Notice

The purchased products, services and features are stipulated by the contract made between Huawei Cloud and the customer. All or part of the products, services and features described in this document may not be within the purchase scope or the usage scope. Unless otherwise specified in the contract, all statements, information, and recommendations in this document are provided "AS IS" without warranties, guarantees or representations of any kind, either express or implied.

The information in this document is subject to change without notice. Every effort has been made in the preparation of this document to ensure accuracy of the contents, but all statements, information, and recommendations in this document do not constitute a warranty of any kind, express or implied.

Contents

1 Before You Start.....	1
1.1 Overview.....	1
1.2 API Calling.....	1
1.3 Constraints.....	1
1.4 Concepts.....	2
1.5 API Types.....	3
2 API Overview.....	4
3 Calling APIs.....	7
3.1 Making an API Request.....	7
3.2 Authentication.....	11
3.3 Response.....	13
4 API v3.1 (Recommended).....	15
4.1 Applying a Parameter Template.....	15
4.2 Modifying Parameters of a Specified Instance.....	18
4.3 Restoring Data to an Existing DB Instance.....	22
4.4 Restoring Tables to a Specified Point in Time (RDS for MySQL).....	35
4.5 Querying Database Error Logs (MySQL).....	40
4.6 Querying Database Slow Logs (RDS for MySQL).....	44
4.7 Deleting a Database (RDS for SQL Server).....	49
4.8 Shrinking Database Logs.....	52
5 API v3 (Recommended).....	55
5.1 Querying Version Information About APIs.....	55
5.1.1 Querying API Versions.....	55
5.1.2 Querying a Specified API Version.....	58
5.2 Querying Version Information About a DB Engine.....	61
5.3 Querying Database Specifications.....	64
5.4 Querying the Storage Type of a Database.....	69
5.5 Querying Storage Usage of a DB Instance.....	75
5.6 DB Instance Management.....	76
5.6.1 Creating a DB Instance.....	77
5.6.2 Creating a DB Instance (API v5).....	123
5.6.3 Changing the Billing Mode from Pay-per-Use to Yearly/Monthly.....	154

5.6.4 Stopping an Instance.....	157
5.6.5 Starting an Instance.....	159
5.6.6 Changing a DB Instance Name.....	161
5.6.7 Changing the Description of a DB Instance.....	163
5.6.8 Applying for a Private Domain Name.....	164
5.6.9 Modifying a Private Domain Name.....	166
5.6.10 Querying the Domain Name of a DB Instance.....	168
5.6.11 Querying the IPv6 Domain Name of a DB Instance.....	169
5.6.12 Obtaining the Replication Status of a DB Instance.....	171
5.6.13 Querying Available Instance Classes for a DB Instance.....	172
5.6.14 Changing DB Instance Specifications.....	176
5.6.15 Scaling Up Storage Space of a DB Instance.....	179
5.6.16 Configuring an Autoscaling Policy.....	182
5.6.17 Querying an Autoscaling Policy.....	185
5.6.18 Changing a Single DB Instance to Primary/Standby DB Instances.....	187
5.6.19 Rebooting a DB Instance.....	190
5.6.20 Deleting a DB Instance.....	194
5.6.21 Querying DB Instances.....	196
5.6.22 Binding and Unbinding an EIP.....	220
5.6.23 Changing the Failover Priority.....	222
5.6.24 Manually Switching Primary/Standby DB Instances.....	224
5.6.25 Changing the Data Replication Mode of Primary/Standby DB Instances.....	226
5.6.26 Changing Read/Write Permissions.....	228
5.6.27 Migrating a Standby DB Instance.....	230
5.6.28 Configuring the Maintenance Window.....	232
5.6.29 Upgrading the Minor Version of a DB Instance.....	233
5.6.30 Configuring an Automatic Minor Version Upgrade Policy for a DB Instance (RDS for PostgreSQL).....	235
5.6.31 Querying the Automatic Minor Version Upgrade Policy of a DB Instance (RDS for PostgreSQL)...	238
5.6.32 Configuring a Monitoring by Seconds Policy.....	240
5.6.33 Querying a Monitoring by Seconds Policy.....	242
5.6.34 Enabling TDE for a DB Instance (RDS for SQL Server).....	243
5.6.35 Querying TDE Status of a DB Instance (RDS for SQL Server).....	245
5.6.36 Unlocking a DB Instance from the Read-Only State.....	247
5.7 DR Instances (RDS for PostgreSQL).....	248
5.7.1 Querying DR relationships.....	248
5.7.2 Configuring the DR Capability for a Primary DB Instance.....	252
5.7.3 Configuring the DR Capability for a DR Instance.....	255
5.7.4 Promoting a DR Instance to Be the Primary DB Instance.....	258
5.7.5 Querying the DR Replication Status.....	260
5.7.6 Querying DR Instances in Batches.....	262
5.7.7 Removing the DR Relationship from a DB Instance.....	264
5.8 Database Security.....	266

5.8.1 Configuring SSL.....	266
5.8.2 Changing a Database Port.....	268
5.8.3 Changing a Security Group.....	271
5.8.4 Changing a Floating IP Address.....	273
5.9 Backup and Restoration.....	274
5.9.1 Setting an Automated Backup Policy.....	274
5.9.2 Setting a Cross-Region Backup Policy.....	279
5.9.3 Obtaining an Automated Backup Policy.....	282
5.9.4 Querying Information About a Cross-Region Backup Policy.....	284
5.9.5 Creating a Manual Backup.....	287
5.9.6 Obtaining Backups.....	292
5.9.7 Querying Cross-Region Backups.....	301
5.9.8 Querying DB Instances for Which Cross-Region Backups Are Created.....	307
5.9.9 Obtaining the Link for Downloading a Backup.....	310
5.9.10 Deleting a Manual Backup.....	313
5.9.11 Querying the Restoration Time Range.....	314
5.9.12 Querying the Restoration Time Range of a Cross-Region Backup.....	316
5.9.13 Restoring Data to a New DB Instance.....	318
5.9.14 Stopping a Backup (RDS for PostgreSQL).....	361
5.9.15 Checking Whether Fast Restoration Can Be Used for Restoring Databases or Tables (RDS for MySQL).....	363
5.9.16 Querying Tables That Can Be Restored to a Specified Point in Time (RDS for PostgreSQL).....	365
5.9.17 Querying Databases That Can Be Restored to a Specified Point in Time.....	368
5.9.18 Restoring Tables to a Specified Point in Time (RDS for PostgreSQL).....	371
5.9.19 Restoring Databases to a Specified Point in Time.....	374
5.9.20 Querying Databases Contained in a Database-Level Backup (RDS for PostgreSQL).....	378
5.9.21 Transferring Backups to an OBS Bucket (RDS for MySQL).....	381
5.9.22 Querying Transfer Tasks (RDS for MySQL).....	384
5.10 Upgrading a Major Version.....	391
5.10.1 Querying the Target Version to Which a DB Instance Can Be Upgraded (RDS for PostgreSQL)....	391
5.10.2 Performing a Major Version Upgrade Pre-Check for a DB Instance (RDS for PostgreSQL).....	393
5.10.3 Querying the Major Version Check Status or Upgrade Status of a DB Instance (RDS for PostgreSQL).....	394
5.10.4 Querying the Major Version Upgrade Check History of a DB Instance (RDS for PostgreSQL).....	396
5.10.5 Upgrading a Major Version of a DB Instance (RDS for PostgreSQL).....	399
5.10.6 Querying the Major Version Upgrade History of a DB Instance (RDS for PostgreSQL).....	402
5.11 Log Information Queries.....	406
5.11.1 Querying Error Logs Through LTS.....	406
5.11.2 Querying Slow Query Logs Through LTS.....	413
5.11.3 (Recommended) Querying Database Error Logs.....	416
5.11.4 (Recommended) Querying Slow Query Logs.....	419
5.11.5 Showing Original Logs.....	422
5.11.6 Querying Slow Query Log Files (SQL Server).....	423

5.11.7 Querying Extended Logs (RDS for SQL Server).....	425
5.11.8 Obtaining Links for Downloading Extended Logs (RDS for SQL Server).....	427
5.11.9 Obtaining Slow Query Log Statistics (RDS for MySQL).....	430
5.11.10 Obtaining Links for Downloading Slow Query Logs.....	433
5.11.11 Obtaining Links for Downloading Error Logs (RDS for PostgreSQL).....	437
5.11.12 Setting SQL Audit.....	441
5.11.13 Querying the Policy for SQL Audit Logs.....	444
5.11.14 Obtaining Audit Logs.....	446
5.11.15 Obtaining the Links for Downloading Audit Logs.....	451
5.11.16 Setting the Local Retention Period of Binlogs.....	452
5.11.17 Obtaining the Local Retention Period of Binlogs.....	454
5.11.18 Querying LTS Configurations.....	455
5.12 Instance Diagnosis.....	460
5.12.1 Obtaining the Number of Instances After Diagnosis.....	461
5.12.2 Obtaining the Result of a Specific Diagnosis Item.....	463
5.13 SQL Throttling (RDS for PostgreSQL).....	467
5.13.1 Adding a SQL Throttling Rule for a Database.....	467
5.13.2 Deleting a SQL Throttling Rule.....	470
5.13.3 Modifying a SQL Throttling Rule.....	473
5.13.4 Querying SQL Throttling Rules.....	476
5.13.5 Enabling or Disabling a SQL Throttling Rule or Disabling All SQL Throttling Rules.....	480
5.14 Database Proxy (RDS for MySQL).....	483
5.14.1 Enabling Database Proxy.....	483
5.14.2 Querying Database Proxies.....	489
5.14.3 Querying Database Proxy Specifications.....	499
5.14.4 Configuring the Routing Policy for a Database Proxy.....	504
5.14.5 Disabling Database Proxy.....	507
5.15 Database and Account Management (MySQL).....	509
5.15.1 Precautions.....	509
5.15.2 Creating a Database.....	510
5.15.3 Querying Details About a Database (Discarded).....	512
5.15.4 Querying Databases.....	515
5.15.5 Querying Authorized Databases of a Specified User.....	517
5.15.6 Modifying the Database Remarks of a Specified DB Instance.....	519
5.15.7 Deleting a Database.....	522
5.15.8 Creating a Database Account.....	523
5.15.9 Querying Database Users of a DB Instance (Discarded).....	528
5.15.10 Querying Database Users.....	530
5.15.11 Querying Authorized Users of a Specified Database.....	533
5.15.12 Modifying Remarks of a Database Account.....	535
5.15.13 Deleting a Database Account.....	537
5.15.14 Configuring a Password for a Database Account.....	539

5.15.15 Authorizing a Database Account.....	541
5.15.16 Revoking Permissions of a Database Account.....	544
5.15.17 Resetting the Password for User root.....	547
5.16 Database and Account Management (PostgreSQL).....	549
5.16.1 Creating a Database.....	549
5.16.2 Creating a Database Account.....	555
5.16.3 Creating a Database Schema.....	558
5.16.4 Granting Read or Write Permissions to a Database Account.....	563
5.16.5 Resetting a Password for a Database Account.....	568
5.16.6 Querying Databases.....	571
5.16.7 Querying Database Users.....	575
5.16.8 Querying Database Schemas.....	581
5.16.9 Configuring Account Permissions.....	585
5.16.10 Changing the Database Owner.....	588
5.16.11 Granting a Role to a User.....	590
5.16.12 Revoking a Role from a User.....	593
5.16.13 Querying Roles.....	596
5.16.14 Querying pg_hba.conf of a DB Instance.....	598
5.16.15 Modifying or Adding One or More Records in pg_hba.conf.....	601
5.16.16 Overwriting pg_hba.conf.....	606
5.16.17 Deleting One or More Records from pg_hba.conf.....	611
5.16.18 Querying the pg_hba.conf Change History of a DB Instance.....	615
5.17 Database and Account Management (Microsoft SQL Server).....	621
5.17.1 Querying the Available SQL Server Character Set.....	621
5.17.2 Creating a Database.....	623
5.17.3 Querying Databases.....	626
5.17.4 Creating a Database Account.....	631
5.17.5 Configuring a Password for a Database Account.....	634
5.17.6 Querying Database Users.....	637
5.17.7 Querying Authorized Users of a Specified Database.....	640
5.17.8 Deleting a Database Account.....	643
5.17.9 Authorizing a Database Account.....	646
5.17.10 Revoking Permissions of a Database Account.....	649
5.17.11 Adding Host Addresses for MSDTC.....	652
5.17.12 Querying MSDTC Hosts.....	655
5.18 Parameter Management.....	658
5.18.1 Obtaining a Parameter Template List.....	658
5.18.2 Creating a Parameter Template.....	661
5.18.3 Modifying a Parameter Template.....	667
5.18.4 Replicating a Parameter Template.....	672
5.18.5 Querying Change History of Instance Parameters.....	676
5.18.6 Obtaining the Parameter Template of a Specified DB Instance.....	681

5.18.7 Obtaining Parameters in a Specified Parameter Template.....	685
5.18.8 Deleting a Parameter Template.....	690
5.19 Extension Management (RDS for PostgreSQL).....	692
5.19.1 Creating an Extension.....	692
5.19.2 Querying Extensions.....	694
5.19.3 Updating an Extension.....	698
5.19.4 Deleting an Extension.....	700
5.19.5 Modifying the Value of a Specified Parameter for an Instance.....	703
5.19.6 Obtaining the Value of a Specified Parameter for an Instance.....	706
5.20 Configuring Replication Delay for a Read Replica (RDS for PostgreSQL).....	708
5.20.1 Obtaining the Delayed Replay Status of WAL Logs.....	709
5.20.2 Querying the Recovery Time Window of WAL Logs.....	711
5.20.3 Pausing or Resuming WAL Log Replay.....	713
5.20.4 Querying the Databases That Can Be Restored to the Primary DB Instance from a Read Replica.	716
5.20.5 Restoring a Database from a Read Replica to the Primary DB Instance.....	719
5.21 Recycling a DB Instance.....	722
5.21.1 Modifying Recycling Policy.....	722
5.21.2 Querying the Recycling Policy.....	725
5.21.3 Querying Instances in the Recycle Bin.....	726
5.22 Tag Management.....	732
5.22.1 Adding Tags in Batches.....	732
5.22.2 Deleting Tags in Batches.....	735
5.22.3 Querying Project Tags.....	738
5.22.4 Querying Tags of a DB Instance.....	740
5.23 Quota Management.....	743
5.23.1 Querying Resource Quotas.....	743
5.24 Obtaining Task Information.....	745
5.24.1 Querying Scheduled Tasks.....	745
5.24.2 Querying Instant Tasks.....	754
5.24.3 Obtaining Information About a Task with a Specified ID.....	761
5.24.4 Obtaining Task Information of a Specified DB Instance in a Specified Time Range (RDS for SQL Server).....	770
6 Historical APIs.....	779
6.1 API v3.....	779
6.1.1 Querying API Versions.....	779
6.1.2 Upgrading a Minor Version.....	782
6.1.3 Applying a Parameter Template.....	784
6.1.4 Modifying Parameters of a Specified DB Instance.....	786
6.1.5 Restoring Data to an Existing DB Instance.....	789
6.1.6 Restoring Tables to a Specified Point in Time (RDS for MySQL).....	796
6.1.7 Deleting a Database (RDS for SQL Server).....	799
6.1.8 Shrinking Database Logs (Not Recommended).....	801

6.1.9 Database Proxy (PostgreSQL).....	802
6.1.9.1 Enabling Database Proxy.....	802
6.1.9.2 Disabling Database Proxy.....	804
6.1.9.3 Querying Information About Database Proxy.....	805
6.1.9.4 Modifying Read Weight.....	811
6.1.9.5 Changing the Delay Threshold of Read/Write Splitting.....	813
6.1.9.6 Changing the Instance Class of a DB Proxy Instance.....	814
6.1.9.7 Querying Available Instance Classes for a DB Proxy Instance (v3.1).....	816
7 Permissions and Supported Actions.....	819
7.1 Introduction.....	819
7.2 RDS Actions.....	820
8 Appendix.....	835
8.1 Abnormal Request Results.....	835
8.2 Status Codes.....	835
8.3 Error Codes.....	839
8.4 Obtaining a Project ID.....	847
8.5 Replication Mode.....	848
8.6 Monitoring Metrics.....	848
8.6.1 RDS for MySQL Metrics.....	848
8.6.2 RDS for PostgreSQL Metrics.....	860
8.6.3 RDS for SQL Server Metrics.....	871
8.7 Idempotent Requests.....	876

1

Before You Start

1.1 Overview

Welcome to *Relational Database Service API Reference*. RDS is an online relational database service based on a cloud computing platform. RDS is reliable, scalable, and easy to manage. It provides a comprehensive performance monitoring system, multiple levels of security, and a professional database management platform, allowing you to easily set up and scale a relational database.

This document describes how to use application programming interfaces (APIs) to perform operations on RDS DB instances, such as DB instance creation, backup and restoration, query, parameter modifications, and deletions. For details about all supported operations, see [API Overview](#).

If you plan to access RDS through an API, ensure that you are familiar with RDS concepts. For details, see [Service Overview](#) in *Relational Database Service User Guide*.

1.2 API Calling

RDS supports Representational State Transfer (REST) APIs, allowing you to call APIs using HTTPS. For details about API calling, see [Calling APIs](#).

NOTE

A request throttling policy is used to limit the number of times that an API can be called within a specific time period. If there are too many API requests within a specific time period, the requests may fail.

Standard request throttling policy: 60 calls per minute for a single user and 8,000 calls per minute for an API.

1.3 Constraints

- The number of RDS DB instances that you can create is determined by your quota. To view or increase the quota, see [Managing Quotas](#).

- For more constraints, see API description.

1.4 Concepts

- Account

An account is created after your registration. The account has full access permissions for all of its cloud services and resources. It can be used to reset user passwords and grant user permissions. The account is a payment entity and should not be used directly to perform routine management. For security purposes, create IAM users and grant them permissions for routine management.

- IAM User

An IAM user is created using an account to use cloud services. Each IAM user has its own identity credentials (password and access keys).

The account name, username, and password will be required for API authentication.

- Region

A region is a geographic area in which cloud resources are deployed. Availability zones (AZs) in the same region can communicate with each other over an intranet, while AZs in different regions are isolated from each other. Deploying cloud resources in different regions can better suit certain user requirements or comply with local laws or regulations.

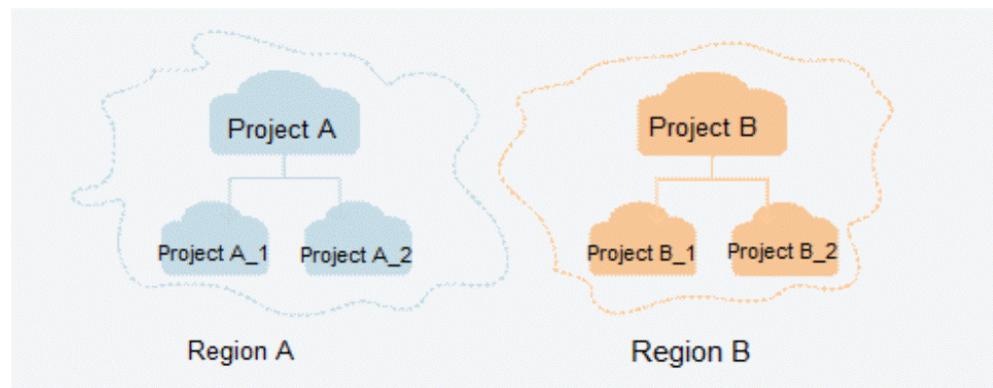

- AZ

An AZ contains one or more physical data centers. Each AZ has independent cooling, fire extinguishing, moisture-proof, and electricity facilities. Within an AZ, computing, network, storage, and other resources are logically divided into multiple clusters. AZs within a region are interconnected using high-speed optical fibers to support cross-AZ high-availability systems.

- Project

Projects group and isolate resources (including compute, storage, and network resources) across physical regions. A default project is provided for each region, and subprojects can be created under each default project. Users can be granted permissions to access all resources in a specific project. For more refined access control, create subprojects under a project and purchase resources in the subprojects. Users can then be assigned permissions to access only specific resources in the subprojects.

Figure 1-1 Project isolating model

- Enterprise Project

Enterprise projects group and manage resources across regions. Resources in enterprise projects are logically isolated from each other. An enterprise project can contain resources in multiple regions, and resources can be directly transferred between enterprise projects.

For more information about enterprise projects and how to obtain enterprise project IDs, see [*Enterprise Management User Guide*](#).

1.5 API Types

Table 1-1 API type description

Version	Recommended	Description
v3	Yes	APIs for RDS with customized specifications
v3.1	Yes	APIs for RDS with customized specifications

2 API Overview

RDS APIs enable you to use all RDS functions, including creating DB instances, obtaining log information, and backing up and restoring data.

Type	Subtype	Description
RDS APIs (v3.1)	API v3.1 (Recommended)	Apply a parameter template, modify parameters of a specified instance, and restore data to an existing instance.
RDS APIs (v3)	Querying Version Information About APIs	Obtain API versions, including the API version list and API version information.
RDS APIs (v3)	Querying Version Information About a DB Engine	Query the DB version information of a specified DB engine.
RDS APIs (v3)	Querying Database Specifications	Query the DB specifications of a specified DB engine version.
RDS APIs (v3)	Querying the Storage Type of a Database	Query the storage type of a specified DB engine version.
RDS APIs (v3)	Querying Storage Usage of a DB Instance	Query storage usage of a DB instance.
RDS APIs (v3)	DB Instance Management	Manage DB instances, including creating a DB instance, adjusting instance storage space, rebooting a DB instance, deleting a DB instance, obtaining a DB instance list, and obtaining detailed information of a specified DB instance.

Type	Subtype	Description
RDS APIs (v3)	DR Instances (RDS for PostgreSQL)	Configure DR capabilities for primary and DR instances, and promote DR instances to primary.
RDS APIs (v3)	Database Security	Improve database security, including configuring SSL encryption, changing database ports, modifying security groups, and changing floating IP addresses.
RDS APIs (v3)	Backup and Restoration	Back up and restore data, including setting an automated backup policy, obtaining an automated backup policy, creating a manual backup, and deleting a manual backup.
RDS APIs (v3)	Upgrading a Major Version	Query the target version to which a DB instance can be upgraded, perform an upgrade pre-check, and query the check status or upgrade status.
RDS APIs (v3)	Log Information Queries	Obtain log information, including querying database error logs and querying database slow logs.
RDS APIs (v3)	Instance Diagnosis	Obtain the number of instances after diagnosis and obtain the result of a specific diagnosis item.
RDS APIs (v3)	SQL Throttling (RDS for PostgreSQL)	Add a SQL throttling rule, delete a SQL throttling rule, and modify a SQL throttling rule.
RDS APIs (v3)	Database Proxy (RDS for MySQL)	Enable or disable the database proxy and query database proxy information.
RDS APIs (v3)	Database and Account Management (MySQL)	Create and query databases, create, query, and delete accounts, and grant and revoke permissions of accounts.
RDS APIs (v3)	Database and Account Management (PostgreSQL)	Create and query databases, and create and query accounts.
RDS APIs (v3)	Database and Account Management (Microsoft SQL Server)	Create and query databases, create, query, and delete accounts, and grant and revoke permissions to accounts.

Type	Subtype	Description
RDS APIs (v3)	Parameter Management	Configure parameters, including obtaining a parameter list, obtaining configuration parameter information, obtaining default parameters of a DB instance, setting configuration parameters, restoring parameters to their default values, obtaining a parameter template list, and obtaining a parameter template.
RDS APIs (v3)	Extension Management (RDS for PostgreSQL)	Create an extension, query extensions, and update an extension.
RDS APIs (v3)	Configuring Replication Delay for a Read Replica (RDS for PostgreSQL)	Obtain the delayed replay status of WAL logs and pause or resume WAL replay.
RDS APIs (v3)	Recycling a DB Instance	Modify the recycling policy, query the recycling policy, and query instances in the recycle bin.
RDS APIs (v3)	Tag Management	Manage tags, including adding tags in batches, deleting tags in batches, and querying project tags.
RDS APIs (v3)	Quota Management	Query resource quotas.
RDS APIs (v3)	Obtaining Task Information	Obtain information about a specified task in the task center.

3 Calling APIs

3.1 Making an API Request

This section describes the structure of a REST API request, and uses the IAM API for [obtaining a user token](#) as an example to demonstrate how to call an API. The obtained token can then be used to authenticate the calling of other APIs.

Request URI

A request URI consists of the following:

{URI-scheme}://{Endpoint}/{resource-path}?{query-string}

Although a request URI is included in a request header, most programming languages or frameworks require the request URI to be separately transmitted, rather than being conveyed in a request message.

Table 3-1 Parameters in a URI

Parameter	Description
URI-scheme	Protocol used to transmit requests. All APIs use HTTPS.
Endpoint	Domain name or IP address of the server bearing the REST service. The endpoint varies between services in different regions. It can be obtained from Regions and Endpoints . For example, the endpoint of IAM in the CN-Hong Kong region is iam.ap-southeast-1.myhuaweicloud.com .
resource-path	Access path of an API for performing a specified operation. Obtain the path from the URI of an API. For example, the resource-path of the API used to obtain a user token is /v3/auth/tokens .

Parameter	Description
query-string	Query parameter, which is optional. Ensure that a question mark (?) is included before each query parameter that is in the format of "Parameter name=Parameter value". For example, ? limit=10 indicates that a maximum of 10 data records will be displayed.

For example, to obtain an IAM token in the **CN-Hong Kong** region, obtain the endpoint of IAM (**iam.ap-southeast-1.myhuaweicloud.com**) for this region and the **resource-path** (**/v3/auth/tokens**) in the URI of the API used to **obtain a user token**. Then, construct the URI as follows:

`https://iam.ap-southeast-1.myhuaweicloud.com/v3/auth/tokens`

NOTE

To simplify the URI display in this document, each API is provided only with a resource-path and a request method. The **URI-scheme** of all APIs is **HTTPS**, and the endpoints of all APIs in the same region are identical.

Request Methods

The HTTP protocol defines the following request methods that can be used to send a request to the server:

Table 3-2 HTTP methods

Method	Description
GET	Requests the server to return specified resources.
PUT	Requests the server to update specified resources.
POST	Requests the server to add resources or perform special operations.
DELETE	Requests the server to delete specified resources, for example, an object.

For example, in the case of the API used to **obtain a user token**, the request method is POST. The request is as follows:

`POST https://iam.ap-southeast-1.myhuaweicloud.com/v3/auth/tokens`

Request Header

You can also add additional fields to a request, such as the fields required by a specified URI or an HTTP method. For example, to request for the authentication information, add **Content-Type**, which specifies the request body type.

Table 3-3 lists common request header fields.

Table 3-3 Common request headers

Name	Description	Mandatory	Example
Host	Specifies the requested server information, which can be obtained from the URL of the service API. The value is in the <i>hostname[:port]</i> format. If the port number is not specified, the default port is used. The default port number for https is 443 .	No This parameter is mandatory for AK/SK authentication.	code.test.com or code.test.com:443
Content-Type	Specifies the MIME type of the request body. You are advised to use the default value application/json . For APIs used to upload objects or images, the value can vary depending on the flow type.	Yes	application/json
Content-Length	Specifies the length of the request body. The unit is byte.	No	3495
X-Project-Id	Specifies the project ID. Obtain the project ID by following the instructions in Obtaining a Project ID .	No This parameter is mandatory for requests that use AK/SK authentication in the Dedicated Cloud (DeC) scenario or multi-project scenario.	e9993fc787d94b6c886cb aa340f9c0f4

Name	Description	Mandatory	Example
X-Auth-Token	<p>Specifies the user token.</p> <p>The user token is a response to the API used to obtain a user token. This API is the only one that does not require authentication.</p> <p>After the request is processed, the value of X-Subject-Token in the message header is the token value.</p>	No This parameter is mandatory for token authentication.	The following is part of an example token: MIIPAgYJKoZIhvcNAQc-Co...ggg1BBIINPXsidG9rZ
X-Language	<p>Specifies the request language type. The default value is en-us.</p> <p>Range</p> <ul style="list-style-type: none">• en-us• zh-cn	No	en-us

NOTE

In addition to supporting token-based authentication, APIs support authentication using access key ID/secret access key (AK/SK). During AK/SK-based authentication, an SDK is used to sign the request, and the **Authorization** (signature information) and **X-Sdk-Date** (time when the request is sent) header fields are automatically added to the request.

For more information, see **AK/SK-based Authentication** in [Authentication](#).

The API used to [obtain a user token](#) does not require authentication. Therefore, only the **Content-Type** field needs to be added to requests for calling the API. An example of such requests is as follows:

```
POST https://iam.ap-southeast-1.myhuaweicloud.com/v3/auth/tokens  
Content-Type: application/json
```

(Optional) Request Body

The body of a request is often sent in a structured format (JSON or XML) as specified in the **Content-Type** header field. The request body transfers content except the request header. If the request body contains full-width characters, these characters must be coded in UTF-8.

The request body varies depending on APIs. Certain APIs do not require the request body, such as the APIs requested using the GET and DELETE methods.

In the case of the API used to [obtain a user token](#), the request parameters and parameter description can be obtained from the API request. The following

provides an example request with a body included. Replace **username**, **domainname**, ********* (login password), and **xxxxxxxxxxxxxx** (project name, such as ap-southeast-1) with actual values. You can obtain the values from [Regions and Endpoints](#).

NOTE

The **scope** parameter specifies where a token takes effect. You can set **scope** to an account or a project under an account. In the following example, the token takes effect only for the resources in a specified project. For more information about this API, see [Obtaining a User Token](#).

```
POST https://iam.ap-southeast-1.myhuaweicloud.com/v3/auth/tokens
Content-Type: application/json
```

```
{
  "auth": {
    "identity": {
      "methods": [
        "password"
      ],
      "password": {
        "user": {
          "name": "username",
          "password": "*****",
          "domain": {
            "name": "domainname"
          }
        }
      }
    },
    "scope": {
      "project": {
        "name": "xxxxxxxxxxxxxx"
      }
    }
  }
}
```

If all data required for the API request is available, you can send the request to call the API through [curl](#), [Postman](#), or coding. In the response to the API used to obtain a user token, **x-subject-token** is the desired user token. This token can then be used to authenticate the calling of other APIs.

3.2 Authentication

Requests for calling an API can be authenticated using either of the following methods:

- Token-based authentication: Requests are authenticated using a token.
- AK/SK-based authentication: Requests are authenticated by encrypting the request body using an AK/SK pair. Authentication using AK/SK is recommended because it is more secure than authentication using tokens.

Token-based Authentication

NOTE

The validity period of a token is 24 hours. When using a token for authentication, cache it to prevent frequently calling the IAM API used to obtain a user token.

A token specifies temporary permissions in a computer system. During API authentication using a token, the token is added to requests to get permissions for calling the API.

When [calling an API to obtain a user token](#), you must set **auth.scope** in the request body to **project**.

```
{  
    "auth": {  
        "identity": {  
            "methods": [  
                "password"  
            ],  
            "password": {  
                "user": {  
                    "name": "username",  
                    "password": "*****",  
                    "domain": {  
                        "name": "domainname"  
                    }  
                }  
            }  
        },  
        "scope": {  
            "project": {  
                "name": "xxxxxxx"  
            }  
        }  
    }  
}
```

In [Making an API Request](#), the process of calling the API used to [obtain a user token](#) is described.

After a token is obtained, the **X-Auth-Token** header field must be added to requests to specify the token when calling other APIs. For example, if the token is **ABCDEFJ....**, **X-Auth-Token: ABCDEFJ....** can be added to a request as follows:

```
POST https://iam.ap-southeast-1.myhuaweicloud.com/v3/auth/tokens  
Content-Type: application/json  
X-Auth-Token: ABCDEFG....
```

AK/SK-based Authentication

NOTE

AK/SK-based authentication supports API requests with a body not larger than 12 MB. For API requests with a larger body, token-based authentication is recommended.

In AK/SK-based authentication, AK/SK is used to sign requests and the signature is then added to the requests for authentication.

- AK: access key ID, which is a unique identifier associated with a secret access key and is used in conjunction with a secret access key to sign requests cryptographically.
- SK: secret access key used in conjunction with an AK to sign requests cryptographically. It identifies a request sender and prevents the request from being modified.

In AK/SK-based authentication, you can use an AK/SK to sign requests based on the signature algorithm or use the signing SDK to sign requests. For details about how to sign requests or use the signing SDK, see [API Request Signing Guide](#).

NOTICE

The signing SDK is only used for signing requests and is different from the SDKs provided by services.

3.3 Response

Status Code

After sending a request, you will receive a response, including the status code, response header, and response body.

A status code is a group of digits ranging from 1xx to 5xx. It indicates the status of a response. For more information, see [Status Codes](#).

For example, if status code **201** is returned for calling the API used to [obtain a user token](#), the request is successful.

Response Header

Similar to a request, a response also has a header, for example, **Content-Type**.

Figure 3-1 shows the response header for the API used to [obtain a user token](#). The **x-subject-token** header field is the desired user token. This token can then be used to authenticate the calling of other APIs.

Figure 3-1 Header fields of the response to the request for obtaining a user token

```
connection → keep-alive
content-type → application/json
date → Tue, 12 Feb 2019 06:52:13 GMT
server → Web Server
strict-transport-security → max-age=31536000; includeSubdomains;
transfer-encoding → chunked

RzT6MUUbpvGw-oPNFYxJECKn0H3Rozv0vN--n5d6Nbpxg==

x-xss-protection → 1; mode=block;
```

(Optional) Response Body

This part is optional. The body of a response is often returned in structured format (for example, JSON or XML) as specified in the **Content-Type** header field. The response body transfers content except the response header.

The following is part of the response body for the API used to [obtain a user token](#).

```
{  
    "token": {  
        "expires_at": "2019-02-13T06:52:13.855000Z",  
        "methods": [  
            "password"  
        ],  
        "catalog": [  
            {  
                "endpoints": [  
                    {  
                        "region_id": "az-01",  
.....  
.....
```

If an error occurs during API calling, an error code and a message will be displayed. The following shows an error response body.

```
{  
    "error_code": "AS.0001",  
    "error_msg": "The format of message is error"  
}
```

In the response body, **error_code** is an error code, and **error_msg** provides information about the error.

4 API v3.1 (Recommended)

4.1 Applying a Parameter Template

Function

This API is used to apply a parameter template to one or more DB instances. This task will be executed asynchronously. You can query the execution status and result of applying a parameter template to DB instances based on **job_id** in the returned result. For details, see [Obtaining Information About a Task with a Specified ID](#).

- Before calling this API, learn how to [authenticate](#) it.
- Before calling this API, learn about [request header parameters](#).

Constraints

- The following DB engines are supported: MySQL, PostgreSQL, and Microsoft SQL Server.

URI

- URI format
`PUT /v3.1/{project_id}/configurations/{config_id}/apply`
- Parameter description

Table 4-1 Parameters

Parameter	Mandatory	Description
project_id	Yes	<p>Definition Project ID of a tenant in a region. To obtain the value, see Obtaining a Project ID.</p> <p>Constraints N/A</p> <p>Range N/A</p> <p>Default Value N/A</p>
config_id	Yes	<p>Definition Parameter template ID.</p> <p>Constraints N/A</p> <p>Range You can obtain the value of this parameter from the id field in Table 5-562.</p> <p>Default Value N/A</p>

Request

Table 4-2 Parameters

Parameter	Mandatory	Type	Description
instance_ids	Yes	Array of strings	<p>Definition Instance IDs.</p> <p>Constraints N/A</p>

Example Request

Apply a parameter template to multiple DB instances.

```
PUT https://[endpoint]/v3.1/0483b6b16e954cb88930a360d2c4e663/configurations/463b4b58-d0e8-4e2b-9560-5dea4552fde9/apply
```

```
{
```

```
{
    "instance_ids": ["73ea2bf70c73497f89ee0ad4ee008aa2in01", "fe5f5a07539c431181fc78220713aebein01"]
}
```

Response

- Normal response

Table 4-3 Parameters

Parameter	Type	Description
configuration_id	String	Definition Parameter template ID. Range N/A
configuration_name	String	Definition Parameter template name. Range N/A
success	Boolean	Definition Whether the parameter template is applied to all requested DB instances successfully. Range <ul style="list-style-type: none"> true: The parameter template was successfully applied to all requested DB instances. false: The parameter template failed to be applied to one or more requested DB instances.
job_id	String	Definition Task flow ID. Range N/A

- Example normal response

```
{
    "configuration_id": "cf49bbd7d2384878bc3808733c9e9d8bpr01",
    "configuration_name": "paramsGroup-bcf9",
    "job_id": "e4942c94-9d66-458e-beb7-90601664641e",
    "success": true
}
```

- Abnormal response
For details, see [Abnormal Request Results](#).

Status Code

- Normal
200
- Abnormal
For details, see [Status Codes](#).

Error Code

For details, see [Error Codes](#).

4.2 Modifying Parameters of a Specified Instance

Function

This API is used to modify parameters of a specified instance.

- Before calling this API, learn how to [authenticate](#) it.
- Before calling this API, learn about [request header parameters](#).

Constraints

- The following DB engines are supported: MySQL, PostgreSQL, and Microsoft SQL Server.
- The new parameter values must be within the default ranges for specified DB engine versions. For details, see [Modifying Parameters of an RDS for MySQL Instance](#) in *Relational Database Service User Guide*.
- Modifying sensitive parameters, for example, `lower_case_table_names`, is risky. For details, see "[Suggestions on RDS for MySQL Parameter Tuning](#)" in *Relational Database Service User Guide*.

URI

- URI format
`PUT https://{{Endpoint}}/v3.1/{{project_id}}/instances/{{instance_id}}/configurations`
- Parameter description

Table 4-4 Parameters

Parameter	Mandatory	Description
project_id	Yes	Definition Project ID of a tenant in a region. To obtain the value, see Obtaining a Project ID . Constraints N/A Range N/A Default Value N/A
instance_id	Yes	Definition Instance ID. Constraints N/A Range N/A Default Value N/A

Request

Table 4-5 Request body parameters

Parameter	Mandatory	Type	Description
values	Yes	Map<String, String>	<p>Definition Parameter values defined by users based on the default parameter template.</p> <p>Constraints N/A</p> <p>Range</p> <ul style="list-style-type: none"> • key: parameter name, for example, div_precision_increment or connect_timeout. If this parameter is not specified, no parameter value is to be changed. • value: parameter value, for example, 6 or 20. If key is not empty, the parameter value cannot be empty, either. <p>Default Value N/A</p>

Example Request

- Change parameter values of an RDS for MySQL instance.

```
PUT https://[endpoint]/v3.1/0483b6b16e954cb88930a360d2c4e663/instances/dsfae23fsfdsae3435in01/configurations

{
    "values" : {
        "div_precision_increment": "6",
        "connect_timeout": "20",
    }
}
```

- ```
 "binlog_checksum" : "CRC32",
 "innodb_purge_threads" : "4"
 }
}

● Change parameter values of an RDS for PostgreSQL instance.

{
 "values" : {
 "autovacuum" : "on",
 "bytea_output" : "escape",
 "client_encoding" : "UTF8",
 "cpu_tuple_cost" : "0.01"
 }
}

● Change parameter values of an RDS for SQL Server instance.

{
 "values":{
 "max server memory (MB)": "26317",
 "max degree of parallelism": "4"
 }
}
```

## Response

- Normal response

**Table 4-6** Parameters

| Parameter        | Type    | Description                                                                                                                                                                                           |

# 4.3 Restoring Data to an Existing DB Instance

## Function

This API is used to restore a database to an existing DB instance.

- Before calling this API, learn how to [authenticate](#) it.
- Before calling this API, learn about [request header parameters](#).

