Contents

1 Before You Start

1.1 Overview

OCR provides services through open Application Programming Interfaces (APIs). You can obtain the inference result by accessing and calling APIs in real time. It helps you collect key data automatically and build an intelligent business system, thereby improving service efficiency. Before calling an API, ensure that the user network can access the Internet.

You can perform related operations based on the API description, syntax, parameter description, and examples provided in this document. For example, you can call the API for recognizing characters in general text, cards, or receipts. APIs vary depending on regions. For details, see **Endpoints**. For details about all operations supported by APIs, see **API Overview**.

Before calling an OCR API, ensure that you are familiar with OCR concepts.

OCR also provides software development kits (SDKs) for multiple programming languages. For details about how to use SDKs, see **SDK Reference**.

1.2 API Calling

OCR provides a broad range of Representational State Transfer (REST) APIs that you can call through HTTPS. For details about API calling, see **Calling APIs**.

Before calling an API, ensure that the user network can access the Internet.

OCR also provides software development kits (SDKs) for multiple programming languages. For details about how to use SDKs, see **SDK Reference**.

1.3 Endpoints

An endpoint is the request address for calling an API. Endpoints vary depending on services and regions. For the endpoints of all services, see **Regions and Endpoints**.

Table 1-1 lists the endpoints of OCR. Select an endpoint based on your service requirements.

Even if the service server is not in the region where the OCR service is deployed, the OCR service can still be used as long as the server can access the Internet. It is recommended that you select the closest region for low network latency and quick access.

Table 1-1 OCR endpoints

Region	Endpoint Region	Endpoint	Service
CN-Hong Kong	ap-southeast-1	ocr.ap-southeast-1.myhuaweicloud.com ocr.ap-southeast-1.myhuaweicloud.cn	Passport OCR, Myanmar ID Card OCR, Myanmar Driving License OCR, Hong Kong ID Card OCR, Macao Resident ID Card OCR, Exit-Entry Permit for Traveling to and from Hong Kong, Macao, and Taiwan OCR, Mainland Travel Permit for Hong Kong, Macao, and Taiwan Residents OCR, ID Document OCR, General Text OCR, Vietnam ID Card OCR, and Smart Document Analysis
AP-Bangkok	ap-southeast-2	ocr.ap-southeast-2.myhuaweicloud.com ocr.ap-southeast-2.myhuaweicloud.cn	Thailand ID Card OCR, Passport OCR, Web Image OCR, and Thailand Plate Number OCR
LA-Santiago	la-south-2	ocr.la-south-2.myhuaweicloud.com ocr.la-south-2.myhuaweicloud.cn	Chile ID Card OCR and Peru ID Card OCR
AP-Singapore	ap-southeast-3	ocr.ap-southeast-3.myhuaweicloud.com ocr.ap-southeast-3.myhuaweicloud.cn	Cambodian ID Card OCR, General Table OCR, and Smart Document Analysis
AF-Johannesburg	af-south-1	ocr.af-south-1.myhuaweicloud.com ocr.af-south-1.myhuaweicloud.cn	Web Image OCR

1.4 Constraints and Limitations

For details, see the API description and **Constraints and Limitations**.

1.5 Concepts

- Account

  An account is created upon successful registration with Huawei Cloud and has full access permissions for all of its cloud services and resources. It can be used to reset user passwords and grant user permissions. The account is a payment entity. Do not directly use an account for routine management, but create users and assign them permissions for that.

- User

  A user is created on in IAM using an account to use cloud services. Each user has its own identity credentials (password and access keys).

  An IAM user can view the account ID and user ID on the **My Credentials** page of the console. The account name, username, and password will be required for API authentication.

- Region

  Regions are divided based on geographical location and network latency. Public services, such as Elastic Cloud Server (ECS), Elastic Volume Service (EVS), Object Storage Service (OBS), Virtual Private Cloud (VPC), Elastic IP (EIP), and Image Management Service (IMS), are accessible within the same region. Regions are classified as universal regions and dedicated regions. A universal region provides universal cloud services for common tenants. A dedicated region provides specific services for specific tenants.

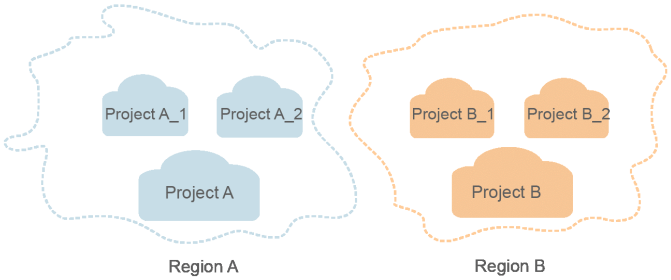
- AZ

  An AZ contains one or more physical data centers. It has independent cooling, fire extinguishing, moisture-proof, and electricity facilities. Within an AZ, computing, network, storage, and other resources are logically divided into multiple clusters. AZs within a region are interconnected using high-speed optical fibers to allow you to build cross-AZ high-availability systems.

- Project

  Projects isolate resources (including compute, storage, and network resources) across physical regions. A default project is provided for each Huawei Cloud region, and subprojects can be created under each default project. Users can be granted permissions to access all resources in a specific project. For more refined access control, create subprojects under a project and purchase resources in the subprojects. Users can then be assigned permissions to access specific resources in the subprojects.

Figure 1-1 Project isolation model



2 API Overview

You can perform the operations described in **Table 2-1** with OCR APIs.

Table 2-1 API description

API	Description	Deployment Region
Smart Document Analysis	This API detects and extracts key-value pairs, text, and table content from various document layouts, such as certificates, receipts, and forms, and converts the text into a structured format.	CN-Hong Kong (ap-southeast-1) AP-Singapore (ap-southeast-3)
General Table	This API detects and extracts text from images of general tables and converts the text into JSON format. The returned results include two types of image area (words_region): text area (text) and table area (table). They also include table structures (rows and columns) and text information. For the notes and constraints on using this API, see **Notes and Constraints**. For how to use this API, see **Introduction to OCR**.	AP-Singapore (ap-southeast-3)
General Text	This API detects and extracts text from images and converts the text and coordinates into JSON format. It can be used in various scenarios, such as scanned files, electronic documents, books, receipts, and forms. English and Chinese are supported but support for traditional Chinese characters is limited. For the notes and constraints on using this API, see **Notes and Constraints**. For how to use this API, see **Introduction to OCR**.	CN-Hong Kong (ap-southeast-1)

API	Description	Deployment Region
Passport	This API detects and extracts text from the first page of images of passports and converts the text into a structured JSON format.	CN-Hong Kong (ap-southeast-1) AP-Bangkok (ap-southeast-2)
Web Image	This API detects and extracts text from web images and converts the text into a structured JSON format.	AP-Bangkok (ap-southeast-2)
Thailand ID Card	This API detects and extracts text from images of Thailand-issued national registration cards and converts the text into a structured format.	AP-Bangkok (ap-southeast-2)
Myanmar ID Card	This API detects and extracts text from images of Myanmar-issued national registration cards and converts the text into a structured format.	CN-Hong Kong (ap-southeast-1)
Cambodian ID Card	This API detects and extracts text from images of Cambodia-issued ID cards and converts the text into a structured format.	AP-Singapore (ap-southeast-3)
Myanmar Driving License	This API detects and extracts text from images of Myanmar-issued driver's licenses and converts the text into a structured JSON format.	CN-Hong Kong (ap-southeast-1)
Chile ID Card	This API detects and extracts text from images of Chile-issued ID cards and converts the text into JSON format.	LA-Santiago-(la-south-2)
Vietnam ID Card	This API detects and extracts text from images of Vietnam-issued ID cards and converts the text into a structured format.	CN-Hong Kong (ap-southeast-1)
Peru ID Card	This API detects and extracts text from images of Peru-issued identity cards and converts the text into a structured format.	LA-Santiago-(la-south-2)
Thailand Plate Number	This API detects and extracts license plate information from images of Thailand license plates and returns the license plate number and location.	AP-Bangkok (ap-southeast-2)
ID Document	This API detects and extracts text from images of identity documents issued by multiple countries and regions, such as ID cards, driving licenses, and passports, and converts the text into a structured format.	CN-Hong Kong (ap-southeast-1)

3 Calling APIs

3.1 Overview

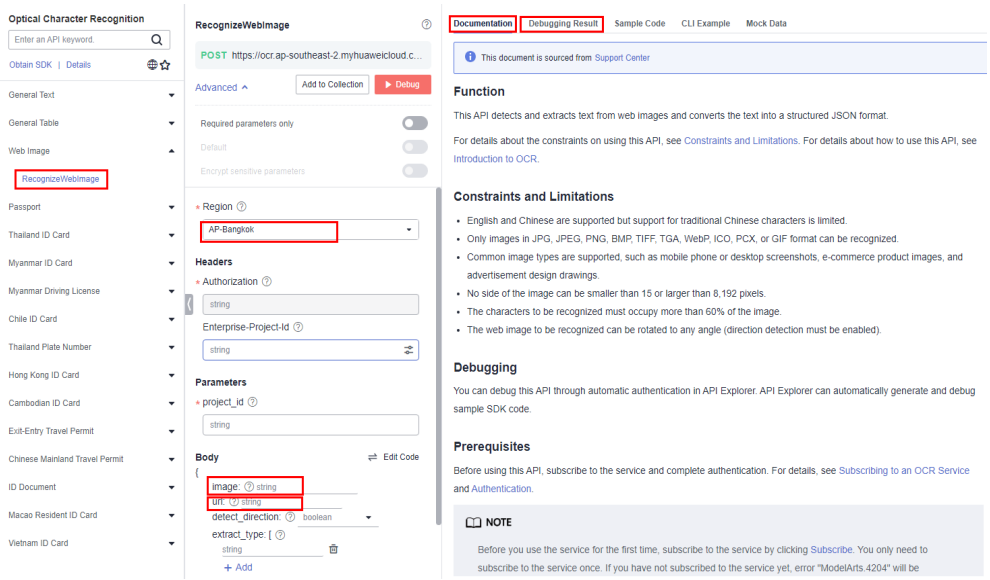
You can debug API calls using Postman or SDK. This involves subscribing to a service, configuring the environment, authenticating, and constructing a request to call the service.

1. Subscribing to a service: includes registration and login, IAM account creation (optional), and service subscription. For details, see **Subscribing to an OCR Service**.
2. Configuring the environment: You can choose to **download Postman** or **download an SDK**.
3. Authenticating: You can choose **Token-based Authentication** (Postman environment) or **AK/SK-based Authentication** (SDK environment). Select an authentication mode based on the environment configured in step 2.
4. Constructing a request. For details about how to construct a request in the Postman environment, see **Making an API Request**. For details about how to call an API in an SDK environment, see **Optical Character Recognition SDK Reference**.

Apart from the preceding two methods, you can also call APIs through **API Explorer online debugging**. The procedure is as follows:

1. The API Explorer page is displayed after a service is subscribed to by referring to **Subscribing to an OCR Service**.
2. Choose the subscribed service and the corresponding region for the service.
3. In the **Body** area, set **image** or **url**. Set other parameters based on site requirements. For details about the parameters, refer to the content displayed on the **Documentation** tab on the right of the page.
4. Click **Debug** and check the calling result on **Debugging Result** on the right.

Figure 3-1 API Explorer online debugging



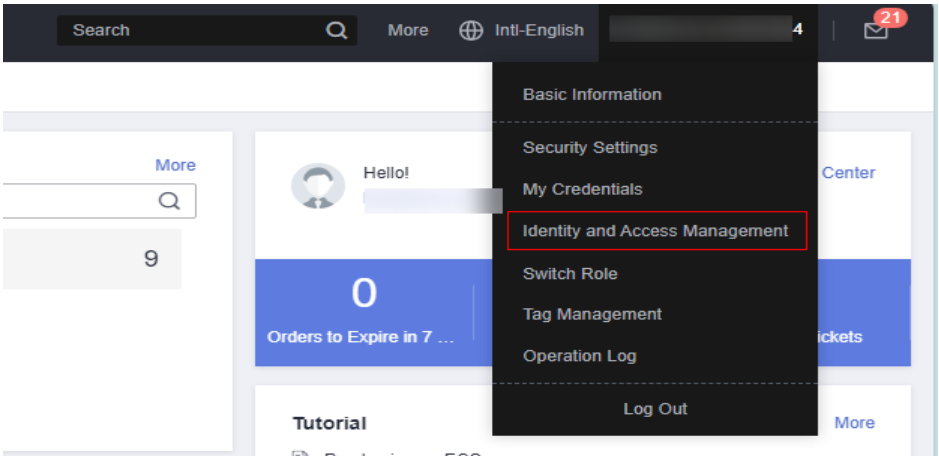
3.2 Subscribing to an OCR Service

Step 1 Register a Huawei Cloud account on the **Huawei Cloud official website** and use it to log in. The account cannot be in arrears or frozen.

Step 2 (Optional) Create an IAM user.

1. Log in to the Huawei Cloud **management console**, hover your cursor over the username in the upper right corner of the page, and choose **Identity and Access Management** from the drop-down list.

Figure 3-2 Identity and Access Management



2. On the **Users** page, click **Create User**. On the page displayed, set the username and password to create an IAM user.

Figure 3-3 Create User

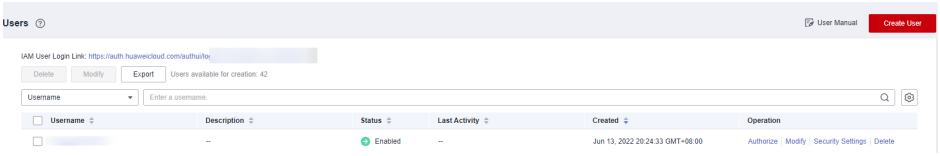


Figure 3-4 Setting the username and password

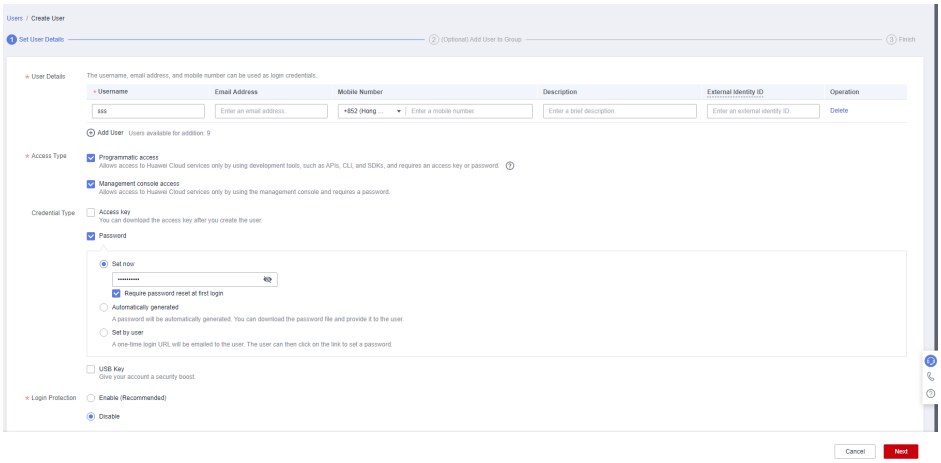
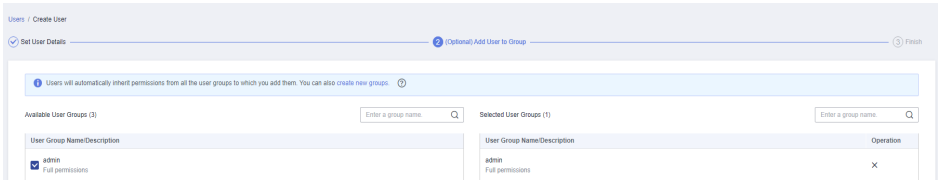


3. Grant permissions to the IAM user. For details, see **Permissions Management**.

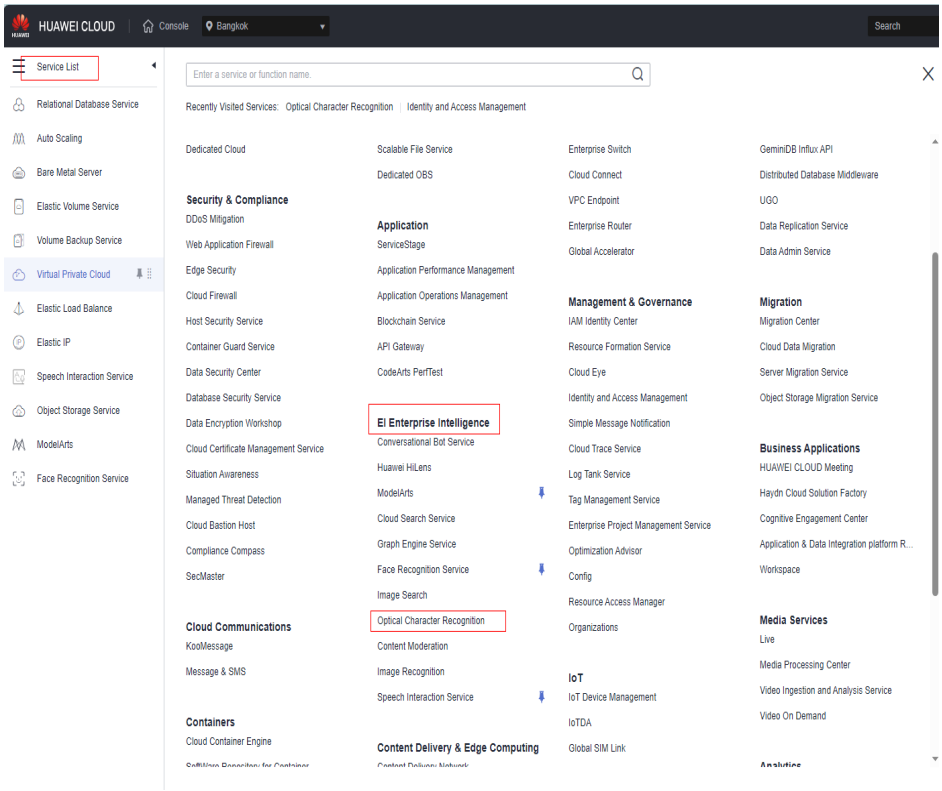
Figure 3-5 Adding the IAM user to a user group



Step 3 Subscribe to a service.

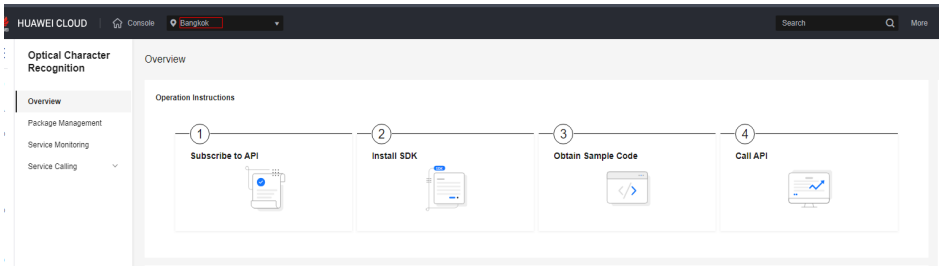
1. On the management console, click **Service List** and choose **EI Enterprise Intelligence** > **Optical Character Recognition** to access the **OCR console**.

Figure 3-6 Accessing the OCR console



2. On the **Overview** page of the OCR console, select the endpoint where you want to subscribe to a service. For details about OCR service availability in different regions, see **Endpoints**.

Figure 3-7 Selecting an endpoint



3. Select a product type, for example, **General** and **Certificate**, and select your desired service to subscribe to it. Set **Billing Mode** to **Pay-per-use**.

Figure 3-8 Subscribing to a service

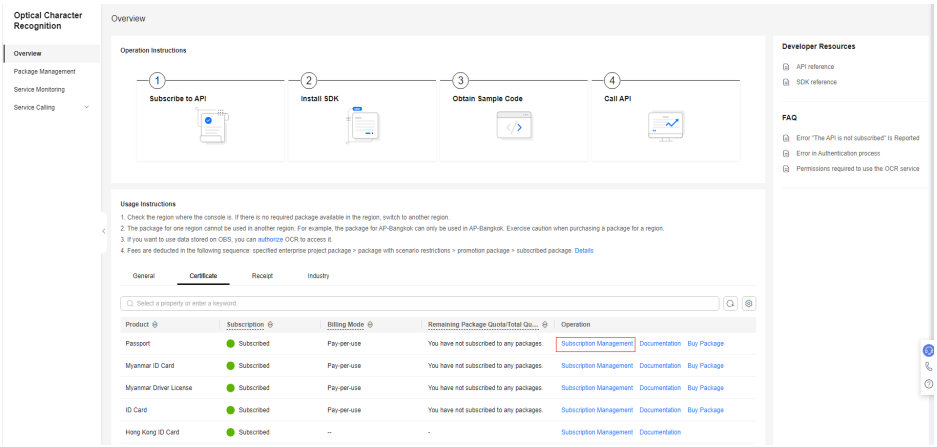


Figure 3-9 Subscription Management

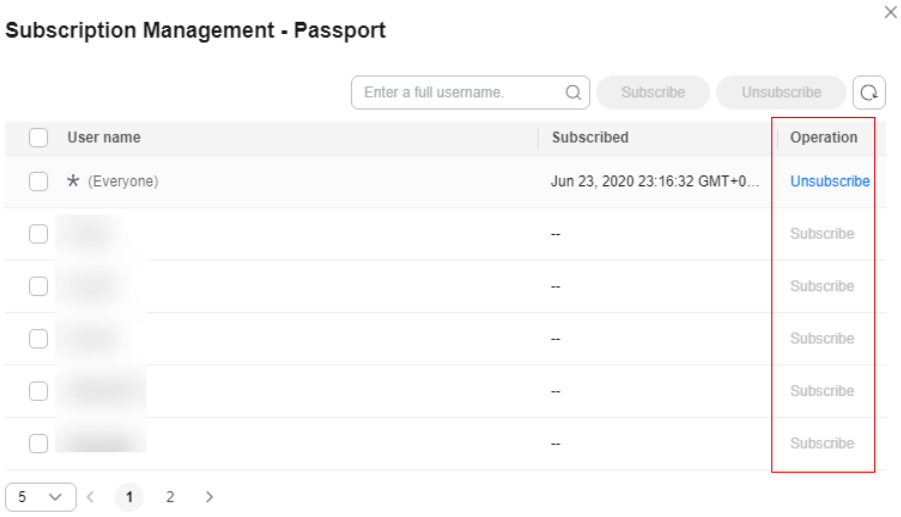
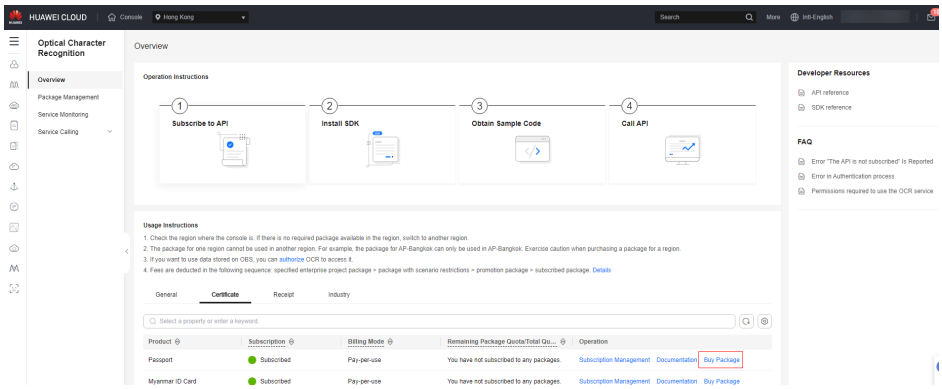


NOTE

- If a master account grants the **OCR FullAccess** permission to an IAM user, both the master account and the IAM user can subscribe to OCR services. IAM users without this permission cannot subscribe to OCR services on their own.
- If a master account only grants the **OCR ReadOnlyAccess** permission or no permission at all to an IAM user, only the master account (or IAM users with the **OCR FullAccess** permission) can subscribe to OCR services for that IAM user.

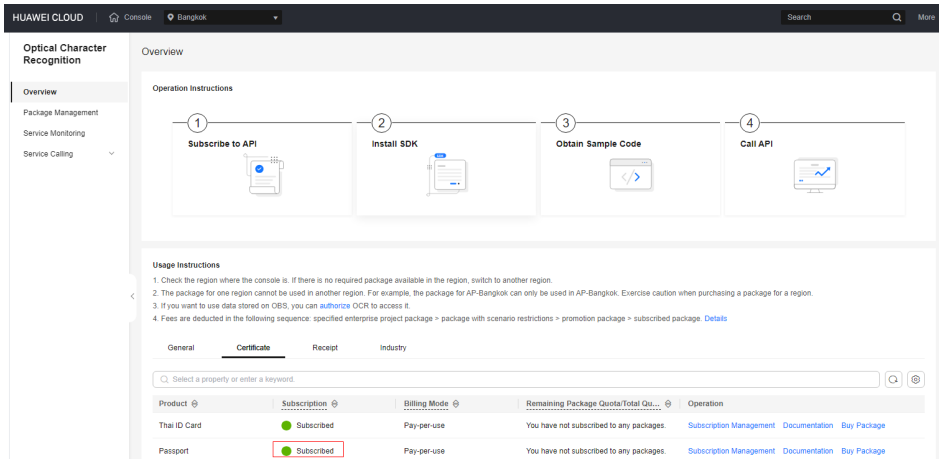
Alternatively, you can click **Buy Package** to subscribe to a service. The billing is on a package basis.

Figure 3-10 Buy Package



4. Once the service is successfully subscribed to, check that the status is **Subscribed**.

Figure 3-11 Subscribed



NOTE

- OCR services are billed in pay-per-use mode by default. In this billing mode, you only need to pay for what you use. If you have purchased a package, see **Billing** for package deduction rules. Packages cannot be refunded once being purchased.
- If you have not subscribed to an OCR service yet, an error message with error code "ModelArts.4204" will be displayed when you call the OCR API.
- If you want to use data stored on OBS, you can authorize OCR to access OBS. You only need to configure the authorization once. For details, see **Configuring Access Permissions of OBS**.

