <a href="#">JobEntities</a> objects | <b>Definition:</b> Specifies the resource to be processed in a subtask. |

Table 5-860 JobEntities

| Parameter     | Type   | Description                                                                                           |
|---------------|--------|-------------------------------------------------------------------------------------------------------|
| resource_id   | String | <b>Definition:</b> Specifies the ID of the resource associated with a subtask.<br><b>Range:</b> N/A   |
| resource_type | String | <b>Definition:</b> Specifies the type of the resource associated with a subtask.<br><b>Range:</b> N/A |

}
```

## More

For SDK sample code of more programming languages, see the Sample Code tab in [API Explorer](#). SDK sample code can be automatically generated.

Status Codes

| Status Code | Description      |
|-------------|------------------|
| 200         | Query succeeded. |

Error Codes

See [Error Codes](#).

5.19 Feature Configuration

5.19.1 Querying the Feature Configurations of ELB

Function

This API is used to query the feature configurations of ELB of a tenant.

Calling Method

For details, see [Calling APIs](#).

URI

GET /v3/{project\_id}/elb/feature/configs

5.19.2 Querying the Feature Configurations of a Load Balancer

Function

This API is used to query the feature configurations of a load balancer.

Calling Method

For details, see [Calling APIs](#).

URI

GET /v3/{project\_id}/elb/loadbalancers/{loadbalancer\_id}/features

Table 5-866 Path Parameters

| Parameter       | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                |
|-----------------|-----------|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| project_id      | Yes       | String | <b>Definition:</b> Specifies the project ID. For details about how to obtain a project ID, see <a href="#">Obtaining a Project ID</a> .<br><b>Constraints:</b> N/A<br><b>Range:</b> The value can contain a maximum of 32 characters, including digits and lowercase letters.<br><b>Default value:</b> N/A |
| loadbalancer_id | Yes       | String | <b>Definition:</b> Specifies the load balancer ID.<br><b>Constraints:</b> N/A<br><b>Range:</b> N/A<br><b>Default value:</b> N/A                                                                                                                                                                            |

## 5.20.1 Querying Load Balancers in the Recycle Bin

### Function

This API is used to query load balancers in the recycle bin.

### Constraints

This API has the following constraints:

- Parameters **marker**, **limit**, and **page\_reverse** are used for pagination query.
- Parameters **marker** and **page\_reverse** take effect only when they are used together with parameter **limit**.

### Calling Method

For details, see [Calling APIs](#).

### URI

GET /v3/{project\_id}/elb/recycle-bin/loadbalancers

**Table 5-869** Path Parameters

| Parameter  | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                |
|------------|-----------|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| project_id | Yes       | String | <b>Definition:</b> Specifies the project ID. For details about how to obtain a project ID, see <a href="#">Obtaining a Project ID</a> .<br><b>Constraints:</b> N/A<br><b>Range:</b> The value can contain a maximum of 32 characters, including digits and lowercase letters.<br><b>Default value:</b> N/A |

**Table 5-870** Query Parameters

| Parameter | Mandatory | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                                    |
|-----------|-----------|---------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| marker    | No        | String  | <b>Definition:</b> Specifies the ID of the last record on the previous page.<br><b>Constraints:</b> <ul style="list-style-type: none"><li>• This parameter must be used together with <b>limit</b>.</li><li>• If the parameter is not specified, only resources on the first page are queried.</li><li>• This parameter cannot be left blank or set to an invalid ID.</li></ul> <b>Range:</b> N/A<br><b>Default value:</b> N/A |
| limit     | No        | Integer | <b>Definition:</b> Specifies the number of records returned on each page.<br><b>Constraints:</b> N/A<br><b>Range:</b> 0 to 2000<br><b>Default value:</b> 2000                                                                                                                                                                                                                                                                  |

| Parameter      | Mandatory | Type             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|----------------|-----------|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| page_reverse   | No        | Boolean          | <b>Definition:</b> Specifies whether to use reverse query.<br><b>Constraints:</b> <ul style="list-style-type: none"><li>• This parameter must be used together with <b>limit</b>.</li><li>• If <b>page_reverse</b> is set to <b>true</b> and you want to query the resources on the previous page, set the value of <b>marker</b> to the value of <b>previous_marker</b>.</li></ul> <b>Range:</b> <ul style="list-style-type: none"><li>• <b>true</b>: Query resources on the previous page.</li><li>• <b>false</b>: Query resources on the next page.</li></ul> <b>Default value:</b> false |
| id             | No        | Array of strings | Specifies the load balancer ID. Multiple IDs can be used for query in the format of <i>id=xxx&amp;id=xxx</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| name           | No        | Array of strings | Specifies the load balancer name. Multiple names can be used for query in the format of <i>name=xxx&amp;name=xxx</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| description    | No        | Array of strings | Provides supplementary information about the load balancer. Multiple descriptions can be used for query in the format of <i>description=xxx&amp;description=xxx</i> .                                                                                                                                                                                                                                                                                                                                                                                                                        |
| admin_state_up | No        | Boolean          | <b>Definition:</b> Specifies whether the load balancer is enabled.<br><b>Range:</b> <ul style="list-style-type: none"><li>• <b>true</b>: enabled</li><li>• <b>false</b>: disabled</li></ul>                                                                                                                                                                                                                                                                                                                                                                                                  |

| Parameter        | Mandatory | Type             | Description                                                                                                                                                                                                                                                                                                                                                                           |
|------------------|-----------|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| operating_status | No        | Array of strings | <p>Specifies the operating status of the load balancer.</p> <p>Value options:</p> <ul style="list-style-type: none"><li>● <b>ONLINE</b>: The load balancer is working normally.</li><li>● <b>FROZEN</b>: The load balancer has been frozen.</li></ul> <p>Multiple operating statuses can be used for query in the format of <i>operating_status=xxx&amp;operating_status=xxx</i>.</p> |