## Constraints

- RDS for SQL Server supports batch calling of this API to restore one database to an existing DB instance.
- When data is restored to an existing DB instance, the API has the following constraints:
  - The DB engine of the original DB instance must be the same as that of the target DB instance. For example, if the original DB instance is running MySQL, the target DB instance must also run MySQL.
  - For RDS for MySQL, the DB engine version of the target DB instance must be at least equal to that of the original DB instance, for example, from MySQL 5.7.25 to 5.7.27.
  - For RDS for PostgreSQL, the DB engine version of the target DB instance must be the same as that of the original DB instance.
  - For RDS for SQL Server, the time zone of the target DB instance must be the same as that of the original DB instance. Otherwise, data inconsistency may occur.
  - For version constraints of RDS for SQL Server, see [Table 4-7](#).
  - The total storage space of the target DB instance must be at least equal to that of the original DB instance for RDS for MySQL.
  - Cross-region restoration is not supported.
  - For RDS for MySQL DB instances, when data is restored to an existing DB instance, the case sensitivity setting of the existing DB instance must be the same as that of the original DB instance. Otherwise, the restoration may fail.
- When data is restored to an original DB instance:  
This API is supported only for MySQL and Microsoft SQL Server DB engines.

**Table 4-7** Restoring to the DB engine versions supported by RDS for SQL Server

| Original DB Engine Version | Restore To                                                                                                                                                                                                                                                                                   |

| Name        | Mandatory | Type   | Description                                                                                                                                                                                              |
|-------------|-----------|--------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| instance_id | Yes       | String | <p><b>Definition</b><br/>Specifies the ID of the DB instance where the backup will be restored to.</p> <p><b>Constraints</b><br/>N/A</p> <p><b>Range</b><br/>N/A</p> <p><b>Default Value</b><br/>N/A</p> |

## Example Request

- Restore data to a DB instance from a backup.

```
POST https://[endpoint]/v3.1/0483b6b16e954cb88930a360d2c4e663/instances/recovery

{
 "source": {
 "instance_id": "d8e6ca5a624745bcb546a227aa3ae1cf01",
 "type": "backup",
 "backup_id": "2f4ddb93-b901-4b08-93d8-1d2e472f30fe"
 },
 "target": {
 "instance_id": "d8e6ca5a624745bcb546a227aa3ae1cf01"
 }
}
```

- Restore all databases to a DB instance from an RDS for SQL Server backup.

```
{
 "source": {
 "instance_id": "61879e6085bc44d1831b0ce62d988fd9in04",
 "type": "backup",
 "backup_id": "b021670e69ba4538b7b2ed07257306aebr04",
 "restore_all_database": true
 },
 "target": {
 "instance_id": "d8e6ca5a624745bcb546a227aa3ae1cf01"
 }
}
```

- Restore instance data to a specific point in time.

```
{
 "source": {
 "instance_id": "d8e6ca5a624745bcb546a227aa3ae1cf01",
 "type": "timestamp",
 "restore_time": 1532001446987
 },
 "target": {

# 4.4 Restoring Tables to a Specified Point in Time (RDS for MySQL)

## Function

To ensure data integrity and reduce impact on the original instance performance, the system restores the full and incremental data at a selected time point to a temporary DB instance, exports the tables to be restored, and then restores the tables to the original DB instance.

- Before calling this API, learn how to [authenticate](#) it.
- Before calling this API, learn about [request header parameters](#).

## Constraints

- This API is available to RDS for MySQL only.
- This operation will generate restored tables on the original DB instance. Ensure that the original DB instance has sufficient storage capacity.

## URI

- URI format

POST /v3.1/{project\_id}/instances/{instance\_id}/restore/tables

- Parameter description

**Table 4-13** Parameters

| Parameter   | Mandatory | Description                                                                                                                                                                                                                             |

## 4.5 Querying Database Error Logs (MySQL)

### Function

This API is used to query the latest error logs of a DB instance. A maximum of 2,000 log records can be queried.

- Before calling this API, learn how to [authenticate](#) it.
- Before calling this API, learn about [request header parameters](#).

### Constraints

This API is supported for MySQL only.

### URI

- URI format  
`GET /v3.1/{project_id}/instances/{instance_id}/errorlog?  
start_date={start_date}&end_date={end_date}`
- Parameter description

**Table 4-18** Parameters

| Parameter   | Mandatory | Description                                                                                                                                                                                                      |

# 4.6 Querying Database Slow Logs (RDS for MySQL)

## Function

This API is used to query the latest slow logs of a DB instance. A maximum of 2,000 log records can be queried.

- Before calling this API, learn how to [authenticate](#) it.
- Before calling this API, learn about [request header parameters](#).

## Constraints

This API is supported only for MySQL.

## URI

- URI format  
`GET /v3.1/{project_id}/instances/{instance_id}/slowlog?  
start_date={start_date}&end_date={end_date}`
- Parameter description

**Table 4-21** Parameters

| Parameter  | Mandatory | Description                                                                                                                                                                                                      |
|------------|-----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

# 5 API v3 (Recommended)

---

## 5.1 Querying Version Information About APIs

### 5.1.1 Querying API Versions

#### Function

This API is used to query the API versions supported by RDS.

- Before calling this API, learn how to [authenticate](#) it.
- Before calling this API, learn about [request header parameters](#).

#### URI

- URI format  
GET /
- Parameter description  
None

#### Request

- Request parameters  
None
- URI example  
GET https://{{endpoint}}/

#### Response

- Normal response

**Table 5-1** Parameters

| Parameter | Type             | Description                                                                                                            |
|-----------|------------------|------------------------------------------------------------------------------------------------------------------------|
| versions  | Array of objects | <p><b>Definition</b><br/>List of detailed API version information.<br/>For details, see <a href="#">Table 5-2</a>.</p> |

**Table 5-2** versions field data structure description

| Parameter | Type             | Description                                                                                                                                                                                                                          |
|-----------|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

## 5.4 Querying the Storage Type of a Database

### Function

This API is used to query the storage type of a specified DB engine version.

- Before calling this API, learn how to [authenticate](#) it.
- Before calling this API, learn about [request header parameters](#).

### URI

- URI format  
`GET /v3/{project_id}/storage-type/{database_name}?version_name={version_name}&ha_mode={ha_mode}`
- Parameter description

**Table 5-14 Parameters**

| Parameter     | Mandatory | Description                                                                                                                                                                                                                                                                                                                                                                   |
|---------------|-----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| project_id    | Yes       | <p><b>Definition</b><br/>Project ID of a tenant in a region.<br/>To obtain the value, see <a href="#">Obtaining a Project ID</a>.</p> <p><b>Constraints</b><br/>N/A</p> <p><b>Range</b><br/>N/A</p> <p><b>Default Value</b><br/>N/A</p>                                                                                                                                       |
| database_name | Yes       | <p><b>Definition</b><br/>DB engine.</p> <p><b>Constraints</b><br/>N/A</p> <p><b>Range</b><br/>The value can be any of the following and is case-insensitive:</p> <ul style="list-style-type: none"> <li>• MySQL</li> <li>• PostgreSQL</li> <li>• SQLServer</li> </ul> <p><b>Default Value</b><br/>N/A</p>                                                                     |
| version_name  | Yes       | <p><b>Definition</b><br/>DB engine version.</p> <p><b>Constraints</b><br/>N/A</p> <p><b>Range</b><br/>For details about how to obtain the DB engine version, see <a href="#">Querying Version Information About a DB Engine</a>.<br/>For the MySQL DB engine, the parameter indicates a major version, for example, 5.6, 5.7, or 8.0.</p> <p><b>Default Value</b><br/>N/A</p> |

| Parameter | Mandatory | Description                                                                                                                                                                                                                              |
|-----------|-----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ha_mode   | No        | <p><b>Definition</b><br/>Primary/standby mode.</p> <p><b>Constraints</b><br/>N/A</p> <p><b>Range</b></p> <ul style="list-style-type: none"> <li>• single</li> <li>• ha</li> <li>• replica</li> </ul> <p><b>Default Value</b><br/>N/A</p> |

## Request

- Request parameters  
None
- URI example  
GET `https://{{endpoint}}/v3/0483b6b16e954cb88930a360d2c4e663/storage-type/mysql?version_name=5.7&ha_mode=ha`

## Response

- Normal response

**Table 5-15** Parameters

| Parameter    | Type             | Description                                                                                                                                                                   |
|--------------|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| storage_type | Array of objects | <p><b>Definition</b><br/>Instance specifications.<br/>For details, see <a href="#">Table 5-16</a>.</p>                                                                        |
| dsspool_info | Array of objects | <p><b>Definition</b><br/>DSS pool specifications.<br/>For details, see <a href="#">Table 5-17</a>.</p> <p><b>NOTE</b><br/>Only Dedicated Cloud (DeC) users are supported.</p> |

**Table 5-16** storage\_type field data structure description

| Parameter                  | Type                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

## 5.5 Querying Storage Usage of a DB Instance

### Function

This API is used to query storage usage of a DB instance.

- Before calling this API, learn how to [authenticate](#) it.
- Before calling this API, learn about [request header parameters](#).

### Constraints

This API is available only for the MySQL and SQL Server DB engines.

To query the storage usage of an RDS for PostgreSQL instance, you can call the API for [querying DB instances](#) and check the value of the response parameter `storage_used_space`.

### URI

- URI format  
`GET /v3/{project_id}/instances/{instance_id}/storage-used-space`
- Parameter description

**Table 5-18** Parameters

| Parameter   | Mandatory | Description                                                                                                                                                                                                      |
|-------------|-----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| project_id  | Yes       | <b>Definition</b><br>Project ID of a tenant in a region.<br>To obtain the value, see <a href="#">Obtaining a Project ID</a> .<br><b>Constraints</b><br>N/A<br><b>Range</b><br>N/A<br><b>Default Value</b><br>N/A |
| instance_id | Yes       | <b>Definition</b><br>ID of the instance to be queried.<br><b>Constraints</b><br>N/A<br><b>Range</b><br>N/A<br><b>Default Value</b><br>N/A                                                                        |

## Request

- Request parameters  
None
- URI example

GET `https://{{Endpoint}}/v3/0483b6b16e954cb88930a360d2c4e663/instances/314958daf6904c478d17c642ac209abbin01/storage-used-space`

## Response

- Normal response

**Table 5-19** Parameters

| Parameter | Type   | Description                                                      |
|-----------|--------|------------------------------------------------------------------|
| node_id   | String | <b>Definition</b><br>Instance node ID.<br><b>Range</b><br>N/A    |
| used      | String | <b>Definition</b><br>Used storage, in GB.<br><b>Range</b><br>N/A |

- Example normal response

```
{

 "used" : "14.21"
}
```
- Abnormal response  
For details, see [Abnormal Request Results](#).

## Status Code

- Normal  
200
- Abnormal  
For details, see [Status Codes](#).

## Error Code

For details, see [Error Codes](#).

## 5.6 DB Instance Management

## 5.6.1 Creating a DB Instance

### Function

This API is used to create an RDS single-node DB instance, primary/standby DB instance, or read replica.

- Before calling this API, learn how to [authenticate](#) it.
- Before calling this API, learn about [request header parameters](#).

This API allows you to set the X-Client-Token request header in the HTTP request header when you create an RDS for MySQL instance, to ensure the request idempotence. For details, see [Idempotent Requests](#).

### URI

- URI format  
POST /v3/{project\_id}/instances
- Parameter description

**Table 5-20** Parameters

| Parameter  | Mandatory | Description                                                                                                                                                                                                      |
|------------|-----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| project_id | Yes       | <b>Definition</b><br>Project ID of a tenant in a region.<br>To obtain the value, see <a href="#">Obtaining a Project ID</a> .<br><b>Constraints</b><br>N/A<br><b>Range</b><br>N/A<br><b>Default Value</b><br>N/A |

## Request

**Table 5-21** Parameters (creating single-node, primary/standby, and cluster instances, except RDS for SQL Server instances configured with the AD domain)

| Parameter | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| name      | Yes       | String | <p><b>Definition</b><br/>Specifies the DB instance name. Instances of the same type can have the same name under the same tenant.</p> <p><b>Constraints</b><br/>N/A</p> <p><b>Range</b></p> <ul style="list-style-type: none"> <li>RDS for MySQL: The DB instance name must be 4 to 64 bytes long, start with a letter, and contain only letters (case-sensitive), digits, hyphens (-), periods (.), and underscores (_).</li> <li>RDS for PostgreSQL and RDS for SQL Server: The DB instance name must be 4 to 64 bytes long, start with a letter, and contain only letters (case-sensitive), digits, hyphens (-), and underscores (_).</li> </ul> <p><b>Default Value</b><br/>N/A</p> |
| datastore | Yes       | Object | <p><b>Definition</b><br/>Specifies the database information. For details, see <a href="#">Table 5-23</a>.</p> <p><b>Constraints</b><br/>N/A</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| Parameter  | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                                   |
|------------|-----------|--------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| flavor_ref | Yes       | String | <p><b>Definition</b><br/>Specifies the specification code.</p> <p><b>Constraints</b><br/>N/A</p> <p><b>Range</b><br/>The value cannot be empty. For details, see <a href="#">spec_code</a> in <a href="#">Table 5-13</a> in section <a href="#">Querying Database Specifications</a>.</p> <p><b>Default Value</b><br/>N/A</p> |
| volume     | Yes       | Object | <p><b>Definition</b><br/>Specifies instance storage.</p> <p>For details, see <a href="#">Table 5-26</a>.</p> <p><b>Constraints</b><br/>N/A</p>                                                                                                                                                                                |
| region     | Yes       | String | <p><b>Definition</b><br/>Specifies the region ID.</p> <p><b>Constraints</b><br/>N/A</p> <p><b>Range</b><br/>The value cannot be empty. To obtain this value, see <a href="#">Regions and Endpoints</a>.</p> <p><b>Default Value</b><br/>N/A</p>                                                                               |

| Parameter         | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|-------------------|-----------|--------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| availability_zone | Yes       | String | <p><b>Definition</b><br/>Specifies the AZ ID. If the DB instance is not a single-node instance, you need to specify an AZ for each node of the instance and separate the AZs with commas (,). For details, see the example.</p> <p>The AZ ID can be obtained from the response returned after the API in <a href="#">Querying Database Specifications</a> is called.</p> <p><b>Constraints</b><br/>N/A</p> <p><b>Range</b><br/>N/A</p> <p><b>Default Value</b><br/>N/A</p> |
| vpc_id            | Yes       | String | <p><b>Definition</b><br/>Specifies the VPC ID.</p> <p><b>Constraints</b><br/>N/A</p> <p><b>Range</b></p> <ul style="list-style-type: none"> <li>Method 1: Log in to the VPC console and view the VPC ID on the VPC details page.</li> <li>Method 2: See the "Querying VPCs" section in the <a href="#">Virtual Private Cloud API Reference</a>.</li> </ul> <p><b>Default Value</b><br/>N/A</p>                                                                             |

| Parameter | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-----------|-----------|--------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| subnet_id | Yes       | String | <p><b>Definition</b><br/>Specifies the network ID of the subnet.</p> <p><b>Constraints</b><br/>N/A</p> <p><b>Range</b></p> <ul style="list-style-type: none"> <li>Method 1: Log in to the VPC console and click the target subnet on the <b>Subnets</b> page. You can view the network ID on the displayed page.</li> <li>Method 2: See the "Querying Subnets" section in the <i>Virtual Private Cloud API Reference</i>.</li> </ul> <p><b>Default Value</b><br/>N/A</p> |

| Parameter         | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|-------------------|-----------|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| security_group_id | Yes       | String | <p><b>Definition</b><br/>           Specifies the security group which the RDS DB instance belongs to. To obtain this parameter value, use either of the following methods:</p> <p><b>Constraints</b><br/>           N/A</p> <p><b>Range</b></p> <ul style="list-style-type: none"> <li>Method 1: Log in to VPC console. Choose <b>Access Control &gt; Security Groups</b> in the navigation pane on the left. On the displayed page, click the target security group. You can view the security group ID on the displayed page.</li> <li>Method 2: See the "Querying Security Groups" section in the <i>Virtual Private Cloud API Reference</i>.</li> </ul> <p>To use multiple security groups for an RDS for MySQL instance, <a href="#">submit a service ticket</a> to apply for required permissions. You can add up to 10 security group IDs for each instance and separate them with commas (,).</p> <p><b>Default Value</b><br/>           N/A</p> |

| Parameter        | Mandatory | Type   | Description                                                                                                                                                                                                                                                                               |
|------------------|-----------|--------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ha               | No        | Object | <p><b>Definition</b><br/>Specifies the HA configuration, which is used when you create primary/standby instances.</p> <p>For details, see <a href="#">Table 5-24</a>.</p> <p><b>Constraints</b><br/>N/A</p>                                                                               |
| configuration_id | No        | String | <p><b>Definition</b><br/>Specifies the parameter template ID.</p> <p><b>Constraints</b><br/>N/A</p> <p><b>Range</b><br/>For details, see <b>id</b> in <a href="#">Table 5-562</a> in section <a href="#">Obtaining a Parameter Template List</a>.</p> <p><b>Default Value</b><br/>N/A</p> |

| Parameter | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|-----------|-----------|--------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| port      | No        | String | <p><b>Definition</b><br/>Specifies the database port information.</p> <p><b>Constraints</b><br/>N/A</p> <p><b>Range</b></p> <ul style="list-style-type: none"> <li>• RDS for MySQL instances can use database ports 1024 to 65535, excluding 12017 and 33071, which are reserved for RDS system use.</li> <li>• RDS for PostgreSQL instances can use database ports 2100 to 9500.</li> <li>• For RDS for SQL Server 2022 Enterprise Edition, 2022 Standard Edition, 2022 Web Edition, 2019 Enterprise Edition, 2019 Standard Edition, 2019 Web Edition, 2017 Enterprise Edition, 2017 Standard Edition, and 2017 Web Edition, the port number can be set to 1433 or 2100 to 9500 (excluding 5050, 5353, 5355, 5985, and 5986). For other editions, the port number can be set to 1433 or 2100 to 9500 (excluding 5355, 5985, and 5986).</li> </ul> <p><b>Default Value</b><br/>If this parameter is not set, the default value is as follows:</p> <ul style="list-style-type: none"> <li>• RDS for MySQL: <b>3306</b></li> </ul> |

|------------------|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| status           | String | <p><b>Definition</b><br/>Indicates the DB instance status.</p> <p><b>Range</b><br/>For example, <b>BUILD</b> indicates that the DB instance is being created.</p> <p>This parameter is returned only when pay-per-use DB instances are created.</p> |
| datastore        | Object | <p><b>Definition</b><br/>Indicates the database information.</p> <p>For details, see <a href="#">Table 5-33</a>.</p>                                                                                                                                |
| ha               | Object | <p><b>Definition</b><br/>Indicates the HA configuration parameters. This parameter is returned only when primary/standby DB instances are created.</p> <p>For details, see <a href="#">Table 5-34</a>.</p>                                          |
| configuration_id | String | <p><b>Definition</b><br/>Indicates the parameter template ID. This parameter is returned only when a custom parameter template is used during DB instance creation.</p> <p><b>Range</b><br/>N/A</p>                                                 |
| port             | String | <p><b>Definition</b><br/>Indicates the database port.</p> <p><b>Range</b><br/>Same as the request parameter.</p>                                                                                                                                    |

| Parameter             | Type   | Description                                                                                                                                                                                                                                             |
|-----------------------|--------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| backup_strategy       | Object | <p><b>Definition</b><br/>Indicates the automated backup policy.<br/>For details, see <a href="#">Table 5-35</a>.</p>                                                                                                                                    |
| enterprise_project_id | String | <p><b>Definition</b><br/>Indicates the project ID.</p> <p><b>Range</b><br/>N/A</p>                                                                                                                                                                      |
| disk_encryption_id    | String | <p><b>Definition</b><br/>Indicates the ID of the key used for disk encryption.</p> <p><b>Range</b><br/>This parameter is available only when you specify this parameter during instance creation. By default, this parameter is left blank.</p>         |
| flavor_ref            | String | <p><b>Definition</b><br/>Indicates the specification code.</p> <p><b>Range</b><br/>The value cannot be empty. For details, see <a href="#">spec_code</a> in <a href="#">Table 5-13</a> in section <a href="#">Querying Database Specifications</a>.</p> |
| volume                | Object | <p><b>Definition</b><br/>Indicates the volume information.</p> <p>For details, see <a href="#">Table 5-36</a>.</p>                                                                                                                                      |
| region                | String | <p><b>Definition</b><br/>Indicates the region ID.</p> <p><b>Range</b><br/>N/A</p>                                                                                                                                                                       |

| Parameter         | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                        |
|-------------------|--------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| availability_zone | String | <p><b>Definition</b><br/>Indicates the AZ ID.</p> <p><b>Range</b><br/>N/A</p>                                                                                                                                                                                                                                                                                                                      |
| vpc_id            | String | <p><b>Definition</b><br/>Indicates the VPC ID.</p> <p><b>Range</b></p> <ul style="list-style-type: none"> <li>Method 1: Log in to the VPC console and view the VPC ID on the VPC details page.</li> <li>Method 2: See the "Querying VPCs" section in the <i>Virtual Private Cloud API Reference</i>.</li> </ul>                                                                                    |
| subnet_id         | String | <p><b>Definition</b><br/>Indicates the network ID of the subnet.</p> <p><b>Range</b></p> <ul style="list-style-type: none"> <li>Method 1: Log in to the VPC console and click the target subnet on the <b>Subnets</b> page. You can view the network ID on the displayed page.</li> <li>Method 2: See the "Querying Subnets" section in the <i>Virtual Private Cloud API Reference</i>.</li> </ul> |

| Parameter         | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-------------------|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| security_group_id | String | <p><b>Definition</b><br/>Indicates the security group which the RDS DB instance belongs to. To obtain this parameter value, use either of the following methods:</p> <p><b>Range</b></p> <ul style="list-style-type: none"> <li>Method 1: Log in to VPC console. Choose <b>Access Control &gt; Security Groups</b> in the navigation pane. On the displayed page, click the target security group. You can view the security group ID on the displayed page.</li> <li>Method 2: See the "Querying Security Groups" section in the <i>Virtual Private Cloud API Reference</i>.</li> </ul> |
| charge_info       | Object | <p><b>Definition</b><br/>Indicates the billing information, which is yearly/monthly or pay-per-use.<br/>For details, see <a href="#">Table 5-37</a>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| collation         | String | <p><b>Definition</b><br/>Indicates the collation set for RDS for SQL Server.</p> <p><b>Range</b><br/>N/A</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| Parameter     | Type   | Description                                                                                                                                                                                  |
|---------------|--------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| restore_point | Object | <p><b>Definition</b><br/>Indicates the restoration information. This parameter is mandatory when data is restored to a new instance.</p> <p>For details, see <a href="#">Table 5-38</a>.</p> |

**Table 5-33** datastore field data structure description

| Parameter | Type   | Description                                                                                                                                                                                                     |
|-----------|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| type      | String | <p><b>Definition</b><br/>Indicates the DB engine.</p> <p><b>Range</b></p> <ul style="list-style-type: none"> <li>• MySQL</li> <li>• PostgreSQL</li> <li>• SQLServer</li> </ul>                                  |
| version   | String | <p><b>Definition</b><br/>Indicates the database version.</p> <p><b>Range</b><br/>For details about supported database versions, see section <a href="#">Querying Version Information About a DB Engine</a>.</p> |

**Table 5-34** ha field data structure description

| Parameter | Type   | Description                                                                                          |
|-----------|--------|------------------------------------------------------------------------------------------------------|
| mode      | String | <p><b>Definition</b><br/>Indicates the primary/standby instance type.</p> <p><b>Range</b><br/>Ha</p> |

| Parameter        | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|------------------|--------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| replication_mode | String | <p><b>Definition</b></p> <p>Indicates the replication mode for the standby DB instance. This parameter is valid only when the instance is an HA instance.</p> <p><b>Range</b></p> <ul style="list-style-type: none"><li>For RDS for MySQL, the value is <b>async</b> or <b>semisync</b>.</li><li>For RDS for PostgreSQL, the value is <b>async</b> or <b>sync</b>.</li><li>For RDS for SQL Server, the value is <b>sync</b>.</li></ul> <p><b>NOTE</b></p> <ul style="list-style-type: none"><li><b>async</b> indicates the asynchronous replication mode.</li><li><b>semisync</b> indicates the semi-synchronous replication mode.</li><li><b>sync</b> indicates the synchronous replication mode.</li></ul> |

**Table 5-35** backupStrategy field data structure description

| Parameter  | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|------------|--------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| start_time | String | <p><b>Definition</b></p> <p>Indicates the backup time window. Automated backups will be triggered during the backup time window.</p> <p><b>Range</b></p> <p>The value cannot be left blank. It must be a valid value in the hh:mm-HH:MM format. The current time is the UTC time.</p> <ul style="list-style-type: none"><li>The <b>HH</b> value must be 1 greater than the <b>hh</b> value.</li><li>The values of <b>mm</b> and <b>MM</b> must be the same and must be set to any of the following: <b>00</b>, <b>15</b>, <b>30</b>, or <b>45</b>.</li></ul> <p>Example value:</p> <ul style="list-style-type: none"><li>08:15-09:15</li><li>23:00-00:00</li></ul> <p>If <b>backup_strategy</b> in the request body is empty, <b>02:00-03:00</b> is returned for <b>start_time</b> by default.</p> |

| Parameter | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|-----------|---------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| keep_days | Integer | <p><b>Definition</b><br/>Indicates the retention days for specific backup files.</p> <p><b>Range</b><br/>0–732 If this parameter is not specified or set to <b>0</b>, the automated backup policy is disabled. To extend the retention period, contact customer service. Automated backups can be retained for up to 2,562 days.<br/>If <b>backup_strategy</b> in the request body is empty, <b>7</b> is returned for <b>keep_days</b> by default.</p> |

## 5.6.2 Creating a DB Instance (API v5)

### Function

This API is derived from the API for creating a DB instance (v3). The **subscription\_agency** field is added to the request body of this API. This field is used when a RAM-based shared key is used to create a yearly/monthly RDS DB instance. This API is used to create a single-node RDS DB instance, primary/standby DB instance, or read replica.

- Before calling this API, learn how to [authenticate](#) it.
- Before calling this API, learn about [request header parameters](#).

This API supports only AK/SK authentication. This API allows you to set the X-Client-Token request header in the HTTP request header to ensure the request idempotence. For details, see [Idempotent Requests](#).

### URI

- URI format  
POST /v5/{project\_id}/instances
- Parameter description

**Table 5-39** Parameters

| Parameter  | Mandatory | Description                                                                                                                         |
|------------|-----------|-------------------------------------------------------------------------------------------------------------------------------------|
| project_id | Yes       | Project ID of a tenant in a region.<br>For details about how to obtain the project ID, see <a href="#">Obtaining a Project ID</a> . |

## Request

**Table 5-40** Parameters (creating single, primary/standby, and cluster instances)

| Parameter        | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|------------------|-----------|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| name             | Yes       | String | Instance name.<br>Instances of the same type can have the same name under the same tenant. Value range: <ul style="list-style-type: none"><li>• RDS for MySQL: The DB instance name must be 4 to 64 bytes long, start with a letter, and contain only letters (case-sensitive), digits, hyphens (-), periods (.), and underscores (_).</li><li>• RDS for PostgreSQL and RDS for SQL Server: The DB instance name must be 4 to 64 bytes long, start with a letter, and contain only letters (case-sensitive), digits, hyphens (-), and underscores (_).</li></ul> |
| datastore        | Yes       | Object | Database information. This parameter is optional when you create RDS for MySQL read replicas.<br>For details, see <a href="#">Table 5-42</a> .                                                                                                                                                                                                                                                                                                                                                                                                                   |
| ha               | No        | Object | HA configuration, which is used when you create primary/standby instances.<br>For details, see <a href="#">Table 5-43</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| configuration_id | No        | String | Parameter template ID.<br>For details, see <a href="#">id</a> in <a href="#">Table 5-562</a> of <a href="#">Obtaining a Parameter Template List</a> .                                                                                                                                                                                                                                                                                                                                                                                                            |

| port      | No        | String | <p>Database port.</p> <ul style="list-style-type: none"> <li>• RDS for MySQL instances can use database ports 1024 to 65535, excluding 12017, 33071, and 33062, which are reserved for RDS system use.</li> <li>• RDS for PostgreSQL instances can use database ports 2100 to 9500.</li> <li>• For RDS for SQL Server 2022 Enterprise Edition, 2022 Standard Edition, 2022 Web Edition, 2019 Enterprise Edition, 2019 Standard Edition, 2019 Web Edition, 2017 Enterprise Edition, 2017 Standard Edition, and 2017 Web Edition, the port number can be set to 1433 or 2100 to 9500 (excluding 5050, 5353, 5355, 5985, and 5986). For other editions, the port number can be set to 1433 or 2100 to 9500 (excluding 5355, 5985, and 5986).</li> </ul> <p>If this parameter is not set, the default value is as follows:</p> <ul style="list-style-type: none"> <li>• RDS for MySQL: <b>3306</b></li> <li>• RDS for PostgreSQL: <b>5432</b></li> <li>• RDS for SQL Server: <b>1433</b></li> </ul> |
| password  | No        | String | <p>Database password.</p> <p>Value range:</p> <p>A database password must be 8 to 32 characters long and contain at least three types of the following characters: uppercase letters, lowercase letters, digits, and special characters.</p> <p>Different DB engines support different special characters.</p> <ul style="list-style-type: none"> <li>• RDS for MySQL: ~!@#\$%^*-_=+?,()&amp; </li> <li>• RDS for SQL Server: ~!@#\$%^*-_=+?,</li> <li>• RDS for PostgreSQL: ~!@#\$%^*-_=+?,</li> </ul> <p>You are advised to enter a strong password to improve security, preventing security risks such as brute force cracking. If the password you provide is regarded as a weak password by the system, you will be prompted to enter a stronger password.</p>                                                                                                                                                                                                                             |

| Parameter             | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                               |
|-----------------------|-----------|--------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| backup_strategy       | No        | Object | Advanced backup policy.<br>For details, see <a href="#">Table 5-44</a> .                                                                                                                                                                                                                                                  |
| enterprise_project_id | No        | String | Enterprise project ID.                                                                                                                                                                                                                                                                                                    |
| disk_encryption_id    | No        | String | Key ID for disk encryption. The default value is empty.<br><b>NOTE</b><br>Serverless instances do not support this parameter.                                                                                                                                                                                             |
| subscription_agency   | No        | String | URN of the agency authorized to the Billing service. This parameter is required when you use a RAM-based shared key to create a yearly/monthly RDS DB instance. For details about how to obtain the agency URN, see <a href="#">Obtaining an Agency URN</a> .                                                             |
| flavor_ref            | Yes       | String | Specification code. The value cannot be empty.<br>For details, see <a href="#">spec_code</a> in <a href="#">Table 5-13</a> of <a href="#">Querying Database Specifications</a> .                                                                                                                                          |
| volume                | Yes       | Object | Volume information.<br>For details, see <a href="#">Table 5-45</a> .                                                                                                                                                                                                                                                      |
| region                | Yes       | String | Region ID.<br>The value cannot be empty. For details about how to obtain this parameter value, see <a href="#">Regions and Endpoints</a> .                                                                                                                                                                                |
| availability_zone     | Yes       | String | AZ ID. If the DB instance is not a single-node instance, you need to specify an AZ for each node of the instance and separate the AZs with commas (,). For details, see the example.<br>The AZ ID can be obtained from the response returned after the API in <a href="#">Querying Database Specifications</a> is called. |

| Parameter | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-----------|-----------|--------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| vpc_id    | Yes       | String | <p>VPC ID. This parameter is optional when you create RDS for MySQL read replicas.</p> <p>To obtain this parameter value, use either of the following methods:</p> <ul style="list-style-type: none"> <li>Method 1: Log in to the VPC console and view the VPC ID on the VPC details page.</li> <li>Method 2: See the "Querying VPCs" section in the <i>Virtual Private Cloud API Reference</i>.</li> </ul>                                                                                              |
| subnet_id | Yes       | String | <p>Subnet ID. This parameter is optional when you create RDS for MySQL read replicas.</p> <p>To obtain this parameter value, use either of the following methods:</p> <ul style="list-style-type: none"> <li>Method 1: Log in to the VPC console and click the target subnet on the <b>Subnets</b> page. You can view the network ID on the displayed page.</li> <li>Method 2: See the "Querying Subnets" section in the <i>Virtual Private Cloud API Reference</i>.</li> </ul>                          |
| data_vip  | No        | String | <p>Floating IP address of a DB instance. Currently, only IPv4 addresses are supported. You can use either of the following methods to obtain the floating IP address:</p> <ul style="list-style-type: none"> <li>Method 1: Log in to the VPC console and click the target subnet on the <b>Subnets</b> page. View the subnet CIDR block and select an IP address that is not in use.</li> <li>Method 2: See the "Querying Subnets" section in the <i>Virtual Private Cloud API Reference</i>.</li> </ul> |

| Parameter         | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|-------------------|-----------|--------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| security_group_id | Yes       | String | <p>Security group which the DB instance is associated with. To obtain this parameter value, use either of the following methods: This parameter is optional when you create RDS for MySQL read replicas.</p> <p>To obtain this parameter value, use either of the following methods:</p> <ul style="list-style-type: none"><li>• Method 1: Log in to VPC console. Choose <b>Access Control &gt; Security Groups</b> in the navigation pane. On the displayed page, click the target security group. You can view the security group ID on the displayed page.</li><li>• Method 2: See the "Querying Security Groups" section in the <i>Virtual Private Cloud API Reference</i>.</li></ul> |
| charge_info       | No        | Object | <p>Billing information, which is yearly/monthly or pay-per-use (default setting). For details, see <a href="#">Table 5-46</a>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| time_zone         | No        | String | <p>UTC time zone.</p> <ul style="list-style-type: none"><li>• If this parameter is not specified, the time zone of each DB engine is as follows:<ul style="list-style-type: none"><li>- MySQL uses UTC by default.</li><li>- PostgreSQL uses UTC by default.</li><li>- Microsoft SQL Server uses UTC by default.</li></ul></li><li>• If this parameter is specified for MySQL or PostgreSQL, the value range is from UTC-12:00 to UTC+12:00 on the hour. For example, the parameter can be UTC+08:00 rather than UTC +08:30.</li></ul>                                                                                                                                                    |
| dsspool_id        | No        | String | DSS pool ID for DeC users. The DSS pool configured for each AZ is different. When DeC users create DB instances other than single-node instances or read replicas, DSS pool IDs must be specified for all nodes of the DB instances and must be separated by commas (,).                                                                                                                                                                                                                                                                                                                                                                                                                  |

| Parameter          | Mandatory | Type             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|--------------------|-----------|------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| replica_of_id      | No        | String           | ID of the primary DB instance. This parameter is mandatory when you create read replicas and is unavailable in other scenarios.                                                                                                                                                                                                                                                                                                                                                                                        |
| restore_point      | No        | Object           | Restoration information. This parameter is mandatory when data is restored to a new instance.<br>For details, see <a href="#">Table 5-48</a> .                                                                                                                                                                                                                                                                                                                                                                         |
| tags               | No        | Array of objects | Tag list. Each DB instance can be associated with tag key-value pairs while being created. <ul style="list-style-type: none"> <li>• <i>{key}</i> indicates the tag key. It must be unique and cannot be empty.</li> <li>• <i>{value}</i> indicates the tag value, which can be empty.</li> </ul> If you want to create DB instances with multiple tag keys and values, separate them with commas (,). A maximum of 10 key-value pairs can be added for a DB instance.<br>For details, see <a href="#">Table 5-47</a> . |
| unchangeable_param | No        | Object           | List of unchangeable parameters. The unchangeable parameters need to be specified before database initialization and cannot be modified after being specified.<br>For details, see <a href="#">Table 5-50</a> .                                                                                                                                                                                                                                                                                                        |
| collation          | No        | String           | This parameter applies only to RDS for SQL Server instances. It is invalid for RDS for MySQL, RDS for MariaDB, and RDS for PostgreSQL instances.<br>Value range: character sets queried in <a href="#">Querying the Available SQL Server Character Set</a> .                                                                                                                                                                                                                                                           |

| Parameter       | Mandatory | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-----------------|-----------|---------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| dry_run         | No        | Boolean | <p>Whether DB instances will not be created after the request is checked. This parameter is supported with the MySQL DB engine only.</p> <ul style="list-style-type: none"> <li>• <b>true</b>: DB instances will not be created after the request is checked. <ul style="list-style-type: none"> <li>– If the check is successful, status code 202 is returned.</li> <li>– If the check fails, an error code is returned. **Table 5-51** Parameters

| Parameter | Type   | Description                                                                                                                                                                                                                                  |
|-----------|--------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| instance  | Object | Instance information.<br>For details, see <a href="#">Table 5-52</a> .                                                                                                                                                                       |
| job_id    | String | ID of the instance creation task.<br>For details about how to query task details, see <a href="#">Obtaining Information About a Task with a Specified ID</a> .<br>This parameter is returned only for the creation of pay-per-use instances. |
| order_id  | String | Order ID. This parameter is returned only for the creation of yearly/monthly instances.                                                                                                                                                      |

**Table 5-52** instance description

| Parameter | Type   | Description                                                                                                                                                                               |
|-----------|--------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| id        | String | Instance ID. If instances are created in batches, multiple instance IDs separated by commas (,) are returned for the MySQL DB engine. For other DB engines, this parameter is left blank. |
| name      | String | Instance name. Instances of the same type can have the same name under the same tenant.                                                                                                   |

| Parameter             | Type   | Description                                                                                                                                                            |
|-----------------------|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| status                | String | Instance status. For example, <b>BUILD</b> indicates that the instance is being created.<br>This parameter is returned only for the creation of pay-per-use instances. |
| datastore             | Object | Database information.<br>For details, see <a href="#">Table 5-53</a> .                                                                                                 |
| ha                    | Object | HA configurations. This parameter is returned only when primary/standby instances are created.<br>For details, see <a href="#">Table 5-54</a> .                        |
| configuration_id      | String | Parameter template ID. This parameter is returned only when a custom parameter template is used during instance creation.                                              |
| port                  | String | Database port, which is the same as the request parameter.                                                                                                             |
| backup_strategy       | Object | Automated backup policy.<br>For details, see <a href="#">Table 5-55</a> .                                                                                              |
| enterprise_project_id | String | Project ID.                                                                                                                                                            |
| disk_encryption_id    | String | Key ID for disk encryption. This parameter is returned only when it is specified during the instance creation. By default, it is empty.                                |
| flavor_ref            | String | Specification code. The value cannot be empty.<br>For details, see <a href="#">spec_code</a> in <a href="#">Table 5-13 of Querying Database Specifications</a> .       |
| volume                | Object | Volume information.<br>For details, see <a href="#">Table 5-56</a> .                                                                                                   |
| region                | String | Region ID.                                                                                                                                                             |
| availability_zone     | String | AZ ID.                                                                                                                                                                 |
| vpc_id                | String | VPC ID.                                                                                                                                                                |
| subnet_id             | String | Subnet ID.                                                                                                                                                             |

| Parameter         | Type   | Description                                                                                                                                    |
|-------------------|--------|------------------------------------------------------------------------------------------------------------------------------------------------|
| security_group_id | String | Security group which the DB instance is associated with. To obtain this parameter value, use either of the following methods:                  |
| charge_info       | Object | Billing information, which is yearly/monthly or pay-per-use.<br>For details, see <a href="#">Table 5-57</a> .                                  |
| collation         | String | Collation for the RDS for SQL Server instance.                                                                                                 |
| restore_point     | Object | Restoration information. This parameter is mandatory when data is restored to a new instance.<br>For details, see <a href="#">Table 5-58</a> . |

**Table 5-53** Data structure description of field datastore

| Parameter        | Type   | Description                                                                                                                                |
|------------------|--------|--------------------------------------------------------------------------------------------------------------------------------------------|
| type             | String | DB engine. Value: <ul style="list-style-type: none"><li>• MySQL</li><li>• PostgreSQL</li><li>• SQLServer</li></ul>                         |
| version          | String | DB engine version.<br>For details about supported DB engine versions, see <a href="#">Querying Version Information About a DB Engine</a> . |
| complete_version | String | Complete database version number.                                                                                                          |

**Table 5-54** Data structure description of field ha

| Parameter | Type   | Description                                     |
|-----------|--------|-------------------------------------------------|
| mode      | String | Primary/standby instance type. The value is Ha. |

| Parameter        | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|------------------|--------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| replication_mode | String | <p>Replication mode for the standby instance. This parameter is valid only when the instance is an HA instance.</p> <p>Value:</p> <ul style="list-style-type: none"> <li>For RDS for MySQL, the value is <b>async</b> or <b>semisync</b>.</li> <li>For RDS for PostgreSQL, the value is <b>async</b> or <b>sync</b>.</li> <li>For RDS for SQL Server, the value is <b>sync</b>.</li> </ul> <p><b>NOTE</b></p> <ul style="list-style-type: none"> <li><b>async</b> indicates asynchronous replication.</li> <li><b>semisync</b> indicates semi-synchronous replication.</li> <li><b>sync</b> indicates synchronous replication.</li> </ul> |

**Table 5-55** Data structure description of field backupStrategy

| Parameter  | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|------------|--------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| start_time | String | <p>Backup time window. Automated backups will be triggered during the backup time window.</p> <p>The value cannot be empty. It must be a valid value in the "hh:mm-HH:MM" format. The current time is in the UTC format.</p> <ul style="list-style-type: none"> <li>The <b>HH</b> value must be 1 greater than the <b>hh</b> value.</li> <li>The values of <b>mm</b> and <b>MM</b> must be the same and must be set to any of the following: <b>00</b>, <b>15</b>, <b>30</b>, or <b>45</b>.</li> </ul> <p>Example value:</p> <ul style="list-style-type: none"> <li>08:15-09:15</li> <li>23:00-00:00</li> </ul> <p>If <b>backup_strategy</b> in the request body is empty, <b>02:00-03:00</b> is returned for <b>start_time</b> by default.</p> |

| Parameter | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                      |
|-----------|---------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| keep_days | Integer | <p>Retention days for backups.</p> <p>The value ranges from 0 to 732. If this parameter is not specified or set to <b>0</b>, the automated backup policy is disabled. To extend the retention period, contact customer service. Automated backups can be retained for up to 2,562 days.</p> <p>If <b>backup_strategy</b> in the request body is empty, <b>7</b> is returned for <b>keep_days</b> by default.</p> |

**Table 5-56** Data structure description of field volume

| Parameter | Type    | Description                                                                                                                                                                                                                                                                                                                                                           |
|-----------|---------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| type      | String  | <p>Storage type.</p> <p>The value can be any of the following (case-sensitive):</p> <ul style="list-style-type: none"> <li>• <b>ULTRAHIGH</b>: SSD storage (ultra-high I/O).</li> <li>• <b>CLOUDSSD</b>: cloud SSD storage. This storage type is supported only with general-purpose and dedicated instances.</li> <li>• <b>ESSD</b>: extreme SSD storage.</li> </ul> |
| size      | Integer | <p>Storage space.</p> <p>Its value range is from 40 GB to 4,000 GB. The value must be a multiple of 10.</p>                                                                                                                                                                                                                                                           |

**Table 5-57** Data structure description of field chargeInfo

| Parameter   | Type   | Description                                                                                                                                                                                |
|-------------|--------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| charge_mode | String | Billing information, which is yearly/monthly or pay-per-use.                                                                                                                               |
| period_type | String | <p>Subscription type.</p> <ul style="list-style-type: none"> <li>• <b>month</b>: The service is subscribed by month.</li> <li>• <b>year</b>: The service is subscribed by year.</li> </ul> |

| Parameter     | Type    | Description                                                                                                                                                                                                                                                                                                                                                       |
|---------------|---------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| period_num    | Integer | Subscription period, which is calculated by month.<br><br>This parameter is valid only when <b>charge_mode</b> is set to <b>prePaid</b> (yearly/monthly billing).                                                                                                                                                                                                 |
| is_auto_pay   | Boolean | Whether the order will be automatically paid after yearly/monthly instances are created. This parameter does not affect the payment method of automatic renewal. <ul style="list-style-type: none"><li>• <b>false</b>: The order will be manually paid. The default value is <b>false</b>.</li><li>• <b>true</b>: The order will be automatically paid.</li></ul> |
| is_auto_renew | Boolean | Whether automatic renewal is enabled for yearly/monthly instances. The renewal period is the same as the original period, and the order will be automatically paid. <ul style="list-style-type: none"><li>• <b>false</b>: Automatic renewal is disabled. The default value is <b>false</b>.</li><li>• <b>true</b>: Automatic renewal is enabled.</li></ul>        |

**Table 5-58** Data structure description of field restore\_point

| Parameter    | Type    | Description                                                                                                                                                                                           |
|--------------|---------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| instance_id  | String  | Source instance ID.                                                                                                                                                                                   |
| type         | String  | Restoration mode. <ul style="list-style-type: none"><li>• <b>backup</b>: indicates using backup files for restoration.</li><li>• <b>timestamp</b>: indicates the point-in-time restoration.</li></ul> |
| backup_id    | String  | ID of the backup used to restore data.                                                                                                                                                                |
| restore_time | Integer | Time point of data restoration in the UNIX timestamp format. The unit is millisecond and the time zone is UTC.                                                                                        |

| Parameter     | Type                | Description                                                                                                                                                       |
|---------------|---------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| database_name | Map<String, String> | This parameter is supported only for Microsoft SQL Server instances. If this parameter is specified, you can restore specific databases and rename new databases. |

### NOTE

The values of **region** and **availability\_zone** in the example response are only for reference.

## Obtaining an Agency URN

1. Log in to the Identity and Access Management (IAM) console.

Figure 5-1 IAM page

2. Click **Agencies**. On the displayed page, click **Create Agency**.
3. On the **Create Agency** page, set the following parameters and click **Next**.
  - **Agency Name**: For example, enter **agency\_billing**.
  - **Agency Type**: Select **Cloud service**.
  - **Cloud Service**: Select **Billing**.
  - **Validity Period**: Select **Unlimited**.
  - **Description**: Enter a description about the agency.

Figure 5-2 Creating an agency

The screenshot shows the 'Create Agency' page. At the top, it says 'Agencies / Create Agency'. The form fields include:

- \* Agency Name:** agency\_billing
- \* Agency Type:**  Cloud service (Delegate a cloud service to access your resources in other cloud services).
- \* Cloud Service:** Billing
- \* Validity Period:** Unlimited
- Description:** Enter a brief description. (0/255)

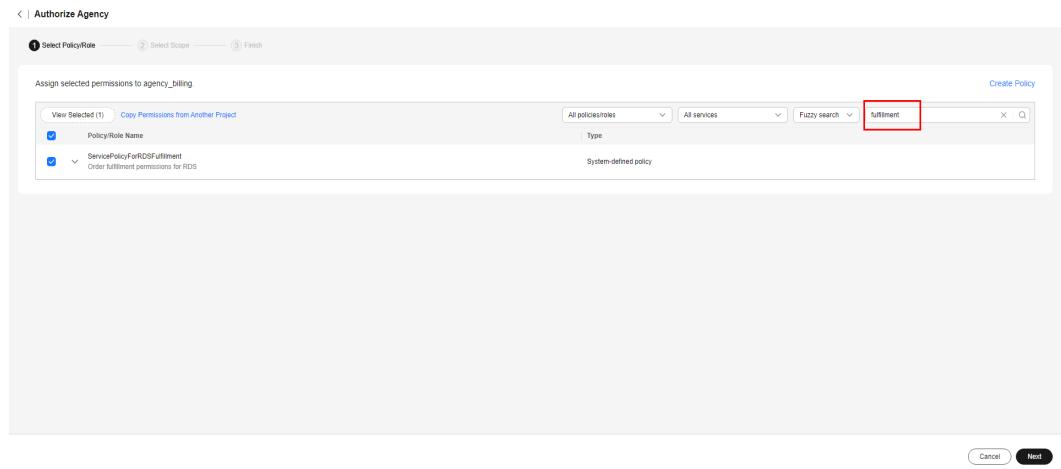

At the bottom are 'Next' and 'Cancel' buttons.

4. Enter **fulfillment** in the search box to start a search, select **ServicePolicyForRDSFulfillment**, and click **Next**.

 **NOTE**

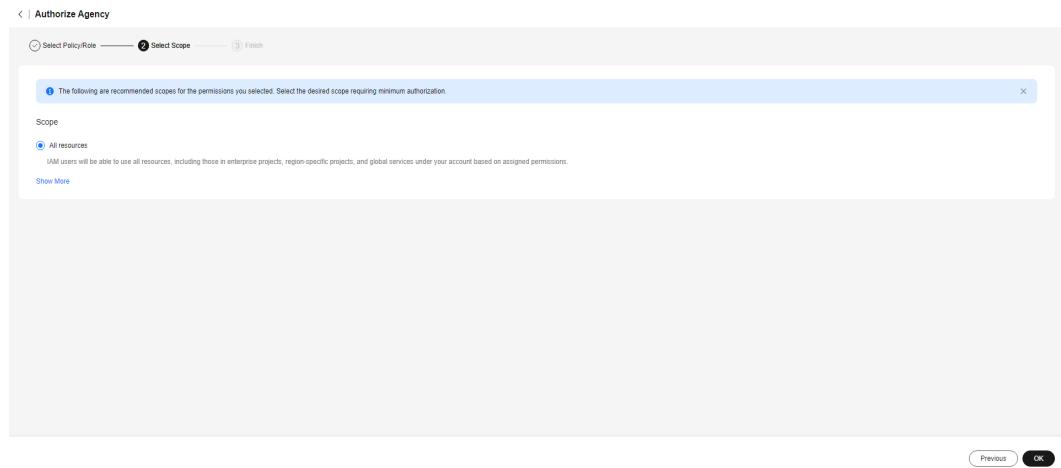

When using a RAM-based KMS shared key to create a yearly/monthly RDS instance, you must grant the Billing service the permission to operate resources in your account and the ServicePolicyForRDSFulfillment permission. After the authorization is successful, the Billing service obtains the KMS key to create encrypted disks.

**Figure 5-3 Selecting a policy**

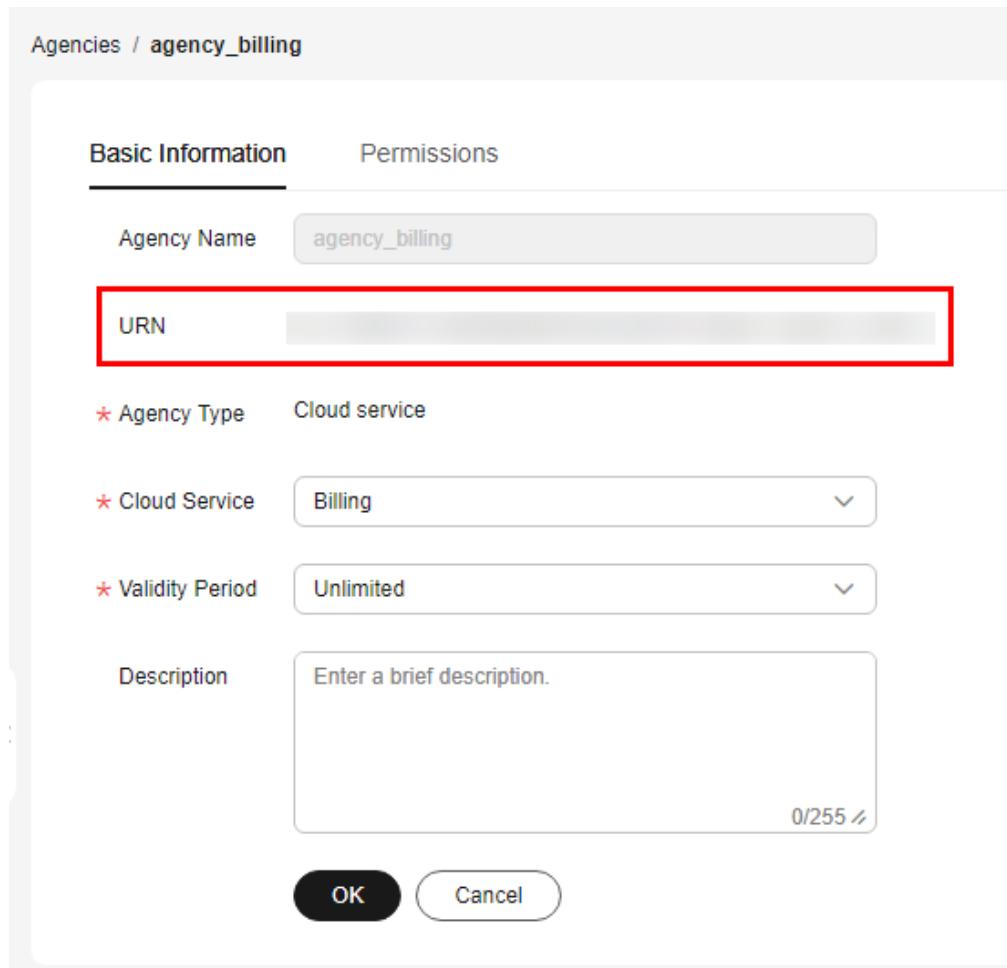

5. By default, the permissions apply to all resources. Click **OK**.

**Figure 5-4 Selecting a scope**

6. Click the name of the created agency. On the **Basic Information** page, obtain the agency URN.

Figure 5-5 Obtaining a URN

### 5.6.3 Changing the Billing Mode from Pay-per-Use to Yearly/Monthly

#### Function

This API is used to change the billing mode of an RDS instance from pay-per-use to yearly/monthly.

- Before calling this API, learn how to [authenticate](#) it.
- Before calling this API, learn about [request header parameters](#).

#### Constraints

This API is available only for RDS for PostgreSQL instances.

#### URI

- URI format  
POST /v3/{project\_id}/instances/{instance\_id}/to-period
- Parameter description

**Table 5-59** Parameters

| Parameter   | Mandatory | Description                                                                                                                                                                                                                                 |
|-------------|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| project_id  | Yes       | <p><b>Definition</b><br/>Project ID of a tenant in a region.<br/>To obtain the value, see <a href="#">Obtaining a Project ID</a>.</p> <p><b>Constraints</b><br/>N/A</p> <p><b>Range</b><br/>N/A</p> <p><b>Default Value</b><br/>N/A</p>     |
| instance_id | Yes       | <p><b>Definition</b><br/>Instance ID.</p> <p><b>Constraints</b><br/>N/A</p> <p><b>Range</b><br/>You can obtain the value of this parameter from the <b>id</b> field in <a href="#">Table 5-116</a>.</p> <p><b>Default Value</b><br/>N/A</p> |

## Request

- Parameter description

**Table 5-60** Parameters

| Parameter   | Mandatory | Type   | Description                                                                                                                                                                                                                   |
|-------------|-----------|--------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

## Status Code

- Normal  
200
- Abnormal  
For details, see [Status Codes](#).

## Error Code

For details, see [Error Codes](#).

## 5.6.4 Stopping an Instance

### Function

This API is used to stop a pay-per-use DB instance.

- Before calling this API, learn how to [authenticate](#) it.
- Before calling this API, learn about [request header parameters](#).

## Constraints

- Only ultra-high I/O, cloud SSD, and extreme SSD pay-per-use instances can be stopped. RDS instances in a DCC cannot be stopped.
- A stopped instance will not be moved to the recycle bin after being deleted.
- If you stop a primary instance, read replicas (if there are any) will also be stopped. You cannot stop a read replica without stopping the primary instance. In CN East-Shanghai1, both the primary instance and read replicas can be stopped for up to 15 days. In other regions, they can be stopped for up to 7 days.
  - In CN East-Shanghai1, if you do not manually start your instance 15 days after the instance is stopped, your instance will start during the next maintenance window.
  - In other regions, if you do not manually start your instance 7 days after the instance is stopped, your instance will start during the next maintenance window.
- After an instance is stopped, the ECS is no longer billed. Other resources, including EIPs, storage resources, and backups, are still billed.
- A stopped pay-per-use DB instance may fail to be started due to insufficient resources. In this case, contact customer service.
- An instance cannot be stopped if it is in any of the following statuses: Creating, rebooting, scaling up, changing instance class, restoring, and changing port.

## URI

- URI format  
`POST /v3/{project_id}/instances/{instance_id}/action/shutdown`
- Parameter description

**Table 5-62** Parameters

| Parameter   | Mandatory | Description                                                                                              |
|-------------|-----------|----------------------------------------------------------------------------------------------------------|
| project_id  | Yes       | Project ID of a tenant in a region.<br>To obtain the value, see <a href="#">Obtaining a Project ID</a> . |
| instance_id | Yes       | Instance ID.                                                                                             |

## Request

None

## Example Request

Stop an instance.