----End

3.3 Making an API Request

This section describes the structure of a REST API request and demonstrates how to call an API.

Request URI

A request URI is in the following format:

{URI-scheme} :// {endpoint} / {resource-path} ? {query-string}

Although a request URI is included in the request header, most programming languages and frameworks require the request URI to be transmitted separately.

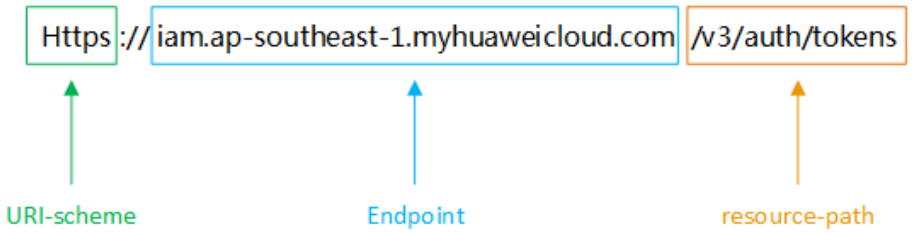
Table 3-1 URI parameter description

Parameter	Description
URI-scheme	Protocol used to transmit requests. All APIs use HTTPS.
endpoint	Domain name or IP address of the server bearing the REST service endpoint. The endpoint varies depending on services in different regions. For more details, see **Endpoints**.
resource-path	Path in which the requested resource is located, that is, the API access path.
query-string	Query parameter, which is optional. Ensure that a question mark (?) is included before each query parameter that is in the format of *Parameter name=Parameter value*. For example, **limit=10** indicates that up to 10 data records will be displayed.

For example, to call the API in the **AP-Bangkok** region, use the endpoint **ocr.ap-southeast-2.myhuaweicloud.com** of the **AP-Bangkok** region and find the value **/v3/auth/tokens** of **resource-path** in **Obtaining a User Token**. The URI is as follows:

```
https://ocr.ap-southeast-2.myhuaweicloud.com/v2/{project_id}/ocr/web-image
```

Figure 3-12 Example URI



NOTE

To simplify the URI display in this document, each API is provided only with a **resource-path** and a request method. The **URI-scheme** of all APIs is **HTTPS**, and the endpoints of all APIs in the same region are identical.

Request Methods

The HTTP protocol defines the following request methods that can be used to send a request to the server:

Table 3-2 HTTP-defined request methods

Method	Description
GET	Requests the server to return specified resources.
PUT	Requests the server to update specified resources.
POST	Requests the server to add resources or perform special operations.
DELETE	Requests the server to delete specified resources, for example, an object.
HEAD	Same as GET except that the server must return only the response header.
PATCH	Requests the server to update partial content of a specified resource. If the resource does not exist, a new resource will be created.

```
POST https://ocr.ap-southeast-2.myhuaweicloud.com/v2/{project_id}/ocr/web-image
```

Request Header

You can also add additional header fields to a request, such as the fields required by a specified URI or HTTP method. For example, to request for the authentication information, add **Content-Type**, which specifies the request body type.

- **Content-Type**: request body type or format. This field is mandatory and its default value is **application/json**. Other values of this field will be provided for specific APIs if any.
- **X-Auth-Token**: user token. This field is required only for token-based API authentication. For details about the user token, see "Authentication".

The following provides an example request with a request header included.

```
POST https://ocr.ap-southeast-2.myhuaweicloud.com/v2/{project_id}/ocr/web-image
Content-Type: application/json
x-auth-token: MIIaBgYJKoZIhvcNAQcC...
```

Request Body

The body of a request is often sent in a structured format as specified in the **Content-Type** header field. The request body transfers all content except the request header.

The request body varies depending on APIs. Some APIs do not require the request body, for example, the APIs requested using the GET and DELETE methods.

The request parameters and parameter description are available in the request. The following provides an example request with a body included.

```
POST https://ocr.ap-southeast-2.myhuaweicloud.com/v2/{project_id}/ocr/web-image
Request Header:
```

```
Content-Type: application/json
X-Auth-Token: MIINRwYJKoZIhvcNAQcCoIINODCCDTQCAQExDTALBglghkgBZQMEAgEwgguVBgkqhkiG...
Request Body:
{
    "image":"/9j/4AAQSkZJRgABAgEASABIAAD/4RFZRXhpZgAATU0AKgAAAAgABwESAAMAA..."
}
```

If all data required for the API request is available, you can send the request to call the API through curl, Postman, or coding.

3.4 Authentication

Requests for calling an API can be authenticated using either of the following methods:

- Token-based authentication: Requests are authenticated using a token.
- AK/SK-based authentication: Requests are authenticated by encrypting the request body using an AK/SK pair.

Token-based Authentication

A token specifies temporary permissions in a computer system. During API authentication using a token, the token is added to a request to get permissions for calling the API.

NOTE

- A token is valid for 24 hours. When using a token for authentication, cache it to avoid frequent calling.
- If your Huawei Cloud account has been upgraded to a Huawei ID, you cannot obtain a token. You are advised to create an IAM user and obtain the user token.

When calling the API to obtain a user token, you must set **auth.scope** in the request body to **project**.

You can log in to the console and choose **My Credentials > API Credentials** to obtain the values of **username**, **domainname**, and **project name**. **password** indicates the user password.

- Pseudocode

```
POST https://iam.ap-southeast-2.myhuaweicloud.com/v3/auth/tokens //Uses obtaining the token in the AP-Bangkok region as an example.
Content-Type: application/json
{
   "auth": {
      "identity": {
         "methods": [
            "password"
         ],
         "password": {
            "user": {
               "name": "username", // IAM username
               "password": "********", // Password
               "domain": {
                  "name": "domainname" // Account name
               }
            }
         }
      },
```

```
        "scope": {
            "project": {
                "name": "project name" //Replace project name with the actual project name, for example, ap-southeast-1.
            }
        }
    }
}
```

- Java

```
package xxx; // Project path where the GetToken class is located

import okhttp3.MediaType;
import okhttp3.OkHttpClient;
import okhttp3.Request;
import okhttp3.RequestBody;
import okhttp3.Response;

public class GetToken {
    public static void main(String[] args) throws Exception {
        OkHttpClient client = new OkHttpClient().newBuilder().build();
        MediaType mediaType = MediaType.parse("application/json");
        String requestBody // Enter the correct account name, IAM username, and password.
            = "{\"auth\": {\"identity\": {\"methods\": [\"password\"],\"password\": {\"user\": {\"name\": \"********\",\"password\": \"********\",\"domain\": {\"name\": \"********\"}}}},\"scope\": {\"project\": {\"name\": \"ap-southeast-3\"}}}}";
        RequestBody body = RequestBody.create(requestBody, mediaType);
        Request request = new Request.Builder().url("https://iam.ap-southeast-3.myhuaweicloud.com/v3/auth/tokens")
            .method("POST", body)
            .addHeader("Content-Type", "application/json")
            .build();
        Response response = client.newCall(request).execute();
        System.out.println(response.header("X-Subject-Token"));
    }
}
```

- Python

```
import requests
import json

url = "https://iam.ap-southeast-3.myhuaweicloud.com/v3/auth/tokens"
payload = json.dumps({
  "auth": {
    "identity": {
      "methods": [
        "password"
      ],
      "password": {
        "user": {
          "name": "username",
          "password": "********",
          "domain": {
            "name": "domainname"
          }
        }
      }
    },
    "scope": {
      "project": {
        "name": "projectname"
      }
    }
  }
})
headers = {
  'Content-Type': 'application/json'
}

response = requests.request("POST", url, headers=headers, data=payload)
```

```
print(response.headers["X-Subject-Token"])
```

As shown in the following figure, **x-subject-token** in the response header is the desired user token. This token can then be used to authenticate the calling of OCR APIs.

Figure 3-13 Response header for obtaining a user token

AK/SK-based Authentication

NOTE

AK/SK-based authentication supports API requests with a body less than or equal to 12 MB. For API requests with a larger body, perform token-based authentication.

In AK/SK-based authentication, AK/SK is used to sign requests and the signature is then added to the requests for authentication.

- AK: access key ID, which is a unique identifier used in conjunction with a secret access key to sign requests cryptographically.
- SK: secret access key used in conjunction with an AK to sign requests cryptographically. It identifies a request sender and prevents the request from being modified.

In AK/SK-based authentication, you can use an AK/SK to sign a request based on the signature algorithm or use a dedicated signature SDK to sign a request. For details about how to sign requests and use the signing SDK, see ***API Request Signing Guide***.

If no AKs/SKs have been generated, log in to the console and choose **My Credentials** page in the upper right corner. On the page that is displayed, choose **Access Keys** in the navigation pane on the left, and click **Create Access Key** to create an AK/SK.

NOTICE

The signing SDK is only used for signing requests and is different from the SDKs provided by services.

For details about how to obtain the AK/SK, see **Obtaining the AK/SK**.

3.5 Response

Status Code

After sending a request, you will receive a response, including a status code, response header, and response body.

A status code consists of multiple digits, which indicates the response status of a request. If the 2*xx* status code is returned, the API is called successfully. For details about the status code list, see **Status Codes**.

Response Header

Similar to a request, a response also has a header, for example, **Content-Type**. **Table 3-3** lists the fields in the response header.

Table 3-3 Response Header

Field	Description
Content-Length	Length of the response body. The unit is byte.
Date	Time when a request response is returned
Content-Type	MIME type of the response body

Response Body

The body of a response is returned in structured format as specified in the **Content-Type** header field. The response body transfers all content except the response header.

If an error occurs during API calling, an error code and a message will be displayed. The following shows an error response body.

```
{
   "error_code": "AIS.0103",
   "error_msg": "The image size does not meet the requirements."
}
```

In the response body, **error_code** indicates the error code, and **error_msg** provides information about the error.

4 API

4.1 Smart Document Analysis

Function

This API recognizes text, analyzes layout, extracts key-value pairs, identifies tables in various formatted documents such as certificates, receipts, and forms, and converts the results into a structured JSON format.

Notes and Constraints

- English, Chinese, and some traditional Chinese characters are supported.
- Only images in PNG, JPG, JPEG, BMP, GIF, TIFF, WebP, PCX, ICO or PSD format and PDF files can be recognized. PDF files can only be recognized one page at a time, but you can use the **pdf_page_number** parameter to specify which page you want to recognize.
- No side of the image can be smaller than 15 or larger than 8,192 pixels.
- The area to be recognized must occupy more than 80% of the image. When scanning a table, ensure that all text and its surrounding area are included in the image.
- An image can be rotated to any angle.
- For more accurate recognition results, the number of characters on a single page must be limited to 1,800 or less.
- Text in images with complex backgrounds (such as outdoor scenery or anti-counterfeit watermarks) or distorted text cannot be analyzed.
- OCR is a public cloud service whose resources are sharable to all online users. If you need to call multiple APIs concurrently, **contact us**.

Calling Method

For details, see **Calling APIs**.

Prerequisites

Before using this API, subscribe to the service and complete authentication. For details, see **Subscribing to an OCR Service** and **Authentication**.

NOTE

Before using the service for the first time, you need to enable the service by clicking **Subscribe**. You only need to subscribe to the service once. If you have not subscribed to the service yet, error "ModelArts.4204" will be displayed when you call this API. Before you call the API, log in to the OCR console and subscribe to the corresponding service. Ensure that you make the subscription to the service in the same region where you want to call this API.

URI

POST /v2/{project_id}/ocr/smart-document-recognizer

Table 4-1 URI parameter

Parameter	Mandatory	Type	Description
project_id	Yes	String	Project ID, which can be obtained by referring to **Obtaining a Project ID**.

Request Parameters

Table 4-2 Request header parameters

Parameter	Mandatory	Type	Description
X-Auth-Token	Yes	String	User token. During API authentication using a token, the token is added to requests to obtain permissions for calling the API. The value of **X-Subject-Token** in the response header is the obtained token.

Parameter	Mandatory	Type	Description
Enterprise-Project-Id	No	String	Enterprise project ID. OCR allows you to use Enterprise Project Management Service (EPS) to split fees for resources used by different user groups and users. To obtain the enterprise project ID, go to the **Enterprise Project Management** console, click the enterprise project name, and obtain the enterprise project ID on the enterprise project details page. For details about how to create an enterprise project, see *Optical Character Recognition User Guide*. **NOTE** After an enterprise project is created, parameter transfer involves the following scenarios: • If a correct enterprise project ID is carried and the OCR service can be used properly, the bills will be categorized under the corresponding enterprise project for that ID. • If an enterprise project ID that is in the correct format but does not actually exist is carried, and the OCR service can be used properly, the bills will display the corresponding non-existent enterprise project ID. • If no enterprise project ID or an enterprise project ID with incorrect format (such as special characters) is carried, and the OCR service can be used properly, the bills will be categorized under **default**.

Table 4-3 Request body parameters

Parameter	Mandatory	Type	Description
data	No	String	Set either this parameter or **url**. Base64 encoded string of the image or PDF. The file has a size limit of 10 MB. No side of the image can be smaller than 15 or larger than 8,192 pixels. Only images in JPG, PNG, BMP, or TIFF format can be recognized. PDFs are converted to images with a resolution of 144 dpi for document analysis, and they must meet the image size requirements mentioned above. If a PDF has multiple pages, only the first page will be recognized.
url	No	String	Set either this parameter or **data**. URL of an image or PDF. Currently, the following URLs are supported: • Public HTTP/HTTPS URL • URL provided by OBS. You need to be authorized to use OBS data, including service authorization, temporary authorization, and anonymous public authorization. For details, see **Configuring Access Permissions of OBS**. **NOTE** • The API response time depends on the image download time. If the image download takes a long time, the API call will fail. • Ensure that the storage service where the image to be detected resides is stable and reliable. OBS is recommended for storing image data. • The URL cannot contain Chinese characters. If Chinese characters exist, they must be encoded using UTF-8.

Parameter	Mandatory	Type	Description
single_orientation_mode	No	Boolean	Whether to enable the single direction mode. The options are: • **true**: The single direction mode is enabled. • **false**: The single direction mode is disabled. Enabling this function when text in the image is oriented uniformly improves recognition accuracy. Disabling it when text in the image varies in direction allows for multi-direction text recognition. If not specified, **true** is used by default. In this case, the fields in the image are recognized as in a single direction by default.
language	No	String	Language. If this parameter is not specified, Chinese and English will be used by default. For details, see **Languages Supported by Huawei Cloud General Text OCR**.
kv	No	Boolean	Whether to extract key-value pairs. If you choose to extract key-value pairs, the results will be returned with the keyword **kv_result**.
table	No	Boolean	Whether to recognize tables. Here, tables refer to logical tables that typically have an M x N format and have a header in the first row or column. If you choose to recognize tables, the results will be returned with the keyword **table_result**.
layout	No	Boolean	Whether to analyze the layout. If you choose to analyze the layout, the results will be returned with the keyword **layout_result**.

Parameter	Mandatory	Type	Description
return_excel	No	Boolean	This parameter is available only when **table** is set to **True**. Whether to return the Base64-encoded field for converting a table into a Microsoft Excel file.
form	No	Boolean	Whether to recognize wired forms. A wired form displays crucial information in wired cells, like household registers and motor vehicle sales invoices. If you choose to recognize wired forms, the results will be returned with the keyword **form_result**.
formula	No	Boolean	Whether to recognize formulas. The results are returned as a LaTeX sequence. If you choose to recognize formulas, the results will be returned with the keyword **formula_result**. • Enabling formula recognition may slow down the response speed. • Currently, formula recognition is supported for up to three lines only. Formulas exceeding three lines are not supported.
kv_map	No	String	JSON-serialized string of a dictionary that needs to be passed in, which is used to normalize and map specific key values in **kv_result**. For example, if **kv_result** contains the key-value pair {"Name": "Xiaoming"}, passing in the **kv_map** {"Name": "Full name"} would result in {"Full Name": "Xiaoming"}. **NOTE** Example: • "kv_map":"{"Name":"Full name"}"

Parameter	Mandatory	Type	Description
erase_seal	No	Boolean	Whether to erase the seal. Enabling it can enhance the character recognition accuracy in the area blocked by the seal.
pdf_page_number	No	Integer	Specify which page of the PDF file you want to recognize. If this parameter is specified, the content on the specified page is identified. If this parameter is not specified, the default is to recognize the first page.

Response Parameters

Status code: 200

Table 4-4 Response body parameter

Parameter	Type	Description
result	Array of **SmartDocumentRecognizerResult** objects	List of results returned in the order of the pages, with the first item in the list being the recognition result of the first page, and so on. This parameter is not included for a failed call.

Table 4-5 SmartDocumentRecognizerResult

Parameter	Type	Description
ocr_result	**SmartDocumentRecognizerOcrResult** object	Character recognition results
kv_result	**SmartDocumentRecognizerKvResult** object	Key-value pair extraction results. This parameter is returned only when **kv** is set to **true**.
table_result	**SmartDocumentRecognizerTableResult** object	Table recognition results. This parameter is returned only when **table** is set to **true**.

Parameter	Type	Description
layout_result	**SmartDocumentRecognizerLayoutResult** object	Layout analysis results. This parameter is returned only when **layout** is set to **true**.
form_result	**SmartDocumentRecognizerFormResult** object	Wired form recognition results. This parameter is returned only when **form** is set to **true**.
formula_result	**SmartDocumentRecognizerFormulaResult** object	Formula recognition result

Table 4-6 SmartDocumentRecognizerOcrResult

Parameter	Type	Description
direction	Float	Image direction
words_block_count	Integer	Number of text blocks that have been recognized
words_block_list	Array of **SmartDocumentRecognizerWordsBlockList** objects	List of text blocks that have been recognized. The output sequence is from left to right and from top to bottom.

Table 4-7 SmartDocumentRecognizerWordsBlockList

Parameter	Type	Description
words	String	Text block recognition results
location	Array<Array<Integer>>	List of location information about a text block, including the 2D coordinates (x, y) of four vertexes in the text area, where the coordinate origin is the upper-left corner of the image, the X axis is horizontal, and the Y axis is vertical.
confidence	Float	Confidence of a recognized text block

Table 4-8 SmartDocumentRecognizerKvResult

Parameter	Type	Description
kv_block_count	Integer	Number of key-value pairs recognized by the model
kv_block_list	Array of **SmartDocumentRecognizerKVBlock** objects	List of key-value pair recognition results

Table 4-9 SmartDocumentRecognizerKVBlock

Parameter	Type	Description
key	String	Key in a key-value pair, for example, Name in Name: Xiaoming.
value	String	Value in a key-value pair, for example, Xiaoming in Name: Xiaoming.
words_block_count	Integer	Number of text boxes contained in the key-value pair
words_block_list	Array of **SmartDocumentRecognizerKVWordsBlock** objects	List of text box recognition results

Table 4-10 SmartDocumentRecognizerKVWordsBlock

Parameter	Type	Description
words	String	Text block recognition results
location	Array<Array<Integer>>	List of location information about a text block, including the 2D coordinates (x, y) of four vertexes in the text area, where the coordinate origin is the upper-left corner of the image, the X axis is horizontal, and the Y axis is vertical.
type	String	Type

Table 4-11 SmartDocumentRecognizerTableResult

Parameter	Type	Description
table_count	Integer	Number of tables recognized by the model
table_list	Array of **SmartDocumentRecognizerTableBlock** objects	List of table recognition results

Table 4-12 SmartDocumentRecognizerLayoutResult

Parameter	Type	Description
layout_block_count	Integer	Number of document layout areas recognized by the model
layout_block_list	Array of **SmartDocumentRecognizerLayoutBlock** objects	List of document layout area recognition results

Table 4-13 SmartDocumentRecognizerLayoutBlock

Parameter	Type	Description
location	Array<Array<Integer>>	List of location information about a text block, including the 2D coordinates (x, y) of four vertexes in the text area, where the coordinate origin is the upper-left corner of the image, the X axis is horizontal, and the Y axis is vertical.
type	String	Document area type, including **text**, **title**, **sub_title**, **image**, **image_caption**, **form**, **table**, **table_caption**, **header**, **footer**, **page_number**, **reference**, **formula**, **stamp**, and **directory**.
text	String	Text in the document area. For tables and images, the text content is not returned.
words_ids	Array of integers	Index list of character recognition results, indicating which text blocks in **words_block_list** of **ocr_result** are located within the document area.

Parameter	Type	Description
table_id	Integer	This parameter is returned only when **type** is **table** and the input parameter **table** is **True**, indicating which recognition result corresponds to the current logical table area in **table_result**.
form_id	Integer	This parameter is returned only when **type** is **form** and the input parameter **table** is **True**, indicating which recognition result corresponds to the current wired form area in **form_result**.

Table 4-14 SmartDocumentRecognizerFormResult

Parameter	Type	Description
form_count	Integer	Number of wired forms recognized by the model
form_list	Array of **SmartDocumentRecognizerTableBlock** objects	List of wired form recognition results

Table 4-15 SmartDocumentRecognizerTableBlock

Parameter	Type	Description
location	Array<Array<Integer>>	Location information of the current table, in list format, indicating the X and Y coordinates of the four vertices in a text block. The coordinate origin is the upper left corner of the image, the X axis is horizontal, and the Y axis is vertical.
words_block_count	Integer	Number of cells in a table
words_block_list	Array of **SmartDocumentRecognizerTableWordsBlock** objects	List of cell recognition results
excel	String	Base64 encoded string of the table recognition results. This parameter is returned only when **return_excel** is set to **True**. Decode the returned code using base64.b64decode and save it as an .xlsx file.

Table 4-16 SmartDocumentRecognizerTableWordsBlock

Parameter	Type	Description
words	String	Character recognition results in a cell
rows	Array of integers	Rows occupied by text. The values start from 0 and are displayed in a list. The data type is **Integer**.
columns	Array of integers	Columns occupied by text. The values start from 0 and are displayed in a list. The data type is **Integer**.

Table 4-17 SmartDocumentRecognizerFormulaResult

Parameter	Type	Description
formula_count	Integer	Number of mathematical formulas
formula_list	Array of **SmartDocumentRecognizerFormulaBlock** objects	List of mathematical formula recognition results

Table 4-18 SmartDocumentRecognizerFormulaBlock

Parameter	Type	Description
formula	String	Mathematical formula recognition results, which are represented as LaTeX strings
location	Array<Array<Integer>>	Mathematical formula location information, in list format, indicating the X and Y coordinates of the four vertices. The coordinate origin is the upper left corner of the image and has a horizontal X axis and vertical Y axis.

Status code: 400

Table 4-19 Response body parameters

Parameter	Type	Description
error_code	String	Error code of a failed API call. For details, see **Error Codes**. This parameter is not returned for a successful call.
error_msg	String	Error message when the API call fails. This parameter is not included when the API is successfully called.

Example Request

- Transfer the Base64 encoded string of the document image for recognition.

```
POST https://{endpoint}/v2/{project_id}/ocr/smart-document-recognizer

{
  "data" : "/9j/4AAQSkZJRgABAgEASABIAAD/4RFZRXhpZgAATU0AKgAAAA..."
}
```

- Transfer the URL of the document image for recognition.

```
POST https://{endpoint}/v2/{project_id}/ocr/smart-document-recognizer

{
  "url" : "https://BucketName.obs.myhuaweicloud.com/ObjectName"
}
```

Example Response

Status code: 200

Status Codes

Status Code	Description
200	Example response for a successful request
400	Example response for a failed request

See **Status Codes**.

Error Codes

See **Error Codes**.

4.2 ID Document

NOTE

ID Document OCR will be officially terminated on February 18, 2025. To ensure your business operations remain unaffected, migrate your workloads as soon as possible. For details, see **Notice on Termination of ID Document OCR**.

Function

This API detects and extracts text from images of identity documents and converts the text into a structured format. These documents include ID cards, driving licenses, and passports from multiple countries and regions. **Table 4-20** lists the mapping between supported countries/regions and document types. For details about the constraints on using this API, see **Constraints and Limitations**. For details about how to use this API, see **Introduction to OCR**.

Table 4-20 Mapping between countries/regions and document types

Country/Region	Code	Document Type
Vietnam	VNM	PP, DL, and ID
India	IND	PP
Philippines	PHL	PP, DL, ID (UMID only)
Albania	ALB	PP, DL, and ID
Brazil	BRA	PP
Indonesia	IDN	PP
Malaysia	MYS	PP
Nigeria	NGA	PP
Pakistan	PAK	PP
Russia	RUS	PP (Only the international standard version is supported.)
Taiwan (China)	TWN	PP
Ukraine	UKR	PP
Thailand	THA	ID and PP
Chile	CHL	ID and PP
Hong Kong (China)	HKG	ID

Country/Region	Code	Document Type
• PP: passport • DL: driving license • ID: identification card, which is an identity card issued by a country or region, such as an ID card, voter registration card, and social security card.		

Constraints and Limitations

- Only images in JPEG, JPG, PNG, BMP, or TIFF format can be recognized.
- No side of the image can be smaller than 100 or larger than 8,192 pixels.

Calling Method

For details, see **Calling APIs**.

Prerequisites

Before using this API, subscribe to the service and complete authentication. For details, see **Subscribing to an OCR Service** and **Authentication**.

NOTE

Before you use the service for the first time, subscribe to the service by clicking **Subscribe**. You only need to subscribe to the service once. If you have not subscribed to the service yet, error "ModelArts.4204" will be displayed when you call this API. Before you call the API, log in to the OCR console and subscribe to the corresponding service. Ensure that you make the subscription to the service in the same region where you want to call this API.

URI

POST /v2/{project_id}/ocr/id-document

Table 4-21 URI parameters

Parameter	Mandatory	Description
endpoint	Yes	Endpoint, which is the request address for calling an API. The endpoint varies depending on services in different regions. For more details, see **Endpoints**.
project_id	Yes	Project ID, which can be obtained by referring to **Obtaining a Project ID**.