| guaranteed       | No        | Boolean          | <p>Specifies whether the load balancer is a dedicated load balancer.</p> <ul style="list-style-type: none"><li>● <b>false</b>: The load balancer is a shared load balancer.</li><li>● <b>true</b>: The load balancer is a dedicated load balancer.</li></ul>                                                                                                                          |
| vpc_id           | No        | Array of strings | <p>Specifies the ID of the VPC where the load balancer resides.</p> <p>Multiple IDs can be used for query in the format of <i>vpc_id=xxx&amp;vpc_id=xxx</i>.</p>                                                                                                                                                                                                                      |

| global_eips  | No        | Array of strings | <p>Specifies the EIP bound to the load balancer. The following shows an example:</p> <pre>{<br/>  "global_eips": [<br/>    {<br/>      "global_eip_id":<br/>        "240000000-0000-0000-0000-1<br/>        000000000001",<br/>      "global_eip_address":<br/>        "10.10.10.10",<br/>      "ip_version": 4<br/>    }<br/>  ]<br/>}</pre> <p>Multiple values can be used for query in the format of:</p> <ul style="list-style-type: none"><li>• If <b>global_eip_id</b> is used as the query condition, the format is<br/><i>global_eips=global_eip_id=xxx&amp;global_eips=global_eip_id=xxx.</i></li><li>• If <b>global_eip_address</b> is used as the query condition, the format is<br/><i>global_eips=global_eip_address=xxx&amp;global_eips=global_eip_address=xxx.</i></li><li>• If <b>ip_version</b> is used as the query condition, the format is<br/><i>global_eips=ip_version=xxx&amp;global_eips=ip_version=xxx.</i></li></ul> |
| log_topic_id | No        | String           | <p>Specifies the ID of the log topic that is associated with the load balancer. Multiple IDs can be used for query in the format of<br/><i>log_topic_id=xxx&amp;log_topic_id=xxx.</i></p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| Parameter    | Mandatory | Type   | Description                                                                                                                                                                     |
|--------------|-----------|--------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| log_group_id | No        | String | Specifies the ID of the log group that is associated with the load balancer. Multiple IDs can be used for query in the format of <i>log_group_id=xxx&amp;log_group_id=xxx</i> . |

## Request Parameters

**Table 5-871** Request header parameters

| Parameter    | Mandatory | Type   | Description                                      |
|--------------|-----------|--------|--------------------------------------------------|
| X-Auth-Token | No        | String | Specifies the token used for IAM authentication. |

## Response Parameters

Status code: 200

**Table 5-872** Response body parameters

| Parameter     | Type                                                 | Description                                                                                                                                                                          |
|---------------|------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| loadbalancers | Array of <a href="#">RecycleLoadBalancer</a> objects | <b>Definition:</b> Lists the load balancers in the recycle bin.<br><b>Range:</b> N/A                                                                                                 |
| page_info     | <a href="#">PageInfo</a> object                      | <b>Definition:</b> Specifies the pagination information.                                                                                                                             |
| request_id    | String                                               | <b>Definition:</b> Specifies the request ID.<br><b>Range:</b> The value is automatically generated, and can contain characters including digits, lowercase letters, and hyphens (-). |

**Table 5-873** RecycleLoadBalancer

| Parameter | Type   | Description                                                             |
|-----------|--------|-------------------------------------------------------------------------|
| id        | String | <b>Definition:</b> Specifies the load balancer ID.<br><b>Range:</b> N/A |

| Parameter           | Type                                | Description                                                                                                                                                                                                                                  |
|---------------------|-------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| auto_terminate_time | String                              | <b>Definition:</b> Specifies the time when the load balancers in the recycle bin will be permanently deleted, in the format of <i>yyyy-MM-dd'T'HH:mm:ss'Z'</i> .<br><b>Range:</b> N/A                                                        |

| elb_virsubnet_ids  | Array of strings                               | <b>Definition:</b> Specifies the network IDs of subnets on the downstream plane.<br><b>Range:</b> N/A                                                                                                                                      |
| elb_virsubnet_type | String                                         | <b>Definition:</b> Specifies the type of the subnet on the downstream plane.<br><b>Range:</b> <ul style="list-style-type: none"><li>• <b>ipv4:</b> IPv4 subnets</li><li>• <b>dualstack:</b> subnets support IPv4/IPv6 dual stack</li></ul> |

| Parameter                  | Type                                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|----------------------------|-------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ip_target_enable           | Boolean                             | <b>Definition:</b> Specifies whether to add backend servers that are not in the load balancer's VPC.<br><br>If you set it to <b>true</b> , you can associate servers in a VPC connected through a VPC peering connection, in a VPC connected through a cloud connection, or in an on-premises data center at the other end of a Direct Connect or VPN connection, by using server IP addresses.<br><b>Range:</b> <ul style="list-style-type: none"><li>• <b>true</b>: This option will be enabled.</li><li>• <b>false</b>: This option will be disabled.</li></ul> |
| frozen_scene               | String                              | <b>Definition:</b> Specifies the scenario where the load balancer is frozen.<br><br>If there are multiple scenarios, separate them with commas (,).<br><b>Range:</b> <ul style="list-style-type: none"><li>• <b>ILLEGAL</b>: The load balancer is frozen due to violation of laws and regulations.</li><li>• <b>VERIFY</b>: Your account has not completed real-name authentication.</li><li>• <b>PARTNER</b>: The load balancer is frozen by the partner.</li><li>• <b>ARREAR</b>: The load balancer is frozen due to arrears.</li></ul>                          |
| ipv6_bandwidth             | <a href="#">BandwidthRef</a> object | <b>Definition:</b> Specifies the ID of the bandwidth.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| deletion_protection_enable | Boolean                             | <b>Definition:</b> Specifies whether to enable deletion protection.<br><b>Range:</b> <ul style="list-style-type: none"><li>• <b>false</b>: This option will be disabled.</li><li>• <b>true</b>: This option will be enabled.</li></ul>                                                                                                                                                                                                                                                                                                                             |