```
POST https://{endpoint}/v3/054ea741f700d4a32f1bc00f5c80dd4c/instances/
```

```
5b409baece064984a1b3eef6addae50cin01/action/shutdown
{}
```

## Response

- Normal response

**Table 5-63** Parameters

| Parameter | Type   | Description |
|-----------|--------|-------------|
| job_id    | String | Task ID.    |

### 5.6.5 Starting an Instance

#### Function

This API is used to start a DB instance. You can stop your instance temporarily to save money. After stopping your instance, you can restart it to begin using it again.

- Before calling this API, learn how to [authenticate](#) it.
- Before calling this API, learn about [request header parameters](#).

#### Constraints

- If you start a primary instance, read replicas (if there are any) will also be started.
- Only instances in **Stopped** state can be started.
- A stopped pay-per-use DB instance may fail to be started due to insufficient resources. In this case, contact customer service.

## URI

- URI format  
POST /v3/{project\_id}/instances/{instance\_id}/action/startup
- Parameter description

**Table 5-64** Parameters

## 5.6.9 Modifying a Private Domain Name

### Function

This API is used to modify a private domain name.

- Before calling this API, learn how to [authenticate](#) it.
- Before calling this API, learn about [request header parameters](#).

### Constraints

This API is available to RDS for MySQL and RDS for PostgreSQL only.

### URI

- URI format  
PUT /v3/{project\_id}/instances/{instance\_id}/modify-dns
- Parameter description

**Table 5-74** Parameters

| Parameter   | Mandatory | Description                                                                                              |
|-------------|-----------|----------------------------------------------------------------------------------------------------------|
| project_id  | Yes       | Project ID of a tenant in a region.<br>To obtain the value, see <a href="#">Obtaining a Project ID</a> . |
| instance_id | Yes       | Specifies the DB instance ID.                                                                            |

## Request

**Table 5-75** Parameters

| Parameter | Mandatory | Type   | Description                                                                                                                                               |
|-----------|-----------|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------|
| dns_name  | Yes       | String | Specifies the prefix of the new domain name.<br>The value contains 8 to 64 characters. Only uppercase letters, lowercase letters, and digits are allowed. |

## Example Request

Modify the private domain name of a DB Instance.

```
PUT https://[endpoint]/v3/054ea741f700d4a32f1bc00f5c80dd4c/instances/
5b409baece064984a1b3eef6addae50cin01/modify-dns
{
 "dns_name": "testModifyDnsNewName"
}
```

## Response

- Normal response

**Table 5-76** Parameters

| Parameter | Type   | Description                                                       |
|-----------|--------|-------------------------------------------------------------------|
| job_id    | String | Indicates the ID of the task for modifying a private domain name. |

- Normal response

```
{
 "job_id": "b9e057a0-f0fb-4987-9d21-f3a7550b32e7"
}
```

- Abnormal response

## 5.6.12 Obtaining the Replication Status of a DB Instance

### Function

This API is used to obtain the primary/standby replication status of a DB instance.

- Before calling this API, learn how to [authenticate](#) it.
- Before calling this API, learn about [request header parameters](#).

### Constraints

This API is available only to RDS for MySQL and RDS for SQL Server.

### URI

- URI format  
GET /v3/{project\_id}/instances/{instance\_id}/replication/status
- Parameter description

**Table 5-81** Parameters

| Parameter   | Mandatory | Description                                                                                              |
|-------------|-----------|----------------------------------------------------------------------------------------------------------|
| project_id  | Yes       | Project ID of a tenant in a region.<br>To obtain the value, see <a href="#">Obtaining a Project ID</a> . |
| instance_id | Yes       | Instance ID.                                                                                             |

## Request

- Parameter description  
None
- URI example  
GET https://{endpoint}/v3/0483b6b16e954cb88930a360d2c4e663/ instances/c90928717dc747e2a20099894a87c468in01/replication/status

## Response

- Normal response

**Table 5-82** Parameters

| Parameter          | Type   | Description                                                                                     |
|--------------------|--------|-------------------------------------------------------------------------------------------------|
| replication_status | String | Replication status: <ul style="list-style-type: none"><li>• normal</li><li>• abnormal</li></ul> |
| abnormal_reason    | String | Reasons why the replication is abnormal.                                                        |

- Example normal response  
{  
    "replication\_status": "normal",  
    "abnormal\_reason": ""  
}
- Abnormal response  
For details, see [Abnormal Request Results](#).

## Status Code

- Normal  
200
- Abnormal  
For details, see [Status Codes](#).

## Error Code

For details, see [Error Codes](#).

## 5.6.13 Querying Available Instance Classes for a DB Instance

### Function

This API is used to query available instance classes for a DB instance.

- Before calling this API, learn how to [authenticate](#) it.
- Before calling this API, learn about [request header parameters](#).

## Constraints

This API is available to RDS for MySQL and RDS for PostgreSQL only.

## URI

- URI format  
GET /v3/{project\_id}/instances/{instance\_id}/flavors-resize
- Parameter description

**Table 5-83** Parameters

| Parameter   | Mandatory | Description                                                                                              |
|-------------|-----------|----------------------------------------------------------------------------------------------------------|
| project_id  | Yes       | Project ID of a tenant in a region.<br>To obtain the value, see <a href="#">Obtaining a Project ID</a> . |
| instance_id | Yes       | Instance ID.                                                                                             |

## Request

None

## Example Request

Query available instance classes for a DB instance.

```
GET https://{{Endpoint}}/v3/054e292c9880d4992f02c0196d3ea468/instances/d674b54d5e0241c49eeb50c82ef3efe0in03/flavors-resize
```

## Response

**Table 5-84** Response body parameters

| Parameter     | Type             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|---------------|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| flavor_groups | Array of objects | <p>List of available instance classes. For details, see <a href="#">Table 5-85</a>.</p> <ul style="list-style-type: none"><li>• <b>normal</b>: general-enhanced</li><li>• <b>normal2</b>: general-enhanced II</li><li>• <b>armFlavors</b>: Kunpeng general-enhanced</li><li>• <b>dedicateNormal (dedicatedNormalLocalssd)</b>: exclusive x86</li><li>• <b>armLocalssd</b>: standard Kunpeng</li><li>• <b>normalLocalssd</b>: standard x86</li><li>• <b>general</b>: general-purpose</li><li>• <b>dedicated</b>: dedicated</li></ul> |

**Table 5-85** Data structure description of field flavor\_groups

| Parameter       | Type             | Description                                                                                                                                                                                                                                                                                                                                                                                     |

## 5.6.14 Changing DB Instance Specifications

### Function

This API is used to change DB instance specifications.

- Before calling this API, learn how to [authenticate](#) it.
- Before calling this API, learn about [request header parameters](#).

### Constraints

- Services will be interrupted for 5 to 10 minutes when you change DB instance specifications. Exercise caution when performing this operation.
- The new DB instance specifications must be different from the original DB instance specifications.
- The instance specifications can be modified only for DB instances in the **Available** status.
- The specifications of a DB instance can be changed only to the specifications of the same DB instance type. (For example, the specifications of a single DB instance cannot be changed to those of primary/standby DB instances.)

### URI

- URI format  
POST /v3/{*project\_id*}/instances/{*instance\_id*}/action
- Parameter description

**Table 5-87** Parameters

| Parameter          | Mandatory | Description                                                                                              |
|--------------------|-----------|----------------------------------------------------------------------------------------------------------|
| <i>project_id</i>  | Yes       | Project ID of a tenant in a region.<br>To obtain the value, see <a href="#">Obtaining a Project ID</a> . |
| <i>instance_id</i> | Yes       | Specifies the DB instance ID.                                                                            |

| Parameter | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-----------|-----------|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| spec_code | Yes       | String | Specifies the resource specification code. Use <b>rds.mysql.m1.xlarge</b> as an example. <b>rds</b> indicates the RDS product, <b>mysql</b> indicates the DB engine, and <b>m1.xlarge</b> indicates the high memory performance specifications. The parameter containing <b>rr</b> indicates the read replica specifications. The parameter not containing <b>rr</b> indicates the single or primary/standby DB instance specifications. |

| Parameter   | Mandatory | Type    | Description                                                                                                                                                                                                                                                                                                                                               |
|-------------|-----------|---------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| is_auto_pay | No        | Boolean | <p>Specifies whether the order will be automatically paid when the specifications of yearly/monthly DB instances are changed.</p> <ul style="list-style-type: none"> <li>• <b>true</b>: indicates the order will be automatically paid.</li> <li>• <b>false</b>: indicates the order will be manually paid. The default value is <b>false</b>.</li> </ul> |

## Example Request

- Change the specifications of an RDS for MySQL DB instance to rds.mysql.m1.xlarge.

```
POST https://[endpoint]/v3/0483b6b16e954cb88930a360d2c4e663/instances/dsfae23fsfdsae3435in01/
action

{
 "resize_flavor": {
 "spec_code": "rds.mysql.m1.xlarge",
 "is_auto_pay": true
 }
}
```

- Change the specifications of an RDS for PostgreSQL DB instance to rds.pg.c2.medium.ha.

```
{
 "resize_flavor": {
 "spec_code": "rds.pg.c2.medium.ha",
 "is_auto_pay": true
 }
}
```

- Change the specifications of an RDS for SQL Server DB instance to rds.mssql.2014.se.s3.large.2.

```
{
 "resize_flavor": {
 "spec_code": "rds.mssql.2014.se.s3.large.2",
 "is_auto_pay": true
 }
}
```

## 5.6.15 Scaling Up Storage Space of a DB Instance

### Function

This API is used to scale up storage space of a DB instance.

- Before calling this API, learn how to [authenticate](#) it.
- Before calling this API, learn about [request header parameters](#).

## Constraints

- The sizes of the primary and standby DB instances are the same. When you scale the primary DB instance, its standby DB instance is also scaled.
- The storage space can be scaled up only when your instance status is **Available** or **Storage full**.

## URI

- URI format  
POST /v3/{project\_id}/instances/{instance\_id}/action
- Parameter description

**Table 5-92** Parameters

| Parameter   | Mandatory | Description                                                                                              |
|-------------|-----------|----------------------------------------------------------------------------------------------------------|
| project_id  | Yes       | Project ID of a tenant in a region.<br>To obtain the value, see <a href="#">Obtaining a Project ID</a> . |
| instance_id | Yes       | Specifies the DB instance ID.                                                                            |

## Request

## 5.6.16 Configuring an Autoscaling Policy

### Function

This API is used to configure autoscaling for a DB instance. You will be billed for the new storage.

If available storage drops to a specified threshold or 10 GB, your storage will autoscale by 20% (in increments of 10 GB) of your allocated storage. If you have customized an autoscaling increment, the storage will autoscale by the specified increment. To customize an autoscaling increment, contact customer service.

Autoscaling up the storage of a read replica does not affect that of the primary instance. The new storage space of the read replica after autoscaling must be no less than that of the primary instance.

- Before calling this API, learn how to [authenticate](#) it.

- Before calling this API, learn about [request header parameters](#).

## Constraints

- Your account balance must be greater than or equal to \$0 USD. If your account balance is insufficient, autoscaling will fail.
- This API is only available to RDS for MySQL and RDS for PostgreSQL instances whose storage type is cloud SSDs or extreme SSDs and storage space is at least 40 GB.
- Storage autoscaling is unavailable when the instance is in any of the following statuses: changing instance class, upgrading a minor version, migrating the standby instance, and rebooting.
- If a yearly/monthly instance has pending orders, it will not be autoscaled.
- The storage space can be autoscaled up only when your instance status is **Available** or **Storage full**. The maximum allowed storage is 4,000 GB.

## URI

- URI format  
`PUT /v3/{project_id}/instances/{instance_id}/disk-auto-expansion`
- Parameter description

**Table 5-97** Parameters

| Parameter   | Mandatory | Description                                                                                              |
|-------------|-----------|----------------------------------------------------------------------------------------------------------|
| project_id  | Yes       | Project ID of a tenant in a region.<br>To obtain the value, see <a href="#">Obtaining a Project ID</a> . |
| instance_id | Yes       | Instance ID.                                                                                             |

## Request

**Table 5-98** Parameters

| Parameter     | Mandatory | Type    | Description                                                                                                                                                                                                |
|---------------|-----------|---------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| switch_option | Yes       | Boolean | Whether to enable autoscaling. <ul style="list-style-type: none"><li><b>true</b>: indicates that autoscaling will be enabled.</li><li><b>false</b>: indicates that autoscaling will be disabled.</li></ul> |

| Parameter         | Mandatory | Type    | Description                                                                                                                                                                                                                                                                                                                                                |
|-------------------|-----------|---------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| limit_size        | No        | Integer | <p>Upper limit for autoscaling, in GB. This parameter is mandatory when <b>switch_option</b> is set to <b>true</b>.</p> <p>The value ranges from 40 GB to 4,000 GB and must be no less than the current storage of the instance.</p>                                                                                                                       |
| trigger_threshold | No        | Integer | <p>Threshold to trigger autoscaling. If the available storage drops to this threshold or 10 GB, autoscaling is triggered. This parameter is mandatory when <b>switch_option</b> is set to <b>true</b>.</p> <p>Enumerated values:</p> <ul style="list-style-type: none"> <li>• 10</li> <li>• 15</li> <li>• 20</li> </ul>                                    |
| step_percent      | No        | Integer | <p>Autoscaling increment. It is the percentage of allocated storage that is automatically scaled up each time. Value range: 5% to 50%</p> <p>This parameter is available when <b>switch_option</b> is set to <b>true</b> and autoscaling increment customization is enabled. If this parameter is not specified, the default value <b>20%</b> is used.</p> |

## Example Request

Configure a storage autoscaling policy for a DB instance, with the trigger threshold set to 10% or 10 GB and upper limit to 4,000 GB.

```
PUT https://[endpoint]/v3/054e292c9880d4992f02c0196d3ea468/instances/3d39c18788b54a919bab633874c159df01/disk-auto-expansion
```

```
{
 "switch_option" : true,
 "limit_size" : 4000,
 "trigger_threshold" : 10
}
```

Configure a storage autoscaling policy for a DB instance, with the trigger threshold set to 10% or 10 GB, upper limit to 4,000 GB, and autoscaling increment to 20%.

```
{
 "switch_option" : true,
```

```
"limit_size" : 4000,
"trigger_threshold" : 10,
"step_percent" : 20
}
```

## 5.6.17 Querying an Autoscaling Policy

### Function

This API is used to query the storage autoscaling policy of a DB instance.

- Before calling this API, learn how to [authenticate](#) it.
- Before calling this API, learn about [request header parameters](#).

### Constraints

This API is only available to RDS for MySQL and RDS for PostgreSQL instances using cloud SSDs or extreme SSDs.

### URI

- URI format  
GET /v3/{project\_id}/instances/{instance\_id}/disk-auto-expansion
- Parameter description

**Table 5-99** Parameters

| Parameter   | Mandatory | Description                                                                                              |
|-------------|-----------|----------------------------------------------------------------------------------------------------------|
| project_id  | Yes       | Project ID of a tenant in a region.<br>To obtain the value, see <a href="#">Obtaining a Project ID</a> . |
| instance_id | Yes       | Instance ID.                                                                                             |

**Table 5-100** Parameters

| Parameter         | Type    | Description                                                                                                                                                                                                                                                              |
|-------------------|---------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| switch_option     | Boolean | Whether autoscaling is enabled. <ul style="list-style-type: none"><li>• <b>true</b>: Enabled.</li><li>• <b>false</b>: Disabled.</li></ul>                                                                                                                                |
| limit_size        | Integer | Upper limit for autoscaling, in GB.                                                                                                                                                                                                                                      |
| trigger_threshold | Integer | Threshold to trigger autoscaling. If the available storage drops to this threshold or 10 GB, autoscaling is triggered.                                                                                                                                                   |
| step_percent      | Integer | Autoscaling increment. It is the percentage of allocated storage that is automatically scaled up each time. This parameter is returned only when autoscaling increment customization is enabled.<br><br>To customize an autoscaling increment, contact customer service. |

- Example normal response

Query the autoscaling policy with autoscaling increment customization disabled.

```
{
 "switch_option" : true,
 "limit_size" : 4000,
 "trigger_threshold" : 10
}
```

Query the autoscaling policy with autoscaling increment customization enabled.

```
{
 "switch_option" : true,
 "limit_size" : 4000,
 "trigger_threshold" : 10,
 "step_percent" : 30
}
```

- Abnormal response  
For details, see [Abnormal Request Results](#).

## Status Code

- Normal  
200
- Abnormal  
For details, see [Status Codes](#).

## Error Code

For details, see [Error Codes](#).

## 5.6.18 Changing a Single DB Instance to Primary/Standby DB Instances

### Function

This API is used to change a single DB instance to primary/standby DB instances.

- Before calling this API, learn how to [authenticate](#) it.
- Before calling this API, learn about [request header parameters](#).

### Constraints

- Single DB instances with certain specifications cannot be changed to primary/standby DB instances.
- Single SQL Server DB instances that are billed on the yearly/monthly basis and are created in a DeC cannot be changed to primary/standby DB instances.

### URI

- URI format  
POST /v3/{project\_id}/instances/{instance\_id}/action
- Parameter description

**Table 5-101** Parameters

| Parameter   | Mandatory | Description                                                                                              |
|-------------|-----------|----------------------------------------------------------------------------------------------------------|
| project_id  | Yes       | Project ID of a tenant in a region.<br>To obtain the value, see <a href="#">Obtaining a Project ID</a> . |
| instance_id | Yes       | Specifies the DB instance ID.                                                                            |

## Request

**Table 5-102** Parameters

| Parameter    | Mandatory | Type   | Description                                    |
|--------------|-----------|--------|------------------------------------------------|
| single_to_ha | Yes       | Object | For details, see <a href="#">Table 5-103</a> . |

**Table 5-103** single\_to\_ha field data structure description

| Parameter        | Mandatory | Type    | Description                                                                                                                                                                                                                                                                                                                                                        |
|------------------|-----------|---------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| az_code_new_node | Yes       | String  | Specifies the AZ code of the DB instance node.                                                                                                                                                                                                                                                                                                                     |
| is_auto_pay      | No        | Boolean | Specifies whether the order will be automatically paid. This parameter can be specified only when the instance type is changed from single to primary/standby. <ul style="list-style-type: none"><li>• <b>true</b>: indicates the order will be automatically paid.</li><li>• <b>false</b> (default setting): indicates the order will be manually paid.</li></ul> |
| ad_domain_info   | No        | Object  | Specifies AD domain information. This parameter is mandatory only when a single instance configured with the AD domain is to be changed to a primary/standby instance.<br><br>This parameter is available only for RDS for SQL Server.<br><br>For details about the field structure, see <a href="#">Table 5-104</a> .                                             |

**Table 5-104 ADDomainInfo field data structure description**

| Parameter                 | Mandatory | Type   | Description                               |
|---------------------------|-----------|--------|-------------------------------------------|
| domain_admin_account_name | Yes       | String | Name of the domain administrator account. |
| domain_admin_pwd          | Yes       | String | Password of the domain administrator.     |

## Example Request

- Change a pay-per-use RDS for MySQL or RDS for PostgreSQL DB instance from single to primary/standby.

```
POST https://[endpoint]/v3/0483b6b16e954cb88930a360d2c4e663/instances/dsfae23fsfdsae3435in01/
action
{
 "single_to_ha": {
 "az_code_new_node": "az2xahz"
 }
}
```

- Change a yearly/monthly RDS for MySQL or RDS for PostgreSQL DB instance from single to primary/standby.

```
{
 "single_to_ha": {
 "az_code_new_node": "az1xahz",
 "is_auto_pay": true
 }
}
```

- Change a pay-per-use RDS for SQL Server DB instance from single to primary/standby.

```
{
 "single_to_ha": {
 "az_code_new_node": "az2xahz",
 "ad_domain_info": {
 "dns_server_ip": "192.168.0.1",
 "domain_admin_account_name": "Administrator",
 "domain_admin_pwd": "password@123",
 "dc_domain_name": "test.com"
 }
 }
}
```

- Change a yearly/monthly RDS for SQL Server DB instance from single to primary/standby

```
{
 "single_to_ha": {
 "az_code_new_node": "az2xahz",
 "is_auto_pay": true,
 "ad_domain_info": {
 "dns_server_ip": "192.168.0.1",
 "domain_admin_account_name": "Administrator",
 "domain_admin_pwd": "password@123",
 "dc_domain_name": "test.com"
 }
 }
}
```

## Response

## 5.6.19 Rebooting a DB Instance

### Function

This API is used to reboot a DB instance.

- Before calling this API, learn how to **authenticate** it.
- Before calling this API, learn about **request header parameters**.

## Constraints

- The DB instance cannot reboot when it is being created, scaled, backed up, frozen, restored, or its instance class or port is being changed.
- The RDS DB instance will be unavailable during the reboot process. Exercise caution when performing this operation.

## URI

- URI format  
POST /v3/{project\_id}/instances/{instance\_id}/action
- Parameter description

**Table 5-107** Parameters

| Parameter   | Mandatory | Description                                                                                                                                                                                                      |

## Example Request

- Reboot an RDS for MySQL or RDS for PostgreSQL instance.  

```
POST https://{{Endpoint}}/v3/0483b6b16e954cb88930a360d2c4e663/instances/dsfae23fsfdsae3435in01/
action
{
 "restart": {}
}
```
- Reboot an RDS for SQL Server instance.  

```
{
 "restart" : {
 "restart_server" : false,
 "forcible" : false,
 "delay" : false
 }
}
```
- Forcibly reboot an RDS for SQL Server instance.  

```
{
 "restart" : {
 "restart_server" : false,
 "forcible" : true,
 "delay" : false
 }
}
```

- ```
        }
    }

● Reboot an RDS for SQL Server instance during the maintenance window.  

{
    "restart" : {
        "restart_server" : false,
        "forcible" : false,
        "delay" : true
    }
}

● Reboot the VM of an RDS for SQL Server instance.  

