## 5.21 Tag Management

### 5.21.1 Batch Adding or Deleting Load Balancer Tags

#### Function

This API is used to batch add tags to or delete tags from a load balancer.

#### Calling Method

For details, see [Calling APIs](#).

#### URI

POST /v3/{project\_id}/loadbalancers/{loadbalancer\_id}/tags/action

**Table 5-908** Path Parameters

| Parameter       | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                |

## 5.21.5 Querying the Tags of All Listeners

### Function

This API is used to query the tags of all listeners in a project.

### Calling Method

For details, see [Calling APIs](#).

### URI

GET /v3/{project\_id}/listeners/tags

**Table 5-920** Path Parameters

| Parameter  | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                |
|------------|-----------|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

| 200         | Successful request. |

## Error Codes

See [Error Codes](#).

# 6 APIs (V2)

## 6.1 Load Balancer

### 6.1.1 Creating a Load Balancer

#### Function

This API is used to create a private network load balancer. After the load balancer is created, its details, such as load balancer ID, IP address, and subnet ID, are returned.

To create a public network load balancer, you also need to call the API for assigning an EIP and associate this IP address to the port bound to the IP address of the private network load balancer.

You can set the **enterprise\_project\_id** parameter to perform fine-grained authorization for resources.

#### URI

POST /v2/{project\_id}/elb/loadbalancers

Table 6-1 Parameter description

| Parameter  | Mandatory | Type   | Description               |
|------------|-----------|--------|---------------------------|
| project_id | Yes       | String | Specifies the project ID. |

## Request

**Table 6-2** Parameter description

| Parameter    | Mandatory | Type                                | Description                                                               |
|--------------|-----------|-------------------------------------|---------------------------------------------------------------------------|
| loadbalancer | Yes       | <a href="#">Loadbalancer</a> object | Specifies the load balancer. For details, see <a href="#">Table 6-3</a> . |

**Table 6-3** [loadbalancer](#) parameter description

| Parameter     | Mandatory | Type   | Description                                                                                                                                                                                                                                                 |
|---------------|-----------|--------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| name          | No        | String | Specifies the load balancer name.<br>The value contains a maximum of 255 characters.                                                                                                                                                                        |
| description   | No        | String | Provides supplementary information about the load balancer.<br>The value contains a maximum of 255 characters.                                                                                                                                              |
| tenant_id     | No        | String | Specifies the ID of the project where the load balancer is used.<br>The value contains a maximum of 255 characters.<br>The value must be the same as the value of <b>project_id</b> in the token.                                                           |
| vip_subnet_id | Yes       | String | Specifies the ID of the IPv4 subnet where the load balancer works. Obtain the value by listing the subnets (The parameter is <b>neutron_subnet_id</b> ). The private IP address of the load balancer is in this subnet.<br>Only IPv4 subnets are supported. |
| provider      | No        | String | Specifies the provider of the load balancer.<br>The value can only be <b>vlb</b> .                                                                                                                                                                          |

| Parameter                          | Mandatory | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|------------------------------------|-----------|---------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>vip_address</code>           | No        | String  | <p>Specifies the private IP address of the load balancer.</p> <p>This IP address must be the one in the subnet specified by <b><code>vip_subnet_id</code></b>. If this parameter is not specified, an IP address is automatically assigned to the load balancer from the subnet specified by <b><code>vip_subnet_id</code></b>.</p> <p>The value contains a maximum of 64 characters.</p> <p>You cannot specify a private IP address for a yearly/monthly load balancer. The system will assign one from the subnet.</p> |
| <code>admin_state_up</code>        | No        | Boolean | <p>Specifies the administrative status of the load balancer. The load balancer stops receiving traffic after it is disabled.</p> <p>The value can be one of the following:</p> <p><b>true</b>: Enable the load balancer.</p> <p><b>false</b>: Disable the load balancer.</p> <p>Default value: <b>true</b></p>                                                                                                                                                                                                           |
| <code>enterprise_project_id</code> | No        | String  | <p>Specifies the enterprise project ID. When creating a load balancer, you can assign an enterprise project to the load balancer.</p> <p>The value is character string <b>0</b> or a UUID with hyphens (-). Value <b>0</b> indicates the default enterprise project.</p> <p>The default value is <b>0</b>.</p> <p><b>NOTE</b></p> <p>For more information about enterprise projects and how to obtain enterprise project IDs, see <a href="#">Enterprise Management User Guide</a>.</p>                                  |
| <code>protection_statuses</code>   | No        | String  | <p>Specifies whether modification protection is enabled. The value can be one of the following:</p> <ul style="list-style-type: none"><li>• <b>nonProtection</b> (default): Modification protection is not enabled.</li><li>• <b>consoleProtection</b>: Modification protection is enabled to avoid that resources are modified by accident on the console.</li></ul>                                                                                                                                                    |

| Parameter         | Mandatory | Type                       | Description                                                                                                                                             |
|-------------------|-----------|----------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------|
| protection_reason | No        | String                     | Specifies the reason to enable modification protection. This parameter is valid only when <b>protection_status</b> is set to <b>consoleProtection</b> . |
| prepaid_options   | No        | PrepaidCreateOption object | Specifies the prepaid billing configuration of a load balancer. If this structure is passed, a prepaid load balancer is created.                        |

**Table 6-4** PrepaidCreateOption

| Parameter   | Mandatory | Type    | Description                                                                                                                                                                                                                                                                                                       |
|-------------|-----------|---------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| period_type | Yes       | String  | Specifies the subscription period type.<br>The value can be: <ul style="list-style-type: none"><li>• <b>month</b>: monthly subscriptions</li><li>• <b>year</b>: yearly subscriptions</li></ul>                                                                                                                    |
| period_num  | No        | Integer | Specifies the number of subscription periods.<br>The value can be: <ul style="list-style-type: none"><li>• If <b>period_type</b> is set to <b>month</b>, the value ranges from <b>1</b> to <b>9</b>.</li><li>• If <b>period_type</b> is set to <b>year</b>, the value ranges from <b>1</b> to <b>3</b>.</li></ul> |
| auto_renew  | No        | Boolean | Specifies whether to enable automatic renewal.<br>The value can be: <ul style="list-style-type: none"><li>• <b>true</b>: Enable automatic renewal.</li><li>• <b>false</b>: Disable automatic renewal.</li></ul>                                                                                                   |

| Parameter | Mandatory | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|-----------|-----------|---------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| auto_pay  | No        | Boolean | <p>Specifies whether an order is automatically paid using your account balance without manual operations.</p> <p>Constraints: If you use automatic payment, only your account balance can be used. If you want to use a voucher, disable automatic payment and select the voucher for the payment in the Billing Center.</p> <p>The value can be:</p> <ul style="list-style-type: none"><li>• <b>true</b>: The order will be automatically paid.</li><li>• <b>false</b>: The order will not be automatically paid.</li></ul> |

## Response

**Table 6-5** Parameter description

| Parameter    | Type                       | Description                                                               |
|--------------|----------------------------|---------------------------------------------------------------------------|
| loadbalancer | <b>Loadbalancer</b> object | Specifies the load balancer. For details, see <a href="#">Table 6-6</a> . |

**Table 6-6** loadbalancer parameter description

| Parameter  | Type   | Description                                                                                     |
|------------|--------|-------------------------------------------------------------------------------------------------|
| id         | String | Specifies the load balancer ID.                                                                 |
| project_id | String | Specifies the ID of the project where the load balancer is used.                                |
| tenant_id  | String | Specifies the tenant ID.                                                                        |
| name       | String | <p>Specifies the load balancer name.</p> <p>The value contains a maximum of 255 characters.</p> |

| Parameter           | Type                                       | Description                                                                                                                                                                                                                       |
|---------------------|--------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| description         | String                                     | Provides supplementary information about the load balancer.<br>The value contains a maximum of 255 characters.                                                                                                                    |
| vip_subnet_id       | String                                     | Specifies the ID of the IPv4 subnet where the load balancer works.                                                                                                                                                                |
| vip_port_id         | String                                     | Specifies the ID of the port bound to the private IP address of the load balancer.                                                                                                                                                |
| provider            | String                                     | Specifies the provider of the load balancer.                                                                                                                                                                                      |
| vip_address         | String                                     | Specifies the private IP address of the load balancer.<br>The value contains a maximum of 64 characters.                                                                                                                          |
| listeners           | Array of <a href="#">Listeners</a> objects | Lists the IDs of listeners added to the load balancer. For details, see <a href="#">Table 6-7</a> .                                                                                                                               |
| pools               | Array of <a href="#">Pools</a> objects     | Lists the IDs of backend server groups associated with the load balancer. For details, see <a href="#">Table 6-8</a> .                                                                                                            |
| operating_status    | String                                     | Specifies the operating status of the load balancer. The value can be <b>ONLINE</b> or <b>FROZEN</b> .                                                                                                                            |
| provisioning_status | String                                     | This parameter is reserved, and its value can only be <b>ACTIVE</b> .<br>It specifies the provisioning status of the load balancer.                                                                                               |
| admin_state_up      | Boolean                                    | Specifies the administrative status of the load balancer. The load balancer stops receiving traffic after it is disabled.<br>Value options:<br><b>true</b> : Enable a load balancer.<br><b>false</b> : Disable the load balancer. |
| tags                | Array                                      | Lists load balancer tags.                                                                                                                                                                                                         |

| Parameter             | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-----------------------|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| created_at            | String | Specifies the time when the load balancer was created.<br>The UTC time is in <i>YYYY-MM-DDTHH:MM:SS</i> format.<br>The value contains a maximum of 19 characters.                                                                                                                                                                                                                                                                                                                 |
| updated_at            | String | Specifies the time when the load balancer was updated.<br>The UTC time is in <i>YYYY-MM-DDTHH:MM:SS</i> format.<br>The value contains a maximum of 19 characters.                                                                                                                                                                                                                                                                                                                 |
| enterprise_project_id | String | Specifies the enterprise project ID. When creating a load balancer, you can assign an enterprise project to the load balancer.<br>The value is character string <b>0</b> or a UUID with hyphens (-). Value <b>0</b> indicates the default enterprise project.<br><b>NOTE</b><br>For more information about enterprise projects and how to obtain enterprise project IDs, see <a href="#">Enterprise Management User Guide</a> .                                                   |
| charge_mode           | String | Specifies how the load balancer will be billed. The value can be one of the following: <ul style="list-style-type: none"><li>• <b>flavor</b>: indicates the guaranteed performance that allows the load balancer to handle up to 50,000 concurrent connections, 5,000 connections and 5,000 queries per second. You will be charged if the load balancer provides guaranteed performance.</li><li>• <b>null</b>: indicates that guaranteed performance is not provided.</li></ul> |
| billing_info          | String | Specifies whether the billing information is left blank.                                                                                                                                                                                                                                                                                                                                                                                                                          |

| Parameter         | Type                                 | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|-------------------|--------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| frozen_scene      | String                               | <p>Specifies the scenario where the load balancer is frozen. If there are multiple scenarios, separate them with commas (,). The value can be one of the following:</p> <ul style="list-style-type: none"><li>● <b>POLICE</b>: The load balancer is frozen for public security.</li><li>● <b>ILLEGAL</b>: The load balancer is frozen due to violation of laws and regulations.</li><li>● <b>VERIFY</b>: The load balancer is frozen because the user fails to pass real-name authentication.</li><li>● <b>PARTNER</b>: The load balancer is frozen by the partner.</li><li>● <b>REAR</b>: Your account is in arrears.</li></ul> |
| protection_status | String                               | <p>Specifies whether modification protection is enabled. The value can be one of the following:</p> <ul style="list-style-type: none"><li>● <b>nonProtection</b> (default): Modification protection is not enabled.</li><li>● <b>consoleProtection</b>: Modification protection is enabled to avoid that resources are modified by accident on the console.</li></ul>                                                                                                                                                                                                                                                            |
| protection_reason | String                               | <p>Specifies the reason to enable modification protection. This parameter is valid only when <b>protection_status</b> is set to <b>consoleProtection</b>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| publicips         | Array of <b>PublicIpInfo</b> objects | <p>Specifies the EIP bound to the load balancer. Only one EIP can be bound to a load balancer.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

**Table 6-7 listeners** parameter description

| Parameter | Type   | Description                                  |
|-----------|--------|----------------------------------------------|
| id        | String | Specifies the ID of the associated listener. |

**Table 6-8 pools** parameter description

| Parameter | Type   | Description                                              |
|-----------|--------|----------------------------------------------------------|
| id        | String | Specifies the ID of the associated backend server group. |

**Table 6-9 PublicIpInfo**

| Parameter        | Type    | Description                                                                    |
|------------------|---------|--------------------------------------------------------------------------------|
| publicip_id      | String  | Specifies the EIP ID.                                                          |
| publicip_address | String  | Specifies the public IP address.                                               |
| ip_version       | Integer | Specifies the IP version. The value can be <b>4</b> (IPv4) or <b>6</b> (IPv6). |

## Example Request

- Example request 1: Creating a private network load balancer  
POST https://{Endpoint}/v2/1867112d054b427e808cc6096d8193a1/elb/loadbalancers

```
{
 "loadbalancer": {

For details, see [Status Codes](#).

## 6.1.2 Querying Load Balancers

### Function

This API is used to query load balancers and display them in a list. Filter query and pagination query are supported.

Unless otherwise specified, exact match is applied.

### URI

GET /v2/{project\_id}/elb/loadbalancers

**Table 6-10** Path parameters

| Parameter  | Mandatory | Type   | Description               |
|------------|-----------|--------|---------------------------|
| project_id | Yes       | String | Specifies the project ID. |

**Table 6-11** Query parameters

| Parameter | Mandatory | Type    | Description                                                                                                                                                                                           |
|-----------|-----------|---------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| marker    | No        | String  | Specifies the ID of the load balancer from which pagination query starts, that is, the ID of the last load balancer on the previous page.<br>This parameter must be used together with <b>limit</b> . |
| limit     | No        | Integer | Specifies the number of load balancers on each page. If this parameter is not set, all load balancers are queried by default.                                                                         |

| Parameter           | Mandatory | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                                       |
|---------------------|-----------|---------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| page_reverse        | No        | Boolean | Specifies the page direction. The value can be <b>true</b> or <b>false</b> , and the default value is <b>false</b> . The last page in the list requested with <b>page_reverse</b> set to <b>false</b> will not contain the "next" link, and the last page in the list requested with <b>page_reverse</b> set to <b>true</b> will not contain the "previous" link.<br><br>This parameter must be used together with <b>limit</b> . |
| id                  | No        | String  | Specifies the load balancer ID.                                                                                                                                                                                                                                                                                                                                                                                                   |
| description         | No        | String  | Provides supplementary information about the load balancer.<br><br>The value contains a maximum of 255 characters.                                                                                                                                                                                                                                                                                                                |
| name                | No        | String  | Specifies the load balancer name.<br><br>The value contains a maximum of 255 characters.                                                                                                                                                                                                                                                                                                                                          |
| operating_status    | No        | String  | Specifies the operating status of the load balancer. The value can be <b>ONLINE</b> or <b>FROZEN</b> .                                                                                                                                                                                                                                                                                                                            |
| provisioning_status | No        | String  | This parameter is reserved, and its value can only be <b>ACTIVE</b> .<br><br>It specifies the provisioning status of the load balancer.                                                                                                                                                                                                                                                                                           |
| admin_state_up      | No        | Boolean | Specifies the administrative status of the load balancer. The load balancer stops receiving traffic after it is disabled.<br><br>The value can be one of the following:<br><b>true</b> : Enable the load balancer.<br><b>false</b> : Disable the load balancer.                                                                                                                                                                   |
| vip_address         | No        | String  | Specifies the private IP address of the load balancer.<br><br>The value contains a maximum of 64 characters.                                                                                                                                                                                                                                                                                                                      |
| vip_port_id         | No        | String  | Specifies the ID of the port bound to the private IP address of the load balancer.                                                                                                                                                                                                                                                                                                                                                |
| vip_subnet_id       | No        | String  | Specifies the ID of the IPv4 subnet where the load balancer works.                                                                                                                                                                                                                                                                                                                                                                |

| Parameter             | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|-----------------------|-----------|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| member_address        | No        | String | Specifies the IP address of the backend server associated with the load balancer.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| member_device_id      | No        | String | Specifies the ID of the cloud server used as the backend server associated with the load balancer.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| vpc_id                | No        | String | Specifies the ID of the VPC where the load balancer resides.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| enterprise_project_id | No        | String | <p>Specifies the enterprise project ID.</p> <ul style="list-style-type: none"><li>If <b>enterprise_project_id</b> is not passed, resources in all enterprise projects are queried by default. Fine-grained authorization is performed. The <b>elb:*list</b> permissions must be assigned to the user group.</li><li>If <b>enterprise_project_id</b> is passed, the value can be a specific enterprise project ID or <b>all_granted_eps</b>. If the value is a specific enterprise project ID, only resources in the enterprise project are queried. If the value is <b>all_granted_eps</b>, resources in the enterprise projects with the <b>elb:*list</b> permissions are queried.</li></ul> |

## Request

None

## Response

**Table 6-12** Response parameters

| Parameter     | Type                                  | Description                                                             |
|---------------|---------------------------------------|-------------------------------------------------------------------------|
| loadbalancers | Array of <b>Loadbalancers</b> objects | Lists the load balancers. For details, see <a href="#">Table 6-13</a> . |

**Table 6-13** loadbalancer parameter description

| Parameter | Type   | Description                     |
|-----------|--------|---------------------------------|
| id        | String | Specifies the load balancer ID. |

| Parameter           | Type                                       | Description                                                                                                                         |
|---------------------|--------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------|
| project_id          | String                                     | Specifies the ID of the project where the load balancer is used.                                                                    |
| tenant_id           | String                                     | Specifies the tenant ID.                                                                                                            |
| name                | String                                     | Specifies the load balancer name.<br>The value contains a maximum of 255 characters.                                                |
| description         | String                                     | Provides supplementary information about the load balancer.<br>The value contains a maximum of 255 characters.                      |
| vip_subnet_id       | String                                     | Specifies the ID of the IPv4 subnet where the load balancer works.                                                                  |
| vip_port_id         | String                                     | Specifies the ID of the port bound to the private IP address of the load balancer.                                                  |
| provider            | String                                     | Specifies the provider of the load balancer.                                                                                        |
| vip_address         | String                                     | Specifies the private IP address of the load balancer.<br>The value contains a maximum of 64 characters.                            |
| listeners           | Array of <a href="#">Listeners</a> objects | Lists the IDs of listeners added to the load balancer. For details, see <a href="#">Table 6-7</a> .                                 |
| pools               | Array of <a href="#">Pools</a> objects     | Lists the IDs of backend server groups associated with the load balancer. For details, see <a href="#">Table 6-8</a> .              |
| operating_status    | String                                     | Specifies the operating status of the load balancer. The value can be <b>ONLINE</b> or <b>FROZEN</b> .                              |
| provisioning_status | String                                     | This parameter is reserved, and its value can only be <b>ACTIVE</b> .<br>It specifies the provisioning status of the load balancer. |

| Parameter             | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-----------------------|---------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| admin_state_up        | Boolean | Specifies the administrative status of the load balancer. The load balancer stops receiving traffic after it is disabled.<br>Value options:<br><b>true</b> : Enable a load balancer.<br><b>false</b> : Disable the load balancer.                                                                                                                                                                                                  |
| tags                  | Array   | Lists load balancer tags.                                                                                                                                                                                                                                                                                                                                                                                                          |
| created_at            | String  | Specifies the time when the load balancer was created.<br>The UTC time is in <i>YYYY-MM-DDTHH:MM:SS</i> format.<br>The value contains a maximum of 19 characters.                                                                                                                                                                                                                                                                  |
| updated_at            | String  | Specifies the time when the load balancer was updated.<br>The UTC time is in <i>YYYY-MM-DDTHH:MM:SS</i> format.<br>The value contains a maximum of 19 characters.                                                                                                                                                                                                                                                                  |
| enterprise_project_id | String  | Specifies the enterprise project ID. When creating a load balancer, you can assign an enterprise project to the load balancer.<br>The value is character string <b>0</b> or a UUID with hyphens (-).<br>Value <b>0</b> indicates the default enterprise project.<br><b>NOTE</b><br>For more information about enterprise projects and how to obtain enterprise project IDs, see <a href="#">Enterprise Management User Guide</a> . |

| Parameter    | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|--------------|--------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| charge_mode  | String | <p>Specifies how the load balancer will be billed. The value can be one of the following:</p> <ul style="list-style-type: none"><li>• <b>flavor</b>: indicates the guaranteed performance that allows the load balancer to handle up to 50,000 concurrent connections, 5,000 connections and 5,000 queries per second. You will be charged if the load balancer provides guaranteed performance.</li><li>• <b>null</b>: indicates that guaranteed performance is not provided.</li></ul>                                                                                                                                         |
| billing_info | String | <p>Specifies whether the billing information is left blank.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| frozen_scene | String | <p>Specifies the scenario where the load balancer is frozen. If there are multiple scenarios, separate them with commas (.). The value can be one of the following:</p> <ul style="list-style-type: none"><li>• <b>POLICE</b>: The load balancer is frozen for public security.</li><li>• <b>ILLEGAL</b>: The load balancer is frozen due to violation of laws and regulations.</li><li>• <b>VERIFY</b>: The load balancer is frozen because the user fails to pass real-name authentication.</li><li>• <b>PARTNER</b>: The load balancer is frozen by the partner.</li><li>• <b>REAR</b>: Your account is in arrears.</li></ul> |

| Parameter         | Type                                 | Description                                                                                                                                                                                                                                                                                                                                                    |
|-------------------|--------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| protection_status | String                               | Specifies whether modification protection is enabled. The value can be one of the following: <ul style="list-style-type: none"><li>• <b>nonProtection</b> (default): Modification protection is not enabled.</li><li>• <b>consoleProtection</b>: Modification protection is enabled to avoid that resources are modified by accident on the console.</li></ul> |
| protection_reason | String                               | Specifies the reason to enable modification protection. This parameter is valid only when <b>protection_status</b> is set to <b>consoleProtection</b> .                                                                                                                                                                                                        |
| publicips         | Array of <b>PublicIpInfo</b> objects | Specifies the EIP bound to the load balancer. Only one EIP can be bound to a load balancer.                                                                                                                                                                                                                                                                    |

Table 6-14 listeners parameter description

| Parameter | Type   | Description                                  |
|-----------|--------|----------------------------------------------|
| id        | String | Specifies the ID of the associated listener. |

Table 6-15 pools parameter description

| Parameter | Type   | Description                                              |
|-----------|--------|----------------------------------------------------------|
| id        | String | Specifies the ID of the associated backend server group. |

## Status Code

For details, see [Status Codes](#).

## 6.1.3 Querying Details of a Load Balancer

### Function

This API is used to query details about a load balancer using its ID.

### URI

GET /v2/{project\_id}/elb/loadbalancers/{loadbalancer\_id}

Table 6-16 Parameter description

| Parameter       | Mandatory | Type   | Description                     |
|-----------------|-----------|--------|---------------------------------|
| project_id      | Yes       | String | Specifies the project ID.       |
| loadbalancer_id | Yes       | String | Specifies the load balancer ID. |

Request

None

Response

Table 6-17 Response parameters

| Parameter    | Type                                | Description                                                                |
|--------------|-------------------------------------|----------------------------------------------------------------------------|
| loadbalancer | <a href="#">Loadbalancer</a> object | Specifies the load balancer. For details, see <a href="#">Table 6-18</a> . |

Table 6-18 loadbalancer parameter description

| Parameter     | Type   | Description                                                                                                    |
|---------------|--------|----------------------------------------------------------------------------------------------------------------|
| id            | String | Specifies the load balancer ID.                                                                                |
| project_id    | String | Specifies the ID of the project where the load balancer is used.                                               |
| tenant_id     | String | Specifies the tenant ID.                                                                                       |
| name          | String | Specifies the load balancer name.<br>The value contains a maximum of 255 characters.                           |
| description   | String | Provides supplementary information about the load balancer.<br>The value contains a maximum of 255 characters. |
| vip_subnet_id | String | Specifies the ID of the IPv4 subnet where the load balancer works.                                             |
| vip_port_id   | String | Specifies the ID of the port bound to the private IP address of the load balancer.                             |

| Parameter           | Type                                       | Description                                                                                                                                                                                                                       |
|---------------------|--------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| provider            | String                                     | Specifies the provider of the load balancer.                                                                                                                                                                                      |
| vip_address         | String                                     | Specifies the private IP address of the load balancer.<br>The value contains a maximum of 64 characters.                                                                                                                          |
| listeners           | Array of <a href="#">Listeners</a> objects | Lists the IDs of listeners added to the load balancer. For details, see <a href="#">Table 6-7</a> .                                                                                                                               |
| pools               | Array of <a href="#">Pools</a> objects     | Lists the IDs of backend server groups associated with the load balancer. For details, see <a href="#">Table 6-8</a> .                                                                                                            |
| operating_status    | String                                     | Specifies the operating status of the load balancer. The value can be <b>ONLINE</b> or <b>FROZEN</b> .                                                                                                                            |
| provisioning_status | String                                     | This parameter is reserved, and its value can only be <b>ACTIVE</b> .<br>It specifies the provisioning status of the load balancer.                                                                                               |
| admin_state_up      | Boolean                                    | Specifies the administrative status of the load balancer. The load balancer stops receiving traffic after it is disabled.<br>Value options:<br><b>true</b> : Enable a load balancer.<br><b>false</b> : Disable the load balancer. |
| tags                | Array                                      | Lists load balancer tags.                                                                                                                                                                                                         |
| created_at          | String                                     | Specifies the time when the load balancer was created.<br>The UTC time is in <i>YYYY-MM-DDTHH:MM:SS</i> format.<br>The value contains a maximum of 19 characters.                                                                 |
| updated_at          | String                                     | Specifies the time when the load balancer was updated.<br>The UTC time is in <i>YYYY-MM-DDTHH:MM:SS</i> format.<br>The value contains a maximum of 19 characters.                                                                 |

| Parameter             | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-----------------------|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| enterprise_project_id | String | <p>Specifies the enterprise project ID. When creating a load balancer, you can assign an enterprise project to the load balancer.</p> <p>The value is character string <b>0</b> or a UUID with hyphens (-). Value <b>0</b> indicates the default enterprise project.</p> <p><b>NOTE</b></p> <p>For more information about enterprise projects and how to obtain enterprise project IDs, see <a href="#">Enterprise Management User Guide</a>.</p>                                        |
| charge_mode           | String | <p>Specifies how the load balancer will be billed. The value can be one of the following:</p> <ul style="list-style-type: none"><li>• <b>flavor</b>: indicates the guaranteed performance that allows the load balancer to handle up to 50,000 concurrent connections, 5,000 connections and 5,000 queries per second. You will be charged if the load balancer provides guaranteed performance.</li><li>• <b>null</b>: indicates that guaranteed performance is not provided.</li></ul> |
| billing_info          | String | <p>Specifies whether the billing information is left blank.</p>                                                                                                                                                                                                                                                                                                                                                                                                                          |

| Parameter         | Type                                 | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|-------------------|--------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| frozen_scene      | String                               | <p>Specifies the scenario where the load balancer is frozen. If there are multiple scenarios, separate them with commas (,). The value can be one of the following:</p> <ul style="list-style-type: none"><li>● <b>POLICE</b>: The load balancer is frozen for public security.</li><li>● <b>ILLEGAL</b>: The load balancer is frozen due to violation of laws and regulations.</li><li>● <b>VERIFY</b>: The load balancer is frozen because the user fails to pass real-name authentication.</li><li>● <b>PARTNER</b>: The load balancer is frozen by the partner.</li><li>● <b>REAR</b>: Your account is in arrears.</li></ul> |
| protection_status | String                               | <p>Specifies whether modification protection is enabled. The value can be one of the following:</p> <ul style="list-style-type: none"><li>● <b>nonProtection</b> (default): Modification protection is not enabled.</li><li>● <b>consoleProtection</b>: Modification protection is enabled to avoid that resources are modified by accident on the console.</li></ul>                                                                                                                                                                                                                                                            |
| protection_reason | String                               | <p>Specifies the reason to enable modification protection. This parameter is valid only when <b>protection_status</b> is set to <b>consoleProtection</b>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| publicips         | Array of <b>PublicIpInfo</b> objects | <p>Specifies the EIP bound to the load balancer. Only one EIP can be bound to a load balancer.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

**Table 6-19 listeners** parameter description

| Parameter | Type   | Description                                  |
|-----------|--------|----------------------------------------------|
| id        | String | Specifies the ID of the associated listener. |

**Table 6-20** pools parameter description

| Parameter | Type   | Description                                              |
|-----------|--------|----------------------------------------------------------|
| id        | String | Specifies the ID of the associated backend server group. |

## Status Code

For details, see [Status Codes](#).

## 6.1.4 Querying the Status Tree of a Load Balancer

### Function

This API is used to query the status tree of a load balancer. You can use this API to query details about the associated listeners, backend server groups, backend servers, health checks, forwarding policies, and forwarding rules, helping you understand the topology of resources associated with the load balancer.

## URI

GET /v2/{project\_id}/elb/loadbalancers/{loadbalancer\_id}/statuses

**Table 6-21** Parameter description

| Parameter       | Mandatory | Type   | Description                     |
|-----------------|-----------|--------|---------------------------------|
| project_id      | Yes       | String | Specifies the project ID.       |
| loadbalancer_id | Yes       | String | Specifies the load balancer ID. |

## Request

None

| Parameter    | Type                                | Description                                                                |
|--------------|-------------------------------------|----------------------------------------------------------------------------|
| loadbalancer | <a href="#">Loadbalancer</a> object | Specifies the load balancer. For details, see <a href="#">Table 6-24</a> . |

**Table 6-24** [loadbalancer](#) parameter description

| Parameter | Type                                       | Description                                                                                                     |
|-----------|--------------------------------------------|-----------------------------------------------------------------------------------------------------------------|
| id        | String                                     | Specifies the load balancer ID.                                                                                 |
| name      | String                                     | Specifies the load balancer name.<br>The value contains a maximum of 255 characters.                            |
| listeners | Array of <a href="#">Listeners</a> objects | Lists the listeners added to the load balancer. For details of this parameter, see <a href="#">Table 6-25</a> . |

| Parameter           | Type                                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|---------------------|----------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| pools               | Array of <a href="#">Pools</a> objects | Lists the backend server groups associated with the load balancer. For details of this parameter, see <a href="#">Table 6-26</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| operating_status    | String                                 | <p>This field is reserved.</p> <p>It specifies the operating status of the load balancer. The value can be one of the following:</p> <ul style="list-style-type: none"><li>● <b>ONLINE</b> (default): The load balancer is running normally.</li><li>● <b>DEGRADED</b>: This status is displayed only when <b>provisioning_status</b> of a forwarding policy or forwarding rule added to a listener of the load balancer is set to <b>ERROR</b> and the API for querying the load balancer status tree is called.</li><li>● <b>DISABLED</b>: This status is displayed only when <b>admin_state_up</b> of the load balancer is set to <b>false</b> and the API for querying the load balancer status tree is called.</li><li>● <b>FROZEN</b>: The load balancer is frozen.</li></ul> |
| provisioning_status | String                                 | <p>This parameter is reserved, and its value can only be <b>ACTIVE</b>.</p> <p>It specifies the provisioning status of the load balancer.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

**Table 6-25** listeners parameter description

| Parameter  | Type                                        | Description                                                                                           |
|------------|---------------------------------------------|-------------------------------------------------------------------------------------------------------|
| id         | String                                      | Specifies the listener ID.                                                                            |
| name       | String                                      | Specifies the listener name.                                                                          |
| l7policies | Array of <a href="#">l7policies</a> objects | Lists associated forwarding policies. For details of this parameter, see <a href="#">Table 6-29</a> . |

| Parameter           | Type                                   | Description                                                                                                                   |
|---------------------|----------------------------------------|-------------------------------------------------------------------------------------------------------------------------------|
| pools               | Array of <a href="#">Pools</a> objects | Lists the backend server groups associated with the listener. For details of this parameter, see <a href="#">Table 6-26</a> . |
| operating_status    | String                                 | This parameter is reserved, and its value can only be <b>ONLINE</b> . It specifies the operating status of the listener.      |
| provisioning_status | String                                 | This parameter is reserved, and its value can only be <b>ACTIVE</b> . It specifies the provisioning status of the listener.   |

**Table 6-26** pools parameter description

| Parameter           | Type                                     | Description                                                                                                                             |
|---------------------|------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------|
| id                  | String                                   | Specifies the ID of the backend server group.                                                                                           |
| name                | String                                   | Specifies the name of the backend server group.                                                                                         |
| healthmonitor       | <a href="#">Healthmonitor</a> object     | Provides health check details of the backend server group. For details of this parameter, see <a href="#">Table 6-27</a> .              |
| members             | Array of <a href="#">Members</a> objects | Lists the members contained in the backend server group. For details of this parameter, see <a href="#">Table 6-28</a> .                |
| operating_status    | String                                   | This parameter is reserved, and its value can only be <b>ONLINE</b> . It specifies the operating status of the backend server group.    |
| provisioning_status | String                                   | This parameter is reserved, and its value can only be <b>ACTIVE</b> . It specifies the provisioning status of the backend server group. |

**Table 6-27 healthmonitor** parameter description

| Parameter           | Type   | Description                                                                                                                                                   |
|---------------------|--------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|
| id                  | String | Specifies the health check ID.                                                                                                                                |
| name                | String | Specifies the health check name.                                                                                                                              |
| type                | String | <ul style="list-style-type: none"><li>Specifies the health check protocol.</li><li>The value can be <b>UDP_CONNECT</b>, <b>TCP</b>, or <b>HTTP</b>.</li></ul> |
| provisioning_status | String | This parameter is reserved, and its value can only be <b>ACTIVE</b> .<br>It specifies the provisioning status of the health check.                            |

**Table 6-28 members** parameter description

| Parameter     | Type    | Description                                                                                                                                    |
|---------------|---------|------------------------------------------------------------------------------------------------------------------------------------------------|
| id            | String  | Specifies the backend server ID.                                                                                                               |
| address       | String  | Specifies the private IP address of the backend server, for example, 192.168.3.11.                                                             |
| protocol_port | Integer | <ul style="list-style-type: none"><li>Specifies the port used by the backend server.</li><li>The port number ranges from 0 to 65535.</li></ul> |

| Parameter           | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|---------------------|--------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| operating_status    | String | <p>This parameter is reserved. It specifies the operating status of the backend server. The value can be one of the following:</p> <ul style="list-style-type: none"><li>• <b>ONLINE</b>: The backend server is running normally.</li><li>• <b>NO_MONITOR</b>: No health check is configured for the backend server group that the backend server belongs to.</li><li>• <b>DISABLED</b>: The backend server is not available. This status is displayed only when <b>admin_state_up</b> of the backend server, or the backend server group to which it belongs, or the associated load balancer is set to <b>false</b> and the API for querying the load balancer status tree is called.</li><li>• <b>OFFLINE</b>: The cloud server used as the backend server is stopped or does not exist.</li></ul> <p><b>NOTE</b><br/>When <b>admin_state_up</b> is set to <b>false</b> and <b>operating_status</b> is set to <b>OFFLINE</b> for a backend server, <b>DISABLED</b> is returned for <b>operating_status</b> of the backend server in the response of this API.</p> |
| provisioning_status | String | <p>This parameter is reserved, and its value can only be <b>ACTIVE</b>. It specifies the provisioning status of the backend server.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

**Table 6-29** l7policies parameter description

| Parameter | Type   | Description                           |
|-----------|--------|---------------------------------------|
| id        | String | Specifies the forwarding policy ID.   |
| name      | String | Specifies the forwarding policy name. |

| Parameter           | Type                                   | Description                                                                                                                                                                                                                                                                                                                                                                                                       |
|---------------------|----------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| rules               | Array of <a href="#">Rules</a> objects | Lists the forwarding rules of the forwarding policy. For details of this parameter, see <a href="#">Table 6-30</a> .                                                                                                                                                                                                                                                                                              |
| action              | String                                 | <ul style="list-style-type: none"><li>Specifies whether requests are forwarded to another backend server group or redirected to an HTTPS listener.</li><li>The value can be <b>REDIRECT_TO_POOL</b> or <b>REDIRECT_TO_LISTENER</b>.<br/><b>REDIRECT_TO_POOL</b>: Requests are forwarded to another backend server group.<br/><b>REDIRECT_TO_LISTENER</b>: Requests are redirected to an HTTPS listener.</li></ul> |
| provisioning_status | String                                 | <p>This parameter is reserved.</p> <p>It specifies the provisioning status of the forwarding policy. The value can be one of the following:</p> <ul style="list-style-type: none"><li><b>ACTIVE</b> (default): The forwarding policy is normal.</li><li><b>ERROR</b>: Another forwarding policy of the same listener has the same forwarding rule.</li></ul>                                                      |

**Table 6-30** rules parameter description

| Parameter | Type   | Description                                                                                                                                                                                                                                                      |
|-----------|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| id        | String | Specifies the forwarding rule ID.                                                                                                                                                                                                                                |
| type      | String | <ul style="list-style-type: none"><li>Specifies the match type of a forwarding rule.</li><li>The value can be <b>PATH</b> or <b>HOST_NAME</b>. <b>PATH</b>: matches the path in the request. <b>HOST_NAME</b>: matches the domain name in the request.</li></ul> |

| Parameter           | Type   | Description                                                                                                                                                                                                                                                                                                                                                  |
|---------------------|--------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| provisioning_status | String | <p>This parameter is reserved.</p> <p>It specifies the provisioning status of the forwarding rule. The value can be one of the following:</p> <ul style="list-style-type: none"><li>● <b>ACTIVE</b> (default): The forwarding rule is normal.</li><li>● <b>ERROR</b>: Another forwarding policy of the same listener has the same forwarding rule.</li></ul> |

Status Code

For details, see [Status Codes](#).

6.1.5 Updating a Load Balancer

Function

This API is used to update the name or description of a load balancer.

URI

PUT /v2/{project\_id}/elb/loadbalancers/{loadbalancer\_id}

Table 6-31 Parameter description

| Parameter       | Mandatory | Type   | Description                     |
|-----------------|-----------|--------|---------------------------------|
| project_id      | Yes       | String | Specifies the project ID.       |
| loadbalancer_id | Yes       | String | Specifies the load balancer ID. |

## Request

**Table 6-32** Parameter description

| Parameter    | Mandatory | Type                                | Description                                                                |
|--------------|-----------|-------------------------------------|----------------------------------------------------------------------------|
| loadbalancer | Yes       | <a href="#">Loadbalancer</a> object | Specifies the load balancer. For details, see <a href="#">Table 6-33</a> . |

**Table 6-33** loadbalancer parameter description

| Parameter      | Mandatory | Type    | Description                                                                                                                                                                                                                                                 |
|----------------|-----------|---------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| name           | No        | String  | Specifies the load balancer name.<br>The value contains a maximum of 255 characters.                                                                                                                                                                        |
| description    | No        | String  | Provides supplementary information about the load balancer.<br>The value contains a maximum of 255 characters.                                                                                                                                              |
| admin_state_up | No        | Boolean | Specifies the administrative status of the load balancer. The load balancer stops receiving traffic after it is disabled.<br>The value can be one of the following:<br><b>true</b> : Enable the load balancer.<br><b>false</b> : Disable the load balancer. |

| Parameter         | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                                                                    |
|-------------------|-----------|--------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| protection_status | No        | String | Specifies whether modification protection is enabled. The value can be one of the following: <ul style="list-style-type: none"><li>• <b>nonProtection</b> (default): Modification protection is not enabled.</li><li>• <b>consoleProtection</b>: Modification protection is enabled to avoid that resources are modified by accident on the console.</li></ul> |
| protection_reason | No        | String | Specifies the reason to enable modification protection. This parameter is valid only when <b>protection_status</b> is set to <b>consoleProtection</b> .                                                                                                                                                                                                        |

## Response

**Table 6-34** Response parameters

| Parameter    | Type                       | Description                                                                |
|--------------|----------------------------|----------------------------------------------------------------------------|
| loadbalancer | <b>Loadbalancer</b> object | Specifies the load balancer. For details, see <a href="#">Table 6-35</a> . |

**Table 6-35** loadbalancer parameter description

| Parameter  | Type   | Description                                                      |
|------------|--------|------------------------------------------------------------------|
| id         | String | Specifies the load balancer ID.                                  |
| project_id | String | Specifies the ID of the project where the load balancer is used. |
| tenant_id  | String | Specifies the tenant ID.                                         |

| Parameter           | Type                                       | Description                                                                                                                         |
|---------------------|--------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------|
| name                | String                                     | Specifies the load balancer name.<br>The value contains a maximum of 255 characters.                                                |
| description         | String                                     | Provides supplementary information about the load balancer.<br>The value contains a maximum of 255 characters.                      |
| vip_subnet_id       | String                                     | Specifies the ID of the IPv4 subnet where the load balancer works.                                                                  |
| vip_port_id         | String                                     | Specifies the ID of the port bound to the private IP address of the load balancer.                                                  |
| provider            | String                                     | Specifies the provider of the load balancer.                                                                                        |
| vip_address         | String                                     | Specifies the private IP address of the load balancer.<br>The value contains a maximum of 64 characters.                            |
| listeners           | Array of <a href="#">Listeners</a> objects | Lists the IDs of listeners added to the load balancer. For details, see <a href="#">Table 6-7</a> .                                 |
| pools               | Array of <a href="#">Pools</a> objects     | Lists the IDs of backend server groups associated with the load balancer. For details, see <a href="#">Table 6-8</a> .              |
| operating_status    | String                                     | Specifies the operating status of the load balancer. The value can be <b>ONLINE</b> or <b>FROZEN</b> .                              |
| provisioning_status | String                                     | This parameter is reserved, and its value can only be <b>ACTIVE</b> .<br>It specifies the provisioning status of the load balancer. |

| Parameter             | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-----------------------|---------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| admin_state_up        | Boolean | <p>Specifies the administrative status of the load balancer. The load balancer stops receiving traffic after it is disabled.</p> <p>Value options:</p> <p><b>true:</b> Enable a load balancer.</p> <p><b>false:</b> Disable the load balancer.</p>                                                                                                                                                                                                |
| tags                  | Array   | <p>Lists load balancer tags.</p>                                                                                                                                                                                                                                                                                                                                                                                                                  |
| created_at            | String  | <p>Specifies the time when the load balancer was created.</p> <p>The UTC time is in <i>YYYY-MM-DDTHH:MM:SS</i> format.</p> <p>The value contains a maximum of 19 characters.</p>                                                                                                                                                                                                                                                                  |
| updated_at            | String  | <p>Specifies the time when the load balancer was updated.</p> <p>The UTC time is in <i>YYYY-MM-DDTHH:MM:SS</i> format.</p> <p>The value contains a maximum of 19 characters.</p>                                                                                                                                                                                                                                                                  |
| enterprise_project_id | String  | <p>Specifies the enterprise project ID. When creating a load balancer, you can assign an enterprise project to the load balancer.</p> <p>The value is character string <b>0</b> or a UUID with hyphens (-). Value <b>0</b> indicates the default enterprise project.</p> <p><b>NOTE</b></p> <p>For more information about enterprise projects and how to obtain enterprise project IDs, see <a href="#">Enterprise Management User Guide</a>.</p> |

| Parameter    | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|--------------|--------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| charge_mode  | String | <p>Specifies how the load balancer will be billed. The value can be one of the following:</p> <ul style="list-style-type: none"><li>• <b>flavor</b>: indicates the guaranteed performance that allows the load balancer to handle up to 50,000 concurrent connections, 5,000 connections and 5,000 queries per second. You will be charged if the load balancer provides guaranteed performance.</li><li>• <b>null</b>: indicates that guaranteed performance is not provided.</li></ul>                                                                                                                                         |
| billing_info | String | <p>Specifies whether the billing information is left blank.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| frozen_scene | String | <p>Specifies the scenario where the load balancer is frozen. If there are multiple scenarios, separate them with commas (.). The value can be one of the following:</p> <ul style="list-style-type: none"><li>• <b>POLICE</b>: The load balancer is frozen for public security.</li><li>• <b>ILLEGAL</b>: The load balancer is frozen due to violation of laws and regulations.</li><li>• <b>VERIFY</b>: The load balancer is frozen because the user fails to pass real-name authentication.</li><li>• <b>PARTNER</b>: The load balancer is frozen by the partner.</li><li>• <b>REAR</b>: Your account is in arrears.</li></ul> |

| Parameter         | Type                                 | Description                                                                                                                                                                                                                                                                                                                                                    |
|-------------------|--------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| protection_status | String                               | Specifies whether modification protection is enabled. The value can be one of the following: <ul style="list-style-type: none"><li>• <b>nonProtection</b> (default): Modification protection is not enabled.</li><li>• <b>consoleProtection</b>: Modification protection is enabled to avoid that resources are modified by accident on the console.</li></ul> |
| protection_reason | String                               | Specifies the reason to enable modification protection. This parameter is valid only when <b>protection_status</b> is set to <b>consoleProtection</b> .                                                                                                                                                                                                        |
| publicips         | Array of <b>PublicIpInfo</b> objects | Specifies the EIP bound to the load balancer. Only one EIP can be bound to a load balancer.                                                                                                                                                                                                                                                                    |

## Status Code

For details, see [Status Codes](#).

## 6.1.6 Deleting a Load Balancer

### Function

This API is used to delete a load balancer by ID.

### Constraints

When you set **cascade** to **false**, you must delete the resources associated with the load balancer before attempting to delete it.

### URI

DELETE /v2/{project\_id}/elb/loadbalancers/{loadbalancer\_id}

**Table 6-38** Parameter description

| Parameter  | Mandator<br>y | Type       | Description               |
|------------|---------------|------------|---------------------------|
| project_id | Yes           | Strin<br>g | Specifies the project ID. |

| Parameter       | Mandatory | Type    | Description                                                                                                                                                          |
|-----------------|-----------|---------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| loadbalancer_id | Yes       | String  | Specifies the load balancer ID.                                                                                                                                      |
| cascade         | No        | Boolean | Specifies whether to delete the resources associated with the load balancer when it is deleted, including the listeners, backend server groups, and backend servers. |

# 6.2 Listener

## 6.2.1 Adding a Listener

### Function

This API is used to add a listener to a load balancer.

### Constraints

- Only users with the ELB administrator permissions can specify the value of **connection\_limit**.
- The value of **protocol** can be **TCP**, **HTTP**, **UDP**, or **TERMINATED\_HTTPS**.

## URI

POST /v2/{project\_id}/elb/listeners

**Table 6-39** Parameter description

| Parameter  | Mandatory | Type   | Description               |
|------------|-----------|--------|---------------------------|
| project_id | Yes       | String | Specifies the project ID. |

## Request

**Table 6-40** Parameter description

| Parameter | Mandatory | Type                            | Description                                                           |
|-----------|-----------|---------------------------------|-----------------------------------------------------------------------|
| listener  | Yes       | <a href="#">Listener</a> object | Specifies the listener. For details, see <a href="#">Table 6-41</a> . |

**Table 6-41** listener parameter description

| Parameter   | Mandatory | Type   | Description                                                                                                                                                                                            |
|-------------|-----------|--------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| tenant_id   | No        | String | Specifies the ID of the project where the listener is used.<br><br>The value must be the same as the value of <b>project_id</b> in the token.<br><br>The value contains a maximum of 255 characters.   |
| name        | No        | String | Specifies the listener name.<br><br>Note: If you leave the listener name empty, you cannot locate it on the listener list and view its details.<br><br>The value contains a maximum of 255 characters. |
| description | No        | String | Provides supplementary information about the listener.<br><br>The value contains a maximum of 255 characters.                                                                                          |

| Parameter        | Mandatory | Type    | Description                                                                                                                                                                                                                                                                                                                                                            |
|------------------|-----------|---------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| protocol         | Yes       | String  | Specifies the protocol used by the listener.<br>The value can be <b>TCP</b> , <b>HTTP</b> , <b>UDP</b> , or <b>TERMINATED_HTTPS</b> .                                                                                                                                                                                                                                  |
| protocol_port    | Yes       | Integer | Specifies the port used by the listener.<br>The port number ranges from 1 to 65535.<br><b>NOTE</b> <ul style="list-style-type: none"><li>If the protocol used by the listener is UDP, the port number cannot be 4789.</li><li>HTTP and TERMINATED_HTTPS listeners cannot use port 21.</li></ul>                                                                        |
| loadbalancer_id  | Yes       | String  | Specifies the ID of the associated load balancer.                                                                                                                                                                                                                                                                                                                      |
| connection_limit | No        | Integer | Specifies the maximum number of connections.<br>The value ranges from <b>-1</b> to <b>2147483647</b> . The default value is <b>-1</b> , indicating that there is no restriction on the maximum number of connections.<br>This parameter is reserved.                                                                                                                   |
| admin_state_up   | No        | Boolean | Specifies the administrative status of the listener.<br>This parameter is reserved, and the default value is <b>true</b> .                                                                                                                                                                                                                                             |
| http2_enable     | No        | Boolean | Specifies whether to use HTTP/2.<br>The value can be <b>true</b> or <b>false</b> . <ul style="list-style-type: none"><li><b>true</b>: HTTP/2 will be used.</li><li><b>false</b>: HTTP/2 will not be used.</li></ul> The default value is <b>false</b> .<br>This parameter takes effect only when the protocol used by the listener is set to <b>TERMINATED_HTTPS</b> . |

| Parameter       | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-----------------|-----------|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| default_pool_id | No        | String | <p>Specifies the ID of the associated backend server group.</p> <p>If a request does not match the forwarding policy, the request is forwarded to the default backend server group for processing. If the value is <b>null</b>, the listener has no default backend server group.</p> <p>The <b>default_pool_id</b> parameter has the following constraints:</p> <ul style="list-style-type: none"><li>• Its value cannot be the ID of any backend server group of other listeners.</li><li>• Its value cannot be the ID of any backend server group associated with the forwarding policies set for other listeners.</li></ul> <p>The relationships between the protocol of the backend server group and the protocol used by the listener are as follows:</p> <ul style="list-style-type: none"><li>• When the protocol used by the listener is <b>TCP</b>, the protocol of the backend server group must be <b>TCP</b>.</li><li>• When the protocol used by the listener is <b>UDP</b>, the protocol of the backend server group must be <b>UDP</b>.</li><li>• When the protocol used by the listener is <b>HTTP</b> or <b>TERMINATED_HTTPS</b>, the protocol of the backend server group must be <b>HTTP</b>.</li></ul> |

| Parameter                   | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| insert_headers     | No        | <a href="#">InsertHeaders</a> object | <p>Specifies whether to insert HTTP extension headers and sent them to backend servers. All headers are synchronized. If this parameter is not set, default values are used.</p> <p>Information required by backend servers can be written into HTTP headers and passed to backend servers.</p> <p>For example, you can use the <b>X-Forwarded-ELB-IP</b> header to transmit the load balancer EIP to backend servers. For details, see <a href="#">Table 6-42</a>.</p> <p><b>NOTE</b><br/>This parameter takes effect only when the protocol used by the listener is set to <b>HTTP</b> or <b>TERMINATED_HTTPS</b>.</p> |
| tls_ciphers_policy | No        | String                               | <p>Specifies the security policy used by the listener. This parameter takes effect only when the protocol used by the listener is set to <b>TERMINATED_HTTPS</b>.</p> <p>The value can be <b>tls-1-0-inherit</b>, <b>tls-1-0</b>, <b>tls-1-1</b>, <b>tls-1-2</b>, or <b>tls-1-2-strict</b>, and the default value is <b>tls-1-0</b>. For details of cipher suites for each security policy, see <a href="#">Table 6-43</a>.</p>                                                                                                                                                                                          |
| protection_status  | No        | String                               | <p>Specifies whether modification protection is enabled. The value can be one of the following:</p> <ul style="list-style-type: none"><li>● <b>nonProtection</b> (default): Modification protection is not enabled.</li><li>● <b>consoleProtection</b>: Modification protection is enabled to avoid that resources are modified by accident on the console.</li></ul>                                                                                                                                                                                                                                                    |
| protection_reason  | No        | String                               | <p>Specifies the reason to enable modification protection. This parameter is valid only when <b>protection_status</b> is set to <b>consoleProtection</b>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

Table 6-42 insert\_headers parameter description

| Parameter          | Mandatory | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                      |
|--------------------|-----------|---------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| X-Forwarded-ELB-IP | No        | Boolean | Specifies whether to transparently transmit the load balancer EIP to backend servers. After this function is enabled, the load balancer EIP is stored in the HTTP header and passes to backend servers.<br><br>The value can be <b>true</b> or <b>false</b> .<br><b>true</b> : This function is enabled.<br><b>false</b> : The function is disabled.<br><br>The function is disabled by default. |
| X-Forwarded-Host   | No        | Boolean | Specifies whether to rewrite the <b>X-Forwarded-Host</b> header. If this function is enabled, <b>X-Forwarded-Host</b> is rewritten based on <b>Host</b> in the request and sent to backend servers.<br><br>The value can be <b>true</b> or <b>false</b> .<br><b>true</b> : This function is enabled.<br><b>false</b> : The function is disabled.<br><br>The function is enabled by default.      |

Table 6-43 tls\_ciphers\_policy parameter description

| Security Policy | TLS Version                | Cipher Suite                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

## Response

**Table 6-44** Response parameters

| Parameter | Type                            | Description                                                           |
|-----------|---------------------------------|-----------------------------------------------------------------------|
| listener  | <a href="#">Listener</a> object | Specifies the listener. For details, see <a href="#">Table 6-45</a> . |

**Table 6-45** listener parameter description

| Parameter  | Type   | Description                                                                                                              |
|------------|--------|--------------------------------------------------------------------------------------------------------------------------|
| id         | String | Specifies the listener ID.                                                                                               |
| tenant_id  | String | Specifies the ID of the project where the listener is used.<br>The value contains a maximum of 255 characters.           |
| project_id | String | Specifies the ID of the project to which the listener belongs. This parameter has the same meaning as <b>tenant_id</b> . |

| Parameter        | Type                                  | Description                                                                                                                                                                                                                                                                                                               |
|------------------|---------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| name             | String                                | Specifies the listener name.<br>Note: If you leave the listener name empty, you cannot locate it on the listener list and view its details.<br>The value contains a maximum of 255 characters.                                                                                                                            |
| description      | String                                | Provides supplementary information about the listener.<br>The value contains a maximum of 255 characters.                                                                                                                                                                                                                 |
| protocol         | String                                | Specifies the protocol used by the listener.<br>The value can be <b>TCP</b> , <b>HTTP</b> , <b>UDP</b> , or <b>TERMINATED_HTTPS</b> .                                                                                                                                                                                     |
| protocol_port    | Integer                               | Specifies the port used by the listener.<br>The port number ranges from 1 to 65535.                                                                                                                                                                                                                                       |
| loadbalancers    | Array of <b>Loadbalancers</b> objects | Specifies the ID of the associated load balancer. For details, see <a href="#">Table 6-46</a> .                                                                                                                                                                                                                           |
| connection_limit | Integer                               | Specifies the maximum number of connections.<br>The value ranges from <b>-1</b> to <b>2147483647</b> . The default value is <b>-1</b> , indicating that there is no restriction on the maximum number of connections.<br>This parameter is reserved.                                                                      |
| admin_state_up   | Boolean                               | Specifies the administrative status of the listener.<br>This parameter is reserved. The value can be <b>true</b> or <b>false</b> . <ul style="list-style-type: none"><li>● <b>true</b>: Enabled</li><li>● <b>false</b>: Disabled</li></ul>                                                                                |
| http2_enable     | Boolean                               | Specifies whether to use HTTP/2.<br>The value can be <b>true</b> or <b>false</b> . <ul style="list-style-type: none"><li>● <b>true</b>: HTTP/2 is used.</li><li>● <b>false</b>: HTTP/2 is not used.</li></ul> This parameter takes effect only when the protocol used by the listener is set to <b>TERMINATED_HTTPS</b> . |

| Parameter                   | Type                                 | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-----------------------------|--------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| default_pool_id             | String                               | Specifies the ID of the associated backend server group.<br><br>If a request does not match the forwarding policy, the request is forwarded to the default backend server group for processing. If the value is <b>null</b> , the listener has no default backend server group.                                                                                                                                                                                   |
| default_tls_container_ref   | String                               | Specifies the ID of the server certificate used by the listener. For details, see <a href="#">Certificate</a> .<br><br>This parameter is mandatory when <b>protocol</b> is set to <b>TERMINATED_HTTPS</b> .<br><br>The value contains a maximum of 128 characters.                                                                                                                                                                                                |
| client_ca_tls_container_ref | String                               | Specifies the ID of the CA certificate used by the listener.<br><br>The value contains a maximum of 128 characters.<br><br>For details, see <a href="#">Certificate</a> .                                                                                                                                                                                                                                                                                         |
| sni_container_refs          | Array                                | Lists the IDs of SNI certificates (server certificates with domain names) used by the listener.<br><br>If the parameter value is an empty list, the SNI feature is disabled.                                                                                                                                                                                                                                                                                      |
| tags                        | Array                                | Tags the listener.                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| insert_headers              | <a href="#">InsertHeaders</a> object | Specifies whether to insert HTTP extension headers and sent them to backend servers. All headers are synchronized. If this parameter is not set, default values are used.<br><br>Information required by backend servers can be written into HTTP headers and passed to backend servers.<br><br>For example, you can use the <b>X-Forwarded-ELB-IP</b> header to transmit the load balancer EIP to backend servers. For details, see <a href="#">Table 6-47</a> . |

| Parameter          | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                              |
|--------------------|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| tls_ciphers_policy | String | Specifies the security policy used by the listener. This parameter takes effect only when the protocol used by the listener is set to <b>TERMINATED_HTTPS</b> .<br><br>The value can be <b>tls-1-0-inherit</b> , <b>tls-1-0</b> , <b>tls-1-1</b> , <b>tls-1-2</b> , or <b>tls-1-2-strict</b> , and the default value is <b>tls-1-0</b> . Lists cipher suites used by each security policy. For details, see <a href="#">Table 6-48</a> . |
| protection_status  | String | String<br>Specifies whether modification protection is enabled. The value can be one of the following: <ul style="list-style-type: none"><li>• <b>nonProtection</b> (default): Modification protection is not enabled.</li><li>• <b>consoleProtection</b>: Modification protection is enabled to avoid that resources are modified by accident on the console.</li></ul>                                                                 |
| protection_reason  | String | String<br>Specifies the reason to enable modification protection. This parameter is valid only when <b>protection_status</b> is set to <b>consoleProtection</b> .                                                                                                                                                                                                                                                                        |

**Table 6-46** loadbalancers parameter description

| Parameter | Mandatory | Type   | Description                                       |
|-----------|-----------|--------|---------------------------------------------------|
| id        | Yes       | String | Specifies the ID of the associated load balancer. |

**Table 6-47 insert\_headers** parameter description

| Parameter          | Mandatory | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                         |
|--------------------|-----------|---------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| X-Forwarded-ELB-IP | No        | Boolean | <p>Specifies whether to transparently transmit the load balancer EIP to backend servers. After this function is enabled, the load balancer EIP is stored in the HTTP header and passes to backend servers.</p> <p>The value can be <b>true</b> or <b>false</b>.<br/><b>true</b>: This function is enabled.<br/><b>false</b>: The function is disabled.<br/>The function is disabled by default.</p> |
| X-Forwarded-Host   | No        | Boolean | <p>Specifies whether to rewrite the <b>X-Forwarded-Host</b> header. If this function is enabled, <b>X-Forwarded-Host</b> is rewritten based on <b>Host</b> in the request and sent to backend servers.</p> <p>The value can be <b>true</b> or <b>false</b>.<br/><b>true</b>: This function is enabled.<br/><b>false</b>: The function is disabled.<br/>The function is enabled by default.</p>      |

**Table 6-48 tls\_ciphers\_policy** parameter description

| Security Policy | TLS Version                | Cipher Suite                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

## Example Request

- Example request 1: Adding a TCP listener

POST https://{Endpoint}/v2/145483a5107745e9b3d80f956713e6a3/elb/listeners

```
{
 "listener": {
 "protocol_port": 80,
 "protocol": "TCP",
 "loadbalancer_id": "0416b6f1-877f-4a51-987e-978b3f084253",
 "name": "listener-test",
 "insert_headers": {},
 "admin_state_up": true
 }
}
```

- Example request 2: Adding a listener with **protocol** set to **TERMINATED\_HTTPS**

POST https://{Endpoint}/v2/601240b9c5c94059b63d484c92cfe308/elb/listeners