| Parameter           | Type                                  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|---------------------|---------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| autoscaling         | <a href="#">AutoscalingRef</a> object | <b>Definition:</b> Specifies information about elastic scaling. If elastic scaling is enabled, the load balancer flavors can be automatically adjusted based on incoming traffic.<br><b>NOTE</b><br>This parameter has been deprecated, but is retained for compatibility purposes. Using this parameter is not recommended. If this parameter is specified, the load balancer with minimum flavors will be created and you will be billed for the minimum flavors. |
| public_border_group | String                                | <b>Definition:</b> Specifies the AZ group to which the load balancer belongs.<br><b>Range:</b> N/A                                                                                                                                                                                                                                                                                                                                                                  |
| charge_mode         | String                                | <b>Definition:</b> Specifies the charge mode of the load balancer.<br><b>Range:</b> <ul style="list-style-type: none"><li>• <b>flavor:</b> billed by the fixed flavor you select.</li><li>• <b>lcu:</b> billed by how many LCUs you have used.</li><li>• <b>Null:</b> If it is a shared load balancer, it is free. If it is a dedicated load balancer, it will be billed by the fixed flavor you select.</li></ul>                                                  |
| waf_failure_action  | String                                | <b>Definition:</b> Specifies traffic distributing policies when the WAF is faulty.<br><b>Range:</b> <b>discard</b> indicates traffic will not be distributed. <b>forward</b> indicates traffic will be distributed to the default backend servers.                                                                                                                                                                                                                  |
| protection_status   | String                                | <b>Definition:</b> Specifies the protection status.<br><b>Constraints:</b> N/A<br><b>Range:</b> <ul style="list-style-type: none"><li>• <b>nonProtection</b> (default): The resource is not protected.</li><li>• <b>consoleProtection:</b> Modifications are not allowed on the console.</li></ul> <b>Default value:</b> N/A                                                                                                                                        |

| Parameter         | Type   | Description                                                                                                                                                                     |
|-------------------|--------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| protection_reason | String | <b>Definition:</b> Specifies why modification protection is enabled.<br><b>Range:</b> The value can contain a maximum of 255 Unicode characters, excluding angle brackets (<>). |
| log_group_id      | String | <b>Definition:</b> Specifies the ID of the log group that is associated with the load balancer.<br><b>Range:</b> N/A                                                            |
| log_topic_id      | String | <b>Definition:</b> Specifies the ID of the log topic that is associated with the load balancer.<br><b>Range:</b> N/A                                                            |

**Table 5-874** PoolRef

| Parameter | Type   | Description                                                                    |
|-----------|--------|--------------------------------------------------------------------------------|
| id        | String | <b>Definition:</b> Specifies the backend server group ID.<br><b>Range:</b> N/A |

**Table 5-875** ListenerRef

| Parameter | Type   | Description                                                        |
|-----------|--------|--------------------------------------------------------------------|
| id        | String | <b>Definition:</b> Specifies the listener ID.<br><b>Range:</b> N/A |

**Table 5-876** Tag

| Parameter | Type   | Description                                                      |
|-----------|--------|------------------------------------------------------------------|
| key       | String | <b>Definition:</b> Specifies the tag key.<br><b>Range:</b> N/A   |
| value     | String | <b>Definition:</b> Specifies the tag value.<br><b>Range:</b> N/A |

**Table 5-877** EipInfo

| Parameter   | Type    | Description                                                                                                                                                           |
|-------------|---------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| eip_id      | String  | <b>Definition:</b> Specifies the EIP ID.<br><b>Range:</b> N/A                                                                                                         |
| eip_address | String  | <b>Definition:</b> Specifies the EIP.<br><b>Range:</b> N/A                                                                                                            |
| ip_version  | Integer | <b>Definition:</b> Specifies the IP address version.<br><b>Range:</b> <ul style="list-style-type: none"><li>• 4: IPv4 addresses</li><li>• 6: IPv6 addresses</li></ul> |

**Table 5-878** PublicIpInfo

| Parameter | Type   | Description                                                  |
|-----------|--------|--------------------------------------------------------------|
| id        | String | <b>Definition:</b> Specifies the ID of the shared bandwidth. |

**Table 5-881** AutoscalingRef

| Parameter        | Type    | Description                                                                                                                                                                                                                                              |
|------------------|---------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| enable           | Boolean | <b>Definition:</b> Specifies whether to enable elastic scaling for the load balancer.<br><b>Range:</b> <ul style="list-style-type: none"><li>• <b>true:</b> This option will be enabled.</li><li>• <b>false:</b> This option will be disabled.</li></ul> |
| min_l7_flavor_id | String  | <b>Definition:</b> Specifies the ID of the minimum elastic flavor at Layer 7.<br><b>Range:</b> N/A                                                                                                                                                       |

**Table 5-882** PageInfo

| Parameter       | Type   | Description                                                                                                                                                                                                                          |
|-----------------|--------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| previous_marker | String | <b>Definition:</b> Specifies the ID of the first record in the pagination query result. If <b>page_reverse</b> is set to <b>true</b> , this parameter is used together to query resources on the previous page.<br><b>Range:</b> N/A |

| Parameter     | Type    | Description                                                                                                                                                         |
|---------------|---------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| next_marker   | String  | <b>Definition:</b> Specifies the ID of the last record in the pagination query result. It is usually used to query resources on the next page.<br><b>Range:</b> N/A |
| current_count | Integer | <b>Definition:</b> Specifies the number of records returned on the current page.<br><b>Range:</b> N/A                                                               |

## Example Requests

Querying load balancers on each page