Request Parameters

Table 4-22 Request header parameters

Parameter	Mandatory	Type	Description
X-Auth-Token	Yes	String	User token Used to obtain the permission to call APIs. The token is the value of **X-Subject-Token** in the response header in **Authentication**.
Content-Type	Yes	String	MIME type of the request body. The value is **application/json**.

Parameter	Mandatory	Type	Description
Enterprise-Project-Id	No	String	Enterprise project ID. OCR uses Enterprise Project Management Service (EPS) to split fees for resources used by different user groups and users. To obtain the enterprise project ID, go to the **Enterprise Project Management** console, click the enterprise project name, and obtain the enterprise project ID on the enterprise project details page.  For details about how to create an enterprise project, see *Optical Character Recognition User Guide*. **NOTE** After an enterprise project is created, parameter transfer involves the following scenarios: • If a correct enterprise project ID is carried and the OCR service can be used properly, the bills will be categorized under the corresponding enterprise project for that ID. • If an enterprise project ID that is in the correct format but does not actually exist is carried, and the OCR service can be used properly, the bills will display the corresponding non-existent enterprise project ID. • If no enterprise project ID or an enterprise project ID with incorrect format (such as special characters) is carried, and the OCR service can be used properly, the bills will be categorized under **default**.

Table 4-23 Request body parameters

Parameter	Mandatory	Type	Description
image	No	String	Set either this parameter or **url**. Base64-encoded image file. The image file has a size limit of 10 MB. No side of the image can be smaller than 100 or larger than 8,192 pixels. Only images in JPEG, JPG, PNG, BMP, or TIFF format can be recognized.
url	No	String	Set either this parameter or **image**. Image URL. Currently, the following URLs are supported: Image URL. Currently, the following URLs are supported: ● Public HTTP/HTTPS URL ● URL provided by OBS. You need to be authorized to use OBS data, including service authorization, temporary authorization, and anonymous public authorization. **NOTE** ● The API response time depends on the image download time. If the image download takes a long time, the API call will fail. ● Ensure that the storage service where the image to be detected resides is stable and reliable. OBS is recommended for storing image data.

Parameter	Mandatory	Type	Description
country_region	No	Array of strings	Code of the country or region where a certificate is issued. The code must be defined in ISO 3166-1 alpha-2 codes. This parameter is optional. You can enter one or more country/region codes. After this parameter is specified, the service identifies cards only in the specified country or region. If this parameter is left blank, all supported cards are identified. It is recommended that this field be filled in when the country/region is fixed or limited. For the list of supported countries and regions, see **Table 4-20**. **NOTE** This parameter is mandatory when Vietnamese is recognized.
id_type	No	Array of strings	Document type. This parameter is optional. One or more types of documents are supported. If this parameter is specified, the service identifies only the documents of the specified type. If this parameter is left blank, all types of documents are identified by default. You are advised to configure this parameter if the document type is known. The following document types are supported: • **PP**: passport • **DL**: driving license • **ID**: identity card, which is an identity card issued by a country or region, such as an ID card, voter registration card, and social security card.

Parameter	Mandatory	Type	Description
return_portrait_image	No	Boolean	Whether to return the portrait image (face image in the document). The value **true** indicates that the portrait image needs to be returned, and the value **false** indicates that the portrait image does not need to be returned.

Response Parameters

Status code: 200

Table 4-24 Response body parameter

Parameter	Type	Description
result	**IdDocumentItem** object	Recognition result This parameter is not included when the API fails to be called.

Table 4-25 IdDocumentItem

Parameter	Type	Description
country_region	String	Code of the country or region where a certificate is issued. The code must be defined in ISO 3166-1 alpha-2 codes. For the list of supported countries and regions, see **Table 4-20**.
id_type	String	Document type. The options are: • **PP**: passport • **DL**: driving license • **ID**: identity card, which is an identity card issued by a country or region, such as an ID card, voter registration card, and social security card.
side	String	Front or back of an identity document. The options are: • **front**: front side of the document, which is typically the side that contains a portrait. • **back**: **front** is returned if a document has only one side.

Parameter	Type	Description
first_name	String	First name
last_name	String	Last name
sex	String	Gender. The options are: **M**: male; **F**: female; **X**: third gender.
nationality	String	Nationality of the document holder
birth_date	String	Date of birth, in YYYY-MM-DD format
issue_date	String	Date of issue, in YYYY-MM-DD format
expiry_date	String	Expiration date, in YYYY-MM-DD format
document_number	String	Document number
address	String	Contact address of the holder
issuing_authority	String	Issuing authority
portrait_image	String	Base64 encoded string of the portrait on the document, which is optional
confidence	Object	Field confidence. The value is a decimal ranging from 0 to 1. A larger value indicates more reliable recognition results.

Status code: 400

Table 4-26 Response body parameters

Parameter	Type	Description
error_code	String	Error code of a failed API call. For details, see **Error Codes**. This parameter is not returned for a successful call.
error_msg	String	Error message when the API call fails. This parameter is not included when the API is successfully called.

Example Request

NOTE

- **endpoint** is the request URL for calling an API. Endpoints vary depending on services and regions. For details, see **Endpoints**.

  For example, ID Document OCR is deployed in the **CN-Hong Kong** region. The endpoint is **ocr.ap-southeast-1.myhuaweicloud.com** or **ocr.ap-southeast-1.myhuaweicloud.cn**. The request URL is **https://ocr.ap-southeast-1.myhuaweicloud.com/v2/{project_id}/ocr/id-document**. **project_id** is the project ID. For how to obtain the project ID, see **Obtaining a Project ID**.
- For details about how to obtain a token, see **Making an API Request**.

- Request example (Method 1: Use the image Base64 string.)

```
POST https://{endpoint}/v2/{project_id}/ocr/id-document

{
  "image" : "/9j/4AAQSkZJRgABAgEASABIAAD/4RFZRXhpZgAATU0AKgAAAA...",
  "country_region" : "ALB",
  "id_type" : "PP"
}
```

- Request example (Method 2: Use the image URL.)

```
POST https://{endpoint}/v2/{project_id}/ocr/id-document

{
  "url" : "https://BucketName.obs.xxxx.com/ObjectName",
  "country_region" : "ALB",
  "id_type" : "PP"
}
```

Example Response

Status code: 200

Example response for a successful request

```
{
  "result" : {
    "country_region" : "ALB",
    "id_type" : "PP",
    "side" : "front"
  }
}
```

Status code: 400

Example response for a failed request

```
{
  "error_code" : "AIS.0103",
  "error_msg" : "The image size does not meet the requirements."
}
```

Example SDK Code

The example SDK code is as follows:

NOTE

You are advised to update the SDKs to the latest versions before use to prevent the local outdated SDKs from being unable to use the latest OCR functions.

4.3 General Table

Function

This API detects and extracts text from images of general tables and converts the text into JSON format. The returned results include two types of image area (words_region): text area (text) and table area (table). They also include table structures (rows and columns) and text information. For details about the constraints on using this API, see **Constraints and Limitations**. For details about how to use this API, see **Introduction to OCR**.

Constraints and Limitations

- Only images in PNG, JPG, JPEG, BMP, or TIFF format can be recognized.
- No side of the image can be smaller than 15 or larger than 8,192 pixels.
- The area to be recognized must occupy more than 80% of the image. When scanning a table, ensure that the entire table and its surrounding area are included in the image.
- An image can be rotated to any angle.
- Text in images with complex backgrounds (such as outdoor scenery or anti-counterfeit watermarks) or distorted table lines cannot be recognized.
- English and Chinese are supported but support for traditional Chinese characters is limited.

Calling Method

For details, see **Calling APIs**.

Prerequisites

Before using this API, subscribe to the service and complete authentication. For details, see **Subscribing to an OCR Service** and **Authentication**.

NOTE

Before using the service for the first time, you need to enable the service by clicking **Subscribe**. You only need to subscribe to the service once. If you have not subscribed to the service yet, error "ModelArts.4204" will be displayed when you call this API. Before you call the API, log in to the OCR console and subscribe to the corresponding service. Ensure that you make the subscription to the service in the same region where you want to call this API.

URI

POST /v2/{project_id}/ocr/general-table

Table 4-27 URI parameters

Parameter	Mandatory	Description
endpoint	Yes	Endpoint, which is the request address for calling an API. The endpoint varies depending on services in different regions. For more details, see **Endpoints**.
project_id	Yes	Project ID, which can be obtained from **Obtaining a Project ID**.

Request Parameters

Table 4-28 Request header parameters

Parameter	Mandatory	Type	Description
X-Auth-Token	Yes	String	User token Used to obtain the permission to call APIs. The token is the value of **X-Subject-Token** in the response header in **Authentication**.
Content-Type	Yes	String	MIME type of the request body. The value is **application/json**.

Parameter	Mandatory	Type	Description
Enterprise-Project-Id	No	String	Enterprise project ID. OCR uses Enterprise Project Management Service (EPS) to split fees for resources used by different user groups and users. To obtain the enterprise project ID, go to the **Enterprise Project Management** console, click the enterprise project name, and obtain the enterprise project ID on the enterprise project details page.  For details about how to create an enterprise project, see *Optical Character Recognition User Guide*. **NOTE** After an enterprise project is created, parameter transfer involves the following scenarios: • If a correct enterprise project ID is carried and the OCR service can be used properly, the bills will be categorized under the corresponding enterprise project for that ID. • If an enterprise project ID that is in the correct format but does not actually exist is carried, and the OCR service can be used properly, the bills will display the corresponding non-existent enterprise project ID. • If no enterprise project ID or an enterprise project ID with incorrect format (such as special characters) is carried, and the OCR service can be used properly, the bills will be categorized under **default**.

Table 4-29 Request body parameters

Parameter	Mandatory	Type	Description
image	No	String	Set either this parameter or **url**. Base64-encoded image file. The image file has a size limit of 10 MB. No side of the image can be smaller than 15 or larger than 8,192 pixels. Only images in JPEG, JPG, PNG, BMP, or TIFF format can be recognized. An example is **/9j/4AAQSkZJRgABAg...**. If the image data contains an unnecessary prefix, the error "The image format is not supported" is reported.
url	No	String	Set either this parameter or **image**. Image URL. Currently, the following URLs are supported: • Public HTTP/HTTPS URL • URL provided by OBS. You need to be authorized to use OBS data, including service authorization, temporary authorization, and anonymous public authorization. For details, see **Configuring Access Permissions of OBS**. **NOTE** • The API response time depends on the image download time. If the image download takes a long time, the API call will fail. • Ensure that the storage service where the image to be detected resides is stable and reliable. OBS is recommended for storing image data. • The URL cannot contain Chinese characters. If Chinese characters exist, they must be encoded using UTF-8.
return_text_location	No	Boolean	Whether to return coordinates of text blocks and cells. Value options are as follows: • **true**: Coordinates of text blocks and cells will be returned. • **false**: Coordinates of text blocks and cells will not be returned. If this parameter is not specified, **false** is used by default.

Parameter	Mandatory	Type	Description
return_char_location	No	Boolean	Coordinate information of a single character. The options are as follows: • **true**: The coordinates of a single character will be returned. • **false**: The coordinates of a single character will not be returned. If this parameter is not specified, **false** is used by default. If this parameter is set to **true**, **return_text_location** must be **true**.
return_confidence	No	Boolean	Whether the confidence will be returned. The options are as follows: • **true**: The confidence will be returned. • **false**: The confidence will not be returned. If this parameter is not specified, **false** is used by default. In this case, the confidence will not be returned.
return_excel	No	Boolean	Whether to return the Base64-encoded field for converting a table into a Microsoft Excel file. The options are as follows: • **true**: The Base64-encoded **excel** field will be returned. • **false**: The Base64-encoded **excel** field will not be returned. The default value is **false**. You can use the Python function **base64.b64decode** to decode the returned Excel code and save it as an .xlsx file.
return_rectification_matrix	No	Boolean	The options are as follows: • **true**: The perspective transformation matrix will be returned. • **false**: The perspective transformation matrix will not be returned. If this parameter is not specified, **false** is used by default. In this case, the perspective transformation matrix will not be returned.

Parameter	Mandatory	Type	Description
with_borders	No	Boolean	The options are as follows: • **true**: The input image contains only bordered tables, and only such tables are recognized. • **false**: The input image may contain borderless tables, and both bordered and borderless tables are recognized. If this parameter is not specified, the default value **false** is used. If the input image contains only bordered tables, set this parameter to **true** to achieve more accurate recognition results.

Response Parameters

NOTE

The status code may vary depending on the recognition results. For example, **200** indicates that the API is successfully called, and **400** indicates that the API fails to be called. The following describes the status codes and corresponding response parameters.

Status code: 200

Table 4-30 Response body parameter

Parameter	Type	Description
result	**GeneralTableResult** object	Calling result of a successful API call This parameter is not included when the API fails to be called.

Table 4-31 GeneralTableResult

Parameter	Type	Description
words_region_count	Integer	Number of text areas
words_region_list	Array of **WordsRegionList** objects	List of recognition results in text areas. The output sequence is from left to right and from top to bottom.

Parameter	Type	Description
excel	String	The table image is converted into the Base64 code of the Excel file. The text and table in the image are written into the Excel file by position. Decode the returned code using base64.b64decode and save it as an .xlsx file.

Table 4-32 WordsRegionList

Parameter	Type	Description
type	String	Type of the text identification area. The options are as follows: • **text**: text recognition area • **table**: table recognition area
words_block_count	Integer	Number of text blocks recognized in a sub-area
words_block_list	Array of **GeneralTableWordsBlockList** objects	List of text blocks recognized in a sub-area. The output sequence is from left to right and from top to bottom.

Table 4-33 GeneralTableWordsBlockList

Parameter	Type	Description
words	String	Recognition result of a text block
confidence	Float	Average confidence of fields. A higher confidence indicates a higher accuracy of the field identified. The confidence is calculated using algorithms and is not equal to the accuracy.
location	Array<Array<Integer>>	Text block location information, in list format, indicating the X and Y coordinates of the four vertices in a text block. The coordinate origin is the upper left corner of the image, the X axis is horizontal, and the Y axis is vertical.
words_list	Array of **WordsListItem** objects	List of the character blocks in a cell. The output sequence is from left to right and from top to bottom. This parameter is available only when the input parameter **return_text_location** is set to **true**.

Parameter	Type	Description
rows	Array of integers	Rows occupied by text. The values start from 0 and are displayed in a list. The data type is **Integer**. This parameter is valid only in table recognition areas, that is, this parameter is valid only when **type** is **table**.
columns	Array of integers	Columns occupied by text. The values start from 0 and are displayed in a list. The data type is **Integer**. This parameter is valid only in table recognition areas, that is, this parameter is valid only when **type** is **table**.
cell_location	Array<Array<Integer>>	Cell position information, in list format, indicating the X and Y coordinates of the four vertices in a cell. The coordinate origin is the upper left corner of the image, the X axis is horizontal, and the Y axis is vertical.

Table 4-34 WordsListIem

Parameter	Type	Description
words	String	Recognition result of a text block
confidence	Float	Average confidence of fields. A higher confidence indicates a higher accuracy of the field identified. The confidence is calculated using algorithms and is not equal to the accuracy.
location	Array<Array<Integer>>	Text block location information, in list format, indicating the X and Y coordinates of the four vertices in a text block. The coordinate origin is the upper left corner of the image, the X axis is horizontal, and the Y axis is vertical.
char_list	Array of **CharListIem** objects	List of the character blocks in a cell. The output sequence is from left to right and from top to bottom. This parameter is available only when the input parameters **return_text_location** and **return_char_location** are both set to **true**.

Table 4-35 CharListIem

Parameter	Type	Description
char	String	Recognition result of a single character

Parameter	Type	Description
char_confidence	Float	Confidence of a single character. A higher confidence indicates a higher accuracy of the field identified. The confidence is calculated using algorithms and is not equal to the accuracy.
char_location	Array<Array<Integer>>	Location information of a single character, in list format, indicating the X and Y coordinates of the four vertices in a text block. The coordinate origin is the upper left corner of the image, the X axis is horizontal, and the Y axis is vertical.

Status code: 400

Table 4-36 Response body parameters

Parameter	Type	Description
error_code	String	Error code of a failed API call. For details, see **Error Codes**. This parameter is not returned when the API is successfully called.
error_msg	String	Error message when the API call fails. This parameter is not included when the API is successfully called.

Example Request

NOTE

- **endpoint** is the request URL for calling an API. Endpoints vary depending on services and regions. For details, see **Endpoints**.

  For example, General Table OCR is deployed in the **AP-Singapore** region. The endpoint is **ocr.ap-southeast-3.myhuaweicloud.com** or **ocr.ap-southeast-3.myhuaweicloud.cn**. The request URL is **https://ocr.ap-southeast-3.myhuaweicloud.com/v2/{project_id}/ocr/general-table**. **project_id** is the project ID. For how to obtain the project ID, see **Obtaining a Project ID**.
- For details about how to obtain a token, see **Authentication**.

- Transfer the Base64 code of a table image for recognition and does not return the confidence.

```
POST https://{endpoint}/v2/{project_id}/ocr/general-table
 Request Header:
 Content-Type: application/json
 X-Auth-Token:
MIINRwYJKoZIhvcNAQcCoIINODCCDTQCAQExDTALBglghkgBZQMEAgEwgguVBgkqhkiG...
 Request Body:
 {
   "image":"/9j/4AAQSkZJRgABAgEASABIAAD/4RFZRXhpZgAATU0AKgAAAAg...",
```

```
  "return_confidence":false
 }
```

- Transfer the URL of a table image for recognition and does not return the confidence.

```
POST https://{endpoint}/v2/{project_id}/ocr/general-table
 Request Header:
 Content-Type: application/json
 X-Auth-Token:
MIINRwYJKoZIhvcNAQcCoIINODCCDTQCAQExDTALBglghkgBZQMEAgEwgguVBgkqhkiG...
 Request Body:
 {
    "url":"https://BucketName.obs.xxxx.com/ObjectName",
    "return_confidence":false
 }
```

Example Response

Status code: 200

Example response for a successful request

```
{
  "result": {
    "words_region_count": 2,
    "words_region_list" : [ {
      "type" : "text",
      "words_block_count" : 1,
      "words_block_list" : [ {
        "words": "Text block 1 recognized in the text area",
        "confidence" : 0.9991
      } ]
    }, {
      "type" : "table",
      "words_block_count" : 2,
      "words_block_list" : [ {
        "words": "Text block 1 recognized in the table area",
        "confidence" : 0.9942,
        "rows" : [ 0 ],
        "columns" : [ 0 ]
      }, {
        "words": "Text block 2 recognized in the table area",
        "confidence" : 0.914,
        "rows" : [ 0 ],
        "columns" : [ 1, 2 ]
      } ]
    } ]
  }
}
```

Status code: 400

Example response for a failed request

```
{
  "result" : {
    "error_code" : "AIS.0103",
    "error_msg" : "The image size does not meet the requirements."
  }
}
```

Example SDK Code

The example SDK code is as follows:

NOTE

You are advised to update the SDKs to the latest versions before use to prevent the local outdated SDKs from being unable to use the latest OCR functions.

        fmt.Printf("%+v\n", response)
    } else {
        fmt.Println(err)
    }
}
```

More Programming Languages

For more SDK code examples in various programming languages, see the **Sample Code** tab on the right of the **API Explorer** page, which can automatically generate corresponding SDK code examples.

Status Codes

Status Code	Description
200	Example response for a successful request
400	Example response for a failed request

See **Status Codes**.

Error Codes

See **Error Codes**.

4.4 General Text

Function

This API detects and extracts text from images and converts the text and coordinates into JSON format. It can be used in various scenarios, such as scanned files, electronic documents, books, receipts, and forms.

English and Chinese are supported but support for traditional Chinese characters is limited. For the notes and constraints on using this API, see **Notes and Constraints**. For how to use this API, see **Introduction to OCR**.

Notes and Constraints

- Only images in PNG, JPG, JPEG, BMP, GIF, TIFF, WebP, PCX, ICO, PSD, or PDF format can be recognized.
- No side of the image can be smaller than 15 or larger than 8,192 pixels.
- The area to be recognized must occupy more than 80% of the image. When scanning a table, ensure that all text and its surrounding area are included in the image.
- An image can be rotated to any angle.
- Light-colored text watermarks can be automatically filtered out.
- Text in images with complex backgrounds (such as outdoor scenery) or distorted text cannot be recognized.
- Supported languages: Chinese, English, some traditional Chinese, Malay, Ukrainian, Hindi, Russian, Vietnamese, Indonesian, Thai, Arabic, German, Latin, French, Italian, Spanish, Portuguese, Romanian, Polish Amharic, Japanese, Korean, Turkish, Norwegian, Danish, Swedish, Khmer, and Hebrew.

Calling Method

For details, see **Calling APIs**.

Prerequisites

Before using this API, subscribe to the service and complete authentication. For details, see **Subscribing to an OCR Service** and **Authentication**.

NOTE

Before using the service for the first time, you need to enable the service by clicking **Subscribe**. You only need to subscribe to the service once. If you have not subscribed to the service yet, error "ModelArts.4204" will be displayed when you call this API. Before you call the API, log in to the OCR console and subscribe to the corresponding service. Ensure that you make the subscription to the service in the same region where you want to call this API.

URI

POST /v2/{project_id}/ocr/general-text

Table 4-37 URI parameters

Parameter	Mandatory	Description
endpoint	Yes	Endpoint, which is the request address for calling an API. The endpoint varies depending on services in different regions. For more details, see **Endpoints**.
project_id	Yes	Project ID, which can be obtained from **Obtaining a Project ID**.

Request Parameters

Table 4-38 Request header parameters

Parameter	Mandatory	Type	Description
X-Auth-Token	Yes	String	User token Used to obtain the permission to call APIs. The token is the value of **X-Subject-Token** in the response header in **Authentication**.
Content-Type	Yes	String	MIME type of the request body. The value is **application/json**.

Parameter	Mandatory	Type	Description
Enterprise-Project-Id	No	String	Enterprise project ID. OCR uses Enterprise Project Management Service (EPS) to split fees for resources used by different user groups and users. To obtain the enterprise project ID, go to the **Enterprise Project Management** console, click the enterprise project name, and obtain the enterprise project ID on the enterprise project details page.  For details about how to create an enterprise project, see *Optical Character Recognition User Guide*. **NOTE** After an enterprise project is created, parameter transfer involves the following scenarios: • If a correct enterprise project ID is carried and the OCR service can be used properly, the bills will be categorized under the corresponding enterprise project for that ID. • If an enterprise project ID that is in the correct format but does not actually exist is carried, and the OCR service can be used properly, the bills will display the corresponding non-existent enterprise project ID. • If no enterprise project ID or an enterprise project ID with incorrect format (such as special characters) is carried, and the OCR service can be used properly, the bills will be categorized under **default**.

Table 4-39 Request body parameters

Parameter	Mandatory	Type	Description
image	No	String	Set either this parameter or **url**. Base64 encoded string of an image file. The image file has a size limit of 10 MB. No side of the image can be smaller than 15 or larger than 8,192 pixels. Only images in JPEG, JPG, PNG, BMP, GIF, TIFF, WebP, PCX, ICO, PDF, or PSD format can be recognized. An example is **/9j/4AAQSkZJRgABAg...**. If the image data contains an unnecessary prefix, the error "The image format is not supported" is reported.
url	No	String	Set either this parameter or **image**. Image URL. Currently, the following URLs are supported: • Public HTTP/HTTPS URL • URL provided by OBS. You need to be authorized to use OBS data, including service authorization, temporary authorization, and anonymous public authorization. For details, see **Configuring Access Permissions of OBS**. **NOTE** • The API response time depends on the image download time. If the image download takes a long time, the API call will fail. • Ensure that the storage service where the image to be detected resides is stable and reliable. OBS is recommended for storing image data. • The URL cannot contain Chinese characters. If Chinese characters exist, they must be encoded using UTF-8.

Parameter	Mandatory	Type	Description
detect_direction	No	Boolean	Whether to align the tilted image. The options are: • **true**: The tilted image will be aligned. • **false**: The tilted image will not be aligned. An image tilted to any angle can be aligned. If this parameter is not specified, **false** is used by default. If the image to be recognized is tilted, you are advised to set this parameter to **true**.
quick_mode	No	Boolean	Whether to enable the quick mode. For a single-line text image (the image contains only one line of text and the text area occupies more than 50% of the image), the recognition results can be returned more quickly when this quick mode is enabled. The options are: • **true**: The quick mode will be enabled. • **false**: The quick mode will be disabled. If this parameter is not specified, **false** is used by default. In this case, the quick mode will be disabled.
character_mode	No	Boolean	Whether to enable the single-character mode. The options are: • **true**: The single-character mode is enabled. • **false**: The single-character mode is disabled. If this parameter is not transferred, the default value **false** is used, and information about a single character that occupies a text line is not returned.

Parameter	Mandatory	Type	Description
language	No	String	Language. If this parameter is not specified, Chinese and English will be used by default. The options are: • **auto**: automatic language classification • **ms**: Malay • **uk**: Ukrainian • **hi**: Hindi • **ru**: Russian • **vi**: Vietnamese • **id**: Indonesian • **th**: Thai • **zh**: Chinese and English • **ar**: Arabic • **de**: German • **la**: Latin • **fr**: French • **it**: Italian • **es**: Spanish • **pt**: Portuguese • **ro**: Romanian • **pl**: Polish • **am**: Amharic • **ja**: Japanese • **ko**: Korean • **tr**: Turkish • **no**: Norwegian • **da**: Danish • **sv**: Swedish • **km**: Khmer • **he**: Hebrew

Parameter	Mandatory	Type	Description
single_orientation_mode	No	Boolean	Whether to enable the single direction mode. The options are: • **true**: The single direction mode is enabled. • **false**: The single direction mode is disabled. If not specified, **false** is used by default. In this case, the fields in the image are recognized as in multiple directions by default.
pdf_page_number	No	Integer	Specify which page of the PDF to recognize. If passed in, the content on the specified page is identified. If not specified, the default is to recognize the first page.

Response Parameters

NOTE

The status code may vary depending on the recognition results. For example, **200** indicates that the API is successfully called, and **400** indicates that the API fails to be called. The following describes the status codes and corresponding response parameters.

Status code: 200

Table 4-40 Response body parameter

Parameter	Type	Description
result	**GeneralTextResult** object	Recognition result This parameter is not returned when the API fails to be called.

Table 4-41 GeneralTextResult

Parameter	Type	Description
direction	Float	Image direction • This parameter is valid only when **detect_direction** is set to **true**. The anti-clockwise rotation angle of an image is returned. The value ranges from 0 to 359. • When **detect_direction** is set to **false**, the value of this parameter is **-1**.

Parameter	Type	Description
words_block_count	Integer	Number of detected text blocks
words_block_list	Array of **GeneralTextWordsBlockList** objects	List of recognized text blocks. The output sequence is from left to right and from top to bottom.

Table 4-42 GeneralTextWordsBlockList

Parameter	Type	Description
words	String	Recognition result of a text block
location	Array<Array<Integer>>	List of location information about a text block, including the 2D coordinates (x, y) of four vertexes in the text area, where the coordinate origin is the upper-left corner of the image, the X axis is horizontal, and the Y axis is vertical.
confidence	Float	Confidence of a recognized text block
char_list	Array of **GeneralTextCharList** objects	Single-character recognition list corresponding to a text block. The output sequence is from left to right and from top to bottom.

Table 4-43 GeneralTextCharList

Parameter	Type	Description
char	String	Recognition result of a single character
char_location	Array<Array<Integer>>	List of location information about a single character, including the 2D coordinates (x, y) of four vertexes in the character area, where the coordinate origin is the upper-left corner of the image, the X axis is horizontal, and the Y axis is vertical.
char_confidence	Float	Confidence of a recognized character

Status code: 400

Table 4-44 Response body parameters

Parameter	Type	Description
error_code	String	Error code of a failed API call. For details, see **Error Codes**. This parameter is not returned when the API is successfully called.
error_msg	String	Error message when the API call fails This parameter is not returned when the API is successfully called.

Example Request

NOTE

- **endpoint** is the request URL for calling an API. Endpoints vary depending on services and regions. For details, see **Endpoints**.

  For example, General Text OCR is deployed in the **CN-Hong Kong** region. The endpoint is **ocr.ap-southeast-1.myhuaweicloud.com** or **ocr.ap-southeast-1.myhuaweicloud.cn**. The request URL is **https://ocr.ap-southeast-1.myhuaweicloud.com/v2/{project_id}/ocr/general-text**. **project_id** is the project ID. For how to obtain the project ID, see **Obtaining a Project ID**.
- For details about how to obtain a token, see **Authentication**.

- Transfer the Base64 encoded string of the image for recognition. During the recognition, the tilt angle of the image is not verified, and the quick mode is disabled.