{
    "restart" : {
        "restart_server" : true,
        "forcible" : false,
        "delay" : false
    }
}
```

5.6.21 Querying DB Instances

Function

This API is used to query DB instances according to search criteria.

- Before calling this API, learn how to [authenticate](#) it.
- Before calling this API, learn about [request header parameters](#).

URI

- URI format
`GET /v3/{project_id}/instances?
id={id}&name={name}&type={type}&datastore_type={datastore_type}&vpc_id
={vpc_id}&subnet_id={subnet_id}&offset={offset}&limit={limit}&tags={key}={v
alue}`
- Parameter description

Table 5-113 Parameters

Parameter	Type	Mandatory	Description
project_id	String	Yes	Definition Project ID of a tenant in a region. To obtain the value, see Obtaining a Project ID . Constraints N/A Range N/A Default Value N/A

Parameter	Type	Mandatory	Description
id	String	No	<p>Definition Instance ID. The asterisk (*) is reserved for the system. If the instance ID starts with *, it indicates that fuzzy match is performed based on the value following *. Otherwise, the exact match is performed based on the instance ID. The value cannot contain only asterisks (*).</p> <p>Constraints N/A</p> <p>Range N/A</p> <p>Default Value N/A</p>
name	String	No	<p>Definition Instance name. The asterisk (*) is reserved for the system. If the instance name starts with *, it indicates that fuzzy match is performed based on the value following *. Otherwise, the exact match is performed based on the instance name. The value cannot contain only asterisks (*).</p> <p>Constraints N/A</p> <p>Range N/A</p> <p>Default Value N/A</p>

Parameter	Type	Mandatory	Description
type	String	No	<p>Definition Instance type.</p> <p>Constraints N/A</p> <p>Range</p> <ul style="list-style-type: none"> • Single: single-node instance • Ha: primary/standby instance • Replica: read replica • Enterprise: distributed instance (Enterprise Edition) <p>Default Value N/A</p>
datastore_type	String	No	<p>Definition DB engine.</p> <p>Constraints The value is case-sensitive.</p> <p>Range</p> <ul style="list-style-type: none"> • MySQL • PostgreSQL • SQLServer <p>Default Value N/A</p>
vpc_id	String	No	<p>Definition VPC ID. To obtain this parameter value, use either of the following methods:</p> <ul style="list-style-type: none"> • Method 1: Log in to the VPC console and view the VPC ID on the VPC details page. • Method 2: See the "Querying VPCs" section in the <i>Virtual Private Cloud API Reference</i>. <p>Constraints N/A</p> <p>Range N/A</p> <p>Default Value N/A</p>

Parameter	Type	Mandatory	Description
subnet_id	String	No	<p>Definition Subnet ID. To obtain this parameter value, use either of the following methods:</p> <ul style="list-style-type: none"> Method 1: Log in to the VPC console and click the target subnet on the Subnets page. You can view the network ID on the displayed page. Method 2: See the "Querying Subnets" section in the <i>Virtual Private Cloud API Reference</i>. <p>Constraints N/A</p> <p>Range N/A</p> <p>Default Value N/A</p>
offset	Integer	No	<p>Definition Index offset. The query starts from the next piece of data indexed by this parameter.</p> <p>Constraints The value must be a non-negative number.</p> <p>Range An integer greater than or equal to 0</p> <p>Default Value 0</p>

Parameter	Type	Mandatory	Description
limit	Integer	No	<p>Definition Number of records to be queried.</p> <p>Constraints N/A</p> <p>Range The default value is 100. The value cannot be a negative number. The minimum value is 1 and the maximum value is 100.</p> <p>Default Value 100</p>
tags	Array of objects	No	<p>Definition Tag key-value pairs of the instance.</p> <ul style="list-style-type: none"> • {key} indicates the tag key. It must be unique and cannot be empty. • {value} indicates the tag value, which can be left empty. <p>To query instances with multiple tag keys and values, separate key-value pairs with commas (,). A maximum of 10 key-value pairs are supported.</p> <p>For details, see Table 5-114.</p> <p>Constraints N/A</p> <p>Range N/A</p> <p>Default Value N/A</p>

Table 5-114 tags field data structure description

Parameter	Type	Mandatory	Description
key	String	Yes	<p>Definition Tag key.</p> <p>Constraints N/A</p> <p>Range It must consist of 1 to 128 Unicode characters. It can contain letters, digits, spaces, and special characters _:=+@. However, it cannot start or end with a space, or start with <code>_sys_</code>.</p> <p>Default Value N/A</p>
value	String	No	<p>Definition Tag value.</p> <p>Constraints N/A</p> <p>Range It can be left blank or contain a maximum of 255 Unicode characters. It can contain letters, digits, spaces, and special characters _:=+@.</p> <p>Default Value N/A</p>

Response

- Normal response

Table 5-115 Parameters

Parameter	Type	Description
instances	Array of objects	Definition Indicates the DB instance information. For details, see Table 5-116 .
total_count	Integer	Definition Indicates the total number of records. Range N/A

Table 5-116 instances field data structure description

Parameter	Type	Description
id	String	Definition Indicates the DB instance ID. Range N/A
name	String	Definition Indicates the created DB instance name. Range N/A

Parameter	Type	Description
status	String	<p>Definition Indicates the DB instance status.</p> <p>Range</p> <ul style="list-style-type: none"> ● BUILD: The instance is being created. ● CREATE FAIL: The instance failed to be created. ● ACTIVE: The instance is running properly. ● FAILED: The instance is abnormal. ● FROZEN: The instance is frozen. ● MODIFYING: The vCPU, memory, or storage space of the instance is being changed. ● REBOOTING: The instance is being rebooted. ● RESTORING: The instance is being restored. ● MODIFYING INSTANCE TYPE: The instance is changing from single to primary/standby. ● SWITCHOVER: The instance is performing a primary/standby switchover. ● MIGRATING: The instance is being migrated. ● BACKING UP: The instance is being backed up. ● MODIFYING DATABASE PORT: The database port is being changed. ● STORAGE FULL: The instance storage space is full.
alias	String	<p>Definition Indicates the DB instance alias.</p> <p>Range N/A</p>

Parameter	Type	Description
private_ips	List<String>	<p>Definition Indicates the private IP address list. It is a blank string until an ECS is created.</p> <p>Range N/A</p>
private_dns_names	List<String>	<p>Definition Indicates the private domain name list of the DB instance. After a DB instance is created, you need to manually apply for a private domain name, or the private domain name is left blank.</p> <p>Range N/A</p>
public_dns_names	List<String>	<p>Definition Indicates the public domain name list of the DB instance. Currently, only RDS for SQL Server supports public domain names. After a DB instance is created, you need to manually apply for a public domain name, or the public domain name is left blank.</p> <p>Range N/A</p>
public_ips	List<String>	<p>Definition Indicates the public IP address list.</p> <p>Range N/A</p>

Parameter	Type	Description
port	Integer	<p>Definition Indicates the database port number.</p> <p>Range</p> <ul style="list-style-type: none"> RDS for MySQL instances can use database ports 1024 to 65535, excluding 12017 and 33071, which are reserved for RDS system use. RDS for PostgreSQL instances can use database ports 2100 to 9500. For RDS for SQL Server 2022 Enterprise Edition, 2022 Standard Edition, 2022 Web Edition, 2019 Enterprise Edition, 2019 Standard Edition, 2019 Web Edition, 2017 Enterprise Edition, 2017 Standard Edition, and 2017 Web Edition, the port number can be set to 1433 or 2100 to 9500 (excluding 5050, 5353, 5355, 5985, and 5986). For other editions, the port number can be set to 1433 or 2100 to 9500 (excluding 5355, 5985, and 5986). <p>If this parameter is not set, the default value is as follows:</p> <ul style="list-style-type: none"> RDS for MySQL: 3306 RDS for PostgreSQL: 5432 RDS for SQL Server: 1433
enable_ssl	Boolean	<p>Definition Indicates whether SSL is enabled for the instance.</p> <p>Range</p> <ul style="list-style-type: none"> true: SSL is enabled for the instance. false: SSL is disabled for the instance.

Parameter	Type	Description
type	String	<p>Definition Instance type.</p> <p>Range</p> <ul style="list-style-type: none"> • Single: single-node instance • Ha: primary/standby instance • Replica: read replica • Enterprise: distributed instance (Enterprise Edition)
ha	Object	<p>Definition Indicates the primary/standby DB instance information. Returned only when you obtain a primary/standby DB instance list.</p> <p>For details, see Table 5-117.</p>
region	String	<p>Definition Indicates the region where the DB instance is deployed.</p> <p>Range N/A</p>
datastore	Object	<p>Definition Indicates the database information.</p> <p>For details, see Table 5-118.</p>
created	String	<p>Definition Indicates the creation time.</p> <p>Range The value is in the "yyyy-mm-ddThh:mm:ssZ" format. T is the separator between the calendar and the hourly notation of time. Z indicates the time zone offset. For example, if the time zone offset is one hour, the value of Z is +0100. The value is empty when the instance is being created. After the instance is created, the value is not empty.</p>

Parameter	Type	Description
updated	String	<p>Definition Indicates the update time.</p> <p>Range The format is the same as that of the created field. The value is empty when the instance is being created. After the instance is created, the value is not empty.</p>
db_user_name	String	<p>Definition Indicates the default username.</p> <p>Range N/A</p>
vpc_id	String	<p>Definition Indicates the VPC ID.</p> <p>Range N/A</p>
subnet_id	String	<p>Definition Indicates the network ID of the subnet.</p> <p>Range N/A</p>
security_group_id	String	<p>Definition Indicates the security group ID.</p> <p>Range N/A</p>
flavor_ref	String	<p>Definition Indicates the specification code.</p> <p>Range N/A</p>
cpu	String	<p>Definition Indicates the number of vCPUs. For example, the value 1 indicates 1 vCPU.</p> <p>Range N/A</p>

Parameter	Type	Description
mem	String	Definition Indicates the memory size in GB. Range N/A
volume	Object	Definition Indicates instance storage. For details, see Table 5-119 .
switch_strategy	String	Definition Indicates the database failover priority. Range <ul style="list-style-type: none"> • reliability: Reliability is given priority during the failover. • availability: Availability is given priority during the failover.
read_only_by_user	Boolean	Definition Indicates the read-only status of the DB instance. This parameter is available only to RDS for MySQL. Range <ul style="list-style-type: none"> • true: indicates that the DB instance is set to read-only. • false: indicates that the DB instance is set to read/write.
backup_strategy	Object	Definition Indicates the backup policy. For details, see Table 5-120 .
maintenance_window	String	Definition Indicates the start time of the maintenance time window in the UTC format. Range N/A
nodes	Array of objects	Definition Indicates the primary/standby DB instance information. For details, see Table 5-121 .

Parameter	Type	Description
related_instance	Array of objects	Definition Indicates all associated DB instances. For details, see Table 5-122 .
disk_encryption_id	String	Definition Indicates the disk encryption key ID. Range N/A
enterprise_project_id	String	Definition Indicates the enterprise project ID. Range N/A
time_zone	String	Definition Indicates the time zone. Range N/A
charge_info	Object	Definition Indicates the billing information, which is yearly/monthly or pay-per-use. By default, pay-per-use is used. For details, see Table 5-123 .
tags	Array of objects	Definition Indicates the tag list. If there is no tag in the list, an empty array is returned. For details, see Table 5-125 .
backup_used_space	Double	Definition Indicates the backup space usage in GB. This field is returned only when you query information about a specified RDS for PostgreSQL or RDS for SQL Server DB instance. Range N/A

Parameter	Type	Description
storage_used_space	Double	<p>Definition Indicates the storage space usage in GB. This field is returned only when you query information about a specified RDS for PostgreSQL or RDS for SQL Server DB instance.</p> <p>Range N/A</p>
order_id	String	<p>Definition Indicates the order ID. This field is returned only when the DB instance is billed on a yearly/monthly basis.</p> <p>Range N/A</p>
associated_with_ddm	Boolean	<p>Definition Indicates whether a DDM instance has been associated.</p> <p>Range N/A</p>
max_iops	Long	<p>Definition Indicates the maximum disk IOPS of the instance. This field is returned only for RDS for SQL Server instances.</p> <p>Range N/A</p>
expiration_time	String	<p>Definition Indicates the time when an instance expires. The format is yyyy-mm-ddThh:mm:ssZ. This field is returned only for yearly/monthly instances.</p> <p>Range N/A</p>
serverless_info	Object	<p>Definition Indicates the compute power range of a serverless instance, in RCU. For details, see Table 5-124.</p>

Table 5-117 ha field data structure description

Parameter	Type	Description
replication_mode	String	<p>Definition Indicates the replication mode for the standby instance.</p> <p>Range</p> <ul style="list-style-type: none"> For RDS for MySQL, the value is async or semisync. For RDS for PostgreSQL, the value is async or sync. For RDS for SQL Server, the value is sync. <p>NOTE</p> <ul style="list-style-type: none"> async indicates the asynchronous replication mode. semisync indicates the semi-synchronous replication mode. sync indicates the synchronous replication mode.

Table 5-118 datastore field data structure description

Parameter	Type	Description
type	String	<p>Definition Indicates the DB engine. Its value can be any of the following and is case-insensitive:</p> <p>Range</p> <ul style="list-style-type: none"> MySQL PostgreSQL SQLServer
version	String	<p>Definition Indicates the database version. When the DB engine is SQL Server, WEB indicates the web edition, SE indicates the standard edition, and EE indicates the enterprise edition.</p> <p>Range N/A</p>

Parameter	Type	Description
complete_version	String	<p>Definition Indicates the complete version number. This parameter is returned only when the DB engine is MySQL or PostgreSQL.</p> <p>Range N/A</p>

Table 5-119 volume field data structure description

Parameter	Type	Description
type	String	<p>Definition Storage type. The value is case-sensitive.</p> <p>Range</p> <ul style="list-style-type: none"> • COMMON: SATA storage. • HIGH: SAS storage. • ULTRAHIGH: ultra-high I/O storage. • ULTRAHIGHPRO: ultra-high I/O (advanced) storage. This storage type is supported only with ultra-high performance (advanced) instances. • CLOUDSSD: cloud SSD storage. This storage type is supported only with general-purpose and dedicated instances. • LOCALSSD: local SSD storage. • ESSD: extreme SSD storage. This storage type is supported only with dedicated instances.
size	Integer	<p>Definition Storage space in GB.</p> <p>Range N/A</p>

Table 5-120 backup_strategy field data structure description

Parameter	Type	Description
start_time	String	Definition Indicates the backup time window. Automated backups will be triggered during the backup time window. The time is in the UTC format. Range N/A
keep_days	Integer	Definition Indicates the number of days to retain the generated backup files. Range 0–732 If the value is 0, the automated backup policy is not configured or has been disabled. To extend the retention period, contact customer service. Automated backups can be retained for up to 2,562 days.

Table 5-121 nodes field data structure description

Parameter	Type	Description
id	String	Definition Indicates the node ID. Range N/A
name	String	Definition Indicates the node name. Range N/A
role	String	Definition Indicates the node type. Range <ul style="list-style-type: none">• master: primary node• slave: standby node• readreplica: read replica node
status	String	Definition Indicates the node status.

Parameter	Type	Description
availability_zone	String	Definition Indicates the AZ. Range N/A

Table 5-122 related_instance field data structure description

Parameter	Type	Description
id	String	Definition ID of the associated DB instance. Range N/A
type	String	Definition Type of the associated DB instance. Range <ul style="list-style-type: none"> • replica_of: indicates a primary DB instance. • replica: indicates a read replica.

Table 5-123 chargeInfo field data structure description

Parameter	Mandatory	Type	Description
charge_mode	Yes	String	Definition Indicates the billing mode. Range <ul style="list-style-type: none"> • prePaid: indicates the yearly/monthly billing mode. • postPaid: indicates the pay-per-use billing mode.

Table 5-124 Data structure of the serverless_info field

Parameter	Man dato ry	Type	Description
min_compute_unit	Yes	String	Definition Minimum compute power of a serverless instance, in RCU. Range 0.5–8, in RCU
max_compute_unit	Yes	String	Definition Maximum compute power of a serverless instance, in RCU. Range 0.5–8, in RCU

Table 5-125 tags field data structure description

Parameter	Type	Description
key	String	Definition Indicates the tag key. Range N/A
value	String	Definition Indicates the tag value. Range N/A

NOTE

The values of **region** and **availability_zone** are used as examples.

- Example normal response
- Query DB instances based on search criteria.

5.6.22 Binding and Unbinding an EIP

Function

This API is used to bind an EIP to a DB instance for public access or unbind an EIP from the DB instance as required.

- Before calling this API, learn how to [authenticate](#) it.
- Before calling this API, learn about [request header parameters](#).

Constraints

An EIP cannot be bound to or unbound from a DB instance that is being created, modified, restored, frozen, or rebooted.

URI

- URI format
`PUT /v3/{project_id}/instances/{instance_id}/public-ip`
- Parameter description

Table 5-126 Parameter description

Name	Mandatory	Description
project_id	Yes	Project ID of a tenant in a region. To obtain the value, see Obtaining a Project ID .
instance_id	Yes	Specifies the DB instance ID.

Request

Table 5-127 Parameters

Parameter	Mandatory	Type	Description
public_ip	No	String	NOTICE When <code>is_bind</code> is <code>true</code> , <code>public_ip</code> is mandatory. Specifies the EIP to be bound. The value must be in the standard IP address format.

Parameter	Mandatory	Type	Description
public_ip_id	No	String	NOTICE When <code>is_bind</code> is true, <code>public_ip_id</code> is mandatory. Specifies the EIP ID. The value must be in the standard UUID format.
is_bind	Yes	Boolean	<ul style="list-style-type: none">• true: Bind an EIP.• false: Unbind an EIP.

Example Request

- Bind an EIP to a DB instance.

```
PUT https://[endpoint]/v3/0483b6b16e954cb88930a360d2c4e663/instances/dsfae23fsfdsae3435in01/public-ip

{
    "public_ip": "10.10.10.1",
    "public_ip_id": "8403e9cd-a7fa-4288-8b15-c7ceac1etest",
    "is_bind": true
}
```

- Unbind an EIP from a DB instance.

```
{
    "is_bind": false
}
```

5.6.23 Changing the Failover Priority

Function

This API is used to change the failover priority for primary/standby DB instances to meet different service requirements. You can select **reliability** or **availability**.

- Before calling this API, learn how to [authenticate](#) it.
- Before calling this API, learn about [request header parameters](#).

Constraints

- This API is available to RDS for MySQL only.
- This API is supported for primary/standby DB instances only.
- The failover priority cannot be changed if the DB instance is in any of the following statuses: creating, upgrading, creating users, or deleting users.

URI

- URI format
`PUT /v3/{project_id}/instances/{instance_id}/failover/strategy`
- Parameter description

Table 5-128 Parameter description

Name	Mandatory	Description
project_id	Yes	Project ID of a tenant in a region. To obtain the value, see Obtaining a Project ID .
instance_id	Yes	Specifies the DB instance ID.

Request

Table 5-129 Parameters

Parameter	Mandatory	Type	Description
repairStrategy	Yes	String	<p>Specifies the failover priority. Valid value:</p> <ul style="list-style-type: none">• reliability: Data reliability is preferentially ensured during the failover to minimize the amount of lost data. It is recommended for services that require high data consistency.• availability: Data availability is preferentially ensured during the failover to recover services quickly. It is recommended for services that have high requirements on the database online duration.

Example Request

Change the failover priority of a DB instance to availability.

```
PUT https://[endpoint]/v3/0483b6b16e954cb88930a360d2c4e663/instances/dsfae23fsfdsae3435in01/failover/strategy
{
    "repairStrategy": "availability"
}
```

Response

5.6.24 Manually Switching Primary/Standby DB Instances

Function

This API is used to manually switch primary/standby DB instances as required.

- Before calling this API, learn how to [authenticate](#) it.
- Before calling this API, learn about [request header parameters](#).

Constraints

- This API is supported for primary/standby DB instances only.
- This operation cannot be performed if the DB instance is in any of the following statuses: creating, rebooting, upgrading, changing instance class, restoring, changing port, deleting database account, or creating database account.
- The primary/standby switchover does not change the floating IP address of your instance.

URI

- URI format
`PUT /v3/{project_id}/instances/{instance_id}/failover`
- Parameter description

Table 5-130 Parameter description

Name	Mandatory	Description
project_id	Yes	Project ID of a tenant in a region. To obtain the value, see Obtaining a Project ID .
instance_id	Yes	Specifies the DB instance ID.

Request

Table 5-131 Parameters

Parameter	Mandatory	Type	Description
force	No	Boolean	<p>Whether to perform a forcible primary/standby switchover. By default, this parameter is left blank, indicating that the switchover is not performed forcibly.</p> <ul style="list-style-type: none">• true: A forcible switchover is performed.• false: No forcible switchover is performed. <p>NOTE This parameter is valid only for the PostgreSQL DB engine.</p>

Example Request

- Perform a primary/standby switchover.

```
PUT https://[endpoint]/v3/0483b6b16e954cb88930a360d2c4e663/instances/dsfae23fsfdsae3435in01/failover
{}
```

- Perform a forcible primary/standby switchover.

```
{
  "force":true
}
```

Response

- Normal response

Parameter	Description
workflowId	Indicates the workflow ID.
instanceId	Indicates the DB instance ID.
nodeId	Indicates the node ID.

- Example normal response

```
{
  "workflowId":"072beb09-0573-40bf-bfe8-4be5cec9e85a",
  "instanceId":"794c38e5309344818f4b33b86ebce9b4in03",

5.6.25 Changing the Data Replication Mode of Primary/Standby DB Instances

Function

This API is used to change the data replication mode of primary/standby DB instances based on service requirements.

- Before calling this API, learn how to [authenticate](#) it.
- Before calling this API, learn about [request header parameters](#).

Constraints

- This API is available to RDS for MySQL only.
- This API is supported for primary/standby DB instances only.
- The replication mode cannot be changed if the DB instance is in any of the following statuses: creating, upgrading, changing instance class, creating users, or deleting users.
- The replication mode in the request must be different from that of the DB instance. You can log in to the management console to view the replication mode of the DB instance. For details about how to change the replication mode, see [Changing the Replication Mode](#).

URI

- URI format
`PUT /v3/{project_id}/instances/{instance_id}/failover/mode`
- Parameter description

Table 5-132 Parameter description

Name	Mandatory	Description
project_id	Yes	Project ID of a tenant in a region. To obtain the value, see Obtaining a Project ID .
instance_id	Yes	Specifies the DB instance ID.

Request

Table 5-133 Parameters

Parameter	Mandatory	Type	Description
mode	Yes	String	<p>Specifies the replication mode.</p> <p>For RDS for MySQL, the value can be any of the following:</p> <ul style="list-style-type: none">• async: asynchronous• semisync: semi-synchronous <p>For RDS for PostgreSQL, the value can be any of the following:</p> <ul style="list-style-type: none">• async: asynchronous• sync: synchronous

Example Request

Change the replication mode of a primary/standby DB instance to asynchronous.

```
PUT https://[endpoint]/v3/0483b6b16e954cb88930a360d2c4e663/instances/dsfae23fsfdsae3435in01/failover	mode
{
    "mode": "async"
}
```

Response

- Normal response

Parameter	Description
workflowId	Indicates the workflow ID.
instanceId	Indicates the DB instance ID.
replicationMode	Indicates the replication mode.

- Example normal response

```
{
    "instanceId": "c8a7d0abe94840dda99bc437e9442982in01",
    "replicationMode": "async",
    "workflowId": "7b55d6ca-dc8e-4844-a9da-6c53a1506db3"
}

5.6.26 Changing Read/Write Permissions

Function

This API is used to change read/write permissions of RDS for MySQL DB instances to meet your workload requirements. After a DB instance is set to read-only, data cannot be written to it.

- Before calling this API, learn how to [authenticate](#) it.
- Before calling this API, learn about [request header parameters](#).

Constraints

- This API is available to RDS for MySQL only.
- This API is available to only single and primary/standby DB instances.
- This operation cannot be performed when the DB instance is in any of the following statuses: creating, changing instance class, frozen, and abnormal.
- If your instance becomes read-only for other reasons (such as full storage and DRS migration), it cannot be changed to readable and writable through this API.
- This API is only used to configure read/write permissions for primary DB instances.
- Changing read/write permissions is in OBT in some regions. If this function is not available in your region, contact customer service to configure a whitelist.

URI

- URI format
`PUT /v3/{project_id}/instances/{instance_id}/readonly-status`
- Parameter description

Table 5-134 Parameters

Parameter	Mandatory	Description
project_id	Yes	Project ID of a tenant in a region. To obtain the value, see Obtaining a Project ID .
instance_id	Yes	Instance ID.

Request

Table 5-135 Parameters

Parameter	Mandatory	Type	Description
readonly	Yes	Boolean	<p>Whether to set the instance to read-only.</p> <ul style="list-style-type: none">• true: indicates that the instance will be set to read-only.• false: indicates that the instance will be set to read/write.

Example Request

Set a DB instance to read-only.

```
PUT https://{endpoint}/v3/054ea741f700d4a32f1bc00f5c80dd4c/instances/  
5b409baece064984a1b3eef6addae50cin01/readonly-status
```

```
{  
    "readonly" : true  
}
```

Response

- Normal response

Table 5-136 Parameters

Parameter	Type	Description
job_id	String	Task ID.

5.6.27 Migrating a Standby DB Instance

Function

This API is used to migrate a standby DB instance to another AZ based on service requirements.

- Before calling this API, learn how to [authenticate](#) it.
- Before calling this API, learn about [request header parameters](#).

Constraints

- This API is only available to RDS for MySQL and RDS for PostgreSQL.
- Primary/standby instances running MySQL 5.6, 5.7, or 8.0 support standby instance migration to another AZ. To migrate an RDS for MySQL 8.0 standby instance, contact customer service to apply for the required permissions.
- This API is supported for primary/standby DB instances only.
- The standby DB instance cannot be migrated if the primary DB instance is in any of the following statuses: creating, rebooting, upgrading, changing instance class, changing port, creating users, or deleting users.

URI

- URI format
`POST /v3/{project_id}/instances/{instance_id}/migrateslave`
- Parameter description

Table 5-137 Parameter description

Name	Mandatory	Description
project_id	Yes	Project ID of a tenant in a region. To obtain the value, see Obtaining a Project ID .
instance_id	Yes	Specifies the DB instance ID.

Request

Table 5-138 Parameters

Parameter	Mandatory	Type	Description
nodeId	Yes	String	ID of the standby DB instance.

Parameter	Mandatory	Type	Description
azCode	Yes	String	<p>Code of the AZ to which the standby DB instance is to be migrated.</p> <p>Specify an AZ code other than the original one after obtaining the codes of the AZs where the instance specifications are supported from Querying Database Specifications.</p>

Example Request

Migrate a standby DB instance to az2.

```
POST https://{endpoint}/v3/0483b6b16e954cb88930a360d2c4e663/instances/dsfae23fsfdsae3435in01/migrateslave
{
  "nodeId": "0119b1068b874cb4a5202989a06b6094no01",

5.6.28 Configuring the Maintenance Window

Function

This API is used to change the maintenance window as required. To prevent service interruption, the maintenance window should fall within the off-peak hours.

- Before calling this API, learn how to [authenticate](#) it.
- Before calling this API, learn about [request header parameters](#).

URI

- URI format

PUT /v3/{*project_id*}/instances/{*instance_id*}/ops-window

- Parameter description

Table 5-139 Parameters

Parameter	Mandatory	Description
project_id	Yes	Project ID of a tenant in a region. To obtain the value, see Obtaining a Project ID .
instance_id	Yes	Specifies the DB instance ID.

Request

Table 5-140 Parameters

Parameter	Mandatory	Type	Description
start_time	Yes	String	Specifies the start time (UTC).
end_time	Yes	String	Specifies the end time (UTC). <ul style="list-style-type: none">• For RDS for MySQL and RDS for PostgreSQL databases, the start time and end time must be on the hour, and the interval between them must be one to four hours.• For RDS for SQL Server databases, the interval between the start time and end time must be four hours.

Example Request

Set the maintenance window of a DB instance to 22:00-02:00.

```
PUT https://{endpoint}/v3/0483b6b16e954cb88930a360d2c4e663/instances/dsfae23fsfdsae3435in01/ops-window

{
    "start_time": "22:00",

5.6.29 Upgrading the Minor Version of a DB Instance

Function

This API is used to upgrade minor versions of RDS for MySQL or RDS for PostgreSQL instances.

- Before calling this API, learn how to [authenticate](#) it.
- Before calling this API, learn about [request header parameters](#).

Constraints

- This API is available to RDS for MySQL and RDS for PostgreSQL only.
- The minor versions of any RDS for PostgreSQL instances containing abnormal nodes cannot be upgraded.
- The minor versions of RDS for PostgreSQL 11 instances earlier than 11.2 cannot be upgraded.
- For RDS for PostgreSQL, minor versions can be upgraded immediately upon request submission only, but not during the specified maintenance window.
- A minor version upgrade of RDS for PostgreSQL instances can cause a primary/standby switchover.

URI

- URI format
POST /v3/{project_id}/instances/{instance_id}/db-upgrade
- Parameter description

Table 5-141 Parameters

Parameter	Mandatory	Description
project_id	Yes	Project ID of a tenant in a region. To obtain the value, see Obtaining a Project ID .
instance_id	Yes	Instance ID.

Request

Table 5-142 Parameters

Parameter	Mandatory	Type	Description
is_delayed	No	Boolean	Whether to delay the upgrade until the maintenance window. Valid values: <ul style="list-style-type: none">• true: The upgrade will be delayed. The instance will be upgraded during the specified maintenance window.• false (default): The instance is upgraded immediately.

Example Request

Upgrade the minor version of a DB instance.

```
POST https://[endpoint]/v3/0483b6b16e954cb88930a360d2c4e663/instances/
cee5265e1e5845649e354841234567dfin01/db-upgrade

5.6.31 Querying the Automatic Minor Version Upgrade Policy of a DB Instance (RDS for PostgreSQL)

Function

This API is used to query the automatic minor version upgrade policy of a DB instance.

- Before calling this API, learn how to [authenticate](#) it.
- Before calling this API, learn about [request header parameters](#).

URI

- URI format
GET /v3/{project_id}/instances/{instance_id}/db-auto-upgrade
- Parameter description

Table 5-147 Parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Definition Project ID of a tenant in a region. To obtain the value, see Obtaining a Project ID . Constraints The value cannot be empty. Range N/A Default Value N/A

Parameter	Mandatory	Type	Description
instance_id	Yes	String	Definition Instance ID. Constraints The value cannot be empty. Range N/A Default Value N/A

Request

None

Example Request

Query the automatic minor version upgrade policy of a DB instance.

```
GET https://{Endpoint}/v3/0483b6b16e954cb88930a360d2c4e663/instances/e28979107ed04d3b8b2f1b819b8d2be3in03/db-auto-upgrade
```

Response

- Normal response

Table 5-148 Parameters

Parameter	Type	Description
switch_option	Boolean	Definition Whether automatic minor version upgrade is enabled. Range <ul style="list-style-type: none"> true: Automatic minor version upgrade is enabled. false: Automatic minor version upgrade is disabled.

- Example normal response

```
{
  "switch_option": true
}
```

5.6.32 Configuring a Monitoring by Seconds Policy

Function

This API is used to configure a Monitoring by Seconds policy for a DB instance. The policy takes effect about 5 minutes after you configure it.

Monitoring by Seconds at an interval of 1s or 5s is billed on a pay-per-use basis. You are charged once per hour.

Monitoring by Seconds policies of the primary instance and read replicas are independent from each other. Monitoring by Seconds is automatically disabled for instances with fewer than 4 vCPUs.

- Before calling this API, learn how to [authenticate](#) it.
- Before calling this API, learn about [request header parameters](#).

Constraints

- This API is in OBT. To use this API, contact customer service.
- This API is available to only RDS for MySQL instances with 4 vCPUs or more.

URI

- URI format
`PUT /v3/{project_id}/instances/{instance_id}/second-level-monitor`
- Parameter description

Table 5-149 Parameters

Parameter	Mandatory	Description
project_id	Yes	Project ID of a tenant in a region. To obtain the value, see Obtaining a Project ID .
instance_id	Yes	Instance ID.

Request

Table 5-150 Parameters

Parameter	Mandatory	Type	Description
switch_option	Yes	Boolean	Whether to enable Monitoring by Seconds. <ul style="list-style-type: none">• true: indicates that Monitoring by Seconds will be enabled.• false: indicates that Monitoring by Seconds will be disabled.
interval	No	Integer	Monitoring interval, which can be 1s or 5s. Enumerated values: <ul style="list-style-type: none">• 1• 5

Example Request

- Enable Monitoring by Seconds for a DB instance, with an interval set to 5s.

```
PUT https://[endpoint]/v3/054e292c9880d4992f02c0196d3ea468/instances/3d39c18788b54a919bab633874c159df101/second-level-monitor
```

```
{  
    "switch_option" : true,  
    "interval" : 5  
}
```

- Disable Monitoring by Seconds.

```
{  
    "switch_option" : false  
}
```

Response

5.6.34 Enabling TDE for a DB Instance (RDS for SQL Server)

Function

This API is used to enable TDE for a DB instance.

- Before calling this API, learn how to [authenticate](#) it.
- Before calling this API, learn about [request header parameters](#).

Constraints

- This API supports only RDS for SQL Server instances.
- TDE cannot be disabled after being enabled, and it cannot be enabled again.
- The DB engine of the target instance must be of the Enterprise Edition or 2019 Standard Edition.

URI

- URI format
PUT /v3/{project_id}/instances/{instance_id}/tde
- Parameter description

Table 5-153 Parameters

Parameter	Mandatory	Description
project_id	Yes	Project ID of a tenant in a region. To obtain the value, see Obtaining a Project ID .
instance_id	Yes	Instance ID.

Request

The following parameters are required for TDE rotation. To use this function, contact customer service first.

Table 5-154 Parameters

Parameter	Mandatory	Type	Description
rotate_day	No	Integer	Days of rotation. Value range: 1-100000.
secret_id	No	String	Key ID.
secret_name	No	String	Key name.
secret_version	No	String	Key version.

Example Request

- Enable TDE for a DB instance (with TDE rotation not used).

```
PUT https://{Endpoint}/v3/054e292c9880d4992f02c0196d3ea468/instances/  
3d39c18788b54a919bab633874c159df1n04/tde  
{}
```

- Enable TDE for a DB instance (with TDE rotation used).

```
{  
  "rotate_day": 365,  
  "secret_id": "d0964270-2716-405b-bc3a-12a942451716",  
  "secret_name": "test",  
  "secret_version": "v10"  
}
```

Response

- Normal response

Table 5-155 Parameters

Parameter	Type	Description
job_id	String	Taskflow ID

- Example normal response

```
{  
    "job_id": "2b414788a6004883a02390e2eb0ea227"  
}
```

For details, see [Error Codes](#).

5.6.35 Querying TDE Status of a DB Instance (RDS for SQL Server)

Function

This API is used to query the TDE status.

- Before calling this API, learn how to [authenticate](#) it.
- Before calling this API, learn about [request header parameters](#).

Constraints

This API supports only RDS for SQL Server instances.

URI

- URI format
GET /v3/{project_id}/instances/{instance_id}/tde-status
- Parameter description

Table 5-156 Parameter description

Name	Mandatory	Description
project_id	Yes	Project ID of a tenant in a region. To obtain the value, see Obtaining a Project ID .
instance_id	Yes	Instance ID.

Request

- Parameter description
None
- URI example

```
GET https://{Endpoint}/v3/054e292c9880d4992f02c0196d3ea468/instances/  
3d39c18788b54a919bab633874c159dfin04/tde-status
```

Response

- Normal response

Table 5-157 Parameters

Parameter	Type	Description
instance_id	String	Instance ID.
tde_status	String	TDE status. Enumerated values: <ul style="list-style-type: none">open: Enabledclose: Disabled

- Example normal response

```
{  
"instance_id":"3d39c18788b54a919bab633874c159dfin04",  
"tde_status":"open"

5.6.36 Unlocking a DB Instance from the Read-Only State

Function

This API is used to remove the read-only status of a DB instance.

- Before calling this API, learn how to [authenticate](#) it.
- Before calling this API, learn about [request header parameters](#).

Constraints

This API is available to RDS for PostgreSQL only.

URI

- URI format
PUT /v3/{project_id}/instances/{instance_id}/unlock-node-readonly-status
- Parameter description

Table 5-158 Parameters

Parameter	Mandatory	Description
project_id	Yes	Project ID of a tenant in a region. To obtain the value, see Obtaining a Project ID .
instance_id	Yes	Instance ID.

Request

Table 5-159 Parameters

Parameter	Mandatory	Type	Description
status_preservation_time	Yes	Integer	Duration (in minutes) during which the HA component no longer sets the instance to read-only. Minimum value: 0 Maximum value: 1440

Example Request

Unlock a DB instance from the read-only state.

```
PUT https://{{Endpoint}}/v3/054e292c9880d4992f02c0196d3ea468/instances/
```

```
42d4b4fc17d144bbb3ba64a306e68c72in03/unlock-node-readonly-status
{
    "status_preservation_time" : 5
}
```

Response

- Normal response

Table 5-160 Parameters

Parameter	Type	Description
resp	String	If the operation is successful, SUCCESS is returned. Otherwise, an error code is returned.

- Example normal response

```
{
    "resp" : "SUCCESS"
}
```

- Abnormal response

For details, see [Abnormal Request Results](#).

For details, see [Error Codes](#).

5.7 DR Instances (RDS for PostgreSQL)

5.7.1 Querying DR relationships

Function

This API is used to query DR relationships.

- Before calling this API, learn how to [authenticate](#) it.
- Before calling this API, learn about [request header parameters](#).

Constraints

DR relationship query is supported only for RDS for PostgreSQL 12 and later.

URI

- URI format
POST /v3/{project_id}/instances/disaster-recovery-infos
- Parameter description

Table 5-161 Parameters

Parameter	Mandatory	Description
project_id	Yes	Project ID of a tenant in a region. To obtain the value, see Obtaining a Project ID .

Request

Table 5-162 Parameters

Parameter	Mandatory	Type	Description
id	No	String	DR relationship ID.
status	No	String	DR configuration status.
master_instance_id	No	String	Primary instance ID.
master_region	No	String	Region where the primary instance is located.
slave_instance_id	No	String	DR instance ID.
slave_region	No	String	Region where the DR instance is located.
create_at_start	No	Long	Creation start time.
create_at_end	No	Long	Creation end time.
order	No	String	Sorting order. <ul style="list-style-type: none">• DESC: descending order• ASC: ascending order Default value: DESC

Parameter	Mandatory	Type	Description
sort_field	No	String	<p>Sorting field.</p> <ul style="list-style-type: none"> • status: Data is sorted by DR configuration status. • time: Data is sorted by DR configuration time. • master_region: Data is sorted by region where the primary instance is located • slave_region: Data is sorted by region where the DR instance is located <p>Default value: time</p>
offset	No	Integer	<p>Index offset. If offset is set to N, the resource query starts from the $N+1$ piece of data. The value is 0 by default, indicating that the query starts from the first piece of data. The value cannot be a negative number.</p>
limit	No	Integer	<p>Number of records to be queried. The default value is 10. The value must be a positive integer. The minimum value is 1 and the maximum value is 100.</p>

Example Request

```
POST https://[endpoint]/v3/0483b6b16e954cb88930a360d2c4e663/instances/disaster-recovery-infos
{
    "status": "normal",
    "order": "ASC",
    "sort_field": "time",
    "offset": 0,
    "limit": 10
}
```

Response

- Normal response

Table 5-163 Parameters

Parameter	Type	Description
total_count	Integer	Total number of records.

Parameter	Type	Description
instance_dr_infos	Array of objects	DR information. For details, see Table 5-164 .

Table 5-164 instance_dr_infos field description

Parameter	Type	Description
id	String	DR relationship ID.
status	String	DR configuration status.
failed_message	String	Failure message.
replica_state	String	Synchronization status. The value can be 0 or -1 . The value 0 indicates that the synchronization is normal, and -1 indicates that the synchronization is abnormal.
wal_write_receive_delay_in_mb	String	WAL send lag volume, in MB. It means the difference between the WAL Log Sequence Number (LSN) written by the primary instance and the WAL LSN received by the DR instance.
wal_write_replay_delay_in_mb	String	End-to-end delayed WAL size, in MB. It refers to the difference between the WAL LSN written by the primary instance and the WAL LSN replayed by the DR instance.
wal_receive_replay_delay_in_ms	String	Replay delay, in milliseconds, on the DR instance.
master_instance_id	String	Primary instance ID.
master_region	String	Region where the primary instance is located.
slave_instance_id	String	DR instance ID.
slave_region	String	Region where the standby instance is located
build_process	String	Process for configuring disaster recovery (DR). <ul style="list-style-type: none"> • master: process of configuring DR capability for the primary instance • slave: process of configuring DR for the DR instance

Parameter	Type	Description
time	Long	DR configuration time.

- Example normal response

```
{

5.7.2 Configuring the DR Capability for a Primary DB Instance

Function

This API is used to configure DR for a primary DB instance when establishing a cross-cloud or cross-region DR relationship.