```
GET https://{ELB_Endpoint}/v3/b2782e6708b8475c993e6064bc456bf8/elb/recycle-bin/loadbalancers?limit=2&marker=87627cb6-9ff1-4580-984f-cc564fa9fc34
```

## Example Responses

**Status code: 200**

Successful request.

For SDK sample code of more programming languages, see the Sample Code tab in [API Explorer](#). SDK sample code can be automatically generated.

## Status Codes

| Status Code | Description         |
|-------------|---------------------|
| 200         | Successful request. |

## Error Codes

See [Error Codes](#).

## 5.20.2 Querying the Recycle Bin Policy

### Function

This API is used to query the recycle bin policy.

### Calling Method

For details, see [Calling APIs](#).

### URI

GET /v3/{project\_id}/elb/recycle-bin

**Table 5-883** Path Parameters

| Parameter  | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                |
|------------|-----------|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| project_id | Yes       | String | <b>Definition:</b> Specifies the project ID. For details about how to obtain a project ID, see <a href="#">Obtaining a Project ID</a> .<br><b>Constraints:</b> N/A<br><b>Range:</b> The value can contain a maximum of 32 characters, including digits and lowercase letters.<br><b>Default value:</b> N/A |

## Request Parameters

**Table 5-884** Request header parameters

| Parameter    | Mandatory | Type   | Description                                                                                                                                      |
|--------------|-----------|--------|--------------------------------------------------------------------------------------------------------------------------------------------------|
| X-Auth-Token | Yes       | String | <b>Definition:</b> Specifies the token used for IAM authentication.<br><b>Constraints:</b> N/A<br><b>Range:</b> N/A<br><b>Default value:</b> N/A |

## Response Parameters

**Status code:** 200