```
POST https://{endpoint}/v2/{project_id}/ocr/general-text
 Request Header:
 Content-Type: application/json
 X-Auth-Token:
MIINRwYJKoZIhvcNAQcCoIINODCCDTQCAQExDTALBglghkgBZQMEAgEwgguVBgkqhkiG...
 Request Body:
 {
    "image":"/9j/4AAQSkZJRgABAgEASABIAAD/4RFZRXhpZgAATU0AKgAAAA...",
    "detect_direction":false,
    "quick_mode":false
 }
```

- Transfer the URL of the image for recognition. During the recognition, the tilt angle of the image is not verified, and the quick mode is disabled.

```
POST https://{endpoint}/v2/{project_id}/ocr/general-text
 Request Header:
 Content-Type: application/json
 X-Auth-Token:
MIINRwYJKoZIhvcNAQcCoIINODCCDTQCAQExDTALBglghkgBZQMEAgEwgguVBgkqhkiG...
 Request Body:
 {
     "url":"https://BucketName.obs.xxxx.com/ObjectName",
     "detect_direction":false,
     "quick_mode":false
 }
```

Example Response

Status code: 200

Example response for a successful request

```
{
  "result" : {
    "direction" : 67.6506,
    "words_block_count" : 1,
    "words_block_list" : [ {
      "words" : "Word",
      "confidence" : 0.9999,
      "location" : [ [ 517, 447 ], [ 540, 504 ], [ 505, 518 ], [ 482, 461 ] ],
      "char_list" : [ {
        "char" : "Character",
        "char_location" : [ [ 517, 447 ], [ 530, 479 ], [ 495, 493 ], [ 482, 461 ] ],
        "char_confidence" : 0.9999
      }, {
        "char" : "Character",
        "char_location" : [ [ 530, 479 ], [ 540, 504 ], [ 505, 518 ], [ 495, 493 ] ],
        "char_confidence" : 0.9999
      } ]
    } ]
  }
}
```

Status code: 400

Example response for a failed request

```
{
   "error_code": "AIS.0103",
   "error_msg": "The image size does not meet the requirements."
}
```

Example SDK Code

The example SDK code is as follows:

NOTE

You are advised to update the SDKs to the latest versions before use to prevent the local outdated SDKs from being unable to use the latest OCR functions.

Java

- Transfer the Base64 encoded string of the image for recognition. During the recognition, the tilt angle of the image is not verified, and the quick mode is disabled.

    response, err := client.RecognizeGeneralText(request)
    if err == nil {
        fmt.Printf("%+v\n", response)
    } else {
        fmt.Println(err)
```

```
    }
}
```

More Programming Languages

For more SDK code examples in various programming languages, see the **Sample Code** tab on the right of the **API Explorer** page, which can automatically generate corresponding SDK code examples.

Status Codes

Status Code	Description
200	Example response for a successful request
400	Example response for a failed request

See **Status Codes**.

Error Codes

See **Error Codes**.

4.5 Web Image

Function

This API detects and extracts text from web images and converts the text into a structured JSON format.

For details about the constraints on using this API, see **Constraints and Limitations**. For details about how to use this API, see **Introduction to OCR**.

Constraints and Limitations

- English and Chinese are supported but support for traditional Chinese characters is limited.
- Only images in JPG, JPEG, PNG, BMP, TIFF, TGA, WebP, ICO, PCX, or GIF format can be recognized.
- Common image types are supported, such as mobile phone or desktop screenshots, e-commerce product images, and advertisement design drawings.
- No side of the image can be smaller than 15 or larger than 30,000 pixels.
- The characters to be recognized must occupy more than 60% of the image.
- The web image to be recognized can be rotated to any angle (direction detection must be enabled).

Calling Method

For details, see **Calling APIs**.

Prerequisites

Before using this API, subscribe to the service and complete authentication. For details, see **Subscribing to an OCR Service** and **Authentication**.

NOTE

Before you use the service for the first time, subscribe to the service by clicking **Subscribe**. You only need to subscribe to the service once. If you have not subscribed to the service yet, error "ModelArts.4204" will be displayed when you call this API. Before you call the API, log in to the OCR console and subscribe to the corresponding service. Ensure that you make the subscription to the service in the same region where you want to call this API.

URI

POST /v2/{project_id}/ocr/web-image

Table 4-45 URI parameters

Parameter	Mandatory	Description
endpoint	Yes	Endpoint, which is the request address for calling an API. The endpoint varies depending on services in different regions. For more details, see **Endpoints**.
project_id	Yes	Project ID, which can be obtained from **Obtaining a Project ID**.

Request Parameters

Table 4-46 Request header parameters

Parameter	Mandatory	Type	Description
X-Auth-Token	Yes	String	User token Used to obtain the permission to call APIs. The token is the value of **X-Subject-Token** in the response header in **Authentication**.
Content-Type	Yes	String	MIME type of the request body. The value is **application/json**.

Table 4-47 Request body parameters

Parameter	Mandatory	Type	Description
image	No	String	Set either this parameter or **url**. Base64-encoded image file. The image file has a size limit of 10 MB. No side of the image can be smaller than 15 or larger than 30,000 pixels. Only images in JPG, JPEG, PNG, BMP, TIFF, TGA, WebP, ICO, PCX, or GIF format can be recognized. An example is **/9j/4AAQSkZJRgABAg...**. If the image data contains an unnecessary prefix, the error "The image format is not supported" is reported.
url	No	String	Set either this parameter or **image**. Image URL. Currently, the following URLs are supported: • Public HTTP/HTTPS URL • URL provided by OBS. You need to be authorized to use OBS data, including service authorization, temporary authorization, and anonymous public authorization. For details, see **Configuring Access Permissions of OBS**. **NOTE** • The API response time depends on the image download time. If the image download takes a long time, the API call will fail. • Ensure that the storage service where the image to be detected resides is stable and reliable. OBS is recommended for storing image data. • The URL cannot contain Chinese characters. If Chinese characters exist, they must be encoded using UTF-8.

Parameter	Mandatory	Type	Description
detect_direction	No	Boolean	Whether to align the tilted image. The options are as follows: • **true**: The tilted image will be aligned. • **false**: The tilted image will not be aligned. An image tilted to any angle can be aligned. If this parameter is not specified, **false** is used by default. If the image to be recognized is tilted, you are advised to set this parameter to **true**.
extract_type	No	Array of strings	Structured data extraction parameter list. Currently, only the image width and height are supported. The input parameter value of the image width and height is **image_size**. If this parameter is not set or is deleted, this parameter will not be used.
detect_font	No	Boolean	The value is of the Boolean type. If this parameter is not specified, slice fonts are not detected by default. If this parameter is set to **True**, the slice font type is detected and the five most similar font names are returned.
detect_text_direction	No	Boolean	The value is of the Boolean type. If this parameter is not transferred, the default value **True** is used, indicating that the text direction of each field is detected. If this parameter is set to **False**, the text direction is not detected. If all text in the image faces up, you are advised to set this parameter to **False**.

Response Parameters

NOTE

The status code may vary depending on the recognition results. For example, **200** indicates that the API is successfully called, and **400** indicates that the API fails to be called. The following describes the status codes and corresponding response parameters.

Status code: 200

Table 4-48 Response body parameter

Parameter	Type	Description
result	**WebImageResult** object	Calling result of a successful API call This parameter is not included when the API fails to be called.

Table 4-49 WebImageResult

Parameter	Type	Description
words_block_count	Integer	This parameter is not included when the API fails to be called.
words_block_list	Array of **WebImageWordsBlockList** objects	List of text blocks to be recognized. The output sequence is from left to right and from top to bottom.
extracted_data	**WebImageExtractedData** object	Structured JSON results extracted. The key value in the dictionary is the same as the value of **extract_type** in the input parameter list. Currently, only the contact (**contact_info**) and image size (**image_size**) can be extracted. If **extract_type** is left blank or missing, no information is extracted.

Table 4-50 WebImageWordsBlockList

Parameter	Type	Description
words	String	Recognition result of a text block
confidence	Float	Confidence of related fields. A higher confidence indicates a higher accuracy of the field identified. The confidence is calculated using algorithms and is not equal to the accuracy.
location	Array<Array<Integer>>	List of location information about a text block, including the 2D coordinates (x, y) of four vertexes in the text area, where the coordinate origin is the upper-left corner of the image, the X axis is horizontal, and the Y axis is vertical.
font_list	Array of strings	Font type of a text block, in list format, indicating the font type closest to the font of the text in a text block.

Parameter	Type	Description
font_scores	Array of numbers	Probability of the font type to which a text block belongs, in list format, corresponding to font_list, indicating the probability that the text in a text block belongs to a font type.

Table 4-51 WebImageExtractedData

Parameter	Type	Description
contact_info	**WebImageContactInfo** object	Extracted contact information, including the name, phone number, province, city, and detailed address. If **extract_type** does not contain this parameter, this parameter is not included in the response.
image_size	**WebImageImageSize** object	Width and height of an image. If **extract_type** does not contain this parameter, this parameter is not included in the response.

Table 4-52 WebImageContactInfo

Parameter	Type	Description
name	String	Name, which is returned when **contact_info** is specified
phone	String	Contact phone number, which is returned when **contact_info** is specified
province	String	Province, which is returned when **contact_info** is specified
city	String	City, which is returned when **contact_info** is specified
district	String	County or district, which is returned when **contact_info** is specified
detail_address	String	Detailed address (excluding the province, city, and county or district), which is returned when **contact_info** is specified

Table 4-53 WebImageImageSize

Parameter	Type	Description
height	Integer	Image height, which is returned when **image_size** is specified
width	Integer	Image width, which is returned when **image_size** is specified

Status code: 400

Table 4-54 Response body parameters

Parameter	Type	Description
error_code	String	Error code of a failed API call. For details, see **Error Codes**. This parameter is not returned when the API is successfully called.
error_msg	String	Error message when the API call fails. This parameter is not included when the API is successfully called.

Example Request

NOTE

- **endpoint** is the request URL for calling an API. Endpoints vary depending on services and regions. For details, see **Endpoints**.

  For example, Web Image OCR is deployed in the **AP-Bangkok** region. The endpoint is **ocr.ap-southeast-2.myhuaweicloud.com** or **ocr.ap-southeast-2.myhuaweicloud.cn**. The request URL is **https://ocr.ap-southeast-2.myhuaweicloud.com/v2/{project_id}/ocr/web-image**. **project_id** is the project ID. For how to obtain the project ID, see **Obtaining a Project ID**.
- For details about how to obtain a token, see **Authentication**.

- Transfer the Base64 code of a web image for recognition.

```
POST https://{endpoint}/v2/{project_id}/ocr/web-image
Request Header:
Content-Type: application/json
X-Auth-Token:
MIINRwYJKoZIhvcNAQcCoIINODCCDTQCAQExDTALBglghkgBZQMEAgEwgguVBgkqhkiG...

Request Body:
{
    "image":"/9j/4AAQSkZJRgABAgEASABIAAD/..."
}
```

- Transfer the URL of a web image for recognition.

```
POST https://{endpoint}/v2/{project_id}/ocr/web-image
Request Header:
Content-Type: application/json
X-Auth-Token:
MIINRwYJKoZIhvcNAQcCoIINODCCDTQCAQExDTALBglghkgBZQMEAgEwgguVBgkqhkiG...
```

```
Request Body:
{
    "url":"https://BucketName.obs.xxxx.com/ObjectName"
}
```

Example Response

Status code: 200

Example response for a successful request

```
{
  "result": {
     "words_block_count": 3,
     "words_block_list": [
        {
           "words": "Text block 1",
           "confidence": 0.9950,

              [48, 494]
           ]
        }
     ],
     "extracted_data": {}
  }
}
```

Status code: 400

Example response for a failed request

```
{
   "error_code": "AIS.0103",
   "error_msg": "The image size does not meet the requirements."
}
```

Example SDK Code

The example SDK code is as follows:

NOTE

You are advised to update the SDKs to the latest versions before use to prevent the local outdated SDKs from being unable to use the latest OCR functions.

Java

- Transfer the Base64 code of a web image for recognition. During the recognition, the service verifies the tilt angle of the image, determines the font type to be recognized, and checks whether the image contains contact information.

    } else {
        fmt.Println(err)
```

```
    }
}
```

More Programming Languages

For more SDK code examples in various programming languages, see the **Sample Code** tab on the right of the **API Explorer** page, which can automatically generate corresponding SDK code examples.

Status Codes

Status Code	Description
200	Example response for a successful request
400	Example response for a failed request

See **Status Codes**.

Error Codes

See **Error Codes**.

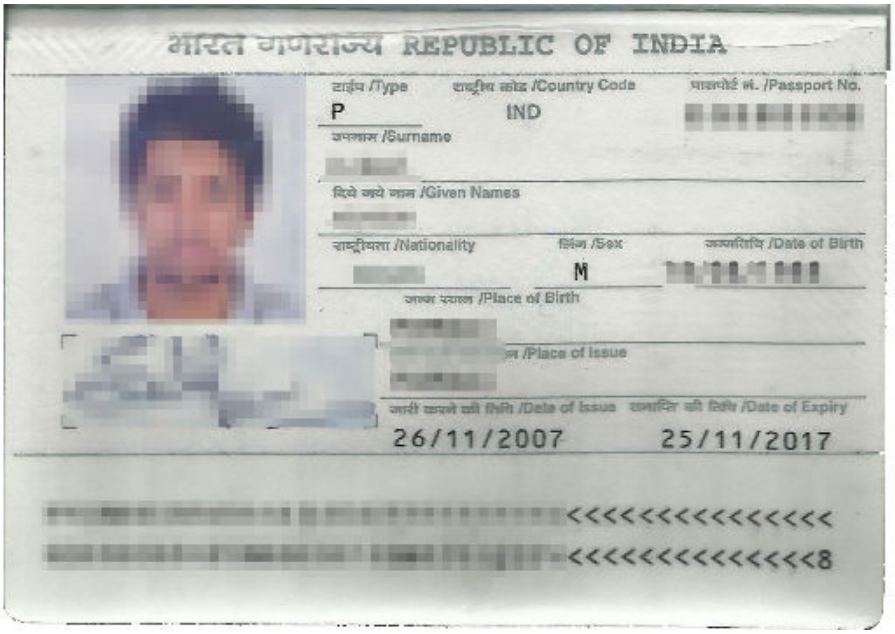
4.6 Passport

Function

This API detects and extracts text from the first page of images of passports and converts the text into a structured JSON format.

In the current version, all fields of a Chinese ordinary electronic passport issued in 2012 or later can be recognized. For passports issued by Hong Kong (China), Macao (China), and Taiwan (China), as well as non-Chinese passports, two lines of internationally standardized machine-readable codes on the bottom of each passport can be recognized, and 7 key fields can be extracted from the codes.For details about the constraints on using this API, see **Constraints and Limitations**. For details about how to use this API, see **Introduction to OCR**.

Figure 4-1 Example passport



Constraints and Limitations

- All fields on Chinese mainland passports can be recognized.
- Passports that are issued by China, Hong Kong (China), Macao (China), Taiwan (China), and other countries and regions and that are with complete machine-readable codes can be recognized.
- Only images in PNG, JPG, JPEG, BMP, or TIFF format can be recognized.
- No side of the image can be smaller than 15 or larger than 8,192 pixels.
- The information page of the passport to be recognized must occupy more than 25% of the image. When scanning a passport, ensure that the entire page is displayed in the image.
- A passport can be rotated to any angle.
- The passport in the image can be moderately distorted, but the aspect ratio cannot be distorted by more than 10%.
- Illuminated or dark images can be recognized, but the accuracy may be compromised.

Calling Method

For details, see **Calling APIs**.

Prerequisites

Before using this API, subscribe to the service and complete authentication. For details, see **Subscribing to an OCR Service** and **Authentication**.

NOTE

Before you use the service for the first time, subscribe to the service by referring to **Subscribing to an OCR Service**. You only need to subscribe to the service once. If you have not subscribed to the service yet, error "ModelArts.4204" will be displayed when you call this API. Before you call the API, log in to the OCR console and subscribe to the corresponding service. Ensure that you make the subscription to the service in the same region where you want to call this API.

URI

POST /v2/{project_id}/ocr/passport

Table 4-55 URI parameters

Parameter	Mandatory	Description
endpoint	Yes	Endpoint, which is the request address for calling an API. The endpoint varies depending on services in different regions. For more details, see **Endpoints**.
project_id	Yes	Project ID, which can be obtained by referring to **Obtaining a Project ID**.

Request Parameters

Table 4-56 Request header parameters

Parameter	Mandatory	Type	Description
X-Auth-Token	Yes	String	User token Used to obtain the permission to call APIs. The token is the value of **X-Subject-Token** in the response header in **Authentication**.
Content-Type	Yes	String	MIME type of the request body. The value is **application/json**.

Table 4-57 Request body parameters

Parameter	Mandatory	Type	Description
image	No	String	Set either this parameter or **url**. Base64-encoded image file. The image file has a size limit of 10 MB. No side of the image can be smaller than 15 or larger than 8,192 pixels. Only images in JPEG, JPG, PNG, BMP, or TIFF format can be recognized. An example is **/9j/4AAQSkZJRgABAg...**. If the image data contains an unnecessary prefix, the error "The image format is not supported" is reported.
url	No	String	Set either this parameter or **image**. Image URL. Currently, the following URLs are supported: • Public HTTP/HTTPS URL • URL provided by OBS. You need to be authorized to use OBS data, including service authorization, temporary authorization, and anonymous public authorization. For details, see **Configuring Access Permissions of OBS** **NOTE** • The API response time depends on the image download time. If the image download takes a long time, the API call will fail. • Ensure that the storage service where the image to be detected resides is stable and reliable. OBS is recommended for storing image data. • The URL cannot contain Chinese characters. If Chinese characters exist, they must be encoded using UTF-8.

Parameter	Mandatory	Type	Description
country_code	No	String	Code of the country where the passport is issued. The passport recognition service is determined based on the country code. • If this parameter is left blank, OCR automatically matches the recognition mode based on the passport type identified by the service. • If you set this parameter to **GENERAL**, the passport is recognized based on the machine-readable code. • If this parameter is set to **CHN**, all fields in the Chinese passport are recognized.

Response Parameters

NOTE

The status code may vary depending on the recognition results. For example, **200** indicates that the API is successfully called, and **400** indicates that the API fails to be called. The following describes the status codes and corresponding response parameters.

Status code: 200

Table 4-58 Response body parameter

Parameter	Type	Description
result	**PassportResult** object	Recognition result This parameter is not returned when the API fails to be called. This parameter consists of the following three parts: 13 key fields, expressed in English; **extra_info**, expressed in local official language; and confidence of key fields. A higher confidence indicates a more accurate result.

Table 4-59 PassportResult

Parameter	Type	Description
passport_type	String	Passport type. The options are: • **P**: ordinary passport for private affairs • **W**: diplomatic passport • **G**: service passport **NOTE** This field is returned only for Chinese mainland passports.
country_code	String	Country code
passport_number	String	Passport number
nationality	String	Nationality of the passport holder **NOTE** This field is returned only for Chinese mainland passports.
surname	String	Family name
given_name	String	Given name
sex	String	Gender
date_of_birth	String	Date of birth, for example, **1990-12-12**
date_of_expiry	String	Passport date of expiry, for example, **2020-07-08**
date_of_issue	String	Date of issue, for example, **2010-07-09** **NOTE** This field is returned only for Chinese mainland passports.
place_of_birth	String	Place of birth **NOTE** This field is returned only for Chinese mainland passports.
place_of_issue	String	Place of issue **NOTE** This field is returned only for Chinese mainland passports.
issuing_authority	String	Issuing authority The abbreviation of the issuing authority of each consulate is not unified. The abbreviation of Chinese issuing authority is **P.R.China**. For example, if the issuing authority is **P.R.C**, the recognition result is **P.R.China**. **NOTE** This field is returned only for Chinese mainland passports.

Parameter	Type	Description
confidence	Object	Confidence of a field. The value ranges from 0 to 1. A higher confidence indicates a higher accuracy of the field identified. The confidence is calculated using algorithms and is not equal to the accuracy.
extra_info	Object	This parameter is left blank by default. For a Chinese passport, the **extra_info** value contains Chinese character-described fields on the passport, such as the name and place of birth. **NOTE** This field is returned only for Chinese mainland passports.

Status code: 400

Table 4-60 Response body parameters

Parameter	Type	Description
error_code	String	Error code of a failed API call. For details, see **Error Codes**. This parameter is not returned when the API is successfully called.
error_msg	String	Error message when the API call fails This parameter is not returned when the API is successfully called.

Example Request

NOTE

- **endpoint** is the request URL for calling an API. Endpoints vary depending on services and regions. For details, see **Endpoints**.

  For example, Passport OCR is deployed in the **CN-Hong Kong** region. The endpoint is **ocr.ap-southeast-1.myhuaweicloud.com or ocr.ap-southeast-1.myhuaweicloud.cn**. The request URL is **https://ocr.ap-southeast-1.myhuaweicloud.com/v2/{project_id}/ocr/passport**. **project_id** is the project ID. For how to obtain the project ID, see **Obtaining a Project ID**.
- For details about how to obtain a token, see **Authentication**.

- Read the Base64 encoded string of a passport image for recognition.

```
POST https://{endpoint}/v2/{project_id}/ocr/passport
Request Header:
Content-Type: application/json
X-Auth-Token:
MIINRwYJKoZIhvcNAQcCoIINODCCDTQCAQExDTALBglghkgBZQMEAgEwgguVBgkqhkiG...
```

```
Request Body:
{
   "image":"/9j/4AAQSkZJRgABAgEASABIAAD/4RFZRXhpZgAATU0AKgAAAA...",
   "country_code": "GENERAL"
}
```

- Read the URL of a passport image for recognition.