- Before calling this API, learn how to [authenticate](#) it.
- Before calling this API, learn about [request header parameters](#).

Constraints

- Before using this function, ensure that the network between the VPC CIDR blocks of the DB instances across clouds or regions is connected, and configure security group rules to allow access from database ports in the VPC CIDR blocks. The DR relationship cannot be established if only the network is connected but security group rules are not configured.

- The primary DB instance and DR instance are available and are deployed in different clouds or regions. The primary DB instance is deployed in primary/standby mode and the DR instance is deployed in standalone mode.
- The vCPUs, memory, and storage space of the DR instance must be greater than or equal to those of the primary instance.
- The underlying architecture and major version of the DR instance must be the same as those of the primary DB instance.
- If the DR instance's minor version differs from the primary DB instance, it will automatically update to be the same as that of the primary DB instance after the DR relationship is established.
- Cross-cloud or cross-region DR relationships cannot be established across major versions.
- After the API for configuring DR for the primary instance is called, you cannot change the instance class or perform a primary/standby switchover until the DR relationship is set up.
- After changing the database port or floating IP address of the primary instance, you need to re-establish the DR relationship.
- RDS for PostgreSQL 12 and later versions support cross-cloud or cross-region DR.

URI

- URI format
POST /v3/{project_id}/instances/{instance_id}/action
- Parameter description

Table 5-165 Parameter description

Name	Mandatory	Description
project_id	Yes	Project ID of a tenant in a region. To obtain the value, see Obtaining a Project ID .
instance_id	Yes	Specifies the DB instance ID.

Request

Table 5-166 Parameters

Parameter	Mandatory	Type	Description
build_master_dr_relation	Yes	Object	Specifies the DR instance information required for configuring the DR relationship for the primary DB instance. For details, see Table 5-167 .

Table 5-167 build_master_dr_relation field description

Parameter	Mandatory	Type	Description
target_instance_id	Yes	String	Specifies the ID of the DR instance.
target_project_id	Yes	String	Specifies the project ID of the tenant to which the DR instance belongs.
target_region	Yes	String	Specifies the ID of the region where the DR instance resides.
target_ip	Yes	String	Specifies the data virtual IP address (VIP) of the DR instance.
target_subnet	Yes	String	Specifies the subnet IP address of the DR instance.

Example Request

Configure a DR relationship for a primary DB instance, with the DR instance deployed in region aaa.

```
POST https://{endpoint}/v3/0483b6b16e954cb88930a360d2c4e663/instances/  
24c6678f474241fe89ee9c42f768022ein03/action

5.7.3 Configuring the DR Capability for a DR Instance

Function

This API is used to configure DR for a DR instance when establishing a cross-cloud or cross-region DR relationship.

- Before calling this API, learn how to [authenticate](#) it.
- Before calling this API, learn about [request header parameters](#).

Constraints

- Before using this function, ensure that the network between the VPC CIDR blocks of the DB instances across clouds or regions is connected, and configure security group rules to allow access from database ports in the VPC CIDR blocks. The DR relationship cannot be established if only the network is connected but security group rules are not configured.
- Before configuring disaster recovery for the DR instance, you must configure it for the primary instance. Otherwise, the DR relationship cannot be established.
- The primary DB instance and DR instance are available and are deployed in different clouds or regions. The DR instance is deployed in standalone mode.
- The vCPUs, memory, and storage space of the DR instance must be greater than or equal to those of the primary instance.

- The underlying architecture and major version of the DR instance must be the same as those of the primary DB instance.
- If the DR instance's minor version differs from the primary DB instance, it will automatically update to be the same as that of the primary DB instance after the DR relationship is established.
- Cross-cloud or cross-region DR relationships cannot be established across major versions.
- After the API for configuring DR for the DR instance is called, you cannot change the instance class or perform a primary/standby switchover until the DR relationship is set up.
- RDS for PostgreSQL 12 and later versions support cross-cloud or cross-region DR.
- After a DR instance is set up, a minor version upgrade cannot be performed.
- Modifying a parameter of the primary instance does not modify that of the DR instance. You need to modify the parameter of the DR instance separately.
- RDS for PostgreSQL DR instances do not support point-in-time recovery (PITR) or CBR snapshot-based backups. Perform such operations on the primary instance if needed.

URI

- URI format
POST /v3/{project_id}/instances/{instance_id}/action
- Parameter description

Table 5-169 Parameters

Parameter	Mandatory	Description
project_id	Yes	Project ID of a tenant in a region. To obtain the value, see Obtaining a Project ID .
instance_id	Yes	Specifies the DB instance ID.

Request

Table 5-170 Parameters

Parameter	Mandatory	Type	Description
build_slave_dr_relation	Yes	Object	Specifies the primary DB instance information required for configuring the DR relationship for the DR instance. For details, see Table 5-171 .

Table 5-171 build_slave_dr_relation field description

Parameter	Mandatory	Type	Description
target_instance_id	Yes	String	Specifies the ID of the primary DB instance.
target_project_id	Yes	String	Specifies the project ID of the tenant to which the primary DB instance belongs.
target_region	Yes	String	Specifies the ID of the region where the primary DB instance resides.
target_ip	Yes	String	Specifies the data VIP of the primary DB instance.

Example Request

Configure a DR relationship for a DR instance, with the primary DB instance deployed in region aaa.

```
POST https://{endpoint}/v3/0483b6b16e954cb88930a360d2c4e663/instances/

5.7.4 Promoting a DR Instance to Be the Primary DB Instance

Function

This API is used to promote a DR instance to be the primary DB instance when a cross-cloud or cross-region DR relationship between DB instances has become abnormal.

- Before calling this API, learn how to [authenticate](#) it.
- Before calling this API, learn about [request header parameters](#).

Constraints

- Before using this function, ensure that the network between the VPC CIDR blocks of the DB instances across clouds or regions is connected, and configure security group rules to allow access from database ports in the VPC CIDR blocks. The DR relationship cannot be established if only the network is connected but security group rules are not configured.
- The primary DB instance and DR instance are available and are deployed in different clouds or regions. The DR instance is deployed in standalone mode.
- The DR relationship between the primary DB instance and DR instance has been established.
- RDS for PostgreSQL 12 and later versions support DR instance promotion to the primary instance.

5.7.5 Querying the DR Replication Status

Function

This API is used to query the replication status and delay between the primary DB instance and DR instance after a cross-cloud or cross-region DR relationship is established.

- Before calling this API, learn how to [authenticate](#) it.
- Before calling this API, learn about [request header parameters](#).

Constraints

- Before using this function, ensure that the network between the VPC CIDR blocks of the DB instances across clouds or regions is connected, and configure security group rules to allow access from database ports in the VPC CIDR blocks. The DR relationship cannot be established if only the network is connected but security group rules are not configured.
- A DR relationship between the primary DB instance and DR instance has been established.
- DR instances of RDS for PostgreSQL 12 and later versions support DR replication status query.

URI

- URI format
GET /v3/{project_id}/instances/{instance_id}/disaster-recovery
- Parameter description

Table 5-176 Parameters

Parameter	Mandatory	Description
project_id	Yes	Project ID of a tenant in a region. To obtain the value, see Obtaining a Project ID .
instance_id	Yes	DR instance ID.

Request

- Parameter description
None
- Example
GET https://{endpoint}/v3/0483b6b16e954cb88930a360d2c4e663/instances/24c6678f474241fe89ee9c42f768022ein03/disaster-recovery
- Request example
None

Response

- Normal response

Table 5-177 Parameters

Parameter	Type	Description
replica_state	String	Indicates the synchronization status. The value can be 0 or -1 . The value 0 indicates that the synchronization status is normal, and the value -1 indicates that the synchronization status is abnormal. NOTE If the primary DB instance does not exist, the synchronization status between the primary DB instance and DR instance is abnormal.
wal_write_receive_delay_in_mb	String	Indicates the sending delay in MB, that is, the difference between the WAL Log Sequence Number (LSN) written by the primary DB instance and the WAL LSN received by the DR instance.
wal_write_replay_delay_in_mb	String	Indicates the end-to-end delay in MB, that is, the difference between the WAL LSN written by the primary DB instance and the WAL LSN replayed by the DR instance.
wal_receive_replay_delay_in_ms	String	Indicates the replay delay in millisecond on the DR instance.

- Example normal response

```
{  
    "replica_state": "0",  
    "wal_write_receive_delay_in_mb": "10.0",  
    "wal_write_replay_delay_in_mb": "10.0",  
    "wal_receive_replay_delay_in_ms": "0"  
}
```

5.7.7 Removing the DR Relationship from a DB Instance

Function

This API is used to remove the DR relationship from a DB instance.

- Before calling this API, learn how to [authenticate](#) it.
- Before calling this API, learn about [request header parameters](#).

Constraints

- Cross-cloud or cross-region DR relationships can be removed only for RDS for PostgreSQL 12 and later versions.
- The DR relationship must be removed from the DR instance first and then the primary instance. Otherwise, your DB instance may not run properly.

URI

- URI format
`DELETE /v3/{project_id}/instances/{instance_id}/delete-disaster-recovery`
- Parameter description

Parameter	Mandatory	Description
project_id	Yes	Project ID of a tenant in a region. To obtain the value, see Obtaining a Project ID .
instance_id	Yes	Instance ID.

Request

Table 5-183 Parameters

Parameter	Mandatory	Type	Description
target_instance_id	Yes	String	ID of the target instance.
target_project_id	Yes	String	ID of the project that the target instance belongs to.
target_region	Yes	String	Region where the target instance is located.
target_ip	Yes	String	Floating IP address of the target instance.
is_master	Yes	Boolean	Whether the operation object is the primary instance. • true : The operation object is the primary instance. • false : The operation object is the DR instance.

Example Request

Remove the DR relationship from a DB instance.

```
DELETE https://[endpoint]/v3/054e292c9880d4992f02c0196d3ea468/instances/
42d4b4fc17d144bbb3ba64a306e68c72in03/delete-disaster-recovery
{

5.8 Database Security

5.8.1 Configuring SSL

Function

This API is used to configure SSL to encrypt connections.

- Before calling this API, learn how to [authenticate](#) it.
- Before calling this API, learn about [request header parameters](#).

Constraints

SSL cannot be configured when a DB instance is being created, rebooted, or upgraded, its specifications are being modified, or database users are being created or deleted.

This API is supported only for RDS for MySQL instances.

URI

- URI format
`PUT /v3/{project_id}/instances/{instance_id}/ssl`
- Parameter description

Table 5-185 Parameters

Parameter	Mandatory	Description
project_id	Yes	<p>Definition Project ID of a tenant in a region. To obtain the value, see Obtaining a Project ID.</p> <p>Constraints N/A</p> <p>Range N/A</p> <p>Default Value N/A</p>
instance_id	Yes	<p>Definition Instance ID.</p> <p>Constraints N/A</p> <p>Range N/A</p> <p>Default Value N/A</p>

Request

Table 5-186 Parameters

Parameter	Mandatory	Type	Description
ssl_option	Yes	boolean	<p>Definition Specifies whether to enable SSL.</p> <p>Constraints N/A</p> <p>Range</p> <ul style="list-style-type: none"> • true: Enable SSL. • false: Disable SSL. <p>Default Value N/A</p>

Example Request

- Enable SSL for a DB instance.

```
PUT https://[endpoint]/v3/0483b6b16e954cb88930a360d2c4e663/instances/  
dsfae23fsfdsae3435in01/ssl  
  
{  
    "ssl_option": true  
}  
  
● Disable SSL for a DB instance.  
{  
    "ssl_option": false  
}
```

Response

- Normal response

Parameter	Description
job_id	Definition Task ID. Range N/A

- Example normal response

```

5.8.2 Changing a Database Port

Function

This API is used to change a database port.

- Before calling this API, learn how to [authenticate](#) it.
- Before calling this API, learn about [request header parameters](#).

Constraints

The database port cannot be changed when a DB instance is being created or rebooted, its specifications are being modified, database users are being created or deleted, or backups are being created for the DB instance.

URI

- URI format
PUT /v3/{*project_id*}/instances/{*instance_id*}/port
- Parameter description

Table 5-187 Parameters

Parameter	Mandatory	Description
project_id	Yes	Project ID of a tenant in a region. To obtain the value, see Obtaining a Project ID .
instance_id	Yes	Specifies the DB instance ID.

Request

Table 5-188 Parameters

Parameter	Mandatory	Type	Description
port	Yes	Integer	<p>Specifies the port number.</p> <ul style="list-style-type: none">• The RDS for MySQL port number ranges from 1024 to 65535, excluding 12017, 33062, and 33071.• The RDS for PostgreSQL port number ranges from 2100 to 9500.• For RDS for SQL Server 2022 Enterprise Edition, 2022 Standard Edition, 2022 Web Edition, 2019 Enterprise Edition, 2019 Standard Edition, 2019 Web Edition, 2017 Enterprise Edition, 2017 Standard Edition, and 2017 Web Edition, the port number can be set to 1433 or 2100 to 9500 (excluding 5050, 5353, 5355, 5985, and 5986). For other editions, the port number can be set to 1433 or 2100 to 9500 (excluding 5355, 5985, and 5986).

Example Request

Change the database port of a DB instance to 8836.

```
PUT https://[endpoint]/v3/0483b6b16e954cb88930a360d2c4e663/instances/dsfae23fsfdsae3435in01/port
{
    "port": 8836
}
```

Response

- Normal response

Parameter	Description
workflowId	Workflow ID.

- Example normal response

```
{  
    "workflowId": "83abc7bc-2c70-4534-8565-351187b37715"  
}
```

5.8.3 Changing a Security Group

Function

This API is used to change the security group of a DB instance.

- Before calling this API, learn how to [authenticate](#) it.
- Before calling this API, learn about [request header parameters](#).

Constraints

The security group cannot be changed if the DB instance is in any of the following statuses: creating, upgrading, changing instance class, creating users, or deleting users.

URI

- URI format
`PUT /v3/{project_id}/instances/{instance_id}/security-group`
- Parameter description

Table 5-189 Parameters

Parameter	Mandatory	Description
project_id	Yes	Project ID of a tenant in a region. To obtain the value, see Obtaining a Project ID .
instance_id	Yes	Specifies the DB instance ID.

Request

Table 5-190 Parameters

Parameter	Mandatory	Type	Description
security_group_id	Yes	String	Security group ID. You can add multiple security group IDs for each instance and separate them with commas (,).

Example Request

Change the security group of a DB instance.

```
PUT https://[endpoint]/v3/0483b6b16e954cb88930a360d2c4e663/instances/dsfae23fsfdsae3435in01/security-group
{
    "security_group_id": "23423kljlk432lk0sdf0234eaa"
}
```

Response

- Normal response

Parameter	Description
workflowId	Workflow ID.

- Example normal response

```
{
    "workflowId": "83abc7bc-2c70-4534-8565-351187b37715"
}
```

5.8.4 Changing a Floating IP Address

Function

This API is used to change the floating IP address of a DB instance.

- Before calling this API, learn how to [authenticate](#) it.
- Before calling this API, learn about [request header parameters](#).

Constraints

The floating IP address cannot be changed if the DB instance is in any of the following statuses: creating, rebooting, upgrading, changing instance class, creating users, or deleting users.

URI

- URI format
PUT /v3/{project_id}/instances/{instance_id}/ip
- Parameter description

Table 5-191 Parameters

Parameter	Mandatory	Description
project_id	Yes	Project ID of a tenant in a region. To obtain the value, see Obtaining a Project ID .
instance_id	Yes	Specifies the DB instance ID.

Request

Table 5-192 Parameters

Parameter	Mandatory	Type	Description
new_ip	Yes	String	Indicates the floating IP address.

Example Request

Change the floating IP address of a DB instance.

```
PUT https://{endpoint}/v3/0483b6b16e954cb88930a360d2c4e663/instances/dsfae23fsfdsae3435in01/ip
{
    "new_ip": "192.168.0.1"
}
```

Response

5.9 Backup and Restoration

5.9.1 Setting an Automated Backup Policy

Function

This API is used to set an automated backup policy.

- Before calling this API, learn how to [authenticate](#) it.
- Before calling this API, learn about [request header parameters](#).

URI

- URI format
`PUT /v3/{project_id}/instances/{instance_id}/backups/policy`
- Parameter description

Table 5-193 Parameters

Parameter	Mandatory	Description
project_id	Yes	Project ID of a tenant in a region. To obtain the value, see Obtaining a Project ID .
instance_id	Yes	Specifies the DB instance ID.

Request

Table 5-194 Parameters

Parameter	Mandatory	Type	Description
backup_policy	Yes	Object	Specifies the backup policy objects, including the backup retention period (days) and backup start time. For details, see Table 5-195 .
reserve_backups	No	Boolean	The default value is true , indicating that automated and unsynchronized backups are retained.

Table 5-195 backup_policy field data structure description

Parameter	Mandatory	Type	Description
keep_days	Yes	Integer	<p>Specifies the number of days to retain the generated backup files.</p> <p>Value range: 1–732. To extend the retention period, contact customer service. Automated backups can be retained for up to 2,562 days.</p>

Parameter	Mandatory	Type	Description
start_time	No	String	<p>Specifies the backup time window. Automated backups will be triggered during the backup time window. This parameter is mandatory except that the automated backup policy is disabled.</p> <p>The value must be a valid value in the "hh:mm-HH:MM" format. The current time is in the UTC format.</p> <ul style="list-style-type: none"> • The HH value must be 1 greater than the hh value. • The values of mm and MM must be the same and must be set to any of the following: 00, 15, 30, or 45. <p>Example value:</p> <ul style="list-style-type: none"> • 08:15-09:15 • 23:00-00:00

Parameter	Mandatory	Type	Description
period	No	String	<p>Specifies the backup cycle configuration. Data will be automatically backed up on the selected days every week. This parameter is mandatory except that the automated backup policy is disabled.</p> <p>Value range: The value is a number separated by commas (,), indicating the days of the week. For example, the value 1,2,3,4 indicates that the backup period is Monday, Tuesday, Wednesday, and Thursday.</p>

Example Request

Configure an automated backup policy for a DB instance, with backup cycle set to Monday and Tuesday, backup window to 19:00–20:00, and retention period to 7 days.

```
PUT https://{endpoint}/v3/0483b6b16e954cb88930a360d2c4e663/instances/dsfae23fsfdsae3435in01/backups/policy

{
    "backup_policy": {
        "keep_days": 7,
        "start_time": "19:00-20:00",
        "period": "1,2"
    }
}
```

Response

- Normal response

- Abnormal
For details, see [Status Codes](#).

Error Code

For details, see [Error Codes](#).

5.9.2 Setting a Cross-Region Backup Policy

Function

This API is used to set a cross-region backup policy in the source backup region.

- Before calling this API, learn how to [authenticate](#) it.
- Before calling this API, learn about [request header parameters](#).

Constraints

- If the cross-region backup policy has been enabled, call the API to set the cross-region backup policy. Only the retention period can be changed.
- For RDS for PostgreSQL DB instances, the retention period of automated full backups must be the same as that for automated incremental backups.
- For RDS for PostgreSQL DB instances, automated incremental backup cannot be enabled unless automated full backup is enabled first.
- For RDS for PostgreSQL DB instances, if you want to disable automated full backup and automated incremental backup, disable automated incremental backup first.
- Cross-region backup is not supported for RDS for PostgreSQL instances with volume snapshot backup enabled.

URI

- URI format
`PUT /v3/{project_id}/instances/{instance_id}/backups/offsite-policy`
- Parameter description

Table 5-196 Parameters

Parameter	Mandatory	Description
project_id	Yes	Project ID of a tenant in a region. To obtain the value, see Obtaining a Project ID .
instance_id	Yes	Specifies the DB instance ID.

Request

Table 5-197 Parameters

Parameter	Mandatory	Type	Description
policy_para	Yes	Object	<p>Specifies the backup policy object, including the backup type, backup retention days, target region ID, and target project ID.</p> <p>For details, see Table 5-198.</p>

Table 5-198 policy_para field data structure description

Parameter	Mandatory	Type	Description
backup_type	Yes	String	<p>Specifies the backup type.</p> <p>For RDS for SQL Server, this parameter can only be set to all. Its value can be any of the following:</p> <ul style="list-style-type: none">• auto: automated full backup• incremental: automated incremental backup• all: all backup types<ul style="list-style-type: none">– RDS for MySQL: Enable automated full backup and automated incremental backup.– RDS for PostgreSQL: Enable automated full backup and automated incremental backup.– RDS for SQL Server: Enable automated full backup, automated incremental backup, and manual backup.

Parameter	Mandatory	Type	Description
keep_days	Yes	Integer	<p>Specifies the number of days to retain the generated backup files.</p> <p>Value range: 0-1825</p> <p>The value 0 indicates that the cross-region backup policy is disabled.</p> <p>NOTICE Once the automated backup policy is disabled, automated backups are no longer created and all incremental backups, if any, are deleted immediately. Operations related to the incremental backups, including downloads, replications, restorations, and rebuilds, may fail.</p>
destination_region	Yes	String	Specifies the target region ID for the cross-region backup policy.
destination_project_id	Yes	String	Specifies the target project ID for the cross-region backup policy.

Example Request

- Configure a cross-region automated full backup policy for an DB instance.

```
PUT https://[endpoint]/v3/0483b6b16e954cb88930a360d2c4e663/instances/dsfae23fsfdae3435in01/backups/offsite-policy
```

```
{
  "policy_para": {
    "backup_type": "auto",
    "keep_days": 7,
    "destination_region": "aaa",
    "destination_project_id": "ba1f7fc8-3307-42a7-aa6f-42c8b9b8f85c"
  }
}
```

- Disable the cross-region automated full backup policy for an DB instance.

```
{
  "policy_para": {
    "backup_type": "auto",
    "keep_days": 0,
    "destination_region": "aaa",
    "destination_project_id": "ba1f7fc8-3307-42a7-aa6f-42c8b9b8f85c"
  }
}
```

- Configure a cross-region backup policy for an RDS for SQL Server DB instance.

```
{
  "policy_para": {
    "backup_type": "all",
    "keep_days": 7,
    "destination_region": "aaa",
    "destination_project_id": "ba1f7fc8-3307-42a7-aa6f-42c8b9b8f85c"
  }
}
```

- Disable the cross-region backup policy for an RDS for SQL Server DB instance.

```
{  
    "policy_para": {  
        "backup_type": "all",  
        "keep_days": 0,  
        "destination_region": "aaa",  
        "destination_project_id": "ba1f7fc8-3307-42a7-aa6f-42c8b9b8f85c"  
    }  
}
```

5.9.3 Obtaining an Automated Backup Policy

Function

This API is used to obtain an automated backup policy.

- Before calling this API, learn how to [authenticate](#) it.
- Before calling this API, learn about [request header parameters](#).

URI

- URI format
GET /v3/{project_id}/instances/{instance_id}/backups/policy
- Parameter description

Table 5-199 Parameters

Parameter	Mandatory	Description
project_id	Yes	Project ID of a tenant in a region. To obtain the value, see Obtaining a Project ID .

Parameter	Mandatory	Description
instance_id	Yes	Specifies the DB instance ID.

Request

- Request parameters
None
- URI example
GET `https://{{endpoint}}/v3/0483b6b16e954cb88930a360d2c4e663/instances/dsfae23fsfdsae3435in01/backups/policy`

Response

- Normal response

Table 5-200 Parameters

Parameter	Type	Description
backup_policy	Object	Indicates the backup policy objects, including the backup retention period (days) and backup start time. For details, see Table 5-201 .

Table 5-201 backup_policy field data structure description

Parameter	Type	Description
keep_days	Integer	Indicates the number of days to retain the backup files.
start_time	String	Indicates the backup time window. Automated backups will be triggered during the backup time window. The current time is the UTC time.

Parameter	Type	Description
period	String	Indicates the backup cycle configuration. Data will be automatically backed up on the selected days every week.

- Example normal response

When the automated backup policy is disabled:

```
{  
    "backup_policy": {  
        "keep_days": 0  
    }  
}
```

When the automated backup policy is enabled:

```
{  
    "backup_policy": {  
        "keep_days": 7,  
        "start_time": "19:00-20:00",

5.9.4 Querying Information About a Cross-Region Backup Policy

Function

This API is used to query information about a cross-region backup policy in the source backup region.

- Before calling this API, learn how to [authenticate](#) it.
- Before calling this API, learn about [request header parameters](#).

URI

- URI format
GET /v3/{project_id}/instances/{instance_id}/backups/offsite-policy
- Parameter description

Table 5-202 Parameters

Parameter	Mandatory	Description
project_id	Yes	Project ID of a tenant in a region. To obtain the value, see Obtaining a Project ID .
instance_id	Yes	Specifies the DB instance ID.

Request

- Request parameters
None
- URI example
GET https://[endpoint]/v3/0483b6b16e954cb88930a360d2c4e663/instances/dsfae23fsfdsae3435in01/backups/offsite-policy

Response

- Normal response

Table 5-203 Parameters

Parameter	Type	Description
policy_para	Array of objects	Indicates the backup policy object, including the backup type, backup retention days, target region ID, and target project ID. For details, see Table 5-204 .

Table 5-204 policy_para field data structure description

Parameter	Type	Description
backup_type	String	Indicates the backup type. Its value can be any of the following: <ul style="list-style-type: none">• auto: automated full backup• incremental: automated incremental backup• manual: manual backup (returned only for RDS for SQL Server DB instances)
keep_days	Integer	Indicates the number of days to retain the backup files.
destination_region	String	Indicates the target region ID for the cross-region backup policy.
destination_project_id	String	Indicates the target project ID for the cross-region backup policy.

- Example normal response

When the backup policy is disabled:

```
{
  "policy_para": {
    "keep_days": 0
  }
}
```

When both the automated backup policy and incremental backup policy are enabled for RDS for MySQL and RDS for PostgreSQL DB instances:

```
{
  "policy_para": [
    {
      "keep_days": 7,
      "backup_type": "auto",
      "destination_region": "aaa",
      "destination_project_id": "0503fd7f7580d3262fc5c001170fbab9"
    },
    {
      "keep_days": 7,
      "backup_type": "incremental",
      "destination_region": "aaa",
      "destination_project_id": "0503fd7f7580d3262fc5c001170fbab9"
    }
  ]
}
```

When the automated backup policy, incremental backup policy, and manual backup policy are enabled for RDS for SQL Server DB instances:

```
{
  "policy_para": [
    {
      "keep_days": 7,
      "backup_type": "incremental",
      "destination_region": "aaa",
      "destination_project_id": "0503fd7f7580d3262fc5c001170fbab9"
    },
    {
      "keep_days": 7,
```

```
"backup_type": "manual",
"destination_region": "aaa",
"destination_project_id": "0503fd7f7580d3262fc5c001170fbab9"
},
{
"keep_days": 7,
"backup_type": "auto",
"destination_region": "aaa",
"destination_project_id": "0503fd7f7580d3262fc5c001170fbab9"
}
]
```

5.9.5 Creating a Manual Backup

Function

This API is used to create a manual backup.

- Before calling this API, learn how to [authenticate](#) it.
- Before calling this API, learn about [request header parameters](#).

Constraints

- RDS for SQL Server supports batch creation of manual backups for individual databases.
- Read replicas do not support manual backup creation.
- The backup name must be unique.

URI

- URI format
POST /v3/{project_id}/backups
- Parameter description

Table 5-205 Parameters

Parameter	Mandatory	Description
project_id	Yes	Project ID of a tenant in a region. To obtain the value, see Obtaining a Project ID .

Request

Table 5-206 Parameters

Parameter	Mandatory	Type	Description
instance_id	Yes	String	Instance ID.
name	Yes	String	Backup name. It must be 4 to 64 characters long, start with a letter, and contain only letters (case-sensitive), digits, hyphens (-), and underscores (_). The backup name must be unique.
description	No	String	Backup description. It contains a maximum of 256 characters and cannot contain the following special characters: >!<"&'=
databases	No	Array of objects	List of user-created databases for partial backup. This parameter is only available for RDS for PostgreSQL and RDS for SQL Server. For details, see Table 5-207 .

Parameter	Mandatory	Type	Description
backup_database_individually	No	Boolean	Whether to back up databases individually. This parameter is available only for RDS for PostgreSQL and RDS for SQL Server. The default value is false .

Table 5-207 databases field data structure description

Parameter	Mandatory	Type	Description
name	Yes	String	Names of self-managed databases.

Example Request

- Create a manual backup **mybackup** for an RDS for MySQL DB instance.

```
POST https://[endpoint]/v3/0483b6b16e954cb88930a360d2c4e663/backups
{
  "instance_id": "d8e6ca5a624745bcb546a227aa3ae1cf01",
  "name": "mybackup",
  "description": "manual backup"
}
```
- Create a manual backup **mybackup** for an RDS for PostgreSQL DB instance.

```
{
  "instance_id": "a8a5fc65b1a04ceb9d72212891ad73f8in03",
  "name": "mybackup",
  "description": "manual backup"
}
```
- Create a manual backup **mybackup** for an RDS for SQL Server DB instance.

```
{
  "instance_id": "34029da944074135a3bc24c75b3bb3edin04",
  "name": "mybackup",
  "description": "manual backup",
  "databases": [
    {
      "name": "db1"
    },
    {
      "name": "db2"
    }
  ]
}
```

Response

5.9.6 Obtaining Backups

Function

This API is used to obtain backups of a DB instance.

- Before calling this API, learn how to [authenticate](#) it.
- Before calling this API, learn about [request header parameters](#).

Constraints

This API is used to query full and incremental backups of DB instances.

URI

- URI format
`GET /v3/{project_id}/backups?`
`instance_id={instance_id}&backup_id={backup_id}&backup_type={backup_type}&offset={offset}&limit={limit}&begin_time={begin_time}&end_time={end_time}`
- Parameter description

Table 5-210 Parameters

Parameter	Mandatory	Description
project_id	Yes	<p>Definition Project ID of a tenant in a region. To obtain the value, see Obtaining a Project ID.</p> <p>Constraints N/A</p> <p>Range N/A</p> <p>Default Value N/A</p>
instance_id	Yes	<p>Definition Instance ID.</p> <p>Constraints N/A</p> <p>Range N/A</p> <p>Default Value N/A</p>
backup_id	No	<p>Definition Backup ID.</p> <p>Constraints N/A</p> <p>Range N/A</p> <p>Default Value N/A</p>

Parameter	Mandatory	Description
backup_type	No	<p>Definition Backup type.</p> <p>Constraints N/A</p> <p>Range</p> <ul style="list-style-type: none"> • auto: automated full backup • manual: manual full backup • fragment: differential full backup • incremental: automated incremental backup (binlog backup for RDS for MySQL) <p>Default Value N/A</p>
status	No	<p>Definition Backup status. Only the statuses of RDS for SQL Server full backups can be filtered.</p> <p>Constraints N/A</p> <p>Range</p> <ul style="list-style-type: none"> • BUILDING: backup in progress • COMPLETED: backup completed • FAILED: backup failed <p>Default Value N/A</p>

Parameter	Mandatory	Description
offset	No	<p>Definition Index offset.</p> <p>Constraints If offset is set to N, the resource query starts from the $N+1$ piece of data. The value is 0 by default, indicating that the query starts from the first piece of data. The value must be a number but cannot be a negative number.</p> <p>Range An integer greater than or equal to 0</p> <p>Default Value 0</p>
limit	No	<p>Definition Number of records to be queried.</p> <p>Constraints The value cannot be a negative number.</p> <p>Range 1–100</p> <p>Default Value 100</p>
begin_time	No	<p>Definition Query start time.</p> <p>Constraints When begin_time is not empty, end_time is mandatory.</p> <p>Range The value is in the "yyyy-mm-ddThh:mm:ssZ" format. T is the separator between the calendar and the hourly notation of time. Z indicates the time zone offset. For example, in the Beijing time zone, the time zone offset is shown as +0800.</p> <p>Default Value N/A</p>

Parameter	Mandatory	Description
end_time	No	Definition Query end time. Constraints When end_time is not empty, begin_time is mandatory. Range The value is in the "yyyy-mm-ddThh:mm:ssZ" format and must be later than the query start time. T is the separator between the calendar and the hourly notation of time. Z indicates the time zone offset. For example, in the Beijing time zone, the time zone offset is shown as +0800 . Default Value N/A

5.9.7 Querying Cross-Region Backups

Function

This API is used to obtain cross-region backups of an instance in the target backup region.

- Before calling this API, learn how to [authenticate](#) it.
- Before calling this API, learn about [request header parameters](#).

Constraints

Cross-region manual backups can be queried only for RDS for SQL Server.

URI

- URI format
`GET /v3/{project_id}/offsite-backups?
instance_id={instance_id}&backup_id={backup_id}&backup_type={backup_type}&offset={offset}&limit={limit}&begin_time={begin_time}&end_time={end_time}`
- Parameter description

Table 5-215 Parameters

Parameter	Mandatory	Description
project_id	Yes	Project ID of a tenant in a region. To obtain the value, see Obtaining a Project ID .
instance_id	Yes	Specifies the DB instance ID.
backup_type	Yes	Specifies the backup type. Its value can be any of the following: <ul style="list-style-type: none">• auto: indicates automated full backups and manual backups. Cross-region manual backups are supported only for RDS for SQL Server.• incremental: indicates automated incremental backups.
backup_id	No	Specifies the backup ID.
offset	No	Specifies the index position. If offset is set to <i>N</i> , the resource query starts from the <i>N</i> +1 piece of data. The value is 0 by default, indicating that the query starts from the first piece of data. The value cannot be a negative number.
limit	No	Specifies the number of records to be queried. The default value is 100 . The value cannot be a negative number. The minimum value is 1 and the maximum value is 100 .
begin_time	No	Specifies the start time for obtaining the cross-region backup list. The format of the start time is "yyyy-mm-ddThh:mm:ssZ". T is the separator between the calendar and the hourly notation of time. Z indicates the time zone offset. For example, in the Beijing time zone, the time zone offset is shown as +0800 . NOTE When begin_time is not empty, end_time is mandatory.

Parameter	Mandatory	Description
end_time	No	<p>Specifies the end time for obtaining the cross-region backup list. The format of the end time is "yyyy-mm-ddThh:mm:ssZ" and the end time must be later than the start time.</p> <p>T is the separator between the calendar and the hourly notation of time. Z indicates the time zone offset. For example, in the Beijing time zone, the time zone offset is shown as +0800.</p> <p>NOTE When end_time is not empty, begin_time is mandatory.</p>

5.9.8 Querying DB Instances for Which Cross-Region Backups Are Created

Function

This API is used to query DB instances for which cross-region backups are created in the target backup region.

- Before calling this API, learn how to [authenticate](#) it.
- Before calling this API, learn about [request header parameters](#).

URI

- URI format
GET /v3/backups/offsite-backup-instance?offset={offset}&limit={limit}
- Parameter description

Table 5-220 Parameters

Parameter	Type	Mandatory	Description
offset	Integer	No	Specifies the index position. If offset is set to N , the resource query starts from the N+1 piece of data. The value is 0 by default, indicating that the query starts from the first piece of data. The value cannot be a negative number.
limit	Integer	No	Specifies the number of records to be queried. The default value is 100 . The value cannot be a negative number. The minimum value is 1 and the maximum value is 100 .

Request

- Request parameters
None
- URI example
 - Querying all DB instance lists
GET `https://{{endpoint}}/v3/backups/offsite-backup-instance`
 - Querying DB instance lists based on search criteria
GET `https://{{endpoint}}/v3/backups/offsite-backup-instance?offset=0&limit=10`

Response

- Normal response

Table 5-221 Parameters

Parameter	Type	Description
offsite_backup_instances	Array of objects	Indicates information about DB instances for which cross-region backups are created. For details, see Table 5-222 .
total_count	Integer	Indicates the total number of records.

Table 5-222 offsite_backup_instances field data structure description

Parameter	Type	Description
id	String	Indicates the DB instance ID.
name	String	Indicates the name of the DB instance for which cross-region backups are created.
source_region	String	Indicates the source backup region.
source_project_id	String	Indicates the project ID in the source backup region.
datastore	Object	Indicates the database information. For details, see Table 5-223 .
destination_region	String	Indicates the region where the cross-region backup is located.
destination_project_id	String	Indicates the project ID in the target backup region.
keep_days	Integer	Indicates the number of days to retain cross-region backups.

Table 5-223 datastore field data structure description

Parameter	Type	Description
type	String	Indicates the DB engine.
version	String	Indicates the database version.

- Example normal response

Querying DB instance lists based on search criteria:

```
{
    "total_count": 1,
    "offsite_backup_instances": [
        {
            "id": "ed7cc6166ec24360a5ed5c5c9c2ed726in01",
            "name": "rds-instance-rep2",
            "source_region": "aaa",
            "source_project_id": "ba1f7fc8-3307-42a7-aa6f-42c8b9b8f85c",
            "datastore": {
                "type": "MySQLPostgreSQL",
                "version": "5.711"
            },
            "destination_region": "bbb",
            "destination_project_id": "0503fd7f7580d3262fc5c001170fbab9",
            "keep_days": 7
        }
    ]
}
```

- **Querying all DB instance lists:**

```
{
    "total_count": 1,
    "offsite_backup_instances": [
        {
            "id": "ed7cc6166ec24360a5ed5c5c9c2ed726in01",
            "name": "rds-instance-rep2",
            "source_region": "aaa",
            "source_project_id": "ba1f7fc8-3307-42a7-aa6f-42c8b9b8f85c",
            "datastore": {
                "type": "MySQLPostgreSQL",
                "version": "5.711"
            },
            "destination_region": "bbb",
            "destination_project_id": "0503fd7f7580d3262fc5c001170fbab9",
            "keep_days": 7
        }
    ]
}

5.9.9 Obtaining the Link for Downloading a Backup

Function

This API is used to obtain the link for downloading a backup.

- Before calling this API, learn how to [authenticate](#) it.
- Before calling this API, learn about [request header parameters](#).

Constraints

This API is used to obtain the link for downloading a full backup or binlog backup of an RDS for MySQL instance, or the link for downloading a full backup or an incremental backup of an RDS for PostgreSQL or RDS for SQL Server instance.

URI

- URI format
GET /v3/{project_id}/backup-files?backup_id={backup_id}
- Parameter description

Table 5-224 Parameters

Parameter	Mandatory	Description
project_id	Yes	Definition Project ID of a tenant in a region. To obtain the value, see Obtaining a Project ID . Constraints N/A Range N/A Default Value N/A

Parameter	Mandatory	Description
backup_id	Yes	<p>Definition Specifies the backup ID. For details about how to obtain the backup ID, see Obtaining Backups.</p> <p>Constraints N/A</p> <p>Range N/A</p> <p>Default Value N/A</p>

Request

- Request parameters
None
- URI example
GET `https://{{endpoint}}/v3/97b026aa9cc4417888c14c84a1ad9860/backup-files?backup_id=c0c9f155c7b7423a9d30f0175998b63bbr01`

Response

- Normal response

Table 5-225 Parameters

Parameter	Type	Description
files	Array of objects	<p>Definition Indicates the list of backup files. For details, see Table 5-226.</p>
bucket	String	<p>Definition Indicates the name of the bucket where the file is located.</p> <p>Range N/A</p>

Table 5-226 files field data structure description

Parameter	Type	Description
name	String	Definition Indicates the file name. Range N/A
size	Long	Definition Indicates the file size in KB. Range N/A
download_link	String	Definition Indicates the link for downloading the backup file. Range N/A
link_expired_time	String	Definition Indicates the link expiration time. The format is "yyyy-mm-ddThh:mm:ssZ". T is the separator between the calendar and the hourly notation of time. Z indicates the time zone offset. For example, in the Beijing time zone, the time zone offset is shown as +0800 . Range N/A
database_name	String	Definition Indicates the name of the database. <ul style="list-style-type: none">• For RDS for SQL Server, the database name is returned if the backup file to be downloaded is a database-level backup. Otherwise, no value is returned.• For other engines, if the backup file is not a database-level backup, no value is returned. Range N/A

5.9.11 Querying the Restoration Time Range

Function

This API is used to query the restoration time range of a DB instance.