```
{
 "listener": {
 "protocol_port": 25,
 "protocol": "TERMINATED_HTTPS",
 "default_tls_container_ref": "02dcd56799e045bf8b131533cc911dd6",
 "loadbalancer_id": "0416b6f1-877f-4a51-987e-978b3f084253",
 "name": "listener-test",
 "admin_state_up": true
 }
}
```

## Example Response

- Example response 1

## Status Code

For details, see [Status Codes](#).

## 6.2.2 Querying Details of a Listener

### Function

This API is used to query details about a listener using its ID.

### URI

GET /v2/{project\_id}/elb/listeners/{listener\_id}

**Table 6-49** Parameter description

| Parameter   | Mandatory | Type   | Description                |
|-------------|-----------|--------|----------------------------|
| project_id  | Yes       | String | Specifies the project ID.  |
| listener_id | Yes       | String | Specifies the listener ID. |

### Request

None

## Response

**Table 6-50** Response parameters

| Parameter | Type                            | Description                                                           |
|-----------|---------------------------------|-----------------------------------------------------------------------|
| listener  | <a href="#">Listener</a> object | Specifies the listener. For details, see <a href="#">Table 6-51</a> . |

**Table 6-51** listener parameter description

| Parameter     | Type                                            | Description                                                                                                                                                                                    |
|---------------|-------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| id            | String                                          | Specifies the listener ID.                                                                                                                                                                     |
| tenant_id     | String                                          | Specifies the ID of the project where the listener is used.<br>The value contains a maximum of 255 characters.                                                                                 |
| project_id    | String                                          | Specifies the ID of the project to which the listener belongs. This parameter has the same meaning as <b>tenant_id</b> .                                                                       |
| name          | String                                          | Specifies the listener name.<br>Note: If you leave the listener name empty, you cannot locate it on the listener list and view its details.<br>The value contains a maximum of 255 characters. |
| description   | String                                          | Provides supplementary information about the listener.<br>The value contains a maximum of 255 characters.                                                                                      |
| protocol      | String                                          | Specifies the protocol used by the listener.<br>The value can be <b>TCP</b> , <b>HTTP</b> , <b>UDP</b> , or <b>TERMINATED_HTTPS</b> .                                                          |
| protocol_port | Integer                                         | Specifies the port used by the listener.<br>The port number ranges from 1 to 65535.                                                                                                            |
| loadbalancers | Array of <a href="#">Loadbalance</a> rs objects | Specifies the ID of the associated load balancer. For details, see <a href="#">Table 6-46</a> .                                                                                                |

| Parameter                   | Type    | Description                                                                                                                                                                                                                                                                                                                               |
|-----------------------------|---------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| connection_limit            | Integer | <p>Specifies the maximum number of connections.</p> <p>The value ranges from <b>-1</b> to <b>2147483647</b>. The default value is <b>-1</b>, indicating that there is no restriction on the maximum number of connections.</p> <p>This parameter is reserved.</p>                                                                         |
| admin_state_up              | Boolean | <p>Specifies the administrative status of the listener.</p> <p>This parameter is reserved. The value can be <b>true</b> or <b>false</b>.</p> <ul style="list-style-type: none"><li>• <b>true</b>: Enabled</li><li>• <b>false</b>: Disabled</li></ul>                                                                                      |
| http2_enable                | Boolean | <p>Specifies whether to use HTTP/2.</p> <p>The value can be <b>true</b> or <b>false</b>.</p> <ul style="list-style-type: none"><li>• <b>true</b>: HTTP/2 is used.</li><li>• <b>false</b>: HTTP/2 is not used.</li></ul> <p>This parameter takes effect only when the protocol used by the listener is set to <b>TERMINATED_HTTPS</b>.</p> |
| default_pool_id             | String  | <p>Specifies the ID of the associated backend server group.</p> <p>If a request does not match the forwarding policy, the request is forwarded to the default backend server group for processing. If the value is <b>null</b>, the listener has no default backend server group.</p>                                                     |
| default_tls_container_ref   | String  | <p>Specifies the ID of the server certificate used by the listener. For details, see <a href="#">Certificate</a>.</p> <p>This parameter is mandatory when <b>protocol</b> is set to <b>TERMINATED_HTTPS</b>.</p> <p>The value contains a maximum of 128 characters.</p>                                                                   |
| client_ca_tls_container_ref | String  | <p>Specifies the ID of the CA certificate used by the listener.</p> <p>The value contains a maximum of 128 characters.</p> <p>For details, see <a href="#">Certificate</a>.</p>                                                                                                                                                           |

| Parameter          | Type                                 | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|--------------------|--------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| sni_container_refs | Array                                | Lists the IDs of SNI certificates (server certificates with domain names) used by the listener.<br><br>If the parameter value is an empty list, the SNI feature is disabled.                                                                                                                                                                                                                                                                                      |
| tags               | Array                                | Tags the listener.                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| created_at         | String                               | Specifies the time when the listener was created. | updated_at         | String                               | Specifies the time when the listener was updated. YYYY-MM-DDTHH:MM:SS                                                                                                                                                                                                                                                                                                                                                                                             |
| insert_headers     | <a href="#">InsertHeaders</a> object | Specifies whether to insert HTTP extension headers and sent them to backend servers. All headers are synchronized. If this parameter is not set, default values are used.<br><br>Information required by backend servers can be written into HTTP headers and passed to backend servers.<br><br>For example, you can use the <b>X-Forwarded-ELB-IP</b> header to transmit the load balancer EIP to backend servers. For details, see <a href="#">Table 6-47</a> . |
| tls_ciphers_policy | String                               | Specifies the security policy used by the listener. This parameter takes effect only when the protocol used by the listener is set to <b>TERMINATED_HTTPS</b> .<br><br>The value can be <b>tls-1-0-inherit</b> , <b>tls-1-0</b> , <b>tls-1-1</b> , <b>tls-1-2</b> , or <b>tls-1-2-strict</b> , and the default value is <b>tls-1-0</b> . Lists cipher suites used by each security policy. For details, see <a href="#">Table 6-48</a> .                          |
| protection_status  | String                               | String<br><br>Specifies whether modification protection is enabled. The value can be one of the following: <ul style="list-style-type: none"><li>● <b>nonProtection</b> (default): Modification protection is not enabled.</li><li>● <b>consoleProtection</b>: Modification protection is enabled to avoid that resources are modified by accident on the console.</li></ul>                                                                                      |
| protection_reason  | String                               | String<br><br>Specifies the reason to enable modification protection. This parameter is valid only when <b>protection_status</b> is set to <b>consoleProtection</b> .                                                                                                                                                                                                                                                                                             |

**Table 6-52 loadbalancers** parameter description

| Parameter | Mandatory | Type   | Description                                       |
|-----------|-----------|--------|---------------------------------------------------|
| id        | Yes       | String | Specifies the ID of the associated load balancer. |

**Table 6-53 insert\_headers** parameter description

| Parameter          | Mandatory | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                         |
|--------------------|-----------|---------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| X-Forwarded-ELB-IP | No        | Boolean | <p>Specifies whether to transparently transmit the load balancer EIP to backend servers. After this function is enabled, the load balancer EIP is stored in the HTTP header and passes to backend servers.</p> <p>The value can be <b>true</b> or <b>false</b>.<br/><b>true</b>: This function is enabled.<br/><b>false</b>: The function is disabled.<br/>The function is disabled by default.</p> |
| X-Forwarded-Host   | No        | Boolean | <p>Specifies whether to rewrite the <b>X-Forwarded-Host</b> header. If this function is enabled, <b>X-Forwarded-Host</b> is rewritten based on <b>Host</b> in the request and sent to backend servers.</p> <p>The value can be <b>true</b> or <b>false</b>.<br/><b>true</b>: This function is enabled.<br/><b>false</b>: The function is disabled.<br/>The function is enabled by default.</p>      |

**Table 6-54** `tls_ciphers_policy` parameter description

| Security Policy | TLS Version                | Cipher Suite                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

### Status Code

For details, see [Status Codes](#).

## 6.2.3 Querying Listeners

### Function

This API is used to query the listeners and display them in a list. Filter query and pagination query are supported. Unless otherwise specified, exact match is applied.

You can query listeners using information such as listener ID, protocol used by the listener, port used by the listener, or backend server private IP address.

### URI

GET /v2/{project\_id}/elb/listeners

Table 6-55 Path parameters

| Parameter  | Mandatory | Type   | Description               |
|------------|-----------|--------|---------------------------|
| project_id | Yes       | String | Specifies the project ID. |

**Table 6-56** Query parameters

| Parameter        | Mandatory | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                                   |
|------------------|-----------|---------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| marker           | No        | String  | Specifies the ID of the listener from which pagination query starts, that is, the ID of the last listener on the previous page.<br>This parameter must be used together with <b>limit</b> .                                                                                                                                                                                                                                   |
| limit            | No        | Integer | Specifies the number of listeners on each page. If this parameter is not set, all listeners are queried by default.                                                                                                                                                                                                                                                                                                           |
| page_reverse     | No        | Boolean | Specifies the page direction. The value can be <b>true</b> or <b>false</b> , and the default value is <b>false</b> . The last page in the list requested with <b>page_reverse</b> set to <b>false</b> will not contain the "next" link, and the last page in the list requested with <b>page_reverse</b> set to <b>true</b> will not contain the "previous" link.<br>This parameter must be used together with <b>limit</b> . |
| id               | No        | String  | Specifies the listener ID.                                                                                                                                                                                                                                                                                                                                                                                                    |
| name             | No        | String  | Specifies the listener name.<br>The value contains a maximum of 255 characters.                                                                                                                                                                                                                                                                                                                                               |
| description      | No        | String  | Provides supplementary information about the listener.<br>The value contains a maximum of 255 characters.                                                                                                                                                                                                                                                                                                                     |
| loadbalancer_id  | No        | String  | Specifies the ID of the associated load balancer.                                                                                                                                                                                                                                                                                                                                                                             |
| connection_limit | No        | Integer | Specifies the maximum number of connections.                                                                                                                                                                                                                                                                                                                                                                                  |
| admin_state_up   | No        | Boolean | Specifies the administrative status of the listener.<br>This parameter is reserved, and the default value is <b>true</b> .                                                                                                                                                                                                                                                                                                    |

| Parameter                   | Mandatory | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|-----------------------------|-----------|---------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| default_pool_id             | No        | String  | Specifies the ID of the associated backend server group.<br><br>If a request does not match the forwarding policy, the request is forwarded to the default backend server group for processing.                                                                                                                                                                                                                                                                                                         |

Table 6-58 Response parameters

| Parameter | Type                                       | Description                                                        |
|-----------|--------------------------------------------|--------------------------------------------------------------------|
| listeners | Array of <a href="#">Listeners</a> objects | Lists the listeners. For details, see <a href="#">Table 6-59</a> . |

Table 6-59 listener parameter description

| Parameter  | Type   | Description                                                                                                                                                                                    |
|------------|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| id         | String | Specifies the listener ID.                                                                                                                                                                     |
| tenant_id  | String | Specifies the ID of the project where the listener is used.<br>The value contains a maximum of 255 characters.                                                                                 |
| project_id | String | Specifies the ID of the project to which the listener belongs. This parameter has the same meaning as <b>tenant_id</b> .                                                                       |
| name       | String | Specifies the listener name.<br>Note: If you leave the listener name empty, you cannot locate it on the listener list and view its details.<br>The value contains a maximum of 255 characters. |

| Parameter        | Type                                  | Description                                                                                                                                                                                                                                                                                                               |
|------------------|---------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| description      | String                                | Provides supplementary information about the listener.<br>The value contains a maximum of 255 characters.                                                                                                                                                                                                                 |
| protocol         | String                                | Specifies the protocol used by the listener.<br>The value can be <b>TCP</b> , <b>HTTP</b> , <b>UDP</b> , or <b>TERMINATED_HTTPS</b> .                                                                                                                                                                                     |
| protocol_port    | Integer                               | Specifies the port used by the listener.<br>The port number ranges from 1 to 65535.                                                                                                                                                                                                                                       |
| loadbalancers    | Array of <b>Loadbalancers</b> objects | Specifies the ID of the associated load balancer. For details, see <a href="#">Table 6-46</a> .                                                                                                                                                                                                                           |
| connection_limit | Integer                               | Specifies the maximum number of connections.<br>The value ranges from <b>-1</b> to <b>2147483647</b> . The default value is <b>-1</b> , indicating that there is no restriction on the maximum number of connections.<br>This parameter is reserved.                                                                      |
| admin_state_up   | Boolean                               | Specifies the administrative status of the listener.<br>This parameter is reserved. The value can be <b>true</b> or <b>false</b> . <ul style="list-style-type: none"><li>● <b>true</b>: Enabled</li><li>● <b>false</b>: Disabled</li></ul>                                                                                |
| http2_enable     | Boolean                               | Specifies whether to use HTTP/2.<br>The value can be <b>true</b> or <b>false</b> . <ul style="list-style-type: none"><li>● <b>true</b>: HTTP/2 is used.</li><li>● <b>false</b>: HTTP/2 is not used.</li></ul> This parameter takes effect only when the protocol used by the listener is set to <b>TERMINATED_HTTPS</b> . |
| default_pool_id  | String                                | Specifies the ID of the associated backend server group.<br>If a request does not match the forwarding policy, the request is forwarded to the default backend server group for processing. If the value is <b>null</b> , the listener has no default backend server group.                                               |

| Parameter                   | Type                                 | Description                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|-----------------------------|--------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| default_tls_container_ref   | String                               | Specifies the ID of the server certificate used by the listener. For details, see <a href="#">Certificate</a> .<br>This parameter is mandatory when <b>protocol</b> is set to <b>TERMINATED_HTTPS</b> .<br>The value contains a maximum of 128 characters.                                                                                                                                                                                                |
| client_ca_tls_container_ref | String                               | Specifies the ID of the CA certificate used by the listener.<br>The value contains a maximum of 128 characters.<br>For details, see <a href="#">Certificate</a> .                                                                                                                                                                                                                                                                                         |
| sni_container_refs          | Array                                | Lists the IDs of SNI certificates (server certificates with domain names) used by the listener.<br>If the parameter value is an empty list, the SNI feature is disabled.                                                                                                                                                                                                                                                                                  |
| tags                        | Array                                | Tags the listener.                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| created_at                  | String                               | Specifies the time when the listener was created. YYYY-MM-DDTHH:MM:SS                                                                                                                                                                                                                                                                                                                                                                                     |
| updated_at                  | String                               | Specifies the time when the listener was updated. YYYY-MM-DDTHH:MM:SS                                                                                                                                                                                                                                                                                                                                                                                     |
| insert_headers              | <a href="#">InsertHeaders</a> object | Specifies whether to insert HTTP extension headers and sent them to backend servers. All headers are synchronized. If this parameter is not set, default values are used.<br>Information required by backend servers can be written into HTTP headers and passed to backend servers.<br>For example, you can use the <b>X-Forwarded-ELB-IP</b> header to transmit the load balancer EIP to backend servers. For details, see <a href="#">Table 6-47</a> . |
| tls_ciphers_policy          | String                               | Specifies the security policy used by the listener. This parameter takes effect only when the protocol used by the listener is set to <b>TERMINATED_HTTPS</b> .<br>The value can be <b>tls-1-0-inherit</b> , <b>tls-1-0</b> , <b>tls-1-1</b> , <b>tls-1-2</b> , or <b>tls-1-2-strict</b> , and the default value is <b>tls-1-0</b> . Lists cipher suites used by each security policy. For details, see <a href="#">Table 6-48</a> .                      |

| Parameter         | Type   | Description                                                                                                                                                                                                                                                                                                                                                              |
|-------------------|--------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| protection_status | String | String<br>Specifies whether modification protection is enabled. The value can be one of the following: <ul style="list-style-type: none"><li>• <b>nonProtection</b> (default): Modification protection is not enabled.</li><li>• <b>consoleProtection</b>: Modification protection is enabled to avoid that resources are modified by accident on the console.</li></ul> |
| protection_reason | String | String<br>Specifies the reason to enable modification protection. This parameter is valid only when <b>protection_status</b> is set to <b>consoleProtection</b> .                                                                                                                                                                                                        |

Table 6-60 loadbalancers parameter description

| Parameter | Mandatory | Type   | Description                                       |
|-----------|-----------|--------|---------------------------------------------------|
| id        | Yes       | String | Specifies the ID of the associated load balancer. |

Table 6-61 insert\_headers parameter description

| Parameter          | Mandatory | Type    | Description                                                                                                                                                                                                                                                                                                                                                                              |
|--------------------|-----------|---------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| X-Forwarded-ELB-IP | No        | Boolean | Specifies whether to transparently transmit the load balancer EIP to backend servers. After this function is enabled, the load balancer EIP is stored in the HTTP header and passes to backend servers.<br>The value can be <b>true</b> or <b>false</b> .<br><b>true</b> : This function is enabled.<br><b>false</b> : The function is disabled.<br>The function is disabled by default. |

| Parameter        | Mandatory | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                       |
|------------------|-----------|---------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| X-Forwarded-Host | No        | Boolean | <p>Specifies whether to rewrite the <b>X-Forwarded-Host</b> header. If this function is enabled, <b>X-Forwarded-Host</b> is rewritten based on <b>Host</b> in the request and sent to backend servers.</p> <p>The value can be <b>true</b> or <b>false</b>.<br/><b>true</b>: This function is enabled.<br/><b>false</b>: The function is disabled.</p> <p>The function is enabled by default.</p> |

Table 6-62 `tls_ciphers_policy` parameter description

| Security Policy | TLS Version                | Cipher Suite                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

## Status Code

For details, see [Status Codes](#).

## 6.2.4 Updating a Listener

### Function

This API is used to update a listener, such as listener name, description, associated backend server groups, and server certificates.

### Constraints

- If the provisioning status of the associated load balancer is not **ACTIVE**, the listener cannot be updated.
- Only users with the ELB administrator permissions can specify the value of **connection\_limit**.
- The **default\_pool\_id** parameter has the following constraints:
  - Its value cannot be the ID of any backend server group of other listeners.
  - Its value cannot be the ID of any backend server group associated with the forwarding policies set for other listeners.
- The relationships between the protocol used by the listener and the protocol of the backend server group are as follows:
  - When the protocol used by the listener is **TCP**, the protocol of the backend server group must be **TCP**.
  - When the protocol used by the listener is **UDP**, the backend server group protocol must be **UDP**.
  - When the protocol used by the listener is **HTTP** or **TERMINATED\_HTTPS**, the protocol of the backend server group must be **HTTP**.

### URI

PUT /v2/{project\_id}/elb/listeners/{listener\_id}

**Table 6-63** Parameter description

| Parameter   | Mandatory | Type   | Description                |
|-------------|-----------|--------|----------------------------|
| project_id  | Yes       | String | Specifies the project ID.  |
| listener_id | Yes       | String | Specifies the listener ID. |

### Request

**Table 6-64** Parameter description

| Parameter | Mandatory | Type                            | Description                                                           |
|-----------|-----------|---------------------------------|-----------------------------------------------------------------------|
| listener  | Yes       | <a href="#">Listener object</a> | Specifies the listener. For details, see <a href="#">Table 6-65</a> . |

**Table 6-65 listener parameter description**

| Parameter        | Mandatory | Type    | Description                                                                                                                                                                                                                                                                                                               |
|------------------|-----------|---------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| name             | No        | String  | Specifies the listener name.<br>Note: If you leave the listener name empty, you cannot locate it on the listener list and view its details.<br>The value contains a maximum of 255 characters.                                                                                                                            |
| description      | No        | String  | Provides supplementary information about the listener.<br>The value contains a maximum of 255 characters.                                                                                                                                                                                                                 |
| connection_limit | No        | Integer | Specifies the maximum number of connections.<br>The value ranges from <b>-1</b> to <b>2147483647</b> .<br>This field is reserved. Do not use it. Only users with the ELB administrator permissions can specify this field.                                                                                                |
| http2_enable     | No        | Boolean | Specifies whether to use HTTP/2.<br>The value can be <b>true</b> or <b>false</b> . <ul style="list-style-type: none"><li>• <b>true</b>: HTTP/2 is used.</li><li>• <b>false</b>: HTTP/2 is not used.</li></ul> This parameter takes effect only when the protocol used by the listener is set to <b>TERMINATED_HTTPS</b> . |

| Parameter       | Mandatory | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-----------------|-----------|---------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| default_pool_id | No        | String  | <p>Specifies the ID of the associated backend server group.</p> <p>If a request does not match the forwarding policy, the request is forwarded to the default backend server group for processing. If the value is <b>null</b>, the listener has no default backend server group.</p> <p>The <b>default_pool_id</b> parameter has the following constraints:</p> <ul style="list-style-type: none"><li>• Its value cannot be the ID of any backend server group of other listeners.</li><li>• Its value cannot be the ID of any backend server group associated with the forwarding policies set for other listeners.</li></ul> <p>The relationships between the protocol of the backend server group and the protocol used by the listener are as follows:</p> <ul style="list-style-type: none"><li>• When the protocol used by the listener is <b>TCP</b>, the protocol of the backend server group must be <b>TCP</b>.</li><li>• When the protocol used by the listener is <b>UDP</b>, the protocol of the backend server group must be <b>UDP</b>.</li><li>• When the protocol used by the listener is <b>HTTP</b> or <b>TERMINATED_HTTPS</b>, the protocol of the backend server group must be <b>HTTP</b>.</li></ul> |
| admin_state_up  | No        | Boolean | <p>Specifies the administrative status of the listener.</p> <p>This parameter is reserved, and the default value is <b>true</b>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

## Response

**Table 6-68** Response parameters

| Parameter | Type                            | Description                                                           |
|-----------|---------------------------------|-----------------------------------------------------------------------|
| listener  | <a href="#">Listener</a> object | Specifies the listener. For details, see <a href="#">Table 6-69</a> . |

**Table 6-69** listener parameter description

| Parameter   | Type   | Description                                                                                                                                                                                    |
|-------------|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| id          | String | Specifies the listener ID.                                                                                                                                                                     |
| tenant_id   | String | Specifies the ID of the project where the listener is used.<br>The value contains a maximum of 255 characters.                                                                                 |
| project_id  | String | Specifies the ID of the project to which the listener belongs. This parameter has the same meaning as <b>tenant_id</b> .                                                                       |
| name        | String | Specifies the listener name.<br>Note: If you leave the listener name empty, you cannot locate it on the listener list and view its details.<br>The value contains a maximum of 255 characters. |
| description | String | Provides supplementary information about the listener.<br>The value contains a maximum of 255 characters.                                                                                      |

| Parameter                 | Type                                  | Description                                                                                                                                                                                                                                                                                                               |
|---------------------------|---------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| protocol                  | String                                | Specifies the protocol used by the listener.<br>The value can be <b>TCP</b> , <b>HTTP</b> , <b>UDP</b> , or <b>TERMINATED_HTTPS</b> .                                                                                                                                                                                     |
| protocol_port             | Integer                               | Specifies the port used by the listener.<br>The port number ranges from 1 to 65535.                                                                                                                                                                                                                                       |
| loadbalancers             | Array of <b>Loadbalancers</b> objects | Specifies the ID of the associated load balancer. For details, see <a href="#">Table 6-46</a> .                                                                                                                                                                                                                           |
| connection_limit          | Integer                               | Specifies the maximum number of connections.<br>The value ranges from <b>-1</b> to <b>2147483647</b> . The default value is <b>-1</b> , indicating that there is no restriction on the maximum number of connections.<br>This parameter is reserved.                                                                      |
| admin_state_up            | Boolean                               | Specifies the administrative status of the listener.<br>This parameter is reserved. The value can be <b>true</b> or <b>false</b> . <ul style="list-style-type: none"><li>• <b>true</b>: Enabled</li><li>• <b>false</b>: Disabled</li></ul>                                                                                |
| http2_enable              | Boolean                               | Specifies whether to use HTTP/2.<br>The value can be <b>true</b> or <b>false</b> . <ul style="list-style-type: none"><li>• <b>true</b>: HTTP/2 is used.</li><li>• <b>false</b>: HTTP/2 is not used.</li></ul> This parameter takes effect only when the protocol used by the listener is set to <b>TERMINATED_HTTPS</b> . |
| default_pool_id           | String                                | Specifies the ID of the associated backend server group.<br>If a request does not match the forwarding policy, the request is forwarded to the default backend server group for processing. If the value is <b>null</b> , the listener has no default backend server group.                                               |
| default_tls_container_ref | String                                | Specifies the ID of the server certificate used by the listener. For details, see <a href="#">Certificate</a> .<br>This parameter is mandatory when <b>protocol</b> is set to <b>TERMINATED_HTTPS</b> .<br>The value contains a maximum of 128 characters.                                                                |

| Parameter                   | Type                                 | Description                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|-----------------------------|--------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| client_ca_tls_container_ref | String                               | Specifies the ID of the CA certificate used by the listener.<br>The value contains a maximum of 128 characters.<br>For details, see <a href="#">Certificate</a> .                                                                                                                                                                                                                                                                                         |
| sni_container_refs          | Array                                | Lists the IDs of SNI certificates (server certificates with domain names) used by the listener.<br>If the parameter value is an empty list, the SNI feature is disabled.                                                                                                                                                                                                                                                                                  |
| tags                        | Array                                | Tags the listener.                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| created_at                  | String                               | Specifies the time when the listener was created. YYYY-MM-DDTHH:MM:SS                                                                                                                                                                                                                                                                                                                                                                                     |
| updated_at                  | String                               | Specifies the time when the listener was updated. YYYY-MM-DDTHH:MM:SS                                                                                                                                                                                                                                                                                                                                                                                     |
| insert_headers              | <a href="#">InsertHeaders</a> object | Specifies whether to insert HTTP extension headers and sent them to backend servers. All headers are synchronized. If this parameter is not set, default values are used.<br>Information required by backend servers can be written into HTTP headers and passed to backend servers.<br>For example, you can use the <b>X-Forwarded-ELB-IP</b> header to transmit the load balancer EIP to backend servers. For details, see <a href="#">Table 6-47</a> . |
| tls_ciphers_policy          | String                               | Specifies the security policy used by the listener. This parameter takes effect only when the protocol used by the listener is set to <b>TERMINATED_HTTPS</b> .<br>The value can be <b>tls-1-0-inherit</b> , <b>tls-1-0</b> , <b>tls-1-1</b> , <b>tls-1-2</b> , or <b>tls-1-2-strict</b> , and the default value is <b>tls-1-0</b> . Lists cipher suites used by each security policy. For details, see <a href="#">Table 6-48</a> .                      |

| Parameter         | Type   | Description                                                                                                                                                                                                                                                                                                                                                              |
|-------------------|--------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| protection_status | String | String<br>Specifies whether modification protection is enabled. The value can be one of the following: <ul style="list-style-type: none"><li>• <b>nonProtection</b> (default): Modification protection is not enabled.</li><li>• <b>consoleProtection</b>: Modification protection is enabled to avoid that resources are modified by accident on the console.</li></ul> |
| protection_reason | String | String<br>Specifies the reason to enable modification protection. This parameter is valid only when <b>protection_status</b> is set to <b>consoleProtection</b> .                                                                                                                                                                                                        |

Table 6-70 loadbalancers parameter description

| Parameter | Mandatory | Type   | Description                                       |
|-----------|-----------|--------|---------------------------------------------------|
| id        | Yes       | String | Specifies the ID of the associated load balancer. |

Table 6-71 insert\_headers parameter description

| Parameter          | Mandatory | Type    | Description                                                                                                                                                                                                                                                                                                                                                                              |
|--------------------|-----------|---------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| X-Forwarded-ELB-IP | No        | Boolean | Specifies whether to transparently transmit the load balancer EIP to backend servers. After this function is enabled, the load balancer EIP is stored in the HTTP header and passes to backend servers.<br>The value can be <b>true</b> or <b>false</b> .<br><b>true</b> : This function is enabled.<br><b>false</b> : The function is disabled.<br>The function is disabled by default. |

| Parameter        | Mandatory | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                       |
|------------------|-----------|---------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| X-Forwarded-Host | No        | Boolean | <p>Specifies whether to rewrite the <b>X-Forwarded-Host</b> header. If this function is enabled, <b>X-Forwarded-Host</b> is rewritten based on <b>Host</b> in the request and sent to backend servers.</p> <p>The value can be <b>true</b> or <b>false</b>.<br/><b>true</b>: This function is enabled.<br/><b>false</b>: The function is disabled.</p> <p>The function is enabled by default.</p> |

Table 6-72 `tls_ciphers_policy` parameter description

| Security Policy | TLS Version                | Cipher Suite                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

## Status Code

For details, see [Status Codes](#).

## 6.2.5 Deleting a Listener

### Function

This API is used to delete a listener by ID.

### Constraints

If the **cascade** value is **false**, delete the associated backend server groups by referring to [Deleting a Backend Server Group](#), or change the value of **default\_pool\_id** to **null** by referring to [Updating a Listener](#) and delete associated forwarding policies by referring to [Deleting a Forwarding Policy](#), before attempting to delete the listener.

### URI

DELETE /v2/{project\_id}/elb/listeners/{listener\_id}

**Table 6-73** Parameter description

| Parameter   | Mandator<br>y | Type        | Description                                                                                                                                 |
|-------------|---------------|-------------|---------------------------------------------------------------------------------------------------------------------------------------------|
| project_id  | Yes           | Strin<br>g  | Specifies the project ID.                                                                                                                   |
| listener_id | Yes           | Strin<br>g  | Specifies the listener ID.                                                                                                                  |
| cascade     | No            | Bool<br>ean | Specifies whether to delete the resources associated with the listener when it is deleted, including forwarding policy and backend servers. |

### Request

None

### Response

None

### Example Request

- Example request: Deleting a listener  
DELETE https://{Endpoint}/v2/{project\_id}/elb/listeners/35cb8516-1173-4035-8dae-0dae3453f37f

## Example Response

- Example response  
None

## Status Code

For details, see [Status Codes](#).

# 6.3 Backend Server Group

## 6.3.1 Adding a Backend Server Group

### Function

This API is used to add a backend server group. After multiple backend servers are added to a backend server group, requests are distributed among backend servers based on the load balancing algorithm configured for the backend server group and the weight set for each backend server.

### Constraints

- If parameter **session-persistence** is configured, parameter **cookie\_name** is available only when the value of **type** is **APP\_COOKIE**.

### URI

POST /v2/{project\_id}/elb/pools

**Table 6-74** Parameter description

| Parameter  | Mandatory | Type   | Description               |
|------------|-----------|--------|---------------------------|
| project_id | Yes       | String | Specifies the project ID. |

### Request

**Table 6-75** Parameter description

| Parameter | Mandatory | Type                        | Description                                                                       |
|-----------|-----------|-----------------------------|-----------------------------------------------------------------------------------|
| pool      | Yes       | <a href="#">Pool object</a> | Specifies the backend server group. For details, see <a href="#">Table 6-76</a> . |

**Table 6-76 pool** parameter description

| Parameter   | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|-------------|-----------|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| tenant_id   | No        | String | Specifies the ID of the project where the backend server group is used.<br>The value must be the same as the value of <b>project_id</b> in the token.<br>The value contains a maximum of 255 characters.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| name        | No        | String | Specifies the name of the backend server group.<br>The value contains a maximum of 255 characters.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| description | No        | String | Provides supplementary information about the backend server group.<br>The value contains a maximum of 255 characters.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| protocol    | Yes       | String | Specifies the protocol that the backend server group uses to receive requests.<br>TCP, UDP, and HTTP are supported.<br>When a backend server group is associated with a listener, the relationships between the protocol used by the listener and the protocol of the backend server group are as follows: <ul style="list-style-type: none"><li>• When the protocol used by the listener is <b>UDP</b>, the protocol of the backend server group must be <b>UDP</b>.</li><li>• When the protocol used by the listener is <b>TCP</b>, the protocol of the backend server group must be <b>TCP</b>.</li><li>• When the protocol used by the listener is <b>HTTP</b> or <b>TERMINATED_HTTPS</b>, the protocol of the backend server group must be <b>HTTP</b>.</li></ul> |

| Parameter           | Mandatory | Type                      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| loadbalancer_id     | No        | String                    | <p>Specifies the ID of the load balancer associated with the backend server group.</p> <p>Specify either <b>listener_id</b> or <b>loadbalancer_id</b>, or both of them.</p>                                                                                                                                                                                                                                                                                                                    |
| session_persistence | No        | SessionPersistence object | <p>Specifies the sticky session timeout duration in minutes. For details, see <a href="#">Table 6-77</a>.</p> <p>If the value is <b>null</b>, the sticky session feature is disabled.</p>                                                                                                                                                                                                                                                                                                      |

| Parameter         | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                                                                    |
|-------------------|-----------|--------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| protection_status | No        | String | Specifies whether modification protection is enabled. The value can be one of the following: <ul style="list-style-type: none"><li>• <b>nonProtection</b> (default): Modification protection is not enabled.</li><li>• <b>consoleProtection</b>: Modification protection is enabled to avoid that resources are modified by accident on the console.</li></ul> |
| protection_reason | No        | String | Specifies the reason to enable modification protection. This parameter is valid only when <b>protection_status</b> is set to <b>consoleProtection</b> .                                                                                                                                                                                                        |

**Table 6-77 session\_persistence** parameter description

| Parameter   | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-------------|-----------|--------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| type        | Yes       | String | <p>Specifies the sticky session type.</p> <p>The value can be:</p> <ul style="list-style-type: none"><li>• <b>SOURCE_IP</b>: Requests are distributed based on the client's IP address. Requests from the same IP address are sent to the same backend server.</li><li>• <b>HTTP_COOKIE</b>: When the client sends a request for the first time, the load balancer automatically generates a cookie and inserts the cookie into the response message. Subsequent requests are sent to the backend server that processes the first request.</li><li>• <b>APP_COOKIE</b>: When the client sends a request for the first time, the backend server that receives the request generates a cookie and inserts the cookie into the response message. Subsequent requests are sent to this backend server.</li></ul> <p>When the protocol of the backend server group is TCP, only <b>SOURCE_IP</b> takes effect. When the protocol of the backend server group is HTTP, only <b>HTTP_COOKIE</b> or <b>APP_COOKIE</b> takes effect.</p> |
| cookie_name | No        | String | <p>Specifies the cookie name. The name can contain up to 64 characters, including letters, digits, hyphens (-), and underscores (_).</p> <p>This parameter is mandatory when the sticky session type is <b>APP_COOKIE</b>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| Parameter           | Mandatory | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|---------------------|-----------|---------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| persistence_timeout | No        | Integer | <p>Specifies the sticky session timeout duration in minutes.</p> <p>This parameter is invalid when <b>type</b> is set to <b>APP_COOKIE</b>.</p> <p>The value range varies depending on the protocol of the backend server group:</p> <ul style="list-style-type: none"><li>• When the protocol of the backend server group is TCP or UDP, the value ranges from <b>1</b> to <b>60</b>.</li><li>• When the protocol of the backend server group is HTTP or HTTPS, the value ranges from <b>1</b> to <b>1440</b>.</li></ul> |

## Response

**Table 6-78** Parameter description

| Parameter | Type                        | Description                                                                       |
|-----------|-----------------------------|-----------------------------------------------------------------------------------|
| pool      | <a href="#">Pool</a> object | Specifies the backend server group. For details, see <a href="#">Table 6-79</a> . |

**Table 6-79** pool parameter description

| Parameter  | Type   | Description                                                                                                                                |
|------------|--------|--------------------------------------------------------------------------------------------------------------------------------------------|
| id         | String | Specifies the ID of the backend server group.                                                                                              |
| tenant_id  | String | <p>Specifies the ID of the project where the backend server group is used.</p> <p>The value contains a maximum of 255 characters.</p>      |
| project_id | String | <p>Specifies the ID of the project to which the backend server group belongs. This parameter has the same meaning as <b>tenant_id</b>.</p> |
| name       | String | <p>Specifies the name of the backend server group.</p> <p>The value contains a maximum of 255 characters.</p>                              |

| Parameter        | Type                            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|------------------|---------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| description      | String                          | Provides supplementary information about the backend server group.<br>The value contains a maximum of 255 characters.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| protocol         | String                          | Specifies the protocol that the backend server group uses to receive requests.<br>TCP, UDP, and HTTP are supported.<br>When a backend server group is associated with a listener, the relationships between the protocol used by the listener and the protocol of the backend server group are as follows: <ul style="list-style-type: none"><li>• When the protocol used by the listener is <b>UDP</b>, the protocol of the backend server group must be <b>UDP</b>.</li><li>• When the protocol used by the listener is <b>TCP</b>, the protocol of the backend server group must be <b>TCP</b>.</li><li>• When the protocol used by the listener is <b>HTTP</b> or <b>TERMINATED_HTTPS</b>, the protocol of the backend server group must be <b>HTTP</b>.</li></ul> |
| lb_algorithm     | String                          | Specifies the load balancing algorithm of the backend server group.<br>The value can be: <ul style="list-style-type: none"><li>• <b>ROUND_ROBIN</b>: indicates the weighted round robin algorithm.</li><li>• <b>LEAST_CONNECTIONS</b>: indicates the weighted least connections algorithm.</li><li>• <b>SOURCE_IP</b>: indicates the source IP hash algorithm. When the value is <b>SOURCE_IP</b>, the weights of backend servers in the server group are invalid.</li></ul>                                                                                                                                                                                                                                                                                           |
| members          | Array of <b>Members</b> objects | Lists the IDs of backend servers in the backend server group. For details, see <a href="#">Table 6-80</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| healthmonitor_id | String                          | Specifies the ID of the health check configured for the backend server group.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| Parameter           | Type                                           | Description                                                                                                                                                                                                                                                                                                                                                              |
|---------------------|------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| admin_state_up      | Boolean                                        | Specifies the administrative status of the backend server group.<br>This parameter is reserved. The value can be <b>true</b> or <b>false</b> . <ul style="list-style-type: none"><li>• <b>true</b>: Enabled</li><li>• <b>false</b>: Disabled</li></ul>                                                                                                                   |
| listeners           | Array of <a href="#">Listeners</a> objects     | Lists the IDs of listeners associated with the backend server group. For details, see <a href="#">Table 6-81</a> .                                                                                                                                                                                                                                                       |
| loadbalancers       | Array of <a href="#">Loadbalancers</a> objects | Lists the IDs of load balancers associated with the backend server group. For details, see <a href="#">Table 6-82</a> .                                                                                                                                                                                                                                                  |
| session_persistence | <a href="#">SessionPersistence</a> object      | Specifies whether to enable the sticky session feature. For details, see <a href="#">Table 6-83</a> .<br>Once sticky session are enabled, requests from the same client are sent to the same backend server during the session.<br>When sticky sessions are disabled, the value is <b>null</b> .                                                                         |
| protection_status   | String                                         | String<br>Specifies whether modification protection is enabled. The value can be one of the following: <ul style="list-style-type: none"><li>• <b>nonProtection</b> (default): Modification protection is not enabled.</li><li>• <b>consoleProtection</b>: Modification protection is enabled to avoid that resources are modified by accident on the console.</li></ul> |
| protection_reason   | String                                         | String<br>Specifies the reason to enable modification protection. This parameter is valid only when <b>protection_status</b> is set to <b>consoleProtection</b> .                                                                                                                                                                                                        |

**Table 6-80 members** parameter description

| Parameter | Type   | Description                                        |
|-----------|--------|----------------------------------------------------|
| id        | String | Specifies the ID of the associated backend server. |

**Table 6-81 listeners** parameter description

| Parameter | Type   | Description                                              |
|-----------|--------|----------------------------------------------------------|
| id        | String | Specifies the ID of the associated backend server group. |

**Table 6-82 loadbalancers** parameter description

| Parameter | Type   | Description                                       |
|-----------|--------|---------------------------------------------------|
| id        | String | Specifies the ID of the associated load balancer. |

**Table 6-83 session\_persistence** parameter description

| Parameter | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-----------|-----------|--------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| type      | Yes       | String | <p>Specifies the sticky session type.</p> <p>The value can be:</p> <ul style="list-style-type: none"><li>• <b>SOURCE_IP</b>: Requests are distributed based on the client's IP address. Requests from the same IP address are sent to the same backend server.</li><li>• <b>HTTP_COOKIE</b>: When the client sends a request for the first time, the load balancer automatically generates a cookie and inserts the cookie into the response message. Subsequent requests are sent to the backend server that processes the first request.</li><li>• <b>APP_COOKIE</b>: When the client sends a request for the first time, the backend server that receives the request generates a cookie and inserts the cookie into the response message. Subsequent requests are sent to this backend server.</li></ul> <p>When the protocol of the backend server group is TCP, only <b>SOURCE_IP</b> takes effect. When the protocol of the backend server group is HTTP, only <b>HTTP_COOKIE</b> or <b>APP_COOKIE</b> takes effect.</p> |

| Parameter           | Mandatory | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|---------------------|-----------|---------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| cookie_name         | No        | String  | Specifies the cookie name. The name can contain up to 64 characters, including letters, digits, hyphens (-), and underscores (_).<br><br>This parameter is mandatory when the sticky session type is <b>APP_COOKIE</b> .                                                                                                                                                                                                                                                                                            |
| persistence_timeout | No        | Integer | Specifies the sticky session timeout duration in minutes.<br><br>This parameter is invalid when <b>type</b> is set to <b>APP_COOKIE</b> .<br><br>The value range varies depending on the protocol of the backend server group: <ul style="list-style-type: none"><li>• When the protocol of the backend server group is TCP or UDP, the value ranges from <b>1</b> to <b>60</b>.</li><li>• When the protocol of the backend server group is HTTP or HTTPS, the value ranges from <b>1</b> to <b>1440</b>.</li></ul> |

## Example Request

- Example request 1: Adding an HTTP backend server group  
POST https://{Endpoint}/v2/601240b9c5c94059b63d484c92cfe308/elb/pools  

```
{
 "pool": {
 "lb_algorithm": "ROUND_ROBIN",
 "loadbalancer_id": "63ad9dfe-4750-479f-9630-ada43ccc8117",
 "protocol": "HTTP"
 }
}
```
- Example request 2: Adding a backend server group with the value of **type** set to **APP\_COOKIE**  
POST https://{Endpoint}/v2/145483a5107745e9b3d80f956713e6a3/elb/pools  

```
{
 "pool": {
 "lb_algorithm": "ROUND_ROBIN",
 "loadbalancer_id": "370fb112-e920-486a-b051-1d0d30704dd3",
 "protocol": "HTTP",
 "session_persistence": {
 "cookie_name": "my_cookie",
 "type": "APP_COOKIE",
 "persistence_timeout": 1
 },
 "admin_state_up": true
 }
}
```
- Example request 3: Adding an HTTP backend server group with the value of **type** set to **HTTP\_COOKIE**

POST https://{Endpoint}/v2/601240b9c5c94059b63d484c92cfe308/elb/pools

```
{
 "pool": {
 "lb_algorithm": "ROUND_ROBIN",
 "loadbalancer_id": "63ad9dfe-4750-479f-9630-ada43ccc8117",
 "protocol": "HTTP",
 "session_persistence": {
 "type": "HTTP_COOKIE"
 }
 }
}
```

## Example Response

- Example response 1

```
{
 "pool": {
 "lb_algorithm": "ROUND_ROBIN",

**Status Code**

For details, see [Status Codes](#).

### 6.3.2 Querying Backend Server Groups

**Function**

This API is used to query the backend server groups and display them in a list. Filter query and pagination query are supported. Unless otherwise specified, exact match is applied.

**URI**

GET /v2/{project\_id}/elb/pools

**Table 6-84** Path parameters

| Parameter  | Mandatory | Type   | Description               |
|------------|-----------|--------|---------------------------|
| project_id | Yes       | String | Specifies the project ID. |

**Table 6-85** Query parameters

| Parameter        | Mandatory | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                                       |
|------------------|-----------|---------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| marker           | No        | String  | Specifies the ID of the backend server group from which pagination query starts, that is, the ID of the last backend server group on the previous page. If this parameter is not specified, the first page will be queried.<br><br>This parameter must be used together with <b>limit</b> .                                                                                                                                       |
| limit            | No        | Integer | Specifies the number of backend server groups on each page. If this parameter is not set, all backend server groups are queried by default.                                                                                                                                                                                                                                                                                       |
| page_reverse     | No        | Boolean | Specifies the page direction. The value can be <b>true</b> or <b>false</b> , and the default value is <b>false</b> . The last page in the list requested with <b>page_reverse</b> set to <b>false</b> will not contain the "next" link, and the last page in the list requested with <b>page_reverse</b> set to <b>true</b> will not contain the "previous" link.<br><br>This parameter must be used together with <b>limit</b> . |
| id               | No        | String  | Specifies the ID of the backend server group.                                                                                                                                                                                                                                                                                                                                                                                     |
| name             | No        | String  | Specifies the name of the backend server group.<br><br>The value contains a maximum of 255 characters.                                                                                                                                                                                                                                                                                                                            |
| description      | No        | String  | Provides supplementary information about the backend server group.<br><br>The value contains a maximum of 255 characters.                                                                                                                                                                                                                                                                                                         |
| healthmonitor_id | No        | String  | Specifies the ID of the health check configured for the backend server group.                                                                                                                                                                                                                                                                                                                                                     |
| loadbalancer_id  | No        | String  | Specifies the ID of the load balancer associated with the backend server group.                                                                                                                                                                                                                                                                                                                                                   |

| Parameter        | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|------------------|-----------|--------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| protocol         | No        | String | Specifies the protocol that the backend server group uses to receive requests.<br>TCP, UDP, and HTTP are supported.                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| lb_algorithm     | No        | String | Specifies the load balancing algorithm of the backend server group.<br>The value can be: <ul style="list-style-type: none"><li>• <b>ROUND_ROBIN</b>: indicates the weighted round robin algorithm.</li><li>• <b>LEAST_CONNECTIONS</b>: indicates the weighted least connections algorithm.</li><li>• <b>SOURCE_IP</b>: indicates the source IP hash algorithm.</li></ul> When the value is <b>SOURCE_IP</b> , the weights of backend servers in the server group are invalid. For details about parameter <b>weight</b> , see <a href="#">Response</a> . |
| member_address   | No        | String | Lists the IDs of backend servers in the backend server group.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| member_device_id | No        | String | Specifies the ID of the cloud server used as the backend server in the backend server group.                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| Parameter             | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| Parameter | Type   | Description                                   |
|-----------|--------|-----------------------------------------------|
| id        | String | Specifies the ID of the backend server group. |

| Parameter   | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|-------------|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| tenant_id   | String | Specifies the ID of the project where the backend server group is used.<br>The value contains a maximum of 255 characters.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| project_id  | String | Specifies the ID of the project to which the backend server group belongs. This parameter has the same meaning as <b>tenant_id</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| name        | String | Specifies the name of the backend server group.<br>The value contains a maximum of 255 characters.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| description | String | Provides supplementary information about the backend server group.<br>The value contains a maximum of 255 characters.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| protocol    | String | Specifies the protocol that the backend server group uses to receive requests.<br>TCP, UDP, and HTTP are supported.<br>When a backend server group is associated with a listener, the relationships between the protocol used by the listener and the protocol of the backend server group are as follows: <ul style="list-style-type: none"><li>• When the protocol used by the listener is <b>UDP</b>, the protocol of the backend server group must be <b>UDP</b>.</li><li>• When the protocol used by the listener is <b>TCP</b>, the protocol of the backend server group must be <b>TCP</b>.</li><li>• When the protocol used by the listener is <b>HTTP</b> or <b>TERMINATED_HTTPS</b>, the protocol of the backend server group must be <b>HTTP</b>.</li></ul> |

| Parameter           | Type                                  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|---------------------|---------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| lb_algorithm        | String                                | <p>Specifies the load balancing algorithm of the backend server group.</p> <p>The value can be:</p> <ul style="list-style-type: none"><li>• <b>ROUND_ROBIN</b>: indicates the weighted round robin algorithm.</li><li>• <b>LEAST_CONNECTIONS</b>: indicates the weighted least connections algorithm.</li><li>• <b>SOURCE_IP</b>: indicates the source IP hash algorithm. When the value is <b>SOURCE_IP</b>, the weights of backend servers in the server group are invalid.</li></ul> |
| members             | Array of <b>Members</b> objects       | <p>Lists the IDs of backend servers in the backend server group. For details, see <a href="#">Table 6-80</a>.</p>                                                                                                                                                                                                                                                                                                                                                                       |
| healthmonitor_id    | String                                | <p>Specifies the ID of the health check configured for the backend server group.</p>                                                                                                                                                                                                                                                                                                                                                                                                    |
| admin_state_up      | Boolean                               | <p>Specifies the administrative status of the backend server group.</p> <p>This parameter is reserved. The value can be <b>true</b> or <b>false</b>.</p> <ul style="list-style-type: none"><li>• <b>true</b>: Enabled</li><li>• <b>false</b>: Disabled</li></ul>                                                                                                                                                                                                                        |
| listeners           | Array of <b>Listeners</b> objects     | <p>Lists the IDs of listeners associated with the backend server group. For details, see <a href="#">Table 6-81</a>.</p>                                                                                                                                                                                                                                                                                                                                                                |
| loadbalancers       | Array of <b>Loadbalancers</b> objects | <p>Lists the IDs of load balancers associated with the backend server group. For details, see <a href="#">Table 6-82</a>.</p>                                                                                                                                                                                                                                                                                                                                                           |
| session_persistence | <b>SessionPersistence</b> object      | <p>Specifies whether to enable the sticky session feature. For details, see <a href="#">Table 6-83</a>.</p> <p>Once sticky session are enabled, requests from the same client are sent to the same backend server during the session.</p> <p>When sticky sessions are disabled, the value is <b>null</b>.</p>                                                                                                                                                                           |

| Parameter         | Type   | Description                                                                                                                                                                                                                                                                                                                                                              |
|-------------------|--------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| protection_status | String | String<br>Specifies whether modification protection is enabled. The value can be one of the following: <ul style="list-style-type: none"><li>• <b>nonProtection</b> (default): Modification protection is not enabled.</li><li>• <b>consoleProtection</b>: Modification protection is enabled to avoid that resources are modified by accident on the console.</li></ul> |
| protection_reason | String | String<br>Specifies the reason to enable modification protection. This parameter is valid only when <b>protection_status</b> is set to <b>consoleProtection</b> .                                                                                                                                                                                                        |

**Table 6-88 members** parameter description

| Parameter | Type   | Description                                        |
|-----------|--------|----------------------------------------------------|
| id        | String | Specifies the ID of the associated backend server. |

**Table 6-89 listeners** parameter description

| Parameter | Type   | Description                                              |
|-----------|--------|----------------------------------------------------------|
| id        | String | Specifies the ID of the associated backend server group. |

| Parameter | Type   | Description                                       |
|-----------|--------|---------------------------------------------------|
| id        | String | Specifies the ID of the associated load balancer. |

**Table 6-91 session\_persistence** parameter description

| Parameter   | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-------------|-----------|--------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| type        | Yes       | String | <p>Specifies the sticky session type.</p> <p>The value can be:</p> <ul style="list-style-type: none"><li>• <b>SOURCE_IP</b>: Requests are distributed based on the client's IP address. Requests from the same IP address are sent to the same backend server.</li><li>• <b>HTTP_COOKIE</b>: When the client sends a request for the first time, the load balancer automatically generates a cookie and inserts the cookie into the response message. Subsequent requests are sent to the backend server that processes the first request.</li><li>• <b>APP_COOKIE</b>: When the client sends a request for the first time, the backend server that receives the request generates a cookie and inserts the cookie into the response message. Subsequent requests are sent to this backend server.</li></ul> <p>When the protocol of the backend server group is TCP, only <b>SOURCE_IP</b> takes effect. When the protocol of the backend server group is HTTP, only <b>HTTP_COOKIE</b> or <b>APP_COOKIE</b> takes effect.</p> |
| cookie_name | No        | String | <p>Specifies the cookie name. The name can contain up to 64 characters, including letters, digits, hyphens (-), and underscores (_).</p> <p>This parameter is mandatory when the sticky session type is <b>APP_COOKIE</b>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| Parameter           | Mandatory | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|---------------------|-----------|---------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| persistence_timeout | No        | Integer | <p>Specifies the sticky session timeout duration in minutes.</p> <p>This parameter is invalid when <b>type</b> is set to <b>APP_COOKIE</b>.</p> <p>The value range varies depending on the protocol of the backend server group:</p> <ul style="list-style-type: none"><li>• When the protocol of the backend server group is TCP or UDP, the value ranges from <b>1</b> to <b>60</b>.</li><li>• When the protocol of the backend server group is HTTP or HTTPS, the value ranges from <b>1</b> to <b>1440</b>.</li></ul> |

## Example Request

- Example request 1: Querying all backend server groups  
GET https://{Endpoint}/v2/1867112d054b427e808cc6096d8193a1/elb/pools
- Example request 2: Querying backend server groups whose load balancing algorithm is **SOURCE\_IP**  
GET https://{Endpoint}/v2/1867112d054b427e808cc6096d8193a1/elb/pools?lb\_algorithm=SOURCE\_IP

## Example Response

Status Code

For details, see [Status Codes](#).

6.3.3 Querying Details of a Backend Server Group

Function

This API is used to query details about a backend server group using its ID.

URI

GET /v2/{project\_id}/elb/pools/{pool\_id}

Table 6-92 Parameter description

| Parameter  | Mandator<br>y | Type       | Description               |
|------------|---------------|------------|---------------------------|
| project_id | Yes           | Strin<br>g | Specifies the project ID. |

| Parameter | Mandatory | Type   | Description                                   |
|-----------|-----------|--------|-----------------------------------------------|
| pool_id   | Yes       | String | Specifies the ID of the backend server group. |

## Request

None

## Response

**Table 6-93** Response parameters

| Parameter | Type                        | Description                                                                       |
|-----------|-----------------------------|-----------------------------------------------------------------------------------|
| pool      | <a href="#">Pool</a> object | Specifies the backend server group. For details, see <a href="#">Table 6-94</a> . |

**Table 6-94** pool parameter description

| Parameter   | Type   | Description                                                                                                                          |
|-------------|--------|--------------------------------------------------------------------------------------------------------------------------------------|
| id          | String | Specifies the ID of the backend server group.                                                                                        |
| tenant_id   | String | Specifies the ID of the project where the backend server group is used.<br>The value contains a maximum of 255 characters.           |
| project_id  | String | Specifies the ID of the project to which the backend server group belongs. This parameter has the same meaning as <b>tenant_id</b> . |
| name        | String | Specifies the name of the backend server group.<br>The value contains a maximum of 255 characters.                                   |
| description | String | Provides supplementary information about the backend server group.<br>The value contains a maximum of 255 characters.                |

| Parameter        | Type                              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|------------------|-----------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| protocol         | String                            | <p>Specifies the protocol that the backend server group uses to receive requests. TCP, UDP, and HTTP are supported.</p> <p>When a backend server group is associated with a listener, the relationships between the protocol used by the listener and the protocol of the backend server group are as follows:</p> <ul style="list-style-type: none"><li>• When the protocol used by the listener is <b>UDP</b>, the protocol of the backend server group must be <b>UDP</b>.</li><li>• When the protocol used by the listener is <b>TCP</b>, the protocol of the backend server group must be <b>TCP</b>.</li><li>• When the protocol used by the listener is <b>HTTP</b> or <b>TERMINATED_HTTPS</b>, the protocol of the backend server group must be <b>HTTP</b>.</li></ul> |
| lb_algorithm     | String                            | <p>Specifies the load balancing algorithm of the backend server group.</p> <p>The value can be:</p> <ul style="list-style-type: none"><li>• <b>ROUND_ROBIN</b>: indicates the weighted round robin algorithm.</li><li>• <b>LEAST_CONNECTIONS</b>: indicates the weighted least connections algorithm.</li><li>• <b>SOURCE_IP</b>: indicates the source IP hash algorithm. When the value is <b>SOURCE_IP</b>, the weights of backend servers in the server group are invalid.</li></ul>                                                                                                                                                                                                                                                                                        |
| members          | Array of <b>Members</b> objects   | <p>Lists the IDs of backend servers in the backend server group. For details, see <a href="#">Table 6-80</a>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| admin_state_up   | Boolean                           | <p>Specifies the administrative status of the backend server group.</p> <p>This parameter is reserved. The value can be <b>true</b> or <b>false</b>.</p> <ul style="list-style-type: none"><li>• <b>true</b>: Enabled</li><li>• <b>false</b>: Disabled</li></ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| listeners        | Array of <b>Listeners</b> objects | <p>Lists the IDs of listeners associated with the backend server group. For details, see <a href="#">Table 6-81</a>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| Parameter           | Type                                           | Description                                                                                                                                                                                                                                                                                                                                                              |
|---------------------|------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| loadbalancers       | Array of <a href="#">Loadbalancers</a> objects | Lists the IDs of load balancers associated with the backend server group. For details, see <a href="#">Table 6-82</a> .                                                                                                                                                                                                                                                  |
| session_persistence | <a href="#">SessionPersistence</a> object      | Specifies whether to enable the sticky session feature. For details, see <a href="#">Table 6-83</a> .<br>Once sticky session are enabled, requests from the same client are sent to the same backend server during the session.<br>When sticky sessions are disabled, the value is <b>null</b> .                                                                         |
| protection_status   | String                                         | String<br>Specifies whether modification protection is enabled. The value can be one of the following: <ul style="list-style-type: none"><li>• <b>nonProtection</b> (default): Modification protection is not enabled.</li><li>• <b>consoleProtection</b>: Modification protection is enabled to avoid that resources are modified by accident on the console.</li></ul> |
| protection_reason   | String                                         | String<br>Specifies the reason to enable modification protection. This parameter is valid only when <b>protection_status</b> is set to <b>consoleProtection</b> .                                                                                                                                                                                                        |

**Table 6-95 members** parameter description

| Parameter | Type   | Description                                        |
|-----------|--------|----------------------------------------------------|
| id        | String | Specifies the ID of the associated backend server. |

**Table 6-96 listeners** parameter description

| Parameter | Type   | Description                                              |
|-----------|--------|----------------------------------------------------------|
| id        | String | Specifies the ID of the associated backend server group. |

**Table 6-97 loadbalancers** parameter description

| Parameter | Type   | Description                                       |
|-----------|--------|---------------------------------------------------|
| id        | String | Specifies the ID of the associated load balancer. |

**Table 6-98 session\_persistence** parameter description

| Parameter   | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-------------|-----------|--------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| type        | Yes       | String | <p>Specifies the sticky session type.</p> <p>The value can be:</p> <ul style="list-style-type: none"><li>• <b>SOURCE_IP</b>: Requests are distributed based on the client's IP address. Requests from the same IP address are sent to the same backend server.</li><li>• <b>HTTP_COOKIE</b>: When the client sends a request for the first time, the load balancer automatically generates a cookie and inserts the cookie into the response message. Subsequent requests are sent to the backend server that processes the first request.</li><li>• <b>APP_COOKIE</b>: When the client sends a request for the first time, the backend server that receives the request generates a cookie and inserts the cookie into the response message. Subsequent requests are sent to this backend server.</li></ul> <p>When the protocol of the backend server group is TCP, only <b>SOURCE_IP</b> takes effect. When the protocol of the backend server group is HTTP, only <b>HTTP_COOKIE</b> or <b>APP_COOKIE</b> takes effect.</p> |
| cookie_name | No        | String | <p>Specifies the cookie name. The name can contain up to 64 characters, including letters, digits, hyphens (-), and underscores (_).</p> <p>This parameter is mandatory when the sticky session type is <b>APP_COOKIE</b>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| Parameter           | Mandatory | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|---------------------|-----------|---------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| persistence_timeout | No        | Integer | <p>Specifies the sticky session timeout duration in minutes.</p> <p>This parameter is invalid when <b>type</b> is set to <b>APP_COOKIE</b>.</p> <p>The value range varies depending on the protocol of the backend server group:</p> <ul style="list-style-type: none"><li>• When the protocol of the backend server group is TCP or UDP, the value ranges from <b>1</b> to <b>60</b>.</li><li>• When the protocol of the backend server group is HTTP or HTTPS, the value ranges from <b>1</b> to <b>1440</b>.</li></ul> |

## Example Request

- Example request: Querying details of a backend server group  
GET [https://\[Endpoint\]/v2/1867112d054b427e808cc6096d8193a1/elb/pools/5a9a3e9e-d1aa-448e-af37-a70171f2a332](https://[Endpoint]/v2/1867112d054b427e808cc6096d8193a1/elb/pools/5a9a3e9e-d1aa-448e-af37-a70171f2a332)

## Example Response

- Example response 1

## Status Code

For details, see [Status Codes](#).

## 6.3.4 Updating a Backend Server Group

### Function

This API is used to update a backend server group.

### Constraints

If the provisioning status of the load balancer associated with a backend server group is not **ACTIVE**, the backend server group cannot be updated.

### URI

PUT /v2/{project\_id}/elb/pools/{pool\_id}

**Table 6-99** Parameter description

| Parameter  | Mandatory | Type   | Description                                   |
|------------|-----------|--------|-----------------------------------------------|
| project_id | Yes       | String | Specifies the project ID.                     |
| pool_id    | Yes       | String | Specifies the ID of the backend server group. |

### Request

**Table 6-100** Parameter description

| Parameter | Mandatory | Type                        | Description                                                                        |
|-----------|-----------|-----------------------------|------------------------------------------------------------------------------------|
| pool      | Yes       | <a href="#">Pool</a> object | Specifies the backend server group. For details, see <a href="#">Table 6-101</a> . |

**Table 6-101** pool parameter description

| Parameter | Mandatory | Type   | Description                                                                                        |
|-----------|-----------|--------|----------------------------------------------------------------------------------------------------|
| name      | No        | String | Specifies the name of the backend server group.<br>The value contains a maximum of 255 characters. |

| Parameter           | Mandatory | Type                             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|---------------------|-----------|----------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| description         | No        | String                           | Provides supplementary information about the backend server group.<br>The value contains a maximum of 255 characters.                                                                                                                                                                                                                                                                                                                                                         |
| lb_algorithm        | No        | String                           | Specifies the load balancing algorithm of the backend server group.<br>The value can be: <ul style="list-style-type: none"><li>● <b>ROUND_ROBIN</b>: indicates the weighted round robin algorithm.</li><li>● <b>LEAST_CONNECTIONS</b>: indicates the weighted least connections algorithm.</li><li>● <b>SOURCE_IP</b>: indicates the source IP hash algorithm.</li></ul> When the value is <b>SOURCE_IP</b> , the weights of backend servers in the server group are invalid. |
| admin_state_up      | No        | Boolean                          | Specifies the administrative status of the backend server group.<br>This parameter is reserved, and the default value is <b>true</b> .                                                                                                                                                                                                                                                                                                                                        |
| session_persistence | No        | <b>SessionPersistence</b> object | Specifies whether to enable the sticky session feature. For details, see <a href="#">Table 6-102</a> .<br>Once sticky session are enabled, requests from the same client are sent to the same backend server during the session.<br>When sticky sessions are disabled, the value is <b>null</b> .                                                                                                                                                                             |

| Parameter         | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                                                                    |
|-------------------|-----------|--------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| protection_status | No        | String | Specifies whether modification protection is enabled. The value can be one of the following: <ul style="list-style-type: none"><li>• <b>nonProtection</b> (default): Modification protection is not enabled.</li><li>• <b>consoleProtection</b>: Modification protection is enabled to avoid that resources are modified by accident on the console.</li></ul> |
| protection_reason | No        | String | Specifies the reason to enable modification protection. This parameter is valid only when <b>protection_status</b> is set to <b>consoleProtection</b> .                                                                                                                                                                                                        |

**Table 6-102 session\_persistence** parameter description

| Parameter   | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-------------|-----------|--------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| type        | Yes       | String | <p>Specifies the sticky session type.</p> <p>The value can be:</p> <ul style="list-style-type: none"><li>• <b>SOURCE_IP</b>: Requests are distributed based on the client's IP address. Requests from the same IP address are sent to the same backend server.</li><li>• <b>HTTP_COOKIE</b>: When the client sends a request for the first time, the load balancer automatically generates a cookie and inserts the cookie into the response message. Subsequent requests are sent to the backend server that processes the first request.</li><li>• <b>APP_COOKIE</b>: When the client sends a request for the first time, the backend server that receives the request generates a cookie and inserts the cookie into the response message. Subsequent requests are sent to this backend server.</li></ul> <p>When the protocol of the backend server group is TCP, only <b>SOURCE_IP</b> takes effect. When the protocol of the backend server group is HTTP, only <b>HTTP_COOKIE</b> or <b>APP_COOKIE</b> takes effect.</p> |
| cookie_name | No        | String | <p>Specifies the cookie name. The name can contain up to 64 characters, including letters, digits, hyphens (-), and underscores (_).</p> <p>This parameter is mandatory when the sticky session type is <b>APP_COOKIE</b>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| Parameter           | Mandatory | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|---------------------|-----------|---------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| persistence_timeout | No        | Integer | <p>Specifies the sticky session timeout duration in minutes.</p> <p>This parameter is invalid when <b>type</b> is set to <b>APP_COOKIE</b>.</p> <p>The value range varies depending on the protocol of the backend server group:</p> <ul style="list-style-type: none"><li>• When the protocol of the backend server group is TCP or UDP, the value ranges from <b>1</b> to <b>60</b>.</li><li>• When the protocol of the backend server group is HTTP or HTTPS, the value ranges from <b>1</b> to <b>1440</b>.</li></ul> |

## Response

**Table 6-103** Response parameters

| Parameter | Type                        | Description                                                                        |
|-----------|-----------------------------|------------------------------------------------------------------------------------|
| pool      | <a href="#">Pool</a> object | Specifies the backend server group. For details, see <a href="#">Table 6-104</a> . |

**Table 6-104** pool parameter description

| Parameter  | Type   | Description                                                                                                                                |
|------------|--------|--------------------------------------------------------------------------------------------------------------------------------------------|
| id         | String | Specifies the ID of the backend server group.                                                                                              |
| tenant_id  | String | <p>Specifies the ID of the project where the backend server group is used.</p> <p>The value contains a maximum of 255 characters.</p>      |
| project_id | String | <p>Specifies the ID of the project to which the backend server group belongs. This parameter has the same meaning as <b>tenant_id</b>.</p> |
| name       | String | <p>Specifies the name of the backend server group.</p> <p>The value contains a maximum of 255 characters.</p>                              |

| Parameter        | Type                            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|------------------|---------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| description      | String                          | Provides supplementary information about the backend server group.<br>The value contains a maximum of 255 characters.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| protocol         | String                          | Specifies the protocol that the backend server group uses to receive requests.<br>TCP, UDP, and HTTP are supported.<br>When a backend server group is associated with a listener, the relationships between the protocol used by the listener and the protocol of the backend server group are as follows: <ul style="list-style-type: none"><li>• When the protocol used by the listener is <b>UDP</b>, the protocol of the backend server group must be <b>UDP</b>.</li><li>• When the protocol used by the listener is <b>TCP</b>, the protocol of the backend server group must be <b>TCP</b>.</li><li>• When the protocol used by the listener is <b>HTTP</b> or <b>TERMINATED_HTTPS</b>, the protocol of the backend server group must be <b>HTTP</b>.</li></ul> |
| lb_algorithm     | String                          | Specifies the load balancing algorithm of the backend server group.<br>The value can be: <ul style="list-style-type: none"><li>• <b>ROUND_ROBIN</b>: indicates the weighted round robin algorithm.</li><li>• <b>LEAST_CONNECTIONS</b>: indicates the weighted least connections algorithm.</li><li>• <b>SOURCE_IP</b>: indicates the source IP hash algorithm. When the value is <b>SOURCE_IP</b>, the weights of backend servers in the server group are invalid.</li></ul>                                                                                                                                                                                                                                                                                           |
| members          | Array of <b>Members</b> objects | Lists the IDs of backend servers in the backend server group. For details, see <a href="#">Table 6-80</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| healthmonitor_id | String                          | Specifies the ID of the health check configured for the backend server group.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| Parameter           | Type                                           | Description                                                                                                                                                                                                                                                                                                                                                              |
|---------------------|------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| admin_state_up      | Boolean                                        | Specifies the administrative status of the backend server group.<br>This parameter is reserved. The value can be <b>true</b> or <b>false</b> . <ul style="list-style-type: none"><li>• <b>true</b>: Enabled</li><li>• <b>false</b>: Disabled</li></ul>                                                                                                                   |
| listeners           | Array of <a href="#">Listeners</a> objects     | Lists the IDs of listeners associated with the backend server group. For details, see <a href="#">Table 6-81</a> .                                                                                                                                                                                                                                                       |
| loadbalancers       | Array of <a href="#">Loadbalancers</a> objects | Lists the IDs of load balancers associated with the backend server group. For details, see <a href="#">Table 6-82</a> .                                                                                                                                                                                                                                                  |
| session_persistence | <a href="#">SessionPersistence</a> object      | Specifies whether to enable the sticky session feature. For details, see <a href="#">Table 6-83</a> .<br>Once sticky session are enabled, requests from the same client are sent to the same backend server during the session.<br>When sticky sessions are disabled, the value is <b>null</b> .                                                                         |
| protection_status   | String                                         | String<br>Specifies whether modification protection is enabled. The value can be one of the following: <ul style="list-style-type: none"><li>• <b>nonProtection</b> (default): Modification protection is not enabled.</li><li>• <b>consoleProtection</b>: Modification protection is enabled to avoid that resources are modified by accident on the console.</li></ul> |
| protection_reason   | String                                         | String<br>Specifies the reason to enable modification protection. This parameter is valid only when <b>protection_status</b> is set to <b>consoleProtection</b> .                                                                                                                                                                                                        |

}
```

## Status Code

For details, see [Status Codes](#).

## 6.3.5 Deleting a Backend Server Group

### Function

This API is used to delete a backend server group.

### Constraints

Before deleting a backend server group, remove all backend servers, delete the health check, and disassociate forwarding policies from the backend server group by changing the value of **redirect\_pool\_id** to **null**. For details, see [Updating a Forwarding Policy](#).

### URI

DELETE /v2/{project\_id}/elb/pools/{pool\_id}

**Table 6-109** Parameter description

| Parameter  | Mandator<br>y | Type       | Description                                   |
|------------|---------------|------------|-----------------------------------------------|
| project_id | Yes           | Strin<br>g | Specifies the project ID.                     |
| pool_id    | Yes           | Strin<br>g | Specifies the ID of the backend server group. |

### Request

# 6.4 Backend Server

## 6.4.1 Adding a Backend Server

### Function

This API is used to add a backend server to a specific backend server group. After a backend server group is added to a listener, traffic is distributed to backend servers in this server group using the specified load balancing algorithm.

### Constraints

Two backend servers in a backend server group cannot have the same private IP address or port number.

The subnet specified during server creation must be in the same VPC as the subnet from which the private IP address of the load balancer is assigned.

You can call this API for a maximum of 200 times per minute globally.

### URI

POST /v2/{project\_id}/elb/pools/{pool\_id}/members

**Table 6-110** Parameter description

| Parameter  | Mandator<br>y | Type       | Description                                   |
|------------|---------------|------------|-----------------------------------------------|
| project_id | Yes           | Strin<br>g | Specifies the project ID.                     |
| pool_id    | Yes           | Strin<br>g | Specifies the ID of the backend server group. |

## Request

**Table 6-111** Parameter description

| Parameter | Mandatory | Type          | Description                                                                  |
|-----------|-----------|---------------|------------------------------------------------------------------------------|
| member    | Yes       | Member object | Specifies the backend server. For details, see <a href="#">Table 6-112</a> . |

**Table 6-112 member** parameter description

| Parameter     | Mandatory | Type    | Description                                                                                                                                                                                                                                                                        |
|---------------|-----------|---------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| tenant_id     | No        | String  | Specifies the ID of the project where the backend server is used.<br>The value must be the same as the value of <b>project_id</b> in the token.<br>The value contains a maximum of 255 characters.                                                                                 |
| name          | No        | String  | Specifies the backend server name. The value is an empty character string by default.<br>The value contains a maximum of 255 characters.                                                                                                                                           |
| address       | Yes       | String  | Specifies the private IP address of the backend server. This IP address must be in the subnet specified by <b>subnet_id</b> .<br>This parameter can be set only to the IP address of the primary NIC, for example, 192.168.3.11.<br>The value contains a maximum of 64 characters. |
| protocol_port | Yes       | Integer | Specifies the port used by the backend server. The port number ranges from 1 to 65535.                                                                                                                                                                                             |
| subnet_id     | Yes       | String  | Specifies the ID of the subnet where the backend server resides.<br>The private IP address of the backend server is in this subnet.<br>Only IPv4 subnets are supported.                                                                                                            |

| Parameter      | Mandatory | Type    | Description                                                                                                                                                                                        |
|----------------|-----------|---------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| admin_state_up | No        | Boolean | Specifies the administrative status of the backend server.<br>This parameter is reserved, and the default value is <b>true</b> .                                                                   |
| weight         | No        | Integer | Specifies the backend server weight. The value ranges from <b>0</b> to <b>100</b> .<br>If the value is <b>0</b> , the backend server will not accept new requests. The default value is <b>1</b> . |

## Response

**Table 6-113** Parameter description

| Parameter | Type                 | Description                                                                  |
|-----------|----------------------|------------------------------------------------------------------------------|
| member    | <b>Member</b> object | Specifies the backend server. For details, see <a href="#">Table 6-114</a> . |

**Table 6-114** member parameter description

| Parameter  | Type   | Description                                                                                                                                                                                            |
|------------|--------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| id         | String | Specifies the backend server ID.<br><b>NOTE</b><br>The value of this parameter is not the ID of server. It is the ID automatically generated for the backend server associated with the load balancer. |
| tenant_id  | String | Specifies the ID of the project where the backend server is used.<br>The value contains a maximum of 255 characters.                                                                                   |
| project_id | String | Specifies the ID of the project to which the backend server belongs. This parameter has the same meaning as <b>tenant_id</b> .                                                                         |
| name       | String | Specifies the backend server name.<br>The value contains a maximum of 255 characters.                                                                                                                  |

| Parameter        | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|------------------|---------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| address          | String  | <p>Specifies the private IP address of the backend server. This IP address must be in the subnet specified by <b>subnet_id</b>.</p> <p>This parameter can be set only to the IP address of the primary NIC, for example, 192.168.3.11.</p> <p>The value contains a maximum of 64 characters.</p>                                                                                                                                                |
| protocol_port    | Integer | <p>Specifies the port used by the backend server. The port number ranges from 1 to 65535.</p>                                                                                                                                                                                                                                                                                                                                                   |
| subnet_id        | String  | <p>Specifies the ID of the subnet where the backend server resides. The private IP address of the backend server is in this subnet.</p> <p>IPv6 subnets are not supported.</p>                                                                                                                                                                                                                                                                  |
| admin_state_up   | Boolean | <p>Specifies the administrative status of the backend server.</p> <p>This parameter is reserved. The value can be <b>true</b> or <b>false</b>.</p> <ul style="list-style-type: none"><li>• <b>true</b>: Enabled</li><li>• <b>false</b>: Disabled</li></ul>                                                                                                                                                                                      |
| weight           | Integer | <p>Specifies the backend server weight. The value ranges from <b>0</b> to <b>100</b>.</p> <p>If the value is <b>0</b>, the backend server will not accept new requests. The default value is <b>1</b>.</p>                                                                                                                                                                                                                                      |
| operating_status | String  | <p>Specifies the health check result of the backend server. The value can be one of the following:</p> <ul style="list-style-type: none"><li>• <b>ONLINE</b>: The backend server is running normally.</li><li>• <b>NO_MONITOR</b>: No health check is configured for the backend server group that the backend server belongs to.</li><li>• <b>OFFLINE</b>: The cloud server used as the backend server is stopped or does not exist.</li></ul> |

## Example Request

- Adding a backend server

Obtain the values of **subnet\_id** and **ip\_address** by querying the subnet ID and IP address of the server associated with the load balancer.

Alternatively, query the subnet ID and IP address using the server ID. **device\_id** in the request indicates the server ID. Obtain the values of **subnet\_id** and **ip\_address** of the primary NIC (the port for which **primary\_interface** is **true**) in the response body.

## Status Code

For details, see [Status Codes](#).

## 6.4.2 Querying Backend Servers

### Function

This API is used to query backend servers in a specific backend server group. Filter query and pagination query are supported. Unless otherwise specified, exact match is applied.

### URI

GET [/v2/{project\\_id}/elb/pools/{pool\\_id}/members](#)

**Table 6-115** Path parameters

| Parameter  | Mandatory | Type   | Description                                   |
|------------|-----------|--------|-----------------------------------------------|
| project_id | Yes       | String | Specifies the project ID.                     |
| pool_id    | Yes       | String | Specifies the ID of the backend server group. |

**Table 6-116** Query parameters

| Parameter    | Mandatory | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                                       |
|--------------|-----------|---------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| marker       | No        | String  | Specifies the ID of the backend server from which pagination query starts, that is, the ID of the last backend server on the previous page. If this parameter is not specified, the first page will be queried.<br><br>This parameter must be used together with <b>limit</b> .                                                                                                                                                   |
| limit        | No        | Integer | Specifies the number of backend servers on each page. If this parameter is not set, all backend servers are queried by default.                                                                                                                                                                                                                                                                                                   |
| page_reverse | No        | Boolean | Specifies the page direction. The value can be <b>true</b> or <b>false</b> , and the default value is <b>false</b> . The last page in the list requested with <b>page_reverse</b> set to <b>false</b> will not contain the "next" link, and the last page in the list requested with <b>page_reverse</b> set to <b>true</b> will not contain the "previous" link.<br><br>This parameter must be used together with <b>limit</b> . |
| id           | No        | String  | Specifies the backend server ID.<br><b>NOTE</b><br>The value of this parameter is not the ID of server. It is the ID automatically generated for the backend server associated with the load balancer.                                                                                                                                                                                                                            |

| Parameter      | Mandatory | Type    | Description                                                                                                                                                                                                                                                  |
|----------------|-----------|---------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| tenant_id      | No        | String  | Specifies the ID of the project where the backend server is used.<br>The value contains a maximum of 255 characters.                                                                                                                                         |
| project_id     | No        | String  | Specifies the ID of the project to which the backend server belongs. This parameter has the same meaning as <b>tenant_id</b> .                                                                                                                               |
| name           | No        | String  | Specifies the backend server name. The value contains a maximum of 255 characters.<br><b>NOTE</b><br>The value of this parameter is not the name of server. It is the name automatically generated for the backend server associated with the load balancer. |
| address        | No        | String  | Specifies the private IP address of the backend server.<br>The value contains a maximum of 64 characters.                                                                                                                                                    |
| protocol_port  | No        | Integer | Specifies the port used by the backend server.                                                                                                                                                                                                               |
| subnet_id      | No        | String  | Specifies the ID of the subnet where the backend server resides.                                                                                                                                                                                             |
| admin_state_up | No        | Boolean | Specifies the administrative status of the backend server.<br>This parameter is reserved, and the default value is <b>true</b> .                                                                                                                             |
| weight         | No        | Integer | Specifies the backend server weight.                                                                                                                                                                                                                         |

| Parameter             | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

**Table 6-117** Parameter description

| Parameter | Type                            | Description                                                                                       |
|-----------|---------------------------------|---------------------------------------------------------------------------------------------------|
| members   | Array of <b>Members</b> objects | Lists backend servers in the backend server group. For details, see <a href="#">Table 6-118</a> . |

**Table 6-118** members parameter description

| Parameter | Type   | Description                                                                                                                                                                                                           |
|-----------|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| id        | String | <p>Specifies the backend server ID.</p> <p><b>NOTE</b></p> <p>The value of this parameter is not the ID of server. It is the ID automatically generated for the backend server associated with the load balancer.</p> |

| Parameter      | Type    | Description                                                                                                                                                                                                                                                                        |
|----------------|---------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| tenant_id      | String  | Specifies the ID of the project where the backend server is used.<br>The value contains a maximum of 255 characters.                                                                                                                                                               |
| project_id     | String  | Specifies the ID of the project to which the backend server belongs. This parameter has the same meaning as <b>tenant_id</b> .                                                                                                                                                     |
| name           | String  | Specifies the backend server name.<br>The value contains a maximum of 255 characters.                                                                                                                                                                                              |
| address        | String  | Specifies the private IP address of the backend server. This IP address must be in the subnet specified by <b>subnet_id</b> .<br>This parameter can be set only to the IP address of the primary NIC, for example, 192.168.3.11.<br>The value contains a maximum of 64 characters. |
| protocol_port  | Integer | Specifies the port used by the backend server.<br>The port number ranges from 1 to 65535.                                                                                                                                                                                          |
| subnet_id      | String  | Specifies the ID of the subnet where the backend server resides. The private IP address of the backend server is in this subnet.<br>IPv6 subnets are not supported.                                                                                                                |
| admin_state_up | Boolean | Specifies the administrative status of the backend server.<br>This parameter is reserved. The value can be <b>true</b> or <b>false</b> . <ul style="list-style-type: none"><li>• <b>true</b>: Enabled</li><li>• <b>false</b>: Disabled</li></ul>                                   |
| weight         | Integer | Specifies the backend server weight. The value ranges from <b>0</b> to <b>100</b> .<br>If the value is <b>0</b> , the backend server will not accept new requests. The default value is <b>1</b> .                                                                                 |

| Parameter        | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|------------------|--------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| operating_status | String | <p>Specifies the health check result of the backend server. The value can be one of the following:</p> <ul style="list-style-type: none"><li>• <b>ONLINE</b>: The backend server is running normally.</li><li>• <b>NO_MONITOR</b>: No health check is configured for the backend server group that the backend server belongs to.</li><li>• <b>OFFLINE</b>: The cloud server used as the backend server is stopped or does not exist.</li></ul> |

## Example Request

- Example request 1: Querying all backend servers  
GET https://{Endpoint}/v2/1a3e005cf9ce40308c900bcb08e5320c/elb/pools/5a9a3e9e-d1aa-448e-af37-a70171f2a332/members
- Example request 2: Querying the backend cloud server whose IP address is 10.0.0.8 and port number is 80  
GET https://{Endpoint}/v2/1a3e005cf9ce40308c900bcb08e5320c/elb/pools/5a9a3e9e-d1aa-448e-af37-a70171f2a332/members?address=10.0.0.8&protocol\_port=80

Status Code

For details, see [Status Codes](#).

6.4.3 Querying Details of a Backend Server

Function

This API is used to query details of a backend server.

URI

GET /v2/{project\_id}/elb/pools/{pool\_id}/members/{member\_id}

Table 6-119 Parameter description

| Parameter  | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                                                                                |
|------------|-----------|--------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| project_id | Yes       | String | Specifies the project ID.                                                                                                                                                                                                                                                                                                                                                  |
| pool_id    | Yes       | String | Specifies the ID of the backend server group.                                                                                                                                                                                                                                                                                                                              |
| member_id  | Yes       | String | Specifies the backend server ID.<br><b>NOTE</b> <ul style="list-style-type: none"><li>The value of this parameter is not the ID of the server. | admin_state_up | Boolean | Specifies the administrative status of the backend server.<br>This parameter is reserved. The value can be <b>true</b> or <b>false</b> . <ul style="list-style-type: none"><li>• <b>true</b>: Enabled</li><li>• <b>false</b>: Disabled</li></ul>                                   |

| Parameter        | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                                              |
|------------------|---------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| weight           | Integer | Specifies the backend server weight. The value ranges from <b>0</b> to <b>100</b> .<br>If the value is <b>0</b> , the backend server will not accept new requests. The default value is <b>1</b> .                                                                                                                                                                                                                                       |
| operating_status | String  | Specifies the health check result of the backend server. The value can be one of the following: <ul style="list-style-type: none"><li>• <b>ONLINE</b>: The backend server is running normally.</li><li>• <b>NO_MONITOR</b>: No health check is configured for the backend server group that the backend server belongs to.</li><li>• <b>OFFLINE</b>: The cloud server used as the backend server is stopped or does not exist.</li></ul> |

## Example Request

- Example request: Querying details of a backend server  
GET https://{Endpoint}/v2/145483a5107745e9b3d80f956713e6a3/elb/pools/5a9a3e9e-d1aa-448e-af37-a70171f2a332/members/cf024846-7516-4e3a-b0fb-6590322c836f  
Example request 2: Querying the EIP bound to a load balancer
- For details, see [Querying EIPs](#).
- Example request  
GET https://{EIP\_Endpoint}/v1/{project\_id}/publicips?port\_id={vip\_port\_id}  
**vip\_port\_id** is the value of **vip\_port\_id** of the load balancer.

## Example Response

- Example response 1

}
```

**public\_ip\_address** indicates the EIP bound to the load balancer.

Status Code

For details, see [Status Codes](#).