```
POST https://{endpoint}/v2/{project_id}/ocr/passport
Request Header:
Content-Type: application/json
X-Auth-Token:
MIINRwYJKoZIhvcNAQcCoIINODCCDTQCAQExDTALBglghkgBZQMEAgEwgguVBgkqhkiG...
Request Body:
{
   "url":"https://BucketName.obs.xxxx.com/ObjectName",
   "country_code": "GENERAL"
}
```

Example Response

Status code: 200

Chinese passport

```

func main() {
    // The AK and SK used for authentication are hard-coded or stored in plaintext, which has great security risks. It is recommended that the AK and SK be stored in ciphertext in configuration files or environment variables and decrypted during use to ensure security.
    // In this example, AK and SK are stored in environment variables for authentication. Before running this example, set environment variables CLOUD_SDK_AK and CLOUD_SDK_SK in the local environment
    ak := os.Getenv("CLOUD_SDK_AK")
    sk := os.Getenv("CLOUD_SDK_SK")

    auth := basic.NewCredentialsBuilder().
        WithAk(ak).
        WithSk(sk).
        Build()

    client := ocr.NewOcrClient(
        ocr.OcrClientBuilder().
            WithRegion(region.ValueOf("<YOUR REGION>")).
            WithCredential(auth).
            Build())

    request := &model.RecognizePassportRequest{}
    countryCodePassportRequestBody:= "CHN"
    urlPassportRequestBody:= "https://BucketName.obs.myhuaweicloud.com/ObjectName"
    request.Body = &model.PassportRequestBody{
        CountryCode: &countryCodePassportRequestBody,
        Url: &urlPassportRequestBody,
    }
    response, err := client.RecognizePassport(request)
    if err == nil {
        fmt.Printf("%+v\n", response)
    } else {
        fmt.Println(err)
    }
}
```

More Programming Languages

For more SDK code examples in various programming languages, see the **Sample Code** tab on the right of the **API Explorer** page, which can automatically generate corresponding SDK code examples.

Status Codes

Status Code	Description
200	Example response for a successful request
400	Example response for a failed request

See **Status Codes**.

Error Codes

See **Error Codes**.

4.7 Thailand ID Card

Function

This API detects and extracts text from images of Thailand-issued national registration cards and converts the text into a structured JSON format. For details about the constraints on using this API, see **Constraints and Limitations**. For details about how to use this API, see **Introduction to OCR**.

Figure 4-2 Example Thailand ID card

Constraints and Limitations

- Only ID cards issued by Thailand can be recognized.
- Only images in PNG, JPG, JPEG, BMP, or TIFF format can be recognized.
- No side of the image can be smaller than 15 or larger than 8,192 pixels.
- An ID card to be recognized must occupy more than 25% of the image. When scanning an ID card, ensure that the entire ID card is displayed in the image.
- An ID card can be rotated to any angle.
- The ID card in the image can be moderately distorted, but the aspect ratio cannot be distorted by more than 10%.

- Illuminated or dark images can be recognized, but the accuracy may be compromised.
- Only the front or back of a single ID card can be identified each time.

Calling Method

For details, see **Calling APIs**.

Prerequisites

Before using this API, subscribe to the service and complete authentication. For details, see **Subscribing to an OCR Service** and **Authentication**.

NOTE

Before you use the service for the first time, subscribe to the service by clicking **Subscribe**. You only need to subscribe to the service once. If you have not subscribed to the service yet, error "ModelArts.4204" will be displayed when you call this API. Before you call the API, log in to the OCR console and subscribe to the corresponding service. Ensure that you make the subscription to the service in the same region where you want to call this API.

URI

POST /v2/{project_id}/ocr/thailand-id-card

Table 4-61 URI parameters

Parameter	Mandatory	Description
endpoint	Yes	Endpoint, which is the request address for calling an API. The endpoint varies depending on services in different regions. For more details, see **Endpoints**.
project_id	Yes	Project ID, which can be obtained by referring to **Obtaining a Project ID**.

Request Parameters

Table 4-62 Request header parameters

Parameter	Mandatory	Type	Description
X-Auth-Token	Yes	String	User token Used to obtain the permission to call APIs. The token is the value of **X-Subject-Token** in the response header in **Authentication**.

Parameter	Mandatory	Type	Description
Content-Type	Yes	String	MIME type of the request body. The value is **application/json**.
Enterprise-Project-Id	No	String	Enterprise project ID. OCR uses Enterprise Project Management Service (EPS) to split fees for resources used by different user groups and users. To obtain the enterprise project ID, go to the **Enterprise Project Management** console, click the enterprise project name, and obtain the enterprise project ID on the enterprise project details page.  For details about how to create an enterprise project, see *Optical Character Recognition User Guide*. **NOTE** After an enterprise project is created, parameter transfer involves the following scenarios: • If a correct enterprise project ID is carried and the OCR service can be used properly, the bills will be categorized under the corresponding enterprise project for that ID. • If an enterprise project ID that is in the correct format but does not actually exist is carried, and the OCR service can be used properly, the bills will display the corresponding non-existent enterprise project ID. • If no enterprise project ID or an enterprise project ID with incorrect format (such as special characters) is carried, and the OCR service can be used properly, the bills will be categorized under **default**.

Table 4-63 Request body parameters

Parameter	Mandatory	Type	Description
image	No	String	Set either this parameter or **url**. Base64 encoded string of an image file. The image file has a size limit of 10 MB. No side of the image can be smaller than 15 or larger than 8,192 pixels. Only images in JPEG, JPG, PNG, BMP, or TIFF format can be recognized. An example is **/9j/4AAQSkZJRgABAg...**. If the image data contains an unnecessary prefix, the error "The image format is not supported" is reported.
url	No	String	Set either this parameter or **image**. Image URL. Currently, the following URLs are supported: • Public HTTP/HTTPS URL • URL provided by OBS. You need to be authorized to use OBS data, including service authorization, temporary authorization, and anonymous public authorization. For details, see **Configuring Access Permissions of OBS**. **NOTE** • The API response time depends on the image download time. If the image download takes a long time, the API call will fail. • Ensure that the storage service where the image to be detected resides is stable and reliable. OBS is recommended for storing image data.
side	No	String	Front or back of the ID card. The options are: • **front**: front of an ID card • **back**: back of an ID card If the value of this parameter is empty or not included, the system will automatically recognize whether the image is the front or back of an ID card. It is recommended to set this parameter for higher accuracy.

Parameter	Mandatory	Type	Description
return_portrait_image	No	Boolean	Whether to return the Base64 encoded string of the portrait on the ID card image. The options are: • **true**: The Base64 encoded string of the portrait on the ID card will be returned. • **false**: The Base64 encoded string of the portrait on the ID card will not be returned. If this parameter is not specified, **false** is used by default. In this case, the Base64 encoded string of the portrait on the ID card will not be returned.
return_portrait_location	No	Boolean	Whether to return the position coordinates of the portrait on the ID card image. The options are: • **true**: The location of the portrait on the ID card will be returned. • **false**: The location of the portrait on the ID card will not be returned.
return_idcard_type	No	Boolean	Whether to return the ID card type. The options are: • **true**: The ID card type will be returned, indicating that the ID card is the original ID card or copy of the original ID card. • **false**: The ID card type will not be returned.
return_text_location	No	Boolean	Location of a text block. The options are: **true**: All text blocks will be returned. **false**: Text blocks will not be returned. If this parameter is not specified, the system does not return the location of any text blocks by default. If a non-Boolean value is entered, an error message will be displayed, indicating that the parameter is invalid.

Response Parameters

Status code: 200

Table 4-64 Response body parameter

Parameter	Type	Description
result	**ThailandIdcardResult** object	Recognition result This parameter is not returned when the API fails to be called.

Table 4-65 ThailandIdcardResult

Parameter	Type	Description
type	String	ID card type. The value **normal** indicates a regular Thailand ID card, and the value **pink** indicates a foreigner's ID card.
name_en	String	English name
ref_number	String	Reference number
side	String	Front or back of an ID card. Value options are **front** and **back**.
id_number	String	ID number
name_th	String	Thai name
first_name_en	String	Name, in English
last_name_en	String	English surname
date_of_birth_th	String	Date of birth, in Thai
date_of_birth_en	String	Date of birth, in English
religion_th	String	Religion
address_th	String	Address
date_of_issue_th	String	Date of issue, in Thai
date_of_issue_en	String	Date of issue, in English
date_of_expiry_th	String	Date of expiry, in Thai
date_of_expiry_en	String	Date of expiry, in English
serial_number	String	Serial number
card_number	String	ID number on the back of the ID card

Parameter	Type	Description
laser_number	String	Laser code
confidence	**ThailandIdcardConfidence** object	Confidence of a field. The value ranges from 0 to 1. A higher confidence indicates a higher accuracy of the field identified. The confidence is calculated using algorithms and is not equal to the accuracy.
portrait_image	String	Base64 encoded string of the portrait. This parameter is returned only when **return_portrait_image** is set to **true**.
portrait_location	Array<Array<Integer>>	Location of the portrait on the original image. This parameter is returned only when **return_portrait_location** is set to **true**. The image is displayed in a list. The list contains the two-dimensional coordinates (x,y) of the four vertices in the portrait area. The origin of the coordinates is the upper left corner of the image. The X axis is horizontal, and the Y axis is vertical.
idcard_type	String	ID card type. This parameter is returned only when **return_idcard_type** is set to **true**. The options are: • **normal**: original ID card • **copy**: copy of the ID card
text_location	Object	Location of all fields identified on the original image, including the two-dimensional coordinates (x,y) of the four vertices in all text areas. The image coordinate system is used. The coordinate origin is the upper left corner of the image, the X axis is horizontal, and the Y axis is vertical.

Table 4-66 ThailandIdcardConfidence

Parameter	Type	Description
id_number	Float	Confidence of the ID number
name_th	Float	Confidence of the Thai name
name_en	Float	Confidence of the English name
ref_number	Float	Confidence of the reference number
first_name_en	Float	Confidence of the English given name

Parameter	Type	Description
last_name_en	Float	Confidence of the English family name
date_of_birth_th	Float	Confidence of the birth date in Thai An example of the return value is **5 ก. พ. 2493**.
date_of_birth_en	Float	Confidence of the birth date in English An example of the return value is **5 Feb. 1950**.
religion_th	Float	Confidence of the religion
address_th	Float	Confidence of the address
date_of_issue_th	Float	Confidence of the issuance date in Thai
date_of_issue_en	Float	Confidence of the issuance date in English
date_of_expiry_th	Float	Confidence of the validity period in Thai
date_of_expiry_en	Float	Confidence of the validity period in English
serial_number	Float	Confidence of the serial number
card_number	Float	Confidence of the card number on the back of the ID card
laser_number	Float	Confidence of the laser code

Status code: 200

Table 4-67 Response body parameters

Parameter	Type	Description
error_code	String	Error code of a failed API call. For details, see **Error Codes**. This parameter is not returned for a successful call.
error_msg	String	Error message when the API call fails This parameter is not returned when the API is successfully called.

Example Request

NOTE

- **endpoint** is the request URL for calling an API. Endpoints vary depending on services and regions. For details, see **Endpoints**.

  For example, Thailand ID Card OCR is deployed in the **AP-Bangkok** region. The endpoint is **ocr.ap-southeast-2.myhuaweicloud.com** or **ocr.ap-southeast-2.myhuaweicloud.cn**. The request URL is **https://ocr.ap-southeast-2.myhuaweicloud.com/v2/{project_id}/thailand-id-card**. **project_id** is the project ID. For how to obtain the project ID, see **Obtaining a Project ID**.
- For details about how to obtain a token, see **Making an API Request**.

- Request example (Method 1: Use the image Base64 string.)

```
POST  https://{endpoint}/v2/{project_id}/ocr/thailand-id-card

Request Header:
Content-Type: application/json
X-Auth-Token:
MIINRwYJKoZIhvcNAQcCoIINODCCDTQCAQExDTALBglghkgBZQMEAgEwgguVBgkqhkiG...
Request Body:

{
  "image" : "/9j/4AAQSkZJRgABAgEASABIAAD/4RFZRXhpZgAATU0AKgAAAA...",
  "side" : "front",
  "return_portrait_image" : true,
  "return_portrait_location" : true,
  "return_idcard_type" : true
}
```

- Request example (Method 2: Use the image URL.)

```
POST  https://{endpoint}/v2/{project_id}/ocr/thailand-id-card

Request Header:
Content-Type: application/json
X-Auth-Token:
MIINRwYJKoZIhvcNAQcCoIINODCCDTQCAQExDTALBglghkgBZQMEAgEwgguVBgkqhkiG...
Request Body:
{
    "url":"https://BucketName.obs.xxxx.com/ObjectName"
}
```

- Sample code for a Python 3 request (For codes in other languages, refer to the following sample or use OCR SDK.)

```
# encoding:utf-8

import requests
import base64

url = "https://{endpoint}/v2/{project_id}/ocr/thailand-id-card"
token = "Actual token value obtained by the user"
headers = {'Content-Type': 'application/json', 'X-Auth-Token': token}

imagepath = r'./data/thailand-id-card-demo.png' # Read a local image.
with open(imagepath, "rb") as bin_data:
    image_data = bin_data.read()
image_base64 = base64.b64encode(image_data).decode("utf-8")  # Use the Base64 encoded string of the image.
payload = {"image": image_base64}
response = requests.post(url, headers=headers, json=payload)
print(response.text)
```

Example Response

Status code: 200

Example response for a successful request (the front)

```
{
  "result" : {
    "side" : "front",
    "id_number" : "X XXXX XXXXX XX X",
    "name_th" : "XXX",
    "first_name_en" : "XX",
    "last_name_en" : "XX",
    "date_of_birth_th" : "5 ก.พ. 2493",
    "date_of_birth_en" : "5 Feb. 1950",
    "religion_th" : "XX",
    "address_th" : "XXXXX",
    "date_of_issue_th" : "XX",
    "date_of_issue_en" : "4 Mar. 2011",
    "date_of_expiry_th" : "22 ก.พ. 2561",
    "date_of_expiry_en" : "22 Feb. 2018",
    "serial_number" : "XXXX-XX-XXXXX",
    "confidence" : {
      "id_number" : 0.9999,
      "name_th" : 0.9994,
      "first_name_en" : 0.998,
      "last_name_en" : 0.9997,
      "date_of_birth_th" : 0.9996,
      "date_of_birth_en" : 0.9997,
      "religion_th" : 0.686,
      "address_th" : 0.624,
      "date_of_issue_th" : 1,
      "date_of_issue_en" : 1,
      "date_of_expiry_th" : 0.9969,
      "date_of_expiry_en" : 0.61,
      "serial_number" : 0.9887
    },
    "portrait_image" : "/9j/4AA... ",
    "portrait_location" : [ [ 576, 237 ], [ 741, 237 ], [ 739, 430 ], [ 574, 431 ] ],
    "idcard_type" : "normal"
  }
}
```

Example response for a successful request (the back)

```
{
    "result": {
        "side": "back",
        "card_number": "XXXX-XXX-XX",
        "laser_number": "XXXX-XXXXXXX-XX",
        "confidence": {
            "id_number": 0.9999,
            "laser_number": 0.9994
        }
    }
}
```

Status code: 400

Example response for a failed request

```
{
    "error_code": "AIS.0103",
    "error_msg": "The image size does not meet the requirements."
}
```

Example SDK Code

The example SDK code is as follows:

NOTE

You are advised to update the SDKs to the latest versions before use to prevent the local outdated SDKs from being unable to use the latest OCR functions.

Java

- Transfer the Base64 encoded string of the Thailand ID card image for recognition.

More Programming Languages

For more SDK code examples in various programming languages, see the **Sample Code** tab on the right of the **API Explorer** page, which can automatically generate corresponding SDK code examples.

Status Codes

Status Code	Description
200	Example response for a successful request
400	Example response for a failed request

See **Status Codes**.

Error Codes

See **Error Codes**.

4.8 Cambodian ID Card

Function

This API detects and extracts text from images of Cambodia-issued ID cards and converts the text into a structured format. For the notes and constraints on using this API, see **Notes and Constraints**. For how to use this API, see **Introduction to OCR**.

Notes and Constraints

- Currently, only the front of an ID card can be recognized each time.
- Only images in PNG, JPG, BMP, or TIFF format can be recognized.
- No side of the image can be smaller than 15 or larger than 8,192 pixels.
- An ID card can be rotated to any angle.
- Illuminated or dark images can be recognized, but the accuracy may be compromised.

Calling Method

For details, see **Calling APIs**.

Prerequisites

Before using this API, subscribe to the service and complete authentication. For details, see **Subscribing to an OCR Service** and **Authentication**.

NOTE

Before using the service for the first time, you need to enable the service by clicking **Subscribe**. You only need to subscribe to the service once. If you have not subscribed to the service yet, error "ModelArts.4204" will be displayed when you call this API. Before you call the API, log in to the OCR console and subscribe to the corresponding service. Ensure that you make the subscription to the service in the same region where you want to call this API.

URI

POST /v2/{project_id}/ocr/cambodian-idcard

Table 4-68 URI parameters

Parameter	Mandatory	Description
endpoint	Yes	Endpoint, which is the request address for calling an API. The endpoint varies depending on services in different regions. For more details, see **Endpoints**.

Parameter	Mandatory	Description
project_id	Yes	Project ID, which can be obtained by referring to **Obtaining a Project ID**.

Request Parameters

Table 4-69 Request header parameters

Parameter	Mandatory	Type	Description
X-Auth-Token	Yes	String	User token Used to obtain the permission to call APIs. The token is the value of **X-Subject-Token** in the response header in **Authentication**.
Content-Type	Yes	String	MIME type of the request body. The value is **application/json**.

Parameter	Mandatory	Type	Description
Enterprise-Project-Id	No	String	Enterprise project ID. OCR uses Enterprise Project Management Service (EPS) to split fees for resources used by different user groups and users. To obtain the enterprise project ID, go to the **Enterprise Project Management** console, click the enterprise project name, and obtain the enterprise project ID on the enterprise project details page.  For details about how to create an enterprise project, see *Optical Character Recognition User Guide*. **NOTE** After an enterprise project is created, parameter transfer involves the following scenarios: • If a correct enterprise project ID is carried and the OCR service can be used properly, the bills will be categorized under the corresponding enterprise project for that ID. • If an enterprise project ID that is in the correct format but does not actually exist is carried, and the OCR service can be used properly, the bills will display the corresponding non-existent enterprise project ID. • If no enterprise project ID or an enterprise project ID with incorrect format (such as special characters) is carried, and the OCR service can be used properly, the bills will be categorized under **default**.

Table 4-70 Request body parameters

Parameter	Mandatory	Type	Description
image	No	String	Set either this parameter or **url**. Base64-encoded string of an image file. No side of the image can be smaller than 15 or larger than 8,192 pixels. Only images in JPG, PNG, BMP, or TIFF format can be recognized.
url	No	String	Set either this parameter or **image**. Image URL. Currently, the following URLs are supported: • Public HTTP/HTTPS URL • URL provided by OBS. You need to be authorized to use OBS data, including service authorization, temporary authorization, and anonymous public authorization. For details, see **Configuring Access Permissions of OBS**. **NOTE** • The API response time depends on the image download time. If the image download takes a long time, the API call will fail. • Ensure that the storage service where the image to be detected resides is stable and reliable. OBS is recommended for storing image data. • The URL cannot contain Chinese characters. If Chinese characters exist, they must be encoded using UTF-8.
return_portrait_image	No	Boolean	Whether to return the portrait. The options are: • **true**: The Base64-encoded string of the portrait on the ID card will be returned. • **false**: The Base64-encoded string will not be returned. If not passed in, the default value **false** is used.
return_portrait_location	No	Boolean	Whether to return the location of the portrait on the travel permit. The options are: • **true**: The location of the portrait on the ID card will be returned. • **false**: The location of the portrait will not be returned. If not passed in, the default value **false** is used.

Parameter	Mandatory	Type	Description
return_idcard_type	No	Boolean	Whether to return the ID card type. The options are: • **true**: The ID card type will be returned, indicating that the ID card is the original or a copy. • **false**: The ID card type will not be returned.
detect_border_integrity	No	Boolean	Whether to return the alarm result for ID card border integrity. The options are: • **true**: The alarm function will be enabled. • **false**: The alarm function will be disabled.
detect_blocking_within_border	No	Boolean	Whether to return the alarm result for blocked ID cards within their borders. The options are: • **true**: The function of generating an alarm when a blocked ID card is detected is enabled. • **false**: The function of generating an alarm when a blocked ID card is detected is disabled.
detect_blur	No	Boolean	Whether to return the alarm result for blurry ID cards. The options are: • **true**: The function of generating an alarm when a blurry ID card is detected is enabled. • **false**: The function of generating an alarm when a blurry ID card is detected is disabled.
detect_glare	No	Boolean	Whether to return the alarm result for glaring ID cards. The options are: • **true**: The function of generating an alarm when a glaring ID card is detected is enabled. • **false**: The function of generating an alarm when a glaring ID card is detected is disabled.

Parameter	Mandatory	Type	Description
return_adjusted_image	No	Boolean	Whether to return the Base64-encoded string of the original ID card image. The options are: • **true**: The Base64-encoded string will be returned. • **false**: The Base64-encoded string will not be returned.
detect_tampering	No	Boolean	Whether to return the alarm result for tampered ID card portraits. The options are: • **true**: The alarm function is enabled. • **false**: The alarm function is disabled. The alarm function does not work if the ID card image has undergone minor edits using a photo editing software.
detect_reproduce	No	Boolean	Whether an alarm is generated when a recaptured ID card image is detected. The options are: • **true**: An alarm is generated when a recaptured ID card image is detected. • **false**: No alarm is generated when a recaptured ID card image is detected.

Response Parameters

Status code: 200

Table 4-71 Response body parameter

Parameter	Type	Description
result	**CambodianIdCardResult** object	Recognition result This parameter is not included when the API fails to be called.

Table 4-72 CambodianIdCardResult

Parameter	Type	Description
id_number	String	ID number
name_kh	String	Khmer name

Parameter	Type	Description
name_en	String	Name in English
birth_date	String	Date of birth
sex	String	Gender
height	String	Height
birth_place	String	Place of birth
address	String	Addresses, separated by spaces
issue_date	String	Date of issue
expiry_date	String	Date of expiry
description	String	Personal features in the image
machine_code1	String	Machine code in the first line
machine_code2	String	Machine code in the second line
machine_code3	String	Machine code in the third line
portrait_image	String	Base64 code of the portrait. This parameter is available only when **return_portrait_image** is set to **true**.
portrait_location	Array<Array<Integer>>	Location of the portrait on the original image. This parameter is returned only when **return_portrait_location** is set to **true**. The image is displayed in a list. The list contains the two-dimensional coordinates (x,y) of the four vertices in the portrait area. The origin of the coordinates is the upper left corner of the image. The X axis is horizontal, and the Y axis is vertical.
idcard_type	String	ID card type. This parameter is returned only when **idcard_type** is set to **true**. The options are as follows: • **normal**: original ID card • **copy**: copy of the ID card
adjusted_image	String	Base64-encoded string of the original ID card image. This parameter is returned only when **return_adjusted_image** is set to **true**.
detect_border_integrity_result	Boolean	Whether ID card borders are complete. **true**: The borders are incomplete. **false**: The borders are complete. This parameter is returned only when **detect_border_integrity** is set to **true**.

Parameter	Type	Description
detect_blocking_within_border_result	Boolean	Whether the ID card is blocked within its borders. **true**: The ID card is blocked within its borders. **false**: The ID card is not blocked within its borders. This parameter is returned only when **detect_blocking_within_border** is set to **true**.
detect_blur_result	Boolean	Whether the ID card image is blurry. **true**: The image is blurry. **false**: The image is clear. This parameter is returned only when **detect_blur** is set to **true**.
detect_glare_result	Boolean	Alarm result for glaring ID cards. **true**: The ID card is glaring. **false**: The ID card is not glaring. This parameter is returned only when **detect_glare** is set to **true**.
detect_tampering_result	Boolean	Alarm result for whether the portrait on the ID card has been tampered with. **true**: The portrait has been tampered with. **false**: The portrait has not been tampered with. This parameter is returned only when **detect_tampering** is set to **true**.
detect_reproduce_result	Boolean	Whether the ID card image is recaptured. The value **true** indicates that the ID card image is recaptured, and the value **false** indicates that the ID card image is not recaptured. This parameter is returned only when **detect_reproduce** is set to **true**.
score_info	**CambodianIdCardScoreInformationResult** object	Alarm scores, including **idcard_type_score**, **border_integrity_score**, **blocking_within_border_score**, **blur_score**, **glare_score**, **tampering_score**, and **reproduce_score**. The value range of these parameters is [0, 99].
confidence	Object	Confidence of a field. The value ranges from 0 to 1. A higher confidence indicates a higher accuracy of the field identified. The confidence is calculated using algorithms and is not equal to the accuracy.

Table 4-73 CambodianIdCardScoreInformationResult

Parameter	Type	Description
idcard_type_score	Integer	Alarm score. The value range of this parameter is [0, 99]. If the value is greater than 50, the ID card is a copy, while a value of 50 or less indicates it is the original. The closer the value is to 99, the more likely it is a copy, and the closer it is to 0, the more likely it is the original. This parameter is returned only when **return_idcard_type** is set to **true**.
border_integrity_score	Integer	Alarm score. The value range of this parameter is [0, 99]. If the value is greater than 50, the borders are incomplete, while a value of 50 or less indicates the borders are complete. The closer the value is to 99, the more likely the borders are incomplete, and the closer it is to 0, the more likely the borders are complete. This parameter is returned only when **detect_border_integrity** is set to **true**.
blocking_within_border_score	Integer	Alarm score. The value range of this parameter is [0, 99]. If the value is greater than 50, the ID card is blocked within its borders, while a value of 50 or less indicates the ID card is not blocked within its borders. The closer the value is to 99, the more likely the ID card is blocked within its borders, and the closer it is to 0, the more likely the ID card is not blocked within its borders. This parameter is returned only when **detect_blocking_within_border** is set to **true**.
blur_score	Integer	Alarm score. The value range of this parameter is [0, 99]. If the value is greater than 50, the ID card is blurry, while a value of 50 or less indicates the ID card is clear. The closer the value is to 99, the more likely the ID card is blurry, and the closer it is to 0, the more likely the ID card is clear. This parameter is returned only when **detect_blur** is set to **true**.
glare_score	Integer	Alarm score. The value range of this parameter is [0, 99]. If the value is greater than 50, the ID card is glaring, while a value of 50 or less indicates the ID card is not glaring. The closer the value is to 99, the more likely the ID card is glaring, and the closer it is to 0, the more likely the ID card is not glaring. This parameter is returned only when **detect_glare** is set to **true**.

Parameter	Type	Description
tampering_score	Integer	Alarm score. The value range of this parameter is [0, 99]. If the value is greater than 50, the portrait on the ID card is tampered with, while a value of 50 or less indicates the portrait is not tampered with. The closer the value is to 99, the more likely the portrait is tampered with, and the closer it is to 0, the more likely the ID card is not tampered with. This parameter is returned only when **detect_tampering** is set to **true**.
reproduce_score	Integer	Alarm score. The value range of this parameter is [0, 99]. If the value is greater than 50, the ID card image is recaptured, while a value of 50 or less indicates the ID card image is not recaptured. The closer the value is to 99, the more likely the ID card image is recaptured, and the closer it is to 0, the more likely the ID card image is not recaptured. This parameter is returned only when **detect_reproduce** is set to **true**.

Status code: 400

Table 4-74 Response body parameters

Parameter	Type	Description
error_code	String	Error code of a failed API call. For details, see **Error Codes**. This parameter is not returned for a successful call.
error_msg	String	Error message when the API call fails This parameter is not returned when the API is successfully called.

Example Request

- Request example (Method 1: Use the image Base64 string.)

