Contents

1 Before You Start.....	1
2 API OVERVIEW.....	3
3 Calling APIs.....	46
3.1 Making an API Request.....	46
3.2 Authentication.....	50
3.3 Response.....	52
4 Development Environment Management.....	54
4.1 Creating a Notebook Instance.....	54
4.2 Querying Notebook Instances.....	85
4.3 Querying All Notebook Instances.....	109
4.4 Querying Details of a Notebook Instance.....	132
4.5 Updating a Notebook Instance.....	149
4.6 Deleting a Notebook Instance.....	178
4.7 Saving a Running Instance as a Container Image.....	195
4.8 Querying the List of Valid Specifications Supported by Notebook Instances.....	203
4.9 Querying the List of Switchable Specifications Supported by Notebook Instances.....	210
4.10 Querying the Available Duration of a Running Notebook Instance.....	217
4.11 Prolonging a Notebook Instance.....	220
4.12 Starting a Notebook Instance.....	224
4.13 Stopping a Notebook Instance.....	242
4.14 Obtaining Details About All Notebook Resource Pool Instances.....	260
4.15 Obtaining Details About a Notebook Resource Pool.....	270
4.16 Querying the Switch and Quota of a Specified Feature of the Current User.....	276
4.17 Obtaining the Notebook Instances with OBS Storage Mounted.....	280
4.18 OBS Storage Mounting.....	284
4.19 Obtaining Details About a Notebook Instance with OBS Storage Mounted.....	289
4.20 Unmounting OBS Storage from a Notebook Instance.....	292
4.21 Querying Supported Images.....	296
4.22 Registering a Custom Image.....	305
4.23 Querying the User Image List.....	314
4.24 Obtaining Details of an Image.....	319
4.25 Deleting an Image.....	324

4.26 Synchronizing the Image Status.....	330
5 Training Management.....	337
5.1 Creating an Algorithm.....	337
5.2 Querying the Algorithm List.....	361
5.3 Querying Algorithm Details.....	375
5.4 Modifying an Algorithm.....	387
5.5 Deleting an Algorithm.....	411
5.6 Creating a Training Job.....	413
5.7 Querying the Details About a Training Job.....	493
5.8 Modifying the Description of a Training Job.....	528
5.9 Deleting a Training Job.....	530
5.10 Terminating a Training Job.....	532
5.11 Querying the Logs of a Specified Task in a Given Training Job (Preview).....	566
5.12 Querying the Logs of a Specified Task in a Training Job (OBS Link).....	570
5.13 Querying the Running Metrics of a Specified Task in a Training Job.....	574
5.14 Querying a Training Job List.....	577
5.15 Obtaining the Events of a Training Job.....	615
5.16 Obtaining the public flavors supported by a training job.....	620
5.17 Obtaining the Preset AI Frameworks Supported by a Training Job.....	626
6 Model Management.....	631
6.1 Obtaining the Model Runtime.....	631
6.2 Querying the AI Application List.....	637
6.3 Creating an AI Application.....	645
6.4 Obtaining Details About an AI Application.....	658
6.5 Deleting an AI application.....	666
7 App Authentication Management.....	670
7.1 Obtaining the App List.....	670
7.2 Creating Apps.....	675
7.3 Obtaining App Details.....	679
7.4 Deleting an App.....	683
7.5 Adding an App Code.....	685
7.6 Resetting an App Code.....	690
7.7 Deleting an App Code.....	694
7.8 Resetting an AppSecret.....	698
7.9 Obtaining the List of APIs Bound to an App.....	702
7.10 Registering an API and Authorizing the API to an App.....	706
7.11 Deleting an API.....	712
7.12 Authorizing an API to an App.....	715
7.13 Updating API Authorization.....	720
7.14 Canceling the Authorization of an API to an App.....	724
7.15 Obtaining API Authorization Relationships.....	728

7.16 Creates an API.....	733
7.17 API query.....	737
7.18 Querying APIs and Apps.....	741
7.19 Check whether the app exists.....	745
7.20 Querying the API Authentication Information of an Application.....	749
8 Service Management.....	753
8.1 Updating the Service Through the Patch Operation.....	753
8.2 Obtaining Service Monitoring.....	757
8.3 Obtaining Services.....	760
8.4 Deploying Services.....	768
8.5 Obtaining Supported Service Deployment Specifications.....	789
8.6 Obtaining Service Details.....	795
8.7 Updating Service Configurations.....	810
8.8 Deleting a Service.....	825
8.9 Updating a Single Property of a Model Service.....	827
8.10 Obtaining Service Event Logs.....	830
8.11 Obtaining Service Update Logs.....	834
8.12 Adding a Resource Tag.....	841
8.13 Deleting Resource Tags.....	845
8.14 Obtaining Inference Service Tags.....	849
8.15 Obtaining an Inference VPC Access Channel.....	853
9 Resource Management.....	857
9.1 Querying OS Configuration Parameters.....	857
9.2 Querying a Plug-in Template.....	859
9.3 Obtaining Nodes in a Resource Pool.....	863
9.4 Deleting nodes in batches.....	876
9.5 Querying a Trace List.....	878
9.6 Creating Network Resources.....	885
9.7 Obtaining Network Resources.....	894
9.8 Obtaining a Network Resource.....	902
9.9 Deleting a Network Resource.....	910
9.10 Updating a Network Resource.....	917
9.11 Querying the Real-Time Resource Usage.....	926
9.12 Creating Resource Pools.....	931
9.13 Obtaining Resource Pools.....	957
9.14 Obtaining a Resource Pool.....	976
9.15 Deleting a Resource Pool.....	995
9.16 Updating a Resource Pool.....	1013
9.17 Monitoring a Resource Pool.....	1036
9.18 Resource Pool Statistics.....	1047
9.19 Obtaining Resource Specifications.....	1051
9.20 Obtain Jobs in a Resource Pool.....	1059

9.21 Querying dedicated resource pool Job Statistics.....	1068
9.22 Query Plugin Templates.....	1072
9.23 Batch Updating Nodes.....	1084
9.24 Locking Node Functions in Batches.....	1089
9.25 Unlocking Node Functions in Batches.....	1092
9.26 Resetting Nodes.....	1096
9.27 Changing the Node Specifications.....	1100
9.28 Migrating Nodes in Batches.....	1104
9.29 Binding Nodes to a Logical Subpool in Batches.....	1114
9.30 Obtaining Custom Node Configurations of a Resource Pool.....	1117
10 Lite Server Management.....	1121
10.1 Creating a Lite Server.....	1121
10.2 Querying All Lite Server Instances of a User.....	1140
10.3 Querying Lite Server Instance Details.....	1151
10.4 Changing the Lite Server Instance Name.....	1160
10.5 Stopping a Lite Server Instance.....	1169
10.6 Starting a Lite Server Instance.....	1178
10.7 Deleting a Lite Server Instance.....	1188
10.8 Creating a Hyper Cluster.....	1197
10.9 Obtaining the Hyper Cluster Details List.....	1200
10.10 Querying Hyper Cluster Instance Details.....	1203
10.11 Deleting a Hyper Cluster Instance.....	1206
10.12 Synchronizing the Status of All Lite Server Instances of a User in Real Time.....	1208
10.13 Creating a Lite Server Supernode Tag.....	1219
10.14 Deleting a Lite Server Supernode Tag.....	1225
10.15 Querying Lite Server Supernode Tags.....	1230
10.16 Reinstalling the OS Image of a Lite Server.....	1234
10.17 Changing the OS Image of a Lite Server.....	1247
10.18 Changing the OS Image of a Lite Server Supernode.....	1260
10.19 Obtaining Details About All Supernode Instances of a User.....	1275
10.20 Obtaining Details About a Specified Supernode Instance.....	1289
10.21 Deleting a Lite Server Supernode Instance.....	1302
10.22 Restarting a Lite Server Instance.....	1315
10.23 Starting a Lite Server Supernode.....	1326
10.24 Stopping a Lite Server Supernode.....	1338
10.25 Mounting a Disk to a Lite Server.....	1350
10.26 Unmounting a Disk from a Lite Server.....	1352
10.27 Binding an EIP to a Lite Server.....	1355
10.28 Query Bound EIPs.....	1358
10.29 Querying the Specification List.....	1360
10.30 Obtaining the Resource Flavor List.....	1366
10.31 Creating a RoCE Network.....	1372

10.32 Querying the Lite Server List of a Tenant.....	1375
10.33 Querying Lite Server Image Details.....	1384
10.34 Querying the Lite Server Image List.....	1387
10.35 Querying the HyperInstance List of a Tenant.....	1390
10.36 Scaling Out Lite Server Supernodes.....	1401
10.37 Scaling in Lite Server Supernodes.....	1416
10.38 Obtaining Operation Details.....	1427
10.39 Querying the Supported Lite Server Scaling Specifications and Capacity Calculation.....	1429
10.40 Querying the Logical Capacity Calculation Result of the hyperinstance-clusters Supernode.....	1432
10.41 Querying the Tor Information of an Instance.....	1436
10.42 Performing Operations on Lite Server Instances in Batches.....	1438
10.43 Querying Lite Server Job Details.....	1453
10.44 Querying the Lite Server Job List.....	1457
10.45 Deleting Lite Server Jobs in Batches.....	1461
10.46 Creating a Lite Server Task.....	1464
10.47 Obtaining the Lite Server Job Template List.....	1469
10.48 Obtaining Lite Server Job Template Details.....	1473
10.49 Obtaining the Lite Server Plug-in List.....	1476
10.50 Obtaining Software Information.....	1479
10.51 Obtaining Lite Server Service Details.....	1483
11 Authorization Management.....	1487
11.1 Viewing an Authorization List.....	1487
11.2 Configuring Authorization.....	1491
11.3 Deleting Authorization.....	1495
11.4 Creating a ModelArts Agency.....	1497
12 Workspace Management.....	1501
12.1 Querying Details About a Workspace.....	1501
12.2 Modifying a Workspace.....	1506
12.3 Deleting a Workspace.....	1510
12.4 Querying a Workspace Quota.....	1513
12.5 Modifying a Workspace Quota.....	1517
12.6 Querying a Workspace List.....	1521
12.7 Creating a Workspace.....	1529
12.8 Querying the Authorization Mode.....	1539
12.9 Updating the Authorization Mode.....	1541
12.10 Authenticating Whether the Current Workspace Can Be Used.....	1543
12.11 Querying the User Role Information.....	1548
13 Quota Management.....	1551
13.1 Obtaining OS Quotas.....	1551
14 Resource Tag Management.....	1555
14.1 Obtaining All Tags of Resource Pools.....	1555

14.2 Obtaining Tags of a Resource Pool.....	1558
15 Node Pool Management.....	1562
15.1 Obtaining Node Pools.....	1562
15.2 Creating a Node Pool.....	1574
15.3 Obtaining Details About a Specified Node Pool.....	1598
15.4 Updating a Node Pool.....	1610
15.5 Deleting a Node Pool.....	1633
15.6 Obtaining Nodes in a Node Pool.....	1645
16 Order Management.....	1658
16.1 Querying Order Details.....	1658
17 Plugin Management.....	1664
17.1 Creating a Plugin.....	1664
17.2 Querying the Plugin List.....	1671
18 Task Management.....	1677
18.1 Querying Tasks.....	1677
19 Notebook Case Studies.....	1682
19.1 Querying Case Studies.....	1682
20 Scheduled Events.....	1687
20.1 Authorizing Scheduled Events.....	1687
20.2 Obtaining the Scheduled Event List.....	1693
21 Node configuration template.....	1702
21.1 Obtaining a Node Configuration Template.....	1702
22 Use Cases.....	1707
22.1 Creating a Development Environment Instance.....	1707
22.2 Using PyTorch to Create a Training Job (New-Version Training).....	1727
22.3 Managing ModelArts Authorization.....	1743
23 Permissions Policies and Supported Actions.....	1747
23.1 Introduction.....	1747
23.2 Workflow Permissions.....	1748
23.3 Data Management Permissions.....	1749
23.4 DevEnviron Permissions.....	1767
23.5 Training Job Permissions.....	1774
23.6 Model Management Permissions.....	1776
23.7 Service Management Permissions.....	1777
23.8 Resource Pool Management Permissions.....	1778
23.9 Granting Management Permissions.....	1781
24 Appendix.....	1783
24.1 Status Code.....	1783

24.2 Error Codes.....	1787
24.3 Obtaining a Project ID and Name.....	1897
24.4 Obtaining an Account Name and ID.....	1898
24.5 Obtaining a Username and ID.....	1898
25 Historical APIs.....	1900
25.1 Data Management (Old Version).....	1900
25.1.1 Querying the Dataset List.....	1900
25.1.2 Creating a Dataset.....	1921
25.1.3 Querying Details About a Dataset.....	1935
25.1.4 Modifying a Dataset.....	1952
25.1.5 Deleting a Dataset.....	1957
25.1.6 Obtaining Dataset Statistics.....	1958
25.1.7 Querying the Monitoring Data of a Dataset.....	1964
25.1.8 Querying the Dataset Version List.....	1966
25.1.9 Creating a Dataset Labeling Version.....	1977
25.1.10 Querying Details About a Dataset Version.....	1980
25.1.11 Deleting a Dataset Labeling Version.....	1988
25.1.12 Obtaining a Sample List.....	1990
25.1.13 Adding Samples in Batches.....	2006
25.1.14 Deleting Samples in Batches.....	2025
25.1.15 Obtaining Details About a Sample.....	2027
25.1.16 Obtaining Sample Search Condition.....	2042
25.1.17 Obtaining a Sample List of a Team Labeling Task by Page.....	2046
25.1.18 Obtaining Details About a Team Labeling Sample.....	2061
25.1.19 Querying the Dataset Label List.....	2075
25.1.20 Creating a Dataset Label.....	2079
25.1.21 Modifying Labels in Batches.....	2084
25.1.22 Deleting Labels in Batches.....	2089
25.1.23 Updating a Label by Label Names.....	2094
25.1.24 Deleting a Label and the Files that Only Contain the Label.....	2097
25.1.25 Updating Sample Labels in Batches.....	2100
25.1.26 Querying the Team Labeling Task List of a Dataset.....	2116
25.1.27 Creating a Team Labeling Task.....	2129
25.1.28 Querying Details About a Team Labeling Task.....	2133
25.1.29 Starting a Team Labeling Task.....	2148
25.1.30 Updating a Team Labeling Task.....	2151
25.1.31 Deleting a Team Labeling Task.....	2155
25.1.32 Creating a Team Labeling Acceptance Task.....	2156
25.1.33 Querying the Report of a Team Labeling Acceptance Task.....	2158
25.1.34 Updating Status of a Team Labeling Acceptance Task.....	2161
25.1.35 Querying Details About Team Labeling Task Statistics.....	2174
25.1.36 Querying Details About the Progress of a Team Labeling Task Member.....	2181

25.1.37 Querying the Team Labeling Task List by a Team Member.....	2183
25.1.38 Submitting Sample Review Comments of an Acceptance Task.....	2187
25.1.39 Reviewing Team Labeling Results.....	2190
25.1.40 Updating Labels of Team Labeling Samples in Batches.....	2192
25.1.41 Querying the Labeling Team List.....	2208
25.1.42 Creating a Labeling Team.....	2210
25.1.43 Querying Details About a Labeling Team.....	2212
25.1.44 Updating a Labeling Team.....	2214
25.1.45 Deleting a Labeling Team.....	2216
25.1.46 Sending an Email to a Labeling Team Member.....	2218
25.1.47 Querying the List of All Labeling Team Members.....	2220
25.1.48 Querying the List of Labeling Team Members.....	2223
25.1.49 Creating a Labeling Team Member.....	2226
25.1.50 Deleting Labeling Team Members in Batches.....	2228
25.1.51 Querying Details About Labeling Team Members.....	2230
25.1.52 Updating a Labeling Team Member.....	2232
25.1.53 Deleting a Labeling Team Member.....	2234
25.1.54 Querying the Dataset Import Task List.....	2235
25.1.55 Creating an Import Task.....	2241
25.1.56 Querying Details About a Dataset Import Task.....	2250
25.1.57 Querying the Dataset Export Task List.....	2255
25.1.58 Creating a Dataset Export Task.....	2264
25.1.59 Querying the Status of a Dataset Export Task.....	2278
25.1.60 Synchronizing a Dataset.....	2285
25.1.61 Querying the Status of a Dataset Synchronization Task.....	2286
25.1.62 Obtaining an Auto Labeling Sample List.....	2288
25.1.63 Querying Details About an Auto Labeling Sample.....	2302
25.1.64 Obtaining an Auto Labeling Task List by Page.....	2315
25.1.65 Starting Intelligent Tasks.....	2339
25.1.66 Obtaining Details About an Auto Labeling Task.....	2364
25.1.67 Stopping an Intelligent Task.....	2386
25.1.68 Querying the List of a Processing Task.....	2387
25.1.69 Creating a Processing Task.....	2395
25.1.70 Querying Details About a Processing Task.....	2403
25.1.71 Updating a Processing Task.....	2408
25.1.72 Deleting a Processing Task.....	2409
25.2 DevEnviron (Old Version).....	2410
25.2.1 Creating a Development Environment Instance.....	2411
25.2.2 Obtaining Development Environment Instances.....	2426
25.2.3 Obtaining Details About a Development Environment Instance.....	2438
25.2.4 Modifying the Description of a Development Environment Instance.....	2449
25.2.5 Deleting a Development Environment Instance.....	2461

25.2.6 Managing a Development Environment Instance.....	2462
25.3 Training Management (Old Version).....	2464
25.3.1 Training Jobs.....	2464
25.3.1.1 Creating a Training Job.....	2464
25.3.1.2 Querying a Training Job List.....	2472
25.3.1.3 Querying the Details About a Training Job Version.....	2475
25.3.1.4 Deleting a Version of a Training Job.....	2483
25.3.1.5 Obtaining Training Job Versions.....	2484
25.3.1.6 Creating a Version of a Training Job.....	2492
25.3.1.7 Stopping a Training Job.....	2498
25.3.1.8 Modifying the Description of a Training Job.....	2499
25.3.1.9 Deleting a Training Job.....	2501
25.3.1.10 Obtaining the Name of a Training Job Log File.....	2502
25.3.1.11 Querying a Built-in Algorithm.....	2504
25.3.1.12 Querying Training Job Logs.....	2508
25.3.2 Training Job Parameter Configuration.....	2510
25.3.2.1 Creating a Training Job Configuration.....	2510
25.3.2.2 Querying a List of Training Job Configurations.....	2514
25.3.2.3 Modifying a Training Job Configuration.....	2517
25.3.2.4 Deleting a Training Job Configuration.....	2522
25.3.2.5 Querying the Details About a Training Job Configuration.....	2523
25.3.3 Visualization Jobs.....	2529
25.3.3.1 Creating a Visualization Job.....	2529
25.3.3.2 Querying a Visualization Job List.....	2532
25.3.3.3 Querying the Details About a Visualization Job.....	2535
25.3.3.4 Modifying the Description of a Visualization Job.....	2536
25.3.3.5 Deleting a Visualization Job.....	2538
25.3.3.6 Stopping a Visualization Job.....	2539
25.3.3.7 Restarting a Visualization Job.....	2541
25.3.4 Resource and Engine Specifications.....	2542
25.3.4.1 Querying Job Resource Specifications.....	2542
25.3.4.2 Querying Job Engine Specifications.....	2545
25.3.5 Job Statuses.....	2548

1 Before You Start

Before calling a ModelArts API, ensure that you have fully understood the concepts related to ModelArts. For details, see the [Service Overview](#).

ModelArts supports Representational State Transfer (REST) APIs, allowing you to call APIs using HTTPS. For details about API calling, see [Calling APIs](#).

In addition, ModelArts provides software development kits (SDKs) of multiple programming languages for you to use. For details about how to use the SDKs, see the [ModelArts SDK Reference](#).

Endpoint

An endpoint is the **request address** for calling an API. Endpoints vary depending on services and regions. For the endpoints of all services, see [Regions and Endpoints](#).

Constraints

- The number of ModelArts resources you can create is determined by your quota. For details about the quota, see [Quotas](#).
- For more constraints, see API description.

Basic Concepts

- Account
An account is created upon successful registration with the cloud platform. The account has full access permissions for all of its cloud services and resources. It can be used to reset user passwords and grant user permissions. The account is a payment entity and should not be used directly to perform routine management. For security purposes, create IAM users and grant them permissions for routine management.
- IAM user
An IAM user is created using an account to use cloud services. Each IAM user has its own identity credentials (password and access keys).
An IAM user can view the account ID and user ID on the [My Credentials](#) page of the console. The account name, username, and password will be required for API authentication.

- **Region**
A region is a geographic area where cloud resources are deployed. Availability zones (AZs) in the same region can communicate with each other over an intranet, while AZs in different regions are isolated from each other. Deploying cloud resources in different regions can better suit certain user requirements or comply with local laws or regulations.
- **AZ**
An AZ contains one or more physical data centers. Each AZ has independent cooling, fire extinguishing, moisture-proof, and electricity facilities. An AZ's computing, network, storage, and other resources are logically divided into multiple clusters. AZs within a region are interconnected using high-speed optical fibers to allow users to build cross-AZ high-availability systems.
- **Project**
Projects group and isolate compute, storage, and network resources across physical regions. A default project is provided for each region, and subprojects can be created under each default project. Users can be granted permissions to access all resources in a specific project. If you need more refined access control, create subprojects under a default project and create resources in subprojects. Then you can assign users the permissions required to access only the resources in the specific subprojects.
To view a project ID, go to the [My Credentials](#) page.

Figure 1-1 Project isolation model

2 API OVERVIEW

Notebook Instance Management

Table 2-1 Notebook Instance Management

API	Description
Querying Notebook Instances	This API is used to obtain information about notebook instances that meet specific conditions.
Creating a Notebook Instance	This API is used to create a notebook instance based on specified parameters.
Querying All Notebook Instances	This API is used to obtain information about all created notebook instances.
Querying Details of a Notebook Instance	This API is used to obtain the details of a specified notebook instance.
Updating a Notebook Instance	This API is used to modify the instance configurations, including its name, description, specifications, and image.
Deleting a Notebook Instance	This API is used to delete a created notebook instance and its related resources.
Saving a Running Instance as a Container Image	This API is used to save a running instance as a container image.

API	Description
Querying the List of Valid Specifications Supported by Notebook Instances	This API is used to obtain the available specifications supported by notebook instances. This API applies to the following scenario: When you want to know the configuration options supported by a notebook instance, you can use this API to query the list of available specifications. Before using this API, ensure that you have logged in to the system and have the permission to access the target notebook instance. After this API is called, the system returns the valid specifications supported by the notebook instance. For example, the memory and CPU. If you do not have the permission to access the specified notebook instance or the notebook instance is not running, the API will return an error message.
Querying the List of Switchable Specifications Supported by Notebook Instances	This API is used to obtain the available specifications that can be switched during notebook instance creation.
Querying the Available Duration of a Running Notebook Instance	This API is used to obtain the available duration of a running notebook instance.
Prolonging a Notebook Instance	This API is used to prolong the running time of a running notebook instance. This API applies to the following scenarios: When you need to prolong the running time of a notebook instance to complete long-time tasks, you can call this API to do so. Before using this API, ensure that you have logged in to the system and have the permission to perform operations on the target notebook instance. In addition, the notebook instance must be running. After this API is called, the system prolongs the running time of the specified notebook instance, so that you can continue to use it. If you do not have the permission to perform operations on the specified notebook instance or the notebook instance is not running, the API will return an error message.
Starting a Notebook Instance	This API is used to start a created notebook instance.
Stopping a Notebook Instance	This API is used to stop a notebook instance that is running.

API	Description
Obtaining Details About All Notebook Resource Pool Instances	This API is used to obtain details about all notebook resource pool instances associated with a user. This API is used when you need to select a resource pool when creating a notebook instance. Before using this API, ensure that you have registered and logged in to the system and have the permission to view resource pool instances. After the API is called, the API returns a list of detailed information about all resource pool instances, including the instance name, status, and node specifications. If you have not logged in to the system, do not have the required permission to access the resource pool, or an internal error occurs in the system, the API returns an error message, for example, unauthorized access, service unavailable, or internal error.
Obtaining Details About a Notebook Resource Pool	This API is used to obtain details about a notebook resource pool. This API is used when you need to query details about a specified cluster when creating a notebook instance job. Before using this API, ensure that the cluster has been managed and you have the required permission. After this API is called, the system returns the instance ID, name, flavor, instance status, and URL for accessing the cluster. If the cluster does not exist, is not managed, or you do not have the access permission, the API will return an error message.
Querying the Switch and Quota of a Specified Feature of the Current User	This API is used to query the switch status and quota information of a specified feature of the current user. This API is used when you need to know whether a specific feature is enabled, check the quota limit, or monitor the used resources. Before using this API, ensure that you have logged in and have the query permission, and the specified feature must exist. After this API is called, the system returns the details, such as whether the feature is enabled, total quota, and used resources. If you do not have the required permission, the feature does not exist, or the system is abnormal, the API will return an error message.

OBS Storage Mounting

Table 2-2 OBS Storage Mounting

API	Description
Obtaining the Notebook Instances with OBS Storage Mounted	This API is used to obtain the OBS parallel file system that can be mounted to a running notebook instance.
OBS Storage Mounting	This API is used to mount an OBS parallel file system to a specified file directory of a running notebook instance.
Obtaining Details About a Notebook Instance with OBS Storage Mounted	This API is used to obtain the details of the OBS parallel file system that has been mounted to a running notebook instance.
Unmounting OBS Storage from a Notebook Instance	This API is used to unmount an OBS parallel file system from a running notebook instance.

Image Management

Table 2-3 Image Management

API	Description
Querying Supported Images	This API is used to query all images by page based on specified conditions.
Registering a Custom Image	This API is used to register a custom image with ModelArts image management.
Querying the User Image List	This API is used to obtain the overview of user image information. Image names are used for aggregation.
Obtaining Details of an Image	This API is used to query image details.
Deleting an Image	This API is used to delete an image object. For a private image, you can also delete its SWR image content using parameters.

API	Description
Synchronizing the Image Status	This API is used to correct the abnormal image status. This API is used when you need to synchronize the latest image status when the image status is abnormal due to misoperations, network problems, or system faults. Before using this API, ensure that the image exists and you have the required permission. After the synchronization, the image status is updated to the latest correct status, and related resources and configurations are synchronized. If the image does not exist, you do not have the operation permission, or an error occurs during the synchronization, the API will return an error message.

Algorithm Management

Table 2-4 Algorithm Management

API	Description
Creating an Algorithm	This API is used to create an algorithm on ModelArts.
Querying the Algorithm List	This API is used to obtain the list of all algorithms on ModelArts.
Querying Algorithm Details	This API is used to obtain the details of a specified algorithm on ModelArts.
Modifying an Algorithm	This API is used to modify the information of an existing algorithm.
Deleting an Algorithm	This API is used to remove a registered algorithm from ModelArts.

Training Job Management

Table 2-5 Training Job Management

API	Description
Creating a Training Job	This API is used to create a training job on ModelArts.
Querying the Details About a Training Job	This API is used to query the details about a training job on ModelArts.

API	Description
Modifying the Description of a Training Job	This API is used to modify the description of an existing training job.
Deleting a Training Job	This API is used to delete a training job from ModelArts.
Terminating a Training Job	This API is used to terminate a training job on ModelArts. Only jobs in the creating, awaiting, or running state can be terminated.
Querying the Logs of a Specified Task in a Given Training Job (Preview)	This API is used to query the logs of a specified task in a given training job on ModelArts (preview).
Querying the Logs of a Specified Task in a Training Job (OBS Link)	This API is used to obtain the OBS link where the log files of a specified training job are stored.
Querying the Running Metrics of a Specified Task in a Training Job	This API is used to query the running metrics of a specified task in a training job on ModelArts.
Querying a Training Job List	This API is used to obtain the list of all training jobs on ModelArts.
Obtaining the Events of a Training Job	This API is used to obtain the events of a training job on ModelArts.

Resource and Engine Specifications

Table 2-6 Resource and Engine Specifications

API	Description
This API is used to obtain the public flavors supported by a training job.	This API is used to obtain the supported resource specifications of training jobs on ModelArts.
Obtaining the Preset AI Frameworks Supported by a Training Job	This API is used to query the list of preset AI frameworks supported by the current system.

Model Management

Table 2-7 Model Management

API	Description
Obtaining the Model Runtime	This API is used to obtain the AI engine and runtime of models.
Querying the AI Application List	This API is used to query the AI application list based on different search parameters.
Creating an AI Application	Import a meta model to create an AI application.
Obtaining Details About an AI Application	This API is used to query details about an AI application based on the AI application ID.
Deleting an AI application	This interface is used to delete an AI application based on the AI application ID. When cascade is set to true, the AI application specified by the AI application ID and other AI applications with the same name but different versions as the specified AI application are deleted. By default, only the AI application corresponding to the current AI application ID is deleted.

App Authentication Management

Table 2-8 App Authentication Management

API	Description
Obtaining the App List	This API is used to obtain the basic information about APIG apps. You can obtain only the information about the apps created by yourself.
Creating Apps	This API is used to create API Gateway applications (apps for short). Each user can create a maximum of five apps. You can apply for increasing the quota as required.
Obtaining App Details	This API is used to obtain details about a specified app.
Deleting an App	This API is used to delete a specified app. Only the user who creates the app can delete it, and the app is not bound to any API.
Adding an App Code	This API is used to create an app code for a specified API Gateway app. Only the user who creates the app can create an app code, and only apps of the shared or dedicated API Gateway can have app codes.

API	Description
Resetting an App Code	This API is used to reset a specified app code of an API Gateway app. Only the user who creates the app can reset it, and only apps of the shared or dedicated API Gateway can have app codes.
Deleting an App Code	This API is used to delete a specified app code of an API Gateway app. Only the user who creates the app can delete it, and only apps of the shared or dedicated API Gateway can have app codes.
Resetting an AppSecret	This API is used to reset the AppSecret of a specified API Gateway app. Only the user who creates the app can reset the AppSecret.
Obtaining the List of APIs Bound to an App	This API is used to obtain the list of APIs bound to an app.
Registering an API and Authorizing the API to an App	This API is used to register an API and authorize the API to an App. Only Huawei Cloud users who have the permission to update the service can call this API.
Deleting an API	This API is used to delete a specified API. Only users who have the permission to delete the service to which the API belongs can delete the API.
Authorizing an API to an App	This API is used to authorize a specified API to an App. The API authentication mode must be App authentication. The user who creates an App must be the creator of the service to which the API belongs, and the request user must have the update permission on the service to which the API belongs.
Updating API Authorization	This API is used to update the authorization relationship of an API. The API authentication mode must be App authentication. The user who creates an App must be the creator of the service to which the API belongs, and the request user must have the update permission on the service to which the API belongs.
Canceling the Authorization of an API to an App	This API is used to cancel the authorization of a specified API to an app. The request user must have the update permission on the service to which the API belongs. Same as the URL: /v1/{project_id}/app-auth/{service_id}/apis/{api_id}/auths
Obtaining API Authorization Relationships	This API is used to obtain the authorization relationships between specified APIs and Apps. The API authentication mode must be App authentication. Administrators can obtain authorization information about all APIs. Common users can obtain only authorization information about APIs of services on which they have access permissions.

API	Description
Creates an API.	An API is created, but the API is not authorized to the app.
API query	This API is used to query details about a specified API.
Querying APIs and Apps	This API is used to query information about APIs and apps authorized by a service.
Check whether the app exists.	Check whether the app exists.

Service Management

Table 2-9 Service Management

API	Description
Obtaining Service Monitoring	This API is used to obtain service monitoring information.
Obtaining Services	This API is used to obtain model services.
Deploying Services	This API is used to deploy a model as a service.
Obtaining Supported Service Deployment Specifications	This API is used to obtain supported service deployment specifications.
Obtaining Service Details	This API is used to obtain the details about a model service based on the service ID.
Updating Service Configurations	This API is used to update configurations of a model service. It can also be used to start or stop a service.
Updating the Service Through the Patch Operation	This API is used to update the service through the patch operation. For details about the patch format, see json patch .
Deleting a Service	This API is used to delete a model service. You can delete your own services only.
Updating a Single Property of a Model Service	This API is used to update a single property of a model service. Currently, only instance_count (number of instances of the model service) is supported. This operation can be performed only for real-time services in the running, alarm, or abnormal state.
Obtaining Service Event Logs	This API is used to obtain service event logs, including service operation records, key actions during deployment, and deployment failure causes.

API	Description
Obtaining Service Update Logs	This API is used to obtain the update logs of a real-time service.
Adding a Resource Tag	This API is used to add tags to specified real-time services. If a tag to be added has the same key as an existing tag, the tag will overwrite the existing one.
Deleting Resource Tags	This API is used to delete tags of a real-time service. Tags can be deleted in batches.
Obtaining Inference Service Tags	This API is used to obtain inference service tags in the current project. Tags in all workspaces are obtained by default. If you do not have the permission, no tag is returned.
Obtaining an Inference VPC Access Channel	This API is used to obtain an inference VPC access channel.

Configuration Management

Table 2-10 Configuration Management

API	Description
Querying OS Configuration Parameters	This API is used to obtain the configuration parameters of ModelArts OS, such as network CIDR and user resource quota. This API is used when you need to query the network configuration, resource allocation, or system management of ModelArts OS. Before using this API, ensure that you have the permission to access ModelArts OS and the service is running properly. After the query, the configuration parameters are returned for future resource planning and system optimization. If you do not have the required permission, the service is unavailable, or the request parameter is invalid, the API will return an error message.

Plug-in Template Management

Table 2-11 Plug-in Template Management

API	Description
Querying a Plug-in Template	This API is used to obtain details about a specified plug-in template. This API is used when you need to query the configuration, functions, or usage of a specific plug-in template. Before using this API, ensure that the plug-in template exists and you have the required permission. After the query, the details of the specified plug-in template are returned, including the configuration parameters and function description of the template, helping you develop and manage plug-ins. If the plug-in template does not exist or you do not have the access permission, the API will return an error message.

Event management

Table 2-12 Event management

API	Description
Querying a Trace List	This API is used to obtain the event information recorded in the system. This API is used when you need to query the event records recorded in the system when monitoring the system status, locating faults, or auditing. Before using this API, ensure that you have the required permission and the event records exist in the system. After the query, the API returns the event list, including the event ID, type, time, and description. If you do not have the required permission, the event record does not exist, or the query parameter is incorrect, the API will return an error message.

Networking

Table 2-13 Networking

API	Description
Creating Network Resources	This API is used to create network resources in a system. This API is used when you need to create network resources, such as virtual networks, subnets, or routes, when you need to expand services, plan resources, or adjust the network architecture. Before using this API, ensure that you have the administrator permission and the system has sufficient resources to create network resources. After the creation, the network resources will be added to the system for future service configurations. If you do not have the required permission, the resources are insufficient, or the input parameter is incorrect, the API will return an error message.
Obtaining Network Resources	This API is used to obtain information about created network resources in the system. This API is used when you need to query the network resource list recorded in the system when monitoring network status, planning resources, locating network faults, or auditing. Before using this API, ensure that you have the required permission and the network resources exist in the system. After the query, the API returns the network resource list, including the resource ID, type, status, and creation time. If you do not have the required permission, the network resources do not exist in the system, or the query parameter is incorrect, the API will return an error message.
Obtaining a Network Resource	This API is used to obtain the details of a specified network resource. This API is used when you need to query details about a specified network resource, such as its configuration, status, or attributes. Before using this API, ensure that you have the required permission and the specified network resource exists in the system. After the query, the API returns the details of the specified network resource, including the resource ID, type, status, and configuration parameters. If the specified network resource does not exist, you do not have the operation permission, or the input parameters are incorrect, the API will return an error message.

API	Description
Deleting a Network Resource	This API is used to remove specified network resources. This API is used when you need to delete a specified network resource when the network resource is no longer required, the configuration is incorrect, or resources need to be cleared. Before using this API, ensure that the network resource exists and you have the administrator permissions. After the deletion, the specified network resource is permanently removed, and related configurations and associations are cleared. If the specified network resource does not exist, you do not have the operation permission, or the resource is depended on by other resources, the API will return an error message.
Updating a Network Resource	This API is used to update the configuration information of a specified network resource. This API is used when you need to update the details of a specified network resource, such as adjusting attributes, fixing configuration errors, or optimizing resource settings. Before using this API, ensure that the network resource exists and you have the administrator permissions. After the update, the configuration information of the specified network resource is modified, and the latest resource status and attributes are displayed. If the specified network resource does not exist, you do not have the operation permission, or the input parameters are incorrect, the API will return an error message.

Resource indicators

Table 2-14 Resource indicators

API	Description
Querying the Real-Time Resource Usage	This API is used to obtain the real-time usage of all resource pools in the current project. This API is used when you need to query the real-time usage of resource pools when monitoring resource usage, optimizing resources, planning capacity, or troubleshooting faults. The resource usage includes the usage of CPU, memory, and storage resources. Before using this API, ensure that you have the required permission and there is a running resource pool. After the query, the API returns the real-time usage data of the resource pool, including the usage percentage, resource type, and timestamp. If you do not have the required permission, the resource pool does not exist, or the system cannot obtain the real-time data, the API will return an error message.

Resource pool management

Table 2-15 Resource pool management

API	Description
Creating Resource Pools	This API is used to create a resource pool in the system. This API is used when you need to allocate resources for new services, optimize resource management, or isolate resources. You can use this API to create a resource pool to manage compute, storage, and network resources. Before using this API, ensure that you have the administrator permission and the system has sufficient resources to create resource pools. After the creation, the resource pool will be added to the system and be available for future resource allocation and management. If you do not have the required permission, the system resources are insufficient, or the input parameter is incorrect, the API will return an error message.

API	Description
Obtaining Resource Pools	This API is used to obtain information about resource pools created in the system. This API is used when you need to query the resource pool list recorded in the system when monitoring resource pool status, planning resources, managing resource allocation, or auditing. Before using this API, ensure that you have the required permission and the resource pool exists in the system. After the query, the API returns the resource pool list, including the resource pool ID, name, type, status, and resource quota. If you do not have the required permission, the resource pools do not exist in the system, or the query parameter is incorrect, the API will return an error message.
Obtaining a Resource Pool	This API is used to obtain the details of a specified resource pool. This API is used when you need to query details about a specified resource pool, such as its configuration, status, resource usage, or resource management. Before using this API, ensure that you have the required permission and the specified resource pool exists in the system. After the query, the API returns the resource pool details, including the resource pool ID, name, type, status, resource quota, and usage. If the specified resource pool does not exist, the user does not have the permission to perform the operation, or the input parameters are incorrect, the API will return an error message.
Deleting a Resource Pool	This API is used to delete a specified resource pool. This API is used when you need to delete a specified resource pool when the resource pool is no longer required, the configuration is incorrect, or resources need to be cleared. Before using this API, ensure that the resource pool exists and you have the administrator permissions. After the deletion, the specified resource pool is permanently removed, and related resources and configurations are cleared. If the resource pool does not exist, you do not have the operation permission, or the resource pool is depended on by other resources, the API will return an error message.

API	Description
Updating a Resource Pool	This API is used to update the configuration and capacity of a specified resource pool. This API is used when you need to update the information about a resource pool when the resource pool capacity needs to be expanded, the configuration needs to be adjusted, or the performance needs to be optimized. Before using this API, ensure that the resource pool exists and you have the administrator permissions. After the update, the configuration and capacity of the resource pool will be updated, and the related resources and configurations will be adjusted. If the resource pool does not exist, the user does not have the permission to perform the operation, or the resource pool cannot be updated, the API will return an error message.
Monitoring a Resource Pool	This API is used to obtain the real-time or historical monitoring information about a specified resource pool. This API is used when you need to obtain the monitoring data of a resource pool in real time, such as resource usage, performance status, or historical data. Before using this API, ensure that the resource pool exists and you have the administrator permissions. After the API is called, the system returns the monitoring information of the resource pool, including the resource usage, performance metrics, and historical trends. If the resource pool does not exist, the user does not have the permission to perform the operation, or the resource pool is unavailable, the API will return an error message.
Resource Pool Statistics	This API is used to obtain the statistics of a specified resource pool. This API is used when you need to obtain the resource usage, allocation, or usage of a resource pool. Before using this API, ensure that the resource pool exists and you have the administrator permissions. After the API is called, the system returns the statistics of the resource pool, including the total resource usage, allocated resources, usage, and resource allocation trend. If the resource pool does not exist, the user does not have the permission to perform the operation, or the resource pool is unavailable, the API will return an error message.
Obtaining Custom Node Configurations of a Resource Pool	This API is used to obtain custom node configurations of a resource pool.

Resource flavor management APIs

Table 2-16 Resource flavor management APIs

API	Description
Obtaining Resource Specifications	This API is used to obtain available resource specifications. This API is used when you need to view or select resource specifications to create resource pools, allocate resources, or learn available resource specifications. Before using this API, ensure that you have the required permissions (such as administrator permissions or resource management permissions). After the API is called, the system returns the resource specifications, including the specification ID, name, number of CPUs, memory size, and storage capacity. If you do not have the required permission or the resource specifications are not configured, the API will return an error message.

Resource Pool Job Management

Table 2-17 Resource Pool Job Management

API	Description
Obtain Jobs in a Resource Pool	This API is used to obtain the job list in a specified dedicated resource pool. This API is used when you need to obtain details about a dedicated resource pool, such as resource usage, job status, or resource allocation. Before using this API, ensure that the dedicated resource pool exists and you have the required permissions (such as administrator permissions or resource management permissions). After the API is called, the system returns the job list of the dedicated resource pool, including the job ID, name, status, and resource usage. If the dedicated resource pool does not exist, the user does not have the operation permission, or the resource pool is unavailable, the API will return an error message.

API	Description
Querying dedicated resource pool Job Statistics	This API is used to obtain job statistics of a dedicated resource pool. This API is used when you need to obtain the job running information, resource usage, or job status distribution of a dedicated resource pool. Before using this API, ensure that the dedicated resource pool exists and you have the required permissions (such as administrator permissions or resource management permissions). After the API is called, the system returns the job statistics of the dedicated resource pool, including the total number of jobs, number of running jobs, number of completed jobs, and resource usage. If the dedicated resource pool does not exist, the user does not have the operation permission, or the resource pool is unavailable, the API returns an error message.

Lite Server Management

Table 2-18 Lite Server Management

API	Description
Querying All Lite Server Instances of a User	This API is used to obtain details about all Lite Server instances of a user. It is used when you need to view the status and configuration of all Lite Server instances of a user for resource management and monitoring. Before using this API, ensure that you have logged in to the system and have the permission to view Lite Server instances. After this API is called, the system returns the list of all Lite Server instances of the user, including the instance ID, name, status, and creation time. If you do not have the required permission or have not logged in, the API returns an error message.
Creating a Lite Server	This API is used to create Lite Server ECSs, BMSs, and supernode servers. It is used when you need to quickly deploy and configure different types of server resources based on service requirements. Before calling this API, ensure that you have logged in to the system and have the permission to create Lite Servers. In addition, you need to provide required parameters, such as the server type, specifications, and network configuration. After the creation, the system returns the information about the created Lite Server instance, including the instance ID and status. If you do not have the required permission, the parameter settings are incorrect, or system resources are insufficient, the API returns an error message.

API	Description
Querying Lite Server Instance Details	This API is used to obtain the details of a specified Lite Server instance. It is used when you need to view the configuration, status, and network information of a specific Lite Server instance for fault locating, resource management, and monitoring. Before using this API, ensure that you have logged in to the system, have the permission to view the Lite Server instance, and have a valid instance ID. After the query, the system returns the details of the specified Lite Server instance, including the instance ID, name, status, configuration, and network configuration. If you do not have the required permission, the instance ID is invalid, or the instance does not exist, the API returns an error message.
Deleting a Lite Server Instance	This API is used to delete a created Lite Server instance. It is used when a pay-per-use Lite Server instance is no longer needed, fails to be created, or is in the ERROR state. Before using this API, ensure that the Lite Server instance exists and you have the administrator permissions. After the deletion, the Lite Server instance is permanently removed, and related resources are cleared. If the Lite Server instance does not exist or you do not have the required permission, the API returns an error message.
Changing the Lite Server Instance Name	This API is used to change the name of a created DevServer instance. It is used when you need to rename a DevServer instance to better reflect the function or usage of the instance, or when the instance name does not comply with the current project naming rules. Before using this API, ensure that the DevServer instance exists and you have the permission to manage the instance. After the modification, the new name of the instance takes effect immediately and is updated in all related views and records. If the DevServer instance does not exist, you do not have the required permission, or the new name does not comply with the naming rules, the API returns an error message.

API	Description
Synchronizing the Status of All Lite Server Instances of a User in Real Time	This API is used to obtain and synchronize the status of a Lite Server instance in real time. It is used when you need to monitor the status of a Lite Server instance in real time to ensure that the instance is running properly or detect and handle exceptions in a timely manner. Before using this API, ensure that you have logged in to the system and have the required permission, and the Lite Server instance has been created and is running. After this API is called, the latest status of the Lite Server instance is returned, including the instance ID, status, and resource usage. If you do not have the required permission or the Lite Server instance does not exist, the API returns an error message.
Starting a Lite Server Instance	This API is used to start a Lite Server instance that has been created but is not running. It is used when you need to use a Lite Server instance for development or testing. Before using this API, ensure that the Lite Server instance has been created and is stopped, and you have the permission to start the instance. If the Lite Server instance does not exist or is running, or you do not have the required permission, the API returns an error message.
Stopping a Lite Server Instance	This API is used to stop a running Lite Server instance. It is used when you need to stop a Lite Server instance to save resources or perform maintenance. Before using this API, ensure that the Lite Server instance has been created and is running, and you have the permission to stop the instance. If the Lite Server instance does not exist or is stopped, or you do not have the required permission, the API returns an error message.
Creating a Lite Server Supernode Tag	This API is used to add a custom tag to a Lite Server supernode. It is used when you need to manage Lite Server supernodes by category or mark specific information. Before using this API, ensure that the Lite Server supernode exists and you have the permission to create tags. After the creation, the tag is added to the specified supernode. You can quickly search for and manage the supernode by tag. If the Lite Server supernode does not exist, the tag already exists, or you do not have the permission to perform operations on the supernode, the API returns an error message.

API	Description
Deleting a Lite Server Supernode Tag	This API is used to delete a Lite Server supernode tag. It is used when you need to delete unnecessary tags or correct tag errors. Before using this API, ensure that the Lite Server supernode exists, the supernode has the tag to be deleted, and you have the permission to delete tags. After the deletion, the specified tag is removed from the supernode, and other configurations and data of the supernode remain unchanged. If the Lite Server supernode does not exist, the tag does not exist, or you do not have the permission to perform operations on the supernode, the API returns an error message.
Querying Lite Server Supernode Tags	This API is used to obtain all tag information on a Lite Server supernode. It is used when you need to view or manage tags of a Lite Server supernode. Before using this API, ensure that the Lite Server supernode exists and you have the permission to query tags. After the query, the API returns all tag information on the supernode, including the tag name and related attributes. If the Lite Server supernode does not exist or you do not have the permission to perform operations on the supernode, the API returns an error message.
Reinstalling the OS Image of a Lite Server	This API is used to reinstall the OS image of a Lite Server. It is used when you need to update the OS version, rectify system faults, or reconfigure the system environment. Before using this API, ensure that the Lite Server exists and is stopped, and you have the permission to reinstall the OS. After the reinstallation, the new OS image is installed for the Lite Server and the Lite Server starts running. If the Lite Server does not exist, is running, or you do not have the required permission, the API returns an error message.
Changing the OS Image of a Lite Server	This API is used to change the OS image of a Lite Server. It is used when you need to change the OS of a Lite Server to meet different development or test requirements. Before using this API, ensure that the Lite Server exists and is stopped, and you have the permission to switch the OS. After the OS is switched, the Lite Server will install the new OS image and enter the running state. If the Lite Server does not exist, is in the running state, or you do not have the operation permission, the API will return an error message.

API	Description
Changing the OS Image of a Lite Server Supernode	This API is used to change the OS image of a Lite Server supernode. It is used when you need to change the OS of a Lite Server supernode to meet different development or test requirements. Before using this API, ensure that the Lite Server supernode exists and is stopped, and you have the permission to switch the OS. After the OS is switched, the Lite Server supernode will install the new OS image and enter the running state. If the Lite Server supernode does not exist, is in the running state, or you do not have the operation permission, the API returns an error message.
Obtaining Details About All Supernode Instances of a User	This API is used to obtain details about all Lite Server supernode instances of a user. It is used when you need to view the configuration, status, and usage of all supernode instances. Before using this API, ensure that you have logged in to the system and have the permission to query supernode instances. After the query, the API returns details about all supernode instances, including the instance ID, OS, status, and resource usage. If you do not have the required permission or the system does not have supernode instances, the API returns an error message.
Obtaining Details About a Specified Supernode Instance	This API is used to obtain the details of a specific Lite Server supernode instance. It is used when you need to view the configuration, status, and usage of a specified supernode instance. Before using this API, ensure that you have logged in to the system and have the permission to query the supernode instance, and the specified supernode instance exists. After the query, the API returns details about a specified supernode instance, including the instance ID, OS, status, and resource usage. If you do not have the required permission to perform the operation, the specified supernode instance does not exist, or the instance ID is invalid, the API returns an error message.

API	Description
Deleting a Lite Server Supernode Instance	This API is used to delete a pay-per-use supernode instance and remove the Lite Server supernode instances in the ERROR state. It is used when a supernode instance is in the ERROR state due to creation failure or other reasons. Before using this API, ensure that you have logged in to the system and have the permission to delete a supernode instance, and the specified supernode instance is pay-per-use and in the RUNNING or ERROR state. After the deletion, the specified supernode instance is permanently removed, and related resources are cleared. If the specified supernode instance does not exist, is not in the ERROR state, or you do not have the operation permission, the API returns an error message.
Restarting a Lite Server Instance	This API is used to restart a running Lite Server instance. It is used when you need to restart a specified Lite Server instance to apply configuration changes, solve running problems, or maintain the system. Before using this API, ensure that the Lite Server instance has been created and is running, and you have the permission to restart the instance. After the restart, the Lite Server instance restarts and enters the running state. You can continue to use the services provided by the instance. If the Lite Server instance does not exist or is stopped, or you do not have the required permission, the API returns an error message.
Starting a Lite Server Supernode	This API is used to start a Lite Server supernode that has been created but is not running. It is used when you need to start a Lite Server supernode for development or testing. Before using this API, ensure that the Lite Server supernode has been created and is stopped, and you have the permission to start the supernode. After the startup, the supernode enters the running state, and you can access and use the services provided by the server. If the Lite Server supernode does not exist, is in the running state, or you do not have the operation permission, the API returns an error message.

API	Description
Stopping a Lite Server Supernode	This API is used to stop a running Lite Server supernode. It is used when you need to stop a Lite Server supernode to save resources or perform maintenance. Before using this API, ensure that the Lite Server supernode has been created and is running or fails to be stopped, and you have the permission to stop the supernode. After the operation, the supernode is stopped and does not provide services. If the Lite Server supernode does not exist, is stopped, or you do not have the permission to stop the supernode, the API returns an error message.
Mounting a Disk to a Lite Server	This API is used to mount an additional disk to a Lite Server. It is used when you need to expand the storage space of a Lite Server to meet larger data storage requirements. Before using this API, ensure that the Lite Server has been created and is running or stopped, you have the permission to mount disks, and the specified disk exists and is not used by other servers. After the mounting, the disk is mounted to the Lite Server, and you can access and use the new storage space. If the Lite Server does not exist, the specified disk does not exist or is in use, or you do not have the required permission, the API returns an error message.
Binding an EIP to a Lite Server	This API is used to bind an EIP to a Lite Server. It is used when you need to assign a fixed public IP address to a Lite Server so that the Lite Server can be accessed from the external network. Before using this API, ensure that the Lite Server has been created and is running, you have the permission to bind an EIP, and the specified EIP exists and is not used by other resources. After the binding, the EIP is bound to the Lite Server and the Lite Server can be accessed from the external network through the EIP. If the Lite Server does not exist, the Lite Server is stopped, the specified EIP does not exist or is in use, or you do not have the required permission, the API returns an error message.
Query Bound EIPs	This API is used to obtain the information about the EIP bound to the Lite Server. It is used when you need to view the EIP bound to the Lite Server and the detailed information. Before using this API, ensure that you have logged in to the system and have the permission to query the EIP, and the specified Lite Server exists. After the query, the API returns the details of the EIP bound to the Lite Server, including the EIP address, binding time, and status. If the Lite Server does not exist, the EIP is not bound to the Lite Server, or you do not have the required permission, the API returns an error message.

API	Description
Obtaining the Resource Flavor List	This API is used to obtain available resource specifications. It is used when you need to know the available resource specifications so that you can select proper configurations when creating or adjusting a Lite Server instance. Before using this API, ensure that you have logged in to the system and have the permission to query resource specifications. After the query, the API returns information about all available resource specifications, including the specification ID, CPU, memory, and storage. If you do not have the required permission or the system does not have available resource specifications, the API returns an error message.
Querying the Specification List	This API is used to obtain information about all available resource specifications in the system. It is used when you need to know the available resource specifications so that you can select proper configurations when creating or adjusting a Lite Server instance. Before using this API, ensure that you have logged in to the system and have the permission to query specifications. After the query, the API returns information about all available resource specifications, including the specification ID, CPU, memory, and storage. If you do not have the required permission or the system does not have available resource specifications, the API returns an error message.
Unmounting a Disk from a Lite Server	This API is used to unmount a disk from a Lite Server. It is used when you need to release storage resources or reallocate disks. Before using this API, ensure that the Lite Server has been created and is running or stopped, you have the permission to unmount disks, and the specified disk has been mounted to the server. After the unmounting, the disk is unmounted from the Lite Server, and you can mount the disk to another server or perform other operations. If the Lite Server does not exist, the specified disk is not mounted to the server, or you do not have the required permission, the API returns an error message.

API	Description
Creating a RoCE Network	This API is used to create a RoCE network in the system. It is used when you need to create a dedicated RoCE network for high-performance computing or low-latency applications. Before using this API, ensure that you have logged in to the system and have the permission to create a RoCE network, and the required network resources have been configured in the system. After the creation, a RoCE network is created, and details about the RoCE network are returned, including the network ID, subnet information, and configuration parameters. If you do not have the required permission, the system lacks necessary network resources, or the network configuration parameters are invalid, the API returns an error message.
Querying the Lite Server List of a Tenant	This API is used to obtain all Lite Server instances of a specified tenant. It is used when you need to view the details of all Lite Server instances of a tenant for management and monitoring. Before using this API, ensure that you have logged in to the system and have the permission to query the Lite Server list of a tenant. After the query, the API returns the details of all Lite Server instances of the tenant, including the instance ID, name, status, and resource configuration. If you do not have the required permission or the tenant does not have Lite Server instances, the API returns an error message.
Querying Lite Server Image Details	This API is used to obtain the details of a specified Lite Server image. It is used when you need to know the configuration and attributes of a Lite Server image so that you can select a proper image when creating or adjusting a Lite Server instance. Before using this API, ensure that you have logged in to the system and have the permission to query image details, and the specified image exists. After the query, the API returns the details of the specified Lite Server image, including the image ID, name, OS, version, and creation time. If you do not have the operation permission, the specified image does not exist, or the image ID is invalid, the API returns an error message.

API	Description
Querying the Lite Server Image List	This API is used to obtain information about all available Lite Server images in the system. It is used when you need to know the available Lite Server images so that you can select a proper image when creating or adjusting a Lite Server instance. Before using this API, ensure that you have logged in to the system and have the permission to query images. After the query, the API returns information about all available Lite Server images, including the image ID, name, and architecture type. If you do not have the permission to perform the operation or no image is available in the system, the API returns an error message.
Querying the HyperInstance List of a Tenant	This API is used to obtain information about all hyper instances of a specified tenant. It is used when you need to view the details of all hyper instances of a tenant for management and monitoring. Before using this API, ensure that you have logged in to the system and have the permission to query the hyper instance list of a tenant. After the query, the API returns the details of all hyper instances of the tenant, including the instance ID, name, status, and resource configuration. If you do not have the required permission or the tenant does not have hyper instances, the API returns an error message.
Obtaining Operation Details	This API is used to obtain the details of a specified operation. It is used when you need to know the execution status of an operation for troubleshooting or operation audit. Before using this API, ensure that you have logged in to the system and have the permission to query the details of an operation, and the specified operation exists. After the query, the API returns the details of the specified operation, including the operation ID, operation type, execution status, start time, end time, and operation result. If you do not have the operation permission, the specified operation does not exist, or the operation ID is invalid, the API returns an error message.

API	Description
Querying the Supported Lite Server Scaling Specifications and Capacity Calculation	This API is used to obtain supported scaling specifications of a Lite Server supernode and calculate the capacity. It is used when you need to know the scaling options supported by the Lite Server supernode so that you can select proper specifications when adjusting the supernode resources and evaluate the resource requirements after scaling. Before using this API, ensure that you have logged in to the system and have the permission to query the supernode scaling specifications, and the specified supernode exists. After the query, the API returns the list of supported scaling specifications and capacity calculation results, including the specification ID, CPU, memory, storage, and resource usage after scaling. If you do not have the required permission, the specified supernode does not exist, or no scaling specifications are available in the system, the API returns an error message.
Scaling Out Lite Server Supernodes	This API is used to increase the resource capacity of a Lite Server supernode. It is used when you need to improve the performance of a Lite Server supernode to support more loads or process more data. Before using this API, ensure that you have logged in to the system and have the permission to expand the supernode capacity, and the specified supernode exists and is running. After the scale-out, the resource capacity of the supernode is adjusted based on the specified specifications. You can use the increased resources immediately. If you do not have the required permission to perform the operation, the specified supernode does not exist, the supernode has reached the maximum capacity, or the specified scale-out specifications are invalid, the API returns an error message.
Scaling in Lite Server Supernodes	This API is used to reduce the resource capacity of a Lite Server supernode. It is used when you need to reduce resource usage of Lite Server supernodes to reduce costs or optimize resource allocation. Before using this API, ensure that you have logged in to the system and have the permission to reduce the supernode capacity, and the specified supernode exists and is running. After the scale-in, the resource capacity of the supernode is adjusted based on the specified specifications. You can use the reduced resources immediately. If you do not have the required permission to perform the operation, the specified supernode does not exist, the supernode has reached the minimum capacity, or the specified scale-in specifications are invalid, the API returns an error message.

API	Description
Querying the Logical Capacity Calculation Result of the hyperinstance-clusters Supernode	This API is used to obtain the logical capacity calculation result of a specified hyper instance cluster. It is used when you need to know the resource usage and capacity planning of a supernode cluster for resource management and optimization. Before using this API, ensure that you have logged in to the system and have the permission to query the logical capacity of a supernode cluster, and the specified supernode cluster exists. After the query, the API returns the logical capacity calculation result of a specified supernode cluster, including the available capacity information. If you do not have the required permission to perform the operation, the specified supernode cluster does not exist, or the cluster ID is invalid, the API returns an error message.
Querying the Tor Information of an Instance	This API is used to obtain the Top-of-Rack (Tor) switch information of a specified instance. It is used when you need to know the Tor switch connected to an instance for network configuration. Before using this API, ensure that you have logged in to the system and have the permission to query the Tor information of an instance, and the specified instance exists. After the query, the API returns the Tor information of the specified instance. If you do not have the operation permission, the specified instance does not exist, or the instance is not connected to the Tor switch, the API returns an error message.
Obtaining the Hyper Cluster Details List	This API is used to obtain details about all hyper clusters. It is used when you need to know the configuration and status of all supernode networks in the system. Before using this API, ensure that you have logged in to the system and have the permission to query hyper cluster details. After the query, the API returns details about all supernode networks, including the ID, name, and subnet information. If you do not have the required permission or the system does not have hyper clusters, the API returns an error message.

API	Description
Creating a Hyper Cluster	This API is used to create a hyper cluster in the system. It is used when you need to use a supernode network and create a hyper cluster. Before using this API, ensure that you have logged in to the system and have the permission to create a hyper cluster, and the required resources have been configured in the system. After the creation, a supernode network is created, and details about the supernode network are returned, including the ID, name, and subnet information. If you do not have the required permission, the system does not have the required resources, or the configuration parameters are invalid, the API returns an error message.
Querying Hyper Cluster Instance Details	This API is used to obtain the details of a specified hyper cluster instance. It is used when you need to know the configuration and status of a supernode network for management and monitoring. Before using this API, ensure that you have logged in to the system, have the permission to query hyper cluster details, and the specified supernode network exists. After the query, the API returns details about the specified supernode network, including the ID, name, and subnet information. If you do not have the required permission to perform the operation, the specified supernode network does not exist, or the ID is invalid, the API returns an error message.
Deleting a Hyper Cluster Instance	This API is used to delete a created hyper cluster instance. It is used when the supernode network is incorrectly configured or resources need to be cleared. Before using this API, ensure that the hyper cluster instance exists and you have the administrator permissions. After the deletion, the supernode network is permanently removed, and related resources and configurations are cleared. If the hyper cluster instance does not exist or you do not have the operation permission, the API returns an error message.

API	Description
Performing Operations on Lite Server Instances in Batches	This API is used to perform unified operations, such as starting, stopping, restarting, or deleting Lite Server instances. It is used when you need to perform the same operation on multiple Lite Server instances, for example, stopping instances in batches during maintenance, restarting instances in batches after configuration update, or clearing unnecessary instances. Before using this API, ensure that the target Lite Server instance exists and you have the required operation permissions. After the operation, all specified Lite Server instances will be changed or removed according to the request, and related resources and configurations will be adjusted or cleared accordingly. If the target Lite Server instance does not exist, you do not have the operation permission, or the request parameters are incorrect, the API returns an error message.
Querying Lite Server Job Details	This API is used to obtain the details of a specified Lite Server job. It is used when you need to view the execution status, configuration parameters, and log information of a Lite Server job. Before using this API, ensure that the target Lite Server job exists and you have the view permission. After the query, the API returns the details of the specified Lite Server job, including the job ID, status, creation time, execution time, configuration parameters, and logs. If the target Lite Server job does not exist or you do not have the required permission, the API returns an error message.
Querying the Lite Server Job List	This API is used to obtain the Lite Server job list and filter jobs by status and ID. It is used when you need to view the brief information about multiple Lite Server jobs. For example, you can use this API to obtain the jobs that meet the filter criteria during job status monitoring, troubleshooting, or routine management. Before using this API, ensure that you have the view permission. After the query, the API returns the Lite Server jobs that meet the search criteria, including the ID, status, and creation time. If you do not have the required permission or the request parameters are incorrect, the API returns an error message.

API	Description
Deleting Lite Server Jobs in Batches	This API is used to remove multiple Lite Server jobs. It is used when multiple Lite Server jobs are completed, incorrectly configured, or resources need to be cleared. Before using this API, ensure that the target Lite Server job exists and you have the administrator permissions. After the deletion, the specified Lite Server job is permanently removed, and related resources and configurations are cleared. If the target Lite Server job does not exist, you do not have the required permission, or the request parameters are incorrect, the API returns an error message.
Creating a Lite Server Task	This API is used to create a Lite Server task. It is used when you need to start a development, test, or deployment task on the Lite Server. Before using this API, ensure that you have the permission to create a task and the task configuration parameters meet the requirements. After the creation, the Lite Server task is created, and the task ID and other related information are returned. If you do not have the required permission, the parameters are incorrect, or the system resources are insufficient, the API returns an error message.
Obtaining the Lite Server Job Template List	This API is used to obtain the list of available Lite Server job templates. It is used when you need to view available job templates and select a proper template to create a Lite Server task. After the query, the API returns all available Lite Server job templates, including the template ID, name, and description. If no template is available in the system, the API returns an error message.
Obtaining Lite Server Job Template Details	This API is used to obtain the details of a specified Lite Server job template. It is used when you need to view the detailed configurations of a specified job template to learn about the parameter settings and usage description. After the query, the API returns the details of the specified template, including the template ID, name, description, and configuration parameters. If the target template does not exist, the API returns an error message.

API	Description
Obtaining the Lite Server Plug-in List	This API is used to obtain the list of available Lite Server plug-ins. It is used when you need to view available plug-ins and select and install the required ones to extend Lite Server functions. Before using this API, ensure that you have the permission to view the plug-in list. After the query, the API returns all available Lite Server plug-ins, including the plug-in ID, name, version, and description. If you do not have the required permission or no plug-in is available, the API returns an error message.
Obtaining Software Information	This API is used to query information about supported software. You can use flavor_type and name to filter software information. It is used when you need to know the software supported by the system and its details, for example, when you need to select a proper software version or configuration environment. Before using this API, ensure that you have the permission to view software information. After the query, the API returns the software list that meets the search criteria, including the software name, version, and type. If you do not have the required permission, the query parameters are incorrect, or no software that meets the search criteria exists in the system, the API returns an error message.

Authorization Management

Table 2-19 Authorization Management

API	Description
Viewing an Authorization List	This API is used to view the authorization information.
Configuring Authorization	This API is used to configure ModelArts authorization.
Deleting Authorization	This API is used to delete the authorization of a specified user or all users.
Creating a ModelArts Agency	This API is used to create a ModelArts agency for ModelArts-dependent services, such as Object Storage Service (OBS), Software Repository for Container (SWR), and Intelligent EdgeFabric (IEF).

Workspace Management

Table 2-20 Workspace Management

API	Description
Querying Details About a Workspace	This API is used to query the details about a workspace.
Modifying a Workspace	This API is used to update the configuration information of a specified workspace.
Deleting a Workspace	This API is used to delete a created workspace.
Querying a Workspace Quota	This API is used to obtain the resource quota of a specified workspace.
Modifying a Workspace Quota	This API is used to update the resource quota of a specified workspace.
Querying a Workspace List	This API is used to obtain the details of all created workspaces.
Creating a Workspace	This API is used to create a workspace. The name of the created workspace cannot be default , which is the name of the default workspace reserved by the system.
Querying the Authorization Mode	This API is used to obtain the authorization mode and permission configuration information of a specified resource or function. This API is used when system administrators can use this API to view the access permission settings of resources. Developers can use this API to verify whether authorization policies are correctly configured. Security auditors can use this API to check whether authorization configurations comply with security specifications. Before using this API, ensure that you have the query permission and the authorization mode of the target resource or function has been configured. After the API is called, the API returns details about the authorization mode, including the authorization mode type, rules, and permission scope. If you do not have the permission to access this API or the authorization mode of the target resource is not configured, the API will return an error message.

API	Description
Updating the Authorization Mode	This API is used to modify the authorization mode and permission configuration information of a specified resource or function. This API is used when system administrators can use this API to adjust the access permission of resources. Developers can use this API to update authorization policies to meet new service requirements. Security auditors can use this API to modify authorization configurations to comply with new security specifications. Before using this API, ensure that you have the update permission and the authorization mode of the target resource or function exists. After the API is called, the API updates the authorization mode of the target resource and returns the updated authorization mode information. If you do not have the permission to access this API or the authorization mode of the target resource does not exist, the API will return an error message.
Authenticating Whether the Current Workspace Can Be Used	This API is used to check whether a user has the permission to access and use resources in the current workspace. This API is used when you try to access or operate resources in the workspace, and the system needs to check whether you have the required permission. Before using this API, ensure that you have logged in and the workspace exists. If the authentication is successful, the user can access and use resources in the workspace. If the authentication fails, the API returns an error message, for example, insufficient permissions or the workspace does not exist.
Querying the User Role Information	This API is used to obtain the role information of a specified user in the system. This API is used when you need to know the permissions and roles of a user in the system. The administrator or system can use this API to query the role information of the user. Before using this API, ensure that the user exists and the role information is defined in the system. After the query, the API returns the role list of the user. If the user does not exist or the role information is not defined in the system, the API returns an error message.

Quota Management

Table 2-21 Quota Management

API	Description
Obtaining OS Quotas	This API is used to obtain the quotas of some ModelArts OS resources, such as resource pool quotas and network quotas. This API is used when you need to know the usage limits of resource pools or network resources, plan resource allocation, or monitor resource usage. Before using this API, ensure that ModelArts OS is deployed and you have the required permissions (such as administrator permissions or resource management permissions). After the API is called, the system returns details about resource pool quotas and network quotas, helping you better plan and manage resources. If you do not have the required permission, the service is unavailable, or the quota information is not configured, the API will return an error message.

Resource Tag Management

Table 2-22 Resource Tag Management

API	Description
Obtaining All Tags of Resource Pools	This API is used to obtain all tags of resource pools in the current project. By default, all workspaces are queried, but tag data is not returned for workspaces to which you do not have permissions. This API is used when you need to manage, classify, or collect statistics on resource pool tags. Before using this API, ensure that you have the required permission and the resource pool exists. After the API is called, the system returns the resource pool tags of all accessible workspaces in the current project. If you do not have the required permission, the resource pool does not exist, or the project is not created, the API will return an error message.

API	Description
Obtaining Tags of a Resource Pool	This API is used to obtain the tag information of a specified resource pool. This API is used when you need to view, manage, or collect statistics on resource pool tags. Before using this API, ensure that the resource pool exists and you have the required permission. After the API is called, the system returns the tag information of the specified resource pool, including the tag key and tag value. If the resource pool does not exist, you do not have the access permission, or the resource pool is not configured with tags, the API will return an error message.

Node Pool Management

Table 2-23 Node Pool Management

API	Description
Obtaining Node Pools	This API is used to obtain the list of a specified node pool. This API is used when you need to obtain the details about a node pool, such as the configuration, status, or resource management. Before using this API, ensure that the node pool exists and you have the administrator permissions. After the API is called, the system returns the node pool list, including the node pool ID, name, number of nodes, and status. If the node pool does not exist, the user does not have the permission to perform the operation, or the node pool is unavailable, the API will return an error message.
Creating a Node Pool	This API is used to create a node pool. This API is used when you need to create a node pool with specified configurations when you need to expand compute resources, optimize resource allocation, or deploy new services. Before using this API, ensure that you have the administrator permission and the node pool parameters (such as the number of nodes, specifications, and network configurations) are correctly set. After the creation, the node pool will be created and be available, and the related node information will be recorded. If you do not have the required permission, the parameter settings are incorrect, or system resources are insufficient, the API will return an error message.

API	Description
Obtaining Details About a Specified Node Pool	This API is used to obtain the details of a specified node pool. This API is used when you need to obtain the details about a node pool, such as the configuration, status, resource usage, or resource management. Before using this API, ensure that the node pool exists and you have the permission to access the node pool. After the API is called, the system returns the details about the node pool, including the node pool ID, name, number of nodes, status, creation time, and configuration parameters. If the node pool does not exist, the user does not have the permission to access the node pool, or the node pool is unavailable, the API will return an error message.
Updating a Node Pool	This API is used to update the configurations of a specified node pool. This API is used when you need to expand the capacity of a node pool, adjust node specifications, optimize resource allocation, or repair node pool configurations. Before using this API, ensure that the node pool exists and you have the administrator permissions. After the update, the configurations of the node pool will be updated, including the number of nodes, node specifications, and network configurations. If the node pool does not exist, the user does not have the permission to operate the node pool, or the configuration parameters are incorrect, the API will return an error message.
Deleting a Node Pool	This API is used to remove a created node pool. This function is not supported for yearly/monthly resource pools. This API is used when you need to delete a specified node pool when the tasks in the node pool are complete, the configuration is incorrect, or resources need to be cleared. Before using this API, ensure that the node pool exists and you have the administrator permissions. After the deletion, the node pool is permanently removed, and related resources and configurations are cleared. If the node pool does not exist, the user does not have the permission to perform the operation, or the node pool cannot be deleted, for example, it is a yearly/monthly resource pool or the node pool is in use, the API will return an error message.

API	Description
Obtaining Nodes in a Node Pool	This API is used to obtain details about all nodes in a specified node pool. This API is used when you need to obtain the details about a node pool, such as the node status, resource usage, or resource management. Before using this API, ensure that the node pool exists and you have the permission to access the node pool. After the API is called, the system returns the node list of the node pool, including the node ID, name, status, IP address, and resource usage. If the node pool does not exist, the user does not have the permission to access the node pool, or the node pool is unavailable, the API will return an error message.

Order Management

Table 2-24 Order Management

API	Description
Querying Order Details	This API is used to query order details.

Plugin Management

Table 2-25 Plugin Management

API	Description
Creating a Plugin	This API is used to create plugin instances.
Querying the Plugin List	This API is used to list plugin instances.

Task Management

Table 2-26 Task Management

API	Description
Querying Tasks	This API is used to obtain the jobs of the current user.

Notebook Case Studies

Table 2-27 Notebook Case Studies

API	Description
Querying Case Studies	This API is used by the tenant-side frontend to retrieve a list of notebook cases. This API is designed for scenarios where you need to view or learn from notebook examples by fetching a case study list. To use this API, you must be logged in and have the necessary viewing permissions. Upon completion of the query, the API returns a list of case studies, including information such as case names, descriptions, and relevant tags. If you lack permissions or an error occurs during the query process, the API will return the corresponding error message.

Application Authentication Management

Table 2-28 Application Authentication Management

API	Description
Querying the API Authentication Information of an Application	This API is used to query the API authentication information of an application.

Plugin Template Management

Table 2-29 Plugin Template Management

API	Description
Query Plugin Templates	This API is used to obtain plugin templates.

Node Management

Table 2-30 Node Management

API	Description
Batch Updating Nodes	This API is used to modify the configuration or attributes of multiple nodes at the same time. Each node can execute the update process independently during batch operations. Use this API when you need to upgrade node software versions, manage resource tags, adjust resource allocation policies, apply security fixes, or synchronize configuration changes. To use it, ensure the target nodes exist, have administrator rights, and are operational (not locked or under maintenance). Provide a valid node list and update parameters like configurations or version numbers. After the update, nodes adopt the new settings and become available, replacing old configurations. If issues arise, like missing nodes, insufficient permissions, incorrect node states (like under maintenance), invalid parameters, or incomplete data, the system returns errors such as 404 node not found, 403 permission denied, or 400 parameter validation failed.
Locking Node Functions in Batches	This API is used to lock node functions in batches. The locked functions cannot be used on the console. This API is used when you need to temporarily disable functions of some nodes to prevent misoperations, or perform system maintenance or tests. You can use this API to lock node functions in batches. Before using this API, ensure that the node function exists and you have the administrator permissions. After the lock operation is complete, the functions of the specified node are disabled on the console, and related operations cannot be performed. If the node function does not exist, you do not have the permission to perform the operation, or the request parameters are invalid, the API will return an error message.
Unlocking Node Functions in Batches	This API is used to unlock functions of a specified node in batches. After the unlocking, the functions become available on the console. This API is used when you need to unlock the locked functions in batches after the system maintenance or test. Before using this API, ensure that the node function has been locked and the user has the administrator permission. After the unlocking, the functions of the specified node become available on the console, and the user can use the functions. If the node function is not locked, the user does not have the permission to perform the operation, or the request parameters are invalid, the API will return an error message.

API	Description
Resetting Nodes	This API is used to reset a node to the initial state and clear data and configurations on the node. This API is used when you need to reset a node to the factory or initial state when the node is faulty, the configuration is incorrect, the node needs to be redeployed, or the system needs to be restored. Before using this API, ensure that the node exists and the user has the administrator permission. After the reset, all data and configurations on the node are cleared, and the node is restarted and restored to the initial state. If the node does not exist, you do not have the permission to perform operations on the node, or the node cannot be reset (for example, a task is running), the API will return an error message.
Changing the Node Specifications	This API is used to adjust the specifications (such as step) of a specified node. For example, you can expand the node from 8-node supernode to 16-node supernode. This API is used when you need to adjust the resource capacity of a node, optimize resource utilization, or upgrade the system based on service requirements. Before using this API, ensure that the node has been created and can be modified, the target specifications are supported, and the user has the administrator permissions. After the specifications are changed, the resource capacity of the node is adjusted as required, and related services and configurations are reloaded to adapt to the new specifications. If the node does not exist, the node cannot be modified, the target specifications are not supported, or the user does not have the permission to perform the operation, an error message will be returned.
Migrating Nodes in Batches	This API is used to batch migrate nodes between resource pools. Nodes are migrated from one resource pool to another. Use this API when nodes in a resource pool are unevenly distributed, during cluster maintenance, or for service expansion. It allows you to move specific nodes between resource pools. Make sure the resource pool has at least two nodes and enough resources like IP addresses before migrating them with this API. The API returns an error if the resource pool has only one node, lacks sufficient cluster resources, the node cannot migrate, or you lack operation permissions.
Binding Nodes to a Logical Subpool in Batches	This API is used to bind nodes in a logical subpool to another logical subpool when node binding is enabled for a physical dedicated pool.

API	Description
Obtaining Nodes in a Resource Pool	This API is used to obtain the node list of a specified resource pool. This API is used when you need to obtain the details about a resource pool, such as the node distribution, status, or resource usage. Before using this API, ensure that the resource pool has been created and is available, and you have the required permission. After the query, the system returns the detailed information about the nodes in the resource pool, including the node ID, status, and resource usage, helping you manage and optimize resources. If the resource pool does not exist, you do not have the permission to access the resource pool, or the request parameters are invalid, the API will return an error message.
Deleting nodes in batches	This API is used to delete nodes from a specified resource pool in batches. This API is used when you need to delete redundant nodes, re-allocate resources, or remove faulty nodes from a resource pool. Before using this API, ensure that the resource pool has been created and is available, you have the required permission, and at least one node is retained in the resource pool. After the deletion, the specified nodes are permanently removed, and the remaining nodes in the resource pool continue to work. If the resource pool does not exist, the node does not exist, you do not have the permission to perform the operation, or the number of nodes in the resource pool is insufficient, the API will return an error message.

Scheduled Events

Table 2-31 Scheduled Events

API	Description
Authorizing Scheduled Events	Specifies the authorization of a scheduled event.
Obtaining the Scheduled Event List	This API is used to obtain the scheduled event list.

3 Calling APIs

3.1 Making an API Request

This section describes the structure of a REST API request, and uses the IAM API for [Obtaining a User Token](#) as an example to demonstrate how to call an API. The obtained token can then be used to authenticate the calling of other APIs.

Request URI

The format of a request URI is as follows:

{URI-scheme} :// {Endpoint} / {resource-path} ? {query-string}

Table 3-1 Request URI

Parameter	Description
URI-scheme	Protocol used to transmit requests. All APIs use HTTPS.
Endpoint	Domain name or IP address of the server for the REST service endpoint. The endpoint varies depending on services in different regions. It can be obtained in Endpoint . For example, the endpoint of IAM in the CN-Hong Kong region is iam.ap-southeast-1.myhuaweicloud.com .
resource-path	Access path of an API for performing a specified operation. Obtain the value from the URI of an API. For example, the resource-path of the API used to obtain a user token is /v3/auth/tokens .
query-string	Query parameter, which is optional. Ensure that a question mark (?) is included before a query parameter that is in the format of "Parameter name=Parameter value". For example, ? limit=10 indicates that a maximum of 10 data records will be displayed.

For example, to obtain a token in the **CN-Hong Kong** region, obtain the endpoint of IAM (**iam.ap-southeast-1.myhuaweicloud.com**) for this region and the

resource-path (/v3/auth/tokens) in the URI of the API used to **obtain a user token**. Then, construct the URI as follows:

```
https://iam.ap-southeast-1.myhuaweicloud.com/v3/auth/tokens
```

Figure 3-1 Example URI

NOTE

To simplify the URI display, each API is provided with only a **resource-path** and a request method. The **URI-scheme** of all APIs is HTTPS, and the endpoints of all APIs in the same region are identical.

Request Methods

HTTP defines the following request methods that can be used to send a request to the server.

Table 3-2 HTTP methods

Method	Description
GET	Request the server to return specified resources.
PUT	Request the server to update specified resources.
POST	Request the server to add resources or perform special operations.
DELETE	Request the server to delete specified resources, for example, an object.
HEAD	Request header.
PATCH	Request the server to update partial content of a specified resource. If the requested resource does not exist, the server may create the resource using the PATCH method.

For example, in the URI of the API for **obtaining a user token**, the request method is POST. The request is as follows:

```
POST https://iam.ap-southeast-1.myhuaweicloud.com/v3/auth/tokens
```

Request Header

You can add additional header fields to a request, such as the fields required by a specified URI or HTTP method. For example, to request for the authentication information, add **Content-Type**, which specifies the request body type.

Table 3-3 describes common request header fields.

Table 3-3 Common request headers

Parameter	Description	Mandatory	Example
Content-type	Request body type or format. The default value is application/json .	Yes	application/json
Content-Length	Length of the request body, in bytes.	Mandatory for POST and PUT requests but must be left blank for GET requests	3495
X-Project-Id	Project ID. This parameter is used to obtain a token for each project.	No	e9993fc787d94b6c886cbaa340f9c0f4
X-Auth-Token	User token, a response to the API used to obtain a user token . This API is the only one that does not require authentication.	Mandatory for token-based authentication	N/A
X-Sdk-Date	Time when the request is sent. The time is in <i>YYYYMMDD'THHMMSS'Z'</i> format. The value is the current GMT time of the system.	Mandatory for AK/SK-based authentication, optional for PKI token-based authentication	20190307T101459Z

Parameter	Description	Mandatory	Example
Authorization	Authentication information. The value is obtained from the request signature result and is required when the AK/SK are used to encrypt the signature. Type: string Default value: none	Mandatory for AK/SK-based authentication	SDK-HMAC-SHA256 Credential=ZIRRKMTWPTQFQI1WKNKB/20150907//ec2/sdk_request, SignedHeaders=content-type;host;x-sdk-date, Signature=55741b610f3c9fa3ae40b5a8021ebf7ebc2a28a603fc62d25cb3bfe6608e1994
Host	Server information of the resource being requested. The value can be obtained from the URL of the service API. This value is <i>host name[:port number]</i> . If the port number is not specified, the default port is used. The default port number for https is 443 .	Mandatory for AK/SK-based authentication	code.test.com or code.test.com:443

 NOTE

In addition to supporting token-based authentication, APIs support authentication using AK/SK. During AK/SK authentication, an SDK is used to sign a request, and the **Authorization** (signature authentication) and **X-Sdk-Date** (time when a request is sent) headers are automatically added to the request. For details about AK/SK authentication, see [API Request Signing Guide](#).

The API used to **obtain a user token** does not require authentication. Therefore, only the **Content-Type** field needs to be added to requests for calling the API. An example of such requests is as follows:

```
POST https://iam.ap-southeast-1.myhuaweicloud.com/v3/auth/tokens
Content-Type: application/json
```

Request Body

The body of a request is often sent in a structured format as specified in the Content-Type header field. The request body transfers content except the request header. If the request body contains Chinese characters, these characters must be encoded in UTF-8.

The request body varies depending on APIs. Some APIs do not require the request body, such as the APIs requested using the GET or DELETE method.

If an API is used to **obtain a user token**, the request parameters and parameter description can be obtained from the API request. The following provides an

example request with a body included. Replace *user_name*, *domain_name*, and *user_password* with the actual username, account name, and login password, respectively. **ap-southeast-1** is the project name. For details, see [Obtaining a Username](#), [Obtaining an Account Name and ID](#), and [Obtaining a Project Name](#).

NOTE

The **scope** parameter specifies where a token takes effect. In the example, the token takes effect only for the resources in a specified project. ModelArts uses a region-specific endpoint to call this API. Set **scope** to **project**. You can set **scope** to an account or a project under an account. For details, see [Obtaining a User Token](#).

```
POST https://iam.ap-southeast-1.myhuaweicloud.com/v3/auth/tokens
Content-Type:application/json
{
  "auth": {
    "identity": {
      "methods": ["password"],
      "password": {
        "user": {
          "name": "user_name",
          "password": "user_password",
          "domain": {
            "name": "domain_name"
          }
        }
      }
    },
    "scope": {
      "project": {
        "name": "ap-southeast-1"
      }
    }
  }
}
```

After all data required for the API request is available, send the request to call the API through [curl](#), [Postman](#), or coding. In the response to the API used to [obtain a user token](#), **x-subject-token** is the desired user token. This token can then be used to authenticate the calling of other APIs.

3.2 Authentication

You can use either of the authentication methods below to call APIs. AK/SK-based authentication is recommended because it is more secure than token-based authentication.

- Token-based authentication: General requests are authenticated using tokens.
- AK/SK-based authentication: Requests are authenticated by encrypting the request body using an AK/SK.

Token-based Authentication

NOTE

The validity period of a token is 24 hours. When using a token for authentication, cache it to prevent frequently calling the IAM API used to obtain a user token.

A token specifies certain permissions in a computer system. During token-based authentication, the token is added to requests to get permissions for calling the API.

When calling the API to [obtain a user token](#), you must set **auth.scope** in the request body to **project**.

In [Making an API Request](#), the process of calling the API used to obtain a user token is described.

```
{
  "auth": {
    "identity": {
      "methods": [
        "password"
      ],
      "password": {
        "user": {
          "name": "user_name",
          "password": "user_password",
          "domain": {
            "name": "domain_name"
          }
        }
      }
    },
    "scope": {
      "project": {
        "name": "project_name"
      }
    }
  }
}
```

After a token is obtained, the **X-Auth-Token** header must be added to requests to specify the token when calling other APIs. For example, if the token is **ABCDEFJ....**, add **X-Auth-Token: ABCDEFJ....** to a request as follows:

```
GET https://modelarts.ap-southeast-1.myhuaweicloud.com/v1/{project_id}/services
Content-Type: application/json
X-Auth-Token: ABCDEFJ....
```

AK/SK-based Authentication

NOTE

AK/SK-based authentication supports API requests with a body not larger than 12 MB. For API requests with a larger body, token authentication is recommended.

In AK/SK-based authentication, AK/SK is used to sign requests and the signature is then added to the request for authentication.

- **AK**: access key ID, which is a unique identifier used with a secret access key to sign requests cryptographically.
- **SK**: secret access key, which is used in conjunction with an AK to sign requests cryptographically. It identifies a request sender and prevents the request from being modified.

In AK/SK authentication, you can use an AK/SK to sign requests based on the signature algorithm or use the signing SDK to sign requests. For details about how to sign requests and use the signing SDK, see [API Request Signing Guide](#).

NOTICE

The signature SDK supports only signature, which is different from the SDKs provided by services.

3.3 Response

After sending a request, you will receive a response, including the status code, response header, and response body.

Status Code

A status code is a group of digits, ranging from 1xx to 5xx. It indicates the status of a request. For more information, see [Status Code](#).

For example, if status code **201** is returned for calling the API used to [obtain a user token](#), the request is successful.

Response Header

Similar to a request, a response also has a header, for example, **Content-type**.

[Figure 1](#) shows the response header fields for the API used to [obtain a user token](#).

x-subject-token is the desired user token. This token can then be used to authenticate the calling of other APIs.

Figure 3-2 Header fields of the response to the request for obtaining a user token

```
connection → keep-alive
content-type → application/json
date → Tue, 12 Feb 2019 06:52:13 GMT
server → Web Server
strict-transport-security → max-age=31536000; includeSubdomains;
transfer-encoding → chunked
via → proxy A
x-content-type-options → nosniff
x-download-options → noopen
x-frame-options → SAMEORIGIN
x-iam-trace-id → 218d45ab-d674-4995-af3a-2d0255ba41b5
x-subject-token → MIIXQYJJoZlhcNAQcCoIIYJCCGEoCAQExDTALBglghkgBZQMEAgEwgharBgkqhkiG9w0BBwGgghacBIIWmHsidG9rZW4iOnsiZXhwaXJlc19hdCI6IjwMTktMDItMTNUMC

RzT6MUbpvGw-oPNFYxJECKnoH3Hrozv0vN--n5d6Nbxg==
x-xss-protection → 1; mode=block;
```

Response Body

The body of a response is often returned in structured format as specified in the **Content-Type** header field. The response body transfers content except the response header.

The following is part of the response body for the API used to [obtain a user token](#).

```
{
  "token": {
    "expires_at": "2019-02-13T06:52:13.855000Z",
    "methods": [
      "password"
    ],
    "catalog": [
      {
        "endpoints": [
          {
            "region_id": "ap-southeast-1",
            .....

```

If an error occurs during API calling, an error code and a message will be displayed. The following shows an error response body.

```
{
  "error_msg": "The format of message is error",
  "error_code": "AS.0001"
}
```

In the error response body, **error_code** is an error code, and **error_msg** provides information about the error. For more details, see [Error Codes](#).

4 Development Environment Management

4.1 Creating a Notebook Instance

Function

This API is used to create a notebook instance based on specified parameters.

This API applies to the following scenario: When you need to create a notebook instance for a specific task or project, you can use this API to specify the instance specifications, AI engine images, and storage configurations. Before using this API, ensure that you have logged in to the system, have the permission to create a notebook instance, and provide valid creation parameters. After this API is called, the system asynchronously creates a notebook instance. You can obtain the instance status by calling the query API. After the notebook instance is created, you can access the notebook instance through the web page or SSH client. If you do not have the permission to create an instance or the parameters are invalid, the API will return an error message. Other exceptions include insufficient system resources and creation failure. The API will return the corresponding error message.

Constraints

No constraints

Debugging

You can debug this API through automatic authentication in [API Explorer](#) or use the SDK sample code generated by API Explorer.

Authorization Information

Each account has all the permissions required to call all APIs, but IAM users must be assigned the required permissions.

- If you are using role/policy-based authorization, see [Permissions Policies and Supported Actions](#) for details on the required permissions.

- If you are using identity policy-based authorization, the following identity policy-based permissions are required.

Action	Access Level	Resource Type (*: required)	Condition Key	Alias	Dependencies
modelarts:notebook:create	Write	notebook*	-	-	-
		-	- g:TagKeys - modelarts:poolType - modelarts:poolId - g:EnterpriseProjectId - g:RequestTag/<tag-key>		

URI

POST /v1/{project_id}/notebooks

Table 4-1 Path Parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Definition: Project ID. For details, see Obtaining a Project ID and Name . Constraints: N/A Range: N/A Default Value: N/A

Request Parameters

Table 4-2 Request body parameters

Parameter	Mandatory	Type	Description
description	No	String	Definition: Instance description. Constraints: N/A Range: The value can contain up to 512 characters and cannot contain these special characters (&<>"'/). Default Value: N/A
endpoints	No	Array of EndpointsRequest objects	Definition: Only a local IDE (such as PyCharm or VS Code) or SSH client can be used to access a notebook instance. Constraints: Configurations are only required for remotely accessing a notebook instance via SSH on a local IDE (such as PyCharm or VS Code) or SSH client.
feature	No	String	Definition: Instance type. Constraints: N/A Range: • DEFAULT: free CodeLab instance. Each user can create only one. • NOTEBOOK: billed instance. Default Value: NOTEBOOK

Parameter	Mandatory	Type	Description
flavor	No	String	Definition: Instance flavor. The following flavors are for reference only. Obtain the flavors displayed on the console in the target region. • modelarts.vm.cpu.2u: General-purpose Intel CPU flavor, ideal for rapid data exploration and experiments • modelarts.vm.cpu.8u: General computing-plus Intel CPU flavors, ideal for compute-intensive applications Constraints: N/A Range: N/A Default Value: N/A
custom_spec	No	NotebookCustomSpec object	Definition: Custom specifications of an instance. Either this parameter or flavor must be set. Constraints: This is only supported in CPU or GPU dedicated pool scenarios based on the specific node specifications of the dedicated pool.
image_id	Yes	String	Definition : ID of the image used for creating notebook instances. The ID is in the format of a Universally Unique Identifier (UUID). For details, see [Querying Supported Images]](https://support.huaweicloud.com/intl/en-us/api-modelarts/ListImage.html). Constraints: N/A Range: Valid image IDs obtained by calling the API for Querying Supported Images. Default Value: N/A

Parameter	Mandatory	Type	Description
name	Yes	String	Definition: Instance name. Constraints: N/A Range: The value can contain a maximum of 128 characters. Only letters, digits, hyphens (-), and underscores (_) are allowed. The name can be duplicate. Default Value: N/A
pool_id	No	String	Definition: ID of a dedicated resource pool. This parameter is mandatory if a dedicated resource pool is used to create an instance. The dedicated resource pool ID can be obtained by calling the API for Obtaining Resource Pools . Constraints: N/A Range: Valid resource pool IDs obtained by calling the API for Obtaining Resource Pools . Default Value: N/A
volume	Yes	VolumeMountRequest object	Definition: Storage configuration. Constraints: N/A
workspace_id	No	String	Definition: Workspace ID. If no workspaces are available, the default value is 0. If a workspace is created and used, use the actual value. Constraints: N/A Range: This value is a string of 0 or 32 characters. Only digits or lowercase letters are allowed. Default Value: 0
hooks	No	CustomHooks object	Definition: Hook configuration of a custom boot script. Constraints: N/A
lease	No	LeaseReq object	Definition: Instance lease configuration. Constraints: N/A

Parameter	Mandatory	Type	Description
affinity	No	AffinityType object	Definition: Instance affinity configuration. Constraints: N/A.
run_user	No	RunUserRequest object	Definition: Startup user and startup user group settings. Constraints: N/A. Default Value: uid=1000, gid=100 Range: When started as root/root : uid=0, gid=0 When started as ma-user/ma-group : uid=1000, gid=100
data_volumes	No	Array of VolumeMountRequest objects	Definition: Instance storage configuration. Constraints: N/A
user_vpc	No	UserVpcRequest object	Definition: User VPC configuration.
duration	No	Integer	Definition: The instance stops as scheduled. Its runtime is measured in milliseconds starting now. Constraints: N/A Range: 3600000 to 259200000 Default Value: 3600000

Table 4-3 EndpointsReq

Parameter	Mandatory	Type	Description
service	No	String	Definition: Supported services. Constraints: N/A Range: • NOTEBOOK: You can access notebook instances using HTTPS. • SSH: You can remotely access notebook instances through SSH. Default Value: N/A

Parameter	Mandatory	Type	Description
key_pair_names	No	Array of strings	Definition: Name of the SSH key pair, which can be created and viewed on the Key Pair page of the Elastic Cloud Server (ECS) console. Constraints: N/A

Table 4-4 NotebookCustomSpec

Parameter	Mandatory	Type	Description
gpu	No	Float	Definition: Number of GPUs of an instance. Constraints: This parameter is unavailable in CPU dedicated resource pools and is mandatory in GPU dedicated resource pools. Range: N/A Default Value: N/A
cpu	Yes	Float	Definition: Number of CPUs of an instance. Constraints: This parameter is mandatory for custom specifications in CPU/GPU dedicated pools. Range: The integer part can contain at most 10 digits and the decimal part can contain at most 2 digits. The value cannot be smaller than 0.4 . Default Value: N/A
memory	Yes	Float	Definition: Memory size of an instance. Constraints: This parameter is mandatory for custom specifications in CPU/GPU dedicated pools. Range: The value must be an integer containing at most 10 digits, and the value cannot be smaller than 513 . Default Value: N/A

Parameter	Mandatory	Type	Description
gpu_type	No	String	Definition: GPU acceleration PU of an instance. Constraints: This parameter is unavailable in CPU dedicated resource pools and is mandatory in GPU dedicated resource pools. Range: N/A Default Value: N/A
arch	No	String	Definition: CPU architecture of an instance. Constraints: This parameter is mandatory for custom specifications in CPU/GPU dedicated resource pools. Range: The value can be: • X86_64: x86 architecture • AARCH64: Arm architecture Default Value: N/A
category	No	String	Definition: Specification type of an instance. Constraints: This parameter is mandatory for custom specifications in CPU/GPU dedicated pools. Range: The value can be: • CPU • GPU Default Value: N/A
resource_flavor	No	String	Definition: Specifications of the target resource pool node selected for the instance. Constraints: N/A Range: N/A Default Value: N/A

Table 4-5 VolumeMountRequest

Parameter	Mandatory	Type	Description
category	Yes	String	Definition: Extended storage type, for example, EFS , OBS , or OBSFS . Constraints: N/A
ownership	Yes	String	Definition: Resource ownership. MANAGED and DEDICATED are supported. Constraints: N/A
uri	No	String	Definition: URI of the EFS dedicated storage disk or path of the OBS parallel file system. Constraints: This parameter is mandatory only when category is set to EFS , OBS , or OBSFS and ownership is set to DEDICATED . The value can contain at most 1,024 characters.
id	No	String	Definition: ID of the EFS dedicated storage disk. Constraints: This parameter is mandatory only when category is set to EFS and ownership is set to DEDICATED . The value must be in the UUID format, for example, 280a8bd5-03e2-4a5c-bea1-83d81e75bc53 .
mount_path	No	String	Definition: Path mounted to the notebook instance. Constraints: The value can contain at most 256 characters.
read_only	No	Boolean	Definition: Whether the mounting directory of extended storage is read-only. The default value is false , indicating that the directory can be read and written. Constraints: N/A

Parameter	Mandatory	Type	Description
dew_secret_name	No	String	Definition: Name of the AK/SK secret stored in DEW. Constraints: This parameter is mandatory when category is set to OBS . The value can contain 1 to 64 characters. Only letters, digits, hyphens (-), and underscores (_) are allowed.
capacity	No	Integer	Definition: EVS storage capacity, in GB. Constraints: This parameter is valid only when category is EVS . Range: N/A Default Value: 5

Table 4-6 CustomHooks

Parameter	Mandatory	Type	Description
container_hooks	No	ContainerHooks object	Definition: Container hook configuration. Constraints: N/A

Table 4-7 ContainerHooks

Parameter	Mandatory	Type	Description
post_start	No	Config object	Definition: Script configuration after the service is started. Constraints: N/A
pre_start	No	Config object	Definition: Script configuration before the service is started. Constraints: N/A

Table 4-8 Config

Parameter	Mandatory	Type	Description
script	No	String	Definition: Custom script (Base64 encoding) or absolute path of a script. Constraints: N/A Range: N/A Default Value: N/A
type	No	String	Definition: Script type. Constraints: N/A Range: • COMMAND: The script content (Base64-encoded) must be specified. • SCRIPT: The script path must be specified. Default Value: SCRIPT
mode	No	String	Definition: Execution mode of custom scripts, which can be synchronous or asynchronous. Constraints: N/A Range: The value can be: • BLOCK: synchronous • ASYNC: asynchronous Default Value: ASYNC

Table 4-9 LeaseReq

Parameter	Mandatory	Type	Description
duration	No	Long	Definition: The instance stops as scheduled. Its runtime is measured in milliseconds starting now. Constraints: N/A Range: 3600000 to 259200000 Default Value: 3600000

Parameter	Mandatory	Type	Description
type	No	String	Definition: Auto stop type. Constraints: N/A Range: • TIMING: auto stop • IDLE: stop when idle Default Value: TIMING

Table 4-10 AffinityType

Parameter	Mandatory	Type	Description
required_during_scheduling_ignored_during_execution	No	Array of AffinityRule objects	Definition: Strong affinity feature in the dedicated pool scenario. Constraints: key , values , and operator are mandatory.
preferred_during_scheduling_ignored_during_execution	No	Array of AffinityRule objects	Definition: Weak affinity feature in the dedicated pool scenario. Constraints: key , values , and operator are mandatory, and weight is optional.

Table 4-11 AffinityRule

Parameter	Mandatory	Type	Description
key	No	String	Definition: Affinity description. Both default labels and custom labels are supported. For details about the default node labels, see Managing Node Labels. Constraints: Labels are key-value pairs. A valid label consists of two segments: prefix (optional) and name, which are separated by a slash (/). Range: The name segment is mandatory and must be less than or equal to 63 characters. It must start and end with a letter or digit and only contain letters, digits, hyphens (-), underscores (_), and periods (.). The prefix is optional. If specified, the prefix must be a DNS subdomain: a series of DNS labels separated by periods (.), with a total of no more than 253 characters, followed by a slash (/). For details, see Labels and Selectors. Default Value: N/A.

Parameter	Mandatory	Type	Description
operator	No	String	Definition: Operator. Constraints: N/A Range: The following operators are supported: In: The label of the affinity or anti-affinity object is in the label value list (values field). NotIn: The label of the affinity or anti-affinity object is not in the label value list (values field). Exists: The affinity or anti-affinity object has a specified label key. DoesNotExist: The affinity or anti-affinity object does not have a specified label key. Gt: The label value of the scheduling node exceeds what is listed (string comparison). Lt: The label value of the scheduling node is under what is listed (string comparison). Default Value: N/A.
values	No	Array of strings	Definition: When configuring node affinity, enter the value of the node label. Constraints: The value must be 63 characters or fewer (can be empty). If the label value is not empty, the value must start and end with a letter or digit and can contain hyphens (-), underscores (_), periods (.), letters, or digits. For details, see Labels and Selectors .
weight	No	Integer	Weight value of the weak affinity node. The value ranges from 0 to 100. The value is NULL for strong affinity and optional for weak affinity.

Table 4-12 RunUserRequest

Parameter	Mandatory	Type	Description
uid	No	Integer	User ID of the container startup user.
gid	No	Integer	Group ID of the container startup user.

Table 4-13 UserVpcRequest

Parameter	Mandatory	Type	Description
vpc_id	Yes	String	Definition: VPC ID. Constraints: N/A Range: N/A Default Value: N/A
subnet_id	Yes	String	Definition: Subnet ID. Constraints: N/A Range: N/A Default Value: N/A
security_group_ids	Yes	Array of strings	Definition: Security group ID list. Constraints: N/A Range: N/A Default Value: N/A
connect_cidrs	No	Array of strings	Definition: Connected CIDR block list. Constraints: This parameter is optional. Use this parameter when you want to use the mounted NIC to access addresses in other IP address ranges. Range: N/A Default Value: N/A

Response Parameters

Status code: 200

Table 4-14 Response body parameters

Parameter	Type	Description
action_progress	Array of JobProgress objects	Definition: Initialization progress of the instance.
description	String	Definition: Instance description. Range: N/A
endpoints	Array of EndpointsRes objects	Definition: Local IDE (such as PyCharm and VS Code) or SSH client for remotely accessing a notebook instance through SSH.
fail_reason	String	Definition: Instance failure cause. Range: N/A
flavor	String	Definition: Instance flavor. 1. If you select a system specification, the returned value is the system specification code. 2. If you select a custom specification when creating an instance, this parameter is always returned as custom.flavor.spec.code . Range: N/A.
custom_spec	NotebookCustomSpecRep object	Definition: Custom specifications of an instance. This parameter is returned only when a CPU or GPU dedicated pool is used and the custom specifications are used. Range: N/A.
id	String	Definition: Instance ID. Range: N/A
image	Image object	Definition: Instance image information.
lease	Lease object	Definition: Countdown to auto stop of an instance.
name	String	Definition: Instance name. Range: N/A
pool	Pool object	Definition: Basic information about the dedicated pool, which is returned by the instance created in the dedicated pool.

Parameter	Type	Description
status	String	Definition: Instance status. Range: • INIT: The instance is being initialized. • CREATING: The instance is being created. • STARTING: The instance is being started. • STOPPING: The instance is being stopped. • DELETING: The instance is being deleted. • RUNNING: The instance is running. • STOPPED: The instance has been stopped. • SNAPSHOTTING: The image of the instance is being saved. • CREATE_FAILED: Creating the instance failed. • START_FAILED: Starting the instance failed. • DELETE_FAILED: Deleting the instance failed. • ERROR: An error occurred. • DELETED: The instance has been deleted. • FROZEN: The instance is frozen.
token	String	Description: Token used for notebook authentication. Range: N/A
url	String	Definition: URL for accessing the instance. Range: N/A
volume	VolumeRes object	Definition: Instance storage information.
workspace_id	String	Definition: Workspace ID. If no workspaces are available, the default value is 0. If a workspace is created and used, use the actual value. Range: N/A

Parameter	Type	Description
feature	String	Definition: Instance type. Range: DEFAULT: free CodeLab instance. Each user can create only one. NOTEBOOK: billed instance.
billing_items	Array of strings	Definition: Billing resource type. Range: STORAGE: Storage resource billing COMPUTE: Computing resources billing ALL: All billing types
user	UserResponse object	Description: Account information.
affinity	AffinityType object	Definition: Affinity information.
run_user	RunUserInfo object	Definition: Information about the startup user and startup user group.
data_volumes	Array of VolumeResponse objects	Definition: Extended storage information.
ip	String	Definition: IP address of the node where the instance is located. Range: N/A
user_vpc	UserVpcResponse object	Definition: User VPC configuration.
user_id	String	Definition: User ID. Range: N/A
is_need_credentials	Boolean	Definition: Whether to create a user secret by default. The default value is true . Range: N/A
jupyter_version	String	Definition: Jupyter version. Range: N/A
tags	Array of TmsTagResponse objects	Definition: Instance tag.

Table 4-15 JobProgress

Parameter	Type	Description
status	String	Definition: Job status in a specified step. Range: • WAITING: The job is awaiting. • PROCESSING: The job is being processed. • FAILED: The job failed. • COMPLETED: The job is complete.
step	Integer	Definition: Job step. Range: • 1: Prepare storage. • 2: Prepare compute resources. • 3: Configure the network. • 4: Initialize the instance.
description	String	Definition: Job description in a specified step. Range: N/A

Table 4-16 EndpointsRes

Parameter	Type	Description
key_pair_names	Array of strings	Definition: List of SSH key pairs. You can set multiple key pairs to access an SSH instance at the same time. Range: N/A
service	String	Definition: Method for accessing the notebook instance. Range: • NOTEBOOK: You can access notebook instances using HTTPS. • SSH: You can remotely access notebook instances through SSH.
uri	String	Definition: Private IP address of the instance. Range: N/A

Table 4-17 NotebookCustomSpecRep

Parameter	Type	Description
gpu	Float	Definition: Number of GPUs of an instance. Range: N/A
gpu_type	String	Definition: GPU acceleration PU of an instance. Range: N/A
cpu	Float	Definition: Number of CPUs of an instance. Range: The integer part can contain at most 10 digits and the decimal part can contain at most 2 digits. The value cannot be smaller than 0.4 .
memory	Float	Definition: Memory size of an instance. Range: The value must be an integer containing at most 10 digits, and the value cannot be smaller than 513 .
arch	String	Definition: CPU architecture of an instance. Range: The value can be: • X86_64: x86 architecture • AARCH64: Arm architecture
category	String	Definition: Specification type of an instance. Range: The value can be: • CPU • GPU
resource_flavor	String	Definition: Specifications of the target resource pool node selected for the instance. Range: N/A

Table 4-18 Image

Parameter	Type	Description
arch	String	Definition: Processor architecture supported by the image. Range • X86_64: x86 architecture • AARCH64: Arm architecture
create_at	Long	Definition: UTC time when the image is created, accurate to millisecond. Range: N/A
description	String	Definition: Image description. Range: Up to 512 characters
dev_services	Array of strings	Definition: Services supported by the image. Range: • NOTEBOOK: You can access a notebook instance using HTTPS. • SSH: You can remotely access a notebook instance from a local IDE through SSH.
id	String	Definition: ID of the image used for creating notebook instances. The ID is in Universally Unique Identifier (UUID) format. For details, see Querying Supported Images . Range: N/A
name	String	Definition: Image name. Range: The name can contain a maximum of 512 characters. Lowercase letters, digits, hyphens (-), underscores (_), and periods (.) are allowed.
namespace	String	Definition: Organization to which the image belongs. You can create and view an organization on the Organization Management page of the SWR console. Range: N/A

Parameter	Type	Description
origin	String	Definition: Image source. Range: • CUSTOMIZE: custom image • IMAGE_SAVE: image saved by a notebook instance
resource_categories	Array of strings	Definition: Flavors supported by the image. Range: • CPU • GPU • ASCEND
service_type	String	Definition: Supported image types. Range: • COMMON: common image • INFERENCE: image used for inference • TRAIN: image used for training • DEV: image used for development and debugging • UNKNOWN: image whose supported services are not specified
size	Long	Definition: Image size, in KB. Range: N/A
status	String	Definition: Image status. Range: • INIT: The image is being initialized. • CREATING: The image is being saved. In this case, the notebook instance is unavailable. • CREATE_FAILED: Saving the image failed. • ERROR: An error occurs. • DELETED: The image has been deleted. • ACTIVE: The image has been saved, which you can view on the SWR console and use to create notebook instances.
status_message	String	Definition: Build information during image saving. Range: N/A

Parameter	Type	Description
swr_path	String	Definition: SWR image path. Range: N/A
tag	String	Definition: Image tag. Range: N/A
type	String	Definition: Image type. Range: • BUILD_IN: built-in system image • DEDICATED: image you have saved
update_at	Long	Definition: Time (UTC) when the image was last updated, accurate to millisecond. Range: N/A
visibility	String	Definition: Image visibility. Range: • PRIVATE: private image • PUBLIC: All users can perform read-only operations based on image_id.
workspace_id	String	Definition: Workspace ID. If no workspaces are available, the default value is 0 . If a workspace is created and used, use the actual value. Range: N/A
flavor_type	String	Definition: Resource type of the image. Range: • ASCEND_SNT9: 910 chip • ASCEND_SNT9B: 910B chip • ASCEND_SNT3: 310 chip
swr_instance_id	String	Definition: Enterprise edition SWR repository ID. Range: N/A
show_tag	String	Definition: Image tag. Range: N/A
show_name	String	Definition: Image name. Range: N/A
tags	Array of TmsTagResponse objects	Definition: Image tag.

Table 4-19 Lease

Parameter	Type	Description
create_at	Long	Definition: UTC time when the instance is created, accurate to millisecond. Range: N/A
duration	Long	Definition: Instance runtime, which is calculated based on the instance creation time. If the instance creation time plus the runtime is greater than the current time, the system automatically stops the instance. Range: N/A
enable	Boolean	Definition: Specifies whether to enable auto stop. Range: Boolean • true: Auto stop is enabled. • false: Auto stop is disabled.
type	String	Definition: Auto stop type. Range: • TIMING: auto stop • IDLE: stop when idle
update_at	Long	Definition: Time (UTC) when the instance is last updated (excluding liveness check), accurate to millisecond. Range: N/A

Table 4-20 Pool

Parameter	Type	Description
id	String	Definition: Dedicated resource pool ID. Range: N/A
name	String	Definition: Dedicated resource pool name. Range: N/A

Table 4-21 VolumeRes

Parameter	Type	Description
capacity	Integer	Definition: Storage capacity. Range: The default value is 5 GB for EVS and 50 GB for EFS. The maximum value is 4,096 GB.
category	String	Definition: Supported storage type. For details about the differences between the storage types, see Selecting Storage in DevEnviron . Range: • SFS • EVS • OBS • OBSFS: parallel file system • EFS: SFS Turbo
mount_path	String	Definition: Directory of the notebook instance to which the storage is mounted. Currently, the directory is <code>/home/ma-user/work/</code> . Range: N/A
ownership	String	Definition: Resource owner. Range: • MANAGED: Resources are managed by the service. • DEDICATED: Resources are managed by the user account. This mode is supported only when the instance category is EFS.
status	String	Definition: EVS disk capacity expansion status, which is RESIZING during capacity expansion and does not affect the instance. Range: N/A
id	String	Definition: EFS disk ID or OBS storage ID. This parameter is returned only when extended storage is used. Range: N/A
read_only	Boolean	Definition: Whether the mounting directory of extended storage is read-only. Range: N/A

Parameter	Type	Description
dew_secret_name	String	Definition: Name of the AK/SK secret stored in DEW. Range: N/A
evs_sku_code	String	Definition: SKU code of EVS storage. Range: N/A
uri	String	Definition: Source path for mounting the storage when category is EFS , OBS , or OBSFS . Range: N/A
mount_type	String	Definition: Storage mount type. Range: The value can be: • STATIC: Storage cannot be mounted or unmounted when the instance is running. • DYNAMIC: Storage can be mounted and unmounted when the instance is running.

Table 4-22 UserResponse

Parameter	Type	Description
id	String	Definition: User ID. Range: N/A
name	String	Definition: Username. Range: N/A
domain	Domain object	Definition: Domain information of an account.

Table 4-23 Domain

Parameter	Type	Description
id	String	Definition: Account ID. Range: N/A
name	String	Definition: Account name. Range: N/A

Table 4-24 AffinityType

Parameter	Type	Description
required_during_scheduling_ignored_during_execution	Array of AffinityRule objects	Definition: Strong affinity feature in the dedicated pool scenario. Constraints: key , values , and operator are mandatory.
preferred_during_scheduling_ignored_during_execution	Array of AffinityRule objects	Definition: Weak affinity feature in the dedicated pool scenario. Constraints: key , values , and operator are mandatory, and weight is optional.

Table 4-25 AffinityRule

Parameter	Type	Description
key	String	Definition: Affinity description. Both default labels and custom labels are supported. For details about the default node labels, see Managing Node Labels . Constraints: Labels are key-value pairs. A valid label key consists of two segments: prefix (optional) and name, which are separated by a slash (/). Range: The name segment is mandatory and must be less than or equal to 63 characters. It must start and end with a letter or digit and only contain letters, digits, hyphens (-), underscores (_), and periods (.). The prefix is optional. If specified, the prefix must be a DNS subdomain: a series of DNS labels separated by periods (.), with a total of no more than 253 characters, followed by a slash (/). For details, see Labels and Selectors . Default Value: N/A.

Parameter	Type	Description
operator	String	Definition: Operator. Constraints: N/A Range: The following operators are supported: In: The label of the affinity or anti-affinity object is in the label value list (values field). NotIn: The label of the affinity or anti-affinity object is not in the label value list (values field). Exists: The affinity or anti-affinity object has a specified label key. DoesNotExist: The affinity or anti-affinity object does not have a specified label key. Gt: The label value of the scheduling node exceeds what is listed (string comparison). Lt: The label value of the scheduling node is under what is listed (string comparison). Default Value: N/A.
values	Array of strings	Definition: When configuring node affinity, enter the value of the node label. Constraints: The value must be 63 characters or fewer (can be empty). If the label value is not empty, the value must start and end with a letter or digit and can contain hyphens (-), underscores (_), periods (.), letters, or digits. For details, see Labels and Selectors .
weight	Integer	Weight value of the weak affinity node. The value ranges from 0 to 100. The value is NULL for strong affinity and optional for weak affinity.

Table 4-26 RunUserInfo

Parameter	Type	Description
uid	Integer	User ID of the container startup user.

Parameter	Type	Description
gid	Integer	Group ID of the container startup user.
user_name	String	Username of the container startup user.
group_name	String	Group name of the container startup user.

Table 4-27 VolumeResponse

Parameter	Type	Description
category	String	Definition: Extended storage type, for example, EFS , OBS , or OBSFS . Constraints: N/A
mount_path	String	Definition: Directory where the storage is mounted to a notebook instance. Constraints: N/A
url	String	Definition: Source path for mounting the storage when category is OBS or OBSFS . Constraints: N/A
status	String	Definition: Storage status. MOUNTING: being mounted MOUNTED: mounted UNMOUNTING: being unmounted UNMOUNTED: unmounted MOUNT_FAILED: mounting failed UNMOUNT_FAILED: unmounting failed Constraints: N/A
mount_type	String	Definition: Storage mount type. Constraints: N/A

Table 4-28 UserVpcResponse

Parameter	Type	Description
vpc_id	String	Definition: VPC ID. Range: N/A

Parameter	Type	Description
subnet_id	String	Definition: Subnet ID. Range: N/A
security_group_ids	Array of strings	Definition: Security group ID list. Range: N/A
connect_cidrs	String	Definition: Connected CIDR block list. Range: N/A
port_id	Array of strings	Definition: NIC ID. Range: N/A
port_ip	String	Definition: NIC IP address. Range: N/A

Table 4-29 TmsTagResponse

Parameter	Type	Description
key	String	Definition: TMS tag key. Range: N/A
value	String	Definition: TMS tag value. Range: N/A

Status code: 201

Created

Example Requests

- Create a notebook instance. Set the instance affinity to either strong or weak. If strong affinity is selected, instances are scheduled to the node whose tag is **<kubernetes.io/hostname, 192.168.1.1>** in the **pool-test1202-06024304be00d5092fbdc0013d201342** dedicated resource pool.

```
{
  "name": "notebooks_test",
  "feature": "NOTEBOOK",
  "workspace_id": "0",
  "description": "api-test",
  "flavor": "modelarts.vm.cpu.2u",
  "image_id": "e1a07296-22a8-4f05-8bc8-e936c8e54090",
  "volume": {
    "category": "evs",
    "ownership": "managed",

  "affinity": {
    "required_during_scheduling_ignored_during_execution": [ {
      "key": "kubernetes.io/hostname",
```

```
      "operator" : "In",
      "values" : [ "192.168.1.1" ]
    } ]
  }
}
```

- Create a notebook instance. If weak affinity is selected, when instances are scheduled to the node whose tag is **<kubernetes.io/hostname, 192.168.1.1>** in the **pool-test1202-06024304be00d5092fbdc0013d201342** dedicated resource pool, the weight is 80. When instances are scheduled to the node whose tag is **<kubernetes.io/hostname, 192.168.1.2>**, the weight is 10. Instances are preferentially scheduled to the node with a larger weight.

Error Codes

See [Error Codes](#).

4.2 Querying Notebook Instances

Function

This API is used to obtain information about notebook instances that meet specific conditions.

This API applies to the following scenarios: When you manage multiple notebook instances or view notebook instances in a specified status, you can use this API to obtain related information. Before using this API, ensure that you have created a notebook instance and have the query permission. After the API is successfully called, the system returns the list of notebook instances that meet the search criteria. Details such as the instance ID, status, and creation time can be obtained. If you do not have the access permission or the query conditions are unclear, the API will return an error message or an empty list.

Constraints

No constraints

Debugging

You can debug this API through automatic authentication in [API Explorer](#) or use the SDK sample code generated by API Explorer.

Authorization Information

Each account has all the permissions required to call all APIs, but IAM users must be assigned the required permissions.

- If you are using role/policy-based authorization, see [Permissions Policies and Supported Actions](#) for details on the required permissions.
- If you are using identity policy-based authorization, the following identity policy-based permissions are required.

Action	Access Level	Resource Type (*: required)	Condition Key	Alias	Dependencies
modelarts:notebook:list	List	notebook*	-	-	-
		-	• g:EnterpriseProjectId • g:RequestTag/<tag-key> • g:TagKeys		

URI

GET /v1/{project_id}/notebooks

Table 4-30 Path Parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Definition: Project ID. For details, see Obtaining a Project ID and Name . Constraints: N/A Range: N/A Default Value: N/A

Table 4-31 Query Parameters

Parameter	Mandatory	Type	Description
feature	No	String	Definition: Instance type Constraints: N/A Range: Enums: • DEFAULT: free CodeLab instance. Each user can create only one. • NOTEBOOK: billed instance Default Value: NOTEBOOK
limit	No	Integer	Definition: Number of instances displayed on each page Constraints: N/A Range: [10,20,50] Default Value: 10
name	No	String	Definition: Instance name. Fuzzy match is supported. Constraints: N/A Range: The value can contain a maximum of 128 characters. Letters, digits, hyphens (-), and underscores (_) are allowed. Default Value: N/A
pool_id	No	String	Definition: Dedicated resource pool ID Constraints: N/A Range: This value contains 4 to 64 characters. Lowercase letters, digits, and hyphens (-) are allowed. It must start with a lowercase letter and end with a lowercase letter or digit. Default Value: N/A
offset	No	Integer	Definition: Start offset of the records on each page Constraints: N/A Range: N/A Default Value: 0

Parameter	Mandatory	Type	Description
owner	No	String	Definition: User ID of the instance. This parameter is valid only when the account is a big account or has the admin permission. Generally, the value is the ID of the current login user. Constraints: N/A Range: This value contains 32 characters. Lowercase letters and digits are allowed. Default Value: N/A
sort_dir	No	String	Definition: Instance sorting mode Constraints: N/A Range: Enums: • ASC: ascending order • DESC: descending order Default Value: DESC
sort_key	No	String	Definition: Sorting field. Separate multiple fields with commas (,). Constraints: N/A Range: The value can contain a maximum of 128 characters. Letters, digits, hyphens (-), underscores (_), and commas (,) are allowed. Default Value: N/A

Parameter	Mandatory	Type	Description
status	No	String	Definition: Instance status Constraints: N/A Range: Enums: • INIT: The instance is being initialized. • CREATING: The instance is being created. • STARTING: The instance is starting. • STOPPING: The instance is being stopped. • DELETING: The instance is being deleted. • RUNNING: The instance is running. • STOPPED: The instance has been stopped. • SNAPSHOTTING: The image of the instance is being saved. • CREATE_FAILED: Creating the instance failed. • START_FAILED: Starting the instance failed. • DELETE_FAILED: Deleting the instance failed. • ERROR: An error occurred. • DELETED: The instance has been deleted. • FROZEN: The instance is frozen. Default Value: N/A
workspace_id	No	String	Definition: Workspace ID. For details about how to obtain the value, see Obtaining Workspaces . If no workspace is created, the default value is 0 . If a workspace is created and used, use the actual value. Constraints: N/A Range: N/A Default Value: 0

Parameter	Mandatory	Type	Description
flavor	No	String	Definition: Instance flavor. The following flavors are for reference only. Obtain the flavors displayed on the console in the target region. • modelarts.vm.cpu.2u: General-purpose Intel CPU flavor, ideal for rapid data exploration and experiments • modelarts.vm.cpu.8u: General computing-plus Intel CPU flavors, ideal for compute-intensive applications Constraints: N/A Range: N/A Default Value: N/A
image_id	No	String	Definition : ID of the image used for creating notebook instances. The ID is in UUID format. For details about how to obtain the image ID, see [Querying Supported Images]] (https://support.huaweicloud.com/intl/en-us/api-modelarts/ListImage.html). Constraints: N/A Range: Valid image IDs obtained by calling the API for Querying Supported Images. Default Value: N/A
id	No	String	Definition: Notebook instance ID. The ID is in Universally Unique Identifier (UUID) format. For details about how to obtain the ID, see Querying Notebook Instances. Constraints: N/A Range: N/A Default Value: N/A

Parameter	Mandatory	Type	Description
billing	No	String	Definition: Instance billing mode. Constraints: N/A Range: The value can be: • COMPUTE: Compute resource billing • STORAGE: Storage resource billing • ALL: All billing modes Default Value: N/A
tags	No	String	Definition: Instance tag information. Constraints: N/A Range: The value cannot start with a comma (,) or vertical bar (), end with a comma (,), or contain consecutive vertical bars () or commas (,). Only Spanish, Portuguese, and special characters (_ . : / = + - @) are allowed. Separate characters with commas (,) or vertical bars (). Default Value: N/A

Request Parameters

None

Response Parameters

Status code: 200

Table 4-32 Response body parameters

Parameter	Type	Description
current	Integer	Definition: Current page number. Range: Positive integers
data	Array of NotebookResp objects	Definition: Notebook instance data.

Parameter	Type	Description
pages	Integer	Definition: Total number of pages. Range: Positive integers
size	Integer	Definition: Number of records on each page. Range: Positive integers
total	Long	Definition: Total number of records. Range: Non-negative integers

Table 4-33 NotebookResp

Parameter	Type	Description
action_progress	Array of JobProgress objects	Definition: Initialization progress of the instance.
description	String	Definition: Instance description. Range: N/A
endpoints	Array of EndpointsRes objects	Definition: Local IDE (such as PyCharm and VS Code) or SSH client for remotely accessing a notebook instance through SSH.
fail_reason	String	Definition: Instance failure cause. Range: N/A
flavor	String	Definition: Instance flavor. 1. If you select a system specification, the returned value is the system specification code. 2. If you select a custom specification when creating an instance, this parameter is always returned as custom.flavor.spec.code . Range: N/A.
custom_spec	NotebookCustomSpecRep object	Definition: Custom specifications of an instance. This parameter is returned only when a CPU or GPU dedicated pool is used and the custom specifications are used. Range: N/A.
id	String	Definition: Instance ID. Range: N/A

Parameter	Type	Description
image	Image object	Definition: Instance image information.
lease	Lease object	Definition: Countdown to auto stop of an instance.
name	String	Definition: Instance name. Range: N/A
pool	Pool object	Definition: Basic information about the dedicated pool, which is returned by the instance created in the dedicated pool.
status	String	Definition: Instance status. Range: • INIT: The instance is being initialized. • CREATING: The instance is being created. • STARTING: The instance is being started. • STOPPING: The instance is being stopped. • DELETING: The instance is being deleted. • RUNNING: The instance is running. • STOPPED: The instance has been stopped. • SNAPSHOTTING: The image of the instance is being saved. • CREATE_FAILED: Creating the instance failed. • START_FAILED: Starting the instance failed. • DELETE_FAILED: Deleting the instance failed. • ERROR: An error occurred. • DELETED: The instance has been deleted. • FROZEN: The instance is frozen.
token	String	Description: Token used for notebook authentication. Range: N/A

Parameter	Type	Description
url	String	Definition: URL for accessing the instance. Range: N/A
volume	VolumeRes object	Definition: Instance storage information.
workspace_id	String	Definition: Workspace ID. If no workspaces are available, the default value is 0 . If a workspace is created and used, use the actual value. Range: N/A
feature	String	Definition: Instance type. Range: • DEFAULT: free CodeLab instance. Each user can create only one. • NOTEBOOK: billed instance.
billing_items	Array of strings	Definition: Billing resource type. Range: • STORAGE: Storage resource billing • COMPUTE: Computing resources billing • ALL: All billing types
user	UserResponse object	Description: Account information.
affinity	AffinityType object	Definition: Affinity information.
run_user	RunUserInfo object	Definition: Information about the startup user and startup user group.
data_volumes	Array of VolumeResponse objects	Definition: Extended storage information.
ip	String	Definition: IP address of the node where the instance is located. Range: N/A
user_vpc	UserVpcResponse object	Definition: User VPC configuration.
user_id	String	Definition: User ID. Range: N/A

Parameter	Type	Description
is_need_credentials	Boolean	Definition: Whether to create a user secret by default. The default value is true . Range: N/A
jupyter_version	String	Definition: Jupyter version. Range: N/A
tags	Array of TmsTagResponse objects	Definition: Instance tag.

Table 4-34 JobProgress

Parameter	Type	Description
status	String	Definition: Job status in a specified step. Range: • WAITING: The job is awaiting. • PROCESSING: The job is being processed. • FAILED: The job failed. • COMPLETED: The job is complete.
step	Integer	Definition: Job step. Range: • 1: Prepare storage. • 2: Prepare compute resources. • 3: Configure the network. • 4: Initialize the instance.
description	String	Definition: Job description in a specified step. Range: N/A

Table 4-35 EndpointsRes

Parameter	Type	Description
key_pair_names	Array of strings	Definition: List of SSH key pairs. You can set multiple key pairs to access an SSH instance at the same time. Range: N/A

Parameter	Type	Description
service	String	Definition: Method for accessing the notebook instance. Range: • NOTEBOOK: You can access notebook instances using HTTPS. • SSH: You can remotely access notebook instances through SSH.
uri	String	Definition: Private IP address of the instance. Range: N/A

Table 4-36 NotebookCustomSpecRep

Parameter	Type	Description
gpu	Float	Definition: Number of GPUs of an instance. Range: N/A
gpu_type	String	Definition: GPU acceleration PU of an instance. Range: N/A
cpu	Float	Definition: Number of CPUs of an instance. Range: The integer part can contain at most 10 digits and the decimal part can contain at most 2 digits. The value cannot be smaller than 0.4 .
memory	Float	Definition: Memory size of an instance. Range: The value must be an integer containing at most 10 digits, and the value cannot be smaller than 513 .
arch	String	Definition: CPU architecture of an instance. Range: The value can be: • X86_64: x86 architecture • AARCH64: Arm architecture

Parameter	Type	Description
category	String	Definition: Specification type of an instance. Range: The value can be: • CPU • GPU
resource_flavor	String	Definition: Specifications of the target resource pool node selected for the instance. Range: N/A

Table 4-37 Image

Parameter	Type	Description
arch	String	Definition: Processor architecture supported by the image. Range • X86_64: x86 architecture • AARCH64: Arm architecture
create_at	Long	Definition: UTC time when the image is created, accurate to millisecond. Range: N/A
description	String	Definition: Image description. Range: Up to 512 characters
dev_services	Array of strings	Definition: Services supported by the image. Range: • NOTEBOOK: You can access a notebook instance using HTTPS. • SSH: You can remotely access a notebook instance from a local IDE through SSH.
id	String	Definition: ID of the image used for creating notebook instances. The ID is in Universally Unique Identifier (UUID) format. For details, see Querying Supported Images . Range: N/A

Parameter	Type	Description
name	String	Definition: Image name. Range: The name can contain a maximum of 512 characters. Lowercase letters, digits, hyphens (-), underscores (_), and periods (.) are allowed.
namespace	String	Definition: Organization to which the image belongs. You can create and view an organization on the Organization Management page of the SWR console. Range: N/A
origin	String	Definition: Image source. Range: • CUSTOMIZE: custom image • IMAGE_SAVE: image saved by a notebook instance
resource_categories	Array of strings	Definition: Flavors supported by the image. Range: • CPU • GPU • ASCEND
service_type	String	Definition: Supported image types. Range: • COMMON: common image • INFERENCE: image used for inference • TRAIN: image used for training • DEV: image used for development and debugging • UNKNOWN: image whose supported services are not specified
size	Long	Definition: Image size, in KB. Range: N/A

Parameter	Type	Description
status	String	Definition: Image status. Range: • INIT: The image is being initialized. • CREATING: The image is being saved. In this case, the notebook instance is unavailable. • CREATE_FAILED: Saving the image failed. • ERROR: An error occurs. • DELETED: The image has been deleted. • ACTIVE: The image has been saved, which you can view on the SWR console and use to create notebook instances.
status_message	String	Definition: Build information during image saving. Range: N/A
swr_path	String	Definition: SWR image path. Range: N/A
tag	String	Definition: Image tag. Range: N/A
type	String	Definition: Image type. Range: • BUILD_IN: built-in system image • DEDICATED: image you have saved
update_at	Long	Definition: Time (UTC) when the image was last updated, accurate to millisecond. Range: N/A
visibility	String	Definition: Image visibility. Range: • PRIVATE: private image • PUBLIC: All users can perform read-only operations based on image_id.
workspace_id	String	Definition: Workspace ID. If no workspaces are available, the default value is 0 . If a workspace is created and used, use the actual value. Range: N/A

Parameter	Type	Description
flavor_type	String	Definition: Resource type of the image. Range: • ASCEND_SNT9: 910 chip • ASCEND_SNT9B: 910B chip • ASCEND_SNT3: 310 chip
swr_instance_id	String	Definition: Enterprise edition SWR repository ID. Range: N/A
show_tag	String	Definition: Image tag. Range: N/A
show_name	String	Definition: Image name. Range: N/A
tags	Array of TmsTagResponse objects	Definition: Image tag.

Table 4-38 Lease

Parameter	Type	Description
create_at	Long	Definition: UTC time when the instance is created, accurate to millisecond. Range: N/A
duration	Long	Definition: Instance runtime, which is calculated based on the instance creation time. If the instance creation time plus the runtime is greater than the current time, the system automatically stops the instance. Range: N/A
enable	Boolean	Definition: Specifies whether to enable auto stop. Range: Boolean • true: Auto stop is enabled. • false: Auto stop is disabled.

Parameter	Type	Description
type	String	Definition: Auto stop type. Range: • TIMING: auto stop • IDLE: stop when idle
update_at	Long	Definition: Time (UTC) when the instance is last updated (excluding liveness check), accurate to millisecond. Range: N/A

Table 4-39 Pool

Parameter	Type	Description
id	String	Definition: Dedicated resource pool ID. Range: N/A
name	String	Definition: Dedicated resource pool name. Range: N/A

Table 4-40 VolumeRes

Parameter	Type	Description
capacity	Integer	Definition: Storage capacity. Range: The default value is 5 GB for EVS and 50 GB for EFS. The maximum value is 4,096 GB.
category	String	Definition: Supported storage type. For details about the differences between the storage types, see Selecting Storage in DevEnviron . Range: • SFS • EVS • OBS • OBSFS: parallel file system • EFS: SFS Turbo

Parameter	Type	Description
mount_path	String	Definition: Directory of the notebook instance to which the storage is mounted. Currently, the directory is /home/ma-user/work/ . Range: N/A
ownership	String	Definition: Resource owner. Range: • MANAGED: Resources are managed by the service. • DEDICATED: Resources are managed by the user account. This mode is supported only when the instance category is EFS.
status	String	Definition: EVS disk capacity expansion status, which is RESIZING during capacity expansion and does not affect the instance. Range: N/A
id	String	Definition: EFS disk ID or OBS storage ID. This parameter is returned only when extended storage is used. Range: N/A
read_only	Boolean	Definition: Whether the mounting directory of extended storage is read-only. Range: N/A
dew_secret_name	String	Definition: Name of the AK/SK secret stored in DEW. Range: N/A
evs_sku_code	String	Definition: SKU code of EVS storage. Range: N/A
uri	String	Definition: Source path for mounting the storage when category is EFS , OBS , or OBSFS . Range: N/A

Parameter	Type	Description
mount_type	String	Definition: Storage mount type. Range: The value can be: • STATIC: Storage cannot be mounted or unmounted when the instance is running. • DYNAMIC: Storage can be mounted and unmounted when the instance is running.

Table 4-41 UserResponse

Parameter	Type	Description
id	String	Definition: User ID. Range: N/A
name	String	Definition: Username. Range: N/A
domain	Domain object	Definition: Domain information of an account.

Table 4-42 Domain

Parameter	Type	Description
id	String	Definition: Account ID. Range: N/A
name	String	Definition: Account name. Range: N/A

Table 4-43 AffinityType

Parameter	Type	Description
required_during_scheduling_ignored_during_execution	Array of AffinityRule objects	Definition: Strong affinity feature in the dedicated pool scenario. Constraints: key , values , and operator are mandatory.

Parameter	Type	Description
preferred_during_scheduling_ignored_during_execution	Array of AffinityRule objects	Definition: Weak affinity feature in the dedicated pool scenario. Constraints: key , values , and operator are mandatory, and weight is optional.

Table 4-44 AffinityRule

Parameter	Type	Description
key	String	Definition: Affinity description. Both default labels and custom labels are supported. For details about the default node labels, see Managing Node Labels . Constraints: Labels are key-value pairs. A valid label key consists of two segments: prefix (optional) and name, which are separated by a slash (/). Range: The name segment is mandatory and must be less than or equal to 63 characters. It must start and end with a letter or digit and only contain letters, digits, hyphens (-), underscores (_), and periods (.). The prefix is optional. If specified, the prefix must be a DNS subdomain: a series of DNS labels separated by periods (.), with a total of no more than 253 characters, followed by a slash (/). For details, see Labels and Selectors . Default Value: N/A.

Parameter	Type	Description
operator	String	Definition: Operator. Constraints: N/A Range: The following operators are supported: In: The label of the affinity or anti-affinity object is in the label value list (values field). NotIn: The label of the affinity or anti-affinity object is not in the label value list (values field). Exists: The affinity or anti-affinity object has a specified label key. DoesNotExist: The affinity or anti-affinity object does not have a specified label key. Gt: The label value of the scheduling node exceeds what is listed (string comparison). Lt: The label value of the scheduling node is under what is listed (string comparison). Default Value: N/A.
values	Array of strings	Definition: When configuring node affinity, enter the value of the node label. Constraints: The value must be 63 characters or fewer (can be empty). If the label value is not empty, the value must start and end with a letter or digit and can contain hyphens (-), underscores (_), periods (.), letters, or digits. For details, see Labels and Selectors .
weight	Integer	Weight value of the weak affinity node. The value ranges from 0 to 100. The value is NULL for strong affinity and optional for weak affinity.

Table 4-45 RunUserInfo

Parameter	Type	Description
uid	Integer	User ID of the container startup user.

Parameter	Type	Description
gid	Integer	Group ID of the container startup user.
user_name	String	Username of the container startup user.
group_name	String	Group name of the container startup user.

Table 4-46 VolumeResponse

Parameter	Type	Description
category	String	Definition: Extended storage type, for example, EFS , OBS , or OBSFS . Constraints: N/A
mount_path	String	Definition: Directory where the storage is mounted to a notebook instance. Constraints: N/A
url	String	Definition: Source path for mounting the storage when category is OBS or OBSFS . Constraints: N/A
status	String	Definition: Storage status. MOUNTING: being mounted MOUNTED: mounted UNMOUNTING: being unmounted UNMOUNTED: unmounted MOUNT_FAILED: mounting failed UNMOUNT_FAILED: unmounting failed Constraints: N/A
mount_type	String	Definition: Storage mount type. Constraints: N/A

Table 4-47 UserVpcResponse

Parameter	Type	Description
vpc_id	String	Definition: VPC ID. Range: N/A

Parameter	Type	Description
subnet_id	String	Definition: Subnet ID. Range: N/A
security_group_ids	Array of strings	Definition: Security group ID list. Range: N/A
connect_cidrs	String	Definition: Connected CIDR block list. Range: N/A
port_id	Array of strings	Definition: NIC ID. Range: N/A
port_ip	String	Definition: NIC IP address. Range: N/A

Table 4-48 TmsTagResponse

Parameter	Type	Description
key	String	Definition: TMS tag key. Range: N/A
value	String	Definition: TMS tag value. Range: N/A

Error Codes

See [Error Codes](#).

4.3 Querying All Notebook Instances

Function

This API is used to obtain information about all created notebook instances.

This API applies to the following scenarios: When you need to know the status and resource usage of all notebook instances in the current system or manage multiple notebook instances, you can use this API to obtain related information. Before using this API, ensure that you have created a notebook instance and have the query permission. After the API is successfully called, the system returns the list of all notebook instances. Details such as the instance ID, status, and creation time can be obtained. If you do not have the access permission, the API will return an error message.

Constraints

No constraints

Debugging

You can debug this API through automatic authentication in [API Explorer](#) or use the SDK sample code generated by API Explorer.

Authorization Information

Each account has all the permissions required to call all APIs, but IAM users must be assigned the required permissions.

- If you are using role/policy-based authorization, see [Permissions Policies and Supported Actions](#) for details on the required permissions.
- If you are using identity policy-based authorization, no identity policy-based permission required for calling this API.

URI

GET /v1/{project_id}/notebooks/all

Table 4-49 Path Parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Definition: Project ID. For details, see Obtaining a Project ID and Name . Constraints: N/A Range: N/A Default Value: N/A

Table 4-50 Query Parameters

Parameter	Mandatory	Type	Description
feature	No	String	Definition: Instance type Constraints: N/A Range: Enums: • DEFAULT: free CodeLab instance. Each user can create only one. • NOTEBOOK: billed instance Default Value: NOTEBOOK
limit	No	Integer	Definition: Number of instances displayed on each page Constraints: N/A Range: [10,20,50] Default Value: 10
name	No	String	Definition: Instance name. Fuzzy match is supported. Constraints: N/A Range: The value can contain a maximum of 128 characters. Letters, digits, hyphens (-), and underscores (_) are allowed. Default Value: N/A
pool_id	No	String	Definition: ID of a dedicated resource pool. For details about how to obtain the ID, see Obtaining Resource Pools . Constraints: N/A Range: This value contains 4 to 64 characters. Lowercase letters, digits, and hyphens (-) are allowed. It must start with a lowercase letter and end with a lowercase letter or digit. Default Value: N/A

Parameter	Mandatory	Type	Description
offset	No	Integer	Definition: Start offset of the records on each page Constraints: N/A Range: N/A Default Value: 0
owner	No	String	Definition: User ID of the instance. This parameter is valid only when the account is a big account or has the admin permission. Generally, the value is the ID of the current login user. Constraints: N/A Range: This value contains 32 characters. Lowercase letters and digits are allowed. Default Value: N/A
sort_dir	No	String	Definition: Instance sorting mode Constraints: N/A Range: Enums: • ASC: ascending order • DESC: descending order Default Value: DESC
sort_key	No	String	Definition: Sorting field. Separate multiple fields with commas (,). Constraints: N/A Range: The value can contain a maximum of 128 characters. Letters, digits, hyphens (-), underscores (_), and commas (,) are allowed. Default Value: N/A

Parameter	Mandatory	Type	Description
status	No	String	Definition: Instance status Constraints: N/A Range: Enums: • INIT: The instance is being initialized. • CREATING: The instance is being created. • STARTING: The instance is starting. • STOPPING: The instance is being stopped. • DELETING: The instance is being deleted. • RUNNING: The instance is running. • STOPPED: The instance has been stopped. • SNAPSHOTTING: The image of the instance is being saved. • CREATE_FAILED: Creating the instance failed. • START_FAILED: Starting the instance failed. • DELETE_FAILED: Deleting the instance failed. • ERROR: An error occurred. • DELETED: The instance has been deleted. • FROZEN: The instance is frozen. Default Value: N/A
workspace_id	No	String	Definition: Workspace ID. For details about how to obtain the value, see Obtaining Workspaces . If no workspace is created, the default value is 0 . If a workspace is created and used, use the actual value. Constraints: N/A Range: N/A Default Value: 0

Parameter	Mandatory	Type	Description
flavor	No	String	Definition: Instance flavor. The following flavors are for reference only. Obtain the flavors displayed on the console in the target region. • modelarts.vm.cpu.2u: General-purpose Intel CPU flavor, ideal for rapid data exploration and experiments • modelarts.vm.cpu.8u: General computing-plus Intel CPU flavors, ideal for compute-intensive applications Constraints: N/A Range: N/A Default Value: N/A
image_id	No	String	Definition : ID of the image used for creating notebook instances. The ID is in UUID format. For details about how to obtain the image ID, see [Querying Supported Images]] (https://support.huaweicloud.com/intl/en-us/api-modelarts/ListImage.html). Constraints: N/A Range: Valid image IDs obtained by calling the API for Querying Supported Images. Default Value: N/A
id	No	String	Definition: Notebook instance ID. The ID is in the format of a Universally Unique Identifier (UUID). For details about how to obtain the ID, see Querying Notebook Instances. Constraints: N/A Range: N/A Default Value: N/A

Parameter	Mandatory	Type	Description
billing	No	String	Definition: Instance billing mode. Constraints: N/A Range: The value can be: • COMPUTE: Compute resource billing • STORAGE: Storage resource billing • ALL: All billing modes Default Value: N/A
tags	No	String	Definition: Instance tag information. Constraints: N/A Range: The value cannot start with a comma (,) or vertical bar (), end with a comma (,), or contain consecutive vertical bars () or commas (,). Only Spanish, Portuguese, and special characters (_ . : / = + - @) are allowed. Separate characters with commas (,) or vertical bars (). Default Value: N/A

Request Parameters

None

Response Parameters

Status code: 200

Table 4-51 Response body parameters

Parameter	Type	Description
current	Integer	Definition: Current page number. Range: Positive integers
data	Array of NotebookResp objects	Definition: Notebook instance data.

Parameter	Type	Description
pages	Integer	Definition: Total number of pages. Range: Positive integers
size	Integer	Definition: Number of records on each page. Range: Positive integers
total	Long	Definition: Total number of records. Range: Non-negative integers

Table 4-52 NotebookResp

Parameter	Type	Description
action_progress	Array of JobProgress objects	Definition: Initialization progress of the instance.
description	String	Definition: Instance description. Range: N/A
endpoints	Array of EndpointsRes objects	Definition: Local IDE (such as PyCharm and VS Code) or SSH client for remotely accessing a notebook instance through SSH.
fail_reason	String	Definition: Instance failure cause. Range: N/A
flavor	String	Definition: Instance flavor. 1. If you select a system specification, the returned value is the system specification code. 2. If you select a custom specification when creating an instance, this parameter is always returned as custom.flavor.spec.code . Range: N/A.
custom_spec	NotebookCustomSpecRep object	Definition: Custom specifications of an instance. This parameter is returned only when a CPU or GPU dedicated pool is used and the custom specifications are used. Range: N/A.
id	String	Definition: Instance ID. Range: N/A

Parameter	Type	Description
image	Image object	Definition: Instance image information.
lease	Lease object	Definition: Countdown to auto stop of an instance.
name	String	Definition: Instance name. Range: N/A
pool	Pool object	Definition: Basic information about the dedicated pool, which is returned by the instance created in the dedicated pool.
status	String	Definition: Instance status. Range: • INIT: The instance is being initialized. • CREATING: The instance is being created. • STARTING: The instance is being started. • STOPPING: The instance is being stopped. • DELETING: The instance is being deleted. • RUNNING: The instance is running. • STOPPED: The instance has been stopped. • SNAPSHOTTING: The image of the instance is being saved. • CREATE_FAILED: Creating the instance failed. • START_FAILED: Starting the instance failed. • DELETE_FAILED: Deleting the instance failed. • ERROR: An error occurred. • DELETED: The instance has been deleted. • FROZEN: The instance is frozen.
token	String	Description: Token used for notebook authentication. Range: N/A

Parameter	Type	Description
url	String	Definition: URL for accessing the instance. Range: N/A
volume	VolumeRes object	Definition: Instance storage information.
workspace_id	String	Definition: Workspace ID. If no workspaces are available, the default value is 0 . If a workspace is created and used, use the actual value. Range: N/A
feature	String	Definition: Instance type. Range: • DEFAULT: free CodeLab instance. Each user can create only one. • NOTEBOOK: billed instance.
billing_items	Array of strings	Definition: Billing resource type. Range: • STORAGE: Storage resource billing • COMPUTE: Computing resources billing • ALL: All billing types
user	UserResponse object	Description: Account information.
affinity	AffinityType object	Definition: Affinity information.
run_user	RunUserInfo object	Definition: Information about the startup user and startup user group.
data_volumes	Array of VolumeResponse objects	Definition: Extended storage information.
ip	String	Definition: IP address of the node where the instance is located. Range: N/A
user_vpc	UserVpcResponse object	Definition: User VPC configuration.
user_id	String	Definition: User ID. Range: N/A

Parameter	Type	Description
is_need_credentials	Boolean	Definition: Whether to create a user secret by default. The default value is true . Range: N/A
jupyter_version	String	Definition: Jupyter version. Range: N/A
tags	Array of TmsTagResponse objects	Definition: Instance tag.

Table 4-53 JobProgress

Parameter	Type	Description
status	String	Definition: Job status in a specified step. Range: • WAITING: The job is awaiting. • PROCESSING: The job is being processed. • FAILED: The job failed. • COMPLETED: The job is complete.
step	Integer	Definition: Job step. Range: • 1: Prepare storage. • 2: Prepare compute resources. • 3: Configure the network. • 4: Initialize the instance.
description	String	Definition: Job description in a specified step. Range: N/A

Table 4-54 EndpointsRes

Parameter	Type	Description
key_pair_names	Array of strings	Definition: List of SSH key pairs. You can set multiple key pairs to access an SSH instance at the same time. Range: N/A

Parameter	Type	Description
service	String	Definition: Method for accessing the notebook instance. Range: • NOTEBOOK: You can access notebook instances using HTTPS. • SSH: You can remotely access notebook instances through SSH.
uri	String	Definition: Private IP address of the instance. Range: N/A

Table 4-55 NotebookCustomSpecRep

Parameter	Type	Description
gpu	Float	Definition: Number of GPUs of an instance. Range: N/A
gpu_type	String	Definition: GPU acceleration PU of an instance. Range: N/A
cpu	Float	Definition: Number of CPUs of an instance. Range: The integer part can contain at most 10 digits and the decimal part can contain at most 2 digits. The value cannot be smaller than 0.4 .
memory	Float	Definition: Memory size of an instance. Range: The value must be an integer containing at most 10 digits, and the value cannot be smaller than 513 .
arch	String	Definition: CPU architecture of an instance. Range: The value can be: • X86_64: x86 architecture • AARCH64: Arm architecture

Parameter	Type	Description
category	String	Definition: Specification type of an instance. Range: The value can be: • CPU • GPU
resource_flavor	String	Definition: Specifications of the target resource pool node selected for the instance. Range: N/A

Table 4-56 Image

Parameter	Type	Description
arch	String	Definition: Processor architecture supported by the image. Range • X86_64: x86 architecture • AARCH64: Arm architecture
create_at	Long	Definition: UTC time when the image is created, accurate to millisecond. Range: N/A
description	String	Definition: Image description. Range: Up to 512 characters
dev_services	Array of strings	Definition: Services supported by the image. Range: • NOTEBOOK: You can access a notebook instance using HTTPS. • SSH: You can remotely access a notebook instance from a local IDE through SSH.
id	String	Definition: ID of the image used for creating notebook instances. The ID is in Universally Unique Identifier (UUID) format. For details, see Querying Supported Images . Range: N/A

Parameter	Type	Description
name	String	Definition: Image name. Range: The name can contain a maximum of 512 characters. Lowercase letters, digits, hyphens (-), underscores (_), and periods (.) are allowed.
namespace	String	Definition: Organization to which the image belongs. You can create and view an organization on the Organization Management page of the SWR console. Range: N/A
origin	String	Definition: Image source. Range: • CUSTOMIZE: custom image • IMAGE_SAVE: image saved by a notebook instance
resource_categories	Array of strings	Definition: Flavors supported by the image. Range: • CPU • GPU • ASCEND
service_type	String	Definition: Supported image types. Range: • COMMON: common image • INFERENCE: image used for inference • TRAIN: image used for training • DEV: image used for development and debugging • UNKNOWN: image whose supported services are not specified
size	Long	Definition: Image size, in KB. Range: N/A

Parameter	Type	Description
status	String	Definition: Image status. Range: • INIT: The image is being initialized. • CREATING: The image is being saved. In this case, the notebook instance is unavailable. • CREATE_FAILED: Saving the image failed. • ERROR: An error occurs. • DELETED: The image has been deleted. • ACTIVE: The image has been saved, which you can view on the SWR console and use to create notebook instances.
status_message	String	Definition: Build information during image saving. Range: N/A
swr_path	String	Definition: SWR image path. Range: N/A
tag	String	Definition: Image tag. Range: N/A
type	String	Definition: Image type. Range: • BUILD_IN: built-in system image • DEDICATED: image you have saved
update_at	Long	Definition: Time (UTC) when the image was last updated, accurate to millisecond. Range: N/A
visibility	String	Definition: Image visibility. Range: • PRIVATE: private image • PUBLIC: All users can perform read-only operations based on image_id.
workspace_id	String	Definition: Workspace ID. If no workspaces are available, the default value is 0 . If a workspace is created and used, use the actual value. Range: N/A

Parameter	Type	Description
flavor_type	String	Definition: Resource type of the image. Range: • ASCEND_SNT9: 910 chip • ASCEND_SNT9B: 910B chip • ASCEND_SNT3: 310 chip
swr_instance_id	String	Definition: Enterprise edition SWR repository ID. Range: N/A
show_tag	String	Definition: Image tag. Range: N/A
show_name	String	Definition: Image name. Range: N/A
tags	Array of TmsTagResponse objects	Definition: Image tag.

Table 4-57 Lease

Parameter	Type	Description
create_at	Long	Definition: UTC time when the instance is created, accurate to millisecond. Range: N/A
duration	Long	Definition: Instance runtime, which is calculated based on the instance creation time. If the instance creation time plus the runtime is greater than the current time, the system automatically stops the instance. Range: N/A
enable	Boolean	Definition: Specifies whether to enable auto stop. Range: Boolean • true: Auto stop is enabled. • false: Auto stop is disabled.

Parameter	Type	Description
type	String	Definition: Auto stop type. Range: • TIMING: auto stop • IDLE: stop when idle
update_at	Long	Definition: Time (UTC) when the instance is last updated (excluding liveness check), accurate to millisecond. Range: N/A

Table 4-58 Pool

Parameter	Type	Description
id	String	Definition: Dedicated resource pool ID. Range: N/A
name	String	Definition: Dedicated resource pool name. Range: N/A

Table 4-59 VolumeRes

Parameter	Type	Description
capacity	Integer	Definition: Storage capacity. Range: The default value is 5 GB for EVS and 50 GB for EFS. The maximum value is 4,096 GB.
category	String	Definition: Supported storage type. For details about the differences between the storage types, see Selecting Storage in DevEnviron . Range: • SFS • EVS • OBS • OBSFS: parallel file system • EFS: SFS Turbo

Parameter	Type	Description
mount_path	String	Definition: Directory of the notebook instance to which the storage is mounted. Currently, the directory is /home/ma-user/work/ . Range: N/A
ownership	String	Definition: Resource owner. Range: • MANAGED: Resources are managed by the service. • DEDICATED: Resources are managed by the user account. This mode is supported only when the instance category is EFS.
status	String	Definition: EVS disk capacity expansion status, which is RESIZING during capacity expansion and does not affect the instance. Range: N/A
id	String	Definition: EFS disk ID or OBS storage ID. This parameter is returned only when extended storage is used. Range: N/A
read_only	Boolean	Definition: Whether the mounting directory of extended storage is read-only. Range: N/A
dew_secret_name	String	Definition: Name of the AK/SK secret stored in DEW. Range: N/A
evs_sku_code	String	Definition: SKU code of EVS storage. Range: N/A
uri	String	Definition: Source path for mounting the storage when category is EFS , OBS , or OBSFS . Range: N/A

Parameter	Type	Description
mount_type	String	Definition: Storage mount type. Range: The value can be: • STATIC: Storage cannot be mounted or unmounted when the instance is running. • DYNAMIC: Storage can be mounted and unmounted when the instance is running.

Table 4-60 UserResponse

Parameter	Type	Description
id	String	Definition: User ID. Range: N/A
name	String	Definition: Username. Range: N/A
domain	Domain object	Definition: Domain information of an account.

Table 4-61 Domain

Parameter	Type	Description
id	String	Definition: Account ID. Range: N/A
name	String	Definition: Account name. Range: N/A

Table 4-62 AffinityType

Parameter	Type	Description
required_during_scheduling_ignored_during_execution	Array of AffinityRule objects	Definition: Strong affinity feature in the dedicated pool scenario. Constraints: key , values , and operator are mandatory.

Parameter	Type	Description
preferred_during_scheduling_ignored_during_execution	Array of AffinityRule objects	Definition: Weak affinity feature in the dedicated pool scenario. Constraints: key , values , and operator are mandatory, and weight is optional.

Table 4-63 AffinityRule

Parameter	Type	Description
key	String	Definition: Affinity description. Both default labels and custom labels are supported. For details about the default node labels, see Managing Node Labels . Constraints: Labels are key-value pairs. A valid label key consists of two segments: prefix (optional) and name, which are separated by a slash (/). Range: The name segment is mandatory and must be less than or equal to 63 characters. It must start and end with a letter or digit and only contain letters, digits, hyphens (-), underscores (_), and periods (.). The prefix is optional. If specified, the prefix must be a DNS subdomain: a series of DNS labels separated by periods (.), with a total of no more than 253 characters, followed by a slash (/). For details, see Labels and Selectors . Default Value: N/A.

Parameter	Type	Description
operator	String	Definition: Operator. Constraints: N/A Range: The following operators are supported: In: The label of the affinity or anti-affinity object is in the label value list (values field). NotIn: The label of the affinity or anti-affinity object is not in the label value list (values field). Exists: The affinity or anti-affinity object has a specified label key. DoesNotExist: The affinity or anti-affinity object does not have a specified label key. Gt: The label value of the scheduling node exceeds what is listed (string comparison). Lt: The label value of the scheduling node is under what is listed (string comparison). Default Value: N/A.
values	Array of strings	Definition: When configuring node affinity, enter the value of the node label. Constraints: The value must be 63 characters or fewer (can be empty). If the label value is not empty, the value must start and end with a letter or digit and can contain hyphens (-), underscores (_), periods (.), letters, or digits. For details, see Labels and Selectors .
weight	Integer	Weight value of the weak affinity node. The value ranges from 0 to 100. The value is NULL for strong affinity and optional for weak affinity.

Table 4-64 RunUserInfo

Parameter	Type	Description
uid	Integer	User ID of the container startup user.

Parameter	Type	Description
gid	Integer	Group ID of the container startup user.
user_name	String	Username of the container startup user.
group_name	String	Group name of the container startup user.

Table 4-65 VolumeResponse

Parameter	Type	Description
category	String	Definition: Extended storage type, for example, EFS , OBS , or OBSFS . Constraints: N/A
mount_path	String	Definition: Directory where the storage is mounted to a notebook instance. Constraints: N/A
url	String	Definition: Source path for mounting the storage when category is OBS or OBSFS . Constraints: N/A
status	String	Definition: Storage status. MOUNTING: being mounted MOUNTED: mounted UNMOUNTING: being unmounted UNMOUNTED: unmounted MOUNT_FAILED: mounting failed UNMOUNT_FAILED: unmounting failed Constraints: N/A
mount_type	String	Definition: Storage mount type. Constraints: N/A

Table 4-66 UserVpcResponse

Parameter	Type	Description
vpc_id	String	Definition: VPC ID. Range: N/A

Parameter	Type	Description
subnet_id	String	Definition: Subnet ID. Range: N/A
security_group_ids	Array of strings	Definition: Security group ID list. Range: N/A
connect_cidrs	String	Definition: Connected CIDR block list. Range: N/A
port_id	Array of strings	Definition: NIC ID. Range: N/A
port_ip	String	Definition: NIC IP address. Range: N/A

Table 4-67 TmsTagResponse

Parameter	Type	Description
key	String	Definition: TMS tag key. Range: N/A
value	String	Definition: TMS tag value. Range: N/A

403	Forbidden
404	Not found

Error Codes

See [Error Codes](#).

4.4 Querying Details of a Notebook Instance

Function

This API is used to obtain the details of a specified notebook instance.

This API applies to the following scenario: When you need to view the detailed configuration and status of a specified notebook instance or obtain the access link, you can use this API to obtain related information. Before using this API, ensure that a notebook instance exists and you have the query permission. After the API is successfully called, the system returns the instance ID, name, specifications, image, status, and URL for access the instance. If the instance does not exist or you do not have the access permission, the API will return an error message.

Constraints

No constraints

Debugging

You can debug this API through automatic authentication in [API Explorer](#) or use the SDK sample code generated by API Explorer.

Authorization Information

Each account has all the permissions required to call all APIs, but IAM users must be assigned the required permissions.

- If you are using role/policy-based authorization, see [Permissions Policies and Supported Actions](#) for details on the required permissions.
- If you are using identity policy-based authorization, the following identity policy-based permissions are required.

Action	Access Level	Resource Type (*: required)	Condition Key	Alias	Dependencies
modelarts:notebook:get	Read	notebook*	g:ResourceTag/<tag-key>	-	-
		-	• g:EnterpriseProjectId • modelarts:poolType • modelarts:poolId		

URI

GET /v1/{project_id}/notebooks/{id}

Table 4-68 Path Parameters

Parameter	Mandatory	Type	Description
id	Yes	String	Definition: Notebook instance ID. The ID is in the format of a Universally Unique Identifier (UUID). Constraints: N/A Range: N/A Default Value: N/A
project_id	Yes	String	Definition: Project ID. For details, see Obtaining a Project ID and Name . Constraints: N/A Range: N/A Default Value: N/A

Request Parameters

None

Response Parameters

Status code: 200

Table 4-69 Response body parameters

Parameter	Type	Description
action_progress	Array of JobProgress objects	Definition: Initialization progress of the instance.
description	String	Definition: Instance description. Range: N/A
endpoints	Array of EndpointsRes objects	Definition: Local IDE (such as PyCharm and VS Code) or SSH client for remotely accessing a notebook instance through SSH.
fail_reason	String	Definition: Instance failure cause. Range: N/A

Parameter	Type	Description
flavor	String	Definition: Instance flavor. 1. If you select a system specification, the returned value is the system specification code. 2. If you select a custom specification when creating an instance, this parameter is always returned as custom.flavor.spec.code . Range: N/A.
custom_spec	NotebookCustomSpecRep object	Definition: Custom specifications of an instance. This parameter is returned only when a CPU or GPU dedicated pool is used and the custom specifications are used. Range: N/A.
id	String	Definition: Instance ID. Range: N/A
image	Image object	Definition: Instance image information.
lease	Lease object	Definition: Countdown to auto stop of an instance.
name	String	Definition: Instance name. Range: N/A
pool	Pool object	Definition: Basic information about the dedicated pool, which is returned by the instance created in the dedicated pool.

Parameter	Type	Description
status	String	Definition: Instance status. Range: • INIT: The instance is being initialized. • CREATING: The instance is being created. • STARTING: The instance is being started. • STOPPING: The instance is being stopped. • DELETING: The instance is being deleted. • RUNNING: The instance is running. • STOPPED: The instance has been stopped. • SNAPSHOTTING: The image of the instance is being saved. • CREATE_FAILED: Creating the instance failed. • START_FAILED: Starting the instance failed. • DELETE_FAILED: Deleting the instance failed. • ERROR: An error occurred. • DELETED: The instance has been deleted. • FROZEN: The instance is frozen.
token	String	Description: Token used for notebook authentication. Range: N/A
url	String	Definition: URL for accessing the instance. Range: N/A
volume	VolumeRes object	Definition: Instance storage information.
workspace_id	String	Definition: Workspace ID. If no workspaces are available, the default value is 0. If a workspace is created and used, use the actual value. Range: N/A

Parameter	Type	Description
feature	String	Definition: Instance type. Range: • DEFAULT: free CodeLab instance. Each user can create only one. • NOTEBOOK: billed instance.
billing_items	Array of strings	Definition: Billing resource type. Range: • STORAGE: Storage resource billing • COMPUTE: Computing resources billing • ALL: All billing types
user	UserResponse object	Description: Account information.
affinity	AffinityType object	Definition: Affinity information.
run_user	RunUserInfo object	Definition: Information about the startup user and startup user group.
data_volumes	Array of VolumeResponse objects	Definition: Extended storage information.
ip	String	Definition: IP address of the node where the instance is located. Range: N/A
user_vpc	UserVpcResponse object	Definition: User VPC configuration.
user_id	String	Definition: User ID. Range: N/A
is_need_credentials	Boolean	Definition: Whether to create a user secret by default. The default value is true . Range: N/A
jupyter_version	String	Definition: Jupyter version. Range: N/A
tags	Array of TmsTagResponse objects	Definition: Instance tag.