6.4.4 Updating a Backend Server

Function

This API is used to update a backend server. You can modify its name and weight. You can set a larger weight for backend servers that can receive more traffic.

Constraints

If the provisioning status of the associated load balancer is not **ACTIVE**, the backend server cannot be updated.

URI

PUT /v2/{project\_id}/elb/pools/{pool\_id}/members/{member\_id}

Table 6-122 Parameter description

| Parameter  | Mandator<br>y | Type       | Description                                   |
|------------|---------------|------------|-----------------------------------------------|
| project_id | Yes           | Strin<br>g | Specifies the project ID.                     |
| pool_id    | Yes           | Strin<br>g | Specifies the ID of the backend server group. |

| Parameter | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                                                                                           |
|-----------|-----------|--------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| member_id | Yes       | String | <p>Specifies the backend server ID.</p> <p><b>NOTE</b></p> <ul style="list-style-type: none"><li>The value of this parameter is not the ID of the server. It is an ID automatically generated for the backend server that is associated with the load balancer.</li><li>You can obtain this value by calling the API described in <a href="#">Querying Backend Servers</a>.</li></ul> |

## Request

**Table 6-123** Parameter description

| Parameter | Mandatory | Type                          | Description                                                                  |
|-----------|-----------|-------------------------------|------------------------------------------------------------------------------|
| member    | Yes       | <a href="#">Member</a> object | Specifies the backend server. For details, see <a href="#">Table 6-124</a> . |

**Table 6-124 member** parameter description

| Parameter      | Mandatory | Type    | Description                                                                                                                                                                                     |
|----------------|-----------|---------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| name           | No        | String  | Specifies the backend server name. The value contains a maximum of 255 characters.                                                                                                              |
| admin_state_up | No        | Boolean | Specifies the administrative status of the backend server. This parameter is reserved, and the default value is <b>true</b> .                                                                   |
| weight         | No        | Integer | Specifies the backend server weight. The value ranges from <b>0</b> to <b>100</b> . If the value is <b>0</b> , the backend server will not accept new requests. The default value is <b>1</b> . |

## Response

## 6.4.5 Removing a Backend Server

### Function

This API is used to remove a backend server by its ID.

### Constraints

After you remove a backend server, new connections to this server will not be established. However, long connections that have been established will be maintained.

### URI

DELETE /v2/{project\_id}/elb/pools/{pool\_id}/members/{member\_id}

**Table 6-127** Parameter description

| Parameter  | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                                                                                |
|------------|-----------|--------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| project_id | Yes       | String | Specifies the project ID.                                                                                                                                                                                                                                                                                                                                                  |
| pool_id    | Yes       | String | Specifies the ID of the backend server group.                                                                                                                                                                                                                                                                                                                              |
| member_id  | Yes       | String | Specifies the backend server ID.<br><b>NOTE</b> <ul style="list-style-type: none"><li>The value of this parameter is not the ID of the server. It is an ID automatically generated for the backend server that is associated with the load balancer.</li><li>You can obtain this value by calling the API described in <a href="#">Querying Backend Servers</a>.</li></ul> |

## Status Code

For details, see [Status Codes](#).

# 6.5 Health Check

## 6.5.1 Configuring a Health Check

### Function

This API is used to configure a health check for a backend server group to check the status of backend servers. If the health check result is **OFFLINE**, backend servers are considered unhealthy. You need to check the server configuration.

### Constraints

- The security groups must have rules that allow access by 100.125.0.0/16.
- If UDP is used for the health check, the protocol of the backend server group must be UDP.

### URI

POST /v2/{project\_id}/elb/healthmonitors

**Table 6-128** Parameter description

| Parameter  | Mandatory | Type   | Description               |
|------------|-----------|--------|---------------------------|
| project_id | Yes       | String | Specifies the project ID. |

## Request

**Table 6-129** Parameter description

| Parameter     | Mandatory | Type                 | Description                                                                |
|---------------|-----------|----------------------|----------------------------------------------------------------------------|
| healthmonitor | Yes       | Healthmonitor object | Specifies the health check. For details, see <a href="#">Table 6-130</a> . |

**Table 6-130** healthmonitor parameter description

| Parameter      | Mandatory | Type    | Description                                                                                                                                                                                                   |
|----------------|-----------|---------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| tenant_id      | No        | String  | Specifies the ID of the project where the health check is performed.<br><br>The value must be the same as the value of <b>project_id</b> in the token.<br><br>The value contains a maximum of 255 characters. |
| name           | No        | String  | Specifies the health check name.<br><br>The value contains a maximum of 255 characters.                                                                                                                       |
| delay          | Yes       | Integer | Specifies the maximum time between health checks in the unit of second. The value ranges from <b>1</b> to <b>50</b> .                                                                                         |
| max_retries    | Yes       | Integer | Specifies the maximum number of retries. The value ranges from <b>1</b> to <b>10</b> .                                                                                                                        |
| pool_id        | Yes       | String  | Specifies the ID of the backend server group.<br><br>Only one health check can be configured for each backend server group.                                                                                   |
| admin_state_up | No        | Boolean | Specifies the administrative status of the health check.<br><br>This parameter is reserved, and the default value is <b>true</b> .                                                                            |

| Parameter    | Mandatory | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|--------------|-----------|---------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| timeout      | Yes       | Integer | <p>Specifies the health check timeout duration in the unit of second. The value ranges from <b>1</b> to <b>50</b>.</p> <p><b>NOTE</b><br/>You are advised to set the value less than that of parameter <b>delay</b>.</p>                                                                                                                                                                                                                                                                                                                     |
| type         | Yes       | String  | <p>Specifies the health check protocol.</p> <p>The value can be <b>TCP</b>, <b>UDP_CONNECT</b>, or <b>HTTP</b>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                          |
| monitor_port | No        | Integer | <p>Specifies the health check port. The port number ranges from 1 to 65535.</p> <p>The value is left blank by default, indicating that the port of the backend server is used as the health check port.</p>                                                                                                                                                                                                                                                                                                                                  |
| domain_name  | No        | String  | <p>Specifies the domain name of HTTP requests during the health check.</p> <p>This parameter takes effect only when the value of <b>type</b> is set to <b>HTTP</b>.</p> <p>The value is left blank by default, indicating that the private IP address of the load balancer is used as the destination address of HTTP requests.</p> <p>The value can contain only digits, letters, hyphens (-), and periods (.) and must start with a digit or letter, for example, www.test.com.</p> <p>The value contains a maximum of 100 characters.</p> |

| Parameter      | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                       |
|----------------|-----------|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| url_path       | No        | String | <p>Specifies the HTTP request path for the health check. The default value is <code>/</code>.</p> <p>The value starts with a slash (<code>/</code>).</p> <p>This parameter takes effect only when the value of <b>type</b> is set to <b>HTTP</b>.</p> <p>An example value is <code>/test</code>.</p> <p>The value contains a maximum of 80 characters.</p>                                                                        |
| expected_codes | No        | String | <p>Specifies the expected HTTP status code. The following options are available:</p> <p>A single value, such as <b>200</b></p> <p>A list of values, such as <b>200,202</b></p> <p>A value range, such as <b>200–204</b></p> <p>This parameter takes effect only when the value of <b>type</b> is set to <b>HTTP</b>.</p> <p>The value contains a maximum of 64 characters.</p> <p><b>NOTE</b><br/>This parameter is reserved.</p> |
| http_method    | No        | String | <p>Specifies the HTTP request method. The default value is <b>GET</b>.</p> <p>The value can be <b>GET</b>, <b>HEAD</b>, <b>POST</b>, <b>PUT</b>, <b>DELETE</b>, <b>TRACE</b>, <b>OPTIONS</b>, <b>CONNECT</b>, or <b>PATCH</b>.</p> <p>This parameter takes effect only when the value of <b>type</b> is set to <b>HTTP</b>.</p> <p><b>NOTE</b><br/>This parameter is reserved.</p>                                                |

## Response

|---------------|---------------------------------------|----------------------------------------------------------------------------|
| healthmonitor | <a href="#">Healthmonit</a> or object | Specifies the health check. For details, see <a href="#">Table 6-132</a> . |

**Table 6-132** healthmonitor parameter description

| Parameter        | Type                                   | Description                                                                                                                                                                                                                                    |
|------------------|----------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| id               | String                                 | Specifies the health check ID.                                                                                                                                                                                                                 |
| tenant_id        | String                                 | Specifies the ID of the project where the health check is performed.                                                                                                                                                                           |
| project_id       | String                                 | Specifies the ID of the project to which the health check belongs. This parameter has the same meaning as <b>tenant_id</b> .                                                                                                                   |
| name             | String                                 | Specifies the health check name.                                                                                                                                                                                                               |
| delay            | Integer                                | Specifies the maximum time between health checks in the unit of second. The value ranges from <b>1</b> to <b>50</b> .                                                                                                                          |
| max_retries      | Integer                                | Specifies the maximum number of retries. The value ranges from <b>1</b> to <b>10</b> .                                                                                                                                                         |
| max_retries_down | Integer                                | Specifies the number of consecutive health checks when the health check result of a backend server changes from <b>ONLINE</b> to <b>OFFLINE</b> . The value ranges from <b>1</b> to <b>10</b> .                                                |
| pools            | Array of <a href="#">Pools</a> objects | Lists the IDs of backend server groups associated with the health check. For details, see <a href="#">Table 6-133</a> .                                                                                                                        |
| admin_state_up   | Boolean                                | Specifies the administrative status of the health check.<br>This parameter is reserved. The value can be <b>true</b> or <b>false</b> . <ul style="list-style-type: none"><li>• <b>true</b>: Enabled</li><li>• <b>false</b>: Disabled</li></ul> |
| timeout          | Integer                                | Specifies the health check timeout duration in the unit of second. The value ranges from <b>1</b> to <b>50</b> .<br><b>NOTE</b><br>You are advised to set the value less than that of parameter <b>delay</b> .                                 |

| Parameter      | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|----------------|---------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| type           | String  | Specifies the health check protocol.<br>The value can be <b>TCP</b> , <b>UDP_CONNECT</b> , or <b>HTTP</b> .                                                                                                                                                                                                                                                                                                                                                         |
| monitor_port   | Integer | Specifies the health check port. The port number ranges from 1 to 65535.<br>The value is left blank by default, indicating that the port of the backend server is used as the health check port.                                                                                                                                                                                                                                                                    |
| expected_codes | String  | Specifies the expected HTTP status code. The following options are available:<br>A single value, such as <b>200</b><br>A list of values, such as <b>200,202</b><br>A value range, such as <b>200-204</b><br>This parameter takes effect only when the value of <b>type</b> is set to <b>HTTP</b> .<br>Currently, this parameter is not supported and is fixed at <b>200</b> .                                                                                       |
| domain_name    | String  | Specifies the domain name of HTTP requests during the health check.<br>This parameter takes effect only when the value of <b>type</b> is set to <b>HTTP</b> .<br>The value is left blank by default, indicating that the private IP address of the load balancer is used as the destination address of HTTP requests.<br>The value can contain only digits, letters, hyphens (-), and periods (.) and must start with a digit or letter, for example: www.test.com. |
| url_path       | String  | Specifies the HTTP request path for the health check. The default value is /.<br>The value starts with a slash (/).<br>This parameter takes effect only when the value of <b>type</b> is set to <b>HTTP</b> .<br>An example value is <b>/test</b> .                                                                                                                                                                                                                 |

| Parameter   | Type   | Description                                                                                                                                                                                                                                                                                                                                                                        |
|-------------|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| http_method | String | <p>Specifies the HTTP request method. The default value is <b>GET</b>.</p> <p>The value can be <b>GET</b>, <b>HEAD</b>, <b>POST</b>, <b>PUT</b>, <b>DELETE</b>, <b>TRACE</b>, <b>OPTIONS</b>, <b>CONNECT</b>, or <b>PATCH</b>.</p> <p>This parameter takes effect only when the value of <b>type</b> is set to <b>HTTP</b>.</p> <p><b>NOTE</b><br/>This parameter is reserved.</p> |

Table 6-133 pools parameter description

| Parameter | Mandatory | Type   | Description                                   |
|-----------|-----------|--------|-----------------------------------------------|
| id        | Yes       | String | Specifies the ID of the backend server group. |

## Example Request

- Example request: Configuring a health check  
POST https://{Endpoint}/v2/145483a5107745e9b3d80f956713e6a3/elb/healthmonitors  

```
{
 "healthmonitor": {
 "admin_state_up": true,
 "pool_id": "bb44bffb-05d9-412c-9d9c-b189d9e14193",
 "domain_name": "www.test.com",
 "delay": 10,
 "max_retries": 10,
 "timeout": 10,
 "type": "HTTP"
 }
}
```

## Example Response

- Example response 1  

```
{
 "healthmonitor": {
 "name": "",
 "admin_state_up": true,
 "tenant_id": "145483a5107745e9b3d80f956713e6a3",

"monitor_port": 112
}
```

### Status Code

For details, see [Status Codes](#).

## 6.5.2 Querying Health Checks

### Function

This API is used to query all the health checks. Filter query and pagination query are supported. Unless otherwise specified, exact match is applied.

### URI

GET /v2/{project\_id}/elb/healthmonitors

Table 6-134 Path parameters

| Parameter  | Mandatory | Type   | Description               |
|------------|-----------|--------|---------------------------|
| project_id | Yes       | String | Specifies the project ID. |

Table 6-135 Query parameters

| Parameter | Mandatory | Type    | Description                                                                                                                                                                                         |
|-----------|-----------|---------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| marker    | No        | String  | Specifies the ID of the health check from which pagination query starts, that is, the ID of the last health check on the previous page.<br>This parameter must be used together with <b>limit</b> . |
| limit     | No        | Integer | Specifies the number of health checks on each page. If this parameter is not set, all health checks are queried by default.                                                                         |

| Parameter      | Mandatory | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                                       |
|----------------|-----------|---------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| page_reverse   | No        | Boolean | Specifies the page direction. The value can be <b>true</b> or <b>false</b> , and the default value is <b>false</b> . The last page in the list requested with <b>page_reverse</b> set to <b>false</b> will not contain the "next" link, and the last page in the list requested with <b>page_reverse</b> set to <b>true</b> will not contain the "previous" link.<br><br>This parameter must be used together with <b>limit</b> . |
| id             | No        | String  | Specifies the health check ID.                                                                                                                                                                                                                                                                                                                                                                                                    |
| tenant_id      | No        | String  | Specifies the ID of the project where the health check is performed.<br><br>The value contains a maximum of 255 characters.                                                                                                                                                                                                                                                                                                       |
| project_id     | No        | String  | Specifies the ID of the project to which the health check belongs. This parameter has the same meaning as <b>tenant_id</b> .                                                                                                                                                                                                                                                                                                      |
| name           | No        | String  | Specifies the health check name.<br><br>The value contains a maximum of 255 characters.                                                                                                                                                                                                                                                                                                                                           |
| delay          | No        | Integer | Specifies the maximum time between health checks in the unit of second. The value ranges from <b>1</b> to <b>50</b> .                                                                                                                                                                                                                                                                                                             |
| max_retries    | No        | Integer | Specifies the number of consecutive health checks when the health check result of a backend server changes from <b>OFFLINE</b> to <b>ONLINE</b> . The value ranges from <b>1</b> to <b>10</b> .                                                                                                                                                                                                                                   |
| admin_state_up | No        | Boolean | Specifies the administrative status of the health check.<br><br>The value can be <b>true</b> or <b>false</b> . The default value is <b>true</b> . <ul style="list-style-type: none"><li>• <b>true</b>: indicates that the health check function is enabled.</li><li>• <b>false</b>: indicates that the health check function is disabled.</li></ul>                                                                               |

| Parameter      | Mandatory | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|----------------|-----------|---------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| timeout        | No        | Integer | <p>Specifies the health check timeout duration in the unit of second. The value ranges from <b>1</b> to <b>50</b>.</p> <p><b>NOTE</b><br/>You are advised to set the value less than that of parameter <b>delay</b>.</p>                                                                                                                                                                                                                                                                                                                     |
| type           | No        | String  | <p>Specifies the health check protocol. The value can be <b>TCP</b>, <b>UDP_CONNECT</b>, or <b>HTTP</b>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| monitor_port   | No        | Integer | <p>Specifies the port used for the health check.</p> <p>The value is left blank by default, indicating that the port of the backend server is used as the health check port.</p>                                                                                                                                                                                                                                                                                                                                                             |
| expected_codes | No        | String  | <p>Specifies the expected HTTP status code. The following options are available:</p> <p>A single value, such as <b>200</b></p> <p>A list of values, such as <b>200,202</b></p> <p>A value range, such as <b>200-204</b></p> <p>This parameter takes effect only when the value of <b>type</b> is set to <b>HTTP</b>.</p> <p>The value contains a maximum of 64 characters.</p> <p><b>NOTE</b><br/>This parameter is reserved.</p>                                                                                                            |
| domain_name    | No        | String  | <p>Specifies the domain name of HTTP requests during the health check.</p> <p>This parameter takes effect only when the value of <b>type</b> is set to <b>HTTP</b>.</p> <p>The value is left blank by default, indicating that the private IP address of the load balancer is used as the destination address of HTTP requests.</p> <p>The value can contain only digits, letters, hyphens (-), and periods (.) and must start with a digit or letter, for example: www.test.com.</p> <p>The value contains a maximum of 100 characters.</p> |

| Parameter   | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                                                                                        |
|-------------|-----------|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| url_path    | No        | String | <p>Specifies the HTTP request path for the health check. The default value is <code>/</code>.</p> <p>The value starts with a slash (<code>/</code>).</p> <p>This parameter takes effect only when the value of <b>type</b> is set to <b>HTTP</b>.</p> <p>An example value is <code>/test</code>.</p> <p>The value contains a maximum of 80 characters.</p>                         |
| http_method | No        | String | <p>Specifies the HTTP request method. The default value is <b>GET</b>.</p> <p>The value can be <b>GET</b>, <b>HEAD</b>, <b>POST</b>, <b>PUT</b>, <b>DELETE</b>, <b>TRACE</b>, <b>OPTIONS</b>, <b>CONNECT</b>, or <b>PATCH</b>.</p> <p>This parameter takes effect only when the value of <b>type</b> is set to <b>HTTP</b>.</p> <p><b>NOTE</b><br/>This parameter is reserved.</p> |

Table 6-136 Parameter description

| Parameter      | Type                                   | Description                                                             |
|----------------|----------------------------------------|-------------------------------------------------------------------------|
| healthmonitors | Array of <b>Healthmonitors</b> objects | Lists the health checks. For details, see <a href="#">Table 6-137</a> . |

Table 6-137 healthmonitor parameter description

| Parameter  | Type   | Description                                                                                                                  |
|------------|--------|------------------------------------------------------------------------------------------------------------------------------|
| id         | String | Specifies the health check ID.                                                                                               |
| tenant_id  | String | Specifies the ID of the project where the health check is performed.                                                         |
| project_id | String | Specifies the ID of the project to which the health check belongs. This parameter has the same meaning as <b>tenant_id</b> . |

| Parameter        | Type                                   | Description                                                                                                                                                                                                                                              |
|------------------|----------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| name             | String                                 | Specifies the health check name.                                                                                                                                                                                                                         |
| delay            | Integer                                | Specifies the maximum time between health checks in the unit of second. The value ranges from <b>1</b> to <b>50</b> .                                                                                                                                    |
| max_retries      | Integer                                | Specifies the maximum number of retries. The value ranges from <b>1</b> to <b>10</b> .                                                                                                                                                                   |
| max_retries_down | Integer                                | Specifies the number of consecutive health checks when the health check result of a backend server changes from <b>ONLINE</b> to <b>OFFLINE</b> . The value ranges from <b>1</b> to <b>10</b> .                                                          |
| pools            | Array of <a href="#">Pools</a> objects | Lists the IDs of backend server groups associated with the health check. For details, see <a href="#">Table 6-133</a> .                                                                                                                                  |
| admin_state_up   | Boolean                                | <p>Specifies the administrative status of the health check.</p> <p>This parameter is reserved. The value can be <b>true</b> or <b>false</b>.</p> <ul style="list-style-type: none"><li>• <b>true</b>: Enabled</li><li>• <b>false</b>: Disabled</li></ul> |
| timeout          | Integer                                | <p>Specifies the health check timeout duration in the unit of second. The value ranges from <b>1</b> to <b>50</b>.</p> <p><b>NOTE</b><br/>You are advised to set the value less than that of parameter <b>delay</b>.</p>                                 |
| type             | String                                 | <p>Specifies the health check protocol.</p> <p>The value can be <b>TCP</b>, <b>UDP_CONNECT</b>, or <b>HTTP</b>.</p>                                                                                                                                      |
| monitor_port     | Integer                                | <p>Specifies the health check port. The port number ranges from 1 to 65535.</p> <p>The value is left blank by default, indicating that the port of the backend server is used as the health check port.</p>                                              |

| Parameter      | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|----------------|--------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| expected_codes | String | <p>Specifies the expected HTTP status code. The following options are available:</p> <p>A single value, such as <b>200</b></p> <p>A list of values, such as <b>200,202</b></p> <p>A value range, such as <b>200-204</b></p> <p>This parameter takes effect only when the value of <b>type</b> is set to <b>HTTP</b>.</p> <p>Currently, this parameter is not supported and is fixed at <b>200</b>.</p>                                                                                |
| domain_name    | String | <p>Specifies the domain name of HTTP requests during the health check.</p> <p>This parameter takes effect only when the value of <b>type</b> is set to <b>HTTP</b>.</p> <p>The value is left blank by default, indicating that the private IP address of the load balancer is used as the destination address of HTTP requests.</p> <p>The value can contain only digits, letters, hyphens (-), and periods (.) and must start with a digit or letter, for example: www.test.com.</p> |
| url_path       | String | <p>Specifies the HTTP request path for the health check. The default value is <b>/</b>.</p> <p>The value starts with a slash (/).</p> <p>This parameter takes effect only when the value of <b>type</b> is set to <b>HTTP</b>.</p> <p>An example value is <b>/test</b>.</p>                                                                                                                                                                                                           |
| http_method    | String | <p>Specifies the HTTP request method. The default value is <b>GET</b>.</p> <p>The value can be <b>GET</b>, <b>HEAD</b>, <b>POST</b>, <b>PUT</b>, <b>DELETE</b>, <b>TRACE</b>, <b>OPTIONS</b>, <b>CONNECT</b>, or <b>PATCH</b>.</p> <p>This parameter takes effect only when the value of <b>type</b> is set to <b>HTTP</b>.</p> <p><b>NOTE</b><br/>This parameter is reserved.</p>                                                                                                    |

**Table 6-138** pools parameter description

| Parameter | Mandatory | Type   | Description                                   |
|-----------|-----------|--------|-----------------------------------------------|
| id        | Yes       | String | Specifies the ID of the backend server group. |

## Example Request

- Example request 1: Querying all health checks  
GET https://{Endpoint}/v2/601240b9c5c94059b63d484c92cfe308/elb/healthmonitors
- Example request 2: Querying HTTP health checks  
GET https://{Endpoint}/v2/601240b9c5c94059b63d484c92cfe308/elb/healthmonitors?type=HTTP

## Example Response

## Status Code

For details, see [Status Codes](#).

## 6.5.3 Querying Health Check Details

### Function

This API is used to query details about a health check.

### URI

GET /v2/{project\_id}/elb/healthmonitors/{healthmonitor\_id}

**Table 6-139** Parameter description

| Parameter        | Mandator<br>y | Type   | Description                    |
|------------------|---------------|--------|--------------------------------|
| project_id       | Yes           | String | Specifies the project ID.      |
| healthmonitor_id | Yes           | String | Specifies the health check ID. |

### Request

None

### Response

**Table 6-140** Parameter description

| Parameter     | Type                                      | Description                                                                |
|---------------|-------------------------------------------|----------------------------------------------------------------------------|
| healthmonitor | <a href="#">Healthmonit<br/>or</a> object | Specifies the health check. For details, see <a href="#">Table 6-141</a> . |

**Table 6-141** healthmonitor parameter description

| Parameter  | Type   | Description                                                                                                                  |
|------------|--------|------------------------------------------------------------------------------------------------------------------------------|
| id         | String | Specifies the health check ID.                                                                                               |
| tenant_id  | String | Specifies the ID of the project where the health check is performed.                                                         |
| project_id | String | Specifies the ID of the project to which the health check belongs. This parameter has the same meaning as <b>tenant_id</b> . |
| name       | String | Specifies the health check name.                                                                                             |

| Parameter        | Type                                   | Description                                                                                                                                                                                                                                                                                                                                                                                            |
|------------------|----------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| delay            | Integer                                | Specifies the maximum time between health checks in the unit of second. The value ranges from <b>1</b> to <b>50</b> .                                                                                                                                                                                                                                                                                  |
| max_retries      | Integer                                | Specifies the maximum number of retries. The value ranges from <b>1</b> to <b>10</b> .                                                                                                                                                                                                                                                                                                                 |
| max_retries_down | Integer                                | Specifies the number of consecutive health checks when the health check result of a backend server changes from <b>ONLINE</b> to <b>OFFLINE</b> . The value ranges from <b>1</b> to <b>10</b> .                                                                                                                                                                                                        |
| pools            | Array of <a href="#">Pools</a> objects | Lists the IDs of backend server groups associated with the health check. For details, see <a href="#">Table 6-133</a> .                                                                                                                                                                                                                                                                                |
| admin_state_up   | Boolean                                | <p>Specifies the administrative status of the health check.</p> <p>This parameter is reserved. The value can be <b>true</b> or <b>false</b>.</p> <ul style="list-style-type: none"><li>• <b>true</b>: Enabled</li><li>• <b>false</b>: Disabled</li></ul>                                                                                                                                               |
| timeout          | Integer                                | <p>Specifies the health check timeout duration in the unit of second. The value ranges from <b>1</b> to <b>50</b>.</p> <p><b>NOTE</b><br/>You are advised to set the value less than that of parameter <b>delay</b>.</p>                                                                                                                                                                               |
| type             | String                                 | <p>Specifies the health check protocol.</p> <p>The value can be <b>TCP</b>, <b>UDP_CONNECT</b>, or <b>HTTP</b>.</p>                                                                                                                                                                                                                                                                                    |
| monitor_port     | Integer                                | <p>Specifies the health check port. The port number ranges from 1 to 65535.</p> <p>The value is left blank by default, indicating that the port of the backend server is used as the health check port.</p>                                                                                                                                                                                            |
| expected_codes   | String                                 | <p>Specifies the expected HTTP status code. The following options are available:</p> <p>A single value, such as <b>200</b></p> <p>A list of values, such as <b>200,202</b></p> <p>A value range, such as <b>200-204</b></p> <p>This parameter takes effect only when the value of <b>type</b> is set to <b>HTTP</b>.</p> <p>Currently, this parameter is not supported and is fixed at <b>200</b>.</p> |

| Parameter   | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|-------------|--------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| domain_name | String | <p>Specifies the domain name of HTTP requests during the health check.</p> <p>This parameter takes effect only when the value of <b>type</b> is set to <b>HTTP</b>.</p> <p>The value is left blank by default, indicating that the private IP address of the load balancer is used as the destination address of HTTP requests.</p> <p>The value can contain only digits, letters, hyphens (-), and periods (.) and must start with a digit or letter, for example: www.test.com.</p> |
| url_path    | String | <p>Specifies the HTTP request path for the health check. The default value is <b>/</b>.</p> <p>The value starts with a slash (/).</p> <p>This parameter takes effect only when the value of <b>type</b> is set to <b>HTTP</b>.</p> <p>An example value is <b>/test</b>.</p>                                                                                                                                                                                                           |
| http_method | String | <p>Specifies the HTTP request method. The default value is <b>GET</b>.</p> <p>The value can be <b>GET</b>, <b>HEAD</b>, <b>POST</b>, <b>PUT</b>, <b>DELETE</b>, <b>TRACE</b>, <b>OPTIONS</b>, <b>CONNECT</b>, or <b>PATCH</b>.</p> <p>This parameter takes effect only when the value of <b>type</b> is set to <b>HTTP</b>.</p> <p><b>NOTE</b><br/>This parameter is reserved.</p>                                                                                                    |

Table 6-142 pools parameter description

| Parameter | Mandatory | Type   | Description                                   |
|-----------|-----------|--------|-----------------------------------------------|
| id        | Yes       | String | Specifies the ID of the backend server group. |

## Example Request

- Example request: Querying details of a health check  
GET https://{endpoint}/v2/145483a5107745e9b3d80f956713e6a3/elb/healthmonitors/  
b7633ade-24dc-4d72-8475-06aa22be5412

## Example Response

Status Code

For details, see [Status Codes](#).

6.5.4 Updating a Health Check

Function

This API is used to update a health check.

Constraints

If **provisioning\_status** of the load balancer for which the health check is configured is not **ACTIVE**, the health check cannot be updated.

URI

PUT /v2/{project\_id}/elb/healthmonitors/{healthmonitor\_id}

Table 6-143 Parameter description

| Parameter        | Mandator<br>y | Type   | Description                    |
|------------------|---------------|--------|--------------------------------|
| project_id       | Yes           | String | Specifies the project ID.      |
| healthmonitor_id | Yes           | String | Specifies the health check ID. |

## Request

The default value is <b>/</b>.</p> <p>The value starts with a slash (/).</p> <p>This parameter takes effect only when the value of <b>type</b> is set to <b>HTTP</b>.</p> <p>An example value is <b>/test</b>.</p> <p>The value contains a maximum of 80 characters.</p>                                                                                                                                                                                                            |
| http_method    | No        | String | <p>Specifies the HTTP request method. The default value is <b>GET</b>.</p> <p>The value can be <b>GET</b>, <b>HEAD</b>, <b>POST</b>, <b>PUT</b>, <b>DELETE</b>, <b>TRACE</b>, <b>OPTIONS</b>, <b>CONNECT</b>, or <b>PATCH</b>.</p> <p>This parameter takes effect only when the value of <b>type</b> is set to <b>HTTP</b>.</p> <p><b>NOTE</b><br/>This parameter is reserved.</p>                                                                                                                                                           |

## Response

**Table 6-146** Parameter description

| Parameter     | Type                                  | Description                                                                |
|---------------|---------------------------------------|----------------------------------------------------------------------------|
| healthmonitor | <a href="#">Healthmonit</a> or object | Specifies the health check. For details, see <a href="#">Table 6-147</a> . |

**Table 6-147** healthmonitor parameter description

| Parameter        | Type                                   | Description                                                                                                                                                                                                                                    |
|------------------|----------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| id               | String                                 | Specifies the health check ID.                                                                                                                                                                                                                 |
| tenant_id        | String                                 | Specifies the ID of the project where the health check is performed.                                                                                                                                                                           |
| project_id       | String                                 | Specifies the ID of the project to which the health check belongs. This parameter has the same meaning as <b>tenant_id</b> .                                                                                                                   |
| name             | String                                 | Specifies the health check name.                                                                                                                                                                                                               |
| delay            | Integer                                | Specifies the maximum time between health checks in the unit of second. The value ranges from <b>1</b> to <b>50</b> .                                                                                                                          |
| max_retries      | Integer                                | Specifies the maximum number of retries. The value ranges from <b>1</b> to <b>10</b> .                                                                                                                                                         |
| max_retries_down | Integer                                | Specifies the number of consecutive health checks when the health check result of a backend server changes from <b>ONLINE</b> to <b>OFFLINE</b> . The value ranges from <b>1</b> to <b>10</b> .                                                |
| pools            | Array of <a href="#">Pools</a> objects | Lists the IDs of backend server groups associated with the health check. For details, see <a href="#">Table 6-133</a> .                                                                                                                        |
| admin_state_up   | Boolean                                | Specifies the administrative status of the health check.<br>This parameter is reserved. The value can be <b>true</b> or <b>false</b> . <ul style="list-style-type: none"><li>• <b>true</b>: Enabled</li><li>• <b>false</b>: Disabled</li></ul> |
| timeout          | Integer                                | Specifies the health check timeout duration in the unit of second. The value ranges from <b>1</b> to <b>50</b> .<br><b>NOTE</b><br>You are advised to set the value less than that of parameter <b>delay</b> .                                 |

| Parameter      | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|----------------|---------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| type           | String  | Specifies the health check protocol.<br>The value can be <b>TCP</b> , <b>UDP_CONNECT</b> , or <b>HTTP</b> .                                                                                                                                                                                                                                                                                                                                                         |
| monitor_port   | Integer | Specifies the health check port. The port number ranges from 1 to 65535.<br>The value is left blank by default, indicating that the port of the backend server is used as the health check port.                                                                                                                                                                                                                                                                    |
| expected_codes | String  | Specifies the expected HTTP status code. The following options are available:<br>A single value, such as <b>200</b><br>A list of values, such as <b>200,202</b><br>A value range, such as <b>200-204</b><br>This parameter takes effect only when the value of <b>type</b> is set to <b>HTTP</b> .<br>Currently, this parameter is not supported and is fixed at <b>200</b> .                                                                                       |
| domain_name    | String  | Specifies the domain name of HTTP requests during the health check.<br>This parameter takes effect only when the value of <b>type</b> is set to <b>HTTP</b> .<br>The value is left blank by default, indicating that the private IP address of the load balancer is used as the destination address of HTTP requests.<br>The value can contain only digits, letters, hyphens (-), and periods (.) and must start with a digit or letter, for example: www.test.com. |
| url_path       | String  | Specifies the HTTP request path for the health check. The default value is /.<br>The value starts with a slash (/).<br>This parameter takes effect only when the value of <b>type</b> is set to <b>HTTP</b> .<br>An example value is <b>/test</b> .                                                                                                                                                                                                                 |

| Parameter   | Type   | Description                                                                                                                                                                                                                                                                                                                                                                        |
|-------------|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| http_method | String | <p>Specifies the HTTP request method. The default value is <b>GET</b>.</p> <p>The value can be <b>GET</b>, <b>HEAD</b>, <b>POST</b>, <b>PUT</b>, <b>DELETE</b>, <b>TRACE</b>, <b>OPTIONS</b>, <b>CONNECT</b>, or <b>PATCH</b>.</p> <p>This parameter takes effect only when the value of <b>type</b> is set to <b>HTTP</b>.</p> <p><b>NOTE</b><br/>This parameter is reserved.</p> |

```

## Status Code

For details, see [Status Codes](#).

## 6.5.5 Deleting a Health Check

### Function

This API is used to delete a health check.

### Constraints

If **provisioning\_status** of the load balancer for which the health check is configured is not **ACTIVE**, the health check cannot be deleted.

### URI

DELETE /v2/{project\_id}/elb/healthmonitors/{healthmonitor\_id}

**Table 6-149** Parameter description

| Parameter        | Mandatory | Type   | Description                    |
|------------------|-----------|--------|--------------------------------|
| project_id       | Yes       | String | Specifies the project ID.      |
| healthmonitor_id | Yes       | String | Specifies the health check ID. |

### Request

None

### Response

None

### Example Request

- Example request: Deleting a health check  
DELETE https://{Endpoint}/v2/145483a5107745e9b3d80f956713e6a3/elb/healthmonitors/b7633ade-24dc-4d72-8475-06aa22be5412

### Example Response

- Example response  
None

## Status Code

For details, see [Status Codes](#).

# 6.6 Forwarding Policy

## 6.6.1 Adding a Forwarding Policy

### Function

This API is used to add a forwarding policy. The listener and forwarding policy determine how traffic is forwarded to backend servers.

- By matching the URL or domain name specified in the forwarding policy when **action** is set to **REDIRECT\_TO\_POOL**, the load balancer distributes the traffic to backend servers in a specific backend server group.
- When **action** is set to **REDIRECT\_TO\_LISTENER**, the HTTP listener is redirected to an HTTPS listener, and requests are routed by the HTTPS listener.

### Constraints

Currently, only redirects from an HTTP listener to an HTTPS listener are supported. When **action** is set to **REDIRECT\_TO\_LISTENER**, the listener specified by **listener\_id** can only be an HTTP listener, and the listener specified by **redirect\_listener\_id** can only be an HTTPS listener.

The load balancer of the HTTPS listener to which traffic is redirected must be the same as that of the HTTP listener.

### URI

POST /v2/{project\_id}/elb/l7policies

**Table 6-150** Parameter description

| Parameter  | Mandatory | Type   | Description               |
|------------|-----------|--------|---------------------------|
| project_id | Yes       | String | Specifies the project ID. |

### Request

**Table 6-151** Parameter description

| Parameter | Mandatory | Type                            | Description                                                                     |
|-----------|-----------|---------------------------------|---------------------------------------------------------------------------------|
| l7policy  | Yes       | <a href="#">L7policy</a> object | Specifies the forwarding policy. For details, see <a href="#">Table 6-152</a> . |

**Table 6-152 l7policy** parameter description

| Parameter      | Man<br>dator<br>y | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|----------------|-------------------|---------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| tenant_id      | No                | String  | Specifies the ID of the project where the forwarding policy is used.<br>The value must be the same as the value of <b>project_id</b> in the token.<br>The value contains a maximum of 255 characters.                                                                                                                                                                                                                                                                                |
| name           | No                | String  | Specifies the forwarding policy name.<br>The value contains a maximum of 255 characters.                                                                                                                                                                                                                                                                                                                                                                                             |
| admin_state_up | No                | Boolean | Specifies the administrative status of the forwarding policy. **Table 6-153** rules parameter description

| Parameter      | Type    | Mandatory | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|----------------|---------|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| admin_state_up | Boolean | No        | Specifies the administrative status of the forwarding rule. The value can only be <b>true</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| type           | String  | Yes       | <p>Specifies the match type of a forwarding rule.</p> <p>The value can be:</p> <ul style="list-style-type: none"><li>● <b>HOST_NAME</b>: matches the domain name in the request.</li><li>● <b>PATH</b>: matches the path in the request.</li></ul> <p>The match type of forwarding rules in a forwarding policy must be unique.</p>                                                                                                                                                                                                                                                   |
| compare_type   | String  | Yes       | <p>Specifies the match mode. The options are as follows:</p> <p>When <b>type</b> is set to <b>HOST_NAME</b>, the value of this parameter can only be the following:</p> <ul style="list-style-type: none"><li>● <b>EQUAL_TO</b>: indicates exact match.</li></ul> <p>When <b>type</b> is set to <b>PATH</b>, the value of this parameter can be one of the following:</p> <ul style="list-style-type: none"><li>● <b>REGEX</b>: indicates regular expression match.</li><li>● <b>STARTS_WITH</b>: indicates prefix match.</li><li>● <b>EQUAL_TO</b>: indicates exact match.</li></ul> |

| Parameter | Type    | Mandatory | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|-----------|---------|-----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| invert    | Boolean | No        | Specifies whether reverse matching is supported.<br>The value can be <b>true</b> or <b>false</b> . The default value is <b>false</b> .<br>This parameter is reserved.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| key       | String  | No        | Specifies the key of the match content. The default value is <b>null</b> .<br>This parameter is reserved.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| value     | String  | Yes       | Specifies the value of the match content. The value cannot contain spaces. <ul style="list-style-type: none"><li>When <b>type</b> is set to <b>HOST_NAME</b>, the value can contain a maximum of 100 characters that contain only letters, digits, hyphens (-), and periods (.), and must start with a letter or digit.</li><li>When <b>type</b> is set to <b>PATH</b>, the value can contain a maximum of 128 characters. When <b>compare_type</b> is set to <b>STARTS_WITH</b> or <b>EQUAL_TO</b>, the value must start with a slash (/) and can contain only letters, digits, and special characters <code>_~!;@^-%#&amp;\$.*+?,=!:  \()[]{}</code></li></ul> |

## Response

**Table 6-154** Parameter description

| Parameter | Type                   | Description                                                                     |
|-----------|------------------------|---------------------------------------------------------------------------------|
| l7policy  | <b>L7policy</b> object | Specifies the forwarding policy. For details, see <a href="#">Table 6-155</a> . |

**Table 6-155** l7policy parameter description

| Parameter | Type   | Description                         |
|-----------|--------|-------------------------------------|
| id        | String | Specifies the forwarding policy ID. |

| Parameter            | Type                          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|----------------------|-------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| tenant_id            | String                        | Specifies the ID of the project where the forwarding policy is used.                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| project_id           | String                        | Specifies the ID of the project to which the forwarding policy belongs. This parameter has the same meaning as <b>tenant_id</b> .                                                                                                                                                                                                                                                                                                                                                                      |
| name                 | String                        | Specifies the forwarding policy name.                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| admin_state_up       | Boolean                       | Specifies the administrative status of the forwarding policy. The value can only be <b>true</b> .                                                                                                                                                                                                                                                                                                                                                                                                      |
| description          | String                        | Provides supplementary information about the forwarding policy.                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| listener_id          | String                        | Specifies the ID of the listener to which the forwarding policy is added.                                                                                                                                                                                                                                                                                                                                                                                                                              |
| action               | String                        | <p>Specifies whether requests are forwarded to another backend server group or redirected to an HTTPS listener.</p> <p>The value can be:</p> <ul style="list-style-type: none"><li>• <b>REDIRECT_TO_POOL</b>: Requests are forwarded to the backend server group specified by <b>redirect_pool_id</b>.</li><li>• <b>REDIRECT_TO_LISTENER</b>: Requests are redirected from the HTTP listener specified by <b>listener_id</b> to the HTTPS listener specified by <b>redirect_listener_id</b>.</li></ul> |
| redirect_pool_id     | String                        | Specifies the ID of the backend server group to which traffic is forwarded.                                                                                                                                                                                                                                                                                                                                                                                                                            |
| redirect_listener_id | String                        | Specifies the ID of the listener to which the traffic is redirected.                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| redirect_url         | String                        | Specifies the URL to which traffic is redirected. This parameter is reserved.                                                                                                                                                                                                                                                                                                                                                                                                                          |
| rules                | Array of <b>Rules</b> objects | Lists the forwarding rules of the forwarding policy. For details, see <a href="#">Table 6-156</a> .                                                                                                                                                                                                                                                                                                                                                                                                    |
| position             | Integer                       | <p>Specifies the forwarding priority. The value ranges from <b>1</b> to <b>100</b>. The default value is <b>100</b>.</p> <p>This parameter is reserved.</p>                                                                                                                                                                                                                                                                                                                                            |
| provisioning_status  | String                        | <p>This parameter is reserved, and its value can only be <b>ACTIVE</b>.</p> <p>It specifies the provisioning status of the forwarding policy.</p>                                                                                                                                                                                                                                                                                                                                                      |

**Table 6-156** rules parameter description

| Parameter | Type   | Description                                         |
|-----------|--------|-----------------------------------------------------|
| id        | String | Specifies the ID of the associated forwarding rule. |

## Example Request

- Example request 1: Adding a forwarding policy  
POST https://{Endpoint}/v2/573d73c9f90e48d0bddfa0eb202b25c2/elb/l7policies

```
{
 "l7policy": {
 "name": "niubiao_yaqing_api-2",
 "listener_id": "3e24a3ca-11e5-4aa3-abd4-61ba0a8a18f1",

```

## Status Code

For details, see [Status Codes](#).

## 6.6.2 Querying Forwarding Policies

### Function

This API is used to query all the forwarding policies. Filter query and pagination query are supported. Unless otherwise specified, exact match is applied.

### URI

GET /v2/{project\_id}/elb/l7policies

**Table 6-157** Path parameters

| Parameter  | Mandatory | Type   | Description               |
|------------|-----------|--------|---------------------------|
| project_id | Yes       | String | Specifies the project ID. |

**Table 6-158** Query parameters

| Parameter    | Mandatory | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                                       |
|--------------|-----------|---------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| marker       | No        | String  | Specifies the ID of the forwarding policy from which pagination query starts, that is, the ID of the last forwarding policy on the previous page.<br><br>This parameter must be used together with <b>limit</b> .                                                                                                                                                                                                                 |
| limit        | No        | Integer | Specifies the number of forwarding policies on each page. If this parameter is not set, all forwarding policies are queried by default.                                                                                                                                                                                                                                                                                           |
| page_reverse | No        | Boolean | Specifies the page direction. The value can be <b>true</b> or <b>false</b> , and the default value is <b>false</b> . The last page in the list requested with <b>page_reverse</b> set to <b>false</b> will not contain the "next" link, and the last page in the list requested with <b>page_reverse</b> set to <b>true</b> will not contain the "previous" link.<br><br>This parameter must be used together with <b>limit</b> . |

| Parameter            | Mandatory | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|----------------------|-----------|---------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| id                   | No        | String  | Specifies the forwarding policy ID.                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| tenant_id            | No        | String  | Specifies the ID of the project where the forwarding policy is used.<br>The value contains a maximum of 255 characters.                                                                                                                                                                                                                                                                                                                                                                     |
| project_id           | No        | String  | Specifies the ID of the project to which the forwarding policy belongs. This parameter has the same meaning as <b>tenant_id</b> .                                                                                                                                                                                                                                                                                                                                                           |
| name                 | No        | String  | Specifies the forwarding policy name.<br>The value contains a maximum of 255 characters.                                                                                                                                                                                                                                                                                                                                                                                                    |
| admin_state_up       | No        | Boolean | Specifies the administrative status of the forwarding policy.                                                                                                                                                                                                                                                                                                                                                                                                                               |
| description          | No        | String  | Provides supplementary information about the forwarding policy.<br>The value contains a maximum of 255 characters.                                                                                                                                                                                                                                                                                                                                                                          |
| listener_id          | No        | String  | Specifies the ID of the listener to which the forwarding policy is added.                                                                                                                                                                                                                                                                                                                                                                                                                   |
| action               | No        | String  | Specifies whether requests are forwarded to another backend server group or redirected to an HTTPS listener.<br>The value can be: <ul style="list-style-type: none"><li>• <b>REDIRECT_TO_POOL</b>: Requests are forwarded to the backend server group specified by <b>redirect_pool_id</b>.</li><li>• <b>REDIRECT_TO_LISTENER</b>: Requests are redirected from the HTTP listener specified by <b>listener_id</b> to the HTTPS listener specified by <b>redirect_listener_id</b>.</li></ul> |
| redirect_pool_id     | No        | String  | Specifies the ID of the backend server group to which traffic is forwarded.                                                                                                                                                                                                                                                                                                                                                                                                                 |
| redirect_listener_id | No        | String  | Specifies the ID of the listener to which the traffic is redirected.                                                                                                                                                                                                                                                                                                                                                                                                                        |

| Parameter             | Mandatory | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-----------------------|-----------|---------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| redirect_url          | No        | String  | Specifies the URL to which traffic is redirected.<br>This parameter is reserved.<br>The value contains a maximum of 255 characters.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| position              | No        | Integer | Specifies the forwarding priority.<br>The value ranges from <b>1</b> to <b>100</b> .<br>The default value is <b>100</b> .<br>This parameter is reserved.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| provisioning_status   | No        | String  | This parameter is reserved, and its value can only be <b>ACTIVE</b> .<br>It specifies the provisioning status of the forwarding policy.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| enterprise_project_id | No        | String  | Specifies the enterprise project ID. Enterprise projects are used for fine-grained authentication. <ul style="list-style-type: none"><li>• If <b>listener_id</b> is passed, the ID of the enterprise project to which the load balancer belongs is used for authentication.</li><li>• If <b>listener_id</b> is not passed, the ID of the enterprise project to which the forwarding policy belongs is used for authentication.</li><li>• If neither <b>listener_id</b> nor <b>enterprise_project_id</b> is passed, fine-grained authentication is performed. The <b>elb:loadbalancers:list</b> permissions must be assigned to the user group.</li></ul> |

None

## Response

**Table 6-159** Response parameters

| Parameter  | Type                                        | Description                                                                   |
|------------|---------------------------------------------|-------------------------------------------------------------------------------|
| l7policies | Array of <a href="#">L7policies</a> objects | Lists the forwarding policies. For details, see <a href="#">Table 6-160</a> . |

**Table 6-160** l7policy parameter description

| Parameter            | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|----------------------|---------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| id                   | String  | Specifies the forwarding policy ID.                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| tenant_id            | String  | Specifies the ID of the project where the forwarding policy is used.                                                                                                                                                                                                                                                                                                                                                                                                                        |
| project_id           | String  | Specifies the ID of the project to which the forwarding policy belongs. This parameter has the same meaning as <b>tenant_id</b> .                                                                                                                                                                                                                                                                                                                                                           |
| name                 | String  | Specifies the forwarding policy name.                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| admin_state_up       | Boolean | Specifies the administrative status of the forwarding policy. The value can only be <b>true</b> .                                                                                                                                                                                                                                                                                                                                                                                           |
| description          | String  | Provides supplementary information about the forwarding policy.                                                                                                                                                                                                                                                                                                                                                                                                                             |
| listener_id          | String  | Specifies the ID of the listener to which the forwarding policy is added.                                                                                                                                                                                                                                                                                                                                                                                                                   |
| action               | String  | Specifies whether requests are forwarded to another backend server group or redirected to an HTTPS listener.<br>The value can be: <ul style="list-style-type: none"><li>• <b>REDIRECT_TO_POOL</b>: Requests are forwarded to the backend server group specified by <b>redirect_pool_id</b>.</li><li>• <b>REDIRECT_TO_LISTENER</b>: Requests are redirected from the HTTP listener specified by <b>listener_id</b> to the HTTPS listener specified by <b>redirect_listener_id</b>.</li></ul> |
| redirect_pool_id     | String  | Specifies the ID of the backend server group to which traffic is forwarded.                                                                                                                                                                                                                                                                                                                                                                                                                 |
| redirect_listener_id | String  | Specifies the ID of the listener to which the traffic is redirected.                                                                                                                                                                                                                                                                                                                                                                                                                        |

| Parameter           | Type                                   | Description                                                                                                                                     |
|---------------------|----------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------|
| redirect_url        | String                                 | Specifies the URL to which traffic is redirected. This parameter is reserved.                                                                   |
| rules               | Array of <a href="#">Rules</a> objects | Lists the forwarding rules of the forwarding policy. For details, see <a href="#">Table 6-156</a> .                                             |
| position            | Integer                                | Specifies the forwarding priority. The value ranges from <b>1</b> to <b>100</b> . The default value is <b>100</b> . This parameter is reserved. |
| provisioning_status | String                                 | This parameter is reserved, and its value can only be <b>ACTIVE</b> . It specifies the provisioning status of the forwarding policy.            |

**Table 6-161** rules parameter description

| Parameter | Type   | Description                                         |
|-----------|--------|-----------------------------------------------------|
| id        | String | Specifies the ID of the associated forwarding rule. |

## Example Request

- Example request 1: Querying all forwarding policies  
GET https://{Endpoint}/v2/a31d2bdcf7604c0faaddb058e1e08819/elb/l7policies
- Example request 2: Querying forwarding policies through which requests are forwarded to the backend server group  
GET https://{Endpoint}/v2/a31d2bdcf7604c0faaddb058e1e08819/elb/l7policies?action=REDIRECT\_TO\_POOL

## Status Code

For details, see [Status Codes](#).

## 6.6.3 Querying Details of a Forwarding Policy

### Function

This API is used to query details about a forwarding policy.

### URI

GET /v2/{project\_id}/elb/l7policies/{l7policy\_id}

**Table 6-162** Parameter description

| Parameter   | Mandatory | Type   | Description                         |
|-------------|-----------|--------|-------------------------------------|
| project_id  | Yes       | String | Specifies the project ID.           |
| l7policy_id | Yes       | String | Specifies the forwarding policy ID. |

### Request

None

### Response

**Table 6-163** Parameter description

| Parameter | Type                            | Description                                                                     |
|-----------|---------------------------------|---------------------------------------------------------------------------------|
| l7policy  | <a href="#">L7policy</a> object | Specifies the forwarding policy. For details, see <a href="#">Table 6-164</a> . |

**Table 6-164 l7policy** parameter description

| Parameter            | Type                          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|----------------------|-------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| id                   | String                        | Specifies the forwarding policy ID.                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| tenant_id            | String                        | Specifies the ID of the project where the forwarding policy is used.                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| project_id           | String                        | Specifies the ID of the project to which the forwarding policy belongs. This parameter has the same meaning as <b>tenant_id</b> .                                                                                                                                                                                                                                                                                                                                                                      |
| name                 | String                        | Specifies the forwarding policy name.                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| admin_state_up       | Boolean                       | Specifies the administrative status of the forwarding policy. The value can only be <b>true</b> .                                                                                                                                                                                                                                                                                                                                                                                                      |
| description          | String                        | Provides supplementary information about the forwarding policy.                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| listener_id          | String                        | Specifies the ID of the listener to which the forwarding policy is added.                                                                                                                                                                                                                                                                                                                                                                                                                              |
| action               | String                        | <p>Specifies whether requests are forwarded to another backend server group or redirected to an HTTPS listener.</p> <p>The value can be:</p> <ul style="list-style-type: none"><li>• <b>REDIRECT_TO_POOL</b>: Requests are forwarded to the backend server group specified by <b>redirect_pool_id</b>.</li><li>• <b>REDIRECT_TO_LISTENER</b>: Requests are redirected from the HTTP listener specified by <b>listener_id</b> to the HTTPS listener specified by <b>redirect_listener_id</b>.</li></ul> |
| redirect_pool_id     | String                        | Specifies the ID of the backend server group to which traffic is forwarded.                                                                                                                                                                                                                                                                                                                                                                                                                            |
| redirect_listener_id | String                        | Specifies the ID of the listener to which the traffic is redirected.                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| redirect_url         | String                        | Specifies the URL to which traffic is redirected. This parameter is reserved.                                                                                                                                                                                                                                                                                                                                                                                                                          |
| rules                | Array of <b>Rules</b> objects | Lists the forwarding rules of the forwarding policy. For details, see <a href="#">Table 6-156</a> .                                                                                                                                                                                                                                                                                                                                                                                                    |
| position             | Integer                       | <p>Specifies the forwarding priority. The value ranges from <b>1</b> to <b>100</b>. The default value is <b>100</b>.</p> <p>This parameter is reserved.</p>                                                                                                                                                                                                                                                                                                                                            |

| Parameter           | Type   | Description                                                                                                                             |
|---------------------|--------|-----------------------------------------------------------------------------------------------------------------------------------------|
| provisioning_status | String | This parameter is reserved, and its value can only be <b>ACTIVE</b> .<br>It specifies the provisioning status of the forwarding policy. |

**Table 6-165** rules parameter description

| Parameter | Type   | Description                                         |
|-----------|--------|-----------------------------------------------------|
| id        | String | Specifies the ID of the associated forwarding rule. |

## Example Request

- Example request: Querying details of a forwarding policy  
GET https://{Endpoint}/v2/a31d2bdcf7604c0faaddb058e1e08819/elb/l7policies/5ae0e1e7-5f0f-47a1-b39f-5d4c428a1586

## Example Response

- Example response 1

## Status Code

For details, see [Status Codes](#).

## 6.6.4 Updating a Forwarding Policy

### Function

This API is used to update a forwarding policy.

### URI

PUT /v2/{project\_id}/elb/l7policies/{l7policy\_id}

**Table 6-166** Parameter description

| Parameter   | Mandatory | Type   | Description                         |
|-------------|-----------|--------|-------------------------------------|
| project_id  | Yes       | String | Specifies the project ID.           |
| l7policy_id | Yes       | String | Specifies the forwarding policy ID. |

### Request

**Table 6-167** Parameter description

| Parameter | Mandatory | Type                   | Description                                                                     |
|-----------|-----------|------------------------|---------------------------------------------------------------------------------|
| l7policy  | Yes       | <b>L7policy</b> object | Specifies the forwarding policy. For details, see <a href="#">Table 6-168</a> . |

**Table 6-168** l7policy parameter description

| Parameter   | Mandatory | Type   | Description                                                                                                        |
|-------------|-----------|--------|--------------------------------------------------------------------------------------------------------------------|
| name        | No        | String | Specifies the forwarding policy name.<br>The value contains a maximum of 255 characters.                           |
| description | No        | String | Provides supplementary information about the forwarding policy.<br>The value contains a maximum of 255 characters. |

| Parameter            | Mandatory | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|----------------------|-----------|---------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| redirect_pool_id     | No        | String  | <p>Specifies the ID of the backend server group to which traffic is forwarded. ## Response

**Table 6-169** Parameter description

| Parameter | Type                   | Description                                                                     |
|-----------|------------------------|---------------------------------------------------------------------------------|
| l7policy  | <b>L7policy</b> object | Specifies the forwarding policy. For details, see <a href="#">Table 6-170</a> . |

**Table 6-170 l7policy** parameter description

| Parameter            | Type                          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|----------------------|-------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| id                   | String                        | Specifies the forwarding policy ID.                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| tenant_id            | String                        | Specifies the ID of the project where the forwarding policy is used.                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| project_id           | String                        | Specifies the ID of the project to which the forwarding policy belongs. This parameter has the same meaning as <b>tenant_id</b> .                                                                                                                                                                                                                                                                                                                                                                      |
| name                 | String                        | Specifies the forwarding policy name.                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| admin_state_up       | Boolean                       | Specifies the administrative status of the forwarding policy. The value can only be <b>true</b> .                                                                                                                                                                                                                                                                                                                                                                                                      |
| description          | String                        | Provides supplementary information about the forwarding policy.                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| listener_id          | String                        | Specifies the ID of the listener to which the forwarding policy is added.                                                                                                                                                                                                                                                                                                                                                                                                                              |
| action               | String                        | <p>Specifies whether requests are forwarded to another backend server group or redirected to an HTTPS listener.</p> <p>The value can be:</p> <ul style="list-style-type: none"><li>• <b>REDIRECT_TO_POOL</b>: Requests are forwarded to the backend server group specified by <b>redirect_pool_id</b>.</li><li>• <b>REDIRECT_TO_LISTENER</b>: Requests are redirected from the HTTP listener specified by <b>listener_id</b> to the HTTPS listener specified by <b>redirect_listener_id</b>.</li></ul> |
| redirect_pool_id     | String                        | Specifies the ID of the backend server group to which traffic is forwarded.                                                                                                                                                                                                                                                                                                                                                                                                                            |
| redirect_listener_id | String                        | Specifies the ID of the listener to which the traffic is redirected.                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| redirect_url         | String                        | Specifies the URL to which traffic is redirected. This parameter is reserved.                                                                                                                                                                                                                                                                                                                                                                                                                          |
| rules                | Array of <b>Rules</b> objects | Lists the forwarding rules of the forwarding policy. For details, see <a href="#">Table 6-156</a> .                                                                                                                                                                                                                                                                                                                                                                                                    |
| position             | Integer                       | <p>Specifies the forwarding priority. The value ranges from <b>1</b> to <b>100</b>. The default value is <b>100</b>.</p> <p>This parameter is reserved.</p>                                                                                                                                                                                                                                                                                                                                            |

| Parameter           | Type   | Description                                                                                                                             |
|---------------------|--------|-----------------------------------------------------------------------------------------------------------------------------------------|
| provisioning_status | String | This parameter is reserved, and its value can only be <b>ACTIVE</b> .<br>It specifies the provisioning status of the forwarding policy. |

## 6.6.5 Deleting a Forwarding Policy

### Function

This API is used to delete a forwarding policy.

### URI

DELETE /v2/{project\_id}/elb/l7policies/{l7policy\_id}

**Table 6-172** Parameter description

| Parameter   | Mandator<br>y | Type   | Description                         |
|-------------|---------------|--------|-------------------------------------|
| project_id  | Yes           | String | Specifies the project ID.           |
| l7policy_id | Yes           | String | Specifies the forwarding policy ID. |

### Request

None

### Response

None

### Example Request

- Example request: Deleting a forwarding policy  
DELETE https://{Endpoint}/v2/a31d2bdcf7604c0faaddb058e1e08819/elb/l7policies/

None

## Status Code

For details, see [Status Codes](#).

## 6.7 Forwarding Rule

## 6.7.1 Adding a Forwarding Rule

### Function

This API is used to add a forwarding rule. After you add a forwarding rule, the load balancer matches the domain name and path in the request and distributes the traffic to the backend server group specified by **redirect\_pool\_id** of the associated forwarding policy.

### Constraints

The match type of forwarding rules in a forwarding policy must be unique.

### URI

POST /v2/{project\_id}/elb/l7policies/{l7policy\_id}/rules

**Table 6-173** Parameter description

| Parameter   | Mandator<br>y | Type       | Description                         |
|-------------|---------------|------------|-------------------------------------|
| project_id  | Yes           | Strin<br>g | Specifies the project ID.           |
| l7policy_id | Yes           | Strin<br>g | Specifies the forwarding policy ID. |

### Request

**Table 6-174** Parameter description

| Parameter | Mandat<br>ory | Type                  | Description                                                                   |
|-----------|---------------|-----------------------|-------------------------------------------------------------------------------|
| rule      | Yes           | <b>Rule</b><br>object | Specifies the forwarding rule. For details, see <a href="#">Table 6-175</a> . |

**Table 6-175** rule parameter description

| Parameter      | Mandatory | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|----------------|-----------|---------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| tenant_id      | No        | String  | Specifies the ID of the project where the forwarding rule is used.<br>The value must be the same as the value of <b>project_id</b> in the token.<br>The value contains a maximum of 255 characters.                                                                                                                                                                                                                                                                                                                                                                   |
| admin_state_up | No        | Boolean | Specifies the administrative status of the forwarding rule. The value can only be <b>true</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| type           | Yes       | String  | Specifies the match type of a forwarding rule.<br>The value can be: <ul style="list-style-type: none"><li>• <b>HOST_NAME</b>: matches the domain name in the request.</li><li>• <b>PATH</b>: matches the path in the request.</li></ul> The match type of forwarding rules in a forwarding policy must be unique.                                                                                                                                                                                                                                                     |
| compare_type   | Yes       | String  | Specifies the match mode. The options are as follows:<br>When <b>type</b> is set to <b>HOST_NAME</b> , the value of this parameter can only be the following: <ul style="list-style-type: none"><li>• <b>EQUAL_TO</b>: indicates exact match.</li></ul> When <b>type</b> is set to <b>PATH</b> , the value of this parameter can be one of the following: <ul style="list-style-type: none"><li>• <b>REGEX</b>: indicates regular expression match.</li><li>• <b>STARTS_WITH</b>: indicates prefix match.</li><li>• <b>EQUAL_TO</b>: indicates exact match.</li></ul> |

| tenant_id      | String  | Specifies the ID of the project where the forwarding rule is used.<br>The value contains a maximum of 255 characters.                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| project_id     | String  | Specifies the ID of the project to which the forwarding rule belongs. This parameter has the same meaning as <b>tenant_id</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| admin_state_up | Boolean | Specifies the administrative status of the forwarding rule. The value can only be <b>true</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| type           | String  | Specifies the match type of a forwarding rule.<br>The value can be: <ul style="list-style-type: none"><li>• <b>HOST_NAME</b>: matches the domain name in the request.</li><li>• <b>PATH</b>: matches the path in the request.</li></ul>                                                                                                                                                                                                                                                                                                                               |
| compare_type   | String  | Specifies the match mode. The options are as follows:<br>When <b>type</b> is set to <b>HOST_NAME</b> , the value of this parameter can only be the following: <ul style="list-style-type: none"><li>• <b>EQUAL_TO</b>: indicates exact match.</li></ul> When <b>type</b> is set to <b>PATH</b> , the value of this parameter can be one of the following: <ul style="list-style-type: none"><li>• <b>REGEX</b>: indicates regular expression match.</li><li>• <b>STARTS_WITH</b>: indicates prefix match.</li><li>• <b>EQUAL_TO</b>: indicates exact match.</li></ul> |
| invert         | Boolean | Specifies whether reverse matching is supported.<br>The value can be <b>true</b> or <b>false</b> . The default value is <b>false</b> .<br>This parameter is reserved.                                                                                                                                                                                                                                                                                                                                                                                                 |
| key            | String  | Specifies the key of the match content. The default value is <b>null</b> .<br>This parameter is reserved.<br>The value contains a maximum of 255 characters.                                                                                                                                                                                                                                                                                                                                                                                                          |

| Parameter           | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|---------------------|--------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| value               | String | <p>Specifies the value of the match content. The value contains a maximum of 128 characters.</p> <ul style="list-style-type: none"><li>When <b>type</b> is set to <b>HOST_NAME</b>, the value can contain a maximum of 100 characters that contain only letters, digits, hyphens (-), and periods (.), and must start with a letter or digit.</li><li>When <b>type</b> is set to <b>PATH</b>, the value can contain a maximum of 128 characters. When <b>compare_type</b> is set to <b>STARTS_WITH</b> or <b>EQUAL_TO</b>, the value must start with a slash (/) and can contain only letters, digits, and special characters <code>_~';@^-%#&amp;\$.*+?,:!=  \()[]{}</code></li></ul> |
| provisioning_status | String | <p>This parameter is reserved, and its value can only be <b>ACTIVE</b>.</p> <p>It specifies the provisioning status of the forwarding rule.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

## Example Request

 "admin_state_up": true,
 "provisioning_status": "ACTIVE",
 "tenant_id": "a31d2bdcf7604c0faaddb058e1e08819",
 "project_id": "a31d2bdcf7604c0faaddb058e1e08819",
 "invert": false,
 "value": "/bbb.html",
 "key": null,
 "type": "PATH",
 "id": "c6f457b8-bf6f-45d7-be5c-a3226945b7b1"
 }
}
```

## Status Code

For details, see [Status Codes](#).

## 6.7.2 Querying Forwarding Rules

### Function

This API is used to query forwarding rules. Filter query and pagination query are supported. Unless otherwise specified, exact match is applied.

### Constraints

Parameters **marker**, **limit**, and **page\_reverse** are used for pagination query. Parameters **marker** and **page\_reverse** take effect only when they are used together with parameter **limit**.

### URI

GET /v2/{project\_id}/elb/l7policies/{l7policy\_id}/rules

**Table 6-178** Path parameters

| Parameter   | Mandatory | Type   | Description                         |
|-------------|-----------|--------|-------------------------------------|
| project_id  | Yes       | String | Specifies the project ID.           |
| l7policy_id | Yes       | String | Specifies the forwarding policy ID. |

**Table 6-179** Query parameters

| Parameter | Mandatory | Type    | Description                                                                                                                                                                                               |
|-----------|-----------|---------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| marker    | No        | String  | Specifies the ID of the forwarding rule from which pagination query starts, that is, the ID of the last forwarding rule on the previous page.<br>This parameter must be used together with <b>limit</b> . |
| limit     | No        | Integer | Specifies the number of forwarding rules on each page. If this parameter is not set, all forwarding rules are queried by default.                                                                         |

| Parameter      | Mandatory | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                                       |
|----------------|-----------|---------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| page_reverse   | No        | Boolean | Specifies the page direction. The value can be <b>true</b> or <b>false</b> , and the default value is <b>false</b> . The last page in the list requested with <b>page_reverse</b> set to <b>false</b> will not contain the "next" link, and the last page in the list requested with <b>page_reverse</b> set to <b>true</b> will not contain the "previous" link.<br><br>This parameter must be used together with <b>limit</b> . |
| id             | No        | String  | Specifies the forwarding rule ID.                                                                                                                                                                                                                                                                                                                                                                                                 |
| tenant_id      | No        | String  | Specifies the ID of the project where the forwarding rule is used.<br><br>The value contains a maximum of 255 characters.                                                                                                                                                                                                                                                                                                         |
| project_id     | No        | String  | Specifies the ID of the project to which the forwarding rule belongs. This parameter has the same meaning as <b>tenant_id</b> .                                                                                                                                                                                                                                                                                                   |
| admin_state_up | No        | Boolean | Specifies the administrative status of the forwarding rule.                                                                                                                                                                                                                                                                                                                                                                       |
| type           | No        | String  | Specifies the match type of a forwarding rule.<br><br>The value can be: <ul style="list-style-type: none"><li>• <b>HOST_NAME</b>: matches the domain name in the request.</li><li>• <b>PATH</b>: matches the path in the request.</li></ul><br>The match type of forwarding rules in a forwarding policy must be unique.                                                                                                          |

## 6.7.3 Querying Details of a Forwarding Rule

### Function

This API is used to query details about a forwarding rule.

### URI

GET /v2/{project\_id}/elb/l7policies/{l7policy\_id}/rules/{l7rule\_id}

**Table 6-182** Parameter description

| Parameter  | Mandator<br>y | Type       | Description               |
|------------|---------------|------------|---------------------------|
| project_id | Yes           | Strin<br>g | Specifies the project ID. |

| Parameter   | Mandatory | Type   | Description                         |
|-------------|-----------|--------|-------------------------------------|
| l7policy_id | Yes       | String | Specifies the forwarding policy ID. |
| l7rule_id   | Yes       | String | Specifies the forwarding rule ID.   |

## Response

**Table 6-183** Parameter description

| Parameter | Type                        | Description                                                                   |
|-----------|-----------------------------|-------------------------------------------------------------------------------|
| rule      | <a href="#">Rule</a> object | Specifies the forwarding rule. For details, see <a href="#">Table 6-184</a> . |

**Table 6-184** rule parameter description

| Parameter      | Type    | Description                                                                                                                                                                                                                             |
|----------------|---------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| id             | String  | Specifies the forwarding rule ID.                                                                                                                                                                                                       |
| tenant_id      | String  | Specifies the ID of the project where the forwarding rule is used.<br>The value contains a maximum of 255 characters.                                                                                                                   |
| project_id     | String  | Specifies the ID of the project to which the forwarding rule belongs. This parameter has the same meaning as <b>tenant_id</b> .                                                                                                         |
| admin_state_up | Boolean | Specifies the administrative status of the forwarding rule. The value can only be <b>true</b> .                                                                                                                                         |
| type           | String  | Specifies the match type of a forwarding rule.<br>The value can be: <ul style="list-style-type: none"><li>• <b>HOST_NAME</b>: matches the domain name in the request.</li><li>• <b>PATH</b>: matches the path in the request.</li></ul> |

| Parameter           | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|---------------------|---------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| compare_type        | String  | <p>Specifies the match mode. The options are as follows:</p> <p>When <b>type</b> is set to <b>HOST_NAME</b>, the value of this parameter can only be the following:</p> <ul style="list-style-type: none"><li>• <b>EQUAL_TO</b>: indicates exact match.</li></ul> <p>When <b>type</b> is set to <b>PATH</b>, the value of this parameter can be one of the following:</p> <ul style="list-style-type: none"><li>• <b>REGEX</b>: indicates regular expression match.</li><li>• <b>STARTS_WITH</b>: indicates prefix match.</li><li>• <b>EQUAL_TO</b>: indicates exact match.</li></ul>                                                                                                             |
| invert              | Boolean | <p>Specifies whether reverse matching is supported.</p> <p>The value can be <b>true</b> or <b>false</b>. The default value is <b>false</b>.</p> <p>This parameter is reserved.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| key                 | String  | <p>Specifies the key of the match content. The default value is <b>null</b>.</p> <p>This parameter is reserved.</p> <p>The value contains a maximum of 255 characters.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| value               | String  | <p>Specifies the value of the match content.</p> <p>The value contains a maximum of 128 characters.</p> <ul style="list-style-type: none"><li>• When <b>type</b> is set to <b>HOST_NAME</b>, the value can contain a maximum of 100 characters that contain only letters, digits, hyphens (-), and periods (.), and must start with a letter or digit.</li><li>• When <b>type</b> is set to <b>PATH</b>, the value can contain a maximum of 128 characters. When <b>compare_type</b> is set to <b>STARTS_WITH</b> or <b>EQUAL_TO</b>, the value must start with a slash (/) and can contain only letters, digits, and special characters <code>_~';@^-%#&amp;\$.*+?,=!:  \()[]{}</code></li></ul> |
| provisioning_status | String  | <p>This parameter is reserved, and its value can only be <b>ACTIVE</b>.</p> <p>It specifies the provisioning status of the forwarding rule.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

### Example Request

- Example request: Querying details of a forwarding rule  
GET https://{Endpoint}/v2/a31d2bdcf7604c0faaddb058e1e08819/elb/l7policies/5ae0e1e7-5f0f-47a1-b39f-5d4c428a1586/rules/67d8a8fa-b0dd-4bd4-a85b-671db19b2ef3

### Example Response

- Example response 1

```
{

 }
}
```

### Status Code

For details, see [Status Codes](#).