```
POST https://{endpoint}/v2/{project_id}/ocr/cambodian-idcard
Request Header:
Content-Type: application/json
X-Auth-Token:
MIINRwYJKoZIhvcNAQcCoIINODCCDTQCAQExDTALBglghkgBZQMEAgEwgguVBgkqhkiG...
Request Body:
{
    "image":"/9j/4AAQSkZJRgABAgEASABIAAD/4RFZRXhpZgAATU0AKgAAAA..."
 }
```

- Request example (Method 2: Use the image URL.)

```
POST https://{endpoint}/v2/{project_id}/ocr/cambodian-idcard
Request Header:
Content-Type: application/json
X-Auth-Token:
MIINRwYJKoZIhvcNAQcCoIINODCCDTQCAQExDTALBglghkgBZQMEAgEwgguVBgkqhkiG...
Request Body:
{
   "url":"https://BucketName.obs.myhwclouds.com/ObjectName"
 }
```

Example Response

Status code: 200

4.9 Myanmar ID Card

Function

This API detects and extracts text from Myanmar-issued national registration cards and converts the text into a structured format. For details about the constraints on

using this API, see **Constraints and Limitations**. For details about how to use this API, see **Introduction to OCR**.

Figure 4-3 Example Myanmar ID card

Constraints and Limitations

- Only images in PNG, JPG, JPEG, BMP, or TIFF format can be recognized.
- No side of the image can be smaller than 15 or larger than 8,192 pixels.
- An ID card to be recognized must occupy more than 25% of the image. When scanning an ID card, ensure that the entire ID card is displayed in the image.
- An ID card can be rotated to any angle.
- The ID card in the image can be moderately distorted, but the aspect ratio cannot be distorted by more than 10%.
- Illuminated or dark images can be recognized, but the accuracy may be compromised.
- Only the front or back of a single ID card can be identified each time.

Calling Method

For details, see **Calling APIs**.

Prerequisites

Before using this API, subscribe to the service and complete authentication. For details, see **Subscribing to an OCR Service** and **Authentication**.

NOTE

Before using the service for the first time, you need to enable the service by clicking **Subscribe**. You only need to subscribe to the service once. If you have not subscribed to the service yet, error "ModelArts.4204" will be displayed when you call this API. Before you call the API, log in to the OCR console and subscribe to the corresponding service. Ensure that you make the subscription to the service in the same region where you want to call this API.

URI

POST /v2/{project_id}/ocr/myanmar-id-card

Table 4-75 URI parameters

Parameter	Mandatory	Description
endpoint	Yes	Endpoint, which is the request address for calling an API. The endpoint varies depending on services in different regions. For more details, see **Endpoints**.
project_id	Yes	Project ID, which can be obtained by referring to **Obtaining a Project ID**.
Enterprise-Project-Id	No	Enterprise project ID. OCR uses Enterprise Project Management Service (EPS) to split fees for resources used by different user groups and users. To obtain the enterprise project ID, go to the **Enterprise Project Management** console, click the enterprise project name, and obtain the enterprise project ID on the enterprise project details page.  For details about how to create an enterprise project, see *Optical Character Recognition User Guide*. **NOTE** After an enterprise project is created, parameter transfer involves the following scenarios: • If a correct enterprise project ID is carried and the OCR service can be used properly, the bills will be categorized under the corresponding enterprise project for that ID. • If an enterprise project ID that is in the correct format but does not actually exist is carried, and the OCR service can be used properly, the bills will display the corresponding non-existent enterprise project ID. • If no enterprise project ID or an enterprise project ID with incorrect format (such as special characters) is carried, and the OCR service can be used properly, the bills will be categorized under **default**.

Request Parameters

Table 4-76 Request header parameters

Parameter	Mandatory	Type	Description
X-Auth-Token	Yes	String	User token Used to obtain the permission to call APIs. The token is the value of **X-Subject-Token** in the response header in **Authentication**.
Content-Type	Yes	String	MIME type of the request body. The value is **application/json**.

Table 4-77 Request body parameters

Parameter	Mandatory	Type	Description
image	No	String	Set either this parameter or **url**. Base64 encoded string of an image file. The image file has a size limit of 10 MB. No side of the image can be smaller than 15 or larger than 8,192 pixels. Only images in JPEG, JPG, PNG, BMP, or TIFF format can be recognized. An example is **/9j/4AAQSkZJRgABAg...**. If the image data contains an unnecessary prefix, the error "The image format is not supported" is reported.

Parameter	Mandatory	Type	Description
url	No	String	Set either this parameter or **image**. Image URL. Currently, the following URLs are supported: • Public HTTP/HTTPS URL • URL provided by OBS. You need to be authorized to use OBS data, including service authorization, temporary authorization, and anonymous public authorization. For details, see **Configuring Access Permissions of OBS**. **NOTE** • The API response time depends on the image download time. If the image download takes a long time, the API call will fail. • Ensure that the storage service where the image to be detected resides is stable and reliable. OBS is recommended for storing image data.
convert_unicode	No	Boolean	Output format. The options are: • **true**: The output will be in the Unicode format. • **false**: The output will be in the zawgyi format. If this parameter is not specified or does not exist, the output will be in the zawgyi format by default.
return_confidence	No	Boolean	Whether to return the confidence. The options are: **true**: The confidence will be returned. **false**: The confidence will not be returned. If this parameter is not specified, the system does not return the confidence by default. If a non-Boolean value is entered, an error message will be displayed, indicating that the parameter is invalid.

Parameter	Mandatory	Type	Description
return_portrait_image	No	Boolean	Whether to return the Base64 encoded string of the portrait on the ID card image. The options are: • **true**: The Base64 encoded string of the portrait on the ID card will be returned. • **false**: The Base64 encoded string of the portrait on the ID card will not be returned. If this parameter is not specified, **false** is used by default. In this case, the Base64 encoded string of the portrait on the ID card will not be returned.
return_portrait_location	No	Boolean	Whether to return the location of the portrait on the ID card image. The options are: • **true**: The location of the portrait on the ID card will be returned. • **false**: The location of the portrait on the ID card will not be returned.
return_idcard_type	No	Boolean	Whether to return the ID card type. The options are: • **true**: The ID card type, either original or copy of the original will be returned. • **false**: The ID card type will not be returned.
return_translation	No	Boolean	Whether to return translation information. The options are: • **true**: The translation information is returned. • **false**: The translation information is not returned.

Response Parameters

Status code: 200

Table 4-78 Response body parameter

Parameter	Type	Description
result	**MyanmarIdcardResult** object	Calling result This parameter is not returned when the API fails to be called.

Table 4-79 MyanmarIdcardResult

Parameter	Type	Description
side	String	Front or back of a national registration card. The options are **front** and **back**.
class	String	ID card type. The options are: • **new_version**: new version of ID card • **old_version**: old version of ID card
nrc_id	String	ID number
issue_date	String	Date of issue
name	String	Name
father_name	String	Father's name
birth	String	Date of birth
bloodlines_religion	String	Ethnic group or religion
height	String	Height
blood_group	String	Blood type
card_id	String	Card number on the back of the ID card
nrc_id_back	String	ID number on the back of the ID card
profession	String	Occupation
address	String	Address
confidence	**MyanmarIdcardConfidence** object	Confidence of a field. The value ranges from 0 to 1. A higher confidence indicates a higher accuracy of the field identified. The confidence is calculated using algorithms and is not equal to the accuracy.
portrait_image	String	Base64 encoded string of the portrait. This parameter is returned only when **return_portrait_image** is set to **true**.

Parameter	Type	Description
portrait_location	Array<Array<Integer>>	Location of the portrait on the original image. This parameter is returned only when **return_portrait_location** is set to **true**. The image is displayed in a list. The list contains the two-dimensional coordinates (x,y) of the four vertices in the portrait area. The origin of the coordinates is the upper left corner of the image. The X axis is horizontal, and the Y axis is vertical.
idcard_type	String	ID card type. This parameter is returned only when **return_idcard_type** is set to **true**. The options are: • **normal**: original ID card • **copy**: copy of the ID card
translation_info	**MyanmarIdcardTranslationInfo** object	Translation information. This parameter is returned only when **return_translation** is set to **true**. This field contains information about **name_translation** and **nrc_id_translation**. When no appropriate translation fields can be found, the original Burmese characters are retained.

Table 4-80 MyanmarIdcardConfidence

Parameter	Type	Description
nrc_id	Float	Confidence of the ID number
issue_date	Float	Confidence of the issuance date
name	Float	Confidence of the name
birth	Float	Confidence of the birth date
bloodlines_religion	Float	Confidence of the ethnic group or religion
height	Float	Confidence of the height
blood_group	Float	Confidence of the blood type
card_id	Float	Confidence of the card number on the back of the ID card
nrc_id_back	Float	ID number on the back of the ID card
profession	Float	Confidence of the occupation
address	Float	Confidence of the address

Table 4-81 MyanmarIdcardTranslationInfo

Parameter	Type	Description
name_translation	String	Name translation. This parameter is returned only when **return_translation** is set to **true**.
father_name_translation	String	Translation of the father's name. This parameter is returned only when **return_translation** is set to **true**.
nrc_id_translation	String	Translation of the ID number. This parameter is returned only when **return_translation** is set to **true**.
birth_translation	String	Birth date translation. This parameter is returned only when **return_translation** is set to **true**.

Status code: 400

Table 4-82 Response body parameters

Parameter	Type	Description
error_code	String	Error code of a failed API call. For details, see **Error Codes**. This parameter is not returned for a successful call.
error_msg	String	Error message when the API call fails This parameter is not returned when the API is successfully called.

Example Request

NOTE

- **endpoint** is the request URL for calling an API. Endpoints vary depending on services and regions. For details, see **Endpoints**.

  For example, Myanmar ID Card OCR is deployed in the **CN-Hong Kong** region. The endpoint is **ocr.ap-southeast-1.myhuaweicloud.com** or **ocr.ap-southeast-1.myhuaweicloud.cn**. The request URL is **https://ocr.ap-southeast-1.myhuaweicloud.com/v2/{project_id}/ocr/myanmar-id-card**. **project_id** is the project ID. For how to obtain the project ID, see **Obtaining a Project ID**.
- For details about how to obtain a token, see **Making an API Request**.

- Request example (Method 1: Use the Base64 encoded string of an image.)

```
POST https://{endpoint}/v2/{project_id}/ocr/myanmar-id-card

Request Header:
Content-Type: application/json
X-Auth-Token:
MIINRwYJKoZIhvcNAQcCoIINODCCDTQCAQExDTALBglghkgBZQMEAgEwgguVBgkqhkiG...
```

```
Request Body:
{
    "image":"/9j/4AAQSkZJRgABAgEASABIAAD/4RFZRXhpZgAATU0AKgAAAAgABwESAAd...",
    "convert_unicode": true,
    "return_confidence": true,
    "return_portrait_image": true,
    "return_portrait_location": true,
    "return_idcard_type": true
}
```

- Request example (Method 2: Use the image URL.)

```
POST https://{endpoint}/v2/{project_id}/ocr/myanmar-id-card

Request Header:
Content-Type: application/json
X-Auth-Token:
MIINRwYJKoZIhvcNAQcCoIINODCCDTQCAQExDTALBglghkgBZQMEAgEwgguVBgkqhkiG...
Request Body:
{
    "url":"https://BucketName.obs.xxxx.com/ObjectName",
    "convert_unicode": true,
    "return_confidence": true,
    "return_portrait_image": true,
    "return_portrait_location": true,
    "return_idcard_type": true
}
```

- Sample code for a Python 3 request (For codes in other languages, refer to the following sample or use OCR SDK.)

```
# encoding:utf-8

import requests
import base64

url = "https://{endpoint}/v2/{project_id}/ocr/myanmar-id-card"
token = "Actual token value obtained by the user"
headers = {'Content-Type': 'application/json', 'X-Auth-Token': token}

imagepath = r'./data/myanmar-id-card-demo.png'  # Read a local image.
with open(imagepath, "rb") as bin_data:
    image_data = bin_data.read()
image_base64 = base64.b64encode(image_data).decode("utf-8")  # Use the Base64 encoded string of
the image.
payload = {"image": image_base64}
response = requests.post(url, headers=headers, json=payload)
print(response.text)
```

Example Response

Status code: 200

Example response for a successful request (the front)

```
{
  "result" : {
    "side" : "front",
    "nrc_id" : "XXXXXXXX",
    "issue_date" : "□□.□.□□□□",
    "name" : "XXXX",

    "birth_translation" : "7.5.1992",
    "nrc_id_translation" : "9/MaKhaNa(C)251959"
   }
  }
}
```

Example response for a successful request (the back)

```
{
   "result":{
      "side": "back",
      "card_id": "XXXXXXX",
      "nrc_id_back": "",
      "profession": "□□□□□□□□□□",
      "address": "XXXXXXXX",
      "class": "new_version",
      "confidence": {
         "card_id": 0.9878,
         "nrc_id_back": 0.9595,
         "profession": 0.9995,
         "address": 0.9299
      },
      "idcard_type": "normal"
   }
}
```

Status code: 400

Example response for a failed request

```
{
   "error_code": "AIS.0103",
   "error_msg": "The image size does not meet the requirements."
}
```

Example SDK Code

The example SDK code is as follows:

NOTE

You are advised to update the SDKs to the latest versions before use to prevent the local outdated SDKs from being unable to use the latest OCR functions.

Java

- Transfer the Base64 encoded string of the Myanmar ID card image for recognition.

```
package com.huaweicloud.sdk.test;

import com.huaweicloud.sdk.core.auth.ICredential;
import com.huaweicloud.sdk.core.auth.BasicCredentials;

More Programming Languages

For more SDK code examples in various programming languages, see the **Sample Code** tab on the right of the **API Explorer** page, which can automatically generate corresponding SDK code examples.

Status Codes

Status Code	Description
200	Example response for a successful request
400	Example response for a failed request

See **Status Codes**.

Error Codes

See **Error Codes**.

4.10 Myanmar Driving License

Function

This API detects and extracts text from images of Myanmar-issued driver's licenses and converts the text into a structured JSON format. For details about the constraints on using this API, see **Constraints and Limitations**. For details about how to use this API, see **Introduction to OCR**.

Figure 4-4 Example Myanmar driving license

Constraints and Limitations

- Only images in PNG, JPG, JPEG, BMP, or TIFF format can be recognized.
- No side of the image can be smaller than 15 or larger than 4,096 pixels.
- Currently, only the front of a driving license can be recognized each time.
- A driving license can be rotated to any angle.
- The driving license in the image can be moderately distorted, but the aspect ratio cannot be distorted by more than 10%.
- Illuminated or dark images can be recognized, but the accuracy may be compromised.

Calling Method

For details, see **Calling APIs**.

Prerequisites

Before using this API, subscribe to the service and complete authentication. For details, see **Subscribing to an OCR Service** and **Authentication**.

NOTE

Before using the service for the first time, you need to enable the service by clicking **Subscribe**. You only need to subscribe to the service once. If you have not subscribed to the service yet, error "ModelArts.4204" will be displayed when you call this API. Before you call the API, log in to the OCR console and subscribe to the corresponding service. Ensure that you make the subscription to the service in the same region where you want to call this API.

URI

POST /v2/{project_id}/ocr/myanmar-driver-license

Table 4-83 URI parameters

Parameter	Mandatory	Description
endpoint	Yes	Endpoint, which is the request address for calling an API. The endpoint varies depending on services in different regions. For more details, see **Endpoints**.
project_id	Yes	Project ID, which can be obtained by referring to **Obtaining a Project ID**.

Request Parameters

Table 4-84 Request header parameters

Parameter	Mandatory	Type	Description
X-Auth-Token	Yes	String	User token Used to obtain the permission to call APIs. The token is the value of **X-Subject-Token** in the response header in **Authentication**.
Content-Type	Yes	String	MIME type of the request body. The value is **application/json**.

Parameter	Mandatory	Type	Description
Enterprise-Project-Id	No	String	Enterprise project ID. OCR uses Enterprise Project Management Service (EPS) to split fees for resources used by different user groups and users. To obtain the enterprise project ID, go to the **Enterprise Project Management** console, click the enterprise project name, and obtain the enterprise project ID on the enterprise project details page.  For details about how to create an enterprise project, see *Optical Character Recognition User Guide*. **NOTE** After an enterprise project is created, parameter transfer involves the following scenarios: • If a correct enterprise project ID is carried and the OCR service can be used properly, the bills will be categorized under the corresponding enterprise project for that ID. • If an enterprise project ID that is in the correct format but does not actually exist is carried, and the OCR service can be used properly, the bills will display the corresponding non-existent enterprise project ID. • If no enterprise project ID or an enterprise project ID with incorrect format (such as special characters) is carried, and the OCR service can be used properly, the bills will be categorized under **default**.

Table 4-85 Request body parameters

Parameter	Mandatory	Type	Description
image	No	String	Set either this parameter or **url**. Base64-encoded image file. The image file has a size limit of 10 MB. No side of the image can be smaller than 15 or larger than 4,096 pixels. Only images in JPEG, JPG, PNG, BMP, or TIFF format can be recognized. An example is **/9j/4AAQSkZJRgABAg...**. If the image data contains an unnecessary prefix, the error "The image format is not supported" is reported.
url	No	String	Set either this parameter or **image**. Image URL. Currently, the following URLs are supported: • Public HTTP/HTTPS URL • URL provided by OBS. You need to be authorized to use OBS data, including service authorization, temporary authorization, and anonymous public authorization. For details, see **Configuring Access Permissions of OBS**. **NOTE** • The API response time depends on the image download time. If the image download takes a long time, the API call will fail. • Ensure that the storage service where the image to be detected resides is stable and reliable. OBS is recommended for storing image data.
convert_unicode	No	Boolean	Output format. The options are: • **true**: The output will be in the Unicode format. • **false**: The output will be in the zawgyi format. If this parameter is not specified or does not exist, the output will be in the zawgyi format by default.

Response Parameters

Status code: 200

Table 4-86 Response body parameter

Parameter	Type	Description
result	**MyanmarDriverLicenseResult** object	Calling result This parameter is not returned when the API fails to be called.

Table 4-87 MyanmarDriverLicenseResult

Parameter	Type	Description
card_number	String	Number of the Myanmar driving license, in Burmese
card_number_en	String	Number of the Myanmar driving license, in English
name	String	Name, in Burmese
name_en	String	Name, in English
nrc_id	String	National registration card number, in Burmese
nrc_id_en	String	National registration card number, in English
birth	String	Date of birth, in Burmese
birth_en	String	Date of birth, in English
blood_group	String	Blood type, in Burmese
blood_group_en	String	Blood type, in English
expiried_date	String	Date of expiry, in Burmese
expiried_date_en	String	Date of expiry, in English
confidence	**MyanmarDriverLicenseConfidence** object	Confidence of a field. The value ranges from 0 to 1. A higher confidence indicates a higher accuracy of the field identified. The confidence is calculated using algorithms and is not equal to the accuracy.

Table 4-88 MyanmarDriverLicenseConfidence

Parameter	Type	Description
card_number	Float	Confidence of the driving license number in Burmese

Parameter	Type	Description
card_number_en	Float	Confidence of the driving license number in English
name	Float	Confidence of the Myanmar name
name_en	Float	Confidence of the English given name
nrc_id	Float	Confidence of the NRC number in Burmese
nrc_id_en	Float	Confidence of the NRC number in English
birth	Float	Confidence of the birth date in Burmese
birth_en	Float	Confidence of the birth date in English
blood_group	Float	Confidence of the blood type in Burmese
blood_group_en	Float	Confidence of the blood type in English
expiried_date	Float	Confidence of the validity period in Burmese
expiried_date_en	Float	Confidence of the validity period in English

Status code: 400

Table 4-89 Response body parameters

Parameter	Type	Description
error_code	String	Error code of a failed API call. For details, see **Error Codes**. This parameter is not returned for a successful call.
error_msg	String	Error message when the API call fails This parameter is not returned when the API is successfully called.

Example Request

NOTE

- **endpoint** is the request URL for calling an API. Endpoints vary depending on services and regions. For details, see **Endpoints**.

  For example, Myanmar Driving License OCR is deployed in the **CN-Hong Kong** region. The endpoint is **ocr.ap-southeast-1.myhuaweicloud.com** or **ocr.ap-southeast-1.myhuaweicloud.cn**. The request URL is **https://ocr.ap-southeast-1.myhuaweicloud.com/v2/{project_id}/ocr/myanmar-driver-license**. **project_id** is the project ID. For how to obtain the project ID, see **Obtaining a Project ID**.
- For details about how to obtain a token, see **Making an API Request**.

- Request example (Method 1: Use the image Base64 string.)

```
POST https://{endpoint}/v2/{project_id}/ocr/myanmar-driver-license

Request Header:
Content-Type: application/json
X-Auth-Token:
MIINRwYJKoZIhvcNAQcCoIINODCCDTQCAQExDTALBglghkgBZQMEAgEwgguVBgkqhkiG...
Request Body:
{
   "image":"/9j/4AAQSkZJRgABAgEASABIAAD/4RFZRXhpZgAATU0AKgAAAA...",
   "convert_unicode": true
}
```

- Request example (Method 2: Use the image URL.)

```
POST https://{endpoint}/v2/{project_id}/ocr/myanmar-driver-license

Request Header:
Content-Type: application/json
X-Auth-Token:
MIINRwYJKoZIhvcNAQcCoIINODCCDTQCAQExDTALBglghkgBZQMEAgEwgguVBgkqhkiG...
Request Body:
{
   "url":"https://BucketName.obs.xxxx.com/ObjectName",
   "convert_unicode": true
}
```

- Sample code for a Python 3 request (For codes in other languages, refer to the following sample or use OCR SDK.)

```
# encoding:utf-8

import requests
import base64

url = "https://{endpoint}/v2/{project_id}/ocr/myanmar-driver-license"
token = "Actual token value obtained by the user"
headers = {'Content-Type': 'application/json', 'X-Auth-Token': token}

imagepath = r'./data/myanmar-driver-license-demo.png' # Read a local image.
with open(imagepath, "rb") as bin_data:
    image_data = bin_data.read()
image_base64 = base64.b64encode(image_data).decode("utf-8")  # Use the Base64 encoded string of the image.
payload = {"image": image_base64}
response = requests.post(url, headers=headers, json=payload)
print(response.text)
```

Example Response

Status code: 200

Example response for a successful request

```
{
  "result" : {
    "card_number" : "XXXX",
    "card_number_en" : "XXXX",
    "name" : "XXXX",
    "name_en" : "XXXX",
    "nrc_id" : "XXX",
    "nrc_id_en" : "XXX",
    "birth" : "□-□-□□□□",
    "birth_en" : "5-5-1992",
    "blood_group" : "□□",
    "blood_group_en" : "2",
    "expiration_date" : "□□-□-□□□□",
    "expiration_date_en" : "13-1-2020",
    "confidence" : {
      "card_number" : 0.8252,
      "card_number_en" : 0.8971,
      "name" : 0.985,
      "name_en" : 0.9528,
      "nrc_id" : 0.9972,
      "nrc_id_en" : 0.9993,
      "birth" : 0.9998,
      "birth_en" : 0.8973,
      "blood_group" : 0.6772,
      "blood_group_en" : 0.6721,
      "expiration_date" : 0.9994,
      "expiration_date_en" : 0.758
    }
  }
}
```

Status code: 400

Example response for a failed request

```
{
    "error_code": "AIS.0103",
    "error_msg": "The image size does not meet the requirements."
}
```

Example SDK Code

The example SDK code is as follows:

NOTE

You are advised to update the SDKs to the latest versions before use to prevent the local outdated SDKs from being unable to use the latest OCR functions.