If the backup retention period has been set to a long period, you are advised to set the query date by referring to [Table 5-228](#).

- Before calling this API, learn how to [authenticate](#) it.
- Before calling this API, learn about [request header parameters](#).

URI

- URI format
`GET /v3/{project_id}/instances/{instance_id}/restore-time?date=2020-12-26`
- Parameter description

Table 5-228 Parameters

Parameter	Mandatory	Description
project_id	Yes	Project ID of a tenant in a region. To obtain the value, see Obtaining a Project ID .
instance_id	Yes	Specifies the DB instance ID.
date	No	Specifies the date to be queried. The value is in the yyyy-mm-dd format, and the time zone is UTC.

Request

- Request parameters
None
- URI example
 - Querying all restoration time ranges
GET `https://{{endpoint}}/v3/0483b6b16e954cb88930a360d2c4e663/instances/dsfae23fsfdsae3435in01/restore-time`
 - Querying the restoration time range based on a specified date
GET `https://{{endpoint}}/v3/0483b6b16e954cb88930a360d2c4e663/instances/dsfae23fsfdsae3435in01/restore-time?date=2020-12-26`

Response

- Normal response

Table 5-229 Parameters

Parameter	Type	Description
restore_time	Array of objects	Indicates the list of restoration time ranges. For details, see Table 5-230 .

Table 5-230 restore_time field data structure description

Parameter	Type	Description
start_time	Integer	Indicates the start time of the restoration time range in the UNIX timestamp format. The unit is millisecond and the time zone is UTC.
end_time	Integer	Indicates the end time of the restoration time range in the UNIX timestamp format. The unit is millisecond and the time zone is UTC.

- Example normal response

```
{  
    "restore_time": [  
        {  
            "start_time": 1532001446987,

5.9.13 Restoring Data to a New DB Instance

Function

This API is used to restore data to a new DB instance.

- Before calling this API, learn how to [authenticate](#) it.
- Before calling this API, learn about [request header parameters](#).

Constraints

- The DB engine of the original DB instance must be the same as that of the target DB instance. For example, if the original DB instance is running MySQL, the target DB instance must also run MySQL.

- The constraints on the original and target DB instances are as follows:
 - For RDS for MySQL and RDS for PostgreSQL, the DB engine versions of the original and target DB instances must be the same.
 - For RDS for SQL Server, the time zones of the original and target DB instances must be the same. Otherwise, data inconsistency may occur.
- For RDS for MySQL and RDS for PostgreSQL, the total disk size of the target DB instance must be at least equal to that of the original DB instance.

URI

- URI format
POST /v3/{project_id}/instances
- Parameter description

Table 5-234 Parameters

Parameter	Mandatory	Description
project_id	Yes	Project ID of a tenant in a region. For details about how to obtain the project ID, see Obtaining a Project ID .

Request

Table 5-235 Parameters

Parameter	Mandatory	Type	Description
name	Yes	String	<p>Specifies the DB instance name.</p> <p>DB instances of the same type can have same names under the same tenant.</p> <p>Valid value:</p> <ul style="list-style-type: none">• RDS for MySQL: The DB instance name must be 4 to 64 bytes long, start with a letter, and contain only letters (case-sensitive), digits, hyphens (-), periods (.), and underscores (_).• RDS for PostgreSQL and RDS for SQL Server: The DB instance name must be 4 to 64 bytes long, start with a letter, and contain only letters (case-sensitive), digits, hyphens (-), and underscores (_).

Parameter	Mandatory	Type	Description
password	No	String	<p>Specifies the database password. If this parameter is not specified, you can reset the password after the instance is created.</p> <p>Valid value:</p> <p>A database password must be 8 to 32 characters long and contain at least three types of the following characters: uppercase letters, lowercase letters, digits, and special characters.</p> <ul style="list-style-type: none"> • RDS for MySQL allows special characters ~! @#\$%^*-_=+?, ()& • RDS for SQL Server allows special characters ~! @#\$%^*-_=+?, • RDS for PostgreSQL allows special characters ~! @#%^*-_=+?, <p>You are advised to enter a strong password to improve security, preventing security risks such as brute force cracking.</p>

Parameter	Mandatory	Type	Description
flavor_ref	Yes	String	<p>Specifies the specification code. The value cannot be empty.</p> <p>For details, see spec_code in section Querying Database Specifications.</p>
volume	Yes	Object	<p>Specifies the volume information.</p> <p>For details, see Table 5-240.</p>
availability_zone	Yes	String	<p>Specifies the AZ ID. If the DB instance is not a single instance, you need to specify an AZ for each node of the instance and separate the AZs with commas (,). For details, see the example.</p> <p>The AZ ID can be obtained from the response returned after the API in Querying Database Specifications is called.</p>
restore_point	Yes	Object	<p>Specifies the restoration information.</p> <p>For details, see Table 5-241.</p>

Parameter	Mandatory	Type	Description
datastore	No	Object	<p>Specifies database information. This parameter is used for RDS for SQL Server DB instances only and is mandatory for cross-version restoration to new DB instances.</p> <p>For details, see Table 5-237.</p> <p>For details about versions for RDS for SQL Server restoration, see Table 5-238.</p>
ha	No	Object	<p>Specifies the HA configuration parameters, which are used when creating primary/standby DB instances.</p> <p>For details, see Table 5-236.</p>
configuration_id	No	String	Specifies the parameter template ID.

Parameter	Mandatory	Type	Description
port	No	String	<p>Specifies the database port information.</p> <ul style="list-style-type: none">• RDS for MySQL instances can use database ports 1024 to 65535, excluding 12017 and 33071, which are reserved for RDS system use.• RDS for PostgreSQL instances can use database ports 2100 to 9500.• For RDS for SQL Server 2022 Enterprise Edition, 2022 Standard Edition, 2022 Web Edition, 2019 Enterprise Edition, 2019 Standard Edition, 2019 Web Edition, 2017 Enterprise Edition, 2017 Standard Edition, and 2017 Web Edition, the port number can be set to 1433 or 2100 to 9500 (excluding 5050, 5353, 5355, 5985, and 5986).

Parameter	Mandatory	Type	Description
			<p>For other editions, the port number can be set to 1433 or 2100 to 9500 (excluding 5355, 5985, and 5986).</p> <p>If this parameter is not set, the default value is as follows:</p> <ul style="list-style-type: none"> • RDS for MySQL: 3306 • RDS for PostgreSQL: 5432 • RDS for SQL Server: 1433
backup_strategy	No	Object	<p>Specifies the advanced backup policy.</p> <p>For details, see Table 5-239.</p>
enterprise_project_id	No	String	Specifies the project ID.
disk_encryption_id	No	String	Specifies the key ID for disk encryption. The default value is empty.
region	No	String	<p>Specifies the region ID. For details, see Regions and Endpoints.</p> <p>This parameter is mandatory for RDS for SQL Server and RDS for PostgreSQL.</p>

Parameter	Mandatory	Type	Description
vpc_id	No	String	<p>Specifies the VPC ID. To obtain this parameter value, use either of the following methods:</p> <ul style="list-style-type: none">• Method 1: Log in to the VPC console and view the VPC ID on the VPC details page.• Method 2: See the "Querying VPCs" section in the <i>Virtual Private Cloud API Reference</i>. <p>This parameter is mandatory for RDS for SQL Server and RDS for PostgreSQL.</p>

Parameter	Mandatory	Type	Description
subnet_id	No	String	<p>Specifies the subnet ID. To obtain this parameter value, use either of the following methods:</p> <ul style="list-style-type: none">• Method 1: Log in to the VPC console and click the target subnet on the Subnets page. You can view the network ID on the displayed page.• Method 2: See the "Querying Subnets" section in the <i>Virtual Private Cloud API Reference</i>. <p>This parameter is mandatory for RDS for SQL Server and RDS for PostgreSQL.</p>

Parameter	Mandatory	Type	Description
data_vip	No	String	<p>Specifies the floating IP address of a DB instance. To obtain this parameter value, use either of the following methods:</p> <ul style="list-style-type: none">• Method 1: Log in to the VPC console and click the target subnet on the Subnets page. You can view the subnet CIDR block on the displayed page.• Method 2: See the "Querying Subnets" section in the <i>Virtual Private Cloud API Reference</i>.

Parameter	Mandatory	Type	Description
security_group_id	No	String	<p>Specifies the security group which the RDS DB instance belongs to. To obtain this parameter value, use either of the following methods:</p> <ul style="list-style-type: none"> Method 1: Log in to VPC console. Choose Access Control > Security Groups in the navigation pane. On the displayed page, click the target security group. You can view the security group ID on the displayed page. Method 2: See the "Querying Security Groups" section in the <i>Virtual Private Cloud API Reference</i>. <p>This parameter is mandatory for RDS for SQL Server.</p> <p>To use multiple security groups for an RDS for MySQL instance, submit a service ticket to apply for required permissions. You can add up to 10 security group IDs for each instance</p>

Parameter	Mandatory	Type	Description
			and separate them with commas (,).
charge_info	No	Object	Specifies the billing information, which is yearly/monthly or pay-per-use (default setting). Only RDS for SQL Server supports restoration of yearly/monthly DB instances to new instances. For details, see Table 5-242 .

Parameter	Mandatory	Type	Description
time_zone	No	String	<p>Specifies the UTC time zone.</p> <ul style="list-style-type: none">• If this parameter is not specified, the time zone of each engine is as follows:<ul style="list-style-type: none">- MySQL uses UTC by default.- PostgreSQL uses UTC by default.- Microsoft SQL Server uses UTC by default.• If this parameter is specified for MySQL or PostgreSQL, the value range is from UTC-12:00 to UTC+12:00 on the hour. For example, the parameter can be UTC+08:00 rather than UTC+08:30.

Parameter	Mandatory	Type	Description
dsspool_id	No	String	<p>Specifies the DSS pool ID of DeC users. The DSS pool configured for each AZ is different. When DeC users create DB instances other than single instances or read replicas, DSS pool IDs must be specified for all nodes of the DB instances and must be separated by commas (,). To obtain the DSS pool ID, you can use either of the following methods:</p> <ul style="list-style-type: none">• Method 1: Log in to the DSS console, view the DSS pool list, and select the desired DSS ID in the AZ.• Method 2: Query the DSS pool ID using the DSS API. For details, see Obtaining Details of DSS Storage Pools.

Parameter	Mandatory	Type	Description
collation	No	String	<p>This parameter applies only to RDS for SQL Server DB instances.</p> <p>Value range: character sets queried in Querying the Available SQL Server Character Set.</p>
tags	No	Array of objects	<p>Specifies the tag list. Each DB instance can be associated with tag key-value pairs while being created.</p> <ul style="list-style-type: none"> • <i>{key}</i> indicates the tag key. It must be unique and cannot be empty. • <i>{value}</i> indicates the tag value, which can be empty. <p>If you want to create DB instances with multiple tag keys and values, separate them with commas (,). A maximum of 20 key-value pairs can be added for a DB instance.</p> <p>For details, see Table 5-243.</p>

Parameter	Mandatory	Type	Description
dry_run	No	Boolean	<p>Specifies whether DB instances will not be created after the request is checked. This parameter is supported with MySQL only.</p> <ul style="list-style-type: none">• true: DB instances will not be created after the request is checked.<ul style="list-style-type: none">– If the check is successful, status code 202 is returned.– If the check fails, an error code is returned. For details, see Error Codes.• false: DB instances will be created after the check is successful.

Parameter	Mandatory	Type	Description
is_auto_upgrade	No	Boolean	<p>Definition Whether to enable automatic minor version upgrade.</p> <p>Constraints This parameter is available only for RDS for PostgreSQL DB instances.</p> <p>Range</p> <ul style="list-style-type: none"> • true: Automatic minor version upgrade is enabled. • false: Automatic minor version upgrade is disabled. <p>Default Value false</p>

Table 5-236 ha field data structure description

Parameter	Mandatory	Type	Description
mode	Yes	String	Specifies the primary/standby instance type. The value is Ha (case-insensitive).

Parameter	Mandatory	Type	Description
replication_mode	Yes	String	<p>Specifies the replication mode for the standby DB instance.</p> <p>The value cannot be empty.</p> <ul style="list-style-type: none">• RDS for MySQL: The value is async or semisync.• RDS for PostgreSQL: The value is async or sync.• RDS for SQL Server: The value is sync. <p>NOTE</p> <ul style="list-style-type: none">• async indicates asynchronous replication.• semisync indicates semi-synchronous replication.• sync indicates synchronous replication.

Table 5-237 datastore field data structure description

Parameter	Mandatory	Type	Description
type	Yes	String	Specifies the DB engine. Value: SQLServer

Parameter	Mandatory	Type	Description
version	Yes	String	<p>Specifies the database version.</p> <ul style="list-style-type: none">For RDS for SQL Server, only 2019 Enterprise Edition, 2019 Standard Edition, 2019 Web Edition, 2017 Enterprise Edition, 2017 Standard Edition, 2017 Web Edition, 2014 Standard Edition, 2014 Enterprise Edition, 2016 Standard Edition, 2016 Enterprise Edition, 2012 Enterprise Edition, 2012 Standard Edition, 2012 Web Edition, 2014 Web Edition, and 2016 Web Edition are supported. <p>Example value: 2014_SE 2008 R2 Enterprise Edition and 2008 R2 Web Edition are only for installed base operations.</p> <p>For details about supported database versions, see Querying Version Information About a DB Engine.</p>

Table 5-239 backup_strategy field data structure description

Parameter	Mandatory	Type	Description
start_time	Yes	String	<p>Specifies the backup time window. Automated backups will be triggered during the backup time window.</p> <p>The value cannot be empty. It must be a valid value in the "hh:mm-HH:MM" format. The current time is in the UTC format.</p> <ul style="list-style-type: none"> • The HH value must be 1 greater than the hh value. • The values of mm and MM must be the same and must be set to any of the following: 00, 15, 30, or 45. <p>Example value:</p> <ul style="list-style-type: none"> • 08:15-09:15 • 23:00-00:00

Parameter	Mandatory	Type	Description
keep_days	No	Integer	<p>Specifies the retention days for specific backup files.</p> <p>The value range is from 0 to 732. If this parameter is not specified or set to 0, the automated backup policy is disabled. To extend the retention period, contact customer service.</p> <p>Automated backups can be retained for up to 2,562 days.</p>

Table 5-240 volume field data structure description

Parameter	Mandatory	Type	Description
type	Yes	String	<p>Specifies the storage type.</p> <p>Its value can be any of the following and is case-sensitive:</p> <ul style="list-style-type: none">• ULTRAHIGH: ultra-high I/O storage.• CLOUDSSD: cloud SSD storage. This storage type is supported only with general-purpose and dedicated instances.• ESSD: extreme SSD storage.

Parameter	Mandatory	Type	Description
size	Yes	Integer	<p>Specifies the storage space. Its value range is from 40 to 4000, in GB. The value must be a multiple of 10.</p> <p>NOTICE The storage of the new DB instance must be at least equal to that of the original DB instance for RDS for MySQL and RDS for PostgreSQL.</p>

Table 5-241 restore_point field data structure description

Parameter	Mandatory	Type	Description
instance_id	Yes	String	Specifies the DB instance ID.
type	Yes	String	<p>Specifies the restoration mode. Enumerated values include:</p> <ul style="list-style-type: none">• backup: indicates restoration from backup files. In this mode, backup_id is mandatory when type is not mandatory.• timestamp: indicates point-in-time restoration. In this mode, restore_time is mandatory when type is mandatory.

Parameter	Mandatory	Type	Description
backup_id	No	String	<p>Specifies the ID of the backup used to restore data. This parameter must be specified when backups are used for restoration.</p> <p>NOTICE When type is not mandatory, backup_id is mandatory.</p>
restore_time	No	Integer	<p>Specifies the time point of data restoration in the UNIX timestamp. The unit is millisecond and the time zone is UTC.</p> <p>NOTICE When type is mandatory, restore_time is mandatory.</p>

Parameter	Mandatory	Type	Description
database_name	No	Map<String, String>	<p>This parameter applies only to Microsoft SQL Server databases.</p> <ul style="list-style-type: none"> ● If this parameter is specified, you can restore all or specific databases and rename new databases. ● If this parameter is not specified, all databases are restored by default. ● You can enter multiple new database names and separate them with commas (,). The new database names can contain but cannot be the same as the original database names. ● Note the following when you are specifying new database names: <ul style="list-style-type: none"> – New database names must be different from the original database names. If they are left

Parameter	Mandatory	Type	Description
			<p>blank, the original database names will be used for restoration by default.</p> <ul style="list-style-type: none">- Check whether new database names are case sensitive based on the character set selected during instance creation and make sure each new database name is unique.- New database names must be different from any database names on the original DB instance.- The total number of new databases cannot exceed the database quota specified by rds_databases_quota.- New database

Parameter	Mandatory	Type	Description
			<p>names cannot contain the following fields (case-insensitive): rdsadmin, master, msdb, tempdb, model, and resource.</p> <ul style="list-style-type: none"> - New database names must consist of 1 to 64 characters, including only letters, digits, underscores (_), and hyphens (-). If you want to restore data to multiple new databases, separate them with commas (,). <p>Example: <code>"database_name": {"Original database name":"New database name"}</code></p> <p>Correct example: <code>"database_name": {"A":"A,A1,A2","B":"B1,B2","C":""}</code></p> <p>Wrong example: <code>"database_name": {"A":"A","B":"B1,B2","C":"B1,C1","D":"D1,d1"},</code></p> <p>Error causes are as follows:</p>

Parameter	Mandatory	Type	Description
			<ol style="list-style-type: none"> 1. The new database name (A) is the same as the original database name (A). 2. The new database name (B1) is not unique. 3. When the database name is case insensitive, the database names D1 and d1 conflict. <p>CAUTION Before the restoration, make sure that the size of the restored data does not exceed the purchased disk capacity.</p>

Table 5-242 charge_info field data structure description

Parameter	Mandatory	Type	Description
charge_mode	Yes	String	<p>Specifies the billing mode. Value range:</p> <ul style="list-style-type: none"> • prePaid: indicates the yearly/monthly billing mode. • postPaid: indicates the pay-per-use billing mode.

Parameter	Mandatory	Type	Description
period_type	No	String	<p>Specifies the subscription type. Value range:</p> <ul style="list-style-type: none"> • month: indicates that the service is subscribed by month. • year: indicates that the service is subscribed by year. <p>NOTE This parameter is valid and mandatory if charge_mode is set to prePaid.</p>
period_num	No	Integer	<p>Specifies the subscription period. This parameter is valid and mandatory if charge_mode is set to prePaid. Value range:</p> <ul style="list-style-type: none"> • When period_type is set to month, the parameter value ranges from 1 to 9. • When period_type is set to year, the parameter value ranges from 1 to 3.
is_auto_renew	No	boolean	<p>Specifies whether automatic renewal is enabled for yearly/monthly DB instances. The renewal period is the same as the original period and the order will be automatically paid.</p> <ul style="list-style-type: none"> • true: indicates that automatic renewal is enabled. • false: indicates that automatic renewal is disabled. The default value is false.
is_auto_pay	No	boolean	<p>Specifies whether the order will be automatically paid after yearly/monthly DB instances are created. This parameter does not affect the payment mode of automatic renewal.</p> <ul style="list-style-type: none"> • true: indicates the order will be automatically paid. • false: indicates the order will be manually paid. The default value is false.

Table 5-243 tags field data structure description

Parameter	Mandatory	Type	Description
key	Yes	String	Tag key. It must consist of 1 to 128 Unicode characters, including letters, digits, spaces, and special characters _:=+-. However, it cannot start or end with a space, or start with _sys_.
value	Yes	String	Tag value. It can be left blank or contain a maximum of 255 Unicode characters, including letters, digits, spaces and special characters _:=+-@.

Example Request

- Restore a MySQL backup to a new DB instance.

```
POST https://{endpoint}/v3/0483b6b16e954cb88930a360d2c4e663/instances
```

```

Response

- Normal response

Table 5-244 Parameters

Parameter	Type	Description
instance	Object	Indicates the DB instance information. For details, see Table 5-245 .
job_id	String	Indicates the ID of the DB instance creation task. This parameter is returned only for the restoration to a new DB instance billed on the pay-per-use basis.
order_id	String	Indicates the order ID. This parameter is returned only for the creation of an RDS for SQL Server DB instance billed on the yearly/monthly basis.

Table 5-245 instance description

Parameter	Type	Description
id	String	Indicates the DB instance ID.
name	String	Indicates the DB instance name. DB instances of the same type can have same names under the same tenant.
status	String	Indicates the DB instance status. For example, BUILD indicates that the DB instance is being created.
datastore	Object	Indicates the database information. For details, see Table 5-246 .

Parameter	Type	Description
ha	Object	Indicates the HA configuration parameters. This parameter is returned only when primary/standby DB instances are created. For details, see Table 5-247 .
configuration_id	String	Indicates the parameter template ID. This parameter is returned only when a custom parameter template is used during DB instance creation.

Parameter	Type	Description
port	String	<p>Indicates the database port information.</p> <ul style="list-style-type: none">• RDS for MySQL instances can use database ports 1024 to 65535, excluding 12017 and 33071, which are reserved for RDS system use.• RDS for PostgreSQL instances can use database ports 2100 to 9500.• For RDS for SQL Server 2022 Enterprise Edition, 2022 Standard Edition, 2022 Web Edition, 2019 Enterprise Edition, 2019 Standard Edition, 2019 Web Edition, 2017 Enterprise Edition, 2017 Standard Edition, and 2017 Web Edition, the port number can be set to 1433 or 2100 to 9500 (excluding 5050, 5353, 5355, 5985, and 5986). For other editions, the port number can be set to 1433 or 2100 to 9500 (excluding 5355, 5985, and 5986). <p>If this parameter is not set, the default value is as follows:</p> <ul style="list-style-type: none">• RDS for MySQL: 3306• RDS for PostgreSQL: 5432• RDS for SQL Server: 1433

Parameter	Type	Description
backup_strategy	Object	Indicates the automated backup policy. For details, see Table 5-248 .
enterprise_project_tag	String	Indicates the project ID.
flavor_ref	String	Indicates the specification ID. For details, see spec_code in Table 5-13 in section Querying Database Specifications .
volume	Object	Indicates the volume information. For details, see Table 5-249 .
region	String	Indicates the region ID.
availability_zone	String	Indicates the AZ ID.
vpc_id	String	Specifies the VPC ID. To obtain this parameter value, use either of the following methods: <ul style="list-style-type: none"> Method 1: Log in to the VPC console and view the VPC ID on the VPC details page. Method 2: See the "Querying VPCs" section in the <i>Virtual Private Cloud API Reference</i>.

Parameter	Type	Description
subnet_id	String	<p>Specifies the network ID. To obtain this parameter value, use either of the following methods:</p> <ul style="list-style-type: none"> Method 1: Log in to the VPC console and click the target subnet on the Subnets page. You can view the network ID on the displayed page. Method 2: See the "Querying Subnets" section in the <i>Virtual Private Cloud API Reference</i>.
security_group_id	String	<p>Indicates the security group which the RDS DB instance belongs to. To obtain this parameter value, use either of the following methods:</p> <ul style="list-style-type: none"> Method 1: Log in to VPC console. Choose Access Control > Security Groups in the navigation pane. On the displayed page, click the target security group. You can view the security group ID on the displayed page. Method 2: See the "Querying Security Groups" section in the <i>Virtual Private Cloud API Reference</i>.
collation	String	Indicates the collation for RDS for SQL Server.

Parameter	Type	Description
charge_info	Object	<p>Indicates the billing information, which is yearly/monthly or pay-per-use.</p> <p>For details, see Table 5-242.</p>

Table 5-246 datastore field data structure description

Parameter	Mandatory	Type	Description
type	Yes	String	<p>Indicates the DB engine. Its value can be any of the following and is case-insensitive:</p> <ul style="list-style-type: none"> • MySQL • PostgreSQL • SQLServer
version	Yes	String	<p>Indicates the database version. For details about supported database versions, see section Querying Version Information About a DB Engine.</p>
complete_version	No	String	Indicates the complete version number. This parameter is returned only when the DB engine is PostgreSQL.

Table 5-247 ha field data structure description

Parameter	Mandatory	Type	Description
mode	Yes	String	Indicates the primary/standby instance type. The value is Ha .
replication_mode	Yes	String	<p>Indicates the replication mode for the standby DB instance.</p> <p>The value cannot be empty.</p> <ul style="list-style-type: none"> • RDS for MySQL: The value is async or semisync. • RDS for PostgreSQL: The value is async or sync. • RDS for SQL Server: The value is sync. <p>NOTE</p> <ul style="list-style-type: none"> • async indicates the asynchronous replication mode. • semisync indicates the semi-synchronous replication mode. • sync indicates the synchronous replication mode.

Table 5-248 backupStrategy field data structure description

Parameter	Mandatory	Type	Description
start_time	Yes	String	<p>Indicates the backup time window. Automated backups will be triggered during the backup time window.</p> <p>The value cannot be empty. It must be a valid value in the "hh:mm-HH:MM" format. The current time is in the UTC format.</p> <ul style="list-style-type: none">• The HH value must be 1 greater than the hh value.• The values of mm and MM must be the same and must be set to any of the following: 00, 15, 30, or 45. <p>Example value:</p> <ul style="list-style-type: none">• 08:15-09:15• 23:00-00:00

Parameter	Mandatory	Type	Description
keep_days	No	Integer	<p>Indicates the retention days for specific backup files.</p> <p>The value range is from 0 to 732. If this parameter is not specified or set to 0, the automated backup policy is disabled. To extend the retention period, contact customer service.</p> <p>Automated backups can be retained for up to 2,562 days.</p>

Table 5-249 volume field data structure description

Parameter	Mandatory	Type	Description
type	Yes	String	<p>Specifies the volume type.</p> <p>Its value can be any of the following and is case-sensitive:</p> <ul style="list-style-type: none">• ULTRAHIGH: ultra-high I/O storage.• CLOUDSSD: cloud SSD storage. This storage type is supported only with general-purpose and dedicated instances.• ESSD: extreme SSD storage.

Parameter	Mandatory	Type	Description
size	Yes	Integer	Indicates the volume size. Its value range is from 40 to 4000, in GB. The value must be a multiple of 10.

5.9.15 Checking Whether Fast Restoration Can Be Used for Restoring Databases or Tables (RDS for MySQL)

Function

This API is used to check whether fast restoration can be used for restoring databases or tables of a DB instance.

- Before calling this API, learn how to [authenticate](#) it.
- Before calling this API, learn about [request header parameters](#).

Constraints

- This API is available to RDS for MySQL only.
- Fast restoration is disabled by default. To use this function, contact customer service.

URI

- URI format
POST /v3/{project_id}/instances/fast-restore
- Parameter description

Table 5-252 Parameters

Parameter	Mandatory	Description
project_id	Yes	Project ID of a tenant in a region. To obtain the value, see Obtaining a Project ID .

Request

Table 5-253 Parameters

Parameter	Mandatory	Type	Description
restore_time	Yes	String	Time point to which data is to be restored. The format is yyyy-mm-ddThh:mm:ssZ. T is the separator between the calendar and the hourly notation of time. Z indicates the time zone offset. For example, in the Beijing time zone, the time zone offset is shown as +0800.
instance_ids	Yes	Array of strings	Instance IDs.

Example Request

Check whether fast restoration can be used for restoring databases or tables of a DB instance.

```
POST https://[endpoint]/v3/0483b6b16e954cb88930a360d2c4e663/instances/fast-restore
{
  "restore_time" : "2023-06-25T11:35:40+0800",
  "instance_ids" : [ "14fc6c06d7e842829ee91d11c6b88b3ain01" ]
}
```

Response

- Normal response

Table 5-254 Response body parameters

Parameter	Type	Description
support_fast_restore_list	Array of objects	Whether fast restoration is supported for the DB instance. For details, see Table 5-255 .

Table 5-255 support_fast_restore_list field data structure description

Parameter	Type	Description
instance_id	String	Instance ID.

Parameter	Type	Description
is_support_fast_table_restore	Boolean	Whether fast restoration can be used for restoring tables.
is_support_fast_database_restore	Boolean	Whether fast restoration can be used for restoring databases.

- Example normal response

```
{  
    "support_fast_restore_list": [ {  
        "instance_id": "14fc6c06d7e842829ee91d11c6b88b3ain01",  
        "is_support_fast_table_restore": true,  
        "is_support_fast_database_restore": true  
    } ]  
}

5.9.19 Restoring Databases to a Specified Point in Time

Function

This API is used to restore databases to a specified point in time.

- Before calling this API, learn how to [authenticate](#) it.
- Before calling this API, learn about [request header parameters](#).

Constraints

- This API is available to RDS for MySQL and RDS for PostgreSQL only.
- Database-level restoration is not supported for databases that contain tables with JSON virtual columns.
- Database-level restoration is not supported for databases whose names contain Chinese characters.
- Fast restoration is not supported for XA transactions.

URI

- URI format
POST /v3/{project_id}/instances/batch/restore/databases

- Parameter description

Table 5-276 Parameters

Parameter	Mandatory	Description
project_id	Yes	Project ID of a tenant in a region. To obtain the value, see Obtaining a Project ID .

Request

Table 5-277 Parameters

Parameter	Mandatory	Type	Description
instances	Yes	Array of objects	Instance information. For details, see Table 5-278 .

Table 5-278 instances field data structure description

Parameter	Mandatory	Type	Description
restore_time	Yes	Long	Restoration time point. A timestamp in milliseconds is used.
instance_id	Yes	String	Instance ID.
databases	Yes	Array of objects	Database information. For details, see Table 5-279 .

Parameter	Mandatory	Type	Description
is_fast_restore	No	Boolean	<p>Whether to use fast restoration. The value can be true or false.</p> <ul style="list-style-type: none">To set this parameter, check whether fast restoration is supported by referring to Checking Whether Fast Restoration Can Be Used for Restoring Databases or Tables (RDS for MySQL). If fast restoration is supported, but there are XA transactions in the DB instance, set this parameter to false to prevent data loss.If this parameter is not specified, the system determines whether to use fast restoration based on the query result of Checking Whether Fast Restoration Can Be Used for Restoring Databases or Tables (RDS for MySQL). If fast restoration is supported, but there are XA transactions in the DB instance, set this parameter to false.

Table 5-279 databases field data structure description

Parameter	Mandatory	Type	Description
old_name	Yes	String	Name of the database before restoration.
new_name	Yes	String	Name of the database after restoration. The database name can contain letters, digits, hyphens (-), underscores (_), and dollar signs (\$). The new database name cannot be the same as the original database name.

Example Request

Restore databases of an RDS for MySQL instance to a specified point in time.

```
POST https://{endpoint}/v3/0483b6b16e954cb88930a360d2c4e663/instances/batch/restore/databases

Table 5-280 Parameters

Parameter	Type	Description
restore_result	Array of objects	Database-level PITR task details. For details, see Table 5-281 .

Table 5-281 restore_result field data structure description

Parameter	Type	Description
instance_id	String	Instance ID.
job_id	String	Workflow ID.

- Example normal response

Restoring databases of an RDS for MySQL instance to a specified point in time:

```
{
  "restore_result" : [ {
    "instance_id" : "5d742eda6e574ff3a003191638ef8c51in01",
    "job_id" : "749d6254-f4f0-4f72-aa32-876e220d2496"
  } ]
}
```

- Abnormal response

5.9.20 Querying Databases Contained in a Database-Level Backup (RDS for PostgreSQL)

Function

This API is used to query databases contained in a database-level backup.

- Before calling this API, learn how to [authenticate](#) it.
- Before calling this API, learn about [request header parameters](#).

URI

- URI format
`GET /v3/{project_id}/instances/{instance_id}/database/db-table-name?backup_id={backup_id}`
- Parameter description

Table 5-282 Parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Definition Project ID of a tenant in a region. To obtain the value, see Obtaining a Project ID . Constraints The value cannot be empty. Range N/A Default Value N/A
instance_id	Yes	String	Definition Instance ID. Constraints The value cannot be empty. Range N/A Default Value N/A

Parameter	Mandatory	Type	Description
backup_id	Yes	String	Definition Backup ID. Constraints The value cannot be empty. Range N/A Default Value N/A

Request

None

Example Request

Query databases contained in a database-level backup.

Response

- Normal response

Table 5-283 Parameters

Parameter	Type	Description
databases	Array of objects	Definition Database information. For details, see Table 5-284 . Range N/A
database_limit	Integer	Definition Number of databases that can be restored from a backup. Range N/A
bucket_name	String	Definition OBS bucket name. Range N/A

Table 5-284 databases field description

Parameter	Type	Description
database_name	String	Definition Database name. Range N/A
backup_file_name	String	Definition Name of the backup file. Range N/A
backup_file_size	Long	Definition Size of the backup file. Range N/A

- Example normal response

```
{  
    "bucket_name": "bucket1",  
    "databases": [  
        {  
            "database_name": "databases1",  
            "backup_file_name": "file1",  
            "backup_file_size": 10  
        },  
        {  
            "database_name": "databases2",  
            "backup_file_name": "file2",  
            "backup_file_size": 11  
        },  
        {  
            "database_name": "databases3",  
            "backup_file_name": "file3",  
            "backup_file_size": 12  
        },  
    ],  
    "database_limit": 50  
}
```

5.9.21 Transferring Backups to an OBS Bucket (RDS for MySQL)

Function

This API is used to transfer backups of a DB instance to an OBS bucket.

- Before calling this API, learn how to [authenticate](#) it.
- Before calling this API, learn about [request header parameters](#).

URI

- URI format
POST /v3/{project_id}/instances/{instance_id}/backups/transfer
- Parameter description

Table 5-285 Parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Definition Project ID of a tenant in a region. To obtain the value, see Obtaining a Project ID . Constraints N/A Range N/A Default Value N/A
instance_id	Yes	String	Definition Instance ID. Constraints N/A Range N/A Default Value N/A

Request

Table 5-286 Parameters

Parameter	Mandatory	Type	Description
backups	Yes	Array of String	Definition List of backup IDs. Constraints N/A Range The minimum number of elements in backups is 1, and each element must be unique. Default Value N/A
instance_id	Yes	String	Definition Instance ID. Constraints N/A Range N/A Default Value N/A
destination	Yes	String	Definition Name of the destination OBS bucket. Constraints N/A Range 0 to 128 characters Default Value N/A

Parameter	Mandatory	Type	Description
prefix	No	String	<p>Definition Prefix of the storage location in the destination OBS bucket.</p> <p>Constraints N/A</p> <p>Range The value can contain 0 to 128 characters and must end with a slash (/).</p> <p>Default Value N/A</p>

Example Request

Transfer backups of a DB instance to an OBS bucket.

```
POST https://[Endpoint]/v3/0483b6b16e954cb88930a360d2c4e663/instances/e38d120bb5a640519fb2a1613140afd9in01/backups/transfer

{

5.9.22 Querying Transfer Tasks (RDS for MySQL)

Function

This API is used to query transfer tasks of a DB instance.

- Before calling this API, learn how to [authenticate](#) it.

- Before calling this API, learn about [request header parameters](#).

URI

- URI format
GET /v3/{project_id}/transfer-info
- Parameter description

Table 5-289 Parameters

Parameter	Mandatory	Type	Description
project_id	Yes	String	Definition Project ID of a tenant in a region. To obtain the value, see Obtaining a Project ID . Constraints N/A Range N/A Default Value N/A
offset	Yes	Integer	Definition Page number. Constraints N/A Range The minimum value is 1 , indicating that the first page is queried. Default Value 1
limit	Yes	Integer	Definition Number of records displayed on each page. Constraints N/A Range Minimum value: 0 Default Value 10

Table 5-290 Parameters

Parameter	Mandatory	Type	Description
order_field	No	String	Definition Sorting field. Constraints N/A Range N/A Default Value N/A
order_rule	No	String	Definition Sorting rule. Constraints N/A Range N/A Default Value N/A
filter_field	No	String	Definition Filter fields. Constraints N/A Range N/A Default Value N/A
filter_content	No	String	Definition Filter keywords. Constraints N/A Range N/A Default Value N/A

Parameter	Mandatory	Type	Description
begin_time	No	Long	Definition Start timestamp. Constraints N/A Range N/A Default Value N/A
end_time	No	Long	Definition End timestamp. Constraints N/A Range N/A Default Value N/A
transfer_type	No	String	Definition Type of transfer tasks. Constraints N/A Range <ul style="list-style-type: none"> • manual: manual transfer task • auto: automatic transfer task Default Value manual

Request

None

Example Request

Query transfer tasks of a DB instance.