## 6.7.4 Updating a Forwarding Rule

### Function

This API is used to update a forwarding rule. You can change the mode that how traffic is distributed by updating the forwarding rule.

### URI

PUT /v2/{project\_id}/elb/l7policies/{l7policy\_id}/rules/{l7rule\_id}

**Table 6-185** Parameter description

| Parameter   | Mandator<br>y | Type       | Description                         |
|-------------|---------------|------------|-------------------------------------|
| project_id  | Yes           | Strin<br>g | Specifies the project ID.           |
| l7policy_id | Yes           | Strin<br>g | Specifies the forwarding policy ID. |
| l7rule_id   | Yes           | Strin<br>g | Specifies the forwarding rule ID.   |

## 6.7.5 Deleting a Forwarding Rule

### Function

This API is used to delete a forwarding rule.

### URI

DELETE /v2/{project\_id}/elb/l7policies/{l7policy\_id}/rules/{l7rule\_id}

**Table 6-190** Parameter description

| Parameter   | Mandatory | Type   | Description                         |
|-------------|-----------|--------|-------------------------------------|
| project_id  | Yes       | String | Specifies the project ID.           |
| l7policy_id | Yes       | String | Specifies the forwarding policy ID. |
| l7rule_id   | Yes       | String | Specifies the forwarding rule ID.   |

## Request

None

## Response

# 6.8 Whitelist

## 6.8.1 Adding a Whitelist

### Function

This API is used to add a whitelist to control access to a specific listener. After a whitelist is added, only IP addresses in the whitelist can access the listener.

### URI

POST /v2/{project\_id}/elb/whitelists

**Table 6-191** Parameter description

| Parameter  | Mandatory | Type   | Description               |
|------------|-----------|--------|---------------------------|
| project_id | Yes       | String | Specifies the project ID. |

## Request

**Table 6-192** Parameter description

6.8.2 Querying Details of a Whitelist

Function

This API is used to query details about a whitelist using its ID.

URI

GET /v2/{project\_id}/elb/whitelists/{whitelist\_id}

Table 6-196 Parameter description

| Parameter    | Mandatory | Type   | Description                 |
|--------------|-----------|--------|-----------------------------|
| project_id   | Yes       | String | Specifies the project ID.   |
| whitelist_id | Yes       | String | Specifies the whitelist ID. |

Request

None

Response

Table 6-197 Parameter description

| Parameter | Type                             | Description                                                             |
|-----------|----------------------------------|-------------------------------------------------------------------------|
| whitelist | <a href="#">Whitelist</a> object | Specifies the whitelist. For details, see <a href="#">Table 6-198</a> . |

Table 6-198 whitelist parameter description

| Parameter | Type   | Description                                                                                                     |
|-----------|--------|-----------------------------------------------------------------------------------------------------------------|
| id        | String | Specifies the whitelist ID.                                                                                     |
| tenant_id | String | Specifies the ID of the project where the whitelist is used.<br>The value contains a maximum of 255 characters. |

| Parameter        | Type    | Description                                                                                                                           |
|------------------|---------|---------------------------------------------------------------------------------------------------------------------------------------|
| listener_id      | String  | Specifies the ID of the listener to which the whitelist is added.                                                                     |
| enable_whitelist | Boolean | Specifies whether to enable access control.<br><b>true</b> : Access control is enabled.<br><b>false</b> : Access control is disabled. |
| whitelist        | String  | Specifies the IP addresses in the whitelist.                                                                                          |

## 6.8.3 Querying Whitelists

### Function

This API is used to query the whitelists. Filter query and pagination query are supported. Unless otherwise specified, exact match is applied.

### Constraints

Parameters **marker**, **limit**, and **page\_reverse** are used for pagination query. Parameters **marker** and **page\_reverse** take effect only when they are used together with parameter **limit**.

### URI

GET /v2/{project\_id}/elb/whitelists

**Table 6-199** Path parameters

| Parameter  | Mandatory | Type   | Description               |
|------------|-----------|--------|---------------------------|
| project_id | Yes       | String | Specifies the project ID. |

**Table 6-200** Query parameters

| Parameter        | Mandatory | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                                   |
|------------------|-----------|---------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| marker           | No        | String  | Specifies the ID of the whitelist from which pagination query starts, that is, the ID of the last whitelist on the previous page.<br>This parameter must be used together with <b>limit</b> .                                                                                                                                                                                                                                 |
| limit            | No        | Integer | Specifies the number of whitelists on each page. If this parameter is not set, all whitelists are queried by default.                                                                                                                                                                                                                                                                                                         |
| page_reverse     | No        | Boolean | Specifies the page direction. The value can be <b>true</b> or <b>false</b> , and the default value is <b>false</b> . The last page in the list requested with <b>page_reverse</b> set to <b>false</b> will not contain the "next" link, and the last page in the list requested with <b>page_reverse</b> set to <b>true</b> will not contain the "previous" link.<br>This parameter must be used together with <b>limit</b> . |
| id               | No        | String  | Specifies the whitelist ID.                                                                                                                                                                                                                                                                                                                                                                                                   |
| tenant_id        | No        | String  | Specifies the ID of the project where the whitelist is used.<br>The value contains a maximum of 255 characters.                                                                                                                                                                                                                                                                                                               |
| listener_id      | No        | String  | Specifies the ID of the listener to which the whitelist is added.                                                                                                                                                                                                                                                                                                                                                             |
| enable_whitelist | No        | Boolean | Specifies whether to enable access control.<br><b>true</b> : Access control is enabled.<br><b>false</b> : Access control is disabled.                                                                                                                                                                                                                                                                                         |

| Parameter | Mandatory | Type   | Description                                  |
|-----------|-----------|--------|----------------------------------------------|
| whitelist | No        | String | Specifies the IP addresses in the whitelist. |

## 6.8.4 Updating a Whitelist

### Function

This API is used to update a whitelist. You can enable or disable the whitelist function or change IP addresses in the whitelist. If you change IP addresses in the whitelist, it will be deleted, and a new one is generated.

### URI

```
PUT /v2/{project_id}/elb/whitelists/{whitelist_id}
```

**Table 6-203** Parameter description

| Parameter    | Mandatory | Type   | Description                 |
|--------------|-----------|--------|-----------------------------|
| project_id   | Yes       | String | Specifies the project ID.   |
| whitelist_id | Yes       | String | Specifies the whitelist ID. |

## Request

**Table 6-204** Parameter description

| Parameter | Mandatory | Type                             | Description                                                             |
|-----------|-----------|----------------------------------|-------------------------------------------------------------------------|
| whitelist | Yes       | <a href="#">Whitelist</a> object | Specifies the whitelist. For details, see <a href="#">Table 6-205</a> . |

**Table 6-205** whitelist parameter description

| Parameter        | Mandatory | Type    | Description                                                                                                                                                                                                                                                                                 |
|------------------|-----------|---------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| enable_whitelist | No        | Boolean | Specifies whether to enable access control.<br><b>true</b> : Access control is enabled.<br><b>false</b> : Access control is disabled.<br>The default value is <b>true</b> .                                                                                                                 |
| whitelist        | No        | String  | Specifies the IP addresses in the whitelist. Use commas (,) to separate multiple IP addresses.<br>You can specify an IP address, for example, 192.168.11.1.<br>You can also specify an IP address range, for example, 192.168.0.1/24.<br>The default value is an empty string, that is, "". |

## Response

6.8.5 Deleting a Whitelist

Function

This API is used to delete a specific whitelist.

URI

DELETE /v2/{project\_id}/elb/whitelists/{whitelist\_id}

Table 6-208 Parameter description

| Parameter    | Mandator<br>y | Type       | Description                 |
|--------------|---------------|------------|-----------------------------|
| project_id   | Yes           | Strin<br>g | Specifies the project ID.   |
| whitelist_id | Yes           | Strin<br>g | Specifies the whitelist ID. |

Request

None

Response

None

## 6.9 Certificate

### 6.9.1 Creating a Certificate

#### Function

This API is used to create a certificate. After a certificate is bound to a listener, the load balancer authenticates the client using this certificate, and backend servers can establish secure and reliable HTTP connections with the client.

#### URI

POST /v2/{project\_id}/elb/certificates

**Table 6-209** Path parameters

| Parameter  | Mandatory | Type   | Description               |
|------------|-----------|--------|---------------------------|
| project_id | Yes       | String | Specifies the project ID. |

#### Request

**Table 6-210** Query parameters

| Parameter      | Mandatory | Type    | Description                                                                                                                   |
|----------------|-----------|---------|-------------------------------------------------------------------------------------------------------------------------------|
| admin_state_up | No        | Boolean | Specifies the administrative status of the certificate.<br>This parameter is reserved, and the default value is <b>true</b> . |
| name           | No        | String  | Specifies the certificate name.<br>The value contains a maximum of 255 characters.                                            |
| description    | No        | String  | Provides supplementary information about the certificate.<br>The value contains a maximum of 255 characters.                  |

| Parameter   | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|-------------|-----------|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| type        | No        | String | <p>Specifies the certificate type. The default value is <b>server</b>.</p> <p>The value can be:</p> <ul style="list-style-type: none"><li>• <b>server</b>: indicates the server certificate.</li><li>• <b>client</b>: indicates the CA certificate.</li></ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| domain      | No        | String | <p>Specifies the domain name associated with the server certificate. The default value is <b>null</b>.</p> <p>The value contains a maximum of 100 characters.</p> <p>Value range:</p> <ul style="list-style-type: none"><li>• A common domain name contains 0 to 100 characters and consists of several labels separated by periods (.). Each label can contain a maximum of 63 characters, including letters, digits, and hyphens (-), and must start and end with a letter or digit.</li><li>• In addition to the requirements for common domain names, a wildcard domain name can start with an asterisk (*).</li></ul> <p><b>NOTE</b><br/>This parameter takes effect only when <b>type</b> is set to <b>server</b>.</p> |
| private_key | No        | String | <p>Specifies the private key of the server certificate. The value must be PEM encoded.</p> <ul style="list-style-type: none"><li>• This parameter will be ignored if <b>type</b> is set to <b>client</b>. A CA server can still be created and used normally. This parameter will be left blank even if you enter a private key that is not PEM encoded.</li><li>• This parameter is mandatory only when <b>type</b> is set to <b>server</b>. If you enter an invalid private key, an error is returned.</li></ul>                                                                                                                                                                                                           |

| Parameter             | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|-----------------------|-----------|--------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| certificate           | Yes       | String | <p>Specifies the public key of the server certificate or CA certificate used to authenticate the client. The value of parameter <b>type</b> determines whether a public key or CA certificate is required.</p> <p>Both types of certificates are in PEM format.</p>                                                                                                                                                                                                                  |
| enterprise_project_id | No        | String | <p>Specifies the enterprise project ID. When creating a load balancer, you can assign an enterprise project to the load balancer.</p> <p>The value is character string <b>0</b> or a UUID with hyphens (-). Value <b>0</b> indicates the default enterprise project.</p> <p>The default value is <b>0</b>.</p> <p><b>NOTE</b><br/>For more information about enterprise projects and how to obtain enterprise project IDs, see <a href="#">Enterprise Management User Guide</a>.</p> |
| source                | No        | String | <p>Specifies the source of the certificate. The default value is <b>null</b>.</p> <p>Constraints: If <b>scm_certificate_id</b> is not left blank and <b>source</b> is not specified, the default value is <b>scm</b>.</p>                                                                                                                                                                                                                                                            |
| protection_status     | No        | String | <p>Specifies the protection status.</p> <p>The value can be:</p> <ul style="list-style-type: none"><li>• <b>nonProtection</b>: The load balancer is not protected.</li><li>• <b>consoleProtection</b>: Modification protection is enabled to avoid that resources are modified by accident on the console.</li></ul> <p>Default value: <b>nonProtection</b></p>                                                                                                                      |
| protection_reason     | No        | String | <p>Specifies why the modification protection is enabled.</p> <p><b>NOTE</b><br/>This parameter is valid only when <b>protection_status</b> is set to <b>consoleProtection</b>.</p>                                                                                                                                                                                                                                                                                                   |

## Response

**Table 6-211** Parameter description

| Parameter      | Type    | Description                                                                                                                                                                                                                                           |
|----------------|---------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| id             | String  | Specifies the certificate ID.                                                                                                                                                                                                                         |
| tenant_id      | String  | Specifies the ID of the project where the certificate is used.<br>The value contains a maximum of 255 characters.                                                                                                                                     |
| admin_state_up | Boolean | Specifies the administrative status of the certificate.<br>This parameter is reserved. The value can be <b>true</b> or <b>false</b> . <ul style="list-style-type: none"><li>• <b>true</b>: Enabled</li><li>• <b>false</b>: Disabled</li></ul>         |
| name           | String  | Specifies the certificate name.<br>The value contains a maximum of 255 characters.                                                                                                                                                                    |
| description    | String  | Provides supplementary information about the certificate.<br>The value contains a maximum of 255 characters.                                                                                                                                          |
| type           | String  | Specifies the certificate type.<br>The value can be: <ul style="list-style-type: none"><li>• <b>server</b>: indicates the server certificate.</li><li>• <b>client</b>: indicates the CA certificate.</li></ul>                                        |
| domain         | String  | Specifies the domain name associated with the server certificate.<br>The value contains a maximum of 100 characters.                                                                                                                                  |
| private_key    | String  | Specifies the private key of the server certificate in PEM format.                                                                                                                                                                                    |
| certificate    | String  | Specifies the public key of the server certificate or CA certificate used to authenticate the client. The value of parameter <b>type</b> determines whether a public key or CA certificate is required. Both types of certificates are in PEM format. |
| expire_time    | String  | Specifies the time when the certificate expires.<br>The UTC time is in <i>YYYY-MM-DDTHH:MM:SS</i> format.                                                                                                                                             |

| Parameter         | Type   | Description                                                                                                                                                                                                                                                                                                                                   |
|-------------------|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| create_time       | String | Specifies the time when the certificate was created.<br>The UTC time is in <i>YYYY-MM-DDTHH:MM:SS</i> format.                                                                                                                                                                                                                                 |
| update_time       | String | Specifies the time when the certificate was updated.<br>The UTC time is in <i>YYYY-MM-DDTHH:MM:SS</i> format.                                                                                                                                                                                                                                 |
| source            | String | Specifies the source of the certificate. The default value is <b>null</b> .<br>Constraints: If <b>scm_certificate_id</b> is not left blank and <b>source</b> is not specified, the default value is <b>scm</b> .                                                                                                                              |
| protection_status | String | Specifies the protection status.<br>The value can be: <ul style="list-style-type: none"><li>● <b>nonProtection</b>: The load balancer is not protected.</li><li>● <b>consoleProtection</b>: Modification protection is enabled to avoid that resources are modified by accident on the console.</li></ul> Default value: <b>nonProtection</b> |
| protection_reason | String | Specifies why the modification protection is enabled.                                                                                                                                                                                                                                                                                         |

## Status Code

For details, see [Status Codes](#).

## 6.9.2 Querying Certificates

### Function

This API is used to query the certificates. Filter query and pagination query are supported. Unless otherwise specified, exact match is applied.

### Constraints

Parameters **marker**, **limit**, and **page\_reverse** are used for pagination query. Parameters **marker** and **page\_reverse** take effect only when they are used together with parameter **limit**.

### URI

GET /v2/{project\_id}/elb/certificates

Table 6-212 Parameter description

| Parameter  | Mandatory | Type   | Description               |
|------------|-----------|--------|---------------------------|
| project_id | Yes       | String | Specifies the project ID. |

**Table 6-213** Parameter description

| Parameter    | Mandatory | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                                |
|--------------|-----------|---------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| marker       | No        | String  | Specifies the ID of the certificate from which pagination query starts, that is, the ID of the last certificate on the previous page. This parameter must be used together with <b>limit</b> .                                                                                                                                                                                                                             |
| limit        | No        | Integer | Specifies the number of certificates on each page. If this parameter is not set, all certificates are queried by default.                                                                                                                                                                                                                                                                                                  |
| page_reverse | No        | Boolean | Specifies the page direction. The value can be <b>true</b> or <b>false</b> , and the default value is <b>false</b> . The last page in the list requested with <b>page_reverse</b> set to <b>false</b> will not contain the "next" link, and the last page in the list requested with <b>page_reverse</b> set to <b>true</b> will not contain the "previous" link. This parameter must be used together with <b>limit</b> . |
| id           | No        | String  | Specifies the certificate ID.                                                                                                                                                                                                                                                                                                                                                                                              |
| name         | No        | String  | Specifies the certificate name. The value contains a maximum of 255 characters.                                                                                                                                                                                                                                                                                                                                            |
| description  | No        | String  | Provides supplementary information about the certificate. The value contains a maximum of 255 characters.                                                                                                                                                                                                                                                                                                                  |
| type         | No        | String  | Specifies the certificate type. The default value is <b>server</b> . The value can be: <ul style="list-style-type: none"><li>• <b>server</b>: indicates the server certificate.</li><li>• <b>client</b>: indicates the CA certificate.</li></ul>                                                                                                                                                                           |

| Parameter   | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|-------------|-----------|--------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| domain      | No        | String | <p>Specifies the domain name associated with the server certificate. The default value is <b>null</b>.</p> <p>The value contains a maximum of 100 characters.</p> <p>Value range:</p> <ul style="list-style-type: none"><li>• A common domain name contains 0 to 100 characters and consists of several labels separated by periods (.). Each label can contain a maximum of 63 characters, including letters, digits, and hyphens (-), and must start and end with a letter or digit.</li><li>• In addition to the requirements for common domain names, a wildcard domain name can start with an asterisk (*). This parameter takes effect only when <b>type</b> is set to <b>server</b>.</li></ul> |
| create_time | No        | String | <p>Specifies the time when the certificate was created.</p> <p>The UTC time is in <i>YYYY-MM-DD HH:MM:SS</i> format.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| update_time | No        | String | <p>Specifies the time when the certificate was updated.</p> <p>The UTC time is in <i>YYYY-MM-DD HH:MM:SS</i> format.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| source      | No        | String | <p>Specifies the source of the certificate. The default value is <b>null</b>.</p> <p>Constraints: If <b>scm_certificate_id</b> is not left blank and <b>source</b> is not specified, the default value is <b>scm</b>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| Parameter         | Mandator<br>y | Type   | Description                                                                                                                                                                                                                                                                                                                                   |
|-------------------|---------------|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| protection_status | No            | String | Specifies the protection status.<br>The value can be: <ul style="list-style-type: none"><li>• <b>nonProtection</b>: The load balancer is not protected.</li><li>• <b>consoleProtection</b>: Modification protection is enabled to avoid that resources are modified by accident on the console.</li></ul> Default value: <b>nonProtection</b> |
| protection_reason | No            | String | Specifies why the modification protection is enabled.<br><b>NOTE</b><br>This parameter is valid only when <b>protection_status</b> is set to <b>consoleProtection</b> .                                                                                                                                                                       |

Response

Table 6-214 Response parameters

| Parameter    | Type                                 | Description                                                            |
|--------------|--------------------------------------|------------------------------------------------------------------------|
| certificates | Array of <b>Certificates</b> objects | Lists the certificates. For details, see <a href="#">Table 6-215</a> . |
| instance_num | Integer                              | Specifies the number of certificates.                                  |

Table 6-215 certificates parameter description

| Parameter | Type   | Description                                                                                                       |
|-----------|--------|-------------------------------------------------------------------------------------------------------------------|
| id        | String | Specifies the certificate ID.                                                                                     |
| tenant_id | String | Specifies the ID of the project where the certificate is used.<br>The value contains a maximum of 255 characters. |

| Parameter      | Type    | Description                                                                                                                                                                                                                                           |
|----------------|---------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| admin_state_up | Boolean | Specifies the administrative status of the certificate.<br>This parameter is reserved. The value can be <b>true</b> or <b>false</b> . <ul style="list-style-type: none"><li>• <b>true</b>: Enabled</li><li>• <b>false</b>: Disabled</li></ul>         |
| name           | String  | Specifies the certificate name.<br>The value contains a maximum of 255 characters.                                                                                                                                                                    |
| description    | String  | Provides supplementary information about the certificate.<br>The value contains a maximum of 255 characters.                                                                                                                                          |
| type           | String  | Specifies the certificate type.<br>The value can be: <ul style="list-style-type: none"><li>• <b>server</b>: indicates the server certificate.</li><li>• <b>client</b>: indicates the CA certificate.</li></ul>                                        |
| domain         | String  | Specifies the domain name associated with the server certificate.<br>The value contains a maximum of 100 characters.                                                                                                                                  |
| private_key    | String  | Specifies the private key of the server certificate in PEM format.                                                                                                                                                                                    |
| certificate    | String  | Specifies the public key of the server certificate or CA certificate used to authenticate the client. The value of parameter <b>type</b> determines whether a public key or CA certificate is required. Both types of certificates are in PEM format. |
| expire_time    | String  | Specifies the time when the certificate expires.<br>The UTC time is in <i>YYYY-MM-DD HH:MM:SS</i> format.                                                                                                                                             |
| create_time    | String  | Specifies the time when the certificate was created.<br>The UTC time is in <i>YYYY-MM-DD HH:MM:SS</i> format.                                                                                                                                         |
| update_time    | String  | Specifies the time when the certificate was updated.<br>The UTC time is in <i>YYYY-MM-DD HH:MM:SS</i> format.                                                                                                                                         |

| Parameter         | Type   | Description                                                                                                                                                                                                                                                                                                                                       |
|-------------------|--------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| source            | String | Specifies the source of the certificate. The default value is <b>null</b> .<br><br>Constraints: If <b>scm_certificate_id</b> is not left blank and <b>source</b> is not specified, the default value is <b>scm</b> .                                                                                                                              |
| protection_status | String | Specifies the protection status.<br><br>The value can be: <ul style="list-style-type: none"><li>● <b>nonProtection</b>: The load balancer is not protected.</li><li>● <b>consoleProtection</b>: Modification protection is enabled to avoid that resources are modified by accident on the console.</li></ul> Default value: <b>nonProtection</b> |
| protection_reason | String | Specifies why the modification protection is enabled.                                                                                                                                                                                                                                                                                             |

## Status Code

For details, see [Status Codes](#).

## 6.9.3 Querying Details of a Certificate

### Function

This API is used to query details about a certificate.

### Constraints

None

### URI

GET /v2/{project\_id}/elb/certificates/{certificate\_id}

**Table 6-216** Parameter description

| Parameter      | Mandatory | Type   | Description                   |
|----------------|-----------|--------|-------------------------------|
| project_id     | Yes       | String | Specifies the project ID.     |
| certificate_id | Yes       | String | Specifies the certificate ID. |

### Request

None

### Response

**Table 6-217** Parameter description

| Parameter | Type   | Description                   |
|-----------|--------|-------------------------------|
| id        | String | Specifies the certificate ID. |

| Parameter      | Type    | Description                                                                                                                                                                                                                                           |
|----------------|---------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| tenant_id      | String  | Specifies the ID of the project where the certificate is used.<br>The value contains a maximum of 255 characters.                                                                                                                                     |
| admin_state_up | Boolean | Specifies the administrative status of the certificate.<br>This parameter is reserved. The value can be <b>true</b> or <b>false</b> . <ul style="list-style-type: none"><li>• <b>true</b>: Enabled</li><li>• <b>false</b>: Disabled</li></ul>         |
| name           | String  | Specifies the certificate name.<br>The value contains a maximum of 255 characters.                                                                                                                                                                    |
| description    | String  | Provides supplementary information about the certificate.<br>The value contains a maximum of 255 characters.                                                                                                                                          |
| type           | String  | Specifies the certificate type.<br>The value can be: <ul style="list-style-type: none"><li>• <b>server</b>: indicates the server certificate.</li><li>• <b>client</b>: indicates the CA certificate.</li></ul>                                        |
| domain         | String  | Specifies the domain name associated with the server certificate.<br>The value contains a maximum of 100 characters.                                                                                                                                  |
| private_key    | String  | Specifies the private key of the server certificate in PEM format.                                                                                                                                                                                    |
| certificate    | String  | Specifies the public key of the server certificate or CA certificate used to authenticate the client. The value of parameter <b>type</b> determines whether a public key or CA certificate is required. Both types of certificates are in PEM format. |
| expire_time    | String  | Specifies the time when the certificate expires.<br>The UTC time is in <i>YYYY-MM-DDTHH:MM:SS</i> format.                                                                                                                                             |
| create_time    | String  | Specifies the time when the certificate was created.<br>The UTC time is in <i>YYYY-MM-DDTHH:MM:SS</i> format.                                                                                                                                         |

| Parameter         | Type   | Description                                                                                                                                                                                                                                                                                                                                   |
|-------------------|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| update_time       | String | Specifies the time when the certificate was updated.<br>The UTC time is in <i>YYYY-MM-DDTHH:MM:SS</i> format.                                                                                                                                                                                                                                 |
| source            | String | Specifies the source of the certificate. The default value is <b>null</b> .<br>Constraints: If <b>scm_certificate_id</b> is not left blank and <b>source</b> is not specified, the default value is <b>scm</b> .                                                                                                                              |
| protection_status | String | Specifies the protection status.<br>The value can be: <ul style="list-style-type: none"><li>● <b>nonProtection</b>: The load balancer is not protected.</li><li>● <b>consoleProtection</b>: Modification protection is enabled to avoid that resources are modified by accident on the console.</li></ul> Default value: <b>nonProtection</b> |
| protection_reason | String | Specifies why the modification protection is enabled.                                                                                                                                                                                                                                                                                         |

## Example Request

- Example request: Querying details of a certificate  
GET <https://{Endpoint}/v2/a31d2bdcf7604c0faaddb058e1e08819/elb/certificates/23ef9aad4ecb463580476d324a6c71af>

## Example Response

## Status Code

For details, see [Status Codes](#).

## 6.9.4 Updating a Certificate

### Function

This API is used to update a certificate.

### URI

PUT /v2/{project\_id}/elb/certificates/{certificate\_id}

**Table 6-218** Parameter description

| Parameter      | Mandatory | Type   | Description                   |
|----------------|-----------|--------|-------------------------------|
| project_id     | Yes       | String | Specifies the project ID.     |
| certificate_id | Yes       | String | Specifies the certificate ID. |

## Request

**Table 6-219** Parameter description

| Parameter      | Mandatory | Type    | Description                                                                                                                   |
|----------------|-----------|---------|-------------------------------------------------------------------------------------------------------------------------------|
| admin_state_up | No        | Boolean | Specifies the administrative status of the certificate.<br>This parameter is reserved, and the default value is <b>true</b> . |
| name           | No        | String  | Specifies the certificate name.<br>The value contains a maximum of 255 characters.                                            |
| description    | No        | String  | Provides supplementary information about the certificate.<br>The value contains a maximum of 255 characters.                  |

| Parameter   | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|-------------|-----------|--------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| domain      | No        | String | <p>Specifies the domain name associated with the server certificate. The default value is <b>null</b>.</p> <p>The value contains a maximum of 100 characters.</p> <p>Value range:</p> <ul style="list-style-type: none"><li>• A common domain name contains 0 to 100 characters and consists of several labels separated by periods (.). Each label can contain a maximum of 63 characters, including letters, digits, and hyphens (-), and must start and end with a letter or digit.</li><li>• In addition to the requirements for common domain names, a wildcard domain name can start with an asterisk (*). This parameter takes effect only when <b>type</b> is set to <b>server</b>.</li></ul> <p><b>NOTE</b><br/>This parameter takes effect only when <b>type</b> is set to <b>server</b>.</p> |
| private_key | No        | String | <p>Specifies the private key of the server certificate. The value must be PEM encoded.</p> <ul style="list-style-type: none"><li>• This parameter will be ignored if <b>type</b> is set to <b>client</b>. A CA server can still be created and used normally. This parameter will be left blank even if you enter a private key that is not PEM encoded.</li><li>• This parameter is mandatory only when <b>type</b> is set to <b>server</b>. If you enter an invalid private key, an error is returned.</li></ul>                                                                                                                                                                                                                                                                                      |
| certificate | No        | String | <p>Specifies the public key of the server certificate or CA certificate used to authenticate the client. The value of parameter <b>type</b> determines whether a public key or CA certificate is required.</p> <p>Both types of certificates are in PEM format.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

## Response

**Table 6-220** Parameter description

| Parameter      | Type    | Description                                                                                                                                                                                                                                       |
|----------------|---------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| id             | String  | Specifies the certificate ID.                                                                                                                                                                                                                     |
| tenant_id      | String  | Specifies the ID of the project where the certificate is used.<br><br>The value contains a maximum of 255 characters.                                                                                                                             |
| admin_state_up | Boolean | Specifies the administrative status of the certificate.<br><br>This parameter is reserved. The value can be <b>true</b> or <b>false</b> . <ul style="list-style-type: none"><li>• <b>true</b>: Enabled</li><li>• <b>false</b>: Disabled</li></ul> |
| name           | String  | Specifies the certificate name.<br><br>The value contains a maximum of 255 characters.                                                                                                                                                            |

| Parameter   | Type   | Description                                                                                                                                                                                                                                           |
|-------------|--------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| description | String | Provides supplementary information about the certificate.<br>The value contains a maximum of 255 characters.                                                                                                                                          |
| type        | String | Specifies the certificate type.<br>The value can be: <ul style="list-style-type: none"><li>• <b>server</b>: indicates the server certificate.</li><li>• <b>client</b>: indicates the CA certificate.</li></ul>                                        |
| domain      | String | Specifies the domain name associated with the server certificate.<br>The value contains a maximum of 100 characters.                                                                                                                                  |
| private_key | String | Specifies the private key of the server certificate in PEM format.                                                                                                                                                                                    |
| certificate | String | Specifies the public key of the server certificate or CA certificate used to authenticate the client. The value of parameter <b>type</b> determines whether a public key or CA certificate is required. Both types of certificates are in PEM format. |
| expire_time | String | Specifies the time when the certificate expires.<br>The UTC time is in <i>YYYY-MM-DDTHH:MM:SS</i> format.                                                                                                                                             |
| create_time | String | Specifies the time when the certificate was created.<br>The UTC time is in <i>YYYY-MM-DDTHH:MM:SS</i> format.                                                                                                                                         |
| update_time | String | Specifies the time when the certificate was updated.<br>The UTC time is in <i>YYYY-MM-DDTHH:MM:SS</i> format.                                                                                                                                         |
| source      | String | Specifies the source of the certificate. The default value is <b>null</b> .<br>Constraints: If <b>scm_certificate_id</b> is not left blank and <b>source</b> is not specified, the default value is <b>scm</b> .                                      |

| Parameter         | Type   | Description                                                                                                                                                                                                                                                                                                                               |
|-------------------|--------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| protection_status | String | Specifies the protection status.<br>The value can be: <ul style="list-style-type: none"><li><b>nonProtection</b>: The load balancer is not protected.</li><li><b>consoleProtection</b>: Modification protection is enabled to avoid that resources are modified by accident on the console.</li></ul> Default value: <b>nonProtection</b> |
| protection_reason | String | Specifies why the modification protection is enabled.                                                                                                                                                                                                                                                                                     |

## Status Code

For details, see [Status Codes](#).

## 6.9.5 Deleting a Certificate

### Function

This API is used to delete a certificate.

### Constraints

If the target certificate is used by a listener, the certificate cannot be deleted, and 409 code will be displayed.

### URI

DELETE /v2/{project\_id}/elb/certificates/{certificate\_id}

**Table 6-221** Parameter description

| Parameter      | Mandator<br>y | Type       | Description                   |
|----------------|---------------|------------|-------------------------------|
| project_id     | Yes           | Strin<br>g | Specifies the project ID.     |
| certificate_id | Yes           | Strin<br>g | Specifies the certificate ID. |

### Request

None

### Response

None

### Example Request

- Example request: Deleting a certificate  
DELETE https://{Endpoint}/v2/a31d2bdcf7604c0faaddb058e1e08819/elb/certificates/

# 7 APIs (OpenStack)

## 7.1 Tag

### 7.1.1 Adding a Tag to a Load Balancer

#### Function

This API is used to add a tag to a specific load balancer for easier management.

#### Constraints

A maximum of 20 tags can be added to a load balancer.

Note the following when you add tags:

- If there are duplicate keys in the request body, an error is reported.
- If there are no duplicate keys in the request body but the key in the request body exists in the database, the key in the database is overwritten.

#### URI

POST /v2.0/{project\_id}/loadbalancers/{loadbalancer\_id}/tags

**Table 7-1** Parameter description

| Parameter       | Mandator<br>y | Type   | Description                                                          |
|-----------------|---------------|--------|----------------------------------------------------------------------|
| project_id      | Yes           | String | Specifies the ID of the project where the tag is used.               |
| loadbalancer_id | Yes           | String | Specifies the ID of the load balancer to which a tag is to be added. |

## Request Parameters

**Table 7-2** Request header parameters

| Parameter    | Mandatory | Type   | Description |
|--------------|-----------|--------|-------------|
| X-Auth-Token | Yes       | String | User token  |

**Table 7-3** Parameter description

| Parameter | Mandatory | Type   | Description                                                     |
|-----------|-----------|--------|-----------------------------------------------------------------|
| tag       | Yes       | Object | Specifies the tag. For details, see <a href="#">Table 7-4</a> . |

**Table 7-4** tag parameter description

| Parameter | Mandatory | Type   | Description                                                                                                                                                                                                                                                                         |
|-----------|-----------|--------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| key       | Yes       | String | Specifies the tag key. <ul style="list-style-type: none"><li>• Cannot be left blank.</li><li>• Can contain a maximum of 128 characters.</li><li>• Can contain letters, digits, underscores (_), and hyphens (-).</li><li>• The tag key of a load balancer must be unique.</li></ul> |
| value     | Yes       | String | Specifies the tag value. <ul style="list-style-type: none"><li>• Can contain a maximum of 255 characters.</li><li>• Can contain letters, digits, underscores (_), periods (.), and hyphens (-).</li></ul>                                                                           |

## 7.1.2 Batch Adding Load Balancer Tags

### Function

This API is used to batch add tags to a load balancer.

### Constraints

A maximum of 20 tags can be added to a listener.

This API is idempotent.

- Note the following when you add tags:
  - If there are duplicate keys in the request body, an error is reported.
  - If there are no duplicate keys in the request body but the key in the request body exists in the database, the key in the database is overwritten.
  - The value of **action** must be **create**.

### URI

POST /v2.0/{project\_id}/loadbalancers/{loadbalancer\_id}/tags/action

**Table 7-5** Parameter description

| Parameter       | Mandatory | Type   | Description                                                          |
|-----------------|-----------|--------|----------------------------------------------------------------------|
| project_id      | Yes       | String | Specifies the ID of the project where the tag is used.               |
| loadbalancer_id | Yes       | String | Specifies the ID of the load balancer to which a tag is to be added. |

## Request Parameters

**Table 7-6** Request header parameters

| Parameter    | Mandatory | Type   | Description |
|--------------|-----------|--------|-------------|
| X-Auth-Token | Yes       | String | User token  |

**Table 7-7** Parameter description

| Parameter | Mandatory | Type   | Description                                                                                                                                                           |
|-----------|-----------|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| tags      | Yes       | Array  | Lists the tags. For details, see <a href="#">Table 7-8</a> .                                                                                                          |
| action    | Yes       | String | Specifies the operation type. The value can be one of the following: <ul style="list-style-type: none"><li>• <b>create</b>: adds tags to the load balancer.</li></ul> |

**Table 7-8** tags parameter description

| Parameter | Mandatory | Type   | Description                                                                                                                                                                                                                                                                         |
|-----------|-----------|--------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| key       | Yes       | String | Specifies the tag key. <ul style="list-style-type: none"><li>• Cannot be left blank.</li><li>• Can contain a maximum of 128 characters.</li><li>• Can contain letters, digits, underscores (_), and hyphens (-).</li><li>• The tag key of a load balancer must be unique.</li></ul> |
| value     | Yes       | String | Specifies the tag value. <ul style="list-style-type: none"><li>• Can contain a maximum of 255 characters.</li><li>• Can contain letters, digits, underscores (_), periods (.), and hyphens (-).</li></ul>                                                                           |

## 7.1.3 Batch Deleting Load Balancer Tags

### Function

This API is used to batch delete tags from a load balancer.

### Constraints

A maximum of 20 tags can be added to a listener.

This API is idempotent.

- Note the following when you delete the tags:
  - If the tag does not exist, the deletion is considered successful by default.
  - The value range of the tag character set is not verified.
  - The tag structure body cannot be missing, and the key cannot be left blank or set to an empty string.
  - The value of **action** must be **delete**.

### URI

POST /v2.0/{project\_id}/loadbalancers/{loadbalancer\_id}/tags/action

**Table 7-9** Parameter description

| Parameter       | Mandatory | Type   | Description                                                              |
|-----------------|-----------|--------|--------------------------------------------------------------------------|
| project_id      | Yes       | String | Specifies the ID of the project where the tag is used.                   |
| loadbalancer_id | Yes       | String | Specifies the ID of the load balancer from which a tag is to be deleted. |

## Request Parameters

**Table 7-10** Request header parameters

| Parameter    | Mandatory | Type   | Description               |
|--------------|-----------|--------|---------------------------|
| X-Auth-Token | Yes       | String | Specifies the user token. |

**Table 7-11** Request parameters

| Parameter | Mandatory | Type   | Description                                                                                                                                           |
|-----------|-----------|--------|-------------------------------------------------------------------------------------------------------------------------------------------------------|
| tags      | Yes       | Array  | Specifies the tags. For details, see <a href="#">Table 7-12</a> .                                                                                     |
| action    | Yes       | String | Specifies the operation type. The value can be: <ul style="list-style-type: none"><li>• <b>delete</b>: deletes tags from the load balancer.</li></ul> |

Table 7-12 Parameter description

| Parameter | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                              |
|-----------|-----------|--------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| key       | Yes       | String | Specifies the tag name. The tag: <ul style="list-style-type: none"><li>• Cannot be left blank.</li><li>• Can contain a maximum of 128 characters.</li><li>• Can contain letters, digits, underscores (_), and hyphens (-).</li><li>• Cannot have the same key with other tags added to the same load balancer.</li></ul> |
| value     | Yes       | String | Specifies the tag value. The value: <ul style="list-style-type: none"><li>• Can contain a maximum of 255 characters.</li><li>• Can contain letters, digits, underscores (_), periods (.), and hyphens (-).</li></ul>                                                                                                     |

## 7.1.4 Querying All Tags of a Load Balancer

### Function

This API is used to query all the tags of one load balancer.

### URI

GET /v2.0/{project\_id}/loadbalancers/{loadbalancer\_id}/tags

**Table 7-13** Parameter description

| Parameter       | Mandatory | Type   | Description                                                         |
|-----------------|-----------|--------|---------------------------------------------------------------------|
| project_id      | Yes       | String | Specifies the ID of the project where the tag is used.              |
| loadbalancer_id | Yes       | String | Specifies the ID of the load balancer whose tags are to be queried. |

### Request Parameters

**Table 7-14** Request header parameters

| Parameter    | Mandatory | Type   | Description |
|--------------|-----------|--------|-------------|
| X-Auth-Token | Yes       | String | User token  |

### Response Parameters

**Table 7-15** Response parameters

| Parameter | Type  | Description                                                   |
|-----------|-------|---------------------------------------------------------------|
| tags      | Array | Lists the tags. For details, see <a href="#">Table 7-16</a> . |

Table 7-16 tags parameter description

| Parameter | Type   | Description                                                                                                                                                                                                                                                                         |
|-----------|--------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| key       | String | Specifies the tag key. <ul style="list-style-type: none"><li>• Cannot be left blank.</li><li>• Can contain a maximum of 128 characters.</li><li>• Can contain letters, digits, underscores (_), and hyphens (-).</li><li>• The tag key of a load balancer must be unique.</li></ul> |
| value     | String | Specifies the tag value. <ul style="list-style-type: none"><li>• Can contain a maximum of 255 characters.</li><li>• Can contain letters, digits, underscores (_), periods (.), and hyphens (-).</li></ul>                                                                           |

## 7.1.6 Querying Load Balancers by Tag

### Function

This API is used to query load balancers using tags.

### Constraints

None

### URI

POST /v2.0/{project\_id}/loadbalancers/resource\_instances/action

**Table 7-21** Parameter description

| Parameter  | Mandator<br>y | Type   | Description                                            |
|------------|---------------|--------|--------------------------------------------------------|
| project_id | Yes           | String | Specifies the ID of the project where the tag is used. |

## Request Parameters

**Table 7-22** Request header parameters

| Parameter    | Mandatory | Type   | Description |
|--------------|-----------|--------|-------------|
| X-Auth-Token | Yes       | String | User token  |

**Table 7-23** Parameter description

| Parameter | Mandatory | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|-----------|-----------|---------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| tags      | No        | Array   | <p>Specifies the included tags. A maximum of 20 keys are allowed for each query operation, and each key can have a maximum of 20 values.</p> <p>The tag key cannot be left blank or set to an empty string.</p> <p>Each tag key and each tag value of the same tag key must be unique.</p> <p>For details, see <a href="#">Table 7-24</a>.</p>                                                                                                                                                                                                                             |
| limit     | No        | Integer | <p>Sets the page size. This parameter is available when <b>action</b> is set to <b>filter</b>. Both the default value and maximum value are <b>1000</b>, and the minimum value is <b>1</b>. The value cannot be a negative integer.</p>                                                                                                                                                                                                                                                                                                                                    |
| offset    | No        | Integer | <p>Specifies the index position. The query starts from the next load balancer indexed by this parameter. This parameter is not required when you query load balancers on the first page. The value in the response returned for querying the load balancers on the previous page will be included in this parameter for querying the load balancers on subsequent pages. This parameter is not available when <b>action</b> is set to <b>count</b>. If <b>action</b> is set to <b>filter</b>, the value must be a positive integer, and the default value is <b>0</b>.</p> |
| action    | Yes       | String  | <p>Identifies the operation. The value can be <b>filter</b> or <b>count</b>.</p> <p><b>filter</b>: indicates pagination query.</p> <p><b>count</b>: indicates that all load balancers meeting the search criteria will be returned.</p>                                                                                                                                                                                                                                                                                                                                    |

| Parameter | Mandatory | Type  | Description                                                                                                                                                                                                                                            |
|-----------|-----------|-------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| matches   | No        | Array | Specifies the search criteria. The tag key is the parameter to match, for example, <b>resource_name</b> . <b>value</b> indicates the value of the match content. The key is a fixed dictionary value.<br>For details, see <a href="#">Table 7-25</a> . |

**Table 7-24 tags** parameter description

| Parameter | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                                  |
|-----------|-----------|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| key       | Yes       | String | Specifies the tag key. It contains a maximum of 128 Unicode characters and cannot be left blank. (This parameter is not verified in the search process.)                                                                                                                                                                     |
| values    | Yes       | Array  | Lists the tag values. Each tag value can contain a maximum of 255 Unicode characters. The values are in the OR relationship.<br><br>If no tag values in the list, the tag key is used for full search. If each value in the list starts with an asterisk (*), fuzzy match is performed based on the part after the asterisk. |

**Table 7-25 matches** parameter description

| Parameter | Mandatory | Type   | Description                                                                                                                                                                                                                              |
|-----------|-----------|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| key       | Yes       | String | Specifies the tag key for match.<br>The value can be one of the following: <ul style="list-style-type: none"><li>• <b>resource_name</b>: indicates the resource name.</li><li>• <b>resource_id</b>: indicates the resource ID.</li></ul> |
| value     | Yes       | String | Specifies the tag value for match. Each tag value can contain a maximum of 255 Unicode characters.                                                                                                                                       |

## Response Parameters

**Table 7-26** Response parameters

| Parameter   | Type    | Description                                                             |
|-------------|---------|-------------------------------------------------------------------------|
| resources   | Array   | Lists the load balancers. For details, see <a href="#">Table 7-27</a> . |
| total_count | Integer | Specifies the total number of queried records.                          |

**Table 7-27** resource parameter description

| Parameter         | Type   | Description                                                                                                             |
|-------------------|--------|-------------------------------------------------------------------------------------------------------------------------|
| resource_id       | String | Specifies the resource ID.                                                                                              |
| resource_detail   | String | Specifies the resource details. The value is a resource object, used for extension. The value is left blank by default. |
| tags              | Array  | Lists the tags. If there is no tag, an empty array is used by default. For details, see <a href="#">Table 7-28</a> .    |
| resource_name     | String | Specifies the resource name. This parameter is an empty string by default if there is no resource name.                 |
| super_resource_id | String | Specifies the parent resource ID.                                                                                       |

**Table 7-28** tags parameter description

| Parameter | Type   | Description                                                                                                                                              |
|-----------|--------|----------------------------------------------------------------------------------------------------------------------------------------------------------|
| key       | String | Specifies the tag key. It contains a maximum of 128 Unicode characters and cannot be left blank. (This parameter is not verified in the search process.) |
| value     | String | Specifies the tag value. Each tag value can contain a maximum of 255 Unicode characters.                                                                 |

## Example Request

- Example request 1 (when **action** is set to **filter**)  
POST https://{Endpoint}/v2.0/6a0de1c3-7d74-4f4a-b75e-e57135bd2b97/loadbalancers/resource\_instances/action

```
{
 "offset": "100",
 "limit": "100",
 "action": "filter",
 "matches": [
 {
 "key": "resource_name",
 "value": "resource1"
 }
],
 "tags": [
 {
 "key": "key1",
 "values": [
 "value1",
 "value2"
]
 }
]
}
```

- Example request 2 (when **action** is set to **count**)

POST https://{Endpoint}/v2.0/6a0de1c3-7d74-4f4a-b75e-e57135bd2b97/loadbalancers/resource\_instances/action

```
{
 "action": "count",
 "tags": [
 {
 "key": "key1",
 "values": [
 "value1",
 "value2"
]
 },
 {
 "key": "key2",
 "values": [
 "value1",
 "value2"
]
 }
],
 "matches": [
 {
 "key": "resource_name",
 "value": "resource1"
 }
]
}
```

## Example Response

- Example response 1

```
{
 "resources": [
 {
 "resource_detail": "",
 "resource_id": "154d135b-3a89-4e89-8023-06efb9acdc05",

## 7.1.7 Deleting a Tag from a Load Balancer

### Function

This API is used to delete a tag with a specific key from a load balancer.

### Constraints

None

### URI

DELETE /v2.0/{project\_id}/loadbalancers/{loadbalancer\_id}/tags/{key}

**Table 7-29** Parameter description

| Parameter       | Mandatory | Type   | Description                                                              |
|-----------------|-----------|--------|--------------------------------------------------------------------------|
| project_id      | Yes       | String | Specifies the ID of the project where the tag is used.                   |
| loadbalancer_id | Yes       | String | Specifies the ID of the load balancer from which a tag is to be deleted. |

### Request Parameters

**Table 7-30** Request header parameters

| Parameter    | Mandatory | Type   | Description |
|--------------|-----------|--------|-------------|
| X-Auth-Token | Yes       | String | User token  |

### Response Parameters

None

## Example Request

- Example request  
DELETE https://{Endpoint}/v2.0/6a0de1c3-7d74-4f4a-b75e-e57135bd2b97/loadbalancers/  
7add33ad-11dc-4ab9-a50f-419703f13163/tags/key1

## Example Response

- Example response  
None

## Status Code

For details, see [Status Codes](#).

## 7.1.8 Adding a Tag to a Listener

### Function

This API is used to add a tag to a specific listener.

### Constraints

- A maximum of 20 tags can be added to a load balancer.
- Note the following when you add tags:
  - If there are duplicate keys in the request body, an error is reported.
  - If there are no duplicate keys in the request body but the key in the request body exists in the database, the key in the database is overwritten.

### URI

POST /v2.0/{project\_id}/listeners/{listener\_id}/tags

**Table 7-31** Parameter description

| Parameter   | Mandatory | Type   | Description                                                     |
|-------------|-----------|--------|-----------------------------------------------------------------|
| project_id  | Yes       | String | Specifies the ID of the project where the tag is used.          |
| listener_id | Yes       | String | Specifies the ID of the listener to which a tag is to be added. |

## Request Parameters

**Table 7-32** Request header parameters

| Parameter    | Mandatory | Type   | Description |
|--------------|-----------|--------|-------------|
| X-Auth-Token | Yes       | String | User token  |

**Table 7-33** Parameter description

| Parameter | Mandatory | Type   | Description                                                      |
|-----------|-----------|--------|------------------------------------------------------------------|
| tag       | Yes       | Object | Specifies the tag. For details, see <a href="#">Table 7-34</a> . |

## 7.1.9 Batch Adding Tags to a Listener

### Function

This API is used to batch add tags to a listener.

### Constraints

- A maximum of 20 tags can be added to a listener.
- This API is idempotent.
- Note the following when you add tags:
  - If there are duplicate keys in the request body, an error is reported.
  - If there are no duplicate keys in the request body but the key in the request body exists in the database, the key in the database is overwritten.
  - The value of **action** must be **create**.

### URI

POST /v2.0/{project\_id}/listeners/{listener\_id}/tags/action

**Table 7-35** Parameter description

| Parameter   | Mandatory | Type   | Description                                                     |
|-------------|-----------|--------|-----------------------------------------------------------------|
| project_id  | Yes       | String | Specifies the ID of the project where the tag is used.          |
| listener_id | Yes       | String | Specifies the ID of the listener to which tags are to be added. |

### Request Parameters

**Table 7-36** Request header parameters

| Parameter    | Mandatory | Type   | Description |
|--------------|-----------|--------|-------------|
| X-Auth-Token | Yes       | String | User token  |

**Table 7-37** Parameter description

| Parameter | Mandatory | Type   | Description                                                                                                                                                               |
|-----------|-----------|--------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| tags      | Yes       | Array  | Lists the tags. For details, see <a href="#">Table 7-38</a> .                                                                                                             |
| action    | Yes       | String | Specifies the operation identifier.<br>The value can be one of the following: <ul style="list-style-type: none"><li>● <b>create</b>: adds tags to the listener.</li></ul> |

**Table 7-38** resource\_tag parameter description

| Parameter | Mandatory | Type   | Description                                                                                                                                                                                                                                                                    |

## 7.1.10 Batch Deleting Tags from a Listener

### Function

This API is used to batch delete tags from a listener.

### Constraints

- A maximum of 20 tags can be added to a listener.
- This API is idempotent.
- Note the following when you delete tags:
  - If the tag to be deleted does not exist, the deletion is considered successful by default.
  - The value range of the tag character set is not verified.
  - The tag structure body cannot be missing, and the key cannot be left blank or set to an empty string.
  - The value of **action** must be **delete**.

### URI

POST /v2.0/{project\_id}/listeners/{listener\_id}/tags/action

**Table 7-39** Parameter description

| Parameter   | Mandator<br>y | Type   | Description                                                         |
|-------------|---------------|--------|---------------------------------------------------------------------|
| project_id  | Yes           | String | Specifies the ID of the project where the tag is used.              |
| listener_id | Yes           | String | Specifies the ID of the listener from which a tag is to be deleted. |

## Request Parameters

**Table 7-40** Request header parameters

| Parameter    | Mandatory | Type   | Description               |
|--------------|-----------|--------|---------------------------|
| X-Auth-Token | Yes       | String | Specifies the user token. |

**Table 7-41** Request parameters

| Parameter | Mandatory | Type   | Description                                                                                                                                                    |
|-----------|-----------|--------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| tags      | Yes       | Array  | Specifies the tags. For details, see <a href="#">Table 7-42</a> .                                                                                              |
| action    | Yes       | String | Specifies the operation identifier.<br>The value can be: <ul style="list-style-type: none"><li>• <b>delete</b>: deletes tags from the load balancer.</li></ul> |

**Table 7-42** resource\_tag parameter description

| Parameter | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                              |
|-----------|-----------|--------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| key       | Yes       | String | Specifies the tag name. The tag: <ul style="list-style-type: none"><li>• Cannot be left blank.</li><li>• Can contain a maximum of 128 characters.</li><li>• Can contain letters, digits, underscores (_), and hyphens (-).</li><li>• Cannot have the same key with other tags added to the same load balancer.</li></ul> |
| value     | Yes       | String | Specifies the tag value. The value: <ul style="list-style-type: none"><li>• Can contain a maximum of 255 characters.</li><li>• Can contain letters, digits, underscores (_), periods (.), and hyphens (-).</li></ul>                                                                                                     |

## Response Parameters

# 7.1.11 Querying All Tags of a Listener

## Function

This API is used to query all tags of one listener.

## Constraints

None

## URI

GET /v2.0/{project\_id}/listeners/{listener\_id}/tags

**Table 7-43** Parameter description

| Parameter  | Mandator<br>y | Type   | Description                                            |
|------------|---------------|--------|--------------------------------------------------------|
| project_id | Yes           | String | Specifies the ID of the project where the tag is used. |

| Parameter   | Mandatory | Type   | Description                                                    |
|-------------|-----------|--------|----------------------------------------------------------------|
| listener_id | Yes       | String | Specifies the ID of the listener whose tags are to be queried. |

## Request Parameters

**Table 7-44** Request header parameters

| Parameter    | Mandatory | Type   | Description |
|--------------|-----------|--------|-------------|
| X-Auth-Token | Yes       | String | User token  |

## Response Parameters

**Table 7-45** Response parameters

| Parameter | Type  | Description                                                   |
|-----------|-------|---------------------------------------------------------------|
| tags      | Array | Lists the tags. For details, see <a href="#">Table 7-46</a> . |

**Table 7-46** tags parameter description

| Parameter | Type   | Description                                                                                                                                                                                                                                                                    |
|-----------|--------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| key       | String | Specifies the tag key. <ul style="list-style-type: none"><li>• Cannot be left blank.</li><li>• Can contain a maximum of 128 characters.</li><li>• Can contain letters, digits, underscores (_), and hyphens (-).</li><li>• The tag key of a listener must be unique.</li></ul> |
| value     | String | Specifies the tag value. <ul style="list-style-type: none"><li>• Can contain a maximum of 255 characters.</li><li>• Can contain letters, digits, underscores (_), periods (.), and hyphens (-).</li></ul>                                                                      |

## 7.1.13 Querying Listeners by Tag

### Function

This API is used to query listeners by tag.

### Constraints

None

### URI

POST /v2.0/{project\_id}/listeners/resource\_instances/action

**Table 7-51** Parameter description

| Parameter  | Mandator<br>y | Type   | Description                                            |
|------------|---------------|--------|--------------------------------------------------------|
| project_id | Yes           | String | Specifies the ID of the project where the tag is used. |

## Request Parameters

**Table 7-52** Request header parameters

| Parameter    | Mandatory | Type   | Description |
|--------------|-----------|--------|-------------|
| X-Auth-Token | Yes       | String | User token  |

**Table 7-53** Parameter description

| Parameter | Mandatory | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-----------|-----------|---------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| tags      | No        | Array   | A maximum of 20 keys can be queried at a time, and each key can contain a maximum of 20 values. The structure body must be included. The tag key cannot be left blank or be an empty string. Each tag key and each tag value of the same tag key must be unique. For details, see <a href="#">Table 7-54</a> .                                                                                                                                                                                                                                     |
| limit     | No        | Integer | Sets the page size. This parameter is available when <b>action</b> is set to <b>filter</b> . Both the default value and maximum value are <b>1000</b> , and the minimum value is <b>1</b> . The value cannot be a negative integer.                                                                                                                                                                                                                                                                                                                |
| offset    | No        | Integer | Specifies the index position. The query starts from the next listener indexed by this parameter. This parameter is not required when you query listeners on the first page. The value in the response returned for querying the listeners on the previous page will be included in this parameter for querying the listeners on subsequent pages. This parameter is not available when <b>action</b> is set to <b>count</b> . If <b>action</b> is set to <b>filter</b> , the value must be a positive integer, and the default value is <b>0</b> . |
| action    | Yes       | String  | Identifies the operation. The value can be <b>filter</b> or <b>count</b> . <ul style="list-style-type: none"><li>• <b>filter</b>: indicates pagination query.</li><li>• <b>count</b>: indicates that all listeners meeting the search criteria will be returned.</li></ul>                                                                                                                                                                                                                                                                         |

| Parameter | Mandatory | Type  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-----------|-----------|-------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| matches   | No        | Array | <p>Specifies the search criteria. The tag key is the parameter to match, for example, <b>resource_name</b>. <b>value</b> indicates the value of the match content. The key is a fixed dictionary value.</p> <p>Determine whether fuzzy match is required based on different parameters. For example, if the <b>key</b> is <b>resource_name</b>, fuzzy search is used by default. If <b>value</b> is an empty string, exact match is used. If the key is <b>resource_id</b>, exact match is used. For details, see <a href="#">Table 7-55</a>.</p> |

Table 7-54 tags parameter description

| Parameter | Mandatory | Type   | Description                                                                                                                                              |
|-----------|-----------|--------|----------------------------------------------------------------------------------------------------------------------------------------------------------|
| key       | Yes       | String | Specifies the tag key. It contains a maximum of 128 Unicode characters and cannot be left blank. (This parameter is not verified in the search process.) |
| values    | Yes       | Array  | Lists the tag values. Each tag value can contain a maximum of 255 Unicode characters. The values are in the OR relationship.                             |

Table 7-55 matches parameter description

| Parameter | Mandatory | Type   | Description                                                                                                                                                                                                                               |
|-----------|-----------|--------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| key       | Yes       | String | <p>Specifies the tag key.</p> <p>The value can be one of the following:</p> <ul style="list-style-type: none"><li>• <b>resource_name</b>: indicates the resource name.</li><li>• <b>resource_id</b>: indicates the resource ID.</li></ul> |
| value     | Yes       | String | Specifies the tag value. Each tag value can contain a maximum of 255 Unicode characters.                                                                                                                                                  |

## Response Parameters

**Table 7-56** Response parameters

| Parameter   | Type    | Description                                                        |
|-------------|---------|--------------------------------------------------------------------|
| resources   | Array   | Lists the listeners. For details, see <a href="#">Table 7-57</a> . |
| total_count | Integer | Specifies the total number of queried records.                     |

**Table 7-57** resource parameter description

| Parameter         | Type   | Description                                                                                                             |
|-------------------|--------|-------------------------------------------------------------------------------------------------------------------------|
| resource_id       | String | Specifies the resource ID.                                                                                              |
| resource_detail   | String | Specifies the resource details. The value is a resource object, used for extension. The value is left blank by default. |
| tags              | Array  | Lists the tags. If there is no tag, an empty array is used by default. For details, see <a href="#">Table 7-58</a> .    |
| resource_name     | String | Specifies the resource name. This parameter is an empty string by default if there is no resource name.                 |
| super_resource_id | String | Specifies the parent resource ID.                                                                                       |

**Table 7-58** tags parameter description

| Parameter | Type   | Description                                                                                                                                              |
|-----------|--------|----------------------------------------------------------------------------------------------------------------------------------------------------------|
| key       | String | Specifies the tag key. It contains a maximum of 128 Unicode characters and cannot be left blank. (This parameter is not verified in the search process.) |
| value     | String | Specifies the tag value. Each tag value can contain a maximum of 255 Unicode characters.                                                                 |

## Example Request

- Example request 1 (when **action** is set to **filter**)  
POST https://{Endpoint}/v2.0/6a0de1c3-7d74-4f4a-b75e-e57135bd2b97/listeners/resource\_instances/  
action

```
{
 "offset": "100",
 "limit": "100",
 "action": "filter",
 "matches": [
 {
 "key": "resource_name",
 "value": "resource1"
 }
],
 "tags": [
 {
 "key": "key1",
 "values": [
 "value1",
 "value2"
]
 }
]
}
```

- Example request 2 (when **action** is set to **count**)

POST https://{Endpoint}/v2.0/6a0de1c3-7d74-4f4a-b75e-e57135bd2b97/listeners/resource\_instances/action

```
{
 "action": "count",
 "tags": [
 {
 "key": "key1",
 "values": [
 "value1",
 "value2"
]
 },
 {
 "key": "key2",
 "values": [
 "value1",
 "value2"
]
 }
],
 "matches": [
 {
 "key": "resource_name",
 "value": "resource1"
 }
]
}
```

## Example Response

- Example response 1

```
{
 "resources": [
 {
 "resource_detail": "",
 "resource_id": "154d135b-3a89-4e89-8023-06efb9acdc05",
 "resource_name": "resource1",
 "tags": [
 {
 "key": "key1",
 "value": "value1"
 },
 {
 "key": "key2",
 "value": "value1"
 }
]
 }
]
}
```

```
 }
]
}
],
"total_count": 1000
}
```

- Example response 2

```
{
 "total_count": 1000
}
```

### Status Code

For details, see [Status Codes](#).

## 7.1.14 Deleting a Tag from a Listener

### Function

This API is used to delete a tag with a specific key from a listener.

### Constraints

None

### URI

DELETE /v2.0/{project\_id}/listeners/{listener\_id}/tags/{key}

**Table 7-59** Parameter description

| Parameter   | Mandatory | Type   | Description                                                         |
|-------------|-----------|--------|---------------------------------------------------------------------|
| project_id  | Yes       | String | Specifies the ID of the project where the tag is used.              |
| listener_id | Yes       | String | Specifies the ID of the listener from which a tag is to be deleted. |

### Request Parameters

**Table 7-60** Request header parameters

| Parameter    | Mandatory | Type   | Description |
|--------------|-----------|--------|-------------|
| X-Auth-Token | Yes       | String | User token  |

### Response Parameters

None

## Example Request

- Example request  
DELETE https://{Endpoint}/v2.0/6a0de1c3-7d74-4f4a-b75e-e57135bd2b97/listeners/  
7add33ad-11dc-4ab9-a50f-419703f13163/tags/key1

## Example Response

- Example response  
None

## Status Code

For details, see [Status Codes](#).

### 7.1.15 Status Codes

**Table 7-61** Normal codes

| Status Code | Message    | Description                                                                                                                                     |
|-------------|------------|-------------------------------------------------------------------------------------------------------------------------------------------------|
| 200         | OK         | Specifies the normal response code for the GET operation.<br>This code is returned when a response body is returned for the POST operation.     |
| 204         | No Content | Specifies the normal response code for the DELETE operation.<br>This code is returned when no response body is returned for the POST operation. |

**Table 7-62** Error codes

| Status Code | Error Code | Description             | Error Message                                     | Measure                                                                    |
|-------------|------------|-------------------------|---------------------------------------------------|----------------------------------------------------------------------------|
| 400         | VPC.1801   | The ID is incorrect.    | resource id is invalid/<br>Getting id is invalid. | Use a correct resource ID.                                                 |
| 400         | VPC.1801   | An action error occurs. | action is invalid.                                | Ensure that the value of <b>action</b> is <b>create</b> or <b>delete</b> . |

| Status Code | Error Code | Description                                                                    | Error Message                                                                           | Measure                                                                                     |
|-------------|------------|--------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------|
| 400         | VPC.1801   | The key length is invalid.                                                     | Tag length is invalid. The key length must be in range [1,36] and value in range [0,43] | Input a valid key.                                                                          |
| 400         | VPC.0007   | The project ID is incorrect.                                                   | urlTenantId is not equal token TenantId.                                                | Check the project ID.                                                                       |
| 401         | VPC.0008   | The token in the request is invalid or the request does not contain the token. | Invalid token in the header./ Authorization information is wrong.                       | Check whether the token is valid.                                                           |
| 400         | VPC.1801   | The value length is invalid.                                                   | Tag length is invalid. The key length must be in range [1,36] and value in range [0,43] | Input a valid value.                                                                        |
| 400         | VPC.1801   | The key or value contains invalid characters.                                  | InvalidInput/Tag value xxx is invalid.                                                  | Check the validity of the key or value.                                                     |
| 400         | VPC.1801   | The key or value is left blank.                                                | Tag xxx can not be null.                                                                | Check whether the key or value is left blank.                                               |
| 400         | VPC.1801   | The tag is null.                                                               | Tag can not be null.                                                                    | Check whether the tag is null.                                                              |
| 400         | VPC.1801   | A resource type error occurs.                                                  | Resource xxx is invalid.                                                                | Ensure that the value of <b>resource_type</b> is <b>loadbalancers</b> or <b>listeners</b> . |

| Status Code | Error Code | Description                                                                    | Error Message                                                                        | Measure                                         |
|-------------|------------|--------------------------------------------------------------------------------|--------------------------------------------------------------------------------------|-------------------------------------------------|
| 400         | VPC.1801   | The total number of tags added at a time exceeds 10.                           | number of tags exceeds max unum of 10.                                               | Reduce the number of tags.                      |
| 400         | VPC.1814   | The total number of existing tags and newly added tags exceeds 10.             | Invalid input for operation: resource_id: XXXX, number of tags exceed max num of 10. | Reduce the number of tags.                      |
| 400         | VPC.1814   | The key values of newly added tags are duplicate.                              | Invalid input for operation: tags key is duplicated.                                 | Change the tag values.                          |
| 400         | VPC.1814   | The resource ID does not exist.                                                | Resource XXX XXX could not be found.                                                 | Check whether the resource is available.        |
| 400         | VPC.1814   | The specified key to be deleted does not exist, or the key is an empty string. | The resource could not be found.                                                     | Enter a correct key and send the request again. |
| 400         | VPC.1814   | More than 10 tags are added to a specified resource.                           | Invalid input for operation:resource_id:xxx, number of tags exceeds max num of 10.   | Each resource supports up to 10 tags.           |
| 400         | VPC.1801   | Tags are duplicate.                                                            | Tag key is repeated.                                                                 | Delete duplicate tags and resend the request.   |
| 500         | -          | The request format is incorrect.                                               | Internal Server Error.                                                               | Use the correct request body format.            |

# 8 Examples

## 8.1 Creating a Dedicated Load Balancer and Binding a New EIP to It

### Scenarios

Call APIs to create a dedicated load balancer and bind a new EIP to it.

### Prerequisites

You have created a VPC and a subnet.

### Procedure

1. Query the subnet you have created.
  - a. Send **GET** `https://{vpc_endpoint}/v1/{project_id}/subnets`. *project\_id* indicates the project ID.
  - b. Add **X-Auth-Token** to the request header.
  - c. Check the response.

- The request is successful if the following response is displayed:

```
{
 "subnets": [
 {
 "id": "0535759e-8104-49d9-902c-a05185a94bdf", // Subnet ID
 "name": "subnet-001", // Subnet name
 "description": "",
 "cidr": "172.16.66.0/24", //IPv4 address range
 "dnsList": [
 "100.125.4.6"
],
 "status": "ACTIVE",
 "vpc_id": "44789a9f-3e80-451a-ac03-0818f99b6cdd", // VPC ID
 "ipv6_enable": true,
 "gateway_ip_v6": "2001:db8:a583:37c::1",
 "cidr_v6": "2001:db8:a583:37c::/64",
 "gateway_ip": "172.16.66.1",
 "dhcp_enable": true,
 "primary_dns": "100.125.4.6",
 "availability_zone": "eu-de-01", //AZ of the subnet
 }
]
}
```

```
"neutron_network_id": "0535759e-8104-49d9-902c-a05185a94bdf", // Network ID
"neutron_subnet_id": "1492f0ba-cfce-4e2c-86f7-561d757dfeee", // IPv4 subnet ID
"neutron_subnet_id_v6": "3c052475-b50b-49b9-abb1-558bad45e592",
"extra_dhcp_opts": [
 {
 "opt_value": "8760h",
 "opt_name": "addresstime"
 }
]
}
```

- If the request is abnormal, locate the fault by referring to [Error Codes](#).
2. Create a dedicated load balancer and bind a new EIP to it.
    - a. Send **POST** `https://{elb_endpoint}/v3/{project_id}/elb/loadbalancers`. *project\_id* indicates the project ID.
    - b. Add **X-Auth-Token** to the request header.
    - c. Ensure that the following parameters, including **publicip**, are passed in the request body:

```
{
 "loadbalancer": {
 "vpc_id": "e5a892ff-3c33-44ef-ada5-b713eb1f7a8b",
 "availability_zone_list": [
 "br-iaas-odin1a"
],
 "admin_state_up": true,
 "vip_subnet_cidr_id": "1800b6b8-a69f-4719-813d-24d62aaf32bd",
 "name": "elb-ipv4",
 "publicip": {
 "network_type": "5_bgp",
 "bandwidth": {
 "size": 2,
 "share_type": "PER",
 "charge_mode": "bandwidth",
 "name": "elb_eip_bandwidth"
 }
 }
 }
}
```

- d. Check the response.
  - The request is successful if the following response is displayed:

```
{
 "request_id": "21177eb184c52c5a4540c78dc7fdaee4",
 "loadbalancer": {
 "id": "a2556f92-3310-4173-a6d1-0b2d0bb68478",

}
```

- If the request is abnormal, locate the fault by referring to [Error Codes](#).

## 8.2 Adding a Listener to a Dedicated Load Balancer

### Scenarios

Call the API to add a listener to a dedicated load balancer.

### Prerequisites

- You have created a dedicated load balancer.
- You have obtained the ID of the dedicated load balancer.

### Procedure

1. Add a listener.
  - a. Send **POST** [https://{elb\\_endpoint}/v3/{project\\_id}/elb/listeners](https://{elb_endpoint}/v3/{project_id}/elb/listeners).  
*project\_id* indicates the project ID.
  - b. Add **X-Auth-Token** to the request header.
  - c. Ensure that the following parameters are passed in the request body:

```
{
 "listener": {
 "protocol_port": 80, // Frontend port. The listener will use this port to receive requests.
```

```
"protocol": "HTTP", // Frontend protocol. The listener will use this protocol to receive requests.
"loadbalancer_id": "f77281cb-9f58-4347-8f82-2180d8bea789", // Load balancer that the listener is added to
 "name": "my_listener" // Listener name
}
}
```

d. Check the response.

- The request is successful if the following response is displayed:

```
{
 "listener": {
 "id": "90ad2705-4ffd-43d3-8f75-af8086bde841",
 "name": "my_listener",
 "protocol_port": 80,
 "protocol": "HTTP",
 "description": "",
 "default_tls_container_ref": null,
 "admin_state_up": true,

- If the request is abnormal, locate the fault by referring to [Error Codes](#).

## 8.3 Deleting a Dedicated Load Balancer

### Scenarios

Call APIs to delete a dedicated load balancer.

Before you delete a dedicated load balancer, delete all resources associated with it. [Figure 8-1](#) shows the associated resources.

**Figure 8-1** Resources associated with a dedicated load balancer

## Procedure

Perform the following steps to delete the associated resources and the load balancer. Skip the corresponding step if the associated resources do not exist. For example, you can skip **1** if no health check is configured.

1. Delete the health check configured for each associated backend server group.
  - a. Send **DELETE** `https://{elb_endpoint}/v3/{project_id}/elb/healthmonitors/{healthmonitor_id}`. *project\_id* indicates the project ID, and *healthmonitor\_id* indicates the health check ID.
  - b. Add **X-Auth-Token** to the request header.
  - c. Check the response.
    - If the request is successful, 204 is returned, and the response body is empty.
    - If the request is abnormal, locate the fault by referring to [Error Codes](#).
2. Remove backend servers from each associated backend server group.
  - a. Send **DELETE** `https://{elb_endpoint}/v3/{project_id}/elb/pools/{pool_id}/members/{member_id}`. *project\_id* indicates the project ID, *pool\_id* indicates the backend server group ID, and *member\_id* indicates the backend server ID.
  - b. Add **X-Auth-Token** to the request header.
  - c. Check the response.
    - If the request is successful, 204 is returned, and the response body is empty.
    - If the request is abnormal, locate the fault by referring to [Error Codes](#).
3. Delete each associated backend server group.
  - a. Send **DELETE** `https://{elb_endpoint}/v3/{project_id}/elb/pools/{pool_id}`. *project\_id* indicates the project ID, and *pool\_id* indicates the backend server group ID.