Table 4-70 JobProgress

Parameter	Type	Description
status	String	Definition: Job status in a specified step. Range: • WAITING: The job is awaiting. • PROCESSING: The job is being processed. • FAILED: The job failed. • COMPLETED: The job is complete.
step	Integer	Definition: Job step. Range: • 1: Prepare storage. • 2: Prepare compute resources. • 3: Configure the network. • 4: Initialize the instance.
description	String	Definition: Job description in a specified step. Range: N/A

Table 4-71 EndpointsRes

Parameter	Type	Description
key_pair_names	Array of strings	Definition: List of SSH key pairs. You can set multiple key pairs to access an SSH instance at the same time. Range: N/A
service	String	Definition: Method for accessing the notebook instance. Range: • NOTEBOOK: You can access notebook instances using HTTPS. • SSH: You can remotely access notebook instances through SSH.
uri	String	Definition: Private IP address of the instance. Range: N/A

Table 4-72 NotebookCustomSpecRep

Parameter	Type	Description
gpu	Float	Definition: Number of GPUs of an instance. Range: N/A
gpu_type	String	Definition: GPU acceleration PU of an instance. Range: N/A
cpu	Float	Definition: Number of CPUs of an instance. Range: The integer part can contain at most 10 digits and the decimal part can contain at most 2 digits. The value cannot be smaller than 0.4 .
memory	Float	Definition: Memory size of an instance. Range: The value must be an integer containing at most 10 digits, and the value cannot be smaller than 513 .
arch	String	Definition: CPU architecture of an instance. Range: The value can be: • X86_64: x86 architecture • AARCH64: Arm architecture
category	String	Definition: Specification type of an instance. Range: The value can be: • CPU • GPU
resource_flavor	String	Definition: Specifications of the target resource pool node selected for the instance. Range: N/A

Table 4-73 Image

Parameter	Type	Description
arch	String	Definition: Processor architecture supported by the image. Range • X86_64: x86 architecture • AARCH64: Arm architecture
create_at	Long	Definition: UTC time when the image is created, accurate to millisecond. Range: N/A
description	String	Definition: Image description. Range: Up to 512 characters
dev_services	Array of strings	Definition: Services supported by the image. Range: • NOTEBOOK: You can access a notebook instance using HTTPS. • SSH: You can remotely access a notebook instance from a local IDE through SSH.
id	String	Definition: ID of the image used for creating notebook instances. The ID is in Universally Unique Identifier (UUID) format. For details, see Querying Supported Images . Range: N/A
name	String	Definition: Image name. Range: The name can contain a maximum of 512 characters. Lowercase letters, digits, hyphens (-), underscores (_), and periods (.) are allowed.
namespace	String	Definition: Organization to which the image belongs. You can create and view an organization on the Organization Management page of the SWR console. Range: N/A

Parameter	Type	Description
origin	String	Definition: Image source. Range: • CUSTOMIZE: custom image • IMAGE_SAVE: image saved by a notebook instance
resource_categories	Array of strings	Definition: Flavors supported by the image. Range: • CPU • GPU • ASCEND
service_type	String	Definition: Supported image types. Range: • COMMON: common image • INFERENCE: image used for inference • TRAIN: image used for training • DEV: image used for development and debugging • UNKNOWN: image whose supported services are not specified
size	Long	Definition: Image size, in KB. Range: N/A
status	String	Definition: Image status. Range: • INIT: The image is being initialized. • CREATING: The image is being saved. In this case, the notebook instance is unavailable. • CREATE_FAILED: Saving the image failed. • ERROR: An error occurs. • DELETED: The image has been deleted. • ACTIVE: The image has been saved, which you can view on the SWR console and use to create notebook instances.
status_message	String	Definition: Build information during image saving. Range: N/A

Parameter	Type	Description
swr_path	String	Definition: SWR image path. Range: N/A
tag	String	Definition: Image tag. Range: N/A
type	String	Definition: Image type. Range: • BUILD_IN: built-in system image • DEDICATED: image you have saved
update_at	Long	Definition: Time (UTC) when the image was last updated, accurate to millisecond. Range: N/A
visibility	String	Definition: Image visibility. Range: • PRIVATE: private image • PUBLIC: All users can perform read-only operations based on image_id.
workspace_id	String	Definition: Workspace ID. If no workspaces are available, the default value is 0 . If a workspace is created and used, use the actual value. Range: N/A
flavor_type	String	Definition: Resource type of the image. Range: • ASCEND_SNT9: 910 chip • ASCEND_SNT9B: 910B chip • ASCEND_SNT3: 310 chip
swr_instance_id	String	Definition: Enterprise edition SWR repository ID. Range: N/A
show_tag	String	Definition: Image tag. Range: N/A
show_name	String	Definition: Image name. Range: N/A
tags	Array of TmsTagResponse objects	Definition: Image tag.

Table 4-74 Lease

Parameter	Type	Description
create_at	Long	Definition: UTC time when the instance is created, accurate to millisecond. Range: N/A
duration	Long	Definition: Instance runtime, which is calculated based on the instance creation time. If the instance creation time plus the runtime is greater than the current time, the system automatically stops the instance. Range: N/A
enable	Boolean	Definition: Specifies whether to enable auto stop. Range: Boolean • true: Auto stop is enabled. • false: Auto stop is disabled.
type	String	Definition: Auto stop type. Range: • TIMING: auto stop • IDLE: stop when idle
update_at	Long	Definition: Time (UTC) when the instance is last updated (excluding liveness check), accurate to millisecond. Range: N/A

Table 4-75 Pool

Parameter	Type	Description
id	String	Definition: Dedicated resource pool ID. Range: N/A
name	String	Definition: Dedicated resource pool name. Range: N/A

Table 4-76 VolumeRes

Parameter	Type	Description
capacity	Integer	Definition: Storage capacity. Range: The default value is 5 GB for EVS and 50 GB for EFS. The maximum value is 4,096 GB.
category	String	Definition: Supported storage type. For details about the differences between the storage types, see Selecting Storage in DevEnviron . Range: • SFS • EVS • OBS • OBSFS: parallel file system • EFS: SFS Turbo
mount_path	String	Definition: Directory of the notebook instance to which the storage is mounted. Currently, the directory is <code>/home/ma-user/work/</code> . Range: N/A
ownership	String	Definition: Resource owner. Range: • MANAGED: Resources are managed by the service. • DEDICATED: Resources are managed by the user account. This mode is supported only when the instance category is EFS.
status	String	Definition: EVS disk capacity expansion status, which is RESIZING during capacity expansion and does not affect the instance. Range: N/A
id	String	Definition: EFS disk ID or OBS storage ID. This parameter is returned only when extended storage is used. Range: N/A
read_only	Boolean	Definition: Whether the mounting directory of extended storage is read-only. Range: N/A

Parameter	Type	Description
dew_secret_name	String	Definition: Name of the AK/SK secret stored in DEW. Range: N/A
evs_sku_code	String	Definition: SKU code of EVS storage. Range: N/A
uri	String	Definition: Source path for mounting the storage when category is EFS , OBS , or OBSFS . Range: N/A
mount_type	String	Definition: Storage mount type. Range: The value can be: • STATIC: Storage cannot be mounted or unmounted when the instance is running. • DYNAMIC: Storage can be mounted and unmounted when the instance is running.

Table 4-77 UserResponse

Parameter	Type	Description
id	String	Definition: User ID. Range: N/A
name	String	Definition: Username. Range: N/A
domain	Domain object	Definition: Domain information of an account.

Table 4-78 Domain

Parameter	Type	Description
id	String	Definition: Account ID. Range: N/A
name	String	Definition: Account name. Range: N/A

Table 4-79 AffinityType

Parameter	Type	Description
required_during_scheduling_ignored_during_execution	Array of AffinityRule objects	Definition: Strong affinity feature in the dedicated pool scenario. Constraints: key , values , and operator are mandatory.
preferred_during_scheduling_ignored_during_execution	Array of AffinityRule objects	Definition: Weak affinity feature in the dedicated pool scenario. Constraints: key , values , and operator are mandatory, and weight is optional.

Table 4-80 AffinityRule

Parameter	Type	Description
key	String	Definition: Affinity description. Both default labels and custom labels are supported. For details about the default node labels, see Managing Node Labels . Constraints: Labels are key-value pairs. A valid label key consists of two segments: prefix (optional) and name, which are separated by a slash (/). Range: The name segment is mandatory and must be less than or equal to 63 characters. It must start and end with a letter or digit and only contain letters, digits, hyphens (-), underscores (_), and periods (.). The prefix is optional. If specified, the prefix must be a DNS subdomain: a series of DNS labels separated by periods (.), with a total of no more than 253 characters, followed by a slash (/). For details, see Labels and Selectors . Default Value: N/A.

Parameter	Type	Description
operator	String	Definition: Operator. Constraints: N/A Range: The following operators are supported: In: The label of the affinity or anti-affinity object is in the label value list (values field). NotIn: The label of the affinity or anti-affinity object is not in the label value list (values field). Exists: The affinity or anti-affinity object has a specified label key. DoesNotExist: The affinity or anti-affinity object does not have a specified label key. Gt: The label value of the scheduling node exceeds what is listed (string comparison). Lt: The label value of the scheduling node is under what is listed (string comparison). Default Value: N/A.
values	Array of strings	Definition: When configuring node affinity, enter the value of the node label. Constraints: The value must be 63 characters or fewer (can be empty). If the label value is not empty, the value must start and end with a letter or digit and can contain hyphens (-), underscores (_), periods (.), letters, or digits. For details, see Labels and Selectors .
weight	Integer	Weight value of the weak affinity node. The value ranges from 0 to 100. The value is NULL for strong affinity and optional for weak affinity.

Table 4-81 RunUserInfo

Parameter	Type	Description
uid	Integer	User ID of the container startup user.

Parameter	Type	Description
gid	Integer	Group ID of the container startup user.
user_name	String	Username of the container startup user.
group_name	String	Group name of the container startup user.

Table 4-82 VolumeResponse

Parameter	Type	Description
category	String	Definition: Extended storage type, for example, EFS , OBS , or OBSFS . Constraints: N/A
mount_path	String	Definition: Directory where the storage is mounted to a notebook instance. Constraints: N/A
url	String	Definition: Source path for mounting the storage when category is OBS or OBSFS . Constraints: N/A
status	String	Definition: Storage status. MOUNTING: being mounted MOUNTED: mounted UNMOUNTING: being unmounted UNMOUNTED: unmounted MOUNT_FAILED: mounting failed UNMOUNT_FAILED: unmounting failed Constraints: N/A
mount_type	String	Definition: Storage mount type. Constraints: N/A

Table 4-83 UserVpcResponse

Parameter	Type	Description
vpc_id	String	Definition: VPC ID. Range: N/A

Parameter	Type	Description
subnet_id	String	Definition: Subnet ID. Range: N/A
security_group_ids	Array of strings	Definition: Security group ID list. Range: N/A
connect_cidrs	String	Definition: Connected CIDR block list. Range: N/A
port_id	Array of strings	Definition: NIC ID. Range: N/A
port_ip	String	Definition: NIC IP address. Range: N/A

Table 4-84 TmsTagResponse

Parameter	Type	Description
key	String	Definition: TMS tag key. Range: N/A
value	String	Definition: TMS tag value. Range: N/A

Error Codes

See [Error Codes](#).

4.5 Updating a Notebook Instance

Function

This API is used to modify the instance configurations, including its name, description, specifications, and image.

This API applies to the following scenario: When you need to modify the configuration of a notebook instance to adapt to new requirements, you can use this API to update the instance details. Before using this API, ensure that you have logged in to the system and have the permission to perform operations on the target notebook instance. In addition, the notebook instance must have been stopped. After this API is called, the system updates the configuration of the specified notebook instance. If you do not have the permission to perform operations on the specified notebook instance or the notebook instance has not been stopped, the API will return an error message. If the specified notebook instance is not found or the modification to the parameters is invalid, the API will return an error message.

Constraints

None

Debugging

You can debug this API through automatic authentication in [API Explorer](#) or use the SDK sample code generated by API Explorer.

Authorization Information

Each account has all the permissions required to call all APIs, but IAM users must be assigned the required permissions.

- If you are using role/policy-based authorization, see [Permissions Policies and Supported Actions](#) for details on the required permissions.
- If you are using identity policy-based authorization, the following identity policy-based permissions are required.

Action	Access Level	Resource Type (*: required)	Condition Key	Alias	Dependencies
modelarts:notebook:update	Write	notebook*	g:ResourceTag/<tag-key>	-	-
		-	• g:EnterpriseProjectId • modelarts:poolType • modelarts:poolId		

URI

PUT /v1/{project_id}/notebooks/{id}

Table 4-85 Path Parameters

Parameter	Mandatory	Type	Description
id	Yes	String	Definition: Notebook instance ID. The ID is in the format of a Universally Unique Identifier (UUID). For details about how to obtain the ID, see Querying Notebook Instances . Constraints: N/A Range: N/A Default Value: N/A
project_id	Yes	String	Definition: Project ID. For details, see Obtaining a Project ID and Name . Constraints: N/A Range: N/A Default Value: N/A

Request Parameters

Table 4-86 Request body parameters

Parameter	Mandatory	Type	Description
description	No	String	Definition: Instance description can be updated. Constraints: N/A Range: The value can contain up to 512 characters and cannot contain special characters (&<>"'"). Default Value: N/A
endpoints	No	Array of EndpointsRequest objects	Definition: Only local IDE (such as PyCharm and VS Code) or SSH client can be used to access a notebook instance. Constraints: Configurations required for remotely accessing a notebook instance through SSH only on the local IDE (such as PyCharm and VS Code) or SSH client.
flavor	No	String	Definition: The machine specifications of the notebook instance can be changed. Specifications that can be changed. You can call the API in Querying Flavors Available for a Notebook Instance to obtain them. Constraints: N/A Range: N/A Default Value: N/A

Parameter	Mandatory	Type	Description
custom_spec	No	NotebookCustomSpec object	Definition: Custom specifications of an instance. This parameter and the flavor field cannot be set at the same time. Constraints: This is only supported in CPU or GPU dedicated pool scenarios based on the specific node specifications of the dedicated pool.
image_id	No	String	Definition: Image ID can be updated. For details, see Querying Supported Images . Constraints: N/A Range: Valid image IDs obtained by calling APIs in Querying Supported Images . Default Value: N/A
name	No	String	Definition: Instance name can be updated. Constraints: N/A Range: The value can contain a maximum of 128 characters. Only letters, digits, hyphens (-), and underscores (_) are allowed. The name can be repeated. Default Value: N/A
storage_new_size	No	Integer	Definition: EVS instance capacity that can be expanded dynamically, in GB. Only scale-out is supported. Constraints: N/A Range: The capacity can be expanded to at most 4,096 GB. Default Value: N/A
hooks	No	CustomHooks object	Definition: The instance startup script can be updated. Constraints: N/A

Parameter	Mandatory	Type	Description
affinity	No	AffinityType object	Definition: Affinity settings can be updated. Constraints: This parameter can be updated only when the instance is stopped or fails to be started.
dew_secret_name	No	String	Definition: Name of the AK/SK secret stored in DEW. Constraints: This parameter is mandatory when category is set to OBS . The value can contain 1 to 64 characters. Only letters, digits, hyphens (-), and underscores (_) are allowed. Range: N/A Default Value: N/A
data_volumes	No	Array of VolumeMountRequest objects	Definition: Extended storage information. Constraints: N/A

Table 4-87 EndpointsReq

Parameter	Mandatory	Type	Description
service	No	String	Definition: Supported services. Constraints: N/A Range: • NOTEBOOK: You can access notebook instances using HTTPS. • SSH: You can remotely access notebook instances through SSH. Default Value: N/A
key_pair_names	No	Array of strings	Definition: Name of the SSH key pair, which can be created and viewed on the Key Pair page of the Elastic Cloud Server (ECS) console. Constraints: N/A

Table 4-88 NotebookCustomSpec

Parameter	Mandatory	Type	Description
gpu	No	Float	Definition: Number of GPUs of an instance. Constraints: This parameter is unavailable in CPU dedicated resource pools and is mandatory in GPU dedicated resource pools. Range: N/A Default Value: N/A
cpu	Yes	Float	Definition: Number of CPUs of an instance. Constraints: This parameter is mandatory for custom specifications in CPU/GPU dedicated pools. Range: The integer part can contain at most 10 digits and the decimal part can contain at most 2 digits. The value cannot be smaller than 0.4 . Default Value: N/A
memory	Yes	Float	Definition: Memory size of an instance. Constraints: This parameter is mandatory for custom specifications in CPU/GPU dedicated pools. Range: The value must be an integer containing at most 10 digits, and the value cannot be smaller than 513 . Default Value: N/A
gpu_type	No	String	Definition: GPU acceleration PU of an instance. Constraints: This parameter is unavailable in CPU dedicated resource pools and is mandatory in GPU dedicated resource pools. Range: N/A Default Value: N/A

Parameter	Mandatory	Type	Description
arch	No	String	Definition: CPU architecture of an instance. Constraints: This parameter is mandatory for custom specifications in CPU/GPU dedicated resource pools. Range: The value can be: • X86_64: x86 architecture • AARCH64: Arm architecture Default Value: N/A
category	No	String	Definition: Specification type of an instance. Constraints: This parameter is mandatory for custom specifications in CPU/GPU dedicated pools. Range: The value can be: • CPU • GPU Default Value: N/A
resource_flavor	No	String	Definition: Specifications of the target resource pool node selected for the instance. Constraints: N/A Range: N/A Default Value: N/A

Table 4-89 CustomHooks

Parameter	Mandatory	Type	Description
container_hooks	No	ContainerHooks object	Definition: Container hook configuration. Constraints: N/A

Table 4-90 ContainerHooks

Parameter	Mandatory	Type	Description
post_start	No	Config object	Definition: Script configuration after the service is started. Constraints: N/A
pre_start	No	Config object	Definition: Script configuration before the service is started. Constraints: N/A

Table 4-91 Config

Parameter	Mandatory	Type	Description
script	No	String	Definition: Custom script (Base64 encoding) or absolute path of a script. Constraints: N/A Range: N/A Default Value: N/A
type	No	String	Definition: Script type. Constraints: N/A Range: • COMMAND: The script content (Base64-encoded) must be specified. • SCRIPT: The script path must be specified. Default Value: SCRIPT
mode	No	String	Definition: Execution mode of custom scripts, which can be synchronous or asynchronous. Constraints: N/A Range: The value can be: • BLOCK: synchronous • ASYNC: asynchronous Default Value: ASYNC

Table 4-92 AffinityType

Parameter	Mandatory	Type	Description
required_during_scheduling_ignored_during_execution	No	Array of AffinityRule objects	Definition: Strong affinity feature in the dedicated pool scenario. Constraints: key , values , and operator are mandatory.
preferred_during_scheduling_ignored_during_execution	No	Array of AffinityRule objects	Definition: Weak affinity feature in the dedicated pool scenario. Constraints: key , values , and operator are mandatory, and weight is optional.

Table 4-93 AffinityRule

Parameter	Mandatory	Type	Description
key	No	String	Definition: Affinity description. Both default labels and custom labels are supported. For details about the default node labels, see Managing Node Labels. Constraints: Labels are key-value pairs. A valid label consists of two segments: prefix (optional) and name, which are separated by a slash (/). Range: The name segment is mandatory and must be less than or equal to 63 characters. It must start and end with a letter or digit and only contain letters, digits, hyphens (-), underscores (_), and periods (.). The prefix is optional. If specified, the prefix must be a DNS subdomain: a series of DNS labels separated by periods (.), with a total of no more than 253 characters, followed by a slash (/). For details, see Labels and Selectors. Default Value: N/A.

Parameter	Mandatory	Type	Description
operator	No	String	Definition: Operator. Constraints: N/A Range: The following operators are supported: In: The label of the affinity or anti-affinity object is in the label value list (values field). NotIn: The label of the affinity or anti-affinity object is not in the label value list (values field). Exists: The affinity or anti-affinity object has a specified label key. DoesNotExist: The affinity or anti-affinity object does not have a specified label key. Gt: The label value of the scheduling node exceeds what is listed (string comparison). Lt: The label value of the scheduling node is under what is listed (string comparison). Default Value: N/A.
values	No	Array of strings	Definition: When configuring node affinity, enter the value of the node label. Constraints: The value must be 63 characters or fewer (can be empty). If the label value is not empty, the value must start and end with a letter or digit and can contain hyphens (-), underscores (_), periods (.), letters, or digits. For details, see Labels and Selectors .
weight	No	Integer	Weight value of the weak affinity node. The value ranges from 0 to 100. The value is NULL for strong affinity and optional for weak affinity.

Table 4-94 VolumeMountRequest

Parameter	Mandatory	Type	Description
category	Yes	String	Definition: Extended storage type, for example, EFS , OBS , or OBSFS . Constraints: N/A
ownership	Yes	String	Definition: Resource ownership. MANAGED and DEDICATED are supported. Constraints: N/A
uri	No	String	Definition: URI of the EFS dedicated storage disk or path of the OBS parallel file system. Constraints: This parameter is mandatory only when category is set to EFS , OBS , or OBSFS and ownership is set to DEDICATED . The value can contain at most 1,024 characters.
id	No	String	Definition: ID of the EFS dedicated storage disk. Constraints: This parameter is mandatory only when category is set to EFS and ownership is set to DEDICATED . The value must be in the UUID format, for example, 280a8bd5-03e2-4a5c-bea1-83d81e75bc53 .
mount_path	No	String	Definition: Path mounted to the notebook instance. Constraints: The value can contain at most 256 characters.
read_only	No	Boolean	Definition: Whether the mounting directory of extended storage is read-only. The default value is false , indicating that the directory can be read and written. Constraints: N/A

Parameter	Mandatory	Type	Description
dew_secret_name	No	String	Definition: Name of the AK/SK secret stored in DEW. Constraints: This parameter is mandatory when category is set to OBS . The value can contain 1 to 64 characters. Only letters, digits, hyphens (-), and underscores (_) are allowed.
capacity	No	Integer	Definition: EVS storage capacity, in GB. Constraints: This parameter is valid only when category is EVS . Range: N/A Default Value: 5

Response Parameters

Status code: 200

Table 4-95 Response body parameters

Parameter	Type	Description
action_progress	Array of JobProgress objects	Definition: Initialization progress of the instance.
description	String	Definition: Instance description. Range: N/A
endpoints	Array of EndpointsRes objects	Definition: Local IDE (such as PyCharm and VS Code) or SSH client for remotely accessing a notebook instance through SSH.
fail_reason	String	Definition: Instance failure cause. Range: N/A

Parameter	Type	Description
flavor	String	Definition: Instance flavor. 1. If you select a system specification, the returned value is the system specification code. 2. If you select a custom specification when creating an instance, this parameter is always returned as custom.flavor.spec.code . Range: N/A.
custom_spec	NotebookCustomSpecRep object	Definition: Custom specifications of an instance. This parameter is returned only when a CPU or GPU dedicated pool is used and the custom specifications are used. Range: N/A.
id	String	Definition: Instance ID. Range: N/A
image	Image object	Definition: Instance image information.
lease	Lease object	Definition: Countdown to auto stop of an instance.
name	String	Definition: Instance name. Range: N/A
pool	Pool object	Definition: Basic information about the dedicated pool, which is returned by the instance created in the dedicated pool.

Parameter	Type	Description
status	String	Definition: Instance status. Range: • INIT: The instance is being initialized. • CREATING: The instance is being created. • STARTING: The instance is being started. • STOPPING: The instance is being stopped. • DELETING: The instance is being deleted. • RUNNING: The instance is running. • STOPPED: The instance has been stopped. • SNAPSHOTTING: The image of the instance is being saved. • CREATE_FAILED: Creating the instance failed. • START_FAILED: Starting the instance failed. • DELETE_FAILED: Deleting the instance failed. • ERROR: An error occurred. • DELETED: The instance has been deleted. • FROZEN: The instance is frozen.
token	String	Description: Token used for notebook authentication. Range: N/A
url	String	Definition: URL for accessing the instance. Range: N/A
volume	VolumeRes object	Definition: Instance storage information.
workspace_id	String	Definition: Workspace ID. If no workspaces are available, the default value is 0 . If a workspace is created and used, use the actual value. Range: N/A

Parameter	Type	Description
feature	String	Definition: Instance type. Range: • DEFAULT: free CodeLab instance. Each user can create only one. • NOTEBOOK: billed instance.
billing_items	Array of strings	Definition: Billing resource type. Range: • STORAGE: Storage resource billing • COMPUTE: Computing resources billing • ALL: All billing types
user	UserResponse object	Description: Account information.
affinity	AffinityType object	Definition: Affinity information.
run_user	RunUserInfo object	Definition: Information about the startup user and startup user group.
data_volumes	Array of VolumeResponse objects	Definition: Extended storage information.
ip	String	Definition: IP address of the node where the instance is located. Range: N/A
user_vpc	UserVpcResponse object	Definition: User VPC configuration.
user_id	String	Definition: User ID. Range: N/A
is_need_credentials	Boolean	Definition: Whether to create a user secret by default. The default value is true . Range: N/A
jupyter_version	String	Definition: Jupyter version. Range: N/A
tags	Array of TmsTagResponse objects	Definition: Instance tag.

Table 4-96 JobProgress

Parameter	Type	Description
status	String	Definition: Job status in a specified step. Range: • WAITING: The job is awaiting. • PROCESSING: The job is being processed. • FAILED: The job failed. • COMPLETED: The job is complete.
step	Integer	Definition: Job step. Range: • 1: Prepare storage. • 2: Prepare compute resources. • 3: Configure the network. • 4: Initialize the instance.
description	String	Definition: Job description in a specified step. Range: N/A

Table 4-97 EndpointsRes

Parameter	Type	Description
key_pair_names	Array of strings	Definition: List of SSH key pairs. You can set multiple key pairs to access an SSH instance at the same time. Range: N/A
service	String	Definition: Method for accessing the notebook instance. Range: • NOTEBOOK: You can access notebook instances using HTTPS. • SSH: You can remotely access notebook instances through SSH.
uri	String	Definition: Private IP address of the instance. Range: N/A

Table 4-98 NotebookCustomSpecRep

Parameter	Type	Description
gpu	Float	Definition: Number of GPUs of an instance. Range: N/A
gpu_type	String	Definition: GPU acceleration PU of an instance. Range: N/A
cpu	Float	Definition: Number of CPUs of an instance. Range: The integer part can contain at most 10 digits and the decimal part can contain at most 2 digits. The value cannot be smaller than 0.4 .
memory	Float	Definition: Memory size of an instance. Range: The value must be an integer containing at most 10 digits, and the value cannot be smaller than 513 .
arch	String	Definition: CPU architecture of an instance. Range: The value can be: • X86_64: x86 architecture • AARCH64: Arm architecture
category	String	Definition: Specification type of an instance. Range: The value can be: • CPU • GPU
resource_flavor	String	Definition: Specifications of the target resource pool node selected for the instance. Range: N/A

Table 4-99 Image

Parameter	Type	Description
arch	String	Definition: Processor architecture supported by the image. Range • X86_64: x86 architecture • AARCH64: Arm architecture
create_at	Long	Definition: UTC time when the image is created, accurate to millisecond. Range: N/A
description	String	Definition: Image description. Range: Up to 512 characters
dev_services	Array of strings	Definition: Services supported by the image. Range: • NOTEBOOK: You can access a notebook instance using HTTPS. • SSH: You can remotely access a notebook instance from a local IDE through SSH.
id	String	Definition: ID of the image used for creating notebook instances. The ID is in Universally Unique Identifier (UUID) format. For details, see Querying Supported Images . Range: N/A
name	String	Definition: Image name. Range: The name can contain a maximum of 512 characters. Lowercase letters, digits, hyphens (-), underscores (_), and periods (.) are allowed.
namespace	String	Definition: Organization to which the image belongs. You can create and view an organization on the Organization Management page of the SWR console. Range: N/A

Parameter	Type	Description
origin	String	Definition: Image source. Range: • CUSTOMIZE: custom image • IMAGE_SAVE: image saved by a notebook instance
resource_categories	Array of strings	Definition: Flavors supported by the image. Range: • CPU • GPU • ASCEND
service_type	String	Definition: Supported image types. Range: • COMMON: common image • INFERENCE: image used for inference • TRAIN: image used for training • DEV: image used for development and debugging • UNKNOWN: image whose supported services are not specified
size	Long	Definition: Image size, in KB. Range: N/A
status	String	Definition: Image status. Range: • INIT: The image is being initialized. • CREATING: The image is being saved. In this case, the notebook instance is unavailable. • CREATE_FAILED: Saving the image failed. • ERROR: An error occurs. • DELETED: The image has been deleted. • ACTIVE: The image has been saved, which you can view on the SWR console and use to create notebook instances.
status_message	String	Definition: Build information during image saving. Range: N/A

Parameter	Type	Description
swr_path	String	Definition: SWR image path. Range: N/A
tag	String	Definition: Image tag. Range: N/A
type	String	Definition: Image type. Range: • BUILD_IN: built-in system image • DEDICATED: image you have saved
update_at	Long	Definition: Time (UTC) when the image was last updated, accurate to millisecond. Range: N/A
visibility	String	Definition: Image visibility. Range: • PRIVATE: private image • PUBLIC: All users can perform read-only operations based on image_id.
workspace_id	String	Definition: Workspace ID. If no workspaces are available, the default value is 0 . If a workspace is created and used, use the actual value. Range: N/A
flavor_type	String	Definition: Resource type of the image. Range: • ASCEND_SNT9: 910 chip • ASCEND_SNT9B: 910B chip • ASCEND_SNT3: 310 chip
swr_instance_id	String	Definition: Enterprise edition SWR repository ID. Range: N/A
show_tag	String	Definition: Image tag. Range: N/A
show_name	String	Definition: Image name. Range: N/A
tags	Array of TmsTagResponse objects	Definition: Image tag.

Table 4-100 Lease

Parameter	Type	Description
create_at	Long	Definition: UTC time when the instance is created, accurate to millisecond. Range: N/A
duration	Long	Definition: Instance runtime, which is calculated based on the instance creation time. If the instance creation time plus the runtime is greater than the current time, the system automatically stops the instance. Range: N/A
enable	Boolean	Definition: Specifies whether to enable auto stop. Range: Boolean • true: Auto stop is enabled. • false: Auto stop is disabled.
type	String	Definition: Auto stop type. Range: • TIMING: auto stop • IDLE: stop when idle
update_at	Long	Definition: Time (UTC) when the instance is last updated (excluding liveness check), accurate to millisecond. Range: N/A

Table 4-101 Pool

Parameter	Type	Description
id	String	Definition: Dedicated resource pool ID. Range: N/A
name	String	Definition: Dedicated resource pool name. Range: N/A

Table 4-102 VolumeRes

Parameter	Type	Description
capacity	Integer	Definition: Storage capacity. Range: The default value is 5 GB for EVS and 50 GB for EFS. The maximum value is 4,096 GB.
category	String	Definition: Supported storage type. For details about the differences between the storage types, see Selecting Storage in DevEnviron . Range: • SFS • EVS • OBS • OBSFS: parallel file system • EFS: SFS Turbo
mount_path	String	Definition: Directory of the notebook instance to which the storage is mounted. Currently, the directory is /home/ma-user/work/ . Range: N/A
ownership	String	Definition: Resource owner. Range: • MANAGED: Resources are managed by the service. • DEDICATED: Resources are managed by the user account. This mode is supported only when the instance category is EFS.
status	String	Definition: EVS disk capacity expansion status, which is RESIZING during capacity expansion and does not affect the instance. Range: N/A
id	String	Definition: EFS disk ID or OBS storage ID. This parameter is returned only when extended storage is used. Range: N/A
read_only	Boolean	Definition: Whether the mounting directory of extended storage is read-only. Range: N/A

Parameter	Type	Description
dew_secret_name	String	Definition: Name of the AK/SK secret stored in DEW. Range: N/A
evs_sku_code	String	Definition: SKU code of EVS storage. Range: N/A
uri	String	Definition: Source path for mounting the storage when category is EFS , OBS , or OBSFS . Range: N/A
mount_type	String	Definition: Storage mount type. Range: The value can be: • STATIC: Storage cannot be mounted or unmounted when the instance is running. • DYNAMIC: Storage can be mounted and unmounted when the instance is running.

Table 4-103 UserResponse

Parameter	Type	Description
id	String	Definition: User ID. Range: N/A
name	String	Definition: Username. Range: N/A
domain	Domain object	Definition: Domain information of an account.

Table 4-104 Domain

Parameter	Type	Description
id	String	Definition: Account ID. Range: N/A
name	String	Definition: Account name. Range: N/A

Table 4-105 AffinityType

Parameter	Type	Description
required_during_scheduling_ignored_during_execution	Array of AffinityRule objects	Definition: Strong affinity feature in the dedicated pool scenario. Constraints: key , values , and operator are mandatory.
preferred_during_scheduling_ignored_during_execution	Array of AffinityRule objects	Definition: Weak affinity feature in the dedicated pool scenario. Constraints: key , values , and operator are mandatory, and weight is optional.

Table 4-106 AffinityRule

Parameter	Type	Description
key	String	Definition: Affinity description. Both default labels and custom labels are supported. For details about the default node labels, see Managing Node Labels . Constraints: Labels are key-value pairs. A valid label key consists of two segments: prefix (optional) and name, which are separated by a slash (/). Range: The name segment is mandatory and must be less than or equal to 63 characters. It must start and end with a letter or digit and only contain letters, digits, hyphens (-), underscores (_), and periods (.). The prefix is optional. If specified, the prefix must be a DNS subdomain: a series of DNS labels separated by periods (.), with a total of no more than 253 characters, followed by a slash (/). For details, see Labels and Selectors . Default Value: N/A.

Parameter	Type	Description
operator	String	Definition: Operator. Constraints: N/A Range: The following operators are supported: In: The label of the affinity or anti-affinity object is in the label value list (values field). NotIn: The label of the affinity or anti-affinity object is not in the label value list (values field). Exists: The affinity or anti-affinity object has a specified label key. DoesNotExist: The affinity or anti-affinity object does not have a specified label key. Gt: The label value of the scheduling node exceeds what is listed (string comparison). Lt: The label value of the scheduling node is under what is listed (string comparison). Default Value: N/A.
values	Array of strings	Definition: When configuring node affinity, enter the value of the node label. Constraints: The value must be 63 characters or fewer (can be empty). If the label value is not empty, the value must start and end with a letter or digit and can contain hyphens (-), underscores (_), periods (.), letters, or digits. For details, see Labels and Selectors .
weight	Integer	Weight value of the weak affinity node. The value ranges from 0 to 100. The value is NULL for strong affinity and optional for weak affinity.

Table 4-107 RunUserInfo

Parameter	Type	Description
uid	Integer	User ID of the container startup user.

Parameter	Type	Description
gid	Integer	Group ID of the container startup user.
user_name	String	Username of the container startup user.
group_name	String	Group name of the container startup user.

Table 4-108 VolumeResponse

Parameter	Type	Description
category	String	Definition: Extended storage type, for example, EFS , OBS , or OBSFS . Constraints: N/A
mount_path	String	Definition: Directory where the storage is mounted to a notebook instance. Constraints: N/A
url	String	Definition: Source path for mounting the storage when category is OBS or OBSFS . Constraints: N/A
status	String	Definition: Storage status. MOUNTING: being mounted MOUNTED: mounted UNMOUNTING: being unmounted UNMOUNTED: unmounted MOUNT_FAILED: mounting failed UNMOUNT_FAILED: unmounting failed Constraints: N/A
mount_type	String	Definition: Storage mount type. Constraints: N/A

Table 4-109 UserVpcResponse

Parameter	Type	Description
vpc_id	String	Definition: VPC ID. Range: N/A

Parameter	Type	Description
subnet_id	String	Definition: Subnet ID. Range: N/A
security_group_ids	Array of strings	Definition: Security group ID list. Range: N/A
connect_cidrs	String	Definition: Connected CIDR block list. Range: N/A
port_id	Array of strings	Definition: NIC ID. Range: N/A
port_ip	String	Definition: NIC IP address. Range: N/A

Table 4-110 TmsTagResponse

Parameter	Type	Description
key	String	Definition: TMS tag key. Range: N/A
value	String	Definition: TMS tag value. Range: N/A

Status code: 201

Created

Example Requests

- Update a notebook instance. The instance must be stopped or failed to be started. Update the value of either strong or weak affinity based on the input value.

```
{
  "affinity" : {
    "required_during_scheduling_ignored_during_execution" : [ {
      "key" : "kubernetes.io/hostname",
      "operator" : "In",
      "values" : [ "192.168.1.1" ]
    } ],
    "preferred_during_scheduling_ignored_during_execution" : [ {
      "key" : "kubernetes.io/hostname",
      "operator" : "In",
      "values" : [ "192.168.1.1" ]
    } ]
  }
}
```

- Select either of the values. No modification is required.

```
{
  "affinity" : {
```

```
"required_during_scheduling_ignored_during_execution" : null,  
"preferred_during_scheduling_ignored_during_execution" : null  
}
```

- Disable and clear affinity settings.

```
{  
  "affinity" : {  
    "required_during_scheduling_ignored_during_execution" : [ ],  
    "preferred_during_scheduling_ignored_during_execution" : [ ]  
  }  
}
```

- Update a notebook instance. No update is required.

```
{  
  "affinity" : null  
}
```

Example Responses

Status code: 200

OK

```
{  
  "affinity" : {  
    "required_during_scheduling_ignored_during_execution" : [ {

See [Error Codes](#).

4.6 Deleting a Notebook Instance

Function

This API is used to delete a created notebook instance and its related resources.

This API applies to the following scenario: When your notebook instance is no longer needed, you can use this API to delete the specified notebook instance, including its containers and all storage resources. Before using this API, ensure that you have logged in to the system and have the permission to perform operations on the target notebook instance. After this API is called, the system deletes the specified notebook instance and its related resources. If you do not have the permission to perform operations on the specified notebook instance or the notebook instance has not been stopped, the API will return an error message. If the specified notebook instance is not found or fails to be deleted, the API will return an error message.

Constraints

No constraints

Debugging

You can debug this API through automatic authentication in [API Explorer](#) or use the SDK sample code generated by API Explorer.

Authorization Information

Each account has all the permissions required to call all APIs, but IAM users must be assigned the required permissions.

- If you are using role/policy-based authorization, see [Permissions Policies and Supported Actions](#) for details on the required permissions.
- If you are using identity policy-based authorization, the following identity policy-based permissions are required.

Action	Access Level	Resource Type (*: required)	Condition Key	Alias	Dependencies
modelarts:notebook:delete	Write	notebook*	g:ResourceTag/<tag-key>	-	-
		-	• g:EnterpriseProjectId • modelarts:poolType • modelarts:poolId		

URI

DELETE /v1/{project_id}/notebooks/{id}

Table 4-111 Path Parameters

Parameter	Mandatory	Type	Description
id	Yes	String	Definition: Notebook instance ID. The ID is in the format of a Universally Unique Identifier (UUID). For details about how to obtain the ID, see Querying Notebook Instances . Constraints: N/A Range: N/A Default Value: N/A
project_id	Yes	String	Definition: Project ID. For details, see Obtaining a Project ID and Name . Constraints: N/A Range: N/A Default Value: N/A

Request Parameters

None

Response Parameters

Status code: 200

Table 4-112 Response body parameters

Parameter	Type	Description
action_progress	Array of JobProgress objects	Definition: Initialization progress of the instance.
description	String	Definition: Instance description. Range: N/A
endpoints	Array of EndpointsRes objects	Definition: Local IDE (such as PyCharm and VS Code) or SSH client for remotely accessing a notebook instance through SSH.

Parameter	Type	Description
fail_reason	String	Definition: Instance failure cause. Range: N/A
flavor	String	Definition: Instance flavor. 1. If you select a system specification, the returned value is the system specification code. 2. If you select a custom specification when creating an instance, this parameter is always returned as custom.flavor.spec.code . Range: N/A.
custom_spec	NotebookCustomSpecRep object	Definition: Custom specifications of an instance. This parameter is returned only when a CPU or GPU dedicated pool is used and the custom specifications are used. Range: N/A.
id	String	Definition: Instance ID. Range: N/A
image	Image object	Definition: Instance image information.
lease	Lease object	Definition: Countdown to auto stop of an instance.
name	String	Definition: Instance name. Range: N/A
pool	Pool object	Definition: Basic information about the dedicated pool, which is returned by the instance created in the dedicated pool.

Parameter	Type	Description
status	String	Definition: Instance status. Range: • INIT: The instance is being initialized. • CREATING: The instance is being created. • STARTING: The instance is being started. • STOPPING: The instance is being stopped. • DELETING: The instance is being deleted. • RUNNING: The instance is running. • STOPPED: The instance has been stopped. • SNAPSHOTTING: The image of the instance is being saved. • CREATE_FAILED: Creating the instance failed. • START_FAILED: Starting the instance failed. • DELETE_FAILED: Deleting the instance failed. • ERROR: An error occurred. • DELETED: The instance has been deleted. • FROZEN: The instance is frozen.
token	String	Description: Token used for notebook authentication. Range: N/A
url	String	Definition: URL for accessing the instance. Range: N/A
volume	VolumeRes object	Definition: Instance storage information.
workspace_id	String	Definition: Workspace ID. If no workspaces are available, the default value is 0 . If a workspace is created and used, use the actual value. Range: N/A

Parameter	Type	Description
feature	String	Definition: Instance type. Range: • DEFAULT: free CodeLab instance. Each user can create only one. • NOTEBOOK: billed instance.
billing_items	Array of strings	Definition: Billing resource type. Range: • STORAGE: Storage resource billing • COMPUTE: Computing resources billing • ALL: All billing types
user	UserResponse object	Description: Account information.
affinity	AffinityType object	Definition: Affinity information.
run_user	RunUserInfo object	Definition: Information about the startup user and startup user group.
data_volumes	Array of VolumeResponse objects	Definition: Extended storage information.
ip	String	Definition: IP address of the node where the instance is located. Range: N/A
user_vpc	UserVpcResponse object	Definition: User VPC configuration.
user_id	String	Definition: User ID. Range: N/A
is_need_credentials	Boolean	Definition: Whether to create a user secret by default. The default value is true . Range: N/A
jupyter_version	String	Definition: Jupyter version. Range: N/A
tags	Array of TmsTagResponse objects	Definition: Instance tag.

Table 4-113 JobProgress

Parameter	Type	Description
status	String	Definition: Job status in a specified step. Range: • WAITING: The job is awaiting. • PROCESSING: The job is being processed. • FAILED: The job failed. • COMPLETED: The job is complete.
step	Integer	Definition: Job step. Range: • 1: Prepare storage. • 2: Prepare compute resources. • 3: Configure the network. • 4: Initialize the instance.
description	String	Definition: Job description in a specified step. Range: N/A

Table 4-114 EndpointsRes

Parameter	Type	Description
key_pair_names	Array of strings	Definition: List of SSH key pairs. You can set multiple key pairs to access an SSH instance at the same time. Range: N/A
service	String	Definition: Method for accessing the notebook instance. Range: • NOTEBOOK: You can access notebook instances using HTTPS. • SSH: You can remotely access notebook instances through SSH.
uri	String	Definition: Private IP address of the instance. Range: N/A

Table 4-115 NotebookCustomSpecRep

Parameter	Type	Description
gpu	Float	Definition: Number of GPUs of an instance. Range: N/A
gpu_type	String	Definition: GPU acceleration PU of an instance. Range: N/A
cpu	Float	Definition: Number of CPUs of an instance. Range: The integer part can contain at most 10 digits and the decimal part can contain at most 2 digits. The value cannot be smaller than 0.4 .
memory	Float	Definition: Memory size of an instance. Range: The value must be an integer containing at most 10 digits, and the value cannot be smaller than 513 .
arch	String	Definition: CPU architecture of an instance. Range: The value can be: • X86_64: x86 architecture • AARCH64: Arm architecture
category	String	Definition: Specification type of an instance. Range: The value can be: • CPU • GPU
resource_flavor	String	Definition: Specifications of the target resource pool node selected for the instance. Range: N/A

Table 4-116 Image

Parameter	Type	Description
arch	String	Definition: Processor architecture supported by the image. Range • X86_64: x86 architecture • AARCH64: Arm architecture
create_at	Long	Definition: UTC time when the image is created, accurate to millisecond. Range: N/A
description	String	Definition: Image description. Range: Up to 512 characters
dev_services	Array of strings	Definition: Services supported by the image. Range: • NOTEBOOK: You can access a notebook instance using HTTPS. • SSH: You can remotely access a notebook instance from a local IDE through SSH.
id	String	Definition: ID of the image used for creating notebook instances. The ID is in Universally Unique Identifier (UUID) format. For details, see Querying Supported Images . Range: N/A
name	String	Definition: Image name. Range: The name can contain a maximum of 512 characters. Lowercase letters, digits, hyphens (-), underscores (_), and periods (.) are allowed.
namespace	String	Definition: Organization to which the image belongs. You can create and view an organization on the Organization Management page of the SWR console. Range: N/A

Parameter	Type	Description
origin	String	Definition: Image source. Range: • CUSTOMIZE: custom image • IMAGE_SAVE: image saved by a notebook instance
resource_categories	Array of strings	Definition: Flavors supported by the image. Range: • CPU • GPU • ASCEND
service_type	String	Definition: Supported image types. Range: • COMMON: common image • INFERENCE: image used for inference • TRAIN: image used for training • DEV: image used for development and debugging • UNKNOWN: image whose supported services are not specified
size	Long	Definition: Image size, in KB. Range: N/A
status	String	Definition: Image status. Range: • INIT: The image is being initialized. • CREATING: The image is being saved. In this case, the notebook instance is unavailable. • CREATE_FAILED: Saving the image failed. • ERROR: An error occurs. • DELETED: The image has been deleted. • ACTIVE: The image has been saved, which you can view on the SWR console and use to create notebook instances.
status_message	String	Definition: Build information during image saving. Range: N/A

Parameter	Type	Description
swr_path	String	Definition: SWR image path. Range: N/A
tag	String	Definition: Image tag. Range: N/A
type	String	Definition: Image type. Range: • BUILD_IN: built-in system image • DEDICATED: image you have saved
update_at	Long	Definition: Time (UTC) when the image was last updated, accurate to millisecond. Range: N/A
visibility	String	Definition: Image visibility. Range: • PRIVATE: private image • PUBLIC: All users can perform read-only operations based on image_id.
workspace_id	String	Definition: Workspace ID. If no workspaces are available, the default value is 0 . If a workspace is created and used, use the actual value. Range: N/A
flavor_type	String	Definition: Resource type of the image. Range: • ASCEND_SNT9: 910 chip • ASCEND_SNT9B: 910B chip • ASCEND_SNT3: 310 chip
swr_instance_id	String	Definition: Enterprise edition SWR repository ID. Range: N/A
show_tag	String	Definition: Image tag. Range: N/A
show_name	String	Definition: Image name. Range: N/A
tags	Array of TmsTagResponse objects	Definition: Image tag.

Table 4-117 Lease

Parameter	Type	Description
create_at	Long	Definition: UTC time when the instance is created, accurate to millisecond. Range: N/A
duration	Long	Definition: Instance runtime, which is calculated based on the instance creation time. If the instance creation time plus the runtime is greater than the current time, the system automatically stops the instance. Range: N/A
enable	Boolean	Definition: Specifies whether to enable auto stop. Range: Boolean • true: Auto stop is enabled. • false: Auto stop is disabled.
type	String	Definition: Auto stop type. Range: • TIMING: auto stop • IDLE: stop when idle
update_at	Long	Definition: Time (UTC) when the instance is last updated (excluding liveness check), accurate to millisecond. Range: N/A

Table 4-118 Pool

Parameter	Type	Description
id	String	Definition: Dedicated resource pool ID. Range: N/A
name	String	Definition: Dedicated resource pool name. Range: N/A

Table 4-119 VolumeRes

Parameter	Type	Description
capacity	Integer	Definition: Storage capacity. Range: The default value is 5 GB for EVS and 50 GB for EFS. The maximum value is 4,096 GB.
category	String	Definition: Supported storage type. For details about the differences between the storage types, see Selecting Storage in DevEnviron . Range: • SFS • EVS • OBS • OBSFS: parallel file system • EFS: SFS Turbo
mount_path	String	Definition: Directory of the notebook instance to which the storage is mounted. Currently, the directory is <code>/home/ma-user/work/</code> . Range: N/A
ownership	String	Definition: Resource owner. Range: • MANAGED: Resources are managed by the service. • DEDICATED: Resources are managed by the user account. This mode is supported only when the instance category is EFS.
status	String	Definition: EVS disk capacity expansion status, which is RESIZING during capacity expansion and does not affect the instance. Range: N/A
id	String	Definition: EFS disk ID or OBS storage ID. This parameter is returned only when extended storage is used. Range: N/A
read_only	Boolean	Definition: Whether the mounting directory of extended storage is read-only. Range: N/A

Parameter	Type	Description
dew_secret_name	String	Definition: Name of the AK/SK secret stored in DEW. Range: N/A
evs_sku_code	String	Definition: SKU code of EVS storage. Range: N/A
uri	String	Definition: Source path for mounting the storage when category is EFS , OBS , or OBSFS . Range: N/A
mount_type	String	Definition: Storage mount type. Range: The value can be: • STATIC: Storage cannot be mounted or unmounted when the instance is running. • DYNAMIC: Storage can be mounted and unmounted when the instance is running.

Table 4-120 UserResponse

Parameter	Type	Description
id	String	Definition: User ID. Range: N/A
name	String	Definition: Username. Range: N/A
domain	Domain object	Definition: Domain information of an account.

Table 4-121 Domain

Parameter	Type	Description
id	String	Definition: Account ID. Range: N/A
name	String	Definition: Account name. Range: N/A

Table 4-122 AffinityType

Parameter	Type	Description
required_during_scheduling_ignored_during_execution	Array of AffinityRule objects	Definition: Strong affinity feature in the dedicated pool scenario. Constraints: key , values , and operator are mandatory.
preferred_during_scheduling_ignored_during_execution	Array of AffinityRule objects	Definition: Weak affinity feature in the dedicated pool scenario. Constraints: key , values , and operator are mandatory, and weight is optional.

Table 4-123 AffinityRule

Parameter	Type	Description
key	String	Definition: Affinity description. Both default labels and custom labels are supported. For details about the default node labels, see Managing Node Labels . Constraints: Labels are key-value pairs. A valid label key consists of two segments: prefix (optional) and name, which are separated by a slash (/). Range: The name segment is mandatory and must be less than or equal to 63 characters. It must start and end with a letter or digit and only contain letters, digits, hyphens (-), underscores (_), and periods (.). The prefix is optional. If specified, the prefix must be a DNS subdomain: a series of DNS labels separated by periods (.), with a total of no more than 253 characters, followed by a slash (/). For details, see Labels and Selectors . Default Value: N/A.

Parameter	Type	Description
operator	String	Definition: Operator. Constraints: N/A Range: The following operators are supported: In: The label of the affinity or anti-affinity object is in the label value list (values field). NotIn: The label of the affinity or anti-affinity object is not in the label value list (values field). Exists: The affinity or anti-affinity object has a specified label key. DoesNotExist: The affinity or anti-affinity object does not have a specified label key. Gt: The label value of the scheduling node exceeds what is listed (string comparison). Lt: The label value of the scheduling node is under what is listed (string comparison). Default Value: N/A.
values	Array of strings	Definition: When configuring node affinity, enter the value of the node label. Constraints: The value must be 63 characters or fewer (can be empty). If the label value is not empty, the value must start and end with a letter or digit and can contain hyphens (-), underscores (_), periods (.), letters, or digits. For details, see Labels and Selectors .
weight	Integer	Weight value of the weak affinity node. The value ranges from 0 to 100. The value is NULL for strong affinity and optional for weak affinity.

Table 4-124 RunUserInfo

Parameter	Type	Description
uid	Integer	User ID of the container startup user.

Parameter	Type	Description
gid	Integer	Group ID of the container startup user.
user_name	String	Username of the container startup user.
group_name	String	Group name of the container startup user.

Table 4-125 VolumeResponse

Parameter	Type	Description
category	String	Definition: Extended storage type, for example, EFS , OBS , or OBSFS . Constraints: N/A
mount_path	String	Definition: Directory where the storage is mounted to a notebook instance. Constraints: N/A
url	String	Definition: Source path for mounting the storage when category is OBS or OBSFS . Constraints: N/A
status	String	Definition: Storage status. MOUNTING: being mounted MOUNTED: mounted UNMOUNTING: being unmounted UNMOUNTED: unmounted MOUNT_FAILED: mounting failed UNMOUNT_FAILED: unmounting failed Constraints: N/A
mount_type	String	Definition: Storage mount type. Constraints: N/A

Table 4-126 UserVpcResponse

Parameter	Type	Description
vpc_id	String	Definition: VPC ID. Range: N/A

Parameter	Type	Description
subnet_id	String	Definition: Subnet ID. Range: N/A
security_group_ids	Array of strings	Definition: Security group ID list. Range: N/A
connect_cidrs	String	Definition: Connected CIDR block list. Range: N/A
port_id	Array of strings	Definition: NIC ID. Range: N/A
port_ip	String	Definition: NIC IP address. Range: N/A

Table 4-127 TmsTagResponse

Parameter	Type	Description
key	String	Definition: TMS tag key. Range: N/A
value	String	Definition: TMS tag value. Range: N/A

4.7 Saving a Running Instance as a Container Image

Function

This API is used to save a running instance as a container image.

This API applies to the following scenario: When you need to save the current running environment for future use or development, you can use this API to save an instance as an image. Before using this API, ensure that you have logged in to the system and have the permission to access the target instance. In addition, the instance must be running. After this API is called, the system saves the running instance as a container image, including the installed dependency packages and plug-ins. If you do not have the permission to access the specified instance or the instance is not running, the API will return an error message.

Constraints

No constraints

Debugging

You can debug this API through automatic authentication in [API Explorer](#) or use the SDK sample code generated by API Explorer.

Authorization Information

Each account has all the permissions required to call all APIs, but IAM users must be assigned the required permissions.

- If you are using role/policy-based authorization, see [Permissions Policies and Supported Actions](#) for details on the required permissions.
- If you are using identity policy-based authorization, the following identity policy-based permissions are required.

		-	g:EnterpriseProjectId		

URI

POST /v1/{project_id}/notebooks/{id}/create-image

Table 4-128 Path Parameters

Parameter	Mandatory	Type	Description
id	Yes	String	Definition: Notebook instance ID. The ID is in the format of a Universally Unique Identifier (UUID). For details about how to obtain the ID, see Querying Notebook Instances . Constraints: N/A Range: N/A Default Value: N/A
project_id	Yes	String	Definition: Project ID. For details, see Obtaining a Project ID and Name . Constraints: N/A Range: N/A Default Value: N/A

Request Parameters

Table 4-129 Request body parameters

Parameter	Mandatory	Type	Description
description	No	String	Definition: Image description. Constraints: N/A Range: Up to 512 characters Default Value: N/A
name	Yes	String	Definition: Image name. Constraints: N/A Range: The value can contain up to 128 characters. Only lowercase letters, digits, hyphens (-), underscores (_), and periods (.) are allowed. The string must start and end with a lowercase letter or digit. Default Value: N/A
namespace	Yes	String	Definition: Organization to which the image belongs. You can create and view an organization on the Organization Management page of the SWR console. Constraints: N/A Range: The value can contain a maximum of 64 characters and must start with a lowercase letter. Only letters, digits, hyphens (-), underscores (_), and periods (.) are allowed. Default Value: N/A
tag	No	String	Definition: Image tag. Constraints: N/A Range: The value can contain a maximum of 64 characters. Letters, digits, hyphens (-), underscores (_), and commas (,) are allowed. Default Value: N/A

Parameter	Mandatory	Type	Description
workspace_id	No	String	Definition: Workspace ID. [For details about how to obtain the ID, see Querying the Workspace List . If no workspaces are available, the default value is 0 . If a workspace is created and used, use the actual value. Constraints: N/A Range: N/A Default Value: 0
swr_instance_id	No	String	Definition: Enterprise edition SWR repository ID. Constraints: N/A Range: N/A Default Value: N/A
swr_instance_domain	No	String	Definition: Enterprise edition SWR repository domain name. Constraints: N/A Range: N/A Default Value: N/A

Response Parameters

Status code: 200

Table 4-130 Response body parameters

Parameter	Type	Description
arch	String	Definition: Processor architecture supported by the image. Range • X86_64: x86 architecture • AARCH64: Arm architecture
create_at	Long	Definition: UTC time when the image is created, accurate to millisecond. Range: N/A
description	String	Definition: Image description. Range: Up to 512 characters

Parameter	Type	Description
dev_services	Array of strings	Definition: Services supported by the image. Range: • NOTEBOOK: You can access a notebook instance using HTTPS. • SSH: You can remotely access a notebook instance from a local IDE through SSH.
id	String	Definition: ID of the image used for creating notebook instances. The ID is in Universally Unique Identifier (UUID) format. For details, see Querying Supported Images . Range: N/A
name	String	Definition: Image name. Range: The name can contain a maximum of 512 characters. Lowercase letters, digits, hyphens (-), underscores (_), and periods (.) are allowed.
namespace	String	Definition: Organization to which the image belongs. You can create and view an organization on the Organization Management page of the SWR console. Range: N/A
origin	String	Definition: Image source. Range: • CUSTOMIZE: custom image • IMAGE_SAVE: image saved by a notebook instance
resource_categories	Array of strings	Definition: Flavors supported by the image. Range: • CPU • GPU • ASCEND

Parameter	Type	Description
service_type	String	Definition: Supported image types. Range: • COMMON: common image • INFERENCE: image used for inference • TRAIN: image used for training • DEV: image used for development and debugging • UNKNOWN: image whose supported services are not specified
size	Long	Definition: Image size, in KB. Range: N/A
status	String	Definition: Image status. Range: • INIT: The image is being initialized. • CREATING: The image is being saved. In this case, the notebook instance is unavailable. • CREATE_FAILED: Saving the image failed. • ERROR: An error occurs. • DELETED: The image has been deleted. • ACTIVE: The image has been saved, which you can view on the SWR console and use to create notebook instances.
status_message	String	Definition: Build information during image saving. Range: N/A
swr_path	String	Definition: SWR image path. Range: N/A
tag	String	Definition: Image tag. Range: N/A
type	String	Definition: Image type. Range: • BUILD_IN: built-in system image • DEDICATED: image you have saved

Parameter	Type	Description
update_at	Long	Definition: Time (UTC) when the image was last updated, accurate to millisecond. Range: N/A
visibility	String	Definition: Image visibility. Range: • PRIVATE: private image • PUBLIC: All users can perform read-only operations based on image_id.
workspace_id	String	Definition: Workspace ID. If no workspaces are available, the default value is 0 . If a workspace is created and used, use the actual value. Range: N/A
flavor_type	String	Definition: Resource type of the image. Range: • ASCEND_SNT9: 910 chip • ASCEND_SNT9B: 910B chip • ASCEND_SNT3: 310 chip
swr_instance_id	String	Definition: Enterprise edition SWR repository ID. Range: N/A
show_tag	String	Definition: Image tag. Range: N/A
show_name	String	Definition: Image name. Range: N/A
tags	Array of TmsTagResponse objects	Definition: Image tag.

Table 4-131 TmsTagResponse

4.8 Querying the List of Valid Specifications Supported by Notebook Instances

Function

This API is used to obtain the available specifications supported by notebook instances. This API applies to the following scenario: When you want to know the configuration options supported by a notebook instance, you can use this API to query the list of available specifications. Before using this API, ensure that you have logged in to the system and have the permission to access the target notebook instance. After this API is called, the system returns the valid specifications supported by the notebook instance. For example, the memory and CPU. If you do not have the permission to access the specified notebook instance or the notebook instance is not running, the API will return an error message.

Constraints

No constraints

Debugging

You can debug this API through automatic authentication in [API Explorer](#) or use the SDK sample code generated by API Explorer.

Authorization Information

Each account has all the permissions required to call all APIs, but IAM users must be assigned the required permissions.

- If you are using role/policy-based authorization, see [Permissions Policies and Supported Actions](#) for details on the required permissions.
- If you are using identity policy-based authorization, no identity policy-based permission required for calling this API.

Table 4-133 Query Parameters

Parameter	Mandatory	Type	Description
category	No	String	Definition: Processor type Constraints: N/A Range: Enums: • CPU • GPU • ASCEND Default Value: N/A
limit	No	Integer	Definition: Number of valid specifications displayed on each page. There is no limit by default. Constraints: N/A Range: N/A Default Value: N/A
offset	No	Integer	Definition: Start offset of the records on each page Constraints: N/A Range: N/A Default Value: 0
type	No	String	Definition: Cluster type Constraints: N/A Range: Enums: • MANAGED: public cluster • DEDICATED: dedicated cluster Default Value: N/A
sort_dir	No	String	Definition: Sorting mode Constraints: N/A Range: Enums: • ASC: ascending order • DESC: descending order Default Value: DESC

Parameter	Mandatory	Type	Description
sort_key	No	String	Definition: Sorting field. Separate multiple fields with commas (,). Constraints: N/A Range: The value can contain a maximum of 128 characters. Letters, digits, hyphens (-), underscores (_), and commas (,) are allowed. Default Value: N/A
flavor_type	No	String	Definition: Resource type. Constraints: N/A Range • ASCEND_SNT9: 910 chip • ASCEND_SNT9B: 910B chip • ASCEND_SNT3: 310 chip Default Value: N/A
feature	No	String	Definition: Feature name. Constraints: N/A Range: The value can be: • NOTEBOOK: Notebook instance created by a user. Default Value: NOTEBOOK

Response Parameters

Status code: 200

Table 4-134 Response body parameters

Parameter	Type	Description
current	Integer	Definition: Current page number. Range: Positive integers
data	Array of NotebookFlavor objects	Definition: Pagination data.

Parameter	Type	Description
pages	Integer	Definition: Total number of pages. Range: Positive integers
size	Integer	Definition: Number of records on each page Range: Positive integers
total	Long	Definition: Total number of records. Range: Non-negative integers
flavors	Array of NotebookFlavor objects	Definition: Pagination data.

Table 4-135 NotebookFlavor

Parameter	Type	Description
arch	String	Definition: Architecture type. Range: • X86_64 • AARCH64
ascend	AscendInfo object	Description: NPU information.
billing	BillingInfo object	Definition: CDR information.
category	String	Definition: Processor type. Range: • CPU • GPU • ASCEND
description	String	Definition: Specifications description. Range: N/A
feature	String	Definition: Instance type. Range: • DEFAULT: free CodeLab instance. Each user can create only one. • NOTEBOOK: billed instance.

Parameter	Type	Description
free	Boolean	Definition: Whether free specifications are used. Range: Boolean • true: free specifications • false: non-free specifications
gpu	GPUInfo object	Description: GPU information.
id	String	Definition: Specification ID. Range: N/A
memory	Long	Definition: Memory size. Range: N/A
name	String	Definition: Specification name. Range: N/A
sold_out	Boolean	Definition: Whether resources are sufficient. Range: Boolean • true: Resources are insufficient. • false: Resources are sufficient.
storages	Array of strings	Definition: Storage type supported by the specification. Range: • EFS • EVS
vcpus	Integer	Definition: Number of CPU cores. Range: N/A
evs_max_size	String	Definition: Maximum size (GB) of EVS storage that can be created. Range: N/A
evs_sku_code	String	Definition: SKU code of EVS storage. Range: N/A

Parameter	Type	Description
grow_support_type	String	Definition: Site type. Range: The value can be: • COMMON: supported on both the Chinese mainland and International sites • NATIONAL: supported only on the Chinese mainland site • INTERNATIONAL: supported only on the International site • NONE: supported on neither the Chinese mainland nor International sites

Table 4-136 AscendInfo

Parameter	Type	Description
npu	Integer	Definition: Number of NPUs. Range: N/A
npu_memory	String	Definition: NPU memory. Range: N/A
type	String	Definition: NPU type. Range: N/A
chip	Integer	Definition: Number of NPUs. Range: N/A

Table 4-137 BillingInfo

Parameter	Type	Description
code	String	Definition: Billing code. Range: N/A
unit_num	Integer	Definition: Billing unit. Range: N/A

Table 4-138 GPUInfo

Parameter	Type	Description
gpu	Integer	Number of GPUs.
gpu_memory	String	Definition: GPU memory. Range: N/A
type	String	Definition: GPU type. Range: N/A

4.9 Querying the List of Switchable Specifications Supported by Notebook Instances

Function

This API is used to obtain the available specifications that can be switched during notebook instance creation.

This API applies to the following scenario: When you want to know the configuration options supported by a notebook instance, you can use this API to query the list of available specifications. Before using this API, ensure that you have logged in to the system and have the permission to create a notebook instance. After this API is called, the system returns the switchable specifications supported by the notebook instance. For example, the memory and CPU. If you do not have the permission to create a notebook instance, the API will return an error message.

Constraints

No constraints

Debugging

You can debug this API through automatic authentication in [API Explorer](#) or use the SDK sample code generated by API Explorer.

Authorization Information

Each account has all the permissions required to call all APIs, but IAM users must be assigned the required permissions.

- If you are using role/policy-based authorization, see [Permissions Policies and Supported Actions](#) for details on the required permissions.
- If you are using identity policy-based authorization, no identity policy-based permission required for calling this API.

4.10 Querying the Available Duration of a Running Notebook Instance

Function

This API is used to obtain the available duration of a running notebook instance.

This API applies to the following scenario: When you need to know how long a notebook instance can remain running to properly arrange tasks, you can use this API to query the available duration of it. Before using this API, ensure that you have logged in to the system and have the permission to access the target notebook instance. In addition, the notebook instance must be running. After this API is called, the system returns the available duration of the specified notebook instance. If you do not have the permission to access the specified notebook instance or the notebook instance is not running, the API will return an error message. If the specified notebook instance is not found or the query fails, the API will return an error message.

Constraints

No constraints

Debugging

You can debug this API through automatic authentication in [API Explorer](#) or use the SDK sample code generated by API Explorer.

Authorization Information

Each account has all the permissions required to call all APIs, but IAM users must be assigned the required permissions.

- If you are using role/policy-based authorization, see [Permissions Policies and Supported Actions](#) for details on the required permissions.
- If you are using identity policy-based authorization, no identity policy-based permission required for calling this API.

4.11 Prolonging a Notebook Instance

Function

This API is used to prolong the running time of a running notebook instance. This API applies to the following scenarios: When you need to prolong the running time of a notebook instance to complete long-time tasks, you can call this API to do so. Before using this API, ensure that you have logged in to the system and have the permission to perform operations on the target notebook instance. In addition, the notebook instance must be running. After this API is called, the system prolongs the running time of the specified notebook instance, so that you can continue to use it. If you do not have the permission to perform operations on the specified notebook instance or the notebook instance is not running, the API will return an error message.

Constraints

No constraints

Debugging

You can debug this API through automatic authentication in [API Explorer](#) or use the SDK sample code generated by API Explorer.

Authorization Information

Each account has all the permissions required to call all APIs, but IAM users must be assigned the required permissions.

- If you are using role/policy-based authorization, see [Permissions Policies and Supported Actions](#) for details on the required permissions.
- If you are using identity policy-based authorization, the following identity policy-based permissions are required.

4.12 Starting a Notebook Instance

Function

This API is used to start a created notebook instance.

This API applies to the following scenarios: When you need to run a notebook instance for data processing, model training, or development, you can use this API to start a specified notebook instance. Before using this API, ensure that you have logged in to the system and have the permission to perform operations on the target notebook instance. In addition, the notebook instance must have been stopped, and configurations must be correct. After this API is called, the system starts the specified notebook instance for your use. If you do not have the permission to perform operations on the specified notebook instance or the notebook instance has not been stopped, the API will return an error message. If the specified notebook instance is not found or the startup fails, the API will return an error message.

Constraints

No constraints

Debugging

You can debug this API through automatic authentication in [API Explorer](#) or use the SDK sample code generated by API Explorer.

Authorization Information

Each account has all the permissions required to call all APIs, but IAM users must be assigned the required permissions.

- If you are using role/policy-based authorization, see [Permissions Policies and Supported Actions](#) for details on the required permissions.
- If you are using identity policy-based authorization, the following identity policy-based permissions are required.

Response Parameters

Status code: 200

Table 4-154 Response body parameters

Parameter	Type	Description
action_progress	Array of JobProgress objects	Definition: Initialization progress of the instance.
description	String	Definition: Instance description. Range: N/A
endpoints	Array of EndpointsRes objects	Definition: Local IDE (such as PyCharm and VS Code) or SSH client for remotely accessing a notebook instance through SSH.
fail_reason	String	Definition: Instance failure cause. Range: N/A

Parameter	Type	Description
flavor	String	Definition: Instance flavor. 1. If you select a system specification, the returned value is the system specification code. 2. If you select a custom specification when creating an instance, this parameter is always returned as custom.flavor.spec.code . Range: N/A.
custom_spec	NotebookCustomSpecRep object	Definition: Custom specifications of an instance. This parameter is returned only when a CPU or GPU dedicated pool is used and the custom specifications are used. Range: N/A.
id	String	Definition: Instance ID. Range: N/A
image	Image object	Definition: Instance image information.
lease	Lease object	Definition: Countdown to auto stop of an instance.
name	String	Definition: Instance name. Range: N/A
pool	Pool object	Definition: Basic information about the dedicated pool, which is returned by the instance created in the dedicated pool.

Parameter	Type	Description
status	String	Definition: Instance status. Range: • INIT: The instance is being initialized. • CREATING: The instance is being created. • STARTING: The instance is being started. • STOPPING: The instance is being stopped. • DELETING: The instance is being deleted. • RUNNING: The instance is running. • STOPPED: The instance has been stopped. • SNAPSHOTTING: The image of the instance is being saved. • CREATE_FAILED: Creating the instance failed. • START_FAILED: Starting the instance failed. • DELETE_FAILED: Deleting the instance failed. • ERROR: An error occurred. • DELETED: The instance has been deleted. • FROZEN: The instance is frozen.
token	String	Description: Token used for notebook authentication. Range: N/A
url	String	Definition: URL for accessing the instance. Range: N/A
volume	VolumeRes object	Definition: Instance storage information.
workspace_id	String	Definition: Workspace ID. If no workspaces are available, the default value is 0. If a workspace is created and used, use the actual value. Range: N/A

Parameter	Type	Description
feature	String	Definition: Instance type. Range: • DEFAULT: free CodeLab instance. Each user can create only one. • NOTEBOOK: billed instance.
billing_items	Array of strings	Definition: Billing resource type. Range: • STORAGE: Storage resource billing • COMPUTE: Computing resources billing • ALL: All billing types
user	UserResponse object	Description: Account information.
affinity	AffinityType object	Definition: Affinity information.
run_user	RunUserInfo object	Definition: Information about the startup user and startup user group.
data_volumes	Array of VolumeResponse objects	Definition: Extended storage information.
ip	String	Definition: IP address of the node where the instance is located. Range: N/A
user_vpc	UserVpcResponse object	Definition: User VPC configuration.
user_id	String	Definition: User ID. Range: N/A
is_need_credentials	Boolean	Definition: Whether to create a user secret by default. The default value is true . Range: N/A
jupyter_version	String	Definition: Jupyter version. Range: N/A
tags	Array of TmsTagResponse objects	Definition: Instance tag.

Table 4-155 JobProgress

Parameter	Type	Description
status	String	Definition: Job status in a specified step. Range: • WAITING: The job is awaiting. • PROCESSING: The job is being processed. • FAILED: The job failed. • COMPLETED: The job is complete.
step	Integer	Definition: Job step. Range: • 1: Prepare storage. • 2: Prepare compute resources. • 3: Configure the network. • 4: Initialize the instance.
description	String	Definition: Job description in a specified step. Range: N/A

Table 4-156 EndpointsRes

Parameter	Type	Description
key_pair_names	Array of strings	Definition: List of SSH key pairs. You can set multiple key pairs to access an SSH instance at the same time. Range: N/A
service	String	Definition: Method for accessing the notebook instance. Range: • NOTEBOOK: You can access notebook instances using HTTPS. • SSH: You can remotely access notebook instances through SSH.
uri	String	Definition: Private IP address of the instance. Range: N/A

Table 4-157 NotebookCustomSpecRep

Parameter	Type	Description
gpu	Float	Definition: Number of GPUs of an instance. Range: N/A
gpu_type	String	Definition: GPU acceleration PU of an instance. Range: N/A
cpu	Float	Definition: Number of CPUs of an instance. Range: The integer part can contain at most 10 digits and the decimal part can contain at most 2 digits. The value cannot be smaller than 0.4 .
memory	Float	Definition: Memory size of an instance. Range: The value must be an integer containing at most 10 digits, and the value cannot be smaller than 513 .
arch	String	Definition: CPU architecture of an instance. Range: The value can be: • X86_64: x86 architecture • AARCH64: Arm architecture
category	String	Definition: Specification type of an instance. Range: The value can be: • CPU • GPU
resource_flavor	String	Definition: Specifications of the target resource pool node selected for the instance. Range: N/A

Table 4-158 Image

Parameter	Type	Description
arch	String	Definition: Processor architecture supported by the image. Range • X86_64: x86 architecture • AARCH64: Arm architecture
create_at	Long	Definition: UTC time when the image is created, accurate to millisecond. Range: N/A
description	String	Definition: Image description. Range: Up to 512 characters
dev_services	Array of strings	Definition: Services supported by the image. Range: • NOTEBOOK: You can access a notebook instance using HTTPS. • SSH: You can remotely access a notebook instance from a local IDE through SSH.
id	String	Definition: ID of the image used for creating notebook instances. The ID is in Universally Unique Identifier (UUID) format. For details, see Querying Supported Images . Range: N/A
name	String	Definition: Image name. Range: The name can contain a maximum of 512 characters. Lowercase letters, digits, hyphens (-), underscores (_), and periods (.) are allowed.
namespace	String	Definition: Organization to which the image belongs. You can create and view an organization on the Organization Management page of the SWR console. Range: N/A

Parameter	Type	Description
origin	String	Definition: Image source. Range: • CUSTOMIZE: custom image • IMAGE_SAVE: image saved by a notebook instance
resource_categories	Array of strings	Definition: Flavors supported by the image. Range: • CPU • GPU • ASCEND
service_type	String	Definition: Supported image types. Range: • COMMON: common image • INFERENCE: image used for inference • TRAIN: image used for training • DEV: image used for development and debugging • UNKNOWN: image whose supported services are not specified
size	Long	Definition: Image size, in KB. Range: N/A
status	String	Definition: Image status. Range: • INIT: The image is being initialized. • CREATING: The image is being saved. In this case, the notebook instance is unavailable. • CREATE_FAILED: Saving the image failed. • ERROR: An error occurs. • DELETED: The image has been deleted. • ACTIVE: The image has been saved, which you can view on the SWR console and use to create notebook instances.
status_message	String	Definition: Build information during image saving. Range: N/A

Parameter	Type	Description
swr_path	String	Definition: SWR image path. Range: N/A
tag	String	Definition: Image tag. Range: N/A
type	String	Definition: Image type. Range: • BUILD_IN: built-in system image • DEDICATED: image you have saved
update_at	Long	Definition: Time (UTC) when the image was last updated, accurate to millisecond. Range: N/A
visibility	String	Definition: Image visibility. Range: • PRIVATE: private image • PUBLIC: All users can perform read-only operations based on image_id.
workspace_id	String	Definition: Workspace ID. If no workspaces are available, the default value is 0 . If a workspace is created and used, use the actual value. Range: N/A
flavor_type	String	Definition: Resource type of the image. Range: • ASCEND_SNT9: 910 chip • ASCEND_SNT9B: 910B chip • ASCEND_SNT3: 310 chip
swr_instance_id	String	Definition: Enterprise edition SWR repository ID. Range: N/A
show_tag	String	Definition: Image tag. Range: N/A
show_name	String	Definition: Image name. Range: N/A
tags	Array of TmsTagResponse objects	Definition: Image tag.

Table 4-159 Lease

Parameter	Type	Description
create_at	Long	Definition: UTC time when the instance is created, accurate to millisecond. Range: N/A
duration	Long	Definition: Instance runtime, which is calculated based on the instance creation time. If the instance creation time plus the runtime is greater than the current time, the system automatically stops the instance. Range: N/A
enable	Boolean	Definition: Specifies whether to enable auto stop. Range: Boolean • true: Auto stop is enabled. • false: Auto stop is disabled.
type	String	Definition: Auto stop type. Range: • TIMING: auto stop • IDLE: stop when idle
update_at	Long	Definition: Time (UTC) when the instance is last updated (excluding liveness check), accurate to millisecond. Range: N/A

Table 4-160 Pool

Parameter	Type	Description
id	String	Definition: Dedicated resource pool ID. Range: N/A
name	String	Definition: Dedicated resource pool name. Range: N/A

Table 4-161 VolumeRes

Parameter	Type	Description
capacity	Integer	Definition: Storage capacity. Range: The default value is 5 GB for EVS and 50 GB for EFS. The maximum value is 4,096 GB.
category	String	Definition: Supported storage type. For details about the differences between the storage types, see Selecting Storage in DevEnviron . Range: • SFS • EVS • OBS • OBSFS: parallel file system • EFS: SFS Turbo
mount_path	String	Definition: Directory of the notebook instance to which the storage is mounted. Currently, the directory is / home/ma-user/work/ . Range: N/A
ownership	String	Definition: Resource owner. Range: • MANAGED: Resources are managed by the service. • DEDICATED: Resources are managed by the user account. This mode is supported only when the instance category is EFS.
status	String	Definition: EVS disk capacity expansion status, which is RESIZING during capacity expansion and does not affect the instance. Range: N/A
id	String	Definition: EFS disk ID or OBS storage ID. This parameter is returned only when extended storage is used. Range: N/A
read_only	Boolean	Definition: Whether the mounting directory of extended storage is read-only. Range: N/A

Parameter	Type	Description
dew_secret_name	String	Definition: Name of the AK/SK secret stored in DEW. Range: N/A
evs_sku_code	String	Definition: SKU code of EVS storage. Range: N/A
uri	String	Definition: Source path for mounting the storage when category is EFS , OBS , or OBSFS . Range: N/A
mount_type	String	Definition: Storage mount type. Range: The value can be: • STATIC: Storage cannot be mounted or unmounted when the instance is running. • DYNAMIC: Storage can be mounted and unmounted when the instance is running.

Table 4-162 UserResponse

Parameter	Type	Description
id	String	Definition: User ID. Range: N/A
name	String	Definition: Username. Range: N/A
domain	Domain object	Definition: Domain information of an account.

Table 4-163 Domain

Parameter	Type	Description
id	String	Definition: Account ID. Range: N/A
name	String	Definition: Account name. Range: N/A

Table 4-164 AffinityType

Parameter	Type	Description
required_during_scheduling_ignored_during_execution	Array of AffinityRule objects	Definition: Strong affinity feature in the dedicated pool scenario. Constraints: key , values , and operator are mandatory.
preferred_during_scheduling_ignored_during_execution	Array of AffinityRule objects	Definition: Weak affinity feature in the dedicated pool scenario. Constraints: key , values , and operator are mandatory, and weight is optional.

Table 4-165 AffinityRule

Parameter	Type	Description
key	String	Definition: Affinity description. Both default labels and custom labels are supported. For details about the default node labels, see Managing Node Labels . Constraints: Labels are key-value pairs. A valid label key consists of two segments: prefix (optional) and name, which are separated by a slash (/). Range: The name segment is mandatory and must be less than or equal to 63 characters. It must start and end with a letter or digit and only contain letters, digits, hyphens (-), underscores (_), and periods (.). The prefix is optional. If specified, the prefix must be a DNS subdomain: a series of DNS labels separated by periods (.), with a total of no more than 253 characters, followed by a slash (/). For details, see Labels and Selectors . Default Value: N/A.

Parameter	Type	Description
operator	String	Definition: Operator. Constraints: N/A Range: The following operators are supported: In: The label of the affinity or anti-affinity object is in the label value list (values field). NotIn: The label of the affinity or anti-affinity object is not in the label value list (values field). Exists: The affinity or anti-affinity object has a specified label key. DoesNotExist: The affinity or anti-affinity object does not have a specified label key. Gt: The label value of the scheduling node exceeds what is listed (string comparison). Lt: The label value of the scheduling node is under what is listed (string comparison). Default Value: N/A.
values	Array of strings	Definition: When configuring node affinity, enter the value of the node label. Constraints: The value must be 63 characters or fewer (can be empty). If the label value is not empty, the value must start and end with a letter or digit and can contain hyphens (-), underscores (_), periods (.), letters, or digits. For details, see Labels and Selectors .
weight	Integer	Weight value of the weak affinity node. The value ranges from 0 to 100. The value is NULL for strong affinity and optional for weak affinity.

Table 4-166 RunUserInfo

Parameter	Type	Description
uid	Integer	User ID of the container startup user.

Parameter	Type	Description
gid	Integer	Group ID of the container startup user.
user_name	String	Username of the container startup user.
group_name	String	Group name of the container startup user.

Table 4-167 VolumeResponse

Parameter	Type	Description
category	String	Definition: Extended storage type, for example, EFS , OBS , or OBSFS . Constraints: N/A
mount_path	String	Definition: Directory where the storage is mounted to a notebook instance. Constraints: N/A
url	String	Definition: Source path for mounting the storage when category is OBS or OBSFS . Constraints: N/A
status	String	Definition: Storage status. MOUNTING: being mounted MOUNTED: mounted UNMOUNTING: being unmounted UNMOUNTED: unmounted MOUNT_FAILED: mounting failed UNMOUNT_FAILED: unmounting failed Constraints: N/A
mount_type	String	Definition: Storage mount type. Constraints: N/A

Table 4-168 UserVpcResponse

Parameter	Type	Description
vpc_id	String	Definition: VPC ID. Range: N/A

Parameter	Type	Description
subnet_id	String	Definition: Subnet ID. Range: N/A
security_group_ids	Array of strings	Definition: Security group ID list. Range: N/A
connect_cidrs	String	Definition: Connected CIDR block list. Range: N/A
port_id	Array of strings	Definition: NIC ID. Range: N/A
port_ip	String	Definition: NIC IP address. Range: N/A

Table 4-169 TmsTagResponse

Parameter	Type	Description
key	String	Definition: TMS tag key. Range: N/A
value	String	Definition: TMS tag value. Range: N/A

Error Codes

See [Error Codes](#).

4.13 Stopping a Notebook Instance

Function

This API is used to stop a notebook instance that is running.

This API applies to the following scenario: When you need to release the resources occupied by a notebook instance or stop a running task, you can use this API to stop a specified notebook instance. Before using this API, ensure that you have logged in to the system and have the permission to perform operations on the target notebook instance. In addition, the notebook instance must be running. After this API is called, the system stops the specified notebook instance and releases related resources. If you do not have the permission to perform operations on the specified notebook instance or the notebook instance is not running, the API will return an error message. If the specified notebook instance is not found or the stop fails, the API will return an error message.

Constraints

No constraints

Debugging

You can debug this API through automatic authentication in [API Explorer](#) or use the SDK sample code generated by API Explorer.

Authorization Information

Each account has all the permissions required to call all APIs, but IAM users must be assigned the required permissions.

- If you are using role/policy-based authorization, see [Permissions Policies and Supported Actions](#) for details on the required permissions.
- If you are using identity policy-based authorization, the following identity policy-based permissions are required.

Action	Access Level	Resource Type (*: required)	Condition Key	Alias	Dependencies
modelarts:notebook:stop	Write	notebook*	g:ResourceTag/<tag-key>	-	-
		-	• g:EnterpriseProjectId • modelarts:poolType • modelarts:poolId		

URI

POST /v1/{project_id}/notebooks/{id}/stop

Table 4-170 Path Parameters

Parameter	Mandatory	Type	Description
id	Yes	String	Definition: Notebook instance ID. The ID is in the format of a Universally Unique Identifier (UUID). For details about how to obtain the ID, see Querying Notebook Instances . Constraints: N/A Range: N/A Default Value: N/A
project_id	Yes	String	Definition: Project ID. For details, see Obtaining a Project ID and Name . Constraints: N/A Range: N/A Default Value: N/A

Request Parameters

None

Response Parameters

Status code: 200

Table 4-171 Response body parameters

Parameter	Type	Description
action_progress	Array of JobProgress objects	Definition: Initialization progress of the instance.
description	String	Definition: Instance description. Range: N/A
endpoints	Array of EndpointsRes objects	Definition: Local IDE (such as PyCharm and VS Code) or SSH client for remotely accessing a notebook instance through SSH.
fail_reason	String	Definition: Instance failure cause. Range: N/A

Parameter	Type	Description
flavor	String	Definition: Instance flavor. 1. If you select a system specification, the returned value is the system specification code. 2. If you select a custom specification when creating an instance, this parameter is always returned as custom.flavor.spec.code . Range: N/A.
custom_spec	NotebookCustomSpecRep object	Definition: Custom specifications of an instance. This parameter is returned only when a CPU or GPU dedicated pool is used and the custom specifications are used. Range: N/A.
id	String	Definition: Instance ID. Range: N/A
image	Image object	Definition: Instance image information.
lease	Lease object	Definition: Countdown to auto stop of an instance.
name	String	Definition: Instance name. Range: N/A
pool	Pool object	Definition: Basic information about the dedicated pool, which is returned by the instance created in the dedicated pool.

Parameter	Type	Description
status	String	Definition: Instance status. Range: • INIT: The instance is being initialized. • CREATING: The instance is being created. • STARTING: The instance is being started. • STOPPING: The instance is being stopped. • DELETING: The instance is being deleted. • RUNNING: The instance is running. • STOPPED: The instance has been stopped. • SNAPSHOTTING: The image of the instance is being saved. • CREATE_FAILED: Creating the instance failed. • START_FAILED: Starting the instance failed. • DELETE_FAILED: Deleting the instance failed. • ERROR: An error occurred. • DELETED: The instance has been deleted. • FROZEN: The instance is frozen.
token	String	Description: Token used for notebook authentication. Range: N/A
url	String	Definition: URL for accessing the instance. Range: N/A
volume	VolumeRes object	Definition: Instance storage information.
workspace_id	String	Definition: Workspace ID. If no workspaces are available, the default value is 0 . If a workspace is created and used, use the actual value. Range: N/A

Parameter	Type	Description
feature	String	Definition: Instance type. Range: • DEFAULT: free CodeLab instance. Each user can create only one. • NOTEBOOK: billed instance.
billing_items	Array of strings	Definition: Billing resource type. Range: • STORAGE: Storage resource billing • COMPUTE: Computing resources billing • ALL: All billing types
user	UserResponse object	Description: Account information.
affinity	AffinityType object	Definition: Affinity information.
run_user	RunUserInfo object	Definition: Information about the startup user and startup user group.
data_volumes	Array of VolumeResponse objects	Definition: Extended storage information.
ip	String	Definition: IP address of the node where the instance is located. Range: N/A
user_vpc	UserVpcResponse object	Definition: User VPC configuration.
user_id	String	Definition: User ID. Range: N/A
is_need_credentials	Boolean	Definition: Whether to create a user secret by default. The default value is true . Range: N/A
jupyter_version	String	Definition: Jupyter version. Range: N/A
tags	Array of TmsTagResponse objects	Definition: Instance tag.

Table 4-172 JobProgress

Parameter	Type	Description
status	String	Definition: Job status in a specified step. Range: • WAITING: The job is awaiting. • PROCESSING: The job is being processed. • FAILED: The job failed. • COMPLETED: The job is complete.
step	Integer	Definition: Job step. Range: • 1: Prepare storage. • 2: Prepare compute resources. • 3: Configure the network. • 4: Initialize the instance.
description	String	Definition: Job description in a specified step. Range: N/A

Table 4-173 EndpointsRes

Parameter	Type	Description
key_pair_names	Array of strings	Definition: List of SSH key pairs. You can set multiple key pairs to access an SSH instance at the same time. Range: N/A
service	String	Definition: Method for accessing the notebook instance. Range: • NOTEBOOK: You can access notebook instances using HTTPS. • SSH: You can remotely access notebook instances through SSH.
uri	String	Definition: Private IP address of the instance. Range: N/A

Table 4-174 NotebookCustomSpecRep

Parameter	Type	Description
gpu	Float	Definition: Number of GPUs of an instance. Range: N/A
gpu_type	String	Definition: GPU acceleration PU of an instance. Range: N/A
cpu	Float	Definition: Number of CPUs of an instance. Range: The integer part can contain at most 10 digits and the decimal part can contain at most 2 digits. The value cannot be smaller than 0.4 .
memory	Float	Definition: Memory size of an instance. Range: The value must be an integer containing at most 10 digits, and the value cannot be smaller than 513 .
arch	String	Definition: CPU architecture of an instance. Range: The value can be: • X86_64: x86 architecture • AARCH64: Arm architecture
category	String	Definition: Specification type of an instance. Range: The value can be: • CPU • GPU
resource_flavor	String	Definition: Specifications of the target resource pool node selected for the instance. Range: N/A

Table 4-175 Image

Parameter	Type	Description
arch	String	Definition: Processor architecture supported by the image. Range • X86_64: x86 architecture • AARCH64: Arm architecture
create_at	Long	Definition: UTC time when the image is created, accurate to millisecond. Range: N/A
description	String	Definition: Image description. Range: Up to 512 characters
dev_services	Array of strings	Definition: Services supported by the image. Range: • NOTEBOOK: You can access a notebook instance using HTTPS. • SSH: You can remotely access a notebook instance from a local IDE through SSH.
id	String	Definition: ID of the image used for creating notebook instances. The ID is in Universally Unique Identifier (UUID) format. For details, see Querying Supported Images . Range: N/A
name	String	Definition: Image name. Range: The name can contain a maximum of 512 characters. Lowercase letters, digits, hyphens (-), underscores (_), and periods (.) are allowed.
namespace	String	Definition: Organization to which the image belongs. You can create and view an organization on the Organization Management page of the SWR console. Range: N/A

Parameter	Type	Description
origin	String	Definition: Image source. Range: • CUSTOMIZE: custom image • IMAGE_SAVE: image saved by a notebook instance
resource_categories	Array of strings	Definition: Flavors supported by the image. Range: • CPU • GPU • ASCEND
service_type	String	Definition: Supported image types. Range: • COMMON: common image • INFERENCE: image used for inference • TRAIN: image used for training • DEV: image used for development and debugging • UNKNOWN: image whose supported services are not specified
size	Long	Definition: Image size, in KB. Range: N/A
status	String	Definition: Image status. Range: • INIT: The image is being initialized. • CREATING: The image is being saved. In this case, the notebook instance is unavailable. • CREATE_FAILED: Saving the image failed. • ERROR: An error occurs. • DELETED: The image has been deleted. • ACTIVE: The image has been saved, which you can view on the SWR console and use to create notebook instances.
status_message	String	Definition: Build information during image saving. Range: N/A

Parameter	Type	Description
swr_path	String	Definition: SWR image path. Range: N/A
tag	String	Definition: Image tag. Range: N/A
type	String	Definition: Image type. Range: • BUILD_IN: built-in system image • DEDICATED: image you have saved
update_at	Long	Definition: Time (UTC) when the image was last updated, accurate to millisecond. Range: N/A
visibility	String	Definition: Image visibility. Range: • PRIVATE: private image • PUBLIC: All users can perform read-only operations based on image_id.
workspace_id	String	Definition: Workspace ID. If no workspaces are available, the default value is 0 . If a workspace is created and used, use the actual value. Range: N/A
flavor_type	String	Definition: Resource type of the image. Range: • ASCEND_SNT9: 910 chip • ASCEND_SNT9B: 910B chip • ASCEND_SNT3: 310 chip
swr_instance_id	String	Definition: Enterprise edition SWR repository ID. Range: N/A
show_tag	String	Definition: Image tag. Range: N/A
show_name	String	Definition: Image name. Range: N/A
tags	Array of TmsTagResponse objects	Definition: Image tag.

Table 4-176 Lease

Parameter	Type	Description
create_at	Long	Definition: UTC time when the instance is created, accurate to millisecond. Range: N/A
duration	Long	Definition: Instance runtime, which is calculated based on the instance creation time. If the instance creation time plus the runtime is greater than the current time, the system automatically stops the instance. Range: N/A
enable	Boolean	Definition: Specifies whether to enable auto stop. Range: Boolean • true: Auto stop is enabled. • false: Auto stop is disabled.
type	String	Definition: Auto stop type. Range: • TIMING: auto stop • IDLE: stop when idle
update_at	Long	Definition: Time (UTC) when the instance is last updated (excluding liveness check), accurate to millisecond. Range: N/A

Table 4-177 Pool

Parameter	Type	Description
id	String	Definition: Dedicated resource pool ID. Range: N/A
name	String	Definition: Dedicated resource pool name. Range: N/A

Table 4-178 VolumeRes

Parameter	Type	Description
capacity	Integer	Definition: Storage capacity. Range: The default value is 5 GB for EVS and 50 GB for EFS. The maximum value is 4,096 GB.
category	String	Definition: Supported storage type. For details about the differences between the storage types, see Selecting Storage in DevEnviron . Range: • SFS • EVS • OBS • OBSFS: parallel file system • EFS: SFS Turbo
mount_path	String	Definition: Directory of the notebook instance to which the storage is mounted. Currently, the directory is /home/ma-user/work/ . Range: N/A
ownership	String	Definition: Resource owner. Range: • MANAGED: Resources are managed by the service. • DEDICATED: Resources are managed by the user account. This mode is supported only when the instance category is EFS.
status	String	Definition: EVS disk capacity expansion status, which is RESIZING during capacity expansion and does not affect the instance. Range: N/A
id	String	Definition: EFS disk ID or OBS storage ID. This parameter is returned only when extended storage is used. Range: N/A
read_only	Boolean	Definition: Whether the mounting directory of extended storage is read-only. Range: N/A

Parameter	Type	Description
dew_secret_name	String	Definition: Name of the AK/SK secret stored in DEW. Range: N/A
evs_sku_code	String	Definition: SKU code of EVS storage. Range: N/A
uri	String	Definition: Source path for mounting the storage when category is EFS , OBS , or OBSFS . Range: N/A
mount_type	String	Definition: Storage mount type. Range: The value can be: • STATIC: Storage cannot be mounted or unmounted when the instance is running. • DYNAMIC: Storage can be mounted and unmounted when the instance is running.

Table 4-179 UserResponse

Parameter	Type	Description
id	String	Definition: User ID. Range: N/A
name	String	Definition: Username. Range: N/A
domain	Domain object	Definition: Domain information of an account.

Table 4-180 Domain

Parameter	Type	Description
id	String	Definition: Account ID. Range: N/A
name	String	Definition: Account name. Range: N/A

Table 4-181 AffinityType

Parameter	Type	Description
required_during_scheduling_ignored_during_execution	Array of AffinityRule objects	Definition: Strong affinity feature in the dedicated pool scenario. Constraints: key , values , and operator are mandatory.
preferred_during_scheduling_ignored_during_execution	Array of AffinityRule objects	Definition: Weak affinity feature in the dedicated pool scenario. Constraints: key , values , and operator are mandatory, and weight is optional.

Table 4-182 AffinityRule

Parameter	Type	Description
key	String	Definition: Affinity description. Both default labels and custom labels are supported. For details about the default node labels, see Managing Node Labels . Constraints: Labels are key-value pairs. A valid label key consists of two segments: prefix (optional) and name, which are separated by a slash (/). Range: The name segment is mandatory and must be less than or equal to 63 characters. It must start and end with a letter or digit and only contain letters, digits, hyphens (-), underscores (_), and periods (.). The prefix is optional. If specified, the prefix must be a DNS subdomain: a series of DNS labels separated by periods (.), with a total of no more than 253 characters, followed by a slash (/). For details, see Labels and Selectors . Default Value: N/A.

Parameter	Type	Description
operator	String	Definition: Operator. Constraints: N/A Range: The following operators are supported: In: The label of the affinity or anti-affinity object is in the label value list (values field). NotIn: The label of the affinity or anti-affinity object is not in the label value list (values field). Exists: The affinity or anti-affinity object has a specified label key. DoesNotExist: The affinity or anti-affinity object does not have a specified label key. Gt: The label value of the scheduling node exceeds what is listed (string comparison). Lt: The label value of the scheduling node is under what is listed (string comparison). Default Value: N/A.
values	Array of strings	Definition: When configuring node affinity, enter the value of the node label. Constraints: The value must be 63 characters or fewer (can be empty). If the label value is not empty, the value must start and end with a letter or digit and can contain hyphens (-), underscores (_), periods (.), letters, or digits. For details, see Labels and Selectors .
weight	Integer	Weight value of the weak affinity node. The value ranges from 0 to 100. The value is NULL for strong affinity and optional for weak affinity.

Table 4-183 RunUserInfo

Parameter	Type	Description
uid	Integer	User ID of the container startup user.

Parameter	Type	Description

4.14 Obtaining Details About All Notebook Resource Pool Instances

Function

This API is used to obtain details about all notebook resource pool instances associated with a user. This API is used when you need to select a resource pool when creating a notebook instance. Before using this API, ensure that you have registered and logged in to the system and have the permission to view resource pool instances. After the API is called, the API returns a list of detailed information about all resource pool instances, including the instance name, status, and node specifications. If you have not logged in to the system, do not have the required permission to access the resource pool, or an internal error occurs in the system, the API returns an error message, for example, unauthorized access, service unavailable, or internal error.

Debugging

You can debug this API through automatic authentication in [API Explorer](#) or use the SDK sample code generated by API Explorer.

Authorization Information

Each account has all the permissions required to call all APIs, but IAM users must be assigned the required permissions.

- If you are using role/policy-based authorization, see [Permissions Policies and Supported Actions](#) for details on the required permissions.
- If you are using identity policy-based authorization, no identity policy-based permission required for calling this API.

URI

GET /v1/{project_id}/authoring/clusters

Table 4-187 Path Parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Definition: Project ID. For details, see Obtaining a Project ID and Name . Constraints: The value can contain 1 to 64 characters. Letters, digits, and hyphens (-) are allowed. Range: N/A Default Value: N/A

Table 4-188 Query Parameters

Parameter	Mandatory	Type	Description
type	Yes	String	Definition: Resource pool type. Constraints: N/A Range • MANAGED: public pool • DEDICATED: dedicated pool Default Value: N/A

Parameter	Mandatory	Type	Description
workspace_id	No	String	Definition: Workspace ID. . Constraints: There must be a workspace in use. Range: N/A Default Value: 0
limit	No	Integer	Definition: Number of instances displayed on each page. Constraints: N/A Range: greater than or equal to 0. Default Value: 1000
offset	No	Integer	Definition: Offset of data records. Constraints: N/A Range: greater than or equal to 0. Default Value: 0
scope	No	String	Definition: Job type. Constraints: N/A Range: The value can be: • NOTEBOOK: development environment • TRAIN: training job • INFER: inference job Default Value: NOTEBOOK

Request Parameters

None

Response Parameters

Status code: 200

Table 4-189 Response body parameters

Parameter	Type	Description
current	Integer	Definition: Current page number. Range: Positive integers.

Parameter	Type	Description
data	Array of ClusterResponse objects	Definition: Notebook instance data.
pages	Integer	Definition: Total number of pages. Range: Positive integers.
size	Integer	Definition: Number of records on each page. Range: Positive integers.
total	Long	Definition: Total number of records. Range: Non-negative integers.

Table 4-190 ClusterResponse

Parameter	Type	Description
logic_cluster_id	String	Definition: Logical resource pool ID. Range: N/A
status	String	Definition: Resource pool status. Range: • PENDING • INITIALIZING • INITIALIZE_FAILED • ACTIVE • DELETING • DELETED • DELETE_FAILED • MIGRATING
pool_id	String	Definition: Resource pool ID. Range: N/A
type	String	Definition: Resource pool type. Range: • MANAGED: public pool • DEDICATED: dedicated pool

Parameter	Type	Description
resource_categories	String	Definition: Resource type. Range: • GPU • CPU • ASCEND
workspace_id	String	Definition: Workspace ID. For details about how to obtain the value, see Obtaining Workspaces . If no workspace is created, the default value is 0. If a workspace is created and used, use the actual value. Range: N/A
create_at	String	Definition: UTC time when the instance is created, accurate to millisecond. Range: N/A
update_at	String	Definition: Time (UTC) when the instance was last updated, accurate to millisecond. Range: N/A
project_id	String	Definition: Project ID. For details, see Obtaining a Project ID and Name . Range: N/A.
domain_id	String	Definition: Account ID. Range: N/A
flavors	Array of Flavor objects	Definition: Resource pool flavors.
is_allow_root	Boolean	Definition: Specifies whether the resource pool permits starting instances with root user access.

Table 4-191 Flavor

Parameter	Type	Description
arch	String	Definition: Hardware architecture type. Range: • x86_64: x86 architecture • aarch64: Arm architecture

Parameter	Type	Description
billing	BillingInfo object	Definition: CDR information.
category	String	Definition: Processor type. Range: • CPU • GPU • ASCEND
description	String	Definition: Flavor description. Range: N/A
evs_max_size	String	Definition: Maximum size (GB) of EVS storage that can be created. Range: N/A
evs_sku_code	String	Definition: SKU code of EVS storage. Range: N/A
feature	String	Definition: Flavor type. Range: • DEFAULT: CodeLab • NOTEBOOK: notebook
free	Boolean	Definition: Indicates whether a free flavor is used. Range: Boolean • true: free flavor. • false: non-free flavor.
grow_support_type	String	Definition: Site type. Range: • COMMON: supported on both the Chinese mainland and International sites • NATIONAL: supported only on the Chinese mainland site • INTERNATIONAL: supported only on the International site • NONE: supported on neither the Chinese mainland nor International sites
id	String	Definition: Flavor ID. Range: N/A
memory	String	Definition: Memory size. Range: N/A

Parameter	Type	Description
name	String	Definition: Flavor name. Range: N/A
sold_out	Boolean	Definition: Indicates whether the flavor is sold out. Range: Boolean • true: The flavor is sold out. • false: The flavor is not sold out.
storages	Array of strings	Definition: Storage type supported by the flavor. Range: • EVS • OBS: Object Storage Service • OBSFS: parallel file system • EFS: SFS Turbo
vcpus	Integer	Definition: Number of CPU cores. Range: N/A
gpu	GPUsInfo object	Definition: GPU specifications when the processor type is GPU .
ascend	AscendInfo object	Definition: Ascend specifications when the processor type is ASCEND .

Table 4-192 BillingInfo

Parameter	Type	Description
code	String	Definition: Billing code. Range: N/A
unit_num	Integer	Definition: Billing unit. Range: N/A

Table 4-193 GPUsInfo

Parameter	Type	Description
type	String	Definition: GPU type. Range: N/A
gpu	Double	Definition: Number of GPUs. Range: N/A

Parameter	Type	Description
gpu_memory	String	Definition: GPU memory. Range: N/A

Table 4-194 AscendInfo

Parameter	Type	Description
npu	Integer	Definition: Number of NPUs. Range: N/A
npu_memory	String	Definition: NPU memory. Range: N/A
type	String	Definition: NPU type. Range: N/A
chip	Integer	Definition: Number of NPUs. Range: N/A

Status code: 401**Table 4-195** Response body parameters

4.15 Obtaining Details About a Notebook Resource Pool

Function

This API is used to obtain details about a notebook resource pool. This API is used when you need to query details about a specified cluster when creating a notebook instance job. Before using this API, ensure that the cluster has been managed and you have the required permission. After this API is called, the system returns the instance ID, name, flavor, instance status, and URL for accessing the cluster. If the cluster does not exist, is not managed, or you do not have the access permission, the API will return an error message.

Debugging

You can debug this API through automatic authentication in [API Explorer](#) or use the SDK sample code generated by API Explorer.

Authorization Information

Each account has all the permissions required to call all APIs, but IAM users must be assigned the required permissions.

- If you are using role/policy-based authorization, see [Permissions Policies and Supported Actions](#) for details on the required permissions.
- If you are using identity policy-based authorization, no identity policy-based permission required for calling this API.

URI

4.16 Querying the Switch and Quota of a Specified Feature of the Current User

Function

This API is used to query the switch status and quota information of a specified feature of the current user. This API is used when you need to know whether a specific feature is enabled, check the quota limit, or monitor the used resources. Before using this API, ensure that you have logged in and have the query permission, and the specified feature must exist. After this API is called, the system returns the details, such as whether the feature is enabled, total quota, and used

resources. If you do not have the required permission, the feature does not exist, or the system is abnormal, the API will return an error message.

Debugging

You can debug this API through automatic authentication in [API Explorer](#) or use the SDK sample code generated by API Explorer.

Authorization Information

Each account has all the permissions required to call all APIs, but IAM users must be assigned the required permissions.

- If you are using role/policy-based authorization, see [Permissions Policies and Supported Actions](#) for details on the required permissions.
- If you are using identity policy-based authorization, no identity policy-based permission required for calling this API.

4.17 Obtaining the Notebook Instances with OBS Storage Mounted

Function

This API is used to obtain the OBS parallel file system that can be mounted to a running notebook instance.

This API applies to the following scenario: When you need to mount an OBS parallel file system to the specified file directory of a notebook instance, you can use this API to obtain the list of available OBS parallel file systems. Before using this API, ensure that you have logged in to the system and have the permission to access the target notebook instance and OBS parallel file system. In addition, the notebook instance must be running. After this API is called, the system returns the list of OBS parallel file systems that can be dynamically mounted. If you do not have the permission to access the specified notebook instance or the notebook instance is not running, the API will return an error message.

Constraints

No constraints

Debugging

You can debug this API through automatic authentication in [API Explorer](#) or use the SDK sample code generated by API Explorer.

Authorization Information

Each account has all the permissions required to call all APIs, but IAM users must be assigned the required permissions.

- If you are using role/policy-based authorization, see [Permissions Policies and Supported Actions](#) for details on the required permissions.

- If you are using identity policy-based authorization, the following identity policy-based permissions are required.

4.18 OBS Storage Mounting

Function

This API is used to mount an OBS parallel file system to a specified file directory of a running notebook instance.

This API applies to the following scenario: When you need to directly operate files in OBS in a notebook instance, you can use this API to mount the OBS parallel file system to a specified directory of the instance. Then the file system can be read and written. Before using this API, ensure that you have logged in to the system and have the permission to access the target notebook instance and OBS parallel file system. In addition, the notebook instance must be running. After this API is called, the system mounts the specified OBS parallel file system to the notebook instance. You can read and write objects in the OBS parallel file system in the container as a file system. If you do not have the permission to access the specified notebook instance or the notebook instance is not running, the API will return an error message.

Constraints

No constraints

Debugging

You can debug this API through automatic authentication in [API Explorer](#) or use the SDK sample code generated by API Explorer.

Authorization Information

Each account has all the permissions required to call all APIs, but IAM users must be assigned the required permissions.

- If you are using role/policy-based authorization, see [Permissions Policies and Supported Actions](#) for details on the required permissions.
- If you are using identity policy-based authorization, the following identity policy-based permissions are required.

Action	Access Level	Resource Type (*: required)	Condition Key	Alias	Dependencies
modelarts:notebook:mountStorage	Write	notebook*	-	-	-
		-	g:EnterpriseProjectId		

URI

POST /v1/{project_id}/notebooks/{instance_id}/storage

Table 4-215 Path Parameters

Parameter	Mandatory	Type	Description
instance_id	Yes	String	Definition: Notebook instance ID. The ID is in the format of a Universally Unique Identifier (UUID). For details about how to obtain the ID, see Querying Notebook Instances . Constraints: N/A Range: N/A Default Value: N/A
project_id	Yes	String	Definition: Project ID. For details, see Obtaining a Project ID and Name . Constraints: N/A Range: N/A Default Value: N/A

Request Parameters

Table 4-216 Request body parameters

Parameter	Mandatory	Type	Description
category	No	String	Definition: Storage type for dynamic mounting. Constraints: N/A Range: • OBS: Object Storage Service Default Value: OBS
mount_path	No	String	Definition: Path mounted to the notebook instance. Constraints: N/A Range: The value can contain a maximum of 256 characters and must be in the /data/ subdirectory of the notebook instance. Default Value: /home/ma-user/work/
uri	No	String	Definition: OBS object path, for example, obs://modelarts/notebook/ . Constraints: Valid object path in the OBS parallel file system. Range: Up to 256 characters Default Value: N/A
efs_id	No	String	Definition: EFS storage instance ID. To obtain the value, log in to the SFS console, click file system name in the list to access its details page, and obtain the value of ID . Constraints: This parameter is mandatory only when category is EFS . The value must be in the UUID format, for example, 280a8bd5-03e2-4a5c-bea1-83d81e75bc53 . Range: N/A Default Value: N/A

Response Parameters

Status code: 200

Table 4-217 Response body parameters

Parameter	Type	Description
category	String	Definition: Storage type. The value can be OBS . Range: N/A
id	String	Definition: ID of the dynamically mounted instance. Range: N/A
mount_path	String	Definition: Path mounted to the notebook instance. Range: N/A
status	String	Definition: Status of dynamically mounted OBS storage. Range: • MOUNTING: being mounted • MOUNT_FAILED: mounting failed • MOUNTED: mounted • UNMOUNTING: being unmounted • UNMOUNT_FAILED: unmounting failed • UNMOUNTED: unmounted
uri	String	Definition: OBS object path. Range: N/A
failure_reason	String	Definition: Mounting failure cause. Range: N/A
efs_id	String	Definition: EFS storage instance ID. Range: N/A

Parameter	Type	Description
mount_type	String	Definition: Storage mount type. Range: The value can be: • STATIC: Storage cannot be mounted or unmounted when the instance is running. • DYNAMIC: Storage can be mounted and unmounted when the instance is running.

Status code: 201

Created

Example Requests

The following is an example of how to dynamically mount an OBS parallel file system to the **/data/wang/** directory in the instance.

```
{
  "category": "OBS",
  "mount_path": "/data/wang/",
  "uri": "obs://authoring-test/wang/"
}
```

Example Responses**Status code: 200**

OK

```
{
  "id": "91dd2d3f-2d92-475f-a375-04636af26cc9",
  "category": "OBSFS",
  "mount_path": "/data/wang/",
  "uri": "obs://authoring-test/wang/",
  "status": "MOUNTING"
}
```

4.19 Obtaining Details About a Notebook Instance with OBS Storage Mounted

Function

This API is used to obtain the details of the OBS parallel file system that has been mounted to a running notebook instance.

This API applies to the following scenario: When you want to view details about an OBS parallel file system that has been mounted to a notebook instance, you can use this API to obtain related information. Before using this API, ensure that you have logged in to the system and have the permission to access the target notebook instance and OBS parallel file system. In addition, the notebook instance must be running. After this API is called, the system returns the details about the OBS parallel file system mounted to the specified notebook instance. If you do not have the permission to access the specified notebook instance or the notebook instance is not running, the API will return an error message.

Constraints

No constraints

Debugging

You can debug this API through automatic authentication in [API Explorer](#) or use the SDK sample code generated by API Explorer.

Authorization Information

Each account has all the permissions required to call all APIs, but IAM users must be assigned the required permissions.

- If you are using role/policy-based authorization, see [Permissions Policies and Supported Actions](#) for details on the required permissions.
- If you are using identity policy-based authorization, the following identity policy-based permissions are required.

4.20 Unmounting OBS Storage from a Notebook Instance

Function

This API is used to unmount an OBS parallel file system from a running notebook instance.

This API applies to the following scenario: When you need to clear or reorganize the resources mounted to a notebook instance, you can use this API to unmount an OBS parallel file system from the instance. Before using this API, ensure that you have logged in to the system and have the permission to access the target notebook instance and OBS parallel file system. In addition, the notebook instance must be running, and have an OBS parallel file system mounted. After this API is called, the system unmounts the specified OBS parallel file system from the notebook instance. The notebook container cannot operate objects in OBS, but objects in OBS remain unchanged. If you do not have the permission to access the specified notebook instance or the notebook instance is not running, the API will return an error message.

Constraints

No constraints

Debugging

You can debug this API through automatic authentication in [API Explorer](#) or use the SDK sample code generated by API Explorer.

Authorization Information

Each account has all the permissions required to call all APIs, but IAM users must be assigned the required permissions.

- If you are using role/policy-based authorization, see [Permissions Policies and Supported Actions](#) for details on the required permissions.
- If you are using identity policy-based authorization, the following identity policy-based permissions are required.

4.21 Querying Supported Images

Function

This API is used to query all images by page based on specified conditions.

This API applies to the following scenarios: When you need to search for a specific image, manage the image repository, or select an appropriate image version for deployment, you can use this API to obtain the image list that meets the conditions. Before using this API, ensure that there is an image repository and you have the access permission. After a query operation is complete, you can obtain an image list that meets the search criteria. Details about the images can be obtained, including the image ID, name, version, type, status, size, and creation time. If there is no image repository, you have no access permission, or the search criteria are incorrect, the API will return an error message.

Constraints

No constraints

Debugging

You can debug this API through automatic authentication in [API Explorer](#) or use the SDK sample code generated by API Explorer.

Authorization Information

Each account has all the permissions required to call all APIs, but IAM users must be assigned the required permissions.

- If you are using role/policy-based authorization, see [Permissions Policies and Supported Actions](#) for details on the required permissions.
- If you are using identity policy-based authorization, the following identity policy-based permissions are required.

Action	Access Level	Resource Type (*: required)	Condition Key	Alias	Dependencies

GET /v1/{project_id}/images

Table 4-222 Path Parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Definition: Project ID. For details, see Obtaining a Project ID and Name . Constraints: N/A Range: N/A Default Value: N/A

Table 4-223 Query Parameters

Parameter	Mandatory	Type	Description
limit	No	Integer	Description: Number of image instances displayed on each page Constraints: N/A Range: Positive integers Default Value: 200
name	No	String	Description: Image name Constraints: N/A Range: The name can contain a maximum of 512 characters. Lowercase letters, digits, hyphens (-), underscores (_), and periods (.) are allowed. Default Value: N/A
name_fuzzy_match	No	Boolean	Definition: Whether the image name is used for fuzzy match Constraints: N/A Range: The value is of the Boolean type. • true: Fuzzy match is supported. • false: Fuzzy match is not supported. Default Value: true

Parameter	Mandatory	Type	Description
namespace	No	String	Definition: Organization to which the image belongs. You can create and view an organization on the Organization Management page of the SWR console. Constraints: N/A Range: The value can contain a maximum of 64 characters and must start with a lowercase letter. Only letters, digits, hyphens (-), underscores (_), and periods (.) are allowed. Default Value: N/A
offset	No	Integer	Definition: Start offset of the records on each page Constraints: N/A Range: Non-negative integers Default Value: 0
service_type	No	String	Definition: Supported image types Constraints: N/A Range: Enums: • COMMON: common image • INFERENCE: image used for inference • TRAIN: image used for training • DEV: image used for development and debugging • UNKNOWN: image whose supported services are not specified Default Value: UNKNOWN

Parameter	Mandatory	Type	Description
sort_dir	No	String	Definition: Instance sorting mode Constraints: N/A Range: Enums: • ASC: ascending order • DESC: descending order Default Value: DESC
sort_key	No	String	Definition: Sorting field. Separate multiple fields with commas (,). Constraints: N/A Range: The value can contain a maximum of 128 characters. Letters, digits, hyphens (-), underscores (_), and commas (,) are allowed. Default Value: N/A
type	No	String	Definition: Image type Constraints: N/A Range: Enums: • BUILD_IN: built-in system image • DEDICATED: image you have saved Default Value: BUILD_IN
workspace_id	No	String	Definition: Workspace ID. If no workspaces are available, the default value is 0. If a workspace is created and used, use the actual value. Constraints: N/A Range: This value contains 0 or 32 characters. Only digits (0 to 9) or lowercase letters (a to z) are allowed. Default Value: 0
show_name	No	String	Definition: Image name. Constraints: N/A Range: N/A Default Value: N/A

Parameter	Mandatory	Type	Description
show_tag	No	String	Definition: Image tag. Constraints: N/A Range: N/A Default Value: N/A

current	Integer	Definition: Current page number. Range: Positive integers
data	Array of ImageResponse objects	Definition: Image data that meets the search criteria.
pages	Integer	Definition: Total number of pages. Range: Positive integers
size	Integer	Definition: Number of records on each page Range: Positive integers
total	Long	Definition: Total number of records. Range: Non-negative integers

Table 4-225 ImageResponse

Parameter	Type	Description
arch	String	Definition: Processor architecture supported by the image. Range: X86_64: x86 architecture AARCH64: Arm architecture

Parameter	Type	Description
create_at	Long	Definition: UTC time when the image is created, accurate to millisecond. Range: N/A
description	String	Definition: Image description with a maximum of 512 characters. Range: N/A
dev_services	Array of strings	Definition: Services supported by the image. Range: • NOTEBOOK: You can access a notebook instance using HTTPS. • SSH: You can remotely access a notebook instance from a local IDE through SSH.
id	String	Definition: ID of the image used for creating notebook instances. The ID is in Universally Unique Identifier (UUID) format. For details, see Querying Supported Images . Range: N/A
name	String	Definition: Image name. Range: The name can contain a maximum of 512 characters. Lowercase letters, digits, hyphens (-), underscores (_), and periods (.) are allowed.
namespace	String	Definition: Organization to which the image belongs. You can create and view an organization on the Organization Management page of the SWR console. Range: N/A
origin	String	Definition: Image source. Range: • CUSTOMIZE: custom image • IMAGE_SAVE: image saved by a notebook instance
resource_categories	Array of strings	Definition: Flavors supported by the image. Range: • CPU • GPU • ASCEND

Parameter	Type	Description
service_type	String	Definition: Supported image types. Range: • COMMON: common image • INFERENCE: image used for inference • TRAIN: image used for training • DEV: image used for development and debugging • UNKNOWN: image whose supported services are not specified
size	Long	Definition: Image size, in KB. Range: N/A
status	String	Definition: Image status. Range: • INIT: The image is being initialized. • CREATING: The image is being saved. In this case, the notebook instance is unavailable. • CREATE_FAILED: Saving the image failed. • ERROR: An error occurs. • DELETED: The image has been deleted. • ACTIVE: The image has been saved, which you can view on the SWR console and use to create notebook instances.
status_message	String	Definition: Build information during image saving. Range: N/A
swr_path	String	Definition: SWR image path. Range: N/A
tag	String	Definition: Image tag. Range: N/A
type	String	Definition: Image type. Range: • BUILD_IN: built-in system image • DEDICATED: image you have saved

Parameter	Type	Description
update_at	Long	Definition: Time (UTC) when the image was last updated, accurate to millisecond. Range: N/A
visibility	String	Definition: Image visibility. Range: • PRIVATE: private image • PUBLIC: All users can perform read-only operations based on image_id.
workspace_id	String	Definition: Workspace ID. If no workspaces are available, the default value is 0 . If a workspace is created and used, use the actual value. Range: N/A
flavor_type	String	Definition: Resource type of the image. Range: • ASCEND_SNT9: 910 chip • ASCEND_SNT9B: 910B chip • ASCEND_SNT3: 310 chip
swr_instance_id	String	Definition: Enterprise edition SWR repository ID. Range: N/A
show_tag	String	Definition: Image tag. Range: N/A
show_name	String	Definition: Image name. Range: N/A

Status code: 401**Table 4-226** Response body parameters

4.22 Registering a Custom Image

Function

This API is used to register a custom image with ModelArts image management.

This API applies to the following scenario: When you need to integrate a custom image (such as a specific algorithm environment, tool chain, or configuration) into ModelArts, you can use this API to register the image with image management for future use. Before using this API, ensure that you have the ModelArts image management permission and valid image path and the required image format are provided. After the registration is complete, the custom image is successfully added to the ModelArts image list. You can use this image subsequently. If the image path is invalid, the image format does not meet the requirements, or you do not have the relevant permission, the API will return an error message.

Constraints

No constraints

Debugging

You can debug this API through automatic authentication in [API Explorer](#) or use the SDK sample code generated by API Explorer.

Authorization Information

Each account has all the permissions required to call all APIs, but IAM users must be assigned the required permissions.

- If you are using role/policy-based authorization, see [Permissions Policies and Supported Actions](#) for details on the required permissions.
- If you are using identity policy-based authorization, the following identity policy-based permissions are required.

Action	Access Level	Resource Type (*: required)	Condition Key	Alias	Dependencies

Request Parameters

Table 4-230 Request body parameters

Parameter	Mandatory	Type	Description
arch	No	String	Definition: Processor architecture supported by the image. Constraints: N/A Range: • X86_64: x86 architecture • AARCH64: Arm architecture Default Value: x86_64
description	No	String	Definition: Image description. Constraints: N/A Range: Up to 512 characters Default Value: N/A
origin	No	String	Definition: Image source. This parameter is optional. Constraints: N/A Range: • CUSTOMIZE: custom image • IMAGE_SAVE: image saved by a notebook instance Default Value: CUSTOMIZE
resource_category	No	Array of strings	Definition: Flavor supported by the image. The default value is CPU or GPU . Range: • CPU • GPU • ASCEND Constraints: N/A

Parameter	Mandatory	Type	Description
service_type	No	String	Definition: Supported image types. Constraints: N/A Range: • COMMON: common image • INFERENCE: image used for inference • TRAIN: image used for training • DEV: image used for development and debugging • UNKNOWN: image whose supported services are not specified Default Value: UNKNOWN
services	No	Array of strings	Definition: Services supported by the image. The default value is NOTEBOOK or SSH . Range: • NOTEBOOK: You can access a notebook instance using HTTPS. • SSH: You can remotely access a notebook instance from a local IDE through SSH. Constraints: N/A
swr_path	Yes	String	Definition: SWR image path. Constraints: N/A Range: The value can contain 16 to 2,048 characters. The address format is [repository_address[:port]]/[namespace]/[image_name]:[tag]. Default Value: N/A

Parameter	Mandatory	Type	Description
visibility	No	String	Definition: Image visibility. Constraints: N/A Range: • PRIVATE: private image • PUBLIC: All users can perform read-only operations based on image_id. Default Value: PRIVATE
workspace_id	No	String	Definition: Workspace ID. [For details about how to obtain the ID, see Querying the Workspace List . If no workspaces are available, the default value is 0 . If a workspace is created and used, use the actual value. Constraints: N/A Range: This value must contain 0 or 32 characters. Only digits or lowercase letters are allowed. Default Value: 0
flavor_type	No	String	Definition: Resource type. Constraints: N/A Range: • ASCEND_SNT9: 910 chip • ASCEND_SNT9B: 910B chip • ASCEND_SNT3: 310 chip Default Value: N/A
swr_instance_id	No	String	Definition: Enterprise edition SWR repository ID. Constraints: N/A Range: N/A Default Value: N/A
read_me	No	String	Definition: Image guide. Constraints: N/A Range: The value can contain at most 3,000 characters. Default Value: N/A

Response Parameters

Status code: 200

Table 4-231 Response body parameters

Parameter	Type	Description
arch	String	Definition: Processor architecture supported by the image. Range: • X86_64: x86 architecture • AARCH64: Arm architecture
create_at	Long	Definition: UTC time when the image is created, accurate to millisecond. Range: N/A
description	String	Definition: Image description with a maximum of 512 characters. Range: N/A
dev_services	Array of strings	Definition: Services supported by the image. Range: • NOTEBOOK: You can access a notebook instance using HTTPS. • SSH: You can remotely access a notebook instance from a local IDE through SSH.
id	String	Definition: ID of the image used for creating notebook instances. The ID is in Universally Unique Identifier (UUID) format. For details, see Querying Supported Images . Range: N/A
name	String	Definition: Image name. Range: The name can contain a maximum of 512 characters. Lowercase letters, digits, hyphens (-), underscores (_), and periods (.) are allowed.
namespace	String	Definition: Organization to which the image belongs. You can create and view an organization on the Organization Management page of the SWR console. Range: N/A

Parameter	Type	Description
origin	String	Definition: Image source. Range: • CUSTOMIZE: custom image • IMAGE_SAVE: image saved by a notebook instance
resource_categories	Array of strings	Definition: Flavors supported by the image. Range: • CPU • GPU • ASCEND
service_type	String	Definition: Supported image types. Range: • COMMON: common image • INFERENCE: image used for inference • TRAIN: image used for training • DEV: image used for development and debugging • UNKNOWN: image whose supported services are not specified
size	Long	Definition: Image size, in KB. Range: N/A
status	String	Definition: Image status. Range: • INIT: The image is being initialized. • CREATING: The image is being saved. In this case, the notebook instance is unavailable. • CREATE_FAILED: Saving the image failed. • ERROR: An error occurs. • DELETED: The image has been deleted. • ACTIVE: The image has been saved, which you can view on the SWR console and use to create notebook instances.
status_message	String	Definition: Build information during image saving. Range: N/A

Parameter	Type	Description
swr_path	String	Definition: SWR image path. Range: N/A
tag	String	Definition: Image tag. Range: N/A
type	String	Definition: Image type. Range: • BUILD_IN: built-in system image • DEDICATED: image you have saved
update_at	Long	Definition: Time (UTC) when the image was last updated, accurate to millisecond. Range: N/A
visibility	String	Definition: Image visibility. Range: • PRIVATE: private image • PUBLIC: All users can perform read-only operations based on image_id.
workspace_id	String	Definition: Workspace ID. If no workspaces are available, the default value is 0 . If a workspace is created and used, use the actual value. Range: N/A
flavor_type	String	Definition: Resource type of the image. Range: • ASCEND_SNT9: 910 chip • ASCEND_SNT9B: 910B chip • ASCEND_SNT3: 310 chip
swr_instance_id	String	Definition: Enterprise edition SWR repository ID. Range: N/A
show_tag	String	Definition: Image tag. Range: N/A
show_name	String	Definition: Image name. Range: N/A

Status code: 201

Created

Example Requests

The following is an example of how to register a custom image whose resource type is **CPU** and architecture is **X86_64**.

```
{
  "description": "",
  "resource_category": [ "CPU" ],
  "arch": "X86_64",
  "swr_path": "swr.xxx.com/op_svc_modelarts_container2/pytorch_1_8:train-pytorch_1.8.0-cuda_10.2-py_3.7"
}
```

Example Responses

Status code: 200

OK

```
{
  "arch": "x86_64",

4.23 Querying the User Image List

Function

This API is used to obtain the overview of user image information. Image names are used for aggregation.

This API applies to the following scenario: When you need to manage multiple images or learn basic information about each image, you can use this API to obtain the image list and overview information. Before using this API, ensure that you have the image management permission and the image exists. After a query operation is complete, you can obtain a list of all images. Details about the images can be obtained, including the image name, version, and status. If the image does not exist or you do not have the access permission, the API will return an error message.

Constraints

No constraints

Debugging

You can debug this API through automatic authentication in [API Explorer](#) or use the SDK sample code generated by API Explorer.

Authorization Information

Each account has all the permissions required to call all APIs, but IAM users must be assigned the required permissions.

- If you are using role/policy-based authorization, see [Permissions Policies and Supported Actions](#) for details on the required permissions.
- If you are using identity policy-based authorization, the following identity policy-based permissions are required.

Action	Access Level	Resource Type (*: required)	Condition Key	Alias	Dependencies
modelarts:image:listGroup	List	image *	-	-	-

URI

GET /v1/{project_id}/images/group

Table 4-232 Path Parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Definition: Project ID. For details, see Obtaining a Project ID and Name . Constraints: N/A Range: N/A Default Value: N/A

Table 4-233 Query Parameters

Parameter	Mandatory	Type	Description
name	No	String	Description: Image name Constraints: N/A Range: The name can contain a maximum of 512 characters. Lowercase letters, digits, hyphens (-), underscores (_), and periods (.) are allowed. Default Value: N/A
name_fuzzy_match	No	Boolean	Definition: Whether the image name is used for fuzzy match Constraints: N/A Range: The value is of the Boolean type. • true: Fuzzy match is supported. • false: Fuzzy match is not supported. Default Value: true

Parameter	Mandatory	Type	Description
namespace	No	String	Definition: Organization to which the image belongs. You can create and view an organization on the Organization Management page of the SWR console. Constraints: N/A Range: The value can contain a maximum of 64 characters and must start with a lowercase letter. Only letters, digits, hyphens (-), underscores (_), and periods (.) are allowed. Default Value: N/A
type	No	String	Definition: Image type Constraints: N/A Range: Enums: • BUILD_IN: built-in system image • DEDICATED: image you have saved Default Value: N/A
workspace_id	No	String	Definition: Workspace ID. If no workspaces are available, the default value is 0 . If a workspace is created and used, use the actual value. For details about how to obtain the ID, see Querying the Workspace List . Constraints: N/A Range: This value contains 0 or 32 characters. Only digits (0 to 9) or lowercase letters (a to z) are allowed. Default Value: 0
limit	No	Integer	Definition: Number of image instances displayed on each page. Constraints: N/A Range: Positive integers Default Value: 200

Parameter	Mandatory	Type	Description
offset	No	Integer	Definition: Start offset of the records on each page. Constraints: N/A Range: Non-negative integers Default Value: 0
swr_instance_id	No	String	Definition: Enterprise edition SWR repository ID. Constraints: N/A Range: N/A Default Value: N/A

4.24 Obtaining Details of an Image

Function

This API is used to query image details.

This API applies to the following scenarios: When you need to obtain details about a specified image (such as the image name, version, creation time, size, and status) or perform operations on the image, you can use this API to obtain the image details. Before using this API, ensure that you have the image management permission and the image to be queried is valid and exists. After the query is complete, image details can be obtained, including the image ID, name, version, creation time, size, and status. If the image does not exist or you do not have the access permission, the API will return an error message.

Constraints

No constraints

Debugging

You can debug this API through automatic authentication in [API Explorer](#) or use the SDK sample code generated by API Explorer.

Authorization Information

Each account has all the permissions required to call all APIs, but IAM users must be assigned the required permissions.

- If you are using role/policy-based authorization, see [Permissions Policies and Supported Actions](#) for details on the required permissions.
- If you are using identity policy-based authorization, the following identity policy-based permissions are required.

Action	Access Level	Resource Type (*: required)	Condition Key	Alias	Dependencies

See [Error Codes](#).

4.25 Deleting an Image

Function

This API is used to delete an image object. For a private image, you can also delete its SWR image content using parameters.

This API applies to the following scenarios: When an image is no longer required, the configuration is incorrect, or resources need to be cleared, you can use this API to delete the specified image object. Before using this API, ensure that the image exists and you have the permission to delete it. After the deletion is complete, the

image object is permanently removed, and related resources and configurations are cleared. If the image does not exist, you do not have the operation permission, or the image is being used, the API will return an error message.

Constraints

No constraints

Debugging

You can debug this API through automatic authentication in [API Explorer](#) or use the SDK sample code generated by API Explorer.

Authorization Information

Each account has all the permissions required to call all APIs, but IAM users must be assigned the required permissions.

- If you are using role/policy-based authorization, see [Permissions Policies and Supported Actions](#) for details on the required permissions.
- If you are using identity policy-based authorization, the following identity policy-based permissions are required.

Error Codes

See [Error Codes](#).

4.26 Synchronizing the Image Status

Function

This API is used to correct the abnormal image status. This API is used when you need to synchronize the latest image status when the image status is abnormal due to misoperations, network problems, or system faults. Before using this API, ensure that the image exists and you have the required permission. After the synchronization, the image status is updated to the latest correct status, and related resources and configurations are synchronized. If the image does not exist, you do not have the operation permission, or an error occurs during the synchronization, the API will return an error message.

Debugging

You can debug this API through automatic authentication in [API Explorer](#) or use the SDK sample code generated by API Explorer.

Authorization Information

Each account has all the permissions required to call all APIs, but IAM users must be assigned the required permissions.

- If you are using role/policy-based authorization, see [Permissions Policies and Supported Actions](#) for details on the required permissions.
- If you are using identity policy-based authorization, no identity policy-based permission required for calling this API.

5 Training Management

5.1 Creating an Algorithm

Function

This API is used to create an algorithm on ModelArts.

This API applies to the following scenario: When you need to upload a customized algorithm model to the platform and manage it, you can use this API to create an algorithm. Before using this API, ensure that you have prepared the algorithm code and related configuration files and uploaded them to ModelArts, or you have built a custom image and uploaded it to ModelArts. ModelArts adds the algorithm to the algorithm list after verifying that the code path and related configurations are correct. If the algorithm code path or related configurations are incomplete, have wrong format, or you do not have the operation permission, the API will return the corresponding error message.

Debugging

You can debug this API through automatic authentication in [API Explorer](#) or use the SDK sample code generated by API Explorer.

Authorization Information

Each account has all the permissions required to call all APIs, but IAM users must be assigned the required permissions.

- If you are using role/policy-based authorization, see [Permissions Policies and Supported Actions](#) for details on the required permissions.
- If you are using identity policy-based authorization, the following identity policy-based permissions are required.

Action	Access Level	Resource Type (*: required)	Condition Key	Alias	Dependencies
modelarts:aiAlgorithm:create	Write	aiAlgorithm *	-	-	-

URI

POST /v2/{project_id}/algorithms

Table 5-1 Path Parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Definition: Project ID. For details, see Obtaining a Project ID and Name . Constraints: The value can contain 1 to 64 characters. Letters, digits, and hyphens (-) are allowed. Range: N/A Default Value: N/A

Request Parameters

Table 5-2 Request body parameters

Parameter	Mandatory	Type	Description
metadata	No	AlgorithmMetadata object	Definition: Algorithm metadata, which describes basic algorithm information. Constraints: N/A
job_config	No	AlgorithmJobConfig object	Definition: Algorithm configuration, such as the boot file. Constraints: N/A

Parameter	Mandatory	Type	Description
resource_requirements	No	Array of ResourceRequirement objects	Definition: Algorithm resource constraints. This parameter is optional. After this parameter is set, the console filters available public resource pools when the algorithm is used in training jobs. Constraints: N/A
advanced_config	No	AlgorithmAdvancedConfig object	Definition: Advanced algorithm policy. • auto_search Constraints: N/A

Table 5-3 AlgorithmMetadata

Parameter	Mandatory	Type	Description
id	No	Integer	Definition: Algorithm ID. You do not need to set this parameter when creating an algorithm. Constraints: N/A Range: N/A Default Value: N/A
name	Yes	String	Definition: Algorithm name. Constraints: The value must contain 1 to 64 characters consisting of only digits, letters, underscores (_), and hyphens (-). Range: N/A Default Value: N/A
description	No	String	Definition: Algorithm description. Constraints: The value must contain 0 to 256 characters. Range: N/A Default Value: NULL

Parameter	Mandatory	Type	Description
workspace_id	No	String	Definition: Workspace where a specified algorithm is located. Constraints: N/A Range: N/A Default Value: 0, which is the default workspace.
ai_project	No	String	Definition: AI project to which a specified algorithm belongs. The AI project has been brought offline. Ignore it. Constraints: N/A Range: N/A Default Value: default-ai-project

Table 5-4 AlgorithmJobConfig

Parameter	Mandatory	Type	Description
code_dir	No	String	Definition: Algorithm code directory, for example, <code>/usr/app/</code> . Constraints: This parameter must be used with boot_file . Range: N/A Default Value: N/A
boot_file	No	String	Definition: Code boot file of the algorithm, which must be stored in the code directory, for example, <code>/usr/app/boot.py</code> . Constraints: This parameter must be used with code_dir . Range: N/A Default Value: N/A
command	No	String	Definition: Container boot command of a custom image algorithm. Constraints: N/A Range: N/A Default Value: N/A

Parameter	Mandatory	Type	Description
parameters	No	Array of Parameters objects	Definition: Running parameters of an algorithm. Constraints: N/A
inputs	No	Array of AlgorithmCreateInput objects	Definition: Data input of an algorithm. Constraints: N/A
outputs	No	Array of AlgorithmCreateOutput objects	Definition: Data output of an algorithm. Constraints: N/A
engine	No	AlgorithmCreateEngine object	Definition: Algorithm engine. Constraints: N/A
parameters_customization	No	Boolean	Definition: Specifies whether the algorithm allows hyperparameter customization during training job creation. Constraints: N/A Range: • true: allowed • false: not allowed Default Value: N/A

Table 5-5 Parameters

Parameter	Mandatory	Type	Description
name	No	String	Definition: Parameter name. Constraints: N/A Range: N/A Default Value: N/A
value	No	String	Definition: Parameter value. Constraints: N/A Range: N/A Default Value: N/A

Parameter	Mandatory	Type	Description
description	No	String	Definition: Parameter description. Constraints: N/A Range: N/A Default Value: N/A
constraint	No	ParametersConstraint object	Definition: Parameter attribute. Constraints: N/A
i18n_description	No	I18nDescription object	Definition: Internationalization description. Constraints: N/A

Table 5-6 ParametersConstraint

Parameter	Mandatory	Type	Description
editable	No	Boolean	Definition: Whether the parameter can be edited. Constraints: N/A Range: • true: editable • false: Not uneditable Default Value: N/A
required	No	Boolean	Definition: Whether the parameter is mandatory. Constraints: N/A Range: • true: mandatory • false: optional Default Value: N/A
sensitive	No	Boolean	Definition: Whether the parameter is sensitive. This function is unavailable currently. Constraints: N/A Range: • true: sensitive • false: insensitive Default Value: N/A

Parameter	Mandatory	Type	Description
valid_range	No	Array of strings	Definition: Valid range. Constraints: N/A

Table 5-7 I18nDescription

Parameter	Mandatory	Type	Description
language	No	String	Definition: Internationalization language. Constraints: N/A Range: N/A Default Value: N/A
description	No	String	Definition: Description. Constraints: N/A Range: N/A Default Value: N/A

Table 5-8 AlgorithmCreateInput

Parameter	Mandatory	Type	Description
name	No	String	Definition: Name of the data input channel. Constraints: N/A Range: N/A Default Value: N/A
description	No	String	Definition: Description of the data input channel. Constraints: N/A Range: N/A Default Value: N/A
remote_constraints	No	Array of RemoteConstraint objects	Definition: Data input constraint. Constraints: N/A

Table 5-9 RemoteConstraint

Parameter	Mandatory	Type	Description
attributes	No	Array of Map<String,String> objects	Definition: Attributes when the data input type is a dataset. Range: • data_format: data format • data_segmentation: data segmentation method • dataset_type: data labeling type Constraints: N/A

Table 5-10 AlgorithmCreateOutput

Parameter	Mandatory	Type	Description
name	Yes	String	Definition: Name of the data output channel. Constraints: N/A Range: N/A Default Value: N/A
description	No	String	Definition: Description of the data output channel. Constraints: N/A Range: N/A Default Value: N/A

Table 5-11 AlgorithmCreateEngine

Parameter	Mandatory	Type	Description
engine_id	No	String	Definition: Engine ID selected for an algorithm. Constraints: N/A Range: N/A Default Value: N/A

Parameter	Mandatory	Type	Description
engine_name	No	String	Definition: Engine version name selected for an algorithm. Constraints: If engine_id is specified, leave this parameter blank. Range: N/A Default Value: N/A
engine_version	No	String	Definition: Engine version name selected for an algorithm. Constraints: If engine_id is specified, leave this parameter blank. Range: N/A Default Value: N/A
image_url	No	String	Definition: Custom image URL selected for an algorithm. Constraints: N/A Range: N/A Default Value: N/A

Table 5-12 ResourceRequirement

Parameter	Mandatory	Type	Description
key	No	String	Definition: Resource constraints. Constraints: N/A Range: • flavor_type: flavor type, which can be CPU, Ascend, or GPU. • device_distributed_mode: whether to support multi-card training. The value can be multiple (supported) or singular (not supported). • host_distributed_mode: whether to support distributed training. The value can be multiple (supported) or singular (not supported). Default Value: N/A
values	No	Array of strings	Definition: Value of the resource constraint key. Constraints: N/A
operator	No	String	Definition: Key-value relationship. Constraints: Only the in operation is supported. For example, flavor_type in [CPU,GPU] . Range: N/A Default Value: N/A

Table 5-13 AlgorithmAdvancedConfig

Parameter	Mandatory	Type	Description
auto_search	No	AutoSearch object	Definition: Hyperparameter search policy. Constraints: N/A

Table 5-14 AutoSearch

Parameter	Mandatory	Type	Description
skip_search_params	No	String	Definition: Hyperparameter parameters that need to be skipped. Constraints: N/A Range: N/A Default Value: N/A
reward_attrs	No	Array of RewardAttrs objects	Definition: Search metrics. Constraints: N/A
search_params	No	Array of SearchParams objects	Definition: Search parameters. Constraints: N/A
algo_configs	No	Array of AlgoConfigs objects	Definition: Search algorithm configurations. Constraints: N/A

Table 5-15 RewardAttrs

Parameter	Mandatory	Type	Description
name	No	String	Definition: Metric name. Constraints: N/A Range: N/A Default Value: N/A
mode	No	String	Definition: Search mode. Constraints: N/A Range: • max: A larger metric value is preferred. • min: A smaller metric value is preferred. Default Value: N/A
regex	No	String	Definition: Regular expression of a metric. Constraints: N/A Range: N/A Default Value: N/A

Table 5-16 SearchParams

Parameter	Mandatory	Type	Description
name	No	String	Definition: Hyperparameter name. Constraints: N/A Range: N/A Default Value: N/A
param_type	No	String	Definition: Parameter type. Constraints: N/A Range: • continuous: The hyperparameter is of the continuous type. When an algorithm is used in a training job, continuous hyperparameters are displayed as text boxes on the console. • discrete: The hyperparameter is of the discrete type. When an algorithm is used in a training job, discrete hyperparameters are displayed as drop-down lists on the console. Default Value: N/A
lower_bound	No	String	Definition: Lower bound of the hyperparameter. Constraints: N/A Range: N/A Default Value: N/A
upper_bound	No	String	Definition: Upper bound of the hyperparameter. Constraints: N/A Range: N/A Default Value: N/A

Parameter	Mandatory	Type	Description
discrete_points_num	No	String	Definition: Number of discrete points of a hyperparameter with continuous values. Constraints: N/A Range: N/A Default Value: N/A
discrete_values	No	Array of strings	Definition: Discrete hyperparameter values. Constraints: N/A

Table 5-17 AlgoConfigs

Parameter	Mandatory	Type	Description
name	No	String	Definition: Search algorithm name. Constraints: N/A Range: N/A Default Value: N/A
params	No	Array of AutoSearchAlgoConfigParameter objects	Definition: Search algorithm parameters. Constraints: N/A

Table 5-18 AutoSearchAlgoConfigParameter

Parameter	Mandatory	Type	Description
key	No	String	Definition: Parameter key. Constraints: N/A Range: N/A Default Value: N/A
value	No	String	Definition: Parameter value. Constraints: N/A Range: N/A Default Value: N/A

Response Parameters

Status code: 201

Table 5-19 Response body parameters

Parameter	Type	Description
metadata	metadata object	Definition: Algorithm metadata, which describes basic algorithm information.
job_config	job_config object	Definition: Algorithm configuration, such as the boot file.
resource_requirements	Array of resource_requirements objects	Definition: Algorithm resource constraints. This parameter is optional. After this parameter is set, the console filters available public resource pools when the algorithm is used in training jobs.
advanced_config	advanced_config object	Definition: Advanced algorithm policy. • auto_search

Table 5-20 metadata

Parameter	Type	Description
id	Integer	Definition: Algorithm ID. You do not need to set this parameter when creating an algorithm. Range: N/A
name	String	Definition: Algorithm name. The value must contain 1 to 64 characters consisting of only digits, letters, underscores (_), and hyphens (-). Range: N/A
description	String	Definition: Algorithm description, which consists of 0 to 256 characters. The default value is NULL . Range: N/A
workspace_id	String	Definition: Workspace where a specified algorithm is located. The default value is 0 . 0 is the default workspace. Range: N/A

Parameter	Type	Description
ai_project	String	Definition: AI project to which a specified algorithm belongs. The default value is default-ai-project . The AI project has been brought offline. Ignore it. Range: N/A
user_name	String	• Definition: Username. Range: N/A
domain_id	String	Definition: Domain ID of a user. Range: N/A
source	String	Definition: Algorithm source type. Range: N/A
api_version	String	Definition: Algorithm API version, which shows whether it is new or old. Range: N/A
is_valid	String	Definition: Algorithm availability. Range: N/A
state	String	Definition: Algorithm status. Range: N/A
tags	Array of Map<String,String> objects	Definition: Algorithm tag.
attr_list	Array of strings	Definition: Algorithm attributes.
version_num	Integer	Definition: Number of algorithm versions. The default value is 0 . Range: N/A
size	Integer	Definition: Algorithm size. Range: N/A
create_time	Long	Definition: Algorithm creation timestamp. Range: N/A
update_time	Long	Definition: Algorithm update timestamp. Range: N/A

Table 5-21 job_config

Parameter	Type	Description
code_dir	String	Definition: Algorithm code directory, for example, <code>/usr/app/</code> . This parameter must be used together with boot_file . Range: N/A
boot_file	String	Definition: Code boot file of the algorithm, which must be stored in the code directory, for example, <code>/usr/app/boot.py</code> . This parameter must be used with code_dir . Range: N/A
command	String	Definition: Container boot command of a custom image algorithm. Range: N/A
parameters	Array of ParameterResp objects	Definition: Running parameters of an algorithm.
inputs	Array of inputs objects	Definition: Data input of an algorithm.
outputs	Array of outputs objects	Definition: Data output of an algorithm.
engine	engine object	Definition: Algorithm engine.
code_tree	Array of code_tree objects	Definition: Algorithm directory tree.
parameters_customization	Boolean	Definition: Specifies whether the algorithm allows hyperparameter customization during training job creation. Range: • true: allowed • false: not allowed

Table 5-22 ParameterResp

Parameter	Type	Description
name	String	Definition: Parameter name. Range: N/A

Parameter	Type	Description
value	String	Definition: Parameter value. Range: N/A
description	String	Definition: Parameter description. Range: N/A
constraint	constraint object	Definition: Parameter attribute.
i18n_description	i18n_description object	Definition: Internationalization description.

Table 5-23 constraint

Parameter	Type	Description
editable	Boolean	Definition: Whether the parameter can be edited. Range: • true: editable • false: Not uneditable
required	Boolean	Definition: Whether the parameter is mandatory. Range: • true: mandatory • false: optional
sensitive	Boolean	Definition: Whether the parameter is sensitive. This function is unavailable currently. Range: • true: sensitive • false: insensitive
valid_range	Array of strings	Definition: Valid range.

Table 5-24 i18n_description

Parameter	Type	Description
language	String	Definition: Internationalization language. The options are as follows: • zh-cn: Chinese • en-us: English Range: N/A

Parameter	Type	Description
description	String	Definition: Internationalization language description. Range: N/A

Table 5-25 inputs

Parameter	Type	Description
name	String	Definition: Name of the data input channel. Range: N/A
description	String	Definition: Description of the data input channel. Range: N/A
remote_constraints	Array of remote_constraints objects	Definition: Data input constraint.

Table 5-26 remote_constraints

Parameter	Type	Description
data_type	String	Definition: Data input type, including the data storage location and dataset. Range: N/A
attributes	Array of Map<String,String> objects	Definition: Attributes when the data input type is a dataset. The value can be: • data_format: data format • data_segmentation: data segmentation method • dataset_type: data labeling type

Table 5-27 outputs

Parameter	Type	Description
name	String	Definition: Name of the data output channel. Range: N/A

Parameter	Type	Description
description	String	Definition: Description of the data output channel. Range: N/A

Table 5-28 engine

Parameter	Type	Description
engine_id	String	Definition: Engine ID selected for an algorithm. Range: N/A
engine_name	String	Definition: Engine version name selected for an algorithm. If engine_id is specified, leave this parameter blank. Range: N/A
engine_version	String	Definition: Engine version name selected for an algorithm. If engine_id is specified, leave this parameter blank. Range: N/A
image_url	String	Definition: Custom image URL selected for an algorithm. Range: N/A

Table 5-29 code_tree

Parameter	Type	Description
name	String	Definition: Name of the current directory in the algorithm directory tree. Range: N/A
children	Object	Definition: Subfiles and subdirectories in the current directory of the algorithm directory tree.

Table 5-30 resource_requirements

Parameter	Type	Description
key	String	Definition: Resource constraints. Range: • flavor_type: Flavor type, which can be CPU, Ascend, or GPU. • device_distributed_mode: Specifies whether to support multi-card training. The value can be multiple (supported) or singular (not supported). • host_distributed_mode: Specifies whether to support distributed training. The value can be multiple (supported) or singular (not supported).
value	Array of strings	Definition: Value of the resource constraint key.
operator	String	Definition: Relationship between keys and values. Currently, only in is supported. For example, flavor_type in [CPU,GPU] . Range: N/A

Table 5-31 advanced_config

Parameter	Type	Description
auto_search	auto_search object	Definition: Hyperparameter search policy.

Table 5-32 auto_search

Parameter	Type	Description
skip_search_parameters	String	Definition: Hyperparameter parameters that need to be skipped. Range: N/A
reward_attrs	Array of reward_attrs objects	Definition: Search metrics.

Parameter	Type	Description
search_params	Array of search_params objects	Definition: Search parameters.
algo_configs	Array of algo_configs objects	Definition: Search algorithm configurations.

Table 5-33 reward_attr

Parameter	Type	Description
name	String	Definition: Metric name. Range: N/A
mode	String	Definition: Search mode. Range: • max: A larger metric value is preferred. • min: A smaller metric value is preferred.
regex	String	Definition: Regular expression of a metric. Range: N/A

Table 5-34 search_params

Parameter	Type	Description
name	String	Definition: Hyperparameter name. Range: N/A

Parameter	Type	Description
param_type	String	Definition: Parameter type. Range: • continuous: The hyperparameter is of the continuous type. When an algorithm is used in a training job, continuous hyperparameters are displayed as text boxes on the console. • discrete: The hyperparameter is of the discrete type. When an algorithm is used in a training job, discrete hyperparameters are displayed as drop-down lists on the console.
lower_bound	String	Definition: Lower bound of the hyperparameter. Range: N/A
upper_bound	String	Definition: Upper bound of the hyperparameter. Range: N/A
discrete_points_num	String	Definition: Number of discrete points of a hyperparameter with continuous values. Range: N/A
discrete_values	String	Definition: Discrete hyperparameter values. Range: N/A

Table 5-35 algo_configs

Parameter	Type	Description
name	String	Definition: Search algorithm name. Range: N/A
params	Array of AutoSearchAlgorithmConfigParameterResponse objects	Definition: Search algorithm parameters.

Table 5-36 AutoSearchAlgoConfigParameterResp

Parameter	Type	Description
key	String	Definition: Parameter key. Range: N/A
value	String	Definition: Parameter value. Range: N/A

Example Requests

The following is an example of how to create an algorithm whose name is **TestModelArtsalgorithm** and description is **This is a ModelArts algorithm**.

Status Codes

Status Code	Description
201	ok

Error Codes

See [Error Codes](#).

5.2 Querying the Algorithm List

Function

This API is used to obtain the list of all algorithms on ModelArts.

This API applies to the following scenarios: When you need to view all available algorithms on the platform, you can call this API to obtain the algorithm list. Before using this API, ensure that you have the permission to view the algorithm list. After the query is complete, the platform returns an algorithm list. Information such as the algorithm name and ID is displayed. If you do not have the permission to perform operations, the API will return an error message.

Debugging

You can debug this API through automatic authentication in [API Explorer](#) or use the SDK sample code generated by API Explorer.

Authorization Information

Each account has all the permissions required to call all APIs, but IAM users must be assigned the required permissions.

- If you are using role/policy-based authorization, see [Permissions Policies and Supported Actions](#) for details on the required permissions.
- If you are using identity policy-based authorization, the following identity policy-based permissions are required.

Action	Access Level	Resource Type (*: required)	Condition Key	Alias	Dependencies
modelarts:aiAlgorithm:list	List	-	-	-	-

URI

GET /v2/{project_id}/algorithms

Table 5-37 Path Parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Definition: Project ID. For details, see Obtaining a Project ID and Name . Constraints: The value can contain 1 to 64 characters. Letters, digits, and hyphens (-) are allowed. Range: N/A Default Value: N/A

Table 5-38 Query Parameters

Parameter	Mandatory	Type	Description
offset	No	Integer	Definition: Offset for querying algorithms Constraints: The minimum value is 0 . For example, if this parameter is set to 1 , the query starts from the second one. Range: N/A Default Value: N/A
limit	No	Integer	Definition: Limit of algorithms to be queried Constraints: The value ranges from 1 to 50. Range: N/A Default Value: N/A
sort_by	No	String	Definition: Metric for sorting algorithms to be queried Constraints: N/A Range: N/A Default Value: create_time is used for sorting by default.
order	No	String	Definition: Order of queried algorithms Constraints: N/A Range: • asc: The queried algorithms are sorted in ascending order. • desc: The queried algorithms are sorted in descending order. Default Value: desc
group_by	No	String	Definition: Condition for grouping the algorithms to be queried Constraints: N/A Range: N/A Default Value: N/A

Parameter	Mandatory	Type	Description
searches	No	String	Definition: Filter criteria for querying algorithms, for example, fuzzy match by the algorithm name Constraints: N/A Range: N/A Default Value: N/A
workspace_id	No	String	Definition: Workspace ID. Constraints: If no workspaces are available, the default value is 0 . If a workspace is created and used, use the actual value. For details about how to obtain the ID, see Querying the Workspace List . Range: N/A Default Value: N/A

Response Parameters

Status code: 200

Table 5-39 Response body parameters

Parameter	Type	Description
total	Integer	Definition: Total number of algorithms of the current user. Range: N/A
count	Integer	Definition: Total number of algorithms that meet the search criteria of the current user. Range: N/A
limit	Integer	Definition: Maximum number of obtained algorithms of the current user. Range: N/A

Parameter	Type	Description
offset	Integer	Definition: Offset of all algorithm obtained of the current user. Range: N/A
sort_by	String	Definition: Fields used to sort obtained algorithms of the current user. Range: N/A
order	String	Definition: Order of queried algorithms of the current user. Range: • asc: ascending order • desc: descending order.
group_by	String	Definition: Grouping mode of obtained algorithms of the current user. Range: N/A
items	Array of AlgorithmResponse objects	Definition: Details of the algorithms that meet the search criteria of the current user.

Table 5-40 AlgorithmResponse

Parameter	Type	Description
metadata	metadata object	Definition: Algorithm metadata, which describes basic algorithm information.
job_config	job_config object	Definition: Algorithm configuration, such as the boot file.
resource_requirements	Array of resource_requirements objects	Definition: Algorithm resource constraints. This parameter is optional. After this parameter is set, the console filters available public resource pools when the algorithm is used in training jobs.
advanced_config	advanced_config object	Definition: Advanced algorithm policy. • auto_search

Table 5-41 metadata

Parameter	Type	Description
id	Integer	Definition: Algorithm ID. You do not need to set this parameter when creating an algorithm. Range: N/A
name	String	Definition: Algorithm name. The value must contain 1 to 64 characters consisting of only digits, letters, underscores (_), and hyphens (-). Range: N/A
description	String	Definition: Algorithm description, which consists of 0 to 256 characters. The default value is NULL . Range: N/A
workspace_id	String	Definition: Workspace where a specified algorithm is located. The default value is 0 . 0 is the default workspace. Range: N/A
ai_project	String	Definition: AI project to which a specified algorithm belongs. The default value is default-ai-project . The AI project has been brought offline. Ignore it. Range: N/A
user_name	String	• Definition: Username. Range: N/A
domain_id	String	Definition: Domain ID of a user. Range: N/A
source	String	Definition: Algorithm source type. Range: N/A
api_version	String	Definition: Algorithm API version, which shows whether it is new or old. Range: N/A
is_valid	String	Definition: Algorithm availability. Range: N/A
state	String	Definition: Algorithm status. Range: N/A

Parameter	Type	Description
tags	Array of Map<String,String> objects	Definition: Algorithm tag.
attr_list	Array of strings	Definition: Algorithm attributes.
version_num	Integer	Definition: Number of algorithm versions. The default value is 0 . Range: N/A
size	Integer	Definition: Algorithm size. Range: N/A
create_time	Long	Definition: Algorithm creation timestamp. Range: N/A
update_time	Long	Definition: Algorithm update timestamp. Range: N/A

Table 5-42 job_config

Parameter	Type	Description
code_dir	String	Definition: Algorithm code directory, for example, /usr/app/ . This parameter must be used together with boot_file . Range: N/A
boot_file	String	Definition: Code boot file of the algorithm, which must be stored in the code directory, for example, /usr/app/boot.py . This parameter must be used with code_dir . Range: N/A
command	String	Definition: Container boot command of a custom image algorithm. Range: N/A
parameters	Array of ParameterResp objects	Definition: Running parameters of an algorithm.
inputs	Array of inputs objects	Definition: Data input of an algorithm.

Parameter	Type	Description
outputs	Array of outputs objects	Definition: Data output of an algorithm.
engine	engine object	Definition: Algorithm engine.
code_tree	Array of code_tree objects	Definition: Algorithm directory tree.
parameters_customization	Boolean	Definition: Specifies whether the algorithm allows hyperparameter customization during training job creation. Range: • true: allowed • false: not allowed

Table 5-43 ParameterResp

Parameter	Type	Description
name	String	Definition: Parameter name. Range: N/A
value	String	Definition: Parameter value. Range: N/A
description	String	Definition: Parameter description. Range: N/A
constraint	constraint object	Definition: Parameter attribute.
i18n_description	i18n_description object	Definition: Internationalization description.

Table 5-44 constraint

Parameter	Type	Description
editable	Boolean	Definition: Whether the parameter can be edited. Range: • true: editable • false: Not uneditable

Parameter	Type	Description
required	Boolean	Definition: Whether the parameter is mandatory. Range: • true: mandatory • false: optional
sensitive	Boolean	Definition: Whether the parameter is sensitive. This function is unavailable currently. Range: • true: sensitive • false: insensitive
valid_range	Array of strings	Definition: Valid range.

Table 5-45 i18n_description

Parameter	Type	Description
language	String	Definition: Internationalization language. The options are as follows: • zh-cn: Chinese • en-us: English Range: N/A
description	String	Definition: Internationalization language description. Range: N/A

Table 5-46 inputs

Parameter	Type	Description
name	String	Definition: Name of the data input channel. Range: N/A
description	String	Definition: Description of the data input channel. Range: N/A
remote_constraints	Array of remote_constraints objects	Definition: Data input constraint.

Table 5-47 remote_constraints

Parameter	Type	Description
data_type	String	Definition: Data input type, including the data storage location and dataset. Range: N/A
attributes	Array of Map<String,String> objects	Definition: Attributes when the data input type is a dataset. The value can be: • data_format: data format • data_segmentation: data segmentation method • dataset_type: data labeling type

Table 5-48 outputs

Parameter	Type	Description
name	String	Definition: Name of the data output channel. Range: N/A
description	String	Definition: Description of the data output channel. Range: N/A

Table 5-49 engine

Parameter	Type	Description
engine_id	String	Definition: Engine ID selected for an algorithm. Range: N/A
engine_name	String	Definition: Engine version name selected for an algorithm. If engine_id is specified, leave this parameter blank. Range: N/A
engine_version	String	Definition: Engine version name selected for an algorithm. If engine_id is specified, leave this parameter blank. Range: N/A

Parameter	Type	Description
image_url	String	Definition: Custom image URL selected for an algorithm. Range: N/A

Table 5-50 code_tree

Parameter	Type	Description
name	String	Definition: Name of the current directory in the algorithm directory tree. Range: N/A
children	Object	Definition: Subfiles and subdirectories in the current directory of the algorithm directory tree.

Table 5-51 resource_requirements

Parameter	Type	Description
key	String	Definition: Resource constraints. Range: • flavor_type: Flavor type, which can be CPU, Ascend, or GPU. • device_distributed_mode: Specifies whether to support multi-card training. The value can be multiple (supported) or singular (not supported). • host_distributed_mode: Specifies whether to support distributed training. The value can be multiple (supported) or singular (not supported).
value	Array of strings	Definition: Value of the resource constraint key.
operator	String	Definition: Relationship between keys and values. Currently, only in is supported. For example, flavor_type in [CPU,GPU] . Range: N/A

Table 5-52 advanced_config

Parameter	Type	Description
auto_search	auto_search object	Definition: Hyperparameter search policy.

Table 5-53 auto_search

Parameter	Type	Description
skip_search_params	String	Definition: Hyperparameter parameters that need to be skipped. Range: N/A
reward_attrs	Array of reward_attrs objects	Definition: Search metrics.
search_params	Array of search_params objects	Definition: Search parameters.
algo_configs	Array of algo_configs objects	Definition: Search algorithm configurations.

Table 5-54 reward_attrs

Parameter	Type	Description
name	String	Definition: Metric name. Range: N/A
mode	String	Definition: Search mode. Range: • max: A larger metric value is preferred. • min: A smaller metric value is preferred.
regex	String	Definition: Regular expression of a metric. Range: N/A

Table 5-55 search_params

Parameter	Type	Description
name	String	Definition: Hyperparameter name. Range: N/A
param_type	String	Definition: Parameter type. Range: • continuous: The hyperparameter is of the continuous type. When an algorithm is used in a training job, continuous hyperparameters are displayed as text boxes on the console. • discrete: The hyperparameter is of the discrete type. When an algorithm is used in a training job, discrete hyperparameters are displayed as drop-down lists on the console.
lower_bound	String	Definition: Lower bound of the hyperparameter. Range: N/A
upper_bound	String	Definition: Upper bound of the hyperparameter. Range: N/A
discrete_points_num	String	Definition: Number of discrete points of a hyperparameter with continuous values. Range: N/A
discrete_values	String	Definition: Discrete hyperparameter values. Range: N/A

Table 5-56 algo_configs

Parameter	Type	Description
name	String	Definition: Search algorithm name. Range: N/A
params	Array of AutoSearchAlgorithmConfigParameterResp objects	Definition: Search algorithm parameters.

Table 5-57 AutoSearchAlgoConfigParameterResp

Parameter	Type	Description
key	String	Definition: Parameter key. Range: N/A
value	String	Definition: Parameter value. Range: N/A

Example Requests

The following shows how to query all algorithms in jobs whose names contain **TestModelArtsalgorithm** and maximum number of algorithms is set to **1**.

GET https://endpoint/v2/{project_id}/algorithms?limit=1&searches=name%3ATestModelArtsalgorithm

Error Codes

See [Error Codes](#).

5.3 Querying Algorithm Details

Function

This API is used to obtain the details of a specified algorithm on ModelArts.

This API applies to the following scenario: When you need to view the detailed configuration and attributes of a specific algorithm, you can use this API to obtain the algorithm details. Before using this API, ensure that you have obtained the algorithm ID and have the permission to view algorithm details. After the query is complete, the platform returns the details, including the algorithm name, description, and version. If the algorithm ID does not exist or you do not have the operation permission, the API will return an error message.

Debugging

You can debug this API through automatic authentication in [API Explorer](#) or use the SDK sample code generated by API Explorer.

Authorization Information

Each account has all the permissions required to call all APIs, but IAM users must be assigned the required permissions.

- If you are using role/policy-based authorization, see [Permissions Policies and Supported Actions](#) for details on the required permissions.
- If you are using identity policy-based authorization, the following identity policy-based permissions are required.