```
GET https://{Endpoint}/v3/0483b6b16e954cb88930a360d2c4e663/transfer-info
```

Response

- Normal response

Table 5-291 Parameters

Parameter	Type	Description
total	Long	Definition Number of tasks. Range N/A
transfer_list	Array of objects	Definition Task list. For details, see Table 5-292 .

Table 5-292 transfer_list field description

Parameter	Type	Description
id	String	Definition Backup ID. Range N/A
name	String	Definition Backup name. Range N/A
begin_time	Long	Definition Task start time. Range N/A
end_time	Long	Definition Task end time. Range N/A
status	String	Definition Task status. Range N/A
size	Double	Definition Object size, in KB. Range N/A

Parameter	Type	Description
instance_id	String	Definition Instance ID. Range N/A
file_name	String	Definition Name of the object to be transferred. Range N/A
destination	String	Definition Destination bucket name. Range N/A
backup_begin_time	Long	Definition Start time for a backup transfer. Range N/A
backup_end_time	Long	Definition End time for a backup transfer. Range N/A
transfer_type	String	Definition Type of a transfer task. Range <ul style="list-style-type: none"> • manual: manual transfer task • auto: automatic transfer task
type	String	Definition Type of backups to be transferred. Range <ul style="list-style-type: none"> • db: automated backup • log: incremental backup • snapshot: manual backup

Parameter	Type	Description
prefix	String	<p>Definition Prefix of the transfer destination.</p> <p>Range The value can contain 0 to 128 characters and must end with a slash (/).</p>

# 5.10 Upgrading a Major Version

## 5.10.1 Querying the Target Version to Which a DB Instance Can Be Upgraded (RDS for PostgreSQL)

### Function

This API is used to query the target version to which an RDS for PostgreSQL DB instance can be upgraded.

- Before calling this API, learn how to [authenticate](#) it.
- Before calling this API, learn about [request header parameters](#).

### Constraints

- This API is available to RDS for PostgreSQL only.
- This operation cannot be performed when the DB instance is in any of the following statuses: creating, changing instance specifications, changing port, frozen, or abnormal.

### URI

- URI format  
`GET /v3/{project_id}/instances/{instance_id}/major-version/available-version`
- Parameter description

**Table 5-293** Parameters

| Parameter   | Type   | Mandatory | Description                                                                                              |
|-------------|--------|-----------|----------------------------------------------------------------------------------------------------------|
| project_id  | String | Yes       | Project ID of a tenant in a region.<br>To obtain the value, see <a href="#">Obtaining a Project ID</a> . |
| instance_id | String | Yes       | Instance ID.                                                                                             |

## Request

- Request parameters  
None
- URI example  
`https://{{Endpoint}}/v3/0483b6b16e954cb88930a360d2c4e663/instances/3aa441c4c98a4b36b100a7e3e87d17cein03/major-version/available-version`

## Response

- Normal response

**Table 5-294** Parameters

| Parameter          | Type             | Description         |
|--------------------|------------------|---------------------|
| available_versions | Array of Strings | Available versions. |

- Example normal response  
`{ "available_versions": ["13.9", "14.4"] }`
- Abnormal response  
For details, see [Abnormal Request Results](#).

## Status Code

- Normal  
200
- Abnormal  
For details, see [Status Codes](#).

## Error Code

For details, see [Error Codes](#).

## 5.10.2 Performing a Major Version Upgrade Pre-Check for a DB Instance (RDS for PostgreSQL)

### Function

This API is used to perform a health check before a major version upgrade.

- Before calling this API, learn how to [authenticate](#) it.
- Before calling this API, learn about [request header parameters](#).

### Constraints

- This API is available to RDS for PostgreSQL only.
- This operation cannot be performed when the DB instance is in any of the following statuses: creating, changing instance specifications, changing port, frozen, or abnormal.

### URI

- URI format  
POST /v3/{project\_id}/instances/{instance\_id}/major-version/inspection
- Parameter description

**Table 5-295** Parameters

| Parameter   | Type   | Mandatory | Description                                                                                              |
|-------------|--------|-----------|----------------------------------------------------------------------------------------------------------|
| project_id  | String | Yes       | Project ID of a tenant in a region.<br>To obtain the value, see <a href="#">Obtaining a Project ID</a> . |
| instance_id | String | Yes       | Instance ID.                                                                                             |

### Request

- Request parameters

**Table 5-296** Parameters

| Parameter      | Type   | Mandatory | Description     |
|----------------|--------|-----------|-----------------|
| target_version | String | Yes       | Target version. |

- URI example  
`https://{{Endpoint}}/v3/0483b6b16e954cb88930a360d2c4e663/instances/3aa441c4c98a4b36b100a7e3e87d17cein03/major-version/inspection`  
`{`  
 `"target_version": "14.9.0"`  
`}`

## Response

- Normal response

**Table 5-297** Parameters

| Parameter | Type   | Description      |
|-----------|--------|------------------|
| report_id | String | Check report ID. |

- Example normal response

```
{
 "report_id": "f7a8e35e-a14c-4e5e-b1f0-d3764e8ed8a8"
}
```

- Abnormal response

## Error Code

For details, see [Error Codes](#).

## 5.10.3 Querying the Major Version Check Status or Upgrade Status of a DB Instance (RDS for PostgreSQL)

### Function

This API is used to query the major version check status or upgrade status.

- Before calling this API, learn how to [authenticate](#) it.
- Before calling this API, learn about [request header parameters](#).

### Constraints

- This API is available to RDS for PostgreSQL only.
- The major version check status is valid within seven days. During this period, if you modify the instance configurations, you need to check the upgrade status again.

### URI

- URI format  
`GET /v3/{project_id}/instances/{instance_id}/major-version/status?  
action={current_action}`
- Parameter description

**Table 5-298** Parameters

| Parameter   | Type   | Mandatory | Description                                                                                                                                                                                        |
|-------------|--------|-----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| project_id  | String | Yes       | Project ID of a tenant in a region.<br>To obtain the value, see <a href="#">Obtaining a Project ID</a> .                                                                                           |
| instance_id | String | Yes       | Instance ID.                                                                                                                                                                                       |
| action      | String | Yes       | The status to be queried. <ul style="list-style-type: none"> <li>• <b>check:</b> Check the pre-upgrade check status.</li> <li>• <b>upgrade:</b> Check the major version upgrade status.</li> </ul> |

## Request

- Request parameters  
None
- URI example  
`https://{{Endpoint}}/v3/0483b6b16e954cb88930a360d2c4e663/instances/3aa441c4c98a4b36b100a7e3e87d17cein03/major-version/status?action=upgrade`

## Response

- Normal response

**Table 5-299** Parameters

| Parameter      | Type   | Description                                                                                                                                                                                                                                                                                                                       |
|----------------|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| status         | String | Major version upgrade status of the instance. <ul style="list-style-type: none"> <li>• <b>running:</b> The pre-check or major version upgrade is in progress.</li> <li>• <b>success:</b> The pre-check or major version upgrade is successful.</li> <li>• <b>failed:</b> The pre-check or major version upgrade fails.</li> </ul> |
| target_version | String | Target version.                                                                                                                                                                                                                                                                                                                   |
| start_time     | String | Start time in the "yyyy-mm-ddThh:mm:ssZ" format.<br>T is the separator between the calendar and the hourly notation of time. Z indicates the time zone offset. For example, if the time zone offset is one hour, the value of Z is +0100.                                                                                         |

| Parameter             | Type   | Description                                                                                                                                                                                                                                                                                 |
|-----------------------|--------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| check_expiration_time | String | Time when a check report expires. The format is yyyy-mm-ddThh:mm:ssZ.<br><b>T</b> is the separator between the calendar and the hourly notation of time. <b>Z</b> indicates the time zone offset. For example, if the time zone offset is one hour, the value of <b>Z</b> is <b>+0100</b> . |
| detail                | String | Details about the pre-check or upgrade report.                                                                                                                                                                                                                                              |

## 5.10.5 Upgrading a Major Version of a DB Instance (RDS for PostgreSQL)

### Function

This API is used to upgrade a major version.

- Before calling this API, learn how to [authenticate](#) it.
- Before calling this API, learn about [request header parameters](#).

## Constraints

- This API is available to RDS for PostgreSQL only.
- This operation cannot be performed when the DB instance is in any of the following statuses: creating, changing instance specifications, changing port, frozen, or abnormal.
- Before an upgrade, ensure that a valid upgrade check report is available. In the check report, the source version is the current instance version, the target version is the one contained in the request body, the check is performed within seven days, and the check result is successful.

## URI

- URI format  
POST /v3/{project\_id}/instances/{instance\_id}/major-version/upgrade
- Parameter description

**Table 5-303** Parameters

| Parameter   | Type   | Mandatory | Description                                                                                              |
|-------------|--------|-----------|----------------------------------------------------------------------------------------------------------|
| project_id  | String | Yes       | Project ID of a tenant in a region.<br>To obtain the value, see <a href="#">Obtaining a Project ID</a> . |
| instance_id | String | Yes       | Instance ID.                                                                                             |

## Request

- Request parameters

| Parameter      | Type   | Mandatory | Description                                                                                                                                                                  |

**Table 5-305** Parameters

| Parameter  | Type   | Mandatory | Description                                                                                              |
|------------|--------|-----------|----------------------------------------------------------------------------------------------------------|
| project_id | String | Yes       | Project ID of a tenant in a region.<br>To obtain the value, see <a href="#">Obtaining a Project ID</a> . |

| Parameter   | Type    | Mandatory | Description                                                                                                                                                                                                                                                         |
|-------------|---------|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| instance_id | String  | Yes       | Instance ID.                                                                                                                                                                                                                                                        |
| offset      | Integer | No        | Index offset. If <b>offset</b> is set to $N$ , the resource query starts from the $N+1$ piece of data. The value is <b>0</b> by default, indicating that the query starts from the first piece of data. The value must be a number but cannot be a negative number. |
| limit       | Integer | No        | Number of query records. The default value is <b>10</b> . The value must be a positive integer. The minimum value is <b>1</b> and the maximum value is <b>100</b> .                                                                                                 |
| order       | String  | No        | Sorting order. <ul style="list-style-type: none"> <li>• <b>DESC</b>: descending order</li> <li>• <b>ASC</b>: ascending order</li> <li>• Default value: <b>desc</b></li> </ul>                                                                                       |
| sort_field  | String  | No        | Sorting field. <ul style="list-style-type: none"> <li>• <b>start_time</b>: specifies the start time.</li> <li>• <b>end_time</b>: specifies the end time.</li> <li>• <b>start_time</b> is the default value.</li> </ul>                                              |

## Request

- Request parameters  
None
- URI example  
`https://{{Endpoint}}/v3/0483b6b16e954cb88930a360d2c4e663/instances/3aa441c4c98a4b36b100a7e3e87d17cein03/major-version/upgrade-histories?offset=0&limit=10`

## Response

- Normal response

**Table 5-306** Parameters

| Parameter       | Type             | Description                                                               |
|-----------------|------------------|---------------------------------------------------------------------------|
| total_count     | Integer          | Total number of records.                                                  |
| upgrade_reports | Array of objects | Upgrade report details.<br>For details, see <a href="#">Table 5-307</a> . |

**Table 5-307 upgrade\_report field data structure description**

| Parameter            | Type   | Description                                                                                                                                                                                                                                                                        |
|----------------------|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| id                   | String | Upgrade report ID.                                                                                                                                                                                                                                                                 |
| start_time           | String | Upgrade start time in the "yyyy-mm-ddThh:mm:ssZ" format.<br><br><b>T</b> is the separator between the calendar and the hourly notation of time. <b>Z</b> indicates the time zone offset. For example, if the time zone offset is one hour, the value of <b>Z</b> is <b>+0100</b> . |
| end_time             | String | Upgrade end time in the "yyyy-mm-ddThh:mm:ssZ" format.<br><br><b>T</b> is the separator between the calendar and the hourly notation of time. <b>Z</b> indicates the time zone offset. For example, if the time zone offset is one hour, the value of <b>Z</b> is <b>+0100</b> .   |
| src_instance_id      | String | Source instance ID.                                                                                                                                                                                                                                                                |
| src_database_version | String | Source instance version.                                                                                                                                                                                                                                                           |
| dst_instance_id      | String | Target instance ID.                                                                                                                                                                                                                                                                |
| dst_database_version | String | Target instance version.                                                                                                                                                                                                                                                           |
| result               | String | Upgrade result. <ul style="list-style-type: none"><li>● <b>success:</b> The upgrade is successful.</li><li>● <b>failed:</b> The upgrade fails.</li><li>● <b>running:</b> The upgrade is in progress.</li></ul>                                                                     |

| Parameter                  | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                 |
|----------------------------|---------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| is_private_ip_changed      | Boolean | <p>Whether to switch the floating IP address of the source instance to the target instance.</p> <ul style="list-style-type: none"> <li>• <b>true</b>: indicates that the floating IP address of the source instance will be switched to the target instance.</li> <li>• <b>false</b>: indicates that the floating IP address of the source instance will not be switched to the target instance.</li> </ul> |
| private_ip_change_time     | String  | <p>Time when the floating IP address is changed. The format is yyyy-mm-ddThh:mm:ssZ.</p> <p>T is the separator between the calendar and the hourly notation of time. Z indicates the time zone offset. For example, if the time zone offset is one hour, the value of Z is <b>+0100</b>.</p>                                                                                                                |
| statistics_collection_mode | String  | <p>When to collect statistics.</p> <ul style="list-style-type: none"> <li>• <b>before_change_private_ip</b>: Statistics are collected before the floating IP address is changed.</li> <li>• <b>after_change_private_ip</b>: Statistics are collected after the floating IP address is changed.</li> </ul>                                                                                                   |
| detail                     | String  | Upgrade report details.                                                                                                                                                                                                                                                                                                                                                                                     |

## Error Code

For details, see [Error Codes](#).

# 5.11 Log Information Queries

## 5.11.1 Querying Error Logs Through LTS

### Function

This API is used to query error logs of a DB instance when Log Tank Service (LTS) is available in the current region.

- Before calling this API, learn how to [authenticate](#) it.
- Before calling this API, learn about [request header parameters](#).

### Constraints

This API is available only to RDS for MySQL and RDS for PostgreSQL.

In RDS for MySQL slow query logs, if the length of a single line of an SQL statement exceeds 10 KB or the total number of lines exceeds 200, the SQL statement will be truncated. When you view slow query log details, the SQL statement may be incomplete after special processing and is for reference only.

### URI

- URI format  
POST /v3/{project\_id}/instances/{instance\_id}/slow-logs
- Parameter description

## 5.11.2 Querying Slow Query Logs Through LTS

### Function

This API is used to query slow query logs of a DB instance when Log Tank Service (LTS) is available in the current region.

- Before calling this API, learn how to [authenticate](#) it.
- Before calling this API, learn about [request header parameters](#).

### URI

- URI format  
POST /v3/{project\_id}/instances/{instance\_id}/error-logs
- Parameter description

**Table 5-312** Parameters

| Parameter   | Mandatory | Description                                                                                              |
|-------------|-----------|----------------------------------------------------------------------------------------------------------|
| project_id  | Yes       | Project ID of a tenant in a region.<br>To obtain the value, see <a href="#">Obtaining a Project ID</a> . |
| instance_id | Yes       | ID of the instance to be queried.                                                                        |

## Request

**Table 5-313** Parameters

| Parameter  | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                                                         |
|------------|-----------|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| start_time | Yes       | String | Start time in the "yyyy-mm-ddThh:mm:ssZ" format.<br><br><b>T</b> is the separator between the calendar and the hourly notation of time. <b>Z</b> indicates the time zone offset. For example, in the Beijing time zone, the time zone offset is shown as <b>+0800</b> . The start time cannot be more than one month earlier than the current time. |
| end_time   | Yes       | String | End time in the "yyyy-mm-ddThh:mm:ssZ" format.<br><br><b>T</b> is the separator between the calendar and the hourly notation of time. <b>Z</b> indicates the time zone offset. For example, in the Beijing time zone, the time zone offset is shown as <b>+0800</b> . Only error logs generated in the past month can be queried.                   |
| level      | No        | String | Log level. The default value is <b>ALL</b> .<br>Enumerated values: <ul style="list-style-type: none"><li>• ALL</li><li>• INFO</li><li>• LOG</li><li>• WARNING</li><li>• ERROR</li><li>• FATAL</li><li>• PANIC</li><li>• NOTE</li></ul>                                                                                                              |
| line_num   | No        | String | Sequence number of a log event. This parameter is not required for the first query, but is required for subsequent pagination queries. The value can be obtained from the response of the last query. The value of <b>line_num</b> should be between the values of <b>start_time</b> and <b>end_time</b> .                                          |

| Parameter   | Mandatory | Type    | Description                                                                                                                                                                               |
|-------------|-----------|---------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| search_type | No        | String  | Search mode. The default value is <b>forwards</b> . This parameter is used together with <b>line_num</b> . The search starts from <b>line_num</b> and is performed forwards or backwards. |
| limit       | No        | Integer | Number of records (query results) displayed on each page. The number ranges from 1 to 100. The default value is <b>10</b> .                                                               |

## Example Request

Query error logs. Each page contains 10 records.

```
POST https://[endpoint]/v3/0483b6b16e954cb88930a360d2c4e663/instances/

**Table 5-317** Parameters

| Parameter      | Type             | Description                                                                       |
|----------------|------------------|-----------------------------------------------------------------------------------|
| error_log_list | Array of objects | Indicates detailed information.<br>For details, see <a href="#">Table 5-318</a> . |
| total_record   | Integer          | Indicates the total number of records.                                            |

**Table 5-318** error\_log\_list field data structure description

| Parameter | Type   | Description                           |
|-----------|--------|---------------------------------------|
| time      | String | Indicates the time in the UTC format. |
| level     | String | Indicates the log level.              |
| content   | String | Indicates the log content.            |

- Example normal response

```
{

## 5.11.4 (Recommended) Querying Slow Query Logs

### Function

This API is used to query the latest 2,000 slow query logs of a DB instance.

- Before calling this API, learn how to [authenticate](#) it.
- Before calling this API, learn about [request header parameters](#).

### Constraints

This API is available only to RDS for MySQL and RDS for PostgreSQL.

### URI

- URI format  
`GET /v3/{project_id}/instances/{instance_id}/slowlog?  
start_date={start_date}&end_date={end_date}`
- Parameter description

**Table 5-319** Parameters

| Parameter   | Mandatory | Description                                                                                                                                                                                                                                                                                                                    |
|-------------|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| project_id  | Yes       | Project ID of a tenant in a region.<br>To obtain the value, see <a href="#">Obtaining a Project ID</a> .                                                                                                                                                                                                                       |
| instance_id | Yes       | ID of the instance to be queried.                                                                                                                                                                                                                                                                                              |
| start_date  | Yes       | Start time in the "yyyy-mm-ddThh:mm:ssZ" format.<br><b>T</b> is the separator between the calendar and the hourly notation of time. <b>Z</b> indicates the time zone offset. For example, in the Beijing time zone, the time zone offset is shown as <b>+0800</b> .                                                            |
| end_date    | Yes       | End time in the "yyyy-mm-ddThh:mm:ssZ" format.<br><b>T</b> is the separator between the calendar and the hourly notation of time. <b>Z</b> indicates the time zone offset. For example, in the Beijing time zone, the time zone offset is shown as <b>+0800</b> . You can only query slow query logs generated within a month. |

| Parameter | Mandatory | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|-----------|-----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| offset    | No        | <p>Page offset, for example, <b>1</b>, <b>2</b>, <b>3</b>, or <b>4</b>. If this parameter is not specified, the default value is <b>1</b>, indicating that data on the first page is queried.</p> <p>The latest 2,000 slow query logs can be queried. The value of <b>offset</b> multiplied by the value of <b>limit</b> must be no more than 2,000. For example, if the value of <b>offset</b> is set to <b>200</b>, and the value of <b>limit</b> cannot be greater than <b>10</b>.</p> |
| limit     | No        | Number of records on each page. Its value range is from 1 to 100. The parameter value is <b>10</b> by default if it is not specified.                                                                                                                                                                                                                                                                                                                                                     |
| type      | No        | Statement type. If it is left blank, all statement types are queried. Valid value: <ul style="list-style-type: none"><li>• INSERT</li><li>• UPDATE</li><li>• SELECT</li><li>• DELETE</li><li>• CREATE</li></ul>                                                                                                                                                                                                                                                                           |

**Table 5-320** Parameters

| Parameter     | Type             | Description                                                                                 |
|---------------|------------------|---------------------------------------------------------------------------------------------|
| slow_log_list | Array of objects | <p>Indicates detailed information.</p> <p>For details, see <a href="#">Table 5-321</a>.</p> |

| Parameter    | Type    | Description                            |
|--------------|---------|----------------------------------------|
| total_record | Integer | Indicates the total number of records. |

**Table 5-321 slow\_log\_list field data structure description**

| Parameter     | Type   | Description                                                                                                                                            |
|---------------|--------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| count         | String | Indicates the number of executions.                                                                                                                    |
| time          | String | Indicates the execution time.                                                                                                                          |
| lock_time     | String | Indicates the lock wait time.                                                                                                                          |
| rows_sent     | String | Indicates the number of sent rows.                                                                                                                     |
| rows_examined | String | Indicates the number of scanned rows.                                                                                                                  |
| database      | String | Indicates the database which the slow log belongs to.                                                                                                  |
| users         | String | Indicates the account.                                                                                                                                 |
| query_sample  | String | Indicates the execution syntax. By default, slow query logs are anonymized. To display them in plaintext, contact customer service to add a whitelist. |
| type          | String | Indicates the statement type.                                                                                                                          |
| start_time    | String | Indicates the start time in the UTC format.                                                                                                            |
| client_ip     | String | Indicates the IP address.                                                                                                                              |

## 5.11.7 Querying Extended Logs (RDS for SQL Server)

### Function

This API is used to query extended logs of a DB instance.

- Before calling this API, learn how to [authenticate](#) it.
- Before calling this API, learn about [request header parameters](#).

### Constraints

This API is supported only for RDS for SQL Server.

### URI

- URI format

GET /v3/{project\_id}/instances/{instance\_id}/xellog-files

- Parameter description

**Table 5-326** Parameters

| Parameter   | Mandatory | Description                                                                                              |
|-------------|-----------|----------------------------------------------------------------------------------------------------------|
| project_id  | Yes       | Project ID of a tenant in a region.<br>To obtain the value, see <a href="#">Obtaining a Project ID</a> . |
| instance_id | Yes       | ID of the instance to be queried.                                                                        |

| Parameter | Mandatory | Description                                                                                                                                                                                                                                                            |
|-----------|-----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| offset    | No        | Index offset.<br>If <b>offset</b> is set to $N$ , the resource query starts from the $N+1$ piece of data. The value is <b>0</b> by default, indicating that the query starts from the first piece of data. The value must be a number but cannot be a negative number. |
| limit     | No        | Number of records on each page. Its value ranges from 1 to 100. The default value is <b>10</b> .                                                                                                                                                                       |

## 5.11.8 Obtaining Links for Downloading Extended Logs (RDS for SQL Server)

### Function

This API is used to obtain links for downloading extended logs.

- Before calling this API, learn how to [authenticate](#) it.
- Before calling this API, learn about [request header parameters](#).

### Constraints

This API is supported only for RDS for SQL Server.

### URI

- URI format  
POST /v3/{project\_id}/instances/{instance\_id}/xellog-download
- Parameter description

**Table 5-329** Parameters

| Parameter   | Mandatory | Description                                                                                              |
|-------------|-----------|----------------------------------------------------------------------------------------------------------|
| project_id  | Yes       | Project ID of a tenant in a region.<br>To obtain the value, see <a href="#">Obtaining a Project ID</a> . |
| instance_id | Yes       | ID of the instance to be queried.                                                                        |

## Request

**Table 5-330** Parameters

| Parameter | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                  |
|-----------|-----------|--------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| file_name | Yes       | String | <p>Name of the file to be downloaded. The value cannot be null or empty. It can contain only uppercase letters, lowercase letters, digits, and underscores (_) and ends with .xel.</p> <p>You can obtain the file name from <a href="#">Querying Extended Logs (RDS for SQL Server)</a>.</p> |

## Example Request

Obtain links for downloading extended logs.

```
POST https://{endpoint}/v3/0483b6b16e954cb88930a360d2c4e663/instances/
cee5265e1e5845649e354841234567dfn01/xelog-download
{
 "file_name": "sqlserver_xelog_name.xel"
}
```

## Response

- Normal response

**Table 5-331** Parameters

| Parameter | Type    | Description                                                                                 |
|-----------|---------|---------------------------------------------------------------------------------------------|
| list      | List    | List of links for downloading extended logs. For details, see <a href="#">Table 5-332</a> . |
| count     | Integer | Number of extended log links.                                                               |

**Table 5-332** linkInfo field data structure description

| Parameter | Type   | Description                                 |
|-----------|--------|---------------------------------------------|
| file_name | String | Name of the generated file for downloading. |

| Parameter | Type   | Description                                                                                                                                                                                                                                                |
|-----------|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| status    | String | Generation status of the link. <ul style="list-style-type: none"><li>● <b>FINISH:</b> The download link has been generated.</li><li>● <b>EXPORTING:</b> The file is being generated.</li><li>● <b>FAILED:</b> The log file fails to be prepared.</li></ul> |
| file_size | String | File size in KB.                                                                                                                                                                                                                                           |
| file_link | String | Download link. If the link generation status is <b>EXPORTING</b> or <b>FAILED</b> , no value is returned.                                                                                                                                                  |
| create_at | String | Generation time.                                                                                                                                                                                                                                           |
| update_at | String | Update time.                                                                                                                                                                                                                                               |

- Example normal response

Generating links for downloading extended logs

```
{
 "list": [
 {
 "file_name": "HkEngineEventFile_0_133337769850300000.xls",
 "status": "EXPORTING",

## 5.11.9 Obtaining Slow Query Log Statistics (RDS for MySQL)

### Function

This API is used to query and collect statistics on slow query logs based on service requirements.

- Before calling this API, learn how to [authenticate](#) it.
- Before calling this API, learn about [request header parameters](#).

### Constraints

This API is supported for MySQL only.

### URI

- URI format  
`GET /v3/{project_id}/instances/{instance_id}/slowlog/statistics?  
cur_page={cur_page}&per_page={per_page}&type={type}&start_date={start_d  
ate}&end_date={end_date}&sort={sort}`
- Parameter description

**Table 5-333** Parameters

| Parameter   | Mandatory | Description                                                                                              |
|-------------|-----------|----------------------------------------------------------------------------------------------------------|
| project_id  | Yes       | Project ID of a tenant in a region.<br>To obtain the value, see <a href="#">Obtaining a Project ID</a> . |
| instance_id | Yes       | Specifies the ID of the DB instance to be queried.                                                       |
| cur_page    | Yes       | Specifies the page offset (the current page number, such as 1, 2, 3, or 4.)                              |
| per_page    | Yes       | Specifies the number of records on each page. The value ranges from 0 to 100.                            |

| Parameter  | Mandatory | Description                                                                                                                                                                                                                                                                                                           |
|------------|-----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| start_date | Yes       | <p>Specifies the start date in the "yyyy-mm-ddThh:mm:ssZ" format.</p> <p>T is the separator between the calendar and the hourly notation of time. Z indicates the time zone offset. For example, in the Beijing time zone, the time zone offset is shown as <b>+0800</b>.</p>                                         |
| end_date   | Yes       | <p>Specifies the end time in the "yyyy-mm-ddThh:mm:ssZ" format.</p> <p>T is the separator between the calendar and the hourly notation of time. Z indicates the time zone offset. For example, in the Beijing time zone, the time zone offset is shown as <b>+0800</b>.</p>                                           |
| type       | Yes       | <p>Specifies the statement type. If it is left blank, all statement types are queried. Valid value:</p> <ul style="list-style-type: none"><li>• INSERT</li><li>• UPDATE</li><li>• SELECT</li><li>• DELETE</li><li>• CREATE</li><li>• ALL</li></ul>                                                                    |
| sort       | No        | <p>Specifies the sorting mode.</p> <ul style="list-style-type: none"><li>• <b>executeTime</b>: indicates sorting slow query logs by execution time in descending order.</li><li>• If this parameter is left empty or set to other values, the slow query logs are sorted by executions in descending order.</li></ul> |

## Request

## 5.11.11 Obtaining Links for Downloading Error Logs (RDS for PostgreSQL)

### Function

This API is used to obtain links for downloading error logs of a DB instance.

You need to call this API repeatedly until **FINISH** is returned for **status**.

Or, you can use the **workflow\_id** value returned by the first API call to query the task status. After the task is successfully executed, call the API again to obtain the download link.

- Before calling this API, learn how to [authenticate](#) it.
- Before calling this API, learn about [request header parameters](#).

## Constraints

This API can only be used to obtain links for downloading error logs of an instance that is working properly.

## URI

- URI format  
`POST /v3/{project_id}/instances/{instance_id}/errorlog-download`
- Parameter description

**Table 5-340** Parameters

| Parameter   | Mandatory | Description                                                                                                                                                                                                      |
|-------------|-----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

## Request

**Table 5-344** Parameters

| Parameter         | Mandatory | Type    | Description                                                                                                                                                                                                                                                                                                                                                   |
|-------------------|-----------|---------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| keep_days         | Yes       | Integer | <p>Number of days for storing audit logs. The value range is from 0 to 732.</p> <ul style="list-style-type: none"><li>• <b>0</b>: indicates that SQL audit is disabled.</li><li>• <b>1 to 732</b>: indicates the retention days for audit logs after SQL audit is enabled.</li></ul>                                                                          |
| reserve_auditlogs | No        | Boolean | <p>This parameter is valid only when SQL audit is disabled.</p> <ul style="list-style-type: none"><li>• <b>true</b> (default): indicates that historical audit logs will be reserved for some time when SQL audit is disabled.</li><li>• <b>false</b>: indicates that historical audit logs will be deleted immediately when SQL audit is disabled.</li></ul> |

| Parameter   | Mandatory | Type             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|-------------|-----------|------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| audit_types | No        | Array of strings | <p>This parameter applies only to RDS for MySQL.</p> <p>Operation types recorded in audit logs. This parameter is valid only when audit logging is enabled. If this parameter is left blank, all operation types will be recorded by default.</p> <ul style="list-style-type: none"> <li>• CREATE_USER, DROP_USER, RENAME_USER, GRANT, REVOKE, ALTER_USER, ALTER_USER_DEFAULT_ROLE</li> <li>• CREATE, ALTER, DROP, RENAME, TRUNCATE, REPAIR, OPTIMIZE</li> <li>• INSERT, DELETE, UPDATE, REPLACE, SELECT</li> <li>• BEGIN/COMMIT/ ROLLBACK,PREPARED_STATEMENT,CALL_PROCEDURE,KILL,SET_OPTION, CHANGE_DB,UNINSTALL_PLUGIN,INSTALL_PLUGIN,SHUTDOWN,SLAVE_START,SLAVE_STOP,LOCK_TABLES,UNLOCK_TABLES,FLUSH,XA</li> </ul> |

## Example Request

- Enable SQL Audit and set the audit log retention period to 5 days.

```
PUT https://[endpoint]/v3/0483b6b16e954cb88930a360d2c4e663/instances/cee5265e1e5845649e354841234567dfin01/auditlog-policy
```

```
{
 "keep_days":5,
 "audit_types": [
 "CREATE_USER"
]
}
```

- Disable SQL Audit and delete existing historical audit logs.

```
{
 "keep_days":0,
 "reserve_auditlogs":false
}
```

## Response

- Normal response

**Table 5-345** Parameters

| Parameter | Type   | Description                                                                    |
|-----------|--------|--------------------------------------------------------------------------------|
| status    | String | <b>Definition</b><br>Result of setting SQL audit.<br><b>Range</b><br>COMPLETED |

- Example normal response

```
{
 "status":"COMPLETED"
}
```

- Abnormal response

For details, see [Abnormal Request Results](#).

## Status Code

- Normal  
200
- Abnormal  
For details, see [Status Codes](#).

## Error Code

## 5.11.13 Querying the Policy for SQL Audit Logs

### Function

This API is used to query the policy for SQL audit logs.

- Before calling this API, learn how to [authenticate](#) it.
- Before calling this API, learn about [request header parameters](#).

### URI

- URI format  
GET /v3/{project\_id}/instances/{instance\_id}/auditlog-policy
- Parameter description

**Table 5-346** Parameters

| Parameter   | Mandatory | Description                                                                                              |
|-------------|-----------|----------------------------------------------------------------------------------------------------------|
| project_id  | Yes       | Project ID of a tenant in a region.<br>To obtain the value, see <a href="#">Obtaining a Project ID</a> . |
| instance_id | Yes       | Specifies the DB instance ID.                                                                            |

## Request

- Request parameters  
None
- URI example  
`GET https://{endpoint}/v3/0483b6b16e954cb88930a360d2c4e663/instances/cee5265e1e5845649e354841234567dfin01/auditlog-policy`

## Response

- Normal response

**Table 5-347** Parameters

| Parameter            | Type             | Description                                                                                                          |
|----------------------|------------------|----------------------------------------------------------------------------------------------------------------------|
| keep_days            | Integer          | Number of days for storing audit logs. The value is <b>0</b> when SQL audit is disabled.                             |
| audit_types          | Array of strings | Actual operation types recorded in audit logs. If this parameter is left blank, no operation types are filtered out. |
| all_audit_log_action | String           | All operation types that can be recorded in audit logs.                                                              |

- Example normal response

```
{
 "keep_days":7,
 "audit_types":["CREATE_USER"],
 "all_audit_log_action":
 '{"DCL":"CREATE_USER,DROP_USER,RENAME_USER,GRANT,REVOKE,ALTER_USER,ALTER_USER_DEFAULT_ROLE","DDL":"CREATE,ALTER,DROP,RENAME,TRUNCATE,REPAIR,OPTIMIZE","DML":"INSERT,DELETE,UPDATE,REPLACE,SELECT","OTHER":"BEGIN/COMMIT/ROLLBACK,PREPARED_STATEMENT,CALL_PROCEDURE,KILL,SET_OPTION,CHANGE_DB,UNINSTALL_PLUGIN,UNINSTALL_PLUGIN,INSTALL_PLUGIN,SHUTDOWN,SLAVE_START,SLAVE_STOP,LOCK_TABLES,UNLOCK_TABLES,FLUSH,XA"}'
}
```

- Abnormal response

## 5.11.15 Obtaining the Links for Downloading Audit Logs

### Function

This API is used to obtain the links for downloading audit logs.

- Before calling this API, learn how to [authenticate](#) it.
- Before calling this API, learn about [request header parameters](#).

### Constraints

This API is available only to RDS for MySQL and RDS for PostgreSQL.

### URI

- URI format  
POST /v3/{project\_id}/instances/{instance\_id}/auditlog-links
- Parameter description

**Table 5-351** Parameters

| Parameter   | Mandatory | Description                                                                                              |
|-------------|-----------|----------------------------------------------------------------------------------------------------------|
| project_id  | Yes       | Project ID of a tenant in a region.<br>To obtain the value, see <a href="#">Obtaining a Project ID</a> . |
| instance_id | Yes       | Specifies the ID of the queried DB instance.                                                             |

### Request

**Table 5-352** Parameters

| Parameter | Mandatory | Type             | Description                                                                              |
|-----------|-----------|------------------|------------------------------------------------------------------------------------------|
| ids       | Yes       | Array of strings | Specifies the list of audit logs. A maximum of 50 audit log IDs are allowed in the list. |

### Example Request

Obtain the links for downloading audit logs.

```
POST https://{endpoint}/v3/0483b6b16e954cb88930a360d2c4e663/instances/
cee5265e1e5845649e354841234567df1n01/auditlog-links
{

## 5.11.16 Setting the Local Retention Period of Binlogs

### Function

This API is used to set the local retention period of binlogs.

- Before calling this API, learn how to [authenticate](#) it.
- Before calling this API, learn about [request header parameters](#).

### Constraints

- The local retention period of binlogs cannot be set during the DB instance creation.
- This API is supported for RDS for MySQL DB instances only.

### URI

- URI format  
`PUT /v3/{project_id}/instances/{instance_id}/binlog/clear-policy`
- Parameter description

**Table 5-354** Parameters

| Parameter   | Mandatory | Description                                                                                              |
|-------------|-----------|----------------------------------------------------------------------------------------------------------|
| project_id  | Yes       | Project ID of a tenant in a region.<br>To obtain the value, see <a href="#">Obtaining a Project ID</a> . |
| instance_id | Yes       | Specifies the DB instance ID.                                                                            |

## Request

**Table 5-355** Parameters

| Parameter              | Mandatory | Type    | Description                                                              |
|------------------------|-----------|---------|--------------------------------------------------------------------------|
| binlog_retention_hours | Yes       | Integer | Specifies the binlog retention period.<br>Value range: 0 to 168 (7 x 24) |

## Example Request

Set the local retention period of binlogs to 3 hours.

```
PUT https://[endpoint]/v3/0483b6b16e954cb88930a360d2c4e663/instances/fa60258325f6424ca1ba28653629d7b1n01/binlog/clear-policy
```

```
{
 "binlog_retention_hours": 3
}
```

## Response

- Normal response

**Table 5-356** Parameters

| Parameter | Type   | Description                                              |
|-----------|--------|----------------------------------------------------------|
| resp      | String | Returns <b>successful</b> if the invoking is successful. |

- Example normal response

```
{
 "resp": "successful"
}
```

- Abnormal response

## Example Request

Add a SQL throttling rule for a database.

```
POST https://rds.ap-southeast-1.myhuaweicloud.com/v3/0483b6b16e954cb88930a360d2c4e663/instances/49b9dd1d6f464ba4bc91df5cbd2e52eb03/sql-limit

{
 "db_name" : "postgres",
 "query_id" : 1,
 "max_concurrency" : 10,
 "max_waiting" : 10,
 "search_path" : "public"
}
```

## Response

- Normal response

**Table 5-374** Parameters

| Parameter | Type   | Description                                                                                                     |
|-----------|--------|-----------------------------------------------------------------------------------------------------------------|
| resp      | String | <b>Definition</b><br>Calling result.<br><b>Range</b><br>Returns <b>successful</b> if the calling is successful. |

- Example normal response

```
{
 "resp" : "successful"

## Request

- Request parameters  
None
- URI example  
GET `https://{{endpoint}}/v3/23a50154cf494ec9ad6883979a12db0a/instances/920ec36cef814a8b830a5bed50d9a088in01/proxy-list`

## Response

- Normal response

**Table 5-392** Parameters

| Parameter             | Type             | Description                                                                                                          |
|-----------------------|------------------|----------------------------------------------------------------------------------------------------------------------|
| proxy_query_info_list | Array of objects | <b>Definition</b><br>List of database proxies under a DB instance.<br>For details, see <a href="#">Table 5-393</a> . |
| max_proxy_num         | Integer          | <b>Definition</b><br>Maximum number of database proxies that can be enabled at the same time.<br><b>Range</b><br>N/A |
| max_proxy_node_num    | Integer          | <b>Definition</b><br>Maximum number of nodes allowed for one database proxy.<br><b>Range</b><br>N/A                  |

| Parameter                                      | Type    | Description                                                                                                            |
|------------------------------------------------|---------|------------------------------------------------------------------------------------------------------------------------|
| support_balance_route_mode_for_favored_version | Boolean | <b>Definition</b><br>Whether load balancing can be configured when a database proxy is created.<br><b>Range</b><br>N/A |

**Table 5-393** proxy\_query\_info\_list field data structure description

| Parameter                         | Type             | Description                                                                                                                 |
|-----------------------------------|------------------|-----------------------------------------------------------------------------------------------------------------------------|
| proxy                             | Object           | <b>Definition</b><br>Database proxy information.<br>For details, see <a href="#">Table 5-394</a> .                          |
| master_instance                   | Object           | <b>Definition</b><br>Primary instance information.<br>For details, see <a href="#">Table 5-397</a> .                        |
| readonly_instances                | Array of objects | <b>Definition</b><br>Read replica information.<br>For details, see <a href="#">Table 5-397</a> .                            |
| proxy_security_group_check_result | Boolean          | <b>Definition</b><br>Whether the security group allows the database proxy to access the DB instance.<br><b>Range</b><br>N/A |

**Table 5-394** proxy field data structure description

| Parameter | Type   | Description                                                    |
|-----------|--------|----------------------------------------------------------------|
| pool_id   | String | <b>Definition</b><br>Database proxy ID.<br><b>Range</b><br>N/A |

| Parameter | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

## 5.14.3 Querying Database Proxy Specifications

### Function

This API is used to query database proxy specifications of a DB instance.

- Before calling this API, learn how to **authenticate** it.
- Before calling this API, learn about **request header parameters**.

## Constraints

This operation cannot be performed when the instance is in the abnormal or frozen state.

## URI

- URI format  
GET /v3/{project\_id}/instances/{instance\_id}/proxy/flavors
- Parameter description

**Table 5-399** Parameters

| Parameter   | Mandatory | Description                                                                                                                                                                                                      |

# 5.15 Database and Account Management (MySQL)

## 5.15.1 Precautions

The **lower\_case\_table\_names** parameter controls whether the MySQL database and table names are case sensitive. This parameter setting may affect the database or table configurations when the APIs in the following sections in this chapter are invoked.

For example, if you have set the table names to be case insensitive and enter a table name containing uppercase letters, the name of the created table may

contain only lowercase letters because the letter cases are insensitive. Therefore, when using the following APIs, ensure that the case of your input is the same as the actual case to avoid being affected by the case setting.

## 5.15.2 Creating a Database

### Function

This API is used to create a database in a specified DB instance.

- Before calling this API, learn how to [authenticate](#) it.
- Before calling this API, learn about [request header parameters](#).

### Constraints

- This operation cannot be performed when the DB instance is in any of the following statuses: creating, changing instance class, changing port, frozen, or abnormal.
- For any database and account created using methods other than the RDS console and APIs, if the database name and account name do not meet the database naming rules (see [Table 5-411](#)) and account naming rules (see [Table 5-429](#)), for example, containing Chinese characters or unsupported special characters, the database and account cannot be managed through the RDS console or APIs.
- In migration scenarios, if any database name and account name of the source database do not meet the database naming rules (see [Table 5-411](#)) and account naming rules (see [Table 5-429](#)), the database and account cannot be managed through the RDS console or APIs after being migrated to the destination RDS for MySQL database.