- b. Add **X-Auth-Token** to the request header.
    - c. Check the response.
      - If the request is successful, 204 is returned, and the response body is empty.
      - If the request is abnormal, locate the fault by referring to [Error Codes](#).
  4. Delete the forwarding rules added to each listener.
    - a. Send **DELETE** `https://{elb_endpoint}/v3/{project_id}/elb/l7policies/{policy_id}/rules/{rule_id}`. *project\_id* indicates the project ID, *policy\_id* indicates the forwarding policy ID, and *rule\_id* indicates the forwarding rule ID.
    - b. Add **X-Auth-Token** to the request header.
    - c. Check the response.
      - If the request is successful, 204 is returned, and the response body is empty.
      - If the request is abnormal, locate the fault by referring to [Error Codes](#).
  5. Delete the forwarding policies added to each listener.
    - a. Send **DELETE** `https://{elb_endpoint}/v3/{project_id}/elb/l7policies/{policy_id}`. *project\_id* indicates the project ID, and *policy\_id* indicates the forwarding policy ID.
    - b. Add **X-Auth-Token** to the request header.
    - c. Check the response.
      - If the request is successful, 204 is returned, and the response body is empty.
      - If the request is abnormal, locate the fault by referring to [Error Codes](#).
  6. Delete each listener added to the load balancer.
    - a. Send **DELETE** `https://{elb_endpoint}/v3/{project_id}/elb/listeners/{listener_id}`. *project\_id* indicates the project ID, and *listener\_id* indicates the listener ID.
    - b. Add **X-Auth-Token** to the request header.
    - c. Check the response.
      - If the request is successful, 204 is returned, and the response body is empty.
      - If the request is abnormal, locate the fault by referring to [Error Codes](#).
  7. Delete the load balancer.
    - a. Send **DELETE** `https://{elb_endpoint}/v3/{project_id}/elbloadbalancers/{loadbalancer_id}`. *project\_id* indicates the project ID, and *loadbalancer\_id* indicates the load balancer ID.

- b. Add **X-Auth-Token** to the request header.
- c. Check the response.
  - If the request is successful, 204 is returned, and the response body is empty.
  - If the request is abnormal, locate the fault by referring to [Error Codes](#).

## 8.4 Creating a Public Network (Shared) Load Balancer

### Scenarios

Call APIs to create a load balancer and bind a new EIP to it.

### Prerequisites

You have created a VPC and a subnet.

### Procedure

Bind an EIP to the port that has been bound to the private IP address of the load balancer based on [Example request 1: Creating a private network load balancer](#). For details about the parameters, see [Table 8-1](#).

**Table 8-1** Request parameters

| Parameter             | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|-----------------------|-----------|--------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| publicip              | Yes       | Object | Specifies the EIP. For details, see <a href="#">Table 8-2</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| bandwidth             | Yes       | Object | Specifies the bandwidth. For details, see <a href="#">Table 8-3</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| id        | No        | String  | <ul style="list-style-type: none"><li>• Specifies the bandwidth ID. You can specify an existing shared bandwidth when assigning an EIP.</li><li>• The value can be the ID of the shared bandwidth whose type is set to <b>WHOLE</b>.</li></ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| Parameter   | Mandatory | Type   | Description                                                                                                                                                                                                                                                              |
|-------------|-----------|--------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| share_type  | Yes       | String | <ul style="list-style-type: none"><li>Specifies the bandwidth type.</li><li>The value can be one of the following:<ul style="list-style-type: none"><li><b>PER</b>: indicates dedicated bandwidth.</li><li><b>WHOLE</b>: indicated shared bandwidth.</li></ul></li></ul> |
| charge_mode | No        | String | <ul style="list-style-type: none"><li>The default value is <b>traffic</b>. Currently, only billing by traffic is supported.</li></ul>                                                                                                                                    |

- Step 1: Apply for an EIP.

POST https://{VPCEndpoint}/v1/8b7e35ad379141fc9df3e178bd64f55c/publicips

```
{
 "publicip": {
 "type": "5_bgp",
 "ip_version": 4
 },
 "bandwidth": {
 "name": "bandwidth123",
 "size": 10,
 "share_type": "PER"
 }
}
```

- Example response

```
{
 "publicip": {
 "id": "f588ccfa-8750-4d7c-bf5d-2ede24414706",
 "status": "PENDING_CREATE",
 "type": "5_bgp",
 "public_ip_address": "139.9.204.183",
 "tenant_id": "8b7e35ad379141fc9df3e178bd64f55c",
 "ip_version": 4,
 "create_time": "2019-06-29 06:45:32",
 "bandwidth_size": 1
 }
}
```

- Step 2: Bind the EIP. (The value of **public\_id** is the same as that in the [Example response](#), and the value of **port\_id** is the same as that of **vip\_port\_id** in [Example response 1](#).)

PUT /v1/8b7e35ad379141fc9df3e178bd64f55c/publicips/f588ccfa-8750-4d7c-bf5d-2ede24414706

```
{
 "publicip": {
 "port_id": "a7ecbdb5-5a63-41dd-a830-e16c0a7e04a7"
 }
}
```

- Example response

```
{
 "publicip": {
 "id": "f588ccfa-8750-4d7c-bf5d-2ede24414706",
 "status": "ACTIVE",
 "type": "5_bgp",
 "port_id": "a7ecbdb5-5a63-41dd-a830-e16c0a7e04a7",
 }
}
```

```
"public_ip_address": "139.9.204.183",
"private_ip_address": "192.168.1.131",
"tenant_id": "8b7e35ad379141fc9df3e178bd64f55c",
"create_time": "2019-06-29 07:33:18",
"bandwidth_size": 1,
"ip_version": 4
}
```

- After the preceding steps are complete, the load balancer has the capability of accessing the public network. You can access the load balancer using 139.9.204.183, the value of parameter **public\_ip\_address**.

## 8.5 Querying the ID of an ECS Used as a Backend Server

### Scenarios

Call APIs to obtain the ID of an ECS used as a backend server of a load balancer.

### Prerequisites

You have created a load balancer, a backend server group, and a backend server.

### Procedure

Send **GET /v3/{project\_id}/elb/members**. *project\_id* indicates the project ID. You can add other criteria as you needed. For details, see the API document. Add **X-Auth-Token** to the request header.

View the response result and obtain the ECS ID from **instance\_id**.

- The request is successful if the following response is displayed:

```
{
 "request_id": "0df89f0ad2ecf0e0a5688978d28e9a6d",
 "members": [
 {
 "weight": 1,
 "admin_state_up": true,
 "project_id": "04dd36f9c0000fe22f9fc00b409f1sq1",
 "address": "192.168.2.96",
 "protocol_port": 80,
 "id": "0b7c1e58-5940-41c1-a7c5-dbe4b3f23e4w",
 "operating_status": ONLINE,
 "status": [
 {
 "listener_id": "73bea9d6-fb7f-47cc-b949-c3382abb1f46",
 "operating_status": "ONLINE"
 }
],
 "instance_id": "6985a0dc-5884-40f2-9426-15fb4bab8f1d", // ECS ID
 "device_id": "6985a0dc-5884-40f2-9426-15fb4bab8f1d",

 "current_count": 1
 }
}
```

- If the request is abnormal, locate the fault by referring to [Error Codes](#).

# 9 Permissions and Supported Actions

---

## 9.1 Introduction

This section describes fine-grained permissions management for ELB. If your Huawei Cloud account does not need individual IAM users, then you may skip this chapter.

By default, new IAM users do not have permissions assigned. You need to add a user to one or more groups, and attach permissions policies or roles to these groups. Users inherit permissions from the groups to which they are added and can perform specified operations on cloud services based on the permissions.

An account has all of the permissions required to call all APIs, but IAM users must have the required permissions specifically assigned. The permissions required for calling an API are determined by the actions supported by the API. Only users who have been granted permissions allowing the actions can call the API successfully. For example, if an IAM user queries backend servers using an API, the user must have been granted permissions that allow the `elb:servers:list` action.

## Supported Actions

ELB provides system-defined policies that can be directly used in IAM. You can also create custom policies and use them to supplement system-defined policies, implementing more refined access control. Operations supported by policies are specific to APIs. The following are common concepts related to policies:

- **Permissions:** Defined by actions in a custom policy.
- **APIs:** REST APIs that can be called in a custom policy.
- **Actions:** Added to a custom policy to control permissions for specific operations.
- **Dependencies:** actions which a specific action depends on. When allowing an action for a user, you also need to allow any existing action dependencies for that user.
- **IAM projects or enterprise projects:** Type of projects in which policies can be used to grant permissions. A policy can be applied to IAM projects, enterprise projects, or both. Policies that contain actions supporting both IAM and

enterprise projects can be assigned to user groups and take effect in both IAM and Enterprise Management. Policies that only contain actions supporting IAM projects can be assigned to user groups and only take effect for IAM. Such policies will not take effect if they are assigned to user groups in Enterprise Project. For details about the differences between IAM and enterprise projects, see [Differences Between IAM Projects and Enterprise Projects](#)

**Supported Actions (V3)** describes the custom policy authorization items supported by ELB.

- **Load balancer actions**, including actions supported by all load balancer APIs, such as the APIs for creating a load balancer, querying a load balancer, querying the load balancer status tree, querying the load balancer list, updating a load balancer, and deleting a load balancer.

 **NOTE**

The check mark (√) indicates that an action takes effect. The cross mark (x) indicates that an action does not take effect.

## 9.2 Supported Actions (V2)

### 9.2.1 Load Balancer

| Permi<br>ssion                                                    | API                                                                               | Action                       | IAM<br>Project | Enterprise<br>Project |
|-------------------------------------------------------------------|-----------------------------------------------------------------------------------|------------------------------|----------------|-----------------------|
| Creat<br>es a<br>load<br>balan<br>cer                             | POST /v2/<br>{project_id}/elb/<br>loadbalancers                                   | elb:loadbalanc<br>ers:create | √              | √                     |

| Queri<br>es the<br>status<br>tree<br>of a<br>load<br>balan<br>cer | GET /v2/<br>{project_id}/elb/<br>loadbalancers/<br>{loadbalancer_id}/<br>statuses | elb:loadbalanc<br>ers:get    | √              | √                     |

| Permission              | API                                                         | Action                   | IAM Project | Enterprise Project |
|-------------------------|-------------------------------------------------------------|--------------------------|-------------|--------------------|
| Queries load balancers  | GET /v2/{project_id}/elb/loadbalancers                      | elb:loadbalancers:list   | √           | √                  |
| Updates a load balancer | PUT /v2/{project_id}/elb/loadbalancers/{loadbalancer_id}    | elb:loadbalancers:put    | √           | √                  |
| Deletes a load balancer | DELETE /v2/{project_id}/elb/loadbalancers/{loadbalancer_id} | elb:loadbalancers:delete | √           | √                  |

## 9.2.2 Listener

| Permission          | API                                                 | Action               | IAM Project | Enterprise Project |
|---------------------|-----------------------------------------------------|----------------------|-------------|--------------------|
| Adds a listener     | POST /v2/{project_id}/elb/listeners                 | elb:listeners:create | √           | √                  |
| Queries a listener  | GET /v2/{project_id}/elb/listeners/{listener_id}    | elb:listeners:get    | √           | √                  |
| Queries listeners   | GET /v2/{project_id}/elb/listeners                  | elb:listeners:list   | √           | √                  |
| Modifies a listener | PUT /v2/{project_id}/elb/listeners/{listener_id}    | elb:listeners:put    | √           | √                  |
| Deletes a listener  | DELETE /v2/{project_id}/elb/listeners/{listener_id} | elb:listeners:delete | √           | √                  |

### 9.2.3 Backend Server Group

| Permission                      | API                                         | Action           | IAM Project | Enterprise Project |
|---------------------------------|---------------------------------------------|------------------|-------------|--------------------|
| Adds a backend server group     | POST /v2/{project_id}/elb/pools             | elb:pools:create | √           | √                  |
| Queries a backend server group  | GET /v2/{project_id}/elb/pools/{pool_id}    | elb:pools:get    | √           | √                  |
| Queries backend server groups   | GET /v2/{project_id}/elb/pools              | elb:pools:list   | √           | √                  |
| Modifies a backend server group | PUT /v2/{project_id}/elb/pools/{pool_id}    | elb:pools:put    | √           | √                  |
| Deletes a backend server group  | DELETE /v2/{project_id}/elb/pools/{pool_id} | elb:pools:delete | √           | √                  |

### 9.2.4 Backend Server

| Permission            | API                                               | Action             | IAM Project | Enterprise Project |
|-----------------------|---------------------------------------------------|--------------------|-------------|--------------------|
| Adds a backend server | POST /v2/{project_id}/elb/pools/{pool_id}/members | elb:members:create | √           | √                  |

| Permission                | API                                                             | Action             | IAM Project | Enterprise Project |
|---------------------------|-----------------------------------------------------------------|--------------------|-------------|--------------------|
| Queries a backend server  | GET /v2/{project_id}/elb/pools/{pool_id}/members/{member_id}    | elb:members:get    | √           | √                  |
| Queries backend servers   | GET /v2/{project_id}/elb/pools/{pool_id}/members                | elb:members:list   | √           | √                  |
| Modifies a backend server | PUT /v2/{project_id}/elb/pools/{pool_id}/members/{member_id}    | elb:members:put    | √           | √                  |
| Removes a backend server  | DELETE /v2/{project_id}/elb/pools/{pool_id}/members/{member_id} | elb:members:delete | √           | √                  |

## 9.2.5 Health Check

| Permission                | API                                                        | Action                    | IAM Project | Enterprise Project |
|---------------------------|------------------------------------------------------------|---------------------------|-------------|--------------------|
| Configures a health check | POST /v2/{project_id}/elb/healthmonitors                   | elb:healthmonitors:create | √           | √                  |
| Queries a health check    | GET /v2/{project_id}/elb/healthmonitors/{healthmonitor_id} | elb:healthmonitors:get    | √           | √                  |
| Queries health checks     | GET /v2/{project_id}/elb/healthmonitors                    | elb:healthmonitors:list   | √           | √                  |
| Modifies a health check   | PUT /v2/{project_id}/elb/healthmonitors/{healthmonitor_id} | elb:healthmonitors:put    | √           | √                  |

| Permissi<br>on         | API                                                           | Action                    | IAM<br>Project | Enterprise<br>Project |
|------------------------|---------------------------------------------------------------|---------------------------|----------------|-----------------------|
| Deletes a health check | DELETE /v2/{project_id}/elb/healthmonitors/{healthmonitor_id} | elb:healthmonitors:delete | √              | √                     |

## 9.2.6 Forwarding Policy

| Permis<br>sion              | API                                                  | Action                | IAM<br>Project | Enterprise<br>Project |
|-----------------------------|------------------------------------------------------|-----------------------|----------------|-----------------------|
| Adds a forwarding policy    | POST /v2/{project_id}/elb/l7policies                 | elb:l7policies:create | √              | √                     |
| Queries a forwarding policy | GET /v2/{project_id}/elb/l7policies/{l7policy_id}    | elb:l7policies:get    | √              | √                     |
| Queries forwarding policies | GET /v2/{project_id}/elb/l7policies                  | elb:l7policies:list   | √              | √                     |
| Updates a forwarding policy | PUT /v2/{project_id}/elb/l7policies/{l7policy_id}    | elb:l7policies:put    | √              | √                     |
| Deletes a forwarding policy | DELETE /v2/{project_id}/elb/l7policies/{l7policy_id} | elb:l7policies:delete | √              | √                     |

## 9.2.7 Forwarding Rule

| Permission               | API                                                                    | Action             | IAM Project | Enterprise Project |
|--------------------------|------------------------------------------------------------------------|--------------------|-------------|--------------------|
| Create a forwarding rule | POST /v2/{project_id}/elb/l7policies/{l7policy_id}/rules               | elb:l7rules:create | √           | √                  |
| Query a forwarding rule  | GET /v2/{project_id}/elb/l7policies/{l7policy_id}/rules/{l7rule_id}    | elb:l7rules:get    | √           | √                  |
| Query forwarding rules   | GET /v2/{project_id}/elb/l7policies/{l7policy_id}/rules                | elb:l7rules:list   | √           | √                  |
| Update a forwarding rule | PUT /v2/{project_id}/elb/l7policies/{l7policy_id}/rules/{l7rule_id}    | elb:l7rules:put    | √           | √                  |
| Delete a forwarding rule | DELETE /v2/{project_id}/elb/l7policies/{l7policy_id}/rules/{l7rule_id} | elb:l7rules:delete | √           | √                  |

## 9.2.8 Whitelist

| Permission        | API                                                | Action                | IAM Project | Enterprise Project |
|-------------------|----------------------------------------------------|-----------------------|-------------|--------------------|
| Adds a whitelist  | POST /v2/{project_id}/elb/whitelists               | elb:whitelists:create | √           | √                  |
| Query a whitelist | GET /v2/{project_id}/elb/whitelists/{whitelist_id} | elb:whitelists:get    | √           | √                  |

| Permi<br>ssion                  | API                                                           | Action                    | IAM<br>Project | Enterprise<br>Project |

## 9.2.11 Tag

| Permissio<br>n                                                              | API                                                                             | Action                              | IAM<br>Project | Enterprise<br>Project |
|-----------------------------------------------------------------------------|---------------------------------------------------------------------------------|-------------------------------------|----------------|-----------------------|
| Queries all<br>tags of a<br>load<br>balancer.                               | GET /v2.0/{project_id}/<br>loadbalancers/<br>{loadbalancer_id}/tags             | elb:loadbal<br>ancerTags:g<br>et    | √              | x                     |
| Adds or<br>deletes<br>load<br>balancer<br>tags in<br>batches.               | POST /v2.0/{project_id}/<br>loadbalancers/<br>{loadbalancer_id}/tags/<br>action | elb:loadbal<br>ancerTags:c<br>reate | √              | x                     |
| Queries<br>tags of all<br>load<br>balancers<br>in a<br>specific<br>project. | GET /v2.0/{project_id}/<br>loadbalancers/tags                                   | elb:loadbal<br>ancerTags:g<br>et    | √              | x                     |

| Permission                                              | API                                                                  | Action                      | IAM Project | Enterprise Project |
|---------------------------------------------------------|----------------------------------------------------------------------|-----------------------------|-------------|--------------------|
| Queries load balancers by tag.                          | POST /v2.0/{project_id}/loadbalancers/resource_instances/action      | elb:loadbalancerTags:get    | √           | x                  |
| Adds a tag to a specific load balancer.                 | POST /v2.0/{project_id}/loadbalancers/{loadbalancer_id}/tags         | elb:loadbalancerTags:create | √           | x                  |
| Deletes a tag with a specific key from a load balancer. | DELETE /v2.0/{project_id}/loadbalancers/{loadbalancer_id}/tags/{key} | elb:loadbalancerTags:delete | √           | x                  |
| Queries all tags of a listener.                         | GET /v2.0/{project_id}/listeners/{listener_id}/tags                  | elb:listenerTags:get        | √           | x                  |
| Adds or deletes listener tags in batches.               | POST /v2.0/{project_id}/listeners/{listener_id}/tags/action          | elb:listenerTags:create     | √           | x                  |
| Queries the tags of all listeners.                      | GET /v2.0/{project_id}/listeners/tags                                | elb:listenerTags:get        | √           | x                  |
| Queries listeners by tag.                               | POST /v2.0/{project_id}/listeners/resource_instances/action          | elb:listenerTags:get        | √           | x                  |
| Adds a tag to a specific listener.                      | POST /v2.0/{project_id}/listeners/{listener_id}/tags                 | elb:listenerTags:create     | √           | x                  |
| Deletes a tag with a specific key from a listener.      | DELETE /v2.0/{project_id}/listeners/{listener_id}/tags/{key}         | elb:listenerTags:delete     | √           | x                  |

## 9.2.12 Precautions for API Permissions

**elb:quotas:list** controls the fine-grained permission for quota display.

**elb:logtanks:create**, **elb:logtanks:list**, **elb:logtanks:get**, **elb:logtanks:put**, and **elb:logtanks:delete** control the fine-grained permission for log creation, log list query, log details query, log update, and log deletion.

The logging function relies on LTS, and the **lts:\*:get\*** and **lts:\*:list\*** permissions at the project level are required.

The monitoring function relies on Cloud Eye.

## 9.3 Supported Actions (V3)

### 9.3.1 Load Balancer

| Permi<br>ssion                                                    | API                                                                               | Action                       | IAM<br>Project | Enterprise<br>Project |
|-------------------------------------------------------------------|-----------------------------------------------------------------------------------|------------------------------|----------------|-----------------------|
| Creat<br>es a<br>load<br>balan<br>cer                             | POST /v3/<br>{project_id}/elb/<br>loadbalancers                                   | elb:loadbalanc<br>ers:create | √              | √                     |
| Queri<br>es a<br>load<br>balan<br>cer                             | GET /v3/<br>{project_id}/elb/<br>loadbalancers/<br>{loadbalancer_id}              | elb:loadbalanc<br>ers:get    | √              | √                     |

| Queri<br>es<br>load<br>balan<br>cers                              | GET /v3/<br>{project_id}/elb/<br>loadbalancers                                    | elb:loadbalanc<br>ers:list   | √              | √                     |
| Updat<br>es a<br>load<br>balan<br>cer                             | PUT /v3/<br>{project_id}/elb/<br>loadbalancers/<br>{loadbalancer_id}              | elb:loadbalanc<br>ers:put    | √              | √                     |

| Permission              | API                                                         | Action                   | IAM Project | Enterprise Project |
|-------------------------|-------------------------------------------------------------|--------------------------|-------------|--------------------|
| Deletes a load balancer | DELETE /v3/{project_id}/elb/loadbalancers/{loadbalancer_id} | elb:loadbalancers:delete | √           | √                  |

### 9.3.2 Listener

| Permission          | API                                                 | Action               | IAM Project | Enterprise Project |
|---------------------|-----------------------------------------------------|----------------------|-------------|--------------------|
| Adds a listener     | POST /v3/{project_id}/elb/listeners                 | elb:listeners:create | √           | √                  |
| Queries a listener  | GET /v3/{project_id}/elb/listeners/{listener_id}    | elb:listeners:get    | √           | √                  |
| Queries listeners   | GET /v3/{project_id}/elb/listeners                  | elb:listeners:list   | √           | √                  |
| Modifies a listener | PUT /v3/{project_id}/elb/listeners/{listener_id}    | elb:listeners:put    | √           | √                  |
| Deletes a listener  | DELETE /v3/{project_id}/elb/listeners/{listener_id} | elb:listeners:delete | √           | √                  |

### 9.3.3 Backend Server Group

| Permission                     | API                             | Action           | IAM Project | Enterprise Project |
|--------------------------------|---------------------------------|------------------|-------------|--------------------|
| Creates a backend server group | POST /v3/{project_id}/elb/pools | elb:pools:create | √           | √                  |

| Permission                      | API                                         | Action           | IAM Project | Enterprise Project |
|---------------------------------|---------------------------------------------|------------------|-------------|--------------------|
| Queries a backend server group  | GET /v3/{project_id}/elb/pools/{pool_id}    | elb:pools:get    | √           | √                  |
| Queries backend server groups   | GET /v3/{project_id}/elb/pools              | elb:pools:list   | √           | √                  |
| Modifies a backend server group | PUT /v3/{project_id}/elb/pools/{pool_id}    | elb:pools:put    | √           | √                  |
| Deletes a backend server group  | DELETE /v3/{project_id}/elb/pools/{pool_id} | elb:pools:delete | √           | √                  |

### 9.3.4 Backend Server

| Permission               | API                                                          | Action             | IAM Project | Enterprise Project |
|--------------------------|--------------------------------------------------------------|--------------------|-------------|--------------------|
| Adds a backend server    | POST /v3/{project_id}/elb/pools/{pool_id}/members            | elb:members:create | √           | √                  |
| Queries a backend server | GET /v3/{project_id}/elb/pools/{pool_id}/members/{member_id} | elb:members:get    | √           | √                  |

| Permission                | API                                                             | Action             | IAM Project | Enterprise Project |
|---------------------------|-----------------------------------------------------------------|--------------------|-------------|--------------------|
| Queries backend servers   | GET /v3/{project_id}/elb/pools/{pool_id}/members                | elb:members:list   | √           | √                  |
| Modifies a backend server | PUT /v3/{project_id}/elb/pools/{pool_id}/members/{member_id}    | elb:members:put    | √           | √                  |
| Removes a backend server  | DELETE /v3/{project_id}/elb/pools/{pool_id}/members/{member_id} | elb:members:delete | √           | √                  |

### 9.3.5 Health Check

| Permission                | API                                                           | Action                    | IAM Project | Enterprise Project |
|---------------------------|---------------------------------------------------------------|---------------------------|-------------|--------------------|
| Configures a health check | POST /v3/{project_id}/elb/healthmonitors                      | elb:healthmonitors:create | √           | √                  |
| Queries a health check    | GET /v3/{project_id}/elb/healthmonitors/{healthmonitor_id}    | elb:healthmonitors:get    | √           | √                  |
| Queries health checks     | GET /v3/{project_id}/elb/healthmonitors                       | elb:healthmonitors:list   | √           | √                  |
| Modifies a health check   | PUT /v3/{project_id}/elb/healthmonitors/{healthmonitor_id}    | elb:healthmonitors:put    | √           | √                  |
| Deletes a health check    | DELETE /v3/{project_id}/elb/healthmonitors/{healthmonitor_id} | elb:healthmonitors:delete | √           | √                  |

### 9.3.6 Forwarding Policy

| Permission                  | API                                                  | Action                | IAM Project | Enterprise Project |
|-----------------------------|------------------------------------------------------|-----------------------|-------------|--------------------|
| Adds a forwarding policy    | POST /v3/{project_id}/elb/l7policies                 | elb:l7policies:create | √           | √                  |
| Queries a forwarding policy | GET /v3/{project_id}/elb/l7policies/{l7policy_id}    | elb:l7policies:get    | √           | √                  |
| Queries forwarding policies | GET /v3/{project_id}/elb/l7policies                  | elb:l7policies:list   | √           | √                  |
| Updates a forwarding policy | PUT /v3/{project_id}/elb/l7policies/{l7policy_id}    | elb:l7policies:put    | √           | √                  |
| Deletes a forwarding policy | DELETE /v3/{project_id}/elb/l7policies/{l7policy_id} | elb:l7policies:delete | √           | √                  |

### 9.3.7 Forwarding Rule

| Permission                | API                                                                 | Action             | IAM Project | Enterprise Project |
|---------------------------|---------------------------------------------------------------------|--------------------|-------------|--------------------|
| Creates a forwarding rule | POST /v3/{project_id}/elb/l7policies/{l7policy_id}/rules            | elb:l7rules:create | √           | √                  |
| Queries a forwarding rule | GET /v3/{project_id}/elb/l7policies/{l7policy_id}/rules/{l7rule_id} | elb:l7rules:get    | √           | √                  |

| Permission                | API                                                                    | Action             | IAM Project | Enterprise Project |
|---------------------------|------------------------------------------------------------------------|--------------------|-------------|--------------------|
| Queries forwarding rules  | GET /v3/{project_id}/elb/l7policies/{l7policy_id}/rules                | elb:l7rules:list   | √           | √                  |
| Updates a forwarding rule | PUT /v3/{project_id}/elb/l7policies/{l7policy_id}/rules/{l7rule_id}    | elb:l7rules:put    | √           | √                  |
| Deletes a forwarding rule | DELETE /v3/{project_id}/elb/l7policies/{l7policy_id}/rules/{l7rule_id} | elb:l7rules:delete | √           | √                  |

### 9.3.8 IP Address Group

| Permission                  | API                                            | Action              | IAM Project | Enterprise Project |
|-----------------------------|------------------------------------------------|---------------------|-------------|--------------------|
| Creates an IP address group | POST /v3/{project_id}/elb/ipgroups             | elb:ipgroups:create | √           | √                  |
| Queries an IP address group | GET /v3/{project_id}/elb/ipgroups/{ipgroup_id} | elb:ipgroups:get    | √           | √                  |
| Queries IP address groups   | GET /v3/{project_id}/elb/ipgroups              | elb:ipgroups:list   | √           | √                  |
| Updates an IP address group | PUT /v3/{project_id}/elb/ipgroups/{ipgroup_id} | elb:ipgroups:put    | √           | √                  |

| Permission                                 | API                                                                    | Action              | IAM Project | Enterprise Project |
|--------------------------------------------|------------------------------------------------------------------------|---------------------|-------------|--------------------|

| Update IP addresses in an IP address group | PUT /v3/{project_id}/elb/ipgroups/{ipgroup_id}/iplist/create-or-update | elb:ipgroups:put    | √           | √                  |
| Delete IP addresses in an IP address group | DELETE /v3/{project_id}/elb/ipgroups/{ipgroup_id}/iplist/batch-delete  | elb:ipgroups:put    | √           | √                  |

### 9.3.9 Certificate

| Permission           | API                                                    | Action                  | IAM Project | Enterprise Project |
|----------------------|--------------------------------------------------------|-------------------------|-------------|--------------------|
| Create a certificate | POST /v3/{project_id}/elb/certificates                 | elb:certificates:create | √           | √                  |
| Query a certificate  | GET /v3/{project_id}/elb/certificates/{certificate_id} | elb:certificates:get    | √           | √                  |
| Query certificates   | GET /v3/{project_id}/elb/certificates                  | elb:certificates:list   | √           | √                  |
| Modify a certificate | PUT /v3/{project_id}/elb/certificates/{certificate_id} | elb:certificates:put    | √           | √                  |

| Permission            | API                                                       | Action                  | IAM Project | Enterprise Project |
|-----------------------|-----------------------------------------------------------|-------------------------|-------------|--------------------|
| Deletes a certificate | DELETE /v3/{project_id}/elb/certificates/{certificate_id} | elb:certificates:delete | √           | √                  |

### 9.3.10 Security Policy

| Permission                       | API                                                         | Action                       | IAM Project | Enterprise Project |
|----------------------------------|-------------------------------------------------------------|------------------------------|-------------|--------------------|
| Creates a custom security policy | POST /v3/{project_id}/elb/security-policies                 | elb:security-policies:create | √           | √                  |
| Queries a custom security policy | GET /v3/{project_id}/elb/security-policies/{certificate_id} | elb:security-policies:get    | √           | √                  |
| Queries custom security policies | GET /v3/{project_id}/elb/security-policies                  | elb:security-policies:list   | √           | √                  |
| Updates a custom security policy | PUT /v3/{project_id}/elb/security-policies/{certificate_id} | elb:security-policies:put    | √           | √                  |

| Permission                       | API                                                            | Action                       | IAM Project | Enterprise Project |
|----------------------------------|----------------------------------------------------------------|------------------------------|-------------|--------------------|
| Deletes a custom security policy | DELETE /v3/{project_id}/elb/security-policies/{certificate_id} | elb:security-policies:delete | √           | √                  |
| Queries system security policies | GET /v3/{project_id}/elb/system-security-policies              | elb:security-policies:list   | √           | √                  |

### 9.3.11 Quota

| Permission                      | API                                     | Action          | IAM Project | Enterprise Project |
|---------------------------------|-----------------------------------------|-----------------|-------------|--------------------|
| Queries current resource quotas | GET /v3/{project_id}/elb/quotas         | elb:quotas:list | √           | √                  |
| Queries quota usage             | GET /v3/{project_id}/elb/quotas/details | elb:quotas:list | √           | √                  |

### 9.3.12 API Version

| Permi<br>ssion                        | API           | Action              | IAM<br>Project | Enterprise<br>Project |
|---------------------------------------|---------------|---------------------|----------------|-----------------------|
| Quer<br>ies the<br>API<br>versio<br>n | GET /versions | elb:quotas<br>:list | √              | x                     |

### 9.3.13 Availability Zone

| Permi<br>ssion  | API                                             | Action                              | IAM<br>Project | Enterprise<br>Project |
|-----------------|-------------------------------------------------|-------------------------------------|----------------|-----------------------|
| Quer<br>ies AZs | GET /v3/{project_id}/elb/<br>availability-zones | elb:availa<br>bility-<br>zones:list | √              | √                     |

### 9.3.14 Load Balancer Flavor

| Permi<br>ssion                                           | API                                              | Action               | IAM<br>Project | Enterprise<br>Project |
|----------------------------------------------------------|--------------------------------------------------|----------------------|----------------|-----------------------|
| Quer<br>ies<br>defaul<br>t<br>resour<br>ce<br>quota<br>s | GET /v3/{project_id}/elb/<br>flavors             | elb:flavors<br>:list | √              | x                     |
| Quer<br>ies<br>curren<br>t<br>resour<br>ce<br>quota<br>s | GET /v3/{project_id}/elb/<br>flavors/{flavor_id} | elb:flavors<br>:get  | √              | x                     |

### 9.3.15 Precautions for API Permissions

**elb:quotas:list** controls the fine-grained permission for quota display.

**elb:logtanks:create**, **elb:logtanks:list**, **elb:logtanks:get**, **elb:logtanks:put**, and **elb:logtanks:delete** control the fine-grained permission for log creation, log list query, log details query, log update, and log deletion.

The logging function relies on LTS, and the **lts:\*:get\*** and **lts:\*:list\*** permissions at the project level are required.

The monitoring function relies on Cloud Eye.

# 10 Historical APIs

## 10.1 Shared Load Balancer APIs (OpenStack) (Discarded)

### 10.1.1 Load Balancer

#### 10.1.1.1 Creating a Load Balancer

##### Function

This API is used to create a private network load balancer. After the load balancer is created, its details, such as load balancer ID, IP address, and subnet ID, are returned.

To create a public network load balancer, you also need to call the API for assigning an EIP and associate this IP address to the port bound to the IP address of the private network load balancer.

##### URI

POST /v2.0/lbaas/loadbalancers

##### Request

Table 10-1 Parameter description

| Parameter    | Mandatory | Type   | Description                                                                |
|--------------|-----------|--------|----------------------------------------------------------------------------|
| loadbalancer | Yes       | Object | Specifies the load balancer. For details, see <a href="#">Table 10-2</a> . |

**Table 10-2 loadbalancer** parameter description

| Parameter     | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                                                        |
|---------------|-----------|--------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| name          | No        | String | Specifies the load balancer name.<br>The value contains a maximum of 255 characters.                                                                                                                                                                                                                                                               |
| description   | No        | String | Provides supplementary information about the load balancer.<br>The value contains a maximum of 255 characters.                                                                                                                                                                                                                                     |
| tenant_id     | No        | String | Specifies the ID of the project where the load balancer is used.<br>The value contains a maximum of 255 characters.<br>The value must be the same as the value of <b>project_id</b> in the token.                                                                                                                                                  |
| project_id    | No        | String | Specifies the ID of the project to which the load balancer belongs. This parameter has the same meaning as <b>tenant_id</b> .<br>The value must be the same as the value of <b>project_id</b> in the token.                                                                                                                                        |
| vip_subnet_id | Yes       | String | Specifies the ID of the IPv4 subnet where the load balancer works. You can obtain the value by calling the API for querying subnets ({VPC endpoint}/v2.0/subnets) using the GET method.<br>The private IP address of the load balancer is in this subnet.<br>Only IPv4 subnets are supported.                                                      |
| provider      | No        | String | Specifies the provider of the load balancer.<br>The value can only be <b>vlb</b> .                                                                                                                                                                                                                                                                 |
| vip_address   | No        | String | Specifies the private IP address of the load balancer.<br>This IP address must be the one in the subnet specified by <b>vip_subnet_id</b> . If this parameter is not specified, an IP address is automatically assigned to the load balancer from the subnet specified by <b>vip_subnet_id</b> .<br>The value contains a maximum of 64 characters. |

| Parameter      | Mandatory | Type    | Description                                                                                                                         |
|----------------|-----------|---------|-------------------------------------------------------------------------------------------------------------------------------------|
| admin_state_up | No        | Boolean | Specifies the administrative status of the load balancer.<br><br>This parameter is reserved, and the default value is <b>true</b> . |

## Response

**Table 10-3** Response parameters

| Parameter    | Type   | Description                                                                |
|--------------|--------|----------------------------------------------------------------------------|
| loadbalancer | Object | Specifies the load balancer. For details, see <a href="#">Table 10-4</a> . |

**Table 10-4** loadbalancer parameter description

| Parameter     | Type   | Description                                                                                                                   |
|---------------|--------|-------------------------------------------------------------------------------------------------------------------------------|
| id            | String | Specifies the load balancer ID.                                                                                               |
| project_id    | String | Specifies the ID of the project to which the load balancer belongs. This parameter has the same meaning as <b>tenant_id</b> . |
| tenant_id     | String | Specifies the ID of the project where the load balancer is used.<br><br>The value contains a maximum of 255 characters.       |
| name          | String | Specifies the load balancer name.<br><br>The value contains a maximum of 255 characters.                                      |
| description   | String | Provides supplementary information about the load balancer.<br><br>The value contains a maximum of 255 characters.            |
| vip_subnet_id | String | Specifies the ID of the IPv4 subnet where the load balancer works.                                                            |

| Parameter           | Type    | Description                                                                                                                                                                                                                                                   |
|---------------------|---------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| vip_port_id         | String  | Specifies the ID of the port bound to the private IP address of the load balancer.<br><br>When you create a load balancer, the system automatically creates a port and associates it with a security group. However, the security group will not take effect. |
| provider            | String  | Specifies the provider of the load balancer.                                                                                                                                                                                                                  |
| vip_address         | String  | Specifies the private IP address of the load balancer.<br><br>The value contains a maximum of 64 characters.                                                                                                                                                  |
| listeners           | Array   | Lists the IDs of listeners added to the load balancer. For details, see <a href="#">Table 10-5</a> .                                                                                                                                                          |
| pools               | Array   | Lists the IDs of backend server groups associated with the load balancer. For details, see <a href="#">Table 10-6</a> .                                                                                                                                       |
| operating_status    | String  | Specifies the operating status of the load balancer.<br><br>This parameter is reserved, and its value can be <b>ONLINE</b> or <b>FROZEN</b> .                                                                                                                 |
| provisioning_status | String  | This parameter is reserved, and its value can only be <b>ACTIVE</b> .<br><br>It specifies the provisioning status of the load balancer.                                                                                                                       |
| admin_state_up      | Boolean | Specifies the administrative status of the load balancer.<br><br>This parameter is reserved. The value can be <b>true</b> or <b>false</b> . <ul style="list-style-type: none"><li>● <b>true</b>: Enabled</li><li>● <b>false</b>: Disabled</li></ul>           |
| tags                | Array   | Lists load balancer tags.                                                                                                                                                                                                                                     |

| Parameter  | Type   | Description                                                                                                                                                       |
|------------|--------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| created_at | String | Specifies the time when the load balancer was created.<br>The UTC time is in <i>YYYY-MM-DDTHH:MM:SS</i> format.<br>The value contains a maximum of 19 characters. |
| updated_at | String | Specifies the time when the load balancer was updated.<br>The UTC time is in <i>YYYY-MM-DDTHH:MM:SS</i> format.<br>The value contains a maximum of 19 characters. |

**Table 10-5** listeners parameter description

| Parameter | Type   | Description                                  |
|-----------|--------|----------------------------------------------|
| id        | String | Specifies the ID of the associated listener. |

**Table 10-6** pools parameter description

| Parameter | Type   | Description                                              |
|-----------|--------|----------------------------------------------------------|
| id        | String | Specifies the ID of the associated backend server group. |

## Example Request

- Example request 1: Creating a private network load balancer

POST <https://{Endpoint}/v2.0/lbaas/loadbalancers>

```
{
 "loadbalancer": {
 "name": "loadbalancer1",
 "description": "simple lb",
 "tenant_id": "1867112d054b427e808cc6096d8193a1",
 "vip_subnet_id": "58077bdb-d470-424b-8c45-2e3c65060a5b",
 "vip_address": "192.168.0.100",
 "admin_state_up": true
 }
}
```

- Example request 2

Bind an EIP to the port that has been bound to the load balancer's private IP address based on [Example request 1: Creating a private network load balancer](#). For details about the parameters, see [Table 10-7](#).

**Table 10-7** Request parameters

| Parameter             | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|-----------------------|-----------|--------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| publicip              | Yes       | Object | Specifies the EIP. For details, see <a href="#">Table 10-8</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| bandwidth             | Yes       | Object | Specifies the bandwidth. For details, see <a href="#">Table 10-9</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| enterprise_project_id | No        | String | <ul style="list-style-type: none"><li>Specifies the enterprise project ID. The value is <b>0</b> or a UUID that can contain a maximum of 36 characters, including hyphens (-).</li><li>When assigning an EIP, you need to bind an enterprise project ID to the EIP.</li><li>If this parameter is not specified, the default value is <b>0</b>.</li></ul> <b>NOTE</b><br>For more information about enterprise projects and how to obtain enterprise project IDs, see <a href="#">Enterprise Management User Guide</a> . |

You can specify an existing shared bandwidth when assigning an EIP.</li><li>The value can be the ID of the shared bandwidth whose type is set to <b>WHOLE</b>.</li></ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| Parameter   | Mandatory | Type   | Description                                                                                                                                                                                                                                      |
|-------------|-----------|--------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| share_type  | Yes       | String | <ul style="list-style-type: none"><li>Specifies the bandwidth type.</li><li>Value options:<ul style="list-style-type: none"><li><b>PER</b>: indicates dedicated bandwidth.</li><li><b>WHOLE</b>: indicated shared bandwidth.</li></ul></li></ul> |
| charge_mode | No        | String | <ul style="list-style-type: none"><li>The default value is <b>traffic</b>. Currently, only billing by traffic is supported.</li></ul>                                                                                                            |

- Step 1: Apply for an EIP.

POST https://{VPCEndpoint}/v1/8b7e35ad379141fc9df3e178bd64f55c/publicips

```
{
 "publicip": {
 "type": "5_bgp",
 "ip_version": 4
 },
 "bandwidth": {
 "name": "bandwidth123",
 "size": 10,
 "share_type": "PER"
 }
}
```

- Example response

```
{
 "publicip": {
 "id": "f588ccfa-8750-4d7c-bf5d-2ede24414706",
 "status": "PENDING_CREATE",
 "type": "5_bgp",
 "public_ip_address": "139.9.204.183",
 "tenant_id": "8b7e35ad379141fc9df3e178bd64f55c",
 "ip_version": 4,
 "create_time": "2019-06-29 06:45:32",
 "bandwidth_size": 1
 }
}
```

- Step 2: Bind the EIP. (The value of **public\_id** is the same as that in the [Example response](#), and the value of **port\_id** is the same as that of **vip\_port\_id** in [Example response 1](#).)

PUT /v1/8b7e35ad379141fc9df3e178bd64f55c/publicips/f588ccfa-8750-4d7c-bf5d-2ede24414706

```
{
 "publicip": {
 "port_id": "a7ecbdb5-5a63-41dd-a830-e16c0a7e04a7"
 }
}
```

- Example response

```
{
 "publicip": {
 "id": "f588ccfa-8750-4d7c-bf5d-2ede24414706",
 "status": "ACTIVE",
 "type": "5_bgp",
 "port_id": "a7ecbdb5-5a63-41dd-a830-e16c0a7e04a7",
 }
}
```

```

 "vip_subnet_id": "58077bdb-d470-424b-8c45-2e3c65060a5b",
 "provider": "vlb",
 "tags": [],
 "name": "loadbalancer1"
 }
}
```

- Example response 2

POST https://{Endpoint}/v2.0/lbaas/loadbalancers

```
{
 "loadbalancer": {
 "name": "loadbalancer1",
 "description": "simple lb",
 "tenant_id": "1867112d054b427e808cc6096d8193a1",
 "vip_subnet_id": "58077bdb-d470-424b-8c45-2e3c65060a5b",
 "vip_address": "192.168.0.100",
 "admin_state_up": true
 }
}
```

After the preceding steps are complete, the load balancer has the capability of accessing the public network. You can access the load balancer using 139.9.204.183, the value of parameter **public\_ip\_address**.

## Status Code

For details, see [Status Codes](#).

### 10.1.1.2 Querying Load Balancers

#### Function

This API is used to query load balancers and display them in a list. Filter query and pagination query are supported. Unless otherwise specified, exact match is applied.

#### Constraints

Parameters **marker**, **limit**, and **page\_reverse** are used for pagination query. Parameters **marker** and **page\_reverse** take effect only when they are used together with parameter **limit**.

#### URI

GET /v2.0/lbaas/loadbalancers

#### Request

**Table 10-10** Parameter description

| Parameter    | Mandatory | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                                       |
|--------------|-----------|---------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| marker       | No        | String  | Specifies the ID of the load balancer from which pagination query starts, that is, the ID of the last load balancer on the previous page.<br><br>This parameter must be used together with <b>limit</b> .                                                                                                                                                                                                                         |
| limit        | No        | Integer | Specifies the number of load balancers on each page.                                                                                                                                                                                                                                                                                                                                                                              |
| page_reverse | No        | Boolean | Specifies the page direction. The value can be <b>true</b> or <b>false</b> , and the default value is <b>false</b> . The last page in the list requested with <b>page_reverse</b> set to <b>false</b> will not contain the "next" link, and the last page in the list requested with <b>page_reverse</b> set to <b>true</b> will not contain the "previous" link.<br><br>This parameter must be used together with <b>limit</b> . |
| tenant_id    | No        | String  | Specifies the ID of the project where the load balancer is used.                                                                                                                                                                                                                                                                                                                                                                  |

| Parameter           | Mandatory | Type    | Description                                                                                                                               |
|---------------------|-----------|---------|-------------------------------------------------------------------------------------------------------------------------------------------|
| project_id          | No        | String  | Specifies the ID of the project to which the load balancer belongs. This parameter has the same meaning as <b>tenant_id</b> .             |
| id                  | No        | String  | Specifies the load balancer ID.                                                                                                           |
| description         | No        | String  | Provides supplementary information about the load balancer.<br>The value contains a maximum of 255 characters.                            |
| name                | No        | String  | Specifies the load balancer name.<br>The value contains a maximum of 255 characters.                                                      |
| operating_status    | No        | String  | Specifies the operating status of the load balancer.<br>This parameter is reserved, and its value can be <b>ONLINE</b> or <b>FROZEN</b> . |
| provisioning_status | No        | String  | This parameter is reserved, and its value can only be <b>ACTIVE</b> .<br>It specifies the provisioning status of the load balancer.       |
| admin_state_up      | No        | Boolean | This parameter is reserved, and its value can only be <b>true</b> .<br>It specifies the administrative status of the load balancer.       |
| vip_address         | No        | String  | Specifies the private IP address of the load balancer.<br>The value contains a maximum of 64 characters.                                  |
| vip_port_id         | No        | String  | Specifies the ID of the port bound to the private IP address of the load balancer.                                                        |
| vip_subnet_id       | No        | String  | Specifies the ID of the IPv4 subnet where the load balancer works.                                                                        |
| member_address      | No        | String  | Specifies the IP address of the backend server associated with the load balancer.                                                         |
| member_device_id    | No        | String  | Specifies the ID of the cloud server used as the backend server associated with the load balancer.                                        |
| vpc_id              | No        | String  | Specifies the ID of the VPC where the load balancer works.                                                                                |

## Response

**Table 10-11** Response parameters

| Parameter           | Type  | Description                                                                                                                                                                                            |
|---------------------|-------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| loadbalancers       | Array | Lists the load balancers. For details, see <a href="#">Table 10-12</a> .                                                                                                                               |
| loadbalancers_links | Array | Provides links to the previous or next page during pagination query, respectively. This parameter exists only in the response body of pagination query. For details, see <a href="#">Table 10-15</a> . |

**Table 10-12** loadbalancer parameter description

| Parameter   | Mandatory | Type   | Description                                                                                                                                                                                                 |
|-------------|-----------|--------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| name        | No        | String | Specifies the load balancer name.<br>The value contains a maximum of 255 characters.                                                                                                                        |
| description | No        | String | Provides supplementary information about the load balancer.<br>The value contains a maximum of 255 characters.                                                                                              |
| tenant_id   | No        | String | Specifies the ID of the project where the load balancer is used.<br>The value contains a maximum of 255 characters.<br>The value must be the same as the value of <b>project_id</b> in the token.           |
| project_id  | No        | String | Specifies the ID of the project to which the load balancer belongs. This parameter has the same meaning as <b>tenant_id</b> .<br>The value must be the same as the value of <b>project_id</b> in the token. |

| Parameter                   | Mandatory | Type    | Description                                                                                                                                                                                                                                                                                                                                                     |
|-----------------------------|-----------|---------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>vip_subnet_id</code>  | Yes       | String  | <p>Specifies the ID of the IPv4 subnet where the load balancer works. You can obtain the value by calling the API for querying subnets ({VPC endpoint}/v2.0/subnets) using the GET method.</p> <p>The private IP address of the load balancer is in this subnet.</p> <p>Only IPv4 subnets are supported. IPv6 subnets are not supported.</p>                    |
| <code>provider</code>       | No        | String  | <p>Specifies the provider of the load balancer.</p> <p>The value can only be <b>vlb</b>.</p>                                                                                                                                                                                                                                                                    |
| <code>vip_address</code>    | No        | String  | <p>Specifies the private IP address of the load balancer.</p> <p>This IP address must be the one in the subnet specified by <b>vip_subnet_id</b>. If this parameter is not specified, an IP address is automatically assigned to the load balancer from the subnet specified by <b>vip_subnet_id</b>.</p> <p>The value contains a maximum of 64 characters.</p> |
| <code>admin_state_up</code> | No        | Boolean | <p>Specifies the administrative status of the load balancer.</p> <p>This parameter is reserved. The default value is <b>true</b>.</p>                                                                                                                                                                                                                           |

**Table 10-13** listeners parameter description

| Parameter       | Type   | Description                                  |
|-----------------|--------|----------------------------------------------|
| <code>id</code> | String | Specifies the ID of the associated listener. |

**Table 10-14** pools parameter description

| Parameter       | Type   | Description                                              |
|-----------------|--------|----------------------------------------------------------|
| <code>id</code> | String | Specifies the ID of the associated backend server group. |

**Table 10-15** loadbalancers\_links parameter description

| Parameter | Type   | Description                                                                                                                                                                                                                                                                                 |
|-----------|--------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| href      | String | Provides links to the previous or next page during pagination query, respectively.                                                                                                                                                                                                          |
| rel       | String | Specifies the prompt of the previous or next page.<br>The value can be <b>next</b> or <b>previous</b> . The value <b>next</b> indicates the Hypertext Reference (href) containing the URL of the next page, and <b>previous</b> indicates the href containing the URL of the previous page. |

## Example Request

- Example request 1: Querying all load balancers  
GET https://{Endpoint}/v2.0/lbaas/loadbalancers
- Example request 2: Querying load balancers by page (Each page contains one load balancer. The ID of the start load balancer is **165b6a38-5278-4569-b747-b2ee65ea84a4**. The load balancer after **165b6a38-5278-4569-b747-b2ee65ea84a4** is the queried load balancer.)  
GET https://{Endpoint}/v2.0/lbaas/loadbalancers?limit=1&marker=165b6a38-5278-4569-b747-b2ee65ea84a4
- Example request 3: Querying the load balancer using the IP address of a backend server (192.168.0.191)  
GET https://{Endpoint}/v2.0/lbaas/loadbalancers?member\_address=192.168.0.181

## Status Code

For details, see [Status Codes](#).

### 10.1.1.3 Querying Details of a Load Balancer

## Function

This API is used to query details about a load balancer using its ID. You can also query the EIP bound to the load balancer based on the value of **vip\_port\_id**.

## URI

GET /v2.0/lbaas/loadbalancers/{loadbalancer\_id}

**Table 10-16** Parameter description

| Parameter       | Mandatory | Type   | Description                     |
|-----------------|-----------|--------|---------------------------------|
| loadbalancer_id | Yes       | String | Specifies the load balancer ID. |

## Request

None

## Response

**Table 10-17** Parameter description

| Parameter    | Type   | Description                                                                 |
|--------------|--------|-----------------------------------------------------------------------------|
| loadbalancer | Object | Specifies the load balancer. For details, see <a href="#">Table 10-18</a> . |

**Table 10-18 loadbalancer** parameter description

| Parameter           | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                                   |
|---------------------|-----------|--------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| name                | No        | String | Specifies the load balancer name.<br>The value contains a maximum of 255 characters.                                                                                                                                                                                                                                          |
| description         | No        | String | Provides supplementary information about the load balancer.<br>The value contains a maximum of 255 characters.                                                                                                                                                                                                                |
| provisioning_status | No        | String | This parameter is reserved.<br>Specifies the provisioning status of the load balancer. The value can be <b>ACTIVE</b> .                                                                                                                                                                                                       |
| tenant_id           | No        | String | Specifies the ID of the project where the load balancer is used.<br>The value contains a maximum of 255 characters.<br>The value must be the same as the value of <b>project_id</b> in the token.                                                                                                                             |
| project_id          | No        | String | Specifies the ID of the project where the load balancer is used. This parameter has the same meaning as <b>tenant_id</b> .<br>The value must be the same as the value of <b>project_id</b> in the token.                                                                                                                      |
| vip_subnet_id       | Yes       | String | Specifies the ID of the IPv4 subnet where the load balancer works. You can obtain the value by calling the API for querying subnets ({VPC endpoint}/v2.0/subnets) using the GET method.<br>The private IP address of the load balancer is in this subnet.<br>Only IPv4 subnets are supported. IPv6 subnets are not supported. |
| provider            | No        | String | Specifies the provider of the load balancer.<br>The value can only be <b>vlb</b> .                                                                                                                                                                                                                                            |

| Parameter                   | Mandatory | Type    | Description                                                                                                                                                                                                                                                                                                                                                                          |

If this parameter is not specified, an IP address is automatically assigned to the load balancer from the subnet specified by <b><code>vip_subnet_id</code></b> .<br><br>The value contains a maximum of 64 characters. |
| <code>admin_state_up</code> | No        | Boolean | Specifies the administrative status of the load balancer.<br><br>This parameter is reserved. The default value is <b>true</b> .                                                                                                                                                                                                                                                      |

**Table 10-19** listeners parameter description

| Parameter       | Type   | Description                                  |
|-----------------|--------|----------------------------------------------|
| <code>id</code> | String | Specifies the ID of the associated listener. |

**Table 10-20** pools parameter description

| Parameter       | Type   | Description                                              |
|-----------------|--------|----------------------------------------------------------|
| <code>id</code> | String | Specifies the ID of the associated backend server group. |

## Example Request

- Example request 1: Querying details of a load balancer using its ID
- Example request 2: Querying the EIP bound to the load balancer. For details, see [Querying EIPs](#).

GET https://{EIP\_Endpoint}/v1/{project\_id}/publicips?port\_id={vip\_port\_id}

**`vip_port_id`** is the value of **`vip_port_id`** for the load balancer.

### 10.1.1.4 Querying the Status Tree of a Load Balancer

#### Function

This API is used to query the status tree of a load balancer. You can use this API to query details about the associated listeners, backend server groups, backend servers, health checks, forwarding policies, and forwarding rules, helping you understand the topology of resources associated with the load balancer.

## URI

GET /v2.0/lbaas/loadbalancers/{loadbalancer\_id}/statuses

**Table 10-21** Parameter description

| Parameter       | Mandatory | Type   | Description                     |
|-----------------|-----------|--------|---------------------------------|
| loadbalancer_id | Yes       | String | Specifies the load balancer ID. |

## Request

None

## Response

| loadbalancer | Object | Specifies the load balancer. For details, see <a href="#">Table 10-24</a> . |

**Table 10-24** loadbalancer parameter description

| Parameter | Type   | Description                                                                                                      |
|-----------|--------|------------------------------------------------------------------------------------------------------------------|
| id        | String | Specifies the load balancer ID.                                                                                  |
| name      | String | Specifies the load balancer name.<br>The value contains a maximum of 255 characters.                             |
| listeners | Array  | Lists the listeners added to the load balancer. For details of this parameter, see <a href="#">Table 10-25</a> . |

| Parameter           | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|---------------------|--------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| pools               | Array  | Lists the backend server groups associated with the load balancer. For details of this parameter, see <a href="#">Table 10-26</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| operating_status    | String | <p>This field is reserved.</p> <p>It specifies the operating status of the load balancer. The value can be one of the following:</p> <ul style="list-style-type: none"><li>● <b>ONLINE</b> (default): The load balancer is running normally.</li><li>● <b>DEGRADED</b>: This status is displayed only when <b>provisioning_status</b> of a forwarding policy or forwarding rule added to a listener of the load balancer is set to <b>ERROR</b> and the API for querying the load balancer status tree is called.</li><li>● <b>DISABLED</b>: This status is displayed only when <b>admin_state_up</b> of the load balancer is set to <b>false</b> and the API for querying the load balancer status tree is called.</li><li>● <b>FROZEN</b>: The load balancer is frozen.</li></ul> |
| provisioning_status | String | <p>This parameter is reserved, and its value can only be <b>ACTIVE</b>.</p> <p>It specifies the provisioning status of the load balancer.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

**Table 10-25** listeners parameter description

| Parameter  | Type   | Description                                                                                            |
|------------|--------|--------------------------------------------------------------------------------------------------------|
| id         | String | Specifies the listener ID.                                                                             |
| name       | String | Specifies the listener name.                                                                           |
| l7policies | Array  | Lists associated forwarding policies. For details of this parameter, see <a href="#">Table 10-29</a> . |

| Parameter           | Type   | Description                                                                                                                    |
|---------------------|--------|--------------------------------------------------------------------------------------------------------------------------------|
| pools               | Array  | Lists the backend server groups associated with the listener. For details of this parameter, see <a href="#">Table 10-26</a> . |
| operating_status    | String | This parameter is reserved, and its value can only be <b>ONLINE</b> . It specifies the operating status of the listener.       |
| provisioning_status | String | This parameter is reserved, and its value can only be <b>ACTIVE</b> . It specifies the provisioning status of the listener.    |

**Table 10-26** pools parameter description

| Parameter           | Type   | Description                                                                                                                             |
|---------------------|--------|-----------------------------------------------------------------------------------------------------------------------------------------|
| id                  | String | Specifies the ID of the backend server group.                                                                                           |
| name                | String | Specifies the name of the backend server group.                                                                                         |
| healthmonitor       | Object | Provides health check details of the backend server group. For details of this parameter, see <a href="#">Table 10-27</a> .             |
| members             | Array  | Lists the members contained in the backend server group. For details of this parameter, see <a href="#">Table 10-28</a> .               |
| operating_status    | String | This parameter is reserved, and its value can only be <b>ONLINE</b> . It specifies the operating status of the backend server group.    |
| provisioning_status | String | This parameter is reserved, and its value can only be <b>ACTIVE</b> . It specifies the provisioning status of the backend server group. |

**Table 10-27 healthmonitor** parameter description

| Parameter           | Type   | Description                                                                                                                                                   |
|---------------------|--------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|
| id                  | String | Specifies the health check ID.                                                                                                                                |
| name                | String | Specifies the health check name.                                                                                                                              |
| type                | String | <ul style="list-style-type: none"><li>Specifies the health check protocol.</li><li>The value can be <b>UDP_CONNECT</b>, <b>TCP</b>, or <b>HTTP</b>.</li></ul> |
| provisioning_status | String | This parameter is reserved, and its value can only be <b>ACTIVE</b> .<br>It specifies the provisioning status of the health check.                            |

**Table 10-28 members** parameter description

| Parameter     | Type    | Description                                                                            |
|---------------|---------|----------------------------------------------------------------------------------------|
| id            | String  | Specifies the backend server ID.                                                       |
| address       | String  | Specifies the private IP address of the backend server, for example, 192.168.3.11.     |
| protocol_port | Integer | Specifies the port used by the backend server. The port number ranges from 0 to 65535. |

| Parameter           | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|---------------------|--------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| operating_status    | String | <p>This parameter is reserved. It specifies the operating status of the backend server. The value can be one of the following:</p> <ul style="list-style-type: none"><li>• <b>ONLINE</b>: The backend server is running normally.</li><li>• <b>NO_MONITOR</b>: No health check is configured for the backend server group that the backend server belongs to.</li><li>• <b>DISABLED</b>: The backend server is not available. This status is displayed only when <b>admin_state_up</b> of the backend server, or the backend server group to which it belongs, or the associated load balancer is set to <b>false</b> and the API for querying the load balancer status tree is called.</li><li>• <b>OFFLINE</b>: The cloud server used as the backend server is stopped or does not exist.</li></ul> <p><b>NOTE</b><br/>When <b>admin_state_up</b> is set to <b>false</b> and <b>operating_status</b> is set to <b>OFFLINE</b> for a backend server, <b>DISABLED</b> is returned for <b>operating_status</b> of the backend server in the response of this API.</p> |
| provisioning_status | String | <p>This parameter is reserved, and its value can only be <b>ACTIVE</b>. It specifies the provisioning status of the backend server.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

**Table 10-29** l7policies parameter description

| Parameter | Type   | Description                           |
|-----------|--------|---------------------------------------|
| id        | String | Specifies the forwarding policy ID.   |
| name      | String | Specifies the forwarding policy name. |

| Parameter           | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|---------------------|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| rules               | Array  | Lists the forwarding rules of the forwarding policy. For details of this parameter, see <a href="#">Table 10-30</a> .                                                                                                                                                                                                                                                                                                                                            |
| action              | String | <ul style="list-style-type: none"><li>Specifies whether requests are forwarded to another backend server group or redirected to an HTTPS listener.</li><li>The value can be <b>REDIRECT_TO_POOL</b> or <b>REDIRECT_TO_LISTENER</b>.<ul style="list-style-type: none"><li><b>REDIRECT_TO_POOL</b>: Requests are forwarded to another backend server group.</li><li><b>REDIRECT_TO_LISTENER</b>: Requests are redirected to an HTTPS listener.</li></ul></li></ul> |
| provisioning_status | String | This parameter is reserved.<br>It specifies the provisioning status of the forwarding policy. Value options: <ul style="list-style-type: none"><li><b>ACTIVE</b> (default): The forwarding policy is normal.</li><li><b>ERROR</b>: Another forwarding policy of the same listener has the same forwarding rule.</li></ul>                                                                                                                                        |

**Table 10-30** rules parameter description

| Parameter | Type   | Description                                                                                                                                                                                                                                                                                                             |
|-----------|--------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| id        | String | Specifies the forwarding rule ID.                                                                                                                                                                                                                                                                                       |

10.1.1.5 Updating a Load Balancer

Function

This API is used to update the name or description of a load balancer.

URI

PUT /v2.0/lbaas/loadbalancers/{loadbalancer\_id}

Table 10-31 Parameter description

| Parameter       | Mandatory | Type   | Description                     |
|-----------------|-----------|--------|---------------------------------|
| loadbalancer_id | Yes       | String | Specifies the load balancer ID. |

Request

Table 10-32 Parameter description

| Parameter    | Mandatory | Type   | Description                                                                 |
|--------------|-----------|--------|-----------------------------------------------------------------------------|
| loadbalancer | Yes       | Object | Specifies the load balancer. For details, see <a href="#">Table 10-33</a> . |

**Table 10-33 loadbalancer** parameter description

| Parameter      | Mandatory | Type    | Description                                                                                                                 |
|----------------|-----------|---------|-----------------------------------------------------------------------------------------------------------------------------|
| name           | No        | String  | Specifies the load balancer name.<br>The value contains a maximum of 255 characters.                                        |
| description    | No        | String  | Provides supplementary information about the load balancer.<br>The value contains a maximum of 255 characters.              |
| admin_state_up | No        | Boolean | Specifies the administrative status of the load balancer.<br>This parameter is reserved. The default value is <b>true</b> . |

## Response

**Table 10-34** Response parameters

| Parameter    | Type   | Description                                                                 |
|--------------|--------|-----------------------------------------------------------------------------|
| loadbalancer | Object | Specifies the load balancer. For details, see <a href="#">Table 10-35</a> . |

**Table 10-35 loadbalancer** parameter description

| Parameter  | Type   | Description                                                                                                                   |
|------------|--------|-------------------------------------------------------------------------------------------------------------------------------|
| id         | String | Specifies the load balancer ID.                                                                                               |
| project_id | String | Specifies the ID of the project to which the load balancer belongs. This parameter has the same meaning as <b>tenant_id</b> . |

| Parameter     | Type   | Description                                                                                                                                                                                                                                               |
|---------------|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| tenant_id     | String | Specifies the ID of the project where the load balancer is used.<br>The value contains a maximum of 255 characters.                                                                                                                                       |
| name          | String | Specifies the load balancer name.<br>The value contains a maximum of 255 characters.                                                                                                                                                                      |
| description   | String | Provides supplementary information about the load balancer.<br>The value contains a maximum of 255 characters.                                                                                                                                            |
| vip_subnet_id | String | Specifies the ID of the IPv4 subnet where the load balancer works.                                                                                                                                                                                        |
| vip_port_id   | String | Specifies the ID of the port bound to the private IP address of the load balancer.<br>When you create a load balancer, the system automatically creates a port and associates it with a security group. However, the security group will not take effect. |
| provider      | String | Specifies the provider of the load balancer.                                                                                                                                                                                                              |
| vip_address   | String | Specifies the private IP address of the load balancer.<br>The value contains a maximum of 64 characters.                                                                                                                                                  |
| listeners     | Array  | Lists the IDs of listeners added to the load balancer. For details, see <a href="#">Table 10-5</a> .                                                                                                                                                      |
| pools         | Array  | Lists the IDs of backend server groups associated with the load balancer. For details, see <a href="#">Table 10-6</a> .                                                                                                                                   |

| Parameter           | Type    | Description                                                                                                                                                                                                                                     |
|---------------------|---------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| operating_status    | String  | Specifies the operating status of the load balancer.<br>This parameter is reserved, and its value can be <b>ONLINE</b> or <b>FROZEN</b> .                                                                                                       |
| provisioning_status | String  | This parameter is reserved, and its value can only be <b>ACTIVE</b> .<br>It specifies the provisioning status of the load balancer.                                                                                                             |

Status Code

For details, see [Status Codes](#).

10.1.2 Listener

10.1.2.1 Adding a Listener

Function

This API is used to add a listener to a load balancer.