Action	Access Level	Resource Type (*: required)	Condition Key	Alias	Dependencies
modelarts:aiAlgorithm:get	Read	aiAlgorithm *	-	-	-

URI

GET /v2/{project_id}/algorithms/{algorithm_id}

Table 5-58 Path Parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Definition: Project ID. For details, see Obtaining a Project ID and Name . Constraints: The value can contain 1 to 64 characters. Letters, digits, and hyphens (-) are allowed. Range: N/A Default Value: N/A
algorithm_id	Yes	String	Definition: Algorithm ID Constraints: N/A Range: N/A Default Value: N/A

Request Parameters

None

Response Parameters

Status code: 200

Table 5-59 Response body parameters

Parameter	Type	Description
metadata	metadata object	Definition: Algorithm metadata, which describes basic algorithm information.
job_config	job_config object	Definition: Algorithm configuration, such as the boot file.
resource_requirements	Array of resource_requirements objects	Definition: Algorithm resource constraints. This parameter is optional. After this parameter is set, the console filters available public resource pools when the algorithm is used in training jobs.
advanced_config	advanced_config object	Definition: Advanced algorithm policy. • auto_search

Table 5-60 metadata

Parameter	Type	Description
id	Integer	Definition: Algorithm ID. You do not need to set this parameter when creating an algorithm. Range: N/A
name	String	Definition: Algorithm name. The value must contain 1 to 64 characters consisting of only digits, letters, underscores (_), and hyphens (-). Range: N/A
description	String	Definition: Algorithm description, which consists of 0 to 256 characters. The default value is NULL . Range: N/A

Parameter	Type	Description
workspace_id	String	Definition: Workspace where a specified algorithm is located. The default value is 0 . 0 is the default workspace. Range: N/A
ai_project	String	Definition: AI project to which a specified algorithm belongs. The default value is default-ai-project . The AI project has been brought offline. Ignore it. Range: N/A
user_name	String	• Definition: Username. Range: N/A
domain_id	String	Definition: Domain ID of a user. Range: N/A
source	String	Definition: Algorithm source type. Range: N/A
api_version	String	Definition: Algorithm API version, which shows whether it is new or old. Range: N/A
is_valid	String	Definition: Algorithm availability. Range: N/A
state	String	Definition: Algorithm status. Range: N/A
tags	Array of Map<String,String> objects	Definition: Algorithm tag.
attr_list	Array of strings	Definition: Algorithm attributes.
version_num	Integer	Definition: Number of algorithm versions. The default value is 0 . Range: N/A
size	Integer	Definition: Algorithm size. Range: N/A
create_time	Long	Definition: Algorithm creation timestamp. Range: N/A

Parameter	Type	Description
update_time	Long	Definition: Algorithm update timestamp. Range: N/A

Table 5-61 job_config

Parameter	Type	Description
code_dir	String	Definition: Algorithm code directory, for example, <code>/usr/app/</code> . This parameter must be used together with boot_file . Range: N/A
boot_file	String	Definition: Code boot file of the algorithm, which must be stored in the code directory, for example, <code>/usr/app/boot.py</code> . This parameter must be used with code_dir . Range: N/A
command	String	Definition: Container boot command of a custom image algorithm. Range: N/A
parameters	Array of ParameterResp objects	Definition: Running parameters of an algorithm.
inputs	Array of inputs objects	Definition: Data input of an algorithm.
outputs	Array of outputs objects	Definition: Data output of an algorithm.
engine	engine object	Definition: Algorithm engine.
code_tree	Array of code_tree objects	Definition: Algorithm directory tree.
parameters_customization	Boolean	Definition: Specifies whether the algorithm allows hyperparameter customization during training job creation. Range: • true: allowed • false: not allowed

Table 5-62 ParameterResp

Parameter	Type	Description
name	String	Definition: Parameter name. Range: N/A
value	String	Definition: Parameter value. Range: N/A
description	String	Definition: Parameter description. Range: N/A
constraint	constraint object	Definition: Parameter attribute.
i18n_description	i18n_description object	Definition: Internationalization description.

Table 5-63 constraint

Parameter	Type	Description
editable	Boolean	Definition: Whether the parameter can be edited. Range: • true: editable • false: Not uneditable
required	Boolean	Definition: Whether the parameter is mandatory. Range: • true: mandatory • false: optional
sensitive	Boolean	Definition: Whether the parameter is sensitive. This function is unavailable currently. Range: • true: sensitive • false: insensitive
valid_range	Array of strings	Definition: Valid range.

Table 5-64 i18n_description

Parameter	Type	Description
language	String	Definition: Internationalization language. The options are as follows: • zh-cn: Chinese • en-us: English Range: N/A
description	String	Definition: Internationalization language description. Range: N/A

Table 5-65 inputs

Parameter	Type	Description
name	String	Definition: Name of the data input channel. Range: N/A
description	String	Definition: Description of the data input channel. Range: N/A
remote_constraints	Array of remote_constraints objects	Definition: Data input constraint.

Table 5-66 remote_constraints

Parameter	Type	Description
data_type	String	Definition: Data input type, including the data storage location and dataset. Range: N/A
attributes	Array of Map<String,String> objects	Definition: Attributes when the data input type is a dataset. The value can be: • data_format: data format • data_segmentation: data segmentation method • dataset_type: data labeling type

Table 5-67 outputs

Parameter	Type	Description
name	String	Definition: Name of the data output channel. Range: N/A
description	String	Definition: Description of the data output channel. Range: N/A

Table 5-68 engine

Parameter	Type	Description
engine_id	String	Definition: Engine ID selected for an algorithm. Range: N/A
engine_name	String	Definition: Engine version name selected for an algorithm. If engine_id is specified, leave this parameter blank. Range: N/A
engine_version	String	Definition: Engine version name selected for an algorithm. If engine_id is specified, leave this parameter blank. Range: N/A
image_url	String	Definition: Custom image URL selected for an algorithm. Range: N/A

Table 5-69 code_tree

Parameter	Type	Description
name	String	Definition: Name of the current directory in the algorithm directory tree. Range: N/A
children	Object	Definition: Subfiles and subdirectories in the current directory of the algorithm directory tree.

Table 5-70 resource_requirements

Parameter	Type	Description
key	String	Definition: Resource constraints. Range: • flavor_type: Flavor type, which can be CPU, Ascend, or GPU. • device_distributed_mode: Specifies whether to support multi-card training. The value can be multiple (supported) or singular (not supported). • host_distributed_mode: Specifies whether to support distributed training. The value can be multiple (supported) or singular (not supported).
value	Array of strings	Definition: Value of the resource constraint key.
operator	String	Definition: Relationship between keys and values. Currently, only in is supported. For example, flavor_type in [CPU,GPU] . Range: N/A

Table 5-71 advanced_config

Parameter	Type	Description
auto_search	auto_search object	Definition: Hyperparameter search policy.

Table 5-72 auto_search

Parameter	Type	Description
skip_search_parameters	String	Definition: Hyperparameter parameters that need to be skipped. Range: N/A
reward_attrs	Array of reward_attrs objects	Definition: Search metrics.

Parameter	Type	Description
search_params	Array of search_params objects	Definition: Search parameters.
algo_configs	Array of algo_configs objects	Definition: Search algorithm configurations.

Table 5-73 reward_attr

Parameter	Type	Description
name	String	Definition: Metric name. Range: N/A
mode	String	Definition: Search mode. Range: • max: A larger metric value is preferred. • min: A smaller metric value is preferred.
regex	String	Definition: Regular expression of a metric. Range: N/A

Table 5-74 search_params

Parameter	Type	Description
name	String	Definition: Hyperparameter name. Range: N/A

Parameter	Type	Description
param_type	String	Definition: Parameter type. Range: • continuous: The hyperparameter is of the continuous type. When an algorithm is used in a training job, continuous hyperparameters are displayed as text boxes on the console. • discrete: The hyperparameter is of the discrete type. When an algorithm is used in a training job, discrete hyperparameters are displayed as drop-down lists on the console.
lower_bound	String	Definition: Lower bound of the hyperparameter. Range: N/A
upper_bound	String	Definition: Upper bound of the hyperparameter. Range: N/A
discrete_points_num	String	Definition: Number of discrete points of a hyperparameter with continuous values. Range: N/A
discrete_values	String	Definition: Discrete hyperparameter values. Range: N/A

Table 5-75 algo_configs

Parameter	Type	Description
name	String	Definition: Search algorithm name. Range: N/A
params	Array of AutoSearchAlgorithmConfigParameterResponse objects	Definition: Search algorithm parameters.

Table 5-76 AutoSearchAlgoConfigParameterResp

Parameter	Type	Description
key	String	Definition: Parameter key. Range: N/A
value	String	Definition: Parameter value. Range: N/A

Example Requests

The following shows how to query the algorithm whose UUID is **2e5451fe-913f-4492-821a-2981031382f7**.

```
GET https://endpoint/v2/{project_id}/algorithms/2e5451fe-913f-4492-821a-2981031382f7
```

Error Codes

See [Error Codes](#).

5.4 Modifying an Algorithm

Function

This API is used to modify the information of an existing algorithm.

This API is used when you need to update the description, tags, and model files of an algorithm. Before using this API, ensure that the algorithm exists and you have the required permission. After the update, the algorithm information is updated, and the related configurations are modified accordingly. If the algorithm does not exist or you do not have the operation permission, the API will return an error message.

Debugging

You can debug this API through automatic authentication in [API Explorer](#) or use the SDK sample code generated by API Explorer.

Authorization Information

Each account has all the permissions required to call all APIs, but IAM users must be assigned the required permissions.

- If you are using role/policy-based authorization, see [Permissions Policies and Supported Actions](#) for details on the required permissions.
- If you are using identity policy-based authorization, the following identity policy-based permissions are required.

Action	Access Level	Resource Type (*: required)	Condition Key	Alias	Dependencies
modelarts:aiAlgorithm:update	Write	aiAlgorithm *	-	-	-

URI

PUT /v2/{project_id}/algorithms/{algorithm_id}

Table 5-77 Path Parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Definition: Project ID. For details, see Obtaining a Project ID and Name . Constraints: The value can contain 1 to 64 characters. Letters, digits, and hyphens (-) are allowed. Range: N/A Default Value: N/A
algorithm_id	Yes	String	Definition: Algorithm ID Constraints: N/A Range: N/A Default Value: N/A

Request Parameters

Table 5-78 Request body parameters

Parameter	Mandatory	Type	Description
metadata	No	AlgorithmMetadata object	Definition: Algorithm metadata, which describes basic algorithm information. Constraints: N/A
job_config	No	AlgorithmJobConfig object	Definition: Algorithm configuration, such as the boot file. Constraints: N/A
resource_requirements	No	Array of ResourceRequirement objects	Definition: Algorithm resource constraints. This parameter is optional. After this parameter is set, the console filters available public resource pools when the algorithm is used in training jobs. Constraints: N/A
advanced_config	No	AlgorithmAdvancedConfig object	Definition: Advanced algorithm policy. • auto_search Constraints: N/A

Table 5-79 AlgorithmMetadata

Parameter	Mandatory	Type	Description
id	No	Integer	Definition: Algorithm ID. You do not need to set this parameter when creating an algorithm. Constraints: N/A Range: N/A Default Value: N/A

Parameter	Mandatory	Type	Description
name	Yes	String	Definition: Algorithm name. Constraints: The value must contain 1 to 64 characters consisting of only digits, letters, underscores (_), and hyphens (-). Range: N/A Default Value: N/A
description	No	String	Definition: Algorithm description. Constraints: The value must contain 0 to 256 characters. Range: N/A Default Value: NULL
workspace_id	No	String	Definition: Workspace where a specified algorithm is located. Constraints: N/A Range: N/A Default Value: 0, which is the default workspace.
ai_project	No	String	Definition: AI project to which a specified algorithm belongs. The AI project has been brought offline. Ignore it. Constraints: N/A Range: N/A Default Value: default-ai-project

Table 5-80 AlgorithmJobConfig

Parameter	Mandatory	Type	Description
code_dir	No	String	Definition: Algorithm code directory, for example, /usr/app/. Constraints: This parameter must be used with boot_file . Range: N/A Default Value: N/A

Parameter	Mandatory	Type	Description
boot_file	No	String	Definition: Code boot file of the algorithm, which must be stored in the code directory, for example, <code>/usr/app/boot.py</code> . Constraints: This parameter must be used with <code>code_dir</code> . Range: N/A Default Value: N/A
command	No	String	Definition: Container boot command of a custom image algorithm. Constraints: N/A Range: N/A Default Value: N/A
parameters	No	Array of Parameters objects	Definition: Running parameters of an algorithm. Constraints: N/A
inputs	No	Array of AlgorithmCreateInput objects	Definition: Data input of an algorithm. Constraints: N/A
outputs	No	Array of AlgorithmCreateOutput objects	Definition: Data output of an algorithm. Constraints: N/A
engine	No	AlgorithmCreateEngine object	Definition: Algorithm engine. Constraints: N/A
parameters_customization	No	Boolean	Definition: Specifies whether the algorithm allows hyperparameter customization during training job creation. Constraints: N/A Range: true: allowed false: not allowed Default Value: N/A

Table 5-81 Parameters

Parameter	Mandatory	Type	Description
name	No	String	Definition: Parameter name. Constraints: N/A Range: N/A Default Value: N/A
value	No	String	Definition: Parameter value. Constraints: N/A Range: N/A Default Value: N/A
description	No	String	Definition: Parameter description. Constraints: N/A Range: N/A Default Value: N/A
constraint	No	ParametersConstraint object	Definition: Parameter attribute. Constraints: N/A
i18n_description	No	I18nDescription object	Definition: Internationalization description. Constraints: N/A

Table 5-82 ParametersConstraint

Parameter	Mandatory	Type	Description
editable	No	Boolean	Definition: Whether the parameter can be edited. Constraints: N/A Range: • true: editable • false: Not uneditable Default Value: N/A

Parameter	Mandatory	Type	Description
required	No	Boolean	Definition: Whether the parameter is mandatory. Constraints: N/A Range: • true: mandatory • false: optional Default Value: N/A
sensitive	No	Boolean	Definition: Whether the parameter is sensitive. This function is unavailable currently. Constraints: N/A Range: • true: sensitive • false: insensitive Default Value: N/A
valid_range	No	Array of strings	Definition: Valid range. Constraints: N/A

Table 5-83 I18nDescription

Parameter	Mandatory	Type	Description
language	No	String	Definition: Internationalization language. Constraints: N/A Range: N/A Default Value: N/A
description	No	String	Definition: Description. Constraints: N/A Range: N/A Default Value: N/A

Table 5-84 AlgorithmCreateInput

Parameter	Mandatory	Type	Description
name	No	String	Definition: Name of the data input channel. Constraints: N/A Range: N/A Default Value: N/A
description	No	String	Definition: Description of the data input channel. Constraints: N/A Range: N/A Default Value: N/A
remote_constraints	No	Array of RemoteConstraint objects	Definition: Data input constraint. Constraints: N/A

Table 5-85 RemoteConstraint

Parameter	Mandatory	Type	Description
attributes	No	Array of Map<String,String> objects	Definition: Attributes when the data input type is a dataset. Range: • data_format: data format • data_segmentation: data segmentation method • dataset_type: data labeling type Constraints: N/A

Table 5-86 AlgorithmCreateOutput

Parameter	Mandatory	Type	Description
name	Yes	String	Definition: Name of the data output channel. Constraints: N/A Range: N/A Default Value: N/A

Parameter	Mandatory	Type	Description
description	No	String	Definition: Description of the data output channel. Constraints: N/A Range: N/A Default Value: N/A

Table 5-87 AlgorithmCreateEngine

Parameter	Mandatory	Type	Description
engine_id	No	String	Definition: Engine ID selected for an algorithm. Constraints: N/A Range: N/A Default Value: N/A
engine_name	No	String	Definition: Engine version name selected for an algorithm. Constraints: If engine_id is specified, leave this parameter blank. Range: N/A Default Value: N/A
engine_version	No	String	Definition: Engine version name selected for an algorithm. Constraints: If engine_id is specified, leave this parameter blank. Range: N/A Default Value: N/A
image_url	No	String	Definition: Custom image URL selected for an algorithm. Constraints: N/A Range: N/A Default Value: N/A

Table 5-88 ResourceRequirement

Parameter	Mandatory	Type	Description
key	No	String	Definition: Resource constraints. Constraints: N/A Range: • flavor_type: flavor type, which can be CPU, Ascend, or GPU. • device_distributed_mode: whether to support multi-card training. The value can be multiple (supported) or singular (not supported). • host_distributed_mode: whether to support distributed training. The value can be multiple (supported) or singular (not supported). Default Value: N/A
values	No	Array of strings	Definition: Value of the resource constraint key. Constraints: N/A
operator	No	String	Definition: Key-value relationship. Constraints: Only the in operation is supported. For example, flavor_type in [CPU,GPU] . Range: N/A Default Value: N/A

Table 5-89 AlgorithmAdvancedConfig

Parameter	Mandatory	Type	Description
auto_search	No	AutoSearch object	Definition: Hyperparameter search policy. Constraints: N/A

Table 5-90 AutoSearch

Parameter	Mandatory	Type	Description
skip_search_params	No	String	Definition: Hyperparameter parameters that need to be skipped. Constraints: N/A Range: N/A Default Value: N/A
reward_attrs	No	Array of RewardAttrs objects	Definition: Search metrics. Constraints: N/A
search_params	No	Array of SearchParams objects	Definition: Search parameters. Constraints: N/A
algo_configs	No	Array of AlgoConfigs objects	Definition: Search algorithm configurations. Constraints: N/A

Table 5-91 RewardAttrs

Parameter	Mandatory	Type	Description
name	No	String	Definition: Metric name. Constraints: N/A Range: N/A Default Value: N/A
mode	No	String	Definition: Search mode. Constraints: N/A Range: • max: A larger metric value is preferred. • min: A smaller metric value is preferred. Default Value: N/A
regex	No	String	Definition: Regular expression of a metric. Constraints: N/A Range: N/A Default Value: N/A

Table 5-92 SearchParams

Parameter	Mandatory	Type	Description
name	No	String	Definition: Hyperparameter name. Constraints: N/A Range: N/A Default Value: N/A
param_type	No	String	Definition: Parameter type. Constraints: N/A Range: • continuous: The hyperparameter is of the continuous type. When an algorithm is used in a training job, continuous hyperparameters are displayed as text boxes on the console. • discrete: The hyperparameter is of the discrete type. When an algorithm is used in a training job, discrete hyperparameters are displayed as drop-down lists on the console. Default Value: N/A
lower_bound	No	String	Definition: Lower bound of the hyperparameter. Constraints: N/A Range: N/A Default Value: N/A
upper_bound	No	String	Definition: Upper bound of the hyperparameter. Constraints: N/A Range: N/A Default Value: N/A

Parameter	Mandatory	Type	Description
discrete_points_num	No	String	Definition: Number of discrete points of a hyperparameter with continuous values. Constraints: N/A Range: N/A Default Value: N/A
discrete_values	No	Array of strings	Definition: Discrete hyperparameter values. Constraints: N/A

Table 5-93 AlgoConfigs

Parameter	Mandatory	Type	Description
name	No	String	Definition: Search algorithm name. Constraints: N/A Range: N/A Default Value: N/A
params	No	Array of AutoSearchAlgoConfigParameter objects	Definition: Search algorithm parameters. Constraints: N/A

Table 5-94 AutoSearchAlgoConfigParameter

Parameter	Mandatory	Type	Description
key	No	String	Definition: Parameter key. Constraints: N/A Range: N/A Default Value: N/A
value	No	String	Definition: Parameter value. Constraints: N/A Range: N/A Default Value: N/A

Response Parameters

Status code: 201

Table 5-95 Response body parameters

Parameter	Type	Description
metadata	metadata object	Definition: Algorithm metadata, which describes basic algorithm information.
job_config	job_config object	Definition: Algorithm configuration, such as the boot file.
resource_requirements	Array of resource_requirements objects	Definition: Algorithm resource constraints. This parameter is optional. After this parameter is set, the console filters available public resource pools when the algorithm is used in training jobs.
advanced_config	advanced_config object	Definition: Advanced algorithm policy. • auto_search

Table 5-96 metadata

Parameter	Type	Description
id	Integer	Definition: Algorithm ID. You do not need to set this parameter when creating an algorithm. Range: N/A
name	String	Definition: Algorithm name. The value must contain 1 to 64 characters consisting of only digits, letters, underscores (_), and hyphens (-). Range: N/A
description	String	Definition: Algorithm description, which consists of 0 to 256 characters. The default value is NULL . Range: N/A
workspace_id	String	Definition: Workspace where a specified algorithm is located. The default value is 0 . 0 is the default workspace. Range: N/A

Parameter	Type	Description
ai_project	String	Definition: AI project to which a specified algorithm belongs. The default value is default-ai-project . The AI project has been brought offline. Ignore it. Range: N/A
user_name	String	• Definition: Username. Range: N/A
domain_id	String	Definition: Domain ID of a user. Range: N/A
source	String	Definition: Algorithm source type. Range: N/A
api_version	String	Definition: Algorithm API version, which shows whether it is new or old. Range: N/A
is_valid	String	Definition: Algorithm availability. Range: N/A
state	String	Definition: Algorithm status. Range: N/A
tags	Array of Map<String,String> objects	Definition: Algorithm tag.
attr_list	Array of strings	Definition: Algorithm attributes.
version_num	Integer	Definition: Number of algorithm versions. The default value is 0 . Range: N/A
size	Integer	Definition: Algorithm size. Range: N/A
create_time	Long	Definition: Algorithm creation timestamp. Range: N/A
update_time	Long	Definition: Algorithm update timestamp. Range: N/A

Table 5-97 job_config

Parameter	Type	Description
code_dir	String	Definition: Algorithm code directory, for example, <code>/usr/app/</code> . This parameter must be used together with boot_file . Range: N/A
boot_file	String	Definition: Code boot file of the algorithm, which must be stored in the code directory, for example, <code>/usr/app/boot.py</code> . This parameter must be used with code_dir . Range: N/A
command	String	Definition: Container boot command of a custom image algorithm. Range: N/A
parameters	Array of ParameterResp objects	Definition: Running parameters of an algorithm.
inputs	Array of inputs objects	Definition: Data input of an algorithm.
outputs	Array of outputs objects	Definition: Data output of an algorithm.
engine	engine object	Definition: Algorithm engine.
code_tree	Array of code_tree objects	Definition: Algorithm directory tree.
parameters_customization	Boolean	Definition: Specifies whether the algorithm allows hyperparameter customization during training job creation. Range: • true: allowed • false: not allowed

Table 5-98 ParameterResp

Parameter	Type	Description
name	String	Definition: Parameter name. Range: N/A

Parameter	Type	Description
value	String	Definition: Parameter value. Range: N/A
description	String	Definition: Parameter description. Range: N/A
constraint	constraint object	Definition: Parameter attribute.
i18n_description	i18n_description object	Definition: Internationalization description.

Table 5-99 constraint

Parameter	Type	Description
editable	Boolean	Definition: Whether the parameter can be edited. Range: • true: editable • false: Not uneditable
required	Boolean	Definition: Whether the parameter is mandatory. Range: • true: mandatory • false: optional
sensitive	Boolean	Definition: Whether the parameter is sensitive. This function is unavailable currently. Range: • true: sensitive • false: insensitive
valid_range	Array of strings	Definition: Valid range.

Table 5-100 i18n_description

Parameter	Type	Description
language	String	Definition: Internationalization language. The options are as follows: • zh-cn: Chinese • en-us: English Range: N/A

Parameter	Type	Description
description	String	Definition: Internationalization language description. Range: N/A

Table 5-101 inputs

Parameter	Type	Description
name	String	Definition: Name of the data input channel. Range: N/A
description	String	Definition: Description of the data input channel. Range: N/A
remote_constraints	Array of remote_constraints objects	Definition: Data input constraint.

Table 5-102 remote_constraints

Parameter	Type	Description
data_type	String	Definition: Data input type, including the data storage location and dataset. Range: N/A
attributes	Array of Map<String,String> objects	Definition: Attributes when the data input type is a dataset. The value can be: • data_format: data format • data_segmentation: data segmentation method • dataset_type: data labeling type

Table 5-103 outputs

Parameter	Type	Description
name	String	Definition: Name of the data output channel. Range: N/A

Parameter	Type	Description
description	String	Definition: Description of the data output channel. Range: N/A

Table 5-104 engine

Parameter	Type	Description
engine_id	String	Definition: Engine ID selected for an algorithm. Range: N/A
engine_name	String	Definition: Engine version name selected for an algorithm. If engine_id is specified, leave this parameter blank. Range: N/A
engine_version	String	Definition: Engine version name selected for an algorithm. If engine_id is specified, leave this parameter blank. Range: N/A
image_url	String	Definition: Custom image URL selected for an algorithm. Range: N/A

Table 5-105 code_tree

Parameter	Type	Description
name	String	Definition: Name of the current directory in the algorithm directory tree. Range: N/A
children	Object	Definition: Subfiles and subdirectories in the current directory of the algorithm directory tree.

Table 5-106 resource_requirements

Parameter	Type	Description
key	String	Definition: Resource constraints. Range: • flavor_type: Flavor type, which can be CPU, Ascend, or GPU. • device_distributed_mode: Specifies whether to support multi-card training. The value can be multiple (supported) or singular (not supported). • host_distributed_mode: Specifies whether to support distributed training. The value can be multiple (supported) or singular (not supported).
value	Array of strings	Definition: Value of the resource constraint key.
operator	String	Definition: Relationship between keys and values. Currently, only in is supported. For example, flavor_type in [CPU,GPU] . Range: N/A

Table 5-107 advanced_config

Parameter	Type	Description
auto_search	auto_search object	Definition: Hyperparameter search policy.

Table 5-108 auto_search

Parameter	Type	Description
skip_search_params	String	Definition: Hyperparameter parameters that need to be skipped. Range: N/A
reward_attrs	Array of reward_attrs objects	Definition: Search metrics.

Parameter	Type	Description
search_params	Array of search_params objects	Definition: Search parameters.
algo_configs	Array of algo_configs objects	Definition: Search algorithm configurations.

Table 5-109 reward_attrs

Parameter	Type	Description
name	String	Definition: Metric name. Range: N/A
mode	String	Definition: Search mode. Range: • max: A larger metric value is preferred. • min: A smaller metric value is preferred.
regex	String	Definition: Regular expression of a metric. Range: N/A

Table 5-110 search_params

Parameter	Type	Description
name	String	Definition: Hyperparameter name. Range: N/A

Parameter	Type	Description
param_type	String	Definition: Parameter type. Range: • continuous: The hyperparameter is of the continuous type. When an algorithm is used in a training job, continuous hyperparameters are displayed as text boxes on the console. • discrete: The hyperparameter is of the discrete type. When an algorithm is used in a training job, discrete hyperparameters are displayed as drop-down lists on the console.
lower_bound	String	Definition: Lower bound of the hyperparameter. Range: N/A
upper_bound	String	Definition: Upper bound of the hyperparameter. Range: N/A
discrete_points_num	String	Definition: Number of discrete points of a hyperparameter with continuous values. Range: N/A
discrete_values	String	Definition: Discrete hyperparameter values. Range: N/A

Table 5-111 algo_configs

Parameter	Type	Description
name	String	Definition: Search algorithm name. Range: N/A
params	Array of AutoSearchAlgoConfigParameterResponse objects	Definition: Search algorithm parameters.

Table 5-112 AutoSearchAlgoConfigParameterResp

Parameter	Type	Description
key	String	Definition: Parameter key. Range: N/A
value	String	Definition: Parameter value. Range: N/A

Example Requests

The following shows how to modify the algorithm whose UUID is **2e5451fe-913f-4492-821a-2981031382f7**.

Status Codes

Status Code	Description
201	ok

Error Codes

See [Error Codes](#).

5.5 Deleting an Algorithm

Function

This API is used to remove a registered algorithm from ModelArts.

This API applies to the following scenarios: When you need to delete an algorithm that is no longer used, you can use this API to do so. Before using this API, ensure that the algorithm exists and you have the permission to delete it. After the deletion is complete, the algorithm is permanently removed from the platform. If the algorithm ID does not exist or you do not have the operation permission, the API will return an error message.

Debugging

You can debug this API through automatic authentication in [API Explorer](#) or use the SDK sample code generated by API Explorer.

Authorization Information

Each account has all the permissions required to call all APIs, but IAM users must be assigned the required permissions.

- If you are using role/policy-based authorization, see [Permissions Policies and Supported Actions](#) for details on the required permissions.
- If you are using identity policy-based authorization, the following identity policy-based permissions are required.

Action	Access Level	Resource Type (*: required)	Condition Key	Alias	Dependencies
modelarts:aiAlgorithm:delete	Write	aiAlgorithm *	-	-	-

URI

DELETE /v2/{project_id}/algorithms/{algorithm_id}

Table 5-113 Path Parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Definition: Project ID. For details, see Obtaining a Project ID and Name . Constraints: The value can contain 1 to 64 characters. Letters, digits, and hyphens (-) are allowed. Range: N/A Default Value: N/A
algorithm_id	Yes	String	Definition: Algorithm ID Constraints: N/A Range: N/A Default Value: N/A

5.6 Creating a Training Job

Function

This API is used to create a training job on ModelArts.

This API applies to the following scenarios: When you need to perform machine learning training based on specific datasets and algorithm models, you can use this API to create and configure a training job. Before using this API, ensure that you have uploaded datasets and model code to ModelArts and have the permission to create training jobs. After a training job is created, the platform starts the training job based on the configured resource specifications. You can monitor the training progress and status by using the job ID. If the dataset or model code does not exist, the resource specifications are incorrectly configured, or you do not have the required permission, the API will return an error message.

Debugging

You can debug this API through automatic authentication in [API Explorer](#) or use the SDK sample code generated by API Explorer.

Authorization Information

Each account has all the permissions required to call all APIs, but IAM users must be assigned the required permissions.

- If you are using role/policy-based authorization, see [Permissions Policies and Supported Actions](#) for details on the required permissions.
- If you are using identity policy-based authorization, the following identity policy-based permissions are required.

Action	Access Level	Resource Type (*: required)	Condition Key	Alias	Dependencies
modelarts:trainJob:logExport	Write	trainJob *	-	-	-

POST /v2/{project_id}/training-jobs

Table 5-114 Path Parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Definition: Project ID. For details, see Obtaining a Project ID and Name . Constraints: The value can contain 1 to 64 characters. Letters, digits, and hyphens (-) are allowed. Range: N/A Default Value: N/A

Request Parameters

Table 5-115 Request body parameters

Parameter	Mandatory	Type	Description
kind	Yes	String	Definition: Type of a training job. Constraints: N/A Range • job: common job • federated_pool_job: resource pool federated job • edge_job: edge job • hetero_job: heterogeneous job • mrs_job: MRS job • autosearch_job: auto search job • diag_job: diagnosis job • visualization_job: visualization job Default Value: job
metadata	Yes	JobMetadata object	Definition: Training job metadata. Constraints: N/A

Parameter	Mandatory	Type	Description
algorithm	No	JobAlgorithm object	Definition: Training job algorithm. Constraints: The options are as follows. • id: Only the algorithm ID is used. • subscription_id+item_version_id: The subscription ID and version ID of the algorithm are used. • code_dir+boot_file: The code directory and boot file of the training job are used.
tasks	No	Array of Task objects	Definition: Task list. This function is not implemented. Constraints: N/A
spec	No	Spec object	Definition: Training job specifications. If this parameter is specified, leave the tasks parameter blank. Constraints: N/A
endpoints	No	JobEndpointsReq object	Definition: Configurations required for remotely accessing a training job. Constraints: N/A

Table 5-116 JobMetadata

Parameter	Mandatory	Type	Description
name	Yes	String	Definition: Name of a training job. Constraints: N/A Range: The value must contain 1 to 64 characters consisting of only digits, letters, underscores (_), and hyphens (-). Default Value: N/A

Parameter	Mandatory	Type	Description
workspace_id	No	String	Definition: Workspace where a specified job is located. Constraints: N/A Range: N/A Default Value: 0
description	No	String	Definition: Definition of a training job. Constraints: The value must contain 0 to 256 characters. Range: N/A Default Value: NULL
annotations	No	Map<String,String>	Definition: Advanced functions of a training job. Constraints: The value can be: • job_template: Template RL (heterogeneous job) • fault-tolerance/job-retry-num: 3 (number of retries upon a fault) • fault-tolerance/job-unconditional-retry: true (unconditional restart) • fault-tolerance/hang-retry: true (restart upon suspension) • jupyter-lab/enable: true (JupyterLab training application) • tensorboard/enable: true (TensorBoard training application) • mindstudio-insight/enable: true (MindStudio Insight training application) • fault-tolerance/hccl_op_retry: true (operator retry) • performance_diagnosis_enabled: true (performance diagnosis)

Table 5-117 JobAlgorithm

Parameter	Mandatory	Type	Description
id	No	String	Definition: Algorithm ID in algorithm management. Constraints: N/A Range: N/A Default Value: N/A
name	No	String	Definition: Algorithm name. Leave it blank. Constraints: N/A Range: N/A Default Value: N/A
subscription_id	No	String	Definition: Subscription ID of a subscription algorithm. Constraints: This parameter must be used with item_version_id . Range: N/A Default Value: N/A
item_version_id	No	String	Definition: Version of a subscription algorithm. Constraints: This parameter must be used with subscription_id . Range: N/A Default Value: N/A
code_dir	No	String	Definition: Code directory of a training job, for example, /usr/app/ . Constraints: This parameter must be used with boot_file . Leave this parameter blank if id , or subscription_id and item_version_id are specified. Range: N/A Default Value: N/A

Parameter	Mandatory	Type	Description
boot_file	No	String	Definition: Boot file of a training job, which must be stored in the code directory, for example, <code>/usr/app/boot.py</code> . Constraints: This parameter must be used with <code>code_dir</code> . Leave this parameter blank if <code>id</code> , or <code>subscription_id</code> and <code>item_version_id</code> are specified. Range: N/A Default Value: N/A
autosearch_config_path	No	String	Definition: YAML configuration path of an auto search job. An OBS URL is required. Constraints: N/A Range: N/A Default Value: N/A
autosearch_framework_path	No	String	Definition: Framework code directory of an auto search job. An OBS URL is required. Constraints: N/A Range: N/A Default Value: N/A
command	No	String	Definition: Command for starting the custom image container of a training job. Constraints: N/A Range: N/A Default Value: N/A
parameters	No	Array of Parameters objects	Definition: Running parameters of the training job. Constraints: N/A
policies	No	JobPolicies object	Definition: Policies supported by jobs, which are used for hyperparameter search. Constraints: N/A
inputs	No	Array of Input objects	Definition: Data input of a training job. Constraints: N/A

Parameter	Mandatory	Type	Description
outputs	No	Array of Output objects	Definition: Output of the training job. Constraints: N/A
engine	No	JobEngine object	Definition: Engine of a training job. Constraints: Leave this parameter blank if the job is created using id of the algorithm in algorithm management, or subscription_id + item_version_id of the subscribed algorithm.
local_code_dir	No	String	Definition: Local directory of the training container to which the algorithm code directory is downloaded. Constraints • The directory must be under /home. • In v1 compatibility mode, the current field does not take effect. • When code_dir is prefixed with file://, the current field does not take effect. • The directory cannot be set to /home/ma-user/modelarts, /home/ma-user/modelarts-dev, /home/ma-user/infer, or their subdirectories, and cannot be set to /home/ma-user. Range: N/A Default Value: N/A
working_dir	No	String	Definition: Work directory where an algorithm is executed. Constraints: In v1 compatibility mode, the current field does not take effect. Range: N/A Default Value: N/A

Parameter	Mandatory	Type	Description
environments	No	Map<String,String>	Definition: Environment variables of a training job. Format: "key":"value" Constraints: The key can contain a maximum of 8,192 characters, and the value can contain a maximum of 4,096 characters. A maximum of 100 key-value pairs are allowed. The variable name can contain only letters, digits, and underscores (<code>_</code>), and must start with a letter or underscore (<code>_</code>). Note: Variables cannot contain \$.
summary	No	Summary object	Definition: Visualization log summary. Constraints: N/A

Table 5-118 Parameters

Parameter	Mandatory	Type	Description
name	No	String	Definition: Parameter name. Constraints: N/A Range: N/A Default Value: N/A
value	No	String	Definition: Parameter value. Constraints: N/A Range: N/A Default Value: N/A
description	No	String	Definition: Parameter description. Constraints: N/A Range: N/A Default Value: N/A
constraint	No	ParametersConstraint object	Definition: Parameter attribute. Constraints: N/A

Parameter	Mandatory	Type	Description
i18n_description	No	I18nDescription object	Definition: Internationalization description. Constraints: N/A

Table 5-119 ParametersConstraint

Parameter	Mandatory	Type	Description
editable	No	Boolean	Definition: Whether the parameter can be edited. Constraints: N/A Range: • true: editable • false: Not uneditable Default Value: N/A
required	No	Boolean	Definition: Whether the parameter is mandatory. Constraints: N/A Range: • true: mandatory • false: optional Default Value: N/A
sensitive	No	Boolean	Definition: Whether the parameter is sensitive. This function is unavailable currently. Constraints: N/A Range: • true: sensitive • false: insensitive Default Value: N/A
valid_range	No	Array of strings	Definition: Valid range. Constraints: N/A

Table 5-120 I18nDescription

Parameter	Mandatory	Type	Description
language	No	String	Definition: Internationalization language. Constraints: N/A Range: N/A Default Value: N/A
description	No	String	Definition: Description. Constraints: N/A Range: N/A Default Value: N/A

Table 5-121 JobPolicies

Parameter	Mandatory	Type	Description
auto_search	No	AutoSearch object	Definition: Hyperparameter search configuration. Constraints: N/A

Table 5-122 AutoSearch

Parameter	Mandatory	Type	Description
skip_search_params	No	String	Definition: Hyperparameter parameters that need to be skipped. Constraints: N/A Range: N/A Default Value: N/A
reward_attrs	No	Array of RewardAttrs objects	Definition: Search metrics. Constraints: N/A
search_params	No	Array of SearchParams objects	Definition: Search parameters. Constraints: N/A
algo_configs	No	Array of AlgoConfigs objects	Definition: Search algorithm configurations. Constraints: N/A

Table 5-123 RewardAttrs

Parameter	Mandatory	Type	Description
name	No	String	Definition: Metric name. Constraints: N/A Range: N/A Default Value: N/A
mode	No	String	Definition: Search mode. Constraints: N/A Range: • max: A larger metric value is preferred. • min: A smaller metric value is preferred. Default Value: N/A
regex	No	String	Definition: Regular expression of a metric. Constraints: N/A Range: N/A Default Value: N/A

Table 5-124 SearchParams

Parameter	Mandatory	Type	Description
name	No	String	Definition: Hyperparameter name. Constraints: N/A Range: N/A Default Value: N/A

Parameter	Mandatory	Type	Description
param_type	No	String	Definition: Parameter type. Constraints: N/A Range: • continuous: The hyperparameter is of the continuous type. When an algorithm is used in a training job, continuous hyperparameters are displayed as text boxes on the console. • discrete: The hyperparameter is of the discrete type. When an algorithm is used in a training job, discrete hyperparameters are displayed as drop-down lists on the console. Default Value: N/A
lower_bound	No	String	Definition: Lower bound of the hyperparameter. Constraints: N/A Range: N/A Default Value: N/A
upper_bound	No	String	Definition: Upper bound of the hyperparameter. Constraints: N/A Range: N/A Default Value: N/A
discrete_points_num	No	String	Definition: Number of discrete points of a hyperparameter with continuous values. Constraints: N/A Range: N/A Default Value: N/A
discrete_values	No	Array of strings	Definition: Discrete hyperparameter values. Constraints: N/A

Table 5-125 AlgoConfigs

Parameter	Mandatory	Type	Description
name	No	String	Definition: Search algorithm name. Constraints: N/A Range: N/A Default Value: N/A
params	No	Array of AutoSearchAlgoConfigParameter objects	Definition: Search algorithm parameters. Constraints: N/A

Table 5-126 AutoSearchAlgoConfigParameter

Parameter	Mandatory	Type	Description
key	No	String	Definition: Parameter key. Constraints: N/A Range: N/A Default Value: N/A
value	No	String	Definition: Parameter value. Constraints: N/A Range: N/A Default Value: N/A

Table 5-127 JobEngine

Parameter	Mandatory	Type	Description
engine_id	No	String	Definition: Engine ID selected for a training job. Constraints: The value can be engine_id , engine_name + engine_version , or image_url . Range: N/A Default Value: N/A

Parameter	Mandatory	Type	Description
engine_name	No	String	Definition: Engine name selected for a training job. Constraints: If engine_id has been set, you do not need to set this parameter. If you use a preset framework and custom image to create a training job, you must set both this parameter and image_url . Range: N/A Default Value: N/A
engine_version	No	String	Definition: Engine version selected for a training job. Constraints: If engine_id has been set, you do not need to set this parameter. Range: N/A Default Value: N/A
image_url	No	String	Definition: Custom image URL selected for a training job. The URL is obtained from SWR. Constraints: The format is organization_name/image_name:tag. Range: N/A Default Value: N/A
install_sys_packages	No	Boolean	Definition: Specifies whether to install the MoXing version specified by the training platform. Constraints: This parameter is available only when engine_name , engine_version , and image_url are set. Range: • true: yes • false: no Default Value: N/A

Table 5-128 Summary

Parameter	Mandatory	Type	Description
log_dir	No	LogDir object	Definition: Visualization log output of a training job. Constraints: This parameter is mandatory when log_type is not left empty.
data_sources	No	Array of DataSource objects	Definition: Visualization log input of the visualization job or training job debugging mode. Constraints: This parameter is mandatory when the advanced function "tensorboard/enable": "true" or "mindstudio-insight/enable": "true" is enabled for the training job.

Table 5-129 LogDir

Parameter	Mandatory	Type	Description
pfs	Yes	PFSSummary object	Definition: Output of an OBS parallel file system. Constraints: N/A

Table 5-130 PFSSummary

Parameter	Mandatory	Type	Description
pfs_path	Yes	String	Definition: URL of the OBS parallel file system. Constraints: N/A Range: N/A Default Value: N/A

Table 5-131 DataSource

Parameter	Mandatory	Type	Description
job	Yes	JobSummary object	Definition: Job data source. Constraints: Visualization log input of a visualization job or debug training job. This parameter is mandatory when tensorboard/enable or mindstudio-insight/enable is set to true for advanced training functions.
nfs	No	NFSSummary object	Definition: Job data source. Constraints: This parameter is mandatory when mindstudio-insight/enable is set to true for advanced training functions.

Table 5-132 JobSummary

Parameter	Mandatory	Type	Description
job_id	Yes	String	Definition: ID of a training job. Constraints: N/A Range: N/A Default Value: N/A

Table 5-133 NFSSummary

Parameter	Mandatory	Type	Description
nfs_path	Yes	String	Definition: URL of the SFS Turbo file system. Constraints: N/A. Range: N/A. Default Value: N/A.

Table 5-134 Task

Parameter	Mandatory	Type	Description
role	No	String	Definition: Task role. This function is not supported currently. Constraints: N/A Range: N/A Default Value: N/A
algorithm	No	algorithm object	Definition: Algorithm configurations for algorithm management. Constraints: N/A
task_resource	No	task_resource object	Definition: Resource flavor of a training job. Constraints: N/A
log_export_path	No	log_export_path object	Definition: Saved information about training job logs. Constraints: N/A

Table 5-135 algorithm

Parameter	Mandatory	Type	Description
job_config	No	job_config object	Definition: Algorithm configuration, such as the boot file. Constraints: N/A
code_dir	No	String	Definition: Algorithm code directory, for example, <code>/usr/app/</code> . Constraints: This parameter must be used with boot_file . Range: N/A Default Value: N/A

Parameter	Mandatory	Type	Description
boot_file	No	String	Definition: Code boot file of the algorithm, which must be stored in the code directory, for example, <code>/usr/app/boot.py</code> . Constraints: This parameter must be used with <code>code_dir</code> . Range: N/A Default Value: N/A
engine	No	<code>engine</code> object	Definition: Algorithm engine of a heterogeneous job. Constraints: N/A
inputs	No	Array of <code>inputs</code> objects	Definition: Data input of an algorithm. Constraints: N/A
outputs	No	Array of <code>outputs</code> objects	Definition: Data output of an algorithm. Constraints: N/A
local_code_dir	No	String	Definition: Local directory of the training container to which the algorithm code directory is downloaded. Constraints: • The directory must be under <code>/home</code>. • In v1 compatibility mode, the current field does not take effect. • When <code>code_dir</code> is prefixed with <code>file://</code>, the current field does not take effect. Range: N/A Default Value: N/A
working_dir	No	String	Definition: Work directory where an algorithm is executed. Constraints: In v1 compatibility mode, the current field does not take effect. Range: N/A Default Value: N/A

Parameter	Mandatory	Type	Description
environments	No	Map<String,String>	Definition: Environment variables of a training job. Constraints: N/A Range: N/A Default Value: N/A

Table 5-136 job_config

Parameter	Mandatory	Type	Description
parameters	No	Array of Parameter objects	Definition: Running parameters of an algorithm. Constraints: N/A
inputs	No	Array of Input objects	Definition: Data input of an algorithm. Constraints: N/A
outputs	No	Array of Output objects	Definition: Data output of an algorithm. Constraints: N/A
engine	No	engine object	Definition: Algorithm engine. Constraints: N/A

Table 5-137 Parameter

Parameter	Mandatory	Type	Description
name	No	String	Definition: Parameter name. Constraints: N/A Range: N/A Default Value: N/A
value	No	String	Definition: Parameter value. Constraints: N/A Range: N/A Default Value: N/A
description	No	String	Definition: Parameter description. Constraints: N/A Range: N/A Default Value: N/A

Parameter	Mandatory	Type	Description
constraint	No	constraint object	Definition: Parameter attribute. Constraints: N/A
i18n_description	No	i18n_description object	Definition: Internationalization description. Constraints: N/A

Table 5-138 constraint

Parameter	Mandatory	Type	Description
type	No	String	Definition: Parameter type. Constraints: N/A Range: N/A Default Value: N/A
editable	No	Boolean	Definition: Whether the parameter can be edited. Constraints: N/A Range: • true: editable • false: Not uneditable Default Value: N/A
required	No	Boolean	Definition: Whether the parameter is mandatory. Constraints: N/A Range: • true: mandatory • false: optional Default Value: N/A
sensitive	No	Boolean	Definition: Whether the parameter is sensitive. Constraints: This function is unavailable currently. Range: • true: sensitive • false: insensitive Default Value: N/A

Parameter	Mandatory	Type	Description
valid_type	No	String	Definition: Valid type. Constraints: N/A Range: N/A Default Value: N/A
valid_range	No	Array of strings	Definition: Valid range. Constraints: N/A

Table 5-139 i18n_description

Parameter	Mandatory	Type	Description
language	No	String	Definition: Internationalization language. Constraints: N/A Range: N/A Default Value: N/A
description	No	String	Definition: Internationalization language description. Constraints: N/A Range: N/A Default Value: N/A

Table 5-140 Input

Parameter	Mandatory	Type	Description
name	Yes	String	Definition: Name of the data input channel. Constraints: N/A Range: N/A Default Value: N/A
description	No	String	Definition: Description of the data input channel. Constraints: N/A Range: N/A Default Value: N/A

Parameter	Mandatory	Type	Description
local_dir	No	String	Definition: Local path of the container to which the data input channels are mapped. Example: <code>/home/ma-user/modelarts/inputs/data_url_0</code> Constraints: N/A Range: N/A Default Value: N/A
access_method	No	String	Definition: Access method of the input data channel path (<code>local_dir</code>). Constraints: N/A Range: • parameter: hyperparameters • env: environment variables Default Value: <code>parameter</code>
remote	Yes	<code>InputDataInfo</code> object	Definition: Description of the actual data input. Constraints: The options are as follows. • dataset: The data input is a dataset. • obs: The data input is an OBS path.
remote_constraint	No	Array of <code>remote_constraint</code> objects	Definition: Data input constraint. Constraints: N/A

Table 5-141 InputDataInfo

Parameter	Mandatory	Type	Description
dataset	No	<code>dataset</code> object	Definition: The input is a dataset. Constraints: N/A
obs	No	<code>obs</code> object	Definition: OBS in which data input and output are stored. Constraints: N/A

Table 5-142 dataset

Parameter	Mandatory	Type	Description
id	Yes	String	Definition: Dataset ID of a training job. Constraints: N/A Range: N/A Default Value: N/A
version_id	No	String	Definition: Dataset version ID of a training job. Constraints: This parameter is mandatory when an old-version dataset is used, that is, service_type is not V3 . Range: N/A Default Value: N/A
service_type	No	String	Definition: Dataset service type. Constraints: N/A Range: N/A Default Value: V3 indicates that a dataset provided by the asset service is used. Other values indicate that an old-version dataset is used.
name	No	String	Definition: Dataset name of a training job.

Table 5-143 obs

Parameter	Mandatory	Type	Description
obs_url	Yes	String	Definition: OBS URL of the dataset for a training job, For example, /usr/data/ . Constraints: N/A Range: N/A Default Value: N/A

Table 5-144 remote_constraint

Parameter	Mandatory	Type	Description
data_type	No	String	Definition: Data input type, including the data storage location and dataset. Constraints: N/A Range: N/A Default Value: N/A
attributes	No	String	Definition: Related attributes. Constraints: N/A Range: If the input is a dataset: • data_format: data format • data_segmentation: data segmentation method • dataset_type: data labeling type Default Value: N/A

Table 5-145 Output

Parameter	Mandatory	Type	Description
name	Yes	String	Definition: Name of the data output channel. Constraints: N/A Range: N/A Default Value: N/A
description	No	String	Definition: Description of the data output channel. Constraints: N/A Range: N/A Default Value: N/A
local_dir	No	String	Definition: Local path of the container to which the data output channels are mapped. Constraints: N/A Range: N/A Default Value: N/A

Parameter	Mandatory	Type	Description
access_method	No	String	Definition: Access method of the output data channel path (local_dir). Constraints: N/A Range: • parameter: hyperparameters • env: environment variables Default Value: parameter
remote	Yes	Remote object	Definition: Description of the actual data output. Constraints: N/A

Table 5-146 Remote

Parameter	Mandatory	Type	Description
obs	Yes	RemoteObs object	Definition: Data actually output to OBS. Constraints: N/A

Table 5-147 RemoteObs

Parameter	Mandatory	Type	Description
obs_url	Yes	String	Definition: Path of the data output to OBS. Constraints: N/A Range: N/A Default Value: N/A

Table 5-148 engine

Parameter	Mandatory	Type	Description
engine_id	No	String	Definition: Engine ID selected for an algorithm. Constraints: N/A Range: N/A Default Value: N/A

Parameter	Mandatory	Type	Description
engine_name	No	String	Definition: Engine name selected for an algorithm. Constraints: If engine_id is specified, leave this parameter blank. Range: N/A Default Value: N/A
engine_version	No	String	Definition: Engine version selected for an algorithm. Constraints: If engine_id is specified, leave this parameter blank. Range: N/A Default Value: N/A
image_url	No	String	Definition: Custom image URL selected for an algorithm. Constraints: N/A Range: N/A Default Value: N/A

Table 5-149 engine

Parameter	Mandatory	Type	Description
engine_id	No	String	Definition: ID of the engine flavor of a heterogeneous job, for example, caffe-1.0.0-python2.7 . Constraints: N/A Range: N/A Default Value: N/A
engine_name	No	String	Definition: Name of the engine flavor of a heterogeneous job, for example, Caffe . Constraints: N/A Range: N/A Default Value: N/A

Parameter	Mandatory	Type	Description
engine_version	No	String	Definition: Version of the engine flavor of a heterogeneous job. Constraints: N/A Range: N/A Default Value: N/A
image_url	No	String	Definition: Custom image URL selected for an algorithm. Constraints: N/A Range: N/A Default Value: N/A
run_user	No	String	Definition: Container image startup user. The default value is 1000. This parameter can be configured only when a custom image is used. Constraints: N/A Range: N/A Default Value: N/A

Table 5-150 inputs

Parameter	Mandatory	Type	Description
name	Yes	String	Definition: Name of the data input channel. Constraints: N/A Range: N/A Default Value: N/A
description	No	String	Definition: Description of the data input channel. Constraints: N/A Range: N/A Default Value: N/A
local_dir	No	String	Definition: Local path of the container to which the data input channels are mapped. Constraints: N/A Range: N/A Default Value: N/A

Parameter	Mandatory	Type	Description
remote	Yes	remote object	Definition: Description of the actual data input. Constraints: The options are as follows: • dataset: The data input is a dataset. • obs: The data input is an OBS path.

Table 5-151 remote

Parameter	Mandatory	Type	Description
obs	No	obs object	Definition: OBS in which data input and output are stored. Constraints: N/A

Table 5-152 obs

Parameter	Mandatory	Type	Description
obs_url	Yes	String	Definition: OBS URL of the dataset for a training job, For example, /usr/data/ . Constraints: N/A Range: N/A Default Value: N/A

Table 5-153 outputs

Parameter	Mandatory	Type	Description
name	Yes	String	Definition: Name of the data output channel. Constraints: N/A Range: N/A Default Value: N/A

Parameter	Mandatory	Type	Description
description	No	String	Definition: Description of the data output channel. Constraints: N/A Range: N/A Default Value: N/A
local_dir	No	String	Definition: Local path of the container to which the data output channels are mapped. Constraints: N/A Range: N/A Default Value: N/A
remote	Yes	remote object	Definition: Description of the actual data output. Constraints: N/A

Table 5-154 remote

Parameter	Mandatory	Type	Description
obs	Yes	obs object	Definition: Data actually output to OBS. Constraints: N/A

Table 5-155 obs

Parameter	Mandatory	Type	Description
obs_url	Yes	String	Definition: Path of the data output to OBS. Constraints: N/A Range: N/A Default Value: N/A

Table 5-156 task_resource

Parameter	Mandatory	Type	Description
flavor_id	No	String	Definition: ID of the resource flavor selected for a training job. Constraints: N/A Range: N/A Default Value: N/A
node_count	Yes	Integer	Definition: Number of resource replicas selected for a training job. Constraints: N/A Range: N/A Default Value: N/A
pool_id	No	String	Definition: ID of the resource pool selected for a training task. Constraints: N/A Range: N/A Default Value: N/A

Table 5-157 log_export_path

Parameter	Mandatory	Type	Description
obs_url	No	String	Definition: OBS path for storing training job logs. Constraints: N/A

Table 5-158 Spec

Parameter	Mandatory	Type	Description
resource	No	SpecResource object	Definition: Resource flavor of a training job. Constraints: Select either flavor_id or pool_id or flavor_id . - If you select a public resource pool, only flavor_id is needed. Select the number of PUs and memory your training job needs. If the public resource pool has enough idle resources, your job will be scheduled. - If you select a dedicated resource pool, both pool_id and flavor_id are needed. Select the smallest number of PUs that meet your training needs to save resources and boost efficiency.
volumes	No	Array of SpecVolumes objects	Definition: Mounting volume information of a training job. Constraints: N/A
log_export_path	No	LogExportPath object	Definition: Log output of a training job. Constraints: N/A
auto_stop	No	AutoStop object	Definition: Auto stop configuration of a training job. Constraints: N/A
schedule_policy	No	SchedulePolicy object	Definition: Scheduling policy of a training job. Constraints: N/A
log_export_config	No	LogExportConfig object	Definition: Log export configuration. Constraints: N/A.
notification	No	Notification object	Definition: Message notification of a training event. Constraints: N/A

Parameter	Mandatory	Type	Description
custom_metrics	No	Array of CustomMetrics objects	Definition: Metric collection configuration.
output_model	No	OutputModel object	Definition: Output information of a custom training job.
asset_model	No	AssetModel object	Definition: Information about the model created using a custom training job.

Table 5-159 SpecResource

Parameter	Mandatory	Type	Description
flavor_id	No	String	Definition: ID of the resource flavor of a training job. Constraints: N/A Range: The flavor_id parameter cannot be specified for a dedicated resource pool of CPU specifications. The options for dedicated resource pools with GPU/Ascend specifications are as follows: • modelarts.pool.visual.xlarge (1 PU) • modelarts.pool.visual.2xlarge (2 PUs) • modelarts.pool.visual.4xlarge (4 PUs) • modelarts.pool.visual.8xlarge (8 PUs) • modelarts.pool.visual.16xlarge (16 cards, only for the Snt9b23 supernode resource pool) Default Value: N/A
node_count	No	Integer	Definition: Number of nodes used to create a training job in a resource pool. Constraints: N/A Range: N/A Default Value: single node

Parameter	Mandatory	Type	Description
pool_id	No	String	Definition: Dedicated resource pool ID. Constraints: N/A Range: N/A Default Value: N/A
pool_group_id	No	String	Definition: Resource pool federation ID. Constraints: This parameter is mandatory when kind is set to federated_pool_job . Range: N/A Default Value: N/A
main_container_customized_flavor	No	MainContainerCustomizedFlavor object	Definition: Custom flavor. Constraints: N/A Range: The number of CPU cores and memory size must be greater than 0, and the number of accelerator PUs must be greater than or equal to 0. Default Value: N/A

Table 5-160 MainContainerCustomizedFlavor

Parameter	Mandatory	Type	Description
cpu_core_num	No	Float	Definition: Number of CPU cores. Range: greater than 0
mem_size	No	Float	Definition: Memory size. Range: greater than 0
accelerator_num	No	Float	Definition: Number of accelerator cards. Range: greater than or equal to 0

Table 5-161 SpecVolumes

Parameter	Mandatory	Type	Description
nfs	No	Nfs object	Definition: NFS mounting volume information of a training job. Constraints: N/A
pfs	No	Pfs object	Definition: obsfs mounting volume information of a training job. Constraints: N/A
obs	No	Obs object	Definition: OBS mounting volume information of a training job. Constraints: N/A

Table 5-162 Nfs

Parameter	Mandatory	Type	Description
nfs_server_path	No	String	Definition: NFS server path, for example, 10.10.10.10:/example/path . Constraints: N/A Range: N/A Default Value: N/A
local_path	No	String	Definition: Path for attaching volumes to the training container, for example, /example/path . Constraints: N/A Range: N/A Default Value: N/A
read_only	No	Boolean	Definition: Specifies whether the disks attached to the container in NFS mode are read-only. Constraints: N/A Range: • true: read only • false: non-read-only Default Value: N/A

Table 5-163 Pfs

Parameter	Mandatory	Type	Description
pfs_path	No	String	Definition: Address of obsfs. For example, /test-bucket/path . Constraints: N/A Range: N/A Default Value: N/A
local_path	No	String	Definition: Path for attaching volumes to the training container, for example, /example/path . Constraints: N/A Range: N/A Default Value: N/A

Table 5-164 Obs

Parameter	Mandatory	Type	Description
obs_path	No	String	Definition: OBS path to be mounted. For example, /test-bucket/path . Constraints: N/A Range: N/A Default Value: N/A
local_path	No	String	Definition: Path for attaching volumes to the training container, for example, /example/path . Constraints: N/A Range: N/A Default Value: N/A

Table 5-165 LogExportPath

Parameter	Mandatory	Type	Description
obs_url	No	String	Definition: OBS path for storing training job logs, for example, obs://example/path . Constraints: N/A Range: N/A Default Value: N/A
host_path	No	String	Definition: Path of the host where training job logs are stored, for example, /example/path . Constraints: N/A Range: N/A Default Value: N/A

Table 5-166 AutoStop

Parameter	Mandatory	Type	Description
time_unit	Yes	String	Definition: Time unit. Constraints: N/A Range: • HOURS: hour Default Value: N/A
duration	Yes	Integer	Definition: Runtime. Constraints: N/A • Range: The minimum value is 1. Default Value: N/A

Table 5-167 SchedulePolicy

Parameter	Mandatory	Type	Description
required_affinity	No	RequiredAffinity object	Definition: Mandatory affinity of the training job. Constraints: N/A.
preferred_affinity	No	PreferredAffinity object	Definition: Preferred affinity of the training job. Constraints: N/A.

Parameter	Mandatory	Type	Description
priority	No	Integer	Definition: Priority of a training job. Constraints: • The priority can be set for a training job only when a dedicated resource pool is used. • The value ranges from 1 to 3. The default priority is 1, and the highest priority is 3. By default, the job priority can be set to 1 or 2 . After the permission to set the highest job priority is configured, the priority can be set to 1 to 3 . Range: 0 to 3 Default Value: N/A
preemptible	No	Boolean	Definition: Whether the resource can be preempted. Constraints: N/A Range: • true: The resource can be preempted. • false: The resource cannot be preempted. Default Value: N/A

Table 5-168 RequiredAffinity

Parameter	Mandatory	Type	Description
affinity_type	No	String	Definition: Affinity scheduling policy. Constraints: N/A Range: • cabinet: strong cabinet scheduling • hyperinstance: supernode affinity scheduling Default Value: N/A

Parameter	Mandatory	Type	Description
affinity_group_size	No	Integer	Definition: Size of an affinity group. Constraints: This parameter is mandatory when affinity_type is set to hyperinstance . In this case, the system schedules tasks specified by affinity_group_size to a supernode to form an affinity group. When a user delivers a training job to the supernode resource pool, if the affinity group size is not set, the system sets the value to 1 by default. Range: N/A Default Value: 1
node_affinity	No	NodeSelector object	Definition: Node affinity. Constraints: N/A. Range: N/A. Default Value: N/A.

Table 5-169 NodeSelector

Parameter	Mandatory	Type	Description
nodeSelectorTerms	Yes	Array of NodeSelectorTerm objects	Definition: Mandatory. List of node selector items. These items are in the OR relationship. Constraints: N/A. Range: N/A. Default Value: N/A.

Table 5-170 NodeSelectorTerm

Parameter	Mandatory	Type	Description
matchExpressions	No	Array of NodeSelectorRequirement objects	Definition: Node selector requirements listed by node tag. Constraints: N/A. Range: N/A. Default Value: N/A.
matchFields	No	Array of NodeSelectorRequirement objects	Definition: Node selector requirements listed by node field. Constraints: N/A. Range: N/A. Default Value: N/A.

Table 5-171 PreferredAffinity

Parameter	Mandatory	Type	Description
node_affinity	No	Array of PreferredSchedulingTerm objects	Definition: The scheduler prioritizes scheduling Pods onto nodes that satisfy the affinity expressions specified in this field; however, it may still select a node that violates one or more of these expressions. The most preferred nodes are those with the highest total weight. For each node that meets all scheduling requirements (such as resource requests and required affinity expressions), the scheduler calculates a sum by iterating through the elements in this field. If a node satisfies a specific match expression, its corresponding "weight" is added to the total. The node with the highest cumulative weight is given the highest priority for selection. Constraints: N/A. Range: N/A. Default Value: N/A.

Table 5-172 PreferredSchedulingTerm

Parameter	Mandatory	Type	Description
weight	No	Integer	Definition: Weight associated with the matched nodeSelectorTerm. Constraints: N/A. Range: 1 to 100. Default Value: N/A.
preference	No	NodeSelectorTerm object	Definition: Node selector item, which is associated with the corresponding weight. Constraints: N/A. Range: N/A. Default Value: N/A.

Table 5-173 NodeSelectorRequirement

Parameter	Mandatory	Type	Description
key	Yes	String	Definition: Label key to which the selector is applied. Constraints: N/A. Range: N/A. Default Value: N/A.

Parameter	Mandatory	Type	Description
operator	Yes	String	Definition: Relationship between the key and a group of values. Constraints: The valid operators are In, NotIn, Exists, DoesNotExist, Gt, and Lt. Range: • In: The value of the key must be in the provided list of values. For example, if the key is color and the value list is ["red", "blue"], then color In ["red", "blue"] means the color must be red or blue. • NotIn: The value of the key must not be in the provided list of values. For example, color NotIn ["red", "blue"] means the color cannot be red or blue. • Exists: The key must exist, but there is no requirement on the value. For example, color Exists means that the color key must exist regardless of the value. • DoesNotExist: The key cannot exist. For example, color DoesNotExist means that the color key cannot exist. • Gt: The value of the key must be greater than the given value. For example, if the key is age, age Gt 18 indicates that the value of age must be greater than 18. • Lt: The value of the key must be less than the specified value. For example, age Lt 18 means the value of age must be less than 18. Default Value: N/A.

Parameter	Mandatory	Type	Description
values	No	Array of strings	Definition: An array of string values. Constraints: If the operator is In or NotIn , the value array cannot be empty. If the operator is Exists or DoesNotExist , the value array cannot be empty. If the operator is Gt or Lt , the value array must contain one element, which will be interpreted as an integer. Range: N/A. Default Value: N/A.

Table 5-174 LogExportConfig

Parameter	Mandatory	Type	Description
version	No	String	Definition: Log version. Constraints: • The log version can be v0 or v1. The default value is v0. Range: v0 or v1 Default Value: v0 .
rotation_enabled	No	Boolean	Definition: Specifies whether to enable the download of logs by time segment. Constraints: N/A. Range: • true: Enable the download of logs by time segment. • false: Disable the download of logs by time segment. Default Value: false .

Table 5-175 Notification

Parameter	Mandatory	Type	Description
topic_urn	No	String	Definition: URN of the selected topic in SMN. Constraints: N/A Range: N/A Default Value: N/A
events	No	Array of strings	Definition: Training event that triggers a notification. Constraints: The options are as follows: • JobStarted: The job is started. • JobCompleted: The job is completed. • JobFailed: The job is failed. • JobTerminated: The job is terminated. • JobRestarted: The job is restarted. • JobHanged: The job is suspended. • JobPreempted: The job is preempted.

Table 5-176 CustomMetrics

Parameter	Mandatory	Type	Description
exec	No	Exec object	Definition: Metrics are collected in CLI mode.
http_get	No	HttpGet object	Definition: Metrics are collected in HTTP mode.

Table 5-177 Exec

Parameter	Mandatory	Type	Description
command	No	Array of strings	Definition: Metrics are collected in CLI mode. Range: N/A.

Table 5-178 HttpGet

Parameter	Mandatory	Type	Description
path	No	String	Definition: URL for obtaining metrics over HTTP. Both the URL and the port below must either be configured together or remain empty. Range: N/A
port	No	Integer	Definition: Port for obtaining metrics over HTTP. This parameter and the URL above must be set or left blank at the same time. Range: N/A

Table 5-179 OutputModel

Parameter	Mandatory	Type	Description
obs	No	ObsModelResp object	Definition: OBS output information stored by a custom training job. Range: N/A

Table 5-180 ObsModelResp

Parameter	Mandatory	Type	Description
obs_url	Yes	String	Definition: OBS path for storing custom training jobs, for example, obs://example/path . Range: N/A
local_path	No	String	Definition: Path of the host where custom training jobs are stored, for example, /example/path . Range: N/A

Table 5-181 AssetModel

Parameter	Mandatory	Type	Description
name	Yes	String	Definition: Model name. Range: N/A
code	No	String	Definition: Model name. Range: N/A
version	Yes	String	Definition: Model version. Range: N/A
desc	No	String	Definition: Model description. Range: N/A
series	No	String	Definition: Model brand. Range: N/A
type	Yes	String	Definition: Model type. Range: N/A

Table 5-182 JobEndpointsReq

Parameter	Mandatory	Type	Description
ssh	No	SSHReq object	Definition: SSH connection information. Constraints: N/A

Table 5-183 SSHReq

Parameter	Mandatory	Type	Description
key_pair_names	No	Array of strings	Definition: Name of the SSH key pair, which can be created and viewed on the Key Pair page of the Elastic Cloud Server (ECS) console. Constraints: N/A

Response Parameters

Status code: 201

Table 5-184 Response body parameters

Parameter	Type	Description
kind	String	Definition: Type of a training job. Range • job: common job • federated_pool_job: resource pool federated job • edge_job: edge job • hetero_job: heterogeneous job • mrs_job: MRS job • autosearch_job: auto search job • diag_job: diagnosis job • visualization_job: visualization job
metadata	JobMetadataResponse object	Definition: Training job metadata.
status	Status object	Definition: Training job status information.
algorithm	JobAlgorithmResponse object	Definition: Training job algorithm.
tasks	Array of TaskResponse objects	Definition: Heterogeneous training tasks.
spec	SpecResponse object	Definition: Training job specifications.
endpoints	JobEndpointsResponse object	Definition: Configurations required for remotely accessing a training job.

Table 5-185 JobMetadataResponse

Parameter	Type	Description
id	String	Definition: Training job ID, which is generated and returned by ModelArts after a training job is created. Range: N/A
name	String	Definition: Name of a training job. Range: The value must contain 1 to 64 characters consisting of only digits, letters, underscores (_), and hyphens (-).

Parameter	Type	Description
workspace_id	String	Definition: Workspace where a specified job is located. Range: N/A
description	String	Definition: Definition of a training job. Range: N/A
create_time	Long	Definition: Time when a training job was created, in milliseconds. The value is generated and returned by ModelArts after a training job is created. Range: N/A
user_name	String	Definition: Username for creating a training job. The username is generated and returned by ModelArts after a training job is created. Range: N/A
annotations	Map<String,String>	Definition: Advanced functions of a training job.

Table 5-186 Status

Parameter	Type	Description
phase	String	Definition: Level-1 status of a training job. Range: • Creating: The job is being created. • Pending: The job is pending. • Running: The job is running. • Failed: The job failed to run. • Completed: The job is complete. • Terminating: The job is being stopped. • Terminated: The job has been stopped. • Abnormal: The job is abnormal.

Parameter	Type	Description
secondary_phase	String	Definition: Level-2 status of a training job. The values are internal detailed statuses and may be added, changed, or deleted. Dependency on the status is not recommended. Range: • Creating: The job is being created. • Queuing: The job is queuing. • Running: The job is running. • Failed: The job failed to run. • Completed: The job is complete. • Terminating: The job is being stopped. • Terminated: The job has been stopped. • CreateFailed: The job fails to be created. • TerminatedFailed: The job fails to be stopped. • Unknown: The job is in an unknown state. • Lost: The job is abnormal.
duration	Long	Definition: Running duration of a training job, in ms. Range: N/A
node_count_metrics	Array<Array<Integer>>	Definition: Node quantity change metric during a training job runtime.
tasks	Array of strings	Definition: Training job subtask name.
start_time	Long	Definition: Timestamp when a training job is started. Range: N/A
task_statuses	Array of TaskStatuses objects	Definition: Status of the first failed subtask of a training job.
running_records	Array of RunningRecord objects	Definition: Running and fault recovery records of a training job.

Table 5-187 TaskStatuses

Parameter	Type	Description
task	String	Definition: Training job subtask name. Range: N/A
exit_code	Integer	Definition: Exit code of a training job subtask. Range: N/A
message	String	Definition: Error message of a training job subtask. Range: N/A

Table 5-188 RunningRecord

Parameter	Type	Description
start_at	Integer	Definition: Unix timestamp of the start time in the current running record, in seconds. Range: N/A
end_at	Integer	Definition: Unix timestamp of the end time in the current running record, in seconds. Range: N/A
xpu_start_at	Integer	Definition: Unix timestamp of the accelerator card startup time in the current running record, in seconds. Range: N/A
start_type	String	Definition: Startup mode of the current execution. Range • init_or_rescheduled: This startup is the first running after scheduling, including the first startup and the running after scheduling recovery. • restarted: This startup is not the first running after scheduling but the running after a process restart.
end_reason	String	Definition: Reason why the running ends. Range: N/A

Parameter	Type	Description
end_related_task	String	Definition: ID of the task worker (for example, worker-0) that ends the running. Range: N/A
end_recover	String	Definition: Fault tolerance policy adopted when the execution ends abnormally. Range • npu_proc_restart: NPU in-place hot recovery • proc_restart: in-place process recovery • npu_step_retry: step recomputation • pod_reschedule: pod-level rescheduling • job_reschedule: job-level rescheduling • job_reschedule_with_taint: isolated job-level rescheduling
end_recover_before_downgrade	String	Definition: There is a downgrade relationship between policies. If a policy fails to be executed, it will be downgraded to another specified policy. end_recover_before_downgrade indicates the tolerance policy used before end_recover is downgraded. Range: same as that of end_recover .
recover_records	Array of RecoverRecord objects	Definition: details about all fault tolerance policies adopted when the execution ends abnormally.

Table 5-189 RecoverRecord

Parameter	Type	Description
recover_start_at	Integer	Unix timestamp of the start time of the fault tolerance policy, in seconds. The timestamp is also the fault occurrence time.
recover_end_at	Integer	Unix timestamp of the end time of the fault tolerance policy, in seconds.

Parameter	Type	Description
recover	String	Fault tolerance policy. Options: • npu_step_retry: step recomputation • npu_proc_restart: NPU in-place hot recovery • proc_restart: in-place process recovery • pod_reschedule: pod-level rescheduling • job_reschedule: job-level rescheduling • job_reschedule_with_taint: isolated job-level rescheduling
fault_scenario	String	Fault scenario. Options: • chip_fault: chip fault • node_fault: node fault • job_failed: job exit upon a failure • job_hanged: job suspension • job_subhealth: job subhealth • error_in_log: log exception
reason	String	Cause of the fault.
related_task	String	ID of the task worker that causes the end of the current running record, for example, worker-0 .
recover_result	String	Execution result of the fault. Options: • recovering: executing • success: successful • failed: failed • downgrade: policy downgrade

Table 5-190 JobAlgorithmResponse

Parameter	Type	Description
id	String	Definition: Training job algorithm. Range: • id: Only the algorithm ID is used. • subscription_id+item_version_id: The subscription ID and version ID of the algorithm are used. • code_dir+boot_file: The code directory and boot file of the training job are used.
name	String	Definition: Algorithm name. Range: N/A
subscription_id	String	Definition: Subscription ID of a subscription algorithm, which must be used with item_version_id . Range: N/A
item_version_id	String	Definition: Version of a subscription algorithm, which must be used with subscription_id . Range: N/A
code_dir	String	Definition: Code directory of a training job, for example, /usr/app/ . This parameter must be used with boot_file . Leave this parameter blank if id , or subscription_id and item_version_id are specified. Range: N/A
boot_file	String	Definition: Boot file of a training job, which must be stored in the code directory, for example, /usr/app/boot.py . This parameter must be used with code_dir . Leave this parameter blank if id , or subscription_id and item_version_id are specified. Range: N/A
autosearch_config_path	String	Definition: YAML configuration path of an auto search job. An OBS URL is required. For example, obs://bucket/file.yaml . Range: N/A

Parameter	Type	Description
autosearch_framework_path	String	Definition: Framework code directory of an auto search job. An OBS URL is required. For example, obs://bucket/files/ . Range: N/A
command	String	Definition: Boot command for starting the container of a custom image for a training job. For example, python train.py . Range: N/A
parameters	Array of ParameterResp objects	Definition: Running parameters of the training job.
policies	policies object	Definition: Policy supported by a job.
inputs	Array of InputResp objects	Definition: Data input of a training job.
outputs	Array of OutputResp objects	Definition: Output of the training job.
engine	JobEngineResp object	Definition: Engine of a training job. Leave this parameter blank if the job is created using id of the algorithm in algorithm management, or subscription_id+item_version_id of the subscribed algorithm.
local_code_dir	String	Definition: Local directory of the training container to which the algorithm code directory is downloaded. The rules are as follows: • The directory must be under /home. • In v1 compatibility mode, the current field does not take effect. • When code_dir is prefixed with file://, the current field does not take effect. Range: N/A
working_dir	String	Definition: Work directory where an algorithm is executed. Rules: In v1 compatibility mode, this parameter does not take effect. Range: N/A

Parameter	Type	Description
environments	Array of Map<String,String> objects	Definition: Environment variables of a training job. The format is key:value . Leave this parameter blank.
summary	SummaryResp object	Definition: Visualization log summary.

Table 5-191 ParameterResp

Parameter	Type	Description
name	String	Definition: Parameter name. Range: N/A
value	String	Definition: Parameter value. Range: N/A
description	String	Definition: Parameter description. Range: N/A
constraint	constraint object	Definition: Parameter attribute.
i18n_description	i18n_description object	Definition: Internationalization description.

Table 5-192 constraint

Parameter	Type	Description
editable	Boolean	Definition: Whether the parameter can be edited. Range: • true: editable • false: Not uneditable
required	Boolean	Definition: Whether the parameter is mandatory. Range: • true: mandatory • false: optional

Parameter	Type	Description
sensitive	Boolean	Definition: Whether the parameter is sensitive. This function is unavailable currently. Range: • true: sensitive • false: insensitive
valid_range	Array of strings	Definition: Valid range.

Table 5-193 i18n_description

Parameter	Type	Description
language	String	Definition: Internationalization language. The options are as follows: • zh-cn: Chinese • en-us: English Range: N/A
description	String	Definition: Internationalization language description. Range: N/A

Table 5-194 policies

Parameter	Type	Description
auto_search	auto_search object	Definition: Hyperparameter search configuration.

Table 5-195 auto_search

Parameter	Type	Description
skip_search_params	String	Definition: Hyperparameter parameters that need to be skipped. Range: N/A
reward_attrs	Array of reward_attrs objects	Definition: Search metrics.

Parameter	Type	Description
search_params	Array of search_params objects	Definition: Search parameters.
algo_configs	Array of algo_configs objects	Definition: Search algorithm configurations.

Table 5-196 reward_attrs

Parameter	Type	Description
name	String	Definition: Metric name. Range: N/A
mode	String	Definition: Search mode. Range: • max: A larger metric value is preferred. • min: A smaller metric value is preferred.
regex	String	Definition: Regular expression of a metric. Range: N/A

Table 5-197 search_params

Parameter	Type	Description
name	String	Definition: Hyperparameter name. Range: N/A

Parameter	Type	Description
param_type	String	Definition: Parameter type. Range: • continuous: The hyperparameter is of the continuous type. When an algorithm is used in a training job, continuous hyperparameters are displayed as text boxes on the console. • discrete: The hyperparameter is of the discrete type. When an algorithm is used in a training job, discrete hyperparameters are displayed as drop-down lists on the console.
lower_bound	String	Definition: Lower bound of the hyperparameter. Range: N/A
upper_bound	String	Definition: Upper bound of the hyperparameter. Range: N/A
discrete_points_num	String	Definition: Number of discrete points of a hyperparameter with continuous values. Range: N/A
discrete_values	Array of strings	Definition: Discrete hyperparameter values.

Table 5-198 algo_configs

Parameter	Type	Description
name	String	Definition: Search algorithm name. Range: N/A
params	Array of AutoSearchAlgoConfigParameterResp objects	Definition: Search algorithm parameters.

Table 5-199 AutoSearchAlgoConfigParameterResp

Parameter	Type	Description
key	String	Definition: Parameter key. Range: N/A
value	String	Definition: Parameter value. Range: N/A

Table 5-200 InputResp

Parameter	Type	Description
name	String	Definition: Name of the data input channel. Range: N/A
description	String	Definition: Description of the data input channel. Range: N/A
local_dir	String	Definition: Local path of the container to which the data input channels are mapped. Example: /home/ma-user/modelarts/inputs/data_url_0 Range: N/A
access_method	String	Definition: Access method of the input data channel path (local_dir). Range: • parameter: hyperparameters • env: environment variables
remote	InputDataInfoResp object	Definition: Description of the actual data input.
remote_constraint	Array of remote_constraint objects	Definition: Data input constraint.

Table 5-201 InputDataInfoResp

Parameter	Type	Description
dataset	dataset object	Definition: The input is a dataset.
obs	obs object	Definition: OBS in which data input and output are stored.

Table 5-202 dataset

Parameter	Type	Description
id	String	Definition: Dataset ID of a training job. Range: N/A
version_id	String	Definition: Dataset version ID of a training job. Constraints: This parameter is mandatory when an old-version dataset is used, that is, service_type is not V3 . Range: N/A
obs_url	String	Definition: OBS URL of the dataset for a training job. It is automatically parsed by ModelArts based on the dataset ID and dataset version ID. For example, /usr/data/ . Range: N/A
service_type	String	Definition: Dataset service type. Constraints: N/A Range: N/A Default Value: V3 indicates that a dataset provided by the asset service is used. Other values indicate that an old-version dataset is used.
name	String	Definition: Dataset name of a training job. Range: N/A

Table 5-203 obs

Parameter	Type	Description
obs_url	String	Definition: OBS URL of the dataset for a training job, For example, /usr/data/ . Range: N/A

Table 5-204 remote_constraint

Parameter	Type	Description
data_type	String	Definition: Data input type, including the data storage location and dataset. Constraints: N/A Range: N/A Default Value: N/A
attributes	String	Definition: Related attributes. Constraints: N/A Range: If the input is a dataset: • data_format: data format • data_segmentation: data segmentation method • dataset_type: data labeling type Default Value: N/A

Table 5-205 OutputResp

Parameter	Type	Description
name	String	Definition: Name of the data output channel. Range: N/A
description	String	Definition: Description of the data output channel. Range: N/A
local_dir	String	Definition: Local path of the container to which the data output channels are mapped. Range: N/A
access_method	String	Definition: Access method of the input data channel path (local_dir). Range: • parameter: hyperparameters • env: environment variables
remote	RemoteResp object	Definition: Description of the actual data output.

Table 5-206 JobEngineResp

Parameter	Type	Description
engine_id	String	Definition: Engine ID selected for a training job. Range: N/A
engine_name	String	Definition: Engine name selected for a training job. Range: N/A
engine_version	String	Definition: Engine version selected for a training job. Range: N/A
image_url	String	Definition: Custom image URL selected for a training job. The URL is obtained from SWR. Range: N/A
install_sys_packages	Boolean	Definition: Specifies whether to install the MoXing version specified by the training platform. Range: • true: yes • false: no

Table 5-207 SummaryResp

Parameter	Type	Description
log_dir	LogDirResp object	Definition: Visualization log output of a training job.
data_sources	Array of DataSourceResp objects	Definition: Visualization log input of the visualization job or training job debugging mode.

Table 5-208 LogDirResp

Parameter	Type	Description
pfs	PFSSummaryResp object	Definition: Output of an OBS parallel file system.

Table 5-209 PFSSummaryResp

Parameter	Type	Description
pfs_path	String	Definition: URL of the OBS parallel file system. Range: N/A

Table 5-210 DataSourceResp

Parameter	Type	Description
job	JobSummaryResp object	Definition: Job data source.

Table 5-211 JobSummaryResp

Parameter	Type	Description
job_id	String	Definition: ID of a training job. Range: N/A

Table 5-212 TaskResponse

Parameter	Type	Description
role	String	Definition: Task role. This function is not supported currently. Range: N/A
algorithm	TaskResponseAlgorithm object	Definition: Algorithm configurations for algorithm management.
task_resource	FlavorResponse object	Definition: Specifications of a training job or algorithm.
log_export_path	log_export_path object	Definition: Saved information about training job logs.

Table 5-213 TaskResponseAlgorithm

Parameter	Type	Description
code_dir	String	Definition: Absolute path of the directory where the algorithm boot file is stored. Range: N/A
boot_file	String	Definition: Absolute path of an algorithm boot file. Range: N/A
inputs	AlgorithmInput object	Definition: Information about the algorithm input channel.
outputs	AlgorithmOutput object	Definition: Information about the algorithm output channel.
engine	AlgorithmEngine object	Definition: Engine that a heterogeneous job depends on.
local_code_dir	String	Definition: Local directory of the training container to which the algorithm code directory is downloaded. The rules are as follows: • The directory must be under / home. • In v1 compatibility mode, the current field does not take effect. • When code_dir is prefixed with file://, the current field does not take effect. Range: N/A
working_dir	String	Definition: Work directory where an algorithm is executed. Note that this parameter does not take effect in v1 compatibility mode. Range: N/A
environments	Map<String,String>	Definition: Environment variables related to a training job. Range: N/A

Table 5-214 AlgorithmInput

Parameter	Type	Description
name	String	Definition: Name of the data input channel. Range: N/A
local_dir	String	Definition: Local path of the container to which the data input and output channels are mapped. Range: N/A
remote	AlgorithmRemote object	Definition: Actual data input, which can only be OBS for heterogeneous jobs.

Table 5-215 AlgorithmRemote

Parameter	Type	Description
obs	RemoteObsResp object	Definition: OBS in which data input and output are stored.

Table 5-216 AlgorithmOutput

Parameter	Type	Description
name	String	Definition: Name of the data output channel. Range: N/A
local_dir	String	Definition: Local path of the container to which the data output channels are mapped. Range: N/A
remote	RemoteResp object	Definition: Description of the actual data output.
mode	String	Definition: Data transmission mode. The default value is upload_periodically . Range: N/A
period	String	Definition: Data transmission period. The default value is 30s . Range: N/A

Table 5-217 RemoteResp

Parameter	Type	Description
obs	RemoteObsResp object	Definition: Data actually output to OBS.

Table 5-218 RemoteObsResp

Parameter	Type	Description
obs_url	String	Definition: Path of the data output to OBS. Range: N/A

Table 5-219 AlgorithmEngine

Parameter	Type	Description
engine_id	String	Definition: Engine flavor ID, for example, caffe-1.0.0-python2.7 . Range: N/A
engine_name	String	Definition: Engine flavor name, for example, Caffe . Range: N/A
engine_version	String	Definition: Engine flavor version. Engines with the same name have multiple versions, for example, Caffe-1.0.0-python2.7 of Python 2.7. Range: N/A
v1_compatible	Boolean	Definition: Specifies whether the v1 compatibility mode is used. Range: • true: The v1 compatibility mode is used. • false: The v1 compatibility mode is not used.
run_user	String	Definition: Default UID for the engine startup. Range: N/A
image_url	String	Definition: Custom image URL selected for an algorithm. Range: N/A

Table 5-220 FlavorResponse

Parameter	Type	Description
pool_id	String	Definition: ID of the resource pool selected for a training job. Range: N/A
flavor_id	String	Definition: Resource flavor ID. Range: N/A
flavor_name	String	Definition: Resource flavor name. Range: N/A
max_num	Integer	Definition: Maximum number of nodes supported by a flavor. Range: N/A
billing	BillingInfo object	Definition: Billing information of a resource flavor.
flavor_info	FlavorInfoResponse object	Definition: Resource flavor details.
attributes	Map<String,String>	Definition: Other flavor attributes. Range: N/A

Table 5-221 FlavorInfoResponse

Parameter	Type	Description
max_num	Integer	Definition: Maximum number of nodes that can be selected. The value 1 indicates that the distributed mode is not supported. Range: N/A
cpu	Cpu object	Definition: CPU specifications.
gpu	Gpu object	Definition: GPU specifications.
npu	Npu object	Definition: Ascend specifications.
memory	Memory object	Definition: Memory information.
disk	DiskResponse object	Definition: Disk information.

Table 5-222 DiskResponse

Parameter	Type	Description
size	Integer	Definition: Disk size. Range: N/A
unit	String	Definition: Unit of the disk size. Range: N/A

Table 5-223 log_export_path

Parameter	Type	Description
obs_url	String	Definition: OBS path for storing training job logs.

Table 5-224 SpecResponse

Parameter	Type	Description
resource	Resource object	Definition: Resource flavor of a training job. Select either flavor_id or pool_id and flavor_id .
volumes	Array of JobVolumeResp objects	Definition: Mounting volume information of a training job.
log_export_path	LogExportPathResp object	Definition: Log output of a training job.
schedule_policy	SchedulePolicyResp object	Definition: Scheduling policy of a training job.
custom_metrics	Array of CustomMetrics objects	Definition: Metric collection configuration.
output_model	OutputModelResp object	Definition: Output information of a custom training job.
asset_model	AssetModelResp object	Definition: Information about the model created using a custom training job.

Table 5-225 Resource

Parameter	Type	Description
policy	String	Definition: Resource flavor mode of a training job. Range: • regular: standard mode
flavor_id	String	Definition: ID of the resource flavor of a training job. Range: The flavor_id parameter cannot be specified for a dedicated resource pool of CPU specifications. The options for dedicated resource pools with GPU/Ascend specifications are as follows: • modelarts.pool.visual.xlarge (1 PU) • modelarts.pool.visual.2xlarge (2 PUs) • modelarts.pool.visual.4xlarge (4 PUs) • modelarts.pool.visual.8xlarge (8 PUs)
flavor_name	String	Definition: Read-only flavor name returned by ModelArts when flavor_id is used. Range: N/A
node_count	Integer	Definition: Number of resource replicas selected for a training job. Range: N/A
pool_id	String	Definition: ID of the resource pool selected for a training job. Range: N/A
pool_group_id	String	Definition: ID of the resource pool federation selected for a training job. Range: N/A
flavor_detail	FlavorDetail object	Definition: Flavor details of a training job or algorithm. This parameter is available only for public resource pools.
main_container_allocated_resources	MainContainerAllocatedResources object	Definition: Resource specifications actually obtained by the training container of a training job.

Parameter	Type	Description
main_container_customized_flavor	MainContainerCustomizedFlavor object	Definition: Custom flavor of a training job. Range: The number of CPU cores and memory size must be greater than 0, and the number of accelerator PUs must be greater than or equal to 0.

Table 5-226 FlavorDetail

Parameter	Type	Description
billing	BillingInfo object	Definition: Billing information of a resource flavor.
flavor_info	FlavorInfo object	Definition: Resource flavor details.

Table 5-227 BillingInfo

Parameter	Type	Description
code	String	Definition: Billing code. Range: N/A
unit_num	Integer	Definition: Billing unit. Range: N/A

Table 5-228 FlavorInfo

Parameter	Type	Description
max_num	Integer	Definition: Maximum number of nodes that can be selected. The value 1 indicates that the distributed mode is not supported. Range: N/A
cpu	Cpu object	Definition: CPU specifications.
gpu	Gpu object	Definition: GPU specifications.
npu	Npu object	Definition: Ascend specifications.
memory	Memory object	Definition: Memory information.
disk	Disk object	Definition: Disk information.

Table 5-229 Cpu

Parameter	Type	Description
arch	String	Definition: CPU architecture. Range: N/A
core_num	Integer	Definition: Number of cores. Range: N/A

Table 5-230 Gpu

Parameter	Type	Description
unit_num	Integer	Definition: Number of GPUs. Range: N/A
product_name	String	Definition: Product name. Range: N/A
memory	String	Definition: Memory. Range: N/A

Table 5-231 Npu

Parameter	Type	Description
unit_num	String	Definition: Number of NPUs. Range: N/A
product_name	String	Definition: Product name. Range: N/A
memory	String	Definition: Memory. Range: N/A

Table 5-232 Memory

Parameter	Type	Description
size	Integer	Definition: Memory size. Range: N/A
unit	String	Definition: Number of memory units. Range: N/A

Table 5-233 Disk

Parameter	Type	Description
size	String	Definition: Disk size. Range: N/A
unit	String	Definition: Unit of the disk size. Generally, the unit is GB. Range: N/A

Table 5-234 MainContainerAllocatedResources

Parameter	Type	Description
cpu_arch	String	Definition: CPU architecture. Range: N/A
cpu_core_num	Float	Definition: Number of cores. Range: N/A
mem_size	Float	Definition: Memory information. Range: N/A
accelerator_num	Float	Definition: Number of accelerator cards. Range: N/A
accelerator_type	String	Definition: Type of accelerator cards. For example, ascend-d910b and ascend-snt9c. Range: N/A

Table 5-235 MainContainerCustomizedFlavor

Parameter	Type	Description
cpu_core_num	Float	Definition: Number of CPU cores. Range: greater than 0
mem_size	Float	Definition: Memory size. Range: greater than 0
accelerator_num	Float	Definition: Number of accelerator cards. Range: greater than or equal to 0

Table 5-236 JobVolumeResp

Parameter	Type	Description
nfs	NfsResp object	Definition: Volumes attached in NFS mode.

Table 5-237 NfsResp

Parameter	Type	Description
nfs_server_path	String	Definition: NFS server path, for example, 10.10.10.10:/example/path . Range: N/A
local_path	String	Definition: Path for attaching volumes to the training container, for example, /example/path . Range: N/A
read_only	Boolean	Definition: Specifies whether the disks attached to the container in NFS mode are read-only. Range: • true: read only • false: non-read-only

Table 5-238 LogExportPathResp

Parameter	Type	Description
obs_url	String	Definition: OBS path for storing training job logs, for example, obs://example/path . Range: N/A
host_path	String	Definition: Path of the host where training job logs are stored, for example, /example/path . Range: N/A

Table 5-239 SchedulePolicyResp

Parameter	Type	Description
required_affinity	RequiredAffinityResp object	Definition: Affinity requirements of a training job.

Parameter	Type	Description
priority	Integer	Definition: Priority of a training job. Range: 0 to 3
preemptible	Boolean	Definition: Whether the resource can be preempted. Range: • true: The resource can be preempted. • false: The resource cannot be preempted.

Table 5-240 RequiredAffinityResp

Parameter	Type	Description
affinity_type	String	Definition: Affinity scheduling policy. Range: • cabinet: strong cabinet scheduling • hyperinstance: supernode affinity scheduling
affinity_group_size	Integer	Definition: Size of an affinity group. Range: N/A

Table 5-241 CustomMetrics

Parameter	Type	Description
exec	Exec object	Definition: Metrics are collected in CLI mode.
http_get	HttpGet object	Definition: Metrics are collected in HTTP mode.

Table 5-242 Exec

Parameter	Type	Description
command	Array of strings	Definition: Metrics are collected in CLI mode. Range: N/A.

Table 5-243 HttpGet

Parameter	Type	Description
path	String	Definition: URL for obtaining metrics over HTTP. Both the URL and the port below must either be configured together or remain empty. Range: N/A
port	Integer	Definition: Port for obtaining metrics over HTTP. This parameter and the URL above must be set or left blank at the same time. Range: N/A

Table 5-244 OutputModelResp

Parameter	Type	Description
obs	ObsModelResp object	Definition: OBS output information stored by a custom training job. Range: N/A

Table 5-245 ObsModelResp

Parameter	Type	Description
obs_url	String	Definition: OBS path for storing custom training jobs, for example, obs://example/path . Range: N/A
local_path	String	Definition: Path of the host where custom training jobs are stored, for example, /example/path . Range: N/A

Table 5-246 AssetModelResp

Parameter	Type	Description
id	String	Definition: Model ID. Range: N/A
name	String	Definition: Model name. Range: N/A

Parameter	Type	Description
code	String	Definition: Model name. Range: N/A
version	String	Definition: Model version. Range: N/A
location	String	Definition: Model address. Range: N/A
desc	String	Definition: Model description. Range: N/A
series	String	Definition: Model brand. Range: N/A
type	String	Definition: Model type. Range: N/A

Table 5-247 JobEndpointsResp

Parameter	Type	Description
ssh	SSHResp object	Definition: SSH connection information.
jupyter_lab	JupyterLab object	Definition: JupyterLab connection information.
tensorboard	Tensorboard object	Definition: TensorBoard connection information.
mindstudio_insight	MindStudioInsight object	Definition: MindStudio Insight connection information.

Table 5-248 SSHResp

Parameter	Type	Description
key_pair_names	Array of strings	Definition: Name of the SSH key pair, which can be created and viewed on the Key Pair page of the Elastic Cloud Server (ECS) console. Range: N/A
task_urls	Array of TaskUrls objects	Definition: SSH connection address.

Table 5-249 TaskUrls

Parameter	Type	Description
task	String	Definition: Task ID of a training job. Range: N/A
url	String	Definition: SSH connection address of a training job. Range: N/A

Table 5-250 JupyterLab

Parameter	Type	Description
url	String	Definition: JupyterLab address of a training job. Range: N/A
token	String	Definition: JupyterLab token of a training job. Range: N/A

Table 5-251 Tensorboard

Parameter	Type	Description
url	String	Definition: TensorBoard address of a training job. Range: N/A
token	String	Definition: TensorBoard token of a training job. Range: N/A

Table 5-252 MindStudioInsight

Parameter	Type	Description
url	String	Definition: MindStudio Insight address of a training job. Range: N/A
token	String	Definition: MindStudio Insight token of a training job. Range: N/A

Status code: 400**Table 5-253** Response body parameters

Parameter	Type	Description
error_msg	String	Error message
error_code	String	Error code
error_solution	String	Solution

Example Requests

- The following is an example of how to create a training job with free specifications. The job name has been set to **TestModelArtsJob** and the description has been set to **This is a ModelArts job**. The required algorithm's ID is **3f5d6706-7b67-408d-8ba0-ec08048c45ed**. The inputs and outputs have not been defined for the algorithm.

5.7 Querying the Details About a Training Job

Function

This API is used to query the details about a training job on ModelArts.

This API applies to the following scenario: When you need to view the running status and configuration information of a specific training job, you can use this API to obtain the job details. Before using this API, ensure that you have obtained the training job ID and have the permission to view job details. After the query is complete, the platform returns the details about the training job, including the job status, configuration, and logs. If the training job ID does not exist or you do not have the operation permission, the API will return an error message.

Debugging

You can debug this API through automatic authentication in [API Explorer](#) or use the SDK sample code generated by API Explorer.

Authorization Information

Each account has all the permissions required to call all APIs, but IAM users must be assigned the required permissions.

- If you are using role/policy-based authorization, see [Permissions Policies and Supported Actions](#) for details on the required permissions.
- If you are using identity policy-based authorization, the following identity policy-based permissions are required.

Action	Access Level	Resource Type (*: required)	Condition Key	Alias	Dependencies
modelarts:trainJob:get	Read	trainJob *	g:ResourceTag/<tag-key>	-	-
		-	- modelarts:poolType - modelarts:poolId		

URI

GET /v2/{project_id}/training-jobs/{training_job_id}

Table 5-254 Path Parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Definition: Project ID. For details, see Obtaining a Project ID and Name . Constraints: The value can contain 1 to 64 characters. Letters, digits, and hyphens (-) are allowed. Range: N/A Default Value: N/A
training_job_id	Yes	String	Definition: Training job ID. For details, see Obtaining Training Jobs . Constraints: N/A Range: N/A Default Value: N/A

Request Parameters

None

Response Parameters

Status code: 200

Table 5-255 Response body parameters

Parameter	Type	Description
kind	String	Definition: Type of a training job. Range • job: common job • federated_pool_job: resource pool federated job • edge_job: edge job • hetero_job: heterogeneous job • mrs_job: MRS job • autosearch_job: auto search job • diag_job: diagnosis job • visualization_job: visualization job
metadata	JobMetadataResponse object	Definition: Training job metadata.
status	Status object	Definition: Training job status information.
algorithm	JobAlgorithmResponse object	Definition: Training job algorithm.
tasks	Array of TaskResponse objects	Definition: Heterogeneous training tasks.
spec	SpecResponse object	Definition: Training job specifications.
endpoints	JobEndpointsResponse object	Definition: Configurations required for remotely accessing a training job.

Table 5-256 JobMetadataResponse

Parameter	Type	Description
id	String	Definition: Training job ID, which is generated and returned by ModelArts after a training job is created. Range: N/A
name	String	Definition: Name of a training job. Range: The value must contain 1 to 64 characters consisting of only digits, letters, underscores (_), and hyphens (-).

Parameter	Type	Description
workspace_id	String	Definition: Workspace where a specified job is located. Range: N/A
description	String	Definition: Definition of a training job. Range: N/A
create_time	Long	Definition: Time when a training job was created, in milliseconds. The value is generated and returned by ModelArts after a training job is created. Range: N/A
user_name	String	Definition: Username for creating a training job. The username is generated and returned by ModelArts after a training job is created. Range: N/A
annotations	Map<String,String>	Definition: Advanced functions of a training job.

Table 5-257 Status

Parameter	Type	Description
phase	String	Definition: Level-1 status of a training job. Range: • Creating: The job is being created. • Pending: The job is pending. • Running: The job is running. • Failed: The job failed to run. • Completed: The job is complete. • Terminating: The job is being stopped. • Terminated: The job has been stopped. • Abnormal: The job is abnormal.

Parameter	Type	Description
secondary_phase	String	Definition: Level-2 status of a training job. The values are internal detailed statuses and may be added, changed, or deleted. Dependency on the status is not recommended. Range: • Creating: The job is being created. • Queuing: The job is queuing. • Running: The job is running. • Failed: The job failed to run. • Completed: The job is complete. • Terminating: The job is being stopped. • Terminated: The job has been stopped. • CreateFailed: The job fails to be created. • TerminatedFailed: The job fails to be stopped. • Unknown: The job is in an unknown state. • Lost: The job is abnormal.
duration	Long	Definition: Running duration of a training job, in ms. Range: N/A
node_count_metrics	Array<Array<Integer>>	Definition: Node quantity change metric during a training job runtime.
tasks	Array of strings	Definition: Training job subtask name.
start_time	Long	Definition: Timestamp when a training job is started. Range: N/A
task_statuses	Array of TaskStatuses objects	Definition: Status of the first failed subtask of a training job.
running_records	Array of RunningRecord objects	Definition: Running and fault recovery records of a training job.

Table 5-258 TaskStatuses

Parameter	Type	Description
task	String	Definition: Training job subtask name. Range: N/A
exit_code	Integer	Definition: Exit code of a training job subtask. Range: N/A
message	String	Definition: Error message of a training job subtask. Range: N/A

Table 5-259 RunningRecord

Parameter	Type	Description
start_at	Integer	Definition: Unix timestamp of the start time in the current running record, in seconds. Range: N/A
end_at	Integer	Definition: Unix timestamp of the end time in the current running record, in seconds. Range: N/A
xpu_start_at	Integer	Definition: Unix timestamp of the accelerator card startup time in the current running record, in seconds. Range: N/A
start_type	String	Definition: Startup mode of the current execution. Range • init_or_rescheduled: This startup is the first running after scheduling, including the first startup and the running after scheduling recovery. • restarted: This startup is not the first running after scheduling but the running after a process restart.
end_reason	String	Definition: Reason why the running ends. Range: N/A

Parameter	Type	Description
end_related_task	String	Definition: ID of the task worker (for example, worker-0) that ends the running. Range: N/A
end_recover	String	Definition: Fault tolerance policy adopted when the execution ends abnormally. Range • npu_proc_restart: NPU in-place hot recovery • proc_restart: in-place process recovery • npu_step_retry: step recomputation • pod_reschedule: pod-level rescheduling • job_reschedule: job-level rescheduling • job_reschedule_with_taint: isolated job-level rescheduling
end_recover_before_downgrade	String	Definition: There is a downgrade relationship between policies. If a policy fails to be executed, it will be downgraded to another specified policy. end_recover_before_downgrade indicates the tolerance policy used before end_recover is downgraded. Range: same as that of end_recover .
recover_records	Array of RecoverRecord objects	Definition: details about all fault tolerance policies adopted when the execution ends abnormally.

Table 5-260 RecoverRecord

Parameter	Type	Description
recover_start_at	Integer	Unix timestamp of the start time of the fault tolerance policy, in seconds. The timestamp is also the fault occurrence time.
recover_end_at	Integer	Unix timestamp of the end time of the fault tolerance policy, in seconds.

Parameter	Type	Description
recover	String	Fault tolerance policy. Options: • npu_step_retry: step recomputation • npu_proc_restart: NPU in-place hot recovery • proc_restart: in-place process recovery • pod_reschedule: pod-level rescheduling • job_reschedule: job-level rescheduling • job_reschedule_with_taint: isolated job-level rescheduling
fault_scenario	String	Fault scenario. Options: • chip_fault: chip fault • node_fault: node fault • job_failed: job exit upon a failure • job_hanged: job suspension • job_subhealth: job subhealth • error_in_log: log exception
reason	String	Cause of the fault.
related_task	String	ID of the task worker that causes the end of the current running record, for example, worker-0 .
recover_result	String	Execution result of the fault. Options: • recovering: executing • success: successful • failed: failed • downgrade: policy downgrade

Table 5-261 JobAlgorithmResponse

Parameter	Type	Description
id	String	Definition: Training job algorithm. Range: • id: Only the algorithm ID is used. • subscription_id+item_version_id: The subscription ID and version ID of the algorithm are used. • code_dir+boot_file: The code directory and boot file of the training job are used.
name	String	Definition: Algorithm name. Range: N/A
subscription_id	String	Definition: Subscription ID of a subscription algorithm, which must be used with item_version_id . Range: N/A
item_version_id	String	Definition: Version of a subscription algorithm, which must be used with subscription_id . Range: N/A
code_dir	String	Definition: Code directory of a training job, for example, /usr/app/ . This parameter must be used with boot_file . Leave this parameter blank if id , or subscription_id and item_version_id are specified. Range: N/A
boot_file	String	Definition: Boot file of a training job, which must be stored in the code directory, for example, /usr/app/boot.py . This parameter must be used with code_dir . Leave this parameter blank if id , or subscription_id and item_version_id are specified. Range: N/A
autosearch_config_path	String	Definition: YAML configuration path of an auto search job. An OBS URL is required. For example, obs://bucket/file.yaml . Range: N/A

Parameter	Type	Description
autosearch_framework_path	String	Definition: Framework code directory of an auto search job. An OBS URL is required. For example, obs://bucket/files/ . Range: N/A
command	String	Definition: Boot command for starting the container of a custom image for a training job. For example, python train.py . Range: N/A
parameters	Array of ParameterResp objects	Definition: Running parameters of the training job.
policies	policies object	Definition: Policy supported by a job.
inputs	Array of InputResp objects	Definition: Data input of a training job.
outputs	Array of OutputResp objects	Definition: Output of the training job.
engine	JobEngineResp object	Definition: Engine of a training job. Leave this parameter blank if the job is created using id of the algorithm in algorithm management, or subscription_id+item_version_id of the subscribed algorithm.
local_code_dir	String	Definition: Local directory of the training container to which the algorithm code directory is downloaded. The rules are as follows: • The directory must be under /home. • In v1 compatibility mode, the current field does not take effect. • When code_dir is prefixed with file://, the current field does not take effect. Range: N/A
working_dir	String	Definition: Work directory where an algorithm is executed. Rules: In v1 compatibility mode, this parameter does not take effect. Range: N/A

Parameter	Type	Description
environments	Array of Map<String,String> objects	Definition: Environment variables of a training job. The format is key:value . Leave this parameter blank.
summary	SummaryResp object	Definition: Visualization log summary.

Table 5-262 ParameterResp

Parameter	Type	Description
name	String	Definition: Parameter name. Range: N/A
value	String	Definition: Parameter value. Range: N/A
description	String	Definition: Parameter description. Range: N/A
constraint	constraint object	Definition: Parameter attribute.
i18n_description	i18n_description object	Definition: Internationalization description.

Table 5-263 constraint

Parameter	Type	Description
editable	Boolean	Definition: Whether the parameter can be edited. Range: • true: editable • false: Not uneditable
required	Boolean	Definition: Whether the parameter is mandatory. Range: • true: mandatory • false: optional

Parameter	Type	Description
sensitive	Boolean	Definition: Whether the parameter is sensitive. This function is unavailable currently. Range: • true: sensitive • false: insensitive
valid_range	Array of strings	Definition: Valid range.

Table 5-264 i18n_description

Parameter	Type	Description
language	String	Definition: Internationalization language. The options are as follows: • zh-cn: Chinese • en-us: English Range: N/A
description	String	Definition: Internationalization language description. Range: N/A

Table 5-265 policies

Parameter	Type	Description
auto_search	auto_search object	Definition: Hyperparameter search configuration.

Table 5-266 auto_search

Parameter	Type	Description
skip_search_params	String	Definition: Hyperparameter parameters that need to be skipped. Range: N/A
reward_attrs	Array of reward_attrs objects	Definition: Search metrics.

Parameter	Type	Description
search_params	Array of search_params objects	Definition: Search parameters.
algo_configs	Array of algo_configs objects	Definition: Search algorithm configurations.

Table 5-267 reward_attrs

Parameter	Type	Description
name	String	Definition: Metric name. Range: N/A
mode	String	Definition: Search mode. Range: • max: A larger metric value is preferred. • min: A smaller metric value is preferred.
regex	String	Definition: Regular expression of a metric. Range: N/A

Table 5-268 search_params

Parameter	Type	Description
name	String	Definition: Hyperparameter name. Range: N/A

Parameter	Type	Description
param_type	String	Definition: Parameter type. Range: • continuous: The hyperparameter is of the continuous type. When an algorithm is used in a training job, continuous hyperparameters are displayed as text boxes on the console. • discrete: The hyperparameter is of the discrete type. When an algorithm is used in a training job, discrete hyperparameters are displayed as drop-down lists on the console.
lower_bound	String	Definition: Lower bound of the hyperparameter. Range: N/A
upper_bound	String	Definition: Upper bound of the hyperparameter. Range: N/A
discrete_points_num	String	Definition: Number of discrete points of a hyperparameter with continuous values. Range: N/A
discrete_values	Array of strings	Definition: Discrete hyperparameter values.

Table 5-269 algo_configs

Parameter	Type	Description
name	String	Definition: Search algorithm name. Range: N/A
params	Array of AutoSearchAlgoConfigParameterResp objects	Definition: Search algorithm parameters.

Table 5-270 AutoSearchAlgoConfigParameterResp

Parameter	Type	Description
key	String	Definition: Parameter key. Range: N/A
value	String	Definition: Parameter value. Range: N/A

Table 5-271 InputResp

Parameter	Type	Description
name	String	Definition: Name of the data input channel. Range: N/A
description	String	Definition: Description of the data input channel. Range: N/A
local_dir	String	Definition: Local path of the container to which the data input channels are mapped. Example: /home/ma-user/modelarts/inputs/data_url_0 Range: N/A
access_method	String	Definition: Access method of the input data channel path (local_dir). Range: • parameter: hyperparameters • env: environment variables
remote	InputDataInfoResp object	Definition: Description of the actual data input.
remote_constraint	Array of remote_constraint objects	Definition: Data input constraint.

Table 5-272 InputDataInfoResp

Parameter	Type	Description
dataset	dataset object	Definition: The input is a dataset.
obs	obs object	Definition: OBS in which data input and output are stored.

Table 5-273 dataset

Parameter	Type	Description
id	String	Definition: Dataset ID of a training job. Range: N/A
version_id	String	Definition: Dataset version ID of a training job. Constraints: This parameter is mandatory when an old-version dataset is used, that is, service_type is not V3 . Range: N/A
obs_url	String	Definition: OBS URL of the dataset for a training job. It is automatically parsed by ModelArts based on the dataset ID and dataset version ID. For example, /usr/data/ . Range: N/A
service_type	String	Definition: Dataset service type. Constraints: N/A Range: N/A Default Value: V3 indicates that a dataset provided by the asset service is used. Other values indicate that an old-version dataset is used.
name	String	Definition: Dataset name of a training job. Range: N/A

Table 5-274 obs

Parameter	Type	Description
obs_url	String	Definition: OBS URL of the dataset for a training job, For example, /usr/data/ . Range: N/A

Table 5-275 remote_constraint

Parameter	Type	Description
data_type	String	Definition: Data input type, including the data storage location and dataset. Constraints: N/A Range: N/A Default Value: N/A
attributes	String	Definition: Related attributes. Constraints: N/A Range: If the input is a dataset: • data_format: data format • data_segmentation: data segmentation method • dataset_type: data labeling type Default Value: N/A

Table 5-276 OutputResp

Parameter	Type	Description
name	String	Definition: Name of the data output channel. Range: N/A
description	String	Definition: Description of the data output channel. Range: N/A
local_dir	String	Definition: Local path of the container to which the data output channels are mapped. Range: N/A
access_method	String	Definition: Access method of the input data channel path (local_dir). Range: • parameter: hyperparameters • env: environment variables
remote	RemoteResp object	Definition: Description of the actual data output.

Table 5-277 JobEngineResp

Parameter	Type	Description
engine_id	String	Definition: Engine ID selected for a training job. Range: N/A
engine_name	String	Definition: Engine name selected for a training job. Range: N/A
engine_version	String	Definition: Engine version selected for a training job. Range: N/A
image_url	String	Definition: Custom image URL selected for a training job. The URL is obtained from SWR. Range: N/A
install_sys_packages	Boolean	Definition: Specifies whether to install the MoXing version specified by the training platform. Range: • true: yes • false: no

Table 5-278 SummaryResp

Parameter	Type	Description
log_dir	LogDirResp object	Definition: Visualization log output of a training job.
data_sources	Array of DataSourceResp objects	Definition: Visualization log input of the visualization job or training job debugging mode.

Table 5-279 LogDirResp

Parameter	Type	Description
pfs	PFSSummaryResp object	Definition: Output of an OBS parallel file system.

Table 5-280 PFSSummaryResp

Parameter	Type	Description
pfs_path	String	Definition: URL of the OBS parallel file system. Range: N/A

Table 5-281 DataSourceResp

Parameter	Type	Description
job	JobSummaryResp object	Definition: Job data source.

Table 5-282 JobSummaryResp

Parameter	Type	Description
job_id	String	Definition: ID of a training job. Range: N/A

Table 5-283 TaskResponse

Parameter	Type	Description
role	String	Definition: Task role. This function is not supported currently. Range: N/A
algorithm	TaskResponseAlgorithm object	Definition: Algorithm configurations for algorithm management.
task_resource	FlavorResponse object	Definition: Specifications of a training job or algorithm.
log_export_path	log_export_path object	Definition: Saved information about training job logs.

Table 5-284 TaskResponseAlgorithm

Parameter	Type	Description
code_dir	String	Definition: Absolute path of the directory where the algorithm boot file is stored. Range: N/A
boot_file	String	Definition: Absolute path of an algorithm boot file. Range: N/A
inputs	AlgorithmInput object	Definition: Information about the algorithm input channel.
outputs	AlgorithmOutput object	Definition: Information about the algorithm output channel.
engine	AlgorithmEngine object	Definition: Engine that a heterogeneous job depends on.
local_code_dir	String	Definition: Local directory of the training container to which the algorithm code directory is downloaded. The rules are as follows: • The directory must be under / home. • In v1 compatibility mode, the current field does not take effect. • When code_dir is prefixed with file://, the current field does not take effect. Range: N/A
working_dir	String	Definition: Work directory where an algorithm is executed. Note that this parameter does not take effect in v1 compatibility mode. Range: N/A
environments	Map<String,String>	Definition: Environment variables related to a training job. Range: N/A

Table 5-285 AlgorithmInput

Parameter	Type	Description
name	String	Definition: Name of the data input channel. Range: N/A
local_dir	String	Definition: Local path of the container to which the data input and output channels are mapped. Range: N/A
remote	AlgorithmRemote object	Definition: Actual data input, which can only be OBS for heterogeneous jobs.

Table 5-286 AlgorithmRemote

Parameter	Type	Description
obs	RemoteObsResp object	Definition: OBS in which data input and output are stored.

Table 5-287 AlgorithmOutput

Parameter	Type	Description
name	String	Definition: Name of the data output channel. Range: N/A
local_dir	String	Definition: Local path of the container to which the data output channels are mapped. Range: N/A
remote	RemoteResp object	Definition: Description of the actual data output.
mode	String	Definition: Data transmission mode. The default value is upload_periodically . Range: N/A
period	String	Definition: Data transmission period. The default value is 30s . Range: N/A

Table 5-288 RemoteResp

Parameter	Type	Description
obs	RemoteObsResp object	Definition: Data actually output to OBS.

Table 5-289 RemoteObsResp

Parameter	Type	Description
obs_url	String	Definition: Path of the data output to OBS. Range: N/A

Table 5-290 AlgorithmEngine

Parameter	Type	Description
engine_id	String	Definition: Engine flavor ID, for example, caffe-1.0.0-python2.7 . Range: N/A
engine_name	String	Definition: Engine flavor name, for example, Caffe . Range: N/A
engine_version	String	Definition: Engine flavor version. Engines with the same name have multiple versions, for example, Caffe-1.0.0-python2.7 of Python 2.7. Range: N/A
v1_compatible	Boolean	Definition: Specifies whether the v1 compatibility mode is used. Range: • true: The v1 compatibility mode is used. • false: The v1 compatibility mode is not used.
run_user	String	Definition: Default UID for the engine startup. Range: N/A
image_url	String	Definition: Custom image URL selected for an algorithm. Range: N/A

Table 5-291 FlavorResponse

Parameter	Type	Description
pool_id	String	Definition: ID of the resource pool selected for a training job. Range: N/A
flavor_id	String	Definition: Resource flavor ID. Range: N/A
flavor_name	String	Definition: Resource flavor name. Range: N/A
max_num	Integer	Definition: Maximum number of nodes supported by a flavor. Range: N/A
billing	BillingInfo object	Definition: Billing information of a resource flavor.
flavor_info	FlavorInfoResponse object	Definition: Resource flavor details.
attributes	Map<String,String>	Definition: Other flavor attributes. Range: N/A

Table 5-292 FlavorInfoResponse

Parameter	Type	Description
max_num	Integer	Definition: Maximum number of nodes that can be selected. The value 1 indicates that the distributed mode is not supported. Range: N/A
cpu	Cpu object	Definition: CPU specifications.
gpu	Gpu object	Definition: GPU specifications.
npu	Npu object	Definition: Ascend specifications.
memory	Memory object	Definition: Memory information.
disk	DiskResponse object	Definition: Disk information.

Table 5-293 DiskResponse

Parameter	Type	Description
size	Integer	Definition: Disk size. Range: N/A
unit	String	Definition: Unit of the disk size. Range: N/A

Table 5-294 log_export_path

Parameter	Type	Description
obs_url	String	Definition: OBS path for storing training job logs.

Table 5-295 SpecResponse

Parameter	Type	Description
resource	Resource object	Definition: Resource flavor of a training job. Select either flavor_id or pool_id and flavor_id .
volumes	Array of JobVolumeResp objects	Definition: Mounting volume information of a training job.
log_export_path	LogExportPathResp object	Definition: Log output of a training job.
schedule_policy	SchedulePolicyResp object	Definition: Scheduling policy of a training job.
custom_metrics	Array of CustomMetrics objects	Definition: Metric collection configuration.
output_model	OutputModelResp object	Definition: Output information of a custom training job.
asset_model	AssetModelResp object	Definition: Information about the model created using a custom training job.

Table 5-296 Resource

Parameter	Type	Description
policy	String	Definition: Resource flavor mode of a training job. Range: • regular: standard mode
flavor_id	String	Definition: ID of the resource flavor of a training job. Range: The flavor_id parameter cannot be specified for a dedicated resource pool of CPU specifications. The options for dedicated resource pools with GPU/Ascend specifications are as follows: • modelarts.pool.visual.xlarge (1 PU) • modelarts.pool.visual.2xlarge (2 PUs) • modelarts.pool.visual.4xlarge (4 PUs) • modelarts.pool.visual.8xlarge (8 PUs)
flavor_name	String	Definition: Read-only flavor name returned by ModelArts when flavor_id is used. Range: N/A
node_count	Integer	Definition: Number of resource replicas selected for a training job. Range: N/A
pool_id	String	Definition: ID of the resource pool selected for a training job. Range: N/A
pool_group_id	String	Definition: ID of the resource pool federation selected for a training job. Range: N/A
flavor_detail	FlavorDetail object	Definition: Flavor details of a training job or algorithm. This parameter is available only for public resource pools.
main_container_allocated_resources	MainContainerAllocatedResources object	Definition: Resource specifications actually obtained by the training container of a training job.

Parameter	Type	Description
main_container_customized_flavor	MainContainerCustomizedFlavor object	Definition: Custom flavor of a training job. Range: The number of CPU cores and memory size must be greater than 0, and the number of accelerator PUs must be greater than or equal to 0.

Table 5-297 FlavorDetail

Parameter	Type	Description
billing	BillingInfo object	Definition: Billing information of a resource flavor.
flavor_info	FlavorInfo object	Definition: Resource flavor details.

Table 5-298 BillingInfo

Parameter	Type	Description
code	String	Definition: Billing code. Range: N/A
unit_num	Integer	Definition: Billing unit. Range: N/A

Table 5-299 FlavorInfo

Parameter	Type	Description
max_num	Integer	Definition: Maximum number of nodes that can be selected. The value 1 indicates that the distributed mode is not supported. Range: N/A
cpu	Cpu object	Definition: CPU specifications.
gpu	Gpu object	Definition: GPU specifications.
npu	Npu object	Definition: Ascend specifications.
memory	Memory object	Definition: Memory information.
disk	Disk object	Definition: Disk information.

Table 5-300 Cpu

Parameter	Type	Description
arch	String	Definition: CPU architecture. Range: N/A
core_num	Integer	Definition: Number of cores. Range: N/A

Table 5-301 Gpu

Parameter	Type	Description
unit_num	Integer	Definition: Number of GPUs. Range: N/A
product_name	String	Definition: Product name. Range: N/A
memory	String	Definition: Memory. Range: N/A

Table 5-302 Npu

Parameter	Type	Description
unit_num	String	Definition: Number of NPUs. Range: N/A
product_name	String	Definition: Product name. Range: N/A
memory	String	Definition: Memory. Range: N/A

Table 5-303 Memory

Parameter	Type	Description
size	Integer	Definition: Memory size. Range: N/A
unit	String	Definition: Number of memory units. Range: N/A

Table 5-304 Disk

Parameter	Type	Description
size	String	Definition: Disk size. Range: N/A
unit	String	Definition: Unit of the disk size. Generally, the unit is GB. Range: N/A

Table 5-305 MainContainerAllocatedResources

Parameter	Type	Description
cpu_arch	String	Definition: CPU architecture. Range: N/A
cpu_core_num	Float	Definition: Number of cores. Range: N/A
mem_size	Float	Definition: Memory information. Range: N/A
accelerator_num	Float	Definition: Number of accelerator cards. Range: N/A
accelerator_type	String	Definition: Type of accelerator cards. For example, ascend-d910b and ascend-snt9c. Range: N/A

Table 5-306 MainContainerCustomizedFlavor

Parameter	Type	Description
cpu_core_num	Float	Definition: Number of CPU cores. Range: greater than 0
mem_size	Float	Definition: Memory size. Range: greater than 0
accelerator_num	Float	Definition: Number of accelerator cards. Range: greater than or equal to 0

Table 5-307 JobVolumeResp

Parameter	Type	Description
nfs	NfsResp object	Definition: Volumes attached in NFS mode.

Table 5-308 NfsResp

Parameter	Type	Description
nfs_server_path	String	Definition: NFS server path, for example, 10.10.10.10:/example/path . Range: N/A
local_path	String	Definition: Path for attaching volumes to the training container, for example, /example/path . Range: N/A
read_only	Boolean	Definition: Specifies whether the disks attached to the container in NFS mode are read-only. Range: • true: read only • false: non-read-only

Table 5-309 LogExportPathResp

Parameter	Type	Description
obs_url	String	Definition: OBS path for storing training job logs, for example, obs://example/path . Range: N/A
host_path	String	Definition: Path of the host where training job logs are stored, for example, /example/path . Range: N/A

Table 5-310 SchedulePolicyResp

Parameter	Type	Description
required_affinity	RequiredAffinityResp object	Definition: Affinity requirements of a training job.

Parameter	Type	Description
priority	Integer	Definition: Priority of a training job. Range: 0 to 3
preemptible	Boolean	Definition: Whether the resource can be preempted. Range: • true: The resource can be preempted. • false: The resource cannot be preempted.

Table 5-311 RequiredAffinityResp

Parameter	Type	Description
affinity_type	String	Definition: Affinity scheduling policy. Range: • cabinet: strong cabinet scheduling • hyperinstance: supernode affinity scheduling
affinity_group_size	Integer	Definition: Size of an affinity group. Range: N/A

Table 5-312 CustomMetrics

Parameter	Type	Description
exec	Exec object	Definition: Metrics are collected in CLI mode.
http_get	HttpGet object	Definition: Metrics are collected in HTTP mode.

Table 5-313 Exec

Parameter	Type	Description
command	Array of strings	Definition: Metrics are collected in CLI mode. Range: N/A.

Table 5-314 HttpGet

Parameter	Type	Description
path	String	Definition: URL for obtaining metrics over HTTP. Both the URL and the port below must either be configured together or remain empty. Range: N/A
port	Integer	Definition: Port for obtaining metrics over HTTP. This parameter and the URL above must be set or left blank at the same time. Range: N/A

Table 5-315 OutputModelResp

Parameter	Type	Description
obs	ObsModelResp object	Definition: OBS output information stored by a custom training job. Range: N/A

Table 5-316 ObsModelResp

Parameter	Type	Description
obs_url	String	Definition: OBS path for storing custom training jobs, for example, obs://example/path . Range: N/A
local_path	String	Definition: Path of the host where custom training jobs are stored, for example, /example/path . Range: N/A

Table 5-317 AssetModelResp

Parameter	Type	Description
id	String	Definition: Model ID. Range: N/A
name	String	Definition: Model name. Range: N/A

Parameter	Type	Description
code	String	Definition: Model name. Range: N/A
version	String	Definition: Model version. Range: N/A
location	String	Definition: Model address. Range: N/A
desc	String	Definition: Model description. Range: N/A
series	String	Definition: Model brand. Range: N/A
type	String	Definition: Model type. Range: N/A

Table 5-318 JobEndpointsResp

Parameter	Type	Description
ssh	SSHResp object	Definition: SSH connection information.
jupyter_lab	JupyterLab object	Definition: JupyterLab connection information.
tensorboard	Tensorboard object	Definition: TensorBoard connection information.
mindstudio_insight	MindStudioInsight object	Definition: MindStudio Insight connection information.

Table 5-319 SSHResp

Parameter	Type	Description
key_pair_names	Array of strings	Definition: Name of the SSH key pair, which can be created and viewed on the Key Pair page of the Elastic Cloud Server (ECS) console. Range: N/A
task_urls	Array of TaskUrls objects	Definition: SSH connection address.

Table 5-320 TaskUrls

Parameter	Type	Description
task	String	Definition: Task ID of a training job. Range: N/A
url	String	Definition: SSH connection address of a training job. Range: N/A

Table 5-321 JupyterLab

Parameter	Type	Description
url	String	Definition: JupyterLab address of a training job. Range: N/A
token	String	Definition: JupyterLab token of a training job. Range: N/A

Table 5-322 Tensorboard

Parameter	Type	Description
url	String	Definition: TensorBoard address of a training job. Range: N/A
token	String	Definition: TensorBoard token of a training job. Range: N/A

Table 5-323 MindStudioInsight

Parameter	Type	Description
url	String	Definition: MindStudio Insight address of a training job. Range: N/A
token	String	Definition: MindStudio Insight token of a training job. Range: N/A

Example Requests

The following shows how to query a training job whose UUID is **3faf5c03-aaa1-4cbe-879d-24b05d997347**.

```
GET https://endpoint/v2/{project_id}/training-jobs/3faf5c03-aaa1-4cbe-879d-24b05d997347
```

Status Codes

Status Code	Description
200	ok

Error Codes

See [Error Codes](#).

5.8 Modifying the Description of a Training Job

Function

This API is used to modify the description of an existing training job.

This API is used when you need to update the description of a training job. Before using this API, ensure that the training job exists and you have the required permission. After the update, the description of the training job is updated. If the training job does not exist or you do not have the required permission, the API will return an error message.

Debugging

You can debug this API through automatic authentication in [API Explorer](#) or use the SDK sample code generated by API Explorer.

Authorization Information

Each account has all the permissions required to call all APIs, but IAM users must be assigned the required permissions.

- If you are using role/policy-based authorization, see [Permissions Policies and Supported Actions](#) for details on the required permissions.
- If you are using identity policy-based authorization, the following identity policy-based permissions are required.

Action	Access Level	Resource Type (*: required)	Condition Key	Alias	Dependencies
modelarts:trainJob:update	Write	trainJob *	g:ResourceTag/<tag-key>	-	-
		-	• modelarts:poolType • modelarts:poolId		

URI

PUT /v2/{project_id}/training-jobs/{training_job_id}

Table 5-324 Path Parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Definition: Project ID. For details, see Obtaining a Project ID and Name . Constraints: The value can contain 1 to 64 characters. Letters, digits, and hyphens (-) are allowed. Range: N/A Default Value: N/A
training_job_id	Yes	String	Definition: Training job ID. For details, see Obtaining Training Jobs . Constraints: N/A Range: N/A Default Value: N/A

Request Parameters

Table 5-325 Request body parameters

Parameter	Mandatory	Type	Description
description	No	String	Definition: Training job description. Constraints: The value can contain at most 256 characters. Range: N/A Default Value: NULL

Response Parameters

Status code: 200

No Content

None

Example Requests

The following shows how to modify a training job with UUID **3faf5c03-aaa1-4cbe-879d-24b05d997347**. After the modification, call the API for obtaining a training job(ListTrainingJobs.xml) to view the modified description.

```
PUT https://endpoint/v2/{project_id}/training-jobs/3faf5c03-aaa1-4cbe-879d-24b05d997347
{
  "description" : "hahaha"
}
```

Error Codes

See [Error Codes](#).

5.9 Deleting a Training Job

Function

This API is used to delete a training job from ModelArts.

This API applies to the following scenarios: When you need to delete completed or unnecessary training jobs, you can use this API to delete a specified training job. Before using this API, ensure that the training job exists and you have the permission to delete it. After the deletion is complete, the training job is permanently removed from the platform, and related resources and configurations are cleared. If the training job ID does not exist or you do not have the operation permission, the API will return an error message.

Debugging

You can debug this API through automatic authentication in [API Explorer](#) or use the SDK sample code generated by API Explorer.

Authorization Information

Each account has all the permissions required to call all APIs, but IAM users must be assigned the required permissions.

- If you are using role/policy-based authorization, see [Permissions Policies and Supported Actions](#) for details on the required permissions.
- If you are using identity policy-based authorization, the following identity policy-based permissions are required.

Action	Access Level	Resource Type (*: required)	Condition Key	Alias	Dependencies
modelarts:trainJob:delete	Write	trainJob *	g:ResourceTag/<tag-key>	-	-
		-	- modelarts:poolType - modelarts:poolId		

URI

DELETE /v2/{project_id}/training-jobs/{training_job_id}

Table 5-326 Path Parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Definition: Project ID. For details, see Obtaining a Project ID and Name . Constraints: The value can contain 1 to 64 characters. Letters, digits, and hyphens (-) are allowed. Range: N/A Default Value: N/A
training_job_id	Yes	String	Definition: Training job ID. For details, see Obtaining Training Jobs . Constraints: N/A Range: N/A Default Value: N/A

Error Codes

See [Error Codes](#).

5.10 Terminating a Training Job

Function

This API is used to terminate a training job on ModelArts. Only jobs in the creating, awaiting, or running state can be terminated.

This API applies to the following scenario: When you need to terminate an ongoing training job, you can use this API to do so. Before using this API, ensure that there is a running training job and you have the permission to terminate the job. After the termination is complete, the training job stops running, and resources are released. If the training job ID does not exist, the job is not in the appropriate running state, or you do not have the operation permission, the API will return an error message.

Debugging

You can debug this API through automatic authentication in [API Explorer](#) or use the SDK sample code generated by API Explorer.

Authorization Information

Each account has all the permissions required to call all APIs, but IAM users must be assigned the required permissions.

- If you are using role/policy-based authorization, see [Permissions Policies and Supported Actions](#) for details on the required permissions.

- If you are using identity policy-based authorization, the following identity policy-based permissions are required.

Action	Access Level	Resource Type (*: required)	Condition Key	Alias	Dependencies
modelarts:trainJob:create	Write	trainJob *	-	-	-
		-	- g:RequestTag/<tag-key> - g:TagKeys - modelarts:poolType - modelarts:poolId

POST /v2/{project_id}/training-jobs/{training_job_id}/actions

Table 5-327 Path Parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Definition: Project ID. For details, see Obtaining a Project ID and Name . Constraints: The value can contain 1 to 64 characters. Letters, digits, and hyphens (-) are allowed. Range: N/A Default Value: N/A
training_job_id	Yes	String	Definition: Training job ID. For details, see Obtaining Training Jobs . Constraints: N/A Range: N/A Default Value: N/A

Request Parameters

Table 5-328 Request body parameters

Parameter	Mandatory	Type	Description
action_type	Yes	String	Definition: Operation request for a training job. Constraints: N/A Range: • terminate: Terminate a training job. Default Value: N/A

Response Parameters

Status code: 202

Table 5-329 Response body parameters

Parameter	Type	Description
kind	String	Definition: Type of a training job. Range • job: common job • federated_pool_job: resource pool federated job • edge_job: edge job • hetero_job: heterogeneous job • mrs_job: MRS job • autosearch_job: auto search job • diag_job: diagnosis job • visualization_job: visualization job
metadata	JobMetadataResponse object	Definition: Training job metadata.
status	Status object	Definition: Training job status information.
algorithm	JobAlgorithmResponse object	Definition: Training job algorithm.
tasks	Array of TaskResponse objects	Definition: Heterogeneous training tasks.

Parameter	Type	Description
spec	SpecResponse object	Definition: Training job specifications.
endpoints	JobEndpointsResponse object	Definition: Configurations required for remotely accessing a training job.

Table 5-330 JobMetadataResponse

Parameter	Type	Description
id	String	Definition: Training job ID, which is generated and returned by ModelArts after a training job is created. Range: N/A
name	String	Definition: Name of a training job. Range: The value must contain 1 to 64 characters consisting of only digits, letters, underscores (_), and hyphens (-).
workspace_id	String	Definition: Workspace where a specified job is located. Range: N/A
description	String	Definition: Definition of a training job. Range: N/A
create_time	Long	Definition: Time when a training job was created, in milliseconds. The value is generated and returned by ModelArts after a training job is created. Range: N/A
user_name	String	Definition: Username for creating a training job. The username is generated and returned by ModelArts after a training job is created. Range: N/A
annotations	Map<String,String>	Definition: Advanced functions of a training job.

Table 5-331 Status

Parameter	Type	Description
phase	String	Definition: Level-1 status of a training job. Range: • Creating: The job is being created. • Pending: The job is pending. • Running: The job is running. • Failed: The job failed to run. • Completed: The job is complete. • Terminating: The job is being stopped. • Terminated: The job has been stopped. • Abnormal: The job is abnormal.
secondary_phase	String	Definition: Level-2 status of a training job. The values are internal detailed statuses and may be added, changed, or deleted. Dependency on the status is not recommended. Range: • Creating: The job is being created. • Queuing: The job is queuing. • Running: The job is running. • Failed: The job failed to run. • Completed: The job is complete. • Terminating: The job is being stopped. • Terminated: The job has been stopped. • CreateFailed: The job fails to be created. • TerminatedFailed: The job fails to be stopped. • Unknown: The job is in an unknown state. • Lost: The job is abnormal.
duration	Long	Definition: Running duration of a training job, in ms. Range: N/A
node_count_metrics	Array<Array<Integer>>	Definition: Node quantity change metric during a training job runtime.

Parameter	Type	Description
tasks	Array of strings	Definition: Training job subtask name.
start_time	Long	Definition: Timestamp when a training job is started. Range: N/A
task_statuses	Array of TaskStatuses objects	Definition: Status of the first failed subtask of a training job.
running_records	Array of RunningRecord objects	Definition: Running and fault recovery records of a training job.

Table 5-332 TaskStatuses

Parameter	Type	Description
task	String	Definition: Training job subtask name. Range: N/A
exit_code	Integer	Definition: Exit code of a training job subtask. Range: N/A
message	String	Definition: Error message of a training job subtask. Range: N/A

Table 5-333 RunningRecord

Parameter	Type	Description
start_at	Integer	Definition: Unix timestamp of the start time in the current running record, in seconds. Range: N/A
end_at	Integer	Definition: Unix timestamp of the end time in the current running record, in seconds. Range: N/A
xpu_start_at	Integer	Definition: Unix timestamp of the accelerator card startup time in the current running record, in seconds. Range: N/A

Parameter	Type	Description
start_type	String	Definition: Startup mode of the current execution. Range • init_or_rescheduled: This startup is the first running after scheduling, including the first startup and the running after scheduling recovery. • restarted: This startup is not the first running after scheduling but the running after a process restart.
end_reason	String	Definition: Reason why the running ends. Range: N/A
end_related_task	String	Definition: ID of the task worker (for example, worker-0) that ends the running. Range: N/A
end_recover	String	Definition: Fault tolerance policy adopted when the execution ends abnormally. Range • npu_proc_restart: NPU in-place hot recovery • proc_restart: in-place process recovery • npu_step_retry: step recomputation • pod_reschedule: pod-level rescheduling • job_reschedule: job-level rescheduling • job_reschedule_with_taint: isolated job-level rescheduling
end_recover_before_downgrade	String	Definition: There is a downgrade relationship between policies. If a policy fails to be executed, it will be downgraded to another specified policy. end_recover_before_downgrade indicates the tolerance policy used before end_recover is downgraded. Range: same as that of end_recover.

Parameter	Type	Description
recover_records	Array of RecoverRecord objects	Definition: details about all fault tolerance policies adopted when the execution ends abnormally.

Table 5-334 RecoverRecord

Parameter	Type	Description
recover_start_at	Integer	Unix timestamp of the start time of the fault tolerance policy, in seconds. The timestamp is also the fault occurrence time.
recover_end_at	Integer	Unix timestamp of the end time of the fault tolerance policy, in seconds.
recover	String	Fault tolerance policy. Options: • npu_step_retry: step recomputation • npu_proc_restart: NPU in-place hot recovery • proc_restart: in-place process recovery • pod_reschedule: pod-level rescheduling • job_reschedule: job-level rescheduling • job_reschedule_with_taint: isolated job-level rescheduling
fault_scenario	String	Fault scenario. Options: • chip_fault: chip fault • node_fault: node fault • job_failed: job exit upon a failure • job_hanged: job suspension • job_subhealth: job subhealth • error_in_log: log exception
reason	String	Cause of the fault.
related_task	String	ID of the task worker that causes the end of the current running record, for example, worker-0 .

Parameter	Type	Description
recover_result	String	Execution result of the fault. Options: • recovering: executing • success: successful • failed: failed • downgrade: policy downgrade

Table 5-335 JobAlgorithmResponse

Parameter	Type	Description
id	String	Definition: Training job algorithm. Range: • id: Only the algorithm ID is used. • subscription_id+item_version_id: The subscription ID and version ID of the algorithm are used. • code_dir+boot_file: The code directory and boot file of the training job are used.
name	String	Definition: Algorithm name. Range: N/A
subscription_id	String	Definition: Subscription ID of a subscription algorithm, which must be used with item_version_id . Range: N/A
item_version_id	String	Definition: Version of a subscription algorithm, which must be used with subscription_id . Range: N/A
code_dir	String	Definition: Code directory of a training job, for example, /usr/app/ . This parameter must be used with boot_file . Leave this parameter blank if id , or subscription_id and item_version_id are specified. Range: N/A

Parameter	Type	Description
boot_file	String	Definition: Boot file of a training job, which must be stored in the code directory, for example, <code>/usr/app/boot.py</code> . This parameter must be used with <code>code_dir</code> . Leave this parameter blank if <code>id</code> , or <code>subscription_id</code> and <code>item_version_id</code> are specified. Range: N/A
autosearch_config_path	String	Definition: YAML configuration path of an auto search job. An OBS URL is required. For example, <code>obs://bucket/file.yaml</code> . Range: N/A
autosearch_framework_path	String	Definition: Framework code directory of an auto search job. An OBS URL is required. For example, <code>obs://bucket/files/</code> . Range: N/A
command	String	Definition: Boot command for starting the container of a custom image for a training job. For example, <code>python train.py</code> . Range: N/A
parameters	Array of <code>ParameterResp</code> objects	Definition: Running parameters of the training job.
policies	<code>policies</code> object	Definition: Policy supported by a job.
inputs	Array of <code>InputResp</code> objects	Definition: Data input of a training job.
outputs	Array of <code>OutputResp</code> objects	Definition: Output of the training job.
engine	<code>JobEngineResp</code> object	Definition: Engine of a training job. Leave this parameter blank if the job is created using <code>id</code> of the algorithm in algorithm management, or <code>subscription_id+item_version_id</code> of the subscribed algorithm.

Parameter	Type	Description
local_code_dir	String	Definition: Local directory of the training container to which the algorithm code directory is downloaded. The rules are as follows: • The directory must be under / home. • In v1 compatibility mode, the current field does not take effect. • When code_dir is prefixed with file://, the current field does not take effect. Range: N/A
working_dir	String	Definition: Work directory where an algorithm is executed. Rules: In v1 compatibility mode, this parameter does not take effect. Range: N/A
environments	Array of Map<String,String> objects	Definition: Environment variables of a training job. The format is key:value . Leave this parameter blank.
summary	SummaryResp object	Definition: Visualization log summary.

Table 5-336 ParameterResp

Parameter	Type	Description
name	String	Definition: Parameter name. Range: N/A
value	String	Definition: Parameter value. Range: N/A
description	String	Definition: Parameter description. Range: N/A
constraint	constraint object	Definition: Parameter attribute.
i18n_description	i18n_description object	Definition: Internationalization description.

Table 5-337 constraint

Parameter	Type	Description
editable	Boolean	Definition: Whether the parameter can be edited. Range: • true: editable • false: Not uneditable
required	Boolean	Definition: Whether the parameter is mandatory. Range: • true: mandatory • false: optional
sensitive	Boolean	Definition: Whether the parameter is sensitive. This function is unavailable currently. Range: • true: sensitive • false: insensitive
valid_range	Array of strings	Definition: Valid range.

Table 5-338 i18n_description

Parameter	Type	Description
language	String	Definition: Internationalization language. The options are as follows: • zh-cn: Chinese • en-us: English Range: N/A
description	String	Definition: Internationalization language description. Range: N/A

Table 5-339 policies

Parameter	Type	Description
auto_search	auto_search object	Definition: Hyperparameter search configuration.

Table 5-340 auto_search

Parameter	Type	Description
skip_search_params	String	Definition: Hyperparameter parameters that need to be skipped. Range: N/A
reward_attrs	Array of reward_attrs objects	Definition: Search metrics.
search_params	Array of search_params objects	Definition: Search parameters.
algo_configs	Array of algo_configs objects	Definition: Search algorithm configurations.

Table 5-341 reward_attrs

Parameter	Type	Description
name	String	Definition: Metric name. Range: N/A
mode	String	Definition: Search mode. Range: • max: A larger metric value is preferred. • min: A smaller metric value is preferred.
regex	String	Definition: Regular expression of a metric. Range: N/A

Table 5-342 search_params

Parameter	Type	Description
name	String	Definition: Hyperparameter name. Range: N/A

Parameter	Type	Description
param_type	String	Definition: Parameter type. Range: • continuous: The hyperparameter is of the continuous type. When an algorithm is used in a training job, continuous hyperparameters are displayed as text boxes on the console. • discrete: The hyperparameter is of the discrete type. When an algorithm is used in a training job, discrete hyperparameters are displayed as drop-down lists on the console.
lower_bound	String	Definition: Lower bound of the hyperparameter. Range: N/A
upper_bound	String	Definition: Upper bound of the hyperparameter. Range: N/A
discrete_points_num	String	Definition: Number of discrete points of a hyperparameter with continuous values. Range: N/A
discrete_values	Array of strings	Definition: Discrete hyperparameter values.

Table 5-343 algo_configs

Parameter	Type	Description
name	String	Definition: Search algorithm name. Range: N/A
params	Array of AutoSearchAlgoConfigParameterResp objects	Definition: Search algorithm parameters.

Table 5-344 AutoSearchAlgoConfigParameterResp

Parameter	Type	Description
key	String	Definition: Parameter key. Range: N/A
value	String	Definition: Parameter value. Range: N/A

Table 5-345 InputResp

Parameter	Type	Description
name	String	Definition: Name of the data input channel. Range: N/A
description	String	Definition: Description of the data input channel. Range: N/A
local_dir	String	Definition: Local path of the container to which the data input channels are mapped. Example: /home/ma-user/modelarts/inputs/data_url_0 Range: N/A
access_method	String	Definition: Access method of the input data channel path (local_dir). Range: • parameter: hyperparameters • env: environment variables
remote	InputDataInfoResp object	Definition: Description of the actual data input.
remote_constraint	Array of remote_constraint objects	Definition: Data input constraint.

Table 5-346 InputDataInfoResp

Parameter	Type	Description
dataset	dataset object	Definition: The input is a dataset.
obs	obs object	Definition: OBS in which data input and output are stored.

Table 5-347 dataset

Parameter	Type	Description
id	String	Definition: Dataset ID of a training job. Range: N/A
version_id	String	Definition: Dataset version ID of a training job. Constraints: This parameter is mandatory when an old-version dataset is used, that is, service_type is not V3 . Range: N/A
obs_url	String	Definition: OBS URL of the dataset for a training job. It is automatically parsed by ModelArts based on the dataset ID and dataset version ID. For example, /usr/data/ . Range: N/A
service_type	String	Definition: Dataset service type. Constraints: N/A Range: N/A Default Value: V3 indicates that a dataset provided by the asset service is used. Other values indicate that an old-version dataset is used.
name	String	Definition: Dataset name of a training job. Range: N/A

Table 5-348 obs

Parameter	Type	Description
obs_url	String	Definition: OBS URL of the dataset for a training job, For example, /usr/data/ . Range: N/A

Table 5-349 remote_constraint

Parameter	Type	Description
data_type	String	Definition: Data input type, including the data storage location and dataset. Constraints: N/A Range: N/A Default Value: N/A
attributes	String	Definition: Related attributes. Constraints: N/A Range: If the input is a dataset: • data_format: data format • data_segmentation: data segmentation method • dataset_type: data labeling type Default Value: N/A

Table 5-350 OutputResp

Parameter	Type	Description
name	String	Definition: Name of the data output channel. Range: N/A
description	String	Definition: Description of the data output channel. Range: N/A
local_dir	String	Definition: Local path of the container to which the data output channels are mapped. Range: N/A
access_method	String	Definition: Access method of the input data channel path (local_dir). Range: • parameter: hyperparameters • env: environment variables
remote	RemoteResp object	Definition: Description of the actual data output.

Table 5-351 JobEngineResp

Parameter	Type	Description
engine_id	String	Definition: Engine ID selected for a training job. Range: N/A
engine_name	String	Definition: Engine name selected for a training job. Range: N/A
engine_version	String	Definition: Engine version selected for a training job. Range: N/A
image_url	String	Definition: Custom image URL selected for a training job. The URL is obtained from SWR. Range: N/A
install_sys_packages	Boolean	Definition: Specifies whether to install the MoXing version specified by the training platform. Range: • true: yes • false: no

Table 5-352 SummaryResp

Parameter	Type	Description
log_dir	LogDirResp object	Definition: Visualization log output of a training job.
data_sources	Array of DataSourceResp objects	Definition: Visualization log input of the visualization job or training job debugging mode.

Table 5-353 LogDirResp

Parameter	Type	Description
pfs	PFSSummaryResp object	Definition: Output of an OBS parallel file system.

Table 5-354 PFSSummaryResp

Parameter	Type	Description
pfs_path	String	Definition: URL of the OBS parallel file system. Range: N/A

Table 5-355 DataSourceResp

Parameter	Type	Description
job	JobSummaryResp object	Definition: Job data source.

Table 5-356 JobSummaryResp

Parameter	Type	Description
job_id	String	Definition: ID of a training job. Range: N/A

Table 5-357 TaskResponse

Parameter	Type	Description
role	String	Definition: Task role. This function is not supported currently. Range: N/A
algorithm	TaskResponseAlgorithm object	Definition: Algorithm configurations for algorithm management.
task_resource	FlavorResponse object	Definition: Specifications of a training job or algorithm.
log_export_path	log_export_path object	Definition: Saved information about training job logs.

Table 5-358 TaskResponseAlgorithm

Parameter	Type	Description
code_dir	String	Definition: Absolute path of the directory where the algorithm boot file is stored. Range: N/A
boot_file	String	Definition: Absolute path of an algorithm boot file. Range: N/A
inputs	AlgorithmInput object	Definition: Information about the algorithm input channel.
outputs	AlgorithmOutput object	Definition: Information about the algorithm output channel.
engine	AlgorithmEngine object	Definition: Engine that a heterogeneous job depends on.
local_code_dir	String	Definition: Local directory of the training container to which the algorithm code directory is downloaded. The rules are as follows: • The directory must be under / home. • In v1 compatibility mode, the current field does not take effect. • When code_dir is prefixed with file://, the current field does not take effect. Range: N/A
working_dir	String	Definition: Work directory where an algorithm is executed. Note that this parameter does not take effect in v1 compatibility mode. Range: N/A
environments	Map<String,String>	Definition: Environment variables related to a training job. Range: N/A

Table 5-359 AlgorithmInput

Parameter	Type	Description
name	String	Definition: Name of the data input channel. Range: N/A
local_dir	String	Definition: Local path of the container to which the data input and output channels are mapped. Range: N/A
remote	AlgorithmRemote object	Definition: Actual data input, which can only be OBS for heterogeneous jobs.

Table 5-360 AlgorithmRemote

Parameter	Type	Description
obs	RemoteObsResp object	Definition: OBS in which data input and output are stored.

Table 5-361 AlgorithmOutput

Parameter	Type	Description
name	String	Definition: Name of the data output channel. Range: N/A
local_dir	String	Definition: Local path of the container to which the data output channels are mapped. Range: N/A
remote	RemoteResp object	Definition: Description of the actual data output.
mode	String	Definition: Data transmission mode. The default value is upload_periodically . Range: N/A
period	String	Definition: Data transmission period. The default value is 30s . Range: N/A

Table 5-362 RemoteResp

Parameter	Type	Description
obs	RemoteObsResp object	Definition: Data actually output to OBS.

Table 5-363 RemoteObsResp

Parameter	Type	Description
obs_url	String	Definition: Path of the data output to OBS. Range: N/A

Table 5-364 AlgorithmEngine

Parameter	Type	Description
engine_id	String	Definition: Engine flavor ID, for example, caffe-1.0.0-python2.7 . Range: N/A
engine_name	String	Definition: Engine flavor name, for example, Caffe . Range: N/A
engine_version	String	Definition: Engine flavor version. Engines with the same name have multiple versions, for example, Caffe-1.0.0-python2.7 of Python 2.7. Range: N/A
v1_compatible	Boolean	Definition: Specifies whether the v1 compatibility mode is used. Range: • true: The v1 compatibility mode is used. • false: The v1 compatibility mode is not used.
run_user	String	Definition: Default UID for the engine startup. Range: N/A
image_url	String	Definition: Custom image URL selected for an algorithm. Range: N/A

Table 5-365 FlavorResponse

Parameter	Type	Description
pool_id	String	Definition: ID of the resource pool selected for a training job. Range: N/A
flavor_id	String	Definition: Resource flavor ID. Range: N/A
flavor_name	String	Definition: Resource flavor name. Range: N/A
max_num	Integer	Definition: Maximum number of nodes supported by a flavor. Range: N/A
billing	BillingInfo object	Definition: Billing information of a resource flavor.
flavor_info	FlavorInfoResponse object	Definition: Resource flavor details.
attributes	Map<String,String>	Definition: Other flavor attributes. Range: N/A

Table 5-366 FlavorInfoResponse

Parameter	Type	Description
max_num	Integer	Definition: Maximum number of nodes that can be selected. The value 1 indicates that the distributed mode is not supported. Range: N/A
cpu	Cpu object	Definition: CPU specifications.
gpu	Gpu object	Definition: GPU specifications.
npu	Npu object	Definition: Ascend specifications.
memory	Memory object	Definition: Memory information.
disk	DiskResponse object	Definition: Disk information.

Table 5-367 DiskResponse

Parameter	Type	Description
size	Integer	Definition: Disk size. Range: N/A
unit	String	Definition: Unit of the disk size. Range: N/A

Table 5-368 log_export_path

Parameter	Type	Description
obs_url	String	Definition: OBS path for storing training job logs.

Table 5-369 SpecResponse

Parameter	Type	Description
resource	Resource object	Definition: Resource flavor of a training job. Select either flavor_id or pool_id and flavor_id .
volumes	Array of JobVolumeResp objects	Definition: Mounting volume information of a training job.
log_export_path	LogExportPathResp object	Definition: Log output of a training job.
schedule_policy	SchedulePolicyResp object	Definition: Scheduling policy of a training job.
custom_metrics	Array of CustomMetrics objects	Definition: Metric collection configuration.
output_model	OutputModelResp object	Definition: Output information of a custom training job.
asset_model	AssetModelResp object	Definition: Information about the model created using a custom training job.

Table 5-370 Resource

Parameter	Type	Description
policy	String	Definition: Resource flavor mode of a training job. Range: • regular: standard mode
flavor_id	String	Definition: ID of the resource flavor of a training job. Range: The flavor_id parameter cannot be specified for a dedicated resource pool of CPU specifications. The options for dedicated resource pools with GPU/Ascend specifications are as follows: • modelarts.pool.visual.xlarge (1 PU) • modelarts.pool.visual.2xlarge (2 PUs) • modelarts.pool.visual.4xlarge (4 PUs) • modelarts.pool.visual.8xlarge (8 PUs)
flavor_name	String	Definition: Read-only flavor name returned by ModelArts when flavor_id is used. Range: N/A
node_count	Integer	Definition: Number of resource replicas selected for a training job. Range: N/A
pool_id	String	Definition: ID of the resource pool selected for a training job. Range: N/A
pool_group_id	String	Definition: ID of the resource pool federation selected for a training job. Range: N/A
flavor_detail	FlavorDetail object	Definition: Flavor details of a training job or algorithm. This parameter is available only for public resource pools.
main_container_allocated_resources	MainContainerAllocatedResources object	Definition: Resource specifications actually obtained by the training container of a training job.

Parameter	Type	Description
main_container_customized_flavor	MainContainerCustomizedFlavor object	Definition: Custom flavor of a training job. Range: The number of CPU cores and memory size must be greater than 0, and the number of accelerator PUs must be greater than or equal to 0.

Table 5-371 FlavorDetail

Parameter	Type	Description
billing	BillingInfo object	Definition: Billing information of a resource flavor.
flavor_info	FlavorInfo object	Definition: Resource flavor details.

Table 5-372 BillingInfo

Parameter	Type	Description
code	String	Definition: Billing code. Range: N/A
unit_num	Integer	Definition: Billing unit. Range: N/A

Table 5-373 FlavorInfo

Parameter	Type	Description
max_num	Integer	Definition: Maximum number of nodes that can be selected. The value 1 indicates that the distributed mode is not supported. Range: N/A
cpu	Cpu object	Definition: CPU specifications.
gpu	Gpu object	Definition: GPU specifications.
npu	Npu object	Definition: Ascend specifications.
memory	Memory object	Definition: Memory information.
disk	Disk object	Definition: Disk information.

Table 5-374 Cpu

Parameter	Type	Description
arch	String	Definition: CPU architecture. Range: N/A
core_num	Integer	Definition: Number of cores. Range: N/A

Table 5-375 Gpu

Parameter	Type	Description
unit_num	Integer	Definition: Number of GPUs. Range: N/A
product_name	String	Definition: Product name. Range: N/A
memory	String	Definition: Memory. Range: N/A

Table 5-376 Npu

Parameter	Type	Description
unit_num	String	Definition: Number of NPUs. Range: N/A
product_name	String	Definition: Product name. Range: N/A
memory	String	Definition: Memory. Range: N/A

Table 5-377 Memory

Parameter	Type	Description
size	Integer	Definition: Memory size. Range: N/A
unit	String	Definition: Number of memory units. Range: N/A

Table 5-378 Disk

Parameter	Type	Description
size	String	Definition: Disk size. Range: N/A
unit	String	Definition: Unit of the disk size. Generally, the unit is GB. Range: N/A

Table 5-379 MainContainerAllocatedResources

Parameter	Type	Description
cpu_arch	String	Definition: CPU architecture. Range: N/A
cpu_core_num	Float	Definition: Number of cores. Range: N/A
mem_size	Float	Definition: Memory information. Range: N/A
accelerator_num	Float	Definition: Number of accelerator cards. Range: N/A
accelerator_type	String	Definition: Type of accelerator cards. For example, ascend-d910b and ascend-snt9c. Range: N/A

Table 5-380 MainContainerCustomizedFlavor

Parameter	Type	Description
cpu_core_num	Float	Definition: Number of CPU cores. Range: greater than 0
mem_size	Float	Definition: Memory size. Range: greater than 0
accelerator_num	Float	Definition: Number of accelerator cards. Range: greater than or equal to 0

Table 5-381 JobVolumeResp

Parameter	Type	Description
nfs	NfsResp object	Definition: Volumes attached in NFS mode.

Table 5-382 NfsResp

Parameter	Type	Description
nfs_server_path	String	Definition: NFS server path, for example, 10.10.10.10:/example/path . Range: N/A
local_path	String	Definition: Path for attaching volumes to the training container, for example, /example/path . Range: N/A
read_only	Boolean	Definition: Specifies whether the disks attached to the container in NFS mode are read-only. Range: • true: read only • false: non-read-only

Table 5-383 LogExportPathResp

Parameter	Type	Description
obs_url	String	Definition: OBS path for storing training job logs, for example, obs://example/path . Range: N/A
host_path	String	Definition: Path of the host where training job logs are stored, for example, /example/path . Range: N/A

Table 5-384 SchedulePolicyResp

Parameter	Type	Description
required_affinity	RequiredAffinityResp object	Definition: Affinity requirements of a training job.

Parameter	Type	Description
priority	Integer	Definition: Priority of a training job. Range: 0 to 3
preemptible	Boolean	Definition: Whether the resource can be preempted. Range: • true: The resource can be preempted. • false: The resource cannot be preempted.

Table 5-385 RequiredAffinityResp

Parameter	Type	Description
affinity_type	String	Definition: Affinity scheduling policy. Range: • cabinet: strong cabinet scheduling • hyperinstance: supernode affinity scheduling
affinity_group_size	Integer	Definition: Size of an affinity group. Range: N/A

Table 5-386 CustomMetrics

Parameter	Type	Description
exec	Exec object	Definition: Metrics are collected in CLI mode.
http_get	HttpGet object	Definition: Metrics are collected in HTTP mode.

Table 5-387 Exec

Parameter	Type	Description
command	Array of strings	Definition: Metrics are collected in CLI mode. Range: N/A.

Table 5-388 HttpGet

Parameter	Type	Description
path	String	Definition: URL for obtaining metrics over HTTP. Both the URL and the port below must either be configured together or remain empty. Range: N/A
port	Integer	Definition: Port for obtaining metrics over HTTP. This parameter and the URL above must be set or left blank at the same time. Range: N/A

Table 5-389 OutputModelResp

Parameter	Type	Description
obs	ObsModelResp object	Definition: OBS output information stored by a custom training job. Range: N/A

Table 5-390 ObsModelResp

Parameter	Type	Description
obs_url	String	Definition: OBS path for storing custom training jobs, for example, obs://example/path . Range: N/A
local_path	String	Definition: Path of the host where custom training jobs are stored, for example, /example/path . Range: N/A

Table 5-391 AssetModelResp

Parameter	Type	Description
id	String	Definition: Model ID. Range: N/A
name	String	Definition: Model name. Range: N/A

Parameter	Type	Description
code	String	Definition: Model name. Range: N/A
version	String	Definition: Model version. Range: N/A
location	String	Definition: Model address. Range: N/A
desc	String	Definition: Model description. Range: N/A
series	String	Definition: Model brand. Range: N/A
type	String	Definition: Model type. Range: N/A

Table 5-392 JobEndpointsResp

Parameter	Type	Description
ssh	SSHResp object	Definition: SSH connection information.
jupyter_lab	JupyterLab object	Definition: JupyterLab connection information.
tensorboard	Tensorboard object	Definition: TensorBoard connection information.
mindstudio_insight	MindStudioInsight object	Definition: MindStudio Insight connection information.

Table 5-393 SSHResp

Parameter	Type	Description
key_pair_names	Array of strings	Definition: Name of the SSH key pair, which can be created and viewed on the Key Pair page of the Elastic Cloud Server (ECS) console. Range: N/A
task_urls	Array of TaskUrls objects	Definition: SSH connection address.

Table 5-394 TaskUrls

Parameter	Type	Description
task	String	Definition: Task ID of a training job. Range: N/A
url	String	Definition: SSH connection address of a training job. Range: N/A

Table 5-395 JupyterLab

Parameter	Type	Description
url	String	Definition: JupyterLab address of a training job. Range: N/A
token	String	Definition: JupyterLab token of a training job. Range: N/A

Table 5-396 Tensorboard

Parameter	Type	Description
url	String	Definition: TensorBoard address of a training job. Range: N/A
token	String	Definition: TensorBoard token of a training job. Range: N/A

Table 5-397 MindStudioInsight

Parameter	Type	Description
url	String	Definition: MindStudio Insight address of a training job. Range: N/A
token	String	Definition: MindStudio Insight token of a training job. Range: N/A

Example Requests

The following is an example of how to stop the training job whose UUID is **3faf5c03-aaa1-4cbe-879d-24b05d997347**.

```
POST https://endpoint/v2/{project_id}/training-jobs/3faf5c03-aaa1-4cbe-879d-24b05d997347/actions
{

5.11 Querying the Logs of a Specified Task in a Given Training Job (Preview)

Function

This API is used to query the logs of a specified task in a given training job on ModelArts (preview).

This API applies to the following scenario: When you need to view the running logs of a specified task in a training job, you can use this API to preview the logs. Before using this API, ensure that you have obtained the training job ID and task ID and have the permission to view logs. After the query is complete, the platform returns the preview information of the task logs. If the training job ID or task ID does not exist, no task log is generated, or you do not have the operation permission, the API will return an error message.

Debugging

You can debug this API through automatic authentication in [API Explorer](#) or use the SDK sample code generated by API Explorer.

Authorization Information

Each account has all the permissions required to call all APIs, but IAM users must be assigned the required permissions.

- If you are using role/policy-based authorization, see [Permissions Policies and Supported Actions](#) for details on the required permissions.
- If you are using identity policy-based authorization, the following identity policy-based permissions are required.

Action	Access Level	Resource Type (*: required)	Condition Key	Alias	Dependencies
modelarts:trainJob:get	Read	trainJob *	g:ResourceTag/<tag-key>	-	-
		-	• modelarts:poolType • modelarts:poolId		

URI

GET /v2/{project_id}/training-jobs/{training_job_id}/tasks/{task_id}/logs/preview

Table 5-398 Path Parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Definition: Project ID. For details, see Obtaining a Project ID and Name . Constraints: The value can contain 1 to 64 characters. Letters, digits, and hyphens (-) are allowed. Range: N/A Default Value: N/A

Parameter	Mandatory	Type	Description
training_job_id	Yes	String	Definition: Training job ID. For details, see Obtaining Training Jobs . Constraints: N/A Range: N/A Default Value: N/A
task_id	Yes	String	Definition: Name of a training job. You can obtain the value from the status.tasks field in the training job details. Constraints: For one node, the default is worker-0 . For multiple nodes, it includes worker-0 , worker-1 , and so on. Range: N/A Default Value: N/A
project_id	Yes	String	Definition: Project ID. For details, see Obtaining a Project ID and Name . Constraints: The value can contain 1 to 64 characters. Letters, digits, and hyphens (-) are allowed. Range: N/A Default Value: N/A
training_job_id	Yes	String	Definition: Training job ID. For details, see Obtaining Training Jobs . Constraints: N/A Range: N/A Default Value: N/A
task_id	Yes	String	Definition: Name of a training job. You can obtain the value from the status.tasks field in the training job details. Constraints: For one node, the default is worker-0 . For multiple nodes, it includes worker-0 , worker-1 , and so on. Range: N/A Default Value: N/A

Request Parameters

None

Response Parameters

Status code: 200

Table 5-399 Response body parameters

Parameter	Type	Description
content	String	Definition: Log content. If the size of a log file does not exceed the upper limit (n MB), all the log files are returned. Otherwise, the latest log file (n MB) is returned. After March 1, 2022, 00:00:00 (GMT+08:00), the parameter name is changed from context to content . Range: N/A
current_size	Integer	Definition: Size of the returned log file, in bytes. The maximum value is 5 MB. Range: N/A
full_size	Integer	Definition: Size of the complete log file, in bytes. Range: N/A

Example Requests

The following shows how to obtain the worker-0 logs of the training job whose UUID is **2cd88daa-31a4-40a8-a58f-d186b0e93e4f**.