Java

- Transfer the Base64 encoded string of the Myanmar driving license image for recognition.

```

More Programming Languages

For more SDK code examples in various programming languages, see the **Sample Code** tab on the right of the **API Explorer** page, which can automatically generate corresponding SDK code examples.

Status Codes

Status Code	Description
200	Example response for a successful request
400	Example response for a failed request

See **Status Codes**.

Error Codes

See **Error Codes**.

4.11 Chile ID Card

Function

This API detects and extracts text from images of Chile-issued ID cards and converts the text into JSON format. For details about the constraints on using this API, see **Constraints and Limitations**. For details about how to use this API, see **Introduction to OCR**.

Figure 4-5 Example Chile ID card

Constraints and Limitations

- Only images in PNG, JPG, BMP, or TIFF format can be recognized.
- No side of the image can be smaller than 15 or larger than 8,192 pixels.
- Currently, only the front of an ID card can be recognized each time.
- An ID card can be rotated to any angle.
- Illuminated or dark images can be recognized, but the accuracy may be compromised.

Calling Method

For details, see **Calling APIs**.

Prerequisites

Before using this API, subscribe to the service and complete authentication. For details, see **Subscribing to an OCR Service** and **Authentication**.

NOTE

Before using the service for the first time, you need to enable the service by clicking **Subscribe**. You only need to subscribe to the service once. If you have not subscribed to the service yet, error "ModelArts.4204" will be displayed when you call this API. Before you call the API, log in to the OCR console and subscribe to the corresponding service. Ensure that you make the subscription to the service in the same region where you want to call this API.

URI

POST /v2/{project_id}/ocr/chile-id-card

Table 4-90 URI parameters

Parameter	Mandatory	Description
endpoint	Yes	Endpoint, which is the request address for calling an API. The endpoint varies depending on services in different regions. For more details, see **Endpoints**. The endpoint of the Chile ID Card OCR API is **ocr.la-south-2.myhuaweicloud.com**.
project_id	Yes	Project ID, which can be obtained by referring to **Obtaining a Project ID**.

Request Parameters

Table 4-91 Request header parameters

Parameter	Mandatory	Type	Description
X-Auth-Token	Yes	String	User token Used to obtain the permission to call APIs. The token is the value of **X-Subject-Token** in the response header in **Authentication**.
Content-Type	Yes	String	MIME type of the request body. The value is **application/json**.

Parameter	Mandatory	Type	Description
Enterprise-Project-Id	No	String	Enterprise project ID. OCR allows you to use Enterprise Project Management Service (EPS) to split fees for resources used by different user groups and users. To obtain the enterprise project ID, go to the **Enterprise Project Management** console, click the enterprise project name, and obtain the enterprise project ID on the enterprise project details page.  For details about how to create an enterprise project, see *Optical Character Recognition User Guide*. **NOTE** After an enterprise project is created, parameter transfer involves the following scenarios: • If a correct enterprise project ID is carried and the OCR service can be used properly, the bills will be categorized under the corresponding enterprise project for that ID. • If an enterprise project ID that is in the correct format but does not actually exist is carried, and the OCR service can be used properly, the bills will display the corresponding non-existent enterprise project ID. • If no enterprise project ID or an enterprise project ID with incorrect format (such as special characters) is carried, and the OCR service can be used properly, the bills will be categorized under **default**.

Table 4-92 Request body parameters

Parameter	Mandatory	Type	Description
image	No	String	Set either this parameter or **url**. Base64 encoded string of an image file. No side of the image can be smaller than 15 or larger than 8,192 pixels. Only images in JPG, PNG, BMP, or TIFF format can be recognized. An example is **/9j/4AAQSkZJRgABAg...**. If the image data contains an unnecessary prefix, the error "The image format is not supported" is reported.
url	No	String	Set either this parameter or **image**. Image URL. Currently, the following URLs are supported: • Public HTTP/HTTPS URL • URL provided by OBS. You need to be authorized to use OBS data, including service authorization, temporary authorization, and anonymous public authorization. For details, see **Configuring Access Permissions of OBS**. **NOTE** • The API response time depends on the image download time. If the image download takes a long time, the API call will fail. • Ensure that the storage service where the image to be detected resides is stable and reliable. OBS is recommended for storing image data.

Response Parameters

Status code: 200

Table 4-93 Response body parameter

Parameter	Type	Description
result	**ChileIdCardResult** object	Calling result This parameter is not returned when the API fails to be called.

Table 4-94 ChileIdCardResult

Parameter	Type	Description
surname	Array of strings	Last name
given_name	String	First name
nationality	String	Nationality
sex	String	Gender
birth	String	Date of birth
issue_date	String	Date of issue
expiry_date	String	Date of expiry
document_number	String	Document number
number	String	ID number
confidence	**ChileIdCardConfidence** object	Confidence of a field. The value ranges from 0 to 1. A higher confidence indicates a higher accuracy of the field identified. The confidence is calculated using algorithms and is not equal to the accuracy.

Table 4-95 ChileIdCardConfidence

Parameter	Type	Description
surname	Float	Confidence of the last name
given_name	Float	Confidence of the given name
nationality	Float	Confidence of the nationality
sex	Float	Confidence of the gender
birth	Float	Confidence of the birth date
issue_date	Float	Confidence of the issuance date
expiry_date	Float	Confidence of the validity period
document_number	Float	Confidence of the document number
number	Float	Confidence of the ID number

Status code: 400

Table 4-96 Response body parameters

Parameter	Type	Description
error_code	String	Error code of a failed API call. For details, see **Error Codes**. This parameter is not returned for a successful call.
error_msg	String	Error message when the API call fails This parameter is not returned when the API is successfully called.

Example Request

NOTE

- **endpoint** is the request URL for calling an API. Endpoints vary depending on services and regions. For details, see **Endpoints**.

  For example, Chile ID Card OCR is deployed in the **LA-Santiago** region. The endpoint is **ocr.la-south-2.myhuaweicloud.com** or **ocr.la-south-2.myhuaweicloud.cn**. The request URL is **https://ocr.la-south-2.myhuaweicloud.com/v2/{project_id}/ocr/chile-id-card**. **project_id** is the project ID. For how to obtain the project ID, see **Obtaining a Project ID**.
- For details about how to obtain a token, see **Making an API Request**.

- Request example (Method 1: Use the Base64 encoded string of an image.)

```
POST https://ocr.la-south-2.myhuaweicloud.com/v2/{project_id}/ocr/chile-id-card

Request Header:
Content-Type: application/json
X-Auth-Token:
MIINRwYJKoZIhvcNAQcCoIINODCCDTQCAQExDTALBglghkgBZQMEAgEwgguVBgkqhkiG...
Request Body:
{
    "image": "/9j/4AAQSkZJRgABAgEASABIAAD/4RFZRXhpZgAATU0AKgA..."
}
```

- Request example (Method 2: Use the image URL.)

```
POST https://ocr.la-south-2.myhuaweicloud.com/v2/{project_id}/ocr/chile-id-card

Request Header:
Content-Type: application/json
X-Auth-Token:
MIINRwYJKoZIhvcNAQcCoIINODCCDTQCAQExDTALBglghkgBZQMEAgEwgguVBgkqhkiG...
Request Body:
{
    "url":"https://BucketName.obs.xxxx.com/ObjectName"
}
```

- Sample code for a Python 3 request (For codes in other languages, refer to the following sample or use OCR SDK.)

```
# encoding:utf-8

import requests
import base64

url = "https://ocr.la-south-2.myhuaweicloud.com/v2/{project_id}/ocr/chile-id-card"
token = "Actual token value obtained by the user"
headers = {'Content-Type': 'application/json', 'X-Auth-Token': token}

imagepath = r'./data/chile-id-card-demo.png' # Read a local image.
```

```
with open(imagepath, "rb") as bin_data:
    image_data = bin_data.read()
image_base64 = base64.b64encode(image_data).decode("utf-8")  # Use the Base64 encoded string of the image.
payload = {"image": image_base64}
response = requests.post(url, headers=headers, json=payload)
print(response.text)
```

Example Response

Status code: 200

Example response for a successful request

```
{
  "result": {
      "surname": [
         "FERNANDEZ",
         "GATICA"
      ],
      "given_name": "MARCELA CAROLINA",
      "nationality": "CHILENA",
      "sex": "F",
      "birth": "21 FEB 1982",
      "document_number": "100000001",
      "issue_date": "1 SEP 2013",
      "expiry_date": "10 AGO 2023",
      "number": "12.749.625-K",
      "confidence": {
          "surname": 0.9584,
          "given_name": 0.8106,
          "nationality": 0.7026,
          "sex": 0.5879,
          "birth": 0.9305,
          "document_number": 0.8181,
          "issue_date": 0.8518,
          "expiry_date": 0.7757,
          "number": 0.9528
      }
  }
}
```

Status code: 400

Example response for a failed request

```
{
   "error_code": "AIS.0103",
   "error_msg": "The image size does not meet the requirements."
}
```

Example SDK Code

The example SDK code is as follows:

NOTE

You are advised to update the SDKs to the latest versions before use to prevent the local outdated SDKs from being unable to use the latest OCR functions.

More Programming Languages

For more SDK code examples in various programming languages, see the **Sample Code** tab on the right of the **API Explorer** page, which can automatically generate corresponding SDK code examples.

Status Codes

Status Code	Description
200	Example response for a successful request
400	Example response for a failed request

See **Status Codes**.

Error Codes

See **Error Codes**.

4.12 Vietnam ID Card

Function

This API detects and extracts text from images of Vietnam-issued ID cards and converts the text into a structured format. For details about the constraints on using this API, see **Constraints and Limitations**. For details about how to use this API, see **Introduction to OCR**.

Constraints and Limitations

- Only ID cards issued by Vietnam can be recognized.
- Only images in PNG, JPG, JPEG, BMP, or TIFF format can be recognized.
- No side of the image can be smaller than 15 or larger than 8,192 pixels.
- An ID card can be rotated to any angle.
- Illuminated or dark images, or images with anti-counterfeit watermarks can be recognized, but the accuracy may be compromised.

Calling Method

For details, see **Calling APIs**.

Prerequisites

Before using this API, subscribe to the service and complete authentication. For details, see **Subscribing to an OCR Service** and **Authentication**.

NOTE

Before you use the service for the first time, subscribe to the service by clicking **Subscribe**. You only need to subscribe to the service once. If you have not subscribed to the service yet, error "ModelArts.4204" will be displayed when you call this API. Before you call the API, log in to the OCR console and subscribe to the corresponding service. Ensure that you make the subscription to the service in the same region where you want to call this API.

URI

POST /v2/{project_id}/ocr/vietnam-id-card

Table 4-97 URI parameters

Parameter	Mandatory	Description
endpoint	Yes	Endpoint, which is the request address for calling an API. The endpoint varies depending on services in different regions. For more details, see **Endpoints**.
project_id	Yes	Project ID, which can be obtained by referring to **Obtaining a Project ID**.

Request Parameters

Table 4-98 Request header parameters

Parameter	Mandatory	Type	Description
X-Auth-Token	Yes	String	User token Used to obtain the permission to call APIs. The token is the value of **X-Subject-Token** in the response header in **Authentication**.
Content-Type	Yes	String	MIME type of the request body. The value is **application/json**.

Parameter	Mandatory	Type	Description
Enterprise-Project-Id	No	String	Enterprise project ID. OCR uses Enterprise Project Management Service (EPS) to split fees for resources used by different user groups and users. To obtain the enterprise project ID, go to the **Enterprise Project Management** console, click the enterprise project name, and obtain the enterprise project ID on the enterprise project details page.  For details about how to create an enterprise project, see *Optical Character Recognition User Guide*. **NOTE** After an enterprise project is created, parameter transfer involves the following scenarios: • If a correct enterprise project ID is carried and the OCR service can be used properly, the bills will be categorized under the corresponding enterprise project for that ID. • If an enterprise project ID that is in the correct format but does not actually exist is carried, and the OCR service can be used properly, the bills will display the corresponding non-existent enterprise project ID. • If no enterprise project ID or an enterprise project ID with incorrect format (such as special characters) is carried, and the OCR service can be used properly, the bills will be categorized under **default**.

Table 4-99 Request body parameters

Parameter	Mandatory	Type	Description
image	No	String	Set either this parameter or **url**. Base64-encoded image file. The image file has a size limit of 10 MB. No side of the image can be smaller than 15 or larger than 8,192 pixels. Only images in JPEG, JPG, PNG, BMP, or TIFF format can be recognized. An example is **/9j/4AAQSkZJRgABAg...**. If the image data contains an unnecessary prefix, the error "The image format is not supported" is reported.
url	No	String	Set either this parameter or **image**. Image URL. Currently, the following URLs are supported: • Public HTTP/HTTPS URL • URL provided by OBS. You need to be authorized to use OBS data, including service authorization, temporary authorization, and anonymous public authorization. For details, see **Configuring Access Permissions of OBS**. **NOTE** • The API response time depends on the image download time. If the image download takes a long time, the API call will fail. • Ensure that the storage service where the image to be detected resides is stable and reliable. OBS is recommended for storing image data. • The URL cannot contain Chinese characters. If Chinese characters exist, they must be encoded using UTF-8.

Parameter	Mandatory	Type	Description
side	No	String	Whether the front or back side of the ID card is displayed. The options are: • **front**: front of the Vietnam ID card • **back**: back of the Vietnam ID card If the value of this parameter is empty or not included, the system will automatically recognize whether the image is the front or back of an ID card. It is recommended to set this parameter for higher accuracy.
return_portrait_image	No	Boolean	Whether to return the portrait. The options are: • **true**: The Base64 encoded string of the portrait on the ID card will be returned. • **false**: The Base64 encoded string of the portrait on the ID card will not be returned. If this parameter is not specified, **false** is used by default. In this case, the Base64 encoded string of the portrait on the ID card will not be returned.
return_portrait_location	No	Boolean	Whether to return the location of the portrait on the ID card. The options are: • **true**: The location of the portrait on the ID card will be returned. • **false**: The location of the portrait on the ID card will not be returned.

Parameter	Mandatory	Type	Description
return_idcard_type	No	Boolean	Whether to return the ID card type. The options are: • **true**: The ID card type will be returned, indicating that the ID card is the original ID card or copy of the original ID card. • **false**: The ID card type will not be returned.
return_text_location	No	Boolean	Location of a text block. The options are: • **true**: All text blocks will be returned. • **false**: Text blocks will not be returned. If this parameter is not specified, the system does not return the location of any text blocks by default. If a non-Boolean value is entered, an error message will be displayed, indicating that the parameter is invalid.

Response Parameters

Status code: 200

Table 4-100 Response body parameter

Parameter	Type	Description
result	Table 4-101 object	Calling result This parameter is not returned when the API fails to be called.

Table 4-101 VietnamIdCardResult

Parameter	Type	Description
side	String	Side of the ID card. The value can be **front** or **back**.
number	String	Card number

Parameter	Type	Description
full_name	String	Name
birth_date	String	Date of birth
sex	String	Gender
nationality	String	Nationality
origin_place	String	Place of origin
residence_place	String	Residence
expiry_date	String	Validity period
personal_identification	String	Personal identification. This field is returned when **side** is set to **back**.
issue_date	String	Date of issue. This field is returned when **side** is set to **back**.
machine_code1	String	Machine-readable code in the first line on the back of an ID card. This field is returned when **side** is set to **back**.
machine_code2	String	Machine-readable code in the second line on the back of an ID card. This field is returned when **side** is set to **back**.
machine_code3	String	Machine-readable code in the third line on the back of an ID card. This field is returned when **side** is set to **back**.
confidence	Object	Confidence of related fields. A higher confidence indicates a higher accuracy of the field identified. The confidence is calculated using algorithms and is not equal to the accuracy.
portrait_image	String	Base64 encoded string of the portrait when **return_portrait_image** is set to **true**.
portrait_location	Array<Array<Integer>>	Location of the portrait on the original image when **return_portrait_location** is set to **true**, including the two-dimensional coordinates (x,y) of the four vertices of the portrait, which is displayed in a list. The origin is at the upper left corner of the image. The X axis is horizontal, and the Y axis is vertical.
idcard_type	String	ID card type returned when **return_idcard_type** is set to **true**. **normal** indicates the original ID card, **copy** indicates the copy of the ID card, and **screen** indicates a recapture of an ID card image on the screen.

Parameter	Type	Description
text_location	Object	Location of all fields identified on the original image, including the two-dimensional coordinates (x,y) of the four vertices in all text areas. The image coordinate system is used. The coordinate origin is the upper left corner of the image, the X axis is horizontal, and the Y axis is vertical.

Status code: 400

Table 4-102 Response body parameters

Parameter	Type	Description
error_code	String	Error code of a failed API call. For details, see **Error Codes**. This parameter is not returned for a successful call.
error_msg	String	Error message when the API call fails This parameter is not returned when the API is successfully called.

Example Request

NOTE

- The endpoint is the request URL for calling an API. Endpoints vary according to services and regions. For details, see **Endpoints**. For example, Vietnam ID Card OCR is deployed in the **CN-Hong Kong** region. The endpoint is **ocr.ap-southeast-1.myhuaweicloud.com**. The request URL is **https://ocr.ap-southeast-1.myhuaweicloud.com/v2/{project_id}/ocr/vietnam-id-card**. **project_id** is the project ID. For how to obtain the project ID, see **Obtaining a Project ID**.
- For details about how to obtain a token, see **Making an API Request**.

```
POST https://{endpoint}/v2/{project_id}/ocr/vietnam-id-card

{
  "image" : "/9j/4AAQSkZJRgABAgEASABIAAD/4RFZRXhpZgAATU0AKgAAAA..."
}
```

Example Response

Status code: 200

Example response for a successful request

```
{
  "result" : {
    "side" : "front",
    "number" : "784-1995-xxxxxxx-4",
    "full_name" : "VŨ THỊ HẢI YẾN",
```

```

More Programming Languages

For more SDK code examples in various programming languages, see the **Sample Code** tab on the right of the **API Explorer** page, which can automatically generate corresponding SDK code examples.

Status Codes

Status Code	Description
200	Example response for a successful request
400	Example response for a failed request

See **Status Codes**.

Error Codes

See **Error Codes**.

4.13 Peru ID Card

Function

This API detects and extracts text from images of Peru-issued identity cards and converts the text into a structured format. For details about the constraints on using this API, see **Constraints and Limitations**. For details about how to use this API, see **Introduction to OCR**.

Figure 4-6 Peru ID card example 1

Figure 4-7 Peru ID card example 2

Constraints and Limitations

- Only ID cards issued by Peru can be recognized.
- Only images in PNG, JPG, JPEG, BMP, or TIFF format can be recognized.
- No side of the image can be smaller than 15 or larger than 8,192 pixels.
- An ID card to be recognized must occupy more than 25% of the image. When scanning an ID card, ensure that the entire ID card is displayed in the image.
- An ID card can be rotated to any angle.
- The ID card in the image can be moderately distorted, but the aspect ratio cannot be distorted by more than 10%.
- Illuminated or dark images can be recognized, but the accuracy may be compromised.

Calling Method

For details, see **Calling APIs**.

Prerequisites

Before using this API, subscribe to the service and complete authentication. For details, see **Subscribing to an OCR Service** and **Authentication**.

NOTE

Before you use the service for the first time, subscribe to the service by clicking **Subscribe**. You only need to subscribe to the service once. If you have not subscribed to the service yet, error "ModelArts.4204" will be displayed when you call this API. Before you call the API, log in to the OCR console and subscribe to the corresponding service. Ensure that you make the subscription to the service in the same region where you want to call this API.

URI

POST /v2/{project_id}/ocr/peru-id-card

Table 4-103 URI parameters

Parameter	Mandatory	Description
endpoint	Yes	Endpoint, which is the request address for calling an API. The endpoint varies depending on services in different regions. For more details, see **Endpoints**.
project_id	Yes	Project ID, which can be obtained by referring to **Obtaining a Project ID**.

Request Parameters

Table 4-104 Request header parameters

Parameter	Mandatory	Type	Description
X-Auth-Token	Yes	String	User token Used to obtain the permission to call APIs. The token is the value of **X-Subject-Token** in the response header in **Authentication**.
Content-Type	Yes	String	MIME type of the request body. The value is **application/json**.

Parameter	Mandatory	Type	Description
Enterprise-Project-Id	No	String	Enterprise project ID. OCR allows you to use Enterprise Project Management Service (EPS) to split fees for resources used by different user groups and users. To obtain the enterprise project ID, go to the **Enterprise Project Management** console, click the enterprise project name, and obtain the enterprise project ID on the enterprise project details page.  For details about how to create an enterprise project, see *Optical Character Recognition User Guide*. **NOTE** After an enterprise project is created, parameter transfer involves the following scenarios: • If a correct enterprise project ID is carried and the OCR service can be used properly, the bills will be categorized under the corresponding enterprise project for that ID. • If an enterprise project ID that is in the correct format but does not actually exist is carried, and the OCR service can be used properly, the bills will display the corresponding non-existent enterprise project ID. • If no enterprise project ID or an enterprise project ID with incorrect format (such as special characters) is carried, and the OCR service can be used properly, the bills will be categorized under **default**.

Table 4-105 Request body parameters

Parameter	Mandatory	Type	Description
image	No	String	Set either this parameter or **url**. Base64 encoded string of an image file. The image file has a size limit of 10 MB. No side of the image can be smaller than 15 or larger than 8,192 pixels. Only images in JPG, PNG, BMP, or TIFF format can be recognized. PDFs with multiple pages can also be recognized. An example is **/9j/4AAQSkZJRgABAg...**. If the image data contains an unnecessary prefix, the error "The image format is not supported" is reported.
url	No	String	Set either this parameter or **image**. Image URL. Currently, the following URLs are supported: • Public HTTP/HTTPS URL • URL provided by OBS. You need to be authorized to use OBS data, including service authorization, temporary authorization, and anonymous public authorization. For details, see **Configuring Access Permissions of OBS**. **NOTE** • The API response time depends on the image download time. If the image download takes a long time, the API call will fail. • Ensure that the storage service where the image to be detected resides is stable and reliable. OBS is recommended for storing image data.

Parameter	Mandatory	Type	Description
return_portrait_image	No	Boolean	Whether to return the portrait. The options are: • **true**: The Base64 encoded string of the portrait on the ID card will be returned. • **false**: A null value is returned. If this parameter is not set, the default value **false** is used, and a null value is returned.
return_portrait_location	No	Boolean	Whether to return the location of the portrait on the ID card. The options are: • **true**: The location of the portrait on the ID card will be returned. • **false**: A null value is returned. If this parameter is not set, the default value **false** is used, and a null value is returned.

Response Parameters

Status code: 200

Table 4-106 Response body parameter

Parameter	Type	Description
result	**PeruIdCardResult** object	Result of a successful API call. This parameter is not included for a failed call.

Table 4-107 PeruIdCardResult

Parameter	Type	Description
cui_number	String	ID number
first_surname	String	First surname
second_surname	String	Second surname
given_name	String	Other names

Parameter	Type	Description
sex	String	Gender
marital_status	String	Marital status
birth_date	String	Date of birth
nationality	String	Nationality
issue_date	String	Date of issue
expiry_date	String	Date of expiration
birth_place	String	Birthplace code
voting_group	String	Voting group
organ_donation	String	Organ donation
registration_date	String	Registration date
portrait_image	String	Base64 encoded string of the portrait. This parameter is returned only when **return_portrait_image** is set to **true**.
portrait_location	Array<Array<Integer>>	Location of the portrait on the original image. This parameter is returned only when **return_portrait_location** is set to **true**. The image is displayed in a list. The list contains the two-dimensional coordinates (x,y) of the four vertices in the portrait area. The origin of the coordinates is the upper left corner of the image. The X axis is horizontal, and the Y axis is vertical.
address	String	Address
department	String	Department
province	String	Province
district	String	District
remarks	String	Remarks
machine_code1	String	Machine code in the first line
machine_code2	String	Machine code in the second line
machine_code3	String	Machine code in the third line

Parameter	Type	Description
duplicate	Boolean	Whether the ID card is a duplicate. The options are: • **true**: The ID card is a duplicate. • **false**: The ID card is not a duplicate.
confidence	Map<String,Number>	Confidence of related fields. A higher confidence indicates a higher accuracy of the field identified. The confidence is calculated using algorithms and is not equal to the accuracy.

Status code: 400

Table 4-108 Response body parameters

Parameter	Type	Description
error_code	String	Error code of a failed API call. For details, see **Error Codes**. This parameter is not returned for a successful call.
error_msg	String	Error message when the API call fails This parameter is not returned for a successful call.

Example Request

NOTE

- **endpoint** is the request URL for calling an API. Endpoints vary depending on services and regions. For details, see **Endpoints**.

  For example, Peru ID Card OCR is deployed in the **LA-Santiago** region. The endpoint is **ocr.la-south-2.myhuaweicloud.com** or **ocr.la-south-2.myhuaweicloud.cn**. The request URL is **https://ocr.la-south-2.myhuaweicloud.com/v2/{project_id}/peru-id-card**. **project_id** is the project ID. For how to obtain the project ID, see **Obtaining a Project ID**.
- For details about how to obtain a token, see **Making an API Request**.