URI

POST /v2.0/lbaas/listeners

## Request

**Table 10-39** Parameter description

| Parameter | Mandatory | Type   | Description                                                            |
|-----------|-----------|--------|------------------------------------------------------------------------|
| listener  | Yes       | Object | Specifies the listener. For details, see <a href="#">Table 10-40</a> . |

**Table 10-40** listener parameter description

| Parameter   | Mandatory | Type   | Description                                                                                                                                                                                                |
|-------------|-----------|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| tenant_id   | No        | String | Specifies the ID of the project where the listener is used.<br><br>The value must be the same as the value of <b>project_id</b> in the token.<br><br>The value contains a maximum of 255 characters.       |
| project_id  | No        | String | Specifies the ID of the project to which the listener belongs. This parameter has the same meaning as <b>tenant_id</b> .<br><br>The value must be the same as the value of <b>project_id</b> in the token. |
| name        | No        | String | Specifies the listener name.<br>The value contains a maximum of 255 characters.                                                                                                                            |
| description | No        | String | Provides supplementary information about the listener.<br>The value contains a maximum of 255 characters.                                                                                                  |
| protocol    | Yes       | String | Specifies the protocol used by the listener.<br><br>The value can be <b>TCP</b> , <b>HTTP</b> , <b>UDP</b> , or <b>TERMINATED_HTTPS</b> .                                                                  |

| Parameter        | Mandatory | Type    | Description                                                                                                                                                                                                                                                                                                                                                                     |
|------------------|-----------|---------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| protocol_port    | Yes       | Integer | <p>Specifies the port used by the listener.</p> <p>The port number ranges from 1 to 65535.</p> <p><b>NOTE</b><br/>If the protocol used by the listener is UDP, the port number cannot be 4789.</p>                                                                                                                                                                              |
| loadbalancer_id  | Yes       | String  | <p>Specifies the ID of the associated load balancer.</p>                                                                                                                                                                                                                                                                                                                        |
| connection_limit | No        | Integer | <p>Specifies the maximum number of connections.</p> <p>The value ranges from <b>-1</b> to <b>2147483647</b>. The default value is <b>-1</b>, indicating that there is no restriction on the maximum number of connections.</p> <p>This parameter is reserved.</p>                                                                                                               |
| admin_state_up   | No        | Boolean | <p>Specifies the administrative status of the listener.</p> <p>This parameter is reserved, and the default value is <b>true</b>.</p>                                                                                                                                                                                                                                            |
| http2_enable     | No        | Boolean | <p>Specifies whether to use HTTP/2.</p> <p>The value can be <b>true</b> or <b>false</b>.</p> <ul style="list-style-type: none"><li>• <b>true</b>: HTTP/2 is used.</li><li>• <b>false</b>: HTTP/2 is not used.</li></ul> <p>The default value is <b>false</b>.</p> <p>This parameter is valid only when the protocol used by the listener is set to <b>TERMINATED_HTTPS</b>.</p> |

| Parameter       | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

## Response

**Table 10-42** Response parameters

| Parameter | Type   | Description                                                            |
|-----------|--------|------------------------------------------------------------------------|
| listener  | Object | Specifies the listener. For details, see <a href="#">Table 10-43</a> . |

**Table 10-43** listeners parameter description

| Parameter        | Type    | Description                                                                                                                                                                                                                                                                            |
|------------------|---------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| id               | String  | Specifies the listener ID.                                                                                                                                                                                                                                                             |
| tenant_id        | String  | Specifies the ID of the project where the listener is used.                                                                                                                                                                                                                            |
| project_id       | String  | Specifies the ID of the project to which the listener belongs. This parameter has the same meaning as <b>tenant_id</b> .                                                                                                                                                               |
| name             | String  | Specifies the listener name.                                                                                                                                                                                                                                                           |
| description      | String  | Provides supplementary information about the listener.                                                                                                                                                                                                                                 |
| protocol         | String  | Specifies the protocol used by the listener.<br>The value can be <b>TCP</b> , <b>HTTP</b> , <b>UDP</b> , or <b>TERMINATED_HTTPS</b> .                                                                                                                                                  |
| protocol_port    | Integer | Specifies the port used by the listener.<br>The port number ranges from 1 to 65535.                                                                                                                                                                                                    |
| loadbalancers    | Array   | Specifies the ID of the associated load balancer. For details, see <a href="#">Table 10-44</a> .                                                                                                                                                                                       |
| connection_limit | Integer | Specifies the maximum number of connections.<br>The value ranges from <b>-1</b> to <b>2147483647</b> . The default value is <b>-1</b> , indicating that there is no restriction on the maximum number of connections.<br>This parameter is reserved.                                   |
| admin_state_up   | Boolean | Specifies the administrative status of the listener.<br>This parameter is reserved. The value can be <b>true</b> or <b>false</b> . <ul style="list-style-type: none"><li>● <b>true</b>: The load balancer is enabled.</li><li>● <b>false</b>: The load balancer is disabled.</li></ul> |

| Parameter                   | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                                  |
|-----------------------------|---------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| http2_enable                | Boolean | <p>Specifies whether to use HTTP/2.<br/>The value can be <b>true</b> or <b>false</b>.</p> <ul style="list-style-type: none"><li>• <b>true</b>: HTTP/2 is used.</li><li>• <b>false</b>: HTTP/2 is not used.</li></ul> <p>This parameter is valid only when the protocol used by the listener is set to <b>TERMINATED_HTTPS</b>.</p>                                                                                           |
| default_pool_id             | String  | <p>Specifies the ID of the associated backend server group.</p> <p>If a request does not match the forwarding policy, the request is forwarded to the default backend server group for processing. If the value is <b>null</b>, the listener has no default backend server group.</p>                                                                                                                                        |
| default_tls_container_ref   | String  | <p>Specifies the ID of the server certificate used by the listener. For details, see <a href="#">Certificate</a>.</p> <p>This parameter is mandatory when <b>protocol</b> is set to <b>TERMINATED_HTTPS</b>.</p>                                                                                                                                                                                                             |
| client_ca_tls_container_ref | String  | <p>Specifies the ID of the CA certificate used by the listener. For details, see <a href="#">Certificate</a>.</p>                                                                                                                                                                                                                                                                                                            |
| sni_container_refs          | Array   | <p>Lists the IDs of SNI certificates (server certificates with domain names) used by the listener.</p> <p>If the parameter value is an empty list, the SNI feature is disabled.</p>                                                                                                                                                                                                                                          |
| tags                        | Array   | <p>Tags the listener.</p>                                                                                                                                                                                                                                                                                                                                                                                                    |
| created_at                  | String  | <p>Specifies the time when the listener was created. The UTC time is in <i>YYYY-MM-DDTHH:MM:SS</i> format.</p>                                                                                                                                                                                                                                                                                                               |
| updated_at                  | String  | <p>Specifies the time when the listener was updated. The UTC time is in <i>YYYY-MM-DDTHH:MM:SS</i> format.</p>                                                                                                                                                                                                                                                                                                               |
| tls_ciphers_policy          | String  | <p>Specifies the security policy used by the listener. This parameter is valid only when the protocol used by the listener is set to <b>TERMINATED_HTTPS</b>.</p> <p>The value can be <b>tls-1-0-inherit</b>, <b>tls-1-0</b>, <b>tls-1-1</b>, <b>tls-1-2</b>, or <b>tls-1-2-strict</b>, and the default value is <b>tls-1-0</b>. For details of cipher suites for each security policy, see <a href="#">Table 10-41</a>.</p> |

**Table 10-44 loadbalancers** parameter description

| Parameter | Type   | Description                                       |
|-----------|--------|---------------------------------------------------|
| id        | String | Specifies the ID of the associated load balancer. |

## Example Request

- Example request 1: Adding a TCP listener

POST https://{Endpoint}/v2.0/lbaas/listeners

```
{
 "listener": {
 "protocol_port": 80,
 "protocol": "TCP",
 "loadbalancer_id": "0416b6f1-877f-4a51-987e-978b3f084253",
 "name": "listener-test",
 "admin_state_up": true
 }
}
```

- Example request 2: Adding an HTTPS listener

POST https://{Endpoint}/v2.0/lbaas/listeners

```
{
 "listener": {
 "protocol_port": 25,
 "protocol": "TERMINATED_HTTPS",
 "default_tls_container_ref": "02dcd56799e045bf8b131533cc911dd6",
 "loadbalancer_id": "0416b6f1-877f-4a51-987e-978b3f084253",
 "name": "listener-test",
 "admin_state_up": true
 }
}
```

## Example Response

- Example response 1

```
{
 "listener": {
 "protocol_port": 80,
 "protocol": "TCP",
 "description": "",
 "client_ca_tls_container_ref": null,
 "default_tls_container_ref": null,
 "admin_state_up": true,

## Status Code

For details, see [Status Codes](#).

### 10.1.2.2 Querying Listeners

#### Function

This API is used to query the listeners and display them in a list. Filter query and pagination query are supported. Unless otherwise specified, exact match is applied.

You can query listeners using information such as listener ID, protocol used by the listener, port used by the listener, or backend server private IP address.

#### Constraints

Parameters **marker**, **limit**, and **page\_reverse** are used for pagination query. Parameters **marker** and **page\_reverse** take effect only when they are used together with parameter **limit**.

#### URI

GET /v2.0/lbaas/listeners

## Request

**Table 10-45** Parameter description

| Parameter       | Mandatory | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-----------------|-----------|---------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| marker          | No        | String  | Specifies the ID of the listener from which pagination query starts, that is, the ID of the last listener on the previous page.<br><br>This parameter must be used together with <b>limit</b> .                                                                                                                                                                                                                                   |
| limit           | No        | Integer | Specifies the number of listeners on each page.                                                                                                                                                                                                                                                                                                                                                                                   |
| page_reverse    | No        | Boolean | Specifies the page direction. The value can be <b>true</b> or <b>false</b> , and the default value is <b>false</b> . The last page in the list requested with <b>page_reverse</b> set to <b>false</b> will not contain the "next" link, and the last page in the list requested with <b>page_reverse</b> set to <b>true</b> will not contain the "previous" link.<br><br>This parameter must be used together with <b>limit</b> . |
| id              | No        | String  | Specifies the listener ID.                                                                                                                                                                                                                                                                                                                                                                                                        |
| tenant_id       | No        | String  | Specifies the ID of the project where the listener is used.                                                                                                                                                                                                                                                                                                                                                                       |
| project_id      | No        | String  | Specifies the ID of the project to which the listener belongs. This parameter has the same meaning as <b>tenant_id</b> .                                                                                                                                                                                                                                                                                                          |
| name            | No        | String  | Specifies the listener name.<br>The value contains a maximum of 255 characters.                                                                                                                                                                                                                                                                                                                                                   |
| description     | No        | String  | Provides supplementary information about the listener.<br>The value contains a maximum of 255 characters.                                                                                                                                                                                                                                                                                                                         |
| loadbalancer_id | No        | String  | Specifies the ID of the associated load balancer.                                                                                                                                                                                                                                                                                                                                                                                 |

| Parameter                   | Mandatory | Type    | Description                                                                                                                                                                                                                                                                                                                                            |
|-----------------------------|-----------|---------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| connection_limit            | No        | Integer | Specifies the maximum number of connections.                                                                                                                                                                                                                                                                                                           |
| admin_state_up              | No        | Boolean | Specifies the administrative status of the listener.<br>This parameter is reserved, and the default value is <b>true</b> .                                                                                                                                                                                                                             |
| default_pool_id             | No        | String  | Specifies the ID of the associated backend server group.                                                                                                                                                                                                                                                                                               |

| default_tls_container_ref   | No        | String  | Specifies the ID of the server certificate used by the listener.<br>The value contains a maximum of 128 characters.                                                                                                                                                                                                                                    |
| client_ca_tls_container_ref | No        | String  | Specifies the ID of the CA certificate used by the listener.<br>The value contains a maximum of 128 characters.                                                                                                                                                                                                                                        |
| protocol                    | No        | String  | Specifies the protocol used by the listener.<br>The value can be <b>TCP</b> , <b>HTTP</b> , <b>UDP</b> , or <b>TERMINATED_HTTPS</b> .                                                                                                                                                                                                                  |
| protocol_port               | No        | Integer | Specifies the port used by the listener.                                                                                                                                                                                                                                                                                                               |
| tls_ciphers_policy          | No        | String  | Specifies the security policy used by the listener. This parameter is valid only when the protocol used by the listener is set to <b>TERMINATED_HTTPS</b> .<br>The value can be <b>tls-1-0</b> , <b>tls-1-1</b> , <b>tls-1-2</b> , or <b>tls-1-2-strict</b> . For details of cipher suites for each security policy, see <a href="#">Table 10-46</a> . |
| tls_container_id            | No        | String  | Queries the listener associated with the certificate.                                                                                                                                                                                                                                                                                                  |

| Parameter          | Mandatory | Type   | Description                                               |
|--------------------|-----------|--------|-----------------------------------------------------------|
| sni_container_refs | No        | String | Queries the listener associated with the SNI certificate. |

**Table 10-46** `tls_ciphers_policy` parameter description

| Security Policy | TLS Version                | Cipher Suite                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

## Response

**Table 10-47** Parameter description

| Parameter       | Type  | Description                                                                                                                                                                                            |
|-----------------|-------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| listeners       | Array | Lists the listeners. For details, see <a href="#">Table 10-48</a> .                                                                                                                                    |
| listeners_links | Array | Provides links to the previous or next page during pagination query, respectively. This parameter exists only in the response body of pagination query. For details, see <a href="#">Table 10-51</a> . |

**Table 10-48** listeners parameter description

| Parameter     | Type    | Description                                                                                                                           |
|---------------|---------|---------------------------------------------------------------------------------------------------------------------------------------|
| id            | String  | Specifies the listener ID.                                                                                                            |
| tenant_id     | String  | Specifies the ID of the project where the listener is used.<br>The value contains a maximum of 255 characters.                        |
| project_id    | String  | Specifies the ID of the project to which the listener belongs.<br>This parameter has the same meaning as <b>tenant_id</b> .           |
| name          | String  | Specifies the listener name.<br>The value contains a maximum of 255 characters.                                                       |
| description   | String  | Provides supplementary information about the listener.<br>The value contains a maximum of 255 characters.                             |
| protocol      | String  | Specifies the protocol used by the listener.<br>The value can be <b>TCP</b> , <b>HTTP</b> , <b>UDP</b> , or <b>TERMINATED_HTTPS</b> . |
| protocol_port | Integer | Specifies the port used by the listener.<br>The port number ranges from 1 to 65535.                                                   |
| loadbalancers | Array   | Specifies the ID of the associated load balancer.                                                                                     |

| Parameter         | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|-------------------|---------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| connection_limit  | Integer | <p>Specifies the maximum number of connections.</p> <p>The value ranges from <b>-1</b> to <b>2147483647</b>.</p> <p><b>NOTE</b></p> <p>This parameter is reserved. The default value is <b>-1</b>, indicating that there is no restriction on the maximum number of connections.</p>                                                                                                                                                                             |
| admin_state_up    | Boolean | <p>Specifies the administrative status of the listener.</p> <p>This parameter is reserved. The value can be <b>true</b> or <b>false</b>.</p> <ul style="list-style-type: none"><li>• <b>true</b>: Enabled</li><li>• <b>false</b>: Disabled</li></ul>                                                                                                                                                                                                             |
| http2_enable      | Boolean | <p>Specifies whether to use HTTP/2.</p> <p>The value can be <b>true</b> or <b>false</b>.</p> <ul style="list-style-type: none"><li>• <b>true</b>: HTTP/2 will be used.</li><li>• <b>false</b>: HTTP/2 will not be used.</li></ul> <p><b>NOTE</b></p> <p>This parameter is valid only when the protocol used by the listener is set to <b>TERMINATED_HTTPS</b>.</p>                                                                                               |
| keepalive_timeout | Integer | <p>Specifies the idle timeout duration in the unit of second.</p> <p>This parameter applies only to TCP, HTTP, or HTTPS listeners.</p> <p>The value can be one of the following:</p> <ul style="list-style-type: none"><li>• TCP listeners: The value ranges from <b>10</b> to <b>4000</b>, and the default value is <b>300</b>.</li><li>• HTTP or HTTPS listeners: The value ranges from <b>0</b> to <b>4000</b>, and the default value is <b>60</b>.</li></ul> |

| Parameter                 | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|---------------------------|---------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| client_timeout            | Integer | <p>Specifies the request timeout duration in the unit of second.</p> <p>The value ranges from <b>1</b> to <b>300</b>. The default value is <b>60</b>.</p> <p>This parameter is valid only when <b>protocol</b> is set to <b>HTTP</b> or <b>HTTPS</b>. In other cases, the request body does not contain this parameter. Otherwise, an error is reported. When <b>protocol</b> is set to <b>HTTP</b> or <b>HTTPS</b>, if the request body does not contain this parameter or the value of this parameter is <b>null</b>, the default value is used.</p>  |
| member_timeout            | Integer | <p>Specifies the response timeout duration in the unit of second.</p> <p>The value ranges from <b>1</b> to <b>300</b>. The default value is <b>60</b>.</p> <p>This parameter is valid only when <b>protocol</b> is set to <b>HTTP</b> or <b>HTTPS</b>. In other cases, the request body does not contain this parameter. Otherwise, an error is reported. When <b>protocol</b> is set to <b>HTTP</b> or <b>HTTPS</b>, if the request body does not contain this parameter or the value of this parameter is <b>null</b>, the default value is used.</p> |
| default_pool_id           | String  | <p>Specifies the ID of the associated backend server group.</p> <p><b>NOTE</b></p> <p>If a request does not match the forwarding policy, the request is forwarded to the default backend server group for processing. If the value is <b>null</b>, the listener has no default backend server group.</p>                                                                                                                                                                                                                                                |
| default_tls_container_ref | String  | <p>Specifies the ID of the server certificate used by the listener.</p> <p>This parameter is mandatory when <b>protocol</b> is set to <b>TERMINATED_HTTPS</b>.</p> <p>The value contains a maximum of 128 characters.</p>                                                                                                                                                                                                                                                                                                                               |

| Parameter                   | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                               |
|-----------------------------|--------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| client_ca_tls_container_ref | String | Specifies the ID of the CA certificate used by the listener.<br>The value contains a maximum of 128 characters.                                                                                                                                                                                                                                                                                                           |
| sni_container_refs          | Array  | Lists the IDs of SNI certificates (server certificates with domain names) used by the listener.                                                                                                                                                                                                                                                                                                                           |
| tags                        | Array  | Tags the listener.                                                                                                                                                                                                                                                                                                                                                                                                        |
| created_at                  | String | Specifies the time when the listener was created. The UTC time is in <i>YYYY-MM-DDTHH:MM:SS</i> format.<br>The value contains a maximum of 19 characters.                                                                                                                                                                                                                                                                 |
| updated_at                  | String | Specifies the time when the listener was updated. The UTC time is in <i>YYYY-MM-DDTHH:MM:SS</i> format.<br>The value contains a maximum of 19 characters.                                                                                                                                                                                                                                                                 |
| listeners_links             | Array  | Provides links to the previous or next page during pagination query, respectively. This parameter exists only in the response body of pagination query.                                                                                                                                                                                                                                                                   |
| tls_ciphers_policy          | String | Specifies the security policy used by the listener. This parameter is valid only when the protocol used by the listener is set to <b>TERMINATED_HTTPS</b> .<br>The value can be <b>tls-1-0-inherit</b> , <b>tls-1-0</b> , <b>tls-1-1</b> , <b>tls-1-2</b> , or <b>tls-1-2-strict</b> , and the default value is <b>tls-1-0</b> . For details of cipher suites for each security policy, see <a href="#">Table 10-50</a> . |

**Table 10-49 loadbalancers** parameter description

| Parameter | Type   | Description                                       |
|-----------|--------|---------------------------------------------------|
| id        | String | Specifies the ID of the associated load balancer. |

**Table 10-50 tls\_ciphers\_policy** parameter description

| Security Policy | TLS Version                | Cipher Suite                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-----------------|----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

**Table 10-51** listeners\_links parameter description

| Parameter | Type   | Description                                                                                                                                                                                                                                                           |
|-----------|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| href      | String | Provides links to the previous or next page during pagination query, respectively.                                                                                                                                                                                    |
| rel       | String | Specifies the prompt of the previous or next page.<br>The value can be <b>next</b> or <b>previous</b> . The value <b>next</b> indicates the href containing the URL of the next page, and <b>previous</b> indicates the href containing the URL of the previous page. |

## Example Request

- Example request 1: Querying all listeners  
GET https://{Endpoint}/v2.0/lbaas/listeners?limit=2
- Request example 2: Querying UDP listeners  
GET https://{Endpoint}/v2.0/lbaas/listeners?protocol=UDP

## Example Response

- Example response 1

## Status Code

For details, see [Status Codes](#).

### 10.1.2.3 Querying Details of a Listener

#### Function

This API is used to query details about a listener using its ID.

#### URI

GET /v2.0/lbaas/listeners/{listener\_id}

**Table 10-52** Parameter description

| Parameter   | Mandatory | Type   | Description                |
|-------------|-----------|--------|----------------------------|
| listener_id | Yes       | String | Specifies the listener ID. |

#### Request

None

#### Response

**Table 10-53** Response parameters

| Parameter | Type   | Description                                                         |
|-----------|--------|---------------------------------------------------------------------|
| listener  | Object | Lists the listeners. For details, see <a href="#">Table 10-54</a> . |

**Table 10-54** listeners parameter description

| Parameter   | Type   | Description                                                                                                              |
|-------------|--------|--------------------------------------------------------------------------------------------------------------------------|
| id          | String | Specifies the listener ID.                                                                                               |
| tenant_id   | String | Specifies the ID of the project where the listener is used.                                                              |
| project_id  | String | Specifies the ID of the project to which the listener belongs. This parameter has the same meaning as <b>tenant_id</b> . |
| name        | String | Specifies the listener name.                                                                                             |
| description | String | Provides supplementary information about the listener.                                                                   |

| Parameter                   | Type    | Description                                                                                                                                                                                                                                                                                                           |
|-----------------------------|---------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| protocol                    | String  | Specifies the protocol used by the listener.<br>The value can be <b>TCP</b> , <b>HTTP</b> , <b>UDP</b> , or <b>TERMINATED_HTTPS</b> .                                                                                                                                                                                 |
| protocol_port               | Integer | Specifies the port used by the listener.<br>The port number ranges from 1 to 65535.                                                                                                                                                                                                                                   |
| loadbalancers               | Array   | Specifies the ID of the associated load balancer. For details, see <a href="#">Table 10-44</a> .                                                                                                                                                                                                                      |
| connection_limit            | Integer | Specifies the maximum number of connections.<br>The value ranges from <b>-1</b> to <b>2147483647</b> . The default value is <b>-1</b> , indicating that there is no restriction on the maximum number of connections.<br>This parameter is reserved.                                                                  |
| admin_state_up              | Boolean | Specifies the administrative status of the listener.<br>This parameter is reserved. The value can be <b>true</b> or <b>false</b> . <ul style="list-style-type: none"><li>• <b>true</b>: The load balancer is enabled.</li><li>• <b>false</b>: The load balancer is disabled.</li></ul>                                |
| http2_enable                | Boolean | Specifies whether to use HTTP/2.<br>The value can be <b>true</b> or <b>false</b> . <ul style="list-style-type: none"><li>• <b>true</b>: HTTP/2 is used.</li><li>• <b>false</b>: HTTP/2 is not used.</li></ul> This parameter is valid only when the protocol used by the listener is set to <b>TERMINATED_HTTPS</b> . |
| default_pool_id             | String  | Specifies the ID of the associated backend server group.<br>If a request does not match the forwarding policy, the request is forwarded to the default backend server group for processing. If the value is <b>null</b> , the listener has no default backend server group.                                           |
| default_tls_container_ref   | String  | Specifies the ID of the server certificate used by the listener. For details, see <a href="#">Certificate</a> .<br>This parameter is mandatory when <b>protocol</b> is set to <b>TERMINATED_HTTPS</b> .                                                                                                               |
| client_ca_tls_container_ref | String  | Specifies the ID of the CA certificate used by the listener. For details, see <a href="#">Certificate</a> .                                                                                                                                                                                                           |

| Parameter          | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                   |
|--------------------|--------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| sni_container_refs | Array  | Lists the IDs of SNI certificates (server certificates with domain names) used by the listener.<br><br>If the parameter value is an empty list, the SNI feature is disabled.                                                                                                                                                                                                                                                  |
| tags               | Array  | Tags the listener.                                                                                                                                                                                                                                                                                                                                                                                                            |
| created_at         | String | Specifies the time when the listener was created. The UTC time is in <i>YYYY-MM-DDTHH:MM:SS</i> format.                                                                                                                                                                                                                                                                                                                       |
| updated_at         | String | Specifies the time when the listener was updated. The UTC time is in <i>YYYY-MM-DDTHH:MM:SS</i> format.                                                                                                                                                                                                                                                                                                                       |
| tls_ciphers_policy | String | Specifies the security policy used by the listener. This parameter is valid only when the protocol used by the listener is set to <b>TERMINATED_HTTPS</b> .<br><br>The value can be <b>tls-1-0-inherit</b> , <b>tls-1-0</b> , <b>tls-1-1</b> , <b>tls-1-2</b> , or <b>tls-1-2-strict</b> , and the default value is <b>tls-1-0</b> . For details of cipher suites for each security policy, see <a href="#">Table 10-41</a> . |

**Table 10-55 loadbalancers** parameter description

| Parameter | Type   | Description                                       |
|-----------|--------|---------------------------------------------------|
| id        | String | Specifies the ID of the associated load balancer. |

## Example Request

- Example request: Querying details of a listener  
GET https://{Endpoint}/v2.0/lbaas/listeners/09e64049-2ab0-4763-a8c5-f4207875dc3e

## Example Response

- Example response

```

```

## Status Code

For details, see [Status Codes](#).

### 10.1.2.4 Updating a Listener

## Function

This API is used to update a listener, such as listener name, description, associated backend server groups, and server certificates.

## Constraints

- If the provisioning status of the associated load balancer is not **ACTIVE**, the listener cannot be updated.
- Only users with the ELB administrator permissions can specify the value of **connection\_limit**.
- The **default\_pool\_id** parameter has the following constraints:
  - Its value cannot be the ID of any backend server group of other listeners.
  - Its value cannot be the ID of any backend server group associated with the forwarding policies set for other listeners.
- The relationships between the protocol used by the listener and the protocol of the backend server group are as follows:
  - When the protocol used by the listener is **TCP**, the protocol of the backend server group must be **TCP**.
  - When the protocol used by the listener is **UDP**, the protocol of the backend server group must be **UDP**.
  - When the protocol used by the listener is **HTTP** or **TERMINATED\_HTTPS**, the protocol of the backend server group must be **HTTP**.

## URI

PUT /v2.0/lbaas/listeners/{listener\_id}

**Table 10-56** Parameter description

| Parameter   | Mandatory | Type   | Description                |
|-------------|-----------|--------|----------------------------|
| listener_id | Yes       | String | Specifies the listener ID. |

## Request

**Table 10-57** Parameter description

| Parameter | Mandatory | Type   | Description                                                            |
|-----------|-----------|--------|------------------------------------------------------------------------|
| listener  | Yes       | Object | Specifies the listener. For details, see <a href="#">Table 10-58</a> . |

**Table 10-58** listener parameter description

| Parameter        | Mandatory | Type    | Description                                                                                                                                                                                                                                                                                                       |
|------------------|-----------|---------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| name             | No        | String  | Specifies the listener name.<br>The value contains a maximum of 255 characters.                                                                                                                                                                                                                                   |
| description      | No        | String  | Provides supplementary information about the listener.<br>The value contains a maximum of 255 characters.                                                                                                                                                                                                         |
| connection_limit | No        | Integer | Specifies the maximum number of connections.<br>The value ranges from -1 to <b>2147483647</b> .<br>This parameter is reserved. Only users with the ELB administrator permissions can specify this field.                                                                                                          |
| http2_enable     | No        | Boolean | Specifies whether to use HTTP/2.<br>The value can be <b>true</b> or <b>false</b> . <ul style="list-style-type: none"><li><b>true</b>: HTTP/2 is used.</li><li><b>false</b>: HTTP/2 is not used.</li></ul> This parameter is valid only when the protocol used by the listener is set to <b>TERMINATED_HTTPS</b> . |

| Parameter                 | Mandatory | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

Response

Table 10-60 Response parameters

| Parameter | Type   | Description                                                            |
|-----------|--------|------------------------------------------------------------------------|
| listener  | Object | Specifies the listener. For details, see <a href="#">Table 10-61</a> . |

**Table 10-61** listeners parameter description

| Parameter        | Type    | Description                                                                                                                                                                                                                                                                                                              |
|------------------|---------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| id               | String  | Specifies the listener ID.                                                                                                                                                                                                                                                                                               |
| tenant_id        | String  | Specifies the ID of the project where the listener is used.                                                                                                                                                                                                                                                              |
| project_id       | String  | Specifies the ID of the project to which the listener belongs. This parameter has the same meaning as <b>tenant_id</b> .                                                                                                                                                                                                 |
| name             | String  | Specifies the listener name.                                                                                                                                                                                                                                                                                             |
| description      | String  | Provides supplementary information about the listener.                                                                                                                                                                                                                                                                   |
| protocol         | String  | Specifies the protocol used by the listener.<br>The value can be <b>TCP</b> , <b>HTTP</b> , <b>UDP</b> , or <b>TERMINATED_HTTPS</b> .                                                                                                                                                                                    |
| protocol_port    | Integer | Specifies the port used by the listener.<br>The port number ranges from 1 to 65535.                                                                                                                                                                                                                                      |
| loadbalancers    | Array   | Specifies the ID of the associated load balancer. For details, see <a href="#">Table 10-44</a> .                                                                                                                                                                                                                         |
| connection_limit | Integer | Specifies the maximum number of connections.<br><br>The value ranges from <b>-1</b> to <b>2147483647</b> . The default value is <b>-1</b> , indicating that there is no restriction on the maximum number of connections.<br><br>This parameter is reserved.                                                             |
| admin_state_up   | Boolean | Specifies the administrative status of the listener.<br><br>This parameter is reserved. The value can be <b>true</b> or <b>false</b> . <ul style="list-style-type: none"><li>● <b>true</b>: The load balancer is enabled.</li><li>● <b>false</b>: The load balancer is disabled.</li></ul>                               |
| http2_enable     | Boolean | Specifies whether to use HTTP/2.<br>The value can be <b>true</b> or <b>false</b> . <ul style="list-style-type: none"><li>● <b>true</b>: HTTP/2 is used.</li><li>● <b>false</b>: HTTP/2 is not used.</li></ul><br>This parameter is valid only when the protocol used by the listener is set to <b>TERMINATED_HTTPS</b> . |

| Parameter                   | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                   |
|-----------------------------|--------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| default_pool_id             | String | Specifies the ID of the associated backend server group.<br><br>If a request does not match the forwarding policy, the request is forwarded to the default backend server group for processing. If the value is <b>null</b> , the listener has no default backend server group.                                                                                                                                               |
| default_tls_container_ref   | String | Specifies the ID of the server certificate used by the listener. For details, see <a href="#">Certificate</a> .<br><br>This parameter is mandatory when <b>protocol</b> is set to <b>TERMINATED_HTTPS</b> .                                                                                                                                                                                                                   |
| client_ca_tls_container_ref | String | Specifies the ID of the CA certificate used by the listener. For details, see <a href="#">Certificate</a> .                                                                                                                                                                                                                                                                                                                   |
| sni_container_refs          | Array  | Lists the IDs of SNI certificates (server certificates with domain names) used by the listener.<br><br>If the parameter value is an empty list, the SNI feature is disabled.                                                                                                                                                                                                                                                  |
| tags                        | Array  | Tags the listener.                                                                                                                                                                                                                                                                                                                                                                                                            |
| created_at                  | String | Specifies the time when the listener was created. The UTC time is in <i>YYYY-MM-DDTHH:MM:SS</i> format.                                                                                                                                                                                                                                                                                                                       |
| updated_at                  | String | Specifies the time when the listener was updated. The UTC time is in <i>YYYY-MM-DDTHH:MM:SS</i> format.                                                                                                                                                                                                                                                                                                                       |
| tls_ciphers_policy          | String | Specifies the security policy used by the listener. This parameter is valid only when the protocol used by the listener is set to <b>TERMINATED_HTTPS</b> .<br><br>The value can be <b>tls-1-0-inherit</b> , <b>tls-1-0</b> , <b>tls-1-1</b> , <b>tls-1-2</b> , or <b>tls-1-2-strict</b> , and the default value is <b>tls-1-0</b> . For details of cipher suites for each security policy, see <a href="#">Table 10-41</a> . |

**Table 10-62 loadbalancers** parameter description

| Parameter | Type   | Description                                       |
|-----------|--------|---------------------------------------------------|
| id        | String | Specifies the ID of the associated load balancer. |

## Example Request

- Example request: Updating a listener

PUT https://{Endpoint}/v2.0/lbaas/listeners/f622c150-72f5-4263-a47a-e5003c652aa3

```
{
 "listener": {

## Status Code

For details, see [Status Codes](#).

### 10.1.2.5 Deleting a Listener

#### Function

This API is used to delete a listener by ID.

#### Constraints

Before deleting the listener, delete the associated backend server groups by referring to [Deleting a Backend Server Group](#), or change the value of **default\_pool\_id** to **null** by referring to [Updating a Listener](#) and delete associated forwarding policies by referring to [Deleting a Forwarding Policy](#).

## URI

DELETE /v2.0/lbaas/listeners/{listener\_id}

**Table 10-63** Parameter description

| Parameter   | Mandatory | Type    | Description                                                                                                                                                                      |
|-------------|-----------|---------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| listener_id | Yes       | String  | Specifies the listener ID.                                                                                                                                                       |
| cascade     | No        | Boolean | <b>[Discarded]</b> Specifies whether to delete the resources associated with the listener when the listener is deleted, including the backend server groups and backend servers. |

## Request

None

## Response

None

## Example Request

- Example request: Deleting a listener  
DELETE https://{Endpoint}/v2.0/lbaas/listeners/35cb8516-1173-4035-8dae-0dae3453f37f

## Example Response

- Example response

## Status Code

For details, see [Status Codes](#).

# 10.1.3 Backend Server Group

## 10.1.3.1 Adding a Backend Server Group

## Function

This API is used to add a backend server group. After multiple backend servers are added to a backend server group, requests are distributed among backend servers based on the load balancing algorithm configured for the backend server group and the weight set for each backend server.

## Constraints

- If parameter **session-persistence** is configured, parameter **cookie\_name** is available only when the value of **type** is **APP\_COOKIE**.

## URI

POST /v2.0/lbaas/pools

## Request

**Table 10-64** Parameter description

| Parameter | Mandatory | Type   | Description                                                                        |
|-----------|-----------|--------|------------------------------------------------------------------------------------|
| pool      | Yes       | Object | Specifies the backend server group. For details, see <a href="#">Table 10-65</a> . |

**Table 10-65** pool parameter description

| Parameter   | Mandatory | Type   | Description                                                                                                                                                                                                            |
|-------------|-----------|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

| description      | String  | Provides supplementary information about the backend server group.<br>The value contains a maximum of 255 characters.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| protocol         | String  | Specifies the protocol that the backend server group uses to receive requests.<br>TCP, UDP, and HTTP are supported.<br>When a backend server group is associated with a listener, the relationships between the protocol used by the listener and the protocol of the backend server group are as follows: <ul style="list-style-type: none"><li>• When the protocol used by the listener is <b>UDP</b>, the protocol of the backend server group must be <b>UDP</b>.</li><li>• When the protocol used by the listener is <b>TCP</b>, the protocol of the backend server group must be <b>TCP</b>.</li><li>• When the protocol used by the listener is <b>HTTP</b> or <b>TERMINATED_HTTPS</b>, the protocol of the backend server group must be <b>HTTP</b>.</li></ul> |
| lb_algorithm     | String  | Specifies the load balancing algorithm of the backend server group.<br>The value can be one of the following: <ul style="list-style-type: none"><li>• <b>ROUND_ROBIN</b>: indicates the weighted round robin algorithm.</li><li>• <b>LEAST_CONNECTIONS</b>: indicates the weighted least connections algorithm.</li><li>• <b>SOURCE_IP</b>: indicates the source IP hash algorithm. When the value is <b>SOURCE_IP</b>, the weights of backend servers in the server group are invalid.</li></ul>                                                                                                                                                                                                                                                                      |
| members          | Array   | Lists the IDs of backend servers in the backend server group.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| healthmonitor_id | String  | Specifies the ID of the health check configured for the backend server group.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| admin_state_up   | Boolean | Specifies the administrative status of the backend server group.<br>This parameter is reserved. The value can be <b>true</b> or <b>false</b> . <ul style="list-style-type: none"><li>• <b>true</b>: Enabled</li><li>• <b>false</b>: Disabled</li></ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| Parameter           | Type   | Description                                                                                                                                                                                                                                                                                         |
|---------------------|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| listeners           | Array  | Lists the IDs of listeners associated with the backend server group.                                                                                                                                                                                                                                |
| loadbalancers       | Array  | Lists the IDs of load balancers associated with the backend server group.                                                                                                                                                                                                                           |
| session_persistence | Object | <p>Specifies whether to enable sticky sessions. For details, see <a href="#">Table 10-72</a>.</p> <p>Once sticky session are enabled, requests from the same client are sent to the same backend server during the session.</p> <p>When sticky sessions are disabled, the value is <b>null</b>.</p> |

**Table 10-69 members** parameter description

| Parameter | Type   | Description                                        |
|-----------|--------|----------------------------------------------------|
| id        | String | Specifies the ID of the associated backend server. |

**Table 10-70 listeners** parameter description

| Parameter | Type   | Description                                              |
|-----------|--------|----------------------------------------------------------|
| id        | String | Specifies the ID of the associated backend server group. |

**Table 10-71 loadbalancers** parameter description

| Parameter | Type   | Description                                       |
|-----------|--------|---------------------------------------------------|
| id        | String | Specifies the ID of the associated load balancer. |

**Table 10-72 session\_persistence** parameter description

| Parameter   | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|-------------|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| type        | String | <p>Specifies the sticky session type.</p> <p>The value can be one of the following:</p> <ul style="list-style-type: none"><li>• <b>SOURCE_IP</b>: Requests are distributed based on the client's IP address. Requests from the same IP address are sent to the same backend server.</li><li>• <b>HTTP_COOKIE</b>: When the client sends a request for the first time, the load balancer automatically generates a cookie and inserts the cookie into the response message. Subsequent requests are sent to the backend server that processes the first request.</li><li>• <b>APP_COOKIE</b>: When the client sends a request for the first time, the backend server that receives the request generates a cookie and inserts the cookie into the response message. Subsequent requests are sent to this backend server.</li></ul> <p>When the protocol of the backend server group is TCP, only <b>SOURCE_IP</b> takes effect. When the protocol of the backend server group is HTTP, only <b>HTTP_COOKIE</b> or <b>APP_COOKIE</b> takes effect.</p> |
| cookie_name | String | <p>Specifies the cookie name.</p> <p>This parameter is mandatory when the sticky session type is <b>APP_COOKIE</b>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| Parameter           | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|---------------------|---------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| persistence_timeout | Integer | <p>Specifies the sticky session timeout duration in minutes.</p> <p>This parameter is invalid when <b>type</b> is set to <b>APP_COOKIE</b>.</p> <ul style="list-style-type: none"><li>Optional value ranges are as follows:<ul style="list-style-type: none"><li>When the protocol of the backend server group is TCP or UDP, the value ranges from <b>1</b> to <b>60</b>.</li><li>When the protocol of the backend server group is HTTP or HTTPS, the value ranges from <b>1</b> to <b>1440</b>.</li></ul></li></ul> |

## Example Request

- Example request 1: Adding a backend server group with the sticky session feature disabled

POST https://{Endpoint}/v2.0/lbaas/pools

```
{
 "pool": {
 "lb_algorithm": "ROUND_ROBIN",
 "loadbalancer_id": "63ad9dfe-4750-479f-9630-ada43ccc8117",
 "protocol": "HTTP"
 }
}
```

- Example request 2: Adding an HTTP backend server group with the value of **type** set to **APP\_COOKIE**

POST https://{Endpoint}/v2.0/lbaas/pools

```
{
 "pool": {
 "lb_algorithm": "ROUND_ROBIN",
 "listener_id": "370fb112-e920-486a-b051-1d0d30704dd3",
 "protocol": "HTTP",
 "session_persistence": {
 "cookie_name": "my_cookie",
 "type": "APP_COOKIE",
 "persistence_timeout": 1
 },
 "admin_state_up": true
 }
}
```

- Example request 3: Adding an HTTP backend server group with the value of **type** set to **HTTP\_COOKIE**

POST https://{Endpoint}/v2.0/lbaas/pools

```
{
 "pool": {
 "lb_algorithm": "ROUND_ROBIN",
 "loadbalancer_id": "63ad9dfe-4750-479f-9630-ada43ccc8117",
 "protocol": "HTTP",
 "session_persistence": {
```

```
 "type": "HTTP_COOKIE"
 }
 }
 }
```

## Example Response

- Example response 1

```
{
 "pool": {
 "lb_algorithm": "ROUND_ROBIN",
 "protocol": "HTTP",
 "description": "",

## Status Code

For details, see [Status Codes](#).

### 10.1.3.2 Querying Backend Server Groups

#### Function

This API is used to query the backend server groups and display them in a list. Filter query and pagination query are supported. Unless otherwise specified, exact match is applied.

#### Constraints

Parameters **marker**, **limit**, and **page\_reverse** are used for pagination query. Parameters **marker** and **page\_reverse** take effect only when they are used together with parameter **limit**.

#### URI

GET /v2.0/lbaas/pools

## Request

**Table 10-73** Parameter description

| Parameter    | Mandatory | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                                       |
|--------------|-----------|---------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| marker       | No        | String  | Specifies the ID of the backend server group from which pagination query starts, that is, the ID of the last backend server group on the previous page. If this parameter is not specified, the first page will be queried.<br><br>This parameter must be used together with <b>limit</b> .                                                                                                                                       |
| limit        | No        | Integer | Specifies the number of backend server groups on each page.                                                                                                                                                                                                                                                                                                                                                                       |
| page_reverse | No        | Boolean | Specifies the page direction. The value can be <b>true</b> or <b>false</b> , and the default value is <b>false</b> . The last page in the list requested with <b>page_reverse</b> set to <b>false</b> will not contain the "next" link, and the last page in the list requested with <b>page_reverse</b> set to <b>true</b> will not contain the "previous" link.<br><br>This parameter must be used together with <b>limit</b> . |
| id           | No        | String  | Specifies the ID of the backend server group.                                                                                                                                                                                                                                                                                                                                                                                     |
| tenant_id    | No        | String  | Specifies the ID of the project where the backend server group is used.<br><br>The value contains a maximum of 255 characters.                                                                                                                                                                                                                                                                                                    |
| project_id   | No        | String  | Specifies the ID of the project to which the backend server group belongs. This parameter has the same meaning as <b>tenant_id</b> .                                                                                                                                                                                                                                                                                              |
| name         | No        | String  | Specifies the name of the backend server group.<br><br>The value contains a maximum of 255 characters.                                                                                                                                                                                                                                                                                                                            |

| Parameter        | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|------------------|-----------|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| description      | No        | String | Provides supplementary information about the backend server group.<br>The value contains a maximum of 255 characters.                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| healthmonitor_id | No        | String | Specifies the ID of the health check configured for the backend server group.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| loadbalancer_id  | No        | String | Specifies the ID of the load balancer associated with the backend server group.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| protocol         | No        | String | Specifies the protocol that the backend server group uses to receive requests.<br>TCP, UDP, and HTTP are supported.                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| lb_algorithm     | No        | String | Specifies the load balancing algorithm of the backend server group.<br>The value can be one of the following: <ul style="list-style-type: none"><li>• <b>ROUND_ROBIN</b>: indicates the weighted round robin algorithm.</li><li>• <b>LEAST_CONNECTIONS</b>: indicates the weighted least connections algorithm.</li><li>• <b>SOURCE_IP</b>: indicates the source IP hash algorithm.</li></ul> When the value is <b>SOURCE_IP</b> , the weights of backend servers in the server group are invalid. For details about parameter <b>weight</b> , see <a href="#">Table 10-110</a> . |
| member_address   | No        | String | Lists the IDs of backend servers in the backend server group.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| member_device_id | No        | String | Specifies the ID of the cloud server used as the backend server in the backend server group.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

## Response

**Table 10-74** Response parameters

| Parameter   | Type  | Description                                                                                                                                                                                               |
|-------------|-------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| pools       | Array | Specifies the backend server group. For details, see <a href="#">Table 10-75</a> .                                                                                                                        |
| pools_links | List  | Provides links to the previous or next page during pagination query, respectively.<br>This parameter exists only in the response body of pagination query. For details, see <a href="#">Table 10-80</a> . |

**Table 10-75** pools parameter description

| Parameter   | Type   | Description                                                                                                                          |
|-------------|--------|--------------------------------------------------------------------------------------------------------------------------------------|
| id          | String | Specifies the ID of the backend server group.                                                                                        |
| tenant_id   | String | Specifies the ID of the project where the backend server group is used.<br>The value contains a maximum of 255 characters.           |
| project_id  | String | Specifies the ID of the project to which the backend server group belongs. This parameter has the same meaning as <b>tenant_id</b> . |
| name        | String | Specifies the name of the backend server group.<br>The value contains a maximum of 255 characters.                                   |
| description | String | Provides supplementary information about the backend server group.<br>The value contains a maximum of 255 characters.                |
| protocol    | String | Specifies the protocol that the backend server group uses to receive requests.<br>TCP, UDP, and HTTP are supported.                  |

| Parameter           | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|---------------------|---------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| lb_algorithm        | String  | <p>Specifies the load balancing algorithm of the backend server group.</p> <p>The value can be one of the following:</p> <ul style="list-style-type: none"><li>• <b>ROUND_ROBIN</b>: indicates the weighted round robin algorithm.</li><li>• <b>LEAST_CONNECTIONS</b>: indicates the weighted least connections algorithm.</li><li>• <b>SOURCE_IP</b>: indicates the source IP hash algorithm.</li></ul> <p>When the value is <b>SOURCE_IP</b>, the weights of backend servers in the server group are invalid.</p> |
| members             | Array   | <p>Lists the IDs of backend servers in the backend server group.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| healthmonitor_id    | String  | <p>Specifies the ID of the health check configured for the backend server group.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                |
| admin_state_up      | Boolean | <p>Specifies the administrative status of the backend server group.</p> <p>This parameter is reserved. The value can be <b>true</b> or <b>false</b>.</p> <ul style="list-style-type: none"><li>• <b>true</b>: Enabled</li><li>• <b>false</b>: Disabled</li></ul>                                                                                                                                                                                                                                                    |
| listeners           | Array   | <p>Lists the IDs of listeners associated with the backend server group.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| loadbalancers       | String  | <p>Lists the IDs of load balancers associated with the backend server group.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| session_persistence | Object  | <p>Specifies whether to enable the sticky session feature. For details, see <a href="#">Table 10-79</a>.</p> <p>Once sticky session are enabled, requests from the same client are sent to the same backend server during the session.</p> <p>When sticky sessions are disabled, the value is <b>null</b>.</p>                                                                                                                                                                                                      |

**Table 10-76** members parameter description

| Parameter | Type   | Description                                               |
|-----------|--------|-----------------------------------------------------------|
| id        | String | <p>Specifies the ID of the associated backend server.</p> |

**Table 10-77 listeners** parameter description

| Parameter | Type   | Description                                              |
|-----------|--------|----------------------------------------------------------|
| id        | String | Specifies the ID of the associated backend server group. |

**Table 10-78 loadbalancers** parameter description

|-----------|--------|---------------------------------------------------|
| id        | String | Specifies the ID of the associated load balancer. |

**Table 10-79 session\_persistence** parameter description

| Parameter | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|-----------|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| type      | String | <p>Specifies the sticky session type.</p> <p>The value can be one of the following:</p> <ul style="list-style-type: none"><li>• <b>SOURCE_IP</b>: Requests are distributed based on the client's IP address. Requests from the same IP address are sent to the same backend server.</li><li>• <b>HTTP_COOKIE</b>: When the client sends a request for the first time, the load balancer automatically generates a cookie and inserts the cookie into the response message. Subsequent requests are sent to the backend server that processes the first request.</li><li>• <b>APP_COOKIE</b>: When the client sends a request for the first time, the backend server that receives the request generates a cookie and inserts the cookie into the response message. Subsequent requests are sent to this backend server.</li></ul> <p>When the protocol of the backend server group is TCP, only <b>SOURCE_IP</b> takes effect. When the protocol of the backend server group is HTTP, only <b>HTTP_COOKIE</b> or <b>APP_COOKIE</b> takes effect.</p> |

| Parameter           | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|---------------------|---------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| cookie_name         | String  | Specifies the cookie name.<br>This parameter is mandatory when the sticky session type is <b>APP_COOKIE</b> .                                                                                                                                                                                                                                                                                                                                                                                               |
| persistence_timeout | Integer | Specifies the sticky session timeout duration in minutes.<br>This parameter is invalid when <b>type</b> is set to <b>APP_COOKIE</b> . <ul style="list-style-type: none"><li>Optional value ranges are as follows:<ul style="list-style-type: none"><li>When the protocol of the backend server group is TCP or UDP, the value ranges from <b>1</b> to <b>60</b>.</li><li>When the protocol of the backend server group is HTTP or HTTPS, the value ranges from <b>1</b> to <b>1440</b>.</li></ul></li></ul> |

**Table 10-80** pools\_links parameter description

| Parameter | Type   | Description                                                                                                                                                                                                                                                            |
|-----------|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| href      | String | Provides links to the previous or next page during pagination query, respectively.                                                                                                                                                                                     |
| rel       | String | Specifies the prompt of the previous or next page. The value can be <b>next</b> or <b>previous</b> . <ul style="list-style-type: none"><li><b>next</b>: indicates the URL of the next page.</li><li><b>previous</b>: indicates the URL of the previous page.</li></ul> |

## Example Request

- Example request 1: Querying backend server groups by pages  
GET https://{Endpoint}/v2.0/lbaas/pools?limit=2
- Example request 2: Querying backend server groups whose load balancing algorithm is **SOURCE\_IP**  
GET https://{Endpoint}/v2.0/lbaas/pools?lb\_algorithm=SOURCE\_IP

## Example Response

10.1.3.3 Querying Details of a Backend Server Group

Function

This API is used to query details about a backend server group using its ID.

URI

GET /v2.0/lbaas/pools/{pool\_id}

Table 10-81 Parameter description

| Parameter | Mandator<br>y | Type   | Description                                   |
|-----------|---------------|--------|-----------------------------------------------|
| pool_id   | Yes           | String | Specifies the ID of the backend server group. |

Request

None

Response

Table 10-82 Response parameters

| Parameter | Type   | Description                                                                        |
|-----------|--------|------------------------------------------------------------------------------------|
| pool      | Object | Specifies the backend server group. For details, see <a href="#">Table 10-83</a> . |

**Table 10-83** pools parameter description

| Parameter   | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|-------------|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| id          | String | Specifies the ID of the backend server group.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| tenant_id   | String | Specifies the ID of the project where the backend server group is used.<br>The value contains a maximum of 255 characters.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| project_id  | String | Specifies the ID of the project to which the backend server group belongs. This parameter has the same meaning as <b>tenant_id</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| name        | String | Specifies the name of the backend server group.<br>The value contains a maximum of 255 characters.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| description | String | Provides supplementary information about the backend server group.<br>The value contains a maximum of 255 characters.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| protocol    | String | Specifies the protocol that the backend server group uses to receive requests.<br>TCP, UDP, and HTTP are supported.<br>When a backend server group is associated with a listener, the relationships between the protocol used by the listener and the protocol of the backend server group are as follows: <ul style="list-style-type: none"><li>• When the protocol used by the listener is <b>UDP</b>, the protocol of the backend server group must be <b>UDP</b>.</li><li>• When the protocol used by the listener is <b>TCP</b>, the protocol of the backend server group must be <b>TCP</b>.</li><li>• When the protocol used by the listener is <b>HTTP</b> or <b>TERMINATED_HTTPS</b>, the protocol of the backend server group must be <b>HTTP</b>.</li></ul> |

| Parameter           | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|---------------------|---------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| lb_algorithm        | String  | <p>Specifies the load balancing algorithm of the backend server group.</p> <p>The value can be one of the following:</p> <ul style="list-style-type: none"><li>• <b>ROUND_ROBIN</b>: indicates the weighted round robin algorithm.</li><li>• <b>LEAST_CONNECTIONS</b>: indicates the weighted least connections algorithm.</li><li>• <b>SOURCE_IP</b>: indicates the source IP hash algorithm. When the value is <b>SOURCE_IP</b>, the weights of backend servers in the server group are invalid.</li></ul> |
| members             | Array   | <p>Lists the IDs of backend servers in the backend server group.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| healthmonitor_id    | String  | <p>Specifies the ID of the health check configured for the backend server group.</p>                                                                                                                                                                                                                                                                                                                                                                                                                         |
| admin_state_up      | Boolean | <p>Specifies the administrative status of the backend server group.</p> <p>This parameter is reserved. The value can be <b>true</b> or <b>false</b>.</p> <ul style="list-style-type: none"><li>• <b>true</b>: Enabled</li><li>• <b>false</b>: Disabled</li></ul>                                                                                                                                                                                                                                             |
| listeners           | Array   | <p>Lists the IDs of listeners associated with the backend server group.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| loadbalancers       | Array   | <p>Lists the IDs of load balancers associated with the backend server group.</p>                                                                                                                                                                                                                                                                                                                                                                                                                             |
| session_persistence | Object  | <p>Specifies whether to enable sticky sessions. For details, see <a href="#">Table 10-72</a>.</p> <p>Once sticky session are enabled, requests from the same client are sent to the same backend server during the session.</p> <p>When sticky sessions are disabled, the value is <b>null</b>.</p>                                                                                                                                                                                                          |

**Table 10-84** members parameter description

| Parameter | Type   | Description                                               |
|-----------|--------|-----------------------------------------------------------|
| id        | String | <p>Specifies the ID of the associated backend server.</p> |

**Table 10-85 listeners** parameter description

| Parameter | Type   | Description                                              |
|-----------|--------|----------------------------------------------------------|
| id        | String | Specifies the ID of the associated backend server group. |

**Table 10-86 loadbalancers** parameter description

| Parameter | Type   | Description                                       |
|-----------|--------|---------------------------------------------------|
| id        | String | Specifies the ID of the associated load balancer. |

**Table 10-87 session\_persistence** parameter description

| Parameter | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|-----------|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| type      | String | <p>Specifies the sticky session type.</p> <p>The value can be one of the following:</p> <ul style="list-style-type: none"><li>• <b>SOURCE_IP</b>: Requests are distributed based on the client's IP address. Requests from the same IP address are sent to the same backend server.</li><li>• <b>HTTP_COOKIE</b>: When the client sends a request for the first time, the load balancer automatically generates a cookie and inserts the cookie into the response message. Subsequent requests are sent to the backend server that processes the first request.</li><li>• <b>APP_COOKIE</b>: When the client sends a request for the first time, the backend server that receives the request generates a cookie and inserts the cookie into the response message. Subsequent requests are sent to this backend server.</li></ul> <p>When the protocol of the backend server group is TCP, only <b>SOURCE_IP</b> takes effect. When the protocol of the backend server group is HTTP, only <b>HTTP_COOKIE</b> or <b>APP_COOKIE</b> takes effect.</p> |

| Parameter           | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|---------------------|---------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| cookie_name         | String  | Specifies the cookie name.<br>This parameter is mandatory when the sticky session type is <b>APP_COOKIE</b> .                                                                                                                                                                                                                                                                                                                                                                                               |
| persistence_timeout | Integer | Specifies the sticky session timeout duration in minutes.<br>This parameter is invalid when <b>type</b> is set to <b>APP_COOKIE</b> . <ul style="list-style-type: none"><li>Optional value ranges are as follows:<ul style="list-style-type: none"><li>When the protocol of the backend server group is TCP or UDP, the value ranges from <b>1</b> to <b>60</b>.</li><li>When the protocol of the backend server group is HTTP or HTTPS, the value ranges from <b>1</b> to <b>1440</b>.</li></ul></li></ul> |

## Example Request

- Example request: Querying details of a backend server group  
GET https://{Endpoint}/v2.0/lbaas/pools/5a9a3e9e-d1aa-448e-af37-a70171f2a332

## Example Response

- Example response

## Status Code

For details, see [Status Codes](#).

### 10.1.3.4 Updating a Backend Server Group

## Function

This API is used to update a backend server group.

## Constraints

If the provisioning status of the load balancer associated with a backend server group is not **ACTIVE**, the backend server group cannot be updated.

## URI

PUT /v2.0/lbaas/pools/{pool\_id}

**Table 10-88** Parameter description

| Parameter | Mandatory | Type   | Description                                   |
|-----------|-----------|--------|-----------------------------------------------|
| pool_id   | Yes       | String | Specifies the ID of the backend server group. |

## Request

**Table 10-89** Parameter description

| Parameter | Mandatory | Type   | Description                                                                        |
|-----------|-----------|--------|------------------------------------------------------------------------------------|
| pool      | Yes       | Object | Specifies the backend server group. For details, see <a href="#">Table 10-90</a> . |

**Table 10-90** pool parameter description

| Parameter | Mandatory | Type   | Description                                                                                        |
|-----------|-----------|--------|----------------------------------------------------------------------------------------------------|
| name      | No        | String | Specifies the name of the backend server group.<br>The value contains a maximum of 255 characters. |

| Parameter           | Mandatory | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|---------------------|-----------|---------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| description         | No        | String  | Provides supplementary information about the backend server group.<br>The value contains a maximum of 255 characters.                                                                                                                                                                                                                                                                                                                                                      |
| lb_algorithm        | No        | String  | Specifies the load balancing algorithm of the backend server group.<br>Value options: <ul style="list-style-type: none"><li>● <b>ROUND_ROBIN</b>: indicates the weighted round robin algorithm.</li><li>● <b>LEAST_CONNECTIONS</b>: indicates the weighted least connections algorithm.</li><li>● <b>SOURCE_IP</b>: indicates the source IP hash algorithm.</li></ul> When the value is <b>SOURCE_IP</b> , the weights of backend servers in the server group are invalid. |
| admin_state_up      | No        | Boolean | Specifies the administrative status of the backend server group.<br>This parameter is reserved, and the default value is <b>true</b> .                                                                                                                                                                                                                                                                                                                                     |
| session_persistence | No        | Object  | Specifies whether to enable the sticky session feature. For details, see <a href="#">Table 10-97</a> .<br>Once sticky session are enabled, requests from the same client are sent to the same backend server during the session.<br>When sticky sessions are disabled, the value is <b>null</b> .                                                                                                                                                                          |

**Table 10-91 session\_persistence** parameter description

| Parameter           | Mandatory | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

When the protocol of the backend server group is HTTP, only <b>HTTP_COOKIE</b> or <b>APP_COOKIE</b> takes effect.</li></ul> |
| cookie_name         | No        | String  | <p>Specifies the cookie name.</p> <p>This parameter is mandatory and can be specified when the sticky session type is <b>APP_COOKIE</b>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| persistence_timeout | No        | Integer | <p>Specifies the sticky session timeout duration in minutes.</p> <p>This parameter is invalid when <b>type</b> is set to <b>APP_COOKIE</b>.</p> <p>Value range options are as follows:</p> <ul style="list-style-type: none"><li>• When the protocol of the backend server group is TCP or UDP, the value ranges from <b>1</b> to <b>60</b>.</li><li>• When the protocol of the backend server group is HTTP or HTTPS, the value ranges from <b>1</b> to <b>1440</b>.</li></ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

## Response

**Table 10-92** Parameter description

| Parameter | Type   | Description                                                                        |
|-----------|--------|------------------------------------------------------------------------------------|
| pool      | Object | Specifies the backend server group. For details, see <a href="#">Table 10-93</a> . |

**Table 10-93** pools parameter description

| Parameter   | Type   | Description                                                                                                                          |
|-------------|--------|--------------------------------------------------------------------------------------------------------------------------------------|
| id          | String | Specifies the ID of the backend server group.                                                                                        |
| tenant_id   | String | Specifies the ID of the project where the backend server group is used.<br>The value contains a maximum of 255 characters.           |
| project_id  | String | Specifies the ID of the project to which the backend server group belongs. This parameter has the same meaning as <b>tenant_id</b> . |
| name        | String | Specifies the name of the backend server group.<br>The value contains a maximum of 255 characters.                                   |
| description | String | Provides supplementary information about the backend server group.<br>The value contains a maximum of 255 characters.                |

| Parameter        | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|------------------|---------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| protocol         | String  | <p>Specifies the protocol that the backend server group uses to receive requests. TCP, UDP, and HTTP are supported.</p> <p>When a backend server group is associated with a listener, the relationships between the protocol used by the listener and the protocol of the backend server group are as follows:</p> <ul style="list-style-type: none"><li>• When the protocol used by the listener is <b>UDP</b>, the protocol of the backend server group must be <b>UDP</b>.</li><li>• When the protocol used by the listener is <b>TCP</b>, the protocol of the backend server group must be <b>TCP</b>.</li><li>• When the protocol used by the listener is <b>HTTP</b> or <b>TERMINATED_HTTPS</b>, the protocol of the backend server group must be <b>HTTP</b>.</li></ul> |
| lb_algorithm     | String  | <p>Specifies the load balancing algorithm of the backend server group.</p> <p>The value can be one of the following:</p> <ul style="list-style-type: none"><li>• <b>ROUND_ROBIN</b>: indicates the weighted round robin algorithm.</li><li>• <b>LEAST_CONNECTIONS</b>: indicates the weighted least connections algorithm.</li><li>• <b>SOURCE_IP</b>: indicates the source IP hash algorithm. When the value is <b>SOURCE_IP</b>, the weights of backend servers in the server group are invalid.</li></ul>                                                                                                                                                                                                                                                                   |
| members          | Array   | <p>Lists the IDs of backend servers in the backend server group.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| healthmonitor_id | String  | <p>Specifies the ID of the health check configured for the backend server group.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| admin_state_up   | Boolean | <p>Specifies the administrative status of the backend server group.</p> <p>This parameter is reserved. The value can be <b>true</b> or <b>false</b>.</p> <ul style="list-style-type: none"><li>• <b>true</b>: Enabled</li><li>• <b>false</b>: Disabled</li></ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| listeners        | Array   | <p>Lists the IDs of listeners associated with the backend server group.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| Parameter           | Type   | Description                                                                                                                                                                                                                                                                                         |
|---------------------|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| loadbalancers       | Array  | Lists the IDs of load balancers associated with the backend server group.                                                                                                                                                                                                                           |
| session_persistence | Object | <p>Specifies whether to enable sticky sessions. For details, see <a href="#">Table 10-72</a>.</p> <p>Once sticky session are enabled, requests from the same client are sent to the same backend server during the session.</p> <p>When sticky sessions are disabled, the value is <b>null</b>.</p> |

|-----------|--------|---------------------------------------------------|
| id        | String | Specifies the ID of the associated load balancer. |

**Table 10-97 session\_persistence** parameter description

| Parameter   | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|-------------|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| type        | String | <p>Specifies the sticky session type.</p> <p>The value can be one of the following:</p> <ul style="list-style-type: none"><li>• <b>SOURCE_IP</b>: Requests are distributed based on the client's IP address. Requests from the same IP address are sent to the same backend server.</li><li>• <b>HTTP_COOKIE</b>: When the client sends a request for the first time, the load balancer automatically generates a cookie and inserts the cookie into the response message. Subsequent requests are sent to the backend server that processes the first request.</li><li>• <b>APP_COOKIE</b>: When the client sends a request for the first time, the backend server that receives the request generates a cookie and inserts the cookie into the response message. Subsequent requests are sent to this backend server.</li></ul> <p>When the protocol of the backend server group is TCP, only <b>SOURCE_IP</b> takes effect. When the protocol of the backend server group is HTTP, only <b>HTTP_COOKIE</b> or <b>APP_COOKIE</b> takes effect.</p> |
| cookie_name | String | <p>Specifies the cookie name.</p> <p>This parameter is mandatory when the sticky session type is <b>APP_COOKIE</b>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| Parameter           | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|---------------------|---------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| persistence_timeout | Integer | <p>Specifies the sticky session timeout duration in minutes.</p> <p>This parameter is invalid when <b>type</b> is set to <b>APP_COOKIE</b>.</p> <ul style="list-style-type: none"><li>Optional value ranges are as follows:<ul style="list-style-type: none"><li>When the protocol of the backend server group is TCP or UDP, the value ranges from <b>1</b> to <b>60</b>.</li><li>When the protocol of the backend server group is HTTP or HTTPS, the value ranges from <b>1</b> to <b>1440</b>.</li></ul></li></ul> |

## Example Request

- Example request 1: Updating a backend server group

PUT https://{Endpoint}/v2.0/lbaas/pools/12ff63af-4127-4074-a251-bcb2ecc53ebe

```
{
 "pool": {
 "name": "pool2",
 "description": "pool two",
 "lb_algorithm": "LEAST_CONNECTIONS"
 }
}
```

- Example request 2: Disabling the sticky session feature of a backend server group

PUT https://{Endpoint}/v2.0/lbaas/pools/d46eab56-d76b-4cd3-8952-3c3c4cf113aa

```
{
 "pool": {
 "session_persistence": null
 }
}
```

## Example Response

- Example response 1

```
{
 "pool": {
 "lb_algorithm": "LEAST_CONNECTIONS",
 "protocol": "HTTP",
 "description": "pool two",
 "loadbalancers": [
 {
 "id": "63ad9dfe-4750-479f-9630-ada43ccc8117"
 }
],

 }
}
```

## Status Code

For details, see [Status Codes](#).

### 10.1.3.5 Deleting a Backend Server Group

#### Function

This API is used to delete a backend server group.

#### Constraints

Before deleting a backend server group, remove all backend servers, delete the health check, and disassociate forwarding policies from the backend server group by changing the value of **redirect\_pool\_id** to **null**. For details, see [Updating a Forwarding Policy](#).

#### URI

DELETE /v2.0/lbaas/pools/{pool\_id}

**Table 10-98** Parameter description

| Parameter | Mandatory | Type   | Description                                   |
|-----------|-----------|--------|-----------------------------------------------|
| pool_id   | Yes       | String | Specifies the ID of the backend server group. |

## Request

None

## Response

None

## Example Request

- Example request: Deleting a backend server group  
DELETE /v2.0/lbaas/pools/5a9a3e9e-d1aa-448e-af37-a70171f2a332

## Example Response

- Example response  
None

## Status Code

For details, see [Status Codes](#).

## 10.1.4 Backend Server

### 10.1.4.1 Adding a Backend Server

#### Function

This API is used to add a backend server to a specific backend server group. After a backend server group is added to a listener, traffic is distributed to backend servers in this server group using the specified load balancing algorithm.

#### Constraints

Two backend servers in a backend server group cannot have the same private IP address or port number.

The subnet specified during server creation must be in the same VPC as the subnet from which the private IP address of the load balancer is assigned.

#### URI

POST /v2.0/lbaas/pools/{pool\_id}/members

**Table 10-99** Parameter description

| Parameter | Mandatory | Type   | Description                                   |
|-----------|-----------|--------|-----------------------------------------------|
| pool_id   | Yes       | String | Specifies the ID of the backend server group. |

## Request

**Table 10-100** Parameter description

| Parameter | Mandatory | Type   | Description                                                                   |
|-----------|-----------|--------|-------------------------------------------------------------------------------|
| member    | Yes       | Object | Specifies the backend server. For details, see <a href="#">Table 10-101</a> . |

**Table 10-101** member parameter description

| Parameter  | Mandatory | Type   | Description                                                                                                                                                                                                      |
|------------|-----------|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| tenant_id  | No        | String | Specifies the ID of the project where the backend server is used.<br><br>The value must be the same as the value of <b>project_id</b> in the token.<br><br>The value contains a maximum of 255 characters.       |
| project_id | No        | String | Specifies the ID of the project to which the backend server belongs. This parameter has the same meaning as <b>tenant_id</b> .<br><br>The value must be the same as the value of <b>project_id</b> in the token. |
| name       | No        | String | Specifies the backend server name. The value is an empty character string by default.<br><br>The value contains a maximum of 255 characters.                                                                     |

| Parameter      | Mandatory | Type    | Description                                                                                                                                                                                                                                                                                      |
|----------------|-----------|---------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| address        | Yes       | String  | <p>Specifies the private IP address of the backend server. This IP address must be in the subnet specified by <b>subnet_id</b>.</p> <p>This parameter can be set only to the IP address of the primary NIC, for example, 192.168.3.11.</p> <p>The value contains a maximum of 64 characters.</p> |
| protocol_port  | Yes       | Integer | <p>Specifies the port used by the backend server. The port number ranges from 1 to 65535.</p>                                                                                                                                                                                                    |
| subnet_id      | Yes       | String  | <p>Specifies the ID of the subnet where the backend server works.</p> <p>The private IP address of the backend server is in this subnet.</p> <p>Only IPv4 subnets are supported.</p>                                                                                                             |
| admin_state_up | No        | Boolean | <p>Specifies the administrative status of the backend server.</p> <p>This parameter is reserved, and the default value is <b>true</b>.</p>                                                                                                                                                       |
| weight         | No        | Integer | <p>Specifies the backend server weight. The value ranges from <b>0</b> to <b>100</b>.</p> <p>If the value is <b>0</b>, the backend server will not accept new requests. The default value is <b>1</b>.</p>                                                                                       |

## Response

**Table 10-102** Response parameters

| Parameter | Type   | Description                                                                   |
|-----------|--------|-------------------------------------------------------------------------------|
| member    | Object | Specifies the backend server. For details, see <a href="#">Table 10-103</a> . |

**Table 10-103 member** parameter description

| Parameter      | Type    | Description                                                                                                                                                                                                                                                                        |
|----------------|---------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| id             | String  | Specifies the backend server ID.<br><b>NOTE</b><br>The value of this parameter is not the ID of server. It is the ID automatically generated for the backend server associated with the load balancer.                                                                             |
| tenant_id      | String  | Specifies the ID of the project where the backend server is used.<br>The value contains a maximum of 255 characters.                                                                                                                                                               |
| project_id     | String  | Specifies the ID of the project to which the backend server belongs. This parameter has the same meaning as <b>tenant_id</b> .                                                                                                                                                     |
| name           | String  | Specifies the backend server name.<br>The value contains a maximum of 255 characters.                                                                                                                                                                                              |
| address        | String  | Specifies the private IP address of the backend server. This IP address must be in the subnet specified by <b>subnet_id</b> .<br>This parameter can be set only to the IP address of the primary NIC, for example, 192.168.3.11.<br>The value contains a maximum of 64 characters. |
| protocol_port  | Integer | Specifies the port used by the backend server. The port number ranges from 1 to 65535.                                                                                                                                                                                             |
| subnet_id      | String  | Specifies the ID of the subnet where the backend server works. The private IP address of the backend server is in this subnet.<br>IPv6 subnets are not supported.                                                                                                                  |
| admin_state_up | Boolean | Specifies the administrative status of the backend server.<br>This parameter is reserved. The value can be <b>true</b> or <b>false</b> . <ul style="list-style-type: none"><li>• <b>true</b>: Enabled</li><li>• <b>false</b>: Disabled</li></ul>                                   |

| Parameter        | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                                              |
|------------------|---------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| weight           | Integer | Specifies the backend server weight. The value ranges from <b>0</b> to <b>100</b> .<br>If the value is <b>0</b> , the backend server will not accept new requests. The default value is <b>1</b> .                                                                                                                                                                                                                                       |
| operating_status | String  | Specifies the health check result of the backend server. The value can be one of the following: <ul style="list-style-type: none"><li>• <b>ONLINE</b>: The backend server is running normally.</li><li>• <b>NO_MONITOR</b>: No health check is configured for the backend server group that the backend server belongs to.</li><li>• <b>OFFLINE</b>: The cloud server used as the backend server is stopped or does not exist.</li></ul> |

## Example Request

- Step 1: Query the subnet ID and IP address using the server ID. **device\_id** in the request indicates the server ID. Obtain the values of **subnet\_id** and **ip\_address** of the primary NIC (the port for which **primary\_interface** is **true**) in the response body.

GET https://{VPCEndpoint}/v2.0/ports?device\_id=f738c464-b5c2-45df-86c0-7f436620cd54

Example response

```

## Status Code

For details, see [Status Codes](#).

### 10.1.4.2 Querying Backend Servers

#### Function

This API is used to query backend servers in a specific backend server group. Filter query and pagination query are supported. Unless otherwise specified, exact match is applied.

#### Constraints

Parameters **marker**, **limit**, and **page\_reverse** are used for pagination query. Parameters **marker** and **page\_reverse** take effect only when they are used together with parameter **limit**.

#### URI

GET [/v2.0/lbaas/pools/{pool\\_id}/members](#)

**Table 10-104** Parameter description

| Parameter | Mandatory | Type   | Description                                   |
|-----------|-----------|--------|-----------------------------------------------|
| pool_id   | Yes       | String | Specifies the ID of the backend server group. |

## Request

**Table 10-105** Parameter description

| Parameter    | Mandatory | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                                       |
|--------------|-----------|---------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| marker       | No        | String  | Specifies the ID of the backend server from which pagination query starts, that is, the ID of the last backend server on the previous page. If this parameter is not specified, the first page will be queried.<br><br>This parameter must be used together with <b>limit</b> .                                                                                                                                                   |
| limit        | No        | Integer | Specifies the number of backend servers on each page. If this parameter is not set, all backend servers are queried by default.                                                                                                                                                                                                                                                                                                   |
| page_reverse | No        | Boolean | Specifies the page direction. The value can be <b>true</b> or <b>false</b> , and the default value is <b>false</b> . The last page in the list requested with <b>page_reverse</b> set to <b>false</b> will not contain the "next" link, and the last page in the list requested with <b>page_reverse</b> set to <b>true</b> will not contain the "previous" link.<br><br>This parameter must be used together with <b>limit</b> . |
| id           | No        | String  | Specifies the backend server ID.<br><b>NOTE</b><br>The value of this parameter is not the ID of server. It is the ID automatically generated for the backend server associated with the load balancer.                                                                                                                                                                                                                            |

| Parameter      | Mandatory | Type    | Description                                                                                                                                                                                                                                                     |
|----------------|-----------|---------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| tenant_id      | No        | String  | Specifies the ID of the project where the backend server is used.<br>The value contains a maximum of 255 characters.                                                                                                                                            |
| project_id     | No        | String  | Specifies the ID of the project to which the backend server belongs. This parameter has the same meaning as <b>tenant_id</b> .                                                                                                                                  |
| name           | No        | String  | Specifies the backend server name.<br>The value contains a maximum of 255 characters.<br><b>NOTE</b><br>The value of this parameter is not the name of server. It is the name automatically generated for the backend server associated with the load balancer. |
| address        | No        | String  | Specifies the private IP address of the backend server.<br>The value contains a maximum of 64 characters.                                                                                                                                                       |
| protocol_port  | No        | Integer | Specifies the port used by the backend server.                                                                                                                                                                                                                  |
| subnet_id      | No        | String  | Specifies the ID of the subnet where the backend server works.                                                                                                                                                                                                  |
| admin_state_up | No        | Boolean | Specifies the administrative status of the backend server.<br>This parameter is reserved, and the default value is <b>true</b> .                                                                                                                                |
| weight         | No        | Integer | Specifies the backend server weight.                                                                                                                                                                                                                            |

## Response

**Table 10-106** Response parameters

| Parameter | Type  | Description                                                                                            |
|-----------|-------|--------------------------------------------------------------------------------------------------------|
| members   | Array | Lists the backend servers in the backend server group. For details, see <a href="#">Table 10-107</a> . |

| Parameter     | Type  | Description                                                                                                                                                                                                |
|---------------|-------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| members_links | Array | Provides links to the previous or next page during pagination query, respectively.<br>This parameter exists only in the response body of pagination query. For details, see <a href="#">Table 10-108</a> . |

**Table 10-107** members parameter description

| Parameter     | Type    | Description                                                                                                                                                                                                                                                                        |
|---------------|---------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| id            | String  | Specifies the backend server ID.<br><b>NOTE</b><br>The value of this parameter is not the ID of server. It is the ID automatically generated for the backend server associated with the load balancer.                                                                             |
| tenant_id     | String  | Specifies the ID of the project where the backend server is used.<br>The value contains a maximum of 255 characters.                                                                                                                                                               |
| project_id    | String  | Specifies the ID of the project to which the backend server belongs. This parameter has the same meaning as <b>tenant_id</b> .                                                                                                                                                     |
| name          | String  | Specifies the backend server name.<br>The value contains a maximum of 255 characters.                                                                                                                                                                                              |
| address       | String  | Specifies the private IP address of the backend server. This IP address must be in the subnet specified by <b>subnet_id</b> .<br>This parameter can be set only to the IP address of the primary NIC, for example, 192.168.3.11.<br>The value contains a maximum of 64 characters. |
| protocol_port | Integer | Specifies the port used by the backend server. The port number ranges from 1 to 65535.                                                                                                                                                                                             |
| subnet_id     | String  | Specifies the ID of the subnet where the backend server works. The private IP address of the backend server is in this subnet.<br>IPv6 subnets are not supported.                                                                                                                  |

| Parameter        | Type    | Description                                                                                                                                                                                                                                      |
|------------------|---------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| admin_state_up   | Boolean | Specifies the administrative status of the backend server.<br>This parameter is reserved. The value can be <b>true</b> or <b>false</b> . <ul style="list-style-type: none"><li>• <b>true</b>: Enabled</li><li>• <b>false</b>: Disabled</li></ul> |
| weight           | Integer | Specifies the backend server weight. The value ranges from <b>0</b> to <b>100</b> .<br>If the value is <b>0</b> , the backend server will not accept new requests. The default value is <b>1</b> .                                               |
| operating_status | String  | Specifies the operating status of the load balancer. This parameter is reserved, and its value can be <b>ONLINE</b> or <b>FROZEN</b> .                                                                                                           |

**Table 10-108** members\_links parameter description

| Parameter | Type   | Description                                                                                                                                                                                                                                                                |
|-----------|--------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| href      | String | Provides links to the previous or next page during pagination query, respectively.                                                                                                                                                                                         |
| rel       | String | Specifies the prompt of the previous or next page. The value can be <b>next</b> or <b>previous</b> . <ul style="list-style-type: none"><li>• <b>next</b>: indicates the URL of the next page.</li><li>• <b>previous</b>: indicates the URL of the previous page.</li></ul> |

## Example Request

- Example request 1: Querying all backend servers  
GET https://{Endpoint}/v2.0/lbaas/pools/5a9a3e9e-d1aa-448e-af37-a70171f2a332/members
- Example request 2: Querying the backend cloud server whose IP address is 10.0.0.8 and port number is 80  
GET https://{Endpoint}/v2.0/lbaas/pools/5a9a3e9e-d1aa-448e-af37-a70171f2a332/members?address=10.0.0.8&protocol\_port=80

### 10.1.4.3 Querying Details of a Backend Server

#### Function

This API is used to query details about a backend server.