```
GET https://endpoint/v2/{project_id}/training-jobs/2cd88daa-31a4-40a8-a58f-d186b0e93e4f/tasks/worker-0/logs/preview
```

5.12 Querying the Logs of a Specified Task in a Training Job (OBS Link)

Function

This API is used to obtain the OBS link where the log files of a specified training job are stored.

This API is used when you need to view or download the detailed log information of a training job task. Before using this API, ensure that the training job task exists and you have the required permission. After the query, the API returns the OBS link where the log files of the specified task are stored. If the training job task does not exist or you do not have the required permission, the API will return an error message.

Debugging

You can debug this API through automatic authentication in [API Explorer](#) or use the SDK sample code generated by API Explorer.

Authorization Information

Each account has all the permissions required to call all APIs, but IAM users must be assigned the required permissions.

- If you are using role/policy-based authorization, see [Permissions Policies and Supported Actions](#) for details on the required permissions.
- If you are using identity policy-based authorization, the following identity policy-based permissions are required.

Action	Access Level	Resource Type (*: required)	Condition Key	Alias	Dependencies
modelarts:trainJob:logExport	Write	trainJob *	-	-	-

URI

GET /v2/{project_id}/training-jobs/{training_job_id}/tasks/{task_id}/logs/url

Table 5-400 Path Parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Definition: Project ID. For details, see Obtaining a Project ID and Name . Constraints: The value can contain 1 to 64 characters. Letters, digits, and hyphens (-) are allowed. Range: N/A Default Value: N/A
training_job_id	Yes	String	Definition: Training job ID. For details, see Obtaining Training Jobs . Constraints: N/A Range: N/A Default Value: N/A
task_id	Yes	String	Definition: Name of a training job. You can obtain the value from the status.tasks field in the training job details. Constraints: For one node, the default is worker-0 . For multiple nodes, it includes worker-0 , worker-1 , and so on. Range: N/A Default Value: N/A

Request Parameters

Table 5-401 Request header parameters

Parameter	Mandatory	Type	Description
Content-Type	No	String	Definition: Message body type. Constraints: N/A Range • text/plain: A temporary preview link is returned. • application/octet-stream: A temporary download link is returned. Default Value: N/A
start_time	No	Long	Definition: Start time of log query. Constraints: This parameter is only valid for jobs for which the log download by time is enabled. If a shard contains logs within the time range, the shard is matched. Range: N/A. Default Value: N/A.
end_time	No	Long	Definition: End time of log query. Constraints: This parameter is only valid for jobs for which the log download by time is enabled. If a shard contains logs within the time range, the shard is matched. Range: N/A. Default Value: N/A.

Response Parameters

Status code: 200

Table 5-402 Response body parameters

Parameter	Type	Description
obs_url	String	Definition: Temporary OBS URL of logs. You can copy the URL to the browser to view all logs. Range: N/A
shards	Shards object	Definition: Log shard information. Range: N/A.

Table 5-403 Shards

Parameter	Type	Description
object_urls	Array of strings	Definition: OBS download link set of the log shards. Range: N/A.
count	Integer	Definition: Number of log shards returned in the request. Range: N/A.
total	Integer	Definition: Total number of log shards matched in the request. Range: N/A.

Example Requests

The following shows how to query the temporary OBS URL for the **work-0** tasks of the training job whose UUID is **2cd88daa-31a4-40a8-a58f-d186b0e93e4f**.

```
GET https://endpoint/v2/{project_id}/training-jobs/2cd88daa-31a4-40a8-a58f-d186b0e93e4f/tasks/worker-0/
logs/url?Content-Type=text/plain
```

Example Responses

Status code: 200

ok

```

5.13 Querying the Running Metrics of a Specified Task in a Training Job

Function

This API is used to query the running metrics of a specified task in a training job on ModelArts.

This API applies to the following scenario: When you need to view the performance metrics of a specified task in a training job, you can call this API to obtain the running metrics. Before using this API, ensure that you have obtained the training job ID and task ID and have the permission to view running metrics. After the query is complete, the platform returns the performance metrics of the task. If the training job ID or task ID does not exist, no task metric is generated, or you do not have the operation permission, the API will return an error message.

Debugging

You can debug this API through automatic authentication in [API Explorer](#) or use the SDK sample code generated by API Explorer.

Authorization Information

Each account has all the permissions required to call all APIs, but IAM users must be assigned the required permissions.

- If you are using role/policy-based authorization, see [Permissions Policies and Supported Actions](#) for details on the required permissions.
- If you are using identity policy-based authorization, the following identity policy-based permissions are required.

Action	Access Level	Resource Type (*: required)	Condition Key	Alias	Dependencies
modelarts:trainJob:get	Read	trainJob *	g:ResourceTag/<tag-key>	-	-
		-	• modelarts:poolType • modelarts:poolId		

URI

GET /v2/{project_id}/training-jobs/{training_job_id}/metrics/{task_id}

Table 5-404 Path Parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Definition: Project ID. For details, see Obtaining a Project ID and Name . Constraints: The value can contain 1 to 64 characters. Letters, digits, and hyphens (-) are allowed. Range: N/A Default Value: N/A
training_job_id	Yes	String	Definition: Training job ID. For details, see Obtaining Training Jobs . Constraints: N/A Range: N/A Default Value: N/A
task_id	Yes	String	Definition: Name of a training job. You can obtain the value from the status.tasks field in the training job details. Constraints: For one node, the default is worker-0 . For multiple nodes, it includes worker-0 , worker-1 , and so on. Range: N/A Default Value: N/A

5.14 Querying a Training Job List

Function

This API is used to obtain the list of all training jobs on ModelArts.

This API applies to the following scenarios: When you need to view all training jobs on the platform, you can use this API to obtain the job list. Before using this API, ensure that you have the permission to view the training job list. After the query is complete, the platform returns a training job list. Information such as the training job name, ID, and status is displayed. If you do not have the permission to perform operations, the API will return an error message.

Debugging

You can debug this API through automatic authentication in [API Explorer](#) or use the SDK sample code generated by API Explorer.

Authorization Information

Each account has all the permissions required to call all APIs, but IAM users must be assigned the required permissions.

- If you are using role/policy-based authorization, see [Permissions Policies and Supported Actions](#) for details on the required permissions.
- If you are using identity policy-based authorization, the following identity policy-based permissions are required.

Action	Access Level	Resource Type (*: required)	Condition Key	Alias	Dependencies
modelarts:trainJob:list	List	-	-	-	-

URI

POST /v2/{project_id}/training-job-searches

Table 5-407 Path Parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Definition: Project ID. For details, see Obtaining a Project ID and Name . Constraints: The value can contain 1 to 64 characters. Letters, digits, and hyphens (-) are allowed. Range: N/A Default Value: N/A

Request Parameters

Table 5-408 Request body parameters

Parameter	Mandatory	Type	Description
workspace_id	No	String	Definition: Workspace ID. Constraints: N/A. Range: 0 or a string of 32 characters. Default Value: 0
offset	No	Integer	Definition: Number of pages for querying jobs. Constraints: The minimum value is 0. For example, if this parameter is set to 0, the query starts from the first page. Range: N/A Default Value: N/A
limit	No	Integer	Definition: Number of records on each page for querying jobs. Constraints: The value ranges from 1 to 50. Range: N/A Default Value: N/A

Parameter	Mandatory	Type	Description
sort_by	No	String	Definition: Metric for sorting jobs to be queried. Constraints: N/A. Range: N/A. Default Value: <code>create_time</code> is used for sorting by default.
order	No	String	Definition: Order of queried jobs. Constraints: N/A Range: • asc: ascending order • desc: descending order. Default Value: <code>desc</code>
group_by	No	String	Definition: Condition for grouping the jobs to be queried Constraints: N/A Range: N/A Default Value: N/A
unified_jobs	No	Boolean	Definition: Whether to enable joint query of custom jobs and fine-tuning jobs. Constraints: N/A Range • true: Enable the joint query of custom jobs and fine-tuning jobs. • false: Disable the joint query of custom jobs and fine-tuning jobs. Default Value: <code>false</code>

Parameter	Mandatory	Type	Description
train_type	No	String	Definition: When the joint query of custom jobs and fine-tuning jobs is enabled, only custom jobs or fine-tuning jobs are displayed. Constraints: N/A. Range: • job: Only custom jobs are queried. • ftjob: Only fine-tuning jobs are queried. Default Value: N/A.
filters	No	Array of Filter objects	Definition: Filter criteria for obtaining training jobs. Constraints: N/A

Table 5-409 Filter

Parameter	Mandatory	Type	Description
operator	No	String	Definition: Grouping condition key operators. Constraints: N/A Range: • between: a range • in: include • not: not like: similar Default Value: N/A
value	No	Array of strings	Definition: Value of the grouping condition key. Constraints: The maximum value of the creation time filter is 31 days.

Response Parameters

Status code: 200

Table 5-410 Response body parameters

Parameter	Type	Description
total	Integer	Definition: Total number of training jobs of the current user. Range: N/A
count	Integer	Definition: Total number of training jobs that meet the search criteria of the current user. Range: N/A
limit	Integer	Definition: Number of records on each page for querying jobs. The value ranges from 1 to 50 . Range: N/A
offset	Integer	Definition: Number of pages for querying jobs. The minimum value is 0 . For example, if this parameter is set to 0 , the query starts from the first page. Range: N/A
sort_by	String	Definition: Metric for sorting jobs to be queried create_time is used by default. Range: N/A
order	String	Definition: Order of queried jobs. The default value is desc , indicating the descending order. You can also set this parameter to asc , indicating the ascending order. Range: N/A
group_by	String	Definition: Condition for grouping the jobs to be queried Range: N/A
workspace_id	String	Definition: Workspace where a training job is deployed. The default value is 0 . Range: N/A
ai_project	String	Definition: AI project to which a job belongs. The default value is default-ai-project . Range: N/A

Parameter	Type	Description
unified_jobs	Boolean	Definition: Whether to enable joint query of custom jobs and fine-tuning jobs. Range - true: Enable the joint query of custom jobs and fine-tuning jobs. - false: Disable the joint query of custom jobs and fine-tuning jobs.
train_type	String	Definition: When the joint query of custom jobs and fine-tuning jobs is enabled, only custom jobs or fine-tuning jobs are displayed. Range: - job: Only custom jobs are queried. - ftjob: Only fine-tuning jobs are queried.
items	Array of JobResponse objects	Definition: Details of the training jobs that meet the search criteria of the current user.

Table 5-411 JobResponse

Parameter	Type	Description
kind	String	Definition: Type of a training job. Range • job: common job • federated_pool_job: resource pool federated job • edge_job: edge job • hetero_job: heterogeneous job • mrs_job: MRS job • autosearch_job: auto search job • diag_job: diagnosis job • visualization_job: visualization job
metadata	JobMetadataResponse object	Definition: Training job metadata.
status	Status object	Definition: Training job status information.
algorithm	JobAlgorithmResponse object	Definition: Training job algorithm.

Parameter	Type	Description
tasks	Array of TaskResponse objects	Definition: Heterogeneous training tasks.
spec	SpecResponse object	Definition: Training job specifications.
endpoints	JobEndpointsResponse object	Definition: Configurations required for remotely accessing a training job.

Table 5-412 JobMetadataResponse

Parameter	Type	Description
id	String	Definition: Training job ID, which is generated and returned by ModelArts after a training job is created. Range: N/A
name	String	Definition: Name of a training job. Range: The value must contain 1 to 64 characters consisting of only digits, letters, underscores (_), and hyphens (-).
workspace_id	String	Definition: Workspace where a specified job is located. Range: N/A
description	String	Definition: Definition of a training job. Range: N/A
create_time	Long	Definition: Time when a training job was created, in milliseconds. The value is generated and returned by ModelArts after a training job is created. Range: N/A
user_name	String	Definition: Username for creating a training job. The username is generated and returned by ModelArts after a training job is created. Range: N/A
annotations	Map<String,String>	Definition: Advanced functions of a training job.

Table 5-413 Status

Parameter	Type	Description
phase	String	Definition: Level-1 status of a training job. Range: • Creating: The job is being created. • Pending: The job is pending. • Running: The job is running. • Failed: The job failed to run. • Completed: The job is complete. • Terminating: The job is being stopped. • Terminated: The job has been stopped. • Abnormal: The job is abnormal.
secondary_phase	String	Definition: Level-2 status of a training job. The values are internal detailed statuses and may be added, changed, or deleted. Dependency on the status is not recommended. Range: • Creating: The job is being created. • Queuing: The job is queuing. • Running: The job is running. • Failed: The job failed to run. • Completed: The job is complete. • Terminating: The job is being stopped. • Terminated: The job has been stopped. • CreateFailed: The job fails to be created. • TerminatedFailed: The job fails to be stopped. • Unknown: The job is in an unknown state. • Lost: The job is abnormal.
duration	Long	Definition: Running duration of a training job, in ms. Range: N/A
node_count_metrics	Array<Array<Integer>>	Definition: Node quantity change metric during a training job runtime.

Parameter	Type	Description
tasks	Array of strings	Definition: Training job subtask name.
start_time	Long	Definition: Timestamp when a training job is started. Range: N/A
task_statuses	Array of TaskStatuses objects	Definition: Status of the first failed subtask of a training job.
running_records	Array of RunningRecord objects	Definition: Running and fault recovery records of a training job.

Table 5-414 TaskStatuses

Parameter	Type	Description
task	String	Definition: Training job subtask name. Range: N/A
exit_code	Integer	Definition: Exit code of a training job subtask. Range: N/A
message	String	Definition: Error message of a training job subtask. Range: N/A

Table 5-415 RunningRecord

Parameter	Type	Description
start_at	Integer	Definition: Unix timestamp of the start time in the current running record, in seconds. Range: N/A
end_at	Integer	Definition: Unix timestamp of the end time in the current running record, in seconds. Range: N/A
xpu_start_at	Integer	Definition: Unix timestamp of the accelerator card startup time in the current running record, in seconds. Range: N/A

Parameter	Type	Description
start_type	String	Definition: Startup mode of the current execution. Range • init_or_rescheduled: This startup is the first running after scheduling, including the first startup and the running after scheduling recovery. • restarted: This startup is not the first running after scheduling but the running after a process restart.
end_reason	String	Definition: Reason why the running ends. Range: N/A
end_related_task	String	Definition: ID of the task worker (for example, worker-0) that ends the running. Range: N/A
end_recover	String	Definition: Fault tolerance policy adopted when the execution ends abnormally. Range • npu_proc_restart: NPU in-place hot recovery • proc_restart: in-place process recovery • npu_step_retry: step recomputation • pod_reschedule: pod-level rescheduling • job_reschedule: job-level rescheduling • job_reschedule_with_taint: isolated job-level rescheduling
end_recover_before_downgrade	String	Definition: There is a downgrade relationship between policies. If a policy fails to be executed, it will be downgraded to another specified policy. end_recover_before_downgrade indicates the tolerance policy used before end_recover is downgraded. Range: same as that of end_recover .

Parameter	Type	Description
recover_records	Array of RecoverRecord objects	Definition: details about all fault tolerance policies adopted when the execution ends abnormally.

Table 5-416 RecoverRecord

Parameter	Type	Description
recover_start_at	Integer	Unix timestamp of the start time of the fault tolerance policy, in seconds. The timestamp is also the fault occurrence time.
recover_end_at	Integer	Unix timestamp of the end time of the fault tolerance policy, in seconds.
recover	String	Fault tolerance policy. Options: • npu_step_retry: step recomputation • npu_proc_restart: NPU in-place hot recovery • proc_restart: in-place process recovery • pod_reschedule: pod-level rescheduling • job_reschedule: job-level rescheduling • job_reschedule_with_taint: isolated job-level rescheduling
fault_scenario	String	Fault scenario. Options: • chip_fault: chip fault • node_fault: node fault • job_failed: job exit upon a failure • job_hanged: job suspension • job_subhealth: job subhealth • error_in_log: log exception
reason	String	Cause of the fault.
related_task	String	ID of the task worker that causes the end of the current running record, for example, worker-0 .

Parameter	Type	Description
recover_result	String	Execution result of the fault. Options: • recovering: executing • success: successful • failed: failed • downgrade: policy downgrade

Table 5-417 JobAlgorithmResponse

Parameter	Type	Description
id	String	Definition: Training job algorithm. Range: • id: Only the algorithm ID is used. • subscription_id+item_version_id: The subscription ID and version ID of the algorithm are used. • code_dir+boot_file: The code directory and boot file of the training job are used.
name	String	Definition: Algorithm name. Range: N/A
subscription_id	String	Definition: Subscription ID of a subscription algorithm, which must be used with item_version_id . Range: N/A
item_version_id	String	Definition: Version of a subscription algorithm, which must be used with subscription_id . Range: N/A
code_dir	String	Definition: Code directory of a training job, for example, /usr/app/ . This parameter must be used with boot_file . Leave this parameter blank if id , or subscription_id and item_version_id are specified. Range: N/A

Parameter	Type	Description
boot_file	String	Definition: Boot file of a training job, which must be stored in the code directory, for example, <code>/usr/app/boot.py</code> . This parameter must be used with <code>code_dir</code> . Leave this parameter blank if <code>id</code> , or <code>subscription_id</code> and <code>item_version_id</code> are specified. Range: N/A
autosearch_config_path	String	Definition: YAML configuration path of an auto search job. An OBS URL is required. For example, <code>obs://bucket/file.yaml</code> . Range: N/A
autosearch_framework_path	String	Definition: Framework code directory of an auto search job. An OBS URL is required. For example, <code>obs://bucket/files/</code> . Range: N/A
command	String	Definition: Boot command for starting the container of a custom image for a training job. For example, <code>python train.py</code> . Range: N/A
parameters	Array of <code>ParameterResp</code> objects	Definition: Running parameters of the training job.
policies	<code>policies</code> object	Definition: Policy supported by a job.
inputs	Array of <code>InputResp</code> objects	Definition: Data input of a training job.
outputs	Array of <code>OutputResp</code> objects	Definition: Output of the training job.
engine	<code>JobEngineResp</code> object	Definition: Engine of a training job. Leave this parameter blank if the job is created using <code>id</code> of the algorithm in algorithm management, or <code>subscription_id+item_version_id</code> of the subscribed algorithm.

Parameter	Type	Description
local_code_dir	String	Definition: Local directory of the training container to which the algorithm code directory is downloaded. The rules are as follows: • The directory must be under / home. • In v1 compatibility mode, the current field does not take effect. • When code_dir is prefixed with file://, the current field does not take effect. Range: N/A
working_dir	String	Definition: Work directory where an algorithm is executed. Rules: In v1 compatibility mode, this parameter does not take effect. Range: N/A
environments	Array of Map<String,String> objects	Definition: Environment variables of a training job. The format is key:value . Leave this parameter blank.
summary	SummaryResp object	Definition: Visualization log summary.

Table 5-418 ParameterResp

Parameter	Type	Description
name	String	Definition: Parameter name. Range: N/A
value	String	Definition: Parameter value. Range: N/A
description	String	Definition: Parameter description. Range: N/A
constraint	constraint object	Definition: Parameter attribute.
i18n_description	i18n_description object	Definition: Internationalization description.

Table 5-419 constraint

Parameter	Type	Description
editable	Boolean	Definition: Whether the parameter can be edited. Range: • true: editable • false: Not uneditable
required	Boolean	Definition: Whether the parameter is mandatory. Range: • true: mandatory • false: optional
sensitive	Boolean	Definition: Whether the parameter is sensitive. This function is unavailable currently. Range: • true: sensitive • false: insensitive
valid_range	Array of strings	Definition: Valid range.

Table 5-420 i18n_description

Parameter	Type	Description
language	String	Definition: Internationalization language. The options are as follows: • zh-cn: Chinese • en-us: English Range: N/A
description	String	Definition: Internationalization language description. Range: N/A

Table 5-421 policies

Parameter	Type	Description
auto_search	auto_search object	Definition: Hyperparameter search configuration.

Table 5-422 auto_search

Parameter	Type	Description
skip_search_params	String	Definition: Hyperparameter parameters that need to be skipped. Range: N/A
reward_attrs	Array of reward_attrs objects	Definition: Search metrics.
search_params	Array of search_params objects	Definition: Search parameters.
algo_configs	Array of algo_configs objects	Definition: Search algorithm configurations.

Table 5-423 reward_attrs

Parameter	Type	Description
name	String	Definition: Metric name. Range: N/A
mode	String	Definition: Search mode. Range: • max: A larger metric value is preferred. • min: A smaller metric value is preferred.
regex	String	Definition: Regular expression of a metric. Range: N/A

Table 5-424 search_params

Parameter	Type	Description
name	String	Definition: Hyperparameter name. Range: N/A

Parameter	Type	Description
param_type	String	Definition: Parameter type. Range: • continuous: The hyperparameter is of the continuous type. When an algorithm is used in a training job, continuous hyperparameters are displayed as text boxes on the console. • discrete: The hyperparameter is of the discrete type. When an algorithm is used in a training job, discrete hyperparameters are displayed as drop-down lists on the console.
lower_bound	String	Definition: Lower bound of the hyperparameter. Range: N/A
upper_bound	String	Definition: Upper bound of the hyperparameter. Range: N/A
discrete_points_num	String	Definition: Number of discrete points of a hyperparameter with continuous values. Range: N/A
discrete_values	Array of strings	Definition: Discrete hyperparameter values.

Table 5-425 algo_configs

Parameter	Type	Description
name	String	Definition: Search algorithm name. Range: N/A
params	Array of AutoSearchAlgoConfigParameterResp objects	Definition: Search algorithm parameters.

Table 5-426 AutoSearchAlgoConfigParameterResp

Parameter	Type	Description
key	String	Definition: Parameter key. Range: N/A
value	String	Definition: Parameter value. Range: N/A

Table 5-427 InputResp

Parameter	Type	Description
name	String	Definition: Name of the data input channel. Range: N/A
description	String	Definition: Description of the data input channel. Range: N/A
local_dir	String	Definition: Local path of the container to which the data input channels are mapped. Example: <code>/home/ma-user/modelarts/inputs/data_url_0</code> Range: N/A
access_method	String	Definition: Access method of the input data channel path (<code>local_dir</code>). Range: • parameter: hyperparameters • env: environment variables
remote	InputDataInfoResp object	Definition: Description of the actual data input.
remote_constraint	Array of remote_constraint objects	Definition: Data input constraint.

Table 5-428 InputDataInfoResp

Parameter	Type	Description
dataset	dataset object	Definition: The input is a dataset.
obs	obs object	Definition: OBS in which data input and output are stored.

Table 5-429 dataset

Parameter	Type	Description
id	String	Definition: Dataset ID of a training job. Range: N/A
version_id	String	Definition: Dataset version ID of a training job. Constraints: This parameter is mandatory when an old-version dataset is used, that is, service_type is not V3 . Range: N/A
obs_url	String	Definition: OBS URL of the dataset for a training job. It is automatically parsed by ModelArts based on the dataset ID and dataset version ID. For example, /usr/data/ . Range: N/A
service_type	String	Definition: Dataset service type. Constraints: N/A Range: N/A Default Value: V3 indicates that a dataset provided by the asset service is used. Other values indicate that an old-version dataset is used.
name	String	Definition: Dataset name of a training job. Range: N/A

Table 5-430 obs

Parameter	Type	Description
obs_url	String	Definition: OBS URL of the dataset for a training job, For example, /usr/data/ . Range: N/A

Table 5-431 remote_constraint

Parameter	Type	Description
data_type	String	Definition: Data input type, including the data storage location and dataset. Constraints: N/A Range: N/A Default Value: N/A
attributes	String	Definition: Related attributes. Constraints: N/A Range: If the input is a dataset: • data_format: data format • data_segmentation: data segmentation method • dataset_type: data labeling type Default Value: N/A

Table 5-432 OutputResp

Parameter	Type	Description
name	String	Definition: Name of the data output channel. Range: N/A
description	String	Definition: Description of the data output channel. Range: N/A
local_dir	String	Definition: Local path of the container to which the data output channels are mapped. Range: N/A
access_method	String	Definition: Access method of the input data channel path (local_dir). Range: • parameter: hyperparameters • env: environment variables
remote	RemoteResp object	Definition: Description of the actual data output.

Table 5-433 JobEngineResp

Parameter	Type	Description
engine_id	String	Definition: Engine ID selected for a training job. Range: N/A
engine_name	String	Definition: Engine name selected for a training job. Range: N/A
engine_version	String	Definition: Engine version selected for a training job. Range: N/A
image_url	String	Definition: Custom image URL selected for a training job. The URL is obtained from SWR. Range: N/A
install_sys_packages	Boolean	Definition: Specifies whether to install the MoXing version specified by the training platform. Range: • true: yes • false: no

Table 5-434 SummaryResp

Parameter	Type	Description
log_dir	LogDirResp object	Definition: Visualization log output of a training job.
data_sources	Array of DataSourceResp objects	Definition: Visualization log input of the visualization job or training job debugging mode.

Table 5-435 LogDirResp

Parameter	Type	Description
pfs	PFSSummaryResp object	Definition: Output of an OBS parallel file system.

Table 5-436 PFSSummaryResp

Parameter	Type	Description
pfs_path	String	Definition: URL of the OBS parallel file system. Range: N/A

Table 5-437 DataSourceResp

Parameter	Type	Description
job	JobSummaryResp object	Definition: Job data source.

Table 5-438 JobSummaryResp

Parameter	Type	Description
job_id	String	Definition: ID of a training job. Range: N/A

Table 5-439 TaskResponse

Parameter	Type	Description
role	String	Definition: Task role. This function is not supported currently. Range: N/A
algorithm	TaskResponseAlgorithm object	Definition: Algorithm configurations for algorithm management.
task_resource	FlavorResponse object	Definition: Specifications of a training job or algorithm.
log_export_path	log_export_path object	Definition: Saved information about training job logs.

Table 5-440 TaskResponseAlgorithm

Parameter	Type	Description
code_dir	String	Definition: Absolute path of the directory where the algorithm boot file is stored. Range: N/A
boot_file	String	Definition: Absolute path of an algorithm boot file. Range: N/A
inputs	AlgorithmInput object	Definition: Information about the algorithm input channel.
outputs	AlgorithmOutput object	Definition: Information about the algorithm output channel.
engine	AlgorithmEngine object	Definition: Engine that a heterogeneous job depends on.
local_code_dir	String	Definition: Local directory of the training container to which the algorithm code directory is downloaded. The rules are as follows: • The directory must be under / home. • In v1 compatibility mode, the current field does not take effect. • When code_dir is prefixed with file://, the current field does not take effect. Range: N/A
working_dir	String	Definition: Work directory where an algorithm is executed. Note that this parameter does not take effect in v1 compatibility mode. Range: N/A
environments	Map<String,String>	Definition: Environment variables related to a training job. Range: N/A

Table 5-441 AlgorithmInput

Parameter	Type	Description
name	String	Definition: Name of the data input channel. Range: N/A
local_dir	String	Definition: Local path of the container to which the data input and output channels are mapped. Range: N/A
remote	AlgorithmRemote object	Definition: Actual data input, which can only be OBS for heterogeneous jobs.

Table 5-442 AlgorithmRemote

Parameter	Type	Description
obs	RemoteObsResp object	Definition: OBS in which data input and output are stored.

Table 5-443 AlgorithmOutput

Parameter	Type	Description
name	String	Definition: Name of the data output channel. Range: N/A
local_dir	String	Definition: Local path of the container to which the data output channels are mapped. Range: N/A
remote	RemoteResp object	Definition: Description of the actual data output.
mode	String	Definition: Data transmission mode. The default value is upload_periodically . Range: N/A
period	String	Definition: Data transmission period. The default value is 30s . Range: N/A

Table 5-444 RemoteResp

Parameter	Type	Description
obs	RemoteObsResp object	Definition: Data actually output to OBS.

Table 5-445 RemoteObsResp

Parameter	Type	Description
obs_url	String	Definition: Path of the data output to OBS. Range: N/A

Table 5-446 AlgorithmEngine

Parameter	Type	Description
engine_id	String	Definition: Engine flavor ID, for example, caffe-1.0.0-python2.7 . Range: N/A
engine_name	String	Definition: Engine flavor name, for example, Caffe . Range: N/A
engine_version	String	Definition: Engine flavor version. Engines with the same name have multiple versions, for example, Caffe-1.0.0-python2.7 of Python 2.7. Range: N/A
v1_compatible	Boolean	Definition: Specifies whether the v1 compatibility mode is used. Range: • true: The v1 compatibility mode is used. • false: The v1 compatibility mode is not used.
run_user	String	Definition: Default UID for the engine startup. Range: N/A
image_url	String	Definition: Custom image URL selected for an algorithm. Range: N/A

Table 5-447 FlavorResponse

Parameter	Type	Description
pool_id	String	Definition: ID of the resource pool selected for a training job. Range: N/A
flavor_id	String	Definition: Resource flavor ID. Range: N/A
flavor_name	String	Definition: Resource flavor name. Range: N/A
max_num	Integer	Definition: Maximum number of nodes supported by a flavor. Range: N/A
billing	BillingInfo object	Definition: Billing information of a resource flavor.
flavor_info	FlavorInfoResponse object	Definition: Resource flavor details.
attributes	Map<String,String>	Definition: Other flavor attributes. Range: N/A

Table 5-448 FlavorInfoResponse

Parameter	Type	Description
max_num	Integer	Definition: Maximum number of nodes that can be selected. The value 1 indicates that the distributed mode is not supported. Range: N/A
cpu	Cpu object	Definition: CPU specifications.
gpu	Gpu object	Definition: GPU specifications.
npu	Npu object	Definition: Ascend specifications.
memory	Memory object	Definition: Memory information.
disk	DiskResponse object	Definition: Disk information.

Table 5-449 DiskResponse

Parameter	Type	Description
size	Integer	Definition: Disk size. Range: N/A
unit	String	Definition: Unit of the disk size. Range: N/A

Table 5-450 log_export_path

Parameter	Type	Description
obs_url	String	Definition: OBS path for storing training job logs.

Table 5-451 SpecResponse

Parameter	Type	Description
resource	Resource object	Definition: Resource flavor of a training job. Select either flavor_id or pool_id and flavor_id .
volumes	Array of JobVolumeResp objects	Definition: Mounting volume information of a training job.
log_export_path	LogExportPathResp object	Definition: Log output of a training job.
schedule_policy	SchedulePolicyResp object	Definition: Scheduling policy of a training job.
custom_metrics	Array of CustomMetrics objects	Definition: Metric collection configuration.
output_model	OutputModelResp object	Definition: Output information of a custom training job.
asset_model	AssetModelResp object	Definition: Information about the model created using a custom training job.

Table 5-452 Resource

Parameter	Type	Description
policy	String	Definition: Resource flavor mode of a training job. Range: • regular: standard mode
flavor_id	String	Definition: ID of the resource flavor of a training job. Range: The flavor_id parameter cannot be specified for a dedicated resource pool of CPU specifications. The options for dedicated resource pools with GPU/Ascend specifications are as follows: • modelarts.pool.visual.xlarge (1 PU) • modelarts.pool.visual.2xlarge (2 PUs) • modelarts.pool.visual.4xlarge (4 PUs) • modelarts.pool.visual.8xlarge (8 PUs)
flavor_name	String	Definition: Read-only flavor name returned by ModelArts when flavor_id is used. Range: N/A
node_count	Integer	Definition: Number of resource replicas selected for a training job. Range: N/A
pool_id	String	Definition: ID of the resource pool selected for a training job. Range: N/A
pool_group_id	String	Definition: ID of the resource pool federation selected for a training job. Range: N/A
flavor_detail	FlavorDetail object	Definition: Flavor details of a training job or algorithm. This parameter is available only for public resource pools.
main_container_allocated_resources	MainContainerAllocatedResources object	Definition: Resource specifications actually obtained by the training container of a training job.

Parameter	Type	Description
main_container_customized_flavor	MainContainerCustomizedFlavor object	Definition: Custom flavor of a training job. Range: The number of CPU cores and memory size must be greater than 0, and the number of accelerator PUs must be greater than or equal to 0.

Table 5-453 FlavorDetail

Parameter	Type	Description
billing	BillingInfo object	Definition: Billing information of a resource flavor.
flavor_info	FlavorInfo object	Definition: Resource flavor details.

Table 5-454 BillingInfo

Parameter	Type	Description
code	String	Definition: Billing code. Range: N/A
unit_num	Integer	Definition: Billing unit. Range: N/A

Table 5-455 FlavorInfo

Parameter	Type	Description
max_num	Integer	Definition: Maximum number of nodes that can be selected. The value 1 indicates that the distributed mode is not supported. Range: N/A
cpu	Cpu object	Definition: CPU specifications.
gpu	Gpu object	Definition: GPU specifications.
npu	Npu object	Definition: Ascend specifications.
memory	Memory object	Definition: Memory information.
disk	Disk object	Definition: Disk information.

Table 5-456 Cpu

Parameter	Type	Description
arch	String	Definition: CPU architecture. Range: N/A
core_num	Integer	Definition: Number of cores. Range: N/A

Table 5-457 Gpu

Parameter	Type	Description
unit_num	Integer	Definition: Number of GPUs. Range: N/A
product_name	String	Definition: Product name. Range: N/A
memory	String	Definition: Memory. Range: N/A

Table 5-458 Npu

Parameter	Type	Description
unit_num	String	Definition: Number of NPUs. Range: N/A
product_name	String	Definition: Product name. Range: N/A
memory	String	Definition: Memory. Range: N/A

Table 5-459 Memory

Parameter	Type	Description
size	Integer	Definition: Memory size. Range: N/A
unit	String	Definition: Number of memory units. Range: N/A

Table 5-460 Disk

Parameter	Type	Description
size	String	Definition: Disk size. Range: N/A
unit	String	Definition: Unit of the disk size. Generally, the unit is GB. Range: N/A

Table 5-461 MainContainerAllocatedResources

Parameter	Type	Description
cpu_arch	String	Definition: CPU architecture. Range: N/A
cpu_core_num	Float	Definition: Number of cores. Range: N/A
mem_size	Float	Definition: Memory information. Range: N/A
accelerator_num	Float	Definition: Number of accelerator cards. Range: N/A
accelerator_type	String	Definition: Type of accelerator cards. For example, ascend-d910b and ascend-snt9c. Range: N/A

Table 5-462 MainContainerCustomizedFlavor

Parameter	Type	Description
cpu_core_num	Float	Definition: Number of CPU cores. Range: greater than 0
mem_size	Float	Definition: Memory size. Range: greater than 0
accelerator_num	Float	Definition: Number of accelerator cards. Range: greater than or equal to 0

Table 5-463 JobVolumeResp

Parameter	Type	Description
nfs	NfsResp object	Definition: Volumes attached in NFS mode.

Table 5-464 NfsResp

Parameter	Type	Description
nfs_server_path	String	Definition: NFS server path, for example, 10.10.10.10:/example/path . Range: N/A
local_path	String	Definition: Path for attaching volumes to the training container, for example, /example/path . Range: N/A
read_only	Boolean	Definition: Specifies whether the disks attached to the container in NFS mode are read-only. Range: • true: read only • false: non-read-only

Table 5-465 LogExportPathResp

Parameter	Type	Description
obs_url	String	Definition: OBS path for storing training job logs, for example, obs://example/path . Range: N/A
host_path	String	Definition: Path of the host where training job logs are stored, for example, /example/path . Range: N/A

Table 5-466 SchedulePolicyResp

Parameter	Type	Description
required_affinity	RequiredAffinityResp object	Definition: Affinity requirements of a training job.

Parameter	Type	Description
priority	Integer	Definition: Priority of a training job. Range: 0 to 3
preemptible	Boolean	Definition: Whether the resource can be preempted. Range: • true: The resource can be preempted. • false: The resource cannot be preempted.

Table 5-467 RequiredAffinityResp

Parameter	Type	Description
affinity_type	String	Definition: Affinity scheduling policy. Range: • cabinet: strong cabinet scheduling • hyperinstance: supernode affinity scheduling
affinity_group_size	Integer	Definition: Size of an affinity group. Range: N/A

Table 5-468 CustomMetrics

Parameter	Type	Description
exec	Exec object	Definition: Metrics are collected in CLI mode.
http_get	HttpGet object	Definition: Metrics are collected in HTTP mode.

Table 5-469 Exec

Parameter	Type	Description
command	Array of strings	Definition: Metrics are collected in CLI mode. Range: N/A.

Table 5-470 HttpGet

Parameter	Type	Description
path	String	Definition: URL for obtaining metrics over HTTP. Both the URL and the port below must either be configured together or remain empty. Range: N/A
port	Integer	Definition: Port for obtaining metrics over HTTP. This parameter and the URL above must be set or left blank at the same time. Range: N/A

Table 5-471 OutputModelResp

Parameter	Type	Description
obs	ObsModelResp object	Definition: OBS output information stored by a custom training job. Range: N/A

Table 5-472 ObsModelResp

Parameter	Type	Description
obs_url	String	Definition: OBS path for storing custom training jobs, for example, obs://example/path . Range: N/A
local_path	String	Definition: Path of the host where custom training jobs are stored, for example, /example/path . Range: N/A

Table 5-473 AssetModelResp

Parameter	Type	Description
id	String	Definition: Model ID. Range: N/A
name	String	Definition: Model name. Range: N/A

Parameter	Type	Description
code	String	Definition: Model name. Range: N/A
version	String	Definition: Model version. Range: N/A
location	String	Definition: Model address. Range: N/A
desc	String	Definition: Model description. Range: N/A
series	String	Definition: Model brand. Range: N/A
type	String	Definition: Model type. Range: N/A

Table 5-474 JobEndpointsResp

Parameter	Type	Description
ssh	SSHResp object	Definition: SSH connection information.
jupyter_lab	JupyterLab object	Definition: JupyterLab connection information.
tensorboard	Tensorboard object	Definition: TensorBoard connection information.
mindstudio_insight	MindStudioInsight object	Definition: MindStudio Insight connection information.

Table 5-475 SSHResp

Parameter	Type	Description
key_pair_names	Array of strings	Definition: Name of the SSH key pair, which can be created and viewed on the Key Pair page of the Elastic Cloud Server (ECS) console. Range: N/A
task_urls	Array of TaskUrls objects	Definition: SSH connection address.

Table 5-476 TaskUrls

Parameter	Type	Description
task	String	Definition: Task ID of a training job. Range: N/A
url	String	Definition: SSH connection address of a training job. Range: N/A

Table 5-477 JupyterLab

Parameter	Type	Description
url	String	Definition: JupyterLab address of a training job. Range: N/A
token	String	Definition: JupyterLab token of a training job. Range: N/A

Table 5-478 Tensorboard

Parameter	Type	Description
url	String	Definition: TensorBoard address of a training job. Range: N/A
token	String	Definition: TensorBoard token of a training job. Range: N/A

Table 5-479 MindStudioInsight

Parameter	Type	Description
url	String	Definition: MindStudio Insight address of a training job. Range: N/A
token	String	Definition: MindStudio Insight token of a training job. Range: N/A

Example Requests

The following is an example of how to obtain training jobs. The number of obtained training jobs has been limited to **1**, and the system will only query data for training jobs with names containing **trainjob**.

```
POST https://endpoint/v2/{project_id}/training-job-searches?limit=1
```

```
{
  "offset" : 0,
  "limit" : 1,
  "filters" : [ {
    "key" : "name",
    "operator" : "like",
    "value" : [ "trainjob" ]
  }, {

Error Codes

See [Error Codes](#).

5.15 Obtaining the Events of a Training Job

Function

This API is used to obtain the events of a training job on ModelArts.

This API applies to the following scenario: When you need to view the event records of a specific training job, you can use this API to obtain the event list. Before using this API, ensure that you have obtained the training job ID and have the permission to view the event list. After the query is complete, the platform returns the event records of the training job. If the training job ID does not exist or you do not have the operation permission, the API will return an error message.

Debugging

You can debug this API through automatic authentication in [API Explorer](#) or use the SDK sample code generated by API Explorer.

Authorization Information

Each account has all the permissions required to call all APIs, but IAM users must be assigned the required permissions.

- If you are using role/policy-based authorization, see [Permissions Policies and Supported Actions](#) for details on the required permissions.
- If you are using identity policy-based authorization, no identity policy-based permission required for calling this API.

URI

GET /v2/{project_id}/training-jobs/{training_job_id}/events

Table 5-480 Path Parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Definition: Project ID. For details, see Obtaining a Project ID and Name . Constraints: The value can contain 1 to 64 characters. Letters, digits, and hyphens (-) are allowed. Range: N/A Default Value: N/A
training_job_id	Yes	String	Definition: Training job ID. For details, see Obtaining Training Jobs . Constraints: N/A Range: N/A Default Value: N/A

Table 5-481 Query Parameters

Parameter	Mandatory	Type	Description
offset	No	Integer	Definition: Offset of data records Constraints: N/A Range: N/A Default Value: N/A
limit	No	Integer	Definition: Maximum number of records returned on each page Constraints: N/A Range: [1, 100] Default Value: 50
order	No	String	Definition: Instance order Constraints: N/A Range: N/A Default Value: N/A

Parameter	Mandatory	Type	Description
start_time	No	String	Definition: Start time Constraints: The start time must be passed together with the end time. Range: N/A Default Value: N/A
end_time	No	String	Definition: End time Constraints: The end time must be passed together with the start time. Range: N/A Default Value: N/A
level	No	String	Definition: Level of the event to be returned Constraints: N/A Range: [Info Error Warning] Default Value: N/A
pattern	No	String	Definition: Content contained in an event Constraints: The value can contain a maximum of 256 characters. Range: N/A Default Value: N/A
source	No	String	Definition: Source of the event to be returned Constraints: N/A Range: [K8S Job Task] Default Value: N/A

Request Parameters

5.16 Obtaining the public flavors supported by a training job.

Function

This API is used to obtain the supported resource specifications of training jobs on ModelArts.

This API applies to the following scenario: When you need to know the resource specifications supported by the platform to configure training jobs, you can use this API to obtain the specification list. Before using this API, ensure that you have the permission to view the resource specifications. After the query is complete, the

platform returns the supported resource specifications. If you do not have the permission to perform operations, the API will return an error message.

Debugging

You can debug this API through automatic authentication in [API Explorer](#) or use the SDK sample code generated by API Explorer.

Authorization Information

Each account has all the permissions required to call all APIs, but IAM users must be assigned the required permissions.

- If you are using role/policy-based authorization, see [Permissions Policies and Supported Actions](#) for details on the required permissions.
- If you are using identity policy-based authorization, no identity policy-based permission required for calling this API.

GET /v2/{project_id}/training-job-flavors

Table 5-486 Path Parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Definition: User project ID. For details, see Obtaining a Project ID and Name . Constraints: The value can contain 1 to 64 characters. Letters, digits, and hyphens (-) are allowed. Range: N/A. Default Value: N/A.

Table 5-487 Query Parameters

Parameter	Mandatory	Type	Description
flavor_type	No	String	Definition: Specification type to be queried. If this parameter is not specified, all specification types are queried. Constraints: N/A. Range: • CPU • GPU • Ascend: NPU resource specifications Default Value: N/A.

Request Parameters

None

Response Parameters

Status code: 200

Table 5-488 Response body parameters

Parameter	Type	Description
total_count	Integer	Definition: Total number of training job resource flavors. Range: N/A.
flavors	Array of FlavorResponse objects	Definition: List of training job resource flavors.

Table 5-489 FlavorResponse

Parameter	Type	Description
pool_id	String	Definition: ID of the resource pool selected for a training job. Range: N/A.
flavor_id	String	Definition: Resource flavor ID. Range: N/A.

Parameter	Type	Description
flavor_name	String	Definition: Resource flavor name. Range: N/A.
max_num	Integer	Definition: Maximum number of nodes supported by a flavor. Range: N/A.
billing	BillingInfo object	Definition: Billing information of a resource flavor.
flavor_info	FlavorInfoResponse object	Definition: Resource flavor details.
attributes	Map<String,String>	Definition: Other flavor attributes. Range: N/A.

Table 5-490 BillingInfo

Parameter	Type	Description
code	String	Definition: Billing code. Range: N/A.
unit_num	Integer	Definition: Billing unit. Range: N/A.

Table 5-491 FlavorInfoResponse

Parameter	Type	Description
max_num	Integer	Definition: Maximum number of nodes that can be selected. The value 1 indicates that the distributed mode is not supported. Range: N/A.
cpu	Cpu object	Definition: CPU specifications.
gpu	Gpu object	Definition: GPU specifications.
npu	Npu object	Definition: Ascend specifications.
memory	Memory object	Definition: Memory information.
disk	DiskResponse object	Definition: Disk information.

Table 5-492 Cpu

Parameter	Type	Description
arch	String	Definition: CPU architecture. Range: N/A.
core_num	Integer	Definition: Number of cores. Range: N/A.

Table 5-493 Gpu

Parameter	Type	Description
unit_num	Integer	Definition: Number of GPUs. Range: N/A.
product_name	String	Definition: Product name. Range: N/A.
memory	String	Definition: Memory. Range: N/A.

Table 5-494 Npu

Parameter	Type	Description
unit_num	String	Definition: Number of NPUs. Range: N/A.
product_name	String	Definition: Product name. Range: N/A.
memory	String	Definition: Memory. Range: N/A.

Table 5-495 Memory

Parameter	Type	Description
size	Integer	Definition: Memory size. Range: N/A.
unit	String	Definition: Number of memory units. Range: N/A.

Table 5-496 DiskResponse

Parameter	Type	Description
size	Integer	Definition: Disk size. Range: N/A.
unit	String	Definition: Unit of the disk size. Range: N/A.

5.17 Obtaining the Preset AI Frameworks Supported by a Training Job

Function

This API is used to query the list of preset AI frameworks supported by the current system.

This API is used when you need to know the preset AI frameworks supported by the system. Before using this API, ensure that you have the required permissions. After the query, you will obtain the details of all preset AI frameworks supported by the system. If you do not have the required permission or the query fails, the API will return an error message.

Debugging

You can debug this API through automatic authentication in [API Explorer](#) or use the SDK sample code generated by API Explorer.

Authorization Information

Each account has all the permissions required to call all APIs, but IAM users must be assigned the required permissions.

- If you are using role/policy-based authorization, see [Permissions Policies and Supported Actions](#) for details on the required permissions.
- If you are using identity policy-based authorization, no identity policy-based permission required for calling this API.

URI

GET /v2/{project_id}/training-job-engines

Table 5-497 Path Parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Definition: User project ID. For details, see Obtaining a Project ID and Name . Constraints: The value can contain 1 to 64 characters. Letters, digits, and hyphens (-) are allowed. Range: N/A. Default Value: N/A.

Request Parameters

None

Response Parameters

Status code: 200

Table 5-498 Response body parameters

Parameter	Type	Description
total	Integer	Definition: Total number of training job engine flavors. Range: N/A.
items	Array of items objects	Definition: Engine flavor parameter list.

Table 5-499 items

Parameter	Type	Description
engine_id	String	Definition: Engine flavor ID, for example, caffe-1.0.0-python2.7 . Range: N/A.
engine_name	String	Definition: Engine flavor name, for example, Caffe . Range: N/A.

Parameter	Type	Description
engine_version	String	Definition: Engine flavor version. Engines with the same name have multiple versions, for example, Caffe-1.0.0-python2.7 of Python 2.7. Range: N/A.
v1_compatible	Boolean	Definition: Specifies whether the v1 compatibility mode is used. Range: • true: v1 compatibility • false: v1 incompatibility
run_user	String	Definition: Default UID for the engine startup. Range: N/A.
image_info	image_info object	Definition: Engine information.

Table 5-500 image_info

Parameter	Type	Description
cpu_image_url	String	Definition: Image of the CPU flavor. Range: N/A.
gpu_image_url	String	Definition: Image with the matched GPU or Ascend flavor. Range: N/A.
image_version	String	Definition: Image version. Range: N/A.

Error Codes

See [Error Codes](#).

6 Model Management

6.1 Obtaining the Model Runtime

Function

This API is used to obtain the AI engine and runtime of models.

Debugging

You can debug this API through automatic authentication in [API Explorer](#) or use the SDK sample code generated by API Explorer.

Authorization Information

Each account has all the permissions required to call all APIs, but IAM users must be assigned the required permissions.

- If you are using role/policy-based authorization, see [Permissions Policies and Supported Actions](#) for details on the required permissions.
- If you are using identity policy-based authorization, no identity policy-based permission required for calling this API.

URI

GET /v1/{project_id}/models/ai-engine-runtimes

Table 6-1 Path Parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Project ID. For details, see Obtaining a Project ID .

Table 6-2 Query Parameters

Parameter	Mandatory	Type	Description
limit	No	String	Number of items displayed on each page
offset	No	String	Offset, which is the position where the query starts. The value must be greater than or equal to 0.

Request Parameters

Table 6-3 Request header parameters

Parameter	Mandatory	Type	Description
X-Auth-Token	Yes	String	User token.

Response Parameters

Status code: 200

Table 6-4 Response body parameters

Parameter	Type	Description
count	Integer	Total number of records that meet the search criteria when no pagination is performed
total_count	Integer	Number of records in the query result. If offset and limit are not configured, the values of count and total are the same.
engine_runtimes	Array of EngineAndRuntimesResponse objects	Engine runtime environment

Table 6-5 EngineAndRuntimesResponse

Parameter	Type	Description
ai_engine	String	AI engine type. The options are as follows: • TensorFlow • PyTorch • MindSpore • XGBoost • Scikit_Learn • Spark_MLlib
runtimes	Array of strings	Runtime image, for example, pytorch_1.8.0-cuda_10.2-py_3.7-ubuntu_18.04-x86_64
request_mode	Array of strings	Request mode. The AI engine supports synchronous or asynchronous real-time services. • sync: synchronous real-time service • async: asynchronous real-time service
accelerators	Array of Accelerator objects	Accelerator cards that can be used by the AI engine.
arch	Array of strings	AI engine architecture. The options are as follows: • x86_64 • aarch64
status_list	Array of strings	AI engine status. The options are as follows: • normal: The AI engine is normal. • deleted: The AI engine is deleted. • deleting: The AI engine is being deleted.
image_source	Array of strings	Image source. The options are as follows: • base_image • uniform_image

Table 6-6 Accelerator

Parameter	Type	Description
type	String	Accelerator card type. The options are as follows: • npu • gpu • none
name	String	Accelerator card name, for example, SNT9B .
cuda_version	String	CUDA driver version.
driver_version_section	String	Driver version set.

Status code: 401**Table 6-7** Response body parameters

Parameter	Type	Description
error_code	String	• Definition: ModelArts error code. Range: N/A
error_msg	String	Definition: Error message. Range: N/A

Status code: 403**Table 6-8** Response body parameters

Parameter	Type	Description
error_code	String	• Definition: ModelArts error code. Range: N/A
error_msg	String	Definition: Error message. Range: N/A

Status code: 404

Table 6-9 Response body parameters

Parameter	Type	Description
error_code	String	Definition: ModelArts error code. Range: N/A
error_msg	String	Definition: Error message. Range: N/A

6.2 Querying the AI Application List

Function

This API is used to query the AI application list based on different search parameters.

Debugging

You can debug this API through automatic authentication in [API Explorer](#) or use the SDK sample code generated by API Explorer.

Authorization Information

Each account has all the permissions required to call all APIs, but IAM users must be assigned the required permissions.

- If you are using role/policy-based authorization, see [Permissions Policies and Supported Actions](#) for details on the required permissions.
- If you are using identity policy-based authorization, the following identity policy-based permissions are required.

Action	Access Level	Resource Type (*: required)	Condition Key	Alias	Dependencies
modelarts: model:list	List	model *	-	-	-
		-	• g:RequestTag/<tag-key> • g:TagKeys		

URI

GET /v1/{project_id}/models

Table 6-10 Path Parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Project ID. For details, see Obtaining a Project ID and Name .

Table 6-11 Query Parameters

Parameter	Mandatory	Type	Description
model_name	No	String	Model name. Fuzzy match is supported. If a model name contains an underscore (_), add the exact_match parameter to the request and set the parameter value to true because the underscore needs to be escaped. This ensures that the query operation can be performed properly.
exact_match	No	Boolean	Whether to escape underscores (.). <i>If a model name contains underscores (),</i> set this parameter to true to ensure that the query operation can be performed properly. By default, this parameter is left blank.
model_version	No	String	Model version The format is Digit:Digit:Digit, where Digit is a one-digit or two-digit positive integer. Note that the version number cannot start with 0, for example, 01.01.01.
model_status	No	String	Model status. You can obtain models based on model statuses. Options: • publishing: The model is being published. • published: The model has been published. • failed: Publishing the model failed. • building: The image is being created. • building_failed: Creating an image failed.
description	No	String	Description. Fuzzy match is supported.
offset	No	Integer	Index of the query page, which defaults to 0

Parameter	Mandatory	Type	Description
limit	No	Integer	Maximum number of records returned on each page. Default value: 1000
sort_by	No	String	Sorting field. Enums: • create_at: time when an AI application is created (default value) • model_version: AI application version • model_size: AI application size
order	No	String	Sorting order. Enums: • asc: ascending order • desc: descending order (default value)
workspace_id	No	String	Workspace ID For details about how to obtain the value, see Querying the Workspace List . If no workspace is created, the default value is 0. If a workspace is created and used, the actual value prevails.
model_type	No	String	Model type. The models of this type are queried. <code>model_type</code> and <code>not_model_type</code> are mutually exclusive and cannot co-exist. The value can be TensorFlow, PyTorch, MindSpore, Image, Custom or Template.
not_model_type	No	String	Model type, which is used for obtaining models of types except for this type The value can be TensorFlow, PyTorch, MindSpore, Image, Custom or Template.

Request Parameters

Table 6-12 Request header parameters

Parameter	Mandatory	Type	Description
X-Auth-Token	Yes	String	User token. It can be obtained by calling the IAM API that is used to obtain a user token. The value of X-Subject-Token in the response header is the user token.

Response Parameters

Status code: 200

Table 6-13 Response body parameters

Parameter	Type	Description
models	Array of ModelListItem objects	Model metadata
total_count	Integer	Total number of models that meet the search criteria when no paging is performed
count	Integer	Total number of models that meet the search criteria

Table 6-14 ModelListItem

Parameter	Type	Description
owner	String	User ID of the tenant to which a model belongs
model_version	String	Model version
model_type	String	Model type
description	String	Model description
project	String	Project ID of the tenant to which a model belongs
source_type	String	Model source type. This parameter is valid and its value is auto only if the model is deployed using ExeML.

Parameter	Type	Description
model_id	String	Model ID
model_source	String	Model source. Options: • auto: ExeML • algos: built-in algorithm • custom: custom model
install_type	Array of strings	Deployment types supported by a model
model_size	Integer	Model size, in bytes
workspace_id	String	Workspace ID For details about how to obtain the value, see Querying the Workspace List . If no workspace is created, the default value is 0. If a workspace is created and used, the actual value prevails.
model_status	String	Model status
market_flag	Boolean	Whether a model is subscribed from AI Gallery
tunable	Boolean	Whether a model can be tuned. true indicates that the model can be tuned, and false indicates not.
model_name	String	Model name
create_at	Long	Time when a model is created, in milliseconds calculated from 1970.1.1 0:0:0 UTC.
publishable_flag	Boolean	Whether a model can be published to AI Gallery

Parameter	Type	Description
source_copy	String	Whether to enable image replication. This parameter is valid only when model_type is set to Image. • true: Image replication is enabled. After this function is enabled, AI applications cannot be rapidly created, and modifying or deleting an image in the SWR source directory will not affect service deployment. • false: Image replication is not enabled. After this function is disabled, AI applications can be rapidly created, but modifying or deleting an image in the SWR source directory will affect service deployment. If this parameter is not configured, image replication is enabled by default.
tenant	String	Account ID of the tenant to which a model belongs
subscription_id	String	Model subscription ID
extra	String	Extended parameter
specification	ModelSpecification object	Deployment specifications.
deployment_constraints	DeploymentConstraints object	Deployment constraints.

Table 6-15 ModelSpecification

Parameter	Type	Description
min_cpu	String	Minimal CPU specifications
min_gpu	String	Minimal GPU specifications
min_memory	String	Minimum memory
min_ascend	String	Minimal Ascend specifications

Table 6-16 DeploymentConstraints

Parameter	Type	Description
accelerators	Array of Accelerator objects	Supported accelerator card types. Custom images support only one accelerator card type during import.
cpu_type	String	CPU type.
input_types	Array of strings	Input and output type in asynchronous mode and video service scenarios, such as OBS and VIS . This parameter is used for importing custom images. Non-custom images are declared in runtime .
output_types	Array of strings	Input and output type in asynchronous mode and video service scenarios, such as OBS and DIS . This parameter is used for importing custom images. Non-custom images are declared in runtime .
request_mode	String	Request model of a job when the model is deployed as a service.
rsa	Rsa object	Used for secure communication between the container and inference platform or field encryption. This parameter is used for importing custom images. Non-custom images are declared in runtime .
service_config	String	Service deployment field, which can be specified during service deployment. This parameter is used for importing custom images. Non-custom images are declared in runtime . As the structure is rather complex, use the value in the XML format.
task_config	String	Field of job-related configurations, which can be specified during job creation. This parameter is used for importing custom images. Non-custom images are declared in runtime . As the structure is rather complex, use the value in the XML format.
model_security	ModelSecurity object	Model encryption and decryption parameters.

Table 6-17 Accelerator

Parameter	Type	Description
type	String	Accelerator card type. The options are as follows: • npu • gpu • none
name	String	Accelerator card name, for example, SNT9B .
cuda_version	String	CUDA driver version.
driver_version_section	String	Driver version set.

Table 6-18 Rsa

Parameter	Type	Description
mode	String	Encryption mode.
private_key	String	Private key.
public_key	String	Public key.

Table 6-19 ModelSecurity

Parameter	Type	Description
model_key	String	After the model is encrypted using Edge, the root key, model key, and encrypted model can be obtained.
root_key	String	After the model is encrypted using Edge, the root key, model key, and encrypted model can be obtained.
security_policy	String	Model encryption mode.
is_verify_app	Boolean	Specifies whether to verify the files in edge scenarios, including the configuration files, container images, and library files.

Error Codes

See [Error Codes](#).

6.3 Creating an AI Application

Function

Import a meta model to create an AI application.

The execution code and model must be uploaded to OBS first. By default, the model generated by a training job is stored in OBS.

Constraints

The body parameter requirements for importing a model using a template are different from those for importing a model without using a template. In the following body parameters, **template parameters** indicate the parameters that can be configured when a model is imported using a template, **non-template parameters** indicate the parameters that can be configured when a model is imported without using a template, and **public parameters** indicate the parameters that are irrelevant to the model import mode.

- When a model is imported using a template (**model_type** is set to **Template**), the **template** field is mandatory and the **source_location** field does not need to be configured.
- If a model is imported without using a template (**model_type** is not set to **Template**), **source_location** is mandatory and **template** does not need to be configured.

Debugging

You can debug this API through automatic authentication in [API Explorer](#) or use the SDK sample code generated by API Explorer.

Authorization Information

Each account has all the permissions required to call all APIs, but IAM users must be assigned the required permissions.

- If you are using role/policy-based authorization, see [Permissions Policies and Supported Actions](#) for details on the required permissions.
- If you are using identity policy-based authorization, the following identity policy-based permissions are required.

Action	Access Level	Resource Type (*: required)	Condition Key	Alias	Dependencies
modelarts: model:create	Write	model *	-	-	-
		-	• g:RequestTag/<tag-key> • g:TagKeys		

URI

POST /v1/{project_id}/models

Table 6-20 Path Parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Project ID. For details, see Obtaining a Project ID and Name .

Request Parameters

Table 6-21 Request header parameters

Parameter	Mandatory	Type	Description
X-Auth-Token	Yes	String	User token. It can be obtained by calling the IAM API that is used to obtain a user token. The value of X-Subject-Token in the response header is the user token.

Table 6-22 Request body parameters

Parameter	Mandatory	Type	Description
model_docs	No	Array of GuideDoc objects	List of model description documents. A maximum of three documents are supported. Common parameter
template	No	ModelTemplate object	Configuration items in a template. This parameter is mandatory when model_type is set to Template . Template parameter
model_version	Yes	String	Model version in the format of <i>Digit.Digit.Digit</i> . Each digit is a one-digit or two-digit positive integer, but cannot start with 0. For example, 01.01.01 is not allowed. Common parameter
source_job_version	No	String	Version of the source training job. If the model is generated from a training job, input this parameter for source tracing. If the model is imported from a third-party meta model, leave this parameter blank. This parameter is left blank by default. Non-template parameter
source_location	Yes	String	OBS path where the model is located or the SWR image location

Parameter	Mandatory	Type	Description
source_copy	No	String	Whether to enable image replication. This parameter is valid only when model_type is set to Image. Options: • true: Default value, indicating that image replication is enabled. After this function is enabled, AI applications cannot be rapidly created, and modifying or deleting an image in the SWR source directory will not affect service deployment. • false: Image replication is not enabled. After this function is disabled, AI applications can be rapidly created, but modifying or deleting an image in the SWR source directory will affect service deployment.
initial_config	No	String	Character string converted from the model configuration file. You are advised to use the initial_config configuration file to provide information about the apis, dependencies, input_params, output_params, health, readiness_health, and startup_health fields. ** Non-template parameter**
execution_code	No	String	OBS path for storing the execution code. By default, this parameter is left blank. The name of the execution code file is consistently to be customize_service.py. The inference code file must be stored in the model directory. This parameter can be left blank. Then, the system will automatically identify the inference code in the model directory. Common parameter

Parameter	Mandatory	Type	Description
source_job_id	No	String	ID of the source training job. If the model is generated from a training job, input this parameter for source tracing. If the model is imported from a third-party meta model, leave this parameter blank. This parameter is left blank by default. Non-template parameter
model_type	Yes	String	Model type. The value is TensorFlow/Image/PyTorch/Template/MindSpore, which is read from the configuration file. ** Common Parameters**
output_parameters	No	Array of CreateModelRequestInferParams objects	Collection of output parameters of a model. By default, this parameter is left blank. If the parameters are read from apis in the configuration file, provide only the initial_config field, and this field can be left blank. Non-template parameter
description	No	String	Model description that consists of 1 to 100 characters. The following special characters cannot be contained: &!"'<>= Common parameter
runtime	No	String	Model runtime environment. Its possible values are determined based on model_type . For details, see Supported AI Engines for ModelArts Inference .
model_metrics	No	String	Model precision. If the value is read from the configuration file, this parameter can be left blank. Non-template parameter

Parameter	Mandatory	Type	Description
source_type	No	String	Model source type. Currently, the value can only be auto, which is used to distinguish models deployed through ExeML (the model download function is not provided). This parameter is not required for models deployed through training jobs or other methods. It is left blank by default. ** Non-template parameter**
dependencies	No	Array of ModelDependencies objects	Package required for inference code and model. By default, this parameter is left blank. If the package is read from the configuration file, this parameter can be left blank. Non-template parameter
workspace_id	No	String	Workspace ID For details about how to obtain the value, see Querying the Workspace List . If no workspace is created, the default value is 0. If a workspace is created and used, the actual value prevails.
model_algorithm	No	String	Model algorithm. If the algorithm is read from the configuration file, this parameter can be left blank. The value can be predict_analysis , object_detection , or image_classification . Non-template parameter
apis	No	Array of CreateModelRequestModelApis objects	All API input and output parameters of the model. If the parameters are parsed from the configuration file, this parameter can be left blank. Non-template parameter

Parameter	Mandatory	Type	Description
model_name	Yes	String	Model name, which consists of 1 to 64 characters. Only letters, digits, hyphens (-), and underscores (_) are allowed. Common parameter
install_type	No	Array of strings	Deployment type. Only lowercase letters are supported. The value can be real-time , edge , or batch . The default value is [real-time , edge , batch].
input_params	No	Array of CreateModelRequestInferParams objects	Collection of input parameters of a model. By default, this parameter is left blank. If the parameters are read from apis in the configuration file, provide only the initial_config field, and this field can be left blank. Non-template parameter
cmd	No	String	Image startup command.
deployment_constraints	No	deployment_constraints object	Model deployment constraints

Table 6-23 GuideDoc

Parameter	Mandatory	Type	Description
doc_url	Yes	String	HTTP(S) link of the document
doc_name	Yes	String	Document name, which must start with a letter. Enter 1 to 48 characters. Only letters, digits, hyphens (-), and underscores (_) are allowed.

Table 6-24 ModelTemplate

Parameter	Mandatory	Type	Description
infer_format	No	String	Input and output mode ID. When this parameter is provided, the built-in input and output modes in the template are overwritten.
template_inputs	Yes	Array of CreateModelRequestTemplateInput objects	Template input configuration, specifying the source path for configuring a model.
template_id	Yes	String	ID of the used template. The template has a built-in input and output mode.

Table 6-25 CreateModelRequestTemplateInput

Parameter	Mandatory	Type	Description
input	Yes	String	Template input path, which can be a path to an OBS file or directory. When you use a template with multiple input items to create a model, if the target paths input_properties specified in the template are the same, the OBS directory or OBS file name entered here must be unique to prevent files from being overwritten.
input_id	Yes	String	Input item ID, which is obtained from template details.

Table 6-26 ModelDependencies

Parameter	Mandatory	Type	Description
installer	Yes	String	Installation mode. Only pip is supported.
packages	Yes	Array of Packages objects	Collection of dependency packages

Table 6-27 Packages

Parameter	Mandatory	Type	Description
package_version	No	String	Version of a dependency package. If this parameter is left blank, the latest version is installed by default. Chinese characters and special characters (&!"'<>=) are not allowed.
package_name	Yes	String	Name of a dependency package. Ensure that the package name is correct and available. Chinese characters and special characters (&!"'<>=) are not allowed.
restraint	No	String	Version restriction. This parameter is mandatory only when package_version exists. The options are as follows: • EXACT: The version is the same as the specified version. • ATLEAST: The version is not earlier than the specified version. • ATMOST: not later than the specified version.

Table 6-28 CreateModelRequestModelApis

Parameter	Mandatory	Type	Description
protocol	No	String	Request protocol. The options are HTTP and HTTPS.
method	No	String	Request method, which can be post or get .
input_params	No	ModelInOutParams object	API input and output parameters, described in JSON Schema format.
output_params	No	ModelInOutParams object	API input and output parameters, described in JSON Schema format.
url	No	String	Inference request URL

Table 6-29 ModelInOutputParams

Parameter	Mandatory	Type	Description
type	No	String	Type in JSON Schema, which can be object .
properties	No	Object	Properties of an object element in JSON Schema. You can configure parameters, including the parameter name and type.

Table 6-30 CreateModelRequestInferParams

Parameter	Mandatory	Type	Description
protocol	Yes	String	Request protocol. The options are HTTP and HTTPS.
min	No	Number	Minimum value of the parameter. This parameter is optional when param_type is set to int or float. By default, this parameter is left blank.
method	Yes	String	Request method, which can be post or get .
max	No	Number	Maximum value of the parameter. This parameter is optional when param_type is set to int or float. By default, this parameter is left blank.
param_desc	No	String	Parameter description. It is recommended that the parameter description contain a maximum of 100 characters. By default, this parameter is left blank.
param_name	Yes	String	Parameter name. It is recommended that the parameter name contain a maximum of 64 characters.
url	Yes	String	API URL
param_type	Yes	String	Parameter type, which can be int , string , float , timestamp , date , or file

Table 6-31 deployment_constraints

Parameter	Mandatory	Type	Description
request_mode	No	String	Request model of a job when the model is deployed as a service
cpu_type	No	String	CPU type
input_types	No	Array of strings	Input and output type in asynchronous mode and video service scenarios, such as OBS and VIS . This parameter is used for importing custom images. Non-custom images are described in the runtime file.
outputTypes	No	Array of strings	Input and output type in asynchronous mode and video service scenarios, such as OBS and DIS . This parameter is used for importing custom images. Non-custom images are described in the runtime file.
service_config	No	String	Service deployment field, which can be specified during service deployment. This parameter is used for importing custom images. Non-custom images are declared in runtime . As the structure is rather complex, use the value in the XML format.
task_config	No	String	Field of job-related configurations, which can be specified during job creation. This parameter is used for importing custom images. Non-custom images are declared in runtime . As the structure is rather complex, use the value in the XML format.
model_security	No	model_security object	After the model is encrypted using the Edge, the root key, model key, and encrypted model can be obtained.

Table 6-32 model_security

Parameter	Mandatory	Type	Description
model_key	No	String	Obtain the model key after using the Edge to encrypt the model.
rootKey	No	String	Obtain the root key after using the Edge to encrypt the model.
security_policy	No	String	Obtain the model encryption policy after using the Edge to encrypt the model.
is_verify_app	No	Boolean	Whether to verify the files in the edge scenario, including the configuration files, container images, and library files.

Response Parameters

Status code: 200

Table 6-33 Response body parameters

Parameter	Type	Description
model_id	String	Model ID.

Example Requests

Create an AI application. Set the AI application name to **mnist**, version to **1.0.0**, type to **TensorFlow**, and model file source to an OBS bucket.

POST https://{endpoint}/v1/{project_id}/models

```
{
  "model_name": "mnist",
  "model_version": "1.0.0",
  "source_location": "https://models.obs.xxxx.com/mnist",
  "source_job_id": "55",
  "source_job_version": "Vnt1",
  "model_type": "TensorFlow",
  "runtime": "python2.7",
  "description": "mnist model",
  "execution_code": "https://testmodel.obs.xxxx.com/customize_service.py",
  "input_params": [ {
    "url": "/v1/xxx/image",
    "protocol": "http",
    "method": "post",
    "param_name": "image_url",
    "param_type": "string",
    "min": 0,
```

```
"max" : 9,
"param_desc" : "http://test/test.jpeg"
}],
"output_params" : [ {
"url" : "/v1/xxx/image",
"protocol" : "http",
"method" : "post",
"param_name" : "face_location",
"param_type" : "box",
"param_desc" : "face_location param value description"
}],
"dependencies" : [ {
"installer" : "pip",
"packages" : [ {
"package_name" : "numpy",
"package_version" : "1.5.0",
"restraint" : "ATLEAST"
} ]
}],
"model_algorithm" : "object_detection",

```

Example Responses

Status code: 200

The model is created.

```
{
  "model_id" : "7feb7235-ed9c-48ae-9833-2876b2458445"
}
```

Status Codes

Status Code	Description
200	The model is created.

Error Codes

See [Error Codes](#).

6.4 Obtaining Details About an AI Application

Function

This API is used to query details about an AI application based on the AI application ID.

Debugging

You can debug this API through automatic authentication in [API Explorer](#) or use the SDK sample code generated by API Explorer.

Authorization Information

Each account has all the permissions required to call all APIs, but IAM users must be assigned the required permissions.

- If you are using role/policy-based authorization, see [Permissions Policies and Supported Actions](#) for details on the required permissions.
- If you are using identity policy-based authorization, the following identity policy-based permissions are required.

Action	Access Level	Resource Type (*: required)	Condition Key	Alias	Dependencies
modelarts: model:get	Read	model *	g:ResourceTag/<tag-key>	-	-

URI

GET /v1/{project_id}/models/{model_id}

Table 6-34 Path Parameters

Parameter	Mandatory	Type	Description
model_id	Yes	String	Model ID, which can be obtained from the response body when an AI application is created. You can also obtain the AI applications owned by the current user by calling the API for querying the AI application list. The model_id field indicates the model ID.
project_id	Yes	String	Project ID. For details, see Obtaining a Project ID and Name .

Request Parameters

Table 6-35 Request header parameters

Parameter	Mandatory	Type	Description
X-Auth-Token	Yes	String	User token. It can be obtained by calling the IAM API that is used to obtain a user token. The value of X-Subject-Token in the response header is the user token.

Response Parameters

Status code: 200

Table 6-36 Response body parameters

Parameter	Type	Description
model_version	String	Model version
source_job_version	String	Version of the source training job
source_location	String	OBS path where the model is located or the template address of the SWR image
source_job_id	String	ID of the source training job

Parameter	Type	Description
source_copy	String	Whether to enable image replication. This parameter is valid only when model_type is set to Image . • true: Default value, indicating that image replication is enabled. After this function is enabled, AI applications cannot be rapidly created, and modifying or deleting an image in the SWR source directory will not affect service deployment. • false: Image replication is not enabled. After this function is disabled, AI applications can be rapidly created, but modifying or deleting an image in the SWR source directory will affect service deployment.
description	String	Model description
project	String	Project ID of the tenant to which a model belongs
workspace_id	String	Workspace ID For details about how to obtain the value, see Querying the Workspace List . If no workspace is created, the default value is 0. If a workspace is created and used, the actual value prevails.
model_algorithm	String	Model algorithm type, which can be predict_analysis , object_detection , or image_classification
model_name	String	Model name
tenant	String	Account ID of the tenant to which a model belongs
model_docs	Array of GuideDoc objects	List of template documents
owner	String	ID of the tenant to which a model belongs
execution_code	String	OBS path for storing the execution code. The name of the execution code file is consistently to be customize_service.py .
schema_doc	String	Download address of the model schema file

Parameter	Type	Description
image_address	String	Image path generated after model packaging
output_params	Array of ModelParamsInfo objects	Collection of output parameters of a model
health	ModelHealth object	Model health check API information.
runtime	String	Model runtime environment
model_metrics	String	Model precision
source_type	String	Model source type. This parameter is valid and its value is auto only if the model is deployed using ExeML.
model_type	String	Model type. The value is TensorFlow/Image/PyTorch/Template/MindSpore.
model_id	String	Model ID
dependencies	Array of ModelDependencies objects	Package required for running the code and model
model_size	Long	Model size, in bytes
model_status	String	Model status
apis	String	All input and output apis parameter information of a model, which is obtained from the model preview
model_source	String	Model source. Options: • auto: ExeML • algos: preset algorithm • custom: customized
tunable	Boolean	Whether a model can be tuned. Options: • true: Supported. • false: Not supported.
market_flag	Boolean	Whether a model is subscribed from the marketplace. Options: • true: from the market • false: no

Parameter	Type	Description
publishable_flag	Boolean	Whether a model can be published to the marketplace. Options: • true: The product can be released to the market. • false: The product cannot be released to the marketplace.
model_labels	Array of strings	Model label array
labels_map	Map<String,String>	Model label map. The key is consistently to be labels , and the value is the model label array.
install_type	Array of strings	Supported service type for deployment
config	String	Model configurations. Probe configurations include health, readiness_health, and startup_health.
specification	ModelSpecification object	Minimum specifications for model deployment
input_params	Array of ModelParamsInfo objects	Collection of input parameters of a model
create_at	Long	Time when a model is created, in milliseconds calculated from 1970.1.1 0:0:0 UTC.
cmd	String	Image startup command.

Table 6-37 GuideDoc

Parameter	Type	Description
doc_url	String	HTTP(S) link of the document
doc_name	String	Document name, which must start with a letter. Enter 1 to 48 characters. Only letters, digits, hyphens (-), and underscores (_) are allowed.

Table 6-38 ModelHealth

Parameter	Type	Description
protocol	String	Request protocol of the health check API. Only HTTP is supported.

Parameter	Type	Description
initial_delay_seconds	String	After an instance is started, a health check starts after the time configured in initial_delay_seconds expires.
timeout_seconds	String	Health check timeout.
url	String	URL of a health check API.
period_seconds	String	Health check period.
failure_threshold	String	Maximum number of health check failures.
check_method	String	Health check method, which can be HTTP or EXEC (commands).
command	String	Commands, which are strings separated by spaces.

Table 6-39 ModelDependencies

Parameter	Type	Description
installer	String	Installation mode. Only pip is supported.
packages	Array of Packages objects	Collection of dependency packages

Table 6-40 Packages

Parameter	Type	Description
package_version	String	Version of a dependency package. If this parameter is left blank, the latest version is installed by default. Chinese characters and special characters (&!"'<>=) are not allowed.
package_name	String	Name of a dependency package. Ensure that the package name is correct and available. Chinese characters and special characters (&!"'<>=) are not allowed.

Parameter	Type	Description
restraint	String	Version restriction. This parameter is mandatory only when package_version exists. The options are as follows: - EXACT: The version is the same as the specified version. - ATLEAST: The version is not earlier than the specified version. - ATMOST: not later than the specified version.

Table 6-41 ModelSpecification

Parameter	Type	Description
min_cpu	String	Minimal CPU specifications
min_gpu	String	Minimal GPU specifications
min_memory	String	Minimum memory
min_ascend	String	Minimal Ascend specifications

Table 6-42 ModelParamsInfo

Parameter	Type	Description
protocol	String	Request protocol, for example, http .
url	String	API URL
min	Number	Minimum value of a numeric parameter.
method	String	Request method, for example, post .
max	Number	Maximum value of a numeric parameter.
param_desc	String	Parameter description.
param_name	String	Parameter name.
param_type	String	Parameter type.

Example Requests

```
GET https://{endpoint}/v1/{project_id}/models/{model_id}
```

Example Responses

Status Codes

Status Code	Description
200	Model details

Error Codes

See [Error Codes](#).

6.5 Deleting an AI application

Function

This interface is used to delete an AI application based on the AI application ID. When cascade is set to true, the AI application specified by the AI application ID and other AI applications with the same name but different versions as the specified AI application are deleted. By default, only the AI application corresponding to the current AI application ID is deleted.

Debugging

You can debug this API through automatic authentication in [API Explorer](#) or use the SDK sample code generated by API Explorer.

Authorization Information

Each account has all the permissions required to call all APIs, but IAM users must be assigned the required permissions.

- If you are using role/policy-based authorization, see [Permissions Policies and Supported Actions](#) for details on the required permissions.
- If you are using identity policy-based authorization, the following identity policy-based permissions are required.

Action	Access Level	Resource Type (*: required)	Condition Key	Alias	Dependencies
modelarts: model:delete	Write	model *	g:ResourceTag/<tag-key>	-	-

URI

DELETE /v1/{project_id}/models/{model_id}

Table 6-43 Path Parameters

Parameter	Mandatory	Type	Description
model_id	Yes	String	ID of the AI application to be deleted.
project_id	Yes	String	Project ID. For details, see Obtaining a Project ID and Name .

Table 6-44 Query Parameters

Parameter	Mandatory	Type	Description
cascade	No	Boolean	Indicates whether to perform cascading deletion. The default value is false, indicating that only the model with the specified model ID is deleted. If this parameter is set to true, the model specified by the model ID is deleted, and all models with the same name but different versions as the specified model are deleted. A maximum of 20 models can be deleted at a time. Excess models are not deleted.

Request Parameters

Table 6-45 Request header parameters

Parameter	Mandatory	Type	Description
X-Auth-Token	Yes	String	User token. It can be obtained by calling the IAM API that is used to obtain a user token. The value of X-Subject-Token in the response header is the user token.

Response Parameters

Status code: 200

Table 6-46 Response body parameters

Parameter	Type	Description
delete_success_list	Array of strings	ID list of models successfully deleted
delete_failed_list	Array of DeleteModelResponseFailedList objects	ID of the model that fails to be deleted and the failure cause list

Table 6-47 DeleteModelResponseFailedList

Parameter	Type	Description
error_msg	String	Error message of the model deletion failure
error_code	String	Error code of the model deletion failure
model_id	String	ID of a model that fails to be deleted

Example Requests

```
DELETE https://{endpoint}/v1/{project_id}/models/{model_id}
```

Example Responses

Status code: 200

Message indicating a successful deletion or a deletion failure

```
{
  "delete_success_list" : [ "10eb0091-887f-4839-9929-cbc884f1e20e" ],
```

```
"delete_failed_list" : [ {  
  "error_msg" : "Failed to delete model because the model (759645d9-3672-4db1-bb6d-49ed58b84e10)

Status Codes

Status Code	Description
200	Message indicating a successful deletion or a deletion failure

Error Codes

See [Error Codes](#).

7 App Authentication Management

7.1 Obtaining the App List

Function

This API is used to obtain the basic information about APIG apps. You can obtain only the information about the apps created by yourself.

Debugging

You can debug this API through automatic authentication in [API Explorer](#) or use the SDK sample code generated by API Explorer.

Authorization Information

Each account has all the permissions required to call all APIs, but IAM users must be assigned the required permissions.

- If you are using role/policy-based authorization, see [Permissions Policies and Supported Actions](#) for details on the required permissions.
- If you are using identity policy-based authorization, no identity policy-based permission required for calling this API.

URI

GET /v1/{project_id}/app-auth/apps

Table 7-1 Path Parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Project ID. For details, see Obtaining a Project ID .

Table 7-2 Query Parameters

Parameter	Mandatory	Type	Description
app_name	No	String	App name.
limit	No	String	Number of items displayed on one page. The default value is 1000 .
offset	No	String	Sequence number of the page from which data is displayed on multiple pages. The default value is 0 .
order	No	String	Sorting mode of the returned app list. The value can be asc and desc . The default value is asc .
sort_by	No	String	Attribute by which the returned app list is sorted. The options are app_name , created_at , and updated_at . The default value is app_name .
workspace_id	No	String	Workspace ID For details about how to obtain the value, see Querying the Workspace List . If no workspace is created, the default value is 0. If a workspace is created and used, the actual value prevails.
iphertext_enabled	No	Boolean	Whether to display the AppSecret in plaintext.
app_ids	No	Array of strings	App IDs to be displayed in plaintext.

Request Parameters

Table 7-3 Request header parameters

Parameter	Mandatory	Type	Description
Content-Type	No	String	Message body type. text/plain indicates that a temporary preview URL is returned. application/octet-stream indicates that a temporary download URL is returned.
X-Auth-Token	Yes	String	User token.

Response Parameters

Status code: 200

Table 7-4 Response body parameters

Parameter	Type	Description
apps	Array of ApigAppDetailInfo objects	Basic app information array, which may be an empty array
count	Integer	Number of queried apps
total_count	Integer	Total number of apps

Table 7-5 ApigAppDetailInfo

Parameter	Type	Description
app_codes	Array of strings	App code list. When app_type is APIC , this parameter is left blank.
app_id	String	App ID
app_key	String	App key
app_name	String	App name
app_remark	String	App description, which is left blank by default. The value contains a maximum of 200 characters.
app_secret	String	App secret key

Parameter	Type	Description
app_type	String	App type. Enums: • APIC: This App is registered with the ROMA Connect gateway. • APIG: This App is registered with the shared API gateway. • DEDICATE_APIG: This App is registered with the dedicated API gateway.
bounded_api_count	Integer	Number of APIs bound to the app
created_at	Long	Time when an app is created
project_id	String	Project ID
updated_at	Long	App update time
user_id	String	ID of the user who creates the app

Status code: 401**Table 7-6** Response body parameters

Parameter	Type	Description
error_code	String	• Definition: ModelArts error code. Range : N/A
error_msg	String	Definition : Error message. Range : N/A

Status code: 403**Table 7-7** Response body parameters

Parameter	Type	Description
error_code	String	• Definition: ModelArts error code. Range : N/A
error_msg	String	Definition : Error message. Range : N/A

Status code: 404

Table 7-8 Response body parameters

Parameter	Type	Description
error_code	String	Definition: ModelArts error code. Range: N/A
error_msg	String	Definition: Error message. Range: N/A

7.2 Creating Apps

Function

This API is used to create API Gateway applications (apps for short). Each user can create a maximum of five apps. You can apply for increasing the quota as required.

Debugging

You can debug this API through automatic authentication in [API Explorer](#) or use the SDK sample code generated by API Explorer.

Authorization Information

Each account has all the permissions required to call all APIs, but IAM users must be assigned the required permissions.

- If you are using role/policy-based authorization, see [Permissions Policies and Supported Actions](#) for details on the required permissions.
- If you are using identity policy-based authorization, no identity policy-based permission required for calling this API.

URI

POST /v1/{project_id}/app-auth/apps

Table 7-9 Path Parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Project ID. For details, see Obtaining a Project ID and Name .

Request Parameters

Table 7-10 Request header parameters

Parameter	Mandatory	Type	Description
Content-Type	No	String	Message body type. text/plain indicates that a temporary preview URL is returned. application/octet-stream indicates that a temporary download URL is returned.
X-Auth-Token	Yes	String	User token

Table 7-11 Request body parameters

Parameter	Mandatory	Type	Description
app_name	Yes	String	App name.
app_remark	No	String	App remarks.
workspace_id	No	String	Workspace ID For details about how to obtain the value, see Querying the Workspace List . If no workspace is created, the default value is 0. If a workspace is created and used, the actual value prevails.

Response Parameters

Status code: 200

Table 7-12 Response body parameters

Parameter	Type	Description
app	ApigAppDetailInfo object	Basic information about the created app

Table 7-13 ApigAppDetailInfo

Parameter	Type	Description
app_codes	Array of strings	App code list. When app_type is APIC , this parameter is left blank.
app_id	String	App ID
app_key	String	App key
app_name	String	App name
app_remark	String	App description, which is left blank by default. The value contains a maximum of 200 characters.
app_secret	String	App secret key

Parameter	Type	Description
app_type	String	App type. Enums: • APIC: This App is registered with the ROMA Connect gateway. • APIG: This App is registered with the shared API gateway. • DEDICATE_APIG: This App is registered with the dedicated API gateway.

7.4 Deleting an App

Function

This API is used to delete a specified app. Only the user who creates the app can delete it, and the app is not bound to any API.

Debugging

You can debug this API through automatic authentication in [API Explorer](#) or use the SDK sample code generated by API Explorer.

Authorization Information

Each account has all the permissions required to call all APIs, but IAM users must be assigned the required permissions.

- If you are using role/policy-based authorization, see [Permissions Policies and Supported Actions](#) for details on the required permissions.
- If you are using identity policy-based authorization, no identity policy-based permission required for calling this API.

URI

DELETE /v1/{project_id}/app-auth/apps/{app_id}

Table 7-25 Path Parameters

Parameter	Mandatory	Type	Description
app_id	Yes	String	App ID, which can be obtained by calling the API for obtaining the App list.
project_id	Yes	String	Project ID. For details, see Obtaining a Project ID and Name .

Table 7-26 Query Parameters

Parameter	Mandatory	Type	Description
workspace_id	No	String	Workspace ID For details about how to obtain the value, see Querying the Workspace List . If no workspace is created, the default value is 0. If a workspace is created and used, the actual value prevails.

Request Parameters

7.6 Resetting an App Code

Function

This API is used to reset a specified app code of an API Gateway app. Only the user who creates the app can reset it, and only apps of the shared or dedicated API Gateway can have app codes.

Debugging

You can debug this API through automatic authentication in [API Explorer](#) or use the SDK sample code generated by API Explorer.

Authorization Information

Each account has all the permissions required to call all APIs, but IAM users must be assigned the required permissions.

- If you are using role/policy-based authorization, see [Permissions Policies and Supported Actions](#) for details on the required permissions.
- If you are using identity policy-based authorization, no identity policy-based permission required for calling this API.

URI

PUT /v1/{project_id}/app-auth/apps/{app_id}/app-code/{app_code}

Table 7-38 Path Parameters

Parameter	Mandatory	Type	Description
app_code	Yes	String	App code to be reset
app_id	Yes	String	App ID, which can be obtained by calling the API for obtaining the app list
project_id	Yes	String	Project ID. For details, see Obtaining a Project ID and Name .

Request Parameters

Table 7-39 Request header parameters

Parameter	Mandatory	Type	Description
Content-Type	No	String	Message body type. text/plain indicates that a temporary preview URL is returned. application/octet-stream indicates that a temporary download URL is returned.
X-Auth-Token	Yes	String	User token.

Table 7-40 Request body parameters

Parameter	Mandatory	Type	Description
app_name	Yes	String	App name.
app_remark	No	String	App remarks.
workspace_id	No	String	Workspace ID For details about how to obtain the value, see Querying the Workspace List . If no workspace is created, the default value is 0. If a workspace is created and used, the actual value prevails.

Response Parameters

Status code: 200

Table 7-41 Response body parameters

}
```

Status Codes

Status Code	Description
200	OK
401	Unauthorized
403	Forbidden
404	Not Found

Error Codes

See [Error Codes](#).

7.7 Deleting an App Code

Function

This API is used to delete a specified app code of an API Gateway app. Only the user who creates the app can delete it, and only apps of the shared or dedicated API Gateway can have app codes.

Debugging

You can debug this API through automatic authentication in [API Explorer](#) or use the SDK sample code generated by API Explorer.

Authorization Information

Each account has all the permissions required to call all APIs, but IAM users must be assigned the required permissions.

- If you are using role/policy-based authorization, see [Permissions Policies and Supported Actions](#) for details on the required permissions.
- If you are using identity policy-based authorization, no identity policy-based permission required for calling this API.

URI

DELETE /v1/{project_id}/app-auth/apps/{app_id}/app-code/{app_code}

Table 7-46 Path Parameters

Parameter	Mandatory	Type	Description
app_code	Yes	String	App code to be deleted

Parameter	Mandatory	Type	Description
app_id	Yes	String	App ID, which can be obtained by calling the API for obtaining the App list.
project_id	Yes	String	Project ID. For details, see Obtaining a Project ID and Name .

Table 7-47 Query Parameters

Parameter	Mandatory	Type	Description
workspace_id	No	String	Workspace ID For details about how to obtain the value, see Querying the Workspace List . If no workspace is created, the default value is 0. If a workspace is created and used, the actual value prevails.

Request Parameters

Table 7-48 Request header parameters

Parameter	Mandatory	Type	Description
Content-Type	No	String	Message body type. text/plain indicates that a temporary preview URL is returned. application/octet-stream indicates that a temporary download URL is returned.
X-Auth-Token	Yes	String	User token.

Response Parameters

Status code: 200

Table 7-49 Response body parameters

Parameter	Type	Description
app	ApigAppDetailInfo object	Basic information about the created app

Table 7-50 ApigAppDetailInfo

Parameter	Type	Description
app_codes	Array of strings	App code list. When app_type is APIC , this parameter is left blank.
app_id	String	App ID
app_key	String	App key
app_name	String	App name
app_remark	String	App description, which is left blank by default. The value contains a maximum of 200 characters.
app_secret	String	App secret key
app_type	String	App type. Enums: • APIC: This App is registered with the ROMA Connect gateway. • APIG: This App is registered with the shared API gateway. • DEDICATE_APIG: This App is registered with the dedicated API gateway.
bounded_api_count	Integer	Number of APIs bound to the app
created_at	Long	Time when an app is created
project_id	String	Project ID
updated_at	Long	App update time
user_id	String	ID of the user who creates the app

Status code: 401**Table 7-51** Response body parameters

Parameter	Type	Description
error_code	String	• Definition: ModelArts error code. Range : N/A
error_msg	String	Definition : Error message. Range : N/A

Status code: 403

Table 7-52 Response body parameters

Parameter	Type	Description
error_code	String	Definition: ModelArts error code. Range: N/A
error_msg	String	Definition: Error message. Range: N/A

Example Requests

DELETE https://{endpoint}/v1/{project_id}/app-auth/apps/{app_id}/app-code/{app_code}

Example Responses

Status code: 200

OK

```
{
  "app" : {
    "app_id" : "f29eddd1443e4dceb76898f881c07a4d",
    "app_name" : "app_xq0XT",
    "app_remark" : "autotest",

7.8 Resetting an AppSecret

Function

This API is used to reset the AppSecret of a specified API Gateway app. Only the user who creates the app can reset the AppSecret.

Debugging

You can debug this API through automatic authentication in [API Explorer](#) or use the SDK sample code generated by API Explorer.

Authorization Information

Each account has all the permissions required to call all APIs, but IAM users must be assigned the required permissions.

- If you are using role/policy-based authorization, see [Permissions Policies and Supported Actions](#) for details on the required permissions.
- If you are using identity policy-based authorization, no identity policy-based permission required for calling this API.

URI

PUT /v1/{project_id}/app-auth/apps/{app_id}/app-secret

Table 7-53 Path Parameters

Parameter	Mandatory	Type	Description
app_id	Yes	String	App ID, which can be obtained by calling the API for obtaining the app list
project_id	Yes	String	Project ID. For details, see Obtaining a Project ID and Name .

Request Parameters

Table 7-54 Request header parameters

Parameter	Mandatory	Type	Description
Content-Type	No	String	Message body type. text/plain indicates that a temporary preview URL is returned. application/octet-stream indicates that a temporary download URL is returned.
X-Auth-Token	Yes	String	User token.

Table 7-55 Request body parameters

Parameter	Mandatory	Type	Description
app_name	Yes	String	App name.
app_remark	No	String	App remarks.
workspace_id	No	String	Workspace ID For details about how to obtain the value, see Querying the Workspace List . If no workspace is created, the default value is 0. If a workspace is created and used, the actual value prevails.

Response Parameters

Status code: 200

Table 7-56 Response body parameters

Parameter	Type	Description
app	ApigAppDetailInfo object	Basic information about the created app

Table 7-57 ApigAppDetailInfo

Parameter	Type	Description
app_codes	Array of strings	App code list. When app_type is APIC , this parameter is left blank.

Parameter	Type	Description
app_id	String	App ID
app_key	String	App key
app_name	String	App name
app_remark	String	App description, which is left blank by default. The value contains a maximum of 200 characters.
app_secret	String	App secret key
app_type	String	App type. Enums: • APIC: This App is registered with the ROMA Connect gateway. • APIG: This App is registered with the shared API gateway. • DEDICATE_APIG: This App is registered with the dedicated API gateway.
bounded_api_count	Integer	Number of APIs bound to the app

7.9 Obtaining the List of APIs Bound to an App

Function

This API is used to obtain the list of APIs bound to an app.

Debugging

You can debug this API through automatic authentication in [API Explorer](#) or use the SDK sample code generated by API Explorer.

Authorization Information

Each account has all the permissions required to call all APIs, but IAM users must be assigned the required permissions.

- If you are using role/policy-based authorization, see [Permissions Policies and Supported Actions](#) for details on the required permissions.
- If you are using identity policy-based authorization, no identity policy-based permission required for calling this API.

URI

GET /v1/{project_id}/app-auth/apps/{app_id}/auth-apis

Table 7-61 Path Parameters

Parameter	Mandatory	Type	Description
app_id	Yes	String	App ID
project_id	Yes	String	Project ID. For details, see Obtaining a Project ID and Name .

Table 7-62 Query Parameters

Parameter	Mandatory	Type	Description
limit	No	String	Number of items displayed on one page. The default value is 1000 .
offset	No	String	Sequence number of the page from which data is displayed on multiple pages. The default value is 0 .
order	No	String	Sorting mode of the returned app list. The value can be asc and desc . The default value is asc .
service_name	No	String	Name of the service to which the API belongs. Fuzzy search is supported.
sort_by	No	String	Attribute by which the returned app list is sorted. The options are app_name , created_at , and updated_at . The default value is app_name .
workspace_id	No	String	Workspace ID For details about how to obtain the value, see Querying the Workspace List . If no workspace is created, the default value is 0. If a workspace is created and used, the actual value prevails.

Request Parameters

Table 7-63 Request header parameters

Parameter	Mandatory	Type	Description
Content-Type	No	String	Message body type. text/plain indicates that a temporary preview URL is returned. application/octet-stream indicates that a temporary download URL is returned.

Parameter	Mandatory	Type	Description
X-Auth-Token	Yes	String	User token.

Response Parameters

Status code: 200

Table 7-64 Response body parameters

Parameter	Type	Description
apis	Array of AuthTypeApiBasicInfo objects	API authentication information list.
count	Integer	Number of records.
total_count	Integer	Total number of records.

Table 7-65 AuthTypeApiBasicInfo

Parameter	Type	Description
api_id	String	API ID
api_method	String	Request method, which can be GET , POST , PUT , DELETE , HEAD , PATCH , OPTIONS , or ANY . ANY is the default value.
api_name	String	API name
api_remark	String	API description. The value contains a maximum of 255 characters.
auth_type	String	API authentication mode. The options are: Enums: • NONE: no authentication • APP: App authentication • IAM: IAM authentication
predict_url	String	Prediction URL
service_id	String	Service ID
service_name	String	Service name
support_app_code	Boolean	Whether to support the App code

Status code: 401**Table 7-66** Response body parameters

Parameter	Type	Description
error_code	String	• Definition: ModelArts error code. Range: N/A

7.12 Authorizing an API to an App

Function

This API is used to authorize a specified API to an App. The API authentication mode must be App authentication. The user who creates an App must be the creator of the service to which the API belongs, and the request user must have the update permission on the service to which the API belongs.

Debugging

You can debug this API through automatic authentication in [API Explorer](#) or use the SDK sample code generated by API Explorer.

Authorization Information

Each account has all the permissions required to call all APIs, but IAM users must be assigned the required permissions.

- If you are using role/policy-based authorization, see [Permissions Policies and Supported Actions](#) for details on the required permissions.
- If you are using identity policy-based authorization, no identity policy-based permission required for calling this API.

URI

POST /v1/{project_id}/services/{service_id}/app-auth-apis/{api_id}/app-auth-api

7.13 Updating API Authorization

Function

This API is used to update the authorization relationship of an API. The API authentication mode must be App authentication. The user who creates an App must be the creator of the service to which the API belongs, and the request user must have the update permission on the service to which the API belongs.

Debugging

You can debug this API through automatic authentication in [API Explorer](#) or use the SDK sample code generated by API Explorer.

Authorization Information

Each account has all the permissions required to call all APIs, but IAM users must be assigned the required permissions.

- If you are using role/policy-based authorization, see [Permissions Policies and Supported Actions](#) for details on the required permissions.
- If you are using identity policy-based authorization, no identity policy-based permission required for calling this API.

URI

PUT /v1/{project_id}/services/{service_id}/app-auth-apis/{api_id}/app-auth-api

Table 7-110 Path Parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Project ID. For details, see Obtaining a Project ID and Name .
service_id	Yes	String	ID of the service to which the API belongs
api_id	Yes	String	API ID

Request Parameters

Table 7-111 Request header parameters

Parameter	Mandatory	Type	Description
X-Auth-Token	Yes	String	User token

Table 7-112 Request body parameters

Parameter	Mandatory	Type	Description
apps	Yes	Array of Apps objects	App list
workspace_id	No	String	Workspace ID For details about how to obtain the value, see Querying the Workspace List . If no workspace is created, the default value is 0. If a workspace is created and used, the actual value prevails.

Table 7-113 Apps

Parameter	Mandatory	Type	Description
app_id	No	String	App ID, which can be obtained by querying apps

Response Parameters

Status code: 200

Table 7-114 Response header parameters

Parameter	Type	Description
X-Request-Id	String	Link trace ID

Table 7-115 Response body parameters

Parameter	Type	Description
auth_result	Array of AppAuthResultInfo objects	Authorization result list.

Table 7-116 AppAuthResultInfo

Parameter	Type	Description
api_id	String	API ID

Parameter	Type	Description
app_id	String	App ID, which can be obtained by querying apps
auth_id	String	Authorization ID, which is empty if the authorization fails
reason	String	Authorization or authorization cancellation failure reason, which is empty if the authorization is successful
success	Boolean	Whether authorization or authorization cancellation is successful

Status code: 401**Table 7-117** Response header parameters

Parameter	Type	Description
X-Request-Id	String	Link trace ID

Table 7-118 Response body parameters

Parameter	Type	Description
error_code	String	Definition: ModelArts error code. Range: N/A
error_msg	String	Definition: Error message. Range: N/A

Status code: 403**Table 7-119** Response header parameters

Parameter	Type	Description
X-Request-Id	String	Link trace ID

Table 7-120 Response body parameters

Parameter	Type	Description
error_code	String	Definition: ModelArts error code. Range: N/A
error_msg	String	Definition: Error message. Range: N/A

Status code: 404**Table 7-121** Response header parameters

Parameter	Type	Description
X-Request-Id	String	Link trace ID

Table 7-122 Response body parameters

Parameter	Type	Description
error_code	String	Definition: ModelArts error code. Range: N/A
error_msg	String	Definition: Error message. Range: N/A

Example Requests

Updating the authorization relationship of an API

```
PUT https://{endpoint}/v1/{project_id}/services/{service_id}/app-auth-apis/{api_id}/app-auth-api
{
  "apps": [ {
    "app_id": "fb1a9eadd87b48abbd74b8ba1755dffd"
  } ]
}
```

Example Responses

Status code: 200

OK

```
{
  "auth_result": [ {
    "api_id": "logic-api-fe84e858-49ec-41c6-80d7-a34fc22435c2",
    "app_id": "logic-app-9b9acb40-6df6-4623-9f87-e0dae781d867",
    "success": true
  }, {
```

```
"api_id" : "logic-api-fe84e858-49ec-41c6-80d7-a34fc22435c2",  
"app_id" : "logic-app-ce0d0a41-451d-4563-94d9-acc75b5e440f",  
"success" : true  
} ]  
}
```

Status Codes

Status Code	Description
200	OK
401	Unauthorized
403	Forbidden
404	Not Found

Error Codes

See [Error Codes](#).

7.14 Canceling the Authorization of an API to an App

Function

This API is used to cancel the authorization of a specified API to an app. The request user must have the update permission on the service to which the API belongs. Same as the URL: /v1/{project_id}/app-auth/{service_id}/apis/{api_id}/auths

Debugging

You can debug this API through automatic authentication in [API Explorer](#) or use the SDK sample code generated by API Explorer.

Authorization Information

Each account has all the permissions required to call all APIs, but IAM users must be assigned the required permissions.

- If you are using role/policy-based authorization, see [Permissions Policies and Supported Actions](#) for details on the required permissions.
- If you are using identity policy-based authorization, no identity policy-based permission required for calling this API.

URI

DELETE /v1/{project_id}/services/{service_id}/app-auth-apis/{api_id}/app-auth-api

Table 7-123 Path Parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Project ID. For details, see Obtaining a Project ID and Name .
service_id	Yes	String	ID of the service to which the API belongs
api_id	Yes	String	API ID

Table 7-124 Query Parameters

Parameter	Mandatory	Type	Description
workspace_id	No	String	Workspace ID For details about how to obtain the value, see Querying the Workspace List . If no workspace is created, the default value is 0. If a workspace is created and used, the actual value prevails.

Request Parameters

Table 7-125 Request header parameters

Parameter	Mandatory	Type	Description
X-Auth-Token	Yes	String	User token.

Table 7-126 Request body parameters

Parameter	Mandatory	Type	Description
apps	Yes	Array of Apps objects	App list
workspace_id	No	String	Workspace ID For details about how to obtain the value, see Querying the Workspace List . If no workspace is created, the default value is 0. If a workspace is created and used, the actual value prevails.

Table 7-127 Apps

Parameter	Mandatory	Type	Description
app_id	No	String	App ID, which can be obtained by querying apps

Response Parameters

Status code: 200

Table 7-128 Response header parameters

Parameter	Type	Description
X-Request-Id	String	Link trace ID

Table 7-129 Response body parameters

Parameter	Type	Description
unauth_result	Array of AppAuthResultInfo objects	Authorization cancellation result

Table 7-130 AppAuthResultInfo

Parameter	Type	Description
api_id	String	API ID
app_id	String	App ID, which can be obtained by querying apps
auth_id	String	Authorization ID, which is empty if the authorization fails
reason	String	Authorization or authorization cancellation failure reason, which is empty if the authorization is successful
success	Boolean	Whether authorization or authorization cancellation is successful

Status code: 401

Table 7-131 Response header parameters

Parameter	Type	Description
X-Request-Id	String	Link trace ID

Table 7-132 Response body parameters

Parameter	Type	Description
error_code	String	• Definition: ModelArts error code. Range: N/A
error_msg	String	Definition: Error message. Range: N/A

Parameter	Type	Description
X-Request-Id	String	Link trace ID

Table 7-134 Response body parameters

Parameter	Type	Description
error_code	String	• Definition: ModelArts error code. Range: N/A
error_msg	String	Definition: Error message. Range: N/A

Example Requests

Canceling the authorization of a specified API to an App

```
DELETE https://{endpoint}/v1/{project_id}/services/{service_id}/app-auth-apis/{api_id}/app-auth-api
```

```
{
  "apps": [ {
    "app_id": "fb1a9eadd87b48abbd74b8ba1755dffd"
  } ]
}
```

Example Responses

Status code: 200

OK

```
{
  "unauth_result" : [ {
    "api_id" : "logic-api-fe84e858-49ec-41c6-80d7-a34fc22435c2",
    "app_id" : "logic-app-9b9acb40-6df6-4623-9f87-e0dae781d867",
    "success" : true
  } ]
}
```

Status Codes

Status Code	Description
200	OK
401	Unauthorized
403	Forbidden

Error Codes

See [Error Codes](#).

7.15 Obtaining API Authorization Relationships

Function

This API is used to obtain the authorization relationships between specified APIs and Apps. The API authentication mode must be App authentication. Administrators can obtain authorization information about all APIs. Common users can obtain only authorization information about APIs of services on which they have access permissions.

Debugging

You can debug this API through automatic authentication in [API Explorer](#) or use the SDK sample code generated by API Explorer.

Authorization Information

Each account has all the permissions required to call all APIs, but IAM users must be assigned the required permissions.

- If you are using role/policy-based authorization, see [Permissions Policies and Supported Actions](#) for details on the required permissions.
- If you are using identity policy-based authorization, no identity policy-based permission required for calling this API.

URI

GET /v1/{project_id}/services/{service_id}/app-auth-apis/{api_id}/api-auths

Table 7-135 Path Parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Project ID. For details, see Obtaining a Project ID and Name .
service_id	Yes	String	Service ID.
api_id	Yes	String	API ID

Table 7-136 Query Parameters

Parameter	Mandatory	Type	Description
limit	No	String	Number of items displayed on one page. The default value is 1000 .
offset	No	String	Sequence number of the page from which data is displayed on multiple pages. The default value is 0 .
app_name	No	String	App name. Fuzzy search is supported.
order	No	String	Sorting mode of the returned App list. The value can be asc and desc . The default value is asc .
show_only	No	String	App information. Enums: • AUTH: Only information about authorized Apps is displayed. • UNAUTH: Only information about unauthorized Apps is displayed. By default, this parameter is left blank, indicating that information about all visible Apps is displayed.

Parameter	Mandatory	Type	Description
sort_by	No	String	Sorting field of the returned App list. Enums: • app_name: application name • created_at: application creation time • updated_at: application update time The default value is app_name .
workspace_id	No	String	Workspace ID For details about how to obtain the value, see Querying the Workspace List . If no workspace is created, the default value is 0. If a workspace is created and used, the actual value prevails.
iphertext_enabled	No	Boolean	Whether to display the AppSecret in plaintext.
app_ids	No	Array of strings	App IDs to be displayed in plaintext.

Request Parameters

None

Response Parameters

Status code: 200

Table 7-137 Response body parameters

Parameter	Type	Description
auths	Array of ApiAuthInfo objects	Authorization array
count	Integer	Number of queried authorizations
total_count	Integer	Total number of authorizations

Table 7-138 ApiAuthInfo

Parameter	Type	Description
app	ApigAppDetailInfo object	App information
authed	Boolean	Whether the API has been authorized to the app

Table 7-139 ApigAppDetailInfo

Parameter	Type	Description
app_codes	Array of strings	App code list. When app_type is APIC , this parameter is left blank.
app_id	String	App ID
app_key	String	App key
app_name	String	App name
app_remark	String	App description, which is left blank by default. The value contains a maximum of 200 characters.
app_secret	String	App secret key
app_type	String	App type. Enums: • APIC: This App is registered with the ROMA Connect gateway. • APIG: This App is registered with the shared API gateway. • DEDICATE_APIG: This App is registered with the dedicated API gateway.
bounded_api_count	Integer	Number of APIs bound to the app
created_at	Long	Time when an app is created
project_id	String	Project ID
updated_at	Long	App update time
user_id	String	ID of the user who creates the app

Status code: 400

Status Code	Description
200	OK
400	Bad Request

Error Codes

See [Error Codes](#).

7.16 Creates an API.

Function

An API is created, but the API is not authorized to the app.

Debugging

You can debug this API through automatic authentication in [API Explorer](#) or use the SDK sample code generated by API Explorer.

Authorization Information

Each account has all the permissions required to call all APIs, but IAM users must be assigned the required permissions.

- If you are using role/policy-based authorization, see [Permissions Policies and Supported Actions](#) for details on the required permissions.
- If you are using identity policy-based authorization, no identity policy-based permission required for calling this API.

URI

POST /v1/{project_id}/app-auth/{service_id}/apis

Table 7-141 Path Parameters

Parameter	Mandatory	Type	Description
service_id	Yes	String	ID of the service to which the API belongs
project_id	Yes	String	Definition: Project ID. For details, see Obtaining a Project ID and Name . Constraints: The value can contain 1 to 64 characters. Letters, digits, and hyphens (-) are allowed. Range: N/A Default Value: N/A

Request Parameters

Table 7-142 Request header parameters

Parameter	Mandatory	Type	Description
X-Auth-Token	Yes	String	Definition: User token. It can be obtained by calling the IAM API. The token is the value of X-Subject-Token in the response header. Constraints: N/A Range: N/A Default Value: N/A

Table 7-143 Request body parameters

Parameter	Mandatory	Type	Description
workspace_id	No	String	Workspace ID
support_app_code	No	Boolean	Whether to support the App code
auth_type	No	String	API authentication mode. Options: • NONE • APP • IAM
api_name	No	String	API name
api_url	No	String	URL of the API. with a maximum of 255 characters.
api_path	No	String	Path of the API. with a maximum of 255 characters.
api_method	No	String	Request method, which can be GET, POST, PUT, DELETE, HEAD, PATCH, OPTIONS , or ANY . ANY is the default value.
api_remark	No	String	API description, with a maximum of 255 characters.

Response Parameters

    } ]
  }
}
```

Status Codes

Status Code	Description
200	OK
401	Unauthorized
403	Forbidden
404	Not Found

Error Codes

See [Error Codes](#).

7.19 Check whether the app exists.

Function

Check whether the app exists.

Debugging

You can debug this API through automatic authentication in [API Explorer](#) or use the SDK sample code generated by API Explorer.

Authorization Information

Each account has all the permissions required to call all APIs, but IAM users must be assigned the required permissions.

- If you are using role/policy-based authorization, see [Permissions Policies and Supported Actions](#) for details on the required permissions.
- If you are using identity policy-based authorization, no identity policy-based permission required for calling this API.

URI

GET /v1/{project_id}/app-auth/apps/{app_name}/exists

Table 7-166 Path Parameters

Parameter	Mandatory	Type	Description
app_name	Yes	String	App name.
project_id	Yes	String	Definition: Project ID. For details, see Obtaining a Project ID and Name . Constraints: The value can contain 1 to 64 characters. Letters, digits, and hyphens (-) are allowed. Range: N/A Default Value: N/A

Table 7-167 Query Parameters

Parameter	Mandatory	Type	Description
workspace_id	No	String	Definition: Workspace ID. . Constraints: There must be a workspace in use. Range: N/A Default Value: 0

Request Parameters

Table 7-168 Request header parameters

Parameter	Mandatory	Type	Description
X-Auth-Token	Yes	String	Definition: User token. It can be obtained by calling the IAM API. The token is the value of X-Subject-Token in the response header. Constraints: N/A Range: N/A Default Value: N/A

Response Parameters

Status code: 200

Table 7-169 Response body parameters

Parameter	Type	Description
exists	Boolean	Indicates whether an app exists.

Status code: 401

Table 7-170 Response body parameters

Parameter	Type	Description
error_code	String	Definition: ModelArts error code. Range: N/A
error_msg	String	Definition: Error message. Range: N/A

Status code: 403

Table 7-171 Response body parameters

Parameter	Type	Description
error_code	String	Definition: ModelArts error code. Range: N/A

Parameter	Type	Description
error_msg	String	Definition: Error message. Range: N/A

Status code: 404

Table 7-172 Response body parameters

Parameter	Type	Description
error_code	String	Definition: ModelArts error code. Range: N/A
error_msg	String	Definition: Error message. Range: N/A

Example Requests

GET https://{endpoint}/v1/{project_id}/app-auth/apps/{app_name}/exists&workspace_id=0

Example Responses

Status code: 200

OK

```
{  
  "exists" : true  
}
```

Status Codes

Status Code	Description
200	OK
401	Unauthorized
403	Forbidden

7.20 Querying the API Authentication Information of an Application

Function

This API is used to query the API authentication information of an application.

Debugging

You can debug this API through automatic authentication in [API Explorer](#) or use the SDK sample code generated by API Explorer.

Authorization Information

Each account has all the permissions required to call all APIs, but IAM users must be assigned the required permissions.

- If you are using role/policy-based authorization, see [Permissions Policies and Supported Actions](#) for details on the required permissions.
- If you are using identity policy-based authorization, no identity policy-based permission required for calling this API.

URI

GET /v1/{project_id}/services/{service_id}/app-auth-apis

Table 7-173 Path Parameters

Parameter	Mandatory	Type	Description
service_id	Yes	String	Service ID
project_id	Yes	String	Definition: Project ID. For details, see Obtaining a Project ID and Name . Constraints: The value can contain 1 to 64 characters. Letters, digits, and hyphens (-) are allowed. Range: N/A Default Value: N/A

Table 7-174 Query Parameters

Parameter	Mandatory	Type	Description
workspace_id	No	String	Definition: Workspace ID. . Constraints: There must be a workspace in use. Range: N/A Default Value: 0

Request Parameters

Table 7-175 Request header parameters

Parameter	Mandatory	Type	Description
X-Auth-Token	Yes	String	Definition: User token. It can be obtained by calling the IAM API. The token is the value of X-Subject-Token in the response header. Constraints: N/A Range: N/A Default Value: N/A

Response Parameters

Status code: 200

Table 7-176 Response body parameters

Parameter	Type	Description
apis	Array of AuthTypeApiBasicInfo objects	API authentication information list.
count	Integer	Number of records.
total_count	Integer	Total number of records.

Table 7-177 AuthTypeApiBasicInfo

Parameter	Type	Description
api_id	String	API ID

Parameter	Type	Description
api_method	String	Request method, which can be GET , POST , PUT , DELETE , HEAD , PATCH , OPTIONS , or ANY . ANY is the default value.
api_name	String	API name
api_remark	String	API description. The value contains a maximum of 255 characters.
auth_type	String	API authentication mode. The options are: Enums: • NONE: no authentication • APP: App authentication • IAM: IAM authentication
predict_url	String	Prediction URL
service_id	String	Service ID
service_name	String	Service name
support_app_code	Boolean	Whether to support the App code

Example Requests

None

Example Responses

Status code: 200

OK

```

8 Service Management

8.1 Updating the Service Through the Patch Operation

Function

This API is used to update the service through the patch operation. For details about the patch format, see [json patch](#).

Debugging

You can debug this API through automatic authentication in [API Explorer](#) or use the SDK sample code generated by API Explorer.

Authorization Information

Each account has all the permissions required to call all APIs, but IAM users must be assigned the required permissions.

- If you are using role/policy-based authorization, see [Permissions Policies and Supported Actions](#) for details on the required permissions.
- If you are using identity policy-based authorization, no identity policy-based permission required for calling this API.

URI

PATCH /v1/{project_id}/services/{service_id}

Table 8-1 Path Parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Project ID. For details, see Obtaining a Project ID and Name .
service_id	Yes	String	Service ID

Request Parameters

Table 8-2 Request header parameters

Parameter	Mandatory	Type	Description
X-ModelArts-User-ID	No	String	User ID required for using the agency token to verify the workspace
X-Auth-Token	Yes	String	User token

Table 8-3 Request body parameters

Parameter	Mandatory	Type	Description
[items]	Yes	Array of PatchServiceV2RequestBody objects	Request body of the service PATCH operation

Table 8-4 PatchServiceV2RequestBody

Parameter	Mandatory	Type	Description
op	No	String	Operation type. Currently, only replace is supported, indicating the value replacement operation.
path	No	String	Operation path, which complies with the standard JSON PATCH format. It indicates the target path (JSON PATH) of the value to be replaced based on the JSON response body of the service details. Currently, only model-related parameters can be replaced and updated. Therefore, the prefix is fixed to /config/. For example, if you want to update the number of instances in the first model, the path is /config/0/instance_count.
value	No	String	Target value for replacement.

Response Parameters

Status code: 200

Table 8-5 Response header parameters

Parameter	Type	Description
X-Request-Id	String	Request link ID, which can be used for log tracing

Table 8-6 Response body parameters

Parameter	Type	Description
update_time	String	Update time. This parameter is returned only when the service configuration upgrade is triggered. For example, if the config parameter is modified, the update result can be filtered from the service update records based on this time. This parameter is not returned when the description is modified or the service is started or stopped.
resource_ids	String	Updated resource IDs.

Status code: 400

Table 8-7 Response header parameters

Parameter	Type	Description
X-Request-Id	String	Request link ID, which can be used for log tracing

Table 8-8 Response body parameters

Parameter	Type	Description
error_code	String	Definition: ModelArts error code. Range: N/A

Parameter	Type	Description
error_msg	String	Definition: Error message. Range: N/A

Example Requests

Update the service through the patch operation.

PATCH https://{endpoint}/v1/{project_id}/services/{service_id}

```
[ {
  "op" : "replace",
  "path" : "/config/0/envs",
  "value" : { }

8.2 Obtaining Service Monitoring

Function

This API is used to obtain service monitoring information.

Debugging

You can debug this API through automatic authentication in [API Explorer](#) or use the SDK sample code generated by API Explorer.

Authorization Information

Each account has all the permissions required to call all APIs, but IAM users must be assigned the required permissions.

- If you are using role/policy-based authorization, see [Permissions Policies and Supported Actions](#) for details on the required permissions.
- If you are using identity policy-based authorization, the following identity policy-based permissions are required.

Action	Access Level	Resource Type (*: required)	Condition Key	Alias	Dependencies
modelarts:service:getMonitor	Read	service *	g:ResourceTag/<tag-key>	-	-

URI

GET /v1/{project_id}/services/{service_id}/monitor

Table 8-9 Path Parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Project ID. For details, see Obtaining a Project ID and Name .
service_id	Yes	String	Service ID

Table 8-10 Query Parameters

Parameter	Mandatory	Type	Description
node_id	No	String	ID of the edge node to be obtained. This parameter is available only when infer_type is set to edge . By default, all nodes are obtained.

Request Parameters

Table 8-11 Request header parameters

Parameter	Mandatory	Type	Description
X-Auth-Token	Yes	String	User token. It can be obtained by calling the IAM API that is used to obtain a user token. The value of X-Subject-Token in the response header is the user token.

Response Parameters

Status code: 200

Table 8-12 Response body parameters

Parameter	Type	Description
service_name	String	Service name
service_id	String	Service ID
monitors	Array of Monitor objects	Monitoring details
service_running_in_stance_count	Integer	Number of running service instances
service_instance_count	Integer	Number of service instances
req_count_per_min	Long	Total number of service calls in the last minute

Table 8-13 Monitor

Parameter	Type	Description
failed_times	Integer	Number of times that a model instance fails to be called. This parameter is available for real-time services.
model_version	String	Model version, which is available for real-time services
cpu_memory_total	Integer	Total memory, in MB
gpu_usage	Float	Number of used GPUs
node_name	String	Node name, which is available for edge services
gpu_total	Float	Total number of GPUs
model_id	String	Model ID, which is available for real-time services
invocation_times	Integer	Number of times that a model instance is called. This parameter is available for real-time services.
cpu_core_usage	Float	Number of used CPU cores
cpu_core_total	Float	Total number of CPU cores
model_name	String	Model name, which is available for real-time services
cpu_memory_usage	Integer	Used memory, in MB
node_id	String	Edge node ID, which is available for edge services
model_running_instance_count	Integer	Number of running model instances
model_instance_count	Integer	Number of model instances
gpu_memory_total	Float	Total GPU memory, in MB.
gpu_memory_usage	Float	Used GPU memory, in MB.
npu_total	Float	Total number of NPUs.
npu_usage	Float	Number of used NPUs.

Parameter	Type	Description
npu_memory_total	Float	Total NPU memory, in MB.
npu_memory_usage	Float	Used NPU memory, in MB.

Example Requests

GET https://{endpoint}/v1/{project_id}/services/{service_id}/monitor

Example Responses

Status code: 200

Monitoring information

```
{
  "service_name" : "mnist",

    "invocation_times" : 50,
    "cpu_core_usage" : 2.4
  } ]
}
```

Status Codes

Status Code	Description
200	Monitoring information

Error Codes

See [Error Codes](#).

8.3 Obtaining Services

Function

This API is used to obtain model services.

Debugging

You can debug this API through automatic authentication in [API Explorer](#) or use the SDK sample code generated by API Explorer.

Authorization Information

Each account has all the permissions required to call all APIs, but IAM users must be assigned the required permissions.

- If you are using role/policy-based authorization, see [Permissions Policies and Supported Actions](#) for details on the required permissions.
- If you are using identity policy-based authorization, the following identity policy-based permissions are required.

Action	Access Level	Resource Type (*: required)	Condition Key	Alias	Dependencies
modelarts:service:list	List	-	• g:RequestTag/<tag-key> • g:TagKeys	-	-

URI

GET /v1/{project_id}/services

Table 8-14 Path Parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Project ID. For details, see Obtaining a Project ID and Name .

Table 8-15 Query Parameters

Parameter	Mandatory	Type	Description
service_id	No	String	Service ID. You can obtain the service ID from the response body when creating a service or obtain the services owned by the current user by calling the API for querying the service list. The service_id field indicates the service ID. By default, service IDs are not filtered.
service_name	No	String	Service name, which is specified by the user during creation. By default, the service name is not filtered.
model_id	No	String	Model ID, which can be obtained from the response body when an AI application is created. You can also obtain the AI applications owned by the current user by calling the API for querying the AI application list. The model_id field indicates the model ID. By default, model IDs are not filtered.
workspace_id	No	String	Workspace ID For details about how to obtain the value, see Querying the Workspace List . If no workspace is created, the default value is 0. If a workspace is created and used, the actual value prevails.
infer_type	No	String	Inference mode. By default, the inference mode is not filtered. Options: • real-time • batch • edge

Parameter	Mandatory	Type	Description
status	No	String	Service status. By default, the service status is not filtered. The options are as follows: • running: The service is running properly. • deploying: The service is being deployed, including image creation and resource scheduling deployment. • concerning: An alarm has been generated, indicating that some backend instances malfunction. • failed: Deploying the service failed. For details about the failure cause, see the event and log tab pages. • stopped: The service has been stopped. • finished: Service running is completed. This status is available only for batch services. • stopping: The service is being stopped. • deleting: The service is being deleted. • pending: The service is pending. This status is available only for real-time services. • waiting: The resource is being queued. This status is available only for real-time services.
offset	No	Integer	Start page for pagination display. The default value is 0 .
limit	No	Integer	Maximum number of records returned on each page. Default value: 1000

Parameter	Mandatory	Type	Description
sort_by	No	String	Sorting field. Enums: • publish_at: service publishing time, which is the default value • service_name: service name • transition_at: update time
order	No	String	Sorting order. Enums: • asc: ascending order • desc: descending order (default value)
tags	No	String	Tag. By default, tags are not filtered.

Request Parameters

Table 8-16 Request header parameters

Parameter	Mandatory	Type	Description
X-Auth-Token	Yes	String	User token. It can be obtained by calling the IAM API that is used to obtain a user token. The value of X-Subject-Token in the response header is the user token.

Response Parameters

Status code: 200

Table 8-17 Response body parameters

Parameter	Type	Description
total_count	Integer	Total number of services that meet the search criteria when no paging is performed
count	Integer	Number of services in the query result. If offset and limit are not configured, the values of count and total are the same.

Parameter	Type	Description
services	Array of ListServices objects	Collection of obtained services

Table 8-18 ListServices

Parameter	Type	Description
failed_times	Long	Number of failed service calls
owner	String	User to which a service belongs
due_time	Number	Time when an online service automatically stops, in milliseconds calculated from 1970.1.1 0:0:0 UTC. This parameter is not returned if automatic stop is not configured.
finished_time	Number	Batch service completion time, in milliseconds calculated from 1970.1.1 0:0:0 UTC. This parameter is returned only when the service is a batch service.
infer_type	String	Inference mode. Options: • real-time • batch • edge
service_name	String	Service name
description	String	Service description.
project	String	Project to which a service belongs
invocation_times	Long	Total number of service calls
publish_at	Long	Latest service release time, in milliseconds calculated from 1970.1.1 0:0:0 UTC.
workspace_id	String	Workspace ID
schedule	Array of Schedule objects	Service scheduling configuration. If this parameter is not configured, no value will be returned.
start_time	Number	Batch service start time, in milliseconds calculated from 1970.1.1 0:0:0 UTC. This parameter is returned only when the service is a batch service.

Parameter	Type	Description
operation_time	Number	Operation time of a request
is_shared	Boolean	Whether a service is subscribed True indicates that the service is a subscription service.
service_id	String	Service ID
progress	Integer	Deployment progress. This parameter is available when the status is deploying .
shared_count	Number	Number of subscribed services
tenant	String	Tenant to which a service belongs
status	String	Service status. The options are as follows: • running: The service is running properly. • deploying: The service is being deployed, including image creation and resource scheduling deployment. • concerning: An alarm has been generated, indicating that some backend instances malfunction. • failed: Deploying the service failed. For details about the failure cause, see the event and log tab pages. • stopped: The service has been stopped. • finished: Service running is completed. This status is available only for batch services.
is_opened_sample_collection	String	Whether to enable data collection, which defaults to false
transition_at	Number	Time when the service status changes
is_free	Boolean	Whether a free-of-charge flavor is used
additional_properties	Map<String,String>	Additional service attribute. If this parameter is not configured, no value will be returned.

Table 8-19 Schedule

Parameter	Type	Description
duration	Integer	Value mapping a time unit. For example, if the task stops after two hours, set time_unit to HOURS and duration to 2 .
time_unit	String	Scheduling time unit. Possible values are DAYS , HOURS , and MINUTES .
type	String	Scheduling type. Currently, the value can only be stop, indicating that the task automatically stops after a specified period of time.

Example Requests

GET https://{endpoint}/v1/{project_id}/services

Example Responses

Status code: 200

See [Error Codes](#).

8.4 Deploying Services

Function

This API is used to deploy a model as a service.

Debugging

You can debug this API through automatic authentication in [API Explorer](#) or use the SDK sample code generated by API Explorer.

Authorization Information

Each account has all the permissions required to call all APIs, but IAM users must be assigned the required permissions.

- If you are using role/policy-based authorization, see [Permissions Policies and Supported Actions](#) for details on the required permissions.
- If you are using identity policy-based authorization, the following identity policy-based permissions are required.

Action	Access Level	Resource Type (*: required)	Condition Key	Alias	Dependencies
modelarts:service:create	Write	-	• g:RequestTag/<tag-key> • g:TagKeys	-	-

URI

POST /v1/{project_id}/services

Table 8-20 Path Parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Project ID. For details, see Obtaining a Project ID and Name .

Request Parameters

Table 8-21 Request header parameters

Parameter	Mandatory	Type	Description
X-Auth-Token	Yes	String	User token. It can be obtained by calling the IAM API that is used to obtain a user token. The value of X-Subject-Token in the response header is the user token.

Table 8-22 Request body parameters

Parameter	Mandatory	Type	Description
workspace_id	No	String	ID of the workspace to which the service belongs. For details about how to obtain the value, see Querying the Workspace List . If no workspace is created, the default value is 0. If a workspace is created and used, the actual value prevails.
schedule	No	Array of Schedule objects	Service scheduling configuration, which can be configured only for real-time services. By default, this parameter is not used. Services run for a long time.

Parameter	Mandatory	Type	Description
cluster_id	No	String	Resource pool ID used for deploying a service. This parameter is optional. For real-time and batch services, the value is the ID of the old-version dedicated resource pool. After this parameter is configured, the network configuration of the cluster is used and the vpc_id parameter does not take effect. Ensure that the cluster status is normal when using a dedicated resource pool to deploy a service. If you want to use a dedicated resource pool, configure either cluster_id or pool_name . The priority of pool_name is higher than that of cluster_id . If neither of them is configured, a shared resource pool is used. When they are configured together with cluster_id or pool_name in the config field, the setting in config is preferentially used. For edge services, the value is the edge resource pool ID. To use an edge resource pool to deploy a service, ensure that the resource pool status is normal. If this parameter is configured together with the cluster_id parameter in the config field, the setting in config is preferentially used.

Parameter	Mandatory	Type	Description
pool_name	No	String	Resource pool ID of the elastic cluster in the AI dedicated resource pool used for service deployment. This parameter is optional for real-time and batch services. Ensure that the cluster status is normal when using a dedicated resource pool to deploy services. If this parameter is configured together with cluster_id or pool_name in config , the config settings are preferentially used. To use a dedicated resource pool, you need to configure either cluster_id or pool_name . The priority of pool_name is higher than that of cluster_id . If neither of them is configured, the shared resource pool is used.
infer_type	Yes	String	Inference type. The value can be real-time, edge, or batch. • real-time: real-time service. A model is deployed as a web service • batch: batch service. A batch service can perform inference on batch data and automatically stops after data processing is completed. • [edge]: edge service. A model is deployed as a web service on an edge node through Intelligent EdgeFabric (IEF). that provides a real-time test UI and monitoring capabilities. The service keeps running. You need to create a node on IEF beforehand.

Parameter	Mandatory	Type	Description
vpc_id	No	String	ID of the VPC to which a real-time service instance is deployed. By default, this parameter is left blank. In this case, ModelArts allocates a dedicated VPC to each user, and users are isolated from each other. To access other service components in the VPC of the service instance, set this parameter to the ID of the corresponding VPC. Once a VPC is configured, it cannot be modified. If both vpc_id and cluster_id are configured, only the dedicated resource pool takes effect.
service_name	Yes	String	Service name, which consists of 1 to 64 characters. Only letters, digits, hyphens (-), and underscores (_) are allowed.
description	No	String	Service description, which is empty by default. The value can contain a maximum of 100 characters and cannot contain the following special characters: !<>+&"
security_group_id	No	String	Security group. By default, this parameter is left blank. This parameter is mandatory if vpc_id is configured. A security group is a virtual firewall that provides secure network access control policies for service instances. A security group must contain at least one inbound rule to permit the requests whose protocol is TCP, source address is 0.0.0.0/0, and port number is 8080.

Parameter	Mandatory	Type	Description
subnet_network_id	No	String	ID of a subnet. By default, this parameter is left blank. This parameter is mandatory if vpc_id is configured. Enter the network ID displayed in the subnet details on the VPC management console. A subnet provides dedicated network resources that are isolated from other networks.
config	Yes	Array of ServiceConfig objects	Model running configurations. If infer_type is batch or edge , you can configure only one model. If infer_type is real-time , you can configure multiple models and assign weights based on service requirements. However, the versions of multiple models must be unique.
additional_properties	No	Map<String, ServiceAdditionalProperties >	Additional service attribute, which facilitates service management
load_balancer_policy	No	String	Backend ELB forwarding policy that can be set only for synchronous real-time services. The value can be ROUND_ROBIN (weighted round robin), LEAST_CONNECTIONS (weighted least connections), or SOURCE_IP (source IP address algorithm).
service_secrets	No	Array of ServiceSecret objects	This API is used to specify the list of keys mounted to the service.
priority	No	Integer	Preemption priority. The value ranges from 1 to 3. The scheduling of high-priority services is guaranteed by setting the preemption priority. When infer_type is set to real-time or batch, the preemption priority can be set.

Table 8-23 Schedule

Parameter	Mandatory	Type	Description
duration	Yes	Integer	Value mapping a time unit. For example, if the task stops after two hours, set time_unit to HOURS and duration to 2 .
time_unit	Yes	String	Scheduling time unit. Possible values are DAYS , HOURS , and MINUTES .
type	Yes	String	Scheduling type. Currently, the value can only be stop, indicating that the task automatically stops after a specified period of time.

Table 8-24 ServiceConfig

Parameter	Mandatory	Type	Description
custom_spec	No	CustomSpec object	Customized resource specification configuration. This parameter is returned only when specification is set to custom.
envs	No	Map<String,String>	Common parameter. (Optional) Environment variable key-value pair required for running a model. By default, this parameter is left blank.

Parameter	Mandatory	Type	Description
specification	Yes	String	Common parameter. Resource flavor. You can query the supported service deployment flavors. The current version supports modelarts.vm.cpu.2u , modelarts.vm.gpu.pnt004 (must be requested), modelarts.vm.ai1.snt3 (must be requested), and custom (available only when the service is deployed in a dedicated resource pool). To request a flavor, submit a service ticket and obtain permissions from ModelArts O&M engineers. If this parameter is set to custom , the custom_spec parameter must be specified.
weight	No	Integer	This parameter is mandatory for real-time . Weight of traffic allocated to a model. This parameter is mandatory only when infer_type is set to real-time . The sum of all weights must be equal to 100. If multiple model versions are configured with different traffic weights in a real-time service, ModelArts will continuously access the prediction API of the service and forward prediction requests to the model instances of the corresponding versions based on the weights.
deploy_timeout_in_seconds	No	Integer	Timeout interval for deploying a single model instance
model_id	Yes	String	Common parameters Model ID. You can obtain the value by calling the API for querying the AI application list.
src_path	No	String	Mandatory for batch services. OBS path to the input data of a batch job

Parameter	Mandatory	Type	Description
req_uri	No	String	Mandatory for batch services. Inference API called in a batch task, which is the RESTful API exposed in the model image. You must select an API URL from the config.json file of the model for inference. If a built-in inference image of ModelArts is used, the API is displayed as <code>/</code> .
mapping_type	No	String	The batch service type is mandatory. Mapping type of the input data. The value can be file or csv. • If file is selected, each inference request corresponds to a file in the input data directory. When this mode is used, req_uri corresponding to the model can have only one input parameter and the parameter type is file. • If csv is selected, each inference request corresponds to a row of data in the CSV file. If this mode is used, the file name extension in the input data directory must be .csv, and the mapping_rule parameter must be configured to indicate the CSV index corresponding to each parameter in the inference request body.

Parameter	Mandatory	Type	Description
cluster_id	No	String	Resource pool ID used for deploying a service. This parameter is optional. For real-time and batch services, the value is the ID of the old-version dedicated resource pool. After this parameter is configured, the network configuration of the cluster is used and the vpc_id parameter does not take effect. When using a dedicated resource pool to deploy a service, ensure that the cluster status is normal and this parameter has a lower priority than pool_name . When setting this parameter, you also need to set the cluster_id or pool_name parameter of the service level, and the priority of this parameter is higher than that of the cluster_id and pool_name parameters of the service level. If both cluster_id and pool_name are missing in config , the cluster_id and pool_name parameters of the service level are used. If none of them is configured, the shared resource pool is used. For edge services, the value is the edge resource pool ID. When using an edge resource pool to deploy a service, ensure that the resource pool status is normal. When setting this parameter, you also need to set the cluster_id parameter of the service level, and the priority of this parameter is higher than that of the cluster_id parameter of the service level. If this parameter is not set, the cluster_id parameter of the service level is used.

Parameter	Mandatory	Type	Description
pool_name	No	String	Resource pool ID of the elastic cluster in the AI dedicated resource pool used for service deployment. When using a dedicated resource pool to deploy a service, ensure that the cluster status is normal and this parameter has a higher priority than cluster_id . When setting this parameter, you also need to set cluster_id or pool_name of the service level, and the priority of this parameter is higher than that of cluster_id and pool_name of the service level. If neither cluster_id nor pool_name is configured in config , the cluster_id and pool_name parameters of the service level are used. If none of them is configured, the shared resource pool is used. This parameter is optional for real-time and batch services.
nodes	No	Array of strings	Edge node ID array. The node ID is the edge node ID on IEF, which can be obtained after the edge node is created on IEF. This parameter is optional for edge services.

Parameter	Mandatory	Type	Description
mapping_rule	No	Object	Optional for batch services. Mapping between input parameters and CSV data. This parameter is mandatory only when mapping_type is set to csv . The mapping rule is similar to the definition of the input parameters in the config.json file. You only need to configure the index parameters under each parameter of the string, number, integer, or boolean type, and specify the value of this parameter to the values of the index parameters in the CSV file to send an inference request. Use commas (,) to separate multiple pieces of CSV data. The values of the index parameters start from 0. If the value of the index parameter is -1, ignore this parameter. For details, see the sample of creating a batch service.
src_type	No	String	Mandatory for batch services. Data source type, which can be ManifestFile . By default, this parameter is left blank, indicating that only files in the src_path directory are read. If this parameter is set to ManifestFile , src_path must be set to a specific manifest path. Multiple data paths can be specified in the manifest file. For details, see the manifest inference specifications.
dest_path	No	String	Mandatory for batch services. OBS path to the output data of a batch job

Parameter	Mandatory	Type	Description
instance_count	Yes	Integer	Common parameter. Number of instances deployed in a model. The maximum number of instances is 128. To use more instances, submit a service ticket.
additional_properties	No	Map<String, ModelAdditionalProperties >	Additional attributes for model deployment, facilitating service instance management
affinity	No	ServiceAffinity object	Service Affinity Deployment

Table 8-25 CustomSpec

Parameter	Mandatory	Type	Description
gpu_p4	No	Float	Number of GPUs, which can be a decimal. The value cannot be smaller than 0, with the third decimal place is rounded off. This parameter is optional and is not used by default.
memory	Yes	Integer	Memory in MB, which must be an integer
cpu	Yes	Float	Number of CPU cores, which can be a decimal. The value cannot be smaller than 0.01, with the third decimal place is rounded off.
ascend_a310	No	Integer	Number of Ascend chips. This parameter is optional and is not used by default. Either this parameter or gpu is configured.

Table 8-26 ModelAdditionalProperties

Parameter	Mandatory	Type	Description
log_volume	No	Array of LogVolume objects	Host directory mounting. This parameter takes effect only if a dedicated resource pool is used. If a public resource pool is used to deploy services, this parameter cannot be configured. Otherwise, an error will occur.
max_surge	No	Float	The value must be greater than 0. If this parameter is not set, the default value 1 is used. If the value is less than 1, it indicates the percentage of instances to be added during the rolling upgrade. If the value is greater than 1, it indicates the maximum number of instances to be added during the rolling upgrade.
max_unavailable	No	Float	The value must be greater than 0. If this parameter is not set, the default value 0 is used. If the value is less than 1, it indicates the percentage of instances that can be scaled in during the rolling upgrade. If the value is greater than 1, it indicates the number of instances that can be scaled in during the rolling upgrade.
termination_grace_period_seconds	No	Integer	Graceful stop period of a container.
persistent_volumes	No	Array of PersistentVolumes objects	Persistent storage mounting.
dew_secret	No	DewSecret object	DEW secret.

Table 8-27 LogVolume

Parameter	Mandatory	Type	Description
host_path	Yes	String	Log path to be mapped on the host
mount_path	Yes	String	Path to the logs in the container

Table 8-28 PersistentVolumes

Parameter	Mandatory	Type	Description
name	No	String	Volume name.
mount_path	Yes	String	Mount path of a volume in the container. Example: /tmp. The container path must not be a system directory, such as / and /var/run. Otherwise, an exception occurs. It is a good practice to mount the container to an empty directory. If the directory is not empty, ensure that there are no files affecting container startup in the directory. Otherwise, such files will be replaced, resulting in failures to start the container and create the workload.
storage_type	No	String	Mount type: sfs_turbo.
source_addresses	No	String	Specifies the mounting source path. The value is the SFS Turbo ID when an EFS file is mounted.

Table 8-29 DewSecret

Parameter	Mandatory	Type	Description
secret_name	No	String	DEW secret name.

Table 8-30 ServiceAffinity

Parameter	Mandatory	Type	Description
node_affinity	No	NodeAffinity object	Set this parameter when node affinity is used.

Table 8-31 NodeAffinity

Parameter	Mandatory	Type	Description
mode	Yes	String	Node affinity mode. The value required indicates strong affinity. A service instance can be scheduled only to a specified node. If the specified node does not exist, the scheduling fails. preferred indicates weak affinity. A service instance tends to be scheduled to a specified node. If the specified node does not meet the scheduling conditions, the service instance will be scheduled to another node.
pool_infos	No	Array of AffinityPoolInfo objects	Configure an affinity policy for a specified cluster and specify the nodes in the cluster.

Table 8-32 AffinityPoolInfo

Parameter	Mandatory	Type	Description
pool_name	Yes	String	Cluster name. The cluster name must be in the outer pool_name.
nodes	Yes	Array of AffinityNodeInfo objects	Affinity Node List

Table 8-33 AffinityNodeInfo

Parameter	Mandatory	Type	Description
name	Yes	String	Node name, which corresponds to the private IP address of the node.

Table 8-34 ServiceAdditionalProperties

Parameter	Mandatory	Type	Description
smn_notification	Yes	Map<String, SmnNotification >	SMN message notification structure, which is used to notify the user of the service status change
log_report_channels	No	Array of LogReportPipeline objects	Log channel group. If this parameter is not specified or the array length is 0, LTS log interconnection is disabled. This function cannot be modified after being enabled.
websocket_upgrade	No	Boolean	Whether the service interface is upgraded to WebSocket. During service deployment, the default value is false . During service configuration update, the default value is the value set last time. • false: Do not upgrade to WebSocket. • true: Upgrade to WebSocket. This parameter cannot be modified after WebSocket is enabled. WebSocket cannot be enabled together with Traffic Limit.

Table 8-35 SmnNotification

Parameter	Mandatory	Type	Description
topic_urn	Yes	String	URN of an SMN topic

Parameter	Mandatory	Type	Description
events	Yes	Array of integers	Event ID. The options are as follows: • 1: failed • 3: running • 7: concerning • 11: pending

Table 8-36 LogReportPipeline

Parameter	Mandatory	Type	Description
type	Yes	String	Log pipeline type. Currently, only LTS is supported.
configuration	No	LtsConfiguration object	LTS log configuration.

Table 8-37 LtsConfiguration

Parameter	Mandatory	Type	Description
log_group_id	Yes	String	LTS log group ID. The value contains 64 characters.
log_stream_id	Yes	String	LTS log stream ID. The value contains 64 characters.

Table 8-38 ServiceSecret

Parameter	Mandatory	Type	Description
secretId	Yes	String	Specifies the key ID.
mount_path	Yes	String	Mount path.

Response Parameters

Status code: 200

Table 8-39 Response body parameters

Parameter	Type	Description
service_id	String	Service ID
resource_ids	Array of strings	Resource ID array for the resource IDs generated by the target model

Example Requests

- Sample request of creating a real-time service

POST https://{endpoint}/v1/{project_id}/services

```
{
  "infer_type": "real-time",
  "service_name": "mnist",
  "description": "mnist service",
  "config": [ {
    "specification": "modelarts.vm.cpu.2u",
    "weight": 100,
    "model_id": "0e07b41b-173e-42db-8c16-8e1b44cc0d44",
    "instance_count": 1
  } ]
}
```

- Create a real-time service and configure multi-version traffic distribution.

POST https://{endpoint}/v1/{project_id}/services

```
{
  "service_name": "mnist",
  "description": "mnist service",
  "infer_type": "real-time",
  "config": [ {
    "model_id": "xxxmodel-idxxx",
    "weight": "70",
    "specification": "modelarts.vm.cpu.2u",
    "instance_count": 1,
    "envs": {
      "model_name": "mxnet-model-1",
      "load_epoch": "0"
    }
  }, {
    "model_id": "xxxxxx",
    "weight": "30",
    "specification": "modelarts.vm.cpu.2u",
    "instance_count": 1
  } ]
}
```

- Create a real-time service in a dedicated resource pool with custom specifications.

POST https://{endpoint}/v1/{project_id}/services

```
{
  "service_name": "realtime-demo",
  "description": "",
  "infer_type": "real-time",
  "cluster_id": "8abf68a969c3cb3a0169c4acb24b0000",
  "config": [ {
    "model_id": "eb6a4a8c-5713-4a27-b8ed-c7e694499af5",
    "weight": "100",
    "cluster_id": "8abf68a969c3cb3a0169c4acb24b0000",
    "specification": "custom",
  } ]
}
```

```
"custom_spec" : {  
  "cpu" : 1.5,  
  "memory" : 7500  
},  
"instance_count" : 1  
}]  
}
```

- Create a real-time service and configure it to automatically stop.

POST https://{endpoint}/v1/{project_id}/services

```
{  
  "service_name" : "service-demo",  
  "description" : "demo",  
  "infer_type" : "real-time",  
  "config" : [ {  
    "model_id" : "xxxmodel-idxxx",  
    "weight" : "100",  
    "specification" : "modelarts.vm.cpu.2u",  
    "instance_count" : 1  
  } ],  
  "schedule" : [ {  
    "type" : "stop",  
    "time_unit" : "HOURS",  
    "duration" : 1  
  } ]  
}
```

- Create a batch service and set **mapping_type** to **file**.

POST https://{endpoint}/v1/{project_id}/services

```
{  
  "service_name" : "batchservicetest",  
  "description" : "",  
  "infer_type" : "batch",  
  "cluster_id" : "8abf68a969c3cb3a0169c4acb24b****",  
  "config" : [ {  
    "model_id" : "598b913a-af3e-41ba-a1b5-bf065320f1e2",  
    "specification" : "modelarts.vm.cpu.2u",  
    "instance_count" : 1,  
    "src_path" : "https://infern-data.obs.xxxx.com/xgboosterdata/",  
    "dest_path" : "https://infern-data.obs.xxxx.com/output/",  
    "req_uri" : "/",  
    "mapping_type" : "file"  
  } ]  
}
```

- Create a batch service and set **mapping_type** to **csv**.

POST https://{endpoint}/v1/{project_id}/services

```
{  
  "service_name" : "batchservicetest",  
  "description" : "",  
  "infer_type" : "batch",  
  "config" : [ {  
    "model_id" : "598b913a-af3e-41ba-a1b5-bf065320f1e2",  
    "specification" : "modelarts.vm.cpu.2u",  
    "instance_count" : 1,  
    "src_path" : "https://infern-data.obs.xxxx.com/xgboosterdata/",  
    "dest_path" : "https://infern-data.obs.xxxx.com/output/",  
    "req_uri" : "/",  
    "mapping_type" : "csv",  
    "mapping_rule" : {  
      "type" : "object",  
      "properties" : {  
        "data" : {  
          "type" : "object",  
          "properties" : {  
            "req_data" : {  
              "type" : "array",
```

```
"items": [ {  
  "type": "object",  
  "properties": {  
    "input5": {  
      "type": "number",  
      "index": 0  
    },  
    "input4": {  
      "type": "number",  
      "index": 1  
    },  
    "input3": {  
      "type": "number",  
      "index": 2  
    },  
    "input2": {  
      "type": "number",  
      "index": 3  
    },  
    "input1": {  
      "type": "number",  
      "index": 4  
    }  
  }  
}  
}]  
}  
}  
}  
}  
}]  
}
```

- Create an edge service.

POST https://{endpoint}/v1/{project_id}/services

```
{  
  "service_name": "service-edge-demo",  
  "description": "",  
  "infer_type": "edge",  
  "config": [ {  
    "model_id": "eb6a4a8c-5713-4a27-b8ed-c7e694499af5",

Status Code	Description
200	Service deployed

Error Codes

See [Error Codes](#).

8.5 Obtaining Supported Service Deployment Specifications

Function

This API is used to obtain supported service deployment specifications.

Debugging

You can debug this API through automatic authentication in [API Explorer](#) or use the SDK sample code generated by API Explorer.

Authorization Information

Each account has all the permissions required to call all APIs, but IAM users must be assigned the required permissions.

- If you are using role/policy-based authorization, see [Permissions Policies and Supported Actions](#) for details on the required permissions.
- If you are using identity policy-based authorization, no identity policy-based permission required for calling this API.

URI

GET /v1/{project_id}/services/specifications

Table 8-40 Path Parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Project ID. For details, see Obtaining a Project ID and Name .

Table 8-41 Query Parameters

Parameter	Mandatory	Type	Description
is_personal_cluster	No	Boolean	Whether to obtain the service deployment flavors supported by dedicated resource pool. The default value is false .
infer_type	No	String	Inference type. Enums: • real-time, which is the default value • batch • edge
limit	No	String	Maximum number of records returned on each page. The default value is 1000 .
offset	No	String	Start offset of the returned data. The default value is 0 .

Request Parameters

Table 8-42 Request header parameters

Parameter	Mandatory	Type	Description
X-Auth-Token	Yes	String	User token. It can be obtained by calling the IAM API that is used to obtain a user token. The value of X-Subject-Token in the response header is the user token.

Response Parameters

Status code: 200

Table 8-43 Response body parameters

Parameter	Type	Description
total_count	Integer	Total number of deployed service specifications.
count	Integer	Number of specifications in the current list.

Parameter	Type	Description
specifications	Array of Specification objects	Supported service deployment flavors

Table 8-44 Specification

Parameter	Type	Description
is_open	Boolean	Whether to enable the flavor. The default value is true . If this parameter is set to false , submit a service ticket to apply for the flavor.
spec_status	String	Specification status. The options are as follows: • normal: The specification is normal. • sellout: The specification cannot be used to deploy services because it is sold out.
specification	String	Unique flavor ID
billing_spec	String	Unique ID of the billing specifications
category	String	The flavor type.
cpu_info	CpuInfo object	Specifies the CPU information of the flavor.
memory_info	MemoryInfo object	Specifies the memory information of the flavor.
gpu_info	GpuInfo object	Specifies the GPU information of the flavor.
npu_info	NpuInfo object	NPU information of the flavor.
source_type	String	Model type, which can be empty or auto . The default value is empty , indicating that the model is generated by the user. If the value is auto , the model is trained using ExeML. The billing mode varies depending on the model type.
is_free	Boolean	Whether the flavor is free of charge. The value true indicates that the flavor is free of charge.
over_quota	Boolean	Whether the quota exceeds the upper limit. The value true indicates that the quota exceeds the upper limit.

Parameter	Type	Description
extend_params	Integer	Billing item
display_en	String	Specifications description in English
display_cn	String	Specification description

Table 8-45 CpuInfo

Parameter	Type	Description
arch	String	Architecture type.
cpu	Number	Number of CPUs

Table 8-46 MemoryInfo

Parameter	Type	Description
unit	String	Unit.
memory	Integer	Memory size.

Table 8-47 GpuInfo

Parameter	Type	Description
brand	String	Brand.
version	String	Card type.
unit	String	Unit.
memory	Integer	Memory size of the card.
gpu	Number	Number of GPUs.

Table 8-48 NpuInfo

Parameter	Type	Description
brand	String	Brand.
version	String	Card type.
unit	String	Unit.
memory	Integer	Memory size of the card.

Parameter	Type	Description
npu	Integer	Number of NPUs.

Status Codes

Status Code	Description
200	Service deployment flavors.

Error Codes

See [Error Codes](#).

8.6 Obtaining Service Details

Function

This API is used to obtain the details about a model service based on the service ID.

Debugging

You can debug this API through automatic authentication in [API Explorer](#) or use the SDK sample code generated by API Explorer.

Authorization Information

Each account has all the permissions required to call all APIs, but IAM users must be assigned the required permissions.

- If you are using role/policy-based authorization, see [Permissions Policies and Supported Actions](#) for details on the required permissions.
- If you are using identity policy-based authorization, the following identity policy-based permissions are required.

Action	Access Level	Resource Type (*: required)	Condition Key	Alias	Dependencies
modelarts:service:get	Read	service *	g:ResourceTag/<tag-key>	-	-

URI

GET /v1/{project_id}/services/{service_id}

Table 8-49 Path Parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Project ID. For details, see Obtaining a Project ID and Name .
service_id	Yes	String	Service ID. You can obtain the service ID from the response body when creating a service or obtain the services owned by the current user by calling the API for querying the service list. The service_id field indicates the service ID.

Request Parameters

Table 8-50 Request header parameters

Parameter	Mandatory	Type	Description
X-Auth-Token	Yes	String	User token. It can be obtained by calling the IAM API that is used to obtain a user token. The value of X-Subject-Token in the response header is the user token.

Response Parameters

Status code: 200

Table 8-51 Response body parameters

Parameter	Type	Description
service_id	String	Service ID
service_name	String	Service name
description	String	Service description
tenant	String	Tenant to which a service belongs
project	String	Project to which a service belongs
owner	String	User to which a service belongs
publish_at	Number	Latest service release time, in milliseconds calculated from 1970.1.1 0:0:0 UTC.
infer_type	String	Inference mode. Options: • real-time • batch • edge
workspace_id	String	Workspace ID

Parameter	Type	Description
cluster_id	String	ID of the dedicated resource pool used by a real-time or batch service or ID of the edge resource pool used by an edge service. This parameter is returned only when a dedicated resource pool or edge resource pool is configured.
vpc_id	String	ID of the VPC to which the real-time service instance belongs. This parameter is available when the network configuration is customized.
subnet_network_id	String	ID of the subnet to which the real-time service instance belongs. This parameter is available when the network configuration is customized.
security_group_id	String	Security group to which the real-time service instance belongs. This parameter is available when the network configuration is customized.

Parameter	Type	Description
status	String	Service status. The options are as follows: • running: The service is running properly. • deploying: The service is being deployed, including image creation and resource scheduling deployment. • concerning: An alarm has been generated, indicating that some backend instances malfunction. • failed: Deploying the service failed. For details about the failure cause, see the event and log tab pages. • stopped: The service has been stopped. • finished: Service running is completed. This status is available only for batch services. • stopping: The service is being stopped. • deleting: The service is being deleted. • pending: The service is pending. This status is available only for real-time services. • waiting: The resource is being queued. This status is available only for real-time services.
progress	Integer	Deployment progress. This parameter is available when the status is deploying .
error_msg	String	Error message. When status is failed , an error message carrying the failure cause is returned.
config	Array of QueryServiceConfig objects	Service configuration (If a service is shared, only model_id , model_name , and model_version are returned.)
access_address	String	Access address of an inference request. This parameter is only valid when infer_type is set to real-time and the service is deployed.

Parameter	Type	Description
bind_access_addresses	String	Request address of a custom domain name. This parameter is available after a domain name is bound.
invocation_times	Number	Total number of service calls
failed_times	Number	Number of failed service calls
is_shared	Boolean	Whether a service is subscribed
shared_count	Number	Number of subscribed services
schedule	Array of Schedule objects	Service scheduling configuration. If this parameter is not configured, no value will be returned.
update_time	Number	Time when the configuration used by the current service is updated, in milliseconds calculated from 1970.1.1 0:0:0 UTC.
debug_url	String	Online debugging address of a real-time service. This parameter is available only when the model supports online debugging and there is only one instance.
due_time	Number	Time when an online service automatically stops, in milliseconds calculated from 1970.1.1 0:0:0 UTC. If automatic stop is not configured, this parameter is not returned.
operation_time	Number	Operation time of a request
transition_at	Number	Time when the service status changes
is_free	Boolean	Whether a free-of-charge flavor is used
additional_properties	Map<String,String>	Additional service attribute
pool_name	String	Resource pool ID of the elastic cluster in the AI dedicated resource pool used by the real-time or batch service. This parameter is returned only when a dedicated resource pool is configured.

Parameter	Type	Description
load_balancer_policy	String	Backend ELB forwarding policy that can be set for synchronous real-time services. The value can be ROUND_ROBIN (weighted round robin), LEAST_CONNECTIONS (weighted least connections), or SOURCE_IP (source IP address algorithm).
priority	Integer	Preemption priority. The value ranges from 1 to 3. The scheduling of high-priority services is guaranteed by setting the preemption priority. When infer_type is set to real-time or batch, the preemption priority can be set.

Table 8-52 QueryServiceConfig

Parameter	Type	Description
model_version	String	Model version
finished_time	Number	Task completion time, in milliseconds calculated from 1970.1.1 0:0:0 UTC. This parameter is not returned before the task is complete.
custom_spec	CustomSpec object	Customized resource specification configuration. This parameter is returned only when specification is set to custom.
envs	Map<String,String>	Environment variable key-value pair required for running a model
specification	String	Resource specifications, for example, modelarts.vm.cpu.2u/ modelarts.vm.gpu.pnt004/ modelarts.vm.ai1.snt3. If this parameter is set to custom, a customized flavor is used, which matches the custom_spec field.
weight	Integer	Traffic weight allocated to a model
source_type	String	Model source. This parameter is returned when a model is created using ExeML. The value is auto .
model_id	String	Model ID

Parameter	Type	Description
src_path	String	OBS path for storing the input data of a batch task, for example, https://xxx.obs.myhwclouds.com/image/.
req_uri	String	Inference path invoked in a batch task, for example, /.
mapping_type	String	Mapping type of the input data, which can be file or csv
start_time	Number	Task start time, in milliseconds calculated from 1970.1.1 0:0:0 UTC. This parameter is not returned before the task starts.
cluster_id	String	ID of the dedicated resource pool or edge resource pool used by the service instance. This parameter is returned only when a dedicated resource pool or edge resource pool is configured.
nodes	Array of Nodes objects	Edge node information. This parameter is returned only when ModelArts edge nodes are configured.
mapping_rule	Object	Mapping between input parameters and CSV data. This parameter is mandatory only when mapping_type is set to csv .
model_name	String	Model name
src_type	String	Data source type. This parameter is returned only when ManifestFile is used.
dest_path	String	OBS path to the output data of a batch job Example: https://xxx.obs.myhwclouds.com/res/.
instance_count	Integer	Number of instances deployed for a model

Parameter	Type	Description
status	String	Service status. The options are as follows: • running: The service is running properly. • deploying: The service is being deployed, including image creation and resource scheduling deployment. • concerning: An alarm has been generated, indicating that some backend instances malfunction. • failed: Deploying the service failed. For details about the failure cause, see the event and log tab pages. • stopped: The service has been stopped. • finished: Service running is completed. This status is available only for batch services.
scaling	Boolean	Whether auto scaling is enabled
support_debug	Boolean	Whether a model supports online debugging
additional_properties	Map<String, ModelAdditionalProperties >	Additional model deployment attribute
pool_name	String	Resource pool ID of the elastic cluster in the AI dedicated resource pool used by the service instance. This parameter is returned only when a dedicated resource pool is configured.
affinity	ServiceAffinity object	Service Affinity Information
specification_details	ServiceSpecificationDetails object	Flavor details.

Table 8-53 CustomSpec

Parameter	Type	Description
gpu_p4	Float	Number of GPUs, which can be a decimal. The value cannot be smaller than 0, with the third decimal place is rounded off. This parameter is optional and is not used by default.
memory	Integer	Memory in MB, which must be an integer
cpu	Float	Number of CPU cores, which can be a decimal. The value cannot be smaller than 0.01, with the third decimal place is rounded off.
ascend_a310	Integer	Number of Ascend chips. This parameter is optional and is not used by default. Either this parameter or gpu is configured.

Table 8-54 Nodes

Parameter	Type	Description
memory	Integer	Memory size, in MB
os_version	String	OS version of a node
cpu	Integer	Number of CPU cores
created_at	String	Creation time, in the format of YYYY-MM-DDThh:mm:ss (UTC)
description	String	Node description.
message	String	Indicates the reason when instance_status is failed or notReady.
predict_url	String	Inference URL of a node
enable_gpu	Boolean	Whether to enable GPUs
gpu_num	Integer	Number of GPUs
host_ips	Array of strings	Host IP address of a node
updated_at	String	Update time, in the format of YYYY-MM-DDThh:mm:ss (UTC)
node_label	String	Node label
os_type	String	OS type of a node

Parameter	Type	Description
name	String	Name of an edge node
os_name	String	OS name of a node
arch	String	Node architecture
id	String	Edge node ID
instance_status	String	Running status of a model instance on the node. The options are as follows: • running: The task is running. • stopped: The service has been stopped. • notReady: not ready. • failed: The task fails to be executed.
state	String	Host status, which can be RUNNING , FAIL , or UNCONNECTED
deployment_num	Integer	Number of application instances deployed on a node
host_name	String	Host name of a node

Table 8-55 ModelAdditionalProperties

Parameter	Type	Description
log_volume	Array of LogVolume objects	Host directory mounting. This parameter takes effect only if a dedicated resource pool is used. If a public resource pool is used to deploy services, this parameter cannot be configured. Otherwise, an error will occur.
max_surge	Float	The value must be greater than 0. If this parameter is not set, the default value 1 is used. If the value is less than 1, it indicates the percentage of instances to be added during the rolling upgrade. If the value is greater than 1, it indicates the maximum number of instances to be added during the rolling upgrade.

Parameter	Type	Description
max_unavailable	Float	The value must be greater than 0. If this parameter is not set, the default value 0 is used. If the value is less than 1, it indicates the percentage of instances that can be scaled in during the rolling upgrade. If the value is greater than 1, it indicates the number of instances that can be scaled in during the rolling upgrade.
termination_grace_period_seconds	Integer	Graceful stop period of a container.
persistent_volumes	Array of PersistentVolumes objects	Persistent storage mounting.
dew_secret	DewSecret object	DEW secret.

Table 8-56 LogVolume

Parameter	Type	Description
host_path	String	Log path to be mapped on the host
mount_path	String	Path to the logs in the container

Table 8-57 PersistentVolumes

Parameter	Type	Description
name	String	Volume name.
mount_path	String	Mount path of a volume in the container. Example: /tmp. The container path must not be a system directory, such as / and /var/run. Otherwise, an exception occurs. It is a good practice to mount the container to an empty directory. If the directory is not empty, ensure that there are no files affecting container startup in the directory. Otherwise, such files will be replaced, resulting in failures to start the container and create the workload.
storage_type	String	Mount type: sfs_turbo.

Parameter	Type	Description
source_address	String	Specifies the mounting source path. The value is the SFS Turbo ID when an EFS file is mounted.

Table 8-58 DewSecret

Parameter	Type	Description
secret_name	String	DEW secret name.

Table 8-59 ServiceAffinity

Parameter	Type	Description
node_affinity	NodeAffinity object	Set this parameter when node affinity is used.

Table 8-60 NodeAffinity

Parameter	Type	Description
mode	String	Node affinity mode. The value required indicates strong affinity. A service instance can be scheduled only to a specified node. If the specified node does not exist, the scheduling fails. preferred indicates weak affinity. A service instance tends to be scheduled to a specified node. If the specified node does not meet the scheduling conditions, the service instance will be scheduled to another node.
pool_infos	Array of AffinityPoolInfo objects	Configure an affinity policy for a specified cluster and specify the nodes in the cluster.

Table 8-61 AffinityPoolInfo

Parameter	Type	Description
pool_name	String	Cluster name. The cluster name must be in the outer pool_name.

Parameter	Type	Description
nodes	Array of AffinityNodeInfo objects	Affinity Node List

Table 8-62 AffinityNodeInfo

Parameter	Type	Description
name	String	Node name, which corresponds to the private IP address of the node.

Table 8-63 ServiceSpecificationDetails

Parameter	Type	Description
display_en	String	Flavor name.
display_cn	String	Flavor name, in Chinese.
category	String	Flavor type, which can be CPU (no accelerator cards), GPU (GPU accelerator cards), or NPU (NPU accelerator cards).
cpu_info	CpuDisplayInfo object	CPU details.
memory_info	MemoryDisplayInfo object	Memory details.
gpu_info	GpuDisplayInfo object	GPU details.
npu_info	NpuDisplayInfo object	NPU details.

Table 8-64 CpuDisplayInfo

Parameter	Type	Description
cpu	Double	Number of CPU cores.
arch	String	CPU architecture, which can be x86 or Arm.

Table 8-65 MemoryDisplayInfo

Parameter	Type	Description
memory	Integer	Memory capacity.
unit	String	Memory unit, for example, MB or GB.

Table 8-66 GpuDisplayInfo

Parameter	Type	Description
gpu	Double	Number of GPUs.
brand	String	GPU vendor.
version	String	GPU model.
memory	Integer	GPU memory capacity.
unit	String	GPU memory unit, for example, MB or GB.

Table 8-67 NpuDisplayInfo

Parameter	Type	Description
npu	Integer	Number of NPUs.
brand	String	NPU vendor.
version	String	NPU model.
memory	Integer	NPU memory.
unit	String	NPU memory unit, for example, MB or GB.

Table 8-68 Schedule

Parameter	Type	Description
duration	Integer	Value mapping a time unit. For example, if the task stops after two hours, set time_unit to HOURS and duration to 2 .
time_unit	String	Scheduling time unit. Possible values are DAYS , HOURS , and MINUTES .

Parameter	Type	Description
type	String	Scheduling type. Currently, the value can only be stop, indicating that the task automatically stops after a specified period of time.

Example Requests

GET https://{endpoint}/v1/{project_id}/services/{service_id}

See [Error Codes](#).

8.7 Updating Service Configurations

Function

This API is used to update configurations of a model service. It can also be used to start or stop a service.

Debugging

You can debug this API through automatic authentication in [API Explorer](#) or use the SDK sample code generated by API Explorer.

Authorization Information

Each account has all the permissions required to call all APIs, but IAM users must be assigned the required permissions.

- If you are using role/policy-based authorization, see [Permissions Policies and Supported Actions](#) for details on the required permissions.
- If you are using identity policy-based authorization, the following identity policy-based permissions are required.