- Request example (Method 1: Use the Base64 encoded string of an image.)

```
POST https://{endpoint}/v2/{project_id}/ocr/peru-id-card

{
  "image" : "/9j/4AAQSkZJRgABAgEASABIAAD/4RFZRXhpZgAATU0AKgAAAA...",
  "return_portrait_image" : true,
  "return_portrait_location" : true
}
```

- Example request (Method 2: Use the image URL.)

```
POST https://{endpoint}/v2/{project_id}/ocr/peru-id-card
```

```
{
  "url" : "https://BucketName.obs.myhuaweicloud.com/ObjectName",
  "return_portrait_image" : true,
  "return_portrait_location" : true
}
```

Example Response

Status code: 200

}
```

More Programming Languages

For more SDK code examples in various programming languages, see the **Sample Code** tab on the right of the **API Explorer** page, which can automatically generate corresponding SDK code examples.

Status Codes

Status Code	Description
200	Example response for a successful request
400	Example response for a failed request

See **Status Codes**.

Error Codes

See **Error Codes**.

4.14 Thailand Plate Number

Function

This API detects and extracts license plate information from images of Thailand license plates and returns the license plate number and location. For details about the constraints on using this API, see **Constraints and Limitations**. For details about how to use this API, see **Introduction to OCR**.

Figure 4-8 Example Thailand plate number

Constraints and Limitations

- Only images in PNG, JPG, JPEG, BMP, or TIFF format can be recognized.
- No side of the image can be smaller than 15 or larger than 8,192 pixels.
- A license plate can be rotated to any angle.
- Illuminated or dark images can be recognized, but the accuracy may be compromised.

Calling Method

For details, see **Calling APIs**.

Prerequisites

Before using this API, subscribe to the service and complete authentication. For details, see **Subscribing to an OCR Service** and **Authentication**.

NOTE

Before you use the service for the first time, subscribe to the service by clicking **Subscribe**. You only need to subscribe to the service once. If you have not subscribed to the service yet, error "ModelArts.4204" will be displayed when you call this API. Before you call the API, log in to the OCR console and subscribe to the corresponding service. Ensure that you make the subscription to the service in the same region where you want to call this API.

URI

POST /v2/{project_id}/ocr/thailand-license-plate

Table 4-109 URI parameters

Parameter	Mandatory	Description
endpoint	Yes	Endpoint, which is the request address for calling an API. The endpoint varies depending on services in different regions. For more details, see **Endpoints**.
project_id	Yes	Project ID, which can be obtained by referring to **Obtaining a Project ID**.

Request Parameters

Table 4-110 Request header parameters

Parameter	Mandatory	Type	Description
X-Auth-Token	Yes	String	User token Used to obtain the permission to call APIs. The token is the value of **X-Subject-Token** in the response header in **Authentication**.
Content-Type	Yes	String	MIME type of the request body. The value is **application/json**.

Parameter	Mandatory	Type	Description
Enterprise-Project-Id	No	String	Enterprise project ID. OCR uses Enterprise Project Management Service (EPS) to split fees for resources used by different user groups and users. To obtain the enterprise project ID, go to the **Enterprise Project Management** console, click the enterprise project name, and obtain the enterprise project ID on the enterprise project details page.  For details about how to create an enterprise project, see *Optical Character Recognition User Guide*. **NOTE** After an enterprise project is created, parameter transfer involves the following scenarios: • If a correct enterprise project ID is carried and the OCR service can be used properly, the bills will be categorized under the corresponding enterprise project for that ID. • If an enterprise project ID that is in the correct format but does not actually exist is carried, and the OCR service can be used properly, the bills will display the corresponding non-existent enterprise project ID. • If no enterprise project ID or an enterprise project ID with incorrect format (such as special characters) is carried, and the OCR service can be used properly, the bills will be categorized under **default**.

Table 4-111 Request body parameters

Parameter	Mandatory	Type	Description
image	No	String	Set either this parameter or **url**. Base64 encoded string of an image file. The image file has a size limit of 10 MB. No side of the image can be smaller than 15 or larger than 8,192 pixels. Only images in JPG, PNG, BMP, TIFF, or JPEG format can be recognized. An example is **/9j/4AAQSkZJRgABAg...**. If the image data contains an unnecessary prefix, the error "The image format is not supported" is reported.
url	No	String	Set either this parameter or **image**. Image URL. Currently, the following URLs are supported: • Public HTTP/HTTPS URL • URL provided by OBS. You need to be authorized to use OBS data, including service authorization, temporary authorization, and anonymous public authorization. For details, see **Configuring Access Permissions of OBS**. **NOTE** • The API response time depends on the image download time. If the image download takes a long time, the API call will fail. • Ensure that the storage service where the image to be detected resides is stable and reliable. OBS is recommended for storing image data.

Response Parameters

Status code: 200

Table 4-112 Response body parameter

Parameter	Type	Description
result	Array of **ThailandLicensePlateItem** objects	Calling result This parameter is not returned when the API fails to be called.

Table 4-113 ThailandLicensePlateItem

Parameter	Type	Description
plate_number	String	License plate content
plate_location	Array<Array<Integer>>	List of location information about a license plate, including the 2D coordinates (x, y) of four vertexes in the text area, where the coordinate origin is the upper-left corner of the image, theX axis is horizontal, and the Y axis is vertical.
confidence	Float	Confidence of a field. The value ranges from 0 to 1. A higher confidence indicates a higher accuracy of the field identified. The confidence is calculated using algorithms and is not equal to the accuracy.
province	String	Province where the license plate is registered

Status code: 400

Table 4-114 Response body parameters

Parameter	Type	Description
error_code	String	Error code of a failed API call. For details, see **Error Codes**. This parameter is not returned for a successful call.
error_msg	String	Error message when the API call fails This parameter is not returned when the API is successfully called.

Example Request

NOTE

- **endpoint** is the request URL for calling an API. Endpoints vary depending on services and regions. For details, see **Endpoints**.

  For example, Thailand Plate Number OCR is deployed in the **AP-Bangkok** region. The endpoint is **ocr.ap-southeast-2.myhuaweicloud.com** or **ocr.ap-southeast-2.myhuaweicloud.cn**. The request URL is **https://ocr.ap-southeast-2.myhuaweicloud.com/v2/{project_id}/ocr/thailand-license-plate**. **project_id** is the project ID. For how to obtain the project ID, see **Obtaining a Project ID**.
- For details about how to obtain a token, see **Making an API Request**.

- Request example (Method 1: Use the image Base64 string.)

```
POST https://{endpoint}/v2/{project_id}/ocr/thailand-license-plate

Request Header:
Content-Type: application/json
X-Auth-Token:
MIINRwYJKoZIhvcNAQcCoIINODCCDTQCAQExDTALBglghkgBZQMEAgEwgguVBgkqhkiG...
Request Body:
{
   "image":"/9j/4AAQSkZJRgABAgEASABIAAD/4RFZRXhpZgAATU0AKgAAAA..."
}
```

- Request example (Method 2: Use the image URL.)

```
POST https://{endpoint}/v2/{project_id}/ocr/thailand-license-plate

Request Header:
Content-Type: application/json
X-Auth-Token:
MIINRwYJKoZIhvcNAQcCoIINODCCDTQCAQExDTALBglghkgBZQMEAgEwgguVBgkqhkiG...
Request Body:
{
   "url":"https://BucketName.obs.xxxx.com/ObjectName"
}
```

- Sample code for a Python 3 request (For codes in other languages, refer to the following sample or use OCR SDK.)

```
# encoding:utf-8

import requests
import base64

url = "https://{endpoint}/v2/{project_id}/ocr/thailand-license-plate"
token = "Actual token value obtained by the user"
headers = {'Content-Type': 'application/json', 'X-Auth-Token': token}

imagepath = r'./data/thailand-license-plate-demo.png' # Read a local image.
with open(imagepath, "rb") as bin_data:
    image_data = bin_data.read()
image_base64 = base64.b64encode(image_data).decode("utf-8")  # Use the Base64 encoded string of the image.
payload = {"image": image_base64}
response = requests.post(url, headers=headers, json=payload)
print(response.text)
```

Example Response

Status code: 200

Example response for a successful request

```
{
  "result" : [ {
    "plate_number" : "กง XXX4",
    "province" : "มหาสารคาม",
    "confidence" : 0.9225,
    "plate_location" : [ [ 370, 881 ], [ 2591, 881 ], [ 2591, 2281 ], [ 370, 2281 ] ]
  } ]
}
```

Status code: 400

Example response for a failed request

```
{
   "error_code": "AIS.0103",
   "error_msg": "The image size does not meet the requirements."
}
```

Example SDK Code

The example SDK code is as follows:

NOTE

You are advised to update the SDKs to the latest versions before use to prevent the local outdated SDKs from being unable to use the latest OCR functions.

Java

- Transfer the Base64 encoded string of the Thailand plate number image for recognition.

```

        ocr.OcrClientBuilder().
            WithRegion(region.ValueOf("<YOUR REGION>")).
            WithCredential(auth).
            Build())

    request := &model.RecognizeThailandLicensePlateRequest{}
    urlThailandLicensePlateRequestBody:= "https://BucketName.obs.myhuaweicloud.com/ObjectName"
    request.Body = &model.ThailandLicensePlateRequestBody{
        Url: &urlThailandLicensePlateRequestBody,
    }
    response, err := client.RecognizeThailandLicensePlate(request)
    if err == nil {
        fmt.Printf("%+v\n", response)
    } else {
        fmt.Println(err)
    }
}
```

More Programming Languages

For more SDK code examples in various programming languages, see the **Sample Code** tab on the right of the **API Explorer** page, which can automatically generate corresponding SDK code examples.

Status Codes

Status Code	Description
200	Example response for a successful request
400	Example response for a failed request

See **Status Codes**.

Error Codes

See **Error Codes**.

5 Status Codes

An HTTP status code consists of three digits, which is classified into five categories: 1*xx*: related information; 2*xx*: operation successful; 3*xx*: redirection; 4*xx*: client error; 5*xx*: server error.

The following table lists the common status codes.

Status Code	Coding	Description
100	Continue	The server has received the initial part of the request and the client should continue to send the remaining part. It is issued on a provisional basis while request processing continues. It alerts the client to wait for a final response.
101	Switching Protocols	The requester has asked the server to switch protocols and the server has agreed to do so. The target protocol must be more advanced than the source protocol. For example, the current HTTPS protocol is switched to a later version.
200	OK	The server has successfully processed the request.
201	Created	The request has been fulfilled, resulting in the creation of a new resource.
202	Accepted	The request has been accepted, but the processing has not been completed.
203	Non-Authoritative Information	The server has successfully processed the request, but is returning information that may be from another source.

Status Code	Coding	Description
204	No Content	The server has successfully processed the request, but does not return any content. The status code is returned in response to an HTTP OPTIONS request.
205	Reset Content	The server has successfully processed the request, but does not return any content.
206	Partial Content	The server has successfully processed a part of the GET request.
300	Multiple Choices	There are multiple options for the location of the requested resource. The response contains a list of resource characteristics and addresses from which the user or user agent (such as a browser) can choose the most appropriate one.
301	Moved Permanently	The requested resource has been assigned a new permanent URI, and the new URI is contained in the response.
302	Found	The requested resource resides temporarily under a different URI.
303	See Other	The response to the request can be found under a different URI, and should be retrieved using a GET or POST method.
304	Not Modified	The requested resource has not been modified. In such a case, there is no need to retransmit the resource since the client has a previously-downloaded copy.
305	Use Proxy	The requested resource must be accessed through a proxy.
306	Unused	The HTTP status code is no longer used.
400	Bad Request	The request is invalid. The client should not repeat the request without modifications.
401	Unauthorized	The authorization information provided by the client is incorrect or invalid.
402	Payment Required	This status code is reserved for future use.
403	Forbidden	The server has received the request and understood it, but refuse to respond to it. The client should modify the request instead of re-initiating it.

Status Code	Coding	Description
404	Not Found	The requested resource cannot be found. The client should not repeat the request without modifications.
405	Method Not Allowed	The method specified in the request is not supported for the requested resource. The client should not repeat the request without modifications.
406	Not Acceptable	The server cannot fulfill the request according to the content characteristics of the request.
407	Proxy Authentication Required	This status code is similar to 401, but indicates that the client must first authenticate itself with the proxy.
408	Request Timeout	The server has timed out waiting for the request. The client may repeat the request without modifications at a later time.
409	Conflict	The request could not be processed due to a conflict. For example, an edit conflict between multiple simultaneous updates or the resource that the client attempts to create already exists.
410	Gone	The requested resource has been deleted permanently and is no longer available. The status code indicates that the requested resource has been deleted permanently.
411	Length Required	The server refuses to accept the request without a defined Content-Length.
412	Precondition Failed	The server did not meet one of the preconditions contained in the request.
413	Request Entity Too Large	The request is larger than the server is willing or able to process. The server may close the connection to prevent the client from continuing the request. If the server is only temporarily unable to process the request, the response will contain a Retry-After header field.
414	Request URI Too Long	The Request-URI is too long for the server to process.

Status Code	Coding	Description
415	Unsupported Media Type	The server is unable to process the media format in the request.
416	Requested Range Not Satisfiable	The requested range is invalid.
417	Expectation Failed	The server has failed to meet the requirements of the Expect request-header field.
422	Unprocessable Entity	The request is well-formed but cannot be processed due to semantic errors.
429	Too Many Requests	The client has sent an excessive number of requests to the server within a given time (exceeding the limit on the access frequency of the client), or the server has received an excessive number of requests within a given time (beyond its processing capability). In this case, the client should resend the requests at any point after the time specified in the Retry-After header of the response.
500	Internal Server Error	The server is able to receive the request but unable to understand it.
501	Not Implemented	The server does not support the function required to fulfill the request.
502	Bad Gateway	The server was acting as a gateway or proxy and received an invalid response from the upstream server.
503	Service Unavailable	The requested service is invalid. The client should not repeat the request without modifications.
504	Gateway Timeout	The request cannot be fulfilled within a given time. This status code is returned to the client only if the **Timeout** parameter is specified in the request.
505	HTTP Version Not Supported	The server does not support the HTTPS protocol version used in the request.

6 Error Codes

If an error occurs during API calling, no result will be returned. You can locate the cause of an error using the error code of each API. When an API call fails, HTTPS status code 4*xx* or 5*xx* is returned. The returned message body contains a specific error code and error message. If you fail to identify the cause of an error, contact Huawei Cloudcustomer service technical support and provide the error code for quick troubleshooting.

Format of an Error Response Body

If an error occurs during API calling, an error code and a message will be displayed. The following shows an error response body.

```
{
   "error_msg": "The input parameter is invalid.",
   "error_code": "AIS.0101"
}
```

In the response body, **error_code** indicates the error code, and **error_msg** provides information about the error.

Error Codes

OCR is deployed on ModelArts and uses API Gateway (APIG). Therefore, OCR error codes may start with ModelArts, APIGW, or APIG.

If an error code starting with **APIGW** is returned after you call an API, rectify the fault by referring to **Error Codes**. If an error code starts with APIG, rectify the fault by referring to this table.

Module	Error Code	Error Message	Description	Solution
OCR	AIS.0101	The input parameter is invalid.	The input parameter does not meet the requirements.	Check whether the input parameter is correct. Possible causes are as follows: • **image** and **url** are both configured or the value format is incorrect. • **true** or **false** is incorrectly spelled. • Incorrect characters are included in the parameter value. For details about the parameter value format, see the request parameter description of each API.
	AIS.0102	The image format is not supported.	The image format is not supported, or the value of **image** is not a Base64 encoded string.	Check the image format. For details about the image formats supported by each service, see **Constraints and Limitations**.
	AIS.0103	The image size does not meet the requirements.	The image size does not meet the requirements.	Check the image size. For details about the image size supported by each service, see **Constraints and Limitations**.
	AIS.0104	The image is not supported or the image quality is poor.	The image is not supported or is of poor quality.	Check the image type and quality. Check whether the called API is correct.
	AIS.0105	Recognition failed.	Algorithm calculation failed.	Contact **Huawei Cloud support personnel**.

Module	Error Code	Error Message	Description	Solution
	AIS.0117	Input ID does not exist.	The entered ID does not exist.	Check whether **classifier_id** or **template_id** is specified.
	AIS.0118	Service request error or the tax authority's interface was malfunctioning.	The tax agency's interface timed out and did not respond, resulting in an error in the service request.	Wait for the tax agency's interface to recover. (You are advised to try again 2 hours later.)
	AIS.0119	Template match failed, template_id={xxx}.	The input image failed to match the template.	Check whether the reference fields in the template match the fields in the input image.
	AIS.0120	Classification failed.	The image category failed to be entered.	Check whether the template in the classifier matches the input image.
	AIS.0121	The recognition area of template is not configured, template_id={xxx}	No recognition area is configured for the template.	Check whether the recognition area is configured for the template.
	AIS.0122	The image contains two or more ID cards with the same side.	There are two or more ID cards in the image that are on the same side.	Check if there are multiple ID cards on the same side in the input image. If the **side** parameter of ID Card OCR is **double_side**, the image cannot contain two or more ID cards on the same side.
Platform	ModelArts.0203	Invalid token.	The token is invalid.	Check whether the token is correct.

Module	Error Code	Error Message	Description	Solution
	ModelArts.4101	Token header cannot be empty.	The token is empty.	The HTTP request header does not contain the token request authentication information of **x-auth-token**. Check the request.
	ModelArts.4102	Parse Token error.	The token failed to be parsed.	The token request authentication information of **x-auth-token** in the HTTP request header is incorrect. Check the sent request and token.
	ModelArts.4103	Invalid Token header.	The token is invalid.	The token request authentication information of **x-auth-token** in the HTTP request header is incorrect. Check the sent request and token.
	ModelArts.4104	Invalid Request Content Length.	The length of the request body is invalid.	Check the request body length. The size cannot exceed 10 MB.
	ModelArts.4105	The JSON format of the input data is incorrect.	The JSON format of the request body is incorrect.	Check the JSON format of the request body.
		Failed to obtain the temporary AK/SK	The temporary AK/SK failed to be obtained.	Contact technical support. (If OBS is used, check the authorization first.)
	ModelArts.4106	Invalid authorization request.	The account is restricted.	Check the user's resources. For details about the account restriction reason, see **My Account FAQ** in **Help Center**.

Module	Error Code	Error Message	Description	Solution
	ModelArts.4107	Get user temp ak sk error.	An exception occurred when obtaining the temporary AK/SK.	Contact **Huawei Cloud support personnel**.
	ModelArts.4201	Request url need service id.	The request URL does not contain the service ID.	Check the service ID in the request URL.
	ModelArts.4202	Request url format invalid.	The request URL format is invalid.	Check the request URL format.
	ModelArts.4203	Access denied! You do not have permission.	Access permission is unavailable.	Check the access permission.
	ModelArts.4204	Request api error! The API XXX is not subscribed.	Failed to request the service because the service has not been subscribed.	• Go to the **OCR** console, select an appropriate region, and subscribe to the API you need. • If the service has been subscribed to, check whether the region (or account) where the service is subscribed to is the same as the region (or account) where the service is called. If they are the same, check whether the URL of the API is spelled correctly.
	ModelArts.4301	Have error when get ai-service admin token.	Failed to obtain the admin token of the service.	Contact Huawei Cloud support personnel.
	ModelArts.4302	Gateway forwarding error.	The serviced failed to be accessed.	Contact Huawei Cloud support personnel.

Module	Error Code	Error Message	Description	Solution
	ModelArts.4401	Max concurrency error.	The number of concurrent requests exceeds the upper limit.	Contact **Huawei Cloud support personnel**.
	ModelArts.4402	Backend service timeout error.	Service processing timed out.	Contact **Huawei Cloud support personnel**.
	ModelArts.4403	Backend service unavailable error.	The service is unavailable because it failed to respond or its failure rate is high.	Contact **Huawei Cloud support personnel**.
	ModelArts.4502	Backend service response error.	The service failed to respond.	Contact **Huawei Cloud support personnel**.
	ModelArts.4503	Backend service found error.	The service does not exist.	Contact **Huawei Cloud support personnel**.
	ModelArts.4504	Backend service api not found.	The API to be accessed does not exist.	Contact **Huawei Cloud support personnel**.
	ModelArts.4505	Backend service internal error.	The internal service error occurs.	Contact **Huawei Cloud support personnel**.
	ModelArts.4506	SubService service found error.	The subservice corresponding to the API does not exist.	Contact **Huawei Cloud support personnel**.
	ModelArts.4508	Service not start.	The service does not exist or is stopped.	Contact **Huawei Cloud support personnel**.
	ModelArts.4601	Failed to download the file because the file path is not valid, please check it format.	The external URL is invalid.	Check the format of the entered download address.

Module	Error Code	Error Message	Description	Solution
	ModelArts.4603	Obtaining the file from the URL failed.	The file failed to be downloaded from the external URL.	Check the network and URL.
	ModelArts.4702	Query Obs agency failed.	The OBS agency failed to be queried.	Check whether the OBS agency has been enabled for the service.
	ModelArts.4703	The Obs URL is invalid.	The OBS URL is invalid.	Check the OBS URL.
	ModelArts.4704	Obtaining the file from the OBS failed.	The OBS file failed to be obtained.	Check the OBS file.
	ModelArts.4705	The file stored on the OBS is oversized.	The OBS file is oversized.	Check the size of the OBS file and ensure that the file does not exceed the size limit.
	ModelArts.4706	The Obs file is not exist.	The OBS file does not exist.	Check whether the corresponding file exists.
	ModelArts.6201	The user account has been suspended. Please check if you have an outstanding balance.	The user account has been frozen.	Check if your account has been frozen. Check your account balance and top up your account if necessary.

Module	Error Code	Error Message	Description	Solution
APIG	APIG.0101	The API does not exist or has not been published in the environment.	The API does not exist or has not been published.	• Check whether the API URL is correct. For example, check whether the project ID is included in the URL. • Check whether the region in the URI is the same as that configured for calling the service by referring to **Endpoints**. • Check whether the HTTP request method (such as POST and GET) is correct. • For details about the URI, see the corresponding API page.

Module	Error Code	Error Message	Description	Solution
	APIG.0201	Backend timeout.	Request timed out.	• Check whether the original API call requests are excessively frequent. If so, use the retry mechanism to rectify the fault by checking the return value in the code and retrying the requests after a short period of time (for example, 2 to 5 seconds). Alternatively, check whether the result of the previous request is returned at the backend. If it is, send the next request. This helps prevent excessively frequent requests. • Check whether the image is too large or the network delay is too long. If the image is too large, compress the image in proportion while ensuring the image definition. If the network delay is long, you can increase the network transmission speed.

Module	Error Code	Error Message	Description	Solution
	APIG.0301	Incorrect IAM authentication information.	The IAM authentication information is incorrect. • **decrypt token fail**: The token fails to be parsed. • **token expires**: The token expires. • **verify aksk signature fail**: The AK/SK authentication fails. • **x-auth-token not found**: The **x-auth-token** parameter is not found.	• If the token fails to be parsed, check the method for obtaining the token, whether the request body is correct, whether the token is correct, and whether the environment for obtaining the token is the same as the environment for calling the token. • If the token expires, obtain a new token that is valid permanently. • Check whether the AK/SK pair is correct. For example, the SK corresponding to the AK is incorrect; an extra space is entered in the AK/SK pair. • AK/SK-based authentication errors occur frequently. If an AK/SK pair fails to be authenticated for more than five consecutive times, the AK/SK pair is locked for 5 minutes (the AK/SK-based authentication is considered as an abnormal

Module	Error Code	Error Message	Description	Solution
				authentication request within 5 minutes). After 5 minutes, the AK/SK pair is unlocked and re-authenticated. • Check the account permissions, for example, whether the account is in arrears or frozen. • Check whether the spelling of **X-Auth-Token** in the request header is correct.
	APIG.0308	The throttling threshold has been reached: policy user over ratelimit,limit:XX,time:1 minute.	The request exceeds the default rate limit of the service.	Rectify the fault by following the instructions provided in **Why Is a Message Stating "APIG.0308" Displayed When the OCR API Is Called?**
Other	If other error codes are displayed, **contact us**.			

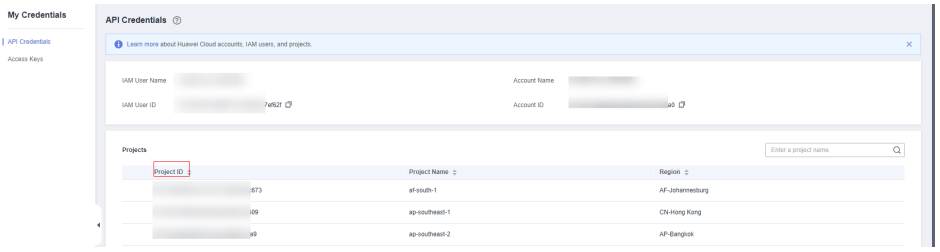
7 Appendix

7.1 Obtaining a Project ID

Obtaining a Project ID from the Management Console

1. Log in to **the management console**.
2. Hover the cursor over your username in the upper right corner and click **My Credentials** from the drop-down list.
3. On the **My Credentials** > **API Credentials** page, view the username and account name and view projects in the project list.

Figure 7-1 Viewing the project ID



If there are multiple projects in one region, expand **Region** and view subproject IDs in the **Project ID** column.

Obtaining a Project ID by Calling an API

The API for obtaining a project ID is **GET https://{endpoint}/v3/projects**. **{Endpoint}** indicates the endpoint of IAM. For details about API authentication, see **Authentication**.

For example, if OCR is deployed in the **ap-southeast-1** region, **name** is **ap-southeast-1**,, and **id** in **projects** is the project ID. If an error is reported when obtaining the project ID, check whether *{endpoint}* is correct.

```
GET https://iam.ap-southeast-1.myhuaweicloud.com/v3/projects
{
   "projects": [
      {
```

```
            "domain_id": "65382450e8f64ac0870cd180d14e684b",
            "is_domain": false,
            "parent_id": "65382450e8f64ac0870cd180d14e684b",
            "name": "ap-southeast-1",
            "description": "",
            "links": {
                "next": null,
                "previous": null,
                "self": "https://support-intl.huaweicloud.com/zh-cn/devg-apisign/api-sign-
provide.htmlcd05f897d6b99"
            },
            "id": "a4a5d4098fb4474fa22cd05f897d6b99",
            "enabled": true
        }
    ],
    "links": {
        "next": null,
        "previous": null,
        "self": "https://www.example.com/v3/projects"
    }
}
```

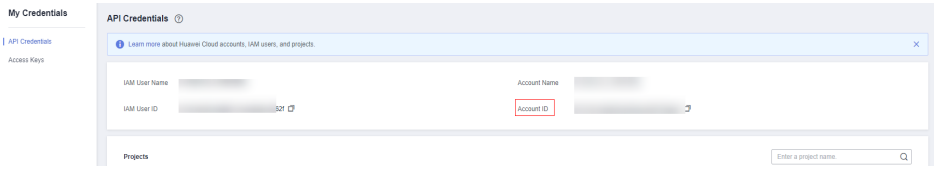
7.2 Obtaining an Account ID

An account ID (domain-id) is required for some URLs when an API is called. To obtain the ID, perform the following operations:

1. Log in to the management console after registration.
2. Hover the cursor over your username and choose **My Credentials**.

   On the **My Credentials** page, view **Account ID**.

   Figure 7-2 Viewing the account ID



7.3 Configuring Access Permissions of OBS

Multimedia files such as images and audio files in the Enterprise Intelligence (EI) services can be directly processed by OBS. This reduces service usage costs, shortens service response time, and improves service experience.

To ensure data security, a service can used authorized URLs (**https://<bucket-name>.<endpoint>/<object-name>**) to access files stored on OBS after it is granted with the required permission. Unauthorized services cannot obtain user data. To obtain the user data in this case, enable public read authorization or provide a URL that has been temporarily authorized.

Enabling Authorization for OCR

To use data in OBS, you need to enable OBS authorization. Go to **the OCR console**. Enable **OBS Authorization**. After the authorization is enabled, you can use the authorized URL to access the service.

Figure 7-3 OBS authorization

NOTE

OBS must reside in the same region as OCR.

For details about the constraints on using OBS features, see **Restrictions and Limitations**.

(Optional) Enabling Public Read Authorization

To do so, configure the bucket policy to **Public Read**. For details, see **Configuring a Standard Bucket Policy** in *Object Storage Service Console Operation Guide*. This method is not recommended for private data.

Using Temporarily Authorized Requests for Authentication

Public read authorization is easy to use. However, when it is enabled, sensitive information, such as private data, may be disclosed. In this scenario, the temporary authorization function provided by OBS comes in handy.

OBS allows users to construct a specific URL for objects in OBS. The URL contains authentication information. Any user can use the URL to access the specified object in OBS, but the URL is valid only before the expiry time specified in **Expires**. After a user issues temporary authorization, other users can perform operations without requiring the user's access key.

For details about how to use the OBS temporary authorization function, see section "Authorized Access" in the **Object Storage Service SDK Reference**. Download the related SDK and sample code, and compile code to obtain the related URL.