#### URI

GET /v2.0/lbaas/pools/{pool\_id}/members/{member\_id}

**Table 10-109** Parameter description

| Parameter | Mandatory | Type   | Description                                   |
|-----------|-----------|--------|-----------------------------------------------|
| pool_id   | Yes       | String | Specifies the ID of the backend server group. |

| Parameter | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                                                                                |
|-----------|-----------|--------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| member_id | Yes       | String | <p>Specifies the backend server ID.</p> <p><b>NOTE</b></p> <ul style="list-style-type: none"><li>The value of this parameter is not the ID of server. It is the ID automatically generated for the backend server associated with the load balancer.</li><li>You can obtain this value by calling the API described in <a href="#">Querying Backend Servers</a>.</li></ul> |

## Request

None

## Response

**Table 10-110** Response parameters

| Parameter | Type   | Description                                                                |
|-----------|--------|----------------------------------------------------------------------------|
| member    | Object | Lists the backend servers. For details, see <a href="#">Table 10-111</a> . |

**Table 10-111** member parameter description

| Parameter  | Type   | Description                                                                                                                                                                                                           |
|------------|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| id         | String | <p>Specifies the backend server ID.</p> <p><b>NOTE</b></p> <p>The value of this parameter is not the ID of server. It is the ID automatically generated for the backend server associated with the load balancer.</p> |
| tenant_id  | String | <p>Specifies the ID of the project where the backend server is used.</p> <p>The value contains a maximum of 255 characters.</p>                                                                                       |
| project_id | String | <p>Specifies the ID of the project to which the backend server belongs. This parameter has the same meaning as <b>tenant_id</b>.</p>                                                                                  |
| name       | String | <p>Specifies the backend server name.</p> <p>The value contains a maximum of 255 characters.</p>                                                                                                                      |

| Parameter        | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|------------------|---------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| address          | String  | <p>Specifies the private IP address of the backend server. This IP address must be in the subnet specified by <b>subnet_id</b>.</p> <p>This parameter can be set only to the IP address of the primary NIC, for example, 192.168.3.11.</p> <p>The value contains a maximum of 64 characters.</p>                                                                                                                                                |
| protocol_port    | Integer | <p>Specifies the port used by the backend server. The port number ranges from 1 to 65535.</p>                                                                                                                                                                                                                                                                                                                                                   |
| subnet_id        | String  | <p>Specifies the ID of the subnet where the backend server works. The private IP address of the backend server is in this subnet.</p> <p>IPv6 subnets are not supported.</p>                                                                                                                                                                                                                                                                    |
| admin_state_up   | Boolean | <p>Specifies the administrative status of the backend server.</p> <p>This parameter is reserved. The value can be <b>true</b> or <b>false</b>.</p> <ul style="list-style-type: none"><li>• <b>true</b>: Enabled</li><li>• <b>false</b>: Disabled</li></ul>                                                                                                                                                                                      |
| weight           | Integer | <p>Specifies the backend server weight. The value ranges from <b>0</b> to <b>100</b>.</p> <p>If the value is <b>0</b>, the backend server will not accept new requests. The default value is <b>1</b>.</p>                                                                                                                                                                                                                                      |
| operating_status | String  | <p>Specifies the health check result of the backend server. The value can be one of the following:</p> <ul style="list-style-type: none"><li>• <b>ONLINE</b>: The backend server is running normally.</li><li>• <b>NO_MONITOR</b>: No health check is configured for the backend server group that the backend server belongs to.</li><li>• <b>OFFLINE</b>: The cloud server used as the backend server is stopped or does not exist.</li></ul> |

## Example Request

## Status Code

For details, see [Status Codes](#).

### 10.1.4.4 Updating a Backend Server

## Function

This API is used to update a backend server. You can modify its name and weight. You can set a larger weight for backend servers that can receive more traffic.

## Constraints

If the provisioning status of the associated load balancer is not **ACTIVE**, the backend server cannot be updated.

## URI

PUT /v2.0/lbaas/pools/{pool\_id}/members/{member\_id}

**Table 10-112** Parameter description

| Parameter | Mandatory | Type   | Description                                   |
|-----------|-----------|--------|-----------------------------------------------|
| pool_id   | Yes       | String | Specifies the ID of the backend server group. |

| Parameter | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                                                                                |

| id            | String  | Specifies the backend server ID.<br><b>NOTE</b><br>The value of this parameter is not the ID of server. It is the ID automatically generated for the backend server associated with the load balancer.                                                                             |
| tenant_id     | String  | Specifies the ID of the project where the backend server is used.<br>The value contains a maximum of 255 characters.                                                                                                                                                               |
| project_id    | String  | Specifies the ID of the project to which the backend server belongs. This parameter has the same meaning as <b>tenant_id</b> .                                                                                                                                                     |
| name          | String  | Specifies the backend server name.<br>The value contains a maximum of 255 characters.                                                                                                                                                                                              |
| address       | String  | Specifies the private IP address of the backend server. This IP address must be in the subnet specified by <b>subnet_id</b> .<br>This parameter can be set only to the IP address of the primary NIC, for example, 192.168.3.11.<br>The value contains a maximum of 64 characters. |
| protocol_port | Integer | Specifies the port used by the backend server. The port number ranges from 1 to 65535.                                                                                                                                                                                             |
| subnet_id     | String  | Specifies the ID of the subnet where the backend server works. The private IP address of the backend server is in this subnet.<br>IPv6 subnets are not supported.                                                                                                                  |

| Parameter        | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                                              |
|------------------|---------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| admin_state_up   | Boolean | Specifies the administrative status of the backend server.<br>This parameter is reserved. The value can be <b>true</b> or <b>false</b> . <ul style="list-style-type: none"><li>• <b>true</b>: Enabled</li><li>• <b>false</b>: Disabled</li></ul>                                                                                                                                                                                         |
| weight           | Integer | Specifies the backend server weight. The value ranges from <b>0</b> to <b>100</b> .<br>If the value is <b>0</b> , the backend server will not accept new requests. The default value is <b>1</b> .                                                                                                                                                                                                                                       |
| operating_status | String  | Specifies the health check result of the backend server. The value can be one of the following: <ul style="list-style-type: none"><li>• <b>ONLINE</b>: The backend server is running normally.</li><li>• <b>NO_MONITOR</b>: No health check is configured for the backend server group that the backend server belongs to.</li><li>• <b>OFFLINE</b>: The cloud server used as the backend server is stopped or does not exist.</li></ul> |

### 10.1.4.5 Removing a Backend Server

## Function

This API is used to remove a backend server by its ID.

## Constraints

After you remove a backend server, new connections to this server will not be established. However, long connections that have been established will be maintained.

## URI

DELETE /v2.0/lbaas/pools/{pool\_id}/members/{member\_id}

**Table 10-117** Parameter description

| Parameter | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                                                                     |
|-----------|-----------|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| pool_id   | Yes       | String | Specifies the ID of the backend server group.                                                                                                                                                                                                                                                                                                                   |
| member_id | Yes       | String | Specifies the backend server ID.<br><b>NOTE</b> <ul style="list-style-type: none"><li>The value of this parameter is not the ID of server. It is the ID automatically generated for the backend server associated with the load balancer.</li><li>You can obtain this value by calling the API described in <a href="#">Querying Backend Servers</a>.</li></ul> |

# 10.1.5 Health Check

## 10.1.5.1 Configuring a Health Check

### Function

This API is used to configure a health check for a backend server group to check the status of backend servers. If the health check result is **OFFLINE**, backend servers are considered unhealthy. You need to check the server configuration.

### Constraints

The security group must allow access from 100.125.0.0/16. Otherwise, the health check cannot be performed.

If UDP is used for the health check, the protocol of the backend server group must be UDP.

### URI

POST /v2.0/lbaas/healthmonitors

### Request

**Table 10-118** Parameter description

| Parameter     | Mandatory | Type   | Description                                                                 |
|---------------|-----------|--------|-----------------------------------------------------------------------------|
| healthmonitor | Yes       | Object | Specifies the health check. For details, see <a href="#">Table 10-119</a> . |

**Table 10-119 healthmonitor** parameter description

| Parameter        | Mandatory | Type    | Description                                                                                                                                                                                                          |
|------------------|-----------|---------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| tenant_id        | No        | String  | <p>Specifies the ID of the project where the health check is performed.</p> <p>The value must be the same as the value of <b>project_id</b> in the token.</p> <p>The value contains a maximum of 255 characters.</p> |
| project_id       | No        | String  | <p>Specifies the ID of the project to which the health check belongs. This parameter has the same meaning as <b>tenant_id</b>.</p> <p>The value must be the same as the value of <b>project_id</b> in the token.</p> |
| name             | No        | String  | <p>Specifies the health check name.</p> <p>The value contains a maximum of 255 characters.</p>                                                                                                                       |
| delay            | Yes       | Integer | <p>Specifies the maximum time between health checks in the unit of second. The value ranges from <b>1</b> to <b>50</b>.</p>                                                                                          |
| max_retries      | Yes       | Integer | <p>Specifies the number of consecutive health checks when the health check result of a backend server changes from <b>OFFLINE</b> to <b>ONLINE</b>.</p> <p>The value ranges from <b>1</b> to <b>10</b>.</p>          |
| max_retries_down | No        | Integer | <p>Specifies the number of consecutive health checks when the health check result of a backend server changes from <b>ONLINE</b> to <b>OFFLINE</b>.</p> <p>The value ranges from <b>1</b> to <b>10</b>.</p>          |
| pool_id          | Yes       | String  | <p>Specifies the ID of the backend server group.</p> <p>Only one health check can be configured for each backend server group.</p>                                                                                   |
| admin_state_up   | No        | Boolean | <p>Specifies the administrative status of the health check.</p> <p>This parameter is reserved, and the default value is <b>true</b>.</p>                                                                             |

| Parameter    | Mandatory | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| timeout      | Yes       | Integer | <p>Specifies the health check timeout duration in the unit of second. The value ranges from <b>1</b> to <b>50</b>.</p> <p><b>NOTE</b><br/>You are advised to set the value less than that of parameter <b>delay</b>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                     |
| type         | Yes       | String  | <p>Specifies the health check protocol. The value can be <b>TCP</b>, <b>UDP_CONNECT</b>, or <b>HTTP</b>.</p> <p>The relationships between the health check protocol and the protocol used by the backend server group are as follows:</p> <ul style="list-style-type: none"><li>• If the protocol of the backend server group is UDP, the parameter value can only be <b>UDP_CONNECT</b>.</li><li>• If the protocol of the backend server group is TCP, the parameter value can be <b>TCP</b> or <b>HTTP</b>.</li><li>• If the protocol of the backend server group is HTTP, the parameter value can be <b>TCP</b> or <b>HTTP</b>.</li></ul> |
| monitor_port | No        | Integer | <p>Specifies the health check port. The port number ranges from 1 to 65535.</p> <p>The value is left blank by default, indicating that the port of the backend server is used as the health check port.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| Parameter      | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|----------------|-----------|--------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| domain_name    | No        | String | <p>Specifies the domain name of HTTP requests during the health check.</p> <p>This parameter is valid only when the value of <b>type</b> is set to <b>HTTP</b>.</p> <p>The value is left blank by default, indicating that the private IP address of the load balancer is used as the destination address of HTTP requests.</p> <p>The value can contain only digits, letters, hyphens (-), and periods (.) and must start with a digit or letter, for example, <b>www.test.com</b>.</p> <p>The value contains a maximum of 100 characters.</p> |
| url_path       | No        | String | <p>Specifies the HTTP request path for the health check. The default value is /, and the value must start with a slash (/).</p> <p>This parameter is valid only when the value of <b>type</b> is set to <b>HTTP</b>.</p> <p>An example value is <b>/test</b>.</p> <p>The value contains a maximum of 80 characters.</p>                                                                                                                                                                                                                         |
| expected_codes | No        | String | <p>Specifies the expected HTTP status code. The following options are available:</p> <p>A single value, such as <b>200</b></p> <p>A list of values, such as <b>200,202</b></p> <p>A value range, such as <b>200-204</b></p> <p>This parameter is valid only when the value of <b>type</b> is set to <b>HTTP</b>.</p> <p>The value contains a maximum of 64 characters.</p> <p><b>NOTE</b><br/>This parameter is reserved.</p>                                                                                                                   |

| Parameter   | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                                                                                    |
|-------------|-----------|--------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| http_method | No        | String | <p>Specifies the HTTP request method. The default value is <b>GET</b>.</p> <p>The value can be <b>GET</b>, <b>HEAD</b>, <b>POST</b>, <b>PUT</b>, <b>DELETE</b>, <b>TRACE</b>, <b>OPTIONS</b>, <b>CONNECT</b>, or <b>PATCH</b>.</p> <p>This parameter is valid only when the value of <b>type</b> is set to <b>HTTP</b>.</p> <p><b>NOTE</b><br/>This parameter is reserved.</p> |

## Response

**Table 10-120** Response parameters

| Parameter     | Type   | Description                                                                 |
|---------------|--------|-----------------------------------------------------------------------------|
| healthmonitor | Object | Specifies the health check. For details, see <a href="#">Table 10-121</a> . |

**Table 10-121** healthmonitor parameter description

| Parameter        | Type    | Description                                                                                                                                                                                     |
|------------------|---------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| id               | String  | Specifies the health check ID.                                                                                                                                                                  |
| tenant_id        | String  | Specifies the ID of the project where the health check is performed.                                                                                                                            |
| project_id       | String  | Specifies the ID of the project to which the health check belongs. This parameter has the same meaning as <b>tenant_id</b> .                                                                    |
| name             | String  | Specifies the health check name.                                                                                                                                                                |
| delay            | Integer | Specifies the maximum time between health checks in the unit of second. The value ranges from <b>1</b> to <b>50</b> .                                                                           |
| max_retries      | Integer | Specifies the number of consecutive health checks when the health check result of a backend server changes from <b>OFFLINE</b> to <b>ONLINE</b> . The value ranges from <b>1</b> to <b>10</b> . |
| max_retries_down | Integer | Specifies the number of consecutive health checks when the health check result of a backend server changes from <b>ONLINE</b> to <b>OFFLINE</b> . The value ranges from <b>1</b> to <b>10</b> . |

| Parameter      | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|----------------|---------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| pools          | Array   | Specifies the ID of the backend server group associated with the health check. For details, see <a href="#">Table 10-122</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| admin_state_up | Boolean | <p>Specifies the administrative status of the health check.</p> <p>This parameter is reserved. The value can be <b>true</b> or <b>false</b>.</p> <ul style="list-style-type: none"><li>• <b>true</b>: Enabled</li><li>• <b>false</b>: Disabled</li></ul>                                                                                                                                                                                                                                                                                                                                                                                         |
| timeout        | Integer | <p>Specifies the health check timeout duration in the unit of second. The value ranges from <b>1</b> to <b>50</b>.</p> <p><b>NOTE</b><br/>You are advised to set the value less than that of parameter <b>delay</b>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                         |
| type           | String  | <p>Specifies the health check protocol.</p> <p>The value can be <b>TCP</b>, <b>UDP_CONNECT</b>, or <b>HTTP</b>.</p> <p>The relationships between the value of this parameter and the protocol of the backend server group are as follows:</p> <ul style="list-style-type: none"><li>• If the protocol of the backend server group is UDP, the parameter value can only be <b>UDP_CONNECT</b>.</li><li>• If the protocol of the backend server group is TCP, the parameter value can be <b>TCP</b> or <b>HTTP</b>.</li><li>• If the protocol of the backend server group is HTTP, the parameter value can be <b>TCP</b> or <b>HTTP</b>.</li></ul> |
| monitor_port   | Integer | <p>Specifies the health check port. The port number ranges from 1 to 65535.</p> <p>The value is left blank by default, indicating that the port of the backend server is used as the health check port.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| Parameter      | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|----------------|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| expected_codes | String | <p>Specifies the expected HTTP status code. The following options are available:</p> <p>A single value, such as <b>200</b></p> <p>A list of values, such as <b>200,202</b></p> <p>A value range, such as <b>200-204</b></p> <p>This parameter is valid only when the value of <b>type</b> is set to <b>HTTP</b>.</p> <p>Currently, this parameter is not supported and is fixed at <b>200</b>.</p>                                                                                       |
| domain_name    | String | <p>Specifies the domain name of HTTP requests during the health check.</p> <p>This parameter is valid only when the value of <b>type</b> is set to <b>HTTP</b>.</p> <p>The value is left blank by default, indicating that the private IP address of the load balancer is used as the destination address of HTTP requests.</p> <p>The value can contain only digits, letters, hyphens (-), and periods (.) and must start with a digit or letter, for example, <b>www.test.com</b>.</p> |
| url_path       | String | <p>Specifies the HTTP request path for the health check. The default value is <b>/</b>, and the value must start with a slash (/).</p> <p>This parameter is valid only when the value of <b>type</b> is set to <b>HTTP</b>.</p> <p>An example value is <b>/test</b>.</p>                                                                                                                                                                                                                 |
| http_method    | String | <p>Specifies the HTTP request method. The default value is <b>GET</b>.</p> <p>The value can be <b>GET</b>, <b>HEAD</b>, <b>POST</b>, <b>PUT</b>, <b>DELETE</b>, <b>TRACE</b>, <b>OPTIONS</b>, <b>CONNECT</b>, or <b>PATCH</b>.</p> <p>This parameter is valid only when the value of <b>type</b> is set to <b>HTTP</b>.</p> <p><b>NOTE</b><br/>This parameter is reserved.</p>                                                                                                           |

**Table 10-122** pools parameter description

| Parameter | Type   | Description                                              |
|-----------|--------|----------------------------------------------------------|
| id        | String | Specifies the ID of the associated backend server group. |

## Example Request

- Example request: Configuring a health check  
POST `https://{Endpoint}/v2.0/lbaas/healthmonitors`

```
{
 "healthmonitor": {
 "admin_state_up": true,
 "pool_id": "bb44bffb-05d9-412c-9d9c-b189d9e14193",
 "domain_name": "www.test.com",
 "delay": 10,
 "max_retries": 10,
 "max_retries_down": 5,
 "timeout": 10,
 "type": "HTTP"
 }
}
```

## Example Response

- Example response

```
{
 "healthmonitor": {
 "name": "",
 "admin_state_up": true,
 "tenant_id": "145483a5107745e9b3d80f956713e6a3",
 "project_id": "145483a5107745e9b3d80f956713e6a3",
 "domain_name": "www.test.com",
 "delay": 10,
 "max_retries": 10,
 "expected_codes": "200",
 "max_retries_down": 5,
 "http_method": "GET",
 "timeout": 10,
 "pools": [
 {
 "id": "bb44bffb-05d9-412c-9d9c-b189d9e14193"
 }
],
 "url_path": "/",
 "type": "HTTP",
 "id": "2dca3867-98c5-4cde-8f2c-b89ae6bd7e36",

 }
}
```

## Status Code

For details, see [Status Codes](#).

### 10.1.5.2 Querying Health Checks

#### Function

This API is used to query the health checks. Filter query and pagination query are supported. Unless otherwise specified, exact match is applied.

#### URI

GET `/v2.0/lbaas/healthmonitors`

## Constraints

Parameters **marker**, **limit**, and **page\_reverse** are used for pagination query. Parameters **marker** and **page\_reverse** take effect only when they are used together with parameter **limit**.

## Request

**Table 10-123** Parameter description

| Parameter    | Mandatory | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                                       |
|--------------|-----------|---------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| marker       | No        | String  | Specifies the ID of the health check from which pagination query starts, that is, the ID of the last health check on the previous page.<br><br>This parameter must be used together with <b>limit</b> .                                                                                                                                                                                                                           |
| limit        | No        | Integer | Specifies the number of health checks on each page. If this parameter is not set, all health checks are queried by default.                                                                                                                                                                                                                                                                                                       |
| page_reverse | No        | Boolean | Specifies the page direction. The value can be <b>true</b> or <b>false</b> , and the default value is <b>false</b> . The last page in the list requested with <b>page_reverse</b> set to <b>false</b> will not contain the "next" link, and the last page in the list requested with <b>page_reverse</b> set to <b>true</b> will not contain the "previous" link.<br><br>This parameter must be used together with <b>limit</b> . |
| id           | No        | String  | Specifies the health check ID.                                                                                                                                                                                                                                                                                                                                                                                                    |
| tenant_id    | No        | String  | Specifies the ID of the project where the health check is performed.<br><br>The value contains a maximum of 255 characters.                                                                                                                                                                                                                                                                                                       |
| project_id   | No        | String  | Specifies the ID of the project to which the health check belongs. This parameter has the same meaning as <b>tenant_id</b> .                                                                                                                                                                                                                                                                                                      |
| name         | No        | String  | Specifies the health check name.<br><br>The value contains a maximum of 255 characters.                                                                                                                                                                                                                                                                                                                                           |
| delay        | No        | Integer | Specifies the maximum time between health checks in the unit of second. The value ranges from <b>1</b> to <b>50</b> .                                                                                                                                                                                                                                                                                                             |

| Parameter        | Mandatory | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                    |
|------------------|-----------|---------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| max_retries      | No        | Integer | Specifies the number of consecutive health checks when the health check result of a backend server changes from <b>OFFLINE</b> to <b>ONLINE</b> . The value ranges from <b>1</b> to <b>10</b> .                                                                                                                                                                                                |
| max_retries_down | No        | Integer | Specifies the number of consecutive health checks when the health check result of a backend server changes from <b>ONLINE</b> to <b>OFFLINE</b> . The value ranges from <b>1</b> to <b>10</b> .                                                                                                                                                                                                |
| admin_state_up   | No        | Boolean | Specifies the administrative status of the health check.<br>This parameter is reserved, and the default value is <b>true</b> .                                                                                                                                                                                                                                                                 |
| timeout          | No        | Integer | Specifies the health check timeout duration in the unit of second. The value ranges from <b>1</b> to <b>50</b> .<br><b>NOTE</b><br>You are advised to set the value less than that of parameter <b>delay</b> .                                                                                                                                                                                 |
| type             | No        | String  | Specifies the health check protocol.<br>The value can be <b>TCP</b> , <b>UDP_CONNECT</b> , or <b>HTTP</b> .                                                                                                                                                                                                                                                                                    |
| monitor_port     | No        | Integer | Specifies the port used for the health check.<br>The value is left blank by default, indicating that the port of the backend server is used as the health check port.                                                                                                                                                                                                                          |
| expected_codes   | No        | String  | Specifies the expected HTTP status code. The following options are available:<br>A single value, such as <b>200</b><br>A list of values, such as <b>200,202</b><br>A value range, such as <b>200-204</b><br>This parameter is valid only when the value of <b>type</b> is set to <b>HTTP</b> .<br>The value contains a maximum of 64 characters.<br><b>NOTE</b><br>This parameter is reserved. |

| Parameter   | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-------------|-----------|--------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| domain_name | No        | String | <p>Specifies the domain name of HTTP requests during the health check.</p> <p>This parameter is valid only when the value of <b>type</b> is set to <b>HTTP</b>.</p> <p>The value is left blank by default, indicating that the private IP address of the load balancer is used as the destination address of HTTP requests.</p> <p>The value can contain only digits, letters, hyphens (-), and periods (.) and must start with a digit or letter, for example, <b>www.test.com</b>.</p> <p>The value contains a maximum of 100 characters.</p> |
| url_path    | No        | String | <p>Specifies the HTTP request path for the health check. The default value is /, and the value must start with a slash (/).</p> <p>This parameter is valid only when the value of <b>type</b> is set to <b>HTTP</b>.</p> <p>An example value is <b>/test</b>.</p> <p>The value contains a maximum of 80 characters.</p>                                                                                                                                                                                                                         |
| http_method | No        | String | <p>Specifies the HTTP request method. The default value is <b>GET</b>.</p> <p>The value can be <b>GET</b>, <b>HEAD</b>, <b>POST</b>, <b>PUT</b>, <b>DELETE</b>, <b>TRACE</b>, <b>OPTIONS</b>, <b>CONNECT</b>, or <b>PATCH</b>.</p> <p>This parameter is valid only when the value of <b>type</b> is set to <b>HTTP</b>.</p> <p><b>NOTE</b><br/>This parameter is reserved.</p>                                                                                                                                                                  |

## Response

**Table 10-124** Response parameters

| Parameter      | Type  | Description                                                              |
|----------------|-------|--------------------------------------------------------------------------|
| healthmonitors | Array | Lists the health checks. For details, see <a href="#">Table 10-125</a> . |

| Parameter            | Type  | Description                                                                                                                                                                                                       |
|----------------------|-------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| healthmonitors_links | Array | Provides links to the previous or next page during pagination query, respectively.<br><br>This parameter exists only in the response body of pagination query.<br>For details, see <a href="#">Table 10-127</a> . |

**Table 10-125 healthmonitors** parameter description

| Parameter        | Type    | Description                                                                                                                                                                                                                                    |
|------------------|---------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| id               | String  | Specifies the health check ID.                                                                                                                                                                                                                 |
| tenant_id        | String  | Specifies the ID of the project where the health check is performed.                                                                                                                                                                           |
| project_id       | String  | Specifies the ID of the project to which the health check belongs. This parameter has the same meaning as <b>tenant_id</b> .                                                                                                                   |
| name             | String  | Specifies the health check name.<br>The value contains a maximum of 255 characters.                                                                                                                                                            |
| delay            | Integer | Specifies the maximum time between health checks in the unit of second. The value ranges from <b>1</b> to <b>50</b> .                                                                                                                          |
| max_retries      | Integer | Specifies the number of consecutive health checks when the health check result of a backend server changes from <b>OFFLINE</b> to <b>ONLINE</b> .<br>The value ranges from <b>1</b> to <b>10</b> .                                             |
| max_retries_down | Integer | Specifies the number of consecutive health checks when the health check result of a backend server changes from <b>ONLINE</b> to <b>OFFLINE</b> .<br>The value ranges from <b>1</b> to <b>10</b> .                                             |
| pools            | Array   | Lists the IDs of backend server groups associated with the health check.                                                                                                                                                                       |
| admin_state_up   | Boolean | Specifies the administrative status of the health check.<br>This parameter is reserved. The value can be <b>true</b> or <b>false</b> . <ul style="list-style-type: none"><li>• <b>true</b>: Enabled</li><li>• <b>false</b>: Disabled</li></ul> |

| Parameter      | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|----------------|---------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| timeout        | Integer | Specifies the health check timeout duration in the unit of second. The value ranges from <b>1</b> to <b>50</b> .<br><b>NOTE</b><br>You are advised to set the value less than that of parameter <b>delay</b> .                                                                                                                                                                                                                                                                                                             |
| type           | String  | Specifies the health check protocol.<br>The value can be <b>TCP</b> , <b>UDP_CONNECT</b> , or <b>HTTP</b> .                                                                                                                                                                                                                                                                                                                                                                                                                |
| monitor_port   | Integer | Specifies the health check port. The port number ranges from 1 to 65535.<br>The value is left blank by default, indicating that the port of the backend server is used as the health check port.                                                                                                                                                                                                                                                                                                                           |
| expected_codes | String  | Specifies the expected HTTP status code. The following options are available:<br>A single value, such as <b>200</b><br>A list of values, such as <b>200,202</b><br>A value range, such as <b>200-204</b><br>This parameter is valid only when the value of <b>type</b> is set to <b>HTTP</b> .<br>The value contains a maximum of 64 characters.                                                                                                                                                                           |
| domain_name    | String  | Specifies the domain name of HTTP requests during the health check.<br>This parameter is valid only when the value of <b>type</b> is set to <b>HTTP</b> .<br>The value is left blank by default, indicating that the private IP address of the load balancer is used as the destination address of HTTP requests.<br>The value can contain only digits, letters, hyphens (-), and periods (.) and must start with a digit or letter, for example, <b>www.test.com</b> .<br>The value contains a maximum of 100 characters. |

| Parameter   | Type   | Description                                                                                                                                                                                                                                                                                                                                                                    |
|-------------|--------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| url_path    | String | <p>Specifies the HTTP request path for the health check. The default value is <code>/</code>, and the value must start with a slash (<code>/</code>).</p> <p>This parameter is valid only when the value of <b>type</b> is set to <b>HTTP</b>.</p> <p>An example value is <code>/test</code>.</p> <p>The value contains a maximum of 80 characters.</p>                        |
| http_method | String | <p>Specifies the HTTP request method. The default value is <b>GET</b>.</p> <p>The value can be <b>GET</b>, <b>HEAD</b>, <b>POST</b>, <b>PUT</b>, <b>DELETE</b>, <b>TRACE</b>, <b>OPTIONS</b>, <b>CONNECT</b>, or <b>PATCH</b>.</p> <p>This parameter is valid only when the value of <b>type</b> is set to <b>HTTP</b>.</p> <p><b>NOTE</b><br/>This parameter is reserved.</p> |

**Table 10-126** pools parameter description

| Parameter | Type   | Description                                              |
|-----------|--------|----------------------------------------------------------|
| id        | String | Specifies the ID of the associated backend server group. |

**Table 10-127** healthmonitors\_links parameter description

| Parameter | Type   | Description                                                                                                                                                                                                                                                                     |
|-----------|--------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| href      | String | Provides links to the previous or next page during pagination query, respectively.                                                                                                                                                                                              |
| rel       | String | <p>Specifies the prompt of the previous or next page.</p> <p>The value can be <b>next</b> or <b>previous</b>. The value <b>next</b> indicates the href containing the URL of the next page, and <b>previous</b> indicates the href containing the URL of the previous page.</p> |

## Example Request

- Example request 1: Querying all health checks  
GET https://{Endpoint}/v2.0/lbaas/healthmonitors
- Example request 2: Querying HTTP health checks  
GET https://{Endpoint}/v2.0/lbaas/healthmonitors?type=HTTP

## Example Response

- Example response 1

```
{
 "healthmonitors": [
 {
 "monitor_port": null,
 "name": "",
 "admin_state_up": true,

## Status Code

For details, see [Status Codes](#).

### 10.1.5.3 Querying Details of a Health Check

#### Function

This API is used to query details about a health check using its ID.

#### URI

GET /v2.0/lbaas/healthmonitors/{healthmonitor\_id}

**Table 10-128** Parameter description

| Parameter        | Mandator<br>y | Type   | Description                    |
|------------------|---------------|--------|--------------------------------|
| healthmonitor_id | Yes           | String | Specifies the health check ID. |

#### Request

None

#### Response

**Table 10-129** Response parameters

| Parameter     | Type   | Description                                                                 |
|---------------|--------|-----------------------------------------------------------------------------|
| healthmonitor | Object | Specifies the health check. For details, see <a href="#">Table 10-130</a> . |

**Table 10-130** healthmonitor parameter description

| Parameter  | Type    | Description                                                                                                                  |
|------------|---------|------------------------------------------------------------------------------------------------------------------------------|
| id         | String  | Specifies the health check ID.                                                                                               |
| tenant_id  | String  | Specifies the ID of the project where the health check is performed.                                                         |
| project_id | String  | Specifies the ID of the project to which the health check belongs. This parameter has the same meaning as <b>tenant_id</b> . |
| name       | String  | Specifies the health check name.                                                                                             |
| delay      | Integer | Specifies the maximum time between health checks in the unit of second. The value ranges from <b>1</b> to <b>50</b> .        |

| Parameter        | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|------------------|---------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| max_retries      | Integer | Specifies the number of consecutive health checks when the health check result of a backend server changes from <b>OFFLINE</b> to <b>ONLINE</b> . The value ranges from <b>1</b> to <b>10</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| max_retries_down | Integer | Specifies the number of consecutive health checks when the health check result of a backend server changes from <b>ONLINE</b> to <b>OFFLINE</b> . The value ranges from <b>1</b> to <b>10</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| pools            | Array   | Specifies the ID of the backend server group associated with the health check. For details, see <a href="#">Table 10-122</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| admin_state_up   | Boolean | <p>Specifies the administrative status of the health check.</p> <p>This parameter is reserved. The value can be <b>true</b> or <b>false</b>.</p> <ul style="list-style-type: none"><li>• <b>true</b>: Enabled</li><li>• <b>false</b>: Disabled</li></ul>                                                                                                                                                                                                                                                                                                                                                                                         |
| timeout          | Integer | <p>Specifies the health check timeout duration in the unit of second. The value ranges from <b>1</b> to <b>50</b>.</p> <p><b>NOTE</b><br/>You are advised to set the value less than that of parameter <b>delay</b>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                         |
| type             | String  | <p>Specifies the health check protocol.</p> <p>The value can be <b>TCP</b>, <b>UDP_CONNECT</b>, or <b>HTTP</b>.</p> <p>The relationships between the value of this parameter and the protocol of the backend server group are as follows:</p> <ul style="list-style-type: none"><li>• If the protocol of the backend server group is UDP, the parameter value can only be <b>UDP_CONNECT</b>.</li><li>• If the protocol of the backend server group is TCP, the parameter value can be <b>TCP</b> or <b>HTTP</b>.</li><li>• If the protocol of the backend server group is HTTP, the parameter value can be <b>TCP</b> or <b>HTTP</b>.</li></ul> |
| monitor_port     | Integer | <p>Specifies the health check port. The port number ranges from 1 to 65535.</p> <p>The value is left blank by default, indicating that the port of the backend server is used as the health check port.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| Parameter      | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|----------------|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| expected_codes | String | <p>Specifies the expected HTTP status code. The following options are available:</p> <p>A single value, such as <b>200</b></p> <p>A list of values, such as <b>200,202</b></p> <p>A value range, such as <b>200-204</b></p> <p>This parameter is valid only when the value of <b>type</b> is set to <b>HTTP</b>.</p> <p>Currently, this parameter is not supported and is fixed at <b>200</b>.</p>                                                                                       |
| domain_name    | String | <p>Specifies the domain name of HTTP requests during the health check.</p> <p>This parameter is valid only when the value of <b>type</b> is set to <b>HTTP</b>.</p> <p>The value is left blank by default, indicating that the private IP address of the load balancer is used as the destination address of HTTP requests.</p> <p>The value can contain only digits, letters, hyphens (-), and periods (.) and must start with a digit or letter, for example, <b>www.test.com</b>.</p> |
| url_path       | String | <p>Specifies the HTTP request path for the health check. The default value is <b>/</b>, and the value must start with a slash (/).</p> <p>This parameter is valid only when the value of <b>type</b> is set to <b>HTTP</b>.</p> <p>An example value is <b>/test</b>.</p>                                                                                                                                                                                                                 |
| http_method    | String | <p>Specifies the HTTP request method. The default value is <b>GET</b>.</p> <p>The value can be <b>GET</b>, <b>HEAD</b>, <b>POST</b>, <b>PUT</b>, <b>DELETE</b>, <b>TRACE</b>, <b>OPTIONS</b>, <b>CONNECT</b>, or <b>PATCH</b>.</p> <p>This parameter is valid only when the value of <b>type</b> is set to <b>HTTP</b>.</p> <p><b>NOTE</b><br/>This parameter is reserved.</p>                                                                                                           |

**Table 10-131** pools parameter description

| Parameter | Type   | Description                                              |
|-----------|--------|----------------------------------------------------------|
| id        | String | Specifies the ID of the associated backend server group. |

## Example Request

- Example request: Querying details of a health check  
GET https://{Endpoint}/v2.0/lbaas/healthmonitors/b7633ade-24dc-4d72-8475-06aa22be5412

## Example Response

- Example response

```

}
```

## Status Code

For details, see [Status Codes](#).

### 10.1.5.4 Updating a Health Check

#### Function

This API is used to update a health check.

#### Constraints

If **provisioning\_status** of the load balancer for which the health check is configured is not **ACTIVE**, the health check cannot be updated.

#### URI

PUT /v2.0/lbaas/healthmonitors/{healthmonitor\_id}

**Table 10-132** Parameter description

| Parameter        | Mandator<br>y | Type   | Description                    |
|------------------|---------------|--------|--------------------------------|
| healthmonitor_id | Yes           | String | Specifies the health check ID. |

## Request

**Table 10-133** Parameter description

| Parameter     | Mandatory | Type   | Description                                                                 |
|---------------|-----------|--------|-----------------------------------------------------------------------------|
| healthmonitor | Yes       | Object | Specifies the health check. For details, see <a href="#">Table 10-134</a> . |

**Table 10-134** healthmonitor parameter description

| Parameter        | Mandatory | Type    | Description                                                                                                                                                                                                    |
|------------------|-----------|---------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| name             | No        | String  | Specifies the health check name.<br>The value contains a maximum of 255 characters.                                                                                                                            |
| delay            | No        | Integer | Specifies the maximum time between health checks in the unit of second.<br>The value ranges from <b>1</b> to <b>50</b> .                                                                                       |
| max_retries      | No        | Integer | Specifies the number of consecutive health checks when the health check result of a backend server changes from <b>OFFLINE</b> to <b>ONLINE</b> . The value ranges from <b>1</b> to <b>10</b> .                |
| max_retries_down | No        | Integer | Specifies the number of consecutive health checks when the health check result of a backend server changes from <b>ONLINE</b> to <b>OFFLINE</b> . The value ranges from <b>1</b> to <b>10</b> .                |
| admin_state_up   | No        | Boolean | Specifies the administrative status of the health check.<br>This parameter is reserved, and the default value is <b>true</b> .                                                                                 |
| timeout          | No        | Integer | Specifies the health check timeout duration in the unit of second. The value ranges from <b>1</b> to <b>50</b> .<br><b>NOTE</b><br>You are advised to set the value less than that of parameter <b>delay</b> . |
| type             | No        | String  | Specifies the health check protocol.<br>The value can be <b>TCP</b> , <b>UDP_CONNECT</b> , or <b>HTTP</b> .                                                                                                    |

| Parameter      | Mandatory | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

## Response

**Table 10-135** Response parameters

| Parameter     | Type   | Description                                                                 |
|---------------|--------|-----------------------------------------------------------------------------|
| healthmonitor | Object | Specifies the health check. For details, see <a href="#">Table 10-136</a> . |

**Table 10-136** healthmonitor parameter description

| Parameter        | Type    | Description                                                                                                                                                                                     |
|------------------|---------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| id               | String  | Specifies the health check ID.                                                                                                                                                                  |
| tenant_id        | String  | Specifies the ID of the project where the health check is performed.                                                                                                                            |
| project_id       | String  | Specifies the ID of the project to which the health check belongs. This parameter has the same meaning as <b>tenant_id</b> .                                                                    |
| name             | String  | Specifies the health check name.                                                                                                                                                                |
| delay            | Integer | Specifies the maximum time between health checks in the unit of second. The value ranges from <b>1</b> to <b>50</b> .                                                                           |
| max_retries      | Integer | Specifies the number of consecutive health checks when the health check result of a backend server changes from <b>OFFLINE</b> to <b>ONLINE</b> . The value ranges from <b>1</b> to <b>10</b> . |
| max_retries_down | Integer | Specifies the number of consecutive health checks when the health check result of a backend server changes from <b>ONLINE</b> to <b>OFFLINE</b> . The value ranges from <b>1</b> to <b>10</b> . |

| Parameter      | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|----------------|---------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| pools          | Array   | Specifies the ID of the backend server group associated with the health check. For details, see <a href="#">Table 10-122</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| admin_state_up | Boolean | <p>Specifies the administrative status of the health check.</p> <p>This parameter is reserved. The value can be <b>true</b> or <b>false</b>.</p> <ul style="list-style-type: none"><li>• <b>true</b>: Enabled</li><li>• <b>false</b>: Disabled</li></ul>                                                                                                                                                                                                                                                                                                                                                                                         |
| timeout        | Integer | <p>Specifies the health check timeout duration in the unit of second. The value ranges from <b>1</b> to <b>50</b>.</p> <p><b>NOTE</b><br/>You are advised to set the value less than that of parameter <b>delay</b>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                         |
| type           | String  | <p>Specifies the health check protocol.</p> <p>The value can be <b>TCP</b>, <b>UDP_CONNECT</b>, or <b>HTTP</b>.</p> <p>The relationships between the value of this parameter and the protocol of the backend server group are as follows:</p> <ul style="list-style-type: none"><li>• If the protocol of the backend server group is UDP, the parameter value can only be <b>UDP_CONNECT</b>.</li><li>• If the protocol of the backend server group is TCP, the parameter value can be <b>TCP</b> or <b>HTTP</b>.</li><li>• If the protocol of the backend server group is HTTP, the parameter value can be <b>TCP</b> or <b>HTTP</b>.</li></ul> |
| monitor_port   | Integer | <p>Specifies the health check port. The port number ranges from 1 to 65535.</p> <p>The value is left blank by default, indicating that the port of the backend server is used as the health check port.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| Parameter      | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|----------------|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| expected_codes | String | <p>Specifies the expected HTTP status code. The following options are available:</p> <p>A single value, such as <b>200</b></p> <p>A list of values, such as <b>200,202</b></p> <p>A value range, such as <b>200-204</b></p> <p>This parameter is valid only when the value of <b>type</b> is set to <b>HTTP</b>.</p> <p>Currently, this parameter is not supported and is fixed at <b>200</b>.</p>                                                                                       |
| domain_name    | String | <p>Specifies the domain name of HTTP requests during the health check.</p> <p>This parameter is valid only when the value of <b>type</b> is set to <b>HTTP</b>.</p> <p>The value is left blank by default, indicating that the private IP address of the load balancer is used as the destination address of HTTP requests.</p> <p>The value can contain only digits, letters, hyphens (-), and periods (.) and must start with a digit or letter, for example, <b>www.test.com</b>.</p> |
| url_path       | String | <p>Specifies the HTTP request path for the health check. The default value is <b>/</b>, and the value must start with a slash (/).</p> <p>This parameter is valid only when the value of <b>type</b> is set to <b>HTTP</b>.</p> <p>An example value is <b>/test</b>.</p>                                                                                                                                                                                                                 |
| http_method    | String | <p>Specifies the HTTP request method. The default value is <b>GET</b>.</p> <p>The value can be <b>GET</b>, <b>HEAD</b>, <b>POST</b>, <b>PUT</b>, <b>DELETE</b>, <b>TRACE</b>, <b>OPTIONS</b>, <b>CONNECT</b>, or <b>PATCH</b>.</p> <p>This parameter is valid only when the value of <b>type</b> is set to <b>HTTP</b>.</p> <p><b>NOTE</b><br/>This parameter is reserved.</p>                                                                                                           |

**Table 10-137** pools parameter description

| Parameter | Type   | Description                                              |
|-----------|--------|----------------------------------------------------------|
| id        | String | Specifies the ID of the associated backend server group. |

## Example Request

- Example request: Updating a health check  
PUT https://{Endpoint}/v2.0/lbaas/healthmonitors/b7633ade-24dc-4d72-8475-06aa22be5412  

```
{
 "healthmonitor": {
 "delay": 15,
 "name": "health-xx",
 "timeout": 12
 }
}
```

## Example Response

- Example response  

```
{
 "healthmonitor": {
 "name": "health-xx",
 "admin_state_up": true,
 "tenant_id": "145483a5107745e9b3d80f956713e6a3",
 "project_id": "145483a5107745e9b3d80f956713e6a3",
 "domain_name": null,
 "delay": 15,
 "expected_codes": "200",
 "max_retries": 10,
 "max_retries_down": 5,
 "http_method": "GET",
 "timeout": 12,
 "pools": [
 {
 "id": "bb44bffb-05d9-412c-9d9c-b189d9e14193"
 }
],

 "type": "HTTP",
 "id": "2dca3867-98c5-4cde-8f2c-b89ae6bd7e36",
 "monitor_port": 112
 }
}
```

## Status Code

For details, see [Status Codes](#).

### 10.1.5.5 Deleting a Health Check

## Function

This API is used to delete a health check.

## Constraints

If **provisioning\_status** of the load balancer for which the health check is configured is not **ACTIVE**, the health check cannot be deleted.

## URI

DELETE /v2.0/lbaas/healthmonitors/{healthmonitor\_id}

**Table 10-138** Parameter description

| Parameter        | Mandatory | Type   | Description                    |
|------------------|-----------|--------|--------------------------------|
| healthmonitor_id | Yes       | String | Specifies the health check ID. |

## Request

None

## Response

None

## Example Request

- Example request: Deleting a health check  
DELETE https://{Endpoint}/v2.0/lbaas/healthmonitors/b7633ade-24dc-4d72-8475-06aa22be5412

## Example Response

- Example response  
None

## Status Code

For details, see [Status Codes](#).

## 10.1.6 Forwarding Policy

### 10.1.6.1 Adding a Forwarding Policy

#### Function

This API is used to add a forwarding policy. The listener and forwarding policy determine how traffic is forwarded to backend servers.

- By matching the URL or domain name specified in the forwarding policy when **action** is set to **REDIRECT\_TO\_POOL**, the load balancer distributes the traffic to backend servers in a specific backend server group.
- When **action** is set to **REDIRECT\_TO\_LISTENER**, the HTTP listener is redirected to an HTTPS listener, and requests are routed by the HTTPS listener.

#### Constraints

Currently, only redirects from an HTTP listener to an HTTPS listener are supported. When **action** is set to **REDIRECT\_TO\_LISTENER**, the listener specified by **listener\_id** can only be an HTTP listener, and the listener specified by **redirect\_listener\_id** can only be an HTTPS listener.

The load balancer of the HTTPS listener to which traffic is redirected must be the same as that of the HTTP listener.

URI

POST /v2.0/lbaas/l7policies

Request

Table 10-139 Parameter description

| Parameter | Mandatory | Type   | Description                                                                      |
|-----------|-----------|--------|----------------------------------------------------------------------------------|
| l7policy  | Yes       | Object | Specifies the forwarding policy. For details, see <a href="#">Table 10-140</a> . |

Table 10-140 l7policy parameter description

| Parameter      | Mandatory | Type    | Description                                                                                                                                                                                                         |
|----------------|-----------|---------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| tenant_id      | No        | String  | Specifies the ID of the project where the forwarding policy is used.<br><br>The value must be the same as the value of <b>tenant_id</b> in the token.<br><br>The value contains a maximum of 255 characters.        |
| project_id     | No        | String  | Specifies the ID of the project to which the forwarding policy belongs. This parameter has the same meaning as <b>tenant_id</b> .<br><br>The value must be the same as the value of <b>project_id</b> in the token. |
| name           | No        | String  | Specifies the forwarding policy name.<br><br>The value contains a maximum of 255 characters.                                                                                                                        |
| admin_state_up | No        | Boolean | Specifies the administrative status of the forwarding policy.<br><br>This parameter is reserved, and the default value is <b>true</b> .                                                                             |

| Parameter   | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|-------------|-----------|--------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| description | No        | String | Provides supplementary information about the forwarding policy.<br>The value contains a maximum of 255 characters.                                                                                                                                                                                                                                                                                                                                                                                           |
| listener_id | Yes       | String | Specifies the ID of the listener to which the forwarding policy is added. <ul style="list-style-type: none"><li>When <b>action</b> is set to <b>REDIRECT_TO_POOL</b>, forwarding policies can be added to a listener with <b>protocol</b> set to <b>HTTP</b> or <b>TERMINATED_HTTPS</b>.</li><li>When <b>action</b> is set to <b>REDIRECT_TO_LISTENER</b>, forwarding policies can be added to a listener with <b>protocol</b> set to <b>HTTP</b>.</li></ul>                                                 |
| action      | Yes       | String | Specifies whether requests are forwarded to another backend server group or redirected to an HTTPS listener.<br>The value can be one of the following: <ul style="list-style-type: none"><li><b>REDIRECT_TO_POOL</b>: Requests are forwarded to the backend server group specified by <b>redirect_pool_id</b>.</li><li><b>REDIRECT_TO_LISTENER</b>: Requests are redirected from the HTTP listener specified by <b>listener_id</b> to the HTTPS listener specified by <b>redirect_listener_id</b>.</li></ul> |

| Parameter            | Mandatory | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|----------------------|-----------|---------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

The default value is <b>null</b>.</p> <p>This parameter is mandatory when <b>action</b> is set to <b>REDIRECT_TO_POOL</b>.</p> <p>This parameter cannot be specified when <b>action</b> is set to <b>REDIRECT_TO_LISTENER</b>.</p> <p>The backend server group must meet the following requirements:</p> <ul style="list-style-type: none"><li>• Cannot be the default backend server group of the listener.</li><li>• Cannot be the backend server group used by forwarding policies of other listeners.</li></ul> |
| redirect_listener_id | No        | String  | <p>Specifies the ID of the listener to which the traffic is redirected. The default value is <b>null</b>.</p> <p>This parameter cannot be specified when <b>action</b> is set to <b>REDIRECT_TO_POOL</b>.</p> <p>This parameter is mandatory when <b>action</b> is set to <b>REDIRECT_TO_LISTENER</b>, and the listener:</p> <ul style="list-style-type: none"><li>• Can only be an HTTPS listener.</li><li>• Can only be a listener of the same load balancer.</li></ul>                                                                                                                          |
| redirect_url         | No        | String  | <p>Specifies the URL to which traffic is redirected. The default value is <b>null</b>.</p> <p>This parameter is reserved.</p> <p>The value contains a maximum of 255 characters.</p>                                                                                                                                                                                                                                                                                                                                                                                                               |
| position             | No        | Integer | <p>Specifies the forwarding priority. The value ranges from <b>1</b> to <b>100</b>. The default value is <b>100</b>.</p> <p>This parameter is reserved.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                        |

| Parameter | Mandatory | Type  | Description                                                                                                                                                                                                            |
|-----------|-----------|-------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| rules     | No        | Array | <p>Lists the forwarding rules of the forwarding policy. For details, see <a href="#">Table 10-141</a>.</p> <p>The list contains a maximum of two rules, and the <b>type</b> parameter of each rule must be unique.</p> |

**Table 10-141** rules parameter description

| Parameter      | Mandatory | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|----------------|-----------|---------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| admin_state_up | No        | Boolean | <p>Specifies the administrative status of the forwarding rule.</p> <p>This parameter is reserved, and the default value is <b>true</b>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| type           | Yes       | String  | <p>Specifies the match type of a forwarding rule.</p> <p>The value can be:</p> <ul style="list-style-type: none"><li>• <b>HOST_NAME</b>: matches the domain name in the request.</li><li>• <b>PATH</b>: matches the path in the request.</li></ul> <p>The match type of forwarding rules in a forwarding policy must be unique.</p>                                                                                                                                                                                                                                                   |
| compare_type   | Yes       | String  | <p>Specifies the match mode. The options are as follows:</p> <p>When <b>type</b> is set to <b>HOST_NAME</b>, the value of this parameter can only be the following:</p> <ul style="list-style-type: none"><li>• <b>EQUAL_TO</b>: indicates exact match.</li></ul> <p>When <b>type</b> is set to <b>PATH</b>, the value of this parameter can be one of the following:</p> <ul style="list-style-type: none"><li>• <b>REGEX</b>: indicates regular expression match.</li><li>• <b>STARTS_WITH</b>: indicates prefix match.</li><li>• <b>EQUAL_TO</b>: indicates exact match.</li></ul> |

| Parameter | Mandatory | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-----------|-----------|---------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| invert    | No        | Boolean | Specifies whether reverse matching is supported.<br>The value can be <b>true</b> or <b>false</b> . The default value is <b>false</b> .<br>This parameter is reserved.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| key       | No        | String  | Specifies the key of the match content.<br>The default value is <b>null</b> .<br>This parameter is reserved.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| value     | Yes       | String  | Specifies the value of the match content. The value cannot contain spaces. <ul style="list-style-type: none"><li>When <b>type</b> is set to <b>HOST_NAME</b>, the value can contain a maximum of 100 characters that contain only letters, digits, hyphens (-), and periods (.), and must start with a letter or digit.</li><li>When <b>type</b> is set to <b>PATH</b>, the value can contain a maximum of 128 characters. When <b>compare_type</b> is set to <b>STARTS_WITH</b> or <b>EQUAL_TO</b>, the value must start with a slash (/) and can contain only letters, digits, and special characters <code>_~';@^-%#&amp;\$.*+? ,=!: \\V()[]{} </code></li></ul> |

## Response

**Table 10-142** Response parameters

| Parameter | Type   | Description                                                                      |
|-----------|--------|----------------------------------------------------------------------------------|
| l7policy  | Object | Specifies the forwarding policy. For details, see <a href="#">Table 10-143</a> . |

**Table 10-143** l7policy parameter description

| Parameter | Type   | Description                                                          |
|-----------|--------|----------------------------------------------------------------------|
| id        | String | Specifies the forwarding policy ID.                                  |
| tenant_id | String | Specifies the ID of the project where the forwarding policy is used. |

| Parameter            | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|----------------------|---------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| project_id           | String  | Specifies the ID of the project to which the forwarding policy belongs. This parameter has the same meaning as <b>tenant_id</b> .                                                                                                                                                                                                                                                                                                                                                                                |
| name                 | String  | Specifies the forwarding policy name.                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| admin_state_up       | Boolean | Specifies the administrative status of the forwarding policy.<br>This parameter is reserved. The value can be <b>true</b> or <b>false</b> . <ul style="list-style-type: none"><li>• <b>true</b>: Enabled</li><li>• <b>false</b>: Disabled</li></ul>                                                                                                                                                                                                                                                              |
| description          | String  | Provides supplementary information about the forwarding policy.                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| listener_id          | String  | Specifies the ID of the listener to which the forwarding policy is added.                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| action               | String  | Specifies whether requests are forwarded to another backend server group or redirected to an HTTPS listener.<br>The value can be one of the following: <ul style="list-style-type: none"><li>• <b>REDIRECT_TO_POOL</b>: Requests are forwarded to the backend server group specified by <b>redirect_pool_id</b>.</li><li>• <b>REDIRECT_TO_LISTENER</b>: Requests are redirected from the HTTP listener specified by <b>listener_id</b> to the HTTPS listener specified by <b>redirect_listener_id</b>.</li></ul> |
| redirect_pool_id     | String  | Specifies the ID of the backend server group to which traffic is forwarded.                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| redirect_listener_id | String  | Specifies the ID of the listener to which the traffic is redirected.                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| redirect_url         | String  | Specifies the URL to which traffic is redirected.<br>This parameter is reserved.                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| rules                | Array   | Lists the forwarding rules of the forwarding policy. For details, see <a href="#">Table 10-144</a> .                                                                                                                                                                                                                                                                                                                                                                                                             |
| position             | Integer | Specifies the forwarding priority. The value ranges from <b>1</b> to <b>100</b> . The default value is <b>100</b> .<br>This parameter is reserved.                                                                                                                                                                                                                                                                                                                                                               |

| Parameter           | Type   | Description                                                                                                                             |
|---------------------|--------|-----------------------------------------------------------------------------------------------------------------------------------------|
| provisioning_status | String | This parameter is reserved, and its value can only be <b>ACTIVE</b> .<br>It specifies the provisioning status of the forwarding policy. |

**Table 10-144** rules parameter description

| Parameter | Type   | Description                                                     |
|-----------|--------|-----------------------------------------------------------------|
| id        | String | Lists the IDs of the forwarding rules in the forwarding policy. |

## Example Request

- Example request 1: Adding a forwarding policy  
POST https://{Endpoint}/v2.0/lbaas/l7policies

```
{
 "l7policy": {
 "name": "niubiao_yaqing_api-2",
 "listener_id": "3e24a3ca-11e5-4aa3-abd4-61ba0a8a18f1",
 "action": "REDIRECT_TO_POOL",
 "redirect_pool_id": "6460f13a-76de-43c7-b776-4fefc06a676e",
 "rules": [
 {
 "type": "PATH",
 "compare_type": "EQUAL_TO",
 "value": "/test"
 },
 {
 "type": "HOST_NAME",
 "compare_type": "EQUAL_TO",
 "value": "www.test.com"
 }
]
 }
}
```

## Example Response

- Example response 1

```
{
 "l7policy": {
 "redirect_pool_id": "6460f13a-76de-43c7-b776-4fefc06a676e",

 "name": "niubiao_yaqing-api-2"
}
```

## Status Code

For details, see [Status Codes](#).

### 10.1.6.2 Querying Forwarding Policies

## Function

This API is used to query the forwarding policies. Filter query and pagination query are supported. Unless otherwise specified, exact match is applied.

## Constraints

Parameters **marker**, **limit**, and **page\_reverse** are used for pagination query. Parameters **marker** and **page\_reverse** take effect only when they are used together with parameter **limit**.

## URI

GET /v2.0/lbaas/l7policies

## Request

**Table 10-145** Parameter description

| Parameter | Mandatory | Type    | Description                                                                                                                                                                                                |
|-----------|-----------|---------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| marker    | No        | String  | Specifies the ID of the forwarding policy from which pagination query starts, that is, the ID of the last forwarding policy on the previous page. This parameter must be used together with <b>limit</b> . |
| limit     | No        | Integer | Specifies the number of forwarding policies on each page. If this parameter is not set, all forwarding policies are queried by default.                                                                    |

| Parameter      | Mandatory | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                                   |
|----------------|-----------|---------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| page_reverse   | No        | Boolean | Specifies the page direction. The value can be <b>true</b> or <b>false</b> , and the default value is <b>false</b> . The last page in the list requested with <b>page_reverse</b> set to <b>false</b> will not contain the "next" link, and the last page in the list requested with <b>page_reverse</b> set to <b>true</b> will not contain the "previous" link.<br>This parameter must be used together with <b>limit</b> . |
| id             | No        | String  | Specifies the forwarding policy ID.                                                                                                                                                                                                                                                                                                                                                                                           |
| tenant_id      | No        | String  | Specifies the ID of the project where the forwarding policy is used.<br>The value contains a maximum of 255 characters.                                                                                                                                                                                                                                                                                                       |
| project_id     | No        | String  | Specifies the ID of the project to which the forwarding policy belongs. This parameter has the same meaning as <b>tenant_id</b> .                                                                                                                                                                                                                                                                                             |
| name           | No        | String  | Specifies the forwarding policy name.<br>The value contains a maximum of 255 characters.                                                                                                                                                                                                                                                                                                                                      |
| admin_state_up | No        | Boolean | Specifies the administrative status of the forwarding policy.<br>This parameter is reserved, and the default value is <b>true</b> .                                                                                                                                                                                                                                                                                           |
| description    | No        | String  | Provides supplementary information about the forwarding policy.<br>The value contains a maximum of 255 characters.                                                                                                                                                                                                                                                                                                            |
| listener_id    | No        | String  | Specifies the ID of the listener to which the forwarding policy is added.                                                                                                                                                                                                                                                                                                                                                     |

| Parameter            | Mandatory | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|----------------------|-----------|---------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| action               | No        | String  | <p>Specifies whether requests are forwarded to another backend server group or redirected to an HTTPS listener.</p> <p>The value can be one of the following:</p> <ul style="list-style-type: none"><li>• <b>REDIRECT_TO_POOL</b>: Requests are forwarded to the backend server group specified by <b>redirect_pool_id</b>.</li><li>• <b>REDIRECT_TO_LISTENER</b>: Requests are redirected from the HTTP listener specified by <b>listener_id</b> to the HTTPS listener specified by <b>redirect_listener_id</b>.</li></ul> |
| redirect_pool_id     | No        | String  | Specifies the ID of the backend server group to which traffic is forwarded.                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| redirect_listener_id | No        | String  | Specifies the ID of the listener to which the traffic is redirected.                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| redirect_url         | No        | String  | <p>Specifies the URL to which traffic is redirected.</p> <p>This parameter is reserved.</p> <p>The value contains a maximum of 255 characters.</p>                                                                                                                                                                                                                                                                                                                                                                          |
| position             | No        | Integer | <p>Specifies the forwarding priority. The value ranges from <b>1</b> to <b>100</b>. The default value is <b>100</b>.</p> <p>This parameter is reserved.</p>                                                                                                                                                                                                                                                                                                                                                                 |
| provisioning_status  | No        | String  | <p>This parameter is reserved, and its value can only be <b>ACTIVE</b>.</p> <p>It specifies the provisioning status of the forwarding policy.</p>                                                                                                                                                                                                                                                                                                                                                                           |
| display_all_rules    | No        | Boolean | <p>Specifies whether to display all forwarding rules added to the forwarding policy.</p> <p>Value options:</p> <p><b>false</b>: Forwarding rules will not be displayed, and only IDs are displayed.</p> <p><b>true</b>: Forwarding rules will be displayed.</p>                                                                                                                                                                                                                                                             |

## Response

**Table 10-146** Response parameters

| Parameter        | Type  | Description                                                                                                                                                                                                   |
|------------------|-------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| l7policies       | Array | Lists the forwarding policies. For details, see <a href="#">Table 10-147</a> .                                                                                                                                |
| l7policies_links | Array | Provides links to the previous or next page during pagination query, respectively.<br>This parameter exists only in the response body of pagination query.<br>For details, see <a href="#">Table 10-149</a> . |

**Table 10-147** l7policy parameter description

| Parameter      | Type    | Description                                                                                                                                                                                                                                         |
|----------------|---------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| id             | String  | Specifies the forwarding policy ID.                                                                                                                                                                                                                 |
| tenant_id      | String  | Specifies the ID of the project where the forwarding policy is used.                                                                                                                                                                                |
| project_id     | String  | Specifies the ID of the project to which the forwarding policy belongs. This parameter has the same meaning as <b>tenant_id</b> .                                                                                                                   |
| name           | String  | Specifies the forwarding policy name.                                                                                                                                                                                                               |
| admin_state_up | Boolean | Specifies the administrative status of the forwarding policy.<br>This parameter is reserved. The value can be <b>true</b> or <b>false</b> . <ul style="list-style-type: none"><li>● <b>true</b>: Enabled</li><li>● <b>false</b>: Disabled</li></ul> |
| description    | String  | Provides supplementary information about the forwarding policy.                                                                                                                                                                                     |
| listener_id    | String  | Specifies the ID of the listener to which the forwarding policy is added.                                                                                                                                                                           |

| Parameter            | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|----------------------|---------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| action               | String  | Specifies whether requests are forwarded to another backend server group or redirected to an HTTPS listener.<br>The value can be one of the following: <ul style="list-style-type: none"><li>• <b>REDIRECT_TO_POOL</b>: Requests are forwarded to the backend server group specified by <b>redirect_pool_id</b>.</li><li>• <b>REDIRECT_TO_LISTENER</b>: Requests are redirected from the HTTP listener specified by <b>listener_id</b> to the HTTPS listener specified by <b>redirect_listener_id</b>.</li></ul> |
| redirect_pool_id     | String  | Specifies the ID of the backend server group to which traffic is forwarded.                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| redirect_listener_id | String  | Specifies the ID of the listener to which the traffic is redirected.                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| redirect_url         | String  | Specifies the URL to which traffic is redirected. This parameter is reserved.                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| rules                | Array   | Lists the forwarding rules of the forwarding policy. For details, see <a href="#">Table 10-144</a> .                                                                                                                                                                                                                                                                                                                                                                                                             |
| position             | Integer | Specifies the forwarding priority. The value ranges from <b>1</b> to <b>100</b> . The default value is <b>100</b> .<br>This parameter is reserved.                                                                                                                                                                                                                                                                                                                                                               |
| provisioning_status  | String  | This parameter is reserved, and its value can only be <b>ACTIVE</b> .<br>It specifies the provisioning status of the forwarding policy.                                                                                                                                                                                                                                                                                                                                                                          |

**Table 10-148 rules** parameter description

| Parameter | Type   | Description                                                     |
|-----------|--------|-----------------------------------------------------------------|
| id        | String | Lists the IDs of the forwarding rules in the forwarding policy. |

**Table 10-149 l7policies\_links** parameter description

| Parameter | Type   | Description                                                                        |
|-----------|--------|------------------------------------------------------------------------------------|
| href      | String | Provides links to the previous or next page during pagination query, respectively. |

| Parameter | Type   | Description                                                                                                                                                                                                                                                               |
|-----------|--------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| rel       | String | Specifies the prompt of the previous or next page.<br><br>The value can be <b>next</b> or <b>previous</b> . The value <b>next</b> indicates the href containing the URL of the next page, and <b>previous</b> indicates the href containing the URL of the previous page. |

## Example Request

- Example request 1: Querying all forwarding policies  
GET https://{Endpoint}/v2.0/lbaas/l7policies
- Example request 2: Querying forwarding policies through which requests are forwarded to the backend server group  
GET https://{Endpoint}/v2.0/lbaas/l7policies?action=REDIRECT\_TO\_POOL

## Example Response

- Example response 1

### Status Code

For details, see [Status Codes](#).

### 10.1.6.3 Querying Details of a Forwarding Policy

#### Function

This API is used to query details about a forwarding policy.

#### URI

GET /v2.0/lbaas/l7policies/{l7policy\_id}

Table 10-150 Parameter description

| Parameter   | Mandatory | Type   | Description                         |
|-------------|-----------|--------|-------------------------------------|
| l7policy_id | Yes       | String | Specifies the forwarding policy ID. |

#### Request

None

#### Response

Table 10-151 Parameter description

| Parameter | Type   | Description                                                                      |
|-----------|--------|----------------------------------------------------------------------------------|
| l7policy  | Object | Specifies the forwarding policy. For details, see <a href="#">Table 10-152</a> . |

Table 10-152 l7policy parameter description

| Parameter  | Type   | Description                                                                                                                       |
|------------|--------|-----------------------------------------------------------------------------------------------------------------------------------|
| id         | String | Specifies the forwarding policy ID.                                                                                               |
| tenant_id  | String | Specifies the ID of the project where the forwarding policy is used.                                                              |
| project_id | String | Specifies the ID of the project to which the forwarding policy belongs. This parameter has the same meaning as <b>tenant_id</b> . |
| name       | String | Specifies the forwarding policy name.                                                                                             |

| Parameter            | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|----------------------|---------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| admin_state_up       | Boolean | Specifies the administrative status of the forwarding policy.<br>This parameter is reserved. The value can be <b>true</b> or <b>false</b> . <ul style="list-style-type: none"><li>• <b>true</b>: Enabled</li><li>• <b>false</b>: Disabled</li></ul>                                                                                                                                                                                                                                                              |
| description          | String  | Provides supplementary information about the forwarding policy.                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| listener_id          | String  | Specifies the ID of the listener to which the forwarding policy is added.                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| action               | String  | Specifies whether requests are forwarded to another backend server group or redirected to an HTTPS listener.<br>The value can be one of the following: <ul style="list-style-type: none"><li>• <b>REDIRECT_TO_POOL</b>: Requests are forwarded to the backend server group specified by <b>redirect_pool_id</b>.</li><li>• <b>REDIRECT_TO_LISTENER</b>: Requests are redirected from the HTTP listener specified by <b>listener_id</b> to the HTTPS listener specified by <b>redirect_listener_id</b>.</li></ul> |
| redirect_pool_id     | String  | Specifies the ID of the backend server group to which traffic is forwarded.                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| redirect_listener_id | String  | Specifies the ID of the listener to which the traffic is redirected.                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| redirect_url         | String  | Specifies the URL to which traffic is redirected.<br>This parameter is reserved.                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| rules                | Array   | Lists the forwarding rules of the forwarding policy. For details, see <a href="#">Table 10-144</a> .                                                                                                                                                                                                                                                                                                                                                                                                             |
| position             | Integer | Specifies the forwarding priority. The value ranges from <b>1</b> to <b>100</b> . The default value is <b>100</b> .<br>This parameter is reserved.                                                                                                                                                                                                                                                                                                                                                               |
| provisioning_status  | String  | This parameter is reserved, and its value can only be <b>ACTIVE</b> .<br>It specifies the provisioning status of the forwarding policy.                                                                                                                                                                                                                                                                                                                                                                          |

**Table 10-153** rules parameter description

| Parameter | Type   | Description                                                     |
|-----------|--------|-----------------------------------------------------------------|
| id        | String | Lists the IDs of the forwarding rules in the forwarding policy. |

## Example Request

- Example request: Querying details of a forwarding policy  
GET https://{Endpoint}/v2.0/lbaas/l7policies/5ae0e1e7-5f0f-47a1-b39f-5d4c428a1586

## Example Response

- Example response

## Status Code

For details, see [Status Codes](#).

### 10.1.6.4 Updating a Forwarding Policy

## Function

This API is used to update a forwarding policy. You can select another backend server group or redirect to another HTTPS listener.

## URI

PUT /v2.0/lbaas/l7policies/{l7policy\_id}

**Table 10-154** Parameter description

| Parameter   | Mandatory | Type   | Description                         |
|-------------|-----------|--------|-------------------------------------|
| l7policy_id | Yes       | Object | Specifies the forwarding policy ID. |

## Request

**Table 10-155** Parameter description

| Parameter | Mandatory | Type   | Description                                                                      |
|-----------|-----------|--------|----------------------------------------------------------------------------------|
| l7policy  | Yes       | Object | Specifies the forwarding policy. For details, see <a href="#">Table 10-156</a> . |

**Table 10-156** l7policy parameter description

| Parameter        | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|------------------|-----------|--------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| name             | No        | String | Specifies the forwarding policy name. The value contains a maximum of 255 characters.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| description      | No        | String | Provides supplementary information about the forwarding policy. The value contains a maximum of 255 characters.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| redirect_pool_id | No        | String | <p>Specifies the ID of the backend server group to which traffic is forwarded. The default value is <b>null</b>.</p> <p>This parameter is mandatory when <b>action</b> is set to <b>REDIRECT_TO_POOL</b>.</p> <p>This parameter cannot be specified when <b>action</b> is set to <b>REDIRECT_TO_LISTENER</b>.</p> <p>The backend server group must meet the following requirements:</p> <ul style="list-style-type: none"><li>• Cannot be the default backend server group of the listener.</li><li>• Cannot be the backend server group used by forwarding policies of other listeners.</li></ul> |

| Parameter            | Mandatory | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| redirect_listener_id | No        | String  | <p>Specifies the ID of the listener to which the traffic is redirected. The default value is <b>null</b>.</p> <p>This parameter is mandatory when <b>action</b> is set to <b>REDIRECT_TO_LISTENER</b>.</p> <p>This parameter cannot be specified when <b>action</b> is set to <b>REDIRECT_TO_POOL</b>. The listener must meet the following requirements:</p> <ul style="list-style-type: none"><li>• Can only be an HTTPS listener.</li><li>• Can only be a listener of the same load balancer.</li></ul> |
| admin_state_up       | No        | Boolean | <p>Specifies the administrative status of the forwarding policy.</p> <p>This parameter is reserved, and the default value is <b>true</b>.</p>                                                                                                                                                                                                                                                                                                                                                              |

## Response

**Table 10-157** Response parameters

| Parameter | Mandatory | Type   | Description                                                                      |
|-----------|-----------|--------|----------------------------------------------------------------------------------|
| l7policy  | Yes       | Object | Specifies the forwarding policy. For details, see <a href="#">Table 10-158</a> . |

**Table 10-158** l7policy parameter description

| Parameter  | Type   | Description                                                                                                                       |
|------------|--------|-----------------------------------------------------------------------------------------------------------------------------------|
| id         | String | Specifies the forwarding policy ID.                                                                                               |
| tenant_id  | String | Specifies the ID of the project where the forwarding policy is used.                                                              |
| project_id | String | Specifies the ID of the project to which the forwarding policy belongs. This parameter has the same meaning as <b>tenant_id</b> . |
| name       | String | Specifies the forwarding policy name.                                                                                             |

| Parameter            | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|----------------------|---------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| admin_state_up       | Boolean | Specifies the administrative status of the forwarding policy.<br>This parameter is reserved. The value can be <b>true</b> or <b>false</b> . <ul style="list-style-type: none"><li>• <b>true</b>: Enabled</li><li>• <b>false</b>: Disabled</li></ul>                                                                                                                                                                                                                                                              |
| description          | String  | Provides supplementary information about the forwarding policy.                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| listener_id          | String  | Specifies the ID of the listener to which the forwarding policy is added.                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| action               | String  | Specifies whether requests are forwarded to another backend server group or redirected to an HTTPS listener.<br>The value can be one of the following: <ul style="list-style-type: none"><li>• <b>REDIRECT_TO_POOL</b>: Requests are forwarded to the backend server group specified by <b>redirect_pool_id</b>.</li><li>• <b>REDIRECT_TO_LISTENER</b>: Requests are redirected from the HTTP listener specified by <b>listener_id</b> to the HTTPS listener specified by <b>redirect_listener_id</b>.</li></ul> |
| redirect_pool_id     | String  | Specifies the ID of the backend server group to which traffic is forwarded.                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| redirect_listener_id | String  | Specifies the ID of the listener to which the traffic is redirected.                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| redirect_url         | String  | Specifies the URL to which traffic is redirected.<br>This parameter is reserved.                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| rules                | Array   | Lists the forwarding rules of the forwarding policy. For details, see <a href="#">Table 10-144</a> .                                                                                                                                                                                                                                                                                                                                                                                                             |
| position             | Integer | Specifies the forwarding priority. The value ranges from <b>1</b> to <b>100</b> . The default value is <b>100</b> .<br>This parameter is reserved.                                                                                                                                                                                                                                                                                                                                                               |
| provisioning_status  | String  | This parameter is reserved, and its value can only be <b>ACTIVE</b> .<br>It specifies the provisioning status of the forwarding policy.                                                                                                                                                                                                                                                                                                                                                                          |

**Table 10-159** rules parameter description

| Parameter | Type   | Description                                                     |
|-----------|--------|-----------------------------------------------------------------|
| id        | String | Lists the IDs of the forwarding rules in the forwarding policy. |

## Example Request

- Example request: Updating a forwarding policy  
PUT https://{Endpoint}/v2.0/lbaas/l7policies/5ae0e1e7-5f0f-47a1-b39f-5d4c428a1586  

```
{
 "l7policy": {
 "name": "test"
 }
}
```

## Example Response

- Example response  

```
{
 "l7policy": {
 "redirect_pool_id": "431a03eb-81bb-408e-ae37-7ce19023692b",

## Status Code

For details, see [Status Codes](#).