Action	Access Level	Resource Type (*: required)	Condition Key	Alias	Dependencies
modelarts:service:update	Write	service *	g:ResourceTag/<tag-key>	-	-

URI

PUT /v1/{project_id}/services/{service_id}

Table 8-69 Path Parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Project ID. For details, see Obtaining a Project ID and Name .
service_id	Yes	String	Service ID

Request Parameters

Table 8-70 Request header parameters

Parameter	Mandatory	Type	Description
X-Auth-Token	Yes	String	User token. It can be obtained by calling the IAM API that is used to obtain a user token. The value of X-Subject-Token in the response header is the user token.

Table 8-71 Request body parameters

Parameter	Mandatory	Type	Description
schedule	No	Array of Schedule objects	Service scheduling configuration, which can be configured only for real-time services. By default, this parameter is not used. Services run for a long time.
description	No	String	Service description, which contains a maximum of 100 characters and cannot contain the following characters: <>=&". If this parameter is not set, no update is performed.
config	No	Array of ServiceConfig objects	Service configuration. If this parameter is not configured, the service is not updated.

Parameter	Mandatory	Type	Description
status	No	String	Service status, which can be running or stopped . If this parameter is not configured, the service status is not changed. Either status or config can be modified. If both of them are used, modify status only.
additional_properties	No	Map<String, ServiceAdditionalProperties >	Additional service attribute, which facilitates service management
load_balancer_policy	No	String	Backend ELB forwarding policy that can be set only for synchronous real-time services. The value can be ROUND_ROBIN (weighted round robin), LEAST_CONNECTIONS (weighted least connections), or SOURCE_IP (source IP address algorithm).
service_secrets	No	Array of ServiceSecret objects	Specifies the list of keys mounted to the service. If this parameter is not set, the key will not be updated.
priority	No	Integer	Preemption priority. The value ranges from 1 to 3. The scheduling of high-priority services is guaranteed by setting the preemption priority. When infer_type is set to real-time or batch, the preemption priority can be set.

Table 8-72 Schedule

Parameter	Mandatory	Type	Description
duration	Yes	Integer	Value mapping a time unit. For example, if the task stops after two hours, set time_unit to HOURS and duration to 2 .

Parameter	Mandatory	Type	Description
time_unit	Yes	String	Scheduling time unit. Possible values are DAYS , HOURS , and MINUTES .
type	Yes	String	Scheduling type. Currently, the value can only be stop, indicating that the task automatically stops after a specified period of time.

Table 8-73 ServiceConfig

Parameter	Mandatory	Type	Description
custom_spec	No	CustomSpec object	Customized resource specification configuration. This parameter is returned only when specification is set to custom.
envs	No	Map<String,String>	Common parameter. (Optional) Environment variable key-value pair required for running a model. By default, this parameter is left blank.
specification	Yes	String	Common parameter. Resource flavor. You can query the supported service deployment flavors. The current version supports modelarts.vm.cpu.2u , modelarts.vm.gpu.pnt004 (must be requested), modelarts.vm.ai1.snt3 (must be requested), and custom (available only when the service is deployed in a dedicated resource pool). To request a flavor, submit a service ticket and obtain permissions from ModelArts O&M engineers. If this parameter is set to custom , the custom_spec parameter must be specified.

Parameter	Mandatory	Type	Description
weight	No	Integer	This parameter is mandatory for real-time . Weight of traffic allocated to a model. This parameter is mandatory only when infer_type is set to real-time . The sum of all weights must be equal to 100. If multiple model versions are configured with different traffic weights in a real-time service, ModelArts will continuously access the prediction API of the service and forward prediction requests to the model instances of the corresponding versions based on the weights.
deploy_timeout_in_seconds	No	Integer	Timeout interval for deploying a single model instance
model_id	Yes	String	Common parameters Model ID. You can obtain the value by calling the API for querying the AI application list.
src_path	No	String	Mandatory for batch services. OBS path to the input data of a batch job
req_uri	No	String	Mandatory for batch services. Inference API called in a batch task, which is the RESTful API exposed in the model image. You must select an API URL from the config.json file of the model for inference. If a built-in inference image of ModelArts is used, the API is displayed as <code>/</code> .

Parameter	Mandatory	Type	Description
mapping_type	No	String	The batch service type is mandatory. Mapping type of the input data. The value can be file or csv. • If file is selected, each inference request corresponds to a file in the input data directory. When this mode is used, req_uri corresponding to the model can have only one input parameter and the parameter type is file. • If csv is selected, each inference request corresponds to a row of data in the CSV file. If this mode is used, the file name extension in the input data directory must be .csv, and the mapping_rule parameter must be configured to indicate the CSV index corresponding to each parameter in the inference request body.

Parameter	Mandatory	Type	Description
cluster_id	No	String	Resource pool ID used for deploying a service. This parameter is optional. For real-time and batch services, the value is the ID of the old-version dedicated resource pool. After this parameter is configured, the network configuration of the cluster is used and the vpc_id parameter does not take effect. When using a dedicated resource pool to deploy a service, ensure that the cluster status is normal and this parameter has a lower priority than pool_name . When setting this parameter, you also need to set the cluster_id or pool_name parameter of the service level, and the priority of this parameter is higher than that of the cluster_id and pool_name parameters of the service level. If both cluster_id and pool_name are missing in config , the cluster_id and pool_name parameters of the service level are used. If none of them is configured, the shared resource pool is used. For edge services, the value is the edge resource pool ID. When using an edge resource pool to deploy a service, ensure that the resource pool status is normal. When setting this parameter, you also need to set the cluster_id parameter of the service level, and the priority of this parameter is higher than that of the cluster_id parameter of the service level. If this parameter is not set, the cluster_id parameter of the service level is used.

Parameter	Mandatory	Type	Description
pool_name	No	String	Resource pool ID of the elastic cluster in the AI dedicated resource pool used for service deployment. When using a dedicated resource pool to deploy a service, ensure that the cluster status is normal and this parameter has a higher priority than cluster_id . When setting this parameter, you also need to set cluster_id or pool_name of the service level, and the priority of this parameter is higher than that of cluster_id and pool_name of the service level. If neither cluster_id nor pool_name is configured in config , the cluster_id and pool_name parameters of the service level are used. If none of them is configured, the shared resource pool is used. This parameter is optional for real-time and batch services.
nodes	No	Array of strings	Edge node ID array. The node ID is the edge node ID on IEF, which can be obtained after the edge node is created on IEF. This parameter is optional for edge services.

Parameter	Mandatory	Type	Description
mapping_rule	No	Object	Optional for batch services. Mapping between input parameters and CSV data. This parameter is mandatory only when mapping_type is set to csv . The mapping rule is similar to the definition of the input parameters in the config.json file. You only need to configure the index parameters under each parameter of the string, number, integer, or boolean type, and specify the value of this parameter to the values of the index parameters in the CSV file to send an inference request. Use commas (,) to separate multiple pieces of CSV data. The values of the index parameters start from 0. If the value of the index parameter is -1, ignore this parameter. For details, see the sample of creating a batch service.
src_type	No	String	Mandatory for batch services. Data source type, which can be ManifestFile . By default, this parameter is left blank, indicating that only files in the src_path directory are read. If this parameter is set to ManifestFile , src_path must be set to a specific manifest path. Multiple data paths can be specified in the manifest file. For details, see the manifest inference specifications.
dest_path	No	String	Mandatory for batch services. OBS path to the output data of a batch job

Parameter	Mandatory	Type	Description
instance_count	Yes	Integer	Common parameter. Number of instances deployed in a model. The maximum number of instances is 128. To use more instances, submit a service ticket.
additional_properties	No	Map<String, ModelAdditionalProperties >	Additional attributes for model deployment, facilitating service instance management
affinity	No	ServiceAffinity object	Service Affinity Deployment

Table 8-74 CustomSpec

Parameter	Mandatory	Type	Description
gpu_p4	No	Float	Number of GPUs, which can be a decimal. The value cannot be smaller than 0, with the third decimal place is rounded off. This parameter is optional and is not used by default.
memory	Yes	Integer	Memory in MB, which must be an integer
cpu	Yes	Float	Number of CPU cores, which can be a decimal. The value cannot be smaller than 0.01, with the third decimal place is rounded off.
ascend_a310	No	Integer	Number of Ascend chips. This parameter is optional and is not used by default. Either this parameter or gpu is configured.

Table 8-75 ModelAdditionalProperties

Parameter	Mandatory	Type	Description
log_volume	No	Array of LogVolume objects	Host directory mounting. This parameter takes effect only if a dedicated resource pool is used. If a public resource pool is used to deploy services, this parameter cannot be configured. Otherwise, an error will occur.
max_surge	No	Float	The value must be greater than 0. If this parameter is not set, the default value 1 is used. If the value is less than 1, it indicates the percentage of instances to be added during the rolling upgrade. If the value is greater than 1, it indicates the maximum number of instances to be added during the rolling upgrade.
max_unavailable	No	Float	The value must be greater than 0. If this parameter is not set, the default value 0 is used. If the value is less than 1, it indicates the percentage of instances that can be scaled in during the rolling upgrade. If the value is greater than 1, it indicates the number of instances that can be scaled in during the rolling upgrade.
termination_grace_period_seconds	No	Integer	Graceful stop period of a container.
persistent_volumes	No	Array of PersistentVolumes objects	Persistent storage mounting.
dew_secret	No	DewSecret object	DEW secret.

Table 8-76 LogVolume

Parameter	Mandatory	Type	Description
host_path	Yes	String	Log path to be mapped on the host
mount_path	Yes	String	Path to the logs in the container

Table 8-77 PersistentVolumes

Parameter	Mandatory	Type	Description
name	No	String	Volume name.
mount_path	Yes	String	Mount path of a volume in the container. Example: /tmp. The container path must not be a system directory, such as / and /var/run. Otherwise, an exception occurs. It is a good practice to mount the container to an empty directory. If the directory is not empty, ensure that there are no files affecting container startup in the directory. Otherwise, such files will be replaced, resulting in failures to start the container and create the workload.
storage_type	No	String	Mount type: sfs_turbo.
source_addresses	No	String	Specifies the mounting source path. The value is the SFS Turbo ID when an EFS file is mounted.

Table 8-78 DewSecret

Parameter	Mandatory	Type	Description
secret_name	No	String	DEW secret name.

Table 8-79 ServiceAffinity

Parameter	Mandatory	Type	Description
node_affinity	No	NodeAffinity object	Set this parameter when node affinity is used.

Table 8-80 NodeAffinity

Parameter	Mandatory	Type	Description
mode	Yes	String	Node affinity mode. The value required indicates strong affinity. A service instance can be scheduled only to a specified node. If the specified node does not exist, the scheduling fails. preferred indicates weak affinity. A service instance tends to be scheduled to a specified node. If the specified node does not meet the scheduling conditions, the service instance will be scheduled to another node.
pool_infos	No	Array of AffinityPoolInfo objects	Configure an affinity policy for a specified cluster and specify the nodes in the cluster.

Table 8-81 AffinityPoolInfo

Parameter	Mandatory	Type	Description
pool_name	Yes	String	Cluster name. The cluster name must be in the outer pool_name.
nodes	Yes	Array of AffinityNodeInfo objects	Affinity Node List

Table 8-82 AffinityNodeInfo

Parameter	Mandatory	Type	Description
name	Yes	String	Node name, which corresponds to the private IP address of the node.

Table 8-83 ServiceAdditionalProperties

Parameter	Mandatory	Type	Description
smn_notification	Yes	Map<String, SmnNotification >	SMN message notification structure, which is used to notify the user of the service status change
log_report_channels	No	Array of LogReportPipeline objects	Log channel group. If this parameter is not specified or the array length is 0, LTS log interconnection is disabled. This function cannot be modified after being enabled.
websocket_upgrade	No	Boolean	Whether the service interface is upgraded to WebSocket. During service deployment, the default value is false . During service configuration update, the default value is the value set last time. • false: Do not upgrade to WebSocket. • true: Upgrade to WebSocket. This parameter cannot be modified after WebSocket is enabled. WebSocket cannot be enabled together with Traffic Limit.

Table 8-84 SmnNotification

Parameter	Mandatory	Type	Description
topic_urn	Yes	String	URN of an SMN topic

Parameter	Mandatory	Type	Description
events	Yes	Array of integers	Event ID. The options are as follows: • 1: failed • 3: running • 7: concerning • 11: pending

Table 8-85 LogReportPipeline

Parameter	Mandatory	Type	Description
type	Yes	String	Log pipeline type. Currently, only LTS is supported.
configuration	No	LtsConfiguration object	LTS log configuration.

Table 8-86 LtsConfiguration

Parameter	Mandatory	Type	Description
log_group_id	Yes	String	LTS log group ID. The value contains 64 characters.
log_stream_id	Yes	String	LTS log stream ID. The value contains 64 characters.

Table 8-87 ServiceSecret

Parameter	Mandatory	Type	Description
secretId	Yes	String	Specifies the key ID.
mount_path	Yes	String	Mount path.

Response Parameters

Status code: 200

The service is updated.

None

Example Requests

The following shows how to update a real-time service.

```
PUT https://{endpoint}/v1/{project_id}/services/{service_id}

{
  "description" : "",
  "status" : "running",
  "config" : [ {
    "model_id" : "xxx",
    "weight" : "100",
    "specification" : "modelarts.vm.cpu.2u",
    "instance_count" : 1
  } ]
}
```

Example Responses

Status code: 200

The service is updated.

```
{}
```

Status Codes

Status Code	Description
200	The service is updated.

Error Codes

See [Error Codes](#).

8.8 Deleting a Service

Function

This API is used to delete a model service. You can delete your own services only.

Debugging

You can debug this API through automatic authentication in [API Explorer](#) or use the SDK sample code generated by API Explorer.

Authorization Information

Each account has all the permissions required to call all APIs, but IAM users must be assigned the required permissions.

- If you are using role/policy-based authorization, see [Permissions Policies and Supported Actions](#) for details on the required permissions.

- If you are using identity policy-based authorization, the following identity policy-based permissions are required.

Action	Access Level	Resource Type (*: required)	Condition Key	Alias	Dependencies
modelarts:service:delete	Write	service *	g:ResourceTag/<tag-key>	-	-

URI

DELETE /v1/{project_id}/services/{service_id}

Table 8-88 Path Parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Project ID. For details, see Obtaining a Project ID and Name .
service_id	Yes	String	Service ID. To delete multiple services in a batch, use commas (,) to separate multiple service_id values.

Request Parameters

Table 8-89 Request header parameters

Parameter	Mandatory	Type	Description
X-Auth-Token	Yes	String	User token. It can be obtained by calling the IAM API that is used to obtain a user token. The value of X-Subject-Token in the response header is the user token.

Response Parameters

Status code: 200

The service is deleted.

None

Example Requests

The following shows how to delete the model service with ID **xxxxxx**.

```
DELETE https://endpoint/v1/{project_id}/services/xxxxxx
```

Example Responses

Status code: 200

The service is deleted.

```
{}
```

Status Codes

Status Code	Description
200	The service is deleted.

Error Codes

See [Error Codes](#).

8.9 Updating a Single Property of a Model Service

Function

This API is used to update a single property of a model service. Currently, only **instance_count** (number of instances of the model service) is supported. This operation can be performed only for real-time services in the running, alarm, or abnormal state.

Debugging

You can debug this API through automatic authentication in [API Explorer](#) or use the SDK sample code generated by API Explorer.

Authorization Information

Each account has all the permissions required to call all APIs, but IAM users must be assigned the required permissions.

- If you are using role/policy-based authorization, see [Permissions Policies and Supported Actions](#) for details on the required permissions.
- If you are using identity policy-based authorization, no identity policy-based permission required for calling this API.

URI

```
PUT /v1/{project_id}/services/{service_id}/property
```

Table 8-90 Path Parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Project ID. For details, see Obtaining a Project ID and Name .
service_id	Yes	String	Service ID.

Request Parameters

Table 8-91 Request header parameters

Parameter	Mandatory	Type	Description
X-Auth-Token	Yes	String	User token.

Table 8-92 Request body parameters

Parameter	Mandatory	Type	Description
changed_property	Yes	String	Property name. Currently, only instance_count (number of instances of the model service) is supported.
configs	No	Array of UpdateServiceConfig objects	Service configurations.

Table 8-93 UpdateServiceConfig

Parameter	Mandatory	Type	Description
changed_value	Yes	String	Property value. The value must be an integer. If changed_property is set to instance_count , this parameter value must be greater than or less than the number of current instances.
model_id	Yes	String	Model ID.

Response Parameters

Status code: 200

Table 8-94 Response header parameters

Parameter	Type	Description
X-Request-Id	String	Tracing ID.

Table 8-95 Response body parameters

Parameter	Type	Description
update_time	String	Update time. This parameter is returned only when the service configuration upgrade is triggered. For example, if the config parameter is modified, the update result can be filtered from the service update records based on this time. This parameter is not returned when the description is modified or the service is started or stopped.
resource_ids	String	Updated resource IDs.

Status code: 401

Table 8-96 Response header parameters

Parameter	Type	Description
X-Request-Id	String	Tracing ID.

Table 8-97 Response body parameters

Parameter	Type	Description
error_code	String	Internal service error code.
error_msg	String	Error message.

Example Requests

Update a single property of a model service.

```
PUT https://{endpoint}/v1/{project_id}/services/{service_id}/property
```

```
{
  "changed_property": "instance_count",
  "configs": [ {
    "model_id": "98240f41-6c69-437c-b894-9c488b1d9c43",
    "changed_value": 2
  } ]
}
```

Example Responses

Status code: 200

OK

```
{
  "update_time": 1712026426703
}
```

Status code: 401

Unauthorized

```
{
  "error_code": "ModelArts.0203",
  "error_msg": "Invalid token."
}
```

Status Codes

Status Code	Description
200	OK
401	Unauthorized

Error Codes

See [Error Codes](#).

8.10 Obtaining Service Event Logs

Function

This API is used to obtain service event logs, including service operation records, key actions during deployment, and deployment failure causes.

Debugging

You can debug this API through automatic authentication in [API Explorer](#) or use the SDK sample code generated by API Explorer.

Authorization Information

Each account has all the permissions required to call all APIs, but IAM users must be assigned the required permissions.

- If you are using role/policy-based authorization, see [Permissions Policies and Supported Actions](#) for details on the required permissions.
- If you are using identity policy-based authorization, the following identity policy-based permissions are required.

Action	Access Level	Resource Type (*: required)	Condition Key	Alias	Dependencies
modelarts:service:getEvents	Read	service *	g:ResourceTag/<tag-key>	-	-

URI

GET /v1/{project_id}/services/{service_id}/events

Table 8-98 Path Parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Project ID. For details, see Obtaining a Project ID and Name .
service_id	Yes	String	Service ID

Table 8-99 Query Parameters

Parameter	Mandatory	Type	Description
event_type	No	String	Event type. Enums: • normal: normal events • abnormal: abnormal events
event_info	No	String	Event information. Only English information can be filtered. The following special characters are not supported: `(){}';,[]<>/?
start_time	No	Number	Start time for filtering events. By default, events are not filtered.
end_time	No	Number	End time for filtering events. By default, events are not filtered.

Parameter	Mandatory	Type	Description
offset	No	Integer	Start page for pagination display. The default value is 0 .
limit	No	Integer	Maximum number of records returned on each page. Default value: 1000
sort_by	No	String	Specifies the sorting field. The default value is <code>occur_time</code> (event generation time).
order	No	String	Sorting order. Enums: • asc: ascending order • desc: descending order (default value)

Request Parameters

Table 8-100 Request header parameters

Parameter	Mandatory	Type	Description
X-Auth-Token	Yes	String	User token. It can be obtained by calling the IAM API that is used to obtain a user token. The value of X-Subject-Token in the response header is the user token.

Response Parameters

Status code: 200

Table 8-101 Response body parameters

Parameter	Type	Description
service_name	String	Service name
total_count	Integer	Total number of events that meet the search criteria when no paging is performed
service_id	String	Service ID
count	Integer	Number of events in the query result

Parameter	Type	Description
events	Array of Events objects	Event logs of a service

Table 8-102 Events

Parameter	Type	Description
event_type	String	Event type. Options: • normal: normal events • abnormal: abnormal events
event_info	String	Event information, which mainly describes the the five phases of the deployment process. More information can be supplemented later. The five phases are image building, environment preparation, resource scheduling, image pulling, and model startup.
occur_time	Number	Time when an event occurs, in milliseconds calculated from 1970.1.1 0:0:0 UTC.

Example Requests

GET https://{endpoint}/v1/{project_id}/services/{service_id}/events

Example Responses

Status code: 200
Event logs of a service

```
{
  "service_name": "service-07085",
  "total_count": 9,
  "service_id": "35de3ca9-1bca-4ae7-9cb0-914f30fa7d3e",
  "count": 9,
  "events": [ {
    "event_type": "normal",
    "event_info": "start to deploy service",
    "occur_time": 1562597251764
  }, {
    "event_type": "normal",
    "event_info": "building image for model [TF 3.0.0]",
    "occur_time": 1562597251788
  }, {
    "event_type": "normal",
    "event_info": "model (TF 3.0.0) build image success",
    "occur_time": 1562597251805
  }, {
    "event_type": "normal",
    "event_info": "preparing environment",
```

```
"occur_time" : 1562597255744
}, {
  "event_type" : "normal",
  "event_info" : "[TF 3.0.0] prepare environment success",
  "occur_time" : 1562597275915
}, {
  "event_type" : "normal",
  "event_info" : "[TF 3.0.0] schedule resource success",
  "occur_time" : 1562597275921
}, {
  "event_type" : "normal",
  "event_info" : "[TF 3.0.0] pulling model image",
  "occur_time" : 1562597275928
}, {
  "event_type" : "normal",
  "event_info" : "[TF 3.0.0] pull image success",
  "occur_time" : 1562597332570
}, {
  "event_type" : "normal",
  "event_info" : "[TF 3.0.0] starting model",
  "occur_time" : 1562597332582
}
}]
}
```

Status Codes

Status Code	Description
200	Event logs of a service

Error Codes

See [Error Codes](#).

8.11 Obtaining Service Update Logs

Function

This API is used to obtain the update logs of a real-time service.

Debugging

You can debug this API through automatic authentication in [API Explorer](#) or use the SDK sample code generated by API Explorer.

Authorization Information

Each account has all the permissions required to call all APIs, but IAM users must be assigned the required permissions.

- If you are using role/policy-based authorization, see [Permissions Policies and Supported Actions](#) for details on the required permissions.
- If you are using identity policy-based authorization, the following identity policy-based permissions are required.

Action	Access Level	Resource Type (*: required)	Condition Key	Alias	Dependencies
modelarts:service:getLogs	Read	service *	g:ResourceTag/<tag-key>	-	-

URI

GET /v1/{project_id}/services/{service_id}/logs

Table 8-103 Path Parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Project ID. For details, see Obtaining a Project ID and Name .
service_id	Yes	String	Service ID

Table 8-104 Query Parameters

Parameter	Mandatory	Type	Description
update_time	No	Number	Update time for filtering. This parameter can be used to obtain the update logs of a real-time service. By default, update logs are not filtered.

Request Parameters

Table 8-105 Request header parameters

Parameter	Mandatory	Type	Description
X-Auth-Token	Yes	String	User token. It can be obtained by calling the IAM API that is used to obtain a user token. The value of X-Subject-Token in the response header is the user token.

Response Parameters

Status code: 200

Table 8-106 Response body parameters

Parameter	Type	Description
service_name	String	Service name
service_id	String	Service ID
logs	Array of Log objects	Service update records

Table 8-107 Log

Parameter	Type	Description
update_time	Number	Update time, in milliseconds calculated from 1970.1.1 0:0:0 UTC.
result	String	Update result. Options: • SUCCESS • FAIL • RUNNING
config	Array of ServiceLogConfig objects	Model running configurations
success_num	Number	Number of nodes that are successfully operated. This parameter is returned when infer_type is set to edge .
failed_num	Number	Number of nodes that fail to be operated. This parameter is returned when infer_type is set to edge .
result_detail	Array of UpdateResult objects	Operation result details. This parameter is returned when infer_type is set to edge .
cluster_id	String	ID of a dedicated resource pool
extend_config	Array of strings	Personalized configuration

Table 8-108 ServiceLogConfig

Parameter	Type	Description
model_id	String	Common parameters Model ID You can obtain the value by calling the API for querying the AI application list.
model_name	String	Model name
model_version	String	Model version
weight	Integer	This parameter is mandatory for the real-time type. Traffic weight allocated to the model. This parameter is mandatory only when infer_type is set to real-time. The sum of multiple weights must be 100. When multiple model versions are configured in a real-time service and different traffic weight ratios are set, ModelArts forwards prediction requests to the corresponding model version instance based on the weight ratio when the prediction API of the service is continuously accessed.
specification	String	Resource specifications. This parameter is returned when infer_type is set to real-time or edge.
custom_spec	CustomSpec object	Custom resource specifications
envs	Map<String,String>	Environment variable key-value pair required for running a model
cluster_id	String	ID of a dedicated resource pool
instance_count	Integer	Number of instances deployed in a model. This parameter is returned when infer_type is set to real-time.
additional_properties	Map<String, ModelAdditionalProperties >	Additional properties for model deployment, facilitating service instance management.

Table 8-109 CustomSpec

Parameter	Type	Description
gpu_p4	Float	Number of GPUs, which can be a decimal. The value cannot be smaller than 0, with the third decimal place is rounded off. This parameter is optional and is not used by default.
memory	Integer	Memory in MB, which must be an integer
cpu	Float	Number of CPU cores, which can be a decimal. The value cannot be smaller than 0.01, with the third decimal place is rounded off.
ascend_a310	Integer	Number of Ascend chips. This parameter is optional and is not used by default. Either this parameter or gpu is configured.

Table 8-110 ModelAdditionalProperties

Parameter	Type	Description
log_volume	Array of LogVolume objects	Host directory mounting. This parameter takes effect only if a dedicated resource pool is used. If a public resource pool is used to deploy services, this parameter cannot be configured. Otherwise, an error will occur.
max_surge	Float	The value must be greater than 0. If this parameter is not set, the default value 1 is used. If the value is less than 1, it indicates the percentage of instances to be added during the rolling upgrade. If the value is greater than 1, it indicates the maximum number of instances to be added during the rolling upgrade.

Parameter	Type	Description
max_unavailable	Float	The value must be greater than 0. If this parameter is not set, the default value 0 is used. If the value is less than 1, it indicates the percentage of instances that can be scaled in during the rolling upgrade. If the value is greater than 1, it indicates the number of instances that can be scaled in during the rolling upgrade.
termination_grace_period_seconds	Integer	Graceful stop period of a container.
persistent_volumes	Array of PersistentVolumes objects	Persistent storage mounting.
dew_secret	DewSecret object	DEW secret.

Table 8-111 LogVolume

Parameter	Type	Description
host_path	String	Log path to be mapped on the host
mount_path	String	Path to the logs in the container

Table 8-112 PersistentVolumes

Parameter	Type	Description
name	String	Volume name.
mount_path	String	Mount path of a volume in the container. Example: /tmp. The container path must not be a system directory, such as / and /var/run. Otherwise, an exception occurs. It is a good practice to mount the container to an empty directory. If the directory is not empty, ensure that there are no files affecting container startup in the directory. Otherwise, such files will be replaced, resulting in failures to start the container and create the workload.
storage_type	String	Mount type: sfs_turbo.

Parameter	Type	Description
source_address	String	Specifies the mounting source path. The value is the SFS Turbo ID when an EFS file is mounted.

Table 8-113 DewSecret

Parameter	Type	Description
secret_name	String	DEW secret name.

Table 8-114 UpdateResult

Parameter	Type	Description
result	Boolean	Operation result. true indicates that the operation is successful, and false indicates that the operation failed.
node_name	String	Name of an edge node
operation	String	Operation. Options: • deploy • delete
node_id	String	Edge node ID You can obtain the value after creating an edge node on IEF.

Example Requests

```
GET https://{endpoint}/v1/{project_id}/services/{service_id}/logs
```

Example Responses

Status code: 200

Service update logs

```
{
  "service_name": "mnist",
  "service_id": "195c1f2d-136d-40af-a0f3-db5717d2634a",
  "logs": [ {
    "result": "SUCCESS",
    "update_time": 1574770228888,
    "config": [ {
      "model_version": "0.0.1",
      "specification": "modelarts.vm.cpu.2u",
      "model_name": "mnist",
      "weight": 100,
      "model_id": "0e07b41b-173e-42db-8c16-8e1b44cc0d44",
      "instance_count": 1
    } ]
  } ]
}
```

```
}]  
}
```

Status Codes

Status Code	Description
200	Service update logs

Error Codes

See [Error Codes](#).

8.12 Adding a Resource Tag

Function

This API is used to add tags to specified real-time services. If a tag to be added has the same key as an existing tag, the tag will overwrite the existing one.

Debugging

You can debug this API through automatic authentication in [API Explorer](#) or use the SDK sample code generated by API Explorer.

Authorization Information

Each account has all the permissions required to call all APIs, but IAM users must be assigned the required permissions.

- If you are using role/policy-based authorization, see [Permissions Policies and Supported Actions](#) for details on the required permissions.
- If you are using identity policy-based authorization, the following identity policy-based permissions are required.

Action	Access Level	Resource Type (*: required)	Condition Key	Alias	Dependencies
modelarts:service:update	Write	service *	g:ResourceTag/<tag-key>	-	-

URI

POST /v1/{project_id}/services/{resource_id}/tags/create

Table 8-115 Path Parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Definition: Project ID. For details, see Obtaining a Project ID and Name . Constraints: The value can contain 1 to 64 characters. Letters, digits, and hyphens (-) are allowed. Range: N/A Default Value: N/A
resource_id	Yes	String	Resource ID (service ID)

Request Parameters

Table 8-116 Request header parameters

Parameter	Mandatory	Type	Description
Content-Type	Yes	String	Definition: Enter application/json;charset=utf8 . Constraints: N/A Range: N/A Default Value: N/A
X-Auth-Token	Yes	String	Definition: User token. It can be obtained by calling the IAM API. The token is the value of X-Subject-Token in the response header. Constraints: N/A Range: N/A Default Value: N/A

Table 8-117 Request body parameters

Parameter	Mandatory	Type	Description
tags	Yes	Array of TmsTag objects	Definition: TMS tags. Constraints: N/A

Table 8-118 TmsTag

Parameter	Mandatory	Type	Description
key	Yes	String	Definition: Key of a TMS tag. Constraints: The value can contain at most 128 characters and cannot start or end with <i>sys</i> . Only letters, digits, spaces, and special characters (_.:/+@) are allowed. Range: N/A Default Value: N/A
value	Yes	String	Definition: Value of a TMS tag. Constraints: The value can contain at most 255 characters. Only letters, digits, spaces, and special characters (_.:/+@) are allowed. Range: N/A Default Value: N/A

Response Parameters

Status code: 204

The tag is added.

Status code: 400

Table 8-119 Response body parameters

Parameter	Type	Description
error_code	String	Definition: ModelArts error code. Range: N/A
error_msg	String	Definition: Error message. Range: N/A

Status code: 401

Table 8-120 Response body parameters

Parameter	Type	Description
error_code	String	• Definition: ModelArts error code. Range: N/A
error_msg	String	Definition: Error message. Range: N/A

Status code: 403**Table 8-121** Response body parameters

Parameter	Type	Description
error_code	String	• Definition: ModelArts error code. Range: N/A
error_msg	String	Definition: Error message. Range: N/A

Status code: 404**Table 8-122** Response body parameters

Parameter	Type	Description
error_code	String	• Definition: ModelArts error code. Range: N/A
error_msg	String	Definition: Error message. Range: N/A

Example Requests

The following is an example of how to add tags to a specified service. The TMS tags have been configured by setting the keys to **test** and **model_version**, and setting the corresponding values to **service-gpu** and **0.1**.

```
https://{endpoint}/v1/{project_id}/services/a55eba18-1ebf-4e9a-8229-d2d3b593a3dc/tags/create
{
  "tags": [ {
    "key": "test",
    "value": "service-gpu"
  }, {
    "key": "model_version",
    "value": "0.1"
  } ]
}
```

```
}]  
}
```

Example Responses

None

Status Codes

Status Code	Description
204	The tag is added.
400	Invalid parameter
401	Authentication failed.
403	Insufficient permissions
404	Resources not found

Error Codes

See [Error Codes](#).

8.13 Deleting Resource Tags

Function

This API is used to delete tags of a real-time service. Tags can be deleted in batches.

Debugging

You can debug this API through automatic authentication in [API Explorer](#) or use the SDK sample code generated by API Explorer.

Authorization Information

Each account has all the permissions required to call all APIs, but IAM users must be assigned the required permissions.

- If you are using role/policy-based authorization, see [Permissions Policies and Supported Actions](#) for details on the required permissions.
- If you are using identity policy-based authorization, the following identity policy-based permissions are required.

Action	Access Level	Resource Type (*: required)	Condition Key	Alias	Dependencies
modelarts:service:update	Write	service *	g:ResourceTag/<tag-key>	-	-

URI

DELETE /v1/{project_id}/services/{resource_id}/tags/delete

Table 8-123 Path Parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Definition: Project ID. For details, see Obtaining a Project ID and Name . Constraints: The value can contain 1 to 64 characters. Letters, digits, and hyphens (-) are allowed. Range: N/A Default Value: N/A
resource_id	Yes	String	Resource ID, for example, the ID of a real-time service

Request Parameters

Table 8-124 Request header parameters

Parameter	Mandatory	Type	Description
Content-Type	Yes	String	Definition: Enter <code>application/json;charset=utf8</code> . Constraints: N/A Range: N/A Default Value: N/A

Parameter	Mandatory	Type	Description
X-Auth-Token	Yes	String	Definition: User token. It can be obtained by calling the IAM API. The token is the value of X-Subject-Token in the response header. Constraints: N/A Range: N/A Default Value: N/A

Table 8-125 Request body parameters

Parameter	Mandatory	Type	Description
tags	Yes	Array of TmsTagForDelete objects	Definition: List of tags to be deleted. Constraints: N/A

Table 8-126 TmsTagForDelete

Parameter	Mandatory	Type	Description
key	Yes	String	Definition: Key of a TMS tag. Constraints: N/A Range: The value allows up to 128 characters, including letters, digits, spaces, and special characters (<code>_</code> :=+@). The value cannot start or end with a space or start with sys . Default Value: N/A
value	No	String	Definition: Value of a TMS tag. This parameter is optional. Constraints: N/A Range: The value allows up to 255 characters, including letters, digits, spaces, and special characters (<code>_</code> ./:=+@). Default Value: N/A

Response Parameters

Status code: 204

The tag is deleted.

Status code: 400

Table 8-127 Response body parameters

Parameter	Type	Description
error_code	String	• Definition: ModelArts error code. Range: N/A
error_msg	String	Definition: Error message. Range: N/A

Status code: 401

Table 8-128 Response body parameters

Parameter	Type	Description
error_code	String	• Definition: ModelArts error code. Range: N/A
error_msg	String	Definition: Error message. Range: N/A

Status code: 403

Table 8-129 Response body parameters

Parameter	Type	Description
error_code	String	• Definition: ModelArts error code. Range: N/A
error_msg	String	Definition: Error message. Range: N/A

Status code: 404

Table 8-130 Response body parameters

Parameter	Type	Description
error_code	String	• Definition: ModelArts error code. Range: N/A

Parameter	Type	Description
error_msg	String	Definition: Error message. Range: N/A

Example Requests

```
https://{endpoint}/v1/{project_id}/services/a55eba18-1ebf-4e9a-8229-d2d3b593a3dc/tags/delete
{
  "tags" : [ {
    "key" : "dev",
    "value" : "dev1"
  } ]
}
```

Example Responses

None

Status Codes

Status Code	Description
204	The tag is deleted.
400	Invalid parameter
401	Authentication failed.
403	Insufficient permissions
404	No resources available.

Error Codes

See [Error Codes](#).

8.14 Obtaining Inference Service Tags

Function

This API is used to obtain inference service tags in the current project. Tags in all workspaces are obtained by default. If you do not have the permission, no tag is returned.

Debugging

You can debug this API through automatic authentication in [API Explorer](#) or use the SDK sample code generated by API Explorer.

Authorization Information

Each account has all the permissions required to call all APIs, but IAM users must be assigned the required permissions.

- If you are using role/policy-based authorization, see [Permissions Policies and Supported Actions](#) for details on the required permissions.
- If you are using identity policy-based authorization, the following identity policy-based permissions are required.

Action	Access Level	Resource Type (*: required)	Condition Key	Alias	Dependencies
modelarts:service:get	Read	service *	g:ResourceTag/<tag-key>	-	-

URI

GET /v1/{project_id}/services/tms/tags

Table 8-131 Path Parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Definition: Project ID. For details, see Obtaining a Project ID and Name . Constraints: The value can contain 1 to 64 characters. Letters, digits, and hyphens (-) are allowed. Range: N/A Default Value: N/A

Request Parameters

Table 8-132 Request header parameters

Parameter	Mandatory	Type	Description
X-Auth-Token	Yes	String	Definition: User token. It can be obtained by calling the IAM API. The token is the value of X-Subject-Token in the response header. Constraints: N/A Range: N/A Default Value: N/A
Content-Type	Yes	String	Definition: Enter application/json;charset=utf8 . Constraints: N/A Range: N/A Default Value: N/A

Response Parameters

Status code: 200

Table 8-133 Response body parameters

Parameter	Type	Description
tags	Array of CombineTmsTags objects	Definition: Data structure of merged tags with the same key.

Table 8-134 CombineTmsTags

Parameter	Type	Description
key	String	Definition: Tag key. Range: The value allows up to 128 characters, including letters, digits, spaces, and the following special characters: _ . : = + - @. The value cannot start or end with a space or start with sys .
values	Array of strings	Definition: Merged tag values with the same key.

Status code: 400**Table 8-135** Response body parameters

Parameter	Type	Description
error_code	String	Definition: ModelArts error code. Range: N/A
error_msg	String	Definition: Error message. Range: N/A

Status code: 401**Table 8-136** Response body parameters

Parameter	Type	Description
error_code	String	Definition: ModelArts error code. Range: N/A
error_msg	String	Definition: Error message. Range: N/A

Status code: 403**Table 8-137** Response body parameters

Parameter	Type	Description
error_code	String	Definition: ModelArts error code. Range: N/A
error_msg	String	Definition: Error message. Range: N/A

Example Requests

```
https://{endpoint}/v1/{project_id}/services/tms/tags
```

Example Responses

Status code: 200

All service tags of the project are returned.

```
{  
  "tags": [{  
    "key": "model_version",
```

```
"values" : [ "0.1", "0.2" ]  
}, {  
  "key" : "conda_version",  
  "values" : [ "10.2", "11.0" ]  
}]  
}
```

Status Codes

Status Code	Description
200	All service tags of the project are returned.
400	Invalid parameter
401	Authentication failed.
403	Insufficient permissions

Error Codes

See [Error Codes](#).

8.15 Obtaining an Inference VPC Access Channel

Function

This API is used to obtain an inference VPC access channel.

Debugging

You can debug this API through automatic authentication in [API Explorer](#) or use the SDK sample code generated by API Explorer.

Authorization Information

Each account has all the permissions required to call all APIs, but IAM users must be assigned the required permissions.

- If you are using role/policy-based authorization, see [Permissions Policies and Supported Actions](#) for details on the required permissions.
- If you are using identity policy-based authorization, no identity policy-based permission required for calling this API.

URI

GET /v1/{project_id}/internal-channel-info

Table 8-138 Path Parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Project ID. For details, see Obtaining a Project ID and Name .

Request Parameters

Table 8-139 Request header parameters

Parameter	Mandatory	Type	Description
X-Auth-Token	Yes	String	User token

Response Parameters

Status code: 200

Table 8-140 Response header parameters

Parameter	Type	Description
X-Request-Id	String	Tracing ID

Table 8-141 Response body parameters

Parameter	Type	Description
dns_domain_name	String	Access domain name displayed in the usage guide and used to add private DNS resolution
vpcep_info	Array of InternalChannelDetail objects	VPC access channel information

Table 8-142 InternalChannelDetail

Parameter	Type	Description
vpcep_service_id	String	VPCEP service ID of the VPC access channel
vpcep_service_name	String	VPCEP service name of the VPC access channel

Parameter	Type	Description
service_port	Integer	Port of the VPC access channel

Status code: 401

Table 8-143 Response header parameters

Parameter	Type	Description
X-Request-Id	String	Tracing ID

Table 8-144 Response body parameters

Parameter	Type	Description
error_code	String	Internal service error code.
error_msg	String	Error message.

Example Requests

Obtain the VPC access channel.

```
/v1/b722xxxxxxxxxxxxxxxxxxxxeb4674/internal-channel-info
```

Example Responses

Status code: 200

The inference VPC access channel is returned.

```
{
  "dns_domain_name" : "xxx.xxx.com",
  "vpcep_info" : [ {
    "vpcep_service_id" : "2275xxxx-c96f-4xxx-820c-c7xxxxxa7899",
    "vpcep_service_name" : "cn-nxxxx-x.vpcepname.2275xxxx-c96f-4xxx-820c-c7xxxxxa7899",
    "service_port" : 443
  } ]
}
```

Status code: 401

Authentication failed.

```
{
  "error_code" : "ModelArts.0203",
  "error_msg" : "Invalid token."
}
```

Status Codes

Status Code	Description
200	The inference VPC access channel is returned.
401	Authentication failed.

Error Codes

See [Error Codes](#).

9 Resource Management

9.1 Querying OS Configuration Parameters

Function

This API is used to obtain the configuration parameters of ModelArts OS, such as network CIIDR and user resource quota. This API is used when you need to query the network configuration, resource allocation, or system management of ModelArts OS. Before using this API, ensure that you have the permission to access ModelArts OS and the service is running properly. After the query, the configuration parameters are returned for future resource planning and system optimization. If you do not have the required permission, the service is unavailable, or the request parameter is invalid, the API will return an error message.

Debugging

You can debug this API through automatic authentication in [API Explorer](#) or use the SDK sample code generated by API Explorer.

Authorization Information

Each account has all the permissions required to call all APIs, but IAM users must be assigned the required permissions.

- If you are using role/policy-based authorization, see [Permissions Policies and Supported Actions](#) for details on the required permissions.
- If you are using identity policy-based authorization, no identity policy-based permission required for calling this API.

URI

GET /v1/{project_id}/os-user-config

Table 9-1 Path Parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Definition: User project ID. For details, see Obtaining a Project ID and Name . Constraints: The value can contain 1 to 64 characters. Letters, digits, and hyphens (-) are allowed. Range: N/A Default Value: N/A

Request Parameters

None

Response Parameters

Status code: 200

Table 9-2 Response body parameters

Parameter	Type	Description
networkCidrs	Array of strings	Definition: Network configuration item.
networkQuota	Integer	Definition: Quota of the number of networks that can be created. Range: N/A
poolQuota	Integer	Definition: Quota of the number of resource pools that can be created. Range: N/A
poolHighAvailable	Boolean	Definition: Whether resource pools with high availability can be created in the current environment or region Range • true: supported • false: not supported

Status code: 404

Table 9-3 Response body parameters

Parameter	Type	Description
error_code	String	• Definition: ModelArts error code. Range: N/A
error_msg	String	Definition: Error message. Range: N/A

Example Requests

```
GET https://{endpoint}/v1/{project_id}/os-user-config
```

Example Responses

Status code: 200

OK.

```
{
  "networkCidrs" : [ "192.168.0.0/24", "172.16.31.0/16" ],
  "networkQuota" : 15,
  "poolQuota" : 15,
  "poolHighAvailable" : true
}
```

Status Codes

Status Code	Description
200	OK.
404	Not Found.

Error Codes

See [Error Codes](#).

9.2 Querying a Plug-in Template

Function

This API is used to obtain details about a specified plug-in template. This API is used when you need to query the configuration, functions, or usage of a specific plug-in template. Before using this API, ensure that the plug-in template exists and you have the required permission. After the query, the details of the specified plug-in template are returned, including the configuration parameters and function description of the template, helping you develop and manage plug-ins. If the plug-in template does not exist or you do not have the access permission, the API will return an error message.

Debugging

You can debug this API through automatic authentication in [API Explorer](#) or use the SDK sample code generated by API Explorer.

Authorization Information

Each account has all the permissions required to call all APIs, but IAM users must be assigned the required permissions.

- If you are using role/policy-based authorization, see [Permissions Policies and Supported Actions](#) for details on the required permissions.
- If you are using identity policy-based authorization, no identity policy-based permission required for calling this API.

URI

GET /v1/{project_id}/plugintemplates/{plugintemplate_name}

Table 9-4 Path Parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Definition: User project ID. For details, see Obtaining a Project ID and Name . Constraints: The value can contain 1 to 64 characters. Letters, digits, and hyphens (-) are allowed. Range: N/A Default Value: N/A
plugintemplate_name	Yes	String	Definition: Plug-in template name. Constraints: N/A Range • gpu-driver: GPU driver plug-in template • npu-driver: NPU driver plug-in template Default Value: N/A

Request Parameters

None

Response Parameters

Status code: 200

Table 9-5 Response body parameters

Parameter	Type	Description
apiVersion	String	Definition: API version. Range: • v1
kind	String	Definition: Resource type. Range: • PluginTemplate: plugin template
metadata	PluginTemplateMetadata object	Definition: Metadata of the plugin template.
spec	PluginTemplateSpec object	Definition: Specifications of the plugin template.

Table 9-6 PluginTemplateMetadata

Parameter	Type	Description
name	String	Definition: Name of the plugin template. Range: N/A
annotations	Map<String,String>	Plugin template annotations in the format of key-value pairs.

Table 9-7 PluginTemplateSpec

Parameter	Type	Description
type	String	Plugin template type. Options: • npu-driver: NPU driver • gpu-driver: GPU driver
description	String	Definition: Description of the plugin template. Range: N/A
versions	Map<String, PluginTemplateVersionV2 >	Definition: Description of the plugin template version.

Table 9-8 PluginTemplateVersionV2

Parameter	Type	Description
version	String	Version number of the plugin template.
creationTimestamp	String	Creation time.
inputs	Object	Plugin installation parameters.
translate	Object	Translation information used by the GUI.
description	String	Version description.
detail	String	Version description.

Status code: 404**Table 9-9** Response body parameters

Parameter	Type	Description
error_code	String	Definition: ModelArts error code. Range: N/A
error_msg	String	Definition: Error message. Range: N/A

Example Requests

```
GET https://{endpoint}/v1/{project_id}/plugintemplates/{plugin_template_name}
```

Example Responses

Status code: 200

OK.

```
{
  "apiVersion": "v1",
  "kind": "PluginTemplate",
  "metadata": {
    "name": "npu-driver"
  },

  "error_msg" : "Plugintemplate {name} not found."
}
```

Status Codes

Status Code	Description
200	OK.
404	Not Found.

Error Codes

See [Error Codes](#).

9.3 Obtaining Nodes in a Resource Pool

Function

This API is used to obtain the node list of a specified resource pool. This API is used when you need to obtain the details about a resource pool, such as the node distribution, status, or resource usage. Before using this API, ensure that the resource pool has been created and is available, and you have the required permission. After the query, the system returns the detailed information about the nodes in the resource pool, including the node ID, status, and resource usage, helping you manage and optimize resources. If the resource pool does not exist, you do not have the permission to access the resource pool, or the request parameters are invalid, the API will return an error message.

Debugging

You can debug this API through automatic authentication in [API Explorer](#) or use the SDK sample code generated by API Explorer.

Authorization Information

Each account has all the permissions required to call all APIs, but IAM users must be assigned the required permissions.

- If you are using role/policy-based authorization, see [Permissions Policies and Supported Actions](#) for details on the required permissions.
- If you are using identity policy-based authorization, the following identity policy-based permissions are required.

Action	Access Level	Resource Type (*: required)	Condition Key	Alias	Dependencies
modelarts:pool:get	Read	pool *	g:ResourceTag/<tag-key>	-	-
		-	g:EnterpriseProjectId		

URI

GET /v2/{project_id}/pools/{pool_name}/nodes

Table 9-10 Path Parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Definition: Project ID. For details, see Obtaining a Project ID and Name . Constraints: The value can contain 1 to 64 characters. Letters, digits, and hyphens (-) are allowed. Range: N/A Default Value: N/A
pool_name	Yes	String	Definition: Resource pool ID. The value is obtained from the metadata.name field in the resource pool details. <i>*Constraints:</i> The value can contain 36 to 63 characters. It must start with a lowercase letter and cannot end with a hyphen (-). Digits and hyphens (-) are allowed. Range: N/A Default Value: N/A

Table 9-11 Query Parameters

Parameter	Mandatory	Type	Description
continue	No	String	Definition: Offset parameter of the pagination query Constraints: Optional Range: The value is obtained from the metadata.continue field in the response to the last pagination query. An empty value indicates no offset. Default Value: N/A
limit	No	Integer	Definition: Number of resources returned in a single pagination query Constraints: N/A Range: 0 to 500 Default Value: 500

Request Parameters

None

Response Parameters

Status code: 200

Table 9-12 Response body parameters

Parameter	Type	Description
apiVersion	String	Definition: API version of the resource. Range: • v2: The current resource version is v2.
kind	String	Definition: Resource type. Range: • NodeList: nodes
metadata	NodeListMetadata object	Definition: Metadata of a node list.
items	Array of Node objects	Definition: Node resource list.

Table 9-13 NodeListMetadata

Parameter	Type	Description
continue	String	Definition: Offset parameter of the pagination query. Range: The value is obtained from the metadata.continue field in the response to the last pagination query. An empty value indicates no offset.
remainingItemCount	Long	Definition: Number of remaining resources in a pagination query. Default Value: N/A

Table 9-14 Node

Parameter	Type	Description
apiVersion	String	Definition: API version of the resource. Range: • v2: The current resource version is v2.
kind	String	Definition: Resource type. Range: • Node: node
metadata	NodeMetadata object	Definition: Metadata of a node resource.
spec	NodeSpec object	Definition: Specifications of a node resource.
status	NodeStatus object	Definition: Status of a node resource.

Table 9-15 NodeMetadata

Parameter	Type	Description
name	String	Definition: Node name. Range: N/A
creationTimestamp	String	Definition: Creation time. Range: N/A
labels	NodeLabels object	Definition: Node labels.

Parameter	Type	Description
annotations	NodeVOAnnotations object	Definition: Node annotations.

Table 9-16 NodeLabels

Parameter	Type	Description
os.modelarts.node/cluster	String	Definition: Name of the cluster where the node is located. Range: N/A
os.modelarts.node/elastic.quota	String	Definition: Logical pool bound to the node. Range: N/A
os.modelarts.node/nodepool	String	Definition: ID of the node pool where the node is located. Range: N/A
os.modelarts.node/batch.uid	String	Definition: Batch creation ID. Range: N/A
os.modelarts.node/batch.name	String	Definition: Batch creation name. Range: N/A
os.modelarts.node/batch.type	String	Definition: Batch creation type. Range • hyperinstance: supernode
os.modelarts.node/batch.count	String	Definition: Number of nodes created in batches. Range: N/A
os.modelarts/resource.id	String	Definition: Node resource ID. Range: N/A
os.modelarts/tenant.domain.id	String	Definition: Tenant ID of a node, which records the tenant account under which the node is created. Range: N/A
os.modelarts/tenant.project.id	String	Definition: Project ID of a node, which records the project under which the node is created. Range: N/A

Parameter	Type	Description
os.modelarts/ billing.status	String	Definition: Node billing status. Range • 0: normal • 1: frozen • 2: deleted or terminated
os.modelarts.node / volcano.scheduler. cabinet-exclusive	String	Definition: Whether the node is exclusively occupied by a full-rack job. If yes, the tag exists and its value is the ID of the exclusive training job. Range: N/A
cce.kubectl.kubern etes.io/cabinet	String	Definition: IP address of the TOR switch where the node is located. Use hyphens (-) to separate multiple IP addresses of TOR switches. Range: N/A
os.modelarts.node / underlying.instanc e.id	String	Definition: Instance ID of the underlying resources of the node, for example, the ECS instance ID of the supernode. Range: N/A
os.modelarts.node / ha.redundant.ena bled	String	Definition: Whether HA redundancy is enabled for the node. Range • true: enabled • false: disabled
os.modelarts.node /nodepoolname	String	Definition: Name of the node pool where the node is located. The value can contain 2 to 50 characters and must start with a lowercase letter. It cannot end with a hyphen (-) or - default. Only lowercase letters, hyphens (-), and digits are allowed. Range: N/A

Table 9-17 NodeVOAnnotations

Parameter	Type	Description
os.modelarts/npu-topology-placement	String	Definition: Topology of the NPU resource usage. The value is a 16-bit binary number, where the first bit from the right indicates PU 1. 1 indicates occupied, and 0 indicates idle. For example, if PUs 1 and 15 are occupied in a 16-PU server, the value is 0100000000000001 . If PUs 1 and 7 are occupied in an 8-PU server, the returned value is 000000001000001 . Constraints: N/A Range: N/A Default Value: N/A

Table 9-18 NodeSpec

Parameter	Type	Description
flavor	String	Definition: ID of node resource specifications. Range: N/A.
os	Os object	Definition: OS image information.
hostNetwork	NodeNetwork object	Definition: Node network information.
rootVolume	VolumeVO object	Definition: System disk information.
dataVolumes	Array of VolumeVO objects	Definition: Data disk information.
extendParams	ResourceExtendParams object	Definition: Custom configuration.

Table 9-19 Os

Parameter	Type	Description
name	String	Definition: OS name and version, for example, EulerOS 2.5. This parameter can be left blank when a private image is specified. Range: N/A.

Parameter	Type	Description
imageId	String	Definition: OS image ID. Range: N/A.
imageType	String	Definition: OS image type. This parameter must be specified when a private image is set. By default, the preset image is used. You do not need to specify this field. Range: • private: private images • "": The preset image is used.
autoMatch	String	Definition: Automatic OS image matching configuration. If this parameter is set, the optimal image is automatically selected, and this parameter is automatically cleared. Range: OS name and version, for example, EulerOS 2.5.

Table 9-20 NodeNetwork

Parameter	Type	Description
vpc	String	Definition: VPC ID. Range: N/A.
subnet	String	Definition: Subnet ID. Range: N/A.
securityGroups	Array of strings	Definition: Security group ID set.

Table 9-21 VolumeVO

Parameter	Type	Description
volumeType	String	Definition: Disk type.. Range: • SSD: Ultra-high I/O disk • GPSSD: General-purpose SSD
size	String	Definition: Disk size, in GiB. Range: N/A.

Parameter	Type	Description
count	Integer	Definition: Number of disks. If this parameter is not specified, the default value 1 is used. Range: N/A.

Table 9-22 ResourceExtendParams

Parameter	Type	Description
dockerBaseSize	String	Definition: Container image space of a node. Range: • Specified: The default value of dockerBaseSize ranges from 50 to 500. However, the actual value is restricted by the container data disk size of the node. • Unlimited: *dockerBaseSize="0", indicating that the container image space is not limited.
postInstall	String	Definition: Post-installation script. The entered value must be encoded using Base64. Range: N/A.
runtime	String	Definition: Container runtime. Range: • docker: Container runtime. It is the most commonly used container engine, which is used to create and manage container instances based on container images. • containerd: Industrial-grade container runtime. It focuses on container lifecycle management and is one of the core components at the bottom layer of Docker. It can also be deployed independently.

Parameter	Type	Description
labelPolicyOnExistingNodes	String	Definition: Kubernetes label update policy of existing nodes. If the value is empty, the existing nodes are updated by default. Range: • refresh: Update. • ignore: Do not update.
taintPolicyOnExistingNodes	String	Definition: Kubernetes taint update policy of existing nodes. If the value is empty, the existing nodes are updated by default. Range: • refresh: Update. • ignore: Do not update.
tagPolicyOnExistingNodes	String	Definition: Resource tag update policy of existing nodes. If the value is empty, the existing nodes are updated by default. Range: • refresh: Update. • ignore: Do not update.
XParameterPlane-Subnet	String	Definition: Subnet ID used for data transmission on the parameter plane between physical clusters. The value cannot be the same as the node subnet or container subnet. Range: N/A.
nodePoolName	String	Definition: Name of the node pool specified by you. The value is a string of 2 to 50 characters, consisting of lowercase letters, hyphens (-), and digits. It must start with a lowercase letter and cannot end with a hyphen (-) or -default . Range: N/A.

Table 9-23 NodeStatus

Parameter	Type	Description
phase	String	Definition: Status of a node. Range: • Available: The node is available. • Creating: The node is being created. • Deleting: The node is being deleted. • Abnormal: The node is abnormal. • Checking: The node is performing a self-check.
az	String	Definition: AZ where a node is located. Range: N/A
privatelp	String	Definition: IP address of a node. Range: N/A
resources	NodeResource object	Definition: Resources of a node.
availableResources	NodeResource object	Definition: Available resources of a node.

Table 9-24 NodeResource

Parameter	Type	Description
cpu	String	Definition: Number of CPU cores on a node. Range: N/A
memory	String	Definition: Memory size of a node, in GiB. Range: N/A
nvidia.com/gpu	String	Definition: Number of GPUs on a node. Range: N/A
huawei.com/ascend-snt3	String	Definition: Number of snt3 NPUs on a node. Range: N/A

Parameter	Type	Description
huawei.com/ascend-snt9	String	Definition: Number of snt9 NPUs on a node. Range: N/A

Status code: 404

Table 9-25 Response body parameters

Parameter	Type	Description
error_code	String	Definition: ModelArts error code. Range: N/A
error_msg	String	Definition: Error message. Range: N/A

Example Requests

Obtain nodes in a resource pool.

```
GET https://{endpoint}/v2/{project_id}/pools/{pool_name}/nodes
{ }
```

9.4 Deleting nodes in batches

Function

This API is used to delete nodes from a specified resource pool in batches. This API is used when you need to delete redundant nodes, re-allocate resources, or remove faulty nodes from a resource pool. Before using this API, ensure that the resource pool has been created and is available, you have the required permission, and at least one node is retained in the resource pool. After the deletion, the specified nodes are permanently removed, and the remaining nodes in the resource pool continue to work. If the resource pool does not exist, the node does not exist, you do not have the permission to perform the operation, or the number of nodes in the resource pool is insufficient, the API will return an error message.

Debugging

You can debug this API through automatic authentication in [API Explorer](#) or use the SDK sample code generated by API Explorer.

Authorization Information

Each account has all the permissions required to call all APIs, but IAM users must be assigned the required permissions.

- If you are using role/policy-based authorization, see [Permissions Policies and Supported Actions](#) for details on the required permissions.
- If you are using identity policy-based authorization, the following identity policy-based permissions are required.

Action	Access Level	Resource Type (*: required)	Condition Key	Alias	Dependencies
modelarts:pool:update	Write	pool *	g:ResourceTag/<tag-key>	-	-
		-	g:EnterpriseProjectId		

URI

POST /v2/{project_id}/pools/{pool_name}/nodes/batch-delete

Table 9-26 Path Parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Definition: User project ID. For details, see Obtaining a Project ID and Name . Constraints: The value can contain 1 to 64 characters. Letters, digits, and hyphens (-) are allowed. Range: N/A Default Value: N/A
pool_name	Yes	String	Definition: Resource pool name. Constraints: N/A Range: N/A Default Value: N/A

Request Parameters

Table 9-27 Request body parameters

Parameter	Mandatory	Type	Description
deleteNodeNames	Yes	Array of strings	Definition: List of names of nodes to be deleted. Constraints: N/A

Response Parameters

Status code: 200

OK.

Status code: 404

Table 9-28 Response body parameters

Parameter	Type	Description
error_code	String	Definition: ModelArts error code. Range: N/A

Parameter	Type	Description
error_msg	String	Definition: Error message. Range: N/A

Example Requests

The following is an example of how to delete nodes in batches.

```
POST /v2/{project_id}/pools/{pool_name}/nodes/batch-delete
{
  "deleteNodeNames" : [ "os-node-created-mnmc" ]
}
```

Example Responses

Status code: 404

Not Found.

```
{
  "error_code" : "ModelArts.50015001",
  "error_msg" : "pool not found"
}
```

Status Codes

Status Code	Description
200	OK.
404	Not Found.

Error Codes

See [Error Codes](#).

9.5 Querying a Trace List

Function

This API is used to obtain the event information recorded in the system. This API is used when you need to query the event records recorded in the system when monitoring the system status, locating faults, or auditing. Before using this API, ensure that you have the required permission and the event records exist in the system. After the query, the API returns the event list, including the event ID, type, time, and description. If you do not have the required permission, the event record does not exist, or the query parameter is incorrect, the API will return an error message.

Debugging

You can debug this API through automatic authentication in [API Explorer](#) or use the SDK sample code generated by API Explorer.

Authorization Information

Each account has all the permissions required to call all APIs, but IAM users must be assigned the required permissions.

- If you are using role/policy-based authorization, see [Permissions Policies and Supported Actions](#) for details on the required permissions.
- If you are using identity policy-based authorization, the following identity policy-based permissions are required.

Action	Access Level	Resource Type (*: required)	Condition Key	Alias	Dependencies
modelarts:pool:get	Read	pool *	g:ResourceTag/<tag-key>	-	-
		-	g:EnterpriseProjectId		

URI

GET /v1/{project_id}/events

Table 9-29 Path Parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Definition: User project ID. For details, see Obtaining a Project ID and Name . Constraints: The value can contain 1 to 64 characters. Letters, digits, and hyphens (-) are allowed. Range: N/A Default Value: N/A

Table 9-30 Query Parameters

Parameter	Mandatory	Type	Description
resource	Yes	String	Definition: Type of the resource where the event is generated. The value can be pools , indicating the resource pool. Constraints: N/A Range: N/A Default Value: N/A
name	Yes	String	Definition: Name of the resource where the event is generated. Constraints: N/A Range: N/A Default Value: N/A
limit	No	Integer	Definition: Maximum number of records on each page. If this parameter is left blank or set to 0 , 500 records are returned by default. A maximum of 500 records are allowed on each page. Constraints: N/A Range: N/A Default Value: N/A
continue	No	String	Definition: Marker of the previous page in pagination query. The value is a UUID string. This parameter is left blank when the first page is queried. Constraints: N/A Range: N/A Default Value: N/A
since	No	Integer	Definition: Timestamp of the event start time. Constraints: N/A Range: N/A Default Value: N/A

Parameter	Mandatory	Type	Description
until	No	Integer	Definition: Timestamp of the event end time. Constraints: N/A Range: N/A Default Value: N/A
type	No	String	Definition: Event type. Constraints: N/A Range • Normal • Warning Default Value: N/A

Request Parameters

None

Response Parameters

Status code: 200

Table 9-31 Response body parameters

Parameter	Type	Description
apiVersion	String	Definition: API version. Range: • v1
kind	String	Definition: Resource type. Range: • EventList: event list
metadata	EventListMeta object	Definition: Metadata of the event list.
items	Array of EventModel objects	Definition: Event list.

Table 9-32 EventListMeta

Parameter	Type	Description
continue	String	Definition: Pagination marker. Range: N/A
remainingItemCount	Integer	Definition: Number of remaining records on the current page. Range: N/A

Table 9-33 EventModel

Parameter	Type	Description
apiVersion	String	Definition: API version. Range: • v1
kind	String	Definition: Resource type. Range: • Event: event
type	String	Definition: Event type. Range: • Normal: normal event • Warning: abnormal event
firstTimestamp	String	Definition: Time when an event occurs for the first time. Range: N/A
lastTimestamp	String	Definition: Time when an event occurs for the last time. Range: N/A
count	Integer	Definition: Number of consecutive occurrences of an event. Range: N/A
reason	String	Definition: Cause of an event. Range: N/A
message	String	Definition: Event details. Range: N/A

Status code: 400

Table 9-34 Response body parameters

Parameter	Type	Description
error_code	String	Definition: ModelArts error code. Range: N/A
error_msg	String	Definition: Error message. Range: N/A

Status code: 404**Table 9-35** Response body parameters

Parameter	Type	Description
error_code	String	Definition: ModelArts error code. Range: N/A
error_msg	String	Definition: Error message. Range: N/A

Example Requests

This interface is used to query the trace list of resource pool pool-6f5da086876d4cd084d36f8bd3346036 by page.

```
/v1/{project_id}/events?  
resource=pools&name=pool-6f5da086876d4cd084d36f8bd3346036&limit=5&continue=cde36780-1120-4753-

9.6 Creating Network Resources

Function

This API is used to create network resources in a system. This API is used when you need to create network resources, such as virtual networks, subnets, or routes, when you need to expand services, plan resources, or adjust the network architecture. Before using this API, ensure that you have the administrator permission and the system has sufficient resources to create network resources. After the creation, the network resources will be added to the system for future service configurations. If you do not have the required permission, the resources are insufficient, or the input parameter is incorrect, the API will return an error message.

Debugging

You can debug this API through automatic authentication in [API Explorer](#) or use the SDK sample code generated by API Explorer.

Authorization Information

Each account has all the permissions required to call all APIs, but IAM users must be assigned the required permissions.

- If you are using role/policy-based authorization, see [Permissions Policies and Supported Actions](#) for details on the required permissions.
- If you are using identity policy-based authorization, the following identity policy-based permissions are required.

Action	Access Level	Resource Type (*: required)	Condition Key	Alias	Dependencies
modelarts:network:create	Write	network*	-	-	-

Action	Access Level	Resource Type (*: required)	Condition Key	Alias	Dependencies
		-	- g:EnterpriseProjectId - g:RequestTag/<tag-key> - g:TagKeys		

URI

POST /v1/{project_id}/networks

Table 9-36 Path Parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Definition: User project ID. For details, see Obtaining a Project ID and Name . Constraints: The value can contain 1 to 64 characters. Letters, digits, and hyphens (-) are allowed. Range: N/A Default Value: N/A

Request Parameters

Table 9-37 Request body parameters

Parameter	Mandatory	Type	Description
apiVersion	Yes	String	Definition: API version. Constraints: N/A Range: v1 Default Value: N/A

Parameter	Mandatory	Type	Description
kind	Yes	String	Definition: Resource type. Constraints: N/A Range: • Network Default Value: N/A
metadata	Yes	NetworkMetadataCreation object	Definition: Metadata of a network resource. Constraints: N/A
spec	Yes	NetworkSpec object	Definition: Description of a network resource. Constraints: N/A

Table 9-38 NetworkMetadataCreation

Parameter	Mandatory	Type	Description
labels	Yes	NetworkMetadataLabels object	Definition: Network resource tags. Constraints: N/A

Table 9-39 NetworkMetadataLabels

Parameter	Mandatory	Type	Description
os.modelarts/ name	Yes	String	Definition: Displayed name of a resource pool. <i>*Range:</i> The value can contain 4 to 32 characters. It must start with a lowercase letter and cannot end with a hyphen (-). Digits and hyphens (-) are allowed.
os.modelarts/ workspace.id	No	String	Definition: Workspace ID. For details about how to obtain the ID, see Querying the Workspace List . Range: N/A

Table 9-40 NetworkSpec

Parameter	Mandatory	Type	Description
cidr	Yes	String	Definition: CIDR value of a network. Range • 172.16.0.0/12 to 172.16.0.0/24 • 192.168.0.0/16 to 192.168.0.0/24
connection	No	NetworkConnection object	Definition: Connection information between the current network and other resources.

Table 9-41 NetworkConnection

Parameter	Mandatory	Type	Description
peerConnectionList	No	Array of PeerConnectionItem objects	Definition: Peering connections.

Table 9-42 PeerConnectionItem

Parameter	Mandatory	Type	Description
peerVpcId	Yes	String	Definition: VPC ID of the peer end. Range: N/A
peerSubnetId	Yes	String	Definition: Subnet ID of the peer end. Range: N/A
defaultGateway	No	Boolean	Definition: Whether to create a default route. The default value is false . Range: N/A

Response Parameters

Status code: 200

Table 9-43 Response body parameters

Parameter	Type	Description
apiVersion	String	Definition: API version of the resource. Range: • v1: The current resource version is v1.
kind	String	Definition: Resource type. Range: • Network
metadata	NetworkMetadata object	Definition: Metadata of a network resource.
spec	NetworkSpec object	Definition: Specifications of a network resource.
status	NetworkStatus object	Definition: Status of a network resource.

Table 9-44 NetworkMetadata

Parameter	Type	Description
name	String	Definition: Network resource ID. Range: N/A
creationTimestamp	String	Definition: Network creation time. For example, 2025-11-01T03:49:41Z . Range: N/A
labels	NetworkMetadataLabels object	Definition: Network labels.
annotations	NetworkMetadataAnnotations object	Definition: Network annotations.

Table 9-45 NetworkMetadataLabels

Parameter	Type	Description
os.modelarts/ name	String	Definition: Displayed name of a resource pool. <i>*Range:</i> The value can contain 4 to 32 characters. It must start with a lowercase letter and cannot end with a hyphen (-). Digits and hyphens (-) are allowed.
os.modelarts/ workspace.id	String	Definition: Workspace ID. For details about how to obtain the ID, see Querying the Workspace List . Range: N/A

Table 9-46 NetworkMetadataAnnotations

Parameter	Type	Description
os.modelarts/ description	String	Definition: Network description. Range: The value cannot contain these characters: !<>=&".

Table 9-47 NetworkSpec

Parameter	Type	Description
cidr	String	Definition: CIDR value of a network. Range 172.16.0.0/12 to 172.16.0.0/24 192.168.0.0/16 to 192.168.0.0/24
connection	NetworkConnection object	Definition: Connection information between the current network and other resources.

Table 9-48 NetworkConnection

Parameter	Type	Description
peerConnectionList	Array of PeerConnectionItem objects	Definition: Peering connections.

Table 9-49 PeerConnectionItem

Parameter	Type	Description
peerVpcId	String	Definition: VPC ID of the peer end. Range: N/A
peerSubnetId	String	Definition: Subnet ID of the peer end. Range: N/A
defaultGateWay	Boolean	Definition: Whether to create a default route. The default value is false . Range: N/A

Table 9-50 NetworkStatus

Parameter	Type	Description
phase	String	Definition: Current status of a network resource. Range: • Creating: The network is being created. • Active: The network is functional. • Abnormal: The network is abnormal.
connectionStatus	NetworkConnectionStatus object	Definition: Connection status between the network and other cloud services.

Table 9-51 NetworkConnectionStatus

Parameter	Type	Description
peerConnectionStatus	Array of PeerConnectionStatus objects	Definition: Status of peering connections.
sfsTurboStatus	Array of SfsTurboConnectionStatus objects	Definition: Status of SFS Turbo accessible to the network.

Table 9-52 PeerConnectionStatus

Parameter	Type	Description
peerVpcId	String	Definition: VPC ID of the peer end. Range: N/A
peerSubnetId	String	Definition: Subnet ID of the peer end. Range: N/A
defaultGateWay	Boolean	Definition: Specifies whether to create a default route. Range: false (default value, indicating that no default route is created)
phase	String	Definition: Connection status of the network. Range: • Connecting: The network is being connected. • Active: The network is connected properly. • Abnormal: The network connection is abnormal.

Table 9-53 SfsTurboConnectionStatus

Parameter	Type	Description
name	String	Definition: Name of the SFS Turbo instance. Range: N/A
sfsId	String	Definition: ID of the SFS Turbo instance. Range: N/A
connectionType	String	Definition: association mode. Range: • VpcPort: passthrough through attached NICs • Peering: connection through VPC peering
ipAddr	String	Definition: Access address of SFS Turbo. Range: N/A

Parameter	Type	Description
status	String	Definition: Connection status of SFS Turbo. Range: • Active: The SFS connection is normal. • Abnormal: The SFS connection is abnormal. • Creating: The SFS connection is being set up. • Deleting: The SFS connection is being deleted.

Status code: 400

Table 9-54 Response body parameters

Parameter	Type	Description
error_code	String	• Definition: ModelArts error code. Range: N/A
error_msg	String	Definition: Error message. Range: N/A

Example Requests

The following is an example of how to create a network whose resource type is **Network**, network name is **network-7a03**, and CIDR block is **192.168.128.0/17**.

POST {endpoint}/v1/{project_id}/networks

```
{
  "apiVersion" : "v1",
  "kind" : "Network",
  "metadata" : {
    "labels" : {
      "os.modelarts/name" : "network-7a03",
      "os.modelarts/workspace.id" : "0"
    }
  },
  "spec" : {
    "cidr" : "192.168.128.0/17"
  }
}
```

Example Responses

Status code: 200

OK

```
{
  "kind" : "Network",
  "apiVersion" : "v1",
  "metadata" : {
    "name" : "network-7a03-86c13962597848eeb29c5861153a391f",
    "creationTimestamp" : "2022-09-16T09:44:59Z",
    "labels" : {
      "os.modelarts/name" : "network-7a03",
      "os.modelarts/workspace.id" : "0"
    },
    "annotations" : { }
  },
  "spec" : {
    "cidr" : "192.168.128.0/17",
    "connection" : { }
  },
  "status" : {
    "phase" : ""
  }
}
```

Status code: 400

Bad request.

```
{
  "error_code" : "ModelArts.50004000",
  "error_msg" : "Bad request."
}
```

Status Codes

Status Code	Description
200	OK
400	Bad request.

Error Codes

See [Error Codes](#).

9.7 Obtaining Network Resources

Function

This API is used to obtain information about created network resources in the system. This API is used when you need to query the network resource list recorded in the system when monitoring network status, planning resources, locating network faults, or auditing. Before using this API, ensure that you have the required permission and the network resources exist in the system. After the query, the API returns the network resource list, including the resource ID, type, status, and creation time. If you do not have the required permission, the network resources do not exist in the system, or the query parameter is incorrect, the API will return an error message.

Debugging

You can debug this API through automatic authentication in [API Explorer](#) or use the SDK sample code generated by API Explorer.

Authorization Information

Each account has all the permissions required to call all APIs, but IAM users must be assigned the required permissions.

- If you are using role/policy-based authorization, see [Permissions Policies and Supported Actions](#) for details on the required permissions.
- If you are using identity policy-based authorization, the following identity policy-based permissions are required.

Action	Access Level	Resource Type (*: required)	Condition Key	Alias	Dependencies
modelarts:network:list	List	network*	-	-	-
		-	• g:EnterpriseProjectId • g:TagKeys • g:RequestTag/<tag-key>		

URI

GET /v1/{project_id}/networks

Table 9-55 Path Parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Definition: Project ID. For details, see Obtaining a Project ID and Name . Constraints: N/A Range: N/A Default Value: N/A

Table 9-56 Query Parameters

Parameter	Mandatory	Type	Description
labelSelector	No	String	Definition: Tag filter. Constraints: N/A. Range: N/A. Default Value: N/A.
limit	No	Integer	Definition: Number of resources returned in a single pagination query Constraints: N/A Range: 0 to 500 Default Value: 500
continue	No	String	Definition: Offset parameter of the pagination query. The value is obtained from the metadata.continue field in the response to the last pagination query. An empty value indicates no offset. Constraints: N/A Range: N/A Default Value: N/A

Request Parameters

None

Response Parameters

Status code: 200

Table 9-57 Response body parameters

Parameter	Type	Description
apiVersion	String	Definition: API version of the resource. Range: v1: The current resource version is v1.
kind	String	Definition: Resource type. Range: NetworkList: networks

Parameter	Type	Description
metadata	NetworkListMetadata object	Definition: Metadata of network resources.
items	Array of Network objects	Definition: Network resource list.

Table 9-58 NetworkListMetadata

Parameter	Type	Description
continue	String	Definition: Next query position in pagination query. Range: N/A
remainingItemCount	Integer	Definition: Number of remaining resources. Range: N/A

Table 9-59 Network

Parameter	Type	Description
apiVersion	String	Definition: API version of the resource. Range: • v1: The current resource version is v1.
kind	String	Definition: Resource type. Range: • Network
metadata	NetworkMetadata object	Definition: Metadata of a network resource.
spec	NetworkSpec object	Definition: Specifications of a network resource.
status	NetworkStatus object	Definition: Status of a network resource.

Table 9-60 NetworkMetadata

Parameter	Type	Description
name	String	Definition: Network resource ID. Range: N/A
creationTimestamp	String	Definition: Network creation time. For example, 2025-11-01T03:49:41Z . Range: N/A
labels	NetworkMetadataLabels object	Definition: Network labels.
annotations	NetworkMetadataAnnotations object	Definition: Network annotations.

Table 9-61 NetworkMetadataLabels

Parameter	Type	Description
os.modelarts/ name	String	Definition: Displayed name of a resource pool. <i>*Range:</i> The value can contain 4 to 32 characters. It must start with a lowercase letter and cannot end with a hyphen (-). Digits and hyphens (-) are allowed.
os.modelarts/ workspace.id	String	Definition: Workspace ID. For details about how to obtain the ID, see Querying the Workspace List . Range: N/A

Table 9-62 NetworkMetadataAnnotations

Parameter	Type	Description
os.modelarts/ description	String	Definition: Network description. Range: The value cannot contain these characters: !<>=&'".

Table 9-63 NetworkSpec

Parameter	Type	Description
cidr	String	Definition: CIDR value of a network. Range • 172.16.0.0/12 to 172.16.0.0/24 • 192.168.0.0/16 to 192.168.0.0/24
connection	NetworkConnection object	Definition: Connection information between the current network and other resources.

Table 9-64 NetworkConnection

Parameter	Type	Description
peerConnectionList	Array of PeerConnectionItem objects	Definition: Peering connections.

Table 9-65 PeerConnectionItem

Parameter	Type	Description
peerVpcId	String	Definition: VPC ID of the peer end. Range: N/A
peerSubnetId	String	Definition: Subnet ID of the peer end. Range: N/A
defaultGateWay	Boolean	Definition: Whether to create a default route. The default value is false . Range: N/A

Table 9-66 NetworkStatus

Parameter	Type	Description
phase	String	Definition: Current status of a network resource. Range: • Creating: The network is being created. • Active: The network is functional. • Abnormal: The network is abnormal.
connectionStatus	NetworkConnect ionStatus object	Definition: Connection status between the network and other cloud services.

Table 9-67 NetworkConnectionStatus

Parameter	Type	Description
peerConnectionSt atus	Array of PeerConnectionS tatus objects	Definition: Status of peering connections.
sfsTurboStatus	Array of SfsTurboConnecti onStatus objects	Definition: Status of SFS Turbo accessible to the network.

Table 9-68 PeerConnectionStatus

Parameter	Type	Description
peerVpcId	String	Definition: VPC ID of the peer end. Range: N/A
peerSubnetId	String	Definition: Subnet ID of the peer end. Range: N/A
defaultGateWay	Boolean	Definition: Specifies whether to create a default route. Range: false (default value, indicating that no default route is created)

Parameter	Type	Description
phase	String	Definition: Connection status of the network. Range: • Connecting: The network is being connected. • Active: The network is connected properly. • Abnormal: The network connection is abnormal.

Table 9-69 SfsTurboConnectionStatus

Parameter	Type	Description
name	String	Definition: Name of the SFS Turbo instance. Range: N/A
sfsId	String	Definition: ID of the SFS Turbo instance. Range: N/A
connectionType	String	Definition: association mode. Range: • VpcPort: passthrough through attached NICs • Peering: connection through VPC peering
ipAddr	String	Definition: Access address of SFS Turbo. Range: N/A
status	String	Definition: Connection status of SFS Turbo. Range: • Active: The SFS connection is normal. • Abnormal: The SFS connection is abnormal. • Creating: The SFS connection is being set up. • Deleting: The SFS connection is being deleted.

Example Requests

Obtain resource pools.

```
GET https://{endpoint}/v2/{project_id}/networks
{ }
```

See [Error Codes](#).

9.8 Obtaining a Network Resource

Function

This API is used to obtain the details of a specified network resource. This API is used when you need to query details about a specified network resource, such as

its configuration, status, or attributes. Before using this API, ensure that you have the required permission and the specified network resource exists in the system. After the query, the API returns the details of the specified network resource, including the resource ID, type, status, and configuration parameters. If the specified network resource does not exist, you do not have the operation permission, or the input parameters are incorrect, the API will return an error message.

Debugging

You can debug this API through automatic authentication in [API Explorer](#) or use the SDK sample code generated by API Explorer.

Authorization Information

Each account has all the permissions required to call all APIs, but IAM users must be assigned the required permissions.

- If you are using role/policy-based authorization, see [Permissions Policies and Supported Actions](#) for details on the required permissions.
- If you are using identity policy-based authorization, the following identity policy-based permissions are required.

Action	Access Level	Resource Type (*: required)	Condition Key	Alias	Dependencies
modelarts:network:get	Read	network*	g:ResourceTag/<tag-key>	-	-
		-	g:EnterpriseProjectId		

URI

GET /v1/{project_id}/networks/{network_name}

Table 9-70 Path Parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Definition: Project ID. For details, see Obtaining a Project ID and Name . Constraints: N/A Range: N/A Default Value: N/A

Parameter	Mandatory	Type	Description
network_name	Yes	String	Definition: Network ID. The value is obtained from the metadata.name field in the network details. <i>*Constraints:</i> The value can contain 36 to 63 characters. It must start with a lowercase letter and cannot end with a hyphen (-). Digits and hyphens (-) are allowed. Range: N/A Default Value: N/A

Request Parameters

None

Response Parameters

Status code: 200

Table 9-71 Response body parameters

Parameter	Type	Description
apiVersion	String	Definition: API version of the resource. Range: • v1: The current resource version is v1.
kind	String	Definition: Resource type. Range: • Network
metadata	NetworkMetadata object	Definition: Metadata of a network resource.
spec	NetworkSpec object	Definition: Specifications of a network resource.
status	NetworkStatus object	Definition: Status of a network resource.

Table 9-72 NetworkMetadata

Parameter	Type	Description
name	String	Definition: Network resource ID. Range: N/A
creationTimestamp	String	Definition: Network creation time. For example, 2025-11-01T03:49:41Z . Range: N/A
labels	NetworkMetadataLabels object	Definition: Network labels.
annotations	NetworkMetadataAnnotations object	Definition: Network annotations.

Table 9-73 NetworkMetadataLabels

Parameter	Type	Description
os.modelarts/ name	String	Definition: Displayed name of a resource pool. <i>*Range:</i> The value can contain 4 to 32 characters. It must start with a lowercase letter and cannot end with a hyphen (-). Digits and hyphens (-) are allowed.
os.modelarts/ workspace.id	String	Definition: Workspace ID. For details about how to obtain the ID, see Querying the Workspace List . Range: N/A

Table 9-74 NetworkMetadataAnnotations

Parameter	Type	Description
os.modelarts/ description	String	Definition: Network description. Range: The value cannot contain these characters: !<>=&'".

Table 9-75 NetworkSpec

Parameter	Type	Description
cidr	String	Definition: CIDR value of a network. Range • 172.16.0.0/12 to 172.16.0.0/24 • 192.168.0.0/16 to 192.168.0.0/24
connection	NetworkConnection object	Definition: Connection information between the current network and other resources.

Table 9-76 NetworkConnection

Parameter	Type	Description
peerConnectionList	Array of PeerConnectionItem objects	Definition: Peering connections.

Table 9-77 PeerConnectionItem

Parameter	Type	Description
peerVpcId	String	Definition: VPC ID of the peer end. Range: N/A
peerSubnetId	String	Definition: Subnet ID of the peer end. Range: N/A
defaultGateWay	Boolean	Definition: Whether to create a default route. The default value is false . Range: N/A

Table 9-78 NetworkStatus

Parameter	Type	Description
phase	String	Definition: Current status of a network resource. Range: • Creating: The network is being created. • Active: The network is functional. • Abnormal: The network is abnormal.
connectionStatus	NetworkConnect ionStatus object	Definition: Connection status between the network and other cloud services.

Table 9-79 NetworkConnectionStatus

Parameter	Type	Description
peerConnectionSt atus	Array of PeerConnectionS tatus objects	Definition: Status of peering connections.
sfsTurboStatus	Array of SfsTurboConnecti onStatus objects	Definition: Status of SFS Turbo accessible to the network.

Table 9-80 PeerConnectionStatus

Parameter	Type	Description
peerVpcId	String	Definition: VPC ID of the peer end. Range: N/A
peerSubnetId	String	Definition: Subnet ID of the peer end. Range: N/A
defaultGateWay	Boolean	Definition: Specifies whether to create a default route. Range: false (default value, indicating that no default route is created)

Parameter	Type	Description

See [Error Codes](#).

9.9 Deleting a Network Resource

Function

This API is used to remove specified network resources. This API is used when you need to delete a specified network resource when the network resource is no longer required, the configuration is incorrect, or resources need to be cleared. Before using this API, ensure that the network resource exists and you have the administrator permissions. After the deletion, the specified network resource is permanently removed, and related configurations and associations are cleared. If the specified network resource does not exist, you do not have the operation permission, or the resource is depended on by other resources, the API will return an error message.

Debugging

You can debug this API through automatic authentication in [API Explorer](#) or use the SDK sample code generated by API Explorer.

Authorization Information

Each account has all the permissions required to call all APIs, but IAM users must be assigned the required permissions.

- If you are using role/policy-based authorization, see [Permissions Policies and Supported Actions](#) for details on the required permissions.
- If you are using identity policy-based authorization, the following identity policy-based permissions are required.

Action	Access Level	Resource Type (*: required)	Condition Key	Alias	Dependencies
modelarts:network:delete	Write	network*	g:ResourceTag/<tag-key>	-	-

9.10 Updating a Network Resource

Function

This API is used to update the configuration information of a specified network resource. This API is used when you need to update the details of a specified network resource, such as adjusting attributes, fixing configuration errors, or optimizing resource settings. Before using this API, ensure that the network resource exists and you have the administrator permissions. After the update, the configuration information of the specified network resource is modified, and the latest resource status and attributes are displayed. If the specified network resource does not exist, you do not have the operation permission, or the input parameters are incorrect, the API will return an error message.

Debugging

You can debug this API through automatic authentication in [API Explorer](#) or use the SDK sample code generated by API Explorer.

Authorization Information

Each account has all the permissions required to call all APIs, but IAM users must be assigned the required permissions.

- If you are using role/policy-based authorization, see [Permissions Policies and Supported Actions](#) for details on the required permissions.
- If you are using identity policy-based authorization, the following identity policy-based permissions are required.

Action	Access Level	Resource Type (*: required)	Condition Key	Alias	Dependencies
modelarts:network:update	Write	network*	g:ResourceTag/<tag-key>	-	-

9.11 Querying the Real-Time Resource Usage

Function

This API is used to obtain the real-time usage of all resource pools in the current project. This API is used when you need to query the real-time usage of resource

pools when monitoring resource usage, optimizing resources, planning capacity, or troubleshooting faults. The resource usage includes the usage of CPU, memory, and storage resources. Before using this API, ensure that you have the required permission and there is a running resource pool. After the query, the API returns the real-time usage data of the resource pool, including the usage percentage, resource type, and timestamp. If you do not have the required permission, the resource pool does not exist, or the system cannot obtain the real-time data, the API will return an error message.

Debugging

You can debug this API through automatic authentication in [API Explorer](#) or use the SDK sample code generated by API Explorer.

Authorization Information

Each account has all the permissions required to call all APIs, but IAM users must be assigned the required permissions.

- If you are using role/policy-based authorization, see [Permissions Policies and Supported Actions](#) for details on the required permissions.
- If you are using identity policy-based authorization, the following identity policy-based permissions are required.

Action	Access Level	Resource Type (*: required)	Condition Key	Alias	Dependencies
modelarts:pool:list	List	pool *	-	-	-
		-	• g:EnterpriseProjectId • g:RequestTag/<tag-key> • g:TagKeys		

URI

GET /v2/{project_id}/metrics/runtime/pools

Table 9-117 Path Parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Definition: User project ID. For details, see Obtaining a Project ID and Name . Constraints: N/A Range: N/A Default Value: N/A

Request Parameters

None

Response Parameters

Status code: 200

Table 9-118 Response body parameters

Parameter	Type	Description
apiVersion	String	Definition: Resource version. Range: os.modelarts.xxxxx/v2
kind	String	Definition: Resource type. Range: PoolMetricsList
items	Array of MetricsItem objects	Definition: Metric list.

Table 9-119 MetricsItem

Parameter	Type	Description
table	MetricTableItem object	Definition: Resource list.
metadata	ResourceMetrics-Metadata object	Definition: Resource metric metadata.

Table 9-120 MetricTableItem

Parameter	Type	Description
allocated	Allocated object	Definition: Allocated resources.
capacity	Capacity object	Definition: Resource capacity.

Table 9-121 Allocated

Parameter	Type	Description
value	Value object	Resource amount.
timestamp	String	UTC time, in the format of yyyy-MM-dd'T'HH:mm:ss'Z'.
window	String	Statistical interval. 1s indicates 1 second, 1m indicates 1 minute, and 1h indicates 1 hour.

Table 9-122 Capacity

Parameter	Type	Description
value	Value object	Resource amount.
maxValue	Value object	Maximum number of elastic resources.
timestamp	String	UTC time, in the format of yyyy-MM-dd'T'HH:mm:ss'Z'.
window	String	Statistical interval. 1s indicates 1 second, 1m indicates 1 minute, and 1h indicates 1 hour.

Table 9-123 Value

Parameter	Type	Description
cpu	String	Number of CPUs, that is, number of computing resources.
memory	String	Memory.
tnt004	String	Number of GPUs.

Table 9-124 ResourceMetricsMetadata

Parameter	Type	Description
name	String	Definition: Name of a resource metric. Range: N/A
labels	Object	Definition: Tags of a resource metric.

Example Requests

GET https://{endpoint}/v2/{project_id}/metrics/runtime/pools

Example Responses

Status code: 200

Status Codes

Status Code	Description
200	OK.

Error Codes

See [Error Codes](#).

9.12 Creating Resource Pools

Function

This API is used to create a resource pool in the system. This API is used when you need to allocate resources for new services, optimize resource management, or isolate resources. You can use this API to create a resource pool to manage compute, storage, and network resources. Before using this API, ensure that you have the administrator permission and the system has sufficient resources to create resource pools. After the creation, the resource pool will be added to the system and be available for future resource allocation and management. If you do not have the required permission, the system resources are insufficient, or the input parameter is incorrect, the API will return an error message.

Debugging

You can debug this API through automatic authentication in [API Explorer](#) or use the SDK sample code generated by API Explorer.

Authorization Information

Each account has all the permissions required to call all APIs, but IAM users must be assigned the required permissions.

- If you are using role/policy-based authorization, see [Permissions Policies and Supported Actions](#) for details on the required permissions.
- If you are using identity policy-based authorization, the following identity policy-based permissions are required.

Action	Access Level	Resource Type (*: required)	Condition Key	Alias	Dependencies
modelarts:pool:create	Write	pool *	-	-	-
		-	• g:EnterpriseProjectId • g:RequestTag/<tag-key> • g:TagKeys		

URI

POST /v2/{project_id}/pools

Table 9-125 Path Parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Definition: User project ID. For details, see Obtaining a Project ID and Name . Constraints: N/A Range: N/A Default Value: N/A

Request Parameters

Table 9-126 Request header parameters

Parameter	Mandatory	Type	Description
X-ModelArts-User-ID	No	String	Definition: Tenant ID. If there is a tenant ID, it will be used for workspace authentication. Constraints: N/A Range: N/A Default Value: N/A

Table 9-127 Request body parameters

Parameter	Mandatory	Type	Description
apiVersion	Yes	String	Definition: API version. Constraints: N/A Range: v2 Default Value: N/A
kind	Yes	String	Definition: Resource type. Constraints: N/A Range: Pool: resource pool Default Value: N/A
metadata	Yes	PoolMetadataCreation object	Definition: Resource pool metadata. Constraints: N/A

Parameter	Mandatory	Type	Description
spec	No	PoolSpecCreation object	Definition: Resource pool description. Constraints: N/A

Table 9-128 PoolMetadataCreation

Parameter	Mandatory	Type	Description
labels	Yes	PoolLabelsCreation object	Definition: Tags of a resource pool. Constraints: N/A
annotations	No	PoolAnnotationsCreation object	Definition: Comments of a resource pool. Constraints: N/A

Table 9-129 PoolLabelsCreation

Parameter	Mandatory	Type	Description
os.modelarts/ name	Yes	String	Definition: Name of the resource pool specified by you. Constraints: N/A Range: N/A Default Value: N/A
os.modelarts/ workspace.id	No	String	Definition: Workspace ID. For details about how to obtain the ID, see Querying the Workspace List . Constraints: N/A Range: If no workspace is created, the default value is 0 . If a workspace is created and used, use the actual value. Default Value: N/A
os.modelarts/ node.prefix	No	String	Definition: Prefix of the node name. Constraints: N/A Range: N/A Default Value: N/A

Table 9-130 PoolAnnotationsCreation

Parameter	Mandatory	Type	Description
os.modelarts/ description	No	String	Definition: Resource pool description. Constraints: N/A Range: N/A Default Value: N/A
os.modelarts/ billing.mode	No	String	Definition: Billing mode. Constraints: N/A Range: • 0: pay-per-use • 1: yearly/monthly Default Value: N/A
os.modelarts/ period.num	No	String	Definition: Subscription period on a yearly/monthly basis, for example, 2. This parameter is mandatory when the billing mode is yearly/monthly. Constraints: N/A Range: N/A Default Value: N/A
os.modelarts/ period.type	No	String	Definition: Subscription type on a yearly/monthly basis. This parameter is mandatory when the billing mode is yearly/monthly. Constraints: N/A Range: • 2: month • 3: year Default Value: N/A
os.modelarts/ auto.renew	No	String	Definition: Specifies whether to automatically renew the subscription. Constraints: N/A Range: • 0: auto-renewal disabled • 1: auto-renewal enabled Default Value: 0

Parameter	Mandatory	Type	Description
os.modelarts/ auto.pay	No	String	Definition: Specifies whether to automatically pay for the subscription. This parameter is only valid when you purchase a yearly/monthly resource. Constraints: N/A Range: • true: automatic payment • false: manual payment (default value) Default Value: N/A
os.modelarts/ promotion.info	No	String	Definition: Discount selected on CBC. Constraints: N/A Range: N/A Default Value: N/A
os.modelarts/ service.console.url	No	String	Definition: URL of the page displayed after the subscription order is paid. Constraints: N/A Range: N/A Default Value: N/A
os.modelarts/ order.id	No	String	Definition: Order ID, which is mandatory for creating a yearly/monthly resource pool or changing the billing mode. Constraints: N/A Range: N/A Default Value: N/A

Table 9-131 PoolSpecCreation

Parameter	Mandatory	Type	Description
type	Yes	String	Definition: Resource pool type. Constraints: N/A Range: • Dedicate: physical resource pool, which uses a separate network and supports network connection, custom drivers, and custom job types. • Logical: logical resource pool. There is no independent network and network connectivity is not supported. Logical resource pools can be created and scaled faster than physical resource pools. Default Value: N/A
scope	Yes	Array of strings	Definition: Job types supported by a resource pool. Constraints: N/A Range: Select at least one type when you create a standard resource pool. All options are supported by physical resource pools. Options: • Train: training job • Infer: inference job • Notebook: notebook job Default Value: N/A
resources	Yes	Array of PoolResource Flavor objects	Definition: Resource specifications in a resource pool, including resource specifications and the number of resources for each specification. Constraints: N/A

Parameter	Mandatory	Type	Description
network	Yes	network object	Definition: Network parameters of a resource pool. This parameter is mandatory when you create a physical resource pool. Constraints: N/A
jobFlavors	No	Array of strings	Definition: Job specifications supported by a resource pool, which are specified by the job specification name Constraints: N/A
driver	No	PoolDriver object	Definition: Resource pool driver information. Constraints: N/A

Table 9-132 PoolResourceFlavor

Parameter	Mandatory	Type	Description
flavor	Yes	String	Definition: Resource flavor, for example, modelarts.vm.gpu.tnt004 . Constraints: N/A Range: N/A Default Value: N/A
count	Yes	Integer	Definition: Committed resources of the flavor. Constraints: N/A Range: N/A Default Value: N/A
maxCount	No	Integer	Definition: Elastic resources of the flavor. The value must be the same as that of count in the physical pool. Constraints: N/A Range: N/A Default Value: N/A
extendParams	No	extendParams object	Definition: Custom configuration parameters. Constraints: N/A

Parameter	Mandatory	Type	Description
os	No	Os object	Definition: Custom OS image information. Constraints: N/A

Table 9-133 extendParams

Parameter	Mandatory	Type	Description
dockerBaseSize	No	String	Definition: Container engine space of a node in a specified resource pool. The value 0 indicates that the size is not limited. Constraints: N/A Range: N/A Default Value: N/A

Table 9-134 Os

Parameter	Mandatory	Type	Description
name	No	String	Definition: OS name and version, for example, EulerOS 2.5. This parameter can be left blank when a private image is specified. Range: N/A.
imageId	No	String	Definition: OS image ID. Range: N/A.
imageType	No	String	Definition: OS image type. This parameter must be specified when a private image is set. By default, the preset image is used. You do not need to specify this field. Range: • private: private images • "": The preset image is used.

Parameter	Mandatory	Type	Description
autoMatch	No	String	Definition: Automatic OS image matching configuration. If this parameter is set, the optimal image is automatically selected, and this parameter is automatically cleared. Range: OS name and version, for example, EulerOS 2.5.

Table 9-135 network

Parameter	Mandatory	Type	Description
name	No	String	Definition: Network name, which is the value of metadata.name in the network details. When you create a network with a specified name, the system will automatically create subnets for you. By default, the first subnet will be used. Constraints: N/A Range: N/A Default Value: N/A

Table 9-136 PoolDriver

Parameter	Mandatory	Type	Description
gpuVersion	No	String	Definition: Default GPU driver version of a resource pool. This parameter is only valid when the physical resource pool contains GPU specifications. Range: N/A
npuVersion	No	String	Definition: Default NPU driver version of a resource pool. This parameter is only valid when the physical resource pool contains NPU specifications. Range: N/A

Parameter	Mandatory	Type	Description
updateStrategy	No	String	Definition: Driver upgrade policy of a resource pool. Range: • force: forcible upgrade. The node drivers are upgraded immediately, which may affect jobs running on the node. • idle: secure upgrade. The drivers are upgraded when no job is running on the node.

Response Parameters

Status code: 200

Table 9-137 Response body parameters

Parameter	Type	Description
apiVersion	String	Definition: API version of the resource. Range: • v2: The current resource version is v2.
kind	String	Definition: Resource type. Range: • Pool: resource pool
metadata	PoolMetadata object	Definition: Metadata of the resource pool.
spec	PoolSpecModel object	Definition: Specifications of a resource pool.
status	PoolStatus object	Definition: Status of a resource pool.

Table 9-138 PoolMetadata

Parameter	Type	Description
name	String	Definition: Resource pool ID. Range: N/A

Parameter	Type	Description
creationTimestamp	String	Definition: Time when a resource pool is created. For example, 2025-11-01T03:49:41Z . Range: N/A
labels	PoolMetaLabels object	Definition: Tags of a resource pool.
annotations	PoolMetaAnnotations object	Definition: Comments of a resource pool. Constraints: N/A Range: N/A Default Value: N/A

Table 9-139 PoolMetaLabels

Parameter	Type	Description
os.modelarts/ name	String	Definition: Displayed name of a resource pool. Constraints: N/A Range: N/A Default Value: N/A
os.modelarts/ workspace.id	String	Definition: Workspace ID. For details about how to obtain the ID, see Querying the Workspace List . Constraints: N/A Range: N/A Default Value: 0
os.modelarts/ node.prefix	String	Definition: Custom node prefix. This parameter is optional. Constraints: N/A Range: N/A Default Value: N/A
os.modelarts/ resource.id	String	Definition: Resource ID used for resource pool billing. Constraints: N/A Range: N/A Default Value: N/A

Parameter	Type	Description
os.modelarts/ tenant.domain.id	String	Definition: ID of the tenant to which a resource pool belongs. Constraints: N/A Range: N/A Default Value: N/A
os.modelarts/ tenant.project.id	String	Definition: ID of the tenant project that a resource pool belongs to. Constraints: N/A Range: N/A Default Value: N/A
os.modelarts/ enterprise.project.i d	String	Definition: ID of the enterprise project that a resource pool belongs to. Constraints: N/A Range: N/A Default Value: N/A
os.modelarts.pool/ biz	String	Definition: Business type of a resource pool. The value can be public or private . Constraints: N/A Range: N/A Default Value: N/A
os.modelarts/ create-from	String	Definition: Source of a resource pool, for example, admin-console , indicating that the resource pool is created by the administrator on the ModelArts console. Constraints: N/A Range: N/A Default Value: N/A
os.modelarts/ nobilling	String	Definition: Indicates whether the resource pool is charged. Constraints: N/A Range: N/A Default Value: N/A
os.modelarts/ order.name	String	Definition: Last order job record associated with the resource pool. Constraints: N/A Range: N/A Default Value: N/A

Parameter	Type	Description
os.modelarts/ region	String	Definition: Region where the resource pool is located. Constraints: N/A Range: N/A Default Value: N/A

Table 9-140 PoolMetaAnnotations

Parameter	Type	Description
os.modelarts/ description	String	Definition: Resource pool description. Constraints: N/A Range: N/A Default Value: N/A
os.modelarts/ billing.mode	String	Definition: Billing mode. Constraints: N/A Range: • 0: pay-per-use • 1: yearly/monthly Default Value: N/A
os.modelarts/ period.num	String	Definition: Subscription period of a yearly/monthly resource pool. Constraints: This parameter is used together with the os.modelarts/period.type field. Range: N/A Default Value: N/A
os.modelarts/ period.type	String	Definition: Subscription type of a yearly/monthly resource pool. Constraints: This parameter is used together with the os.modelarts/period.num field. Range: • 2: monthly • 3: yearly Default Value: N/A

Parameter	Type	Description
os.modelarts/ auto.renew	String	Definition: Auto-renewal status of a yearly/monthly resource pool. Constraints: N/A Range: • 0: Auto-renewal is disabled. • 1: Auto-renewal is enabled. Default Value: 0
os.modelarts/ promotion.info	String	Definition: Discount information selected when a yearly/monthly resource pool is purchased. Constraints: N/A Range: N/A Default Value: N/A
os.modelarts/ service.console.url	String	Definition: URL to which you are redirected after the order of a yearly/monthly resource pool is paid. Constraints: N/A Range: N/A Default Value: N/A
os.modelarts/ order.id	String	Definition: Order ID transferred when a yearly/monthly resource pool is purchased. Constraints: N/A Range: N/A Default Value: N/A
os.modelarts/ flavor.resource.ids	String	Definition: Resource ID of the resource specifications in a yearly/monthly resource pool. Constraints: N/A Range: N/A Default Value: N/A
os.modelarts/ tms.tags	String	Definition: Resource tags of a resource pool. Constraints: N/A Range: N/A Default Value: N/A

Parameter	Type	Description
os.modelarts.pool/ scheduler.queue.st ategy	String	Definition: Policy of the resource pool scheduling queue, which is used to define task scheduling rules. Constraints: N/A Range: N/A Default Value: N/A
os.modelarts.pool/ subpools.count	String	Definition: Number of logical subpools in a resource pool. Constraints: N/A Range: N/A Default Value: N/A
os.modelarts/ tenant.domain.na me	String	Definition: Tenant account of the resource pool. Constraints: N/A Range: N/A Default Value: N/A
os.modelarts.pool/ scope.external.dep endency.train	String	Definition: External dependency ID of the training job. Constraints: N/A Range: N/A Default Value: N/A

Table 9-141 PoolSpecModel

Parameter	Type	Description
type	String	Definition: Resource pool type. Constraints: N/A Range: • Dedicate: physical resource pool, which uses a separate network and supports network connection, custom drivers, and custom job types. • Logical: logical resource pool. There is no independent network and network connectivity is not supported. Logical resource pools can be created and scaled faster than physical resource pools. Default Value: N/A

Parameter	Type	Description
scope	Array of strings	Definition: Job types supported by a resource pool.
resources	Array of resources objects	Definition: Resource specifications in a resource pool, including resource specifications and the number of resources for each specification.
containernetwork	containernetworkk object	Kubernetes container network.
network	network object	Definition: Network parameters of a resource pool.
jobFlavors	Array of strings	Definition: Job specifications supported by a resource pool. The value is the job specification name.
driver	PoolDriver object	Definition: Resource pool driver information.
controlMode	Integer	Definition: Restriction status of a resource pool. Multiple statuses are allowed. For example, 9 indicates that it is frozen and changing its billing mode to yearly/monthly is restricted. Range: • 0: not restricted • 1: Changing to the yearly/monthly billing is restricted. • 2: Modifying specifications is restricted. • 4: The service is restricted. • 8: The resource pool is frozen. • 16: The resource pool is frozen by the public security department (cannot be unsubscribed).

Table 9-142 resources

Parameter	Type	Description
flavor	String	Definition: Resource flavor ID. Range: N/A

Parameter	Type	Description
count	Integer	Definition: Number of resource specification instances in a resource pool. Range: N/A
maxCount	Integer	Elastic resource amount of the resource specifications. The value must be the same as that of count in the physical pool.
azs	Array of PoolNodeAz objects	Definition: AZ distribution of the resource specification instances to be created in a resource pool.
extendParams	extendParams object	Definition: Custom parameters of a resource pool.
os	Os object	Definition: OS image information of nodes in a resource pool.
dataVolumes	dataVolumes object	List of custom cloud data disks. The list cannot be modified after being specified.
volumeGroupConfigs	volumeGroupConfigs object	Advanced disk configurations.

Table 9-143 extendParams

Parameter	Type	Description
dockerBaseSize	String	Definition: Container engine space of a node created in a resource pool. The value 0 indicates that the size is not limited. Constraints: N/A Range: N/A Default Value: N/A
volumeGroup	String	Disk group name.
runtime	String	Model runtime environment.

Table 9-144 Os

Parameter	Type	Description
name	String	Definition: OS name and version, for example, EulerOS 2.5. This parameter can be left blank when a private image is specified. Range: N/A.
imageId	String	Definition: OS image ID. Range: N/A.
imageType	String	Definition: OS image type. This parameter must be specified when a private image is set. By default, the preset image is used. You do not need to specify this field. Range: • private: private images • "": The preset image is used.
autoMatch	String	Definition: Automatic OS image matching configuration. If this parameter is set, the optimal image is automatically selected, and this parameter is automatically cleared. Range: OS name and version, for example, EulerOS 2.5.

Table 9-145 dataVolumes

Parameter	Type	Description
volumeType	String	Disk type.. Options: • SSD: ultra-high I/O disk • GPSSD: general-purpose SSD • SAS: high I/O disk
size	String	Disk size, in GiB.
count	String	Number of disks.
extendParams	extendParams object	Custom disk configuration.

Table 9-146 extendParams

Parameter	Type	Description
billing	String	Indicates whether the storage instance is billed. If this parameter is left blank, the storage instance is not billed. This field cannot be specified or modified by users.
volumeGroup	String	Name of a disk group, which is used to divide storage space. Options: • vgpaas: container disk. • default: common data disk, which is mounted in default mode. • vguser{num}: common data disk, which is mounted to a specified path. The group name varies depending on the path, for example, vguser1 and vguser2. • vg-everest-localvolume-persistent: common data disk, which is used as the persistent storage volume. • vg-everest-localvolume-ephemeral: common data disk, which is used as a temporary storage volume.

Table 9-147 volumeGroupConfigs

Parameter	Type	Description
volumeGroup	String	Disk group name. Index of the volume group in the dataVolumes.
dockerThinPool	Integer	Percentage of container disks to data disks on nodes in a resource pool. This parameter can be specified only when volumeGroup is vgpaas (container disk).
lvmConfig	lvmConfig object	LVM configuration management.

Table 9-148 lvmConfig

Parameter	Type	Description
lvType	String	LVM write mode. Options: • linear: linear mode. • striped: striped mode in which multiple disks are used to form a strip to improve disk performance.

Table 9-149 containernetwork

Parameter	Type	Description
mode	String	Container network model. Options: overlay_l2 : an overlay_l2 network (container tunnel network) built for containers by using OpenVSwitch (OVS). • vpc-router: an underlay_l2 network built for containers by using IPvlan and custom VPC routes. • eni: Cloud Native Network 2.0. This model deeply integrates the native ENI capability of VPC, uses the VPC CIDR block to allocate container addresses, and supports passthrough networking. You can use this model when creating a CCE Turbo cluster.

Table 9-150 network

Parameter	Type	Description
name	String	Definition: Network ID. Range: N/A

Table 9-151 PoolDriver

Parameter	Type	Description
gpuVersion	String	Definition: Default GPU driver version of a resource pool. This parameter is only valid when the physical resource pool contains GPU specifications. Range: N/A
npuVersion	String	Definition: Default NPU driver version of a resource pool. This parameter is only valid when the physical resource pool contains NPU specifications. Range: N/A
updateStrategy	String	Definition: Driver upgrade policy of a resource pool. Range: • force: forcible upgrade. The node drivers are upgraded immediately, which may affect jobs running on the node. • idle: secure upgrade. The drivers are upgraded when no job is running on the node.

Table 9-152 PoolStatus

Parameter	Type	Description
phase	String	Definition: Resource pool status. Range: • Creating: The resource pool is being created. • Running: The resource pool is running. • Abnormal: The resource pool is abnormal. • Deleting: The resource pool is being deleted. • Error: An error occurred in the resource pool.
message	String	Definition: Prompt information about the resource pool status. Range: N/A

Parameter	Type	Description
resources	resources object	Definition: Resource information in different states of the resource pool.
scope	Array of scope objects	Definition: Status of the service type supported by the resource pool.
driver	driver object	Definition: Resource pool driver status.
parent	String	Definition: ID of the parent resource pool to which a resource pool belongs. The physical pool is empty. Range: N/A
root	String	Definition: ID of the root resource pool. Range: N/A
clusters	clusters object	Resource pool cluster information. This parameter is available only for privileged pools.

Table 9-153 resources

Parameter	Type	Description
creating	PoolResourceFlavorCount object	Definition: Resource information in creating states of the resource pool.
available	PoolResourceFlavorCount object	Definition: Resource information in available states of the resource pool.
abnormal	PoolResourceFlavorCount object	Definition: Resource information in abnormal states of the resource pool.
deleting	PoolResourceFlavorCount object	Definition: Resource information in deleting states of the resource pool.

Table 9-154 PoolResourceFlavorCount

Parameter	Type	Description
flavor	String	Definition: Resource flavor ID. Range: N/A
count	Integer	Definition: Number of resource specification instances in a resource pool. Range: N/A

Parameter	Type	Description
maxCount	Integer	Definition: Number of elastic resource specification instances in a resource pool. The value of this parameter in a physical pool is the same as that of count . Range: N/A
azs	Array of PoolNodeAz objects	Definition: AZ distribution of the resource specification instances to be created in a resource pool.
nodePool	String	Definition: Node pool ID. Range: N/A

Table 9-155 PoolNodeAz

Parameter	Type	Description
az	String	Definition: AZ name. Range: N/A
count	Integer	Definition: Number of AZ resource instances. Range: N/A

Table 9-156 scope

Parameter	Type	Description
scopeType	String	Definition: Service type of the resource pool. Range: • Train: training jobs • Infer: inference jobs • Notebook: notebook jobs

Parameter	Type	Description
state	String	Definition: Service type status of the resource pool. Range: • Enabling: The service is being enabled. • Enabled: The service has been enabled. • Disabling: The service is being disabled. • Disabled: The service has been disabled.

Table 9-157 driver

Parameter	Type	Description
gpu	PoolDriverStatus object	Definition: GPU driver status of a resource pool. Range: N/A
npu	PoolDriverStatus object	Definition: NPU driver status of a resource pool. Range: N/A

Table 9-158 PoolDriverStatus

Parameter	Type	Description
version	String	Definition: Current driver version of a resource pool. Range: N/A
state	String	Definition: Current driver status of a resource pool. Range: • Creating: The driver is being installed. • Upgrading: The driver is being upgraded. • Running: The driver is running. • Abnormal: The driver is abnormal.

Table 9-159 clusters

Parameter	Type	Description
name	String	Cluster name.
clusterFlavor	String	Cluster flavor of a standard pool.
type	String	Type of the resource pool cluster.
version	String	Cluster version.
plugins	plugins object	Name of the plugin supported by the cluster.

Table 9-160 plugins

Parameter	Type	Description
name	String	Name of the plugin supported by the cluster.

Status code: 400**Table 9-161** Response body parameters

Parameter	Type	Description
error_code	String	Definition: ModelArts error code. Range: N/A
error_msg	String	Definition: Error message. Range: N/A

Status code: 409**Table 9-162** Response body parameters

Parameter	Type	Description
error_code	String	Definition: ModelArts error code. Range: N/A
error_msg	String	Definition: Error message. Range: N/A

Example Requests

The following is an example of how to create a dedicated resource pool whose resource type is **Pool**, pool name is **pool-001**, pool type is **Dedicate** (physical resource pool), and supported job type is **Train**.

```
POST https://{endpoint}/v2/{project_id}/pools

{

}
```

Status Codes

Status Code	Description
200	OK

Status Code	Description
400	Bad request
409	Already exists

Error Codes

See [Error Codes](#).

9.13 Obtaining Resource Pools

Function

This API is used to obtain information about resource pools created in the system. This API is used when you need to query the resource pool list recorded in the system when monitoring resource pool status, planning resources, managing resource allocation, or auditing. Before using this API, ensure that you have the required permission and the resource pool exists in the system. After the query, the API returns the resource pool list, including the resource pool ID, name, type, status, and resource quota. If you do not have the required permission, the resource pools do not exist in the system, or the query parameter is incorrect, the API will return an error message.

Debugging

You can debug this API through automatic authentication in [API Explorer](#) or use the SDK sample code generated by API Explorer.

Authorization Information

Each account has all the permissions required to call all APIs, but IAM users must be assigned the required permissions.

- If you are using role/policy-based authorization, see [Permissions Policies and Supported Actions](#) for details on the required permissions.
- If you are using identity policy-based authorization, the following identity policy-based permissions are required.

Action	Access Level	Resource Type (*: required)	Condition Key	Alias	Dependencies
modelarts:pool:list	List	pool *	-	-	-

Action	Access Level	Resource Type (*: required)	Condition Key	Alias	Dependencies
		-	- g:EnterpriseProjectId - g:RequestTag/<tag-key> - g:TagKeys		

URI

GET /v2/{project_id}/pools

Table 9-163 Path Parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Definition: Project ID. For details, see Obtaining a Project ID and Name . Constraints: N/A Range: N/A Default Value: N/A

Table 9-164 Query Parameters

Parameter	Mandatory	Type	Description
workspaceId	No	String	Definition: Workspace ID.[For details about how to obtain the ID, see Querying the Workspace List . If no workspace is created, the default value is 0 . If a workspace is created and used, use the actual value. Constraints: N/A Range: N/A Default Value: 0

Parameter	Mandatory	Type	Description
labelSelector	No	String	Definition: Resource pool tag filtering Constraints: N/A Range: N/A Default Value: N/A
status	No	String	Definition: Resource pool status Constraints: N/A Range: The options are as follows: • created: The resource pool is successfully created. • failed: The resource pool failed to be created. The failure record is retained for three days. • creating: The resource pool is being created. Default Value: N/A

Request Parameters

None

Response Parameters

Status code: 200

Table 9-165 Response body parameters

Parameter	Type	Description
apiVersion	String	Definition: API version of the resource. Range: • v2: The current resource version is v2.
kind	String	Definition: Resource type. Range: • PoolList: Resource pool list.
items	Array of PoolModel objects	Definition: Resource list.

Table 9-166 PoolModel

Parameter	Type	Description
apiVersion	String	Definition: API version of the resource. Range: • v2: The current resource version is v2.
kind	String	Definition: Resource type. Range: • Pool: resource pool
metadata	PoolMetadata object	Definition: Metadata of the resource pool.
spec	PoolSpecModel object	Definition: Specifications of a resource pool.
status	PoolStatus object	Definition: Status of a resource pool.

Table 9-167 PoolMetadata

Parameter	Type	Description
name	String	Definition: Resource pool ID. Range: N/A
creationTimestamp	String	Definition: Time when a resource pool is created. For example, 2025-11-01T03:49:41Z . Range: N/A
labels	PoolMetaLabels object	Definition: Tags of a resource pool.
annotations	PoolMetaAnnotations object	Definition: Comments of a resource pool. Constraints: N/A Range: N/A Default Value: N/A

Table 9-168 PoolMetaLabels

Parameter	Type	Description
os.modelarts/ name	String	Definition: Displayed name of a resource pool. Constraints: N/A Range: N/A Default Value: N/A
os.modelarts/ workspace.id	String	Definition: Workspace ID. [For details about how to obtain the ID, see Querying the Workspace List .] Constraints: N/A Range: N/A Default Value: 0
os.modelarts/ node.prefix	String	Definition: Custom node prefix. This parameter is optional. Constraints: N/A Range: N/A Default Value: N/A
os.modelarts/ resource.id	String	Definition: Resource ID used for resource pool billing. Constraints: N/A Range: N/A Default Value: N/A
os.modelarts/ tenant.domain.id	String	Definition: ID of the tenant to which a resource pool belongs. Constraints: N/A Range: N/A Default Value: N/A
os.modelarts/ tenant.project.id	String	Definition: ID of the tenant project that a resource pool belongs to. Constraints: N/A Range: N/A Default Value: N/A
os.modelarts/ enterprise.project.i d	String	Definition: ID of the enterprise project that a resource pool belongs to. Constraints: N/A Range: N/A Default Value: N/A

Parameter	Type	Description
os.modelarts.pool/ biz	String	Definition: Business type of a resource pool. The value can be public or private . Constraints: N/A Range: N/A Default Value: N/A
os.modelarts/ create-from	String	Definition: Source of a resource pool, for example, admin-console , indicating that the resource pool is created by the administrator on the ModelArts console. Constraints: N/A Range: N/A Default Value: N/A
os.modelarts/ nobilling	String	Definition: Indicates whether the resource pool is charged. Constraints: N/A Range: N/A Default Value: N/A
os.modelarts/ order.name	String	Definition: Last order job record associated with the resource pool. Constraints: N/A Range: N/A Default Value: N/A
os.modelarts/ region	String	Definition: Region where the resource pool is located. Constraints: N/A Range: N/A Default Value: N/A

Table 9-169 PoolMetaAnnotations

Parameter	Type	Description
os.modelarts/ description	String	Definition: Resource pool description. Constraints: N/A Range: N/A Default Value: N/A

Parameter	Type	Description
os.modelarts/ billing.mode	String	Definition: Billing mode. Constraints: N/A Range: • 0: pay-per-use • 1: yearly/monthly Default Value: N/A
os.modelarts/ period.num	String	Definition: Subscription period of a yearly/monthly resource pool. Constraints: This parameter is used together with the os.modelarts/period.type field. Range: N/A Default Value: N/A
os.modelarts/ period.type	String	Definition: Subscription type of a yearly/monthly resource pool. Constraints: This parameter is used together with the os.modelarts/period.num field. Range: • 2: monthly • 3: yearly Default Value: N/A
os.modelarts/ auto.renew	String	Definition: Auto-renewal status of a yearly/monthly resource pool. Constraints: N/A Range: • 0: Auto-renewal is disabled. • 1: Auto-renewal is enabled. Default Value: 0
os.modelarts/ promotion.info	String	Definition: Discount information selected when a yearly/monthly resource pool is purchased. Constraints: N/A Range: N/A Default Value: N/A

Parameter	Type	Description
os.modelarts/ service.console.url	String	Definition: URL to which you are redirected after the order of a yearly/monthly resource pool is paid. Constraints: N/A Range: N/A Default Value: N/A
os.modelarts/ order.id	String	Definition: Order ID transferred when a yearly/monthly resource pool is purchased. Constraints: N/A Range: N/A Default Value: N/A
os.modelarts/ flavor.resource.ids	String	Definition: Resource ID of the resource specifications in a yearly/monthly resource pool. Constraints: N/A Range: N/A Default Value: N/A
os.modelarts/ tms.tags	String	Definition: Resource tags of a resource pool. Constraints: N/A Range: N/A Default Value: N/A
os.modelarts.pool/ scheduler.queue.st rategy	String	Definition: Policy of the resource pool scheduling queue, which is used to define task scheduling rules. Constraints: N/A Range: N/A Default Value: N/A
os.modelarts.pool/ subpools.count	String	Definition: Number of logical subpools in a resource pool. Constraints: N/A Range: N/A Default Value: N/A
os.modelarts/ tenant.domain.na me	String	Definition: Tenant account of the resource pool. Constraints: N/A Range: N/A Default Value: N/A

Parameter	Type	Description
os.modelarts.pool/scope.external.dependency.train	String	Definition: External dependency ID of the training job. Constraints: N/A Range: N/A Default Value: N/A

Table 9-170 PoolSpecModel

Parameter	Type	Description
type	String	Definition: Resource pool type. Constraints: N/A Range: • Dedicate: physical resource pool, which uses a separate network and supports network connection, custom drivers, and custom job types. • Logical: logical resource pool. There is no independent network and network connectivity is not supported. Logical resource pools can be created and scaled faster than physical resource pools. Default Value: N/A
scope	Array of strings	Definition: Job types supported by a resource pool.
resources	Array of resources objects	Definition: Resource specifications in a resource pool, including resource specifications and the number of resources for each specification.
containernetwork	containernetworkk object	Kubernetes container network.
network	network object	Definition: Network parameters of a resource pool.
jobFlavors	Array of strings	Definition: Job specifications supported by a resource pool. The value is the job specification name.
driver	PoolDriver object	Definition: Resource pool driver information.

Parameter	Type	Description
controlMode	Integer	Definition: Restriction status of a resource pool. Multiple statuses are allowed. For example, 9 indicates that it is frozen and changing its billing mode to yearly/monthly is restricted. Range: • 0: not restricted • 1: Changing to the yearly/monthly billing is restricted. • 2: Modifying specifications is restricted. • 4: The service is restricted. • 8: The resource pool is frozen. • 16: The resource pool is frozen by the public security department (cannot be unsubscribed).

Table 9-171 resources

Parameter	Type	Description
flavor	String	Definition: Resource flavor ID. Range: N/A
count	Integer	Definition: Number of resource specification instances in a resource pool. Range: N/A
maxCount	Integer	Elastic resource amount of the resource specifications. The value must be the same as that of count in the physical pool.
azs	Array of PoolNodeAz objects	Definition: AZ distribution of the resource specification instances to be created in a resource pool.
extendParams	extendParams object	Definition: Custom parameters of a resource pool.
os	Os object	Definition: OS image information of nodes in a resource pool.
dataVolumes	dataVolumes object	List of custom cloud data disks. The list cannot be modified after being specified.

Parameter	Type	Description
volumeGroupConfigs	volumeGroupConfigs object	Advanced disk configurations.

Table 9-172 extendParams

Parameter	Type	Description
dockerBaseSize	String	Definition: Container engine space of a node created in a resource pool. The value 0 indicates that the size is not limited. Constraints: N/A Range: N/A Default Value: N/A
volumeGroup	String	Disk group name.
runtime	String	Model runtime environment.

Table 9-173 Os

Parameter	Type	Description
name	String	Definition: OS name and version, for example, EulerOS 2.5. This parameter can be left blank when a private image is specified. Range: N/A.
imageId	String	Definition: OS image ID. Range: N/A.
imageType	String	Definition: OS image type. This parameter must be specified when a private image is set. By default, the preset image is used. You do not need to specify this field. Range: private: private images "": The preset image is used.

Parameter	Type	Description
autoMatch	String	Definition: Automatic OS image matching configuration. If this parameter is set, the optimal image is automatically selected, and this parameter is automatically cleared. Range: OS name and version, for example, EulerOS 2.5.

Table 9-174 dataVolumes

Parameter	Type	Description
volumeType	String	Disk type.. Options: • SSD: ultra-high I/O disk • GPSSD: general-purpose SSD • SAS: high I/O disk
size	String	Disk size, in GiB.
count	String	Number of disks.
extendParams	extendParams object	Custom disk configuration.

Table 9-175 extendParams

Parameter	Type	Description
billing	String	Indicates whether the storage instance is billed. If this parameter is left blank, the storage instance is not billed. This field cannot be specified or modified by users.

Parameter	Type	Description
volumeGroup	String	Name of a disk group, which is used to divide storage space. Options: • vgpaas: container disk. • default: common data disk, which is mounted in default mode. • vguser{num}: common data disk, which is mounted to a specified path. The group name varies depending on the path, for example, vguser1 and vguser2. • vg-everest-localvolume-persistent: common data disk, which is used as the persistent storage volume. • vg-everest-localvolume-ephemeral: common data disk, which is used as a temporary storage volume.

Table 9-176 volumeGroupConfigs

Parameter	Type	Description
volumeGroup	String	Disk group name. Index of the volume group in the dataVolumes.
dockerThinPool	Integer	Percentage of container disks to data disks on nodes in a resource pool. This parameter can be specified only when volumeGroup is vgpaas (container disk).
lvmConfig	lvmConfig object	LVM configuration management.

Table 9-177 lvmConfig

Parameter	Type	Description
lvType	String	LVM write mode. Options: • linear: linear mode. • striped: striped mode in which multiple disks are used to form a strip to improve disk performance.

Table 9-178 containernetwork

Parameter	Type	Description
mode	String	Container network model. Options: overlay_l2 : an overlay_l2 network (container tunnel network) built for containers by using OpenVSwitch (OVS). • vpc-router: an underlay_l2 network built for containers by using IPvlan and custom VPC routes. • eni: Cloud Native Network 2.0. This model deeply integrates the native ENI capability of VPC, uses the VPC CIDR block to allocate container addresses, and supports passthrough networking. You can use this model when creating a CCE Turbo cluster.

Table 9-179 network

Parameter	Type	Description
name	String	Definition: Network ID. Range: N/A

Table 9-180 PoolDriver

Parameter	Type	Description
gpuVersion	String	Definition: Default GPU driver version of a resource pool. This parameter is only valid when the physical resource pool contains GPU specifications. Range: N/A
npuVersion	String	Definition: Default NPU driver version of a resource pool. This parameter is only valid when the physical resource pool contains NPU specifications. Range: N/A

Parameter	Type	Description
updateStrategy	String	Definition: Driver upgrade policy of a resource pool. Range: • force: forcible upgrade. The node drivers are upgraded immediately, which may affect jobs running on the node. • idle: secure upgrade. The drivers are upgraded when no job is running on the node.

Table 9-181 PoolStatus

Parameter	Type	Description
phase	String	Definition: Resource pool status. Range: • Creating: The resource pool is being created. • Running: The resource pool is running. • Abnormal: The resource pool is abnormal. • Deleting: The resource pool is being deleted. • Error: An error occurred in the resource pool.
message	String	Definition: Prompt information about the resource pool status. Range: N/A
resources	resources object	Definition: Resource information in different states of the resource pool.
scope	Array of scope objects	Definition: Status of the service type supported by the resource pool.
driver	driver object	Definition: Resource pool driver status.
parent	String	Definition: ID of the parent resource pool to which a resource pool belongs. The physical pool is empty. Range: N/A

Parameter	Type	Description
root	String	Definition: ID of the root resource pool. Range: N/A
clusters	clusters object	Resource pool cluster information. This parameter is available only for privileged pools.

Table 9-182 resources

Parameter	Type	Description
creating	PoolResourceFlavorCount object	Definition: Resource information in creating states of the resource pool.
available	PoolResourceFlavorCount object	Definition: Resource information in available states of the resource pool.
abnormal	PoolResourceFlavorCount object	Definition: Resource information in abnormal states of the resource pool.
deleting	PoolResourceFlavorCount object	Definition: Resource information in deleting states of the resource pool.

Table 9-183 PoolResourceFlavorCount

Parameter	Type	Description
flavor	String	Definition: Resource flavor ID. Range: N/A
count	Integer	Definition: Number of resource specification instances in a resource pool. Range: N/A
maxCount	Integer	Definition: Number of elastic resource specification instances in a resource pool. The value of this parameter in a physical pool is the same as that of count . Range: N/A
azs	Array of PoolNodeAz objects	Definition: AZ distribution of the resource specification instances to be created in a resource pool.

Parameter	Type	Description
nodePool	String	Definition: Node pool ID. Range: N/A

Table 9-184 PoolNodeAz

Parameter	Type	Description
az	String	Definition: AZ name. Range: N/A
count	Integer	Definition: Number of AZ resource instances. Range: N/A

Table 9-185 scope

Parameter	Type	Description
scopeType	String	Definition: Service type of the resource pool. Range: • Train: training jobs • Infer: inference jobs • Notebook: notebook jobs
state	String	Definition: Service type status of the resource pool. Range: • Enabling: The service is being enabled. • Enabled: The service has been enabled. • Disabling: The service is being disabled. • Disabled: The service has been disabled.

Table 9-186 driver

Parameter	Type	Description
gpu	PoolDriverStatus object	Definition: GPU driver status of a resource pool. Range: N/A
npu	PoolDriverStatus object	Definition: NPU driver status of a resource pool. Range: N/A

Table 9-187 PoolDriverStatus

Parameter	Type	Description
version	String	Definition: Current driver version of a resource pool. Range: N/A
state	String	Definition: Current driver status of a resource pool. Range: • Creating: The driver is being installed. • Upgrading: The driver is being upgraded. • Running: The driver is running. • Abnormal: The driver is abnormal.

Table 9-188 clusters

Parameter	Type	Description
name	String	Cluster name.
clusterFlavor	String	Cluster flavor of a standard pool.
type	String	Type of the resource pool cluster.
version	String	Cluster version.
plugins	plugins object	Name of the plugin supported by the cluster.

Table 9-189 plugins

Parameter	Type	Description
name	String	Name of the plugin supported by the cluster.

Example Requests

Obtain resource pools.

```
GET https://{endpoint}/v2/{project_id}/pools
{ }
```

Example Responses

Status code: 200

OK

Error Codes

See [Error Codes](#).

9.14 Obtaining a Resource Pool

Function

This API is used to obtain the details of a specified resource pool. This API is used when you need to query details about a specified resource pool, such as its configuration, status, resource usage, or resource management. Before using this API, ensure that you have the required permission and the specified resource pool exists in the system. After the query, the API returns the resource pool details, including the resource pool ID, name, type, status, resource quota, and usage. If the specified resource pool does not exist, the user does not have the permission to perform the operation, or the input parameters are incorrect, the API will return an error message.

Debugging

You can debug this API through automatic authentication in [API Explorer](#) or use the SDK sample code generated by API Explorer.

Authorization Information

Each account has all the permissions required to call all APIs, but IAM users must be assigned the required permissions.

- If you are using role/policy-based authorization, see [Permissions Policies and Supported Actions](#) for details on the required permissions.
- If you are using identity policy-based authorization, the following identity policy-based permissions are required.

Action	Access Level	Resource Type (*: required)	Condition Key	Alias	Dependencies
modelarts:pool:get	Read	pool *	g:ResourceTag/<tag-key>	-	-
		-	g:EnterpriseProjectId		

URI

GET /v2/{project_id}/pools/{pool_name}

Table 9-190 Path Parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Definition: Project ID. For details, see Obtaining a Project ID and Name . Constraints: N/A Range: N/A Default Value: N/A
pool_name	Yes	String	Definition: Resource pool ID. The value is obtained from the metadata.name field in the resource pool details. Constraints: N/A <i>*Range:</i> The value can contain 36 to 63 characters. It must start with a lowercase letter and cannot end with a hyphen (-). Digits and hyphens (-) are allowed. Default Value: N/A

Request Parameters

Table 9-191 Request header parameters

Parameter	Mandatory	Type	Description
X-ModelArts-User-ID	No	String	Definition: Tenant ID. This ID is used for authentication when this parameter is transferred. Constraints: N/A Range: N/A Default Value: N/A

Response Parameters

Status code: 200**Table 9-192** Response body parameters

Parameter	Type	Description
apiVersion	String	Definition: API version of the resource. Range: • v2: The current resource version is v2.
kind	String	Definition: Resource type. Range: • Pool: resource pool
metadata	PoolMetadata object	Definition: Metadata of the resource pool.
spec	PoolSpecModel object	Definition: Specifications of a resource pool.
status	PoolStatus object	Definition: Status of a resource pool.

Table 9-193 PoolMetadata

Parameter	Type	Description
name	String	Definition: Resource pool ID. Range: N/A

Parameter	Type	Description
creationTimestamp	String	Definition: Time when a resource pool is created. For example, 2025-11-01T03:49:41Z . Range: N/A
labels	PoolMetaLabels object	Definition: Tags of a resource pool.
annotations	PoolMetaAnnotations object	Definition: Comments of a resource pool. Constraints: N/A Range: N/A Default Value: N/A

Table 9-194 PoolMetaLabels

Parameter	Type	Description
os.modelarts/ name	String	Definition: Displayed name of a resource pool. Constraints: N/A Range: N/A Default Value: N/A
os.modelarts/ workspace.id	String	Definition: Workspace ID. For details about how to obtain the ID, see Querying the Workspace List . Constraints: N/A Range: N/A Default Value: 0
os.modelarts/ node.prefix	String	Definition: Custom node prefix. This parameter is optional. Constraints: N/A Range: N/A Default Value: N/A
os.modelarts/ resource.id	String	Definition: Resource ID used for resource pool billing. Constraints: N/A Range: N/A Default Value: N/A

Parameter	Type	Description
os.modelarts/ tenant.domain.id	String	Definition: ID of the tenant to which a resource pool belongs. Constraints: N/A Range: N/A Default Value: N/A
os.modelarts/ tenant.project.id	String	Definition: ID of the tenant project that a resource pool belongs to. Constraints: N/A Range: N/A Default Value: N/A
os.modelarts/ enterprise.project.i d	String	Definition: ID of the enterprise project that a resource pool belongs to. Constraints: N/A Range: N/A Default Value: N/A
os.modelarts.pool/ biz	String	Definition: Business type of a resource pool. The value can be public or private . Constraints: N/A Range: N/A Default Value: N/A
os.modelarts/ create-from	String	Definition: Source of a resource pool, for example, admin-console , indicating that the resource pool is created by the administrator on the ModelArts console. Constraints: N/A Range: N/A Default Value: N/A
os.modelarts/ nobilling	String	Definition: Indicates whether the resource pool is charged. Constraints: N/A Range: N/A Default Value: N/A
os.modelarts/ order.name	String	Definition: Last order job record associated with the resource pool. Constraints: N/A Range: N/A Default Value: N/A

Parameter	Type	Description
os.modelarts/ region	String	Definition: Region where the resource pool is located. Constraints: N/A Range: N/A Default Value: N/A

Table 9-195 PoolMetaAnnotations

Parameter	Type	Description
os.modelarts/ description	String	Definition: Resource pool description. Constraints: N/A Range: N/A Default Value: N/A
os.modelarts/ billing.mode	String	Definition: Billing mode. Constraints: N/A Range: • 0: pay-per-use • 1: yearly/monthly Default Value: N/A
os.modelarts/ period.num	String	Definition: Subscription period of a yearly/monthly resource pool. Constraints: This parameter is used together with the os.modelarts/period.type field. Range: N/A Default Value: N/A
os.modelarts/ period.type	String	Definition: Subscription type of a yearly/monthly resource pool. Constraints: This parameter is used together with the os.modelarts/period.num field. Range: • 2: monthly • 3: yearly Default Value: N/A

Parameter	Type	Description
os.modelarts/ auto.renew	String	Definition: Auto-renewal status of a yearly/monthly resource pool. Constraints: N/A Range: • 0: Auto-renewal is disabled. • 1: Auto-renewal is enabled. Default Value: 0
os.modelarts/ promotion.info	String	Definition: Discount information selected when a yearly/monthly resource pool is purchased. Constraints: N/A Range: N/A Default Value: N/A
os.modelarts/ service.console.url	String	Definition: URL to which you are redirected after the order of a yearly/monthly resource pool is paid. Constraints: N/A Range: N/A Default Value: N/A
os.modelarts/ order.id	String	Definition: Order ID transferred when a yearly/monthly resource pool is purchased. Constraints: N/A Range: N/A Default Value: N/A
os.modelarts/ flavor.resource.ids	String	Definition: Resource ID of the resource specifications in a yearly/monthly resource pool. Constraints: N/A Range: N/A Default Value: N/A
os.modelarts/ tms.tags	String	Definition: Resource tags of a resource pool. Constraints: N/A Range: N/A Default Value: N/A

Parameter	Type	Description
os.modelarts.pool/ scheduler.queue.st ategy	String	Definition: Policy of the resource pool scheduling queue, which is used to define task scheduling rules. Constraints: N/A Range: N/A Default Value: N/A
os.modelarts.pool/ subpools.count	String	Definition: Number of logical subpools in a resource pool. Constraints: N/A Range: N/A Default Value: N/A
os.modelarts/ tenant.domain.na me	String	Definition: Tenant account of the resource pool. Constraints: N/A Range: N/A Default Value: N/A
os.modelarts.pool/ scope.external.dep endency.train	String	Definition: External dependency ID of the training job. Constraints: N/A Range: N/A Default Value: N/A

Table 9-196 PoolSpecModel

Parameter	Type	Description
type	String	Definition: Resource pool type. Constraints: N/A Range: • Dedicate: physical resource pool, which uses a separate network and supports network connection, custom drivers, and custom job types. • Logical: logical resource pool. There is no independent network and network connectivity is not supported. Logical resource pools can be created and scaled faster than physical resource pools. Default Value: N/A

Parameter	Type	Description
scope	Array of strings	Definition: Job types supported by a resource pool.
resources	Array of resources objects	Definition: Resource specifications in a resource pool, including resource specifications and the number of resources for each specification.
containernetwork	containernetworkk object	Kubernetes container network.
network	network object	Definition: Network parameters of a resource pool.
jobFlavors	Array of strings	Definition: Job specifications supported by a resource pool. The value is the job specification name.
driver	PoolDriver object	Definition: Resource pool driver information.
controlMode	Integer	Definition: Restriction status of a resource pool. Multiple statuses are allowed. For example, 9 indicates that it is frozen and changing its billing mode to yearly/monthly is restricted. Range: • 0: not restricted • 1: Changing to the yearly/monthly billing is restricted. • 2: Modifying specifications is restricted. • 4: The service is restricted. • 8: The resource pool is frozen. • 16: The resource pool is frozen by the public security department (cannot be unsubscribed).

Table 9-197 resources

Parameter	Type	Description
flavor	String	Definition: Resource flavor ID. Range: N/A

Parameter	Type	Description
count	Integer	Definition: Number of resource specification instances in a resource pool. Range: N/A
maxCount	Integer	Elastic resource amount of the resource specifications. The value must be the same as that of count in the physical pool.
azs	Array of PoolNodeAz objects	Definition: AZ distribution of the resource specification instances to be created in a resource pool.
extendParams	extendParams object	Definition: Custom parameters of a resource pool.
os	Os object	Definition: OS image information of nodes in a resource pool.
dataVolumes	dataVolumes object	List of custom cloud data disks. The list cannot be modified after being specified.
volumeGroupConfigs	volumeGroupConfigs object	Advanced disk configurations.

Table 9-198 extendParams

Parameter	Type	Description
dockerBaseSize	String	Definition: Container engine space of a node created in a resource pool. The value 0 indicates that the size is not limited. Constraints: N/A Range: N/A Default Value: N/A
volumeGroup	String	Disk group name.
runtime	String	Model runtime environment.

Table 9-199 Os

Parameter	Type	Description
name	String	Definition: OS name and version, for example, EulerOS 2.5. This parameter can be left blank when a private image is specified. Range: N/A.
imageId	String	Definition: OS image ID. Range: N/A.
imageType	String	Definition: OS image type. This parameter must be specified when a private image is set. By default, the preset image is used. You do not need to specify this field. Range: • private: private images • "": The preset image is used.
autoMatch	String	Definition: Automatic OS image matching configuration. If this parameter is set, the optimal image is automatically selected, and this parameter is automatically cleared. Range: OS name and version, for example, EulerOS 2.5.

Table 9-200 dataVolumes

Parameter	Type	Description
volumeType	String	Disk type.. Options: • SSD: ultra-high I/O disk • GPSSD: general-purpose SSD • SAS: high I/O disk
size	String	Disk size, in GiB.
count	String	Number of disks.
extendParams	extendParams object	Custom disk configuration.

Table 9-201 extendParams

Parameter	Type	Description
billing	String	Indicates whether the storage instance is billed. If this parameter is left blank, the storage instance is not billed. This field cannot be specified or modified by users.
volumeGroup	String	Name of a disk group, which is used to divide storage space. Options: • vgpaas: container disk. • default: common data disk, which is mounted in default mode. • vguser{num}: common data disk, which is mounted to a specified path. The group name varies depending on the path, for example, vguser1 and vguser2. • vg-everest-localvolume-persistent: common data disk, which is used as the persistent storage volume. • vg-everest-localvolume-ephemeral: common data disk, which is used as a temporary storage volume.

Table 9-202 volumeGroupConfigs

Parameter	Type	Description
volumeGroup	String	Disk group name. Index of the volume group in the dataVolumes.
dockerThinPool	Integer	Percentage of container disks to data disks on nodes in a resource pool. This parameter can be specified only when volumeGroup is vgpaas (container disk).
lvmConfig	lvmConfig object	LVM configuration management.

Table 9-203 lvmConfig

Parameter	Type	Description
lvType	String	LVM write mode. Options: • linear: linear mode. • striped: striped mode in which multiple disks are used to form a strip to improve disk performance.

Table 9-204 containernetwork

Parameter	Type	Description
mode	String	Container network model. Options: overlay_l2 : an overlay_l2 network (container tunnel network) built for containers by using OpenVSwitch (OVS). • vpc-router: an underlay_l2 network built for containers by using IPvlan and custom VPC routes. • eni: Cloud Native Network 2.0. This model deeply integrates the native ENI capability of VPC, uses the VPC CIDR block to allocate container addresses, and supports passthrough networking. You can use this model when creating a CCE Turbo cluster.

Table 9-205 network

Parameter	Type	Description
name	String	Definition: Network ID. Range: N/A

Table 9-206 PoolDriver

Parameter	Type	Description
gpuVersion	String	Definition: Default GPU driver version of a resource pool. This parameter is only valid when the physical resource pool contains GPU specifications. Range: N/A
npuVersion	String	Definition: Default NPU driver version of a resource pool. This parameter is only valid when the physical resource pool contains NPU specifications. Range: N/A
updateStrategy	String	Definition: Driver upgrade policy of a resource pool. Range: • force: forcible upgrade. The node drivers are upgraded immediately, which may affect jobs running on the node. • idle: secure upgrade. The drivers are upgraded when no job is running on the node.

Table 9-207 PoolStatus

Parameter	Type	Description
phase	String	Definition: Resource pool status. Range: • Creating: The resource pool is being created. • Running: The resource pool is running. • Abnormal: The resource pool is abnormal. • Deleting: The resource pool is being deleted. • Error: An error occurred in the resource pool.
message	String	Definition: Prompt information about the resource pool status. Range: N/A

Parameter	Type	Description
resources	resources object	Definition: Resource information in different states of the resource pool.
scope	Array of scope objects	Definition: Status of the service type supported by the resource pool.
driver	driver object	Definition: Resource pool driver status.
parent	String	Definition: ID of the parent resource pool to which a resource pool belongs. The physical pool is empty. Range: N/A
root	String	Definition: ID of the root resource pool. Range: N/A
clusters	clusters object	Resource pool cluster information. This parameter is available only for privileged pools.

Table 9-208 resources

Parameter	Type	Description
creating	PoolResourceFlavorCount object	Definition: Resource information in creating states of the resource pool.
available	PoolResourceFlavorCount object	Definition: Resource information in available states of the resource pool.
abnormal	PoolResourceFlavorCount object	Definition: Resource information in abnormal states of the resource pool.
deleting	PoolResourceFlavorCount object	Definition: Resource information in deleting states of the resource pool.

Table 9-209 PoolResourceFlavorCount

Parameter	Type	Description
flavor	String	Definition: Resource flavor ID. Range: N/A
count	Integer	Definition: Number of resource specification instances in a resource pool. Range: N/A

Parameter	Type	Description
maxCount	Integer	Definition: Number of elastic resource specification instances in a resource pool. The value of this parameter in a physical pool is the same as that of count . Range: N/A
azs	Array of PoolNodeAz objects	Definition: AZ distribution of the resource specification instances to be created in a resource pool.
nodePool	String	Definition: Node pool ID. Range: N/A

Table 9-210 PoolNodeAz

Parameter	Type	Description
az	String	Definition: AZ name. Range: N/A
count	Integer	Definition: Number of AZ resource instances. Range: N/A

Table 9-211 scope

Parameter	Type	Description
scopeType	String	Definition: Service type of the resource pool. Range: • Train: training jobs • Infer: inference jobs • Notebook: notebook jobs

Parameter	Type	Description
state	String	Definition: Service type status of the resource pool. Range: • Enabling: The service is being enabled. • Enabled: The service has been enabled. • Disabling: The service is being disabled. • Disabled: The service has been disabled.

Table 9-212 driver

Parameter	Type	Description
gpu	PoolDriverStatus object	Definition: GPU driver status of a resource pool. Range: N/A
npu	PoolDriverStatus object	Definition: NPU driver status of a resource pool. Range: N/A

Table 9-213 PoolDriverStatus

Parameter	Type	Description
version	String	Definition: Current driver version of a resource pool. Range: N/A
state	String	Definition: Current driver status of a resource pool. Range: • Creating: The driver is being installed. • Upgrading: The driver is being upgraded. • Running: The driver is running. • Abnormal: The driver is abnormal.

Table 9-214 clusters

Parameter	Type	Description
name	String	Cluster name.
clusterFlavor	String	Cluster flavor of a standard pool.
type	String	Type of the resource pool cluster.
version	String	Cluster version.
plugins	plugins object	Name of the plugin supported by the cluster.

Table 9-215 plugins

Parameter	Type	Description
name	String	Name of the plugin supported by the cluster.

Status code: 404**Table 9-216** Response body parameters

Parameter	Type	Description
error_code	String	Definition: ModelArts error code. Range: N/A
error_msg	String	Definition: Error message. Range: N/A

Example Requests

Obtain details about a resource pool.