```

## More

For SDK sample code of more programming languages, see the Sample Code tab in [API Explorer](#). SDK sample code can be automatically generated.

## Status Codes

| Status Code | Description      |
|-------------|------------------|
| 200         | Query succeeded. |

## Error Codes

See [Error Codes](#).

## 5.20.3 Enabling or Disabling Recycle Bin

### Function

This API is used to enable or disable recycle bin. Once this option is enabled, deleted load balancers will be kept in the recycle bin. If this option is not enabled, deleted load balancers will be permanently deleted and cannot be restored. Before disabling recycle bin, restore or permanently delete load balancers from the recycle bin.

### Calling Method

For details, see [Calling APIs](#).

### URI

PUT /v3/{project\_id}/elb/recycle-bin

**Table 5-888** Path Parameters

| Parameter  | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                |

| policy    | No        | <a href="#">RecycleBinPolicy</a> object | <b>Definition:</b> Specifies the recycle bin policy. |

**Table 5-899** RecycleBinPolicy

| Parameter                  | Mandatory | Type    | Description                                                                                                                                                                                                                                                                          |
|----------------------------|-----------|---------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| recycle_thresh<br>old_hour | No        | Integer | <b>Definition:</b> Specifies how old a deleted or unsubscribed load balancer has to be for it to be moved to the recycle bin. A load balancer can only be moved to the recycle bin if it has been there longer than the specified number of days in the policy.<br><b>Range:</b> N/A |
| retention_hour             | No        | Integer | <b>Definition:</b> Specifies how long you want your load balancers to be kept in the recycle bin.<br><b>Range:</b> N/A                                                                                                                                                               |

## Response Parameters

**Status code:** 200

**Table 5-900** Response body parameters

| Parameter   | Type                                          | Description                                                         |
|-------------|-----------------------------------------------|---------------------------------------------------------------------|
| recycle_bin | <a href="#">RecycleBinResponseBody</a> object | <b>Definition:</b> Specifies the response body for the recycle bin. |

**Table 5-901** RecycleBinResponseBody

| Parameter  | Type                                    | Description                                                                                                                                                                                                                                        |
|------------|-----------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| project_id | String                                  | <b>Definition:</b> Specifies the project ID. For details about how to obtain a project ID, see <a href="#">Obtaining a Project ID</a> .<br><b>Range:</b> The value can contain a maximum of 32 characters, including digits and lowercase letters. |
| policy     | <a href="#">RecycleBinPolicy</a> object | <b>Definition:</b> Specifies the recycle bin policy.                                                                                                                                                                                               |

| Parameter | Type    | Description                                                                                                                                                                                                  |