### 10.1.6.5 Deleting a Forwarding Policy

## Function

This API is used to delete a specific forwarding policy.

## URI

DELETE /v2.0/lbaas/l7policies/{l7policy\_id}

**Table 10-160** Parameter description

| Parameter   | Mandatory | Type   | Description                         |
|-------------|-----------|--------|-------------------------------------|
| l7policy_id | Yes       | Object | Specifies the forwarding policy ID. |

## Request

None

## Response

None

## Example Request

- Example request: Deleting a forwarding policy  
DELETE https://{Endpoint}/v2.0/lbaas/l7policies/5ae0e1e7-5f0f-47a1-b39f-5d4c428a1586

## Example Response

- Example response  
None

## Status Code

For details, see [Status Codes](#).

## 10.1.7 Forwarding Rule

### 10.1.7.1 Adding a Forwarding Rule

## Function

This API is used to add a forwarding rule. After you add a forwarding rule, the load balancer matches the domain name and path in the request and distributes the traffic to the backend server group specified by **redirect\_pool\_id** of the associated forwarding policy.

## Constraints

The match type of forwarding rules in a forwarding policy must be unique.

## URI

POST /v2.0/lbaas/l7policies/{l7policy\_id}/rules

**Table 10-161** Parameter description

| Parameter   | Mandatory | Type   | Description                         |
|-------------|-----------|--------|-------------------------------------|
| l7policy_id | Yes       | String | Specifies the forwarding policy ID. |

## Request

**Table 10-162** Parameter description

| Parameter | Mandatory | Type   | Description                                                                    |
|-----------|-----------|--------|--------------------------------------------------------------------------------|
| rule      | Yes       | Object | Specifies the forwarding rule. For details, see <a href="#">Table 10-163</a> . |

**Table 10-163** rule parameter description

| Parameter      | Mandatory | Type    | Description                                                                                                                                                                                                       |
|----------------|-----------|---------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| tenant_id      | No        | String  | Specifies the ID of the project where the forwarding rule is used.<br><br>The value must be the same as the value of <b>project_id</b> in the token.<br><br>The value contains a maximum of 255 characters.       |
| project_id     | No        | String  | Specifies the ID of the project to which the forwarding rule belongs. This parameter has the same meaning as <b>tenant_id</b> .<br><br>The value must be the same as the value of <b>project_id</b> in the token. |
| admin_state_up | No        | Boolean | Specifies the administrative status of the forwarding rule.<br><br>This parameter is reserved, and the default value is <b>true</b> .                                                                             |

| Parameter    | Mandatory | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|--------------|-----------|---------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

## Response

**Table 10-164** Response parameters

| Parameter | Type   | Description                                                                    |
|-----------|--------|--------------------------------------------------------------------------------|
| rule      | Object | Specifies the forwarding rule. For details, see <a href="#">Table 10-165</a> . |

**Table 10-165** rule parameter description

| Parameter  | Type   | Description                                                                                                                      |
|------------|--------|----------------------------------------------------------------------------------------------------------------------------------|
| id         | String | Specifies the forwarding rule ID.                                                                                                |
| tenant_id  | String | <p>Specifies the ID of the project where the forwarding rule is used.</p> <p>The value contains a maximum of 255 characters.</p> |
| project_id | String | Specifies the ID of the project to which the forwarding rule belongs. This parameter has the same meaning as <b>tenant_id</b> .  |

| Parameter      | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|----------------|---------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| admin_state_up | Boolean | <p>Specifies the administrative status of the forwarding rule.</p> <p>This parameter is reserved. The value can be <b>true</b> or <b>false</b>.</p> <ul style="list-style-type: none"><li>• <b>true</b>: Enabled</li><li>• <b>false</b>: Disabled</li></ul>                                                                                                                                                                                                                                                                                                                           |
| type           | String  | <p>Specifies the match type of a forwarding rule.</p> <p>The value can be one of the following:</p> <ul style="list-style-type: none"><li>• <b>HOST_NAME</b>: matches the domain name in the request.</li><li>• <b>PATH</b>: matches the path in the request.</li></ul>                                                                                                                                                                                                                                                                                                               |

 }
}
```

## Status Code

For details, see [Status Codes](#).

### 10.1.7.2 Querying Forwarding Rules

#### Function

This API is used to query forwarding rules. Filter query and pagination query are supported. Unless otherwise specified, exact match is applied.

#### Constraints

Parameters **marker**, **limit**, and **page\_reverse** are used for pagination query. Parameters **marker** and **page\_reverse** take effect only when they are used together with parameter **limit**.

#### URI

GET /v2.0/lbaas/l7policies/{l7policy\_id}/rules

**Table 10-166** Parameter description

| Parameter   | Mandatory | Type   | Description                         |
|-------------|-----------|--------|-------------------------------------|
| l7policy_id | Yes       | String | Specifies the forwarding policy ID. |

#### Request

**Table 10-167** Parameter description

| Parameter | Mandatory | Type    | Description                                                                                                                                                                                                   |
|-----------|-----------|---------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| marker    | No        | String  | Specifies the ID of the forwarding rule from which pagination query starts, that is, the ID of the last forwarding rule on the previous page.<br><br>This parameter must be used together with <b>limit</b> . |
| limit     | No        | Integer | Specifies the number of forwarding rules on each page. If this parameter is not set, all forwarding rules are queried by default.                                                                             |

| Parameter      | Mandatory | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                                       |
|----------------|-----------|---------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| page_reverse   | No        | Boolean | Specifies the page direction. The value can be <b>true</b> or <b>false</b> , and the default value is <b>false</b> . The last page in the list requested with <b>page_reverse</b> set to <b>false</b> will not contain the "next" link, and the last page in the list requested with <b>page_reverse</b> set to <b>true</b> will not contain the "previous" link.<br><br>This parameter must be used together with <b>limit</b> . |
| id             | No        | String  | Specifies the forwarding rule ID.                                                                                                                                                                                                                                                                                                                                                                                                 |
| tenant_id      | No        | String  | Specifies the ID of the project where the forwarding rule is used.<br><br>The value contains a maximum of 255 characters.                                                                                                                                                                                                                                                                                                         |
| project_id     | No        | String  | Specifies the ID of the project to which the forwarding rule belongs. This parameter has the same meaning as <b>tenant_id</b> .                                                                                                                                                                                                                                                                                                   |
| admin_state_up | No        | Boolean | Specifies the administrative status of the forwarding rule.<br><br>This parameter is reserved, and the default value is <b>true</b> .                                                                                                                                                                                                                                                                                             |
| type           | No        | String  | Specifies the match type of a forwarding rule.<br><br>The value can be one of the following: <ul style="list-style-type: none"><li>• <b>HOST_NAME</b>: matches the domain name in the request.</li><li>• <b>PATH</b>: matches the path in the request.</li></ul><br>The match type of forwarding rules in a forwarding policy must be unique.                                                                                     |

| Parameter    | Mandatory | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

## Status Code

For details, see [Status Codes](#).

### 10.1.7.3 Querying Details of a Forwarding Rule

## Function

This API is used to query details about a forwarding rule by ID.

## URI

GET /v2.0/lbaas/l7policies/{l7policy\_id}/rules/{l7rule\_id}

**Table 10-171** Parameter description

| Parameter   | Mandatory | Type   | Description                         |
|-------------|-----------|--------|-------------------------------------|
| l7policy_id | Yes       | String | Specifies the forwarding policy ID. |
| l7rule_id   | Yes       | String | Specifies the forwarding rule ID.   |

## Request

None

## Response

**Table 10-172** Response parameters

| Parameter | Type   | Description                                                                    |
|-----------|--------|--------------------------------------------------------------------------------|
| rule      | Object | Specifies the forwarding rule. For details, see <a href="#">Table 10-173</a> . |

**Table 10-173** rule parameter description

| Parameter | Type   | Description                       |
|-----------|--------|-----------------------------------|
| id        | String | Specifies the forwarding rule ID. |

| Parameter      | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|----------------|---------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| tenant_id      | String  | Specifies the ID of the project where the forwarding rule is used.<br>The value contains a maximum of 255 characters.                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| project_id     | String  | Specifies the ID of the project to which the forwarding rule belongs. This parameter has the same meaning as <b>tenant_id</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| admin_state_up | Boolean | Specifies the administrative status of the forwarding rule.<br>This parameter is reserved. The value can be <b>true</b> or <b>false</b> . <ul style="list-style-type: none"><li>• <b>true</b>: Enabled</li><li>• <b>false</b>: Disabled</li></ul>                                                                                                                                                                                                                                                                                                                     |
| type           | String  | Specifies the match type of a forwarding rule.<br>The value can be one of the following: <ul style="list-style-type: none"><li>• <b>HOST_NAME</b>: matches the domain name in the request.</li><li>• <b>PATH</b>: matches the path in the request.</li></ul>                                                                                                                                                                                                                                                                                                          |
| compare_type   | String  | Specifies the match mode. The options are as follows:<br>When <b>type</b> is set to <b>HOST_NAME</b> , the value of this parameter can only be the following: <ul style="list-style-type: none"><li>• <b>EQUAL_TO</b>: indicates exact match.</li></ul> When <b>type</b> is set to <b>PATH</b> , the value of this parameter can be one of the following: <ul style="list-style-type: none"><li>• <b>REGEX</b>: indicates regular expression match.</li><li>• <b>STARTS_WITH</b>: indicates prefix match.</li><li>• <b>EQUAL_TO</b>: indicates exact match.</li></ul> |
| invert         | Boolean | Specifies whether reverse matching is supported.<br>The value can be <b>true</b> or <b>false</b> . The default value is <b>false</b> .<br>This parameter is reserved.                                                                                                                                                                                                                                                                                                                                                                                                 |
| key            | String  | Specifies the key of the match content. The default value is <b>null</b> .<br>This parameter is reserved.<br>The value contains a maximum of 255 characters.                                                                                                                                                                                                                                                                                                                                                                                                          |

| Parameter           | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

## Status Code

For details, see [Status Codes](#).

### 10.1.7.4 Updating a Forwarding Rule

#### Function

This API is used to update a forwarding rule. You can change the mode that how traffic is distributed by updating the forwarding rule.

#### URI

PUT /v2.0/lbaas/l7policies/{l7policy\_id}/rules/{l7rule\_id}

**Table 10-174** Parameter description

| Parameter   | Mandatory | Type   | Description                         |
|-------------|-----------|--------|-------------------------------------|
| l7policy_id | Yes       | String | Specifies the forwarding policy ID. |
| l7rule_id   | Yes       | String | Specifies the forwarding rule ID.   |

#### Request

**Table 10-175** Parameter description

| Parameter | Mandatory | Type   | Description                                                                    |
|-----------|-----------|--------|--------------------------------------------------------------------------------|
| rule      | Yes       | Object | Specifies the forwarding rule. For details, see <a href="#">Table 10-176</a> . |

**Table 10-176** rule parameter description

| Parameter    | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|--------------|-----------|--------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

 }
}
```

## Status Code

For details, see [Status Codes](#).

### 10.1.7.5 Deleting a Forwarding Rule

#### Function

This API is used to delete a specific forwarding rule.

#### URI

DELETE /v2.0/lbaas/l7policies/{l7policy\_id}/rules/{l7rule\_id}

**Table 10-179** Parameter description

| Parameter   | Mandatory | Type   | Description                         |
|-------------|-----------|--------|-------------------------------------|
| l7policy_id | Yes       | String | Specifies the forwarding policy ID. |
| l7rule_id   | Yes       | String | Specifies the forwarding rule ID.   |

#### Request

None

#### Response

None

#### Example Request

## 10.1.8 Whitelist

### 10.1.8.1 Adding a Whitelist

#### Function

This API is used to add a whitelist to control access to a specific listener. After a whitelist is added, only IP addresses in the whitelist can access the listener.

## URI

POST /v2.0/lbaas/whitelists

## Request

**Table 10-180** Parameter description

| Parameter | Mandatory | Type   | Description                                                              |
|-----------|-----------|--------|--------------------------------------------------------------------------|
| whitelist | Yes       | Object | Specifies the whitelist. For details, see <a href="#">Table 10-181</a> . |

**Table 10-181** whitelist parameter description

| Parameter        | Mandatory | Type    | Description                                                                                                                                                                                                                                                                                 |
|------------------|-----------|---------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| tenant_id        | No        | String  | Specifies the ID of the project where the whitelist is used.<br><br>The value must be the same as the value of <b>project_id</b> in the token.<br>The value contains a maximum of 255 characters.                                                                                           |
| listener_id      | Yes       | String  | Specifies the listener ID.<br>Only one whitelist can be created for a listener.                                                                                                                                                                                                             |
| enable_whitelist | No        | Boolean | Specifies whether to enable access control.<br><b>true</b> : Access control is enabled.<br><b>false</b> : Access control is disabled.<br>The default value is <b>true</b> .                                                                                                                 |
| whitelist        | No        | String  | Specifies the IP addresses in the whitelist. Use commas (,) to separate multiple IP addresses.<br>You can specify an IP address, for example, 192.168.11.1.<br>You can also specify an IP address range, for example, 192.168.0.1/24.<br>The default value is an empty string, that is, "". |

## Response

 "whitelist": "192.168.11.1,192.168.0.1/24,192.168.201.18/8,100.164.0.1/24"
 }
}
```

```
}
}
```

### Status Code

For details, see [Status Codes](#).

### 10.1.8.2 Querying Whitelists

#### Function

This API is used to query the whitelists. Filter query and pagination query are supported. Unless otherwise specified, exact match is applied.

#### Constraints

Parameters **marker**, **limit**, and **page\_reverse** are used for pagination query. Parameters **marker** and **page\_reverse** take effect only when they are used together with parameter **limit**.

#### URI

GET /v2.0/lbaas/whitelists

#### Request

Table 10-184 Parameter description

| Parameter | Mandatory | Type    | Description                                                                                                                                                                                       |
|-----------|-----------|---------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| marker    | No        | String  | Specifies the ID of the whitelist from which pagination query starts, that is, the ID of the last whitelist on the previous page.<br><br>This parameter must be used together with <b>limit</b> . |
| limit     | No        | Integer | Specifies the number of whitelists on each page. If this parameter is not set, all whitelists are queried by default.                                                                             |

| Parameter        | Mandatory | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                                   |
|------------------|-----------|---------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| page_reverse     | No        | Boolean | Specifies the page direction. The value can be <b>true</b> or <b>false</b> , and the default value is <b>false</b> . The last page in the list requested with <b>page_reverse</b> set to <b>false</b> will not contain the "next" link, and the last page in the list requested with <b>page_reverse</b> set to <b>true</b> will not contain the "previous" link.<br>This parameter must be used together with <b>limit</b> . |
| id               | No        | String  | Specifies the whitelist ID.                                                                                                                                                                                                                                                                                                                                                                                                   |
| tenant_id        | No        | String  | Specifies the ID of the project where the whitelist is used.<br>The value contains a maximum of 255 characters.                                                                                                                                                                                                                                                                                                               |
| listener_id      | No        | String  | Specifies the ID of the listener to which the whitelist is added.                                                                                                                                                                                                                                                                                                                                                             |
| enable_whitelist | No        | Boolean | Specifies whether to enable access control.<br><b>true</b> : Access control is enabled.<br><b>false</b> : Access control is disabled.                                                                                                                                                                                                                                                                                         |
| whitelist        | No        | String  | Specifies the IP addresses in the whitelist.                                                                                                                                                                                                                                                                                                                                                                                  |

## Response

**Table 10-185** Response parameters

| Parameter        | Type  | Description                                                                                                                                                                                                   |
|------------------|-------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| whitelists       | Array | Lists the whitelists. For details, see <a href="#">Table 10-186</a> .                                                                                                                                         |
| whitelists_links | Array | Provides links to the previous or next page during pagination query, respectively.<br>This parameter exists only in the response body of pagination query.<br>For details, see <a href="#">Table 10-187</a> . |

**Table 10-186 whitelist** parameter description

| Parameter        | Type   | Description                                                                                                                           |
|------------------|--------|---------------------------------------------------------------------------------------------------------------------------------------|
| id               | String | Specifies the whitelist ID.                                                                                                           |
| tenant_id        | String | Specifies the ID of the project where the whitelist is used.<br>The value contains a maximum of 255 characters.                       |
| listener_id      | String | Specifies the ID of the listener to which the whitelist is added.                                                                     |
| enable_whitelist | Bool   | Specifies whether to enable access control.<br><b>true</b> : Access control is enabled.<br><b>false</b> : Access control is disabled. |
| whitelist        | String | Specifies the IP addresses in the whitelist.                                                                                          |

**Table 10-187 whitelists\_links** parameter description

| Parameter | Type   | Description                                                                                                                                                                                                                                                           |
|-----------|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| href      | String | Provides links to the previous or next page during pagination query, respectively.                                                                                                                                                                                    |
| rel       | String | Specifies the prompt of the previous or next page.<br>The value can be <b>next</b> or <b>previous</b> . The value <b>next</b> indicates the href containing the URL of the next page, and <b>previous</b> indicates the href containing the URL of the previous page. |

## Example Request

- Example request 1: Querying all whitelists  
GET https://{Endpoint}/v2.0/lbaas/whitelists
- Example request 2: Querying the whitelists added to listener eabfefa3fd1740a88a47ad98e132d230  
GET https://{Endpoint}/v2.0/lbaas/whitelists?listener\_id=eabfefa3fd1740a88a47ad98e132d230

## Example Response

- Example response 1

```

10.1.8.3 Querying Details of a Whitelist

Function

This API is used to query details about a whitelist using its ID.

URI

GET /v2.0/lbaas/whitelists/{whitelist\_id}

Table 10-188 Parameter description

| Parameter    | Mandatory | Type   | Description                 |
|--------------|-----------|--------|-----------------------------|
| whitelist_id | Yes       | String | Specifies the whitelist ID. |

## Request

None

## Response

**Table 10-189** Response parameters

| Parameter | Type   | Description                                                              |
|-----------|--------|--------------------------------------------------------------------------|
| whitelist | Object | Specifies the whitelist. For details, see <a href="#">Table 10-190</a> . |

**Table 10-190** whitelist parameter description

| Parameter        | Type    | Description                                                                                                                           |
|------------------|---------|---------------------------------------------------------------------------------------------------------------------------------------|
| id               | String  | Specifies the whitelist ID.                                                                                                           |
| tenant_id        | String  | Specifies the ID of the project where the forwarding rule is used.<br>The value contains a maximum of 255 characters.                 |
| listener_id      | String  | Specifies the ID of the listener to which the whitelist is added.                                                                     |
| enable_whitelist | Boolean | Specifies whether to enable access control.<br><b>true</b> : Access control is enabled.<br><b>false</b> : Access control is disabled. |
| whitelist        | String  | Specifies the IP addresses in the whitelist.                                                                                          |

## Example Request

### 10.1.8.4 Updating a Whitelist

## Function

This API is used to update a whitelist. You can enable or disable the whitelist function or change IP addresses in the whitelist. If you change IP addresses in the whitelist, it will be deleted, and a new one is generated.

## URI

PUT /v2.0/lbaas/whitelists/{whitelist\_id}

**Table 10-191** Parameter description

| Parameter    | Mandatory | Type   | Description                 |
|--------------|-----------|--------|-----------------------------|
| whitelist_id | Yes       | String | Specifies the whitelist ID. |

## Request

**Table 10-192** Parameter description

| Parameter | Mandatory | Type   | Description                                                              |
|-----------|-----------|--------|--------------------------------------------------------------------------|
| whitelist | Yes       | Object | Specifies the whitelist. For details, see <a href="#">Table 10-193</a> . |

**Table 10-193** whitelist parameter description

| Parameter        | Mandatory | Type    | Description                                                                                                                                                                 |
|------------------|-----------|---------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| enable_whitelist | No        | Boolean | Specifies whether to enable access control.<br><b>true</b> : Access control is enabled.<br><b>false</b> : Access control is disabled.<br>The default value is <b>true</b> . |

| Parameter | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                    |
|-----------|-----------|--------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| whitelist | No        | String | <p>Specifies the IP addresses in the whitelist. Use commas (,) to separate multiple IP addresses.</p> <p>You can specify an IP address, for example, 192.168.11.1.</p> <p>You can also specify an IP address range, for example, 192.168.0.1/24.</p> <p>The default value is an empty string, that is, "".</p> |

## Response

**Table 10-194** Parameter description

| Parameter | Type   | Description                                                              |
|-----------|--------|--------------------------------------------------------------------------|
| whitelist | Object | Specifies the whitelist. For details, see <a href="#">Table 10-195</a> . |

**Table 10-195** whitelist parameter description

| Parameter        | Type    | Description                                                                                                                                        |
|------------------|---------|----------------------------------------------------------------------------------------------------------------------------------------------------|
| id               | String  | Specifies the whitelist ID.                                                                                                                        |
| tenant_id        | String  | <p>Specifies the ID of the project where the whitelist is used.</p> <p>The value contains a maximum of 255 characters.</p>                         |
| listener_id      | String  | Specifies the ID of the listener to which the whitelist is added.                                                                                  |
| enable_whitelist | Boolean | <p>Specifies whether to enable access control.</p> <p><b>true:</b> Access control is enabled.</p> <p><b>false:</b> Access control is disabled.</p> |
| whitelist        | String  | Specifies the IP addresses in the whitelist.                                                                                                       |

## Example Request

- Example request: Updating a whitelist

Response

None

Example Request

- Example request: Deleting a whitelist  
DELETE https://{Endpoint}/v2.0/lbaas/whitelists/35cb8516-1173-4035-8dae-0dae3453f37f

Example Response

- Example response 1

None

## Status Code

For details, see [Status Codes](#).

## 10.1.9 Certificate

### 10.1.9.1 Creating a Certificate

#### Function

This API is used to create a certificate. After a certificate is bound to a listener, the load balancer authenticates the client using this certificate, and backend servers can establish secure and reliable HTTP connections with the client.

#### URI

POST /v2.0/lbaas/certificates

#### Request

**Table 10-197** Parameter description

| Parameter      | Mandatory | Type    | Description                                                                                                                                                                                             |
|----------------|-----------|---------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| tenant_id      | No        | String  | Specifies the ID of the project where the certificate is used.<br><br>The value must be the same as the value of <b>project_id</b> in the token.<br><br>The value contains a maximum of 255 characters. |
| admin_state_up | No        | Boolean | Specifies the administrative status of the certificate.<br><br>This parameter is reserved, and the default value is <b>true</b> .                                                                       |
| name           | No        | String  | Specifies the certificate name.<br><br>The value contains a maximum of 255 characters.                                                                                                                  |

| type        | No        | String | <p>Specifies the certificate type. The default value is <b>server</b>.</p> <p>The value can be one of the following:</p> <ul style="list-style-type: none"><li>• <b>server</b>: indicates the server certificate.</li><li>• <b>client</b>: indicates the CA certificate.</li></ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| domain      | No        | String | <p>Specifies the domain name associated with the server certificate.</p> <p>A domain name can contain up to 100 characters. You can specify up to 30 domain names and separate them using commas (,).</p> <p>The value can be one of the following:</p> <ul style="list-style-type: none"><li>• A common domain name contains 0 to 100 characters and consists of several labels separated by periods (.). Each label can contain a maximum of 63 characters, including letters, digits, and hyphens (-), and must start and end with a letter or digit. Example: www.test.com</li><li>• In addition to the requirements for common domain names, a wildcard domain name can start with an asterisk (*). Example: *.test.com</li></ul> <p><b>NOTE</b></p> <ul style="list-style-type: none"><li>• This parameter is valid only when <b>type</b> is set to <b>server</b>.</li></ul> |
| private_key | No        | String | <p>Specifies the private key of the server certificate. The value must be PEM encoded.</p> <ul style="list-style-type: none"><li>• This parameter will be ignored if <b>type</b> is set to <b>client</b>. A CA server can still be created and used normally. This parameter will be left blank even if you enter a private key that is not PEM encoded.</li><li>• This parameter is valid and mandatory only when <b>type</b> is set to <b>server</b>. If you enter an invalid private key, an error is returned.</li></ul>                                                                                                                                                                                                                                                                                                                                                       |
| certificate | Yes       | String | <p>Specifies the public key of the server certificate or CA certificate used to authenticate the client. The value of parameter <b>type</b> determines whether a public key or CA certificate is required.</p> <p>The public key is in PEM format.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

## Response

**Table 10-198** Parameter description

| Parameter      | Type    | Description                                                                                                                                                                                                                                   |
|----------------|---------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| id             | String  | Specifies the certificate ID.                                                                                                                                                                                                                 |
| tenant_id      | String  | Specifies the ID of the project where the certificate is used.<br>The value contains a maximum of 255 characters.                                                                                                                             |
| admin_state_up | Boolean | Specifies the administrative status of the certificate.<br>This parameter is reserved. The value can be <b>true</b> or <b>false</b> . <ul style="list-style-type: none"><li>• <b>true</b>: Enabled</li><li>• <b>false</b>: Disabled</li></ul> |
| name           | String  | Specifies the certificate name.<br>The value contains a maximum of 255 characters.                                                                                                                                                            |
| description    | String  | Provides supplementary information about the certificate.<br>The value contains a maximum of 255 characters.                                                                                                                                  |
| type           | String  | Specifies the certificate type.<br>The value can be one of the following: <ul style="list-style-type: none"><li>• <b>server</b>: indicates the server certificate.</li><li>• <b>client</b>: indicates the CA certificate.</li></ul>           |

| Parameter   | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-------------|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| domain      | String | <p>Specifies the domain name associated with the server certificate.</p> <p>A domain name can contain up to 100 characters. You can specify up to 30 domain names and separate them using commas (,).</p> <p>The value can be one of the following:</p> <ul style="list-style-type: none"><li>• A common domain name contains 0 to 100 characters and consists of several labels separated by periods (.). Each label can contain a maximum of 63 characters, including letters, digits, and hyphens (-), and must start and end with a letter or digit. | private_key | String | Specifies the private key of the server certificate in PEM format.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| certificate | String | Specifies the public key of the server certificate or CA certificate used to authenticate the client. The value of parameter <b>type</b> determines whether a public key or CA certificate is required. Both types of certificates are in PEM format.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| expire_time | String | Specifies the time when the certificate expired. The UTC time is in <i>YYYY-MM-DDTHH:MM:SS</i> format.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| create_time | String | Specifies the time when the certificate was created. ## Status Code

For details, see [Status Codes](#).

### 10.1.9.2 Querying Certificates

## Function

This API is used to query all the certificates. Filter query and pagination query are supported. Unless otherwise specified, exact match is applied.

## Constraints

Parameters **marker**, **limit**, and **page\_reverse** are used for pagination query. Parameters **marker** and **page\_reverse** take effect only when they are used together with parameter **limit**.

## URI

GET /v2.0/lbaas/certificates

## Request

**Table 10-199** Parameter description

| Parameter    | Mandator<br>y | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                                |
|--------------|---------------|---------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| marker       | No            | String  | Specifies the ID of the certificate from which pagination query starts, that is, the ID of the last certificate on the previous page. This parameter must be used together with <b>limit</b> .                                                                                                                                                                                                                             |
| limit        | No            | Integer | Specifies the number of certificates on each page. If this parameter is not set, all certificates are queried by default.                                                                                                                                                                                                                                                                                                  |
| page_reverse | No            | Boolean | Specifies the page direction. The value can be <b>true</b> or <b>false</b> , and the default value is <b>false</b> . The last page in the list requested with <b>page_reverse</b> set to <b>false</b> will not contain the "next" link, and the last page in the list requested with <b>page_reverse</b> set to <b>true</b> will not contain the "previous" link. This parameter must be used together with <b>limit</b> . |
| id           | No            | String  | Specifies the certificate ID.                                                                                                                                                                                                                                                                                                                                                                                              |
| name         | No            | String  | Specifies the certificate name. The value contains a maximum of 255 characters.                                                                                                                                                                                                                                                                                                                                            |
| description  | No            | String  | Provides supplementary information about the certificate. The value contains a maximum of 255 characters.                                                                                                                                                                                                                                                                                                                  |

| Parameter | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

Example: www.test.com</li><li>• In addition to the requirements for common domain names, a wildcard domain name can start with an asterisk (*). Example: *.test.com</li></ul> <p><b>NOTE</b></p> <ul style="list-style-type: none"><li>• This parameter is valid only when <b>type</b> is set to <b>server</b>.</li></ul> |
| private_key | String | Specifies the private key of the server certificate in PEM format.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| certificate | String | Specifies the public key of the server certificate or CA certificate used to authenticate the client. The value of parameter <b>type</b> determines whether a public key or CA certificate is required. Both types of certificates are in PEM format.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| expire_time | String | Specifies the time when the certificate expired. The UTC time is in <i>YYYY-MM-DD HH:MM:SS</i> format.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| create_time | String | Specifies the time when the certificate was created. The UTC time is in <i>YYYY-MM-DD HH:MM:SS</i> format.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| update_time | String | Specifies the time when the certificate was updated. The UTC time is in <i>YYYY-MM-DD HH:MM:SS</i> format.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

## Example Request

- Request example 1: Querying all certificates  
GET https://{Endpoint}/v2.0/lbaas/certificates

- Example 2: Querying a certificate whose ID is ef4d341365754a959556576501791b19 or ed40e8ea9957488ea82de025e35b74c0

GET https://{Endpoint}/v2.0/lbaas/certificates?

## Status Code

For details, see [Status Codes](#).

### 10.1.9.3 Querying Details of a Certificate

## Function

This API is used to query details about a certificate.

## URI

GET /v2.0/lbaas/certificates/{certificate\_id}

**Table 10-202** Parameter description

| Parameter      | Mandatory | Type   | Description                   |
|----------------|-----------|--------|-------------------------------|
| certificate_id | Yes       | String | Specifies the certificate ID. |

## Request

None

## Response

**Table 10-203** Parameter description

| Parameter      | Type    | Description                                                                                                                                                                                                                                   |
|----------------|---------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| id             | String  | Specifies the certificate ID.                                                                                                                                                                                                                 |
| tenant_id      | String  | Specifies the ID of the project where the certificate is used.<br>The value contains a maximum of 255 characters.                                                                                                                             |
| admin_state_up | Boolean | Specifies the administrative status of the certificate.<br>This parameter is reserved. The value can be <b>true</b> or <b>false</b> . <ul style="list-style-type: none"><li>● <b>true</b>: Enabled</li><li>● <b>false</b>: Disabled</li></ul> |
| name           | String  | Specifies the certificate name.<br>The value contains a maximum of 255 characters.                                                                                                                                                            |
| description    | String  | Provides supplementary information about the certificate.<br>The value contains a maximum of 255 characters.                                                                                                                                  |
| type           | String  | Specifies the certificate type.<br>The value can be one of the following: <ul style="list-style-type: none"><li>● <b>server</b>: indicates the server certificate.</li><li>● <b>client</b>: indicates the CA certificate.</li></ul>           |

| Parameter   | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

| domain      | String | <p>Specifies the domain name associated with the server certificate.</p> <p>A domain name can contain up to 100 characters. You can specify up to 30 domain names and separate them using commas (,).</p> <p>The value can be one of the following:</p> <ul style="list-style-type: none"><li>• A common domain name contains 0 to 100 characters and consists of several labels separated by periods (.). Each label can contain a maximum of 63 characters, including letters, digits, and hyphens (-), and must start and end with a letter or digit. Example: www.test.com</li><li>• In addition to the requirements for common domain names, a wildcard domain name can start with an asterisk (*). Example: *.test.com</li></ul> <p><b>NOTE</b></p> <ul style="list-style-type: none"><li>• This parameter is valid only when <b>type</b> is set to <b>server</b>.</li></ul> |
| private_key | String | Specifies the private key of the server certificate in PEM format.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| certificate | String | Specifies the public key of the server certificate or CA certificate used to authenticate the client. The value of parameter <b>type</b> determines whether a public key or CA certificate is required. Both types of certificates are in PEM format.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| expire_time | String | Specifies the time when the certificate expired. The UTC time is in <i>YYYY-MM-DDTHH:MM:SS</i> format.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| create_time | String | Specifies the time when the certificate was created. The UTC time is in <i>YYYY-MM-DDTHH:MM:SS</i> format.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| update_time | String | Specifies the time when the certificate was updated. The UTC time is in <i>YYYY-MM-DDTHH:MM:SS</i> format.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

## Example Request

- Example request: Querying details of a certificate  
GET https://{Endpoint}/v2.0/lbaas/certificates/23ef9aad4ecb463580476d324a6c71af

## Example Response

- Example response

## Status Code

For details, see [Status Codes](#).

### 10.1.9.4 Updating a Certificate

#### Function

This API is used to update a certificate.

#### URI

PUT /v2.0/lbaas/certificates/{certificate\_id}

**Table 10-204** Parameter description

| Parameter      | Mandatory | Type   | Description                   |
|----------------|-----------|--------|-------------------------------|
| certificate_id | Yes       | String | Specifies the certificate ID. |

#### Request

**Table 10-205** Parameter description

| Parameter      | Mandatory | Type    | Description                                                                                                                   |
|----------------|-----------|---------|-------------------------------------------------------------------------------------------------------------------------------|
| admin_state_up | No        | Boolean | Specifies the administrative status of the certificate.<br>This parameter is reserved, and the default value is <b>true</b> . |
| name           | No        | String  | Specifies the certificate name.<br>The value contains a maximum of 255 characters.                                            |
| description    | No        | String  | Provides supplementary information about the certificate.<br>The value contains a maximum of 255 characters.                  |

| Parameter   | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-------------|-----------|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| domain      | No        | String | <p>Specifies the domain name associated with the server certificate.</p> <p>A domain name can contain up to 100 characters. You can specify up to 30 domain names and separate them using commas (,).</p> <p>The value can be one of the following:</p> <ul style="list-style-type: none"><li>• A common domain name contains 0 to 100 characters and consists of several labels separated by periods (.). Each label can contain a maximum of 63 characters, including letters, digits, and hyphens (-), and must start and end with a letter or digit. Example: www.test.com</li><li>• In addition to the requirements for common domain names, a wildcard domain name can start with an asterisk (*). Example: *.test.com</li></ul> <p><b>NOTE</b></p> <ul style="list-style-type: none"><li>• This parameter is valid only when <b>type</b> is set to <b>server</b>.</li></ul> |
| private_key | No        | String | <p>Specifies the private key of the server certificate. The value must be PEM encoded.</p> <ul style="list-style-type: none"><li>• This parameter will be ignored if <b>type</b> is set to <b>client</b>. A CA server can still be created and used normally. This parameter will be left blank even if you enter a private key that is not PEM encoded.</li><li>• This parameter is valid and mandatory only when <b>type</b> is set to <b>server</b>. If you enter an invalid private key, an error is returned.</li></ul>                                                                                                                                                                                                                                                                                                                                                       |
| certificate | No        | String | <p>Specifies the public key of the server certificate or CA certificate used to authenticate the client. The value of parameter <b>type</b> determines whether a public key or CA certificate is required. The public key is in PEM format.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

## Response

**Table 10-206** Parameter description

| Parameter      | Type    | Description                                                                                                                                                                                                                                   |
|----------------|---------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| id             | String  | Specifies the certificate ID.                                                                                                                                                                                                                 |
| tenant_id      | String  | Specifies the ID of the project where the certificate is used.<br>The value contains a maximum of 255 characters.                                                                                                                             |
| admin_state_up | Boolean | Specifies the administrative status of the certificate.<br>This parameter is reserved. The value can be <b>true</b> or <b>false</b> . <ul style="list-style-type: none"><li>● <b>true</b>: Enabled</li><li>● <b>false</b>: Disabled</li></ul> |
| name           | String  | Specifies the certificate name.<br>The value contains a maximum of 255 characters.                                                                                                                                                            |
| description    | String  | Provides supplementary information about the certificate.<br>The value contains a maximum of 255 characters.                                                                                                                                  |
| type           | String  | Specifies the certificate type.<br>The value can be one of the following: <ul style="list-style-type: none"><li>● <b>server</b>: indicates the server certificate.</li><li>● <b>client</b>: indicates the CA certificate.</li></ul>           |

| Parameter   | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-------------|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| domain      | String | <p>Specifies the domain name associated with the server certificate.</p> <p>A domain name can contain up to 100 characters. You can specify up to 30 domain names and separate them using commas (,).</p> <p>The value can be one of the following:</p> <ul style="list-style-type: none"><li>• A common domain name contains 0 to 100 characters and consists of several labels separated by periods (.). Each label can contain a maximum of 63 characters, including letters, digits, and hyphens (-), and must start and end with a letter or digit. Example: www.test.com</li><li>• In addition to the requirements for common domain names, a wildcard domain name can start with an asterisk (*). Example: *.test.com</li></ul> <p><b>NOTE</b></p> <ul style="list-style-type: none"><li>• This parameter is valid only when <b>type</b> is set to <b>server</b>.</li></ul> |
| private_key | String | Specifies the private key of the server certificate in PEM format.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| certificate | String | Specifies the public key of the server certificate or CA certificate used to authenticate the client. The value of parameter <b>type</b> determines whether a public key or CA certificate is required. Both types of certificates are in PEM format.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| expire_time | String | Specifies the time when the certificate expired. The UTC time is in <i>YYYY-MM-DDTHH:MM:SS</i> format.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| create_time | String | Specifies the time when the certificate was created. The UTC time is in <i>YYYY-MM-DDTHH:MM:SS</i> format.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| update_time | String | Specifies the time when the certificate was updated. The UTC time is in <i>YYYY-MM-DDTHH:MM:SS</i> format.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

## Status Code

For details, see [Status Codes](#).

### 10.1.9.5 Deleting a Certificate

#### Function

This API is used to delete a specific certificate.

#### Constraints

If the target certificate is used by a listener, the certificate cannot be deleted, and 409 code will be displayed.

## URI

DELETE /v2.0/lbaas/certificates/{certificate\_id}

**Table 10-207** Parameter description

| Parameter      | Mandatory | Type   | Description                   |
|----------------|-----------|--------|-------------------------------|
| certificate_id | Yes       | String | Specifies the certificate ID. |

## Request

- Request parameters  
None

## Response

- Response parameters  
None

## Example Request

- Example request: Deleting a certificate  
DELETE https://{Endpoint}/v2.0/lbaas/certificates/23ef9aad4ecb463580476d324a6c71af

## Example Response

- Example response 1  
None

## Status Code

For details, see [Status Codes](#).

# 10.2 Asynchronous Job Query (Discarded)

## Function

This API is used to query the execution status of an asynchronous job.

## URI

GET /v1.0/{project\_id}/jobs/{job\_id}

**Table 10-208** Parameter description

| Parameter  | Mandatory | Type   | Description               |
|------------|-----------|--------|---------------------------|
| project_id | Yes       | String | Specifies the project ID. |

| Parameter | Mandatory | Type   | Description                                                                                    |
|-----------|-----------|--------|------------------------------------------------------------------------------------------------|
| job_id    | Yes       | String | Specifies the unique ID assigned to the job for querying the execution status in Combined API. |

Request

None

Response

Table 10-209 Response parameters

| Parameter   | Type                             | Description                                                                                                                                                                                                        |
|-------------|----------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| status      | String                           | Specifies the job execution status.<br><b>SUCCESS:</b> The job was successfully executed.<br><b>FAIL:</b> The job failed.<br><b>RUNNING:</b> The job is in progress.<br><b>INIT:</b> The job is being initialized. |
| entities    | <i>Dictionary data structure</i> | Specifies the resource information or error information. The ELB resource ID is used as an example in the response example.                                                                                        |
| job_id      | String                           | Specifies the unique ID assigned to the job for querying the execution status in Combined API.                                                                                                                     |
| job_type    | String                           | Specifies the job type.                                                                                                                                                                                            |
| error_code  | String                           | Specifies the error code.                                                                                                                                                                                          |
| fail_reason | String                           | Specifies the cause of an error.                                                                                                                                                                                   |

 {
 "href": "http://192.168.82.231:9696/v2.0",
 "rel": "self"
 }
]
 }
]
}
```

## 10.4 Getting Started

### 10.4.1 Creating a Load Balancer

#### Scenarios

Assume that you have created a VPC and several ECSs on the cloud platform. To ensure high performance and availability of ECSs, a load balancer is required to distribute requests to different backend ECSs.

This section describes how to invoke the API to create a load balancer.

#### NOTE

The validity period of a token obtained from IAM is 24 hours. If you want to use a token for authentication, cache it to avoid frequently calling the IAM API.

#### Involved APIs

If you use a token for authentication, you must obtain the token and add **X-Auth-Token** to the request header of the ELB API when making an API call.

- IAM API used to obtain the token
- ELB API used to create a load balancer

#### Procedure

1. Obtain the token by referring to [Authentication](#).
2. Send **POST https://ELB endpoint/v2.0/lbaas/loadbalancers**.
3. Add **X-Auth-Token** to the request header.
4. Specify the following parameters in the request body:

```
{
 "loadbalancer": {
 "name": "loadbalancer1", //Load balancer name
 "description": "simple lb", //Load balancer description
 "vip_subnet_id": "58077bdb-d470-424b-8c45-2e3c65060a5b", //ID of the IPv4 subnet where the
load balancer works
 "vip_address": "10.0.0.4" //IP address of the load balancer
 }
}
```

If the request is successful, the response body is returned.

If the request fails, an error code and error information are returned. For details, see [Status Codes](#).

## 10.4.2 Obtaining a Token

### Application Scenarios

If you use a token for authentication, you must obtain the token and add **X-Auth-Token** to the request header of the API when making a call.

### Authenticating the Token

**Step 1** Send **POST** <https://IAM endpoint/v3/auth/tokens>. Obtain the Identity and Access Management (IAM) endpoint and region name in the message body.

See [Regions and Endpoints](#).

The following is an example request:

#### NOTE

The italic words in the following example need to be replaced with the actual values. For details, see [Obtaining a User Token](#).

```
{
 "auth": {
 "identity": {
 "methods": [
 "password"
],
 "password": {
 "user": {
 "name": "username",
 "password": "password",
 "domain": {
 "name": "domainname"
 }
 }
 }
 },
 "scope": {
 "project": {
 "name": "aaa"
 }
 }
 }
}
```

**Step 2** Obtain the token. The token is the value of **X-Subject-Token** in the response.

**Step 3** Call a service API, add **X-Auth-Token** to the request header, and set the value of **X-Auth-Token** to the token obtained in [Step 2](#).

----End

## 10.4.3 Creating a Load Balancer

Assume that you have created a Virtual Private Cloud (VPC) and several Elastic Cloud Servers (ECSs) on the cloud platform. To ensure high performance and availability of ECSs, a load balancer is required to distribute requests to different backend ECSs.

## API Format

| Method | URI                       | Description              |
|--------|---------------------------|--------------------------|
| POST   | /v2.0/lbaas/loadbalancers | Creates a load balancer. |

## Procedure

### Step 1 Set the request header.

Set the header in Postman and place the obtained token in the header.

**Figure 10-1** Request header

### NOTE

The value of the token can be transferred through an environment variable or directly entered.

### Step 2 Under **Body**, set the request body.

**Figure 10-2** Request body

You can refer to [Sample Code](#) to set the request body, or add other required fields by referring to the Elastic Load Balance API Reference.

### Step 3 Enter the URL.

The request URL consists of the following parts:

| Endpoint |              |             |                    | URI                       |
|----------|--------------|-------------|--------------------|---------------------------|
| https:// | elb          | .cn-north-1 | .myhuaweicloud.com | /v2.0/lbaas/loadbalancers |
| -        | Service name | Region      | Endpoint           | URI                       |

**Step 4** Send the request. Set the POST request method and click **Send** to wait for response from the server.

```
{
 "loadbalancer": {
 "description": "simple lb",
 "admin_state_up": true,
 "tenant_id": "0d0bf0e8fb564cc9abbe526dbdca9248",
 "provisioning_status": "ACTIVE",
 "vip_subnet_id": "8d944cda-1f29-4035-9681-ad8c5117fbc5",
 "listeners": [],
 "vip_address": "192.168.0.144",
 "vip_port_id": "b06bdc8f-cc00-41b4-8aba-280a333342ee",
 "provider": "vlb",
 "pools": [],
 "id": "bb2f1569-4c03-4e48-8e02-a2d831c0db56",
 "operating_status": "ONLINE",
 "name": "loadbalancer4guide"
 }
}
```

If the request is correct, information about the newly created load balancer is displayed. After logging in to the web console, you can see a load balancer named **loadbalancer4guide**.

----End

## Sample Code

Request body in [Step 2](#)

```
{
 "loadbalancer": {
 "name": "loadbalancer1",
 "description": "simple lb",
 "vip_subnet_id": "58077bdb-d470-424b-8c45-2e3c65060a5b",
 "admin_state_up": true
 }
}
```

### NOTE

The value of **vip\_subnet\_id** is the ID of the subnet where the create load balancer works.

## 10.4.4 Creating a Public Network Load Balancer

When an EIP is bound to a private network load balancer, the load balancer becomes a public network load balancer. Clients can access backend servers through this load balancer over Internet.

### Apply for an EIP

#### API Format

| Method | URI                       | Description         |
|--------|---------------------------|---------------------|
| POST   | /v1/{tenant_id}/publicips | Applies for an EIP. |

## Procedure

### Step 1 Set the request header.

Set the header in Postman and place the obtained token in the header.

### Step 2 Under **Body**, set the request body.

### Step 3 Enter the URL.

https://vpc.cn-east-2.myhuaweicloud.com/v1/0d0bf0e8fb564cc9abbe526dbdca9248/publicips

### Step 4 Send the request. Set the POST request method and click **Send** to wait for response from the server.

```
{
 "publicip": {
 "id": "73c079fc-357a-4d34-8ba1-818a9d9a2aa2",
 "status": "PENDING_CREATE",
 "type": "5_sbgp",
 "public_ip_address": "122.112.235.121",
 "tenant_id": "0d0bf0e8fb564cc9abbe526dbdca9248",
 "create_time": "2018-07-11 02:40:32",
 "bandwidth_size": 0,
 "enterprise_project_id": "0"
 }
}
```

 NOTE

Note that the value of **tenant\_id** in the response body is the project ID on the web console.

----End

### Sample Code

Request body in [Step 2](#)

```
{
 "publicip": {
 "type": "5_sbgp"
 },
 "bandwidth": {
 "name": "bandwidth_elb",
 "size": 1,
 "share_type": "PER",
 "charge_mode": "traffic"
 }
}
```

 NOTE

For details about fields in the request body and their formats, see the *Virtual Private Cloud API Reference*.

## Bind the EIP

### API Format

| Method | URI                                     | Description                       |
|--------|-----------------------------------------|-----------------------------------|
| PUT    | /v1/{tenant_id}/publicips/{publicip_id} | Binds the EIP to a load balancer. |

### Procedure

#### Step 1 Set the request header.

Set the header in Postman and place the obtained token in the header.

#### Step 2 Under **Body**, set the request body.

#### NOTE

The value of **port\_id** can be obtained by calling the VPC API. The request is as follows:

```
GET https://vpc.cn-north-1.myhuaweicloud.com/v2.0/ports?network_id=Network
ID&fixed_ips=ip_address=Private IP address of the load balancer
```

Choose **Network > Virtual Private Cloud**, click the target VPC name, and obtain the network ID and private IP address of the load balancer on the subnet details page.

#### Step 3 Enter the URL.

```
https://vpc.cn-east-2.myhuaweicloud.com/v1/{{project_id}}/publicips/{{eip_id}}
```

#### NOTE

**eip\_id** is the ID returned when the EIP is assigned in [Apply for an EIP](#).

#### Step 4 Send the request. Set the PUT request method and click **Send** to wait for response from the server.

```
{
 "publicip": {
 "id": "73c079fc-357a-4d34-8ba1-818a9d9a2aa2",
 "status": "ACTIVE",
 "type": "5_sbgp",
 "port_id": "d2c5a9fc-6a91-4a2d-8aac-e8e8ca6da727",
 "public_ip_address": "122.112.235.121",
 "private_ip_address": "192.168.0.160",
 "tenant_id": "0d0bf0e8fb564cc9abbe526dbdca9248",
 "create_time": "2018-07-11 02:40:32",
 "bandwidth_size": 1
 }
}
```

----End

#### Sample Code

Request body in [Step 2](#)

```
{
 "publicip": {
 "port_id": "d2c5a9fc-6a91-4a2d-8aac-e8e8ca6da727"
 }
}
```

## 10.4.5 Adding a Listener

### API Format

| Method | URI                   | Description      |
|--------|-----------------------|------------------|
| POST   | /v2.0/lbaas/listeners | Adds a listener. |

### Constraints

Each listener added a load balancer can listen on only one port.

### Procedure

- Step 1** Set the request header. Set the header in Postman and place the obtained token in the header.

- Step 2** Under **Body**, set the request body.

- Step 3** Enter the URL.

https://elb.cn-east-2.myhuaweicloud.com/v2.0/lbaas/listeners

- Step 4** Send the request. Set the POST request method and click **Send** to wait for response from the server.

```
{
 "listener": {
 "protocol_port": 80,
```

```
{
 "protocol": "HTTP",
 "description": "",
 "default_tls_container_ref": null,
 "admin_state_up": true,
 "loadbalancers": [
 {
 "id": "abe3ee34-1882-408f-a2ba-1ce7e428d6e3"
 }
],
 "tenant_id": "0d0bf0e8fb564cc9abbe526dbdca9248",
 "sni_container_refs": [],
 "connection_limit": -1,
 "default_pool_id": null,
 "id": "779d77c8-f3f9-486d-a598-18e2aa2aa319",
 "name": "listener4guide"
}
```

----End

## Sample Code

Request body in [Step 2](#)

```
{
 "listener": {
 "protocol_port": "80",
 "protocol": "HTTP",
 "loadbalancer_id": "abe3ee34-1882-408f-a2ba-1ce7e428d6e3",
 "name": "listener4guide",
 "admin_state_up": true
 }
}
```

## 10.4.6 Creating a Backend Server Group

### API Format

| Method | URI               | Description                  |
|--------|-------------------|------------------------------|
| POST   | /v2.0/lbaas/pools | Adds a backend server group. |

### Procedure

- Step 1** Set the request header. Set the header in Postman and place the obtained token in the header.

**Step 2** Under **Body**, set the request body.

**Step 3** Enter the URL.

`https://elb.cn-east-2.myhuaweicloud.com/v2.0/lbaas/pools`

**Step 4** Send the request. Set the POST request method and click **Send** to wait for response from the server.

```
{
 "pool": {
 "lb_algorithm": "ROUND_ROBIN",
 "protocol": "HTTP",
 "description": "",
 "admin_state_up": true,
 "loadbalancers": [
 {
 "id": "abe3ee34-1882-408f-a2ba-1ce7e428d6e3"
 }
],
 "tenant_id": "0d0bf0e8fb564cc9abbe526dbdca9248",
 "session_persistence": null,
 "healthmonitor_id": null,
 "listeners": [
 {
 "id": "ecb4d58e-3b09-4a9d-9ad2-159b21e13f83"
 }
],
 "members": [],
 "id": "752c3773-a046-4966-a5d6-0ad7f9a49d0a",
 "name": ""
 }
}
```

----End

## Sample Code

Request body in [Step 2](#)

```
{
 "pool": {
 "lb_algorithm": "ROUND_ROBIN",
 "listener_id": "{{listener_id}}",
 "protocol": "HTTP",
 "admin_state_up": true
 }
}
```

## 10.4.7 Adding Backend Servers

### API Format

| Method | URI                                 | Description                                                 |
|--------|-------------------------------------|-------------------------------------------------------------|
| POST   | /v2.0/lbaas/pools/{pool_id}/members | Adds backend servers that belong to a backend server group. |

### Constraints

- Two backend servers in the same backend server group must have different IP addresses and ports.
- The subnet specified during server creation and the subnet to which the virtual IP address belongs must be in the same VPC.
- The value of **admin\_state\_up** must be **true**.

### Procedure

- Step 1** Set the request header. Set the header in Postman and place the obtained token in the header.

- Step 2** Under **Body**, set the request body.

**Step 3** Query the subnet ID and primary NIC IP address of the VM.

The URL is as follows:

```
GET https://{VPCEndpoint}/v2.0/ports?device_id={ecs_id}
```

Obtain the values of **subnet\_id** and **ip\_address** of the port for which **primary\_interface** is **true** from the response body. The following is an example of the response body:

```
{
 "ports": [
 {
 "id": "4813697b-62ba-4f4b-90e5-13bbbdec7198",
 "name": "",
 "status": "ACTIVE",
 "admin_state_up": true,
 "fixed_ips": [
 {
 "subnet_id": "d97b6b89-6aa2-4636-a86b-132eb4eb566e",
 "ip_address": "10.1.1.89"
 }
],
 "mac_address": "fa:16:3e:cb:8d:0a",
 "network_id": "1b76b9c2-9b7e-4ced-81bd-d13f7389d7c9",
 "tenant_id": "04dd36f978800fe22f9bc00bea090736",
 "project_id": "04dd36f978800fe22f9bc00bea090736",
 "device_id": "f738c464-b5c2-45df-86c0-7f436620cd54",
 "device_owner": "compute:cn-north-4a",
 "security_groups": [
 "7a233393-5be2-4dff-8360-1558dd950f6e"
],
 "extra_dhcp_opts": [],
 "allowed_address_pairs": [],
 "binding:vnic_type": "normal",
 "binding:vif_details": {},
 "binding:profile": {},
 "port_security_enabled": true,
 "created_at": "2019-11-19T09:28:38",
 "updated_at": "2019-11-19T09:28:39"
 },
 {
 "id": "94971c39-46f0-443a-85e8-31cb7497c78e",
 "name": "",
 "status": "ACTIVE",
 "admin_state_up": true,
 "fixed_ips": [
 {
 "subnet_id": "8d944cda-1f29-4035-9681-ad8c5117fbc5",
 "ip_address": "192.168.0.11"
 }
],
 "mac_address": "fa:16:3e:5c:d2:57",
 "network_id": "1b76b9c2-9b7e-4ced-81bd-d13f7389d7c9",
 "tenant_id": "04dd36f978800fe22f9bc00bea090736",
 "project_id": "04dd36f978800fe22f9bc00bea090736",
 "device_id": "f738c464-b5c2-45df-86c0-7f436620cd54",
 "device_owner": "compute:cn-north-4a",
 "security_groups": [
 "a10dfc31-0055-4b84-b36e-1291b918125c",
 "7a233393-5be2-4dff-8360-1558dd950f6e"
],
 "extra_dhcp_opts": [],
 "allowed_address_pairs": [],
 "binding:vnic_type": "normal",
 "binding:vif_details": {
 "primary_interface": true
 },
 "binding:profile": {}
 }
]
}
```

```
 "port_security_enabled": true,
 "created_at": "2019-11-12T17:17:51",
 "updated_at": "2019-11-12T17:17:51"
 }
]
}
```

**Step 4** Enter the URL.

`https://{ELBEndpoint}/v2.0/lbaas/pools/{pool_id}/members`

**Step 5** Send the request. Set the values of **subnet\_id** and **ip\_address** to these obtained in [Step 3](#), select POST as the request method, and click **Send**.

```
{
 "member": {
 "name": "member4j",
 "weight": 1,
 "admin_state_up": false,
 "subnet_id": "8d944cda-1f29-4035-9681-ad8c5117fbc5",
 "tenant_id": "0d0bf0e8fb564cc9abb526dbdca9248",
 "address": "192.168.0.11",
 "protocol_port": 8080,
 "id": "97f18d73-e97d-434c-8cb7-3274a83dda73",
 "operating_status": "ONLINE"
 }
}
```

----End

## Sample Code

Request body in [Step 2](#)

```
{
 "member": {
 "subnet_id": "8d944cda-1f29-4035-9681-ad8c5117fbc5",
 "protocol_port": "8080",
 "name": "member4j",
 "address": "192.168.0.11"
 }
}
```

## 10.4.8 Configuring a Health Check

### API Format

| Method | URI                            | Description                   |
|--------|--------------------------------|-------------------------------|
| POST   | /v2.0/lbaas/<br>healthmonitors | Configures a health<br>check. |

### Constraints

- The security group must have rules to allow access from the 100.125.0.0/16 network segment.
- The value of **admin\_state\_up** must be **true**.
- To use UDP for health checks, the backend server group must use UDP as backend protocol.

## Procedure

- Step 1** Set the request header. Set the header in Postman and place the obtained token in the header.

- Step 2** Under **Body**, set the request body.

- Step 3** Enter the URL.

<https://elb.cn-east-2.myhuaweicloud.com/v2.0/lbaas/healthmonitors>

- Step 4** Send the request. Set the POST request method and click **Send** to wait for response from the server.

```
{
 "healthmonitor": {
 "monitor_port": null,
 "name": "",
 "admin_state_up": true,
 "tenant_id": "0d0bf0e8fb564cc9abbe526dbdca9248",
 "delay": 10,
 "expected_codes": "200",
 "max_retries": 10,
 "http_method": "GET",
 "timeout": 10,
 "pools": [
 {
 "id": "752c3773-a046-4966-a5d6-0ad7f9a49d0a"
 }
],
 "url_path": "/",
 "type": "HTTP",
 }
}
```

```
 "id": "9b6d7438-a6eb-4d49-ae77-3c130e3b7ae8"
 }
}
```

----End

## Sample Code

Request body in [Step 2](#)

```
{
 "healthmonitor": {
 "admin_state_up": true,
 "pool_id": "752c3773-a046-4966-a5d6-0ad7f9a49d0a",
 "delay": "10",
 "max_retries": "10",
 "timeout": "10",
 "type": "HTTP"
 }
}
```

## 10.4.9 Adding a Forwarding Policy

### API Format

| Method | URI                    | Description               |
|--------|------------------------|---------------------------|
| POST   | /v2.0/lbaas/l7policies | Adds a forwarding policy. |

## Application Scenarios

By adding forwarding policies and rules, you can forward different requests to a specific backend server.

Suppose that you have several servers on the cloud platform to provide services for the Internet, and the resources mainly include music (/music/{music\_id}), images (/pic/{pic\_id}), and files (/file/{file\_id}). If there are no forwarding policies, each backend server has a copy of all resources. Requests from a client are always distributed to only one backend server. Therefore, only one copy is used. The storage cost increases as there are more and more backend servers.

Forwarding policies and rules provided by ELB can well solve this problem. In this way, the storage cost is reduced and you can obtain better economic benefits.

## Constraints

- Forwarding policies can be added for listeners when **protocol** is set to **HTTP** or **TERMINATED\_HTTPS**.
- The value of **redirect\_pool** configured for the forwarding policy cannot be the same as that of **default\_pool** configured for the listener.
- The backend server group specified in **redirect\_pool** cannot be used by forwarding policies of other listeners.

## Scenario Assumption

Assume that you have created a load balancer named **loadbalancer\_1**. You can add a listener named **listener\_1** and three backend server groups **pool\_1**, **pool\_2**, and **pool\_3**. **pool\_1** is the default backend server group of **listener\_1**, and **pool\_2** and **pool\_3** are associated with **loadbalancer\_1**. For better load distribution, HTTP requests whose URI starts with **/music** are sent to **pool\_2**, and HTTP requests whose URI starts with **/pic** are forwarded to **pool\_3**.

## Procedure

To match the URIs, HTTP messages need to be parsed. Therefore, the listener and three backend server groups must use the HTTP or HTTPS protocol.

### Step 1 Add an HTTP listener named **listener\_1**.

```
POST https://elb.cn-east-2.myhuaweicloud.com/v2.0/lbaas/listeners
{
 "listener": {
 "protocol_port": "80",
 "protocol": "HTTP",
 "loadbalancer_id": "abe3ee34-1882-408f-a2ba-1ce7e428d6e3",
 "name": "listener_1",
 "admin_state_up": true
 }
}
```

### Step 2 Add a backend server group named **pool\_1** and its backend protocol is HTTP.

```
POST https://elb.cn-east-2.myhuaweicloud.com/v2.0/lbaas/pools/
{
 "pool": {
 "name": "pool_1",
 "lb_algorithm": "ROUND_ROBIN",
 "listener_id": "a7b996cf-23ec-4c0b-b310-45495d29f80c",
 "protocol": "HTTP",
 "admin_state_up": true
 }
}
```

### Step 3 Add a backend server group named **pool\_2** and its backend protocol is HTTP.

```
POST https://elb.cn-east-2.myhuaweicloud.com/v2.0/lbaas/pools/
{
 "pool": {
 "name": "pool_2",
 "lb_algorithm": "ROUND_ROBIN",
 "listener_id": "a7b996cf-23ec-4c0b-b310-45495d29f80c",
 "protocol": "HTTP",
 "admin_state_up": true
 }
}
```

### Step 4 Add a backend server group named **pool\_3** and its backend protocol is HTTP.

```
POST https://elb.cn-east-2.myhuaweicloud.com/v2.0/lbaas/pools/
{
 "pool": {
 "name": "pool_3",
 "lb_algorithm": "ROUND_ROBIN",
 "listener_id": "a7b996cf-23ec-4c0b-b310-45495d29f80c",
 "protocol": "HTTP",
 "admin_state_up": true
 }
}
```

### Step 5 Add a forwarding policy to **pool\_2**.

```
POST https://elb.cn-east-2.myhuaweicloud.com/v2.0/lbaas/l7policies
{
 "l7policy": {
 "action": "REDIRECT_TO_POOL",
 "listener_id": "a7b996cf-23ec-4c0b-b310-45495d29f80c",
 "redirect_pool_id": "b9a01911-8364-44d8-ab5a-4f635820edb2",
 "name": "l7policy_music",
 "admin_state_up": true
 }
}
```

**Step 6** Add a forwarding policy to **pool\_3**.

```
POST https://elb.cn-east-2.myhuaweicloud.com/v2.0/lbaas/l7policies
{
 "l7policy": {
 "action": "REDIRECT_TO_POOL",
 "listener_id": "a7b996cf-23ec-4c0b-b310-45495d29f80c",
 "redirect_pool_id": "3a9b8338-3086-4acc-92e6-83c5e750e44a",
 "name": "l7policy_pic",
 "admin_state_up": true
 }
}
```

**Step 7** Check the created forwarding policies. They do not match any request because there are no specific forwarding rules. To make the forwarding policies to take effect, forwarding rules must be added to forward requests with different URIs.

----End

## 10.4.10 Adding a Forwarding Rule

### API Format

| Method | URI                                        | Description             |
|--------|--------------------------------------------|-------------------------|
| POST   | /v2.0/lbaas/l7policies/{l7policy_id}/rules | Adds a forwarding rule. |

### Constraints

The type of forwarding rules for the same forwarding policy cannot be the same.

### Procedure

**Step 1** Set the request header. Set the header in Postman and place the obtained token in the header.

**Step 2** Create a forwarding rule for the request whose name starts with **/music**.

```
POST https://elb.cn-east-2.myhuaweicloud.com/v2.0/lbaas/l7policies/5b94fb42-
b018-4ad6-9ba6-0e8a509c6821/rules
{
 "rule": {
 "compare_type": "STARTS_WITH",
 "type": "PATH",
 "value": "/music"
 }
}
```

**Step 3** Create a forwarding rule for the request whose name starts with `/pic`.

```
POST https://elb.cn-east-2.myhuaweicloud.com/v2.0/lbaas/l7policies/
f6c5862d-460c-4ab6-8dc7-2294df442f67/rules
{
 "rule": {
 "compare_type": "STARTS_WITH",
 "type": "PATH",
 "value": "/pic"
 }
}
```

**Step 4** Check the created forwarding rules on the web console.

-----End

10.4.11 Adding a Whitelist

API Format

| Method | URI                    | Description       |
|--------|------------------------|-------------------|
| POST   | /v2.0/lbaas/whitelists | Adds a whitelist. |

Procedure

**Step 1** Set the request header. Set the header in Postman and place the obtained token in the header.

**Step 2** Under **Body**, set the request body.

**Step 3** Enter the URL.

```
https://elb.cn-east-2.myhuaweicloud.com/v2.0/lbaas/whitelists
```

**Step 4** Send the request.

Set the POST request method and click **Send** to wait for response from the server.

```
{
 "whitelist": {
 "tenant_id": "0d0bf0e8fb564cc9abbe526dbdca9248",
 "whitelist": "192.168.11.1,192.168.0.1/24,192.168.201.18/8,100.164.0.1/24",
 "enable_whitelist": true,
 "id": "317a0ea1-e47b-4e8b-996f-0556270245c3",
 "listener_id": "a7b996cf-23ec-4c0b-b310-45495d29f80c"
 }
}
```

----End

## Sample Code

Request body in [Step 2](#)

```
{
 "whitelist": {
 "listener_id": "a7b996cf-23ec-4c0b-b310-45495d29f80c",
 "enable_whitelist": true,
 "whitelist": "192.168.11.1,192.168.0.1/24,192.168.201.18/8,100.164.0.1/24"
 }
}
```

## 10.4.12 Creating an SSL Certificate

**Step 1** Set the request header.

Set the header in Postman and place the obtained token in the header.

**Step 2** Under **Body**, set the request body.

[illegible]

### Step 3 Enter the URL.

<https://elb.cn-east-2.myhuaweicloud.com/v2.0/lbaas/certificates>

**Step 4** Send the request. Set the POST request method and click **Send** to wait for response from the server.

## A.2 Status Codes

**Table A-1** Normal status codes

| Status Code | Message    | Description                              |
|-------------|------------|------------------------------------------|
| 200         | OK         | Normal response to GET and PUT requests. |
| 201         | Created    | Normal response to POST requests.        |
| 204         | No Content | Normal response to DELETE requests.      |

**Table A-2** Error codes

| Status Code | Message      | Description                                                   |
|-------------|--------------|---------------------------------------------------------------|
| 400         | Bad Request  | Invalid request URI.                                          |
|             |              | Too long request header.                                      |
|             |              | Invalid request body.                                         |
|             |              | Unreleased fields in the request body.                        |
| 401         | Unauthorized | Authentication information unavailable in the request header. |
|             |              | Expired authentication information in the request header.     |
| 403         | Forbidden    | No permissions to access APIs.                                |

| Status Code | Message                                | Description                                                                                              |
|-------------|----------------------------------------|----------------------------------------------------------------------------------------------------------|
| 404         | Not Found                              | No available request URI.                                                                                |
|             |                                        | No available requested resources.                                                                        |
| 405         | Method Not Allowed                     | Method specified in the request not allowed.                                                             |
| 406         | Not Acceptable                         | Responses from the server failed to be received by the client.                                           |
| 407         | Proxy Authentication Required          | Proxy authentication required before the request can be processed.                                       |
| 408         | Request Timeout                        | Request timed out.                                                                                       |
| 409         | Conflict                               | Failed to complete the request due to conflicts.                                                         |
|             |                                        | The resource being accessed by another request.                                                          |
| 500         | Internal IaaS OpenStack network error. | Service internal error.                                                                                  |
|             |                                        | Server exception.                                                                                        |
| 501         | Not Implemented                        | Failed to complete the request because the server does not support the requested function.               |
| 502         | Bad Gateway                            | Failed to complete the request because the server receives an invalid response from the upstream server. |
| 503         | Service Unavailable                    | Failed to complete the request because the system is temporarily abnormal.                               |
| 504         | Gateway Timeout                        | Gateway timed out.                                                                                       |

## A.3 General Information About Shared Load Balancers

The following information applies only to shared load balancers.

### A.3.1 Querying Data in Pages

APIs v2.0 allow users to query data in pages by adding the limit and marker parameters to the URL of the list request. The query results are displayed in the ascending order of IDs.

- **next ref** in the response indicates the URL of the next page.
- **previous ref** in the response indicates the URL of the previous page.

## Request

**Table A-3** Parameter description

| Parameter    | Type   | Mandatory | Description                                                                                                                  |
|--------------|--------|-----------|------------------------------------------------------------------------------------------------------------------------------|
| limit        | int    | No        | Specifies the number of records on each page.                                                                                |
| marker       | String | No        | Specifies the resource ID of pagination query. If the parameter is left blank, only resources on the first page are queried. |
| page_reverse | Bool   | No        | Specifies the paging sequence. The value can be <b>true</b> or <b>false</b> .                                                |

## Response

None

## Example

- Example request  
GET /v2.0/networks?limit=2&marker=3d42a0d4-a980-4613-ae76-a2cddecff054&page\_reverse=False

- Example response

```
{
 "networks": [
 {
 "status": "ACTIVE",
 "subnets": [],
 "name": "liudongtest ",
 "admin_state_up": false,
 "tenant_id": "6fbe9263116a4b68818cf1edce16bc4f",
 "id": "60c809cb-6731-45d0-ace8-3bf5626421a9"
 },
 {
 "status": "ACTIVE",
 "subnets": [

 "rel": "previous"
 }
]
}
```

## A.3.2 Sequencing Query Results

API v2.0 enables the system to sort queried results based on customized keys by adding the **sort\_key** and **sort\_dir** parameters to the URL of the list request.

**sort\_key** specifies the parameter used for sequencing results, and **sort\_dir** specifies whether results are displayed in ascending or descending order.

These APIs allow you to sort query results by multiple criteria. The number of **sort\_key** parameters must be equal to that of **sort\_dir** parameters. Otherwise, 400 status code is returned.

### Example Request

```
GET /v2.0/networks?sort_key=name&sort_dir=asc&sort_key=status&sort_dir=desc
```

### Example Response

```
{
 "networks": [
 {
 "status": "ACTIVE",
 "subnets": [],
 "name": "liudongtest ",
 "admin_state_up": false,
 "tenant_id": "6fbe9263116a4b68818cf1edce16bc4f",
 "id": "60c809cb-6731-45d0-ace8-3bf5626421a9"
 },
 {

 "id": "3d42a0d4-a980-4613-ae76-a2cddecff054"
 }
]
}
```

## A.3.3 Basic Workflow

The basic workflow of sharedload balancers contains the following: creating a load balancer, adding a listener to a specific load balancer, adding a backend server group to a specific listener, configuring a health check for a specific backend server group, and adding a backend server to a specific backend server group. Deletion operations include removing a backend server, deleting a health check, deleting a backend server group, deleting a listener, and deleting a load balancer.

## Provision Resources

- Creating a load balancer
- Adding a listener to a specific load balancer
- Adding a backend server group to a specific listener
- Configuring a health check for a specific backend server group
- Adding a backend server to a specific backend server group

## Reclaim Resources

- Removing a backend server
- Deleting a health check
- Deleting a backend server group
- Deleting a listener
- Deleting a load balancer

# A.4 Obtaining a Project ID

## Scenarios

A project ID is required for some URLs when an API is called. Therefore, you need to obtain a project ID in advance. Two methods are available:

- [Obtain the Project ID by Calling an API](#)
- [Obtain the Project ID from the Console](#)

## Obtain the Project ID by Calling an API

You can obtain a project ID by calling the API used to [query projects based on specified criteria](#).

The API used to obtain a project ID is GET `https://{Endpoint}/v3/projects`. {Endpoint} is the IAM endpoint and can be obtained from [Regions and Endpoints](#). For details about API authentication, see [Authentication](#).

The following is an example response. The value of **id** is the project ID.

```
{
 "projects": [
 {
 "domain_id": "65ewtrgaggshhk1223245sghjlse684b",
 "is_domain": false,
 "parent_id": "65ewtrgaggshhk1223245sghjlse684b",
 "name": "project_name",
 "description": "",
 "links": {
 "next": null,
 "previous": null,

## Obtain a Project ID from the Console

To obtain a project ID from the console, perform the following operations:

1. Access [My Credentials](#).
2. On the **API Credentials** page, check the project ID in the project list.

**Figure A-1** Viewing the project ID