```
GET https://{endpoint}/v2/{project_id}/pools/{pool_name}
{ }
```

Error Codes

See [Error Codes](#).

9.15 Deleting a Resource Pool

Function

This API is used to delete a specified resource pool. This API is used when you need to delete a specified resource pool when the resource pool is no longer required, the configuration is incorrect, or resources need to be cleared. Before using this API, ensure that the resource pool exists and you have the administrator permissions. After the deletion, the specified resource pool is permanently removed, and related resources and configurations are cleared. If the resource pool does not exist, you do not have the operation permission, or the resource pool is depended on by other resources, the API will return an error message.

Debugging

You can debug this API through automatic authentication in [API Explorer](#) or use the SDK sample code generated by API Explorer.

Authorization Information

Each account has all the permissions required to call all APIs, but IAM users must be assigned the required permissions.

- If you are using role/policy-based authorization, see [Permissions Policies and Supported Actions](#) for details on the required permissions.
- If you are using identity policy-based authorization, the following identity policy-based permissions are required.

Action	Access Level	Resource Type (*: required)	Condition Key	Alias	Dependencies
modelarts:pool:delete	Write	pool *	g:ResourceTag/<tag-key>	-	-
		-	g:EnterpriseProjectId		

URI

DELETE /v2/{project_id}/pools/{pool_name}

Table 9-217 Path Parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Definition: User project ID. For details, see Obtaining a Project ID and Name . Constraints: N/A Range: N/A Default Value: N/A
pool_name	Yes	String	Definition: Resource pool name generated by the system. Constraints: N/A Range: N/A Default Value: N/A

Request Parameters

Table 9-218 Request header parameters

Parameter	Mandatory	Type	Description
X-ModelArts-User-ID	No	String	Definition: Tenant ID. If there is a tenant ID, it will be used for workspace authentication. Constraints: N/A Range: N/A Default Value: N/A

Response Parameters

Status code: 200

Table 9-219 Response body parameters

Parameter	Type	Description
apiVersion	String	Definition: API version. Range: v2
kind	String	Definition: Resource type. Range: Pool: resource pool

Parameter	Type	Description
metadata	PoolMetadataDeletion object	Metadata of a resource pool.
spec	PoolSpecModel object	Description of a resource pool.
status	PoolStatus object	Status of a resource pool.

Table 9-220 PoolMetadataDeletion

Parameter	Type	Description
name	String	Definition: Automatically generated resource pool name, which is equivalent to pool ID . Range: N/A
creationTimestamp	String	Definition: Timestamp, for example, 2021-11-01T03:49:41Z . Range: N/A
deletionTimestamp	String	Definition: Timestamp, for example, 2021-11-01T03:49:41Z . Range: N/A
labels	PoolMetaLabels object	Resource pool labels.
annotations	PoolMetaAnnotations object	Resource pool annotations.

Table 9-221 PoolMetaLabels

Parameter	Type	Description
os.modelarts/name	String	Definition: Displayed name of a resource pool. Constraints: N/A Range: N/A Default Value: N/A

Parameter	Type	Description
os.modelarts/ workspace.id	String	Definition: Workspace ID. [For details about how to obtain the ID, see Querying the Workspace List .] Constraints: N/A Range: N/A Default Value: 0
os.modelarts/ node.prefix	String	Definition: Custom node prefix. This parameter is optional. Constraints: N/A Range: N/A Default Value: N/A
os.modelarts/ resource.id	String	Definition: Resource ID used for resource pool billing. Constraints: N/A Range: N/A Default Value: N/A
os.modelarts/ tenant.domain.id	String	Definition: ID of the tenant to which a resource pool belongs. Constraints: N/A Range: N/A Default Value: N/A
os.modelarts/ tenant.project.id	String	Definition: ID of the tenant project that a resource pool belongs to. Constraints: N/A Range: N/A Default Value: N/A
os.modelarts/ enterprise.project.i d	String	Definition: ID of the enterprise project that a resource pool belongs to. Constraints: N/A Range: N/A Default Value: N/A
os.modelarts.pool/ biz	String	Definition: Business type of a resource pool. The value can be public or private . Constraints: N/A Range: N/A Default Value: N/A

Parameter	Type	Description
os.modelarts/ create-from	String	Definition: Source of a resource pool, for example, admin-console , indicating that the resource pool is created by the administrator on the ModelArts console. Constraints: N/A Range: N/A Default Value: N/A
os.modelarts/ nobilling	String	Definition: Indicates whether the resource pool is charged. Constraints: N/A Range: N/A Default Value: N/A
os.modelarts/ order.name	String	Definition: Last order job record associated with the resource pool. Constraints: N/A Range: N/A Default Value: N/A
os.modelarts/ region	String	Definition: Region where the resource pool is located. Constraints: N/A Range: N/A Default Value: N/A

Table 9-222 PoolMetaAnnotations

Parameter	Type	Description
os.modelarts/ description	String	Definition: Resource pool description. Constraints: N/A Range: N/A Default Value: N/A
os.modelarts/ billing.mode	String	Definition: Billing mode. Constraints: N/A Range: • 0: pay-per-use • 1: yearly/monthly Default Value: N/A

Parameter	Type	Description
os.modelarts/ period.num	String	Definition: Subscription period of a yearly/monthly resource pool. Constraints: This parameter is used together with the os.modelarts/period.type field. Range: N/A Default Value: N/A
os.modelarts/ period.type	String	Definition: Subscription type of a yearly/monthly resource pool. Constraints: This parameter is used together with the os.modelarts/period.num field. Range: • 2: monthly • 3: yearly Default Value: N/A
os.modelarts/ auto.renew	String	Definition: Auto-renewal status of a yearly/monthly resource pool. Constraints: N/A Range: • 0: Auto-renewal is disabled. • 1: Auto-renewal is enabled. Default Value: 0
os.modelarts/ promotion.info	String	Definition: Discount information selected when a yearly/monthly resource pool is purchased. Constraints: N/A Range: N/A Default Value: N/A
os.modelarts/ service.console.url	String	Definition: URL to which you are redirected after the order of a yearly/monthly resource pool is paid. Constraints: N/A Range: N/A Default Value: N/A

Parameter	Type	Description
os.modelarts/ order.id	String	Definition: Order ID transferred when a yearly/monthly resource pool is purchased. Constraints: N/A Range: N/A Default Value: N/A
os.modelarts/ flavor.resource.ids	String	Definition: Resource ID of the resource specifications in a yearly/monthly resource pool. Constraints: N/A Range: N/A Default Value: N/A
os.modelarts/ tms.tags	String	Definition: Resource tags of a resource pool. Constraints: N/A Range: N/A Default Value: N/A
os.modelarts.pool/ scheduler.queue.st ategy	String	Definition: Policy of the resource pool scheduling queue, which is used to define task scheduling rules. Constraints: N/A Range: N/A Default Value: N/A
os.modelarts.pool/ subpools.count	String	Definition: Number of logical subpools in a resource pool. Constraints: N/A Range: N/A Default Value: N/A
os.modelarts/ tenant.domain.na me	String	Definition: Tenant account of the resource pool. Constraints: N/A Range: N/A Default Value: N/A
os.modelarts.pool/ scope.external.dep endency.train	String	Definition: External dependency ID of the training job. Constraints: N/A Range: N/A Default Value: N/A

Table 9-223 PoolSpecModel

Parameter	Type	Description
type	String	Definition: Resource pool type. Constraints: N/A Range: • Dedicate: physical resource pool, which uses a separate network and supports network connection, custom drivers, and custom job types. • Logical: logical resource pool. There is no independent network and network connectivity is not supported. Logical resource pools can be created and scaled faster than physical resource pools. Default Value: N/A
scope	Array of strings	Definition: Job types supported by a resource pool.
resources	Array of resources objects	Definition: Resource specifications in a resource pool, including resource specifications and the number of resources for each specification.
containernetwork	containernetwork object	Kubernetes container network.
network	network object	Definition: Network parameters of a resource pool.
jobFlavors	Array of strings	Definition: Job specifications supported by a resource pool. The value is the job specification name.
driver	PoolDriver object	Definition: Resource pool driver information.

Parameter	Type	Description
controlMode	Integer	Definition: Restriction status of a resource pool. Multiple statuses are allowed. For example, 9 indicates that it is frozen and changing its billing mode to yearly/monthly is restricted. Range: • 0: not restricted • 1: Changing to the yearly/monthly billing is restricted. • 2: Modifying specifications is restricted. • 4: The service is restricted. • 8: The resource pool is frozen. • 16: The resource pool is frozen by the public security department (cannot be unsubscribed).

Table 9-224 resources

Parameter	Type	Description
flavor	String	Definition: Resource flavor ID. Range: N/A
count	Integer	Definition: Number of resource specification instances in a resource pool. Range: N/A
maxCount	Integer	Elastic resource amount of the resource specifications. The value must be the same as that of count in the physical pool.
azs	Array of PoolNodeAz objects	Definition: AZ distribution of the resource specification instances to be created in a resource pool.
extendParams	extendParams object	Definition: Custom parameters of a resource pool.
os	Os object	Definition: OS image information of nodes in a resource pool.
dataVolumes	dataVolumes object	List of custom cloud data disks. The list cannot be modified after being specified.

Parameter	Type	Description
volumeGroupConfigs	volumeGroupConfigs object	Advanced disk configurations.

Table 9-225 extendParams

Parameter	Type	Description
dockerBaseSize	String	Definition: Container engine space of a node created in a resource pool. The value 0 indicates that the size is not limited. Constraints: N/A Range: N/A Default Value: N/A
volumeGroup	String	Disk group name.
runtime	String	Model runtime environment.

Table 9-226 Os

Parameter	Type	Description
name	String	Definition: OS name and version, for example, EulerOS 2.5. This parameter can be left blank when a private image is specified. Range: N/A.
imageId	String	Definition: OS image ID. Range: N/A.
imageType	String	Definition: OS image type. This parameter must be specified when a private image is set. By default, the preset image is used. You do not need to specify this field. Range: private: private images "": The preset image is used.

Parameter	Type	Description
autoMatch	String	Definition: Automatic OS image matching configuration. If this parameter is set, the optimal image is automatically selected, and this parameter is automatically cleared. Range: OS name and version, for example, EulerOS 2.5.

Table 9-227 dataVolumes

Parameter	Type	Description
volumeType	String	Disk type.. Options: • SSD: ultra-high I/O disk • GPSSD: general-purpose SSD • SAS: high I/O disk
size	String	Disk size, in GiB.
count	String	Number of disks.
extendParams	extendParams object	Custom disk configuration.

Table 9-228 extendParams

Parameter	Type	Description
billing	String	Indicates whether the storage instance is billed. If this parameter is left blank, the storage instance is not billed. This field cannot be specified or modified by users.

Parameter	Type	Description
volumeGroup	String	Name of a disk group, which is used to divide storage space. Options: • vgpaas: container disk. • default: common data disk, which is mounted in default mode. • vguser{num}: common data disk, which is mounted to a specified path. The group name varies depending on the path, for example, vguser1 and vguser2. • vg-everest-localvolume-persistent: common data disk, which is used as the persistent storage volume. • vg-everest-localvolume-ephemeral: common data disk, which is used as a temporary storage volume.

Table 9-229 volumeGroupConfigs

Parameter	Type	Description
volumeGroup	String	Disk group name. Index of the volume group in the dataVolumes.
dockerThinPool	Integer	Percentage of container disks to data disks on nodes in a resource pool. This parameter can be specified only when volumeGroup is vgpaas (container disk).
lvmConfig	lvmConfig object	LVM configuration management.

Table 9-230 lvmConfig

Parameter	Type	Description
lvType	String	LVM write mode. Options: • linear: linear mode. • striped: striped mode in which multiple disks are used to form a strip to improve disk performance.

Table 9-231 containernetwork

Parameter	Type	Description
mode	String	Container network model. Options: overlay_l2 : an overlay_l2 network (container tunnel network) built for containers by using OpenVSwitch (OVS). • vpc-router: an underlay_l2 network built for containers by using IPvlan and custom VPC routes. • eni: Cloud Native Network 2.0. This model deeply integrates the native ENI capability of VPC, uses the VPC CIDR block to allocate container addresses, and supports passthrough networking. You can use this model when creating a CCE Turbo cluster.

Table 9-232 network

Parameter	Type	Description
name	String	Definition: Network ID. Range: N/A

Table 9-233 PoolDriver

Parameter	Type	Description
gpuVersion	String	Definition: Default GPU driver version of a resource pool. This parameter is only valid when the physical resource pool contains GPU specifications. Range: N/A
npuVersion	String	Definition: Default NPU driver version of a resource pool. This parameter is only valid when the physical resource pool contains NPU specifications. Range: N/A

Parameter	Type	Description
updateStrategy	String	Definition: Driver upgrade policy of a resource pool. Range: • force: forcible upgrade. The node drivers are upgraded immediately, which may affect jobs running on the node. • idle: secure upgrade. The drivers are upgraded when no job is running on the node.

Table 9-234 PoolStatus

Parameter	Type	Description
phase	String	Definition: Resource pool status. Range: • Creating: The resource pool is being created. • Running: The resource pool is running. • Abnormal: The resource pool is abnormal. • Deleting: The resource pool is being deleted. • Error: An error occurred in the resource pool.
message	String	Definition: Prompt information about the resource pool status. Range: N/A
resources	resources object	Definition: Resource information in different states of the resource pool.
scope	Array of scope objects	Definition: Status of the service type supported by the resource pool.
driver	driver object	Definition: Resource pool driver status.
parent	String	Definition: ID of the parent resource pool to which a resource pool belongs. The physical pool is empty. Range: N/A

Parameter	Type	Description
root	String	Definition: ID of the root resource pool. Range: N/A
clusters	clusters object	Resource pool cluster information. This parameter is available only for privileged pools.

Table 9-235 resources

Parameter	Type	Description
creating	PoolResourceFlavorCount object	Definition: Resource information in creating states of the resource pool.
available	PoolResourceFlavorCount object	Definition: Resource information in available states of the resource pool.
abnormal	PoolResourceFlavorCount object	Definition: Resource information in abnormal states of the resource pool.
deleting	PoolResourceFlavorCount object	Definition: Resource information in deleting states of the resource pool.

Table 9-236 PoolResourceFlavorCount

Parameter	Type	Description
flavor	String	Definition: Resource flavor ID. Range: N/A
count	Integer	Definition: Number of resource specification instances in a resource pool. Range: N/A
maxCount	Integer	Definition: Number of elastic resource specification instances in a resource pool. The value of this parameter in a physical pool is the same as that of count . Range: N/A
azs	Array of PoolNodeAz objects	Definition: AZ distribution of the resource specification instances to be created in a resource pool.

Parameter	Type	Description
nodePool	String	Definition: Node pool ID. Range: N/A

Table 9-237 PoolNodeAz

Parameter	Type	Description
az	String	Definition: AZ name. Range: N/A
count	Integer	Definition: Number of AZ resource instances. Range: N/A

Table 9-238 scope

Parameter	Type	Description
scopeType	String	Definition: Service type of the resource pool. Range: • Train: training jobs • Infer: inference jobs • Notebook: notebook jobs
state	String	Definition: Service type status of the resource pool. Range: • Enabling: The service is being enabled. • Enabled: The service has been enabled. • Disabling: The service is being disabled. • Disabled: The service has been disabled.

Table 9-239 driver

Parameter	Type	Description
gpu	PoolDriverStatus object	Definition: GPU driver status of a resource pool. Range: N/A
npu	PoolDriverStatus object	Definition: NPU driver status of a resource pool. Range: N/A

Table 9-240 PoolDriverStatus

Parameter	Type	Description
version	String	Definition: Current driver version of a resource pool. Range: N/A
state	String	Definition: Current driver status of a resource pool. Range: • Creating: The driver is being installed. • Upgrading: The driver is being upgraded. • Running: The driver is running. • Abnormal: The driver is abnormal.

Table 9-241 clusters

Parameter	Type	Description
name	String	Cluster name.
clusterFlavor	String	Cluster flavor of a standard pool.
type	String	Type of the resource pool cluster.
version	String	Cluster version.
plugins	plugins object	Name of the plugin supported by the cluster.

Error Codes

See [Error Codes](#).

9.16 Updating a Resource Pool

Function

This API is used to update the configuration and capacity of a specified resource pool. This API is used when you need to update the information about a resource pool when the resource pool capacity needs to be expanded, the configuration needs to be adjusted, or the performance needs to be optimized. Before using this API, ensure that the resource pool exists and you have the administrator permissions. After the update, the configuration and capacity of the resource pool will be updated, and the related resources and configurations will be adjusted. If

the resource pool does not exist, the user does not have the permission to perform the operation, or the resource pool cannot be updated, the API will return an error message.

Debugging

You can debug this API through automatic authentication in [API Explorer](#) or use the SDK sample code generated by API Explorer.

Authorization Information

Each account has all the permissions required to call all APIs, but IAM users must be assigned the required permissions.

- If you are using role/policy-based authorization, see [Permissions Policies and Supported Actions](#) for details on the required permissions.
- If you are using identity policy-based authorization, the following identity policy-based permissions are required.

Action	Access Level	Resource Type (*: required)	Condition Key	Alias	Dependencies
modelarts:pool:update	Write	pool *	g:ResourceTag/<tag-key>	-	-
		-	g:EnterpriseProjectId		

URI

PATCH /v2/{project_id}/pools/{pool_name}

Table 9-244 Path Parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Definition: User project ID. For details, see Obtaining a Project ID and Name . Constraints: N/A Range: N/A Default Value: N/A

Parameter	Mandatory	Type	Description
pool_name	Yes	String	Definition: Resource pool name generated by the system. Constraints: N/A Range: N/A Default Value: N/A

Request Parameters

Table 9-245 Request header parameters

Parameter	Mandatory	Type	Description
X-ModelArts-User-ID	No	String	Definition: Tenant ID. If there is a tenant ID, it will be used for workspace authentication. Constraints: N/A Range: N/A Default Value: N/A
Content-Type	Yes	String	Message body type (format). Options: • application/merge-patch+json

Table 9-246 Request body parameters

Parameter	Mandatory	Type	Description
metadata	No	PoolMetadataUpdate object	Definition: Resource pool metadata.
spec	No	PoolSpecUpdate object	Definition: Resource pool description.

Table 9-247 PoolMetadataUpdate

Parameter	Mandatory	Type	Description
annotations	No	annotations object	Definition: Comments of a resource pool.

Table 9-248 annotations

Parameter	Mandatory	Type	Description
os.modelarts/ description	No	String	Definition: Description of a resource pool, specifying the application scenarios of the resource pool. The following special characters are not allowed: !<>=&"" Constraints: N/A Range: N/A Default Value: N/A
os.modelarts/ order.id	No	String	Definition: Order ID, which is required when you create or modify a yearly/monthly order. Constraints: N/A Range: N/A Default Value: N/A

Table 9-249 PoolSpecUpdate

Parameter	Mandatory	Type	Description
scope	No	Array of strings	Definition: Type of the job to be updated. Constraints: N/A Range: • Train: training job • Infer: inference job • Notebook: notebook job Default Value: N/A
resources	No	Array of resources objects	Definition: Updated resource flavors.
jobFlavors	No	Array of strings	Definition: Job flavors supported by a resource pool. Constraints: N/A Range: N/A Default Value: N/A
driver	No	PoolDriver object	Definition: Resource pool driver information.

Table 9-250 resources

Parameter	Mandatory	Type	Description
flavor	Yes	String	Definition: Resource flavor. Constraints: N/A Range: N/A Default Value: N/A
count	Yes	Integer	Definition: Number of resources of the flavor. Constraints: N/A Range: N/A Default Value: N/A
azs	No	Array of PoolNodeAz objects	Definition: Updated AZs.

Table 9-251 PoolNodeAz

Parameter	Mandatory	Type	Description
az	Yes	String	Definition: AZ name. Range: N/A
count	Yes	Integer	Definition: Number of AZ resource instances. Range: N/A

Table 9-252 PoolDriver

Parameter	Mandatory	Type	Description
gpuVersion	No	String	Definition: Default GPU driver version of a resource pool. This parameter is only valid when the physical resource pool contains GPU specifications. Range: N/A

Parameter	Mandatory	Type	Description
npuVersion	No	String	Definition: Default NPU driver version of a resource pool. This parameter is only valid when the physical resource pool contains NPU specifications. Range: N/A
updateStrategy	No	String	Definition: Driver upgrade policy of a resource pool. Range: • force: forcible upgrade. The node drivers are upgraded immediately, which may affect jobs running on the node. • idle: secure upgrade. The drivers are upgraded when no job is running on the node.

Response Parameters

Status code: 200

Table 9-253 Response body parameters

Parameter	Type	Description
apiVersion	String	Definition: API version of the resource. Range: • v2: The current resource version is v2.
kind	String	Definition: Resource type. Range: • Pool: resource pool
metadata	PoolMetadata object	Definition: Metadata of the resource pool.
spec	PoolSpecModel object	Definition: Specifications of a resource pool.
status	PoolStatus object	Definition: Status of a resource pool.

Table 9-254 PoolMetadata

Parameter	Type	Description
name	String	Definition: Resource pool ID. Range: N/A
creationTimestamp	String	Definition: Time when a resource pool is created. For example, 2025-11-01T03:49:41Z . Range: N/A
labels	PoolMetaLabels object	Definition: Tags of a resource pool.
annotations	PoolMetaAnnotations object	Definition: Comments of a resource pool. Constraints: N/A Range: N/A Default Value: N/A

Table 9-255 PoolMetaLabels

Parameter	Type	Description
os.modelarts/ name	String	Definition: Displayed name of a resource pool. Constraints: N/A Range: N/A Default Value: N/A
os.modelarts/ workspace.id	String	Definition: Workspace ID. [For details about how to obtain the ID, see Querying the Workspace List .] Constraints: N/A Range: N/A Default Value: 0
os.modelarts/ node.prefix	String	Definition: Custom node prefix. This parameter is optional. Constraints: N/A Range: N/A Default Value: N/A

Parameter	Type	Description
os.modelarts/ resource.id	String	Definition: Resource ID used for resource pool billing. Constraints: N/A Range: N/A Default Value: N/A
os.modelarts/ tenant.domain.id	String	Definition: ID of the tenant to which a resource pool belongs. Constraints: N/A Range: N/A Default Value: N/A
os.modelarts/ tenant.project.id	String	Definition: ID of the tenant project that a resource pool belongs to. Constraints: N/A Range: N/A Default Value: N/A
os.modelarts/ enterprise.project.i d	String	Definition: ID of the enterprise project that a resource pool belongs to. Constraints: N/A Range: N/A Default Value: N/A
os.modelarts.pool/ biz	String	Definition: Business type of a resource pool. The value can be public or private . Constraints: N/A Range: N/A Default Value: N/A
os.modelarts/ create-from	String	Definition: Source of a resource pool, for example, admin-console , indicating that the resource pool is created by the administrator on the ModelArts console. Constraints: N/A Range: N/A Default Value: N/A
os.modelarts/ nobilling	String	Definition: Indicates whether the resource pool is charged. Constraints: N/A Range: N/A Default Value: N/A

Parameter	Type	Description
os.modelarts/ order.name	String	Definition: Last order job record associated with the resource pool. Constraints: N/A Range: N/A Default Value: N/A
os.modelarts/ region	String	Definition: Region where the resource pool is located. Constraints: N/A Range: N/A Default Value: N/A

Table 9-256 PoolMetaAnnotations

Parameter	Type	Description
os.modelarts/ description	String	Definition: Resource pool description. Constraints: N/A Range: N/A Default Value: N/A
os.modelarts/ billing.mode	String	Definition: Billing mode. Constraints: N/A Range: • 0: pay-per-use • 1: yearly/monthly Default Value: N/A
os.modelarts/ period.num	String	Definition: Subscription period of a yearly/monthly resource pool. Constraints: This parameter is used together with the os.modelarts/period.type field. Range: N/A Default Value: N/A

Parameter	Type	Description
os.modelarts/ period.type	String	Definition: Subscription type of a yearly/monthly resource pool. Constraints: This parameter is used together with the os.modelarts/period.num field. Range: • 2: monthly • 3: yearly Default Value: N/A
os.modelarts/ auto.renew	String	Definition: Auto-renewal status of a yearly/monthly resource pool. Constraints: N/A Range: • 0: Auto-renewal is disabled. • 1: Auto-renewal is enabled. Default Value: 0
os.modelarts/ promotion.info	String	Definition: Discount information selected when a yearly/monthly resource pool is purchased. Constraints: N/A Range: N/A Default Value: N/A
os.modelarts/ service.console.url	String	Definition: URL to which you are redirected after the order of a yearly/monthly resource pool is paid. Constraints: N/A Range: N/A Default Value: N/A
os.modelarts/ order.id	String	Definition: Order ID transferred when a yearly/monthly resource pool is purchased. Constraints: N/A Range: N/A Default Value: N/A
os.modelarts/ flavor.resource.ids	String	Definition: Resource ID of the resource specifications in a yearly/monthly resource pool. Constraints: N/A Range: N/A Default Value: N/A

Parameter	Type	Description
os.modelarts/ tms.tags	String	Definition: Resource tags of a resource pool. Constraints: N/A Range: N/A Default Value: N/A
os.modelarts.pool/ scheduler.queue.st ategy	String	Definition: Policy of the resource pool scheduling queue, which is used to define task scheduling rules. Constraints: N/A Range: N/A Default Value: N/A
os.modelarts.pool/ subpools.count	String	Definition: Number of logical subpools in a resource pool. Constraints: N/A Range: N/A Default Value: N/A
os.modelarts/ tenant.domain.na me	String	Definition: Tenant account of the resource pool. Constraints: N/A Range: N/A Default Value: N/A
os.modelarts.pool/ scope.external.dep endency.train	String	Definition: External dependency ID of the training job. Constraints: N/A Range: N/A Default Value: N/A

Table 9-257 PoolSpecModel

Parameter	Type	Description
type	String	Definition: Resource pool type. Constraints: N/A Range: • Dedicate: physical resource pool, which uses a separate network and supports network connection, custom drivers, and custom job types. • Logical: logical resource pool. There is no independent network and network connectivity is not supported. Logical resource pools can be created and scaled faster than physical resource pools. Default Value: N/A
scope	Array of strings	Definition: Job types supported by a resource pool.
resources	Array of resources objects	Definition: Resource specifications in a resource pool, including resource specifications and the number of resources for each specification.
containernetwork	containernetwork object	Kubernetes container network.
network	network object	Definition: Network parameters of a resource pool.
jobFlavors	Array of strings	Definition: Job specifications supported by a resource pool. The value is the job specification name.
driver	PoolDriver object	Definition: Resource pool driver information.

Parameter	Type	Description
controlMode	Integer	Definition: Restriction status of a resource pool. Multiple statuses are allowed. For example, 9 indicates that it is frozen and changing its billing mode to yearly/monthly is restricted. Range: • 0: not restricted • 1: Changing to the yearly/monthly billing is restricted. • 2: Modifying specifications is restricted. • 4: The service is restricted. • 8: The resource pool is frozen. • 16: The resource pool is frozen by the public security department (cannot be unsubscribed).

Table 9-258 resources

Parameter	Type	Description
flavor	String	Definition: Resource flavor ID. Range: N/A
count	Integer	Definition: Number of resource specification instances in a resource pool. Range: N/A
maxCount	Integer	Elastic resource amount of the resource specifications. The value must be the same as that of count in the physical pool.
azs	Array of PoolNodeAz objects	Definition: AZ distribution of the resource specification instances to be created in a resource pool.
extendParams	extendParams object	Definition: Custom parameters of a resource pool.
os	Os object	Definition: OS image information of nodes in a resource pool.
dataVolumes	dataVolumes object	List of custom cloud data disks. The list cannot be modified after being specified.

Parameter	Type	Description
volumeGroupConfigs	volumeGroupConfigs object	Advanced disk configurations.

Table 9-259 extendParams

Parameter	Type	Description
dockerBaseSize	String	Definition: Container engine space of a node created in a resource pool. The value 0 indicates that the size is not limited. Constraints: N/A Range: N/A Default Value: N/A
volumeGroup	String	Disk group name.
runtime	String	Model runtime environment.

Table 9-260 Os

Parameter	Type	Description
name	String	Definition: OS name and version, for example, EulerOS 2.5. This parameter can be left blank when a private image is specified. Range: N/A.
imageId	String	Definition: OS image ID. Range: N/A.
imageType	String	Definition: OS image type. This parameter must be specified when a private image is set. By default, the preset image is used. You do not need to specify this field. Range: private: private images "": The preset image is used.

Parameter	Type	Description
autoMatch	String	Definition: Automatic OS image matching configuration. If this parameter is set, the optimal image is automatically selected, and this parameter is automatically cleared. Range: OS name and version, for example, EulerOS 2.5.

Table 9-261 dataVolumes

Parameter	Type	Description
volumeType	String	Disk type.. Options: • SSD: ultra-high I/O disk • GPSSD: general-purpose SSD • SAS: high I/O disk
size	String	Disk size, in GiB.
count	String	Number of disks.
extendParams	extendParams object	Custom disk configuration.

Table 9-262 extendParams

Parameter	Type	Description
billing	String	Indicates whether the storage instance is billed. If this parameter is left blank, the storage instance is not billed. This field cannot be specified or modified by users.

Parameter	Type	Description
volumeGroup	String	Name of a disk group, which is used to divide storage space. Options: • vgpaas: container disk. • default: common data disk, which is mounted in default mode. • vguser{num}: common data disk, which is mounted to a specified path. The group name varies depending on the path, for example, vguser1 and vguser2. • vg-everest-localvolume-persistent: common data disk, which is used as the persistent storage volume. • vg-everest-localvolume-ephemeral: common data disk, which is used as a temporary storage volume.

Table 9-263 volumeGroupConfigs

Parameter	Type	Description
volumeGroup	String	Disk group name. Index of the volume group in the dataVolumes.
dockerThinPool	Integer	Percentage of container disks to data disks on nodes in a resource pool. This parameter can be specified only when volumeGroup is vgpaas (container disk).
lvmConfig	lvmConfig object	LVM configuration management.

Table 9-264 lvmConfig

Parameter	Type	Description
lvType	String	LVM write mode. Options: • linear: linear mode. • striped: striped mode in which multiple disks are used to form a strip to improve disk performance.

Table 9-265 containernetwork

Parameter	Type	Description
mode	String	Container network model. Options: overlay_l2 : an overlay_l2 network (container tunnel network) built for containers by using OpenVSwitch (OVS). • vpc-router: an underlay_l2 network built for containers by using IPvlan and custom VPC routes. • eni: Cloud Native Network 2.0. This model deeply integrates the native ENI capability of VPC, uses the VPC CIDR block to allocate container addresses, and supports passthrough networking. You can use this model when creating a CCE Turbo cluster.

Table 9-266 network

Parameter	Type	Description
name	String	Definition: Network ID. Range: N/A

Table 9-267 PoolDriver

Parameter	Type	Description
gpuVersion	String	Definition: Default GPU driver version of a resource pool. This parameter is only valid when the physical resource pool contains GPU specifications. Range: N/A
npuVersion	String	Definition: Default NPU driver version of a resource pool. This parameter is only valid when the physical resource pool contains NPU specifications. Range: N/A

Parameter	Type	Description
updateStrategy	String	Definition: Driver upgrade policy of a resource pool. Range: • force: forcible upgrade. The node drivers are upgraded immediately, which may affect jobs running on the node. • idle: secure upgrade. The drivers are upgraded when no job is running on the node.

Table 9-268 PoolStatus

Parameter	Type	Description
phase	String	Definition: Resource pool status. Range: • Creating: The resource pool is being created. • Running: The resource pool is running. • Abnormal: The resource pool is abnormal. • Deleting: The resource pool is being deleted. • Error: An error occurred in the resource pool.
message	String	Definition: Prompt information about the resource pool status. Range: N/A
resources	resources object	Definition: Resource information in different states of the resource pool.
scope	Array of scope objects	Definition: Status of the service type supported by the resource pool.
driver	driver object	Definition: Resource pool driver status.
parent	String	Definition: ID of the parent resource pool to which a resource pool belongs. The physical pool is empty. Range: N/A

Parameter	Type	Description
root	String	Definition: ID of the root resource pool. Range: N/A
clusters	clusters object	Resource pool cluster information. This parameter is available only for privileged pools.

Table 9-269 resources

Parameter	Type	Description
creating	PoolResourceFlavorCount object	Definition: Resource information in creating states of the resource pool.
available	PoolResourceFlavorCount object	Definition: Resource information in available states of the resource pool.
abnormal	PoolResourceFlavorCount object	Definition: Resource information in abnormal states of the resource pool.
deleting	PoolResourceFlavorCount object	Definition: Resource information in deleting states of the resource pool.

Table 9-270 PoolResourceFlavorCount

Parameter	Type	Description
flavor	String	Definition: Resource flavor ID. Range: N/A
count	Integer	Definition: Number of resource specification instances in a resource pool. Range: N/A
maxCount	Integer	Definition: Number of elastic resource specification instances in a resource pool. The value of this parameter in a physical pool is the same as that of count . Range: N/A
azs	Array of PoolNodeAz objects	Definition: AZ distribution of the resource specification instances to be created in a resource pool.

Parameter	Type	Description
nodePool	String	Definition: Node pool ID. Range: N/A

Table 9-271 PoolNodeAz

Parameter	Type	Description
az	String	Definition: AZ name. Range: N/A
count	Integer	Definition: Number of AZ resource instances. Range: N/A

Table 9-272 scope

Parameter	Type	Description
scopeType	String	Definition: Service type of the resource pool. Range: • Train: training jobs • Infer: inference jobs • Notebook: notebook jobs
state	String	Definition: Service type status of the resource pool. Range: • Enabling: The service is being enabled. • Enabled: The service has been enabled. • Disabling: The service is being disabled. • Disabled: The service has been disabled.

Table 9-273 driver

Parameter	Type	Description
gpu	PoolDriverStatus object	Definition: GPU driver status of a resource pool. Range: N/A
npu	PoolDriverStatus object	Definition: NPU driver status of a resource pool. Range: N/A

Table 9-274 PoolDriverStatus

Parameter	Type	Description
version	String	Definition: Current driver version of a resource pool. Range: N/A
state	String	Definition: Current driver status of a resource pool. Range: • Creating: The driver is being installed. • Upgrading: The driver is being upgraded. • Running: The driver is running. • Abnormal: The driver is abnormal.

Table 9-275 clusters

Parameter	Type	Description
name	String	Cluster name.
clusterFlavor	String	Cluster flavor of a standard pool.
type	String	Type of the resource pool cluster.
version	String	Cluster version.
plugins	plugins object	Name of the plugin supported by the cluster.

Table 9-276 plugins

Parameter	Type	Description
name	String	Name of the plugin supported by the cluster.

Status code: 400**Table 9-277** Response body parameters

Parameter	Type	Description
error_code	String	Definition: ModelArts error code. Range: N/A
error_msg	String	Definition: Error message. Range: N/A

Status code: 404**Table 9-278** Response body parameters

Parameter	Type	Description
error_code	String	Definition: ModelArts error code. Range: N/A
error_msg	String	Definition: Error message. Range: N/A

Example Requests

Expand the capacity of a resource pool.

PATCH https://{endpoint}/v2/{project_id}/pools/{pool_name}

```
{
  "spec": {
    "resources": [ {
      "flavor": "modelarts.vm.cpu.4ud",

See [Error Codes](#).

9.17 Monitoring a Resource Pool

Function

This API is used to obtain the real-time or historical monitoring information about a specified resource pool. This API is used when you need to obtain the monitoring data of a resource pool in real time, such as resource usage, performance status, or historical data. Before using this API, ensure that the resource pool exists and you have the administrator permissions. After the API is called, the system returns the monitoring information of the resource pool, including the resource usage, performance metrics, and historical trends. If the resource pool does not exist, the user does not have the permission to perform the operation, or the resource pool is unavailable, the API will return an error message.

Debugging

You can debug this API through automatic authentication in [API Explorer](#) or use the SDK sample code generated by API Explorer.

Authorization Information

Each account has all the permissions required to call all APIs, but IAM users must be assigned the required permissions.

- If you are using role/policy-based authorization, see [Permissions Policies and Supported Actions](#) for details on the required permissions.
- If you are using identity policy-based authorization, the following identity policy-based permissions are required.

Action	Access Level	Resource Type (*: required)	Condition Key	Alias	Dependencies
modelarts:pool:get	Read	pool *	g:ResourceTag/<tag-key>	-	-
		-	g:EnterpriseProjectId		

URI

GET /v2/{project_id}/pools/{pool_name}/monitor

Table 9-279 Path Parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Definition: Project ID. For details, see Obtaining a Project ID and Name . Constraints: N/A Range: N/A Default Value: N/A
pool_name	Yes	String	Definition: Resource pool ID. The value is obtained from the metadata.name field in the resource pool details. Constraints: N/A <i>*Range:</i> The value can contain 36 to 63 characters. It must start with a lowercase letter and cannot end with a hyphen (-). Digits and hyphens (-) are allowed. Default Value: N/A

Table 9-280 Query Parameters

Parameter	Mandatory	Type	Description
time_range	No	String	Definition: Time range for obtaining the monitored information of a resource pool, in the format of startTimeInMillis.endTimeInMillis.durationInMinutes. Specifically, startTimeInMillis indicates start time (UTC) of the query, in milliseconds. If this parameter is set to -1, the server calculates the start time as follows: endTimeInMillis - durationInMinutes × 60 × 1000. endTimeInMillis indicates end time (UTC) of the query, in milliseconds. If this parameter is set to -1, the server calculates the end time as follows: startTimeInMillis + durationInMinutes × 60 × 1000. If the calculated end time is later than the current system time, the current system time is used. durationInMinutes indicates the query time span, in minutes. The value must be greater than 0, and no greater than the result of "(endTimeInMillis - startTimeInMillis)/(60 × 1000) - 1". If both the start time and end time are set to -1, the system sets the end time to the current UTC time (in milliseconds) and calculates the start time as follows: endTimeInMillis - durationInMinutes × 60 × 1000. For example, -1.-1.60 indicates the latest 60 minutes. Constraints: In a single request, the following condition must be met: durationInMinutes × 60 / period ≤ 1,440 Range: N/A

Parameter	Mandatory	Type	Description
			Default Value: -1.-1.60 Query time range. The default value is -1.-1.60. The format is startTimeInMillis.endTimeInMillis.durationInMinutes. Parameter description: • startTimeInMillis: Start time (UTC) of the query, in milliseconds. If this parameter is set to -1, the server calculates the start time as follows: endTimeInMillis - durationInMinutes × 60 × 1000. • endTimeInMillis: End time (UTC) of the query, in milliseconds. If this parameter is set to -1, the server calculates the end time as follows: startTimeInMillis + durationInMinutes × 60 × 1000. If the calculated end time is later than the current system time, the current system time is used. • durationInMinutes: time span, in minutes. The value must be greater than 0, and no greater than the result of "(endTimeInMillis - startTimeInMillis)/(60 × 1000) - 1". If both the start time and end time are set to -1, the system sets the end time to the current UTC time (in milliseconds) and calculates the start time as follows: endTimeInMillis - durationInMinutes × 60 × 1000. For example, -1.-1.60 indicates the latest 60 minutes. Constraints: In a single request, the following condition must be met: durationInMinutes × 60/period ≤ 1440

Parameter	Mandatory	Type	Description
statistics	No	String	Definition: Statistical method of resource pool monitoring information at a specified time granularity Constraints: N/A Range: The options are as follows: • maximum: maximum value statistics (default setting) • minimum: minimum value statistics • sum: sum statistics • average: average value statistics • sampleCount: sampling statistics Default Value: maximum
period	No	String	Definition: Time granularity for obtaining the monitored information of a resource pool, in seconds Constraints: N/A Range: The options are as follows: • 60: The granularity is 1 minute, which is the default value. • 300: The granularity is 5 minutes. • 900: The granularity is 15 minutes. • 3600: The granularity is 1 hour. Default Value: 60

Request Parameters

None

Response Parameters

Status code: 200

Table 9-281 Response body parameters

Parameter	Type	Description
metrics	Array of metrics objects	Definition: Monitoring metric data of a resource pool.

Table 9-282 metrics

Parameter	Type	Description
metric	metric object	Definition: Metric description.
dataPoints	Array of dataPoints objects	Definition: Monitoring metric data.

Table 9-283 metric

Parameter	Type	Description
dimensions	Array of dimensions objects	Definition: Metric dimension information.
metricName	String	Definition: Metric name. Range: • cpuUsage: CPU usage • memUsedRate: memory usage • gpuUtil: GPU usage • gpuMemUsage: used GPU memory • npuUtil: NPU usage • npuMemUsage: used NPU memory • diskCapacity: disk capacity • diskAvailableCapacity: available disk capacity • diskUsedRate: disk usage

Parameter	Type	Description
namespace	String	Definition: Metric namespace. Range: • PAAS.CONTAINER: namespace of component, instance, process, and container metrics • PAAS.NODE: namespace of host, network, disk, and file system metrics • PAAS.SLA: namespace of SLA metrics • PAAS.AGGR: namespace of cluster metrics • CUSTOMMETRICS: default namespace of custom metrics

Table 9-284 dimensions

Parameter	Type	Description
name	String	Definition: Metric dimension name. Range: metric name. Options: • clusterId: cluster ID
value	String	Definition: Metric dimension value. Range: N/A

Table 9-285 dataPoints

Parameter	Type	Description
timestamp	Integer	Definition: Metric data timestamp, in ms. Range: N/A
unit	String	Definition: Metric data unit. Range: • Percent: percentage • Megabytes: MB
statistics	Array of statistics objects	Definition: Metric data value.

Table 9-286 statistics

Parameter	Type	Description
statistic	String	Definition: Statistical method of resource pool monitoring information at a specified time granularity. Range: • maximum: maximum value (default setting) • minimum: minimum value • sum: sum • average: average value • sampleCount: sampling statistics
value	Float	Definition: Metric value. The value -1 indicates that no metric data is available. Range: N/A

Status code: 404**Table 9-287** Response body parameters

Parameter	Type	Description
error_code	String	• Definition: ModelArts error code. Range: N/A
error_msg	String	Definition: Error message. Range: N/A

Example Requests

Obtain the monitored resource pool information.

```
GET https://{endpoint}/v2/{project_id}/pools/{pool_name}/monitor
{ }
```

9.18 Resource Pool Statistics

Function

This API is used to obtain the statistics of a specified resource pool. This API is used when you need to obtain the resource usage, allocation, or usage of a resource pool. Before using this API, ensure that the resource pool exists and you have the administrator permissions. After the API is called, the system returns the statistics of the resource pool, including the total resource usage, allocated resources, usage, and resource allocation trend. If the resource pool does not exist, the user does not have the permission to perform the operation, or the resource pool is unavailable, the API will return an error message.

Debugging

You can debug this API through automatic authentication in [API Explorer](#) or use the SDK sample code generated by API Explorer.

Authorization Information

Each account has all the permissions required to call all APIs, but IAM users must be assigned the required permissions.

- If you are using role/policy-based authorization, see [Permissions Policies and Supported Actions](#) for details on the required permissions.

- If you are using identity policy-based authorization, the following identity policy-based permissions are required.

Action	Access Level	Resource Type (*: required)	Condition Key	Alias	Dependencies
modelarts:pool:list	List	pool *	-	-	-
		-	- g:EnterpriseProjectId - g:RequestTag/<tag-key> - g:TagKeys

9.19 Obtaining Resource Specifications

Function

This API is used to obtain available resource specifications. This API is used when you need to view or select resource specifications to create resource pools, allocate resources, or learn available resource specifications. Before using this API, ensure that you have the required permissions (such as administrator permissions or resource management permissions). After the API is called, the system returns the resource specifications, including the specification ID, name, number of CPUs, memory size, and storage capacity. If you do not have the required permission or the resource specifications are not configured, the API will return an error message.

Debugging

You can debug this API through automatic authentication in [API Explorer](#) or use the SDK sample code generated by API Explorer.

Authorization Information

Each account has all the permissions required to call all APIs, but IAM users must be assigned the required permissions.

- If you are using role/policy-based authorization, see [Permissions Policies and Supported Actions](#) for details on the required permissions.
- If you are using identity policy-based authorization, no identity policy-based permission required for calling this API.

Response Parameters

Status code: 200

Table 9-296 Response body parameters

Parameter	Type	Description
apiVersion	String	Definition: API version of a resource. Range: v1: The current resource version is v1.
kind	String	Definition: Resource type. Range: ResourceFlavorList: resource flavors

Parameter	Type	Description
metadata	metadata object	Definition: Metadata of a resource flavor list.
items	Array of ResourceFlavor objects	Definition: Resource flavor list. Range: N/A

Table 9-297 metadata

Parameter	Type	Description
continue	String	Definition: Offset parameter of the pagination query. Range: The value is obtained from the metadata.continue field in the response to the last pagination query. An empty value indicates no offset.
remainingItemCount	Integer	Definition: Number of remaining resources in a pagination query. Default Value: N/A

Table 9-298 ResourceFlavor

Parameter	Type	Description
apiVersion	String	Definition: API version of a resource. Range: • v1: The current resource version is v1.
kind	String	Definition: Resource type. Range: • ResourceFlavor: resource flavor
metadata	metadata object	Definition: Metadata of a resource flavor.
spec	ResourceFlavorSpec object	Definition: Specifications of a resource flavor.
status	ResourceFlavorStatus object	Definition: Status of a resource flavor.

Table 9-299 metadata

Parameter	Type	Description
name	String	Definition: Resource flavor ID. Constraints: N/A Range: N/A Default Value: N/A
labels	ResourceFlavorLabel object	Definition: Tags of a resource flavor.
annotations	ResourceFlavorAnnotation object	Definition: Comments of a resource flavor.

Table 9-300 ResourceFlavorLabel

Parameter	Type	Description
os.modelarts/scope	String	Definition: Job types supported by the resource flavor. Use periods (.) to separate multiple job types. Constraints: N/A Range: N/A Default Value: N/A

Table 9-301 ResourceFlavorAnnotation

Parameter	Type	Description
os.modelarts.flavor/image.filter	String	Definition: Filter criteria of private images supported by the resource flavor. Constraints: N/A Range: N/A Default Value: N/A

Table 9-302 ResourceFlavorSpec

Parameter	Type	Description
type	String	Definition: Resource flavor type. Range: • Dedicate: physical resource flavor Physical resource flavors can be used to create node resources.
cpuArch	String	Definition: Compute architecture of a resource flavor. Range: • x86: x86 architecture • arm64: Arm architecture
cpu	String	Definition: Number of CPU cores of a resource flavor. Range: N/A
memory	String	Definition: Memory size of a resource flavor, in GiB. Range: N/A
gpu	gpu object	Definition: GPU resource information of a resource flavor.
npu	npu object	Definition: NPU information of a resource flavor. Constraints: N/A Range: N/A Default Value: N/A
dataVolume	Array of dataVolume objects	Definition: Storage resource information of a resource flavor.
billingModes	Array of integers	Definition: Billing mode supported by a resource flavor.
billingCode	String	Definition: Billing code of a resource flavor. Range: N/A
jobFlavors	Array of strings	Definition: List of job types supported by a resource flavor.

Table 9-303 gpu

Parameter	Type	Description
type	String	Definition: Type of GPUs of a resource flavor. Range: N/A
size	String	Definition: Number of GPUs of a resource flavor. Range: N/A

Table 9-304 npu

Parameter	Type	Description
type	String	Definition: Type of NPUs of a resource flavor. Range: N/A
size	String	Definition: Number of NPUs of a resource flavor. Range: N/A

Table 9-305 dataVolume

Parameter	Type	Description
volumeType	String	Definition: Disk type. Range: • SSD: ultra-high I/O disk • GPSSD: general-purpose SSD • SAS: high I/O disk
size	String	Definition: Disk size, in GiB. Range: N/A

Table 9-306 ResourceFlavorStatus

Parameter	Type	Description
phase	Map<String,String>	Definition: Capacity status of a resource flavor. The value is in the key-value pair format. The key is the AZ code, and the value is the resource status of the AZ. The options are as follows: • normal: normal • soldout

Status code: 401**Table 9-307** Response body parameters

See [Error Codes](#).

9.20 Obtain Jobs in a Resource Pool

Function

This API is used to obtain the job list in a specified dedicated resource pool. This API is used when you need to obtain details about a dedicated resource pool, such as resource usage, job status, or resource allocation. Before using this API, ensure that the dedicated resource pool exists and you have the required permissions (such as administrator permissions or resource management permissions). After the API is called, the system returns the job list of the dedicated resource pool, including the job ID, name, status, and resource usage. If the dedicated resource pool does not exist, the user does not have the operation permission, or the resource pool is unavailable, the API will return an error message.

Debugging

You can debug this API through automatic authentication in [API Explorer](#) or use the SDK sample code generated by API Explorer.

Authorization Information

Each account has all the permissions required to call all APIs, but IAM users must be assigned the required permissions.

- If you are using role/policy-based authorization, see [Permissions Policies and Supported Actions](#) for details on the required permissions.
- If you are using identity policy-based authorization, the following identity policy-based permissions are required.

Action	Access Level	Resource Type (*: required)	Condition Key	Alias	Dependencies
modelarts:pool:get	Read	pool *	g:ResourceTag/<tag-key>	-	-
		-	g:EnterpriseProjectId

GET /v2/{project_id}/pools/{pool_name}/workloads

Table 9-309 Path Parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Definition: Project ID. For details, see Obtaining a Project ID and Name . Constraints: N/A Range: N/A Default Value: N/A
pool_name	Yes	String	Definition: Resource pool ID. The value is obtained from the metadata.name field in the resource pool details. Constraints: N/A <i>*Range:</i> The value can contain 36 to 63 characters. It must start with a lowercase letter and cannot end with a hyphen (-). Digits and hyphens (-) are allowed. Default Value: N/A

Table 9-310 Query Parameters

Parameter	Mandatory	Type	Description
type	No	String	Definition: Job types based on which the resource pool job list is queried Constraints: N/A Range: The options are as follows: • train: training job • infer: inference service • notebook: notebook job • x-infer: new inference job Default Value: N/A

Parameter	Mandatory	Type	Description
status	No	String	Definition: Job statuses based on which the resource pool job list is queried Constraints: N/A Range: The options are as follows: • Queue: jobs in the queue • Pending: pending jobs • Abnormal: abnormal jobs • Terminating: jobs being terminated • Creating: jobs being created • Running: running jobs • Completed: completed jobs • Terminated: terminated jobs • Failed: jobs that fail to be executed Default Value: N/A
sort	No	String	Definition: Sorting criteria for querying jobs in a resource pool Constraints: N/A Range: The options are as follows: • create_time: Sort jobs by creation time. Default Value: N/A
ascend	No	Boolean	Definition: Whether jobs in a resource pool to be queried are sorted in ascending order Constraints: This parameter must be used with the sort query parameter. Range: The options are as follows: • true: in ascending order • false: in descending order Default Value: false

Parameter	Mandatory	Type	Description
offset	No	String	Definition: Offset of pagination query Constraints: N/A Range: 0 to 2147483647 Default Value: 0
limit	No	Integer	Definition: Number of resources returned in a single pagination query Constraints: N/A Range: 0 to 500 Default Value: 500

Request Parameters

None

Response Parameters

Status code: 200

Table 9-311 Response body parameters

Parameter	Type	Description
apiVersion	String	Definition: API version of the resource Range: The options are as follows: • v1: The current resource version is v1.
kind	String	Definition: Resource type Range: The options are as follows: • WorkloadList: Job list
items	Array of Workload objects	Definition: Job list in the resource pool.

Table 9-312 Workload

Parameter	Type	Description
apiVersion	String	Definition: API version of the resource Range: The options are as follows: • v1: The current resource version is v1.
kind	String	Definition: Resource type Range: The options are as follows: • Workload: Resource pool job
type	String	Definition: Service type of a job in the resource pool. Range: • train: Training job • infer: Inference service • notebook: Notebook job • x-infer: New-version inference job
namespace	String	Definition: Namespace to which a job in a cluster belongs Range: N/A
name	String	Definition: Job name Range: N/A
jobName	String	Definition: Name of the upper-layer service to which a job belongs Range: N/A
uid	String	Definition: Job ID Range: N/A
jobUUID	String	Definition: ID of the upper-layer service to which a job belongs Range: N/A
flavor	String	Definition: Resource specifications of a job Range: N/A
status	String	Definition: Job status. Range: N/A
resourceRequirement	resourceRequirement object	Definition: Resource volume requested for job running.
priority	String	Definition: Job priority Range: N/A

Parameter	Type	Description
runningDuration	Integer	Definition: Duration of job running, in seconds Range: N/A
pendingDuration	Integer	Definition: Queue time of a job, in seconds Range: N/A
pendingPosition	Integer	Definition: Position of a job in the queue Range: N/A
createTime	Integer	Definition: Unix timestamp of the job creation, in milliseconds Range: N/A
gvk	String	Definition: Kubernetes resource type, group, and version of a job Range: N/A
hostIps	String	Definition: IP addresses of the nodes where a job is running. The values are separated with commas (.). Range: N/A
nodes	Array of WorkloadNodeVO objects	Definition: Node resource information occupied by a running job.

Table 9-313 resourceRequirement

Parameter	Type	Description
cpu	String	Definition: CPU resources used for job running Range: N/A
memory	String	Definition: Memory resources used for job running Range: N/A
nvidia.com/gpu	String	Definition: GPU resources used for job running Range: N/A
huawei.com/ascend-snt3	String	Definition: snt3 NPU resources used for job running Range: N/A

Parameter	Type	Description
huawei.com/ascend-snt9	String	Definition: snt9 NPU resources used for job running Range: N/A

Table 9-314 WorkloadNodeVO

Parameter	Type	Description
hostIp	String	Definition: IP address of the node where a job runs Range: N/A
npuTopologyPlacement	String	Definition: Topology of the NPU card resource usage. The value is a 16-bit binary number, where the first bit from the right indicates card 1. 1 indicates occupied, and 0 indicates idle. For example, if cards 1 and 15 are occupied in a 16-card model, the value is 0100000000000001 . If cards 1 and 7 are occupied in an 8-card model, the returned value is 0000000001000001 . Range: N/A
resourceRequirement	ResourceRequirementVO object	Definition: Resources used for job running.

Table 9-315 ResourceRequirementVO

Parameter	Type	Description
cpu	String	Definition: CPU resources used for job running. Range: N/A
memory	String	Definition: Memory resources used for job running. Range: N/A
nvidia.com/gpu	String	Definition: GPU resources used for job running. Range: N/A
huawei.com/ascend-310	String	Definition: snt3 NPU resources used for job running. Range: N/A

Parameter	Type	Description
huawei.com/ascend-1980	String	Definition: snt9 NPU resources used for job running. Range: N/A

Status code: 400

Table 9-316 Response body parameters

Parameter	Type	Description
error_code	String	Definition: ModelArts error code. Range: N/A
error_msg	String	Definition: Error message. Range: N/A

Status code: 404

Table 9-317 Response body parameters

Parameter	Type	Description
error_code	String	Definition: ModelArts error code. Range: N/A
error_msg	String	Definition: Error message. Range: N/A

Example Requests

```

9.21 Querying dedicated resource pool Job Statistics

Function

This API is used to obtain job statistics of a dedicated resource pool. This API is used when you need to obtain the job running information, resource usage, or job status distribution of a dedicated resource pool. Before using this API, ensure that the dedicated resource pool exists and you have the required permissions (such as administrator permissions or resource management permissions). After the API is called, the system returns the job statistics of the dedicated resource pool, including the total number of jobs, number of running jobs, number of completed jobs, and resource usage. If the dedicated resource pool does not exist, the user does not have the operation permission, or the resource pool is unavailable, the API returns an error message.

Debugging

You can debug this API through automatic authentication in [API Explorer](#) or use the SDK sample code generated by API Explorer.

Authorization Information

Each account has all the permissions required to call all APIs, but IAM users must be assigned the required permissions.

- If you are using role/policy-based authorization, see [Permissions Policies and Supported Actions](#) for details on the required permissions.
- If you are using identity policy-based authorization, the following identity policy-based permissions are required.

Action	Access Level	Resource Type (*: required)	Condition Key	Alias	Dependencies
modelarts:pool:get	Read	pool *	g:ResourceTag/<tag-key>	-	-
		-	g:EnterpriseProjectId		

URI

GET /v2/{project_id}/statistics/pools/{pool_name}/workloads

Table 9-318 Path Parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Definition: User project ID. For details, see Obtaining a Project ID and Name . Constraints: N/A Range: N/A Default Value: N/A
pool_name	Yes	String	Definition: Resource pool to which the job belongs. Constraints: N/A Range: N/A Default Value: N/A

Request Parameters

None

Response Parameters

Status code: 200

Table 9-319 Response body parameters

Parameter	Type	Description
statistics	statistics object	Definition: Job statistics.

Table 9-320 statistics

Parameter	Type	Description
total	Integer	Definition: Number of statistics lists. Range: N/A
items	Array of WorkloadStatistics objects	Definition: Statistics of a specific job type.

Table 9-321 WorkloadStatistics

Parameter	Type	Description
type	String	Definition: Job type. Range • train: training job • infer: inference job • notebook: notebook job
total	Integer	Definition: Number of jobs. Range: N/A
status	status object	Definition: Number of jobs in different states.

Table 9-322 status

Parameter	Type	Description
Queue	Integer	Definition: Number of queuing jobs. Range: N/A
Pending	Integer	Definition: Number of pending jobs. Range: N/A
Abnormal	Integer	Definition: Number of abnormal jobs. Range: N/A
Terminating	Integer	Definition: Number of jobs being terminated. Range: N/A
Creating	Integer	Definition: Number of jobs being created. Range: N/A
Running	Integer	Definition: Number of running jobs. Range: N/A
Completed	Integer	Definition: Number of completed jobs. Range: N/A
Terminated	Integer	Definition: Number of terminated jobs. Range: N/A
Failed	Integer	Definition: Number of jobs that fail to be executed. Range: N/A

Status code: 400**Table 9-323** Response body parameters

Parameter	Type	Description
error_code	String	Definition: ModelArts error code. Range: N/A

9.22 Query Plugin Templates

Function

This API is used to obtain plugin templates.

Debugging

You can debug this API through automatic authentication in [API Explorer](#) or use the SDK sample code generated by API Explorer.

Authorization Information

Each account has all the permissions required to call all APIs, but IAM users must be assigned the required permissions.

- If you are using role/policy-based authorization, see [Permissions Policies and Supported Actions](#) for details on the required permissions.
- If you are using identity policy-based authorization, no identity policy-based permission required for calling this API.

URI

GET /v2/{project_id}/plugintemplates

Table 9-325 Path Parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Definition: User project ID. For details, see Obtaining a Project ID and Name . Constraints: N/A Range: N/A Default Value: N/A

Table 9-326 Query Parameters

Parameter	Mandatory	Type	Description
templateName	No	String	Definition: Plug-in name. If this parameter is set, the plug-in with the specified name is queried. Constraints: N/A Range: N/A Default Value: N/A
poolName	No	String	Definition: Resource pool name. If this parameter is set, the list of plug-ins that meet the resource pool's installation requirements is queried. Constraints: N/A Range: N/A Default Value: N/A

Request Parameters

None

Response Parameters

Status code: 200

Table 9-327 Response body parameters

Parameter	Type	Description
apiVersion	String	Definition: API version. Range: • v1
kind	String	API type. Options: • PluginTemplateList: plugin template list
items	Array of PluginTemplateV2 objects	List of plugin templates.

Table 9-328 PluginTemplateV2

Parameter	Type	Description
apiVersion	String	Definition: API version. Range: • v2
kind	String	Resource type. Options: • PluginTemplate: plugin template
metadata	PluginTemplateMetadata object	Plugin template metadata.
spec	PluginTemplateSpecV2 object	Detailed information about the plugin template, for example, the version list.

Table 9-329 PluginTemplateMetadata

Parameter	Type	Description
name	String	Definition: Name of the plugin template. Range: N/A
annotations	Map<String,String>	Plugin template annotations in the format of key-value pairs.

Table 9-330 PluginTemplateSpecV2

Parameter	Type	Description
optional	Boolean	Controls whether the plugin is mandatory.
type	String	Plugin template type. Options: • helm: Helm type • ccePlugin: CCE type
logoURL	String	Definition : URL of the logo image. Range : N/A
description	String	Plugin template description.
versions	Array of PluginTemplateVersionV2 objects	Details about the plugin template version.

Table 9-331 PluginTemplateVersionV2

Parameter	Type	Description
version	String	Version number of the plugin template.
creationTimestamp	String	Creation time.
inputs	Object	Plugin installation parameters.
translate	Object	Translation information used by the GUI.
description	String	Version description.
detail	String	Version description.

Status code: 404**Table 9-332** Response body parameters

Parameter	Type	Description
error_code	String	• Definition: ModelArts error code. Range : N/A
error_msg	String	Definition : Error message. Range : N/A

Example Requests

Query details about node-local-dns plugin templates.

9.23 Batch Updating Nodes

Function

This API is used to modify the configuration or attributes of multiple nodes at the same time. Each node can execute the update process independently during batch operations. Use this API when you need to upgrade node software versions, manage resource tags, adjust resource allocation policies, apply security fixes, or synchronize configuration changes. To use it, ensure the target nodes exist, have administrator rights, and are operational (not locked or under maintenance). Provide a valid node list and update parameters like configurations or version numbers. After the update, nodes adopt the new settings and become available, replacing old configurations. If issues arise, like missing nodes, insufficient permissions, incorrect node states (like under maintenance), invalid parameters, or incomplete data, the system returns errors such as 404 node not found, 403 permission denied, or 400 parameter validation failed.

Debugging

You can debug this API through automatic authentication in [API Explorer](#) or use the SDK sample code generated by API Explorer.

Authorization Information

Each account has all the permissions required to call all APIs, but IAM users must be assigned the required permissions.

- If you are using role/policy-based authorization, see [Permissions Policies and Supported Actions](#) for details on the required permissions.
- If you are using identity policy-based authorization, no identity policy-based permission required for calling this API.

URI

POST /v2/{project_id}/pools/{pool_name}/nodes/batch-update

Table 9-333 Path Parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Definition: User project ID. For details, see Obtaining a Project ID and Name . Constraints: The value can contain 1 to 64 characters. Letters, digits, and hyphens (-) are allowed. Range: N/A. Default Value: N/A.
pool_name	Yes	String	Definition: Resource pool ID. The value is the metadata.name field in the resource pool details. Constraints: N/A. Range: N/A. Default Value: N/A.

Request Parameters

Table 9-334 Request body parameters

Parameter	Mandatory	Type	Description
nodeNames	Yes	Array of strings	Definition: List of nodes to be updated. Constraints: N/A.

Parameter	Mandatory	Type	Description
action	Yes	String	Definition: Node update type. Constraints: N/A. Range: • openHaRedundant: Enable HA redundancy. • closeHaRedundant: Disable HA redundancy. • createTags: Batch add node resource tags. • deleteTags: Batch delete node resource tags. Default Value: N/A.
haRedundant Enable	No	Boolean	Definition: HA redundancy tag. If the value is true , HA redundancy is enabled for the node. Constraints: N/A. Range: N/A. Default Value: N/A.
haRedundant Effect	No	String	Definition: HA redundancy tag effect. Constraints: N/A. Range: • NoSchedule: No scheduling is allowed. • NoExecute: No execution is allowed. Default Value: N/A.
driver	No	NodeDriver object	Definition: Driver version and status of a node. Constraints: N/A.
tags	No	Array of NodeTag objects	Definition: List of resource tags to be operated in batches. Constraints: N/A.

Table 9-335 NodeDriver

Parameter	Mandatory	Type	Description
version	No	String	Definition: Driver version on the node. Constraints: N/A. Range: N/A. Default Value: N/A.
updateStrategy	No	String	Definition: Node driver upgrade policy. Constraints: N/A. Range: N/A. Default Value: N/A.

Table 9-336 NodeTag

Parameter	Mandatory	Type	Description
key	Yes	String	Definition: Tag key. It can contain letters, digits, spaces, and special characters (_.:=-@), but cannot start or end with a space or start with sys . Constraints: N/A. Range: N/A. Default Value: N/A.
value	Yes	String	Definition: Tag value. Can contain letters, digits, spaces, and special characters _.:=-@ but cannot start or end with a space. Constraints: N/A. Range: N/A. Default Value: N/A.

Response Parameters

Status code: 200

Table 9-337 Response body parameters

Parameter	Type	Description
successNodeNames	Array of strings	Definition: List of nodes that are successfully updated.
failNodeNames	Array of strings	Definition: List of nodes that fail to be updated.

Status code: 404**Table 9-338** Response body parameters

Parameter	Type	Description
error_code	String	Definition: ModelArts error code. Range: N/A
error_msg	String	Definition: Error message. Range: N/A

Example Requests

Enable node HA redundancy.

```
POST /v2/{project_id}/pools/{pool_name}/nodes/batch-update
{
  "nodeNames": [ "os-node-created-xzz78" ],
  "action": "openHaRedundant"
}
```

Example Responses

Status code: 200

Request succeeded.

```
{
  "successNodeNames": [ {
    "name": "os-node-created-xzz78",
    "status": "success"
  } ]
}
```

Status code: 404

404	Not found.

Error Codes

See [Error Codes](#).

9.24 Locking Node Functions in Batches

Function

This API is used to lock node functions in batches. The locked functions cannot be used on the console. This API is used when you need to temporarily disable functions of some nodes to prevent misoperations, or perform system maintenance or tests. You can use this API to lock node functions in batches. Before using this API, ensure that the node function exists and you have the administrator permissions. After the lock operation is complete, the functions of the specified node are disabled on the console, and related operations cannot be performed. If the node function does not exist, you do not have the permission to perform the operation, or the request parameters are invalid, the API will return an error message.

Debugging

You can debug this API through automatic authentication in [API Explorer](#) or use the SDK sample code generated by API Explorer.

Authorization Information

Each account has all the permissions required to call all APIs, but IAM users must be assigned the required permissions.

- If you are using role/policy-based authorization, see [Permissions Policies and Supported Actions](#) for details on the required permissions.
- If you are using identity policy-based authorization, no identity policy-based permission required for calling this API.

URI

POST /v2/{project_id}/pools/{pool_name}/nodes/batch-lock

Table 9-339 Path Parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Definition: User project ID. For details, see Obtaining a Project ID and Name . Constraints: The value can contain 1 to 64 characters. Letters, digits, and hyphens (-) are allowed. Range: N/A Default Value: N/A
pool_name	Yes	String	Definition: Resource pool ID. The value is the metadata.name field in the resource pool details. Constraints: N/A Range: N/A Default Value: N/A

Request Parameters

Table 9-340 Request body parameters

Parameter	Mandatory	Type	Description
nodeNames	Yes	Array of strings	Definition: Names of nodes whose lock status needs to be changed. Constraints: N/A
actions	Yes	Array of strings	Definition: Function type to be changed. Constraints: N/A

Response Parameters

Status code: 200

Table 9-341 Response body parameters

Parameter	Type	Description
nodes	Array of NodesResultMsg objects	Definition: IDs and statuses of resource pool nodes that are operated in batches. Range: N/A

Table 9-342 NodesResultMsg

Parameter	Type	Description
name	String	<i>Definition*</i> : ID of the unlocked resource pool node. The value is the same as that of metadata.name in the node details. Range: N/A
status	String	Definition: Batch operation result of resource pool nodes. Range: • failed: The operation failed. • success: The operation succeeded.

Status code: 404**Table 9-343** Response body parameters

Parameter	Type	Description
error_code	String	• Definition: ModelArts error code. Range: N/A
error_msg	String	Definition: Error message. Range: N/A

Example Requests

Lock node functions in batches.

```
POST /v2/{project_id}/pools/{pool_name}/nodes/batch-lock
```

```
{
  "nodeNames" : [ "os-node-created-xzz78" ],
  "actions" : [ "delete" ]
}
```

Example Responses

Status code: 200

OK

```
{
  "nodes" : [ {
    "name" : "os-node-created-xzz78",
    "status" : "success"
  } ]
}
```

Status code: 404

Not found

```
{

}
```

Status Codes

Status Code	Description
200	OK
404	Not found

Error Codes

See [Error Codes](#).

9.25 Unlocking Node Functions in Batches

Function

This API is used to unlock functions of a specified node in batches. After the unlocking, the functions become available on the console. This API is used when you need to unlock the locked functions in batches after the system maintenance or test. Before using this API, ensure that the node function has been locked and the user has the administrator permission. After the unlocking, the functions of the specified node become available on the console, and the user can use the functions. If the node function is not locked, the user does not have the permission to perform the operation, or the request parameters are invalid, the API will return an error message.

Debugging

You can debug this API through automatic authentication in [API Explorer](#) or use the SDK sample code generated by API Explorer.

Authorization Information

Each account has all the permissions required to call all APIs, but IAM users must be assigned the required permissions.

- If you are using role/policy-based authorization, see [Permissions Policies and Supported Actions](#) for details on the required permissions.
- If you are using identity policy-based authorization, no identity policy-based permission required for calling this API.

URI

POST /v2/{project_id}/pools/{pool_name}/nodes/batch-unlock

Table 9-344 Path Parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Definition: User project ID. For details, see Obtaining a Project ID and Name . Constraints: The value can contain 1 to 64 characters. Letters, digits, and hyphens (-) are allowed. Range: N/A Default Value: N/A
pool_name	Yes	String	Definition: Resource pool ID. The value is the metadata.name field in the resource pool details. Constraints: N/A Range: N/A Default Value: N/A

Request Parameters

Table 9-345 Request body parameters

Parameter	Mandatory	Type	Description
nodeNames	Yes	Array of strings	Definition: Names of nodes whose lock status needs to be changed. Constraints: N/A

Parameter	Mandatory	Type	Description
actions	Yes	Array of strings	Definition: Function type to be changed. Constraints: N/A

Response Parameters

404	Not found

Error Codes

See [Error Codes](#).

9.26 Resetting Nodes

Function

This API is used to reset a node to the initial state and clear data and configurations on the node. This API is used when you need to reset a node to the factory or initial state when the node is faulty, the configuration is incorrect, the node needs to be redeployed, or the system needs to be restored. Before using this API, ensure that the node exists and the user has the administrator permission. After the reset, all data and configurations on the node are cleared, and the node is restarted and restored to the initial state. If the node does not exist, you do not have the permission to perform operations on the node, or the node cannot be reset (for example, a task is running), the API will return an error message.

Debugging

You can debug this API through automatic authentication in [API Explorer](#) or use the SDK sample code generated by API Explorer.

Authorization Information

Each account has all the permissions required to call all APIs, but IAM users must be assigned the required permissions.

- If you are using role/policy-based authorization, see [Permissions Policies and Supported Actions](#) for details on the required permissions.
- If you are using identity policy-based authorization, no identity policy-based permission required for calling this API.

Table 9-349 Path Parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Definition: User project ID. For details, see Obtaining a Project ID and Name . Constraints: The value can contain 1 to 64 characters. Letters, digits, and hyphens (-) are allowed. Range: N/A Default Value: N/A

Parameter	Mandatory	Type	Description
pool_name	Yes	String	Definition: Resource pool ID. The value is the metadata.name field in the resource pool details. Constraints: N/A Range: N/A Default Value: N/A

Request Parameters

Table 9-350 Request body parameters

Parameter	Mandatory	Type	Description
nodeNames	Yes	Array of strings	Definition: List of names of nodes to be reset. Constraints: N/A
rollingConfig	Yes	rollingConfig object	Definition: Node reset is a rolling configuration. Constraints: N/A
nodeConfig	Yes	Object	Definition: Node configuration parameters. Constraints: N/A

Table 9-351 rollingConfig

Parameter	Mandatory	Type	Description
strategy	Yes	String	Definition: Rolling policy. Constraints: N/A Range: • RollingByNumber: Indicates the number of nodes that can be reset at the same time. For example, if this parameter is set to 10, a maximum of 10 nodes can be reset at a time. • RollingByPercent: Indicates the maximum percentage of nodes that can be reset at the same time. For example, if this parameter is set to 10, a maximum of 10/ %nodes can be reset at a time. Default Value: N/A
maxUnavailable	Yes	Integer	Definition: Number or percentage of nodes to be reset in rolling mode. If strategy is set to RollingByNumber , this parameter indicates the number of nodes that can be reset at the same time. If strategy is set to RollingByPercent , this parameter indicates the maximum percentage of nodes that can be reset at the same time. Constraints: N/A Range: N/A Default Value: N/A

Response Parameters

9.27 Changing the Node Specifications

Function

This API is used to adjust the specifications (such as step) of a specified node. For example, you can expand the node from 8-node supernode to 16-node supernode. This API is used when you need to adjust the resource capacity of a node, optimize resource utilization, or upgrade the system based on service requirements. Before using this API, ensure that the node has been created and can be modified, the target specifications are supported, and the user has the administrator permissions. After the specifications are changed, the resource capacity of the node is adjusted as required, and related services and configurations are reloaded to adapt to the new specifications. If the node does not exist, the node cannot be modified, the target specifications are not supported, or the user does not have the permission to perform the operation, an error message will be returned.

Debugging

You can debug this API through automatic authentication in [API Explorer](#) or use the SDK sample code generated by API Explorer.

Authorization Information

Each account has all the permissions required to call all APIs, but IAM users must be assigned the required permissions.

- If you are using role/policy-based authorization, see [Permissions Policies and Supported Actions](#) for details on the required permissions.
- If you are using identity policy-based authorization, no identity policy-based permission required for calling this API.

URI

POST /v2/{project_id}/pools/{pool_name}/nodes/batch-resize

Table 9-354 Path Parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Definition: User project ID. For details, see Obtaining a Project ID and Name . Constraints: The value can contain 1 to 64 characters. Letters, digits, and hyphens (-) are allowed. Range: N/A Default Value: N/A
pool_name	Yes	String	Definition: Resource pool ID. The value is the metadata.name field in the resource pool details. Constraints: N/A Range: N/A Default Value: N/A

Request Parameters

Table 9-355 Request body parameters

Parameter	Mandatory	Type	Description
nodes	Yes	Array of ResizeNodeInfo objects	Definition: Information about the batch of supernodes to be scaled. Constraints: A maximum of 50 supernodes can be scaled at a time.
source	Yes	NodeResizeParams object	Definition: Source node pool and specifications information of the supernode to be changed. Constraints: N/A
target	Yes	NodeResizeParams object	Definition: Target node pool and specifications information of the supernode to be changed. Constraints: N/A

Table 9-356 ResizeNodeInfo

Parameter	Mandatory	Type	Description
batchUID	No	String	Definition: Node batch ID, which is required for batch change and can be obtained from the os.modelarts.node/batch.uid tag of the node. Constraints: N/A Range: N/A Default Value: N/A
deleteNodeNames	No	Array of strings	Definition: List of nodes to be scaled in a batch scale-in scenario. Constraints: N/A

Table 9-357 NodeResizeParams

Parameter	Mandatory	Type	Description
nodePool	No	String	Definition: Node pool. Constraints: N/A Range: N/A Default Value: N/A
flavor	No	String	Definition: Flavor. Constraints: N/A Range: N/A Default Value: N/A
creatingStep	No	Object	Definition: Step. Constraints: N/A

9.28 Migrating Nodes in Batches

Function

This API is used to batch migrate nodes between resource pools. Nodes are migrated from one resource pool to another. Use this API when nodes in a resource pool are unevenly distributed, during cluster maintenance, or for service expansion. It allows you to move specific nodes between resource pools. Make sure the resource pool has at least two nodes and enough resources like IP addresses before migrating them with this API. The API returns an error if the resource pool has only one node, lacks sufficient cluster resources, the node cannot migrate, or you lack operation permissions.

Debugging

You can debug this API through automatic authentication in [API Explorer](#) or use the SDK sample code generated by API Explorer.

Authorization Information

Each account has all the permissions required to call all APIs, but IAM users must be assigned the required permissions.

- If you are using role/policy-based authorization, see [Permissions Policies and Supported Actions](#) for details on the required permissions.
- If you are using identity policy-based authorization, no identity policy-based permission required for calling this API.

URI

POST /v2/{project_id}/pools/{pool_name}/nodes/batch-migrate

Table 9-359 Path Parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Definition: User project ID. For details, see Obtaining a Project ID and Name . Constraints: N/A Range: N/A Default Value: N/A
pool_name	Yes	String	Resource pool name. The value is the same as the metadata.name value of the resource pool.

Request Parameters

Table 9-360 Request body parameters

Parameter	Mandatory	Type	Description
migrateNodeNames	No	Array of strings	Names of the nodes to be migrated.
fromClusterName	Yes	String	Name of the source cluster.
toClusterName	Yes	String	Name of the destination cluster.
toPoolName	No	String	Name of the target resource pool.
resourceSpec	No	MigrateResourceSpec object	Configurations of the node to be migrated in the target resource pool. This parameter is mandatory when a node is migrated across resource pools.

Table 9-361 MigrateResourceSpec

Parameter	Mandatory	Type	Description
flavor	Yes	String	Resource flavor name. This parameter is mandatory for cross-resource-pool migration.

Parameter	Mandatory	Type	Description
creatingStep	No	CreatingStep object	Resource step information. When the entire cabinet or supernode is migrated, the step information needs to be specified.
nodePool	No	String	Name of the target node pool to which resources are migrated.
rootVolume	No	RootVolume object	System disk information of the target node pool. This parameter is valid only when a node pool is created.
dataVolumes	No	Array of DataVolumeItem objects	Data disk information of the target node pool. This parameter is valid only when a node pool is created.
volumeGroup Configs	No	Array of VolumeGroupConfig objects	Advanced disk configurations. This parameter is mandatory when a custom data disk exists. This parameter is valid when a node pool is created.
labels	No	Map<String,String>	Kubernetes label, in the format of a key-value pair. This parameter cannot be specified for a non-privileged pool. This parameter is valid when a node pool is created.
taints	No	Array of Taints objects	Taints to be added to nodes to set anti-affinity. This parameter cannot be specified for a non-privileged pool. This parameter is valid when a node pool is created.
tags	No	Array of UserTags objects	Resource tag. This parameter is valid when a node pool is created.
network	No	NodeNetwork object	Network configuration. This parameter cannot be specified for a non-privileged pool. This parameter is valid when a node pool is created.

Parameter	Mandatory	Type	Description
extendParams	No	ResourceExtendParams object	Custom configuration, for example, setting dockerSize for the node. This parameter is valid when a node pool is created.

Table 9-362 CreatingStep

Parameter	Mandatory	Type	Description
step	No	Integer	Definition: Step of a supernode. Constraints: N/A Range: Only the step contained in the resource specification details is supported. Default Value: N/A
type	No	String	Definition: Batch creation type. Constraints: N/A Range: • hyperinstance: supernode Default Value: N/A

Table 9-363 RootVolume

Parameter	Mandatory	Type	Description
volumeType	Yes	String	Definition: Disk type.. Range: • SSD: Ultra-high I/O disk • GPSSD: General-purpose SSD • SAS: High I/O disk
size	Yes	String	Definition: Disk size, in GiB. Range: N/A.

Table 9-364 DataVolumeItem

Parameter	Mandatory	Type	Description
volumeType	Yes	String	Definition: Disk type.. Range: • SSD: Ultra-high I/O disk • GPSSD: General-purpose SSD • SAS: High I/O disk
size	Yes	String	Definition: Disk size, in GiB. Range: N/A.
count	No	Integer	Definition: Number of disks. Range: N/A.
extendParams	Yes	VolumeExtendParams object	Definition: Custom disk configuration.

Table 9-365 VolumeExtendParams

Parameter	Mandatory	Type	Description
volumeGroup	Yes	String	Definition: Name of a disk group, which is used to divide storage space. Range: • vgpaas: container disk. • default: common data disk, which is mounted in default mode. • vguser: common data disk, which is mounted to a specified path. The group name varies depending on the path, for example, vguser1 and vguser2. • vg-everest-localvolume-persistent: common data disk, which is used as the persistent storage volume. • vg-everest-localvolume-ephemeral: common data disk, which is used as a temporary storage volume.

Table 9-366 VolumeGroupConfig

Parameter	Mandatory	Type	Description
volumeGroup	Yes	String	Definition: Disk group name. Index of the volume group in the dataVolumes. Range: N/A.
dockerThinPool	No	Integer	Definition: Percentage of data disks designated as container disks. This parameter can be specified only when volumeGroup is vgpaas (container disk). Range: N/A.
lvmConfig	No	LvmConfig object	Definition: LVM configuration management.
types	No	Array of strings	Definition: Storage type. Options: • volume: Cloud hard disk. When dataVolumes is specified, the default value is used. • local: Local disk. This parameter must be specified when a local disk is used.

Table 9-367 LvmConfig

Parameter	Mandatory	Type	Description
lvType	Yes	String	Definition: LVM write mode. Range: • linear: Linear mode. • striped: Striped mode in which multiple disks are used to form a strip to improve disk performance.

Parameter	Mandatory	Type	Description
path	No	String	Definition: Disk mount path. This parameter takes effect only in user configuration. The value is an absolute path. Digits, letters, periods (.), hyphens (-), and underscores (_) are allowed. Range: N/A.

Table 9-368 Taints

Parameter	Mandatory	Type	Description
key	Yes	String	Definition: Key. Range: N/A
value	No	String	Value.
effect	Yes	String	Effect.

Table 9-369 UserTags

Parameter	Mandatory	Type	Description
key	Yes	String	Definition: Key. The value cannot start with CCE- or __type_baremetal . Range: N/A
value	Yes	String	Value.

Table 9-370 NodeNetwork

Parameter	Mandatory	Type	Description
vpc	No	String	• Definition: VPC ID. Range: N/A.
subnet	No	String	Definition: Subnet ID. Range: N/A.
securityGroups	No	Array of strings	Definition: Security group ID set.

Table 9-371 ResourceExtendParams

Parameter	Mandatory	Type	Description
dockerBaseSize	No	String	Definition: Container image space of a node. Range: • Specified: The default value of dockerBaseSize ranges from 50 to 500. However, the actual value is restricted by the container data disk size of the node. • Unlimited: *dockerBaseSize="0", indicating that the container image space is not limited.
postInstall	No	String	Definition: Post-installation script. The entered value must be encoded using Base64. Range: N/A.
runtime	No	String	Definition: Container runtime. Range: • docker: Container runtime. It is the most commonly used container engine, which is used to create and manage container instances based on container images. • containerd: Industrial-grade container runtime. It focuses on container lifecycle management and is one of the core components at the bottom layer of Docker. It can also be deployed independently.
labelPolicyOnExistingNodes	No	String	Definition: Kubernetes label update policy of existing nodes. If the value is empty, the existing nodes are updated by default. Range: • refresh: Update. • ignore: Do not update.

Parameter	Mandatory	Type	Description
taintPolicyOnExistingNodes	No	String	Definition: Kubernetes taint update policy of existing nodes. If the value is empty, the existing nodes are updated by default. Range: • refresh: Update. • ignore: Do not update.
tagPolicyOnExistingNodes	No	String	Definition: Resource tag update policy of existing nodes. If the value is empty, the existing nodes are updated by default. Range: • refresh: Update. • ignore: Do not update.
XParameterPlaneSubnet	No	String	Definition: Subnet ID used for data transmission on the parameter plane between physical clusters. The value cannot be the same as the node subnet or container subnet. Range: N/A.
nodePoolName	No	String	Definition: Name of the node pool specified by you. The value is a string of 2 to 50 characters, consisting of lowercase letters, hyphens (-), and digits. It must start with a lowercase letter and cannot end with a hyphen (-) or - default. Range: N/A.

Response Parameters

9.29 Binding Nodes to a Logical Subpool in Batches

Function

This API is used to bind nodes in a logical subpool to another logical subpool when node binding is enabled for a physical dedicated pool.

Debugging

You can debug this API through automatic authentication in [API Explorer](#) or use the SDK sample code generated by API Explorer.

Authorization Information

Each account has all the permissions required to call all APIs, but IAM users must be assigned the required permissions.

- If you are using role/policy-based authorization, see [Permissions Policies and Supported Actions](#) for details on the required permissions.
- If you are using identity policy-based authorization, no identity policy-based permission required for calling this API.

URI

POST /v2/{project_id}/pools/{pool_name}/nodes/batch-bind

Table 9-374 Path Parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Definition: User project ID. For details, see Obtaining a Project ID and Name . Constraints: N/A Range: N/A Default Value: N/A

Parameter	Mandatory	Type	Description
pool_name	Yes	String	Resource pool ID. The value is the metadata.name field in the resource pool details.

Request Parameters

Table 9-375 Request body parameters

Parameter	Mandatory	Type	Description
nodes	Yes	Array of BindNodeItem objects	List of nodes to be bound with another pool.
drain	No	Boolean	Specifies whether to drain the node to be bound with another pool. true : The node will be drained.

Table 9-376 BindNodeItem

Parameter	Mandatory	Type	Description
name	Yes	String	Name of the node to be bound with another pool.
quotaName	No	String	ID of the logical subpool bound to the node. If the value is empty, the node is not bound to any logical subpool.

Response Parameters

Status code: 200

Request succeeded.

10 Lite Server Management

10.1 Creating a Lite Server

Function

This API is used to create Lite Server ECSs, BMSs, and supernode servers. It is used when you need to quickly deploy and configure different types of server resources based on service requirements. Before calling this API, ensure that you have logged in to the system and have the permission to create Lite Servers. In addition, you need to provide required parameters, such as the server type, specifications, and network configuration. After the creation, the system returns the information about the created Lite Server instance, including the instance ID and status. If you do not have the required permission, the parameter settings are incorrect, or system resources are insufficient, the API returns an error message.

Constraints

No constraints

Debugging

You can debug this API through automatic authentication in [API Explorer](#) or use the SDK sample code generated by API Explorer.

Authorization Information

Each account has all the permissions required to call all APIs, but IAM users must be assigned the required permissions.

- If you are using role/policy-based authorization, see [Permissions Policies and Supported Actions](#) for details on the required permissions.
- If you are using identity policy-based authorization, the following identity policy-based permissions are required.

Action	Access Level	Resource Type (*: required)	Condition Key	Alias	Dependencies
modelarts:devserver:create	Write	devserver*	-	-	-
		-	g:EnterpriseProjectId		

URI

POST /v1/{project_id}/dev-servers

Table 10-1 Path Parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Definition: Project ID Constraints: Mandatory Range: The value can contain 1 to 64 characters. Letters, digits, and hyphens (-) are allowed. Default Value: N/A

Request Parameters

Table 10-2 Request body parameters

Parameter	Mandatory	Type	Description
admin_pass	No	String	Definition: Password used for logging in to the server. Select either admin_pass or key_pair_name. The password must: • Contain 8 to 26 characters. • Contain at least three of the following types: uppercase letters, lowercase letters, digits, and special characters (!@%-_=[{}];,./?). • Cannot be the username or the username spelled backwards. • Cannot contain root, administrator, or their reverse. Constraints: admin_pass and key_pair_name cannot exist at the same time. Range: The value must contain 8 to 26 characters and meet the preceding password rules. Default Value: N/A
arch	No	String	Definition: Architecture type of a server flavor. Constraints: N/A Range: • X86: The CPU architecture is x86. • ARM: The CPU architecture is Arm. Default Value: N/A

Parameter	Mandatory	Type	Description
availability_zone	No	String	Definition: AZ where the server is located. Constraints: N/A Range: The value can contain 1 to 256 characters. Only letters, digits, hyphens (-), underscores (_), and periods (.) are allowed. Default Value: N/A
charging_info	No	ChargingInfo object	Definition: Billing mode of a server.
count	No	Integer	Definition: Number of servers purchased at a time. Constraints: Supernodes are not supported. Range: 1 to 10. Default Value: N/A.
enterprise_project_id	No	String	Definition: Enterprise ID. Constraints: N/A Range: The value can contain 1 to 36 characters. Only letters, digits, hyphens (-), underscores (_), and periods (.) are allowed. Default Value: N/A
flavor	No	String	Definition: Server flavor name. Constraints: Select either flavor or resource_flavor . Range: 1 to 128 characters. Default Value: N/A.
resource_flavor	No	String	Definition: Server resource flavor name. Constraints: Select either flavor or resource_flavor . Range: The value can contain 1 to 256 characters. Only letters, digits, hyphens (-), underscores (_), and periods (.) are allowed. Default Value: N/A.

Parameter	Mandatory	Type	Description
image_id	Yes	String	Definition: Server image ID. Constraints: N/A Range: The value must be a string of 36 characters in UUID format. Default Value: N/A
key_pair_name	No	String	Definition: Key pair name used for logging in to the server. Select either admin_pass or key_pair_name . Note that supernodes can be created only using key pairs. Constraints: admin_pass and key_pair_name cannot exist at the same time. Range: The value can contain 1 to 64 characters. Only letters, digits, hyphens (-), underscores (_), and periods (.) are allowed. Default Value: N/A
name	Yes	String	Definition: Server name. Constraints: N/A Range: The value can contain 1 to 64 characters. Only letters, digits, hyphens (-), underscores (_), and periods (.) are allowed. Default Value: N/A
network	Yes	ServerNetwork object	Definition: Server network information. Constraints: N/A Range: See #/definitions/ServerNetwork . Default Value: N/A

Parameter	Mandatory	Type	Description
root_volume	No	EvsVolume object	Definition: System disk information of a server. Constraints: This parameter is mandatory for all ECS and HPS flavors and some BMS flavors, such as Ant8, Ant1, and Snt9b. Range: See #/definitions/EvsVolume. Default Value: N/A
data_volume	No	ServerDataVolume object	Definition: Data disk information of a server. Constraints: N/A Range: See #/definitions/ServerDataVolume. Default Value: N/A
server_type	No	String	Definition: Server type. Constraints: N/A Range: • BMS • ECS • HPS: supernode server Default Value: N/A

Parameter	Mandatory	Type	Description
user_data	No	String	Definition Custom data to be injected into the instance during cloud server creation. Texts and text files can be injected. Example: Before Base64 encoding: - Linux server: <pre>#!/bin/bash echo user_test > /home/user.txt</pre> After Base64 encoding: - Linux server: <pre>IyEvYmluL2Jhc2gKZWNoYyB1c2VyX3Rlc 3QgPiAvaG9tZS91c2VyLnR4dA==</pre> For more information about user data injection, see Injecting User Data. You must be aware of the effects of user_data. You are responsible for the impact and risks. Constraints - The content of user_data must be encoded with Base64. - The maximum size of the content to be injected (before encoding) is 32 KB. Range: N/A Default Value: N/A
hps_cluster_id	No	String	Definition: Network information of the supernode cluster. This parameter is required only when a supernode is created. Constraints: This parameter is used only for creating HPS servers. Range: The value must be a string of 36 characters in UUID format. Default Value: N/A

Table 10-3 ChargingInfo

Parameter	Mandatory	Type	Description
charging_mode	Yes	String	Definition: Payment type, which is the billing mode of the server. Constraints: N/A Range: • COMMON: Both yearly/monthly and pay-per-use are supported. • POST_PAID: postpaid charging mode • PRE_PAID: prepaid charging mode Default Value: N/A
is_auto_pay	No	Boolean	Definition: Specifies whether to enable automatic payment. Constraints: N/A Range: • true: The order will be automatically paid. • false: The order will not be automatically paid. Default Value: N/A
is_auto_renew	No	Boolean	Definition: Specifies whether to enable auto renewal. Constraints: N/A Range: • true: Auto renewal is enabled. • false: Auto renewal is not enabled. Default Value: N/A
period_num	Yes	Integer	Definition: Number of subscription periods. Constraints: N/A Range: 1 to 11 Default Value: N/A

Parameter	Mandatory	Type	Description
period_type	Yes	String	Definition: Subscription period type, which defines the time unit for the subscription period. Constraints: N/A Range: • ABSOLUTE • DAY • HOUR • MONTH • WEEK • YEAR Default Value: N/A

Table 10-4 ServerNetwork

Parameter	Mandatory	Type	Description
ipv6_enable	No	Boolean	Definition: Whether IPv6 is enabled when a server is created. Constraints: N/A Range: • true: IPv6 is enabled. • false: IPv6 is disabled. Default Value: N/A
roce_id	No	String	Definition: RoCE network ID of the server. Constraints: N/A Range: The value must be a string in UUID format. Default Value: N/A
security_group_id	Yes	String	Definition: ID of the security group to which the server belongs. Constraints: N/A Range: The value must be a string in UUID format. Default Value: N/A

Parameter	Mandatory	Type	Description
subnet_id	Yes	String	Definition: ID of the subnet where the server is located. Constraints: N/A Range: The value must be a string in UUID format. Default Value: N/A
vpc_id	Yes	String	Definition: ID of the VPC where the server is located. Constraints: N/A Range: The value must be a string in UUID format. Default Value: N/A
hyper_cluster	No	hyper_cluster object	Definition: Network information of the parameter plane of the server. Constraints: N/A. Range: N/A. Default Value: N/A.

Table 10-5 hyper_cluster

Parameter	Mandatory	Type	Description
id	No	String	Definition: ID of the HyperCluster. Constraints: N/A Range: N/A Default Value: N/A
hyper_cluster_subnet_id	No	String	Definition: Subnet ID of the HyperCluster. Constraints: N/A Range: N/A Default Value: N/A

Table 10-6 EvsVolume

Parameter	Mandatory	Type	Description
size	No	Integer	Definition: System disk size, which is the storage space allocated to the system disk. Constraints: N/A Range: 100 to 1,024 GB Default Value: N/A
type	No	String	Definition: System disk type, which indicates the storage type of the system disk. Constraints: N/A Range: • ESSD: extreme SSD • GPSSD: General-purpose SSD • SAS: high I/O EVS disk • SATA: common I/O EVS disk • SSD: ultra-high I/O EVS disk Default Value: N/A

Table 10-7 ServerDataVolume

Parameter	Mandatory	Type	Description
size	Yes	Integer	Definition: Data disk size. Storage space allocated to a data disk. Constraints: N/A Range: 100 to 32,768 GB Default Value: N/A

Parameter	Mandatory	Type	Description
type	Yes	String	Definition: System disk type, which indicates the storage type of the data disk. Constraints: N/A Range: • ESSD: extreme SSD • GPSSD: General-purpose SSD • SAS: high I/O EVS disk • SATA: common I/O EVS disk • SSD: ultra-high I/O EVS disk Default Value: N/A
count	Yes	Integer	Definition: Number of data disks. Number of data disks allocated to an instance. Constraints: N/A Range: 1 to 8 Default Value: N/A

Response Parameters

Status code: 200

Table 10-8 Response body parameters

Parameter	Type	Description
create_at	Long	Definition: Creation time. Range: N/A
update_at	Long	Definition: Update time. Range: N/A
charging_mode	String	Definition: Billing mode. Range: • COMMON: both yearly/monthly and pay-per-use • POST_PAID: pay-per-use • PRE_PAID: yearly/monthly
cloud_server	CloudServer object	Definition: Cloud service information.

Parameter	Type	Description
endpoints_response	Array of Endpoints objects	Definition: Private IP address of the instance.
flavor	String	Definition: Instance flavor name. Range: ^.{1,128}\$
id	String	Definition: Instance ID. Range: ^[0-9a-f]{8}-[0-9a-f]{4}-[1-5][0-9a-f]{3}-[89ab][0-9a-f]{3}-[0-9a-f]{12}\$
key_pair_name	String	Definition: Key pair name. Range: ^[-_.a-zA-Z0-9]{1,64}\$
name	String	Definition: Instance name. Range: ^[-_.a-zA-Z0-9]{1,64}\$
order_id	String	Definition: Order ID. Range: ^[a-zA-Z0-9]{1,64}\$
server_image_response	ServerImageResponse object	Definition: Instance image information. Range: N/A

Parameter	Type	Description
status	String	Definition: Instance status. Current running status of the instance, which is used to monitor the lifecycle and health status of the instance. Range: • CREATE_FAILED: Creating the instance failed. • CREATING: The instance is being created. • DELETED: The instance has been deleted. • DELETE_FAILED: Deleting the instance failed. • DELETING: The instance is being deleted. • ERROR: An error occurred. • RUNNING: The instance is running. • STARTING: The instance is being started. • START_FAILED: Starting the instance failed. • STOPPED: The instance has been stopped. • STOPPING: The instance is being stopped. • STOP_FAILED: Stopping the instance failed. • REBOOTING: The instance is being restarted. • REBOOT_FAILED: Restarting the instance failed. • CHANGINGOS: The OS is being changed. • CHANGINGOS_FAILED: Changing the OS failed. • REINSTALLINGOS: The OS is being reinstalled. • REINSTALLINGOS_FAILED: Reinstalling the OS failed.

Parameter	Type	Description
vpc_id	String	Definition: ID of the VPC where the instance is located. Range: <code>^[0-9a-f]{8}-[0-9a-f]{4}-[1-5][0-9a-f]{3}-[89ab][0-9a-f]{3}-[0-9a-f]{12}\$</code>
endpoints	Array of EndpointsRes objects	Definition: Private IP address of the server.
volumes	Array of ServerVolume objects	Definition: Information about the mounted hard disk.
image	ServerImageResponse object	Definition: Server image information.
category	String	Definition: Server type. Range: • HPS: supernode server • SPOD: full-cabinet server • SERVER: single server
server_hps	ServerHpsInfo object	Definition: Information about the supernode to which the server belongs.
subnet_id	String	Parameter description: ID of the subnet where the instance is located. ** Value range: <code>**^[0-9a-f]{8}-[0-9a-f]{4}-[1-5][0-9a-f]{3}-[89ab][0-9a-f]{3}-[0-9a-f]{12}\$</code> .

Table 10-9 CloudServer

Parameter	Type	Description
id	String	Definition: Server resource ID or supernode's child node ID. Range: <code>^[0-9a-f]{8}-[0-9a-f]{4}-[1-5][0-9a-f]{3}-[89ab][0-9a-f]{3}-[0-9a-f]{12}\$</code>

Parameter	Type	Description
type	String	Definition: Lite Server server type. Range: • BMS: Bare Metal Server • ECS: Elastic Cloud Server • HPS: Supernode server
hps_id	String	Definition: Server resource ID of the supernode's child node. Range: ^[0-9a-f]{8}-[0-9a-f]{4}-[1-5][0-9a-f]{3}-[89ab][0-9a-f]{3}-[0-9a-f]{12}\$
hps_ecs_id	String	Definition: Server resource ID of the supernode's child node. Range: ^[0-9a-f]{8}-[0-9a-f]{4}-[1-5][0-9a-f]{3}-[89ab][0-9a-f]{3}-[0-9a-f]{12}\$

Table 10-10 Endpoints

Parameter	Type	Description
dev_service	String	Definition: Supported services. Range: • NOTEBOOK: You can access notebook instances using HTTPS. • SSH: You can remotely access notebook instances through SSH.
extensions	Map<String,String>	Definition: App-specific URL for accessing the remote development mode of the app. It includes extended configurations of the application. Constraints: N/A Range: N/A Default Value: N/A
ssh_keys	Array of strings	Definition: List of SSH key pairs. You can set multiple key pairs to access an SSH instance at the same time. Constraints: N/A Range: 0 to 1,024 key pairs Default Value: N/A

Table 10-11 EndpointsRes

Parameter	Type	Description
allowed_access_ips	Array of strings	Definition: Whitelisted public IP addresses that are allowed to access notebook instances through SSH. By default, all public IP addresses can access the notebook instances. If IP addresses are specified, only the clients with the specified IP addresses can access the notebook instances.
dev_service	String	Definition: Method for accessing the notebook instance. Range: • NOTEBOOK: You can access notebook instances using HTTPS. • SSH: You can remotely access notebook instances through SSH.
ssh_keys	Array of strings	Definition: List of SSH key pairs. You can set multiple key pairs to access an SSH instance at the same time.
service	String	Definition: Method for accessing the notebook instance. Range: • NOTEBOOK: You can access notebook instances using HTTPS. • SSH: You can remotely access notebook instances through SSH.
uri	String	Definition: Private IP address of the instance. Range: N/A

Table 10-12 ServerVolume

Parameter	Type	Description
size	Integer	Definition: EVS disk size, which is the storage space allocated to the system disk. Constraints: N/A Range: 100 to 1,024 GB Default Value: N/A

Parameter	Type	Description
type	String	Definition: Storage type, which can be a system disk or data disk. Constraints: N/A. Range: • ROOT: System disk • DATA: Data disk Default Value: N/A.
evs_type	String	Definition: EVS disk type. Storage type of the EVS disk. Constraints: N/A. Range: • ESSD: Extreme SSD • GPSSD: General-purpose SSD • SAS: High I/O EVS disk • SATA: Common I/O EVS disk • SSD: Ultra-high I/O EVS disk Default Value: N/A.
evs_id	String	Definition: ID of the EVS disk. Range: ^[0-9a-f]{8}-[0-9a-f]{4}-[1-5][0-9a-f]{3}-[89ab][0-9a-f]{3}-[0-9a-f]{12}\$

Table 10-13 ServerImageResponse

Parameter	Type	Description
arch	String	Definition: Architecture type of a server image. Range: • ARM • X86
image_id	String	Definition: Server image ID. Range: ^[0-9a-f]{8}-[0-9a-f]{4}-[1-5][0-9a-f]{3}-[89ab][0-9a-f]{3}-[0-9a-f]{12}\$
name	String	Definition: Server image name. Constraints: N/A Range: 1 to 256 characters Default Value: N/A

Parameter	Type	Description
server_type	String	Definition: Server type. Range: • BMS: BMS • ECS: ECS • HPS: supernode server
status	String	Definition: Server image status. Range: • ACTIVE • INACTIVE

Table 10-14 ServerHpsInfo

Parameter	Type	Description
id	String	Definition: Lite Server supernode instance ID. Range: ^[0-9a-f]{8}-[0-9a-f]{4}-[1-5][0-9a-f]{3}-[89ab][0-9a-f]{3}-[0-9a-f]{12}\$
name	String	Definition: Lite Server supernode name. Range: ^[-_a-zA-Z0-9]{1,64}\$

Error Codes

See [Error Codes](#).

10.2 Querying All Lite Server Instances of a User

Function

This API is used to obtain details about all Lite Server instances of a user. It is used when you need to view the status and configuration of all Lite Server instances of a user for resource management and monitoring. Before using this API, ensure that you have logged in to the system and have the permission to view Lite Server instances. After this API is called, the system returns the list of all Lite Server instances of the user, including the instance ID, name, status, and creation time. If you do not have the required permission or have not logged in, the API returns an error message.

Constraints

No constraints

Debugging

You can debug this API through automatic authentication in [API Explorer](#) or use the SDK sample code generated by API Explorer.

Authorization Information

Each account has all the permissions required to call all APIs, but IAM users must be assigned the required permissions.

- If you are using role/policy-based authorization, see [Permissions Policies and Supported Actions](#) for details on the required permissions.
- If you are using identity policy-based authorization, no identity policy-based permission required for calling this API.

URI

GET /v1/{project_id}/dev-servers

Table 10-15 Path Parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Definition: Project ID Constraints: Mandatory Range: The value can contain 1 to 64 characters. Letters, digits, and hyphens (-) are allowed. Default Value: N/A

Table 10-16 Query Parameters

Parameter	Mandatory	Type	Description
owner	No	String	Definition: User ID of the instance Constraints: Optional Range: This value contains 1 to 64 characters. Lowercase letters, digits, and hyphens (-) are allowed. This parameter is valid only when the account is a big account or has the admin permission. Generally, the value is the ID of the current login user. Default Value: N/A
sort_dir	No	String	Definition: Sorting mode. Constraints: Optional. Range: • ASC: Ascending order • DESC: Descending order Default Value: ASC.

Parameter	Mandatory	Type	Description
sort_key	No	String	Definition: Sorting field. Constraints: Optional. Range: • createTime: Sorting by creation time (default value). • updateTime: Sorting by update time. Default Value: createTime.
limit	No	Integer	Definition: Number of records on each page Constraints: Optional Range: 0 to 1024 Default Value: 10
offset	No	Integer	Definition: Start offset of the records on each page Constraints: Optional Range: 0 to 2147483647 Default Value: 0

Request Parameters

None

Response Parameters

Status code: 200

Table 10-17 Response body parameters

Parameter	Type	Description
current	Integer	Definition: Current page number. Value range: 1 to 2097152
data	Array of ServerResponse objects	Definition: Lite Server instance list.
pages	Integer	Definition: Total number of pages. Value range: 1 to 2097152

Parameter	Type	Description
size	Integer	Definition: Number of records on each page. Maximum number of instances returned on each page. The value of this parameter directly affects the amount of returned data. You can adjust the value to optimize the query performance or increase the information volume of a single request. Range: 1 to 1024
total	Long	Definition: Total number of records. Total number of instances that meet the search criteria. This field is used to learn the overall data scale. Range: 1 to 2147483647

Table 10-18 ServerResponse

Parameter	Type	Description
create_at	Long	Definition: Creation time. Range: N/A
update_at	Long	Definition: Update time. Range: N/A
charging_mode	String	Definition: Billing mode. Range: • COMMON: both yearly/monthly and pay-per-use • POST_PAID: pay-per-use • PRE_PAID: yearly/monthly
cloud_server	CloudServer object	Definition: Cloud service information.
endpoints_response	Array of Endpoints objects	Definition: Private IP address of the instance.
flavor	String	Definition: Instance flavor name. Range: ^.{1,128}\$
id	String	Definition: Instance ID. Range: ^[0-9a-f]{8}-[0-9a-f]{4}-[1-5][0-9a-f]{3}-[89ab][0-9a-f]{3}-[0-9a-f]{12}\$

Parameter	Type	Description
key_pair_name	String	Definition: Key pair name. Range: ^[-_a-zA-Z0-9]{1,64}\$
name	String	Definition: Instance name. Range: ^[-_a-zA-Z0-9]{1,64}\$
order_id	String	Definition: Order ID. Range: ^[a-zA-Z0-9]{1,64}\$
server_image_response	ServerImageResponse object	Definition: Instance image information. Range: N/A

Parameter	Type	Description
status	String	Definition: Instance status. Current running status of the instance, which is used to monitor the lifecycle and health status of the instance. Range: • CREATE_FAILED: Creating the instance failed. • CREATING: The instance is being created. • DELETED: The instance has been deleted. • DELETE_FAILED: Deleting the instance failed. • DELETING: The instance is being deleted. • ERROR: An error occurred. • RUNNING: The instance is running. • STARTING: The instance is being started. • START_FAILED: Starting the instance failed. • STOPPED: The instance has been stopped. • STOPPING: The instance is being stopped. • STOP_FAILED: Stopping the instance failed. • REBOOTING: The instance is being restarted. • REBOOT_FAILED: Restarting the instance failed. • CHANGINGOS: The OS is being changed. • CHANGINGOS_FAILED: Changing the OS failed. • REINSTALLINGOS: The OS is being reinstalled. • REINSTALLINGOS_FAILED: Reinstalling the OS failed.

Parameter	Type	Description
vpc_id	String	Definition: ID of the VPC where the instance is located. Range: <code>^[0-9a-f]{8}-[0-9a-f]{4}-[1-5][0-9a-f]{3}-[89ab][0-9a-f]{3}-[0-9a-f]{12}\$</code>
endpoints	Array of EndpointsRes objects	Definition: Private IP address of the server.
volumes	Array of ServerVolume objects	Definition: Information about the mounted hard disk.
image	ServerImageResponse object	Definition: Server image information.
category	String	Definition: Server type. Range: • HPS: supernode server • SPOD: full-cabinet server • SERVER: single server
server_hps	ServerHpsInfo object	Definition: Information about the supernode to which the server belongs.
subnet_id	String	Parameter description: ID of the subnet where the instance is located. ** Value range: <code>**^[0-9a-f]{8}-[0-9a-f]{4}-[1-5][0-9a-f]{3}-[89ab][0-9a-f]{3}-[0-9a-f]{12}\$</code> .

Table 10-19 CloudServer

Parameter	Type	Description
id	String	Definition: Server resource ID or supernode's child node ID. Range: <code>^[0-9a-f]{8}-[0-9a-f]{4}-[1-5][0-9a-f]{3}-[89ab][0-9a-f]{3}-[0-9a-f]{12}\$</code>

Parameter	Type	Description
type	String	Definition: Lite Server server type. Range: • BMS: Bare Metal Server • ECS: Elastic Cloud Server • HPS: Supernode server
hps_id	String	Definition: Server resource ID of the supernode's child node. Range: ^[0-9a-f]{8}-[0-9a-f]{4}-[1-5][0-9a-f]{3}-[89ab][0-9a-f]{3}-[0-9a-f]{12}\$
hps_ecs_id	String	Definition: Server resource ID of the supernode's child node. Range: ^[0-9a-f]{8}-[0-9a-f]{4}-[1-5][0-9a-f]{3}-[89ab][0-9a-f]{3}-[0-9a-f]{12}\$

Table 10-20 Endpoints

Parameter	Type	Description
dev_service	String	Definition: Supported services. Range: • NOTEBOOK: You can access notebook instances using HTTPS. • SSH: You can remotely access notebook instances through SSH.
extensions	Map<String,String>	Definition: App-specific URL for accessing the remote development mode of the app. It includes extended configurations of the application. Constraints: N/A Range: N/A Default Value: N/A
ssh_keys	Array of strings	Definition: List of SSH key pairs. You can set multiple key pairs to access an SSH instance at the same time. Constraints: N/A Range: 0 to 1,024 key pairs Default Value: N/A

Table 10-21 EndpointsRes

Parameter	Type	Description
allowed_access_ips	Array of strings	Definition: Whitelisted public IP addresses that are allowed to access notebook instances through SSH. By default, all public IP addresses can access the notebook instances. If IP addresses are specified, only the clients with the specified IP addresses can access the notebook instances.
dev_service	String	Definition: Method for accessing the notebook instance. Range: • NOTEBOOK: You can access notebook instances using HTTPS. • SSH: You can remotely access notebook instances through SSH.
ssh_keys	Array of strings	Definition: List of SSH key pairs. You can set multiple key pairs to access an SSH instance at the same time.
service	String	Definition: Method for accessing the notebook instance. Range: • NOTEBOOK: You can access notebook instances using HTTPS. • SSH: You can remotely access notebook instances through SSH.
uri	String	Definition: Private IP address of the instance. Range: N/A

Table 10-22 ServerVolume

Parameter	Type	Description
size	Integer	Definition: EVS disk size, which is the storage space allocated to the system disk. Constraints: N/A Range: 100 to 1,024 GB Default Value: N/A

Parameter	Type	Description
type	String	Definition: Storage type, which can be a system disk or data disk. Constraints: N/A. Range: • ROOT: System disk • DATA: Data disk Default Value: N/A.
evs_type	String	Definition: EVS disk type. Storage type of the EVS disk. Constraints: N/A. Range: • ESSD: Extreme SSD • GPSSD: General-purpose SSD • SAS: High I/O EVS disk • SATA: Common I/O EVS disk • SSD: Ultra-high I/O EVS disk Default Value: N/A.
evs_id	String	Definition: ID of the EVS disk. Range: ^[0-9a-f]{8}-[0-9a-f]{4}-[1-5][0-9a-f]{3}-[89ab][0-9a-f]{3}-[0-9a-f]{12}\$

Table 10-23 ServerImageResponse

Parameter	Type	Description
arch	String	Definition: Architecture type of a server image. Range: • ARM • X86
image_id	String	Definition: Server image ID. Range: ^[0-9a-f]{8}-[0-9a-f]{4}-[1-5][0-9a-f]{3}-[89ab][0-9a-f]{3}-[0-9a-f]{12}\$
name	String	Definition: Server image name. Constraints: N/A Range: 1 to 256 characters Default Value: N/A

Parameter	Type	Description
server_type	String	Definition: Server type. Range: • BMS: BMS • ECS: ECS • HPS: supernode server
status	String	Definition: Server image status. Range: • ACTIVE • INACTIVE

Table 10-24 ServerHpsInfo

Parameter	Type	Description
id	String	Definition: Lite Server supernode instance ID. Range: ^[0-9a-f]{8}-[0-9a-f]{4}-[1-5][0-9a-f]{3}-[89ab][0-9a-f]{3}-[0-9a-f]{12}\$
name	String	Definition: Lite Server supernode name. Range: ^[-_a-zA-Z0-9]{1,64}\$

10.3 Querying Lite Server Instance Details

Function

This API is used to obtain the details of a specified Lite Server instance. It is used when you need to view the configuration, status, and network information of a specific Lite Server instance for fault locating, resource management, and monitoring. Before using this API, ensure that you have logged in to the system, have the permission to view the Lite Server instance, and have a valid instance ID. After the query, the system returns the details of the specified Lite Server instance, including the instance ID, name, status, configuration, and network configuration. If you do not have the required permission, the instance ID is invalid, or the instance does not exist, the API returns an error message.

Constraints

No constraints

Debugging

You can debug this API through automatic authentication in [API Explorer](#) or use the SDK sample code generated by API Explorer.

Authorization Information

Each account has all the permissions required to call all APIs, but IAM users must be assigned the required permissions.

- If you are using role/policy-based authorization, see [Permissions Policies and Supported Actions](#) for details on the required permissions.
- If you are using identity policy-based authorization, the following identity policy-based permissions are required.

Action	Access Level	Resource Type (*: required)	Condition Key	Alias	Dependencies

Table 10-25 Path Parameters

Parameter	Mandatory	Type	Description
id	Yes	String	Definition: Lite Server ID. Constraints: Mandatory. Range: 1 to 64 characters. Default Value: N/A
project_id	Yes	String	Definition: Project ID Constraints: Mandatory Range: The value can contain 1 to 64 characters. Letters, digits, and hyphens (-) are allowed. Default Value: N/A

Request Parameters

None

Response Parameters

Status code: 200

Table 10-26 Response body parameters

Parameter	Type	Description
create_at	Long	Definition: Creation time. Range: N/A
update_at	Long	Definition: Update time. Range: N/A
charging_mode	String	Definition: Billing mode. Range: • COMMON: both yearly/monthly and pay-per-use • POST_PAID: pay-per-use • PRE_PAID: yearly/monthly
cloud_server	CloudServer object	Definition: Cloud service information.
endpoints_response	Array of Endpoints objects	Definition: Private IP address of the instance.
flavor	String	Definition: Instance flavor name. Range: ^.{1,128}\$
id	String	Definition: Instance ID. Range: ^[0-9a-f]{8}-[0-9a-f]{4}-[1-5][0-9a-f]{3}-[89ab][0-9a-f]{3}-[0-9a-f]{12}\$
key_pair_name	String	Definition: Key pair name. Range: ^[-_.a-zA-Z0-9]{1,64}\$
name	String	Definition: Instance name. Range: ^[-_.a-zA-Z0-9]{1,64}\$
order_id	String	Definition: Order ID. Range: ^[a-zA-Z0-9]{1,64}\$
server_image_response	ServerImageResponse object	Definition: Instance image information. Range: N/A

Parameter	Type	Description
status	String	Definition: Instance status. Current running status of the instance, which is used to monitor the lifecycle and health status of the instance. Range: • CREATE_FAILED: Creating the instance failed. • CREATING: The instance is being created. • DELETED: The instance has been deleted. • DELETE_FAILED: Deleting the instance failed. • DELETING: The instance is being deleted. • ERROR: An error occurred. • RUNNING: The instance is running. • STARTING: The instance is being started. • START_FAILED: Starting the instance failed. • STOPPED: The instance has been stopped. • STOPPING: The instance is being stopped. • STOP_FAILED: Stopping the instance failed. • REBOOTING: The instance is being restarted. • REBOOT_FAILED: Restarting the instance failed. • CHANGINGOS: The OS is being changed. • CHANGINGOS_FAILED: Changing the OS failed. • REINSTALLINGOS: The OS is being reinstalled. • REINSTALLINGOS_FAILED: Reinstalling the OS failed.

Parameter	Type	Description
vpc_id	String	Definition: ID of the VPC where the instance is located. Range: <code>^[0-9a-f]{8}-[0-9a-f]{4}-[1-5][0-9a-f]{3}-[89ab][0-9a-f]{3}-[0-9a-f]{12}\$</code>
endpoints	Array of EndpointsRes objects	Definition: Private IP address of the server.
volumes	Array of ServerVolume objects	Definition: Information about the mounted hard disk.
image	ServerImageResponse object	Definition: Server image information.
category	String	Definition: Server type. Range: • HPS: supernode server • SPOD: full-cabinet server • SERVER: single server
server_hps	ServerHpsInfo object	Definition: Information about the supernode to which the server belongs.
subnet_id	String	Parameter description: ID of the subnet where the instance is located. ** Value range: <code>**^[0-9a-f]{8}-[0-9a-f]{4}-[1-5][0-9a-f]{3}-[89ab][0-9a-f]{3}-[0-9a-f]{12}\$</code> .

Table 10-27 CloudServer

Parameter	Type	Description
id	String	Definition: Server resource ID or supernode's child node ID. Range: <code>^[0-9a-f]{8}-[0-9a-f]{4}-[1-5][0-9a-f]{3}-[89ab][0-9a-f]{3}-[0-9a-f]{12}\$</code>

Parameter	Type	Description
type	String	Definition: Lite Server server type. Range: • BMS: Bare Metal Server • ECS: Elastic Cloud Server • HPS: Supernode server
hps_id	String	Definition: Server resource ID of the supernode's child node. Range: <code>^[0-9a-f]{8}-[0-9a-f]{4}-[1-5][0-9a-f]{3}-[89ab][0-9a-f]{3}-[0-9a-f]{12}\$</code>
hps_ecs_id	String	Definition: Server resource ID of the supernode's child node. Range: <code>^[0-9a-f]{8}-[0-9a-f]{4}-[1-5][0-9a-f]{3}-[89ab][0-9a-f]{3}-[0-9a-f]{12}\$</code>

Table 10-28 Endpoints

Parameter	Type	Description
dev_service	String	Definition: Supported services. Range: • NOTEBOOK: You can access notebook instances using HTTPS. • SSH: You can remotely access notebook instances through SSH.
extensions	Map<String,String>	Definition: App-specific URL for accessing the remote development mode of the app. It includes extended configurations of the application. Constraints: N/A Range: N/A Default Value: N/A
ssh_keys	Array of strings	Definition: List of SSH key pairs. You can set multiple key pairs to access an SSH instance at the same time. Constraints: N/A Range: 0 to 1,024 key pairs Default Value: N/A

Table 10-29 EndpointsRes

Parameter	Type	Description
allowed_access_ips	Array of strings	Definition: Whitelisted public IP addresses that are allowed to access notebook instances through SSH. By default, all public IP addresses can access the notebook instances. If IP addresses are specified, only the clients with the specified IP addresses can access the notebook instances.
dev_service	String	Definition: Method for accessing the notebook instance. Range: • NOTEBOOK: You can access notebook instances using HTTPS. • SSH: You can remotely access notebook instances through SSH.
ssh_keys	Array of strings	Definition: List of SSH key pairs. You can set multiple key pairs to access an SSH instance at the same time.
service	String	Definition: Method for accessing the notebook instance. Range: • NOTEBOOK: You can access notebook instances using HTTPS. • SSH: You can remotely access notebook instances through SSH.
uri	String	Definition: Private IP address of the instance. Range: N/A

Table 10-30 ServerVolume

Parameter	Type	Description
size	Integer	Definition: EVS disk size, which is the storage space allocated to the system disk. Constraints: N/A Range: 100 to 1,024 GB Default Value: N/A

Parameter	Type	Description
type	String	Definition: Storage type, which can be a system disk or data disk. Constraints: N/A. Range: • ROOT: System disk • DATA: Data disk Default Value: N/A.
evs_type	String	Definition: EVS disk type. Storage type of the EVS disk. Constraints: N/A. Range: • ESSD: Extreme SSD • GPSSD: General-purpose SSD • SAS: High I/O EVS disk • SATA: Common I/O EVS disk • SSD: Ultra-high I/O EVS disk Default Value: N/A.
evs_id	String	Definition: ID of the EVS disk. Range: ^[0-9a-f]{8}-[0-9a-f]{4}-[1-5][0-9a-f]{3}-[89ab][0-9a-f]{3}-[0-9a-f]{12}\$

Table 10-31 ServerImageResponse

Parameter	Type	Description
arch	String	Definition: Architecture type of a server image. Range: • ARM • X86
image_id	String	Definition: Server image ID. Range: ^[0-9a-f]{8}-[0-9a-f]{4}-[1-5][0-9a-f]{3}-[89ab][0-9a-f]{3}-[0-9a-f]{12}\$
name	String	Definition: Server image name. Constraints: N/A Range: 1 to 256 characters Default Value: N/A

Parameter	Type	Description
server_type	String	Definition: Server type. Range: • BMS: BMS • ECS: ECS • HPS: supernode server
status	String	Definition: Server image status. Range: • ACTIVE • INACTIVE

Table 10-32 ServerHpsInfo

Parameter	Type	Description
id	String	Definition: Lite Server supernode instance ID. Range: ^[0-9a-f]{8}-[0-9a-f]{4}-[1-5][0-9a-f]{3}-[89ab][0-9a-f]{3}-[0-9a-f]{12}\$
name	String	Definition: Lite Server supernode name. Range: ^[-_a-zA-Z0-9]{1,64}\$

See [Error Codes](#).

10.4 Changing the Lite Server Instance Name

Function

This API is used to change the name of a created DevServer instance. It is used when you need to rename a DevServer instance to better reflect the function or usage of the instance, or when the instance name does not comply with the current project naming rules. Before using this API, ensure that the DevServer instance exists and you have the permission to manage the instance. After the modification, the new name of the instance takes effect immediately and is updated in all related views and records. If the DevServer instance does not exist, you do not have the required permission, or the new name does not comply with the naming rules, the API returns an error message.

Debugging

You can debug this API through automatic authentication in [API Explorer](#) or use the SDK sample code generated by API Explorer.

Authorization Information

Each account has all the permissions required to call all APIs, but IAM users must be assigned the required permissions.

- If you are using role/policy-based authorization, see [Permissions Policies and Supported Actions](#) for details on the required permissions.
- If you are using identity policy-based authorization, no identity policy-based permission required for calling this API.

URI

10.5 Stopping a Lite Server Instance

Function

This API is used to stop a running Lite Server instance. It is used when you need to stop a Lite Server instance to save resources or perform maintenance. Before using this API, ensure that the Lite Server instance has been created and is running, and you have the permission to stop the instance. If the Lite Server instance does not exist or is stopped, or you do not have the required permission, the API returns an error message.

Constraints

No constraints

Debugging

You can debug this API through automatic authentication in [API Explorer](#) or use the SDK sample code generated by API Explorer.

Authorization Information

Each account has all the permissions required to call all APIs, but IAM users must be assigned the required permissions.

- If you are using role/policy-based authorization, see [Permissions Policies and Supported Actions](#) for details on the required permissions.
- If you are using identity policy-based authorization, the following identity policy-based permissions are required.

10.6 Starting a Lite Server Instance

Function

This API is used to start a Lite Server instance that has been created but is not running. It is used when you need to use a Lite Server instance for development or testing. Before using this API, ensure that the Lite Server instance has been created and is stopped, and you have the permission to start the instance. If the Lite Server instance does not exist or is running, or you do not have the required permission, the API returns an error message.

Constraints

No constraints

Debugging

You can debug this API through automatic authentication in [API Explorer](#) or use the SDK sample code generated by API Explorer.

Authorization Information

Each account has all the permissions required to call all APIs, but IAM users must be assigned the required permissions.

- If you are using role/policy-based authorization, see [Permissions Policies and Supported Actions](#) for details on the required permissions.
- If you are using identity policy-based authorization, the following identity policy-based permissions are required.

Action	Access Level	Resource Type (*: required)	Condition Key	Alias	Dependencies
modelarts:devserver:start	Write	devserver*	-	-	-
		-	g:EnterpriseProjectId		

URI

PUT /v1/{project_id}/dev-servers/{id}/start

Table 10-50 Path Parameters

Parameter	Mandatory	Type	Description
id	Yes	String	Definition: Lite Server instance ID. Constraints: <code>^[0-9a-f]{8}-[0-9a-f]{4}-[1-5][0-9a-f]{3}-[89ab][0-9a-f]{3}-[0-9a-f]{12}\$</code> Range: N/A Default Value: N/A
project_id	Yes	String	Definition: Project ID Constraints: For details, see Obtaining a Project ID and Name . Range: N/A Default Value: N/A

Request Parameters

Table 10-51 Request body parameters

Parameter	Mandatory	Type	Description
arch	No	String	Definition: Server architecture information. Constraints: N/A Range: • ARM • X86 Default value: N/A
charging_mode	No	String	Definition: Billing mode of the server flavor. Constraints: N/A Range: • COMMON: both yearly/monthly and pay-per-use • POST_PAID: pay-per-use • PRE_PAID: yearly/monthly Default value: N/A
server_type	No	String	Definition: Server type. Constraints: N/A Range: • BMS: BMS • ECS: ECS • HPS: supernode server Default value: N/A

Response Parameters

Status code: 200**Table 10-52** Response body parameters

Parameter	Type	Description
create_at	Long	Definition: Creation time. Range: N/A
update_at	Long	Definition: Update time. Range: N/A

Parameter	Type	Description
charging_mode	String	Definition: Billing mode. Range: • COMMON: both yearly/monthly and pay-per-use • POST_PAID: pay-per-use • PRE_PAID: yearly/monthly
cloud_server	CloudServer object	Definition: Cloud service information.
endpoints_response	Array of Endpoints objects	Definition: Private IP address of the instance.
flavor	String	Definition: Instance flavor name. Range: ^.{1,128}\$
id	String	Definition: Instance ID. Range: ^[0-9a-f]{8}-[0-9a-f]{4}-[1-5][0-9a-f]{3}-[89ab][0-9a-f]{3}-[0-9a-f]{12}\$

See [Error Codes](#).

10.7 Deleting a Lite Server Instance

Function

This API is used to delete a created Lite Server instance. It is used when a pay-per-use Lite Server instance is no longer needed, fails to be created, or is in the **ERROR** state. Before using this API, ensure that the Lite Server instance exists and you have the administrator permissions. After the deletion, the Lite Server instance is permanently removed, and related resources are cleared. If the Lite Server instance does not exist or you do not have the required permission, the API returns an error message.

Constraints

Only pay-per-use instances that fail to be created or in the **ERROR** state can be deleted.

Debugging

You can debug this API through automatic authentication in [API Explorer](#) or use the SDK sample code generated by API Explorer.

Authorization Information

Each account has all the permissions required to call all APIs, but IAM users must be assigned the required permissions.

- If you are using role/policy-based authorization, see [Permissions Policies and Supported Actions](#) for details on the required permissions.
- If you are using identity policy-based authorization, the following identity policy-based permissions are required.

10.8 Creating a Hyper Cluster

Function

This API is used to create a hyper cluster in the system. It is used when you need to use a supernode network and create a hyper cluster. Before using this API, ensure that you have logged in to the system and have the permission to create a hyper cluster, and the required resources have been configured in the system. After the creation, a supernode network is created, and details about the supernode network are returned, including the ID, name, and subnet information. If you do not have the required permission, the system does not have the required resources, or the configuration parameters are invalid, the API returns an error message.

Constraints

No constraints.

Debugging

You can debug this API through automatic authentication in [API Explorer](#) or use the SDK sample code generated by API Explorer.

Authorization Information

Each account has all the permissions required to call all APIs, but IAM users must be assigned the required permissions.

- If you are using role/policy-based authorization, see [Permissions Policies and Supported Actions](#) for details on the required permissions.
- If you are using identity policy-based authorization, no identity policy-based permission required for calling this API.

10.9 Obtaining the Hyper Cluster Details List

Function

This API is used to obtain details about all hyper clusters. It is used when you need to know the configuration and status of all supernode networks in the system. Before using this API, ensure that you have logged in to the system and have the permission to query hyper cluster details. After the query, the API returns details about all supernode networks, including the ID, name, and subnet information. If you do not have the required permission or the system does not have hyper clusters, the API returns an error message.

Constraints

No constraints.

Debugging

You can debug this API through automatic authentication in [API Explorer](#) or use the SDK sample code generated by API Explorer.

Authorization Information

Each account has all the permissions required to call all APIs, but IAM users must be assigned the required permissions.

- If you are using role/policy-based authorization, see [Permissions Policies and Supported Actions](#) for details on the required permissions.
- If you are using identity policy-based authorization, no identity policy-based permission required for calling this API.

URI

GET /v1/{project_id}/dev-servers/hyper-clusters

Table 10-71 Path Parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Definition: User project ID. Constraints: Mandatory. Range: The value can contain 1 to 64 characters. Letters, digits, and hyphens (-) are allowed. Default Value: N/A

Table 10-72 Query Parameters

Parameter	Mandatory	Type	Description
type	No	String	Definition: HyperCluster type. Constraints: Optional. Range: • HPS: Default value, which is used to query the HyperCluster of the HPS model. • ECS: Query the HyperCluster of the ECS model. Default Value: HPS.

Request Parameters

10.10 Querying Hyper Cluster Instance Details

Function

This API is used to obtain the details of a specified hyper cluster instance. It is used when you need to know the configuration and status of a supernode network for management and monitoring. Before using this API, ensure that you have logged in to the system, have the permission to query hyper cluster details, and the specified supernode network exists. After the query, the API returns details about the specified supernode network, including the ID, name, and subnet information. If you do not have the required permission to perform the operation, the specified supernode network does not exist, or the ID is invalid, the API returns an error message.

Constraints

No constraints.

Debugging

You can debug this API through automatic authentication in [API Explorer](#) or use the SDK sample code generated by API Explorer.

Authorization Information

Each account has all the permissions required to call all APIs, but IAM users must be assigned the required permissions.

- If you are using role/policy-based authorization, see [Permissions Policies and Supported Actions](#) for details on the required permissions.
- If you are using identity policy-based authorization, no identity policy-based permission required for calling this API.

URI

10.11 Deleting a Hyper Cluster Instance

Function

This API is used to delete a created hyper cluster instance. It is used when the supernode network is incorrectly configured or resources need to be cleared. Before using this API, ensure that the hyper cluster instance exists and you have the administrator permissions. After the deletion, the supernode network is permanently removed, and related resources and configurations are cleared. If the hyper cluster instance does not exist or you do not have the operation permission, the API returns an error message.

Constraints

No constraints.

Debugging

You can debug this API through automatic authentication in [API Explorer](#) or use the SDK sample code generated by API Explorer.

Authorization Information

Each account has all the permissions required to call all APIs, but IAM users must be assigned the required permissions.

- If you are using role/policy-based authorization, see [Permissions Policies and Supported Actions](#) for details on the required permissions.
- If you are using identity policy-based authorization, no identity policy-based permission required for calling this API.

URI

DELETE /v1/{project_id}/dev-servers/hyper-clusters/{id}

10.12 Synchronizing the Status of All Lite Server Instances of a User in Real Time

Function

This API is used to obtain and synchronize the status of a Lite Server instance in real time. It is used when you need to monitor the status of a Lite Server instance in real time to ensure that the instance is running properly or detect and handle exceptions in a timely manner. Before using this API, ensure that you have logged in to the system and have the required permission, and the Lite Server instance has been created and is running. After this API is called, the latest status of the Lite Server instance is returned, including the instance ID, status, and resource usage. If you do not have the required permission or the Lite Server instance does not exist, the API returns an error message.

Constraints

No constraints

Debugging

You can debug this API through automatic authentication in [API Explorer](#) or use the SDK sample code generated by API Explorer.

Authorization Information

Each account has all the permissions required to call all APIs, but IAM users must be assigned the required permissions.

- If you are using role/policy-based authorization, see [Permissions Policies and Supported Actions](#) for details on the required permissions.
- If you are using identity policy-based authorization, the following identity policy-based permissions are required.

Action	Access Level	Resource Type (*: required)	Condition Key	Alias	Dependencies
modelarts:devserver:sync	Write	devserver*	-	-	-
		-	g:EnterpriseProjectId		

URI

PUT /v1/{project_id}/dev-servers/sync

Table 10-82 Path Parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Definition: Project ID Constraints: Mandatory Range: The value can contain 1 to 64 characters. Letters, digits, and hyphens (-) are allowed. Default Value: N/A

Table 10-83 Query Parameters

Parameter	Mandatory	Type	Description
owner	No	String	Definition: User ID of the instance Constraints: Optional Range: This value contains 1 to 64 characters. Lowercase letters, digits, and hyphens (-) are allowed. This parameter is valid only when the account is a big account or has the admin permission. Generally, the value is the ID of the current login user. Default Value: N/A

Parameter	Mandatory	Type	Description
sort_dir	No	String	Definition: Sorting mode Constraints: Optional Range: • ASC: ascending order • DESC: descending order Default Value: ASC
sort_key	No	String	Definition: sorting field. Constraints: optional. Options: • createTime: sorting by creation time (default value) • updateTime: sorting by update time. Default Value: createTime
offset	No	Integer	Definition: Start offset of the records on each page Constraints: Optional Range: 0 to 2147483647 Default Value: 0
limit	No	Integer	Definition: Number of records on each page Constraints: Optional Range: 0 to 1024 Default Value: 10

Request Parameters

Response Parameters

Status code: 200

Table 10-84 Response body parameters

Parameter	Type	Description
current	Integer	Definition: Current page number. Value range: 1 to 2097152

Parameter	Type	Description
data	Array of ServerResponse objects	Definition: Lite Server instance list.
pages	Integer	Definition: Total number of pages. Value range: 1 to 2097152
size	Integer	Definition: Number of records on each page. Maximum number of instances returned on each page. The value of this parameter directly affects the amount of returned data. You can adjust the value to optimize the query performance or increase the information volume of a single request. Range: 1 to 1024
total	Long	Definition: Total number of records. Total number of instances that meet the search criteria. This field is used to learn the overall data scale. Range: 1 to 2147483647

Table 10-85 ServerResponse

Parameter	Type	Description
create_at	Long	Definition: Creation time. Range: N/A
update_at	Long	Definition: Update time. Range: N/A
charging_mode	String	Definition: Billing mode. Range: • COMMON: both yearly/monthly and pay-per-use • POST_PAID: pay-per-use • PRE_PAID: yearly/monthly
cloud_server	CloudServer object	Definition: Cloud service information.
endpoints_response	Array of Endpoints objects	Definition: Private IP address of the instance.

Parameter	Type	Description
flavor	String	Definition: Instance flavor name. Range: ^.{1,128}\$
id	String	Definition: Instance ID. Range: ^[0-9a-f]{8}-[0-9a-f]{4}-[1-5][0-9a-f]{3}-[89ab][0-9a-f]{3}-[0-9a-f]{12}\$
key_pair_name	String	Definition: Key pair name. Range: ^[-_.a-zA-Z0-9]{1,64}\$
name	String	Definition: Instance name. Range: ^[-_.a-zA-Z0-9]{1,64}\$
order_id	String	Definition: Order ID. Range: ^[a-zA-Z0-9]{1,64}\$
server_image_response	ServerImageResponse object	Definition: Instance image information. Range: N/A

Parameter	Type	Description
status	String	Definition: Instance status. Current running status of the instance, which is used to monitor the lifecycle and health status of the instance. Range: • CREATE_FAILED: Creating the instance failed. • CREATING: The instance is being created. • DELETED: The instance has been deleted. • DELETE_FAILED: Deleting the instance failed. • DELETING: The instance is being deleted. • ERROR: An error occurred. • RUNNING: The instance is running. • STARTING: The instance is being started. • START_FAILED: Starting the instance failed. • STOPPED: The instance has been stopped. • STOPPING: The instance is being stopped. • STOP_FAILED: Stopping the instance failed. • REBOOTING: The instance is being restarted. • REBOOT_FAILED: Restarting the instance failed. • CHANGINGOS: The OS is being changed. • CHANGINGOS_FAILED: Changing the OS failed. • REINSTALLINGOS: The OS is being reinstalled. • REINSTALLINGOS_FAILED: Reinstalling the OS failed.

Parameter	Type	Description
vpc_id	String	Definition: ID of the VPC where the instance is located. Range: ^[0-9a-f]{8}-[0-9a-f]{4}-[1-5][0-9a-f]{3}-[89ab][0-9a-f]{3}-[0-9a-f]{12}\$
endpoints	Array of EndpointsRes objects	Definition: Private IP address of the server.
volumes	Array of ServerVolume objects	Definition: Information about the mounted hard disk.
image	ServerImageResponse object	Definition: Server image information.
category	String	Definition: Server type. Range: • HPS: supernode server • SPOD: full-cabinet server • SERVER: single server
server_hps	ServerHpsInfo object	Definition: Information about the supernode to which the server belongs.
subnet_id	String	Parameter description: ID of the subnet where the instance is located. ** Value range: ** ^[0-9a-f]{8}-[0-9a-f]{4}-[1-5][0-9a-f]{3}-[89ab][0-9a-f]{3}-[0-9a-f]{12}\$.

Table 10-86 CloudServer

Parameter	Type	Description
id	String	Definition: Server resource ID or supernode's child node ID. Range: ^[0-9a-f]{8}-[0-9a-f]{4}-[1-5][0-9a-f]{3}-[89ab][0-9a-f]{3}-[0-9a-f]{12}\$

Parameter	Type	Description
type	String	Definition: Lite Server server type. Range: • BMS: Bare Metal Server • ECS: Elastic Cloud Server • HPS: Supernode server
hps_id	String	Definition: Server resource ID of the supernode's child node. Range: ^[0-9a-f]{8}-[0-9a-f]{4}-[1-5][0-9a-f]{3}-[89ab][0-9a-f]{3}-[0-9a-f]{12}\$
hps_ecs_id	String	Definition: Server resource ID of the supernode's child node. Range: ^[0-9a-f]{8}-[0-9a-f]{4}-[1-5][0-9a-f]{3}-[89ab][0-9a-f]{3}-[0-9a-f]{12}\$

Table 10-87 Endpoints

Parameter	Type	Description
dev_service	String	Definition: Supported services. Range: • NOTEBOOK: You can access notebook instances using HTTPS. • SSH: You can remotely access notebook instances through SSH.
extensions	Map<String,String>	Definition: App-specific URL for accessing the remote development mode of the app. It includes extended configurations of the application. Constraints: N/A Range: N/A Default Value: N/A
ssh_keys	Array of strings	Definition: List of SSH key pairs. You can set multiple key pairs to access an SSH instance at the same time. Constraints: N/A Range: 0 to 1,024 key pairs Default Value: N/A

Table 10-88 EndpointsRes

Parameter	Type	Description
allowed_access_ips	Array of strings	Definition: Whitelisted public IP addresses that are allowed to access notebook instances through SSH. By default, all public IP addresses can access the notebook instances. If IP addresses are specified, only the clients with the specified IP addresses can access the notebook instances.
dev_service	String	Definition: Method for accessing the notebook instance. Range: • NOTEBOOK: You can access notebook instances using HTTPS. • SSH: You can remotely access notebook instances through SSH.
ssh_keys	Array of strings	Definition: List of SSH key pairs. You can set multiple key pairs to access an SSH instance at the same time.
service	String	Definition: Method for accessing the notebook instance. Range: • NOTEBOOK: You can access notebook instances using HTTPS. • SSH: You can remotely access notebook instances through SSH.
uri	String	Definition: Private IP address of the instance. Range: N/A

Table 10-89 ServerVolume

Parameter	Type	Description
size	Integer	Definition: EVS disk size, which is the storage space allocated to the system disk. Constraints: N/A Range: 100 to 1,024 GB Default Value: N/A

Parameter	Type	Description
type	String	Definition: Storage type, which can be a system disk or data disk. Constraints: N/A. Range: • ROOT: System disk • DATA: Data disk Default Value: N/A.
evs_type	String	Definition: EVS disk type. Storage type of the EVS disk. Constraints: N/A. Range: • ESSD: Extreme SSD • GPSSD: General-purpose SSD • SAS: High I/O EVS disk • SATA: Common I/O EVS disk • SSD: Ultra-high I/O EVS disk Default Value: N/A.
evs_id	String	Definition: ID of the EVS disk. Range: ^[0-9a-f]{8}-[0-9a-f]{4}-[1-5][0-9a-f]{3}-[89ab][0-9a-f]{3}-[0-9a-f]{12}\$

Table 10-90 ServerImageResponse

Parameter	Type	Description
arch	String	Definition: Architecture type of a server image. Range: • ARM • X86
image_id	String	Definition: Server image ID. Range: ^[0-9a-f]{8}-[0-9a-f]{4}-[1-5][0-9a-f]{3}-[89ab][0-9a-f]{3}-[0-9a-f]{12}\$
name	String	Definition: Server image name. Constraints: N/A Range: 1 to 256 characters Default Value: N/A

Parameter	Type	Description
server_type	String	Definition: Server type. Range: • BMS: BMS • ECS: ECS • HPS: supernode server
status	String	Definition: Server image status. Range: • ACTIVE • INACTIVE

Table 10-91 ServerHpsInfo

Parameter	Type	Description
id	String	Definition: Lite Server supernode instance ID. Range: ^[0-9a-f]{8}-[0-9a-f]{4}-[1-5][0-9a-f]{3}-[89ab][0-9a-f]{3}-[0-9a-f]{12}\$
name	String	Definition: Lite Server supernode name. Range: ^[-_a-zA-Z0-9]{1,64}\$

10.13 Creating a Lite Server Supernode Tag

Function

This API is used to add a custom tag to a Lite Server supernode. It is used when you need to manage Lite Server supernodes by category or mark specific information. Before using this API, ensure that the Lite Server supernode exists and you have the permission to create tags. After the creation, the tag is added to the specified supernode. You can quickly search for and manage the supernode by tag. If the Lite Server supernode does not exist, the tag already exists, or you do not have the permission to perform operations on the supernode, the API returns an error message.

Debugging

You can debug this API through automatic authentication in [API Explorer](#) or use the SDK sample code generated by API Explorer.

Authorization Information

Each account has all the permissions required to call all APIs, but IAM users must be assigned the required permissions.

- If you are using role/policy-based authorization, see [Permissions Policies and Supported Actions](#) for details on the required permissions.
- If you are using identity policy-based authorization, no identity policy-based permission required for calling this API.

Error Codes

See [Error Codes](#).

10.14 Deleting a Lite Server Supernode Tag

Function

This API is used to delete a Lite Server supernode tag. It is used when you need to delete unnecessary tags or correct tag errors. Before using this API, ensure that the Lite Server supernode exists, the supernode has the tag to be deleted, and you have the permission to delete tags. After the deletion, the specified tag is removed from the supernode, and other configurations and data of the supernode remain unchanged. If the Lite Server supernode does not exist, the tag does not exist, or you do not have the permission to perform operations on the supernode, the API returns an error message.

Debugging

You can debug this API through automatic authentication in [API Explorer](#) or use the SDK sample code generated by API Explorer.

Authorization Information

Each account has all the permissions required to call all APIs, but IAM users must be assigned the required permissions.

- If you are using role/policy-based authorization, see [Permissions Policies and Supported Actions](#) for details on the required permissions.
- If you are using identity policy-based authorization, no identity policy-based permission required for calling this API.

URI

POST /v1/{project_id}/dev-servers/hyperinstance/{id}/tags/delete

Table 10-106 Path Parameters

Parameter	Mandatory	Type	Description
id	Yes	String	Definition: Lite Server supernode ID.

Parameter	Mandatory	Type	Description
project_id	Yes	String	Definition: Project ID Constraints: For details, see Obtaining a Project ID and Name . Range: N/A Default Value: N/A

Request Parameters

10.15 Querying Lite Server Supernode Tags

Function

This API is used to obtain all tag information on a Lite Server supernode. It is used when you need to view or manage tags of a Lite Server supernode. Before using this API, ensure that the Lite Server supernode exists and you have the permission to query tags. After the query, the API returns all tag information on the supernode, including the tag name and related attributes. If the Lite Server supernode does not exist or you do not have the permission to perform operations on the supernode, the API returns an error message.

Debugging

You can debug this API through automatic authentication in [API Explorer](#) or use the SDK sample code generated by API Explorer.

Authorization Information

Each account has all the permissions required to call all APIs, but IAM users must be assigned the required permissions.

- If you are using role/policy-based authorization, see [Permissions Policies and Supported Actions](#) for details on the required permissions.
- If you are using identity policy-based authorization, no identity policy-based permission required for calling this API.

10.16 Reinstalling the OS Image of a Lite Server

Function

This API is used to reinstall the OS image of a Lite Server. It is used when you need to update the OS version, rectify system faults, or reconfigure the system environment. Before using this API, ensure that the Lite Server exists and is stopped, and you have the permission to reinstall the OS. After the reinstallation, the new OS image is installed for the Lite Server and the Lite Server starts running. If the Lite Server does not exist, is running, or you do not have the required permission, the API returns an error message.

Debugging

You can debug this API through automatic authentication in [API Explorer](#) or use the SDK sample code generated by API Explorer.

Authorization Information

Each account has all the permissions required to call all APIs, but IAM users must be assigned the required permissions.

- If you are using role/policy-based authorization, see [Permissions Policies and Supported Actions](#) for details on the required permissions.
- If you are using identity policy-based authorization, no identity policy-based permission required for calling this API.

URI

POST /v1/{project_id}/dev-servers/{id}/reinstallos

Table 10-132 Path Parameters

Parameter	Mandatory	Type	Description
id	Yes	String	Definition: Lite Server instance ID. Constraints: <code>^[0-9a-f]{8}-[0-9a-f]{4}-[1-5][0-9a-f]{3}-[89ab][0-9a-f]{3}-[0-9a-f]{12}\$</code> Range: N/A Default Value: N/A
project_id	Yes	String	Definition: Project ID Constraints: For details, see Obtaining a Project ID and Name . Range: N/A Default Value: N/A

Request Parameters

Table 10-133 Request body parameters

Parameter	Mandatory	Type	Description
admin_pass	No	String	Definition: Password used for logging in to the server. Note that either admin_pass or key_pair_name must be specified for ECSs and BMSs and supernodes support only key_pair_name. Constraints: The password must: • Contain 8 to 26 characters. • Contain at least three of the following types: uppercase letters, lowercase letters, digits, and special characters (!@%_-=+[{ }],./?). • Cannot be the username or the username spelled backwards. • Cannot contain root, administrator, or their reverse. Range: N/A Default value: N/A
key_pair_name	No	String	Name of the key pair for logging in to the server. Note that either admin_pass or key_pair_name must be specified. This parameter is supported only when ECSs or BMSs are reset or their OSs are changed. Supernodes do not support this parameter.
image_id	No	String	Definition: Image ID. This parameter is mandatory when the OS is changed. Constraints: N/A Range: N/A Default value: N/A

Parameter	Mandatory	Type	Description
user_data	No	String	Definition Custom data to be injected into the instance during cloud server creation. Texts and text files can be injected. Example: Before Base64 encoding: - Linux server: <pre>#!/bin/bash echo user_test > /home/user.txt</pre> After Base64 encoding: - Linux server: <pre>IyEvYmluL2Jhc2gKZWNoYyB1c2VyX3Rlc3QgPiAvaG9tZS91c2VyLnR4dA==</pre> For more information about user data injection, see Injecting User Data. You must be aware of the effects of user_data. You are responsible for the impact and risks. Constraints - The content of user_data must be encoded with Base64. - The maximum size of the content to be injected (before encoding) is 32 KB. Range: N/A Default Value: N/A

Response Parameters

Status code: 200

Table 10-134 Response header parameters

Parameter	Type	Description
X-Request-Id	String	Link trace ID.

Table 10-135 Response body parameters

Parameter	Type	Description
create_at	Long	Definition: Creation time. Range: N/A
update_at	Long	Definition: Update time. Range: N/A
charging_mode	String	Definition: Billing mode. Range: • COMMON: both yearly/monthly and pay-per-use • POST_PAID: pay-per-use • PRE_PAID: yearly/monthly
cloud_server	CloudServer object	Definition: Cloud service information.
endpoints_response	Array of Endpoints objects	Definition: Private IP address of the instance.
flavor	String	Definition: Instance flavor name. Range: ^.{1,128}\$
id	String	Definition: Instance ID. Range: ^[0-9a-f]{8}-[0-9a-f]{4}-[1-5][0-9a-f]{3}-[89ab][0-9a-f]{3}-[0-9a-f]{12}\$
key_pair_name	String	Definition: Key pair name. Range: ^[-_.a-zA-Z0-9]{1,64}\$
name	String	Definition: Instance name. Range: ^[-_.a-zA-Z0-9]{1,64}\$
order_id	String	Definition: Order ID. Range: ^[a-zA-Z0-9]{1,64}\$
server_image_response	ServerImageResponse object	Definition: Instance image information. Range: N/A

Parameter	Type	Description
status	String	Definition: Instance status. Current running status of the instance, which is used to monitor the lifecycle and health status of the instance. Range: • CREATE_FAILED: Creating the instance failed. • CREATING: The instance is being created. • DELETED: The instance has been deleted. • DELETE_FAILED: Deleting the instance failed. • DELETING: The instance is being deleted. • ERROR: An error occurred. • RUNNING: The instance is running. • STARTING: The instance is being started. • START_FAILED: Starting the instance failed. • STOPPED: The instance has been stopped. • STOPPING: The instance is being stopped. • STOP_FAILED: Stopping the instance failed. • REBOOTING: The instance is being restarted. • REBOOT_FAILED: Restarting the instance failed. • CHANGINGOS: The OS is being changed. • CHANGINGOS_FAILED: Changing the OS failed. • REINSTALLINGOS: The OS is being reinstalled. • REINSTALLINGOS_FAILED: Reinstalling the OS failed.

Parameter	Type	Description
vpc_id	String	Definition: ID of the VPC where the instance is located. Range: <code>^[0-9a-f]{8}-[0-9a-f]{4}-[1-5][0-9a-f]{3}-[89ab][0-9a-f]{3}-[0-9a-f]{12}\$</code>
endpoints	Array of EndpointsRes objects	Definition: Private IP address of the server.
volumes	Array of ServerVolume objects	Definition: Information about the mounted hard disk.
image	ServerImageResponse object	Definition: Server image information.
category	String	Definition: Server type. Range: • HPS: supernode server • SPOD: full-cabinet server • SERVER: single server
server_hps	ServerHpsInfo object	Definition: Information about the supernode to which the server belongs.
subnet_id	String	Parameter description: ID of the subnet where the instance is located. ** Value range: <code>**^[0-9a-f]{8}-[0-9a-f]{4}-[1-5][0-9a-f]{3}-[89ab][0-9a-f]{3}-[0-9a-f]{12}\$</code> .

Table 10-136 CloudServer

Parameter	Type	Description
id	String	Definition: Server resource ID or supernode's child node ID. Range: <code>^[0-9a-f]{8}-[0-9a-f]{4}-[1-5][0-9a-f]{3}-[89ab][0-9a-f]{3}-[0-9a-f]{12}\$</code>

Parameter	Type	Description
type	String	Definition: Lite Server server type. Range: • BMS: Bare Metal Server • ECS: Elastic Cloud Server • HPS: Supernode server
hps_id	String	Definition: Server resource ID of the supernode's child node. Range: ^[0-9a-f]{8}-[0-9a-f]{4}-[1-5][0-9a-f]{3}-[89ab][0-9a-f]{3}-[0-9a-f]{12}\$
hps_ecs_id	String	Definition: Server resource ID of the supernode's child node. Range: ^[0-9a-f]{8}-[0-9a-f]{4}-[1-5][0-9a-f]{3}-[89ab][0-9a-f]{3}-[0-9a-f]{12}\$

Table 10-137 Endpoints

Parameter	Type	Description
dev_service	String	Definition: Supported services. Range: • NOTEBOOK: You can access notebook instances using HTTPS. • SSH: You can remotely access notebook instances through SSH.
extensions	Map<String,String>	Definition: App-specific URL for accessing the remote development mode of the app. It includes extended configurations of the application. Constraints: N/A Range: N/A Default Value: N/A
ssh_keys	Array of strings	Definition: List of SSH key pairs. You can set multiple key pairs to access an SSH instance at the same time. Constraints: N/A Range: 0 to 1,024 key pairs Default Value: N/A

Table 10-138 EndpointsRes

Parameter	Type	Description
allowed_access_ips	Array of strings	Definition: Whitelisted public IP addresses that are allowed to access notebook instances through SSH. By default, all public IP addresses can access the notebook instances. If IP addresses are specified, only the clients with the specified IP addresses can access the notebook instances.
dev_service	String	Definition: Method for accessing the notebook instance. Range: • NOTEBOOK: You can access notebook instances using HTTPS. • SSH: You can remotely access notebook instances through SSH.
ssh_keys	Array of strings	Definition: List of SSH key pairs. You can set multiple key pairs to access an SSH instance at the same time.
service	String	Definition: Method for accessing the notebook instance. Range: • NOTEBOOK: You can access notebook instances using HTTPS. • SSH: You can remotely access notebook instances through SSH.
uri	String	Definition: Private IP address of the instance. Range: N/A

Table 10-139 ServerVolume

Parameter	Type	Description
size	Integer	Definition: EVS disk size, which is the storage space allocated to the system disk. Constraints: N/A Range: 100 to 1,024 GB Default Value: N/A

Parameter	Type	Description
type	String	Definition: Storage type, which can be a system disk or data disk. Constraints: N/A. Range: • ROOT: System disk • DATA: Data disk Default Value: N/A.
evs_type	String	Definition: EVS disk type. Storage type of the EVS disk. Constraints: N/A. Range: • ESSD: Extreme SSD • GPSSD: General-purpose SSD • SAS: High I/O EVS disk • SATA: Common I/O EVS disk • SSD: Ultra-high I/O EVS disk Default Value: N/A.
evs_id	String	Definition: ID of the EVS disk. Range: ^[0-9a-f]{8}-[0-9a-f]{4}-[1-5][0-9a-f]{3}-[89ab][0-9a-f]{3}-[0-9a-f]{12}\$

10.17 Changing the OS Image of a Lite Server

Function

This API is used to change the OS image of a Lite Server. It is used when you need to change the OS of a Lite Server to meet different development or test requirements. Before using this API, ensure that the Lite Server exists and is stopped, and you have the permission to switch the OS. After the OS is switched, the Lite Server will install the new OS image and enter the running state. If the Lite Server does not exist, is in the running state, or you do not have the operation permission, the API will return an error message.

Debugging

You can debug this API through automatic authentication in [API Explorer](#) or use the SDK sample code generated by API Explorer.

Authorization Information

Each account has all the permissions required to call all APIs, but IAM users must be assigned the required permissions.

- If you are using role/policy-based authorization, see [Permissions Policies and Supported Actions](#) for details on the required permissions.
- If you are using identity policy-based authorization, no identity policy-based permission required for calling this API.

Parameter	Mandatory	Type	Description
user_data	No	String	Definition Custom data to be injected into the instance during cloud server creation. Texts and text files can be injected. Example: Before Base64 encoding: - Linux server: <pre>#!/bin/bash echo user_test > /home/user.txt</pre> After Base64 encoding: - Linux server: <pre>IyEvYmluL2Jhc2gKZWNoYyB1c2VyX3Rlc3QgPiAvaG9tZS91c2VyLnR4dA==</pre> For more information about user data injection, see Injecting User Data. You must be aware of the effects of user_data. You are responsible for the impact and risks. Constraints - The content of user_data must be encoded with Base64. - The maximum size of the content to be injected (before encoding) is 32 KB. Range: N/A Default Value: N/A

Response Parameters

Status code: 200

Table 10-152 Response header parameters

Parameter	Type	Description
X-Request-Id	String	Link trace ID.

Table 10-153 Response body parameters

Parameter	Type	Description
create_at	Long	Definition: Creation time. Range: N/A
update_at	Long	Definition: Update time. Range: N/A
charging_mode	String	Definition: Billing mode. Range: • COMMON: both yearly/monthly and pay-per-use • POST_PAID: pay-per-use • PRE_PAID: yearly/monthly
cloud_server	CloudServer object	Definition: Cloud service information.
endpoints_response	Array of Endpoints objects	Definition: Private IP address of the instance.
flavor	String	Definition: Instance flavor name. Range: ^.{1,128}\$
id	String	Definition: Instance ID. Range: ^[0-9a-f]{8}-[0-9a-f]{4}-[1-5][0-9a-f]{3}-[89ab][0-9a-f]{3}-[0-9a-f]{12}\$
key_pair_name	String	Definition: Key pair name. Range: ^[-_.a-zA-Z0-9]{1,64}\$
name	String	Definition: Instance name. Range: ^[-_.a-zA-Z0-9]{1,64}\$
order_id	String	Definition: Order ID. Range: ^[a-zA-Z0-9]{1,64}\$
server_image_response	ServerImageResponse object	Definition: Instance image information. Range: N/A

Parameter	Type	Description
status	String	Definition: Instance status. Current running status of the instance, which is used to monitor the lifecycle and health status of the instance. Range: • CREATE_FAILED: Creating the instance failed. • CREATING: The instance is being created. • DELETED: The instance has been deleted. • DELETE_FAILED: Deleting the instance failed. • DELETING: The instance is being deleted. • ERROR: An error occurred. • RUNNING: The instance is running. • STARTING: The instance is being started. • START_FAILED: Starting the instance failed. • STOPPED: The instance has been stopped. • STOPPING: The instance is being stopped. • STOP_FAILED: Stopping the instance failed. • REBOOTING: The instance is being restarted. • REBOOT_FAILED: Restarting the instance failed. • CHANGINGOS: The OS is being changed. • CHANGINGOS_FAILED: Changing the OS failed. • REINSTALLINGOS: The OS is being reinstalled. • REINSTALLINGOS_FAILED: Reinstalling the OS failed.

Parameter	Type	Description
vpc_id	String	Definition: ID of the VPC where the instance is located. Range: <code>^[0-9a-f]{8}-[0-9a-f]{4}-[1-5][0-9a-f]{3}-[89ab][0-9a-f]{3}-[0-9a-f]{12}\$</code>
endpoints	Array of EndpointsRes objects	Definition: Private IP address of the server.
volumes	Array of ServerVolume objects	Definition: Information about the mounted hard disk.
image	ServerImageResponse object	Definition: Server image information.
category	String	Definition: Server type. Range: • HPS: supernode server • SPOD: full-cabinet server • SERVER: single server
server_hps	ServerHpsInfo object	Definition: Information about the supernode to which the server belongs.
subnet_id	String	Parameter description: ID of the subnet where the instance is located. ** Value range: <code>**^[0-9a-f]{8}-[0-9a-f]{4}-[1-5][0-9a-f]{3}-[89ab][0-9a-f]{3}-[0-9a-f]{12}\$</code> .

Table 10-154 CloudServer

Parameter	Type	Description
id	String	Definition: Server resource ID or supernode's child node ID. Range: <code>^[0-9a-f]{8}-[0-9a-f]{4}-[1-5][0-9a-f]{3}-[89ab][0-9a-f]{3}-[0-9a-f]{12}\$</code>

Parameter	Type	Description
type	String	Definition: Lite Server server type. Range: • BMS: Bare Metal Server • ECS: Elastic Cloud Server • HPS: Supernode server
hps_id	String	Definition: Server resource ID of the supernode's child node. Range: ^[0-9a-f]{8}-[0-9a-f]{4}-[1-5][0-9a-f]{3}-[89ab][0-9a-f]{3}-[0-9a-f]{12}\$
hps_ecs_id	String	Definition: Server resource ID of the supernode's child node. Range: ^[0-9a-f]{8}-[0-9a-f]{4}-[1-5][0-9a-f]{3}-[89ab][0-9a-f]{3}-[0-9a-f]{12}\$

Table 10-155 Endpoints

Parameter	Type	Description
dev_service	String	Definition: Supported services. Range: • NOTEBOOK: You can access notebook instances using HTTPS. • SSH: You can remotely access notebook instances through SSH.
extensions	Map<String,String>	Definition: App-specific URL for accessing the remote development mode of the app. It includes extended configurations of the application. Constraints: N/A Range: N/A Default Value: N/A
ssh_keys	Array of strings	Definition: List of SSH key pairs. You can set multiple key pairs to access an SSH instance at the same time. Constraints: N/A Range: 0 to 1,024 key pairs Default Value: N/A

Table 10-156 EndpointsRes

Parameter	Type	Description
allowed_access_ips	Array of strings	Definition: Whitelisted public IP addresses that are allowed to access notebook instances through SSH. By default, all public IP addresses can access the notebook instances. If IP addresses are specified, only the clients with the specified IP addresses can access the notebook instances.
dev_service	String	Definition: Method for accessing the notebook instance. Range: • NOTEBOOK: You can access notebook instances using HTTPS. • SSH: You can remotely access notebook instances through SSH.
ssh_keys	Array of strings	Definition: List of SSH key pairs. You can set multiple key pairs to access an SSH instance at the same time.
service	String	Definition: Method for accessing the notebook instance. Range: • NOTEBOOK: You can access notebook instances using HTTPS. • SSH: You can remotely access notebook instances through SSH.
uri	String	Definition: Private IP address of the instance. Range: N/A

Table 10-157 ServerVolume

Parameter	Type	Description
size	Integer	Definition: EVS disk size, which is the storage space allocated to the system disk. Constraints: N/A Range: 100 to 1,024 GB Default Value: N/A

Parameter	Type	Description
type	String	Definition: Storage type, which can be a system disk or data disk. Constraints: N/A. Range: • ROOT: System disk • DATA: Data disk Default Value: N/A.
evs_type	String	Definition: EVS disk type. Storage type of the EVS disk. Constraints: N/A. Range: • ESSD: Extreme SSD • GPSSD: General-purpose SSD • SAS: High I/O EVS disk • SATA: Common I/O EVS disk • SSD: Ultra-high I/O EVS disk Default Value: N/A.
evs_id	String	Definition: ID of the EVS disk. Range: ^[0-9a-f]{8}-[0-9a-f]{4}-[1-5][0-9a-f]{3}-[89ab][0-9a-f]{3}-[0-9a-f]{12}\$

Table 10-158 ServerImageResponse

Parameter	Type	Description
arch	String	Definition: Architecture type of a server image. Range: • ARM • X86
image_id	String	Definition: Server image ID. Range: ^[0-9a-f]{8}-[0-9a-f]{4}-[1-5][0-9a-f]{3}-[89ab][0-9a-f]{3}-[0-9a-f]{12}\$
name	String	Definition: Server image name. Constraints: N/A Range: 1 to 256 characters Default Value: N/A

Parameter	Type	Description
server_type	String	Definition: Server type. Range: • BMS: BMS • ECS: ECS • HPS: supernode server
status	String	Definition: Server image status. Range: • ACTIVE • INACTIVE

Table 10-159 ServerHpsInfo

Parameter	Type	Description
id	String	Definition: Lite Server supernode instance ID. Range: ^[0-9a-f]{8}-[0-9a-f]{4}-[1-5][0-9a-f]{3}-[89ab][0-9a-f]{3}-[0-9a-f]{12}\$
name	String	Definition: Lite Server supernode name. Range: ^[-_a-zA-Z0-9]{1,64}\$

Status code: 400**Table 10-160** Response header parameters

Parameter	Type	Description
X-Request-Id	String	Link trace ID.

Table 10-161 Response body parameters

Parameter	Type	Description
error_code	String	• Definition: ModelArts error code. Range: N/A
error_msg	String	Definition: Error message. Range: N/A

Status code: 401**Table 10-162** Response header parameters

Parameter	Type	Description
X-Request-Id	String	Link trace ID.

Table 10-163 Response body parameters

Parameter	Type	Description
error_code	String	• Definition: ModelArts error code. Range: N/A
error_msg	String	Definition: Error message. Range: N/A

Status code: 403**Table 10-164** Response header parameters

Parameter	Type	Description
X-Request-Id	String	Link trace ID.

Table 10-165 Response body parameters

Parameter	Type	Description
error_code	String	• Definition: ModelArts error code. Range: N/A
error_msg	String	Definition: Error message. Range: N/A

Status code: 500**Table 10-166** Response header parameters

Parameter	Type	Description
X-Request-Id	String	Link trace ID.

Table 10-167 Response body parameters

Parameter	Type	Description
error_code	String	Definition: ModelArts error code. Range: N/A
error_msg	String	Definition: Error message. Range: N/A

Example Requests

```
POST https://{endpoint}/v1/{project_id}/dev-servers/{id}/changeos
{

Status Codes

Status Code	Description
200	OK
400	Bad Request
401	Unauthorized
403	Forbidden
500	Server Internal Error

Error Codes

See [Error Codes](#).

10.18 Changing the OS Image of a Lite Server Supernode

Function

This API is used to change the OS image of a Lite Server supernode. It is used when you need to change the OS of a Lite Server supernode to meet different development or test requirements. Before using this API, ensure that the Lite Server supernode exists and is stopped, and you have the permission to switch the OS. After the OS is switched, the Lite Server supernode will install the new OS image and enter the running state. If the Lite Server supernode does not exist, is in the running state, or you do not have the operation permission, the API returns an error message.

Debugging

You can debug this API through automatic authentication in [API Explorer](#) or use the SDK sample code generated by API Explorer.

Authorization Information

Each account has all the permissions required to call all APIs, but IAM users must be assigned the required permissions.

- If you are using role/policy-based authorization, see [Permissions Policies and Supported Actions](#) for details on the required permissions.
- If you are using identity policy-based authorization, no identity policy-based permission required for calling this API.

URI

POST /v1/{project_id}/dev-servers/hyperinstance/{id}/changeos

Table 10-168 Path Parameters

Parameter	Mandatory	Type	Description
id	Yes	String	Definition: Supernode ID of the Lite Server instance. Constraints: <code>^[0-9a-f]{8}-[0-9a-f]{4}-[1-5][0-9a-f]{3}-[89ab][0-9a-f]{3}-[0-9a-f]{12}\$</code> Range: N/A Default Value: N/A

Parameter	Mandatory	Type	Description
project_id	Yes	String	Definition: Project ID Constraints: For details, see Obtaining a Project ID and Name . Range: N/A Default Value: N/A

Request Parameters

Table 10-169 Request body parameters

Parameter	Mandatory	Type	Description
admin_pass	No	String	Definition: Password used for logging in to the server. Note that either admin_pass or key_pair_name must be specified for ECSs and BMSs and supernodes support only key_pair_name . Constraints: The password must: • Contain 8 to 26 characters. • Contain at least three of the following types: uppercase letters, lowercase letters, digits, and special characters (!@%-_+[{ }],./?). • Cannot be the username or the username spelled backwards. • Cannot contain root, administrator, or their reverse. Range: N/A Default value: N/A

Parameter	Mandatory	Type	Description
key_pair_name	No	String	Name of the key pair for logging in to the server. Note that either admin_pass or key_pair_name must be specified. This parameter is supported only when ECSs or BMSs are reset or their OSs are changed. Supernodes do not support this parameter.
image_id	No	String	Definition: Image ID. This parameter is mandatory when the OS is changed. Constraints: N/A Range: N/A Default value: N/A

Parameter	Mandatory	Type	Description
user_data	No	String	Definition Custom data to be injected into the instance during cloud server creation. Texts and text files can be injected. Example: Before Base64 encoding: - Linux server: <pre>#!/bin/bash echo user_test > /home/user.txt</pre> After Base64 encoding: - Linux server: <pre>IyEvYmluL2Jhc2gKZWNoYyB1c2VyX3Rlc3QgPiAvaG9tZS91c2VyLnR4dA==</pre> For more information about user data injection, see Injecting User Data. You must be aware of the effects of user_data. You are responsible for the impact and risks. Constraints - The content of user_data must be encoded with Base64. - The maximum size of the content to be injected (before encoding) is 32 KB. Range: N/A Default Value: N/A

Response Parameters

Status code: 200

Table 10-170 Response header parameters

Parameter	Type	Description
X-Request-Id	String	Link trace ID.

Table 10-171 Response body parameters

Parameter	Type	Description
create_at	Long	Definition: Creation time. Constraints: N/A Range: N/A Default Value: N/A
hps_cluster_id	String	Definition: Network ID of the supernode cluster. Constraints: N/A Range: ^[0-9a-f]{8}-[0-9a-f]{4}-[1-5][0-9a-f]{3}-[89ab][0-9a-f]{3}-[0-9a-f]{12}\$ Default Value: N/A
hps_id	String	Definition: Supernode ID. Constraints: N/A Range: ^[0-9a-f]{8}-[0-9a-f]{4}-[1-5][0-9a-f]{3}-[89ab][0-9a-f]{3}-[0-9a-f]{12}\$ Default Value: N/A
id	String	Definition: Lite Server supernode ID. Constraints: N/A. Range: ^[0-9a-f]{8}-[0-9a-f]{4}-[1-5][0-9a-f]{3}-[89ab][0-9a-f]{3}-[0-9a-f]{12}\$ Default Value: N/A.
name	String	Definition: Instance name. Constraints: N/A Range: ^[_a-zA-Z0-9]{1,64}\$ Default Value: N/A
order_id	String	Definition: Order ID. Constraints: N/A Range: ^[a-zA-Z0-9]{1,64}\$ Default Value: N/A

Parameter	Type	Description
status	String	Definition: Supernode instance status. Constraints: N/A Range: • PROVISIONING: The request for creating a supernode has been accepted, but the supernode is still being created. • ACTIVE: The supernode is active and its resources can be used. • ERROR: The supernode fails to be created. • REIMAGING: The OS of the supernode is being changed. • TERMINATING: Resources are being released. • TERMINATED: The supernode resources have been released and are no longer available. Default Value: N/A
servers	Array of ServerResponse objects	Definition: List of supernode subnode instances. Constraints: N/A Range: N/A Default Value: N/A
update_at	Long	Definition: Creation time. Constraints: N/A Range: N/A Default Value: N/A

Table 10-172 ServerResponse

Parameter	Type	Description
create_at	Long	Definition: Creation time. Range: N/A
update_at	Long	Definition: Update time. Range: N/A

Parameter	Type	Description
charging_mode	String	Definition: Billing mode. Range: • COMMON: both yearly/monthly and pay-per-use • POST_PAID: pay-per-use • PRE_PAID: yearly/monthly
cloud_server	CloudServer object	Definition: Cloud service information.
endpoints_response	Array of Endpoints objects	Definition: Private IP address of the instance.
flavor	String	Definition: Instance flavor name. Range: ^.{1,128}\$
id	String	Definition: Instance ID. Range: ^[0-9a-f]{8}-[0-9a-f]{4}-[1-5][0-9a-f]{3}-[89ab][0-9a-f]{3}-[0-9a-f]{12}\$
key_pair_name	String	Definition: Key pair name. Range: ^[-_.a-zA-Z0-9]{1,64}\$
name	String	Definition: Instance name. Range: ^[-_.a-zA-Z0-9]{1,64}\$
order_id	String	Definition: Order ID. Range: ^[a-zA-Z0-9]{1,64}\$
server_image_response	ServerImageResponse object	Definition: Instance image information. Range: N/A

Parameter	Type	Description
status	String	Definition: Instance status. Current running status of the instance, which is used to monitor the lifecycle and health status of the instance. Range: • CREATE_FAILED: Creating the instance failed. • CREATING: The instance is being created. • DELETED: The instance has been deleted. • DELETE_FAILED: Deleting the instance failed. • DELETING: The instance is being deleted. • ERROR: An error occurred. • RUNNING: The instance is running. • STARTING: The instance is being started. • START_FAILED: Starting the instance failed. • STOPPED: The instance has been stopped. • STOPPING: The instance is being stopped. • STOP_FAILED: Stopping the instance failed. • REBOOTING: The instance is being restarted. • REBOOT_FAILED: Restarting the instance failed. • CHANGINGOS: The OS is being changed. • CHANGINGOS_FAILED: Changing the OS failed. • REINSTALLINGOS: The OS is being reinstalled. • REINSTALLINGOS_FAILED: Reinstalling the OS failed.

Parameter	Type	Description
vpc_id	String	Definition: ID of the VPC where the instance is located. Range: <code>^[0-9a-f]{8}-[0-9a-f]{4}-[1-5][0-9a-f]{3}-[89ab][0-9a-f]{3}-[0-9a-f]{12}\$</code>
endpoints	Array of EndpointsRes objects	Definition: Private IP address of the server.
volumes	Array of ServerVolume objects	Definition: Information about the mounted hard disk.
image	ServerImageResponse object	Definition: Server image information.
category	String	Definition: Server type. Range: • HPS: supernode server • SPOD: full-cabinet server • SERVER: single server
server_hps	ServerHpsInfo object	Definition: Information about the supernode to which the server belongs.
subnet_id	String	Parameter description: ID of the subnet where the instance is located. ** Value range: <code>**^[0-9a-f]{8}-[0-9a-f]{4}-[1-5][0-9a-f]{3}-[89ab][0-9a-f]{3}-[0-9a-f]{12}\$</code> .

Table 10-173 CloudServer

Parameter	Type	Description
id	String	Definition: Server resource ID or supernode's child node ID. Range: <code>^[0-9a-f]{8}-[0-9a-f]{4}-[1-5][0-9a-f]{3}-[89ab][0-9a-f]{3}-[0-9a-f]{12}\$</code>

Parameter	Type	Description
type	String	Definition: Lite Server server type. Range: • BMS: Bare Metal Server • ECS: Elastic Cloud Server • HPS: Supernode server
hps_id	String	Definition: Server resource ID of the supernode's child node. Range: ^[0-9a-f]{8}-[0-9a-f]{4}-[1-5][0-9a-f]{3}-[89ab][0-9a-f]{3}-[0-9a-f]{12}\$
hps_ecs_id	String	Definition: Server resource ID of the supernode's child node. Range: ^[0-9a-f]{8}-[0-9a-f]{4}-[1-5][0-9a-f]{3}-[89ab][0-9a-f]{3}-[0-9a-f]{12}\$

Table 10-174 Endpoints

Parameter	Type	Description
dev_service	String	Definition: Supported services. Range: • NOTEBOOK: You can access notebook instances using HTTPS. • SSH: You can remotely access notebook instances through SSH.
extensions	Map<String,String>	Definition: App-specific URL for accessing the remote development mode of the app. It includes extended configurations of the application. Constraints: N/A Range: N/A Default Value: N/A
ssh_keys	Array of strings	Definition: List of SSH key pairs. You can set multiple key pairs to access an SSH instance at the same time. Constraints: N/A Range: 0 to 1,024 key pairs Default Value: N/A

Table 10-175 EndpointsRes

Parameter	Type	Description
allowed_access_ips	Array of strings	Definition: Whitelisted public IP addresses that are allowed to access notebook instances through SSH. By default, all public IP addresses can access the notebook instances. If IP addresses are specified, only the clients with the specified IP addresses can access the notebook instances.
dev_service	String	Definition: Method for accessing the notebook instance. Range: • NOTEBOOK: You can access notebook instances using HTTPS. • SSH: You can remotely access notebook instances through SSH.
ssh_keys	Array of strings	Definition: List of SSH key pairs. You can set multiple key pairs to access an SSH instance at the same time.
service	String	Definition: Method for accessing the notebook instance. Range: • NOTEBOOK: You can access notebook instances using HTTPS. • SSH: You can remotely access notebook instances through SSH.
uri	String	Definition: Private IP address of the instance. Range: N/A

Table 10-176 ServerVolume

Parameter	Type	Description
size	Integer	Definition: EVS disk size, which is the storage space allocated to the system disk. Constraints: N/A Range: 100 to 1,024 GB Default Value: N/A

Parameter	Type	Description
type	String	Definition: Storage type, which can be a system disk or data disk. Constraints: N/A. Range: • ROOT: System disk • DATA: Data disk Default Value: N/A.
evs_type	String	Definition: EVS disk type. Storage type of the EVS disk. Constraints: N/A. Range: • ESSD: Extreme SSD • GPSSD: General-purpose SSD • SAS: High I/O EVS disk • SATA: Common I/O EVS disk • SSD: Ultra-high I/O EVS disk Default Value: N/A.
evs_id	String	Definition: ID of the EVS disk. Range: ^[0-9a-f]{8}-[0-9a-f]{4}-[1-5][0-9a-f]{3}-[89ab][0-9a-f]{3}-[0-9a-f]{12}\$

10.19 Obtaining Details About All Supernode Instances of a User

Function

This API is used to obtain details about all Lite Server supernode instances of a user. It is used when you need to view the configuration, status, and usage of all supernode instances. Before using this API, ensure that you have logged in to the system and have the permission to query supernode instances. After the query, the API returns details about all supernode instances, including the instance ID, OS, status, and resource usage. If you do not have the required permission or the system does not have supernode instances, the API returns an error message.

Constraints

No constraints.

Debugging

You can debug this API through automatic authentication in [API Explorer](#) or use the SDK sample code generated by API Explorer.

Authorization Information

Each account has all the permissions required to call all APIs, but IAM users must be assigned the required permissions.

- If you are using role/policy-based authorization, see [Permissions Policies and Supported Actions](#) for details on the required permissions.
- If you are using identity policy-based authorization, no identity policy-based permission required for calling this API.

URI

GET /v1/{project_id}/dev-servers/hyperinstance

Table 10-187 Path Parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Definition: Project ID Constraints: For details, see Obtaining a Project ID and Name . Range: N/A Default Value: N/A

Table 10-188 Query Parameters

Parameter	Mandatory	Type	Description
sort_dir	No	String	Definition: Sorting mode Constraints: N/A Range: Enums: - ASC: ascending order - DESC: descending order Default Value: N/A
sort_key	No	String	Definition: Sorting field Constraints: N/A Range: Enums: - createTime: sorting by creation time (default value) - updateTime: sorting by update time Default Value: N/A
limit	No	Integer	Definition: Number of records on each page Constraints: N/A Range: [1, 1024] Default Value: 10
offset	No	Integer	Definition: Start offset of the records on each page Constraints: N/A Range: [0, 2147483647] Default Value: N/A

Request Parameters

None

Response Parameters

Status code: 200

Table 10-189 Response header parameters

Parameter	Type	Description
X-Request-Id	String	Link trace ID.

Table 10-190 Response body parameters

Parameter	Type	Description
current	Integer	Definition: Current page number. Constraints: N/A Range: N/A Default Value: N/A
data	Array of ServerHyperinstanceResponse objects	Definition: Lite Server supernode instance list. Constraints: N/A. Range: N/A. Default Value: N/A.
pages	Integer	Definition: Total number of pages. Constraints: N/A Range: N/A Default Value: N/A
size	Integer	Definition: Number of records on each page. Constraints: N/A Range: N/A Default Value: N/A
total	Long	Definition: Total number of records. Constraints: N/A Range: N/A Default Value: N/A

Table 10-191 ServerHyperinstanceResponse

Parameter	Type	Description
create_at	Long	Definition: Creation time. Constraints: N/A Range: N/A Default Value: N/A
hps_cluster_id	String	Definition: Network ID of the supernode cluster. Constraints: N/A Range: ^[0-9a-f]{8}-[0-9a-f]{4}-[1-5][0-9a-f]{3}-[89ab][0-9a-f]{3}-[0-9a-f]{12}\$ Default Value: N/A
hps_id	String	Definition: Supernode ID. Constraints: N/A Range: ^[0-9a-f]{8}-[0-9a-f]{4}-[1-5][0-9a-f]{3}-[89ab][0-9a-f]{3}-[0-9a-f]{12}\$ Default Value: N/A
id	String	Definition: Lite Server supernode ID. Constraints: N/A. Range: ^[0-9a-f]{8}-[0-9a-f]{4}-[1-5][0-9a-f]{3}-[89ab][0-9a-f]{3}-[0-9a-f]{12}\$ Default Value: N/A.
name	String	Definition: Instance name. Constraints: N/A Range: ^[-_a-zA-Z0-9]{1,64}\$ Default Value: N/A
order_id	String	Definition: Order ID. Constraints: N/A Range: ^[a-zA-Z0-9]{1,64}\$ Default Value: N/A

Parameter	Type	Description
status	String	Definition: Supernode instance status. Constraints: N/A Range: • PROVISIONING: The request for creating a supernode has been accepted, but the supernode is still being created. • ACTIVE: The supernode is active and its resources can be used. • ERROR: The supernode fails to be created. • REIMAGING: The OS of the supernode is being changed. • TERMINATING: Resources are being released. • TERMINATED: The supernode resources have been released and are no longer available. Default Value: N/A
servers	Array of ServerResponse objects	Definition: List of supernode subnode instances. Constraints: N/A Range: N/A Default Value: N/A
update_at	Long	Definition: Creation time. Constraints: N/A Range: N/A Default Value: N/A

Table 10-192 ServerResponse

Parameter	Type	Description
create_at	Long	Definition: Creation time. Range: N/A
update_at	Long	Definition: Update time. Range: N/A

Parameter	Type	Description
charging_mode	String	Definition: Billing mode. Range: • COMMON: both yearly/monthly and pay-per-use • POST_PAID: pay-per-use • PRE_PAID: yearly/monthly
cloud_server	CloudServer object	Definition: Cloud service information.
endpoints_response	Array of Endpoints objects	Definition: Private IP address of the instance.
flavor	String	Definition: Instance flavor name. Range: ^.{1,128}\$
id	String	Definition: Instance ID. Range: ^[0-9a-f]{8}-[0-9a-f]{4}-[1-5][0-9a-f]{3}-[89ab][0-9a-f]{3}-[0-9a-f]{12}\$
key_pair_name	String	Definition: Key pair name. Range: ^[-_.a-zA-Z0-9]{1,64}\$
name	String	Definition: Instance name. Range: ^[-_.a-zA-Z0-9]{1,64}\$
order_id	String	Definition: Order ID. Range: ^[a-zA-Z0-9]{1,64}\$
server_image_response	ServerImageResponse object	Definition: Instance image information. Range: N/A

Parameter	Type	Description
status	String	Definition: Instance status. Current running status of the instance, which is used to monitor the lifecycle and health status of the instance. Range: • CREATE_FAILED: Creating the instance failed. • CREATING: The instance is being created. • DELETED: The instance has been deleted. • DELETE_FAILED: Deleting the instance failed. • DELETING: The instance is being deleted. • ERROR: An error occurred. • RUNNING: The instance is running. • STARTING: The instance is being started. • START_FAILED: Starting the instance failed. • STOPPED: The instance has been stopped. • STOPPING: The instance is being stopped. • STOP_FAILED: Stopping the instance failed. • REBOOTING: The instance is being restarted. • REBOOT_FAILED: Restarting the instance failed. • CHANGINGOS: The OS is being changed. • CHANGINGOS_FAILED: Changing the OS failed. • REINSTALLINGOS: The OS is being reinstalled. • REINSTALLINGOS_FAILED: Reinstalling the OS failed.

Parameter	Type	Description
vpc_id	String	Definition: ID of the VPC where the instance is located. Range: <code>^[0-9a-f]{8}-[0-9a-f]{4}-[1-5][0-9a-f]{3}-[89ab][0-9a-f]{3}-[0-9a-f]{12}\$</code>
endpoints	Array of EndpointsRes objects	Definition: Private IP address of the server.
volumes	Array of ServerVolume objects	Definition: Information about the mounted hard disk.
image	ServerImageResponse object	Definition: Server image information.
category	String	Definition: Server type. Range: • HPS: supernode server • SPOD: full-cabinet server • SERVER: single server
server_hps	ServerHpsInfo object	Definition: Information about the supernode to which the server belongs.
subnet_id	String	Parameter description: ID of the subnet where the instance is located. ** Value range: <code>**^[0-9a-f]{8}-[0-9a-f]{4}-[1-5][0-9a-f]{3}-[89ab][0-9a-f]{3}-[0-9a-f]{12}\$</code> .

Table 10-193 CloudServer

Parameter	Type	Description
id	String	Definition: Server resource ID or supernode's child node ID. Range: <code>^[0-9a-f]{8}-[0-9a-f]{4}-[1-5][0-9a-f]{3}-[89ab][0-9a-f]{3}-[0-9a-f]{12}\$</code>

Parameter	Type	Description
type	String	Definition: Lite Server server type. Range: • BMS: Bare Metal Server • ECS: Elastic Cloud Server • HPS: Supernode server
hps_id	String	Definition: Server resource ID of the supernode's child node. Range: ^[0-9a-f]{8}-[0-9a-f]{4}-[1-5][0-9a-f]{3}-[89ab][0-9a-f]{3}-[0-9a-f]{12}\$
hps_ecs_id	String	Definition: Server resource ID of the supernode's child node. Range: ^[0-9a-f]{8}-[0-9a-f]{4}-[1-5][0-9a-f]{3}-[89ab][0-9a-f]{3}-[0-9a-f]{12}\$

Table 10-194 Endpoints

Parameter	Type	Description
dev_service	String	Definition: Supported services. Range: • NOTEBOOK: You can access notebook instances using HTTPS. • SSH: You can remotely access notebook instances through SSH.
extensions	Map<String,String>	Definition: App-specific URL for accessing the remote development mode of the app. It includes extended configurations of the application. Constraints: N/A Range: N/A Default Value: N/A
ssh_keys	Array of strings	Definition: List of SSH key pairs. You can set multiple key pairs to access an SSH instance at the same time. Constraints: N/A Range: 0 to 1,024 key pairs Default Value: N/A

Table 10-195 EndpointsRes

Parameter	Type	Description
allowed_access_ips	Array of strings	Definition: Whitelisted public IP addresses that are allowed to access notebook instances through SSH. By default, all public IP addresses can access the notebook instances. If IP addresses are specified, only the clients with the specified IP addresses can access the notebook instances.
dev_service	String	Definition: Method for accessing the notebook instance. Range: • NOTEBOOK: You can access notebook instances using HTTPS. • SSH: You can remotely access notebook instances through SSH.
ssh_keys	Array of strings	Definition: List of SSH key pairs. You can set multiple key pairs to access an SSH instance at the same time.
service	String	Definition: Method for accessing the notebook instance. Range: • NOTEBOOK: You can access notebook instances using HTTPS. • SSH: You can remotely access notebook instances through SSH.
uri	String	Definition: Private IP address of the instance. Range: N/A

Table 10-196 ServerVolume

Parameter	Type	Description
size	Integer	Definition: EVS disk size, which is the storage space allocated to the system disk. Constraints: N/A Range: 100 to 1,024 GB Default Value: N/A

Parameter	Type	Description
type	String	Definition: Storage type, which can be a system disk or data disk. Constraints: N/A. Range: • ROOT: System disk • DATA: Data disk Default Value: N/A.
evs_type	String	Definition: EVS disk type. Storage type of the EVS disk. Constraints: N/A. Range: • ESSD: Extreme SSD • GPSSD: General-purpose SSD • SAS: High I/O EVS disk • SATA: Common I/O EVS disk • SSD: Ultra-high I/O EVS disk Default Value: N/A.
evs_id	String	Definition: ID of the EVS disk. Range: ^[0-9a-f]{8}-[0-9a-f]{4}-[1-5][0-9a-f]{3}-[89ab][0-9a-f]{3}-[0-9a-f]{12}\$

Table 10-197 ServerImageResponse

Parameter	Type	Description
arch	String	Definition: Architecture type of a server image. Range: • ARM • X86
image_id	String	Definition: Server image ID. Range: ^[0-9a-f]{8}-[0-9a-f]{4}-[1-5][0-9a-f]{3}-[89ab][0-9a-f]{3}-[0-9a-f]{12}\$
name	String	Definition: Server image name. Constraints: N/A Range: 1 to 256 characters Default Value: N/A

Parameter	Type	Description
server_type	String	Definition: Server type. Range: • BMS: BMS • ECS: ECS • HPS: supernode server
status	String	Definition: Server image status. Range: • ACTIVE • INACTIVE

Table 10-198 ServerHpsInfo

Parameter	Type	Description
id	String	Definition: Lite Server supernode instance ID. Range: ^[0-9a-f]{8}-[0-9a-f]{4}-[1-5][0-9a-f]{3}-[89ab][0-9a-f]{3}-[0-9a-f]{12}\$
name	String	Definition: Lite Server supernode name. Range: ^[-_a-zA-Z0-9]{1,64}\$

10.20 Obtaining Details About a Specified Supernode Instance

Function

This API is used to obtain the details of a specific Lite Server supernode instance. It is used when you need to view the configuration, status, and usage of a specified supernode instance. Before using this API, ensure that you have logged in to the system and have the permission to query the supernode instance, and the specified supernode instance exists. After the query, the API returns details about a specified supernode instance, including the instance ID, OS, status, and resource usage. If you do not have the required permission to perform the operation, the specified supernode instance does not exist, or the instance ID is invalid, the API returns an error message.

Constraints

No constraints.

Debugging

You can debug this API through automatic authentication in [API Explorer](#) or use the SDK sample code generated by API Explorer.

Authorization Information

Each account has all the permissions required to call all APIs, but IAM users must be assigned the required permissions.

- If you are using role/policy-based authorization, see [Permissions Policies and Supported Actions](#) for details on the required permissions.
- If you are using identity policy-based authorization, no identity policy-based permission required for calling this API.

Parameter	Type	Description
dev_service	String	Definition: Supported services. Range: • NOTEBOOK: You can access notebook instances using HTTPS. • SSH: You can remotely access notebook instances through SSH.
extensions	Map<String,String>	Definition: App-specific URL for accessing the remote development mode of the app. It includes extended configurations of the application. Constraints: N/A Range: N/A Default Value: N/A
ssh_keys	Array of strings	Definition: List of SSH key pairs. You can set multiple key pairs to access an SSH instance at the same time. Constraints: N/A Range: 0 to 1,024 key pairs Default Value: N/A

Table 10-213 EndpointsRes

Parameter	Type	Description
allowed_access_ips	Array of strings	Definition: Whitelisted public IP addresses that are allowed to access notebook instances through SSH. By default, all public IP addresses can access the notebook instances. If IP addresses are specified, only the clients with the specified IP addresses can access the notebook instances.
dev_service	String	Definition: Method for accessing the notebook instance. Range: • NOTEBOOK: You can access notebook instances using HTTPS. • SSH: You can remotely access notebook instances through SSH.
ssh_keys	Array of strings	Definition: List of SSH key pairs. You can set multiple key pairs to access an SSH instance at the same time.
service	String	Definition: Method for accessing the notebook instance. Range: • NOTEBOOK: You can access notebook instances using HTTPS. • SSH: You can remotely access notebook instances through SSH.
uri	String	Definition: Private IP address of the instance. Range: N/A

Table 10-214 ServerVolume

Parameter	Type	Description
size	Integer	Definition: EVS disk size, which is the storage space allocated to the system disk. Constraints: N/A Range: 100 to 1,024 GB Default Value: N/A

Parameter	Type	Description
type	String	Definition: Storage type, which can be a system disk or data disk. Constraints: N/A. Range: • ROOT: System disk • DATA: Data disk Default Value: N/A.
evs_type	String	Definition: EVS disk type. Storage type of the EVS disk. Constraints: N/A. Range: • ESSD: Extreme SSD • GPSSD: General-purpose SSD • SAS: High I/O EVS disk • SATA: Common I/O EVS disk • SSD: Ultra-high I/O EVS disk Default Value: N/A.
evs_id	String	Definition: ID of the EVS disk. Range: ^[0-9a-f]{8}-[0-9a-f]{4}-[1-5][0-9a-f]{3}-[89ab][0-9a-f]{3}-[0-9a-f]{12}\$

Table 10-215 ServerImageResponse

Parameter	Type	Description
arch	String	Definition: Architecture type of a server image. Range: • ARM • X86
image_id	String	Definition: Server image ID. Range: ^[0-9a-f]{8}-[0-9a-f]{4}-[1-5][0-9a-f]{3}-[89ab][0-9a-f]{3}-[0-9a-f]{12}\$
name	String	Definition: Server image name. Constraints: N/A Range: 1 to 256 characters Default Value: N/A

Parameter	Type	Description
server_type	String	Definition: Server type. Range: • BMS: BMS • ECS: ECS • HPS: supernode server
status	String	Definition: Server image status. Range: • ACTIVE • INACTIVE

Table 10-216 ServerHpsInfo

Parameter	Type	Description
id	String	Definition: Lite Server supernode instance ID. Range: ^[0-9a-f]{8}-[0-9a-f]{4}-[1-5][0-9a-f]{3}-[89ab][0-9a-f]{3}-[0-9a-f]{12}\$
name	String	Definition: Lite Server supernode name. Range: ^[-_a-zA-Z0-9]{1,64}\$

Error Codes

See [Error Codes](#).

10.21 Deleting a Lite Server Supernode Instance

Function

This API is used to delete a pay-per-use supernode instance and remove the Lite Server supernode instances in the **ERROR** state. It is used when a supernode instance is in the **ERROR** state due to creation failure or other reasons. Before using this API, ensure that you have logged in to the system and have the permission to delete a supernode instance, and the specified supernode instance is pay-per-use and in the **RUNNING** or **ERROR** state. After the deletion, the specified supernode instance is permanently removed, and related resources are cleared. If the specified supernode instance does not exist, is not in the **ERROR** state, or you do not have the operation permission, the API returns an error message.

Constraints

No constraints.

Debugging

You can debug this API through automatic authentication in [API Explorer](#) or use the SDK sample code generated by API Explorer.

Authorization Information

Each account has all the permissions required to call all APIs, but IAM users must be assigned the required permissions.

- If you are using role/policy-based authorization, see [Permissions Policies and Supported Actions](#) for details on the required permissions.
- If you are using identity policy-based authorization, no identity policy-based permission required for calling this API.

Table 10-226 Response header parameters

Parameter	Type	Description
X-Request-Id	String	Link trace ID.

Table 10-227 Response body parameters

Parameter	Type	Description
create_at	Long	Definition: Creation time. Constraints: N/A Range: N/A Default Value: N/A
hps_cluster_id	String	Definition: Network ID of the supernode cluster. Constraints: N/A Range: ^[0-9a-f]{8}-[0-9a-f]{4}-[1-5][0-9a-f]{3}-[89ab][0-9a-f]{3}-[0-9a-f]{12}\$ Default Value: N/A

Parameter	Type	Description
hps_id	String	Definition: Supernode ID. Constraints: N/A Range: <code>^[0-9a-f]{8}-[0-9a-f]{4}-[1-5][0-9a-f]{3}-[89ab][0-9a-f]{3}-[0-9a-f]{12}\$</code> Default Value: N/A
id	String	Definition: Lite Server supernode ID. Constraints: N/A. Range: <code>^[0-9a-f]{8}-[0-9a-f]{4}-[1-5][0-9a-f]{3}-[89ab][0-9a-f]{3}-[0-9a-f]{12}\$</code> Default Value: N/A.
name	String	Definition: Instance name. Constraints: N/A Range: <code>^[_,.a-zA-Z0-9]{1,64}\$</code> Default Value: N/A
order_id	String	Definition: Order ID. Constraints: N/A Range: <code>^[a-zA-Z0-9]{1,64}\$</code> Default Value: N/A
status	String	Definition: Supernode instance status. Constraints: N/A Range: ● PROVISIONING: The request for creating a supernode has been accepted, but the supernode is still being created. ● ACTIVE: The supernode is active and its resources can be used. ● ERROR: The supernode fails to be created. ● REIMAGING: The OS of the supernode is being changed. ● TERMINATING: Resources are being released. ● TERMINATED: The supernode resources have been released and are no longer available. Default Value: N/A

Parameter	Type	Description
servers	Array of ServerResponse objects	Definition: List of supernode subnode instances. Constraints: N/A Range: N/A Default Value: N/A
update_at	Long	Definition: Creation time. Constraints: N/A Range: N/A Default Value: N/A

Table 10-228 ServerResponse

Parameter	Type	Description
create_at	Long	Definition: Creation time. Range: N/A
update_at	Long	Definition: Update time. Range: N/A
charging_mode	String	Definition: Billing mode. Range: • COMMON: both yearly/monthly and pay-per-use • POST_PAID: pay-per-use • PRE_PAID: yearly/monthly
cloud_server	CloudServer object	Definition: Cloud service information.
endpoints_response	Array of Endpoints objects	Definition: Private IP address of the instance.
flavor	String	Definition: Instance flavor name. Range: ^.{1,128}\$
id	String	Definition: Instance ID. Range: ^[0-9a-f]{8}-[0-9a-f]{4}-[1-5][0-9a-f]{3}-[89ab][0-9a-f]{3}-[0-9a-f]{12}\$
key_pair_name	String	Definition: Key pair name. Range: ^[-_.a-zA-Z0-9]{1,64}\$

Parameter	Type	Description
name	String	Definition: Instance name. Range: ^[-_a-zA-Z0-9]{1,64}\$
order_id	String	Definition: Order ID. Range: ^[a-zA-Z0-9]{1,64}\$
server_image_response	ServerImageResponse object	Definition: Instance image information. Range: N/A

Parameter	Type	Description
status	String	Definition: Instance status. Current running status of the instance, which is used to monitor the lifecycle and health status of the instance. Range: • CREATE_FAILED: Creating the instance failed. • CREATING: The instance is being created. • DELETED: The instance has been deleted. • DELETE_FAILED: Deleting the instance failed. • DELETING: The instance is being deleted. • ERROR: An error occurred. • RUNNING: The instance is running. • STARTING: The instance is being started. • START_FAILED: Starting the instance failed. • STOPPED: The instance has been stopped. • STOPPING: The instance is being stopped. • STOP_FAILED: Stopping the instance failed. • REBOOTING: The instance is being restarted. • REBOOT_FAILED: Restarting the instance failed. • CHANGINGOS: The OS is being changed. • CHANGINGOS_FAILED: Changing the OS failed. • REINSTALLINGOS: The OS is being reinstalled. • REINSTALLINGOS_FAILED: Reinstalling the OS failed.

Parameter	Type	Description
vpc_id	String	Definition: ID of the VPC where the instance is located. Range: <code>^[0-9a-f]{8}-[0-9a-f]{4}-[1-5][0-9a-f]{3}-[89ab][0-9a-f]{3}-[0-9a-f]{12}\$</code>
endpoints	Array of EndpointsRes objects	Definition: Private IP address of the server.
volumes	Array of ServerVolume objects	Definition: Information about the mounted hard disk.
image	ServerImageResponse object	Definition: Server image information.
category	String	Definition: Server type. Range: • HPS: supernode server • SPOD: full-cabinet server • SERVER: single server
server_hps	ServerHpsInfo object	Definition: Information about the supernode to which the server belongs.
subnet_id	String	Parameter description: ID of the subnet where the instance is located. ** Value range: <code>**^[0-9a-f]{8}-[0-9a-f]{4}-[1-5][0-9a-f]{3}-[89ab][0-9a-f]{3}-[0-9a-f]{12}\$</code> .

Table 10-229 CloudServer

Parameter	Type	Description
id	String	Definition: Server resource ID or supernode's child node ID. Range: <code>^[0-9a-f]{8}-[0-9a-f]{4}-[1-5][0-9a-f]{3}-[89ab][0-9a-f]{3}-[0-9a-f]{12}\$</code>

Parameter	Type	Description
type	String	Definition: Lite Server server type. Range: • BMS: Bare Metal Server • ECS: Elastic Cloud Server • HPS: Supernode server
hps_id	String	Definition: Server resource ID of the supernode's child node. Range: ^[0-9a-f]{8}-[0-9a-f]{4}-[1-5][0-9a-f]{3}-[89ab][0-9a-f]{3}-[0-9a-f]{12}\$
hps_ecs_id	String	Definition: Server resource ID of the supernode's child node. Range: ^[0-9a-f]{8}-[0-9a-f]{4}-[1-5][0-9a-f]{3}-[89ab][0-9a-f]{3}-[0-9a-f]{12}\$

Table 10-230 Endpoints

Parameter	Type	Description
dev_service	String	Definition: Supported services. Range: • NOTEBOOK: You can access notebook instances using HTTPS. • SSH: You can remotely access notebook instances through SSH.
extensions	Map<String,String>	Definition: App-specific URL for accessing the remote development mode of the app. It includes extended configurations of the application. Constraints: N/A Range: N/A Default Value: N/A
ssh_keys	Array of strings	Definition: List of SSH key pairs. You can set multiple key pairs to access an SSH instance at the same time. Constraints: N/A Range: 0 to 1,024 key pairs Default Value: N/A

Table 10-231 EndpointsRes

Parameter	Type	Description

10.22 Restarting a Lite Server Instance

Function

This API is used to restart a running Lite Server instance. It is used when you need to restart a specified Lite Server instance to apply configuration changes, solve running problems, or maintain the system. Before using this API, ensure that the Lite Server instance has been created and is running, and you have the permission to restart the instance. After the restart, the Lite Server instance restarts and enters the running state. You can continue to use the services provided by the instance. If the Lite Server instance does not exist or is stopped, or you do not have the required permission, the API returns an error message.

Debugging

You can debug this API through automatic authentication in [API Explorer](#) or use the SDK sample code generated by API Explorer.

Authorization Information

Each account has all the permissions required to call all APIs, but IAM users must be assigned the required permissions.

- If you are using role/policy-based authorization, see [Permissions Policies and Supported Actions](#) for details on the required permissions.
- If you are using identity policy-based authorization, no identity policy-based permission required for calling this API.

10.23 Starting a Lite Server Supernode

Function

This API is used to start a Lite Server supernode that has been created but is not running. It is used when you need to start a Lite Server supernode for development or testing. Before using this API, ensure that the Lite Server supernode has been created and is stopped, and you have the permission to start the supernode. After the startup, the supernode enters the running state, and you can access and use the services provided by the server. If the Lite Server supernode does not exist, is in the running state, or you do not have the operation permission, the API returns an error message.

Debugging

You can debug this API through automatic authentication in [API Explorer](#) or use the SDK sample code generated by API Explorer.

Authorization Information

Each account has all the permissions required to call all APIs, but IAM users must be assigned the required permissions.

- If you are using role/policy-based authorization, see [Permissions Policies and Supported Actions](#) for details on the required permissions.
- If you are using identity policy-based authorization, no identity policy-based permission required for calling this API.

URI

PUT /v1/{project_id}/dev-servers/hyperinstance/{id}/start

Table 10-260 Path Parameters

Parameter	Mandatory	Type	Description
id	Yes	String	Definition: Lite Server supernode ID. Constraints: N/A Range: $^{[0-9a-f]\{8\}-[0-9a-f]\{4\}-[1-5][0-9a-f]\{3\}-[89ab][0-9a-f]\{3\}-[0-9a-f]\{12\}}$ Default Value: N/A
project_id	Yes	String	Definition: Project ID. For details, see Obtaining a Project ID and Name . Constraints: The value can contain 1 to 64 characters. Letters, digits, and hyphens (-) are allowed. Range: N/A Default Value: N/A

Request Parameters

Table 10-261 Response header parameters

Parameter	Type	Description
X-Request-Id	String	LinkTrace ID

Table 10-262 Response body parameters

Parameter	Type	Description
create_at	Long	Definition: Creation time. Constraints: N/A Range: N/A Default Value: N/A

Parameter	Type	Description
hps_cluster_id	String	Definition: Network ID of the supernode cluster. Constraints: N/A Range: $^{\wedge}[0-9a-f]\{8\}-[0-9a-f]\{4\}-[1-5][0-9a-f]\{3\}-[89ab][0-9a-f]\{3\}-[0-9a-f]\{12\}$ Default Value: N/A
hps_id	String	Definition: Supernode ID. Constraints: N/A Range: $^{\wedge}[0-9a-f]\{8\}-[0-9a-f]\{4\}-[1-5][0-9a-f]\{3\}-[89ab][0-9a-f]\{3\}-[0-9a-f]\{12\}$ Default Value: N/A
id	String	Definition: Lite Server supernode ID. Constraints: N/A. Range: $^{\wedge}[0-9a-f]\{8\}-[0-9a-f]\{4\}-[1-5][0-9a-f]\{3\}-[89ab][0-9a-f]\{3\}-[0-9a-f]\{12\}$ Default Value: N/A.
name	String	Definition: Instance name. Constraints: N/A Range: $^{\wedge}[_\cdot a-zA-Z0-9]\{1,64\}$ Default Value: N/A
order_id	String	Definition: Order ID. Constraints: N/A Range: $^{\wedge}[a-zA-Z0-9]\{1,64\}$ Default Value: N/A

Parameter	Type	Description
status	String	Definition: Supernode instance status. Constraints: N/A Range: • PROVISIONING: The request for creating a supernode has been accepted, but the supernode is still being created. • ACTIVE: The supernode is active and its resources can be used. • ERROR: The supernode fails to be created. • REIMAGING: The OS of the supernode is being changed. • TERMINATING: Resources are being released. • TERMINATED: The supernode resources have been released and are no longer available. Default Value: N/A
servers	Array of ServerResponse objects	Definition: List of supernode subnode instances. Constraints: N/A Range: N/A Default Value: N/A
update_at	Long	Definition: Creation time. Constraints: N/A Range: N/A Default Value: N/A

Table 10-263 ServerResponse

Parameter	Type	Description
create_at	Long	Definition: Creation time. Range: N/A
update_at	Long	Definition: Update time. Range: N/A

Parameter	Type	Description
charging_mode	String	Definition: Billing mode. Range: COMMON: both yearly/monthly and pay-per-use POST_PAID: pay-per-use PRE_PAID: yearly/monthly
cloud_server	CloudServer object	Definition: Cloud service information.
endpoints_response	Array of Endpoints objects	Definition: Private IP address of the instance.
flavor	String	Definition: Instance flavor name. Range: ^.{1,128}\$
id	String	Definition: Instance ID. Range: ^[0-9a-f]{8}-[0-9a-f]{4}-[1-5][0-9a-f]{3}-[89ab][0-9a-f]{3}-[0-9a-f]{12}\$
key_pair_name	String	Definition: Key pair name. Range: ^[-_.a-zA-Z0-9]{1,64}\$
name	String	Definition: Instance name. Range: ^[-_.a-zA-Z0-9]{1,64}\$
order_id	String	Definition: Order ID. Range: ^[a-zA-Z0-9]{1,64}\$
server_image_response	ServerImageResponse object	Definition: Instance image information. Range: N/A

Parameter	Type	Description
status	String	Definition: Instance status. Current running status of the instance, which is used to monitor the lifecycle and health status of the instance. Range: • CREATE_FAILED: Creating the instance failed. • CREATING: The instance is being created. • DELETED: The instance has been deleted. • DELETE_FAILED: Deleting the instance failed. • DELETING: The instance is being deleted. • ERROR: An error occurred. • RUNNING: The instance is running. • STARTING: The instance is being started. • START_FAILED: Starting the instance failed. • STOPPED: The instance has been stopped. • STOPPING: The instance is being stopped. • STOP_FAILED: Stopping the instance failed. • REBOOTING: The instance is being restarted. • REBOOT_FAILED: Restarting the instance failed. • CHANGINGOS: The OS is being changed. • CHANGINGOS_FAILED: Changing the OS failed. • REINSTALLINGOS: The OS is being reinstalled. • REINSTALLINGOS_FAILED: Reinstalling the OS failed.

Parameter	Type	Description
vpc_id	String	Definition: ID of the VPC where the instance is located. Range: <code>^[0-9a-f]{8}-[0-9a-f]{4}-[1-5][0-9a-f]{3}-[89ab][0-9a-f]{3}-[0-9a-f]{12}\$</code>
endpoints	Array of EndpointsRes objects	Definition: Private IP address of the server.
volumes	Array of ServerVolume objects	Definition: Information about the mounted hard disk.
image	ServerImageResponse object	Definition: Server image information.
category	String	Definition: Server type. Range: • HPS: supernode server • SPOD: full-cabinet server • SERVER: single server
server_hps	ServerHpsInfo object	Definition: Information about the supernode to which the server belongs.
subnet_id	String	Parameter description: ID of the subnet where the instance is located. ** Value range: <code>**^[0-9a-f]{8}-[0-9a-f]{4}-[1-5][0-9a-f]{3}-[89ab][0-9a-f]{3}-[0-9a-f]{12}\$</code> .

Table 10-264 CloudServer

Parameter	Type	Description
id	String	Definition: Server resource ID or supernode's child node ID. Range: <code>^[0-9a-f]{8}-[0-9a-f]{4}-[1-5][0-9a-f]{3}-[89ab][0-9a-f]{3}-[0-9a-f]{12}\$</code>

Parameter	Type	Description
type	String	Definition: Lite Server server type. Range: • BMS: Bare Metal Server • ECS: Elastic Cloud Server • HPS: Supernode server
hps_id	String	Definition: Server resource ID of the supernode's child node. Range: <code>^[0-9a-f]{8}-[0-9a-f]{4}-[1-5][0-9a-f]{3}-[89ab][0-9a-f]{3}-[0-9a-f]{12}\$</code>
hps_ecs_id	String	Definition: Server resource ID of the supernode's child node. Range: <code>^[0-9a-f]{8}-[0-9a-f]{4}-[1-5][0-9a-f]{3}-[89ab][0-9a-f]{3}-[0-9a-f]{12}\$</code>

Table 10-265 Endpoints

Parameter	Type	Description
dev_service	String	Definition: Supported services. Range: • NOTEBOOK: You can access notebook instances using HTTPS. • SSH: You can remotely access notebook instances through SSH.
extensions	Map<String,String>	Definition: App-specific URL for accessing the remote development mode of the app. It includes extended configurations of the application. Constraints: N/A Range: N/A Default Value: N/A
ssh_keys	Array of strings	Definition: List of SSH key pairs. You can set multiple key pairs to access an SSH instance at the same time. Constraints: N/A Range: 0 to 1,024 key pairs Default Value: N/A

Table 10-266 EndpointsRes

Parameter	Type	Description
allowed_access_ips	Array of strings	Definition: Whitelisted public IP addresses that are allowed to access notebook instances through SSH. By default, all public IP addresses can access the notebook instances. If IP addresses are specified, only the clients with the specified IP addresses can access the notebook instances.
dev_service	String	Definition: Method for accessing the notebook instance. Range: • NOTEBOOK: You can access notebook instances using HTTPS. • SSH: You can remotely access notebook instances through SSH.
ssh_keys	Array of strings	Definition: List of SSH key pairs. You can set multiple key pairs to access an SSH instance at the same time.
service	String	Definition: Method for accessing the notebook instance. Range: • NOTEBOOK: You can access notebook instances using HTTPS. • SSH: You can remotely access notebook instances through SSH.
uri	String	Definition: Private IP address of the instance. Range: N/A

Table 10-267 ServerVolume

Parameter	Type	Description
size	Integer	Definition: EVS disk size, which is the storage space allocated to the system disk. Constraints: N/A Range: 100 to 1,024 GB Default Value: N/A

Parameter	Type	Description
type	String	Definition: Storage type, which can be a system disk or data disk. Constraints: N/A. Range: • ROOT: System disk • DATA: Data disk Default Value: N/A.
evs_type	String	Definition: EVS disk type. Storage type of the EVS disk. Constraints: N/A. Range: • ESSD: Extreme SSD • GPSSD: General-purpose SSD • SAS: High I/O EVS disk • SATA: Common I/O EVS disk • SSD: Ultra-high I/O EVS disk Default Value: N/A.
evs_id	String	Definition: ID of the EVS disk. Range: ^[0-9a-f]{8}-[0-9a-f]{4}-[1-5][0-9a-f]{3}-[89ab][0-9a-f]{3}-[0-9a-f]{12}\$

Table 10-268 ServerImageResponse

Parameter	Type	Description
arch	String	Definition: Architecture type of a server image. Range: • ARM • X86
image_id	String	Definition: Server image ID. Range: ^[0-9a-f]{8}-[0-9a-f]{4}-[1-5][0-9a-f]{3}-[89ab][0-9a-f]{3}-[0-9a-f]{12}\$
name	String	Definition: Server image name. Constraints: N/A Range: 1 to 256 characters Default Value: N/A

Parameter	Type	Description
server_type	String	Definition: Server type. Range: • BMS: BMS • ECS: ECS • HPS: supernode server
status	String	Definition: Server image status. Range: • ACTIVE • INACTIVE

Table 10-269 ServerHpsInfo

Parameter	Type	Description
id	String	Definition: Lite Server supernode instance ID. Range: ^[0-9a-f]{8}-[0-9a-f]{4}-[1-5][0-9a-f]{3}-[89ab][0-9a-f]{3}-[0-9a-f]{12}\$
name	String	Definition: Lite Server supernode name. Range: ^[-_a-zA-Z0-9]{1,64}\$

See [Error Codes](#).

10.24 Stopping a Lite Server Supernode

Function

This API is used to stop a running Lite Server supernode. It is used when you need to stop a Lite Server supernode to save resources or perform maintenance. Before using this API, ensure that the Lite Server supernode has been created and is running or fails to be stopped, and you have the permission to stop the supernode. After the operation, the supernode is stopped and does not provide services. If the Lite Server supernode does not exist, is stopped, or you do not have the permission to stop the supernode, the API returns an error message.

Debugging

You can debug this API through automatic authentication in [API Explorer](#) or use the SDK sample code generated by API Explorer.

Authorization Information

Each account has all the permissions required to call all APIs, but IAM users must be assigned the required permissions.

- If you are using role/policy-based authorization, see [Permissions Policies and Supported Actions](#) for details on the required permissions.
- If you are using identity policy-based authorization, no identity policy-based permission required for calling this API.

endpoints_response	Array of Endpoints objects	Definition: Private IP address of the instance.
flavor	String	Definition: Instance flavor name. Range: ^.{1,128}\$
id	String	Definition: Instance ID. Range: ^[0-9a-f]{8}-[0-9a-f]{4}-[1-5][0-9a-f]{3}-[89ab][0-9a-f]{3}-[0-9a-f]{12}\$
key_pair_name	String	Definition: Key pair name. Range: ^[-_.a-zA-Z0-9]{1,64}\$

Parameter	Type	Description
name	String	Definition: Instance name. Range: ^[-_a-zA-Z0-9]{1,64}\$
order_id	String	Definition: Order ID. Range: ^[a-zA-Z0-9]{1,64}\$
server_image_response	ServerImageResponse object	Definition: Instance image information. Range: N/A

Parameter	Type	Description
status	String	Definition: Instance status. Current running status of the instance, which is used to monitor the lifecycle and health status of the instance. Range: • CREATE_FAILED: Creating the instance failed. • CREATING: The instance is being created. • DELETED: The instance has been deleted. • DELETE_FAILED: Deleting the instance failed. • DELETING: The instance is being deleted. • ERROR: An error occurred. • RUNNING: The instance is running. • STARTING: The instance is being started. • START_FAILED: Starting the instance failed. • STOPPED: The instance has been stopped. • STOPPING: The instance is being stopped. • STOP_FAILED: Stopping the instance failed. • REBOOTING: The instance is being restarted. • REBOOT_FAILED: Restarting the instance failed. • CHANGINGOS: The OS is being changed. • CHANGINGOS_FAILED: Changing the OS failed. • REINSTALLINGOS: The OS is being reinstalled. • REINSTALLINGOS_FAILED: Reinstalling the OS failed.

Parameter	Type	Description
vpc_id	String	Definition: ID of the VPC where the instance is located. Range: <code>^[0-9a-f]{8}-[0-9a-f]{4}-[1-5][0-9a-f]{3}-[89ab][0-9a-f]{3}-[0-9a-f]{12}\$</code>
endpoints	Array of EndpointsRes objects	Definition: Private IP address of the server.
volumes	Array of ServerVolume objects	Definition: Information about the mounted hard disk.
image	ServerImageResponse object	Definition: Server image information.
category	String	Definition: Server type. Range: • HPS: supernode server • SPOD: full-cabinet server • SERVER: single server
server_hps	ServerHpsInfo object	Definition: Information about the supernode to which the server belongs.
subnet_id	String	Parameter description: ID of the subnet where the instance is located. ** Value range: <code>**^[0-9a-f]{8}-[0-9a-f]{4}-[1-5][0-9a-f]{3}-[89ab][0-9a-f]{3}-[0-9a-f]{12}\$</code> .

Table 10-274 CloudServer

Parameter	Type	Description
id	String	Definition: Server resource ID or supernode's child node ID. Range: <code>^[0-9a-f]{8}-[0-9a-f]{4}-[1-5][0-9a-f]{3}-[89ab][0-9a-f]{3}-[0-9a-f]{12}\$</code>

Parameter	Type	Description
type	String	Definition: Lite Server server type. Range: • BMS: Bare Metal Server • ECS: Elastic Cloud Server • HPS: Supernode server
hps_id	String	Definition: Server resource ID of the supernode's child node. Range: ^[0-9a-f]{8}-[0-9a-f]{4}-[1-5][0-9a-f]{3}-[89ab][0-9a-f]{3}-[0-9a-f]{12}\$
hps_ecs_id	String	Definition: Server resource ID of the supernode's child node. Range: ^[0-9a-f]{8}-[0-9a-f]{4}-[1-5][0-9a-f]{3}-[89ab][0-9a-f]{3}-[0-9a-f]{12}\$

Table 10-275 Endpoints

Parameter	Type	Description
dev_service	String	Definition: Supported services. Range: • NOTEBOOK: You can access notebook instances using HTTPS. • SSH: You can remotely access notebook instances through SSH.
extensions	Map<String,String>	Definition: App-specific URL for accessing the remote development mode of the app. It includes extended configurations of the application. Constraints: N/A Range: N/A Default Value: N/A
ssh_keys	Array of strings	Definition: List of SSH key pairs. You can set multiple key pairs to access an SSH instance at the same time. Constraints: N/A Range: 0 to 1,024 key pairs Default Value: N/A

Table 10-276 EndpointsRes

Parameter	Type	Description
allowed_access_ips	Array of strings	Definition: Whitelisted public IP addresses that are allowed to access notebook instances through SSH. By default, all public IP addresses can access the notebook instances. If IP addresses are specified, only the clients with the specified IP addresses can access the notebook instances.
dev_service	String	Definition: Method for accessing the notebook instance. Range: • NOTEBOOK: You can access notebook instances using HTTPS. • SSH: You can remotely access notebook instances through SSH.
ssh_keys	Array of strings	Definition: List of SSH key pairs. You can set multiple key pairs to access an SSH instance at the same time.
service	String	Definition: Method for accessing the notebook instance. Range: • NOTEBOOK: You can access notebook instances using HTTPS. • SSH: You can remotely access notebook instances through SSH.
uri	String	Definition: Private IP address of the instance. Range: N/A

Table 10-277 ServerVolume

Parameter	Type	Description
size	Integer	Definition: EVS disk size, which is the storage space allocated to the system disk. Constraints: N/A Range: 100 to 1,024 GB Default Value: N/A

Parameter	Type	Description
type	String	Definition: Storage type, which can be a system disk or data disk. Constraints: N/A. Range: • ROOT: System disk • DATA: Data disk Default Value: N/A.
evs_type	String	Definition: EVS disk type. Storage type of the EVS disk. Constraints: N/A. Range: • ESSD: Extreme SSD • GPSSD: General-purpose SSD • SAS: High I/O EVS disk • SATA: Common I/O EVS disk • SSD: Ultra-high I/O EVS disk Default Value: N/A.
evs_id	String	Definition: ID of the EVS disk. Range: ^[0-9a-f]{8}-[0-9a-f]{4}-[1-5][0-9a-f]{3}-[89ab][0-9a-f]{3}-[0-9a-f]{12}\$

Table 10-278 ServerImageResponse

Parameter	Type	Description
arch	String	Definition: Architecture type of a server image. Range: • ARM • X86
image_id	String	Definition: Server image ID. Range: ^[0-9a-f]{8}-[0-9a-f]{4}-[1-5][0-9a-f]{3}-[89ab][0-9a-f]{3}-[0-9a-f]{12}\$
name	String	Definition: Server image name. Constraints: N/A Range: 1 to 256 characters Default Value: N/A

Parameter	Type	Description
server_type	String	Definition: Server type. Range: • BMS: BMS • ECS: ECS • HPS: supernode server
status	String	Definition: Server image status. Range: • ACTIVE • INACTIVE

Table 10-279 ServerHpsInfo

Parameter	Type	Description
id	String	Definition: Lite Server supernode instance ID. Range: ^[0-9a-f]{8}-[0-9a-f]{4}-[1-5][0-9a-f]{3}-[89ab][0-9a-f]{3}-[0-9a-f]{12}\$
name	String	Definition: Lite Server supernode name. Range: ^[-_a-zA-Z0-9]{1,64}\$

See [Error Codes](#).

10.25 Mounting a Disk to a Lite Server

Function

This API is used to mount an additional disk to a Lite Server. It is used when you need to expand the storage space of a Lite Server to meet larger data storage requirements. Before using this API, ensure that the Lite Server has been created and is running or stopped, you have the permission to mount disks, and the specified disk exists and is not used by other servers. After the mounting, the disk is mounted to the Lite Server, and you can access and use the new storage space. If the Lite Server does not exist, the specified disk does not exist or is in use, or you do not have the required permission, the API returns an error message.

Constraints

Only for A3.

Debugging

You can debug this API through automatic authentication in [API Explorer](#) or use the SDK sample code generated by API Explorer.

Authorization Information

Each account has all the permissions required to call all APIs, but IAM users must be assigned the required permissions.

- If you are using role/policy-based authorization, see [Permissions Policies and Supported Actions](#) for details on the required permissions.
- If you are using identity policy-based authorization, no identity policy-based permission required for calling this API.

10.26 Unmounting a Disk from a Lite Server

Function

This API is used to unmount a disk from a Lite Server. It is used when you need to release storage resources or reallocate disks. Before using this API, ensure that the

Lite Server has been created and is running or stopped, you have the permission to unmount disks, and the specified disk has been mounted to the server. After the unmounting, the disk is unmounted from the Lite Server, and you can mount the disk to another server or perform other operations. If the Lite Server does not exist, the specified disk is not mounted to the server, or you do not have the required permission, the API returns an error message.

Constraints

Only for A3.

Debugging

You can debug this API through automatic authentication in [API Explorer](#) or use the SDK sample code generated by API Explorer.

Authorization Information

Each account has all the permissions required to call all APIs, but IAM users must be assigned the required permissions.

- If you are using role/policy-based authorization, see [Permissions Policies and Supported Actions](#) for details on the required permissions.
- If you are using identity policy-based authorization, no identity policy-based permission required for calling this API.

10.27 Binding an EIP to a Lite Server

Function

This API is used to bind an EIP to a Lite Server. It is used when you need to assign a fixed public IP address to a Lite Server so that the Lite Server can be accessed from the external network. Before using this API, ensure that the Lite Server has been created and is running, you have the permission to bind an EIP, and the specified EIP exists and is not used by other resources. After the binding, the EIP is bound to the Lite Server and the Lite Server can be accessed from the external network through the EIP. If the Lite Server does not exist, the Lite Server is stopped, the specified EIP does not exist or is in use, or you do not have the required permission, the API returns an error message.

Constraints

Only for A3.

Debugging

You can debug this API through automatic authentication in [API Explorer](#) or use the SDK sample code generated by API Explorer.

Authorization Information

Each account has all the permissions required to call all APIs, but IAM users must be assigned the required permissions.

- If you are using role/policy-based authorization, see [Permissions Policies and Supported Actions](#) for details on the required permissions.
- If you are using identity policy-based authorization, no identity policy-based permission required for calling this API.

10.28 Query Bound EIPs

Function

This API is used to obtain the information about the EIP bound to the Lite Server. It is used when you need to view the EIP bound to the Lite Server and the detailed information. Before using this API, ensure that you have logged in to the system and have the permission to query the EIP, and the specified Lite Server exists. After the query, the API returns the details of the EIP bound to the Lite Server, including the EIP address, binding time, and status. If the Lite Server does not exist, the EIP is not bound to the Lite Server, or you do not have the required permission, the API returns an error message.

Constraints

Only for A3.

Debugging

You can debug this API through automatic authentication in [API Explorer](#) or use the SDK sample code generated by API Explorer.

Authorization Information

Each account has all the permissions required to call all APIs, but IAM users must be assigned the required permissions.

- If you are using role/policy-based authorization, see [Permissions Policies and Supported Actions](#) for details on the required permissions.
- If you are using identity policy-based authorization, no identity policy-based permission required for calling this API.

10.29 Querying the Specification List

Function

This API is used to obtain information about all available resource specifications in the system. It is used when you need to know the available resource specifications so that you can select proper configurations when creating or adjusting a Lite Server instance. Before using this API, ensure that you have logged in to the system and have the permission to query specifications. After the query, the API returns information about all available resource specifications, including the specification ID, CPU, memory, and storage. If you do not have the required permission or the system does not have available resource specifications, the API returns an error message.

Debugging

You can debug this API through automatic authentication in [API Explorer](#) or use the SDK sample code generated by API Explorer.

Authorization Information

Each account has all the permissions required to call all APIs, but IAM users must be assigned the required permissions.

- If you are using role/policy-based authorization, see [Permissions Policies and Supported Actions](#) for details on the required permissions.
- If you are using identity policy-based authorization, no identity policy-based permission required for calling this API.

10.30 Obtaining the Resource Flavor List

Function

This API is used to obtain available resource specifications. It is used when you need to know the available resource specifications so that you can select proper configurations when creating or adjusting a Lite Server instance. Before using this API, ensure that you have logged in to the system and have the permission to query resource specifications. After the query, the API returns information about all available resource specifications, including the specification ID, CPU, memory, and storage. If you do not have the required permission or the system does not have available resource specifications, the API returns an error message.

Debugging

You can debug this API through automatic authentication in [API Explorer](#) or use the SDK sample code generated by API Explorer.

Authorization Information

Each account has all the permissions required to call all APIs, but IAM users must be assigned the required permissions.

- If you are using role/policy-based authorization, see [Permissions Policies and Supported Actions](#) for details on the required permissions.
- If you are using identity policy-based authorization, no identity policy-based permission required for calling this API.

URI

GET /v1/{project_id}/dev-servers/resource-flavors

Table 10-304 Path Parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Definition: Project ID. For details, see Obtaining a Project ID and Name . Constraints: The value can contain 1 to 64 characters. Letters, digits, and hyphens (-) are allowed. Range: N/A Default Value: N/A

Table 10-305 Query Parameters

Parameter	Mandatory	Type	Description
server_type	No	String	Definition: Service type. Constraints: N/A. Range: • BMS: The resource type is Bare Metal Server (BMS). • ECS: The resource type is Elastic Cloud Server (ECS) • HPS: The resource type is supernode server. Default Value: N/A.
arch	No	String	Definition: CPU architecture of the flavor. Constraints: N/A. Range: • X86: The CPU architecture is x86. • ARM: The CPU architecture is Arm. Default Value: N/A.

Parameter	Mandatory	Type	Description
charging_mode	No	String	Definition: CPU architecture of the flavor. Constraints: N/A. Range: • X86: The CPU architecture is x86. • ARM: The CPU architecture is Arm. Default Value: N/A.

10.31 Creating a RoCE Network

Function

This API is used to create a RoCE network in the system. It is used when you need to create a dedicated RoCE network for high-performance computing or low-latency applications. Before using this API, ensure that you have logged in to the system and have the permission to create a RoCE network, and the required network resources have been configured in the system. After the creation, a RoCE network is created, and details about the RoCE network are returned, including the network ID, subnet information, and configuration parameters. If you do not have the required permission, the system lacks necessary network resources, or the network configuration parameters are invalid, the API returns an error message.

Debugging

You can debug this API through automatic authentication in [API Explorer](#) or use the SDK sample code generated by API Explorer.

Authorization Information

Each account has all the permissions required to call all APIs, but IAM users must be assigned the required permissions.

- If you are using role/policy-based authorization, see [Permissions Policies and Supported Actions](#) for details on the required permissions.
- If you are using identity policy-based authorization, no identity policy-based permission required for calling this API.

10.32 Querying the Lite Server List of a Tenant

Function

This API is used to obtain all Lite Server instances of a specified tenant. It is used when you need to view the details of all Lite Server instances of a tenant for management and monitoring. Before using this API, ensure that you have logged in to the system and have the permission to query the Lite Server list of a tenant. After the query, the API returns the details of all Lite Server instances of the tenant, including the instance ID, name, status, and resource configuration. If you do not have the required permission or the tenant does not have Lite Server instances, the API returns an error message.

Debugging

You can debug this API through automatic authentication in [API Explorer](#) or use the SDK sample code generated by API Explorer.

Authorization Information

Each account has all the permissions required to call all APIs, but IAM users must be assigned the required permissions.

- If you are using role/policy-based authorization, see [Permissions Policies and Supported Actions](#) for details on the required permissions.
- If you are using identity policy-based authorization, no identity policy-based permission required for calling this API.

URI

GET /v1/{project_id}/dev-servers/all

Table 10-318 Path Parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Definition: Project ID. For details, see Obtaining a Project ID and Name . Constraints: The value can contain 1 to 64 characters. Letters, digits, and hyphens (-) are allowed. Range: N/A Default Value: N/A

Request Parameters

None

Response Parameters

Status code: 200

Table 10-319 Response body parameters

Parameter	Type	Description
current	Integer	Definition: Current page number. Value range: 1 to 2097152
data	Array of ServerResponse objects	Definition: Lite Server instance list.
pages	Integer	Definition: Total number of pages. Value range: 1 to 2097152
size	Integer	Definition: Number of records on each page. Maximum number of instances returned on each page. The value of this parameter directly affects the amount of returned data. You can adjust the value to optimize the query performance or increase the information volume of a single request. Range: 1 to 1024
total	Long	Definition: Total number of records. Total number of instances that meet the search criteria. This field is used to learn the overall data scale. Range: 1 to 2147483647

Table 10-320 ServerResponse

Parameter	Type	Description
create_at	Long	Definition: Creation time. Range: N/A
update_at	Long	Definition: Update time. Range: N/A

Parameter	Type	Description
charging_mode	String	Definition: Billing mode. Range: COMMON: both yearly/monthly and pay-per-use POST_PAID: pay-per-use PRE_PAID: yearly/monthly
cloud_server	CloudServer object	Definition: Cloud service information.
endpoints_response	Array of Endpoints objects	Definition: Private IP address of the instance.
flavor	String	Definition: Instance flavor name. Range: ^.{1,128}\$
id	String	Definition: Instance ID. Range: ^[0-9a-f]{8}-[0-9a-f]{4}-[1-5][0-9a-f]{3}-[89ab][0-9a-f]{3}-[0-9a-f]{12}\$
key_pair_name	String	Definition: Key pair name. Range: ^[-_.a-zA-Z0-9]{1,64}\$
name	String	Definition: Instance name. Range: ^[-_.a-zA-Z0-9]{1,64}\$
order_id	String	Definition: Order ID. Range: ^[a-zA-Z0-9]{1,64}\$
server_image_response	ServerImageResponse object	Definition: Instance image information. Range: N/A

Parameter	Type	Description
status	String	Definition: Instance status. Current running status of the instance, which is used to monitor the lifecycle and health status of the instance. Range: • CREATE_FAILED: Creating the instance failed. • CREATING: The instance is being created. • DELETED: The instance has been deleted. • DELETE_FAILED: Deleting the instance failed. • DELETING: The instance is being deleted. • ERROR: An error occurred. • RUNNING: The instance is running. • STARTING: The instance is being started. • START_FAILED: Starting the instance failed. • STOPPED: The instance has been stopped. • STOPPING: The instance is being stopped. • STOP_FAILED: Stopping the instance failed. • REBOOTING: The instance is being restarted. • REBOOT_FAILED: Restarting the instance failed. • CHANGINGOS: The OS is being changed. • CHANGINGOS_FAILED: Changing the OS failed. • REINSTALLINGOS: The OS is being reinstalled. • REINSTALLINGOS_FAILED: Reinstalling the OS failed.

Parameter	Type	Description
vpc_id	String	Definition: ID of the VPC where the instance is located. Range: <code>^[0-9a-f]{8}-[0-9a-f]{4}-[1-5][0-9a-f]{3}-[89ab][0-9a-f]{3}-[0-9a-f]{12}\$</code>
endpoints	Array of EndpointsRes objects	Definition: Private IP address of the server.
volumes	Array of ServerVolume objects	Definition: Information about the mounted hard disk.
image	ServerImageResponse object	Definition: Server image information.
category	String	Definition: Server type. Range: • HPS: supernode server • SPOD: full-cabinet server • SERVER: single server
server_hps	ServerHpsInfo object	Definition: Information about the supernode to which the server belongs.
subnet_id	String	Parameter description: ID of the subnet where the instance is located. ** Value range: <code>**^[0-9a-f]{8}-[0-9a-f]{4}-[1-5][0-9a-f]{3}-[89ab][0-9a-f]{3}-[0-9a-f]{12}\$</code> .

Table 10-321 CloudServer

Parameter	Type	Description
id	String	Definition: Server resource ID or supernode's child node ID. Range: <code>^[0-9a-f]{8}-[0-9a-f]{4}-[1-5][0-9a-f]{3}-[89ab][0-9a-f]{3}-[0-9a-f]{12}\$</code>

Parameter	Type	Description
type	String	Definition: Lite Server server type. Range: • BMS: Bare Metal Server • ECS: Elastic Cloud Server • HPS: Supernode server
hps_id	String	Definition: Server resource ID of the supernode's child node. Range: ^[0-9a-f]{8}-[0-9a-f]{4}-[1-5][0-9a-f]{3}-[89ab][0-9a-f]{3}-[0-9a-f]{12}\$
hps_ecs_id	String	Definition: Server resource ID of the supernode's child node. Range: ^[0-9a-f]{8}-[0-9a-f]{4}-[1-5][0-9a-f]{3}-[89ab][0-9a-f]{3}-[0-9a-f]{12}\$

Table 10-322 Endpoints

Parameter	Type	Description
dev_service	String	Definition: Supported services. Range: • NOTEBOOK: You can access notebook instances using HTTPS. • SSH: You can remotely access notebook instances through SSH.
extensions	Map<String,String>	Definition: App-specific URL for accessing the remote development mode of the app. It includes extended configurations of the application. Constraints: N/A Range: N/A Default Value: N/A
ssh_keys	Array of strings	Definition: List of SSH key pairs. You can set multiple key pairs to access an SSH instance at the same time. Constraints: N/A Range: 0 to 1,024 key pairs Default Value: N/A

Table 10-323 EndpointsRes

Parameter	Type	Description
allowed_access_ips	Array of strings	Definition: Whitelisted public IP addresses that are allowed to access notebook instances through SSH. By default, all public IP addresses can access the notebook instances. If IP addresses are specified, only the clients with the specified IP addresses can access the notebook instances.
dev_service	String	Definition: Method for accessing the notebook instance. Range: • NOTEBOOK: You can access notebook instances using HTTPS. • SSH: You can remotely access notebook instances through SSH.
ssh_keys	Array of strings	Definition: List of SSH key pairs. You can set multiple key pairs to access an SSH instance at the same time.
service	String	Definition: Method for accessing the notebook instance. Range: • NOTEBOOK: You can access notebook instances using HTTPS. • SSH: You can remotely access notebook instances through SSH.
uri	String	Definition: Private IP address of the instance. Range: N/A

Table 10-324 ServerVolume

Parameter	Type	Description
size	Integer	Definition: EVS disk size, which is the storage space allocated to the system disk. Constraints: N/A Range: 100 to 1,024 GB Default Value: N/A

Parameter	Type	Description
type	String	Definition: Storage type, which can be a system disk or data disk. Constraints: N/A. Range: • ROOT: System disk • DATA: Data disk Default Value: N/A.
evs_type	String	Definition: EVS disk type. Storage type of the EVS disk. Constraints: N/A. Range: • ESSD: Extreme SSD • GPSSD: General-purpose SSD • SAS: High I/O EVS disk • SATA: Common I/O EVS disk • SSD: Ultra-high I/O EVS disk Default Value: N/A.
evs_id	String	Definition: ID of the EVS disk. Range: ^[0-9a-f]{8}-[0-9a-f]{4}-[1-5][0-9a-f]{3}-[89ab][0-9a-f]{3}-[0-9a-f]{12}\$

Table 10-325 ServerImageResponse

Parameter	Type	Description
arch	String	Definition: Architecture type of a server image. Range: • ARM • X86
image_id	String	Definition: Server image ID. Range: ^[0-9a-f]{8}-[0-9a-f]{4}-[1-5][0-9a-f]{3}-[89ab][0-9a-f]{3}-[0-9a-f]{12}\$
name	String	Definition: Server image name. Constraints: N/A Range: 1 to 256 characters Default Value: N/A

Parameter	Type	Description
server_type	String	Definition: Server type. Range: • BMS: BMS • ECS: ECS • HPS: supernode server
status	String	Definition: Server image status. Range: • ACTIVE • INACTIVE

Table 10-326 ServerHpsInfo

Parameter	Type	Description
id	String	Definition: Lite Server supernode instance ID. Range: ^[0-9a-f]{8}-[0-9a-f]{4}-[1-5][0-9a-f]{3}-[89ab][0-9a-f]{3}-[0-9a-f]{12}\$
name	String	Definition: Lite Server supernode name. Range: ^[-_.a-zA-Z0-9]{1,64}\$

10.33 Querying Lite Server Image Details

Function

This API is used to obtain the details of a specified Lite Server image. It is used when you need to know the configuration and attributes of a Lite Server image so that you can select a proper image when creating or adjusting a Lite Server instance. Before using this API, ensure that you have logged in to the system and have the permission to query image details, and the specified image exists. After the query, the API returns the details of the specified Lite Server image, including the image ID, name, OS, version, and creation time. If you do not have the operation permission, the specified image does not exist, or the image ID is invalid, the API returns an error message.

Debugging

You can debug this API through automatic authentication in [API Explorer](#) or use the SDK sample code generated by API Explorer.

Authorization Information

Each account has all the permissions required to call all APIs, but IAM users must be assigned the required permissions.

- If you are using role/policy-based authorization, see [Permissions Policies and Supported Actions](#) for details on the required permissions.
- If you are using identity policy-based authorization, no identity policy-based permission required for calling this API.

URI

10.34 Querying the Lite Server Image List

Function

This API is used to obtain information about all available Lite Server images in the system. It is used when you need to know the available Lite Server images so that you can select a proper image when creating or adjusting a Lite Server instance. Before using this API, ensure that you have logged in to the system and have the permission to query images. After the query, the API returns information about all available Lite Server images, including the image ID, name, and architecture type. If you do not have the permission to perform the operation or no image is available in the system, the API returns an error message.

Debugging

You can debug this API through automatic authentication in [API Explorer](#) or use the SDK sample code generated by API Explorer.

Authorization Information

Each account has all the permissions required to call all APIs, but IAM users must be assigned the required permissions.

- If you are using role/policy-based authorization, see [Permissions Policies and Supported Actions](#) for details on the required permissions.
- If you are using identity policy-based authorization, no identity policy-based permission required for calling this API.

See [Error Codes](#).

10.35 Querying the HyperInstance List of a Tenant

Function

This API is used to obtain information about all hyper instances of a specified tenant. It is used when you need to view the details of all hyper instances of a tenant for management and monitoring. Before using this API, ensure that you have logged in to the system and have the permission to query the hyper instance list of a tenant. After the query, the API returns the details of all hyper instances of the tenant, including the instance ID, name, status, and resource configuration. If you do not have the required permission or the tenant does not have hyper instances, the API returns an error message.

Debugging

You can debug this API through automatic authentication in [API Explorer](#) or use the SDK sample code generated by API Explorer.

Authorization Information

Each account has all the permissions required to call all APIs, but IAM users must be assigned the required permissions.

- If you are using role/policy-based authorization, see [Permissions Policies and Supported Actions](#) for details on the required permissions.
- If you are using identity policy-based authorization, no identity policy-based permission required for calling this API.

Table 10-334 Response body parameters

Parameter	Type	Description
current	Integer	Definition: Current page number. Constraints: N/A Range: N/A Default Value: N/A
data	Array of ServerHyperinstanceResponse objects	Definition: Lite Server supernode instance list. Constraints: N/A. Range: N/A. Default Value: N/A.
pages	Integer	Definition: Total number of pages. Constraints: N/A Range: N/A Default Value: N/A
size	Integer	Definition: Number of records on each page. Constraints: N/A Range: N/A Default Value: N/A

Parameter	Type	Description
total	Long	Definition: Total number of records. Constraints: N/A Range: N/A Default Value: N/A

Table 10-335 ServerHyperinstanceResponse

Parameter	Type	Description
create_at	Long	Definition: Creation time. Constraints: N/A Range: N/A Default Value: N/A
hps_cluster_id	String	Definition: Network ID of the supernode cluster. Constraints: N/A Range: ^[0-9a-f]{8}-[0-9a-f]{4}-[1-5][0-9a-f]{3}-[89ab][0-9a-f]{3}-[0-9a-f]{12}\$ Default Value: N/A
hps_id	String	Definition: Supernode ID. Constraints: N/A Range: ^[0-9a-f]{8}-[0-9a-f]{4}-[1-5][0-9a-f]{3}-[89ab][0-9a-f]{3}-[0-9a-f]{12}\$ Default Value: N/A
id	String	Definition: Lite Server supernode ID. Constraints: N/A. Range: ^[0-9a-f]{8}-[0-9a-f]{4}-[1-5][0-9a-f]{3}-[89ab][0-9a-f]{3}-[0-9a-f]{12}\$ Default Value: N/A.
name	String	Definition: Instance name. Constraints: N/A Range: ^[-_a-zA-Z0-9]{1,64}\$ Default Value: N/A

Parameter	Type	Description
order_id	String	Definition: Order ID. Constraints: N/A Range: ^[a-zA-Z0-9]{1,64}\$ Default Value: N/A
status	String	Definition: Supernode instance status. Constraints: N/A Range: • PROVISIONING: The request for creating a supernode has been accepted, but the supernode is still being created. • ACTIVE: The supernode is active and its resources can be used. • ERROR: The supernode fails to be created. • REIMAGING: The OS of the supernode is being changed. • TERMINATING: Resources are being released. • TERMINATED: The supernode resources have been released and are no longer available. Default Value: N/A
servers	Array of ServerResponse objects	Definition: List of supernode subnode instances. Constraints: N/A Range: N/A Default Value: N/A
update_at	Long	Definition: Creation time. Constraints: N/A Range: N/A Default Value: N/A

Table 10-336 ServerResponse

Parameter	Type	Description
create_at	Long	Definition: Creation time. Range: N/A

Parameter	Type	Description
update_at	Long	Definition: Update time. Range: N/A
charging_mode	String	Definition: Billing mode. Range: • COMMON: both yearly/monthly and pay-per-use • POST_PAID: pay-per-use • PRE_PAID: yearly/monthly
cloud_server	CloudServer object	Definition: Cloud service information.
endpoints_response	Array of Endpoints objects	Definition: Private IP address of the instance.
flavor	String	Definition: Instance flavor name. Range: ^.{1,128}\$
id	String	Definition: Instance ID. Range: ^[0-9a-f]{8}-[0-9a-f]{4}-[1-5][0-9a-f]{3}-[89ab][0-9a-f]{3}-[0-9a-f]{12}\$
key_pair_name	String	Definition: Key pair name. Range: ^[-_.a-zA-Z0-9]{1,64}\$
name	String	Definition: Instance name. Range: ^[-_.a-zA-Z0-9]{1,64}\$
order_id	String	Definition: Order ID. Range: ^[a-zA-Z0-9]{1,64}\$
server_image_response	ServerImageResponse object	Definition: Instance image information. Range: N/A

Parameter	Type	Description
status	String	Definition: Instance status. Current running status of the instance, which is used to monitor the lifecycle and health status of the instance. Range: • CREATE_FAILED: Creating the instance failed. • CREATING: The instance is being created. • DELETED: The instance has been deleted. • DELETE_FAILED: Deleting the instance failed. • DELETING: The instance is being deleted. • ERROR: An error occurred. • RUNNING: The instance is running. • STARTING: The instance is being started. • START_FAILED: Starting the instance failed. • STOPPED: The instance has been stopped. • STOPPING: The instance is being stopped. • STOP_FAILED: Stopping the instance failed. • REBOOTING: The instance is being restarted. • REBOOT_FAILED: Restarting the instance failed. • CHANGINGOS: The OS is being changed. • CHANGINGOS_FAILED: Changing the OS failed. • REINSTALLINGOS: The OS is being reinstalled. • REINSTALLINGOS_FAILED: Reinstalling the OS failed.

Parameter	Type	Description
vpc_id	String	Definition: ID of the VPC where the instance is located. Range: <code>^[0-9a-f]{8}-[0-9a-f]{4}-[1-5][0-9a-f]{3}-[89ab][0-9a-f]{3}-[0-9a-f]{12}\$</code>
endpoints	Array of EndpointsRes objects	Definition: Private IP address of the server.
volumes	Array of ServerVolume objects	Definition: Information about the mounted hard disk.
image	ServerImageResponse object	Definition: Server image information.
category	String	Definition: Server type. Range: • HPS: supernode server • SPOD: full-cabinet server • SERVER: single server
server_hps	ServerHpsInfo object	Definition: Information about the supernode to which the server belongs.
subnet_id	String	Parameter description: ID of the subnet where the instance is located. ** Value range: <code>**^[0-9a-f]{8}-[0-9a-f]{4}-[1-5][0-9a-f]{3}-[89ab][0-9a-f]{3}-[0-9a-f]{12}\$</code> .

Table 10-337 CloudServer

Parameter	Type	Description
id	String	Definition: Server resource ID or supernode's child node ID. Range: <code>^[0-9a-f]{8}-[0-9a-f]{4}-[1-5][0-9a-f]{3}-[89ab][0-9a-f]{3}-[0-9a-f]{12}\$</code>

Parameter	Type	Description
type	String	Definition: Lite Server server type. Range: • BMS: Bare Metal Server • ECS: Elastic Cloud Server • HPS: Supernode server
hps_id	String	Definition: Server resource ID of the supernode's child node. Range: ^[0-9a-f]{8}-[0-9a-f]{4}-[1-5][0-9a-f]{3}-[89ab][0-9a-f]{3}-[0-9a-f]{12}\$
hps_ecs_id	String	Definition: Server resource ID of the supernode's child node. Range: ^[0-9a-f]{8}-[0-9a-f]{4}-[1-5][0-9a-f]{3}-[89ab][0-9a-f]{3}-[0-9a-f]{12}\$

Table 10-338 Endpoints

Parameter	Type	Description
dev_service	String	Definition: Supported services. Range: • NOTEBOOK: You can access notebook instances using HTTPS. • SSH: You can remotely access notebook instances through SSH.
extensions	Map<String,String>	Definition: App-specific URL for accessing the remote development mode of the app. It includes extended configurations of the application. Constraints: N/A Range: N/A Default Value: N/A
ssh_keys	Array of strings	Definition: List of SSH key pairs. You can set multiple key pairs to access an SSH instance at the same time. Constraints: N/A Range: 0 to 1,024 key pairs Default Value: N/A

Table 10-339 EndpointsRes

Parameter	Type	Description
allowed_access_ips	Array of strings	Definition: Whitelisted public IP addresses that are allowed to access notebook instances through SSH. By default, all public IP addresses can access the notebook instances. If IP addresses are specified, only the clients with the specified IP addresses can access the notebook instances.
dev_service	String	Definition: Method for accessing the notebook instance. Range: • NOTEBOOK: You can access notebook instances using HTTPS. • SSH: You can remotely access notebook instances through SSH.
ssh_keys	Array of strings	Definition: List of SSH key pairs. You can set multiple key pairs to access an SSH instance at the same time.
service	String	Definition: Method for accessing the notebook instance. Range: • NOTEBOOK: You can access notebook instances using HTTPS. • SSH: You can remotely access notebook instances through SSH.
uri	String	Definition: Private IP address of the instance. Range: N/A

Table 10-340 ServerVolume

Parameter	Type	Description
size	Integer	Definition: EVS disk size, which is the storage space allocated to the system disk. Constraints: N/A Range: 100 to 1,024 GB Default Value: N/A

Parameter	Type	Description
type	String	Definition: Storage type, which can be a system disk or data disk. Constraints: N/A. Range: • ROOT: System disk • DATA: Data disk Default Value: N/A.
evs_type	String	Definition: EVS disk type. Storage type of the EVS disk. Constraints: N/A. Range: • ESSD: Extreme SSD • GPSSD: General-purpose SSD • SAS: High I/O EVS disk • SATA: Common I/O EVS disk • SSD: Ultra-high I/O EVS disk Default Value: N/A.
evs_id	String	Definition: ID of the EVS disk. Range: ^[0-9a-f]{8}-[0-9a-f]{4}-[1-5][0-9a-f]{3}-[89ab][0-9a-f]{3}-[0-9a-f]{12}\$

Table 10-341 ServerImageResponse

Parameter	Type	Description
arch	String	Definition: Architecture type of a server image. Range: • ARM • X86
image_id	String	Definition: Server image ID. Range: ^[0-9a-f]{8}-[0-9a-f]{4}-[1-5][0-9a-f]{3}-[89ab][0-9a-f]{3}-[0-9a-f]{12}\$
name	String	Definition: Server image name. Constraints: N/A Range: 1 to 256 characters Default Value: N/A

Parameter	Type	Description
server_type	String	Definition: Server type. Range: • BMS: BMS • ECS: ECS • HPS: supernode server
status	String	Definition: Server image status. Range: • ACTIVE • INACTIVE

Table 10-342 ServerHpsInfo

Parameter	Type	Description
id	String	Definition: Lite Server supernode instance ID. Range: ^[0-9a-f]{8}-[0-9a-f]{4}-[1-5][0-9a-f]{3}-[89ab][0-9a-f]{3}-[0-9a-f]{12}\$
name	String	Definition: Lite Server supernode name. Range: ^[-_a-zA-Z0-9]{1,64}\$

Error Codes

See [Error Codes](#).

10.36 Scaling Out Lite Server Supernodes

Function

This API is used to increase the resource capacity of a Lite Server supernode. It is used when you need to improve the performance of a Lite Server supernode to support more loads or process more data. Before using this API, ensure that you have logged in to the system and have the permission to expand the supernode capacity, and the specified supernode exists and is running. After the scale-out, the resource capacity of the supernode is adjusted based on the specified specifications. You can use the increased resources immediately. If you do not have the required permission to perform the operation, the specified supernode does not exist, the supernode has reached the maximum capacity, or the specified scale-out specifications are invalid, the API returns an error message.

Debugging

You can debug this API through automatic authentication in [API Explorer](#) or use the SDK sample code generated by API Explorer.

Authorization Information

Each account has all the permissions required to call all APIs, but IAM users must be assigned the required permissions.

- If you are using role/policy-based authorization, see [Permissions Policies and Supported Actions](#) for details on the required permissions.
- If you are using identity policy-based authorization, no identity policy-based permission required for calling this API.

URI

POST /v1/{project_id}/dev-servers/hyperinstance/{id}/live-scale-up

Table 10-343 Path Parameters

Parameter	Mandatory	Type	Description
id	Yes	String	Definition: Lite Server supernode ID. Constraints: <code>^[0-9a-f]{8}-[0-9a-f]{4}-[1-5][0-9a-f]{3}-[89ab][0-9a-f]{3}-[0-9a-f]{12}\$</code> Range: N/A Default Value: N/A
project_id	Yes	String	Definition: Project ID. For details, see Obtaining a Project ID and Name . Constraints: The value can contain 1 to 64 characters. Letters, digits, and hyphens (-) are allowed. Range: N/A Default Value: N/A

Request Parameters

Table 10-344 Request body parameters

Parameter	Mandatory	Type	Description
flavor	Yes	String	Definition: Server flavor name. Constraints: N/A Range: The value can contain 1 to 128 characters. Only letters, digits, and periods (.) are allowed. Default Value: N/A
root_volume	No	EvsVolume object	Definition: System disk information of the new server.
data_volume	No	ServerDataVolume object	Definition: Data disk information of the new server.
image_id	Yes	String	Definition: Server image ID. Constraints: N/A Range: The value must be a string of 36 characters in UUID format. Default Value: N/A

Parameter	Mandatory	Type	Description
userdata	No	String	Definition Custom data to be injected into the instance during cloud server creation. Texts and text files can be injected. Example: Before Base64 encoding: - Linux server: <pre>#!/bin/bash echo user_test > /home/user.txt</pre> After Base64 encoding: - Linux server: <pre>IyEvYmluL2Jhc2gKZWNoYyB1c2VyX3Rlc 3QgPiAvaG9tZS91c2VyLnR4dA==</pre> For more information about user data injection, see Injecting User Data. You must be aware of the effects of user_data. You are responsible for the impact and risks. Constraints - The content of user_data must be encoded with Base64. - The maximum size of the content to be injected (before encoding) is 32 KB. Range: N/A Default Value: N/A

Parameter	Mandatory	Type	Description
key_pair_name	No	String	Definition: Key pair name used for logging in to the server. Select either admin_pass or key_pair_name . Note that supernodes can be created only using key pairs. Constraints: admin_pass and key_pair_name cannot exist at the same time. Range: The value can contain 1 to 64 characters. Only letters, digits, hyphens (-), underscores (_), and periods (.) are allowed. Default Value: N/A

Table 10-345 EvsVolume

Parameter	Mandatory	Type	Description
size	No	Integer	Definition: System disk size, which is the storage space allocated to the system disk. Constraints: N/A Range: 100 to 1,024 GB Default Value: N/A
type	No	String	Definition: System disk type, which indicates the storage type of the system disk. Constraints: N/A Range: ● ESSD: extreme SSD ● GPSSD: General-purpose SSD ● SAS: high I/O EVS disk ● SATA: common I/O EVS disk ● SSD: ultra-high I/O EVS disk Default Value: N/A

Table 10-346 ServerDataVolume

Parameter	Mandatory	Type	Description
size	Yes	Integer	Definition: Data disk size. Storage space allocated to a data disk. Constraints: N/A Range: 100 to 32,768 GB Default Value: N/A
type	Yes	String	Definition: System disk type, which indicates the storage type of the data disk. Constraints: N/A Range: • ESSD: extreme SSD • GPSSD: General-purpose SSD • SAS: high I/O EVS disk • SATA: common I/O EVS disk • SSD: ultra-high I/O EVS disk Default Value: N/A
count	Yes	Integer	Definition: Number of data disks. Number of data disks allocated to an instance. Constraints: N/A Range: 1 to 8 Default Value: N/A

Response Parameters

Status code: 200

Table 10-347 Response body parameters

Parameter	Type	Description
create_at	Long	Definition: Creation time. Constraints: N/A Range: N/A Default Value: N/A

Parameter	Type	Description
hps_cluster_id	String	Definition: Network ID of the supernode cluster. Constraints: N/A Range: <code>^[0-9a-f]{8}-[0-9a-f]{4}-[1-5][0-9a-f]{3}-[89ab][0-9a-f]{3}-[0-9a-f]{12}\$</code> Default Value: N/A
hps_id	String	Definition: Supernode ID. Constraints: N/A Range: <code>^[0-9a-f]{8}-[0-9a-f]{4}-[1-5][0-9a-f]{3}-[89ab][0-9a-f]{3}-[0-9a-f]{12}\$</code> Default Value: N/A
id	String	Definition: Lite Server supernode ID. Constraints: N/A. Range: <code>^[0-9a-f]{8}-[0-9a-f]{4}-[1-5][0-9a-f]{3}-[89ab][0-9a-f]{3}-[0-9a-f]{12}\$</code> Default Value: N/A.
name	String	Definition: Instance name. Constraints: N/A Range: <code>^[_.a-zA-Z0-9]{1,64}\$</code> Default Value: N/A
order_id	String	Definition: Order ID. Constraints: N/A Range: <code>^[a-zA-Z0-9]{1,64}\$</code> Default Value: N/A

Parameter	Type	Description
status	String	Definition: Supernode instance status. Constraints: N/A Range: • PROVISIONING: The request for creating a supernode has been accepted, but the supernode is still being created. • ACTIVE: The supernode is active and its resources can be used. • ERROR: The supernode fails to be created. • REIMAGING: The OS of the supernode is being changed. • TERMINATING: Resources are being released. • TERMINATED: The supernode resources have been released and are no longer available. Default Value: N/A
servers	Array of ServerResponse objects	Definition: List of supernode subnode instances. Constraints: N/A Range: N/A Default Value: N/A
update_at	Long	Definition: Creation time. Constraints: N/A Range: N/A Default Value: N/A

Table 10-348 ServerResponse

Parameter	Type	Description

Parameter	Type	Description
id	String	Definition: Server resource ID or supernode's child node ID. Range: <code>^[0-9a-f]{8}-[0-9a-f]{4}-[1-5][0-9a-f]{3}-[89ab][0-9a-f]{3}-[0-9a-f]{12}\$</code>

Parameter	Type	Description
type	String	Definition: Lite Server server type. Range: • BMS: Bare Metal Server • ECS: Elastic Cloud Server • HPS: Supernode server
hps_id	String	Definition: Server resource ID of the supernode's child node. Range: ^[0-9a-f]{8}-[0-9a-f]{4}-[1-5][0-9a-f]{3}-[89ab][0-9a-f]{3}-[0-9a-f]{12}\$
hps_ecs_id	String	Definition: Server resource ID of the supernode's child node. Range: ^[0-9a-f]{8}-[0-9a-f]{4}-[1-5][0-9a-f]{3}-[89ab][0-9a-f]{3}-[0-9a-f]{12}\$

Table 10-350 Endpoints

Parameter	Type	Description
dev_service	String	Definition: Supported services. Range: • NOTEBOOK: You can access notebook instances using HTTPS. • SSH: You can remotely access notebook instances through SSH.
extensions	Map<String,String>	Definition: App-specific URL for accessing the remote development mode of the app. It includes extended configurations of the application. Constraints: N/A Range: N/A Default Value: N/A
ssh_keys	Array of strings	Definition: List of SSH key pairs. You can set multiple key pairs to access an SSH instance at the same time. Constraints: N/A Range: 0 to 1,024 key pairs Default Value: N/A

Table 10-351 EndpointsRes

Parameter	Type	Description
allowed_access_ips	Array of strings	Definition: Whitelisted public IP addresses that are allowed to access notebook instances through SSH. By default, all public IP addresses can access the notebook instances. If IP addresses are specified, only the clients with the specified IP addresses can access the notebook instances.
dev_service	String	Definition: Method for accessing the notebook instance. Range: • NOTEBOOK: You can access notebook instances using HTTPS. • SSH: You can remotely access notebook instances through SSH.
ssh_keys	Array of strings	Definition: List of SSH key pairs. You can set multiple key pairs to access an SSH instance at the same time.
service	String	Definition: Method for accessing the notebook instance. Range: • NOTEBOOK: You can access notebook instances using HTTPS. • SSH: You can remotely access notebook instances through SSH.
uri	String	Definition: Private IP address of the instance. Range: N/A

Table 10-352 ServerVolume

Parameter	Type	Description
size	Integer	Definition: EVS disk size, which is the storage space allocated to the system disk. Constraints: N/A Range: 100 to 1,024 GB Default Value: N/A

Parameter	Type	Description
type	String	Definition: Storage type, which can be a system disk or data disk. Constraints: N/A. Range: • ROOT: System disk • DATA: Data disk Default Value: N/A.
evs_type	String	Definition: EVS disk type. Storage type of the EVS disk. Constraints: N/A. Range: • ESSD: Extreme SSD • GPSSD: General-purpose SSD • SAS: High I/O EVS disk • SATA: Common I/O EVS disk • SSD: Ultra-high I/O EVS disk Default Value: N/A.
evs_id	String	Definition: ID of the EVS disk. Range: ^[0-9a-f]{8}-[0-9a-f]{4}-[1-5][0-9a-f]{3}-[89ab][0-9a-f]{3}-[0-9a-f]{12}\$

Table 10-353 ServerImageResponse

Parameter	Type	Description
arch	String	Definition: Architecture type of a server image. Range: • ARM • X86
image_id	String	Definition: Server image ID. Range: ^[0-9a-f]{8}-[0-9a-f]{4}-[1-5][0-9a-f]{3}-[89ab][0-9a-f]{3}-[0-9a-f]{12}\$
name	String	Definition: Server image name. Constraints: N/A Range: 1 to 256 characters Default Value: N/A

Parameter	Type	Description
server_type	String	Definition: Server type. Range: • BMS: BMS • ECS: ECS • HPS: supernode server
status	String	Definition: Server image status. Range: • ACTIVE • INACTIVE

Table 10-354 ServerHpsInfo

Parameter	Type	Description
id	String	Definition: Lite Server supernode instance ID. Range: <code>^[0-9a-f]{8}-[0-9a-f]{4}-[1-5][0-9a-f]{3}-[89ab][0-9a-f]{3}-[0-9a-f]{12}\$</code>
name	String	Definition: Lite Server supernode name. Range: <code>^[_\.a-zA-Z0-9]{1,64}\$</code>

10.37 Scaling in Lite Server Supernodes

Function

This API is used to reduce the resource capacity of a Lite Server supernode. It is used when you need to reduce resource usage of Lite Server supernodes to reduce costs or optimize resource allocation. Before using this API, ensure that you have logged in to the system and have the permission to reduce the supernode capacity, and the specified supernode exists and is running. After the scale-in, the resource capacity of the supernode is adjusted based on the specified specifications. You can use the reduced resources immediately. If you do not have the required permission to perform the operation, the specified supernode does

not exist, the supernode has reached the minimum capacity, or the specified scale-in specifications are invalid, the API returns an error message.

Debugging

You can debug this API through automatic authentication in [API Explorer](#) or use the SDK sample code generated by API Explorer.

Authorization Information

Each account has all the permissions required to call all APIs, but IAM users must be assigned the required permissions.

- If you are using role/policy-based authorization, see [Permissions Policies and Supported Actions](#) for details on the required permissions.
- If you are using identity policy-based authorization, no identity policy-based permission required for calling this API.

URI

POST /v1/{project_id}/dev-servers/hyperinstance/{id}/live-scale-down

Table 10-355 Path Parameters

Parameter	Mandatory	Type	Description
id	Yes	String	Definition: Lite Server supernode ID. Constraints: <code>^[0-9a-f]{8}-[0-9a-f]{4}-[1-5][0-9a-f]{3}-[89ab][0-9a-f]{3}-[0-9a-f]{12}\$</code> Range: N/A Default Value: N/A
project_id	Yes	String	Definition: Project ID. For details, see Obtaining a Project ID and Name . Constraints: The value can contain 1 to 64 characters. Letters, digits, and hyphens (-) are allowed. Range: N/A Default Value: N/A

Request Parameters

Table 10-356 Request body parameters

Parameter	Mandatory	Type	Description
id	No	String	Supernode ID.
flavor	No	String	Flavor information.
server_ids	No	Array of strings	ID of the node to be deleted.
resource_flavor	No	String	Resource flavor.

Response Parameters

Status code: 200**Table 10-357** Response body parameters

Parameter	Type	Description
create_at	Long	Definition: Creation time. Constraints: N/A Range: N/A Default Value: N/A
hps_cluster_id	String	Definition: Network ID of the supernode cluster. Constraints: N/A Range: ^[0-9a-f]{8}-[0-9a-f]{4}-[1-5][0-9a-f]{3}-[89ab][0-9a-f]{3}-[0-9a-f]{12}\$ Default Value: N/A
hps_id	String	Definition: Supernode ID. Constraints: N/A Range: ^[0-9a-f]{8}-[0-9a-f]{4}-[1-5][0-9a-f]{3}-[89ab][0-9a-f]{3}-[0-9a-f]{12}\$ Default Value: N/A

Parameter	Type	Description
id	String	Definition: Lite Server supernode ID. Constraints: N/A. Range: <code>^[0-9a-f]{8}-[0-9a-f]{4}-[1-5][0-9a-f]{3}-[89ab][0-9a-f]{3}-[0-9a-f]{12}\$</code> Default Value: N/A.
name	String	Definition: Instance name. Constraints: N/A Range: <code>^[-_.a-zA-Z0-9]{1,64}\$</code> Default Value: N/A
order_id	String	Definition: Order ID. Constraints: N/A Range: <code>^[a-zA-Z0-9]{1,64}\$</code> Default Value: N/A
status	String	Definition: Supernode instance status. Constraints: N/A Range: • PROVISIONING: The request for creating a supernode has been accepted, but the supernode is still being created. • ACTIVE: The supernode is active and its resources can be used. • ERROR: The supernode fails to be created. • REIMAGING: The OS of the supernode is being changed. • TERMINATING: Resources are being released. • TERMINATED: The supernode resources have been released and are no longer available. Default Value: N/A
servers	Array of ServerResponse objects	Definition: List of supernode subnode instances. Constraints: N/A Range: N/A Default Value: N/A

Parameter	Type	Description
update_at	Long	Definition: Creation time. Constraints: N/A Range: N/A Default Value: N/A

Table 10-358 ServerResponse

Parameter	Type	Description
create_at	Long	Definition: Creation time. Range: N/A
update_at	Long	Definition: Update time. Range: N/A
charging_mode	String	Definition: Billing mode. Range: • COMMON: both yearly/monthly and pay-per-use • POST_PAID: pay-per-use • PRE_PAID: yearly/monthly
cloud_server	CloudServer object	Definition: Cloud service information.
endpoints_response	Array of Endpoints objects	Definition: Private IP address of the instance.
flavor	String	Definition: Instance flavor name. Range: ^.{1,128}\$
id	String	Definition: Instance ID. Range: ^[0-9a-f]{8}-[0-9a-f]{4}-[1-5][0-9a-f]{3}-[89ab][0-9a-f]{3}-[0-9a-f]{12}\$
key_pair_name	String	Definition: Key pair name. Range: ^[_a-zA-Z0-9]{1,64}\$
name	String	Definition: Instance name. Range: ^[_a-zA-Z0-9]{1,64}\$
order_id	String	Definition: Order ID. Range: ^[a-zA-Z0-9]{1,64}\$

Parameter	Type	Description
server_image_response	ServerImageResponse object	Definition: Instance image information. Range: N/A
status	String	Definition: Instance status. Current running status of the instance, which is used to monitor the lifecycle and health status of the instance. Range: • CREATE_FAILED: Creating the instance failed. • CREATING: The instance is being created. • DELETED: The instance has been deleted. • DELETE_FAILED: Deleting the instance failed. • DELETING: The instance is being deleted. • ERROR: An error occurred. • RUNNING: The instance is running. • STARTING: The instance is being started. • START_FAILED: Starting the instance failed. • STOPPED: The instance has been stopped. • STOPPING: The instance is being stopped. • STOP_FAILED: Stopping the instance failed. • REBOOTING: The instance is being restarted. • REBOOT_FAILED: Restarting the instance failed. • CHANGINGOS: The OS is being changed. • CHANGINGOS_FAILED: Changing the OS failed. • REINSTALLINGOS: The OS is being reinstalled. • REINSTALLINGOS_FAILED: Reinstalling the OS failed.

Parameter	Type	Description
vpc_id	String	Definition: ID of the VPC where the instance is located. Range: <code>^[0-9a-f]{8}-[0-9a-f]{4}-[1-5][0-9a-f]{3}-[89ab][0-9a-f]{3}-[0-9a-f]{12}\$</code>
endpoints	Array of EndpointsRes objects	Definition: Private IP address of the server.
volumes	Array of ServerVolume objects	Definition: Information about the mounted hard disk.
image	ServerImageResponse object	Definition: Server image information.
category	String	Definition: Server type. Range: • HPS: supernode server • SPOD: full-cabinet server • SERVER: single server
server_hps	ServerHpsInfo object	Definition: Information about the supernode to which the server belongs.
subnet_id	String	Parameter description: ID of the subnet where the instance is located. ** Value range: <code>**^[0-9a-f]{8}-[0-9a-f]{4}-[1-5][0-9a-f]{3}-[89ab][0-9a-f]{3}-[0-9a-f]{12}\$</code> .

Table 10-359 CloudServer

Parameter	Type	Description
id	String	Definition: Server resource ID or supernode's child node ID. Range: <code>^[0-9a-f]{8}-[0-9a-f]{4}-[1-5][0-9a-f]{3}-[89ab][0-9a-f]{3}-[0-9a-f]{12}\$</code>

Parameter	Type	Description
type	String	Definition: Lite Server server type. Range: • BMS: Bare Metal Server • ECS: Elastic Cloud Server • HPS: Supernode server
hps_id	String	Definition: Server resource ID of the supernode's child node. Range: ^[0-9a-f]{8}-[0-9a-f]{4}-[1-5][0-9a-f]{3}-[89ab][0-9a-f]{3}-[0-9a-f]{12}\$
hps_ecs_id	String	Definition: Server resource ID of the supernode's child node. Range: ^[0-9a-f]{8}-[0-9a-f]{4}-[1-5][0-9a-f]{3}-[89ab][0-9a-f]{3}-[0-9a-f]{12}\$

Table 10-360 Endpoints

Parameter	Type	Description
dev_service	String	Definition: Supported services. Range: • NOTEBOOK: You can access notebook instances using HTTPS. • SSH: You can remotely access notebook instances through SSH.
extensions	Map<String,String>	Definition: App-specific URL for accessing the remote development mode of the app. It includes extended configurations of the application. Constraints: N/A Range: N/A Default Value: N/A
ssh_keys	Array of strings	Definition: List of SSH key pairs. You can set multiple key pairs to access an SSH instance at the same time. Constraints: N/A Range: 0 to 1,024 key pairs Default Value: N/A

Table 10-361 EndpointsRes

Parameter	Type	Description
allowed_access_ips	Array of strings	Definition: Whitelisted public IP addresses that are allowed to access notebook instances through SSH. By default, all public IP addresses can access the notebook instances. If IP addresses are specified, only the clients with the specified IP addresses can access the notebook instances.
dev_service	String	Definition: Method for accessing the notebook instance. Range: • NOTEBOOK: You can access notebook instances using HTTPS. • SSH: You can remotely access notebook instances through SSH.
ssh_keys	Array of strings	Definition: List of SSH key pairs. You can set multiple key pairs to access an SSH instance at the same time.
service	String	Definition: Method for accessing the notebook instance. Range: • NOTEBOOK: You can access notebook instances using HTTPS. • SSH: You can remotely access notebook instances through SSH.
uri	String	Definition: Private IP address of the instance. Range: N/A

Table 10-362 ServerVolume

Parameter	Type	Description
size	Integer	Definition: EVS disk size, which is the storage space allocated to the system disk. Constraints: N/A Range: 100 to 1,024 GB Default Value: N/A

Parameter	Type	Description
type	String	Definition: Storage type, which can be a system disk or data disk. Constraints: N/A. Range: • ROOT: System disk • DATA: Data disk Default Value: N/A.
evs_type	String	Definition: EVS disk type. Storage type of the EVS disk. Constraints: N/A. Range: • ESSD: Extreme SSD • GPSSD: General-purpose SSD • SAS: High I/O EVS disk • SATA: Common I/O EVS disk • SSD: Ultra-high I/O EVS disk Default Value: N/A.
evs_id	String	Definition: ID of the EVS disk. Range: ^[0-9a-f]{8}-[0-9a-f]{4}-[1-5][0-9a-f]{3}-[89ab][0-9a-f]{3}-[0-9a-f]{12}\$

Table 10-363 ServerImageResponse

Parameter	Type	Description
arch	String	Definition: Architecture type of a server image. Range: • ARM • X86
image_id	String	Definition: Server image ID. Range: ^[0-9a-f]{8}-[0-9a-f]{4}-[1-5][0-9a-f]{3}-[89ab][0-9a-f]{3}-[0-9a-f]{12}\$
name	String	Definition: Server image name. Constraints: N/A Range: 1 to 256 characters Default Value: N/A

Parameter	Type	Description
server_type	String	Definition: Server type. Range: • BMS: BMS • ECS: ECS • HPS: supernode server
status	String	Definition: Server image status. Range: • ACTIVE • INACTIVE

Table 10-364 ServerHpsInfo

Parameter	Type	Description
id	String	Definition: Lite Server supernode instance ID. Range: ^[0-9a-f]{8}-[0-9a-f]{4}-[1-5][0-9a-f]{3}-[89ab][0-9a-f]{3}-[0-9a-f]{12}\$
name	String	Definition: Lite Server supernode name. Range: ^[-_a-zA-Z0-9]{1,64}\$

Example Requests

```

Error Codes

See [Error Codes](#).

10.38 Obtaining Operation Details

Function

This API is used to obtain the details of a specified operation. It is used when you need to know the execution status of an operation for troubleshooting or operation audit. Before using this API, ensure that you have logged in to the system and have the permission to query the details of an operation, and the specified operation exists. After the query, the API returns the details of the specified operation, including the operation ID, operation type, execution status, start time, end time, and operation result. If you do not have the operation permission, the specified operation does not exist, or the operation ID is invalid, the API returns an error message.

Debugging

You can debug this API through automatic authentication in [API Explorer](#) or use the SDK sample code generated by API Explorer.

Authorization Information

Each account has all the permissions required to call all APIs, but IAM users must be assigned the required permissions.

- If you are using role/policy-based authorization, see [Permissions Policies and Supported Actions](#) for details on the required permissions.
- If you are using identity policy-based authorization, no identity policy-based permission required for calling this API.

URI

10.39 Querying the Supported Lite Server Scaling Specifications and Capacity Calculation

Function

This API is used to obtain supported scaling specifications of a Lite Server supernode and calculate the capacity. It is used when you need to know the

scaling options supported by the Lite Server supernode so that you can select proper specifications when adjusting the supernode resources and evaluate the resource requirements after scaling. Before using this API, ensure that you have logged in to the system and have the permission to query the supernode scaling specifications, and the specified supernode exists. After the query, the API returns the list of supported scaling specifications and capacity calculation results, including the specification ID, CPU, memory, storage, and resource usage after scaling. If you do not have the required permission, the specified supernode does not exist, or no scaling specifications are available in the system, the API returns an error message.

Debugging

You can debug this API through automatic authentication in [API Explorer](#) or use the SDK sample code generated by API Explorer.

Authorization Information

Each account has all the permissions required to call all APIs, but IAM users must be assigned the required permissions.

- If you are using role/policy-based authorization, see [Permissions Policies and Supported Actions](#) for details on the required permissions.
- If you are using identity policy-based authorization, no identity policy-based permission required for calling this API.

10.40 Querying the Logical Capacity Calculation Result of the hyperinstance-clusters Supernode

Function

This API is used to obtain the logical capacity calculation result of a specified hyper instance cluster. It is used when you need to know the resource usage and capacity planning of a supernode cluster for resource management and optimization. Before using this API, ensure that you have logged in to the system and have the permission to query the logical capacity of a supernode cluster, and the specified supernode cluster exists. After the query, the API returns the logical capacity calculation result of a specified supernode cluster, including the available capacity information. If you do not have the required permission to perform the operation, the specified supernode cluster does not exist, or the cluster ID is invalid, the API returns an error message.

Debugging

You can debug this API through automatic authentication in [API Explorer](#) or use the SDK sample code generated by API Explorer.

Authorization Information

Each account has all the permissions required to call all APIs, but IAM users must be assigned the required permissions.

- If you are using role/policy-based authorization, see [Permissions Policies and Supported Actions](#) for details on the required permissions.
- If you are using identity policy-based authorization, no identity policy-based permission required for calling this API.

10.41 Querying the Tor Information of an Instance

Function

This API is used to obtain the Top-of-Rack (Tor) switch information of a specified instance. It is used when you need to know the Tor switch connected to an instance for network configuration. Before using this API, ensure that you have logged in to the system and have the permission to query the Tor information of an instance, and the specified instance exists. After the query, the API returns the Tor information of the specified instance. If you do not have the operation permission, the specified instance does not exist, or the instance is not connected to the Tor switch, the API returns an error message.

Debugging

You can debug this API through automatic authentication in [API Explorer](#) or use the SDK sample code generated by API Explorer.

Authorization Information

Each account has all the permissions required to call all APIs, but IAM users must be assigned the required permissions.

- If you are using role/policy-based authorization, see [Permissions Policies and Supported Actions](#) for details on the required permissions.
- If you are using identity policy-based authorization, no identity policy-based permission required for calling this API.

URI

GET /v1/{project_id}/dev-servers/instance-physical-topologies

Table 10-378 Path Parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Definition: Project ID. For details, see Obtaining a Project ID and Name . Constraints: The value can contain 1 to 64 characters. Letters, digits, and hyphens (-) are allowed. Range: N/A Default Value: N/A

Table 10-379 Query Parameters

Parameter	Mandatory	Type	Description
id	No	String	Definition: Lite Server instance ID. Constraints: ^[0-9a-f]{8}-[0-9a-f]{4}-[1-5][0-9a-f]{3}-[89ab][0-9a-f]{3}-[0-9a-f]{12}\$ Range: N/A Default Value: N/A
resource_id	No	String	Definition: Resource ID of the Lite Server instance. Constraints: ^[0-9a-f]{8}-[0-9a-f]{4}-[1-5][0-9a-f]{3}-[89ab][0-9a-f]{3}-[0-9a-f]{12}\$ Range: N/A Default Value: N/A

Request Parameters

  } ]
}
```

Status Codes

Status Code	Description
200	Definition: Response body for querying the Tor information of an instance

Error Codes

See [Error Codes](#).

10.42 Performing Operations on Lite Server Instances in Batches

Function

This API is used to perform unified operations, such as starting, stopping, restarting, or deleting Lite Server instances. It is used when you need to perform the same operation on multiple Lite Server instances, for example, stopping instances in batches during maintenance, restarting instances in batches after configuration update, or clearing unnecessary instances. Before using this API, ensure that the target Lite Server instance exists and you have the required operation permissions. After the operation, all specified Lite Server instances will be changed or removed according to the request, and related resources and configurations will be adjusted or cleared accordingly. If the target Lite Server

instance does not exist, you do not have the operation permission, or the request parameters are incorrect, the API returns an error message.

Constraints

No constraints.

Debugging

You can debug this API through automatic authentication in [API Explorer](#) or use the SDK sample code generated by API Explorer.

Authorization Information

Each account has all the permissions required to call all APIs, but IAM users must be assigned the required permissions.

- If you are using role/policy-based authorization, see [Permissions Policies and Supported Actions](#) for details on the required permissions.
- If you are using identity policy-based authorization, no identity policy-based permission required for calling this API.

URI

POST /v1/{project_id}/dev-servers/action

Table 10-382 Path Parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Definition: Project ID. For details, see Obtaining a Project ID and Name . Constraints: The value can contain 1 to 64 characters. Letters, digits, and hyphens (-) are allowed. Range: N/A Default Value: N/A

Request Parameters

Table 10-383 Request body parameters

Parameter	Mandatory	Type	Description
type	Yes	String	Definition: Batch operation type. Constraints: N/A. Range: • START: Lite Server instances are started in batches. • STOP: Lite Server instances are stopped in batches. • REBOOT: Lite Server instances are restarted in batches. • CHANGEOS: Lite Server OS images are changed in batches. • REINSTALLOS: Lite Server OS images are reinstalled in batches. • DELETE: Lite Server instances are deleted in batches. Default Value: N/A.
servers	Yes	Array of BatchActionDevServerIds objects	Definition: Lite Server ID list for batch operations.
extend_param	No	ServerOsRequest object	Definition: Parameters for changing and resetting the OS image of Lite Server instances in batches.

Table 10-384 BatchActionDevServerIds

Parameter	Mandatory	Type	Description
id	Yes	String	Definition: Lite Server instance ID. Constraints: N/A. Range: N/A. Default Value: N/A.

Table 10-385 ServerOsRequest

Parameter	Mandatory	Type	Description
admin_pass	No	String	Definition: Password used for logging in to the server. Note that either admin_pass or key_pair_name must be specified for ECSs and BMSs and supernodes support only key_pair_name . Constraints: The password must: • Contain 8 to 26 characters. • Contain at least three of the following types: uppercase letters, lowercase letters, digits, and special characters (!@%-_=[{}];,./?). • Cannot be the username or the username spelled backwards. • Cannot contain root, administrator, or their reverse. Range: N/A Default value: N/A
key_pair_name	No	String	Name of the key pair for logging in to the server. Note that either admin_pass or key_pair_name must be specified. This parameter is supported only when ECSs or BMSs are reset or their OSs are changed. Supernodes do not support this parameter.
image_id	No	String	Definition: Image ID. This parameter is mandatory when the OS is changed. Constraints: N/A Range: N/A Default value: N/A

Parameter	Mandatory	Type	Description
user_data	No	String	Definition Custom data to be injected into the instance during cloud server creation. Texts and text files can be injected. Example: Before Base64 encoding: - Linux server: <pre>#!/bin/bash echo user_test > /home/user.txt</pre> After Base64 encoding: - Linux server: <pre>IyEvYmluL2Jhc2gKZWNoYyB1c2VyX3Rlc3QgPiAvaG9tZS91c2VyLnR4dA==</pre> For more information about user data injection, see Injecting User Data. You must be aware of the effects of user_data. You are responsible for the impact and risks. Constraints - The content of user_data must be encoded with Base64. - The maximum size of the content to be injected (before encoding) is 32 KB. Range: N/A Default Value: N/A

Response Parameters

Status code: 200

Table 10-386 Response body parameters

Parameter	Type	Description
current	Integer	Definition: Current page number. Value range: 1 to 2097152
data	Array of ServerResponse objects	Definition: Lite Server instance list.

Parameter	Type	Description
pages	Integer	Definition: Total number of pages. Value range: 1 to 2097152
size	Integer	Definition: Number of records on each page. Maximum number of instances returned on each page. The value of this parameter directly affects the amount of returned data. You can adjust the value to optimize the query performance or increase the information volume of a single request. Range: 1 to 1024
total	Long	Definition: Total number of records. Total number of instances that meet the search criteria. This field is used to learn the overall data scale. Range: 1 to 2147483647

Table 10-387 ServerResponse

Parameter	Type	Description
create_at	Long	Definition: Creation time. Range: N/A
update_at	Long	Definition: Update time. Range: N/A
charging_mode	String	Definition: Billing mode. Range: • COMMON: both yearly/monthly and pay-per-use • POST_PAID: pay-per-use • PRE_PAID: yearly/monthly
cloud_server	CloudServer object	Definition: Cloud service information.
endpoints_response	Array of Endpoints objects	Definition: Private IP address of the instance.
flavor	String	Definition: Instance flavor name. Range: ^.{1,128}\$

Parameter	Type	Description
id	String	Definition: Instance ID. Range: ^[0-9a-f]{8}-[0-9a-f]{4}-[1-5][0-9a-f]{3}-[89ab][0-9a-f]{3}-[0-9a-f]{12}\$
key_pair_name	String	Definition: Key pair name. Range: ^[-_.a-zA-Z0-9]{1,64}\$
name	String	Definition: Instance name. Range: ^[-_.a-zA-Z0-9]{1,64}\$
order_id	String	Definition: Order ID. Range: ^[a-zA-Z0-9]{1,64}\$
server_image_response	ServerImageResponse object	Definition: Instance image information. Range: N/A

Parameter	Type	Description
status	String	Definition: Instance status. Current running status of the instance, which is used to monitor the lifecycle and health status of the instance. Range: • CREATE_FAILED: Creating the instance failed. • CREATING: The instance is being created. • DELETED: The instance has been deleted. • DELETE_FAILED: Deleting the instance failed. • DELETING: The instance is being deleted. • ERROR: An error occurred. • RUNNING: The instance is running. • STARTING: The instance is being started. • START_FAILED: Starting the instance failed. • STOPPED: The instance has been stopped. • STOPPING: The instance is being stopped. • STOP_FAILED: Stopping the instance failed. • REBOOTING: The instance is being restarted. • REBOOT_FAILED: Restarting the instance failed. • CHANGINGOS: The OS is being changed. • CHANGINGOS_FAILED: Changing the OS failed. • REINSTALLINGOS: The OS is being reinstalled. • REINSTALLINGOS_FAILED: Reinstalling the OS failed.

Parameter	Type	Description
vpc_id	String	Definition: ID of the VPC where the instance is located. Range: <code>^[0-9a-f]{8}-[0-9a-f]{4}-[1-5][0-9a-f]{3}-[89ab][0-9a-f]{3}-[0-9a-f]{12}\$</code>
endpoints	Array of EndpointsRes objects	Definition: Private IP address of the server.
volumes	Array of ServerVolume objects	Definition: Information about the mounted hard disk.
image	ServerImageResponse object	Definition: Server image information.
category	String	Definition: Server type. Range: • HPS: supernode server • SPOD: full-cabinet server • SERVER: single server
server_hps	ServerHpsInfo object	Definition: Information about the supernode to which the server belongs.
subnet_id	String	Parameter description: ID of the subnet where the instance is located. ** Value range: <code>**^[0-9a-f]{8}-[0-9a-f]{4}-[1-5][0-9a-f]{3}-[89ab][0-9a-f]{3}-[0-9a-f]{12}\$</code> .

Table 10-388 CloudServer

Parameter	Type	Description
id	String	Definition: Server resource ID or supernode's child node ID. Range: <code>^[0-9a-f]{8}-[0-9a-f]{4}-[1-5][0-9a-f]{3}-[89ab][0-9a-f]{3}-[0-9a-f]{12}\$</code>

Parameter	Type	Description
type	String	Definition: Lite Server server type. Range: • BMS: Bare Metal Server • ECS: Elastic Cloud Server • HPS: Supernode server
hps_id	String	Definition: Server resource ID of the supernode's child node. Range: ^[0-9a-f]{8}-[0-9a-f]{4}-[1-5][0-9a-f]{3}-[89ab][0-9a-f]{3}-[0-9a-f]{12}\$
hps_ecs_id	String	Definition: Server resource ID of the supernode's child node. Range: ^[0-9a-f]{8}-[0-9a-f]{4}-[1-5][0-9a-f]{3}-[89ab][0-9a-f]{3}-[0-9a-f]{12}\$

Table 10-389 Endpoints

Parameter	Type	Description
dev_service	String	Definition: Supported services. Range: • NOTEBOOK: You can access notebook instances using HTTPS. • SSH: You can remotely access notebook instances through SSH.
extensions	Map<String,String>	Definition: App-specific URL for accessing the remote development mode of the app. It includes extended configurations of the application. Constraints: N/A Range: N/A Default Value: N/A
ssh_keys	Array of strings	Definition: List of SSH key pairs. You can set multiple key pairs to access an SSH instance at the same time. Constraints: N/A Range: 0 to 1,024 key pairs Default Value: N/A

Table 10-390 EndpointsRes

Parameter	Type	Description
allowed_access_ips	Array of strings	Definition: Whitelisted public IP addresses that are allowed to access notebook instances through SSH. By default, all public IP addresses can access the notebook instances. If IP addresses are specified, only the clients with the specified IP addresses can access the notebook instances.
dev_service	String	Definition: Method for accessing the notebook instance. Range: • NOTEBOOK: You can access notebook instances using HTTPS. • SSH: You can remotely access notebook instances through SSH.
ssh_keys	Array of strings	Definition: List of SSH key pairs. You can set multiple key pairs to access an SSH instance at the same time.
service	String	Definition: Method for accessing the notebook instance. Range: • NOTEBOOK: You can access notebook instances using HTTPS. • SSH: You can remotely access notebook instances through SSH.
uri	String	Definition: Private IP address of the instance. Range: N/A

Table 10-391 ServerVolume

Parameter	Type	Description
size	Integer	Definition: EVS disk size, which is the storage space allocated to the system disk. Constraints: N/A Range: 100 to 1,024 GB Default Value: N/A

Parameter	Type	Description
type	String	Definition: Storage type, which can be a system disk or data disk. Constraints: N/A. Range: • ROOT: System disk • DATA: Data disk Default Value: N/A.
evs_type	String	Definition: EVS disk type. Storage type of the EVS disk. Constraints: N/A. Range: • ESSD: Extreme SSD • GPSSD: General-purpose SSD • SAS: High I/O EVS disk • SATA: Common I/O EVS disk • SSD: Ultra-high I/O EVS disk Default Value: N/A.
evs_id	String	Definition: ID of the EVS disk. Range: ^[0-9a-f]{8}-[0-9a-f]{4}-[1-5][0-9a-f]{3}-[89ab][0-9a-f]{3}-[0-9a-f]{12}\$

Table 10-392 ServerImageResponse

Parameter	Type	Description
arch	String	Definition: Architecture type of a server image. Range: • ARM • X86
image_id	String	Definition: Server image ID. Range: ^[0-9a-f]{8}-[0-9a-f]{4}-[1-5][0-9a-f]{3}-[89ab][0-9a-f]{3}-[0-9a-f]{12}\$
name	String	Definition: Server image name. Constraints: N/A Range: 1 to 256 characters Default Value: N/A

Parameter	Type	Description
server_type	String	Definition: Server type. Range: • BMS: BMS • ECS: ECS • HPS: supernode server
status	String	Definition: Server image status. Range: • ACTIVE • INACTIVE

Table 10-393 ServerHpsInfo

Parameter	Type	Description
id	String	Definition: Lite Server supernode instance ID. Range: ^[0-9a-f]{8}-[0-9a-f]{4}-[1-5][0-9a-f]{3}-[89ab][0-9a-f]{3}-[0-9a-f]{12}\$
name	String	Definition: Lite Server supernode name. Range: ^[-_a-zA-Z0-9]{1,64}\$

10.43 Querying Lite Server Job Details

Function

This API is used to obtain the details of a specified Lite Server job. It is used when you need to view the execution status, configuration parameters, and log information of a Lite Server job. Before using this API, ensure that the target Lite Server job exists and you have the view permission. After the query, the API returns the details of the specified Lite Server job, including the job ID, status, creation time, execution time, configuration parameters, and logs. If the target Lite Server job does not exist or you do not have the required permission, the API returns an error message.

Debugging

You can debug this API through automatic authentication in [API Explorer](#) or use the SDK sample code generated by API Explorer.

Authorization Information

Each account has all the permissions required to call all APIs, but IAM users must be assigned the required permissions.

- If you are using role/policy-based authorization, see [Permissions Policies and Supported Actions](#) for details on the required permissions.
- If you are using identity policy-based authorization, no identity policy-based permission required for calling this API.

URI

Table 10-403 Response body parameters

Parameter	Type	Description
create_at	String	Definition: Creation time. Range: N/A
update_at	String	Definition: Update time. Range: N/A
id	String	Definition: Task ID. Range: N/A

Parameter	Type	Description
name	String	Definition: Task name. Range: N/A
type	String	Definition: Task template type. Range: COMMON , SERVICE_DEPLOY , and others.
status	String	Definition: Status. Range: ACTIVE .
items	Array of DevServerJobItem objects	Definition: Task instance list information.
tasks	Array of DevServerTaskResponse objects	Definition: Task details list.
template_id	String	Definition: Task template ID. Range: N/A
user_name	String	Definition: Information about the user who delivers the task. Range: N/A
abnormal_count	Integer	Definition: number of nodes where the task fails. Range: N/A
description	String	Definition: Description. Range: N/A

Table 10-404 DevServerJobItem

Parameter	Type	Description
type	String	Definition: Fine-grained task type. Range: COMMON , DEVICE_LOG_COLLECT , and others.
spec	Map<String,String>	Definition: Parameters required by the task.

Table 10-405 DevServerTaskResponse

Parameter	Type	Description
id	String	Definition: Task ID. Range: N/A.
server_id	String	DevServer ID.
server_name	String	DevServer name.
status	String	Definition: Task status. Range: • PROCESSING: The task is being processed. • SUCCESS: The task is successful. • FAILED: The task failed. • SKIPPED: The task is skipped.
cloud_server	Map<String,String>	Underlying ECS/BMS/HPS ID.
message	String	Output information.
create_at	String	Creation time.
update_at	String	Update time.

Example Requests

Query details about the job specified by **job_id**.

10.44 Querying the Lite Server Job List

Function

This API is used to obtain the Lite Server job list and filter jobs by status and ID. It is used when you need to view the brief information about multiple Lite Server jobs. For example, you can use this API to obtain the jobs that meet the filter criteria during job status monitoring, troubleshooting, or routine management. Before using this API, ensure that you have the view permission. After the query, the API returns the Lite Server jobs that meet the search criteria, including the ID, status, and creation time. If you do not have the required permission or the request parameters are incorrect, the API returns an error message.

Debugging

You can debug this API through automatic authentication in [API Explorer](#) or use the SDK sample code generated by API Explorer.

Authorization Information

Each account has all the permissions required to call all APIs, but IAM users must be assigned the required permissions.

- If you are using role/policy-based authorization, see [Permissions Policies and Supported Actions](#) for details on the required permissions.
- If you are using identity policy-based authorization, no identity policy-based permission required for calling this API.

URI

GET /v1/{project_id}/dev-servers/jobs

Table 10-406 Path Parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Definition: Project ID. For details, see Obtaining a Project ID and Name . Constraints: The value can contain 1 to 64 characters. Letters, digits, and hyphens (-) are allowed. Range: N/A Default Value: N/A

Table 10-407 Query Parameters

Parameter	Mandatory	Type	Description
id	No	String	Definition: Lite Server job ID. Constraints: None Range: 1 to 64 characters Default Value: N/A
name	No	String	Definition: Lite Server job name. Constraints: None Range: N/A Default Value: N/A
type	No	String	Definition: Lite Server job type. Constraints: None Range: N/A Default Value: N/A
status	No	String	Definition: Lite Server job status. Constraints: None Range: N/A Default Value: N/A

Parameter	Mandatory	Type	Description
visible	No	Boolean	Definition: Visible or not. Constraints: bool Range: N/A Default Value: N/A

10.45 Deleting Lite Server Jobs in Batches

Function

This API is used to remove multiple Lite Server jobs. It is used when multiple Lite Server jobs are completed, incorrectly configured, or resources need to be cleared. Before using this API, ensure that the target Lite Server job exists and you have the administrator permissions. After the deletion, the specified Lite Server job is permanently removed, and related resources and configurations are cleared. If the target Lite Server job does not exist, you do not have the required permission, or the request parameters are incorrect, the API returns an error message.

Debugging

You can debug this API through automatic authentication in [API Explorer](#) or use the SDK sample code generated by API Explorer.

Authorization Information

Each account has all the permissions required to call all APIs, but IAM users must be assigned the required permissions.

- If you are using role/policy-based authorization, see [Permissions Policies and Supported Actions](#) for details on the required permissions.
- If you are using identity policy-based authorization, no identity policy-based permission required for calling this API.

10.46 Creating a Lite Server Task

Function

This API is used to create a Lite Server task. It is used when you need to start a development, test, or deployment task on the Lite Server. Before using this API, ensure that you have the permission to create a task and the task configuration parameters meet the requirements. After the creation, the Lite Server task is created, and the task ID and other related information are returned. If you do not have the required permission, the parameters are incorrect, or the system resources are insufficient, the API returns an error message.

Debugging

You can debug this API through automatic authentication in [API Explorer](#) or use the SDK sample code generated by API Explorer.

Authorization Information

Each account has all the permissions required to call all APIs, but IAM users must be assigned the required permissions.

- If you are using role/policy-based authorization, see [Permissions Policies and Supported Actions](#) for details on the required permissions.
- If you are using identity policy-based authorization, no identity policy-based permission required for calling this API.

10.47 Obtaining the Lite Server Job Template List

Function

This API is used to obtain the list of available Lite Server job templates. It is used when you need to view available job templates and select a proper template to create a Lite Server task. After the query, the API returns all available Lite Server job templates, including the template ID, name, and description. If no template is available in the system, the API returns an error message.

Debugging

You can debug this API through automatic authentication in [API Explorer](#) or use the SDK sample code generated by API Explorer.

Authorization Information

Each account has all the permissions required to call all APIs, but IAM users must be assigned the required permissions.

- If you are using role/policy-based authorization, see [Permissions Policies and Supported Actions](#) for details on the required permissions.
- If you are using identity policy-based authorization, no identity policy-based permission required for calling this API.

10.48 Obtaining Lite Server Job Template Details

Function

This API is used to obtain the details of a specified Lite Server job template. It is used when you need to view the detailed configurations of a specified job template to learn about the parameter settings and usage description. After the query, the API returns the details of the specified template, including the template ID, name, description, and configuration parameters. If the target template does not exist, the API returns an error message.

Debugging

You can debug this API through automatic authentication in [API Explorer](#) or use the SDK sample code generated by API Explorer.

Authorization Information

Each account has all the permissions required to call all APIs, but IAM users must be assigned the required permissions.

- If you are using role/policy-based authorization, see [Permissions Policies and Supported Actions](#) for details on the required permissions.
- If you are using identity policy-based authorization, no identity policy-based permission required for calling this API.

10.49 Obtaining the Lite Server Plug-in List

Function

This API is used to obtain the list of available Lite Server plug-ins. It is used when you need to view available plug-ins and select and install the required ones to extend Lite Server functions. Before using this API, ensure that you have the permission to view the plug-in list. After the query, the API returns all available Lite Server plug-ins, including the plug-in ID, name, version, and description. If you

do not have the required permission or no plug-in is available, the API returns an error message.

Debugging

You can debug this API through automatic authentication in [API Explorer](#) or use the SDK sample code generated by API Explorer.

Authorization Information

Each account has all the permissions required to call all APIs, but IAM users must be assigned the required permissions.

- If you are using role/policy-based authorization, see [Permissions Policies and Supported Actions](#) for details on the required permissions.
- If you are using identity policy-based authorization, no identity policy-based permission required for calling this API.

10.50 Obtaining Software Information

Function

This API is used to query information about supported software. You can use **flavor_type** and **name** to filter software information. It is used when you need to know the software supported by the system and its details, for example, when you need to select a proper software version or configuration environment. Before using this API, ensure that you have the permission to view software information. After the query, the API returns the software list that meets the search criteria, including the software name, version, and type. If you do not have the required permission, the query parameters are incorrect, or no software that meets the search criteria exists in the system, the API returns an error message.

Debugging

You can debug this API through automatic authentication in [API Explorer](#) or use the SDK sample code generated by API Explorer.

Authorization Information

Each account has all the permissions required to call all APIs, but IAM users must be assigned the required permissions.

- If you are using role/policy-based authorization, see [Permissions Policies and Supported Actions](#) for details on the required permissions.
- If you are using identity policy-based authorization, no identity policy-based permission required for calling this API.

URI

GET /v1/{project_id}/dev-servers/software

Table 10-433 Path Parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Definition: Project ID. For details, see Obtaining a Project ID and Name . Constraints: The value can contain 1 to 64 characters. Letters, digits, and hyphens (-) are allowed. Range: N/A Default Value: N/A

Table 10-434 Query Parameters

Parameter	Mandatory	Type	Description
flavor_type	No	String	Definition: Lite Server specification type. Constraints: The value can contain letters, digits, and hyphens (-). Range: N/A Default Value: N/A
type	No	String	Definition: Lite Server software type. Constraints: The value can contain letters, digits, and hyphens (-). Range: N/A Default Value: N/A

10.51 Obtaining Lite Server Service Details

Function

This API is used to obtain Lite Server deployment service details based on the service ID. It is used when you need to view the details of a deployed service, such as the status and APIs of the service. Before using this API, ensure that you have the permission to view services. After the query, the API returns the details of the deployed service, including the name, status, description, used model, and instance details. If you do not have the required permission or the ID does not exist, the API returns an error message.

Debugging

You can debug this API through automatic authentication in [API Explorer](#) or use the SDK sample code generated by API Explorer.

Authorization Information

Each account has all the permissions required to call all APIs, but IAM users must be assigned the required permissions.

- If you are using role/policy-based authorization, see [Permissions Policies and Supported Actions](#) for details on the required permissions.
- If you are using identity policy-based authorization, no identity policy-based permission required for calling this API.

URI

GET /v1/{project_id}/dev-servers/jobs/services/{id}

Table 10-440 Path Parameters

11 Authorization Management

11.1 Viewing an Authorization List

Function

This API is used to view the authorization information.

This API applies to the following scenarios: When you need to know the current authorization status, review permission assignment, or manage permissions, you can use this API to view the authorization list. Before using this API, ensure that you have the permission to view authorization. After the query is complete, the authorization list is returned, including the authorized resources, authorization type, and authorization content. If you do not have the permission to view the authorization list or the authorization list does not exist, the API will return an error message.

Debugging

You can debug this API through automatic authentication in [API Explorer](#) or use the SDK sample code generated by API Explorer.

Authorization Information

Each account has all the permissions required to call all APIs, but IAM users must be assigned the required permissions.

- If you are using role/policy-based authorization, see [Permissions Policies and Supported Actions](#) for details on the required permissions.
- If you are using identity policy-based authorization, no identity policy-based permission required for calling this API.

URI

GET /v2/{project_id}/authorizations

Table 11-1 Path Parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Definition: Project ID. For details, see Obtaining a Project ID and Name . Constraints: N/A Range: N/A Default Value: N/A

Table 11-2 Query Parameters

Parameter	Mandatory	Type	Description
sort_by	No	String	Definition: Sorting field Constraints: N/A Range: Enums: • user_name: IAM user • create_time: creation time Default Value: user_name
order	No	String	Definition: Sorting mode Constraints: N/A Range: Enums: • ASC: ascending order • DESC: descending order Default Value: ASC
limit	No	Integer	Definition: Maximum number of records returned on each page Constraints: N/A Range: [1, 1000] Default Value: 1000
offset	No	Integer	Definition: Start page for pagination display Constraints: N/A Range: Non-negative integers Default Value: 0

Request Parameters

None

Response Parameters

Status code: 200

Table 11-3 Response body parameters

Parameter	Type	Description
total_count	Number	Definition: Total number of authorizations. Range: N/A
auth	Array of AuthorizationResponse objects	Definition: Authorization information list.

Table 11-4 AuthorizationResponse

Parameter	Type	Description
user_id	String	Definition: user ID. For details, see Obtaining a Username and ID . If user_id is set to all , all IAM users are authorized. If some IAM users have been authorized, the authorization setting will be updated. This parameter is mandatory only if the authorization method is set to Agency . Constraints: N/A Range: The value must contain 3 to 32 characters. Letters, digits, and hyphens (-) are allowed. Default Value: N/A
type	String	Definition: Authorization type. Agency is recommended. Constraints: N/A Range: • AGENCY: agency • CREDENTIAL: access keys (AK/SK) Default Value: N/A

Parameter	Type	Description
content	String	Definition: Authorization content. Constraints: - When the authorization type is agency, this field is the agency name. - When the authorization type is access key, this field is the access key ID (AK). Range: 0 to 64 Default Value: N/A
secret_key	String	Definition: Secret access key (SK). Constraints: This field is required only when the authorization type is access key. Range: The value must contain 40 characters. Letters and digits are allowed. Default Value: N/A
user_name	String	Definition: Username. Constraints: If user_id is set to all-users , all users will be displayed. Range: N/A Default Value: N/A
user_type	String	Definition: User type. Constraints: N/A Range: IAM: IAM user. The user_id field is mandatory. FEDERATE: federated user. The user_name field is mandatory, and the user_id field is not needed. GRANT: agency. The user_id field is mandatory, and its value is the agency ID. ALL-USERS: all users. The user_id field is mandatory, and its value is all. Default Value: IAM.
create_time	Long	Definition: Creation timestamp. Range: N/A

Example Requests

View an authorization list.

```
GET https://{endpoint}/v2/{project_id}/authorizations
```

Example Responses

Status code: 200

OK

```
{
  "total_count": 1,
  "auth": [ {

}
```

Status Codes

Status Code	Description
200	OK
400	Bad request
401	Unauthorized
403	Forbidden
404	Not found

Error Codes

See [Error Codes](#).

11.2 Configuring Authorization

Function

This API is used to configure ModelArts authorization.

This API applies to the following scenario: When IAM users need to be granted the permission to access ModelArts, the administrator can use this API to configure authorization. Before using this API, the administrator must have the Security Administrator permission configured in IAM, and access keys must be configured for the IAM users. After the authorization is configured, IAM users are granted the permission to access ModelArts resources so that they can use functions such as training management, development environment, data management, and real-

time services. If the administrator does not have the required permission or an IAM user does not exist, the API will return an error message.

Debugging

You can debug this API through automatic authentication in [API Explorer](#) or use the SDK sample code generated by API Explorer.

Authorization Information

Each account has all the permissions required to call all APIs, but IAM users must be assigned the required permissions.

- If you are using role/policy-based authorization, see [Permissions Policies and Supported Actions](#) for details on the required permissions.
- If you are using identity policy-based authorization, no identity policy-based permission required for calling this API.

URI

POST /v2/{project_id}/authorizations

Table 11-5 Path Parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Definition: Project ID. For details, see Obtaining a Project ID and Name . Constraints: N/A Range: N/A Default Value: N/A

Request Parameters

Table 11-6 Request body parameters

Parameter	Mandatory	Type	Description
user_id	No	String	Definition: user ID. For details, see Obtaining a Username and ID . If user_id is set to all , all IAM users are authorized. If some IAM users have been authorized, the authorization setting will be updated. This parameter is mandatory only if the authorization method is set to Agency . Constraints: N/A Range: The value must contain 3 to 32 characters. Letters, digits, and hyphens (-) are allowed. Default Value: N/A
type	No	String	Definition: Authorization type. Agency is recommended. Constraints: N/A Range: • AGENCY: agency • CREDENTIAL: access keys (AK/SK) Default Value: N/A
content	Yes	String	Definition: Authorization content. Constraints: • When the authorization type is agency, this field is the agency name. • When the authorization type is access key, this field is the access key ID (AK). Range: 0 to 64 Default Value: N/A

Parameter	Mandatory	Type	Description
secret_key	No	String	Definition: Secret access key (SK). Constraints: This field is required only when the authorization type is access key. Range: The value must contain 40 characters. Letters and digits are allowed. Default Value: N/A
user_name	No	String	Definition: Username. Constraints: If user_id is set to all-users , all users will be displayed. Range: N/A Default Value: N/A
user_type	No	String	Definition: User type. Constraints: N/A Range: • IAM: IAM user. The user_id field is mandatory. • FEDERATE: federated user. The user_name field is mandatory, and the user_id field is not needed. • GRANT: agency. The user_id field is mandatory, and its value is the agency ID. • ALL-USERS: all users. The user_id field is mandatory, and its value is all. Default Value: IAM.

Response Parameters

Status code: 200

OK

None

Example Requests

The following is an example of how to upload authorization whose authorization type is **agency** and authorization content is **modelarts_agency**.

```
POST https://{endpoint}/v2/{project_id}/authorizations
{
  "user_id" : "****d80fb058844ae8b82aa66d9fe****",
  "type" : "agency",
  "content" : "modelarts_agency"
}
```

Example Responses

Status code: 200

OK

```
{
  "result" : "true"
}
```

Status Codes

Status Code	Description
200	OK
400	Bad request
401	Unauthorized
403	Forbidden
404	Not found

Error Codes

See [Error Codes](#).

11.3 Deleting Authorization

Function

This API is used to delete the authorization of a specified user or all users.

This API applies to the following scenarios: When the access permission of a specified user needs to be revoked or the authorization of all users needs to be cleared during system maintenance, the administrator can use this API to do so. Before using this API, the administrator must have the permission to delete the authorization and specify the user whose authorization is to be deleted or delete the authorization of all users. After the deletion is complete, the authorization of the specified user will be removed, or the authorization of all users will be cleared.

Users cannot access related functions. If the user does not exist, the administrator does not have the operation permission, or the system detects that there is no administrator permission during authorization deletion of all users, the API will return an error message.

Debugging

You can debug this API through automatic authentication in [API Explorer](#) or use the SDK sample code generated by API Explorer.

Authorization Information

Each account has all the permissions required to call all APIs, but IAM users must be assigned the required permissions.

- If you are using role/policy-based authorization, see [Permissions Policies and Supported Actions](#) for details on the required permissions.
- If you are using identity policy-based authorization, no identity policy-based permission required for calling this API.

URI

DELETE /v2/{project_id}/authorizations

Table 11-7 Path Parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Definition: Project ID. For details, see Obtaining a Project ID and Name . Constraints: N/A Range: N/A Default Value: N/A

Table 11-8 Query Parameters

Parameter	Mandatory	Type	Description
user_id	No	String	Definition: User ID. If this parameter is set to all , the authorization of all IAM users will be deleted. Constraints: N/A Range: N/A Default Value: N/A

Request Parameters

None

Response Parameters

Status code: 200

OK

None

Example Requests

Delete the authorization of a specified user.

```
DELETE https://{endpoint}/v2/{project_id}/authorizations?user_id=****d80fb058844ae8b82aa66d9fe****
```

Example Responses

Status code: 200

OK

```
{
  "result" : "true"
}
```

400	Bad request
401	Unauthorized
403	Forbidden
404	Not found

Error Codes

See [Error Codes](#).

11.4 Creating a ModelArts Agency

Function

This API is used to create a ModelArts agency for ModelArts-dependent services, such as Object Storage Service (OBS), Software Repository for Container (SWR), and Intelligent EdgeFabric (IEF).

This API applies to the following scenarios: When you need to configure permissions for ModelArts to access services such as OBS, SWR, and IEF, you can use this API to create an agency. Before using this API, ensure that you have the permission to create an agency and have corresponding permissions in IAM. After the agency is created, ModelArts is authorized to access services such as OBS, SWR, and IEF for data storage, image pulling, model deployment, and other functions. If you do not have the permission to create an agency or dependent services have not been configured, the API will return an error message.

Debugging

You can debug this API through automatic authentication in [API Explorer](#) or use the SDK sample code generated by API Explorer.

Authorization Information

Each account has all the permissions required to call all APIs, but IAM users must be assigned the required permissions.

- If you are using role/policy-based authorization, see [Permissions Policies and Supported Actions](#) for details on the required permissions.
- If you are using identity policy-based authorization, no identity policy-based permission required for calling this API.

URI

POST /v2/{project_id}/agency

Table 11-9 Path Parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Definition: Project ID. For details, see Obtaining a Project ID and Name . Constraints: N/A Range: N/A Default Value: N/A

Request Parameters

Table 11-10 Request body parameters

Parameter	Mandatory	Type	Description
agency_name_suffix	No	String	Definition: Suffix of the agency name. The agency name prefix is consistently to be ma_agency . For example, if the value of this parameter is iam-user01 , the name of the created agency is ma_agency_iam-user01 . The value of this parameter is left blank by default, indicating that an agency named ma_agency is created. Constraints: N/A Range: 0 to 50 Default Value: N/A

Response Parameters

Status code: 200

OK

None

Example Requests

The following is an example of how to create a ModelArts agency whose name suffix is **iam-user01**.

```
POST https://{endpoint}/v2/{project_id}/agency
{
  "agency_name_suffix" : "iam-user01"
}
```

Example Responses

Status code: 200

OK

```
{
  "agency_name" : "ma_agency_iam-user01"
}
```

400	Bad request
401	Unauthorized
403	Forbidden
404	Not found

Error Codes

See [Error Codes](#).

12 Workspace Management

12.1 Querying Details About a Workspace

Function

This API is used to query the details about a workspace.

This API is used when you need to view the configuration, status, or other information about a workspace. Before using this API, ensure that the workspace exists and you have the permission to view the workspace. After the query, the API returns the workspace details, including the workspace name, description, creation time, and status. If the workspace does not exist or you do not have the operation permission, the API will return an error message.

Debugging

You can debug this API through automatic authentication in [API Explorer](#) or use the SDK sample code generated by API Explorer.

Authorization Information

Each account has all the permissions required to call all APIs, but IAM users must be assigned the required permissions.

- If you are using role/policy-based authorization, see [Permissions Policies and Supported Actions](#) for details on the required permissions.
- If you are using identity policy-based authorization, the following identity policy-based permissions are required.

Action	Access Level	Resource Type (*: required)	Condition Key	Alias	Dependencies
modelarts:workspace:get	Read	workspace *	-	-	-

URI

GET /v1/{project_id}/workspaces/{workspace_id}

Table 12-1 Path Parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Definition: User project ID. For details, see Obtaining a Project ID and Name . Constraints: N/A Range: N/A Default Value: N/A
workspace_id	Yes	String	Definition: Workspace ID. If no workspaces are available, the default value is 0 . If a workspace is created and used, use the actual value. Constraints: N/A Range: N/A Default Value: N/A

Request Parameters

Table 12-2 Request header parameters

Parameter	Mandatory	Type	Description
X-Auth-Token	Yes	String	Definition: User token. It can be obtained by calling the IAM API. The token is the value of X-Subject-Token in the response header. Constraints: N/A Range: N/A Default Value: N/A

Response Parameters

Status code: 200

Table 12-3 Response body parameters

Parameter	Type	Description
grants	Array of grants objects	Definition: Authorization user list. By default, this parameter is left blank. This parameter must be used with auth_type and takes effect only when auth_type is set to INTERNAL .
owner	String	Definition: Creator name. Range: N/A
auth_type	String	Definition: Authorization type. Range: • PUBLIC: accessible to tenants • PRIVATE: accessible only to the creator and tenant accounts • INTERNAL: accessible to the creator, tenant accounts, and specified IAM users. This parameter must be used with grants.
enterprise_project_id	String	Definition Range: N/A Enterprise project ID.
update_time	Integer	Definition: Last modification time (UTC). Range: N/A

Parameter	Type	Description
create_time	Integer	Definition: Creation time (UTC). Range: N/A
enterprise_project_name	String	Definition: Enterprise project name. Range: N/A
name	String	Definition: Workspace name. The value can contain 4 to 64 characters. Only letters, digits, hyphens (-), and underscores (_) are allowed. default is the name of the default workspace reserved by the system. You are not allowed to create a workspace named default . Range: N/A
description	String	Definition: Workspace description. Range: N/A
id	String	Definition: Workspace ID, which is a 32-bit UUID generated by the system without hyphens (-). Range: N/A
status	String	Definition: Workspace status. Range • CREATE_FAILED: Creating the workspace failed. • NORMAL: The workspace is running properly. • DELETING: The workspace is being deleted. • DELETE_FAILED: Deleting the workspace failed.
status_info	String	Definition: Status description. This parameter is left empty by default. This parameter is used to show detailed information about a status. If a deletion failed, you can use this parameter to obtain the failure cause. Range: N/A

Table 12-4 grants

Parameter	Type	Description
user_id	String	Definition: User ID. Either this parameter or user_name must be configured. If both of them are available, user_id is preferred. Range: N/A.
user_name	String	Definition: Username. Either this parameter or user_id must be configured. Range: N/A.
user_type	String	Definition Authorized user type. Constraints This parameter is mandatory for federated users or agency users. Range IAM: IAM user FEDERATE: federated user AGENCY: agency user Default value IAM

Example Requests

```

}
```

Status Codes

Status Code	Description
200	The details about a workspace are obtained.

Error Codes

See [Error Codes](#).

12.2 Modifying a Workspace

Function

This API is used to update the configuration information of a specified workspace.

This API is used when you need to change the name, description, or other configuration information of a workspace. Before using this API, ensure that the workspace exists and you have the permission to modify the workspace. After the modification is complete, the API returns the updated workspace details, including the workspace name, description, and update time. If the workspace does not exist or you do not have the operation permission, the API will return an error message.

Debugging

You can debug this API through automatic authentication in [API Explorer](#) or use the SDK sample code generated by API Explorer.

Authorization Information

Each account has all the permissions required to call all APIs, but IAM users must be assigned the required permissions.

- If you are using role/policy-based authorization, see [Permissions Policies and Supported Actions](#) for details on the required permissions.
- If you are using identity policy-based authorization, the following identity policy-based permissions are required.

Action	Access Level	Resource Type (*: required)	Condition Key	Alias	Dependencies
modelarts:workspace:update	Write	workspace*	-	-	-

URI

PUT /v1/{project_id}/workspaces/{workspace_id}

Table 12-5 Path Parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Definition: User project ID. For details, see Obtaining a Project ID and Name . Constraints: N/A Range: N/A Default Value: N/A
workspace_id	Yes	String	Definition: Workspace ID. If no workspaces are available, the default value is 0 . If a workspace is created and used, use the actual value. Constraints: N/A Range: N/A Default Value: N/A

Request Parameters

Table 12-6 Request header parameters

Parameter	Mandatory	Type	Description
X-Auth-Token	Yes	String	Definition: User token. It can be obtained by calling the IAM API. The token is the value of X-Subject-Token in the response header. Constraints: N/A Range: N/A Default Value: N/A

Table 12-7 Request body parameters

Parameter	Mandatory	Type	Description
grants	No	Array of grants objects	Definition: Authorization user list. Constraints: This parameter is valid only when auth_type is set to INTERNAL . The value contains a maximum of 500 characters.
auth_type	No	String	Definition: Authorization type. Constraints: N/A Range: • PUBLIC: accessible to tenants • PRIVATE: accessible only to the creator and tenant accounts • INTERNAL: accessible to the creator, tenant accounts, and specified IAM users. This parameter must be used with grants. Default Value: PUBLIC
name	No	String	Definition: Workspace name. Constraints: Enter 4 to 64 characters. Only letters, digits, hyphens (-), and underscores (_) are allowed. default is the name of the default workspace reserved by the system. You are not allowed to create a workspace named default . Range: N/A Default Value: N/A
description	No	String	Definition: Workspace description. Constraints: The value can contain at most 256 characters. Range: N/A Default Value: This parameter is left empty by default.

Table 12-8 grants

Parameter	Mandatory	Type	Description
user_id	No	String	Definition: User ID. Constraints: If user_type is set to IAM , either user_name or user_id must be specified. user_id is recommended. This parameter is mandatory for agencies. This parameter is ignored for federated users. The response is automatically generated. Range: N/A. Default Value: N/A.
user_name	No	String	Definition: Username. Constraints: If user_type is set to IAM , either user_id or user_name must be specified. user_id is recommended. This parameter is mandatory for agencies and federated users. Range: N/A. Default Value: N/A.
user_type	No	String	Definition Authorized user type. Constraints This parameter is mandatory for federated users or agency users. Range IAM: IAM user FEDERATE: federated user AGENCY: agency user Default Value IAM

Response Parameters

Status code: 200

Table 12-9 Response body parameters

Parameter	Type	Description
workspace_id	String	Definition: Workspace ID. Range: N/A

Example Requests

```
PUT https://{endpoint}/v1/{project_id}/workspaces/ccd05d1a553b4e188ea878e7dcb85e47
{
  "name" : "my_workspace",
  "description" : "It is my workspace",
  "auth_type" : "INTERNAL",
  "grants" : [ {
    "user_name" : "my_iam_user"
  } ]
}
```

Example Responses

Status code: 200

Response parameter indicating that a workspace is modified

```
{
  "workspace_id" : "***05d1a553b4e188ea878e7dcb85***"
}
```

Status Codes

Status Code	Description
200	Response parameter indicating that a workspace is modified

Error Codes

See [Error Codes](#).

12.3 Deleting a Workspace

Function

This API is used to delete a created workspace.

This API applies to the following scenarios: When a workspace is no longer required, or resources need to be cleared, you can use this API to delete the specified workspace. Before using this API, ensure that the workspace exists and you have the permission to delete the workspace. After the deletion is complete, the workspace is permanently removed, and related resources are cleared. If the

workspace does not exist or you do not have the operation permission, the API will return an error message.

Debugging

You can debug this API through automatic authentication in [API Explorer](#) or use the SDK sample code generated by API Explorer.

Authorization Information

Each account has all the permissions required to call all APIs, but IAM users must be assigned the required permissions.

- If you are using role/policy-based authorization, see [Permissions Policies and Supported Actions](#) for details on the required permissions.
- If you are using identity policy-based authorization, the following identity policy-based permissions are required.

Action	Access Level	Resource Type (*: required)	Condition Key	Alias	Dependencies
modelarts:workspace:delete	Write	workspace *	-	-	-

URI

DELETE /v1/{project_id}/workspaces/{workspace_id}

Table 12-10 Path Parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Definition: Project ID. For details, see Obtaining a Project ID and Name . Constraints: The value can contain 1 to 64 characters. Letters, digits, and hyphens (-) are allowed. Range: N/A Default Value: N/A

Parameter	Mandatory	Type	Description
workspace_id	Yes	String	Definition: Workspace ID. For details about how to obtain the ID, see Querying the Workspace List . Constraints: N/A Range: N/A Default Value: N/A

Request Parameters

Table 12-11 Request header parameters

Parameter	Mandatory	Type	Description
X-Auth-Token	Yes	String	Definition: Requests for calling an API can be authenticated using either a token or AK/SK. If token-based authentication is used, this parameter is mandatory and must be set to a user token. For details, see Obtaining a User Token . Constraints: N/A Range: N/A Default Value: N/A

Response Parameters

Status code: 200

Table 12-12 Response body parameters

Parameter	Type	Description
workspace_id	String	Definition: Workspace ID. For details about how to obtain the value, see Obtaining Workspaces . Range: If no workspaces are available, there is no default value. If a workspace is created and used, use the actual value.

Example Requests

(Example) Deleting the workspace whose UUID is **ccd05d1a553b4e188ea878e7dcb85e47**

```
DELETE https://{endpoint}/v1/{project_id}/workspaces/ccd05d1a553b4e188ea878e7dcb85e47
```

Example Responses

Status code: 200

Response parameter indicating that a workspace is deleted

```
{  
  "workspace_id" : "ccd05d1a553b4e188ea878e7dcb85e47"  
}
```

Status Codes

Status Code	Description
200	Response parameter indicating that a workspace is deleted

Error Codes

See [Error Codes](#).

12.4 Querying a Workspace Quota

Function

This API is used to obtain the resource quota of a specified workspace.

This API is used when you need to know the resource usage and quota limits of a workspace. Before using this API, ensure that the workspace exists and you have the permission to view the workspace quota. After the query, the API returns the

quota information of the workspace, including the quotas and used amounts of compute, storage, and network resources. If the workspace does not exist or you do not have the operation permission, the API will return an error message.

Debugging

You can debug this API through automatic authentication in [API Explorer](#) or use the SDK sample code generated by API Explorer.

Authorization Information

Each account has all the permissions required to call all APIs, but IAM users must be assigned the required permissions.

- If you are using role/policy-based authorization, see [Permissions Policies and Supported Actions](#) for details on the required permissions.
- If you are using identity policy-based authorization, the following identity policy-based permissions are required.

Action	Access Level	Resource Type (*: required)	Condition Key	Alias	Dependencies
modelarts:workspace:getQuotas	Read	workspace *	-	-	-

URI

GET /v1/{project_id}/workspaces/{workspace_id}/quotas

Table 12-13 Path Parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Definition: User project ID. For details, see Obtaining a Project ID and Name . Constraints: N/A Range: N/A Default Value: N/A

Parameter	Mandatory	Type	Description
workspace_id	Yes	String	Definition: Workspace ID. If no workspaces are available, the default value is 0 . If a workspace is created and used, use the actual value. Constraints: N/A Range: N/A Default Value: N/A

Request Parameters

Table 12-14 Request header parameters

Parameter	Mandatory	Type	Description
X-Auth-Token	Yes	String	Definition: User token. It can be obtained by calling the IAM API. The token is the value of X-Subject-Token in the response header. Constraints: N/A Range: N/A Default Value: N/A

Response Parameters

Status code: 200

Table 12-15 Response body parameters

Parameter	Type	Description
quotas	Array of WorkspaceQuotasResponse objects	Definition: Workspace quota data.

Table 12-16 WorkspaceQuotasResponse

Parameter	Type	Description
max_quota	Integer	Definition: Maximum quota value. Range: N/A

Parameter	Type	Description
update_time	Integer	Definition: Last modification time (UTC). If the resource quota has not been modified, the default value is the time when a workspace was created. Range: N/A
resource	String	Definition: Unique ID of a resource. Range: N/A
quota	Integer	Definition: Current quota value. Value -1 indicates that the quota is not limited. Range: N/A
min_quota	Integer	Definition: Minimum quota value. Range: N/A
name_cn	String	Definition: Quota name (Chinese) Range: N/A
unit_cn	String	Definition: Quantity unit (Chinese). Range: N/A
name_en	String	Definition: Quota name (English). Range: N/A
unit_en	String	Definition: Quantity unit (English). Range: N/A
used_quota	Integer	Definition: Used quota. If the value of quota is -1 (indicating that the quota is not limited), the value of used_quota is null . Range: N/A

Example Requests

```
GET https://{endpoint}/v1/{project_id}/workspaces/ccd05d1a553b4e188ea878e7dcb85e47/quotas
```

Example Responses

Status code: 200

Response parameter indicating that a workspace quota is queried

```
{
  "quotas": [ {
    "max_quota": 60000,
    "update_time": 1470000020000,
    "resource": "exemplProject.gpu_duration",
    "used_quota": 5,
    "quota": 10,
```

```
"min_quota" : -1,  
"name_cn" : "ExeML Training Duration (Image Classification, Object Detection, and Sound Classification)",  
"unit_cn" : "Minute",  
"name_en" : "ExeMLtraining duration (image classification, object detection, and soundclassification)",  
"unit_en" : "minute"  
}]  
}
```

Error Codes

See [Error Codes](#).

12.5 Modifying a Workspace Quota

Function

This API is used to update the resource quota of a specified workspace.

This API is used when you need to adjust the resource quota of a workspace, for example, increase or decrease the quota of compute, storage, or network resources. Before using this API, ensure that the workspace exists and you have the permission to modify the workspace quota. After the modification is complete, the API returns the updated quota information, including the new quotas of compute, storage, and network resources. If the workspace does not exist or you do not have the operation permission, the API will return an error message.

Debugging

You can debug this API through automatic authentication in [API Explorer](#) or use the SDK sample code generated by API Explorer.

Authorization Information

Each account has all the permissions required to call all APIs, but IAM users must be assigned the required permissions.

- If you are using role/policy-based authorization, see [Permissions Policies and Supported Actions](#) for details on the required permissions.
- If you are using identity policy-based authorization, the following identity policy-based permissions are required.

Action	Access Level	Resource Type (*: required)	Condition Key	Alias	Dependencies
modelarts:workspace:updateQuotas	Write	workspace *	-	-	-

URI

PUT /v1/{project_id}/workspaces/{workspace_id}/quotas

Error Codes

See [Error Codes](#).

12.6 Querying a Workspace List

Function

This API is used to obtain the details of all created workspaces.

This API applies to the following scenario: When you need to view all available workspaces or perform audit, you can use this API to query the workspace list. Before using this API, ensure that you have the view permission. After the query is complete, the system returns all workspace details, including the name, creation time, and status. If you do not have the permission to perform operations, the API will return an error message.

Debugging

You can debug this API through automatic authentication in [API Explorer](#) or use the SDK sample code generated by API Explorer.

Authorization Information

Each account has all the permissions required to call all APIs, but IAM users must be assigned the required permissions.

- If you are using role/policy-based authorization, see [Permissions Policies and Supported Actions](#) for details on the required permissions.
- If you are using identity policy-based authorization, the following identity policy-based permissions are required.

Action	Access Level	Resource Type (*: required)	Condition Key	Alias	Dependencies
modelarts:workspace:list	List	-	-	-	-

URI

GET /v1/{project_id}/workspaces

Table 12-23 Path Parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Definition: Project ID. For details, see Obtaining a Project ID and Name . Constraints: The value can contain 1 to 64 characters. Letters, digits, and hyphens (-) are allowed. Range: N/A Default Value: N/A

Table 12-24 Query Parameters

Parameter	Mandatory	Type	Description
offset	No	Integer	Definition: Start page of the pagination list Constraints: N/A Range: The value must no less than 0 and no more than 2147483647. Default Value: 0
limit	No	Integer	Definition: Maximum number of records displayed on each page Constraints: N/A Range: The value must no less than 1 and no more than 1000. Default Value: 1000
sort_by	No	String	Definition: Sorting field Constraints: N/A Range: • name: workspace name • update_time: last modification time, in UTC format • status: workspace status Default Value: name

Parameter	Mandatory	Type	Description
order	No	String	Definition: Sorting mode Constraints: N/A Range: • asc: ascending order • desc: descending order Default Value: desc
enterprise_project_id	No	String	Definition: Enterprise project ID. If this parameter is specified, only the workspaces of the enterprise project are returned. By default, all workspaces are displayed. Constraints: N/A Range: The value can contain 36 characters. Letters, digits, and hyphens (-) are allowed. Default Value: N/A
name	No	String	Definition: Workspace name. If this parameter is specified, the fuzzy-match workspaces are queried. By default, all workspaces are displayed. Constraints: N/A Range: The value can contain 1 to 64 characters. Letters, digits, hyphens (-), and underscores (_) are allowed. Default Value: N/A

Parameter	Mandatory	Type	Description
filter_accessible	No	Boolean	Definition: Whether accessible workspaces are filtered Constraints: N/A Range: • false: All workspaces are displayed. • true: Workspaces that the current user does not have permission to access are filtered. Default Value: false

Request Parameters

Table 12-25 Request header parameters

Parameter	Mandatory	Type	Description
X-Auth-Token	Yes	String	Definition: Requests for calling an API can be authenticated using either a token or AK/SK. If token-based authentication is used, this parameter is mandatory and must be set to a user token. For details, see Obtaining a User Token . Constraints: N/A Range: N/A Default Value: N/A

Response Parameters

Status code: 200

Table 12-26 Response body parameters

Parameter	Type	Description
total_count	Integer	Definition: Total number of workspaces. Range: N/A
count	Integer	Definition: Number of workspaces returned for the current request. Range: The value must be no less than 0 and no more than the value of limit .
workspaces	Array of WorkspaceResponse objects	Definition: workspace parameters.

Table 12-27 WorkspaceResponse

Parameter	Type	Description
owner	String	Definition: Creator name Range: The value can contain 4 to 64 characters. Letters, digits, hyphens (-), and underscores (_) are allowed.
auth_type	String	Definition: Authorization type Range: • PUBLIC: accessible to tenants • PRIVATE: accessible only to the creator and primary account • INTERNAL: accessible to the creator, primary account, and specified IAM users. This parameter must be used together with grants.

Parameter	Type	Description
enterprise_project_id	String	Definition: Enterprise project ID Range: ID of an enabled enterprise project. The value contains 36 characters. Letters, digits, and hyphens (-) are allowed.
update_time	Integer	Definition: Last modification time, in UTC format Range: N/A
create_time	Integer	Definition: Creation time, in UTC format Range: N/A
enterprise_project_name	String	Definition: Enterprise project name Range: Name of the enterprise project corresponding to the response parameter enterprise_project_id
name	String	Definition: Workspace name Range: The value can contain 4 to 64 characters. Letters, digits, hyphens (-), and underscores (_) are allowed.
description	String	Definition: Workspace description Range: The value can contain 0 to 256 characters. It cannot contain the following special characters: < > = & " ' /

Parameter	Type	Description
status	String	Definition: Workspace status Range: • CREATE_FAILED: The workspace creation fails. • NORMAL: The workspace is running properly. • DELETING: The workspace is being deleted. • DELETE_FAILED: Deleting the workspace failed.
status_info	String	Definition: Status description. By default, this parameter is left blank. This parameter is used to show detailed information about a status. If a deletion failed, you can use this parameter to obtain the failure cause. Range: N/A

Example Requests

Filtering the records whose enterprise project ID is **0**, sorting the records by **name** in descending order, and obtaining a record on the fourth page in pagination mode

```
GET https://{endpoint}/v1/{project_id}/workspaces?  
limit=1&offset=3&sort_by=name&order=desc&enterprise_project_id=0
```

Example Responses

Status code: 200

Response parameter indicating that workspaces are obtained

```
{  
  "total_count" : 1,  
  "count" : 1,  
  "workspaces" : [ {  
    "id" : 0,

    "description" : "",  
    "owner" : "testUser",  
    "enterprise_project_id" : "****b0091-887f-4839-9929-cbc884f1e****",  
    "enterprise_project_name" : "default",  
    "auth_type" : "public",  
    "create_time" : 1460000010000,  
    "update_time" : 1460000010000,  
    "status" : "NORMAL",  
    "status_info" : ""  
  }  
]
```

```
}]  
}
```

Status Codes

Status Code	Description
200	Response parameter indicating that workspaces are obtained

Error Codes

See [Error Codes](#).

12.7 Creating a Workspace

Function

This API is used to create a workspace. The name of the created workspace cannot be **default**, which is the name of the default workspace reserved by the system.

This API applies to the following scenarios: When you need to create independent workspaces for different service objectives, teams, or projects, you can use this API to create new workspaces. Before using this API, ensure that you have the permission to create a workspace and the workspace name is not in use and is not **default**. After the workspace is created, the system allocates a default access control policy to the workspace. You can develop, manage, and deploy models in the workspace. If the workspace name already exists, the workspace name is **default**, or you do not have the operation permission, the API returns an error message.

Debugging

You can debug this API through automatic authentication in [API Explorer](#) or use the SDK sample code generated by API Explorer.

Authorization Information

Each account has all the permissions required to call all APIs, but IAM users must be assigned the required permissions.

- If you are using role/policy-based authorization, see [Permissions Policies and Supported Actions](#) for details on the required permissions.
- If you are using identity policy-based authorization, the following identity policy-based permissions are required.

Action	Access Level	Resource Type (*: required)	Condition Key	Alias	Dependencies
modelarts:workspace:create	Write	workspace *	-	-	-

URI

POST /v1/{project_id}/workspaces

Table 12-28 Path Parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Definition: Project ID. For details, see Obtaining a Project ID and Name . Constraints: The value can contain 1 to 64 characters. Letters, digits, and hyphens (-) are allowed. Range: N/A Default Value: N/A

Request Parameters

Table 12-29 Request header parameters

Parameter	Mandatory	Type	Description
X-Auth-Token	Yes	String	Definition: Requests for calling an API can be authenticated using either a token or AK/SK. If token-based authentication is used, this parameter is mandatory and must be set to a user token. For details, see Obtaining a User Token . Constraints: N/A Range: N/A Default Value: N/A

Table 12-30 Request body parameters

Parameter	Mandatory	Type	Description
grants	No	Array of grants objects	Definition: list of authorized users. Constraints: This parameter is valid only when auth_type is set to INTERNAL . The value contains a maximum of 500 characters.

Parameter	Mandatory	Type	Description
auth_type	No	String	Definition: authorization type. Constraints: N/A Range: • PUBLIC: accessible to tenants • PRIVATE: accessible only to the creator and tenant account • INTERNAL: accessible to the creator, tenant account, and specified IAM users. This parameter must be used with grants. Default Value: PUBLIC
enterprise_project_id	No	String	Definition: Enterprise project ID. If this parameter is specified, only the workspaces of the enterprise project are returned. By default, all workspaces are displayed. Constraints: N/A Range: ID of an enabled enterprise project. The value contains 36 characters. Letters, digits, and hyphens (-) are allowed. Default Value: N/A

Parameter	Mandatory	Type	Description
name	Yes	String	Definition: Workspace name. Constraints: You are not allowed to create a workspace named default. default is the name of the default workspace reserved by the system. Range: The value can contain 4 to 64 characters. Letters, digits, hyphens (-), and underscores (_) are allowed. Default Value: N/A
description	No	String	Definition: Workspace description. Constraints: N/A Range: The value can contain 0 to 256 characters. It cannot contain the following special characters: < > = & " ' /. Default Value: It is left blank by default.

Table 12-31 grants

Parameter	Mandatory	Type	Description
user_id	No	String	Definition: User ID. For details, see Obtaining a Username and ID . Constraints: If user_type is set to IAM , either user_name or user_id must be specified. user_id is recommended. This parameter is mandatory for agencies. This parameter is ignored for federated users. The response is automatically generated. Range: N/A. Default Value: N/A.
user_name	No	String	Definition: Username. Constraints: If user_type is set to IAM , either user_id or user_name must be specified. user_id is recommended. This parameter is mandatory for agencies and federated users. Range: N/A. Default Value: N/A.

Parameter	Mandatory	Type	Description
user_type	No	String	Definition: Authorized user type. Constraints This parameter is mandatory for federated users or agency users. Range IAM: IAM user FEDERATE: federated user AGENCY: agency user Default Value IAM

Parameter	Type	Description
enterprise_project_id	String	Definition: Enterprise project ID. Range: ID of an enabled enterprise project. The value contains 36 characters. Letters, digits, and hyphens (-) are allowed.
update_time	Integer	Definition: Last modification time, in UTC format Range: N/A
create_time	Integer	Definition: Creation time, in UTC format. Range: N/A
enterprise_project_name	String	Definition: Enterprise project name. Range: Name of the enterprise project corresponding to the response parameter enterprise_project_id
name	String	Definition: Workspace name. Range: The value can contain 4 to 64 characters. Letters, digits, hyphens (-), and underscores (_) are allowed.
description	String	Definition: Workspace description. Range: The value can contain 0 to 256 characters. It cannot contain the following special characters: < > = & " ' /.

Parameter	Type	Description
id	String	Definition Workspace ID. For details about how to obtain the value, see Obtaining Workspaces. If no workspace is created, the default value is 0. If a workspace is created and used, use the actual value. Range The value is a 32-bit UUID generated by the system without hyphens (-).
status	String	Definition: Workspace status. Range: • CREATE_FAILED: Creating the workspace failed. • NORMAL: The workspace is running properly. • DELETING: The workspace is being deleted. • DELETE_FAILED: Deleting the workspace failed.
status_info	String	Definition: Status description. By default, this parameter is left blank. This parameter is used to show detailed information about a status. If a deletion failed, you can use this parameter to obtain the failure cause. Range: N/A
grants	Array of grants objects	Definition: List of authorized users. By default, this parameter is left blank. This parameter must be used with auth_type and takes effect only when auth_type is set to INTERNAL.

Table 12-33 grants

Parameter	Type	Description
user_id	String	Definition: User ID. For details, see Obtaining a Username and ID . Range: N/A.
user_name	String	Definition: Username. Range: N/A.

Example Requests

The following is an example of how to create a workspace whose name is **test-workspace**, authorization type is **internal**, and authorized IAM user is **test**.

```
POST https://{endpoint}/v1/{project_id}/workspaces
{
  "name": "test-workspace",
  "description": "It is a test project",
  "enterprise_project_id": "****b0091-887f-4839-9929-cbc884f1e****",
  "auth_type": "internal",
  "grants": [ {
    "user_name": "test"
  } ]
}
```

Example Responses

Status code: 200

Response parameter indicating that a workspace is created

```
{
  "id": "****d05d1a553b4e188ea878e7dcb85e****",
  "name": "test-workspace",
  "description": "It is a test project",
  "owner": "testUser",
  "create_time": 1470000020000,
  "update_time": 1470000030000,
  "enterprise_project_id": "****b0091-887f-4839-9929-cbc884f1e****",
  "enterprise_project_name": "test-eps",
  "auth_type": "internal",
  "status": "NORMAL",
  "status_info": ""
}
```

Status Codes

Status Code	Description
200	Response parameter indicating that a workspace is created

Error Codes

See [Error Codes](#).

12.8 Querying the Authorization Mode

Function

This API is used to obtain the authorization mode and permission configuration information of a specified resource or function. This API is used when system administrators can use this API to view the access permission settings of resources. Developers can use this API to verify whether authorization policies are correctly configured. Security auditors can use this API to check whether authorization configurations comply with security specifications. Before using this API, ensure that you have the query permission and the authorization mode of the target resource or function has been configured. After the API is called, the API returns details about the authorization mode, including the authorization mode type, rules, and permission scope. If you do not have the permission to access this API or the authorization mode of the target resource is not configured, the API will return an error message.

Debugging

You can debug this API through automatic authentication in [API Explorer](#) or use the SDK sample code generated by API Explorer.

Authorization Information

Each account has all the permissions required to call all APIs, but IAM users must be assigned the required permissions.

- If you are using role/policy-based authorization, see [Permissions Policies and Supported Actions](#) for details on the required permissions.
- If you are using identity policy-based authorization, no identity policy-based permission required for calling this API.

URI

GET /v1/auth-mode

Request Parameters

Table 12-34 Request header parameters

Parameter	Mandatory	Type	Description
X-Auth-Token	Yes	String	Definition: User token. It can be obtained by calling the IAM API. The token is the value of X-Subject-Token in the response header. Constraints: N/A Range: N/A Default Value: N/A

Response Parameters

Status code: 200

Table 12-35 Response body parameters

Parameter	Type	Description
domain_id	String	Definition: Account domain ID. Range: N/A
mode	String	Definition: Authorization mode. Range • strict: strict mode • loose: non-strict mode

Example Requests

None

Example Responses

Status code: 200

The authorization mode is queried.

```
{
  "domain_id" : "06024304b180d5090fbac00141b6cae0",
  "mode" : "loose"
}
```

Status Codes

Status Code	Description
200	The authorization mode is queried.

Error Codes

See [Error Codes](#).

12.9 Updating the Authorization Mode

Function

This API is used to modify the authorization mode and permission configuration information of a specified resource or function. This API is used when system administrators can use this API to adjust the access permission of resources. Developers can use this API to update authorization policies to meet new service requirements. Security auditors can use this API to modify authorization configurations to comply with new security specifications. Before using this API, ensure that you have the update permission and the authorization mode of the target resource or function exists. After the API is called, the API updates the authorization mode of the target resource and returns the updated authorization mode information. If you do not have the permission to access this API or the authorization mode of the target resource does not exist, the API will return an error message.

Debugging

You can debug this API through automatic authentication in [API Explorer](#) or use the SDK sample code generated by API Explorer.

Authorization Information

Each account has all the permissions required to call all APIs, but IAM users must be assigned the required permissions.

- If you are using role/policy-based authorization, see [Permissions Policies and Supported Actions](#) for details on the required permissions.
- If you are using identity policy-based authorization, no identity policy-based permission required for calling this API.

URI

PUT /v1/auth-mode

Request Parameters

Table 12-36 Request header parameters

Parameter	Mandatory	Type	Description
X-Auth-Token	Yes	String	Definition: Requests for calling an API can be authenticated using either a token or AK/SK. If token-based authentication is used, this parameter is mandatory and must be set to a user token. For details, see Obtaining a User Token . Constraints: N/A Range: N/A Default Value: N/A

Table 12-37 Request body parameters

Parameter	Mandatory	Type	Description
mode	Yes	String	Definition: Update mode type. Range • strict: strict mode • loose: non-strict mode

Response Parameters

Status code: 200

Table 12-38 Response body parameters

Parameter	Type	Description
domain_id	String	Definition: Account domain ID. Range: N/A
mode	String	Definition: Authorization mode. Range • strict: strict mode • loose: non-strict mode

Example Requests

Update to strict mode.

```
PUT https://{endpoint}/v1/auth-mode
{
  "mode" : "strict"
}
```

Example Responses

Status code: 200

Response body for querying the authorization mode.

```
{
  "domain_id" : "06024304b180d5090fbac00141b6cae0",
  "mode" : "strict"
}
```

Status Codes

Status Code	Description
200	Response body for querying the authorization mode.

Error Codes

See [Error Codes](#).

12.10 Authenticating Whether the Current Workspace Can Be Used

Function

This API is used to check whether a user has the permission to access and use resources in the current workspace. This API is used when you try to access or operate resources in the workspace, and the system needs to check whether you have the required permission. Before using this API, ensure that you have logged in and the workspace exists. If the authentication is successful, the user can access and use resources in the workspace. If the authentication fails, the API returns an error message, for example, insufficient permissions or the workspace does not exist.

Debugging

You can debug this API through automatic authentication in [API Explorer](#) or use the SDK sample code generated by API Explorer.

Authorization Information

Each account has all the permissions required to call all APIs, but IAM users must be assigned the required permissions.

- If you are using role/policy-based authorization, see [Permissions Policies and Supported Actions](#) for details on the required permissions.
- If you are using identity policy-based authorization, no identity policy-based permission required for calling this API.

URI

POST /v1/{project_id}/workspaces/{workspace_id}/auth

Table 12-39 Path Parameters

Parameter	Mandatory	Type	Description
workspace_id	Yes	String	Definition: Workspace ID. For details about how to obtain the value, see Obtaining Workspaces . If no workspace is created, the default value is 0 . If a workspace is created and used, use the actual value. Constraints: N/A Range: N/A Default Value: 0
project_id	Yes	String	Definition: User project ID. For details, see Obtaining a Project ID and Name . Constraints: The value can contain 1 to 64 characters. Letters, digits, and hyphens (-) are allowed. Range: N/A Default Value: N/A

Request Parameters

Table 12-40 Request header parameters

Parameter	Mandatory	Type	Description
X-Auth-Token	Yes	String	Definition: Requests for calling an API can be authenticated using either a token or AK/SK. If token-based authentication is used, this parameter is mandatory and must be set to a user token. For details, see Obtaining a User Token . Constraints: N/A Range: N/A Default Value: N/A

Table 12-41 Request body parameters

Parameter	Mandatory	Type	Description
requests	Yes	Array of AuthRequests objects	Definition: Workspace authentication request body.

Table 12-42 AuthRequests

Parameter	Mandatory	Type	Description
action_id	Yes	String	Definition: Random UUID, which is used for locating. Range: N/A
action	Yes	String	Definition: Fine-grained action. Range: N/A
resource	No	String	Definition: Resource ID. Range: N/A
service_attributes	No	Map<String,String>	Definition: Operation object. Range: N/A

Response Parameters

Status code: 200

Table 12-43 Response body parameters

Parameter	Type	Description
results	Array of ValidateAuthResults objects	Definition: Authentication result.

Table 12-44 ValidateAuthResults

Parameter	Type	Description
action	String	Definition: Fine-grained permission. Range: N/A
verdict	String	Definition: Authentication result. Range • allow: Authenticated. • deny: Authentication failed.
action_id	String	Definition: Random UUID, which is used to locate faults. Range: N/A
resource	String	Definition: Request resource. Range: N/A
cause	Array of Cause objects	Definition: Failure cause.

Table 12-45 Cause

Parameter	Type	Description
policy_name	String	Definition: Policy name. Range: N/A
condition	Array of Conditions objects	Definition: Policy condition.

Table 12-46 Conditions

Parameter	Type	Description
key	String	Definition: Operation attribute. Range: N/A
operator	String	Definition: Operator. Range: N/A
value	Array of strings	Definition: Operator value.

Example Requests

Authenticate whether the current user can perform operations in the current workspace.

```
POST https://{endpoint}/v1/{projectId}/workspaces/{workspaceId}/auth
```

```
{
  "requests": [ {
    "action_id": "cf6ad5b9_bd73_4354_b663_364348597e29",
    "action": "modelarts:trainJob:get"
  } ]
}
```

Example Responses

Status code: 200

Response body for workspace authentication.

```
{
  "results": [ {
    "action": "modelarts:trainJob:get",
    "verdict": "allow",
    "action_id": "cf6ad5b9_bd73_4354_b663_364348597e29",
    "resource": null,
    "cause": null
  } ]
}
```

Status Codes

Status Code	Description
200	Response body for workspace authentication.

Error Codes

See [Error Codes](#).

12.11 Querying the User Role Information

Function

This API is used to obtain the role information of a specified user in the system. This API is used when you need to know the permissions and roles of a user in the system. The administrator or system can use this API to query the role information of the user. Before using this API, ensure that the user exists and the role information is defined in the system. After the query, the API returns the role list of the user. If the user does not exist or the role information is not defined in the system, the API returns an error message.

Debugging

You can debug this API through automatic authentication in [API Explorer](#) or use the SDK sample code generated by API Explorer.

Authorization Information

Each account has all the permissions required to call all APIs, but IAM users must be assigned the required permissions.

- If you are using role/policy-based authorization, see [Permissions Policies and Supported Actions](#) for details on the required permissions.
- If you are using identity policy-based authorization, no identity policy-based permission required for calling this API.

URI

GET /v1/{project_id}/workspaces/users/roles

Table 12-47 Path Parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Definition: User project ID. For details, see Obtaining a Project ID and Name . Constraints: The value can contain 1 to 64 characters. Letters, digits, and hyphens (-) are allowed. Range: N/A Default Value: N/A

Request Parameters

Table 12-48 Request header parameters

Parameter	Mandatory	Type	Description
X-Auth-Token	Yes	String	Definition: User token. It can be obtained by calling the IAM API. The token is the value of X-Subject-Token in the response header. Constraints: N/A Range: N/A Default Value: N/A

Response Parameters

Status code: 200

Table 12-49 Response body parameters

Parameter	Type	Description
roles	Array of strings	Definition: User role.

Example Requests

None

Example Responses

Status code: 200

Query the user role information.

```
{  
  "roles" : [ "gray_workspace" ]  
}
```

Status Codes

Status Code	Description
200	Query the user role information.

Error Codes

See [Error Codes](#).

13 Quota Management

13.1 Obtaining OS Quotas

Function

This API is used to obtain the quotas of some ModelArts OS resources, such as resource pool quotas and network quotas. This API is used when you need to know the usage limits of resource pools or network resources, plan resource allocation, or monitor resource usage. Before using this API, ensure that ModelArts OS is deployed and you have the required permissions (such as administrator permissions or resource management permissions). After the API is called, the system returns details about resource pool quotas and network quotas, helping you better plan and manage resources. If you do not have the required permission, the service is unavailable, or the quota information is not configured, the API will return an error message.

Debugging

You can debug this API through automatic authentication in [API Explorer](#) or use the SDK sample code generated by API Explorer.

Authorization Information

Each account has all the permissions required to call all APIs, but IAM users must be assigned the required permissions.

- If you are using role/policy-based authorization, see [Permissions Policies and Supported Actions](#) for details on the required permissions.
- If you are using identity policy-based authorization, no identity policy-based permission required for calling this API.

URI

GET /v1/{project_id}/quotas

Table 13-1 Path Parameters

      "quota" : 15,
      "used" : 10
    } ]
  }
}
```

Status Codes

Status Code	Description
200	OK.
404	Not found.

Error Codes

See [Error Codes](#).

14 Resource Tag Management

14.1 Obtaining All Tags of Resource Pools

Function

This API is used to obtain all tags of resource pools in the current project. By default, all workspaces are queried, but tag data is not returned for workspaces to which you do not have permissions. This API is used when you need to manage, classify, or collect statistics on resource pool tags. Before using this API, ensure that you have the required permission and the resource pool exists. After the API is called, the system returns the resource pool tags of all accessible workspaces in the current project. If you do not have the required permission, the resource pool does not exist, or the project is not created, the API will return an error message.

Debugging

You can debug this API through automatic authentication in [API Explorer](#) or use the SDK sample code generated by API Explorer.

Authorization Information

Each account has all the permissions required to call all APIs, but IAM users must be assigned the required permissions.

- If you are using role/policy-based authorization, see [Permissions Policies and Supported Actions](#) for details on the required permissions.
- If you are using identity policy-based authorization, no identity policy-based permission required for calling this API.

URI

GET /v1/{project_id}/pools/tags

Table 14-1 Path Parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Definition: User project ID. For details, see Obtaining a Project ID and Name . Constraints: N/A Range: N/A Default Value: N/A

Table 14-2 Query Parameters

Parameter	Mandatory	Type	Description
limit	No	Integer	Definition: Maximum number of records returned on each page. The default value is 200 . Constraints: N/A Range: N/A Default Value: N/A
offset	No	Integer	Definition: Start page for pagination display. The default value is 0 . Constraints: N/A Range: N/A Default Value: N/A

Request Parameters

None

Response Parameters

Status code: 200

Table 14-3 Response body parameters

Parameter	Type	Description
tags	Array of PoolTag objects	Definition: Resource tag list.

Table 14-4 PoolTag

Parameter	Type	Description
key	String	Definition: Tag of the resource type. Range: N/A
values	Array of strings	Definition: Tag value of the resource type.

Status code: 400**Table 14-5** Response body parameters

Parameter	Type	Description
error_code	String	Definition: ModelArts error code. Range: N/A
error_msg	String	Definition: Error message. Range: N/A

error_code	String	Definition: ModelArts error code. Range: N/A
error_msg	String	Definition: Error message. Range: N/A

Example Requests

```
https://{endpoint}/v1/{project_id}/pools/tags
```

Example Responses

Status code: 200

Obtaining all tags of a specified resource type in a project

```
{
  "tags": [ {
    "key": "model_version",
    "values": [ "0.1", "0.2" ]
  }, {
    "key": "conda_version",
    "values": [ "10.2", "11.0" ]
  } ]
}
```

Status Codes

Status Code	Description
200	Obtaining all tags of a specified resource type in a project
400	Invalid parameter.
401	Authentication failed.
403	Insufficient permission.

Error Codes

See [Error Codes](#).

14.2 Obtaining Tags of a Resource Pool

Function

This API is used to obtain the tag information of a specified resource pool. This API is used when you need to view, manage, or collect statistics on resource pool tags. Before using this API, ensure that the resource pool exists and you have the required permission. After the API is called, the system returns the tag information of the specified resource pool, including the tag key and tag value. If the resource pool does not exist, you do not have the access permission, or the resource pool is not configured with tags, the API will return an error message.

Debugging

You can debug this API through automatic authentication in [API Explorer](#) or use the SDK sample code generated by API Explorer.

Authorization Information

Each account has all the permissions required to call all APIs, but IAM users must be assigned the required permissions.

- If you are using role/policy-based authorization, see [Permissions Policies and Supported Actions](#) for details on the required permissions.
- If you are using identity policy-based authorization, no identity policy-based permission required for calling this API.

15 Node Pool Management

15.1 Obtaining Node Pools

Function

This API is used to obtain the list of a specified node pool. This API is used when you need to obtain the details about a node pool, such as the configuration, status, or resource management. Before using this API, ensure that the node pool exists and you have the administrator permissions. After the API is called, the system returns the node pool list, including the node pool ID, name, number of nodes, and status. If the node pool does not exist, the user does not have the permission to perform the operation, or the node pool is unavailable, the API will return an error message.

Debugging

You can debug this API through automatic authentication in [API Explorer](#) or use the SDK sample code generated by API Explorer.

Authorization Information

Each account has all the permissions required to call all APIs, but IAM users must be assigned the required permissions.

- If you are using role/policy-based authorization, see [Permissions Policies and Supported Actions](#) for details on the required permissions.
- If you are using identity policy-based authorization, no identity policy-based permission required for calling this API.

URI

GET /v2/{project_id}/pools/{pool_name}/nodepools

Table 15-1 Path Parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Definition: User project ID. For details, see Obtaining a Project ID and Name . Constraints: N/A Range: N/A Default Value: N/A
pool_name	Yes	String	Definition: Resource pool name. Constraints: N/A Range: N/A Default Value: N/A

Request Parameters

None

Response Parameters

Status code: 200

Table 15-2 Response body parameters

Parameter	Type	Description
apiVersion	String	Definition: API version. Range: *v2
kind	String	Definition: Resource type. Range: NodePoolList: node list
items	Array of NodePool objects	Definition: Node pool list.

Table 15-3 NodePool

Parameter	Type	Description
apiVersion	String	Definition: API version. Range: v2

Parameter	Type	Description
kind	String	Node pool type. The options are as follows: • NodePool: node pool
metadata	NodePoolMetadata object	Definition: Node pool metadata.
spec	NodePoolSpec object	Definition: Node pool expectation.
status	NodePoolStatus object	Definition: Node pool status.

Table 15-4 NodePoolMetadata

Parameter	Type	Description
name	String	Definition: Node pool name. You can specify the name. If not specified, the default name is used. Range: N/A

Table 15-5 NodePoolSpec

Parameter	Type	Description
resources	PoolResource object	Definition: List of resources in a node pool, including resource flavors, quantity, and custom configurations. Range: N/A

Table 15-6 PoolResource

Parameter	Type	Description
flavor	String	Definition: Resource flavor name, for example, modelarts.vm.gpu.t4u8 . Range: N/A.
count	Integer	Definition: Committed specifications. Range: N/A.

Parameter	Type	Description
maxCount	Integer	Definition: Elastic usage of the resource flavor. This parameter value is the same the count value in a physical pool. Range: N/A.
azs	Array of PoolNodeAz objects	Definition: AZ information of nodes in the resource pool.
nodePool	String	Definition: Node pool name, for example, nodePool-1 . Range: N/A.
taints	Array of Taints objects	Definition: Taints to be added to nodes to set anti-affinity. This parameter cannot be specified for a non-privileged pool.
labels	Map<String,String>	Definition: Kubernetes label, in key-value pair format.
tags	Array of UserTags objects	Definition: Resource tag. This parameter cannot be specified for a non-privileged pool.
network	NodeNetwork object	Definition: Network configuration. This parameter cannot be specified for a non-privileged pool.
extendParams	ResourceExtendParams object	Definition: Custom configuration.
creatingStep	CreatingStep object	Definition: Information about batch creation.
rootVolume	RootVolume object	Definition: Information about the custom system disk (cloud hard disk).
dataVolumes	Array of DataVolumeItem objects	Definition: List of custom data disks (cloud hard disks).
volumeGroupConfigs	Array of VolumeGroupConfig objects	Definition: Advanced disk configuration. This parameter is mandatory when a custom data disk exists.
os	Os object	Definition: OS image information.

Table 15-7 Taints

Parameter	Type	Description
key	String	Definition: Key. Range: N/A
value	String	Value.
effect	String	Effect.

Table 15-8 UserTags

Parameter	Type	Description
key	String	Definition: Key. The value cannot start with CCE- or __type_baremetal . Range: N/A
value	String	Value.

Table 15-9 NodeNetwork

Parameter	Type	Description
vpc	String	Definition: VPC ID. Range: N/A.
subnet	String	Definition: Subnet ID. Range: N/A.
securityGroups	Array of strings	Definition: Security group ID set.

Table 15-10 ResourceExtendParams

Parameter	Type	Description
dockerBaseSize	String	Definition: Container image space of a node. Range: Specified: The default value of dockerBaseSize ranges from 50 to 500. However, the actual value is restricted by the container data disk size of the node. Unlimited: *dockerBaseSize="", indicating that the container image space is not limited.

Parameter	Type	Description
postInstall	String	Definition: Post-installation script. The entered value must be encoded using Base64. Range: N/A.
runtime	String	Definition: Container runtime. Range: • docker: Container runtime. It is the most commonly used container engine, which is used to create and manage container instances based on container images. • containerd: Industrial-grade container runtime. It focuses on container lifecycle management and is one of the core components at the bottom layer of Docker. It can also be deployed independently.
labelPolicyOnExistingNodes	String	Definition: Kubernetes label update policy of existing nodes. If the value is empty, the existing nodes are updated by default. Range: • refresh: Update. • ignore: Do not update.
taintPolicyOnExistingNodes	String	Definition: Kubernetes taint update policy of existing nodes. If the value is empty, the existing nodes are updated by default. Range: • refresh: Update. • ignore: Do not update.
tagPolicyOnExistingNodes	String	Definition: Resource tag update policy of existing nodes. If the value is empty, the existing nodes are updated by default. Range: • refresh: Update. • ignore: Do not update.

Parameter	Type	Description
XParameterPlane-Subnet	String	Definition: Subnet ID used for data transmission on the parameter plane between physical clusters. The value cannot be the same as the node subnet or container subnet. Range: N/A.
nodePoolName	String	Definition: Name of the node pool specified by you. The value is a string of 2 to 50 characters, consisting of lowercase letters, hyphens (-), and digits. It must start with a lowercase letter and cannot end with a hyphen (-) or -default . Range: N/A.

Table 15-11 CreatingStep

Parameter	Type	Description
step	Integer	Definition: Step of a supernode. Constraints: N/A Range: Only the step contained in the resource specification details is supported. Default Value: N/A
type	String	Definition: Batch creation type. Constraints: N/A Range: • hyperinstance: supernode Default Value: N/A

Table 15-12 RootVolume

Parameter	Type	Description
volumeType	String	Definition: Disk type.. Range: • SSD: Ultra-high I/O disk • GPSSD: General-purpose SSD • SAS: High I/O disk

Parameter	Type	Description
size	String	Definition: Disk size, in GiB. Range: N/A.

Table 15-13 DataVolumeItem

Parameter	Type	Description
volumeType	String	Definition: Disk type.. Range: • SSD: Ultra-high I/O disk • GPSSD: General-purpose SSD • SAS: High I/O disk
size	String	Definition: Disk size, in GiB. Range: N/A.
count	Integer	Definition: Number of disks. Range: N/A.
extendParams	VolumeExtendParams object	Definition: Custom disk configuration.

Table 15-14 VolumeExtendParams

Parameter	Type	Description
volumeGroup	String	Definition: Name of a disk group, which is used to divide storage space. Range: • vgpaas: container disk. • default: common data disk, which is mounted in default mode. • vguser: common data disk, which is mounted to a specified path. The group name varies depending on the path, for example, vguser1 and vguser2. • vg-everest-localvolume-persistent: common data disk, which is used as the persistent storage volume. • vg-everest-localvolume-ephemeral: common data disk, which is used as a temporary storage volume.

Table 15-15 VolumeGroupConfig

Parameter	Type	Description
volumeGroup	String	Definition: Disk group name. Index of the volume group in the dataVolumes. Range: N/A.
dockerThinPool	Integer	Definition: Percentage of data disks designated as container disks. This parameter can be specified only when volumeGroup is vgpaas (container disk). Range: N/A.
lvmConfig	LvmConfig object	Definition: LVM configuration management.
types	Array of strings	Definition: Storage type. Options: • volume: Cloud hard disk. When dataVolumes is specified, the default value is used. • local: Local disk. This parameter must be specified when a local disk is used.

Table 15-16 LvmConfig

Parameter	Type	Description
lvType	String	Definition: LVM write mode. Range: • linear: Linear mode. • striped: Striped mode in which multiple disks are used to form a strip to improve disk performance.
path	String	Definition: Disk mount path. This parameter takes effect only in user configuration. The value is an absolute path. Digits, letters, periods (.), hyphens (-), and underscores (_) are allowed. Range: N/A.

Table 15-17 Os

Parameter	Type	Description
name	String	Definition: OS name and version, for example, EulerOS 2.5. This parameter can be left blank when a private image is specified. Range: N/A.
imageId	String	Definition: OS image ID. Range: N/A.
imageType	String	Definition: OS image type. This parameter must be specified when a private image is set. By default, the preset image is used. You do not need to specify this field. Range: • private: private images • "": The preset image is used.
autoMatch	String	Definition: Automatic OS image matching configuration. If this parameter is set, the optimal image is automatically selected, and this parameter is automatically cleared. Range: OS name and version, for example, EulerOS 2.5.

Table 15-18 NodePoolStatus

Parameter	Type	Description
resources	resources object	Definition: Resources in different states in a node pool.

Table 15-19 resources

Parameter	Type	Description
creating	PoolResourceFlavorCount object	Definition: Number of resources that are being created.
available	PoolResourceFlavorCount object	Definition: Number of available resources.
abnormal	PoolResourceFlavorCount object	Definition: Number of abnormal resources.
deleting	PoolResourceFlavorCount object	Definition: Number of resources that are being deleted.

Table 15-20 PoolResourceFlavorCount

Parameter	Type	Description
flavor	String	Definition: Resource flavor ID. Range: N/A
count	Integer	Definition: Number of resource specification instances in a resource pool. Range: N/A
maxCount	Integer	Definition: Number of elastic resource specification instances in a resource pool. The value of this parameter in a physical pool is the same as that of count . Range: N/A
azs	Array of PoolNodeAz objects	Definition: AZ distribution of the resource specification instances to be created in a resource pool.
nodePool	String	Definition: Node pool ID. Range: N/A

Table 15-21 PoolNodeAz

Parameter	Type	Description
az	String	Definition: AZ name. Range: N/A
count	Integer	Definition: Number of AZ resource instances. Range: N/A

Example Requests

Obtain node pools.

```
GET https://{endpoint}/v2/{project_id}/pools/{pool_name}/nodepools
{ }
```

Example Responses

Status code: 200

OK.

Status Codes

Status Code	Description
200	OK.

Error Codes

See [Error Codes](#).

15.2 Creating a Node Pool

Function

This API is used to create a node pool. This API is used when you need to create a node pool with specified configurations when you need to expand compute resources, optimize resource allocation, or deploy new services. Before using this API, ensure that you have the administrator permission and the node pool parameters (such as the number of nodes, specifications, and network configurations) are correctly set. After the creation, the node pool will be created and be available, and the related node information will be recorded. If you do not have the required permission, the parameter settings are incorrect, or system resources are insufficient, the API will return an error message.

Debugging

You can debug this API through automatic authentication in [API Explorer](#) or use the SDK sample code generated by API Explorer.

Authorization Information

Each account has all the permissions required to call all APIs, but IAM users must be assigned the required permissions.

- If you are using role/policy-based authorization, see [Permissions Policies and Supported Actions](#) for details on the required permissions.
- If you are using identity policy-based authorization, no identity policy-based permission required for calling this API.

URI

POST /v2/{project_id}/pools/{pool_name}/nodepools

Table 15-22 Path Parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Definition: User project ID. For details, see Obtaining a Project ID and Name . Constraints: N/A Range: N/A Default Value: N/A
pool_name	Yes	String	Definition: Resource pool name. Constraints: N/A Range: N/A Default Value: N/A

Request Parameters

Table 15-23 Request body parameters

Parameter	Mandatory	Type	Description
apiVersion	Yes	String	Definition: API version. Range: • v2

Parameter	Mandatory	Type	Description
kind	Yes	String	Definition: Node pool type. Range: • NodePool: node pool
metadata	Yes	CreateNodePoolMetaVO object	Definition: Node pool metadata.
spec	No	NodePoolSpec object	Definition: Node pool expectation.

Table 15-24 CreateNodePoolMetaVO

Parameter	Mandatory	Type	Description
name	Yes	String	Definition: Node pool name. Constraints: N/A Range: N/A Default Value: N/A
annotations	No	CreateNodePoolAnnotations object	Definition: Node pool annotations. Constraints: N/A Range: N/A Default Value: N/A

Table 15-25 CreateNodePoolAnnotations

Parameter	Mandatory	Type	Description
os.modelarts/billing.mode	No	String	Definition: Billing mode. Constraints: N/A Range: • 0: pay-per-use • 1: yearly/monthly Default Value: N/A

Parameter	Mandatory	Type	Description
os.modelarts/ period.num	No	String	Definition: Subscription period on a yearly/monthly basis, for example, 2 . This parameter is mandatory when the billing mode is yearly/monthly. Constraints: N/A Range: N/A Default Value: N/A
os.modelarts/ period.type	No	String	Definition: Subscription type on a yearly/monthly basis. This parameter is mandatory when the billing mode is yearly/monthly. Constraints: N/A Range: • 2: month • 3: year • 4: hour Default Value: N/A
os.modelarts/ auto.renew	No	String	Definition: Specifies whether to automatically renew the subscription. Constraints: N/A Range: • 0: auto-renewal disabled • 1: auto-renewal enabled Default Value: 0
os.modelarts/ promotion.info	No	String	Definition: Discount selected on the operations platform. Constraints: N/A Range: N/A Default Value: N/A
os.modelarts/ service.console.url	No	String	Definition: URL of the page displayed after the subscription order is paid. Constraints: N/A Range: N/A Default Value: N/A

Parameter	Mandatory	Type	Description
os.modelarts/ order.id	No	String	Definition: Order ID, which is mandatory for creating a yearly/monthly resource or changing the billing mode. Constraints: N/A Range: N/A Default Value: N/A

Table 15-26 NodePoolSpec

Parameter	Mandatory	Type	Description
resources	Yes	PoolResource object	Definition: List of resources in a node pool, including resource flavors, quantity, and custom configurations. Range: N/A

Table 15-27 PoolResource

Parameter	Mandatory	Type	Description
flavor	Yes	String	Definition: Resource flavor name, for example, modelarts.vm.gpu.t4u8 . Range: N/A.
count	Yes	Integer	Definition: Committed specifications. Range: N/A.
maxCount	Yes	Integer	Definition: Elastic usage of the resource flavor. This parameter value is the same the count value in a physical pool. Range: N/A.
azs	No	Array of PoolNodeAz objects	Definition: AZ information of nodes in the resource pool.
nodePool	No	String	Definition: Node pool name, for example, nodePool-1 . Range: N/A.

Parameter	Mandatory	Type	Description
taints	No	Array of Taints objects	Definition: Taints to be added to nodes to set anti-affinity. This parameter cannot be specified for a non-privileged pool.
labels	No	Map<String,String>	Definition: Kubernetes label, in key-value pair format.
tags	No	Array of UserTags objects	Definition: Resource tag. This parameter cannot be specified for a non-privileged pool.
network	No	NodeNetwork object	Definition: Network configuration. This parameter cannot be specified for a non-privileged pool.
extendParams	No	ResourceExtendParams object	Definition: Custom configuration.
creatingStep	No	CreatingStep object	Definition: Information about batch creation.
rootVolume	No	RootVolume object	Definition: Information about the custom system disk (cloud hard disk).
dataVolumes	No	Array of DataVolumeItem objects	Definition: List of custom data disks (cloud hard disks).
volumeGroupConfigs	No	Array of VolumeGroupConfig objects	Definition: Advanced disk configuration. This parameter is mandatory when a custom data disk exists.
os	No	Os object	Definition: OS image information.

Table 15-28 PoolNodeAz

Parameter	Mandatory	Type	Description
az	Yes	String	Definition: AZ name. Range: N/A
count	Yes	Integer	Definition: Number of AZ resource instances. Range: N/A

Table 15-29 Taints

Parameter	Mandatory	Type	Description
key	Yes	String	Definition: Key. Range: N/A
value	No	String	Value.
effect	Yes	String	Effect.

Table 15-30 UserTags

Parameter	Mandatory	Type	Description
key	Yes	String	Definition: Key. The value cannot start with CCE- or __type_baremetal . Range: N/A
value	Yes	String	Value.

Table 15-31 NodeNetwork

Parameter	Mandatory	Type	Description
vpc	No	String	• Definition: VPC ID. Range: N/A.
subnet	No	String	Definition: Subnet ID. Range: N/A.
securityGroups	No	Array of strings	Definition: Security group ID set.

Table 15-32 ResourceExtendParams

Parameter	Mandatory	Type	Description
dockerBaseSize	No	String	Definition: Container image space of a node. Range: • Specified: The default value of dockerBaseSize ranges from 50 to 500. However, the actual value is restricted by the container data disk size of the node. • Unlimited: *dockerBaseSize="0", indicating that the container image space is not limited.
postInstall	No	String	Definition: Post-installation script. The entered value must be encoded using Base64. Range: N/A.
runtime	No	String	Definition: Container runtime. Range: • docker: Container runtime. It is the most commonly used container engine, which is used to create and manage container instances based on container images. • containerd: Industrial-grade container runtime. It focuses on container lifecycle management and is one of the core components at the bottom layer of Docker. It can also be deployed independently.
labelPolicyOnExistingNodes	No	String	Definition: Kubernetes label update policy of existing nodes. If the value is empty, the existing nodes are updated by default. Range: • refresh: Update. • ignore: Do not update.

Parameter	Mandatory	Type	Description
taintPolicyOnExistingNodes	No	String	Definition: Kubernetes taint update policy of existing nodes. If the value is empty, the existing nodes are updated by default. Range: • refresh: Update. • ignore: Do not update.
tagPolicyOnExistingNodes	No	String	Definition: Resource tag update policy of existing nodes. If the value is empty, the existing nodes are updated by default. Range: • refresh: Update. • ignore: Do not update.
XParameterPlaneSubnet	No	String	Definition: Subnet ID used for data transmission on the parameter plane between physical clusters. The value cannot be the same as the node subnet or container subnet. Range: N/A.
nodePoolName	No	String	Definition: Name of the node pool specified by you. The value is a string of 2 to 50 characters, consisting of lowercase letters, hyphens (-), and digits. It must start with a lowercase letter and cannot end with a hyphen (-) or - default. Range: N/A.

Table 15-33 CreatingStep

Parameter	Mandatory	Type	Description
step	No	Integer	Definition: Step of a supernode. Constraints: N/A Range: Only the step contained in the resource specification details is supported. Default Value: N/A
type	No	String	Definition: Batch creation type. Constraints: N/A Range: • hyperinstance: supernode Default Value: N/A

Table 15-34 RootVolume

Parameter	Mandatory	Type	Description
volumeType	Yes	String	Definition: Disk type.. Range: • SSD: Ultra-high I/O disk • GPSSD: General-purpose SSD • SAS: High I/O disk
size	Yes	String	Definition: Disk size, in GiB. Range: N/A.

Table 15-35 DataVolumeItem

Parameter	Mandatory	Type	Description
volumeType	Yes	String	Definition: Disk type.. Range: • SSD: Ultra-high I/O disk • GPSSD: General-purpose SSD • SAS: High I/O disk

Parameter	Mandatory	Type	Description
size	Yes	String	Definition: Disk size, in GiB. Range: N/A.
count	No	Integer	Definition: Number of disks. Range: N/A.
extendParams	Yes	VolumeExtendParams object	Definition: Custom disk configuration.

Table 15-36 VolumeExtendParams

Parameter	Mandatory	Type	Description
volumeGroup	Yes	String	Definition: Name of a disk group, which is used to divide storage space. Range: • vgpaas: container disk. • default: common data disk, which is mounted in default mode. • vguser: common data disk, which is mounted to a specified path. The group name varies depending on the path, for example, vguser1 and vguser2. • vg-everest-localvolume-persistent: common data disk, which is used as the persistent storage volume. • vg-everest-localvolume-ephemeral: common data disk, which is used as a temporary storage volume.

Table 15-37 VolumeGroupConfig

Parameter	Mandatory	Type	Description
volumeGroup	Yes	String	Definition: Disk group name. Index of the volume group in the dataVolumes. Range: N/A.

Parameter	Mandatory	Type	Description
dockerThinPool	No	Integer	Definition: Percentage of data disks designated as container disks. This parameter can be specified only when volumeGroup is vgpaas (container disk). Range: N/A.
lvmConfig	No	LvmConfig object	Definition: LVM configuration management.
types	No	Array of strings	Definition: Storage type. Options: • volume: Cloud hard disk. When dataVolumes is specified, the default value is used. • local: Local disk. This parameter must be specified when a local disk is used.

Table 15-38 LvmConfig

Parameter	Mandatory	Type	Description
lvType	Yes	String	Definition: LVM write mode. Range: • linear: Linear mode. • striped: Striped mode in which multiple disks are used to form a strip to improve disk performance.
path	No	String	Definition: Disk mount path. This parameter takes effect only in user configuration. The value is an absolute path. Digits, letters, periods (.), hyphens (-), and underscores (_) are allowed. Range: N/A.

Table 15-39 Os

Parameter	Mandatory	Type	Description
name	No	String	Definition: OS name and version, for example, EulerOS 2.5. This parameter can be left blank when a private image is specified. Range: N/A.
imageId	No	String	Definition: OS image ID. Range: N/A.
imageType	No	String	Definition: OS image type. This parameter must be specified when a private image is set. By default, the preset image is used. You do not need to specify this field. Range: • private: private images • "": The preset image is used.
autoMatch	No	String	Definition: Automatic OS image matching configuration. If this parameter is set, the optimal image is automatically selected, and this parameter is automatically cleared. Range: OS name and version, for example, EulerOS 2.5.

Response Parameters

Status code: 200

Table 15-40 Response body parameters

Parameter	Type	Description
apiVersion	String	Definition: API version. Range: • v2

Parameter	Type	Description
kind	String	Definition: Node pool type. Range: • NodePool: node pool
metadata	CreateNodePoolMetaVO object	Definition: Node pool metadata.
spec	NodePoolSpec object	Definition: Node pool expectation.

Table 15-41 CreateNodePoolMetaVO

Parameter	Type	Description
name	String	Definition: Node pool name. Constraints: N/A Range: N/A Default Value: N/A
annotations	CreateNodePoolAnnotations object	Definition: Node pool annotations. Constraints: N/A Range: N/A Default Value: N/A

Table 15-42 CreateNodePoolAnnotations

Parameter	Type	Description
os.modelarts/ billing.mode	String	Definition: Billing mode. Constraints: N/A Range: • 0: pay-per-use • 1: yearly/monthly Default Value: N/A
os.modelarts/ period.num	String	Definition: Subscription period on a yearly/monthly basis, for example, 2 . This parameter is mandatory when the billing mode is yearly/monthly. Constraints: N/A Range: N/A Default Value: N/A

Parameter	Type	Description
os.modelarts/ period.type	String	Definition: Subscription type on a yearly/monthly basis. This parameter is mandatory when the billing mode is yearly/monthly. Constraints: N/A Range: • 2: month • 3: year • 4: hour Default Value: N/A
os.modelarts/ auto.renew	String	Definition: Specifies whether to automatically renew the subscription. Constraints: N/A Range: • 0: auto-renewal disabled • 1: auto-renewal enabled Default Value: 0
os.modelarts/ promotion.info	String	Definition: Discount selected on the operations platform. Constraints: N/A Range: N/A Default Value: N/A
os.modelarts/ service.console.url	String	Definition: URL of the page displayed after the subscription order is paid. Constraints: N/A Range: N/A Default Value: N/A
os.modelarts/ order.id	String	Definition: Order ID, which is mandatory for creating a yearly/monthly resource or changing the billing mode. Constraints: N/A Range: N/A Default Value: N/A

Table 15-43 NodePoolSpec

Parameter	Type	Description
resources	PoolResource object	Definition: List of resources in a node pool, including resource flavors, quantity, and custom configurations. Range: N/A

Table 15-44 PoolResource

Parameter	Type	Description
flavor	String	Definition: Resource flavor name, for example, modelarts.vm.gpu.t4u8 . Range: N/A.
count	Integer	Definition: Committed specifications. Range: N/A.
maxCount	Integer	Definition: Elastic usage of the resource flavor. This parameter value is the same the count value in a physical pool. Range: N/A.
azs	Array of PoolNodeAz objects	Definition: AZ information of nodes in the resource pool.
nodePool	String	Definition: Node pool name, for example, nodePool-1 . Range: N/A.
taints	Array of Taints objects	Definition: Taints to be added to nodes to set anti-affinity. This parameter cannot be specified for a non-privileged pool.
labels	Map<String,String>	Definition: Kubernetes label, in key-value pair format.
tags	Array of UserTags objects	Definition: Resource tag. This parameter cannot be specified for a non-privileged pool.
network	NodeNetwork object	Definition: Network configuration. This parameter cannot be specified for a non-privileged pool.
extendParams	ResourceExtendParams object	Definition: Custom configuration.

Parameter	Type	Description
creatingStep	CreatingStep object	Definition: Information about batch creation.
rootVolume	RootVolume object	Definition: Information about the custom system disk (cloud hard disk).
dataVolumes	Array of DataVolumeItem objects	Definition: List of custom data disks (cloud hard disks).
volumeGroupConfigs	Array of VolumeGroupConfig objects	Definition: Advanced disk configuration. This parameter is mandatory when a custom data disk exists.
os	Os object	Definition: OS image information.

Table 15-45 PoolNodeAz

Parameter	Type	Description
az	String	Definition: AZ name. Range: N/A
count	Integer	Definition: Number of AZ resource instances. Range: N/A

Table 15-46 Taints

Parameter	Type	Description
key	String	Definition: Key. Range: N/A
value	String	Value.
effect	String	Effect.

Parameter	Type	Description
key	String	Definition: Key. The value cannot start with CCE- or __type_baremetal. Range: N/A

Parameter	Type	Description
value	String	Value.

Table 15-48 NodeNetwork

Parameter	Type	Description
vpc	String	• Definition: VPC ID. Range: N/A.
subnet	String	Definition: Subnet ID. Range: N/A.
securityGroups	Array of strings	Definition: Security group ID set.

Table 15-49 ResourceExtendParams

Parameter	Type	Description
dockerBaseSize	String	Definition: Container image space of a node. Range: • Specified: The default value of dockerBaseSize ranges from 50 to 500. However, the actual value is restricted by the container data disk size of the node. • Unlimited: *dockerBaseSize="0", indicating that the container image space is not limited.
postInstall	String	Definition: Post-installation script. The entered value must be encoded using Base64. Range: N/A.

Parameter	Type	Description
runtime	String	Definition: Container runtime. Range: • docker: Container runtime. It is the most commonly used container engine, which is used to create and manage container instances based on container images. • containerd: Industrial-grade container runtime. It focuses on container lifecycle management and is one of the core components at the bottom layer of Docker. It can also be deployed independently.
labelPolicyOnExistingNodes	String	Definition: Kubernetes label update policy of existing nodes. If the value is empty, the existing nodes are updated by default. Range: • refresh: Update. • ignore: Do not update.
taintPolicyOnExistingNodes	String	Definition: Kubernetes taint update policy of existing nodes. If the value is empty, the existing nodes are updated by default. Range: • refresh: Update. • ignore: Do not update.
tagPolicyOnExistingNodes	String	Definition: Resource tag update policy of existing nodes. If the value is empty, the existing nodes are updated by default. Range: • refresh: Update. • ignore: Do not update.
XParameterPlane-Subnet	String	Definition: Subnet ID used for data transmission on the parameter plane between physical clusters. The value cannot be the same as the node subnet or container subnet. Range: N/A.

Parameter	Type	Description
nodePoolName	String	Definition: Name of the node pool specified by you. The value is a string of 2 to 50 characters, consisting of lowercase letters, hyphens (-), and digits. It must start with a lowercase letter and cannot end with a hyphen (-) or -default . Range: N/A.

Table 15-50 CreatingStep

Parameter	Type	Description
step	Integer	Definition: Step of a supernode. Constraints: N/A Range: Only the step contained in the resource specification details is supported. Default Value: N/A
type	String	Definition: Batch creation type. Constraints: N/A Range: • hyperinstance: supernode Default Value: N/A

Table 15-51 RootVolume

Parameter	Type	Description
volumeType	String	Definition: Disk type.. Range: • SSD: Ultra-high I/O disk • GPSSD: General-purpose SSD • SAS: High I/O disk
size	String	Definition: Disk size, in GiB. Range: N/A.

Table 15-52 DataVolumeItem

Parameter	Type	Description
volumeType	String	Definition: Disk type.. Range: • SSD: Ultra-high I/O disk • GPSSD: General-purpose SSD • SAS: High I/O disk
size	String	Definition: Disk size, in GiB. Range: N/A.
count	Integer	Definition: Number of disks. Range: N/A.
extendParams	VolumeExtendParams object	Definition: Custom disk configuration.

Table 15-53 VolumeExtendParams

Parameter	Type	Description
volumeGroup	String	Definition: Name of a disk group, which is used to divide storage space. Range: • vgpaas: container disk. • default: common data disk, which is mounted in default mode. • vguser: common data disk, which is mounted to a specified path. The group name varies depending on the path, for example, vguser1 and vguser2. • vg-everest-localvolume-persistent: common data disk, which is used as the persistent storage volume. • vg-everest-localvolume-ephemeral: common data disk, which is used as a temporary storage volume.

Table 15-54 VolumeGroupConfig

Parameter	Type	Description
volumeGroup	String	Definition: Disk group name. Index of the volume group in the dataVolumes. Range: N/A.
dockerThinPool	Integer	Definition: Percentage of data disks designated as container disks. This parameter can be specified only when volumeGroup is vgpaas (container disk). Range: N/A.
lvmConfig	LvmConfig object	Definition: LVM configuration management.
types	Array of strings	Definition: Storage type. Options: • volume: Cloud hard disk. When dataVolumes is specified, the default value is used. • local: Local disk. This parameter must be specified when a local disk is used.

Table 15-55 LvmConfig

Parameter	Type	Description
lvType	String	Definition: LVM write mode. Range: • linear: Linear mode. • striped: Striped mode in which multiple disks are used to form a strip to improve disk performance.
path	String	Definition: Disk mount path. This parameter takes effect only in user configuration. The value is an absolute path. Digits, letters, periods (.), hyphens (-), and underscores (_) are allowed. Range: N/A.

Table 15-56 Os

Parameter	Type	Description
name	String	Definition: OS name and version, for example, EulerOS 2.5. This parameter can be left blank when a private image is specified. Range: N/A.
imageId	String	Definition: OS image ID. Range: N/A.
imageType	String	Definition: OS image type. This parameter must be specified when a private image is set. By default, the preset image is used. You do not need to specify this field. Range: • private: private images • "": The preset image is used.
autoMatch	String	Definition: Automatic OS image matching configuration. If this parameter is set, the optimal image is automatically selected, and this parameter is automatically cleared. Range: OS name and version, for example, EulerOS 2.5.

Status code: 400**Table 15-57** Response body parameters

Parameter	Type	Description
error_code	String	• Definition: ModelArts error code. Range: N/A
error_msg	String	Definition: Error message. Range: N/A

Example Requests

Create a node pool.

```
POST https://{endpoint}/v2/{project_id}/pools/{pool_name}/nodepools
```

```
{  
  "kind" : "NodePool",  
}
```

```
"apiVersion": "v2",
"metadata": {
  "name": "nodepool-1",
  "annotations": { }
},
"spec": {
  "resources": {
    "nodePool": "nodepool-1",
    "flavor": "modelarts.vm.2u4g.dcc",
    "count": 1,
    "maxCount": 1,
    "network": {
      "vpc": "277e9abc-0e6b-431a-9232-cfd25d5fc566",
      "subnet": "03796378-c356-4c14-826b-e4913aa9c8b9",
      "securityGroups": [ "0a15b48d-06f1-41e4-b782-ade90087bf59" ]
    }
  }
}
```

Example Responses

Status code: 200

OK.

```
{
  "kind": "NodePool",

15.3 Obtaining Details About a Specified Node Pool

Function

This API is used to obtain the details of a specified node pool. This API is used when you need to obtain the details about a node pool, such as the configuration, status, resource usage, or resource management. Before using this API, ensure that the node pool exists and you have the permission to access the node pool. After the API is called, the system returns the details about the node pool, including the node pool ID, name, number of nodes, status, creation time, and configuration parameters. If the node pool does not exist, the user does not have the permission to access the node pool, or the node pool is unavailable, the API will return an error message.

Debugging

You can debug this API through automatic authentication in [API Explorer](#) or use the SDK sample code generated by API Explorer.

Authorization Information

Each account has all the permissions required to call all APIs, but IAM users must be assigned the required permissions.

- If you are using role/policy-based authorization, see [Permissions Policies and Supported Actions](#) for details on the required permissions.
- If you are using identity policy-based authorization, no identity policy-based permission required for calling this API.

URI

GET /v2/{project_id}/pools/{pool_name}/nodepools/{nodepool_name}

Table 15-58 Path Parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Definition: User project ID. For details, see Obtaining a Project ID and Name . Constraints: N/A Range: N/A Default Value: N/A

Parameter	Mandatory	Type	Description
pool_name	Yes	String	Definition: Resource pool name. Constraints: N/A Range: N/A Default Value: N/A
nodepool_name	Yes	String	Definition: Node pool name. Constraints: N/A Range: N/A Default Value: N/A

Table 15-59 Query Parameters

Parameter	Mandatory	Type	Description
continue	No	String	Definition: Position of the previous page during pagination query. Constraints: N/A Range: N/A Default Value: N/A
limit	No	String	Definition: Number of records returned in a single pagination query. Constraints: N/A Range: N/A Default Value: N/A

Request Parameters

None

Response Parameters

Status code: 200

Table 15-60 Response body parameters

Parameter	Type	Description
apiVersion	String	Definition: API version. Range: v2
kind	String	Node pool type. The options are as follows: NodePool: node pool
metadata	NodePoolMetadata object	Definition: Node pool metadata.
spec	NodePoolSpec object	Definition: Node pool expectation.
status	NodePoolStatus object	Definition: Node pool status.

Table 15-61 NodePoolMetadata

Parameter	Type	Description
name	String	Definition: Node pool name. You can specify the name. If not specified, the default name is used. Range: N/A

Table 15-62 NodePoolSpec

Parameter	Type	Description
resources	PoolResource object	Definition: List of resources in a node pool, including resource flavors, quantity, and custom configurations. Range: N/A

Table 15-63 PoolResource

Parameter	Type	Description
flavor	String	Definition: Resource flavor name, for example, modelarts.vm.gpu.t4u8 . Range: N/A.

Parameter	Type	Description
count	Integer	Definition: Committed specifications. Range: N/A.
maxCount	Integer	Definition: Elastic usage of the resource flavor. This parameter value is the same the count value in a physical pool. Range: N/A.
azs	Array of PoolNodeAz objects	Definition: AZ information of nodes in the resource pool.
nodePool	String	Definition: Node pool name, for example, nodePool-1 . Range: N/A.
taints	Array of Taints objects	Definition: Taints to be added to nodes to set anti-affinity. This parameter cannot be specified for a non-privileged pool.
labels	Map<String,String>	Definition: Kubernetes label, in key-value pair format.
tags	Array of UserTags objects	Definition: Resource tag. This parameter cannot be specified for a non-privileged pool.
network	NodeNetwork object	Definition: Network configuration. This parameter cannot be specified for a non-privileged pool.
extendParams	ResourceExtendParams object	Definition: Custom configuration.
creatingStep	CreatingStep object	Definition: Information about batch creation.
rootVolume	RootVolume object	Definition: Information about the custom system disk (cloud hard disk).
dataVolumes	Array of DataVolumeItem objects	Definition: List of custom data disks (cloud hard disks).
volumeGroupConfigs	Array of VolumeGroupConfig objects	Definition: Advanced disk configuration. This parameter is mandatory when a custom data disk exists.
os	Os object	Definition: OS image information.

Table 15-64 Taints

Parameter	Type	Description
key	String	Definition: Key. Range: N/A
value	String	Value.
effect	String	Effect.

Table 15-65 UserTags

Parameter	Type	Description
key	String	Definition: Key. The value cannot start with CCE- or __type_baremetal . Range: N/A
value	String	Value.

Table 15-66 NodeNetwork

Parameter	Type	Description
vpc	String	• Definition: VPC ID. Range: N/A.
subnet	String	Definition: Subnet ID. Range: N/A.
securityGroups	Array of strings	Definition: Security group ID set.

Table 15-67 ResourceExtendParams

Parameter	Type	Description
dockerBaseSize	String	Definition: Container image space of a node. Range: • Specified: The default value of dockerBaseSize ranges from 50 to 500. However, the actual value is restricted by the container data disk size of the node. • Unlimited: *dockerBaseSize="0, indicating that the container image space is not limited.

Parameter	Type	Description
postInstall	String	Definition: Post-installation script. The entered value must be encoded using Base64. Range: N/A.
runtime	String	Definition: Container runtime. Range: • docker: Container runtime. It is the most commonly used container engine, which is used to create and manage container instances based on container images. • containerd: Industrial-grade container runtime. It focuses on container lifecycle management and is one of the core components at the bottom layer of Docker. It can also be deployed independently.
labelPolicyOnExistingNodes	String	Definition: Kubernetes label update policy of existing nodes. If the value is empty, the existing nodes are updated by default. Range: • refresh: Update. • ignore: Do not update.
taintPolicyOnExistingNodes	String	Definition: Kubernetes taint update policy of existing nodes. If the value is empty, the existing nodes are updated by default. Range: • refresh: Update. • ignore: Do not update.
tagPolicyOnExistingNodes	String	Definition: Resource tag update policy of existing nodes. If the value is empty, the existing nodes are updated by default. Range: • refresh: Update. • ignore: Do not update.

Parameter	Type	Description
XParameterPlane-Subnet	String	Definition: Subnet ID used for data transmission on the parameter plane between physical clusters. The value cannot be the same as the node subnet or container subnet. Range: N/A.
nodePoolName	String	Definition: Name of the node pool specified by you. The value is a string of 2 to 50 characters, consisting of lowercase letters, hyphens (-), and digits. It must start with a lowercase letter and cannot end with a hyphen (-) or -default . Range: N/A.

Table 15-68 CreatingStep

Parameter	Type	Description
step	Integer	Definition: Step of a supernode. Constraints: N/A Range: Only the step contained in the resource specification details is supported. Default Value: N/A
type	String	Definition: Batch creation type. Constraints: N/A Range: • hyperinstance: supernode Default Value: N/A

Table 15-69 RootVolume

Parameter	Type	Description
volumeType	String	Definition: Disk type.. Range: • SSD: Ultra-high I/O disk • GPSSD: General-purpose SSD • SAS: High I/O disk

Parameter	Type	Description
size	String	Definition: Disk size, in GiB. Range: N/A.

Table 15-70 DataVolumeItem

Parameter	Type	Description
volumeType	String	Definition: Disk type.. Range: • SSD: Ultra-high I/O disk • GPSSD: General-purpose SSD • SAS: High I/O disk
size	String	Definition: Disk size, in GiB. Range: N/A.
count	Integer	Definition: Number of disks. Range: N/A.
extendParams	VolumeExtendParams object	Definition: Custom disk configuration.

Table 15-71 VolumeExtendParams

Parameter	Type	Description
volumeGroup	String	Definition: Name of a disk group, which is used to divide storage space. Range: • vgpaas: container disk. • default: common data disk, which is mounted in default mode. • vguser: common data disk, which is mounted to a specified path. The group name varies depending on the path, for example, vguser1 and vguser2. • vg-everest-localvolume-persistent: common data disk, which is used as the persistent storage volume. • vg-everest-localvolume-ephemeral: common data disk, which is used as a temporary storage volume.

Table 15-72 VolumeGroupConfig

Parameter	Type	Description
volumeGroup	String	Definition: Disk group name. Index of the volume group in the dataVolumes. Range: N/A.
dockerThinPool	Integer	Definition: Percentage of data disks designated as container disks. This parameter can be specified only when volumeGroup is vgpaas (container disk). Range: N/A.
lvmConfig	LvmConfig object	Definition: LVM configuration management.
types	Array of strings	Definition: Storage type. Options: • volume: Cloud hard disk. When dataVolumes is specified, the default value is used. • local: Local disk. This parameter must be specified when a local disk is used.

Table 15-73 LvmConfig

Parameter	Type	Description
lvType	String	Definition: LVM write mode. Range: • linear: Linear mode. • striped: Striped mode in which multiple disks are used to form a strip to improve disk performance.
path	String	Definition: Disk mount path. This parameter takes effect only in user configuration. The value is an absolute path. Digits, letters, periods (.), hyphens (-), and underscores (_) are allowed. Range: N/A.

Table 15-74 Os

Parameter	Type	Description
name	String	Definition: OS name and version, for example, EulerOS 2.5. This parameter can be left blank when a private image is specified. Range: N/A.
imageId	String	Definition: OS image ID. Range: N/A.
imageType	String	Definition: OS image type. This parameter must be specified when a private image is set. By default, the preset image is used. You do not need to specify this field. Range: • private: private images • "": The preset image is used.
autoMatch	String	Definition: Automatic OS image matching configuration. If this parameter is set, the optimal image is automatically selected, and this parameter is automatically cleared. Range: OS name and version, for example, EulerOS 2.5.

Table 15-75 NodePoolStatus

Parameter	Type	Description
resources	resources object	Definition: Resources in different states in a node pool.

Table 15-76 resources

Parameter	Type	Description
creating	PoolResourceFlavorCount object	Definition: Number of resources that are being created.
available	PoolResourceFlavorCount object	Definition: Number of available resources.
abnormal	PoolResourceFlavorCount object	Definition: Number of abnormal resources.
deleting	PoolResourceFlavorCount object	Definition: Number of resources that are being deleted.

Table 15-77 PoolResourceFlavorCount

Parameter	Type	Description
flavor	String	Definition: Resource flavor ID. Range: N/A
count	Integer	Definition: Number of resource specification instances in a resource pool. Range: N/A
maxCount	Integer	Definition: Number of elastic resource specification instances in a resource pool. The value of this parameter in a physical pool is the same as that of count . Range: N/A
azs	Array of PoolNodeAz objects	Definition: AZ distribution of the resource specification instances to be created in a resource pool.
nodePool	String	Definition: Node pool ID. Range: N/A

Table 15-78 PoolNodeAz

Parameter	Type	Description
az	String	Definition: AZ name. Range: N/A
count	Integer	Definition: Number of AZ resource instances. Range: N/A

Status code: 400**Table 15-79** Response body parameters

Parameter	Type	Description
error_code	String	Definition: ModelArts error code. Range: N/A
error_msg	String	Definition: Error message. Range: N/A

Example Requests

Obtain details about a specified node pool.

```
GET https://{endpoint}/v2/{project_id}/pools/{pool_name}/nodepools/{nodepool_name}
{ }
```

Example Responses

Error Codes

See [Error Codes](#).

15.4 Updating a Node Pool

Function

This API is used to update the configurations of a specified node pool. This API is used when you need to expand the capacity of a node pool, adjust node specifications, optimize resource allocation, or repair node pool configurations. Before using this API, ensure that the node pool exists and you have the administrator permissions. After the update, the configurations of the node pool will be updated, including the number of nodes, node specifications, and network configurations. If the node pool does not exist, the user does not have the permission to operate the node pool, or the configuration parameters are incorrect, the API will return an error message.

Debugging

You can debug this API through automatic authentication in [API Explorer](#) or use the SDK sample code generated by API Explorer.

Authorization Information

Each account has all the permissions required to call all APIs, but IAM users must be assigned the required permissions.

- If you are using role/policy-based authorization, see [Permissions Policies and Supported Actions](#) for details on the required permissions.
- If you are using identity policy-based authorization, no identity policy-based permission required for calling this API.

URI

PATCH /v2/{project_id}/pools/{pool_name}/nodepools/{nodepool_name}

Table 15-80 Path Parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Definition: User project ID. For details, see Obtaining a Project ID and Name . Constraints: N/A Range: N/A Default Value: N/A
pool_name	Yes	String	Definition: Resource pool name. Constraints: N/A Range: N/A Default Value: N/A
nodepool_name	Yes	String	Definition: Node pool name. Constraints: N/A Range: N/A Default Value: N/A

Request Parameters

Table 15-81 Request header parameters

Parameter	Mandatory	Type	Description
Content-Type	Yes	String	Definition: Message body type (format). Constraints: N/A Range application/merge-patch+json Default Value: N/A

Table 15-82 Request body parameters

Parameter	Mandatory	Type	Description
metadata	No	PatchNodePoolMetaVO object	Definition: Node pool metadata.
spec	Yes	NodePoolSpec object	Definition: Request body for updating a node pool.

Table 15-83 PatchNodePoolMetaVO

Parameter	Mandatory	Type	Description
annotations	No	PatchNodePoolAnnotations object	Definition: Node pool annotations.

Table 15-84 PatchNodePoolAnnotations

Parameter	Mandatory	Type	Description
os.modelarts/billing.mode	No	String	Definition: Specifies the billing mode. If this parameter is not specified, new nodes use the existing settings for the resource pool. Range: 0: Pay-per-use

Parameter	Mandatory	Type	Description
os.modelarts/ period.num	No	String	Definition: Subscription period on a yearly/monthly basis, for example, 2 . This parameter is mandatory when the billing mode is yearly/monthly. Range: N/A.
os.modelarts/ period.type	No	String	Definition: Subscription type on a yearly/monthly basis. This parameter is mandatory when the billing mode is yearly/monthly. Range: • 2: Monthly • 3: Year
os.modelarts/ auto.renew	No	String	Definition: Specifies whether auto-renewal is enabled. If this parameter is not specified, new nodes use the existing settings for the resource pool. Range: • 0: Auto-renewal disabled (default value) • 1: Auto-renewal enabled
os.modelarts/ promotion.info	No	String	Definition: Discount selected on the operations platform. Range: N/A.
os.modelarts/ service.console.url	No	String	Definition: URL of the page displayed after the subscription order is paid. Range: N/A.
os.modelarts/ order.id	No	String	Definition: Order ID, which is mandatory for creating a yearly/monthly resource or changing the billing mode. Range: N/A.

Table 15-85 NodePoolSpec

Parameter	Mandatory	Type	Description
resources	Yes	PoolResource object	Definition: List of resources in a node pool, including resource flavors, quantity, and custom configurations. Range: N/A

Table 15-86 PoolResource

Parameter	Mandatory	Type	Description
flavor	Yes	String	Definition: Resource flavor name, for example, modelarts.vm.gpu.t4u8 . Range: N/A.
count	Yes	Integer	Definition: Committed specifications. Range: N/A.
maxCount	Yes	Integer	Definition: Elastic usage of the resource flavor. This parameter value is the same the count value in a physical pool. Range: N/A.
azs	No	Array of PoolNodeAz objects	Definition: AZ information of nodes in the resource pool.
nodePool	No	String	Definition: Node pool name, for example, nodePool-1 . Range: N/A.
taints	No	Array of Taints objects	Definition: Taints to be added to nodes to set anti-affinity. This parameter cannot be specified for a non-privileged pool.
labels	No	Map<String,String>	Definition: Kubernetes label, in key-value pair format.
tags	No	Array of UserTags objects	Definition: Resource tag. This parameter cannot be specified for a non-privileged pool.

Parameter	Mandatory	Type	Description
network	No	NodeNetwork object	Definition: Network configuration. This parameter cannot be specified for a non-privileged pool.
extendParams	No	ResourceExtendParams object	Definition: Custom configuration.
creatingStep	No	CreatingStep object	Definition: Information about batch creation.
rootVolume	No	RootVolume object	Definition: Information about the custom system disk (cloud hard disk).
dataVolumes	No	Array of DataVolumeItem objects	Definition: List of custom data disks (cloud hard disks).
volumeGroupConfigs	No	Array of VolumeGroupConfig objects	Definition: Advanced disk configuration. This parameter is mandatory when a custom data disk exists.
os	No	Os object	Definition: OS image information.

step	No	Integer	Definition: Step of a supernode. Constraints: N/A Range: Only the step contained in the resource specification details is supported. Default Value: N/A
type	No	String	Definition: Batch creation type. Constraints: N/A Range: • hyperinstance: supernode Default Value: N/A

Table 15-93 RootVolume

Parameter	Mandatory	Type	Description
volumeType	Yes	String	Definition: Disk type.. Range: • SSD: Ultra-high I/O disk • GPSSD: General-purpose SSD • SAS: High I/O disk
size	Yes	String	Definition: Disk size, in GiB. Range: N/A.

Table 15-94 DataVolumeItem

Parameter	Mandatory	Type	Description
volumeType	Yes	String	Definition: Disk type.. Range: • SSD: Ultra-high I/O disk • GPSSD: General-purpose SSD • SAS: High I/O disk
size	Yes	String	Definition: Disk size, in GiB. Range: N/A.
count	No	Integer	Definition: Number of disks. Range: N/A.
extendParams	Yes	VolumeExtendParams object	Definition: Custom disk configuration.

Table 15-95 VolumeExtendParams

Parameter	Mandatory	Type	Description
volumeGroup	Yes	String	Definition: Name of a disk group, which is used to divide storage space. Range: • vgpaas: container disk. • default: common data disk, which is mounted in default mode. • vguser: common data disk, which is mounted to a specified path. The group name varies depending on the path, for example, vguser1 and vguser2. • vg-everest-localvolume-persistent: common data disk, which is used as the persistent storage volume. • vg-everest-localvolume-ephemeral: common data disk, which is used as a temporary storage volume.

Table 15-96 VolumeGroupConfig

Parameter	Mandatory	Type	Description
volumeGroup	Yes	String	Definition: Disk group name. Index of the volume group in the dataVolumes. Range: N/A.
dockerThinPool	No	Integer	Definition: Percentage of data disks designated as container disks. This parameter can be specified only when volumeGroup is vgpaas (container disk). Range: N/A.
lvmConfig	No	LvmConfig object	Definition: LVM configuration management.

Parameter	Mandatory	Type	Description
types	No	Array of strings	Definition: Storage type. Options: • volume: Cloud hard disk. When dataVolumes is specified, the default value is used. • local: Local disk. This parameter must be specified when a local disk is used.

Table 15-97 LvmConfig

Parameter	Mandatory	Type	Description
lvType	Yes	String	Definition: LVM write mode. Range: • linear: Linear mode. • striped: Striped mode in which multiple disks are used to form a strip to improve disk performance.
path	No	String	Definition: Disk mount path. This parameter takes effect only in user configuration. The value is an absolute path. Digits, letters, periods (.), hyphens (-), and underscores (_) are allowed. Range: N/A.

Table 15-98 Os

Parameter	Mandatory	Type	Description
name	No	String	Definition: OS name and version, for example, EulerOS 2.5. This parameter can be left blank when a private image is specified. Range: N/A.
imageId	No	String	Definition: OS image ID. Range: N/A.

Parameter	Mandatory	Type	Description
imageType	No	String	Definition: OS image type. This parameter must be specified when a private image is set. By default, the preset image is used. You do not need to specify this field. Range: • private: private images • "": The preset image is used.
autoMatch	No	String	Definition: Automatic OS image matching configuration. If this parameter is set, the optimal image is automatically selected, and this parameter is automatically cleared. Range: OS name and version, for example, EulerOS 2.5.

Response Parameters

Status code: 200

Table 15-99 Response body parameters

Parameter	Type	Description
metadata	PatchNodePoolMetaVO object	Definition: Node pool metadata.
spec	NodePoolSpec object	Definition: Request body for updating a node pool.

Table 15-100 PatchNodePoolMetaVO

Parameter	Type	Description
annotations	PatchNodePoolAnnotations object	Definition: Node pool annotations.

Table 15-101 PatchNodePoolAnnotations

Parameter	Type	Description
os.modelarts/ billing.mode	String	Definition: Specifies the billing mode. If this parameter is not specified, new nodes use the existing settings for the resource pool. Range: • 0: Pay-per-use
os.modelarts/ period.num	String	Definition: Subscription period on a yearly/monthly basis, for example, 2. This parameter is mandatory when the billing mode is yearly/monthly. Range: N/A.
os.modelarts/ period.type	String	Definition: Subscription type on a yearly/monthly basis. This parameter is mandatory when the billing mode is yearly/monthly. Range: • 2: Monthly • 3: Year
os.modelarts/ auto.renew	String	Definition: Specifies whether auto-renewal is enabled. If this parameter is not specified, new nodes use the existing settings for the resource pool. Range: • 0: Auto-renewal disabled (default value) • 1: Auto-renewal enabled
os.modelarts/ promotion.info	String	Definition: Discount selected on the operations platform. Range: N/A.
os.modelarts/ service.console.url	String	Definition: URL of the page displayed after the subscription order is paid. Range: N/A.
os.modelarts/ order.id	String	Definition: Order ID, which is mandatory for creating a yearly/monthly resource or changing the billing mode. Range: N/A.

Table 15-102 NodePoolSpec

Parameter	Type	Description
resources	PoolResource object	Definition: List of resources in a node pool, including resource flavors, quantity, and custom configurations. Range: N/A

Table 15-103 PoolResource

Parameter	Type	Description
flavor	String	Definition: Resource flavor name, for example, modelarts.vm.gpu.t4u8 . Range: N/A.
count	Integer	Definition: Committed specifications. Range: N/A.
maxCount	Integer	Definition: Elastic usage of the resource flavor. This parameter value is the same the count value in a physical pool. Range: N/A.
azs	Array of PoolNodeAz objects	Definition: AZ information of nodes in the resource pool.
nodePool	String	Definition: Node pool name, for example, nodePool-1 . Range: N/A.
taints	Array of Taints objects	Definition: Taints to be added to nodes to set anti-affinity. This parameter cannot be specified for a non-privileged pool.
labels	Map<String,String>	Definition: Kubernetes label, in key-value pair format.
tags	Array of UserTags objects	Definition: Resource tag. This parameter cannot be specified for a non-privileged pool.
network	NodeNetwork object	Definition: Network configuration. This parameter cannot be specified for a non-privileged pool.
extendParams	ResourceExtendParams object	Definition: Custom configuration.

Parameter	Type	Description
creatingStep	CreatingStep object	Definition: Information about batch creation.
rootVolume	RootVolume object	Definition: Information about the custom system disk (cloud hard disk).
dataVolumes	Array of DataVolumeItem objects	Definition: List of custom data disks (cloud hard disks).
volumeGroupConfigs	Array of VolumeGroupConfig objects	Definition: Advanced disk configuration. This parameter is mandatory when a custom data disk exists.
os	Os object	Definition: OS image information.

Table 15-104 PoolNodeAz

Parameter	Type	Description
az	String	Definition: AZ name. Range: N/A
count	Integer	Definition: Number of AZ resource instances. Range: N/A

Table 15-105 Taints

Parameter	Type	Description
key	String	Definition: Key. Range: N/A
value	String	Value.
effect	String	Effect.

Table 15-106 UserTags

Parameter	Type	Description
key	String	Definition: Key. The value cannot start with CCE- or __type_baremetal. Range: N/A

Parameter	Type	Description
value	String	Value.

Table 15-107 NodeNetwork

Parameter	Type	Description
vpc	String	• Definition: VPC ID. Range: N/A.
subnet	String	Definition: Subnet ID. Range: N/A.
securityGroups	Array of strings	Definition: Security group ID set.

Table 15-108 ResourceExtendParams

Parameter	Type	Description
dockerBaseSize	String	Definition: Container image space of a node. Range: • Specified: The default value of dockerBaseSize ranges from 50 to 500. However, the actual value is restricted by the container data disk size of the node. • Unlimited: *dockerBaseSize="0", indicating that the container image space is not limited.
postInstall	String	Definition: Post-installation script. The entered value must be encoded using Base64. Range: N/A.

Parameter	Type	Description
runtime	String	Definition: Container runtime. Range: • docker: Container runtime. It is the most commonly used container engine, which is used to create and manage container instances based on container images. • containerd: Industrial-grade container runtime. It focuses on container lifecycle management and is one of the core components at the bottom layer of Docker. It can also be deployed independently.
labelPolicyOnExistingNodes	String	Definition: Kubernetes label update policy of existing nodes. If the value is empty, the existing nodes are updated by default. Range: • refresh: Update. • ignore: Do not update.
taintPolicyOnExistingNodes	String	Definition: Kubernetes taint update policy of existing nodes. If the value is empty, the existing nodes are updated by default. Range: • refresh: Update. • ignore: Do not update.
tagPolicyOnExistingNodes	String	Definition: Resource tag update policy of existing nodes. If the value is empty, the existing nodes are updated by default. Range: • refresh: Update. • ignore: Do not update.
XParameterPlane-Subnet	String	Definition: Subnet ID used for data transmission on the parameter plane between physical clusters. The value cannot be the same as the node subnet or container subnet. Range: N/A.

Parameter	Type	Description
nodePoolName	String	Definition: Name of the node pool specified by you. The value is a string of 2 to 50 characters, consisting of lowercase letters, hyphens (-), and digits. It must start with a lowercase letter and cannot end with a hyphen (-) or -default . Range: N/A.

Table 15-109 CreatingStep

Parameter	Type	Description
step	Integer	Definition: Step of a supernode. Constraints: N/A Range: Only the step contained in the resource specification details is supported. Default Value: N/A
type	String	Definition: Batch creation type. Constraints: N/A Range: • hyperinstance: supernode Default Value: N/A

Table 15-110 RootVolume

Parameter	Type	Description
volumeType	String	Definition: Disk type.. Range: • SSD: Ultra-high I/O disk • GPSSD: General-purpose SSD • SAS: High I/O disk
size	String	Definition: Disk size, in GiB. Range: N/A.

Table 15-111 DataVolumeItem

Parameter	Type	Description
volumeType	String	Definition: Disk type.. Range: • SSD: Ultra-high I/O disk • GPSSD: General-purpose SSD • SAS: High I/O disk
size	String	Definition: Disk size, in GiB. Range: N/A.
count	Integer	Definition: Number of disks. Range: N/A.
extendParams	VolumeExtendParams object	Definition: Custom disk configuration.

Table 15-112 VolumeExtendParams

Parameter	Type	Description
volumeGroup	String	Definition: Name of a disk group, which is used to divide storage space. Range: • vgpaas: container disk. • default: common data disk, which is mounted in default mode. • vguser: common data disk, which is mounted to a specified path. The group name varies depending on the path, for example, vguser1 and vguser2. • vg-everest-localvolume-persistent: common data disk, which is used as the persistent storage volume. • vg-everest-localvolume-ephemeral: common data disk, which is used as a temporary storage volume.

Table 15-113 VolumeGroupConfig

Parameter	Type	Description
volumeGroup	String	Definition: Disk group name. Index of the volume group in the dataVolumes. Range: N/A.
dockerThinPool	Integer	Definition: Percentage of data disks designated as container disks. This parameter can be specified only when volumeGroup is vgpaas (container disk). Range: N/A.
lvmConfig	LvmConfig object	Definition: LVM configuration management.
types	Array of strings	Definition: Storage type. Options: • volume: Cloud hard disk. When dataVolumes is specified, the default value is used. • local: Local disk. This parameter must be specified when a local disk is used.

Table 15-114 LvmConfig

Parameter	Type	Description
lvType	String	Definition: LVM write mode. Range: • linear: Linear mode. • striped: Striped mode in which multiple disks are used to form a strip to improve disk performance.
path	String	Definition: Disk mount path. This parameter takes effect only in user configuration. The value is an absolute path. Digits, letters, periods (.), hyphens (-), and underscores (_) are allowed. Range: N/A.

Table 15-115 Os

Parameter	Type	Description
name	String	Definition: OS name and version, for example, EulerOS 2.5. This parameter can be left blank when a private image is specified. Range: N/A.
imageId	String	Definition: OS image ID. Range: N/A.
imageType	String	Definition: OS image type. This parameter must be specified when a private image is set. By default, the preset image is used. You do not need to specify this field. Range: • private: private images • "": The preset image is used.
autoMatch	String	Definition: Automatic OS image matching configuration. If this parameter is set, the optimal image is automatically selected, and this parameter is automatically cleared. Range: OS name and version, for example, EulerOS 2.5.

Status code: 400**Table 15-116** Response body parameters

Parameter	Type	Description
error_code	String	• Definition: ModelArts error code. Range: N/A
error_msg	String	Definition: Error message. Range: N/A

Example Requests

Update a node pool.

```
PATCH https://{endpoint}/v2/{project_id}/pools/{pool_name}/nodepools/{nodepool_name}
{
  "spec": {
```

```
"resources" : {  
  "nodePool" : "modelarts.vm.2u4g.dcc-Default",  
  "flavor" : "modelarts.vm.2u4g.dcc",  
  "count" : 1,  
  "maxCount" : 1,  
  "network" : {

15.5 Deleting a Node Pool

Function

This API is used to remove a created node pool. This function is not supported for yearly/monthly resource pools. This API is used when you need to delete a specified node pool when the tasks in the node pool are complete, the configuration is incorrect, or resources need to be cleared. Before using this API, ensure that the node pool exists and you have the administrator permissions. After the deletion, the node pool is permanently removed, and related resources and configurations are cleared. If the node pool does not exist, the user does not have the permission to perform the operation, or the node pool cannot be deleted, for example, it is a yearly/monthly resource pool or the node pool is in use, the API will return an error message.

Debugging

You can debug this API through automatic authentication in [API Explorer](#) or use the SDK sample code generated by API Explorer.

Authorization Information

Each account has all the permissions required to call all APIs, but IAM users must be assigned the required permissions.

- If you are using role/policy-based authorization, see [Permissions Policies and Supported Actions](#) for details on the required permissions.
- If you are using identity policy-based authorization, no identity policy-based permission required for calling this API.

URI

DELETE /v2/{project_id}/pools/{pool_name}/nodepools/{nodepool_name}

Table 15-117 Path Parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Definition: User project ID. For details, see Obtaining a Project ID and Name . Constraints: N/A Range: N/A Default Value: N/A

Parameter	Mandatory	Type	Description
pool_name	Yes	String	Definition: Resource pool name. Constraints: N/A Range: N/A Default Value: N/A
nodepool_name	Yes	String	Definition: Node pool name. Constraints: N/A Range: N/A Default Value: N/A

Request Parameters

None

Response Parameters

Status code: 200

Table 15-118 Response body parameters

Parameter	Type	Description
apiVersion	String	Definition: API version. Range: • v2
kind	String	Node pool type. The options are as follows: • NodePool: node pool
metadata	NodePoolMetadata object	Definition: Node pool metadata.
spec	NodePoolSpec object	Definition: Node pool expectation.
status	NodePoolStatus object	Definition: Node pool status.

Table 15-119 NodePoolMetadata

Parameter	Type	Description
name	String	Definition: Node pool name. You can specify the name. If not specified, the default name is used. Range: N/A

Table 15-120 NodePoolSpec

Parameter	Type	Description
resources	PoolResource object	Definition: List of resources in a node pool, including resource flavors, quantity, and custom configurations. Range: N/A

Table 15-121 PoolResource

Parameter	Type	Description
flavor	String	Definition: Resource flavor name, for example, modelarts.vm.gpu.t4u8 . Range: N/A.
count	Integer	Definition: Committed specifications. Range: N/A.
maxCount	Integer	Definition: Elastic usage of the resource flavor. This parameter value is the same the count value in a physical pool. Range: N/A.
azs	Array of PoolNodeAz objects	Definition: AZ information of nodes in the resource pool.
nodePool	String	Definition: Node pool name, for example, nodePool-1 . Range: N/A.
taints	Array of Taints objects	Definition: Taints to be added to nodes to set anti-affinity. This parameter cannot be specified for a non-privileged pool.
labels	Map<String,String>	Definition: Kubernetes label, in key-value pair format.

Parameter	Type	Description
tags	Array of UserTags objects	Definition: Resource tag. This parameter cannot be specified for a non-privileged pool.
network	NodeNetwork object	Definition: Network configuration. This parameter cannot be specified for a non-privileged pool.
extendParams	ResourceExtendParams object	Definition: Custom configuration.
creatingStep	CreatingStep object	Definition: Information about batch creation.
rootVolume	RootVolume object	Definition: Information about the custom system disk (cloud hard disk).
dataVolumes	Array of DataVolumeItem objects	Definition: List of custom data disks (cloud hard disks).
volumeGroupConfigs	Array of VolumeGroupConfig objects	Definition: Advanced disk configuration. This parameter is mandatory when a custom data disk exists.
os	Os object	Definition: OS image information.

Table 15-122 Taints

Parameter	Type	Description
key	String	Definition: Key. Range: N/A
value	String	Value.
effect	String	Effect.

Table 15-123 UserTags

Parameter	Type	Description
key	String	Definition: Key. The value cannot start with CCE- or __type_baremetal. Range: N/A
value	String	Value.

Table 15-124 NodeNetwork

Parameter	Type	Description
vpc	String	• Definition: VPC ID. Range: N/A.
subnet	String	Definition: Subnet ID. Range: N/A.
securityGroups	Array of strings	Definition: Security group ID set.

Table 15-125 ResourceExtendParams

Parameter	Type	Description
dockerBaseSize	String	Definition: Container image space of a node. Range: • Specified: The default value of dockerBaseSize ranges from 50 to 500. However, the actual value is restricted by the container data disk size of the node. • Unlimited: *dockerBaseSize="0", indicating that the container image space is not limited.
postInstall	String	Definition: Post-installation script. The entered value must be encoded using Base64. Range: N/A.
runtime	String	Definition: Container runtime. Range: • docker: Container runtime. It is the most commonly used container engine, which is used to create and manage container instances based on container images. • containerd: Industrial-grade container runtime. It focuses on container lifecycle management and is one of the core components at the bottom layer of Docker. It can also be deployed independently.

Parameter	Type	Description
labelPolicyOnExistingNodes	String	Definition: Kubernetes label update policy of existing nodes. If the value is empty, the existing nodes are updated by default. Range: • refresh: Update. • ignore: Do not update.
taintPolicyOnExistingNodes	String	Definition: Kubernetes taint update policy of existing nodes. If the value is empty, the existing nodes are updated by default. Range: • refresh: Update. • ignore: Do not update.
tagPolicyOnExistingNodes	String	Definition: Resource tag update policy of existing nodes. If the value is empty, the existing nodes are updated by default. Range: • refresh: Update. • ignore: Do not update.
XParameterPlane-Subnet	String	Definition: Subnet ID used for data transmission on the parameter plane between physical clusters. The value cannot be the same as the node subnet or container subnet. Range: N/A.
nodePoolName	String	Definition: Name of the node pool specified by you. The value is a string of 2 to 50 characters, consisting of lowercase letters, hyphens (-), and digits. It must start with a lowercase letter and cannot end with a hyphen (-) or -default . Range: N/A.

Table 15-126 CreatingStep

Parameter	Type	Description
step	Integer	Definition: Step of a supernode. Constraints: N/A Range: Only the step contained in the resource specification details is supported. Default Value: N/A
type	String	Definition: Batch creation type. Constraints: N/A Range: • hyperinstance: supernode Default Value: N/A

Table 15-127 RootVolume

Parameter	Type	Description
volumeType	String	Definition: Disk type.. Range: • SSD: Ultra-high I/O disk • GPSSD: General-purpose SSD • SAS: High I/O disk
size	String	Definition: Disk size, in GiB. Range: N/A.

Table 15-128 DataVolumeItem

Parameter	Type	Description
volumeType	String	Definition: Disk type.. Range: • SSD: Ultra-high I/O disk • GPSSD: General-purpose SSD • SAS: High I/O disk
size	String	Definition: Disk size, in GiB. Range: N/A.
count	Integer	Definition: Number of disks. Range: N/A.

Parameter	Type	Description
extendParams	VolumeExtendParams object	Definition: Custom disk configuration.

Table 15-129 VolumeExtendParams

Parameter	Type	Description
volumeGroup	String	Definition: Name of a disk group, which is used to divide storage space. Range: • vgpaas: container disk. • default: common data disk, which is mounted in default mode. • vguser: common data disk, which is mounted to a specified path. The group name varies depending on the path, for example, vguser1 and vguser2. • vg-everest-localvolume-persistent: common data disk, which is used as the persistent storage volume. • vg-everest-localvolume-ephemeral: common data disk, which is used as a temporary storage volume.

Table 15-130 VolumeGroupConfig

Parameter	Type	Description
volumeGroup	String	Definition: Disk group name. Index of the volume group in the dataVolumes. Range: N/A.
dockerThinPool	Integer	Definition: Percentage of data disks designated as container disks. This parameter can be specified only when volumeGroup is vgpaas (container disk). Range: N/A.
lvmConfig	LvmConfig object	Definition: LVM configuration management.

Parameter	Type	Description
types	Array of strings	Definition: Storage type. Options: • volume: Cloud hard disk. When dataVolumes is specified, the default value is used. • local: Local disk. This parameter must be specified when a local disk is used.

Table 15-131 LvmConfig

Parameter	Type	Description
lvType	String	Definition: LVM write mode. Range: • linear: Linear mode. • striped: Striped mode in which multiple disks are used to form a strip to improve disk performance.
path	String	Definition: Disk mount path. This parameter takes effect only in user configuration. The value is an absolute path. Digits, letters, periods (.), hyphens (-), and underscores (_) are allowed. Range: N/A.

Table 15-132 Os

Parameter	Type	Description
name	String	Definition: OS name and version, for example, EulerOS 2.5. This parameter can be left blank when a private image is specified. Range: N/A.
imageId	String	Definition: OS image ID. Range: N/A.

Parameter	Type	Description
imageType	String	Definition: OS image type. This parameter must be specified when a private image is set. By default, the preset image is used. You do not need to specify this field. Range: • private: private images • "": The preset image is used.
autoMatch	String	Definition: Automatic OS image matching configuration. If this parameter is set, the optimal image is automatically selected, and this parameter is automatically cleared. Range: OS name and version, for example, EulerOS 2.5.

Table 15-133 NodePoolStatus

Parameter	Type	Description
resources	resources object	Definition: Resources in different states in a node pool.

Table 15-134 resources

Parameter	Type	Description
creating	PoolResourceFlavorCount object	Definition: Number of resources that are being created.
available	PoolResourceFlavorCount object	Definition: Number of available resources.
abnormal	PoolResourceFlavorCount object	Definition: Number of abnormal resources.
deleting	PoolResourceFlavorCount object	Definition: Number of resources that are being deleted.

Table 15-135 PoolResourceFlavorCount

Parameter	Type	Description
flavor	String	Definition: Resource flavor ID. Range: N/A
count	Integer	Definition: Number of resource specification instances in a resource pool. Range: N/A
maxCount	Integer	Definition: Number of elastic resource specification instances in a resource pool. The value of this parameter in a physical pool is the same as that of count . Range: N/A
azs	Array of PoolNodeAz objects	Definition: AZ distribution of the resource specification instances to be created in a resource pool.
nodePool	String	Definition: Node pool ID. Range: N/A

Table 15-136 PoolNodeAz

Parameter	Type	Description
az	String	Definition: AZ name. Range: N/A
count	Integer	Definition: Number of AZ resource instances. Range: N/A

15.6 Obtaining Nodes in a Node Pool

Function

This API is used to obtain details about all nodes in a specified node pool. This API is used when you need to obtain the details about a node pool, such as the node status, resource usage, or resource management. Before using this API, ensure that the node pool exists and you have the permission to access the node pool. After the API is called, the system returns the node list of the node pool, including the node ID, name, status, IP address, and resource usage. If the node pool does not exist, the user does not have the permission to access the node pool, or the node pool is unavailable, the API will return an error message.

Debugging

You can debug this API through automatic authentication in [API Explorer](#) or use the SDK sample code generated by API Explorer.

Authorization Information

Each account has all the permissions required to call all APIs, but IAM users must be assigned the required permissions.

- If you are using role/policy-based authorization, see [Permissions Policies and Supported Actions](#) for details on the required permissions.
- If you are using identity policy-based authorization, no identity policy-based permission required for calling this API.

URI

GET /v2/{project_id}/pools/{pool_name}/nodepools/{nodepool_name}/nodes

Table 15-138 Path Parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Definition: User project ID. For details, see Obtaining a Project ID and Name . Constraints: N/A Range: N/A Default Value: N/A
pool_name	Yes	String	Definition: Resource pool name. Constraints: N/A Range: N/A Default Value: N/A
nodepool_name	Yes	String	Definition: Node pool name. Constraints: N/A Range: N/A Default Value: N/A

Table 15-139 Query Parameters

Parameter	Mandatory	Type	Description
continue	No	String	Definition: Position of the previous page during pagination query. Constraints: N/A Range: N/A Default Value: N/A
limit	No	String	Definition: Number of records returned in a single pagination query. Constraints: N/A Range: N/A Default Value: N/A

Request Parameters

Response Parameters

Status code: 200

Table 15-140 Response body parameters

Parameter	Type	Description
apiVersion	String	Definition: API version of the resource. Range: • v2: The current resource version is v2.
kind	String	Definition: Resource type. Range: • NodeList: nodes
metadata	NodeListMetadata object	Definition: Metadata of a node list.
items	Array of Node objects	Definition: Node resource list.

Table 15-141 NodeListMetadata

Parameter	Type	Description
continue	String	Definition: Offset parameter of the pagination query. Range: The value is obtained from the metadata.continue field in the response to the last pagination query. An empty value indicates no offset.
remainingItemCount	Long	Definition: Number of remaining resources in a pagination query. Default Value: N/A

Table 15-142 Node

Parameter	Type	Description
apiVersion	String	Definition: API version of the resource. Range: • v2: The current resource version is v2.
kind	String	Definition: Resource type. Range: • Node: node
metadata	NodeMetadata object	Definition: Metadata of a node resource.

Parameter	Type	Description
spec	NodeSpec object	Definition: Specifications of a node resource.
status	NodeStatus object	Definition: Status of a node resource.

Table 15-143 NodeMetadata

Parameter	Type	Description
name	String	Definition: Node name. Range: N/A
creationTimestamp	String	Definition: Creation time. Range: N/A
labels	NodeLabels object	Definition: Node labels.
annotations	NodeVOAnnotations object	Definition: Node annotations.

Table 15-144 NodeLabels

Parameter	Type	Description
os.modelarts.node/cluster	String	Definition: Name of the cluster where the node is located. Range: N/A
os.modelarts.node/elastic.quota	String	Definition: Logical pool bound to the node. Range: N/A
os.modelarts.node/nodepool	String	Definition: ID of the node pool where the node is located. Range: N/A
os.modelarts.node/batch.uid	String	Definition: Batch creation ID. Range: N/A
os.modelarts.node/batch.name	String	Definition: Batch creation name. Range: N/A
os.modelarts.node/batch.type	String	Definition: Batch creation type. Range hyperinstance: supernode

Parameter	Type	Description
os.modelarts.node / batch.count	String	Definition: Number of nodes created in batches. Range: N/A
os.modelarts / resource.id	String	Definition: Node resource ID. Range: N/A
os.modelarts / tenant.domain.id	String	Definition: Tenant ID of a node, which records the tenant account under which the node is created. Range: N/A
os.modelarts / tenant.project.id	String	Definition: Project ID of a node, which records the project under which the node is created. Range: N/A
os.modelarts / billing.status	String	Definition: Node billing status. Range • 0: normal • 1: frozen • 2: deleted or terminated
os.modelarts.node / volcano.scheduler.cabinet-exclusive	String	Definition: Whether the node is exclusively occupied by a full-rack job. If yes, the tag exists and its value is the ID of the exclusive training job. Range: N/A
cce.kubectrl.kubernetes.io/cabinet	String	Definition: IP address of the TOR switch where the node is located. Use hyphens (-) to separate multiple IP addresses of TOR switches. Range: N/A
os.modelarts.node / underlying.instance.id	String	Definition: Instance ID of the underlying resources of the node, for example, the ECS instance ID of the supernode. Range: N/A
os.modelarts.node / ha.redundant.enabled	String	Definition: Whether HA redundancy is enabled for the node. Range • true: enabled • false: disabled

Parameter	Type	Description
os.modelarts.node/ nodepoolname	String	Definition: Name of the node pool where the node is located. The value can contain 2 to 50 characters and must start with a lowercase letter. It cannot end with a hyphen (-) or - default. Only lowercase letters, hyphens (-), and digits are allowed. Range: N/A

Table 15-145 NodeVOAnnotations

Parameter	Type	Description
os.modelarts/npu- topology- placement	String	Definition: Topology of the NPU resource usage. The value is a 16-bit binary number, where the first bit from the right indicates PU 1. 1 indicates occupied, and 0 indicates idle. For example, if PUs 1 and 15 are occupied in a 16-PU server, the value is 0100000000000001 . If PUs 1 and 7 are occupied in an 8-PU server, the returned value is 0000000001000001 . Constraints: N/A Range: N/A Default Value: N/A

Table 15-146 NodeSpec

Parameter	Type	Description
flavor	String	Definition: ID of node resource specifications. Range: N/A.
os	Os object	Definition: OS image information.
hostNetwork	NodeNetwork object	Definition: Node network information.
rootVolume	VolumeVO object	Definition: System disk information.
dataVolumes	Array of VolumeVO objects	Definition: Data disk information.

Parameter	Type	Description
extendParams	ResourceExtendParams object	Definition: Custom configuration.

Table 15-147 Os

Parameter	Type	Description
name	String	Definition: OS name and version, for example, EulerOS 2.5. This parameter can be left blank when a private image is specified. Range: N/A.
imageId	String	Definition: OS image ID. Range: N/A.
imageType	String	Definition: OS image type. This parameter must be specified when a private image is set. By default, the preset image is used. You do not need to specify this field. Range: • private: private images • "": The preset image is used.
autoMatch	String	Definition: Automatic OS image matching configuration. If this parameter is set, the optimal image is automatically selected, and this parameter is automatically cleared. Range: OS name and version, for example, EulerOS 2.5.

Table 15-148 NodeNetwork

Parameter	Type	Description
vpc	String	• Definition: VPC ID. Range: N/A.
subnet	String	Definition: Subnet ID. Range: N/A.
securityGroups	Array of strings	Definition: Security group ID set.

Table 15-149 VolumeVO

Parameter	Type	Description
volumeType	String	Definition: Disk type.. Range: • SSD: Ultra-high I/O disk • GPSSD: General-purpose SSD
size	String	Definition: Disk size, in GiB. Range: N/A.
count	Integer	Definition: Number of disks. If this parameter is not specified, the default value 1 is used. Range: N/A.

Table 15-150 ResourceExtendParams

Parameter	Type	Description
dockerBaseSize	String	Definition: Container image space of a node. Range: • Specified: The default value of dockerBaseSize ranges from 50 to 500. However, the actual value is restricted by the container data disk size of the node. • Unlimited: *dockerBaseSize="", indicating that the container image space is not limited.
postInstall	String	Definition: Post-installation script. The entered value must be encoded using Base64. Range: N/A.

Parameter	Type	Description
runtime	String	Definition: Container runtime. Range: • docker: Container runtime. It is the most commonly used container engine, which is used to create and manage container instances based on container images. • containerd: Industrial-grade container runtime. It focuses on container lifecycle management and is one of the core components at the bottom layer of Docker. It can also be deployed independently.
labelPolicyOnExistingNodes	String	Definition: Kubernetes label update policy of existing nodes. If the value is empty, the existing nodes are updated by default. Range: • refresh: Update. • ignore: Do not update.
taintPolicyOnExistingNodes	String	Definition: Kubernetes taint update policy of existing nodes. If the value is empty, the existing nodes are updated by default. Range: • refresh: Update. • ignore: Do not update.
tagPolicyOnExistingNodes	String	Definition: Resource tag update policy of existing nodes. If the value is empty, the existing nodes are updated by default. Range: • refresh: Update. • ignore: Do not update.
XParameterPlane-Subnet	String	Definition: Subnet ID used for data transmission on the parameter plane between physical clusters. The value cannot be the same as the node subnet or container subnet. Range: N/A.

Parameter	Type	Description
nodePoolName	String	Definition: Name of the node pool specified by you. The value is a string of 2 to 50 characters, consisting of lowercase letters, hyphens (-), and digits. It must start with a lowercase letter and cannot end with a hyphen (-) or -default . Range: N/A.

Table 15-151 NodeStatus

Parameter	Type	Description
phase	String	Definition: Status of a node. Range: • Available: The node is available. • Creating: The node is being created. • Deleting: The node is being deleted. • Abnormal: The node is abnormal. • Checking: The node is performing a self-check.
az	String	Definition: AZ where a node is located. Range: N/A
privateIp	String	Definition: IP address of a node. Range: N/A
resources	NodeResource object	Definition: Resources of a node.
availableResources	NodeResource object	Definition: Available resources of a node.

Table 15-152 NodeResource

Parameter	Type	Description
cpu	String	Definition: Number of CPU cores on a node. Range: N/A

Parameter	Type	Description
memory	String	Definition: Memory size of a node, in GiB. Range: N/A
nvidia.com/gpu	String	Definition: Number of GPUs on a node. Range: N/A
huawei.com/ascend-snt3	String	Definition: Number of snt3 NPUs on a node. Range: N/A
huawei.com/ascend-snt9	String	Definition: Number of snt9 NPUs on a node. Range: N/A

Status code: 400

Table 15-153 Response body parameters

Parameter	Type	Description
error_code	String	Definition: ModelArts error code. Range: N/A
error_msg	String	Definition: Error message. Range: N/A

Example Requests

Obtain nodes in a node pool.

GET https://{endpoint}/v2/{project_id}/pools/{pool_name}/nodepools/{nodepool_name}/nodes

```
{
  "kind": "NodeList",
  "apiVersion": "v2",
  "metadata": { },
  "items": [ {

16 Order Management

16.1 Querying Order Details

Function

This API is used to query order details.

Debugging

You can debug this API through automatic authentication in [API Explorer](#) or use the SDK sample code generated by API Explorer.

Authorization Information

Each account has all the permissions required to call all APIs, but IAM users must be assigned the required permissions.

- If you are using role/policy-based authorization, see [Permissions Policies and Supported Actions](#) for details on the required permissions.
- If you are using identity policy-based authorization, no identity policy-based permission required for calling this API.

URI

GET /v1/{project_id}/orders/{order_name}

Table 16-1 Path Parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Definition: User project ID. For details, see Obtaining a Project ID and Name . Constraints: N/A Range: N/A Default Value: N/A
order_name	Yes	String	Range: N/A

Request Parameters

Table 16-2 Request header parameters

Parameter	Mandatory	Type	Description
X-Auth-Token	Yes	String	Constraints: N/A

Response Parameters

Status code: 200

Table 16-3 Response body parameters

Parameter	Type	Description
count	Integer	Definition: Number of resources associated with the order. Constraints: N/A Range: N/A Default Value: N/A
items	Array of OrderDetailItem objects	Definition: Resource information list associated with the order. Constraints: N/A Range: N/A Default Value: N/A

Table 16-4 OrderDetailItem

Parameter	Type	Description
resourceName	String	Definition: Resource ID. The value is obtained from the metadata.name field in resource details. Constraints: N/A Range: N/A Default Value: N/A
action	String	Definition: Type of the resource change associated with the order. Constraints: N/A Range: • createPool: Create a resource pool. • deletePool: Delete a resource pool. • createNode: Create a node. • deleteNode: Delete a node. This option is mainly used for unsubscribing from yearly/monthly nodes. • renew: Renew a subscription. • toPeriodic: Change the billing mode to yearly/monthly. Default Value: N/A
status	String	Definition: Change status of the resource associated with the order. Constraints: N/A Range: • processing: The resource is being processed. • succeed: The resource is processed. • failed: The resource fails to be processed. Default Value: N/A
beginTimestamp	String	Definition: Timestamp when the resource starts to change, in milliseconds. For example, 1744285793000 . Constraints: N/A Range: N/A Default Value: N/A

Parameter	Type	Description
updateTimestamp	String	Definition: Timestamp when the resource is last updated, in milliseconds. For example, 1744285793000 . Constraints: N/A Range: N/A Default Value: N/A
message	String	Definition: Execution information of resource change, for example, failure cause. Constraints: N/A Range: N/A Default Value: N/A

Status code: 400**Table 16-5** Response body parameters

Parameter	Type	Description
error_code	String	Definition: ModelArts error code. Range: N/A
error_msg	String	Definition: Error message. Range: N/A

Status code: 404**Table 16-6** Response body parameters

Parameter	Type	Description
error_code	String	Definition: ModelArts error code. Range: N/A
error_msg	String	Definition: Error message. Range: N/A

Example Requests

Query resource information in the order details.

```
GET /v1/{project_id}/orders/{order_name}
```

Example Responses

Status code: 200

Default Value: N/A

```
{
  "count" : 4,

17 Plugin Management

17.1 Creating a Plugin

Function

This API is used to create plugin instances.

Debugging

You can debug this API through automatic authentication in [API Explorer](#) or use the SDK sample code generated by API Explorer.

Authorization Information

Each account has all the permissions required to call all APIs, but IAM users must be assigned the required permissions.

- If you are using role/policy-based authorization, see [Permissions Policies and Supported Actions](#) for details on the required permissions.
- If you are using identity policy-based authorization, no identity policy-based permission required for calling this API.

URI

POST /v2/{project_id}/pools/{pool_name}/plugins

Table 17-1 Path Parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Definition: User project ID. For details, see Obtaining a Project ID and Name . Constraints: N/A Range: N/A Default Value: N/A
pool_name	Yes	String	Resource pool name.

Request Parameters

Table 17-2 Request body parameters

Parameter	Mandatory	Type	Description
apiVersion	Yes	String	Definition: API resource type. The value is fixed at Plugin and cannot be changed. Constraints: N/A Range: N/A Default Value: N/A
kind	Yes	String	API version. The value is fixed at v2 and cannot be changed.
spec	Yes	PluginSpec object	Detailed description of plugin installation or upgrade.

Table 17-3 PluginSpec

Parameter	Mandatory	Type	Description
template	Yes	Template object	Definition: Template information. Constraints: N/A

Table 17-4 Template

Parameter	Mandatory	Type	Description
name	Yes	String	Name of the plugin template to be installed, for example, log-agent .
version	No	String	Version of the plugin to be installed or upgraded.
inputs	No	Map<String, Object>	Plugin template installation parameters (varying depending on the plugin). During the plugin upgrade, you need to specify all the installation parameters. If the parameters are not specified, the default values in the plugin template are used. The current plugin installation parameters can be obtained through the API for querying plugin instances.

Response Parameters

Status code: 200

Table 17-5 Response body parameters

Parameter	Type	Description
apiVersion	String	Definition: API version. Range: v2
kind	String	Type of the plugin instance. Options: Plugin: plugin
metadata	PluginMetadata object	Metadata of the plugin instance.
spec	PluginSpec object	Plugin instance details.
status	PluginStatus object	Plugin instance status.

Table 17-6 PluginMetadata

Parameter	Type	Description
name	String	Name of the plugin instance.
creationTimestamp	String	Creation time.

Table 17-7 PluginSpec

Parameter	Type	Description
template	Template object	Definition: Template information. Constraints: N/A

Table 17-8 Template

Parameter	Type	Description
name	String	Name of the plugin template to be installed, for example, log-agent .
version	String	Version of the plugin to be installed or upgraded.
inputs	Map<String, Object>	Plugin template installation parameters (varying depending on the plugin). During the plugin upgrade, you need to specify all the installation parameters. If the parameters are not specified, the default values in the plugin template are used. The current plugin installation parameters can be obtained through the API for querying plugin instances.

Table 17-9 PluginStatus

Parameter	Type	Description
phase	String	Plugin instance status. Options: • Pending: The plugin is being installed. • Running: All of the plugin instances are running. This specifies that the plugin runs properly. • Updating: The plugin is being updated. • Abnormal: The plugin instances are abnormal and the plugin cannot be used. You can click the status to view the failure cause. • Deleting: The plugin is being deleted.
version	String	Version of the plugin instances.
reason	String	Details about the plugin instance installation failure.
values	String	Installation parameters of the plugin instances. The parameters vary depending on the plugin.
resources	Array of PluginResources objects	Resources used by the plugin instances.

Table 17-10 PluginResources

Parameter	Type	Description
involvedObject	ObjectReference object	Resource objects referenced by the plugin.
replicas	Integer	Number of replicas of the resource object.
limits	Map<String,String>	Limit on requested resources.
requests	Map<String,String>	Requested resources.

Table 17-11 ObjectReference

Parameter	Type	Description
kind	String	API type of the resource object, for example, DaemonSet and Deployment .
apiVersion	String	Definition: API version of the resource object. Range: N/A
namespace	String	Namespace of the resource object.
name	String	Name of the resource object.
uid	String	Unique ID of the resource object.
resourceVersion	String	Current version of the resource object.

Status code: 400**Table 17-12** Response body parameters

Parameter	Type	Description
error_code	String	• Definition: ModelArts error code. Range: N/A
error_msg	String	Definition: Error message. Range: N/A

Example Requests

Create plugin instances.

POST https://{endpoint}/v2/{project_id}/pools/{pool_name}/plugins

```
{
  "apiVersion": "v2",
  "kind": "Plugin",
  "spec": {
    "template": {
      "version": "1.6.36",
      "name": "node-local-dns"
    }
  }
}
```

Example Responses

Status code: 200

Request succeeded.

```
{
  "apiVersion": "v2",
  "kind": "Plugin",
  "spec": {
    "template": {
      "name": "node-local-dns",
      "version": "1.6.36",
      "inputs": {
        "flavor": {
          "description": "High available",
          "name": "HA",

17.2 Querying the Plugin List

Function

This API is used to list plugin instances.

Debugging

You can debug this API through automatic authentication in [API Explorer](#) or use the SDK sample code generated by API Explorer.

Authorization Information

Each account has all the permissions required to call all APIs, but IAM users must be assigned the required permissions.

- If you are using role/policy-based authorization, see [Permissions Policies and Supported Actions](#) for details on the required permissions.
- If you are using identity policy-based authorization, no identity policy-based permission required for calling this API.

URI

GET /v2/{project_id}/pools/{pool_name}/plugins

Table 17-13 Path Parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Definition: User project ID. For details, see Obtaining a Project ID and Name . Constraints: N/A Range: N/A Default Value: N/A
pool_name	Yes	String	Resource pool name.

Request Parameters

None

Response Parameters

Status code: 200

Table 17-14 Response body parameters

Parameter	Type	Description
apiVersion	String	Definition: API version. Range: • v2
kind	String	Resource type. Options: • PluginList: plugin list
items	Array of Plugin objects	Plugin list of the resource pool.

Table 17-15 Plugin

Parameter	Type	Description
apiVersion	String	Definition: API version. Range: • v2
kind	String	Type of the plugin instance. Options: • Plugin: plugin
metadata	PluginMetadata object	Metadata of the plugin instance.
spec	PluginSpec object	Plugin instance details.
status	PluginStatus object	Plugin instance status.

Table 17-16 PluginMetadata

Parameter	Type	Description
name	String	Name of the plugin instance.
creationTimestamp	String	Creation time.

Table 17-17 PluginSpec

Parameter	Type	Description
template	Template object	Definition: Template information. Constraints: N/A

Table 17-18 Template

Parameter	Type	Description
name	String	Name of the plugin template to be installed, for example, log-agent .
version	String	Version of the plugin to be installed or upgraded.
inputs	Map<String,Object>	Plugin template installation parameters (varying depending on the plugin). During the plugin upgrade, you need to specify all the installation parameters. If the parameters are not specified, the default values in the plugin template are used. The current plugin installation parameters can be obtained through the API for querying plugin instances.

Table 17-19 PluginStatus

Parameter	Type	Description
phase	String	Plugin instance status. Options: • Pending: The plugin is being installed. • Running: All of the plugin instances are running. This specifies that the plugin runs properly. • Updating: The plugin is being updated. • Abnormal: The plugin instances are abnormal and the plugin cannot be used. You can click the status to view the failure cause. • Deleting: The plugin is being deleted.
version	String	Version of the plugin instances.
reason	String	Details about the plugin instance installation failure.
values	String	Installation parameters of the plugin instances. The parameters vary depending on the plugin.
resources	Array of PluginResources objects	Resources used by the plugin instances.

Table 17-20 PluginResources

Parameter	Type	Description
involvedObject	ObjectReference object	Resource objects referenced by the plugin.
replicas	Integer	Number of replicas of the resource object.
limits	Map<String,String>	Limit on requested resources.
requests	Map<String,String>	Requested resources.

Table 17-21 ObjectReference

Parameter	Type	Description
kind	String	API type of the resource object, for example, DaemonSet and Deployment .
apiVersion	String	Definition: API version of the resource object. Range: N/A
namespace	String	Namespace of the resource object.
name	String	Name of the resource object.
uid	String	Unique ID of the resource object.
resourceVersion	String	Current version of the resource object.

Example Requests

Query plugin instances.

```
GET https://{endpoint}/v2/{project_id}/pools/{pool_name}/plugins
```

```
{

Status Codes

Status Code	Description
200	Request succeeded.

Error Codes

See [Error Codes](#).

18 Task Management

18.1 Querying Tasks

Function

This API is used to obtain the jobs of the current user.

Debugging

You can debug this API through automatic authentication in [API Explorer](#) or use the SDK sample code generated by API Explorer.

Authorization Information

Each account has all the permissions required to call all APIs, but IAM users must be assigned the required permissions.

- If you are using role/policy-based authorization, see [Permissions Policies and Supported Actions](#) for details on the required permissions.
- If you are using identity policy-based authorization, no identity policy-based permission required for calling this API.

URI

GET /v2/{project_id}/jobs

Table 18-1 Path Parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Definition: User project ID. For details, see Obtaining a Project ID and Name . Constraints: N/A Range: N/A Default Value: N/A

Table 18-2 Query Parameters

Parameter	Mandatory	Type	Description
type	No	String	Task type. Options: ● replace-node: faulty node replacement task ● reboot-node: node restart task ● reset-nodes: node reset task
limit	No	Integer	Maximum number of records on each page. If this parameter is left blank, 100 records are returned by default. A maximum of 500 records are allowed on each page.
offset	No	Integer	Offset of the pagination query. This parameter is left blank when the first page is queried.
since	No	Long	Start time of the query, in milliseconds. By default, the query starts from 30 days ago.
until	No	Long	End time of the query, in milliseconds. The current time is used by default.
resource	No	String	Type of the resource associated with the job. Options: ● pools: resource pool
name	No	String	Name of the associated resource. This parameter is used together with resource .

Request Parameters

None

Response Parameters

Status code: 200

Table 18-3 Response body parameters

Parameter	Type	Description
count	Integer	Total number of results.
items	Array of PoolJob objects	Job list.

Table 18-4 PoolJob

Parameter	Type	Description
startTimestamp	Long	Time when a job starts to be processed, in milliseconds.
endTimestamp	Long	Job end time, in milliseconds.
jobId	String	Task ID.
jobName	String	Task name.
involvedObjects	String	Resources associated with a job, for example, resource pool description.
inputs	String	Job input parameters.
phase	String	Job status. Options: • Running: The job is running. • Success: The task has been executed. • Failed: The task failed to be executed.
suspend	Boolean	Indicates whether the job is suspended.
type	String	Job type.
conditions	String	Job execution process information.
message	String	Execution information returned when a job fails to be executed.

Status code: 400

Table 18-5 Response body parameters

Parameter	Type	Description
error_code	String	Definition: ModelArts error code. Range: N/A
error_msg	String	Definition: Error message. Range: N/A

Example Requests

Query the node restart task list.

```
GET https://{endpoint}/v2/{project_id}/jobs?type=reboot-node
{ }
```

Example Responses

Status code: 200

Job list response body.

Status Code	Description
200	Job list response body.
400	Error response

Error Codes

See [Error Codes](#).

19 Notebook Case Studies

19.1 Querying Case Studies

Function

This API is used by the tenant-side frontend to retrieve a list of notebook cases. This API is designed for scenarios where you need to view or learn from notebook examples by fetching a case study list. To use this API, you must be logged in and have the necessary viewing permissions. Upon completion of the query, the API returns a list of case studies, including information such as case names, descriptions, and relevant tags. If you lack permissions or an error occurs during the query process, the API will return the corresponding error message.

Debugging

You can debug this API through automatic authentication in [API Explorer](#) or use the SDK sample code generated by API Explorer.

Authorization Information

Each account has all the permissions required to call all APIs, but IAM users must be assigned the required permissions.

- If you are using role/policy-based authorization, see [Permissions Policies and Supported Actions](#) for details on the required permissions.
- If you are using identity policy-based authorization, no identity policy-based permission required for calling this API.

URI

GET /v1/{project_id}/notebooks/practices

Table 19-1 Path Parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Definition: User project ID. For details, see Obtaining a Project ID and Name . Constraints: The value can contain 1 to 64 characters. Letters, digits, and hyphens (-) are allowed. Range: N/A. Default Value: N/A.

Table 19-2 Query Parameters

Parameter	Mandatory	Type	Description
limit	No	Integer	Definition: Maximum number of records returned per page. Constraints: N/A. Range: [1, 100]. Default Value: 10.
offset	No	Integer	Definition: Offset where a query starts. Constraints: N/A. Range: [0, 1000000000]. Default Value: 0.
practice_id	No	String	Definition: ID of the case. Constraints: The case ID is a UUID and must meet the regular expression <code>^[0-9a-f]{8}-[0-9a-f]{4}-[1-5][0-9a-f]{3}-[89ab][0-9a-f]{3}-[0-9a-f]{12}\$</code> . Range: N/A. Default value: N/A.

Parameter	Mandatory	Type	Description
sort_key	No	String	Definition: Sorting field. Separate multiple fields with commas (,). Constraints: N/A Range: The value can contain at most 128 characters. Only letters, digits, hyphens (-), underscores (_), and commas (,) are allowed. Default Value: N/A
sort_dir	No	String	Definition: Instance sorting mode. Constraints: N/A Range: The value can be: • ASC: Ascending order • DESC: Descending order Default Value: DESC

Request Parameters

Table 19-3 Request header parameters

Parameter	Mandatory	Type	Description
X-Language	Yes	String	Definition: Language environment for the current API call. Constraints: This request header is mandatory only for APIs that depend on internationalization information. Range: N/A. Default Value: N/A.

Parameter	Mandatory	Type	Description
X-Auth-Token	Yes	String	Definition: User token. It can be obtained by calling the IAM API that is used to obtain a user token. The value of X-Subject-Token in the response header is the user token. Constraints: N/A. Range: N/A. Default Value: N/A.

Response Parameters

Status code: 200

Table 19-4 Response body parameters

Parameter	Type	Description
data	Array of data objects	Definition: Case data.

Table 19-5 data

Parameter	Type	Description
image_id	String	Definition: Image ID recommended for the case. Range: N/A.
practice_id	String	Definition: Case ID. Range: N/A.
shared_url	String	Definition: URL (Base64-encoded) of the IPYNB file used by the case in an OBS bucket. Range: N/A.
status	String	Definition: Case enabling status. Range: N/A.
title	String	Definition: Case title. Range: N/A.

Example Requests

None

Example Responses

None

Status Codes

Status Code	Description
200	Definition: Return value of the API for querying cases. The list of cases that meet the search criteria is returned by page. Range: N/A.

Error Codes

See [Error Codes](#).

20 Scheduled Events

20.1 Authorizing Scheduled Events

Function

Specifies the authorization of a scheduled event.

Debugging

You can debug this API through automatic authentication in [API Explorer](#) or use the SDK sample code generated by API Explorer.

Authorization Information

Each account has all the permissions required to call all APIs, but IAM users must be assigned the required permissions.

- If you are using role/policy-based authorization, see [Permissions Policies and Supported Actions](#) for details on the required permissions.
- If you are using identity policy-based authorization, no identity policy-based permission required for calling this API.

URI

POST /v1/{project_id}/scheduled-events/{event_id}/accept

Table 20-1 Path Parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Definition: User project ID. For details, see Obtaining a Project ID and Name . Constraints: N/A Range: N/A Default Value: N/A
event_id	Yes	String	Definition: Scheduled event ID. The value is the event_id field in the API for querying the scheduled event list. Constraints: N/A Range: The value is automatically generated by the system. It must start with a lowercase letter and consist of digits and hyphens (-). It cannot end with a hyphen (-) and can contain a maximum of 63 characters. Default Value: N/A

Table 20-2 Query Parameters

Parameter	Mandatory	Type	Description
workspaceId	No	String	Definition: Workspace ID. The default value is 0 . The value is the id field in the API for obtaining the workspace list. Constraints: The value is automatically generated by the system. It must start with a lowercase letter and cannot end with a hyphen (-). The value can contain at most 63 characters. Only lowercase letters, digits, and hyphens (-) are allowed. Range: N/A Default Value: N/A

Request Parameters

Table 20-3 Request body parameters

Parameter	Mandatory	Type	Description
notBefore	No	String	Definition: Planned start time of an event, in the format of yyyy-MM-ddTHH:mm:ssZ. Constraints: N/A Range: later than the current time. Default Value: If this parameter is left empty, the event is executed immediately.

Response Parameters

Status code: 200

Table 20-4 Response header parameters

Parameter	Type	Description
X-request-id	String	Definition: Request ID for task tracing. The format is **request_uuid - - ** Range: N/A

Table 20-5 Response body parameters

Parameter	Type	Description
id	String	Event ID.
catalog	String	Category.
type	String	Event type. system-maintenance: system maintenance localdisk-recovery: local disk recovery node_reboot: node reboot operation-request: O&M authorization node_maintenance: supernode maintenance node_redeploy: supernode redeployment

Parameter	Type	Description
description	String	Description.
state	String	Event status. inquiring : The request is to be authorized. scheduled : The request has been authorized. executing : The request is being executed. completed : The request is completed. failed : The request failed. canceled : The request is canceled.
instanceType	String	Definition : node type. Range : • devserver: lite-server node • lite-cluster: lite pool • standard: standard pool
instanceId	String	Definition : server ID. Instance ID automatically generated by the compute service system. The length of the ID is fewer than 63 characters. Range : N/A
nodeName	String	Definition : node name, which is the value of metadata.name in the node details. The value is automatically generated by the system. It must start with a lowercase letter and consist of digits and hyphens (-). It cannot end with a hyphen (-) and can contain no more than 63 characters. Range : N/A
poolName	String	Definition : Name of the resource pool. This parameter is only available for lite-cluster and standard . The value is obtained from the metadata.name field in resource pool details. The value is automatically generated by the system. It must start with a lowercase letter and consist of digits and hyphens (-). It cannot end with a hyphen (-) and can contain no more than 63 characters. Range : N/A

Parameter	Type	Description
poolDisplayName	String	Definition: Name of the resource pool displayed externally. This parameter is only available for lite-cluster and standard . The value is obtained from the metadata.name field in resource pool details. The value can contain 36 to 63 characters. It must start with a lowercase letter and cannot end with a hyphen (-). Digits and hyphens (-) are allowed. Range: N/A.
publishTime	String	Definition: Event release time. Constraints: The value is a UTC time string, for example, 2025-09-15T07:02:30Z . Range: N/A Default Value: N/A
startTime	String	Definition: Start time of an event. Constraints: The value is a UTC time string, for example, 2025-09-15T07:02:30Z . Range: N/A. Default Value: N/A.
finishTime	String	Definition: Event completion time. Constraints: The value is a UTC time string, for example, 2025-09-15T07:02:30Z . Range: N/A Default Value: N/A
notBefore	String	Definition: start time of the event plan, in UTC time string format, for example, 2025-09-15T07:02:30Z . Constraints: later than the current time. Range: N/A Default Value: If this parameter is left empty, the event is executed immediately.

Parameter	Type	Description
probeMsg	String	Definition: Prompt information. Constraints: The value is automatically generated by the system. It must start with a lowercase letter and consist of digits and hyphens (-). It cannot end with a hyphen (-) and can contain no more than 63 characters. Range: N/A Default Value: N/A
redeployType	Array of strings	Definition: Node redeployment type. Constraints: N/A Range: - HARD: forcible redeployment; - SOFT: redeployment Default Value: N/A

Status code: 400**Table 20-6** Response header parameters

Parameter	Type	Description
X-request-id	String	Definition: Request ID for task tracing. The format is **request_uuid - - ** Range: N/A

Table 20-7 Response body parameters

Parameter	Type	Description
error_code	String	Error code.
error_msg	String	Error description.

Example Requests

```
/v1/{project_id}/scheduled-events/{event_id}/accept
{
  "notBefore" : "xxxx"
}
```

Example Responses

None

20.2 Obtaining the Scheduled Event List

Function

This API is used to obtain the scheduled event list.

Debugging

You can debug this API through automatic authentication in [API Explorer](#) or use the SDK sample code generated by API Explorer.

Authorization Information

Each account has all the permissions required to call all APIs, but IAM users must be assigned the required permissions.

- If you are using role/policy-based authorization, see [Permissions Policies and Supported Actions](#) for details on the required permissions.
- If you are using identity policy-based authorization, no identity policy-based permission required for calling this API.

URI

GET /v1/{project_id}/scheduled-events

Table 20-8 Path Parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Definition: User project ID. For details, see Obtaining a Project ID and Name . Constraints: N/A Range: N/A Default Value: N/A

Table 20-9 Query Parameters

Parameter	Mandatory	Type	Description
workspaceId	No	String	Definition: Workspace ID. The default value is 0. The value is the id field in the API for querying the workspace list. Constraints: The value is automatically generated by the system. It must start with a lowercase letter and consist of digits and hyphens (-). It cannot end with a hyphen (-) and can contain no more than 63 characters. Range: N/A Default Value: N/A
state	No	Array of strings	Definition: Event status. Constraints: N/A Range • inquiring: To be authorized. • scheduled: To be executed. • executing: Being executed. • completed: Executed. • failed: Execution failed. canceled: Canceled. Default Value: N/A

Parameter	Mandatory	Type	Description
type	No	Array of strings	Definition: Event type. Constraints: N/A. Range: • system-maintenance: System maintenance • localdisk-recovery: Local disk recovery • node_reboot: Node reboot • operation-request: O&M authorization • node_maintenance: Supernode maintenance • node_redeploy: Supernode redeployment • node_localdisk_recovery: Supernode local disk recovery Default Value: N/A.
id	No	String	Definition: Scheduled event ID. The value is the event_id field in the API for querying the scheduled event list. Constraints: The value is automatically generated by the system. It must start with a lowercase letter and consist of digits and hyphens (-). It cannot end with a hyphen (-) and can contain no more than 63 characters. Range: N/A. Default Value: N/A.

Parameter	Mandatory	Type	Description
nodeName	No	String	Definition: Node name, which is the value of metadata.name in the node details. Constraints: The value is automatically generated by the system. It must start with a lowercase letter and consist of digits and hyphens (-). It cannot end with a hyphen (-) and can contain no more than 63 characters. Range: N/A. Default Value: N/A.
poolName	No	String	Definition: Name of the resource pool. This parameter is only available for lite-cluster and standard. The value is obtained from the metadata.name field in resource pool details. This parameter can be transferred when you query the scheduled events of nodes in a specified standard cluster or lite cluster. Constraints: The value is automatically generated by the system. It must start with a lowercase letter and consist of digits and hyphens (-). It cannot end with a hyphen (-) and can contain no more than 63 characters. Range: N/A. Default Value: N/A.
publishStartTime	No	String	Definition: Start time of publishing an event. The value is filtered by time range. Constraints: The value is in the format of "yyyy-MM-ddTHH:mm:ssZ" in UTC+0 and complies with ISO8601. Range: N/A. Default Value: N/A.

Parameter	Mandatory	Type	Description
publishEndTime	No	String	Definition: End time of publishing an event. The value is filtered by time range. Constraints: The value is in the format of "yyyy-MM-ddTHH:mm:ssZ" in UTC+0 and complies with ISO8601. Range: N/A. Default Value: N/A
offset	No	Integer	Definition: Offset where a query starts. Constraints: N/A. Range: [0, 10000000000]. Default Value: 0.
limit	No	Integer	Definition: Maximum number of records returned per page. Constraints: N/A. Range: [1, 100]. Default Value: 100.

Request Parameters

None

Response Parameters

Status code: 200

Table 20-10 Response header parameters

Parameter	Type	Description
X-request-id	String	This field is the request ID number for task tracking. Format is request_uuid-timestamp-hostname.

Table 20-11 Response body parameters

Parameter	Type	Description
events	Array of ScheduledEvent objects	Definition: Scheduled event list.

Parameter	Type	Description
count	Integer	Definition: Total number of scheduled events. Range: N/A.

Table 20-12 ScheduledEvent

Parameter	Type	Description
id	String	Event ID.
catalog	String	Category.
type	String	Event type. system-maintenance: system maintenance localdisk-recovery: local disk recovery node_reboot: node reboot operation-request: O&M authorization node_maintenance: supernode maintenance node_redeploy: supernode redeployment
description	String	Description.
state	String	Event status. inquiring: The request is to be authorized. scheduled: The request has been authorized. executing: The request is being executed. completed: The request is completed. failed: The request failed. canceled: The request is canceled.
instanceType	String	Definition: node type. Range: • devserver: lite-server node • lite-cluster: lite pool • standard: standard pool

Parameter	Type	Description
instanceId	String	Definition: server ID. Instance ID automatically generated by the compute service system. The length of the ID is fewer than 63 characters. Range: N/A
nodeName	String	Definition: node name, which is the value of metadata.name in the node details. The value is automatically generated by the system. It must start with a lowercase letter and consist of digits and hyphens (-). It cannot end with a hyphen (-) and can contain no more than 63 characters. Range: N/A
poolName	String	Definition: Name of the resource pool. This parameter is only available for lite-cluster and standard . The value is obtained from the metadata.name field in resource pool details. The value is automatically generated by the system. It must start with a lowercase letter and consist of digits and hyphens (-). It cannot end with a hyphen (-) and can contain no more than 63 characters. Range: N/A
poolDisplayName	String	Definition: Name of the resource pool displayed externally. This parameter is only available for lite-cluster and standard . The value is obtained from the metadata.name field in resource pool details. The value can contain 36 to 63 characters. It must start with a lowercase letter and cannot end with a hyphen (-). Digits and hyphens (-) are allowed. Range: N/A.
publishTime	String	Definition: Event release time. Constraints: The value is a UTC time string, for example, 2025-09-15T07:02:30Z . Range: N/A Default Value: N/A

Parameter	Type	Description
startTime	String	Definition: Start time of an event. Constraints: The value is a UTC time string, for example, 2025-09-15T07:02:30Z . Range: N/A. Default Value: N/A.
finishTime	String	Definition: Event completion time. Constraints: The value is a UTC time string, for example, 2025-09-15T07:02:30Z . Range: N/A Default Value: N/A
notBefore	String	Definition: start time of the event plan, in UTC time string format, for example, 2025-09-15T07:02:30Z . Constraints: later than the current time. Range: N/A Default Value: If this parameter is left empty, the event is executed immediately.
probeMsg	String	Definition: Prompt information. Constraints: The value is automatically generated by the system. It must start with a lowercase letter and consist of digits and hyphens (-). It cannot end with a hyphen (-) and can contain no more than 63 characters. Range: N/A Default Value: N/A
redeployType	Array of strings	Definition: Node redeployment type. Constraints: N/A Range: - HARD: forcible redeployment; - SOFT: redeployment Default Value: N/A

Status code: 400

Table 20-13 Response header parameters

Parameter	Type	Description
X-request-id	String	This field is the request ID number for task tracking. Format is request_uuid-timestamp-hostname.

Table 20-14 Response body parameters

Parameter	Type	Description
error_code	String	Error code.
error_msg	String	Error description.

Example Requests

None

Example Responses

None

Status Codes

Status Code	Description
200	Response to the request for querying the scheduled event list.
400	Error response

Error Codes

21 Node configuration template

21.1 Obtaining a Node Configuration Template

Function

This API is used to obtain details about a node configuration template. This API is used when you need to view a node configuration template, manage node configurations, or perform related operations. Before using this API, ensure that the node configuration template exists and you have the required permission. After this API is called, the system returns the details of the specified node configuration template, including the template name, version, configuration parameters, and description. If the node configuration template does not exist or you do not have the access permission, the API will return an error message.

Debugging

You can debug this API through automatic authentication in [API Explorer](#) or use the SDK sample code generated by API Explorer.

Authorization Information

Each account has all the permissions required to call all APIs, but IAM users must be assigned the required permissions.

- If you are using role/policy-based authorization, see [Permissions Policies and Supported Actions](#) for details on the required permissions.
- If you are using identity policy-based authorization, no identity policy-based permission required for calling this API.

URI

GET /v1/{project_id}/nodeconfigtemplates/{nodeconfigtemplate_name}

Table 21-1 Path Parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Definition: User project ID. For details, see Obtaining a Project ID and Name . Constraints: N/A Range: N/A Default Value: N/A
nodeconfigtemplate_name	Yes	String	Definition: Name of the node configuration template. Constraints: N/A Range: N/A Default Value: N/A

Request Parameters

None

Response Parameters

Status code: 200

Table 21-2 Response body parameters

Parameter	Type	Description
apiVersion	String	Definition: API version. Range: v1
kind	String	Definition: Resource type. Range: NodeConfigTemplate: node configuration template
metadata	NodeConfigTemplateMeta object	Definition: Metadata of the node configuration template.
spec	NodeConfigTemplateSpec object	Definition: Specifications of the node configuration template.

Table 21-3 NodeConfigTemplateMeta

Parameter	Type	Description
name	String	Definition: Name of the node configuration template. Range: N/A

Table 21-4 NodeConfigTemplateSpec

Parameter	Type	Description
dockerBaseSize	Integer	Definition: Available disk space of a single container on a resource pool node, in GB. Range: N/A
dockerLvmConfig	DockerLvmConfig object	Definition: Docker data disk configuration of a resource pool node.

Table 21-5 DockerLvmConfig

Parameter	Type	Description
dockerThinPool	Integer	Definition: Percentage of Docker disks to data disks on nodes in a resource pool. For example, if the Docker disks take 20% of the data disks, the value of this parameter is 20 . Range: N/A
kubernetesLV	Integer	Definition: Percentage of Kubernetes disks to data disks on nodes in a resource pool. For example, if the Docker disks take 20% of the data disks, the value of this parameter is 20 . Range: N/A
dockerDiskType	String	Definition: Disk type. Range: • evs: EVS disks • ssd: local SSDs

Parameter	Type	Description
lvType	String	Definition: LVM write mode. Range: • striped: striped mode in which multiple disks are used to form a strip to improve disk performance • linear: linear mode

Status code: 404

Table 21-6 Response body parameters

Parameter	Type	Description
error_code	String	• Definition: ModelArts error code. Range: N/A
error_msg	String	Definition: Error message. Range: N/A

Example Requests

None

Example Responses

Status code: 200

OK.

```
{
  "kind" : "NodeConfigTemplate",
  "apiVersion" : "v1",

    "name" : "base.template"
  },
  "spec" : {
    "dockerBaseSize" : 50,
    "dockerLvmConfig" : {
      "dockerThinPool" : 90,
      "kubernetesLV" : 10,
      "dockerDiskType" : "evs"
    }
  }
}
```

Status code: 404

Not found.

```
{
  "error_code" : "ModelArts.50005101",
  "error_msg" : "Nodeconfigtemplate {name} not found"
}
```

Status Codes

Status Code	Description
200	OK.
404	Not found.

Error Codes

See [Error Codes](#).

22 Use Cases

22.1 Creating a Development Environment Instance

This section describes how to create a development environment instance by calling ModelArts APIs.

Overview

The process for creating a development environment instance is as follows:

1. Call the API for [authentication](#) to obtain a user token, which will be added in a request header for authentication.
2. Call the API for [querying supported images](#) to view the image type and version in the development environment.
3. Call the API for [creating a notebook instance](#) to create an instance.
4. Call the API for [querying details of a notebook instance](#) to query the instance creation details based on the instance ID.
5. Call the API for [prolonging a notebook instance](#) to reset the usage duration of the instance.
6. Call the API for [stopping a notebook instance](#) to stop the instance that is running.
7. Call the API for [starting a notebook instance](#) to restart the instance.
8. Call the API for [deleting a notebook instance](#) to delete the instance that is no longer needed.

Prerequisites

- You have obtained the endpoints of [IAM](#) and ModelArts.
- The following information is available: region where ModelArts is deployed, project ID and name, account name and ID, and username and user ID.

Procedure

1. Call the API for [authentication](#) to obtain a user token.

a. Request body:

URI: POST `https://{iam_endpoint}/v3/auth/tokens`

Request header: Content-Type → application/json

Request body:

```
{
  "auth": {
    "identity": {
      "methods": ["password"],
      "password": {
        "user": {
          "name": "user_name",
          "password": "user_password",
          "domain": {
            "name": "domain_name"
          }
        }
      }
    },
    "scope": {
      "project": {
        "name": "ap-southeast-1"
      }
    }
  }
}
```

Set the following parameters based on site requirements:

- *iam_endpoint*: IAM endpoint
- **user_name**: IAM username
- **user_password**: password of the login user
- **domain_name**: account to which the user belongs
- **ap-southeast-1**: project name, which is the region where ModelArts is deployed

b. Status code **201 Created** is returned. The **X-Subject-Token** value in the response header is the token.

x-subject-token
→ *MIIZmgYJKoZIhvcNAQcColIZizCCGYcCAQExDTALBglghkgBZQMEAgEwgXXXXXX...*

2. Call the API for **querying supported images** to view the image type and version in the development environment.

a. Request body:

URI: GET `https://{ma_endpoint}/v1/{project_id}/images`

Request header:

- X-auth-Token
→ *MIIZmgYJKoZIhvcNAQcColIZizCCGYcCAQExDTALBglghkgBZQMEAgEwgXXXXXX...*
- Content-Type → application/json

Set the following parameters based on site requirements:

- *ma_endpoint*: ModelArts endpoint
- *project_id*: user's project ID

- **X-auth-Token:** token obtained in the previous step
- b. Status code **200** is returned. The response body is as follows:

```

Select the image required for creating a notebook instance based on the **description** and **name** parameters and record its ID. This section provides an example of using TensorFlow to create a notebook instance with an **id** of **e1a07296-22a8-4f05-8bc8-e936c8e54100**.

3. Call the API for [creating a notebook instance](#) to create an instance.

- a. Request body:

URI: POST `https://{ma_endpoint}/v1/{project_id}/notebooks`

Request header:

- X-auth-Token
→ *MIIZmgYJKoZIhvcNAQcCollZizCCGYcCAQExDTALBgIghkgBZQME
AgEwgXXXXXX...*
- Content-Type → application/json

Request body:

```
{  
  "name" : "notebooks_test",  
  "feature" : "NOTEBOOK",  
  "workspace_id" : "0",  
  "description" : "api-test",  
  "flavor" : "modelarts.vm.cpu.2u",  
  "image_id" : "e1a07296-22a8-4f05-8bc8-e936c8e54090",  
  "volume" : {  
    "category" : "efs",  
    "ownership" : "managed",  
    "capacity" : 50  
  }  
}
```

Set the following parameters based on site requirements:

- *ma_endpoint*: ModelArts endpoint
 - *project_id*: user's project ID
 - **X-auth-Token**: token obtained in the previous step
 - **flavor**: flavor of the notebook instance
 - **image_id**: image ID of the notebook instance
- b. Status code **200** is returned. The response body is as follows:

```
{  
  "action_progress": [  
    {  
      "step": 4,  
      "status": "WAITING",  
      "description": "Initialize the notebook instance."  
    },  
  ],  
}
```

```
{
  "step": 3,
  "status": "WAITING",
  "description": "Configuring the network."
},
{
  "step": 2,
  "status": "WAITING",
  "description": "Prepare the compute resource."
},
{
  "step": 1,
  "status": "WAITING",
  "description": "Prepare the storage."
}
],
"create_at": 1687656452472,
"description": "api-test",
"endpoints": [],
"feature": "NOTEBOOK",
"flavor": "modelarts.vm.cpu.2u",
"id": "936bea3e-d3df-435e-8b58-d817283284ae",
"image": {
  "description": "",
  "id": "e1a07296-22a8-4f05-8bc8-e936c8e54090",
  "name": "notebook2.0-mul-kernel-cpu-cp36",
  "swr_path": "swr.myhuaweicloud.com/atelier/notebook2.0-mul-kernel-cpu-cp36:5.0.1-release-v2-20220505",
  "tag": "5.0.1-release-v2-20220505",
  "type": "BUILD_IN"
},
"lease": {
  "create_at": 1687656452470,
  "duration": 3600000,
  "enable": true,
  "type": "TIMING",
  "update_at": 1687656452470
},
"name": "notebooks_test",
"status": "RUNNING",
"tags": [],
"token": "3452e0d5-15fe-a20d-18a2-010a574aeaf",

"user_id": "99250e439b33431081xxxxxxxxxa885",
"workspace_id": "0",
"billing_items": []
}
```

You can view the notebook instance details in the response. If **status** is **RUNNING**, the notebook instance is successfully created.

4. Call the API for [querying details of a notebook instance](#) to query the instance creation details based on the instance ID.

- a. Request body:

URI: GET `https://{ma_endpoint}/v1/{project_id}/notebooks/{id}`

Request header: X-auth-Token

→ **MIIZmgYJKoZlhvcNAQcCollZizCCGYcCAQExDTALBgIghkgBZQMEAgEwgXXXXXX...**

Set the bold parameters based on site requirements.

- b. Status code **200** is returned. The response body is as follows:

```
{
  "create_at": 1687656452472,
  "data_volumes": [],
  "description": "api-test",
  "endpoints": [
```

```
{
  "service": "NOTEBOOK",

    "type": "BUILD_IN"
  },
  "lease": {
    "create_at": 1687656452470,
    "duration": 3627372,
    "enable": true,
    "type": "TIMING",
    "update_at": 1687656479842
  },
  "name": "notebooks_test",
  "status": "RUNNING",
  "tags": [],
  "token": "3452e0d5-15fe-a20d-18a2-010a574aeaaf",
  "update_at": 1687656479880,
  "url": "https://authoring-modelarts.huaweicloud.com/936bea3e-d3df-435e-8b58-d817283284ae/lab",
  "user": {
    "domain": {
      "id": "878991804cdc4ba597xxxxxxxxx9dd9",
      "name": "hwstaff_pub_CBUInfo_EI"
    },
    "id": "99250e439b33431081xxxxxxxxxa885",
    "name": "xwx1128222"
  },
  "user_id": "99250e439b33431081xxxxxxxxxa885",
  "volume": {
    "category": "EFS",
    "ownership": "MANAGED",
    "mount_path": "/home/ma-user/work/",
    "capacity": 50,
    "read_only": false
  },
  "workspace_id": "0",
  "billing_items": [
    "COMPUTE"
  ]
}
```

5. Call the API for **prolonging a notebook instance** to reset the usage duration of the instance.

- a. Request body:

URI: PATCH `https://{ma_endpoint}/v1/{project_id}/notebooks/{id}/lease`

Request header:

- X-auth-Token
→ *MIIZmgYJKoZlhcNAQcCollIZizCCGYcCAQExDTALBglghkgBZQMEAgEwgXXXXXX...*

- Content-Type → application/json

Request body:

```
{
  "duration": 3600000,
  "type": "timing"
}
```

Set the following parameters based on site requirements:

- **duration**: instance running duration, which is calculated based on the instance creation time. If the instance creation time plus the duration is greater than the current time, the system automatically stops the instance.
 - **type**: auto stop type. The default value is **timing**.
- b. Status code **200** is returned, indicating that labeling is successful. The response body is as follows:

```
{
  "create_at": 1687656452470,
  "duration": 4657544,
  "enable": true,
  "type": "TIMING",
  "update_at": 1687657510014
}
```

6. Call the API for **stopping a notebook instance** to stop the instance that is running.

- a. Request body.

URI: POST `https://{ma_endpoint}/v1/{project_id}/notebooks/{id}/stop`

Request header: X-auth-Token

→ **MIIZmgYJKoZlhvcNAQcColIZizCCGYcCAQExDTALBgIghkgBZQMEAgEwgXXXXXX...**

Set the bold parameters based on site requirements.

- b. Status code **200** is returned. The response body is as follows:

```
{
  "create_at": 1687656452472,
  "data_volumes": [],
  "description": "api-test",
  "endpoints": [
    {
      "service": "NOTEBOOK",
      "uri": "https://authoring-modelarts.huaweicloud.com/936bea3e-d3df-435e-8b58-d817283284ae/lab"
    }
  ],

}
```

8. Call the API for **deleting a notebook instance** to delete the instance that is no longer needed.
 - a. Request body:
URI: DELETE `https://{ma_endpoint}/v1/{project_id}/notebooks/{id}`
Request header:
 - X-auth-Token
→ ***MIIZmgYJKoZIhvcNAQcCollIZizCCGYcCAQExDTALBglghkgBZQMEAgEwgXXXXXX...***
 - Content-Type → application/jsonSet the bold parameters based on site requirements.
 - b. Status code **200** is returned, indicating that the instance is successfully deleted.

22.2 Using PyTorch to Create a Training Job (New-Version Training)

This section describes how to train a model by calling ModelArts APIs.

Overview

The process for creating a training job using PyTorch is as follows:

1. Call the API for authentication to obtain a user token, which will be added in a request header for authentication.
2. Call the API for **obtaining general flavors supported by a training job** to obtain the required flavors.
3. Call the API for **obtaining the preset AI frameworks supported by a training job** to view the engines and their versions supported by a training job.

4. Call the API for [creating an algorithm](#) to create an algorithm and record the algorithm ID.
5. Call the API for [creating a training job](#) to create a training job using the UUID returned by the created algorithm and record the job ID.
6. Call the API for [querying details about a training job](#) to query the job status using the job ID.
7. Call the API for [querying the logs of a specified task in a training job \(OBS link\)](#) to obtain the OBS path of the training job logs.
8. Call the API for [querying the running metrics of a specified task in a training job](#) to view detailed metrics of the job.
9. Call the API for [deleting a training job](#) to delete the job if it is no longer needed.

Prerequisites

- You have obtained the endpoints of [IAM](#) and ModelArts.
- The following information is available: region where ModelArts is deployed, project ID and name, account name and ID, and username and user ID.
- The training code of PyTorch is available. For example, the startup file **test-pytorch.py** has been stored in the **obs://cnnorth4-job-test-v2/pytorch/fast_example/code/cpu** directory of OBS.
- A data file for the training job is available. For example, a training dataset has been stored in the **obs://cnnorth4-job-test-v2/pytorch/fast_example/data** directory of OBS.
- A path for outputting the training job model has been created, for example, **obs://cnnorth4-job-test-v2/pytorch/fast_example/outputs**.
- A path for outputting the training job logs has been created, for example, **obs://cnnorth4-job-test-v2/pytorch/fast_example/log**.

Procedure

1. Call the API for [authentication](#) to obtain a user token.
 - a. Request body:

URI: POST `https://{iam_endpoint}/v3/auth/tokens`

Request header: Content-Type → application/json

Request body:

```
{
  "auth": {
    "identity": {
      "methods": ["password"],
      "password": {
        "user": {
          "name": "user_name",
          "password": "user_password",
          "domain": {
            "name": "domain_name"
          }
        }
      }
    },
    "scope": {
      "project": {
        "name": "ap-southeast-1"
      }
    }
  }
}
```

```
}  
}  
}  
}
```

Set the following parameters based on site requirements:

- *iam_endpoint*: IAM endpoint
 - **user_name**: IAM username
 - **user_password**: password of the login user
 - **domain_name**: account to which the user belongs
 - **ap-southeast-1**: project name, which is the region where ModelArts is deployed
- b. Status code **201 Created** is returned. The **X-Subject-Token** value in the response header is the token.

```
x-subject-token  
→ MIIZmgYJKoZIhvcNAQcColIZizCCGYcCAQExDTALBglghkgBZQMEAgEwgXXXXXX...
```

2. Call the API for [obtaining general flavors supported by a training job](#) to obtain the required flavors.

- a. Request body:

URI: GET `https://{ma_endpoint}/v2/{project_id}/training-job-flavors?flavor_type=CPU`

Request header: X-Auth-Token

→ **MIIZmgYJKoZIhvcNAQcColIZizCCGYcCAQExDTALBglghkgBZQMEAgEwgXXXXXX...**

Set the following parameters based on site requirements:

- *ma_endpoint*: ModelArts endpoint
 - *project_id*: user's project ID
 - **X-auth-Token**: token obtained in the previous step
- b. Status code **200** is returned. The response body is as follows:

```
{  
  "total_count": 2,  
  "flavors": [  
    {  
      "flavor_id": "modelarts.vm.cpu.2u",  
      "flavor_name": "Computing CPU(2U) instance",  
      "flavor_type": "CPU",  
      "billing": {  
        "code": "modelarts.vm.cpu.2u",  
        "unit_num": 1  
      },  
      "flavor_info": {  
        "max_num": 1,  
        "cpu": {  
          "arch": "x86",  
          "core_num": 2  
        },  
        "memory": {  
          "size": 8,  
          "unit": "GB"  
        },  
        "disk": {  
          "size": 50,  
          "unit": "GB"  
        }  
      }  
    }  
  ]  
}
```

```
        "unit": "GB"
      }
    },
    {
      "flavor_id": "modelarts.vm.cpu.8u",
      "flavor_name": "Computing CPU(8U) instance",
      "flavor_type": "CPU",
      "billing": {
        "code": "modelarts.vm.cpu.8u",
        "unit_num": 1
      },
      "flavor_info": {
        "max_num": 16,
        "cpu": {
          "arch": "x86",
          "core_num": 8
        },
        "memory": {
          "size": 32,
          "unit": "GB"
        },
        "disk": {
          "size": 50,
          "unit": "GB"
        }
      }
    }
  ]
}
```

- Select and record the flavor required for creating the training job based on the **flavor_id** value. This section uses flavor **modelarts.vm.cpu.8u** with its **max_num** set to **16** as an example.
3. Call the API for **obtaining the preset AI frameworks supported by a training job** to view the engines and their versions supported by a training job.
- a. Request body:
URI: GET `https://{ma_endpoint}/v2/{project_id}/job/training-job-engines`
Request header:
X-Auth-Token → ***MIIZmgYJKoZlhvcNAQcColIZizCCGYcCAQExDTALBglghkgBZQMEAgEwgXXXXXX...***
Content-Type → `application/json`
Set the bold parameters based on site requirements.
 - b. Status code **200** is returned. The response body is as follows (only part of the response body is displayed because there are many engines):

```
{
  "total": 28,
  "items": [
    .....
    {
      "engine_id": "mindspore_1.6.0-cann_5.0.3.6-py_3.7-euler_2.8.3-aarch64",
      "engine_name": "Ascend-Powered-Engine",
      "engine_version": "mindspore_1.6.0-cann_5.0.3.6-py_3.7-euler_2.8.3-aarch64",
      "v1_compatible": false,
      "run_user": "1000",
      "image_info": {
        "cpu_image_url": "",

Select the engine flavor required for creating a training job based on the **engine_name** and **engine_version** fields, and record the field values. This section uses the PyTorch engine as an example to describe how to create a job. In this example, the **engine_name** value is **PyTorch**, and the **engine_version** value is **pytorch_1.8.0-cuda_10.2-py_3.7-ubuntu_18.04-x86_64**.

4. Call the API for **creating an algorithm** to create an algorithm and record the algorithm ID.
 - a. Request body:
URI: POST `https://{ma_endpoint}/v2/{project_id}/algorithms`
Request header:
X-Auth-Token → **MIIZmgYJKoZlhvcNAQcCoIIzizCCGYcCAQExDTALBgIghkgBZQM EAgEwgXXXXXX...**
Content-Type → application/json
Set the bold parameters based on site requirements.

Request body:

```
{
  "metadata": {
    "name": "test-pytorch-cpu",
    "description": "test pytorch job in cpu in mode gloo"
  },
  "job_config": {
    "boot_file": "/cnnorth4-job-test-v2/pytorch/fast_example/code/cpu/test-pytorch.py",
    "code_dir": "/cnnorth4-job-test-v2/pytorch/fast_example/code/cpu/",
    "engine": {
      "engine_name": "PyTorch",
      "engine_version": "pytorch_1.8.0-cuda_10.2-py_3.7-ubuntu_18.04-x86_64"
    },
    "inputs": [{
      "name": "data_url",
      "description": "Data source 1"
    }],
    "outputs": [{
      "name": "train_url",
      "description": "Output data 1"
    }],
    "parameters": [{
      "name": "dist",
      "description": "",
      "value": "False",
      "constraint": {
        "editable": true,
        "required": false,
        "sensitive": false,
        "type": "Boolean",
        "valid_range": [],
        "valid_type": "None"
      }
    }],
    {
      "name": "world_size",
      "description": "",
      "value": "1",
      "constraint": {
        "editable": true,
        "required": false,
        "sensitive": false,
        "type": "Integer",
        "valid_range": [],
        "valid_type": "None"
      }
    }
  ],
  "parameters_customization": true
},
"resource_requirements": []
}
```

Set the following parameters based on site requirements:

- **name** and **description** in the **metadata** field indicate the algorithm name and description, respectively.
- **code_dir** and **boot_file** in the **job_config** field indicate the code directory and code startup file of the algorithm, respectively. The code directory is the level-1 directory of the code startup file.
- **inputs** and **outputs** in the **job_config** field indicate the input and output of the algorithm, respectively. You can specify **data_url** and **train_url** based on the instance, and parse hyperparameters in the

code to specify the local path of the data file required for training and the local output path of the model generated during training.

- **parameters_customization** in the **job_config** field indicates whether to support custom hyperparameters. Set this parameter to **true**.
 - **parameters** in the **job_config** field indicates the hyperparameters of the algorithm. Set **name** to the hyperparameter name (a maximum of 64 characters, including uppercase letters, lowercase letters, digits, underscores (_), and hyphens (-)). Set **value** to the default value of the hyperparameter. Set **constraint** to the constraints of the hyperparameter. For example, set **type** to **String** (**String**, **Integer**, **Float**, and **Boolean** are supported), set **editable** to **true**, and set **required** to **false**.
 - **engine** in the **job_config** field indicates the engine on which the algorithm depends. Use the **engine_name** and **engine_version** values recorded in [3](#).
- b. Status code **200 OK** is returned, indicating that the algorithm is successfully created. The response body is as follows:

```
{
  "metadata": {
    "id": "01c399ae-8593-4ef5-9e4d-085950aacde1",

    "advanced_config": {}
}
```

Record the value of **id** (algorithm ID, 32-bit UUID) in the **metadata** field for subsequent steps.

5. Call the API for **creating a training job** to create a training job using the UUID returned by the created algorithm and record the job ID.

- a. Request body:

URI: POST `https://{ma_endpoint}/v2/{project_id}/training-jobs`

Request header:

- X-Auth-Token
→ ***MIIZmgYJKoZIhvcNAQcCollZizCCGYcCAQExDTALBglghkgBZQMEAgEwgXXXXXX...***

- Content-Type → application/json

Set the bold parameters based on site requirements.

Request body:

```
{
  "kind": "job",
  "metadata": {
    "name": "test-pytorch-cpu01",
    "description": "test pytorch work cpu in mode gloo"
  },
  "algorithm": {
    "id": "01c399ae-8593-4ef5-9e4d-085950aacde1",
    "parameters": [{
      "name": "dist",
      "value": "False"
    },
    {
      "name": "world_size",
      "value": "1"
    }
  ],
  "inputs": [{
    "name": "data_url",
    "remote": {
      "obs": {
        "obs_url": "/cnnorth4-job-test-v2/pytorch/fast_example/data/"
      }
    }
  }],
  "outputs": [{
    "name": "train_url",
    "remote": {
      "obs": {
        "obs_url": "/cnnorth4-job-test-v2/pytorch/fast_example/outputs/"
      }
    }
  }],
  "spec": {
    "resource": {
      "flavor_id": "modelarts.vm.cpu.8u",
      "node_count": 1
    },
    "log_export_path": {
      "obs_url": "/cnnorth4-job-test-v2/pytorch/fast_example/log/"
    }
  }
}
```

Set the following parameters based on site requirements:

- Set **kind** to the type of the training job. The default value is **job**.
- Set **name** and **description** in the **metadata** field to the name and description of the training job.
- Set **id** in the **algorithm** field to the algorithm ID obtained in [4](#).
- Set **inputs** and **outputs** in the **algorithm** field to the information about the input and output URLs of the training job. In this example, **obs_url** in **remote** of the **inputs** parameter indicates the OBS path for selecting the training data from the OBS bucket. **obs_url** in **remote** of the **outputs** parameter indicates the OBS path for storing the training output.

- Set **flavor_id** in the **spec** field to the flavor on which the training job depends. Use the **flavor_id** recorded in [2. node_count](#) indicates whether to use multi-node training (distributed training). Set it to **1** for a single-node training by default. **log_export_path** specifies the OBS path to which logs are uploaded.
- b. Status code **201 Created** is returned, indicating that the training job has been created. The response body is as follows:

```
{
  "kind": "job",
  "metadata": {
    "id": "66ff6991-fd66-40b6-8101-0829a46d3731",

}
```

You can learn about the version details of the training job based on the response. The **status** value is **Running**, indicating that the training job is running.

7. Call the API for [querying the logs of a specified task in a training job \(OBS link\)](#) to obtain the OBS path of the training job logs.

- a. Request body:

URI format: GET https://{ma_endpoint}/v2/{project_id}/training-jobs/{training_job_id}/tasks/{task_id}/logs/url

Request header:

X-Auth-

Token → *MIIZmgYJKoZIhvcNAQcColIZizCCGYcCAQExDTALBglghkgBZQM
EAgEwgXXXXXX...*

Content-Type → **text/plain**

Set the following parameters based on site requirements:

- **task_id** indicates the name of the training job. Generally, set it to **work-0**.
- **Content-Type** can be set either to **text/plain** or **application/octet-stream**. **text/plain** indicates that a temporary OBS preview URL is returned. **application/octet-stream** indicates that a temporary OBS download URL is returned.

- b. Status code **200 OK** is returned. The response body is as follows:

```
{
  "obs_url": "https://modelarts-training-log-cn-north-4.obs.cn-
north-4.myhuaweicloud.com:443/66ff6991-fd66-40b6-8101-0829a46d3731/worker-0/modelarts-
job-66ff6991-fd66-40b6-8101-0829a46d3731-worker-0.log?
AWSAccessKeyId=GFGTBKOZENDD83QEMZMV&Expires=1641896599&Signature=BedFZHEU1oC
mqlI912UL9mXlhkg%3D"
}
```

The returned field indicates the OBS path of logs. You can copy the value to the browser to view the result.

8. Call the API for **querying the running metrics of a specified task in a training job** to view detailed metrics of the job.

- a. Request body:

URI format: GET https://{ma_endpoint}/v2/{project_id}/training-jobs/{training_job_id}/metrics/{task_id}

Request header: X-Auth-Token

→ **MIIZmgYJKoZlhcNAQcCollZizCCGYcCAQExDTALBgIghkgBZQMEAgEwgXXXXXX...**

Set the bold parameters based on site requirements.

- b. Status code **200 OK** is returned. The response body is as follows:

```
{
  "metrics": [
    {
      "metric": "cpuUsage",
      "value": [
        -1,
        -1,
        28.622,
        35.053,
        39.988,
        40.069,
        40.082,
        40.094
      ]
    },
    {
      "metric": "memUsage",
      "value": [
        -1,
        -1,
        0.544,
        0.641,
        0.736,
        0.737,
        0.738,
        0.739
      ]
    }
  ],
  {
```

```
{
  "metric": "npuUtil",
  "value": [
    -1,
    -1,
    -1,
    -1,
    -1,
    -1,
    -1,
    -1,
    -1
  ]
},
{
  "metric": "npuMemUsage",
  "value": [
    -1,
    -1,
    -1,
    -1,
    -1,
    -1,
    -1,
    -1
  ]
},
{
  "metric": "gpuUtil",
  "value": [
    -1,
    -1,
    -1,
    -1,
    -1,
    -1,
    -1,
    -1
  ]
},
{
  "metric": "gpuMemUsage",
  "value": [
    -1,
    -1,
    -1,
    -1,
    -1,
    -1,
    -1,
    -1
  ]
}
]
```

You can view the metrics such as the CPU usage.

9. Call the API for **deleting a training job** to delete the job if it is no longer needed.

- a. Request body:

URI: DELETE `https://{ma_endpoint}/v2/{project_id}/training-jobs/{training_job_id}`

Request header: X-Auth-Token

→ ***MIIZmgYJKoZIhvcNAQcColIZizCCGYcCAQExDTALBgIghkgBZQMEAgEwgXXXXXX...***

Set the bold parameters based on site requirements.

- b. Status code **202 No Content** is returned, indicating that the job is successfully deleted.

22.3 Managing ModelArts Authorization

This section describes how to manage agency authorization by calling ModelArts APIs.

Overview

The process of managing ModelArts authorization is as follows:

1. Call the API for [authentication](#) to obtain a user token, which will be added in a request header for authentication.
2. Call the API for [creating a ModelArts agency](#) to create an agency for ModelArts-dependent services, such as OBS and SWR.
3. Call the API for [configuring authorization](#) to configure ModelArts authorization. The administrator can use this API to set an agency for IAM users and set the access key of the current user.

NOTE

ModelArts functions, such as data management, training management, development environment, and real-time services, can be used only after being authorized.

4. Call the API for [obtaining the authorization list](#) to view the authorization.
5. Call the API for [deleting authorization](#) to delete the authorization of a specified user or all users.

Prerequisites

- You have obtained the [IAM endpoint](#) and ModelArts endpoint.
- The following information is available: region where ModelArts is deployed, [project name and ID](#), [account name and ID](#), and [username and ID](#).

Procedure

1. Call the API for [authentication](#) to obtain a user token.

- a. Request body:

URI: POST `https://{iam_endpoint}/v3/auth/tokens`

Request header: Content-Type → application/json

Request body:

```
{
  "auth": {
    "identity": {
      "methods": ["password"],
      "password": {
        "user": {
          "name": "user_name",
          "password": "user_password",
          "domain": {
            "name": "domain_name"
          }
        }
      }
    }
  }
}
```

```
{
  "scope": {
    "project": {
      "name": "ap-southeast-1"
    }
  }
}
```

Set the italic parameters based on site requirements.

- *iam_endpoint*: IAM endpoint
 - *user_name*: IAM username
 - *user_password*: Login password of the user
 - *domain_name*: Account to which the user belongs
 - *ap-southeast-1*: Project name, which is the region where ModelArts is deployed
- b. Status code **201 Created** is returned. The **X-Subject-Token** value in the response header is the token.
- ```
x-subject-token →
MIIZmgYJKoZIhvcNAQcCollIZizCCGYcCAQExDTALBglghkgBZQMEAgEwgXXXXXX...
```
2. Call the API for [creating a ModelArts agency](#) to create an agency for ModelArts-dependent services, such as OBS, SWR, and IEF.
- a. Request body:
- URI: POST `https://{endpoint}/v2/{project_id}/agency`
- Request header:
- X-auth-Token  
→ *MIIZmgYJKoZIhvcNAQcCollIZizCCGYcCAQExDTALBglghkgBZQMEAgEwgXXXXXX...*
  - Content-Type → application/json
- Request body:
- ```
{
  "agency_name_suffix" : "iam-user01"
}
```
- Set the italic parameters based on site requirements.
- *endpoint*: ModelArts endpoint
 - *project_id*: Your project ID
 - **X-auth-Token**: Token obtained in the previous step
 - **agency_name_suffix**: Customized suffix of the agency name
- b. Response body with status code **200 OK** returned (indicating that **ma_agency_iam-user01** has been created):
- ```
{
 "agency_name": "ma_agency_iam-user01"
}
```
3. Call the API for [configuring authorization](#) to configure ModelArts authorization. The administrator can use this API to set an agency for IAM users and set the access key of the current user.

## a. Request body:

URI: POST https://{endpoint}/v2/{project\_id}/authorizations

Request header:

- X-auth-Token  
→ *MIIZmgYJKoZIhvcNAQcCollZizCCGYcCAQExDTALBglghkgBZQMEAgEwgXXXXXX...*
- Content-Type → application/json

Request body:

```
{
 "user_id": "****af917080f5d21f55c018ba19****",
 "type": "agency",
 "content": "ma_agency_iam-user01"
}
```

Set the italic parameters based on site requirements. Set **user\_id** to the IAM user ID and **content** to the ModelArts agency created in the previous step.

b. Response body with status code **200 OK** returned (indicating that the authorization configuration is complete):

```
{
 "result": true
}
```

4. Call the API for **obtaining the authorization list** to view the authorization.

## a. Request body:

URI: GET https://{endpoint}/v2/{project\_id}/authorizations

Request header: X-auth-Token

→ *MIIZmgYJKoZIhvcNAQcCollZizCCGYcCAQExDTALBglghkgBZQMEAgEwgXXXXXX...*

Set the italic parameters based on site requirements.

b. Response body with status code **200 OK** returned:

```
{
 "auth": [
 {
 "create_time": 1622804433221,
 "user_id": "all-users",
 "user_name": "all-users",
 "type": "agency",
 "content": "modelarts_agency"
 },
 {
 "create_time": 1625457065365,
 "user_id": "****af917080f5d21f55c018ba19****",
 "user_name": null,
 "type": "agency",
 "content": "ma_agency_iam-user01"
 }
],
 "total_count": 2
}
```

Obtain the authorization information based on the response.

5. Call the API for **deleting authorization** to delete the authorization of a specified user or all users.

## a. Request body:

URI: DELETE https://{endpoint}/v2/{project\_id}/authorizations?

user\_id=\*\*\*\*d80fb058844ae8b82aa66d9fe\*\*\*\*

Request header: X-auth-Token

→ *MIIZmgYJKoZlhvcNAQcCollZizCCGYcCAQExDTALBglghkgBZQMEAgEwgXXXXXX...*

Set the italic parameters based on site requirements. Set

*\*\*\*d80fb058844ae8b82aa66d9fe\*\*\** to the IAM user ID of the specified user.

- b. Response body with status code **200 OK** returned (indicating that the authorization has been deleted):

```
{
 "result": true
}
```

- c. If **user\_id** is set to **all-users**, the authorization of all IAM users will be deleted. Response body with status code **200 OK** returned (indicating that the authorization has been deleted):

```
{
 "result": true,
 "success_message": "Delete all-users auth info successfully!"
}
```

# 23 Permissions Policies and Supported Actions

---

## 23.1 Introduction

This section describes fine-grained permissions management for ModelArts. If your Huawei Cloud account does not require individual IAM users, skip this section.

New IAM users do not have any permissions assigned by default. You need to first add them to one or more groups and attach policies or roles to these groups. The users then inherit permissions from the groups and can perform specified operations on cloud services based on the permissions they have been assigned.

You can grant users permissions by using [roles](#) and [policies](#). Roles are provided by IAM to define service-based permissions that match users' job responsibilities. Policies are more fine-grained, API-based permissions required to perform operations on specific cloud resources under certain conditions, meeting requirements for secure access control.

### NOTE

If you want to allow or deny the access to an API, use fine-grained policies.

An account has all the permissions required to call all APIs, but IAM users must be assigned the required permissions. The required permissions are determined by the actions supported by the API. Only users with the policies allowing for those actions can call the API successfully. For example, if an IAM user wants to create notebook instances using an API, the user must have been granted permissions that allow the **modelarts:notebook:create** action.

## Supported Actions

ModelArts provides system policies that can be directly used in IAM. You can also create custom policies and use them to supplement system policies, implementing more refined access control. The following are related concepts:

- **Permission:** A statement in a policy that allows or denies certain operations.
- **APIs:** REST APIs that can be called in a custom policy.

- **Actions:** specific operations that are allowed or denied.
- **Dependencies:** actions which a specific action depends on. When allowing an action for a user, you also need to allow its dependent actions for that user.
- **IAM or enterprise projects:** Type of projects for which an action will take effect. Policies that contain actions for both IAM and enterprise projects can be used and applied for both IAM and Enterprise Management. Policies that contain actions only for IAM projects can be used and applied to IAM only. For details about the differences between IAM and enterprise projects, see [Differences Between IAM and Enterprise Management](#).

 **NOTE**

√: supported; x: not supported

## 23.2 Workflow Permissions

Workflow APIs are for internal use only. To use workflow functions on the management console and manage permissions, perform the operations described in the following table.

**Table 23-1** Fine-grained workflow permissions

| Permission                 | Action                     | Related Action | IAM Project | Enterprise Project |
|----------------------------|----------------------------|----------------|-------------|--------------------|
| Creating a workflow        | modelarts:workflow:create  | -              | √           | √                  |
| Updating a workflow        | modelarts:workflow:update  | -              | √           | √                  |
| Deleting a workflow        | modelarts:workflow:delete  | -              | √           | √                  |
| Executing a workflow       | modelarts:workflow:execute | -              | √           | √                  |
| Obtaining workflow details | modelarts:workflow:get     | -              | √           | √                  |
| Obtaining workflows        | modelarts:workflow:list    | -              | √           | √                  |

## 23.3 Data Management Permissions

**Table 23-2** Fine-grained permissions for dataset management

| Permission                       | API                                           | Action                   | Related Action                                                                                                                | IAM Project | Enterprise Project |
|----------------------------------|-----------------------------------------------|--------------------------|-------------------------------------------------------------------------------------------------------------------------------|-------------|--------------------|
| Querying the Dataset List        | GET /v2/{project_id}/datasets                 | modelarts:dataset:list   | N/A                                                                                                                           | √           | √                  |
| Creating a Dataset               | POST /v2/{project_id}/datasets                | modelarts:dataset:create | obs:bucket:HeadBucket<br>obs:bucket:ListBucket<br>obs:object:PutObject<br>obs:object:PutObject<br>obs:bucket:ListAllMyBuckets | √           | √                  |
| Querying Details About a Dataset | GET /v2/{project_id}/datasets/{dataset_id}    | modelarts:dataset:get    | N/A                                                                                                                           | √           | √                  |
| Modifying a Dataset              | PUT /v2/{project_id}/datasets/{dataset_id}    | modelarts:dataset:update | N/A                                                                                                                           | √           | √                  |
| Deleting a Dataset               | DELETE /v2/{project_id}/datasets/{dataset_id} | modelarts:dataset:delete | obs:bucket:ListAllMyBuckets<br>obs:bucket:ListBucket<br>obs:object:DeleteObject                                               | √           | √                  |

| Permission                                                                     | API                                                                                                   | Action                             | Related Action | IAM Project | Enterprise Project |
|--------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------|------------------------------------|----------------|-------------|--------------------|
| Querying Dataset Statistics                                                    | GET /v2/{project_id}/datasets/{dataset_id}/data-annotations/stats                                     | modelarts:dataset:get              | N/A            | √           | √                  |
| Querying the Monitoring Data of a Dataset                                      | GET /v2/{project_id}/datasets/{dataset_id}/metrics                                                    | modelarts:dataset:get              | N/A            | √           | √                  |
| Querying Statistics for a Team Labeling Task                                   | GET /v2/{project_id}/datasets/{dataset_id}/workforce-tasks/{workforce_task_id}/data-annotations/stats | modelarts:dataset:getWorkforceTask | N/A            | √           | √                  |
| Querying Statistics for the Member Labeling Progresses in a Team Labeling Task | GET /v2/{project_id}/datasets/{dataset_id}/workforce-tasks/{workforce_task_id}/metrics                | modelarts:dataset:getWorkforceTask | N/A            | √           | √                  |

**Table 23-3** Fine-grained permissions for dataset version management

| Permission                               | API                                                                 | Action                           | Related Action                                                                  | IAM Project | Enterprise Project |
|------------------------------------------|---------------------------------------------------------------------|----------------------------------|---------------------------------------------------------------------------------|-------------|--------------------|

## 24.1 Status Code

Table 24-1 describes the status codes.

Table 24-1 Status codes

| Status Code | Code                          | Status Code Description                                                                                                                                                               |
|-------------|-------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 100         | Continue                      | The client continues sending the request.<br><br>This provisional response informs the client that part of the request has been received and has not yet been rejected by the server. |
| 101         | Switching Protocols           | Switching protocols. The target protocol must be more advanced than the source protocol.<br><br>For example, the current HTTP protocol is switched to a later version of HTTP.        |
| 200         | OK                            | The request has been fulfilled.                                                                                                                                                       |
| 201         | Created                       | The request for creating a resource has been fulfilled.                                                                                                                               |
| 202         | Accepted                      | The request has been accepted, but the processing has not been completed.                                                                                                             |
| 203         | Non-Authoritative Information | Non-authoritative information. The request is successful.                                                                                                                             |

| Status Code | Code              | Status Code Description                                                                                                                                                                                                                  |
|-------------|-------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 204         | NoContent         | The request has been fulfilled, but the HTTP response does not contain a response body.<br>The status code is returned in response to an HTTP OPTIONS request.                                                                           |
| 205         | Reset Content     | The server has fulfilled the request, but the requester is required to reset the content.                                                                                                                                                |
| 206         | Partial Content   | The server has successfully processed a part of the GET request.                                                                                                                                                                         |
| 300         | Multiple Choices  | There are multiple options for the location of the requested resource. The response contains a list of resource characteristics and addresses from which the user or user agent (such as a browser) can choose the most appropriate one. |
| 301         | Moved Permanently | The requested resource has been assigned a new permanent URI, and the new URI is contained in the response.                                                                                                                              |
| 302         | Found             | The requested resource resides temporarily under a different URI.                                                                                                                                                                        |
| 303         | See Other         | The response to the request can be found under a different URI, and should be retrieved using a GET or POST method.                                                                                                                      |
| 304         | Not Modified      | The requested resource has not been modified. When the server returns this status code, it does not return any resources.                                                                                                                |
| 305         | Use Proxy         | The requested resource must be accessed through a proxy.                                                                                                                                                                                 |
| 306         | Unused            | The HTTP status code is no longer used.                                                                                                                                                                                                  |
| 400         | BadRequest        | The request is invalid.<br>Do not retry the request before modification.                                                                                                                                                                 |

| Status Code | Code                          | Status Code Description                                                                                                                                                                                                                           |
|-------------|-------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 401         | Unauthorized                  | The status code is returned after the client provides the authentication information, indicating that the authentication information is incorrect or invalid.                                                                                     |
| 402         | Payment Required              | This status code is reserved for future use.                                                                                                                                                                                                      |
| 403         | Forbidden                     | The request has been rejected.<br>The server has received and understood the request; yet it refused to respond, because the request is set to deny access. Do not retry the request before modification.                                         |
| 404         | NotFound                      | The requested resource cannot be found.<br>Do not retry the request before modification.                                                                                                                                                          |
| 405         | MethodNotAllowed              | The request contains one or more methods not supported for the resource.<br>Do not retry the request before modification.                                                                                                                         |
| 406         | Not Acceptable                | The server cannot fulfill the request according to the content characteristics of the request.                                                                                                                                                    |
| 407         | Proxy Authentication Required | This status code is similar to 401, but the client must first authenticate itself with the proxy.                                                                                                                                                 |
| 408         | Request Time-out              | The request timed out.<br>The client may repeat the request without modifications at any time later.                                                                                                                                              |
| 409         | Conflict                      | The request could not be processed due to a conflict with the current state of the resource.<br>This status code indicates that the resource that the client attempts to create already exists, or the requested update failed due to a conflict. |

| Status Code | Code                            | Status Code Description                                                                                                                                                                                                                                                                                                                                                                                      |