### URI

- URI format  
POST /v3/{project\_id}/instances/{instance\_id}/database
- Parameter description

**Table 5-410** Parameters

| Parameter   | Mandatory | Description                                                                                              |
|-------------|-----------|----------------------------------------------------------------------------------------------------------|
| project_id  | Yes       | Project ID of a tenant in a region.<br>To obtain the value, see <a href="#">Obtaining a Project ID</a> . |
| instance_id | Yes       | Specifies the DB instance ID.                                                                            |

## Request

**Table 5-411** Parameters

| Parameter     | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|---------------|-----------|--------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| name          | Yes       | String | <p>Specifies the database name.</p> <p>The database name can contain 1 to 64 characters. Only letters, digits, hyphens (-), underscores (_), and dollar signs (\$) are allowed. The total number of hyphens (-) and dollar signs (\$) cannot exceed 10. RDS for MySQL 8.0 does not support dollar signs (\$).</p>                                                                                                                                                                                                                      |
| character_set | Yes       | String | <p>Specifies the character set used by the database, such as utf8, gbk, and ascii.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| comment       | No        | String | <p>Specifies the database remarks.</p> <p>The value can contain 0 to 512 characters.</p> <p><b>NOTE</b></p> <ul style="list-style-type: none"><li>To use this function, contact customer service to apply for the required permissions.</li><li>This parameter takes effect only for kernel versions 5.6.51.3 or later, 5.7.33.1 or later, and 8.0.25.1 or later. If your kernel version does not meet the requirements, upgrade the kernel to the latest version by referring to <a href="#">Upgrading a Minor Version</a>.</li></ul> |

## Example Request

Create a database named **rds-test**.

```
POST https://[endpoint]/v3/0483b6b16e954cb88930a360d2c4e663/instances/dsfae23fsfdsae3435in01/
database
{
 "name": "rds-test",
 "character_set": "utf8",
 "comment": "comment"
}
```

## Response

## 5.15.3 Querying Details About a Database (Discarded)

### Function

This API is used to query details about a database on a specified DB instance.

- Before calling this API, learn how to [authenticate](#) it.
- Before calling this API, learn about [request header parameters](#).

### Constraints

This operation cannot be performed when the DB instance is in the abnormal or frozen state.

## URI

- URI format  
GET /v3/{project\_id}/instances/{instance\_id}/database
- Parameter description

**Table 5-413** Parameters

| Parameter   | Mandatory | Description                                                                                              |
|-------------|-----------|----------------------------------------------------------------------------------------------------------|
| project_id  | Yes       | Project ID of a tenant in a region.<br>To obtain the value, see <a href="#">Obtaining a Project ID</a> . |
| instance_id | Yes       | Specifies the DB instance ID.                                                                            |

## Request

- Request parameters  
None
- URI example  
GET <https://{{endpoint}}/v3/0483b6b16e954cb88930a360d2c4e663/instances/dsfae23fsfdsae3435in01/database>

## Response

- Normal response

**Table 5-414** Parameters

| Parameter | Type             | Description                                                                                      |
|-----------|------------------|--------------------------------------------------------------------------------------------------|
| databases | Array of objects | Each element in the list indicates a database.<br>For details, see <a href="#">Table 5-415</a> . |

**Table 5-415** databases element structure description

| Parameter     | Type   | Description                                                                     |
|---------------|--------|---------------------------------------------------------------------------------|
| name          | String | Indicates the database name.                                                    |
| character_set | String | Indicates the character set used by the database, such as utf8, gbk, and ascii. |

| Parameter | Type             | Description                                                                                                                   |
|-----------|------------------|-------------------------------------------------------------------------------------------------------------------------------|
| users     | Array of objects | Each element in the list indicates an account associated with the database.<br>For details, see <a href="#">Table 5-416</a> . |

**Table 5-416** users element structure description

| Parameter | Type    | Description                                                                                                                                            |
|-----------|---------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| name      | String  | Account name.                                                                                                                                          |
| readonly  | Boolean | Whether the permission is read-only.<br><ul style="list-style-type: none"> <li>• <b>true</b>: read-only</li> <li>• <b>false</b>: read/write</li> </ul> |

- Example normal response

```

## 5.15.4 Querying Databases

### Function

This API is used to query databases in a specified DB instance.

- Before calling this API, learn how to [authenticate](#) it.
- Before calling this API, learn about [request header parameters](#).

### Constraints

- Databases cannot be queried when the DB instance is in the abnormal or frozen state.
- The database list of read replicas cannot be queried.

### URI

- URI format  
`GET /v3/{project_id}/instances/{instance_id}/database/detail?  
page={page}&limit={limit}`
- Parameter description

**Table 5-417** Parameters

| Parameter   | Mandatory | Description                                                                                              |
|-------------|-----------|----------------------------------------------------------------------------------------------------------|
| project_id  | Yes       | Project ID of a tenant in a region.<br>To obtain the value, see <a href="#">Obtaining a Project ID</a> . |
| instance_id | Yes       | Specifies the DB instance ID.                                                                            |
| page        | Yes       | Specifies the page number. The value starts from 1.                                                      |
| limit       | Yes       | Specifies the number of records on each page. The value ranges from 1 (inclusive) to 100 (inclusive).    |

### Request

- Request parameters  
None
- URI example

## 5.15.5 Querying Authorized Databases of a Specified User

### Function

This API is used to query authorized databases of a specified database user.

- Before calling this API, learn how to [authenticate](#) it.
- Before calling this API, learn about [request header parameters](#).

### Constraints

- This operation cannot be performed when the instance is in the abnormal or frozen state.
- If you delete a database using SQL statements, the deleted database will be displayed when you query the authorized databases through the API or RDS console.
- For databases authorized using the SQL statement **GRANT ALL ON \*.\* TO `user`@`host`**, no result will be returned after this API is called. You can run the **show grants for** command to query the authorized databases instead.  
You are advised to authorize a database by specifying it: **GRANT ALL ON db1.\* TO `user`@`host`**.

### URI

- URI format  
`GET /v3/{project_id}/instances/{instance_id}/db_user/database?user-name={user-name}&page={page}&limit={limit}`
- Parameter description

**Table 5-420** Parameters

| Parameter  | Mandatory | Description                                                                                              |
|------------|-----------|----------------------------------------------------------------------------------------------------------|
| project_id | Yes       | Project ID of a tenant in a region.<br>To obtain the value, see <a href="#">Obtaining a Project ID</a> . |

| Parameter   | Mandatory | Description                                                                                           |
|-------------|-----------|-------------------------------------------------------------------------------------------------------|
| instance_id | Yes       | Specifies the DB instance ID.                                                                         |
| user-name   | Yes       | Specifies the database username.                                                                      |
| page        | Yes       | Specifies the page number. The value starts from 1.                                                   |
| limit       | Yes       | Specifies the number of records on each page. The value ranges from 1 (inclusive) to 100 (inclusive). |

## Request

- Request parameters  
None
- URI example

## Error Code

For details, see [Error Codes](#).

## 5.15.6 Modifying the Database Remarks of a Specified DB Instance

### Function

This API is used to modify the database remarks of a specified DB instance.

- Before calling this API, learn how to [authenticate](#) it.
- Before calling this API, learn about [request header parameters](#).

## Constraints

- To use this function, contact customer service to apply for the required permissions.
- This operation cannot be performed when the DB instance is in any of the following statuses: creating, changing instance class, changing port, frozen, or abnormal.
- This operation can be performed no matter whether the database exists.
  - The remarks will be updated or created when this operation is performed, depending on whether the remarks already exist.
  - The remarks will be deleted if its value is changed to an empty string or null.
  - If the database does not exist or is deleted when remarks are created, the remarks will still be saved.
- This operation is supported only for specified kernel versions. If your kernel version does not meet the requirements, upgrade the kernel to the latest version by referring to [Upgrading a Minor Version](#).
  - RDS for MySQL 5.6: 5.6.51.3 or later.
  - RDS for MySQL 5.7: 5.7.33.1 or later.
  - RDS for MySQL 8.0: 8.0.25.1 or later.
- For any database and account created using methods other than the RDS console and APIs, if the database name and account name do not meet the database naming rules (see [Table 5-411](#)) and account naming rules (see [Table 5-429](#)), for example, containing Chinese characters or unsupported special characters, the database and account cannot be managed through the RDS console or APIs.
- In migration scenarios, if any database name and account name of the source database do not meet the database naming rules (see [Table 5-411](#)) and account naming rules (see [Table 5-429](#)), the database and account cannot be managed through the RDS console or APIs after being migrated to the destination RDS for MySQL database.

## URI

- URI format  
POST /v3/{project\_id}/instances/{instance\_id}/database/update
- Parameter description

**Table 5-423** Parameters

| Parameter   | Mandatory | Description                                                                                              |
|-------------|-----------|----------------------------------------------------------------------------------------------------------|
| project_id  | Yes       | Project ID of a tenant in a region.<br>To obtain the value, see <a href="#">Obtaining a Project ID</a> . |
| instance_id | Yes       | Specifies the DB instance ID.                                                                            |

## Request

**Table 5-424** Parameter description

| Parameter | Mandatory | Type   | Description                                                                   |
|-----------|-----------|--------|-------------------------------------------------------------------------------|
| name      | Yes       | String | Specifies the database name.                                                  |
| comment   | No        | String | Specifies the database remarks.<br>The value can contain 0 to 512 characters. |

## Example Request

Modify the database remarks of a DB instance.

```
POST https://[endpoint]/v3/0483b6b16e954cb88930a360d2c4e663/instances/dsfae23fsfdsae3435in01/database/update
{
 "name": "rds",
 "comment": "this is a comment"
}
```

## 5.15.7 Deleting a Database

### Function

This API is used to delete a database from a specified DB instance.

- Before calling this API, learn how to [authenticate](#) it.
- Before calling this API, learn about [request header parameters](#).

### Constraints

- This operation cannot be performed when the DB instance is in any of the following statuses: creating, changing instance class, changing port, frozen, or abnormal.
- For any database and account created using methods other than the RDS console and APIs, if the database name and account name do not meet the database naming rules (see [Table 5-411](#)) and account naming rules (see [Table 5-429](#)), for example, containing Chinese characters or unsupported special characters, the database and account cannot be managed through the RDS console or APIs.
- In migration scenarios, if any database name and account name of the source database do not meet the database naming rules (see [Table 5-411](#)) and account naming rules (see [Table 5-429](#)), the database and account cannot be managed through the RDS console or APIs after being migrated to the destination RDS for MySQL database.

### URI

- URI format  
`DELETE /v3/{project_id}/instances/{instance_id}/database/{db_name}`
- Parameter description

**Table 5-426** Parameters

| Parameter   | Mandatory | Description                                                                                              |
|-------------|-----------|----------------------------------------------------------------------------------------------------------|
| project_id  | Yes       | Project ID of a tenant in a region.<br>To obtain the value, see <a href="#">Obtaining a Project ID</a> . |
| instance_id | Yes       | Specifies the DB instance ID.                                                                            |
| db_name     | Yes       | Specifies the name of the database to be deleted.                                                        |

### Request

Empty request body.

## Example Request

```
DELETE https://[endpoint]/v3/0483b6b16e954cb88930a360d2c4e663/instances/dsfae23fsfdae3435in01/
database/rds-test
{}
```

## Response

## 5.15.8 Creating a Database Account

### Function

This API is used to create a database account for a specified DB instance.

- Before calling this API, learn how to [authenticate](#) it.
- Before calling this API, learn about [request header parameters](#).

### Constraints

- This operation cannot be performed when the DB instance is in any of the following statuses: creating, changing instance class, changing port, frozen, or abnormal.
- If you want to call this API repeatedly to create database accounts for your DB instance, call it in serial.

- For any database and account created using methods other than the RDS console and APIs, if the database name and account name do not meet the database naming rules (see [Table 5-411](#)) and account naming rules (see [Table 5-429](#)), for example, containing Chinese characters or unsupported special characters, the database and account cannot be managed through the RDS console or APIs.
- In migration scenarios, if any database name and account name of the source database do not meet the database naming rules (see [Table 5-411](#)) and account naming rules (see [Table 5-429](#)), the database and account cannot be managed through the RDS console or APIs after being migrated to the destination RDS for MySQL database.

## URI

- URI format  
POST /v3/{project\_id}/instances/{instance\_id}/db\_user
- Parameter description

**Table 5-428** Parameters

| Parameter   | Mandatory | Description                                                                                              |
|-------------|-----------|----------------------------------------------------------------------------------------------------------|
| project_id  | Yes       | Project ID of a tenant in a region.<br>To obtain the value, see <a href="#">Obtaining a Project ID</a> . |
| instance_id | Yes       | Specifies the DB instance ID.                                                                            |

## Request

**Table 5-429** Parameters

| Parameter | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|-----------|-----------|--------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| name      | Yes       | String | <p>Specifies the username of the database account.</p> <p>The username consists of 1 to 32 characters. Only lowercase letters, digits, hyphens (-), and underscores (_) are allowed.</p> <ul style="list-style-type: none"><li>• If the database version is MySQL 5.6, the username consists of 1 to 16 characters.</li><li>• If the database version is MySQL 5.7 or 8.0, the username consists of 1 to 32 characters.</li></ul>                                                                            |
| password  | Yes       | String | <p>Specifies the password of the database account.</p> <p>Valid value:</p> <p>The value must be 8 to 32 characters long and contain at least three types of the following characters: uppercase letters, lowercase letters, digits, and special characters (~!@#\$%^*-_=+?,()&amp;). The value must be different from the account name or account name spelled backwards.</p> <p>You are advised to enter a strong password to improve security, preventing security risks such as brute force cracking.</p> |

| Parameter | Mandatory | Type             | Description                                                                                                                                                                                                                                                                                                                                                                            |
|-----------|-----------|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| comment   | No        | String           | <p>Specifies remarks of the database account.</p> <p>The parameter must be 1 to 512 characters long and is supported only for MySQL 8.0.25 and later versions.</p>                                                                                                                                                                                                                     |
| hosts     | No        | Array of strings | <p>IP addresses that are allowed to access your DB instance.</p> <ul style="list-style-type: none"><li>• If the IP address is set to %, all IP addresses are allowed to access your instance.</li><li>• If the IP address is set to 10.10.10.%, all IP addresses in the subnet 10.10.10.X are allowed to access your instance.</li><li>• Multiple IP addresses can be added.</li></ul> |
| databases | No        | Array of objects | Databases that you can log in using the account. For details, see <a href="#">Table 5-430</a> .                                                                                                                                                                                                                                                                                        |

**Table 5-430** databases element structure description

| Parameter | Mandatory | Type    | Description                                                                                                                                                                                                            |
|-----------|-----------|---------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| name      | Yes       | String  | Database name.                                                                                                                                                                                                         |
| readonly  | No        | Boolean | <p>Whether the database is read-only.</p> <ul style="list-style-type: none"><li>• <b>true</b>: indicates the database is read-only.</li><li>• <b>false</b>: indicates the database is readable and writable.</li></ul> |

## Example Request

Creating a database account named **rds**

```
POST https://[endpoint]/v3/0483b6b16e954cb88930a360d2c4e663/instances/dsfae23fsfdsae3435in01/db_user

{
 "name": "rds",
 "password": "*****",
 "comment": "mysql",
 "hosts": [
 "%"
],
 "databases" : [
 {
 "name" : "***",
 "readonly" : false
 }
]
}
```

## Response

- Normal response

**Table 5-431** Parameters

| Parameter | Type   | Description                                              |
|-----------|--------|----------------------------------------------------------|
| resp      | String | Returns <b>successful</b> if the invoking is successful. |

- Example normal response

```
{
 "resp": "successful"
}
```

- Abnormal response

## 5.15.9 Querying Database Users of a DB Instance (Discarded)

### Function

This API is used to query database users of a specified DB instance.

- Before calling this API, learn how to [authenticate](#) it.
- Before calling this API, learn about [request header parameters](#).

### Constraints

- This operation cannot be performed when the DB instance is in the abnormal or frozen state.
- Database users of read replicas cannot be queried.

### URI

- URI format  
GET /v3/{project\_id}/instances/{instance\_id}/db\_user
- Parameter description

**Table 5-432** Parameters

| Parameter   | Mandatory | Description                                                                                              |
|-------------|-----------|----------------------------------------------------------------------------------------------------------|
| project_id  | Yes       | Project ID of a tenant in a region.<br>To obtain the value, see <a href="#">Obtaining a Project ID</a> . |
| instance_id | Yes       | Specifies the DB instance ID.                                                                            |

### Request

- Request parameters  
None
- URI example  
GET `https://{endpoint}/v3/0483b6b16e954cb88930a360d2c4e663/instances/dsfae23fsfdsae3435in01/db_user`

### Response

- Normal response

**Table 5-433** Parameters

| Parameter | Type             | Description                                                                                              |
|-----------|------------------|----------------------------------------------------------------------------------------------------------|
| users     | Array of objects | Each element in the list indicates a database account.<br>For details, see <a href="#">Table 5-434</a> . |

**Table 5-434** users element structure description

| Parameter | Type             | Description                                                                                                                  |
|-----------|------------------|------------------------------------------------------------------------------------------------------------------------------|
| name      | String           | Account name.                                                                                                                |
| databases | Array of objects | Each element in the list indicates a database associated with the account.<br>For details, see <a href="#">Table 5-435</a> . |

**Table 5-435** databases element structure description

| Parameter | Type    | Description                                                                                                                                                                                             |
|-----------|---------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| name      | String  | Indicates a database name.                                                                                                                                                                              |
| readonly  | Boolean | Indicates the read-only permission. <ul style="list-style-type: none"><li>• <b>true</b>: indicates the read-only permission.</li><li>• <b>false</b>: indicates the read and write permission.</li></ul> |

## 5.15.10 Querying Database Users

### Function

This API is used to query database users of a specified DB instance.

- Before calling this API, learn how to [authenticate](#) it.
- Before calling this API, learn about [request header parameters](#).

### Constraints

- This operation cannot be performed when the DB instance is in the abnormal or frozen state.
- The database user list of read replicas cannot be queried.

### URI

- URI format  
`GET /v3/{project_id}/instances/{instance_id}/db_user/detail?  
page={page}&limit={limit}`
- Parameter description

**Table 5-436** Parameters

| Parameter  | Mandatory | Description                                                                                              |
|------------|-----------|----------------------------------------------------------------------------------------------------------|
| project_id | Yes       | Project ID of a tenant in a region.<br>To obtain the value, see <a href="#">Obtaining a Project ID</a> . |

| Parameter   | Mandatory | Description                                                                                           |
|-------------|-----------|-------------------------------------------------------------------------------------------------------|
| instance_id | Yes       | Specifies the DB instance ID.                                                                         |
| page        | Yes       | Specifies the page number. The value starts from 1.                                                   |
| limit       | Yes       | Specifies the number of records on each page. The value ranges from 1 (inclusive) to 100 (inclusive). |

## Request

- Request parameters  
None
- URI example  
`GET https://{{endpoint}}/v3/0483b6b16e954cb88930a360d2c4e663/instances/dsfae23fsfdsae3435in01/db_user/detail?page=1&limit=10`

## Response

- Normal response

**Table 5-437** Parameters

| Parameter   | Type             | Description                                                                     |
|-------------|------------------|---------------------------------------------------------------------------------|
| users       | Array of objects | Database account information.<br>For details, see <a href="#">Table 5-438</a> . |
| total_count | Integer          | Total number of database accounts.                                              |

**Table 5-438** users element structure description

| Parameter | Type   | Description                                                                                   |
|-----------|--------|-----------------------------------------------------------------------------------------------|
| name      | String | Account name.                                                                                 |
| comment   | String | Account remarks. This parameter is only available to RDS for MySQL 8.0.25 and later versions. |

| Parameter | Type             | Description                                                                            |
|-----------|------------------|----------------------------------------------------------------------------------------|
| databases | Array of objects | Databases authorized to the account.<br>For details, see <a href="#">Table 5-439</a> . |
| hosts     | Array of strings | Hosts configured for the account.                                                      |

**Table 5-439** databases element structure description

| Parameter | Type    | Description                          |
|-----------|---------|--------------------------------------|
| name      | String  | Database name.                       |
| readonly  | Boolean | Whether the permission is read-only. |

- Example normal response

```

## 5.15.12 Modifying Remarks of a Database Account

### Function

This API is used to modify remarks of a database account for a specified DB instance.

- Before calling this API, learn how to [authenticate](#) it.
- Before calling this API, learn about [request header parameters](#).

### Constraints

- To use this function, contact customer service to apply for the required permissions.
- This operation cannot be performed when the DB instance is in any of the following statuses: creating, changing instance class, changing port, frozen, or abnormal.
- This operation can be performed no matter whether the associated database exists.
  - The remarks will be updated or created when this operation is performed, depending on whether the remarks already exist.
  - The remarks will be deleted if its value is changed to an empty string or null.
  - If the associated database does not exist or is deleted when remarks are created, the remarks will still be saved.
- This operation is supported only for specified kernel versions. If your kernel version does not meet the requirements, upgrade the kernel to the latest version by referring to [Upgrading a Minor Version](#).
  - RDS for MySQL 5.6: Not supported.
  - RDS for MySQL 5.7: Not supported.
  - RDS for MySQL 8.0: 8.0.25 or later.
- For any database and account created using methods other than the RDS console and APIs, if the database name and account name do not meet the database naming rules (see [Table 5-411](#)) and account naming rules (see [Table 5-429](#)), for example, containing Chinese characters or unsupported special characters, the database and account cannot be managed through the RDS console or APIs.
- In migration scenarios, if any database name and account name of the source database do not meet the database naming rules (see [Table 5-411](#)) and account naming rules (see [Table 5-429](#)), the database and account cannot be managed through the RDS console or APIs after being migrated to the destination RDS for MySQL database.

### URI

- URI format

PUT /v3/{project\_id}/instances/{instance\_id}/db-users/{user\_name}/comment

- Parameter description

**Table 5-443** Parameters

| Parameter   | Mandatory | Description                                                                                              |
|-------------|-----------|----------------------------------------------------------------------------------------------------------|
| project_id  | Yes       | Project ID of a tenant in a region.<br>To obtain the value, see <a href="#">Obtaining a Project ID</a> . |
| instance_id | Yes       | Instance ID.                                                                                             |
| user_name   | Yes       | Database username.                                                                                       |

## Request

**Table 5-444** Parameters

| Parameter | Mandatory | Type   | Description                                                            |
|-----------|-----------|--------|------------------------------------------------------------------------|
| comment   | No        | String | Remarks of the database username.<br>Value range: 1 to 512 characters. |

## Example Request

Modify the remarks of user **root** for a DB instance.

```
PUT https://[endpoint]/v3/0483b6b16e954cb88930a360d2c4e663/instances/dsfae23fsfdsae3435in01/db-users/root/comment
{
 "comment": "this is a comment"
}
```

## Response

## 5.15.16 Revoking Permissions of a Database Account

### Function

This API is used to revoke permissions of a database account in a specified DB instance.

- Before calling this API, learn how to [authenticate](#) it.
- Before calling this API, learn about [request header parameters](#).

### Constraints

- This operation cannot be performed when the DB instance is in any of the following statuses: creating, changing instance class, changing port, frozen, or abnormal.
- For any database and account created using methods other than the RDS console and APIs, if the database name and account name do not meet the database naming rules (see [Table 5-411](#)) and account naming rules (see [Table 5-429](#)), for example, containing Chinese characters or unsupported special characters, the database and account cannot be managed through the RDS console or APIs.

- In migration scenarios, if any database name and account name of the source database do not meet the database naming rules (see [Table 5-411](#)) and account naming rules (see [Table 5-429](#)), the database and account cannot be managed through the RDS console or APIs after being migrated to the destination RDS for MySQL database.

## URI

## Status Code

- Normal  
200
- Abnormal  
For details, see [Status Codes](#).

## Error Code

For details, see [Error Codes](#).

## 5.15.17 Resetting the Password for User root

### Function

This API is used to reset the password if you forget the password of your database account when using RDS. If there is a problem with the **root** account, for example, if your **root** account credentials are lost or deleted, you can reset the **root** password to restore access.

- Before calling this API, learn how to [authenticate](#) it.
- Before calling this API, learn about [request header parameters](#).

### Constraints

The password cannot be reset if the DB instance is in any of the following statuses: creating, rebooting, upgrading, changing instance class, creating users, or deleting users.

This API is available to RDS for MySQL and RDS for PostgreSQL only.

### URI

- URI format  
POST /v3/{*project\_id*}/instances/{*instance\_id*}/password
- Parameter description

**Table 5-459** Parameters

| Parameter   | Mandatory | Description                                                                                              |
|-------------|-----------|----------------------------------------------------------------------------------------------------------|
| project_id  | Yes       | Project ID of a tenant in a region.<br>To obtain the value, see <a href="#">Obtaining a Project ID</a> . |
| instance_id | Yes       | Specifies the DB instance ID.                                                                            |

## Request

**Table 5-460** Parameters

| Parameter   | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|-------------|-----------|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| db_user_pwd | Yes       | String | <p>Specifies the database password.</p> <p>Valid value:</p> <p>RDS for MySQL:</p> <p>The value must be 8 to 32 characters long and contain at least three types of the following characters: uppercase letters, lowercase letters, digits, and special characters (~!@#\$%^*-_=+?,()&amp;).</p> <p>RDS for PostgreSQL:</p> <p>The value must be 8 to 32 characters long and contain at least three types of the following characters: uppercase letters, lowercase letters, digits, and special characters (~!@#\$%^*-_=+?,).</p> <p>You are advised to enter a strong password to improve security, preventing security risks such as brute force cracking.</p> |

## Example Request

Reset the password for user **root**.

```
POST https://{endpoint}/v3/0483b6b16e954cb88930a360d2c4e663/instances/dsfae23fsfdsae3435in01/
password
```

```
{
 "db_user_pwd": "*****"
}
```

# 5.16 Database and Account Management (PostgreSQL)

## 5.16.1 Creating a Database

### Function

This API is used to create a database in a specified DB instance.

- Before calling this API, learn how to [authenticate](#) it.
- Before calling this API, learn about [request header parameters](#).

### Constraints

- This operation cannot be performed when the DB instance is in any of the following statuses: creating, changing instance class, changing port, frozen, or abnormal.
- If you create a database using other methods instead of invoking a v3 API, for example, logging in to a node or using a client tool, the database name verification rule is inconsistent with that of the v3 API. As a result, the v3 API may fail to be invoked to perform operations on the database.

### URI

- URI format  
`POST /v3/{project_id}/instances/{instance_id}/database`
- Parameter description

**Table 5-461** Parameters

| Parameter   | Mandatory | Description                                                                                                                                                                                                      |
|-------------|-----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

## 5.16.2 Creating a Database Account

### Function

This API is used to create a database account for a specified DB instance.

- Before calling this API, learn how to [authenticate](#) it.
- Before calling this API, learn about [request header parameters](#).

### Constraints

- This operation cannot be performed when the DB instance is in any of the following statuses: creating, changing instance class, changing port, frozen, or abnormal.
- If you want to call this API repeatedly to create database accounts for your DB instance, call it in serial.

### URI

- URI format  
POST /v3/{project\_id}/instances/{instance\_id}/db\_user
- Parameter description

**Table 5-464** Parameters

| Parameter   | Mandatory | Description                                                                                                                                                                                                      |

| instance_id | Yes       | <b>Definition</b><br>Instance ID.<br><b>Constraints</b><br>N/A<br><b>Range</b><br>N/A<br><b>Default Value</b><br>N/A                                                                                             |

## Request

**Table 5-465 Parameters**

| Parameter | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|-----------|-----------|--------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| name      | Yes       | String | <b>Definition</b><br>Specifies the username of the database account.<br><b>Constraints</b><br>N/A<br><b>Range</b><br>The username contains 1 to 63 characters, including letters, digits, and underscores (_). It cannot start with <b>pg</b> or a digit and must be different from system usernames.<br>System users include <b>rdsAdmin</b> , <b>rdsMetric</b> , <b>rdsBackup</b> , <b>rdsRepl</b> , <b>rdsProxy</b> , and <b>rdsDdm</b> .<br><b>Default Value</b><br>N/A                                                                            |
| password  | Yes       | String | <b>Definition</b><br>Specifies the password of the database account.<br><b>Constraints</b><br>N/A<br><b>Range</b><br>The value must be 8 to 32 characters long and contain at least three types of the following characters: uppercase letters, lowercase letters, digits, and special characters (~!@#%^*-_=+?,.). The value cannot contain the username or the username spelled backwards.<br>You are advised to enter a strong password to improve security, preventing security risks such as brute force cracking.<br><b>Default Value</b><br>N/A |

## Example Request

Creating a database account named **rds**

```
POST https://[endpoint]/v3/0483b6b16e954cb88930a360d2c4e663/instances/
f569f1358436479dbcba8603c32cc4aein03/db_user

{
 "name": "rds",
 "password": "*****"
}
```

## Response

- Normal response

**Table 5-466** Parameters

| Parameter | Type   | Description                                                                                                     |
|-----------|--------|-----------------------------------------------------------------------------------------------------------------|
| resp      | String | <b>Definition</b><br>Calling result.<br><b>Range</b><br>Returns <b>successful</b> if the calling is successful. |

- Example normal response  
{  
 "resp": "successful"  
}
- Abnormal response  
For details, see [Abnormal Request Results](#).

## Status Code

- Normal  
202
- Abnormal  
For details, see [Status Codes](#).

## Error Code

For details, see [Error Codes](#).

## 5.16.3 Creating a Database Schema

### Function

This API is used to create a database schema in a specified DB instance.

- Before calling this API, learn how to [authenticate](#) it.
- Before calling this API, learn about [request header parameters](#).

## Constraints

This operation cannot be performed when the DB instance is in any of the following statuses: creating, changing instance class, changing port, frozen, or abnormal.

## URI

- URI format  
POST /v3/{project\_id}/instances/{*instance\_id*}/schema
- Parameter description

**Table 5-467** Parameters

| Parameter   | Mandatory | Description                                                                                                                                                                                                      |
|-------------|-----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| project_id  | Yes       | <b>Definition</b><br>Project ID of a tenant in a region.<br>To obtain the value, see <a href="#">Obtaining a Project ID</a> .<br><b>Constraints</b><br>N/A<br><b>Range</b><br>N/A<br><b>Default Value</b><br>N/A |
| instance_id | Yes       | <b>Definition</b><br>Instance ID.<br><b>Constraints</b><br>N/A<br><b>Range</b><br>N/A<br><b>Default Value</b><br>N/A                                                                                             |

## Request

**Table 5-468** Parameters

| Parameter | Mandatory | Type             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| db_name   | Yes       | String           | <p><b>Definition</b><br/>Specifies the database name.</p> <p><b>Constraints</b><br/>N/A</p> <p><b>Range</b><br/>The database name can contain 1 to 63 characters. Only letters, digits, and underscores (_) are allowed. It cannot start with <b>pg</b> or a digit and cannot be the same as RDS for PostgreSQL template database names.<br/>RDS for PostgreSQL template databases include <code>postgres</code>, <code>template0</code>, and <code>template1</code>.</p> <p><b>Default Value</b><br/>N/A</p> |
| schemas   | Yes       | Array of objects | <p><b>Definition</b><br/>Each element is the schema information associated with the database. A single request supports a maximum of 20 elements.<br/>For details on the element structure, see <a href="#">Table 5-469</a>.</p> <p><b>Constraints</b><br/>N/A</p>                                                                                                                                                                                                                                            |

**Table 5-469** schemas field data structure description

| Parameter   | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-------------|-----------|--------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| schema_name | Yes       | String | <b>Definition</b><br>Specifies the schema name.<br><b>Constraints</b><br>N/A<br><b>Range</b><br>The value contains 1 to 63 characters, including letters, digits, and underscores (_). It cannot start with <b>pg</b> or a digit, and must be different from RDS for PostgreSQL template database names and existing schema names.<br>RDS for PostgreSQL template databases include postgres, template0, and template1.<br>Existing schemas include public and information_schema.<br><b>Default Value</b><br>N/A |

| Parameter | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                               |
|-----------|-----------|--------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| owner     | Yes       | String | <p><b>Definition</b><br/>Specifies the database owner.</p> <p><b>Constraints</b><br/>N/A</p> <p><b>Range</b><br/>The value contains 1 to 63 characters. It cannot start with <b>pg</b> or a digit, and must be different from system usernames.<br/>System users include <b>rdsAdmin</b>, <b>rdsMetric</b>, <b>rdsBackup</b>, <b>rdsRepl</b>, <b>rdsProxy</b>, and <b>rdsDdm</b>.</p> <p><b>Default Value</b><br/>N/A</p> |

## Example Request

Create a database schema.

```
POST https://{{endpoint}}/v3/0483b6b16e954cb88930a360d2c4e663/instances/f569f1358436479dbcba8603c32cc4aein03/schema

{
 "db_name": "rds_test",
 "schemas": [
 {
 "schema_name": "teste123",
 "owner": "teste123"
 }
]
}
```

## Response

- Normal response

**Table 5-470** Parameters

| Parameter | Type   | Description                                                                                                     |
|-----------|--------|-----------------------------------------------------------------------------------------------------------------|
| resp      | String | <b>Definition</b><br>Calling result.<br><b>Range</b><br>Returns <b>successful</b> if the calling is successful. |

- Example normal response

```
{ "resp": "successful"}
```
- Abnormal response  
For details, see [Abnormal Request Results](#).

## Status Code

- Normal  
200
- Abnormal  
For details, see [Status Codes](#).

For details, see [Error Codes](#).

## 5.16.4 Granting Read or Write Permissions to a Database Account

### Function

This API is used to grant read or write permissions to a database account in a specified DB instance.

- Before calling this API, learn how to [authenticate](#) it.
- Before calling this API, learn about [request header parameters](#).

### Constraints

- This operation cannot be performed when the DB instance is in any of the following statuses: creating, changing instance class, changing port, frozen, or abnormal.
- By default, read-only users have the **create** and **usage** permissions on the public schema.

### URI

- URI format  
POST /v3/{project\_id}/instances/{instance\_id}/db\_privilege

- Parameter description

**Table 5-471** Parameters

| Parameter   | Mandatory | Description                                                                                                                                                                                                      |
|-------------|-----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| project_id  | Yes       | <b>Definition</b><br>Project ID of a tenant in a region.<br>To obtain the value, see <a href="#">Obtaining a Project ID</a> .<br><b>Constraints</b><br>N/A<br><b>Range</b><br>N/A<br><b>Default Value</b><br>N/A |

## 5.16.5 Resetting a Password for a Database Account

### Function

This API is used to reset a password for a database account.

- Before calling this API, learn how to [authenticate](#) it.
- Before calling this API, learn about [request header parameters](#).

### Constraints

The password of a database account cannot be reset if the DB instance is in any of the following statuses: creating, changing instance class, changing port, rebooting, frozen, or abnormal.

## URI

- URI format  
POST /v3/{project\_id}/instances/{instance\_id}/db\_user/resetpwd
- Parameter description

**Table 5-475** Parameters

| Parameter   | Mandatory | Description                                                                                                                                                                                                      |
|-------------|-----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| project_id  | Yes       | <b>Definition</b><br>Project ID of a tenant in a region.<br>To obtain the value, see <a href="#">Obtaining a Project ID</a> .<br><b>Constraints</b><br>N/A<br><b>Range</b><br>N/A<br><b>Default Value</b><br>N/A |

## 5.16.7 Querying Database Users

### Function

This API is used to query database users for a specified DB instance.

- Before calling this API, learn how to [authenticate](#) it.
- Before calling this API, learn about [request header parameters](#).

### Constraints

- This operation cannot be performed when the DB instance is in any of the following statuses: creating, changing instance class, changing port, frozen, or abnormal.
- For any database and account created using methods other than the RDS console and APIs, if the database name and account name do not meet the database naming rules (see [Table 5-411](#)) and account naming rules (see [Table 5-429](#)), for example, containing Chinese characters or unsupported special characters, the database and account cannot be managed through the RDS console or APIs.
- In migration scenarios, if any database name and account name of the source database do not meet the database naming rules (see [Table 5-411](#)) and account naming rules (see [Table 5-429](#)), the database and account cannot be managed through the RDS console or APIs after being migrated to the destination RDS for MySQL database.

### URI

- URI format

GET /v3/{project\_id}/instances/{instance\_id}/db\_user/detail?  
page={page}&limit={limit}

- Parameter description

**Table 5-481** Parameters

| Parameter   | Mandatory | Description                                                                                                                                                                                                      |

## 5.16.8 Querying Database Schemas

### Function

This API is used to query database schemas of a specified DB instance.

- Before calling this API, learn how to [authenticate](#) it.
- Before calling this API, learn about [request header parameters](#).

### Constraints

- This operation cannot be performed when the DB instance is in the abnormal or frozen state.

- The database schemas of read replicas cannot be queried.

## URI

- URI format

GET /v3/{project\_id}/instances/{instance\_id}/schema/detail?  
db\_name={name}&page={page}&limit={limit}

- Parameter description

## Request

**Table 5-494 Parameters**

| Parameter | Mandatory | Type             | Description                                                                                                                                                                           |
|-----------|-----------|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| user      | Yes       | String           | <b>Definition</b><br>Username.<br><b>Constraints</b><br>N/A<br><b>Range</b><br>The username must be different from the name of the built-in user.<br><b>Default Value</b><br>N/A      |
| roles     | Yes       | Array of strings | <b>Definition</b><br>Role name.<br><b>Constraints</b><br>N/A<br><b>Range</b><br>The role name must be different from the names of built-in user roles.<br><b>Default Value</b><br>N/A |

## Example Request

Grant roles **user3** and **user4** to the user **user1**.

```
POST https://rds.ap-southeast-1.myhuaweicloud.com/v3/0483b6b16e954cb88930a360d2c4e663/instances/dsfae23fsfdsae3435in03/db-user-role
{
 "user" : "user1",
 "roles" : ["user3", "user4"]
}
```

## Response

- Normal response

**Table 5-495** Parameters

| Parameter | Type   | Description                                                                                                     |
|-----------|--------|-----------------------------------------------------------------------------------------------------------------|
| resp      | String | <b>Definition</b><br>Calling result.<br><b>Range</b><br>Returns <b>successful</b> if the calling is successful. |

- Example normal response

```
{
 "resp" : "successful"
}
```
- Abnormal response

## Status Code

- Normal  
200
- Abnormal  
For details, see [Status Codes](#).

## Error Code

For details, see [Error Codes](#).

## 5.16.12 Revoking a Role from a User

### Function

This API is used to revoke a role from a user.

- Before calling this API, learn how to [authenticate](#) it.
- Before calling this API, learn about [request header parameters](#).

### Constraints

This operation cannot be performed when the DB instance is in the abnormal or frozen state.

### URI

- URI format  
DELETE /v3/{project\_id}/instances/{instance\_id}/db-user-role
- Parameter description

**Table 5-496** Parameters

| Parameter   | Mandatory | Description                                                                                                                                                                                                      |
|-------------|-----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| project_id  | Yes       | <b>Definition</b><br>Project ID of a tenant in a region.<br>To obtain the value, see <a href="#">Obtaining a Project ID</a> .<br><b>Constraints</b><br>N/A<br><b>Range</b><br>N/A<br><b>Default Value</b><br>N/A |
| instance_id | Yes       | <b>Definition</b><br>Instance ID.<br><b>Constraints</b><br>N/A<br><b>Range</b><br>N/A<br><b>Default Value</b><br>N/A                                                                                             |

## Request

**Table 5-497** Parameters

| Parameter | Mandatory | Type   | Description                                                                                                                                                                    |
|-----------|-----------|--------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| user      | Yes       | String | <b>Definition</b><br>Username.<br><b>Constraints</b><br>N/A<br><b>Range</b><br>The username must be different from the names of built-in users.<br><b>Default Value</b><br>N/A |

| Parameter | Mandatory | Type             | Description                                                                                                                                                                                                  |
|-----------|-----------|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

## 5.16.16 Overwriting pg\_hba.conf

### Function

This API is used to overwrite the **pg\_hba.conf** file with the input configurations. If the input parameters are left blank, the file is overwritten with the default configurations.

- Before calling this API, learn how to [authenticate](#) it.
- Before calling this API, learn about [request header parameters](#).

### URI

- URI format  
POST /v3/{project\_id}/instances/{instance\_id}/hba-info
- Parameter description

**Table 5-509** Parameters

| Parameter   | Mandatory | Description                                                                                                                                                                                                                             |
|-------------|-----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

| Parameter | Type   | Description                                              |
|-----------|--------|----------------------------------------------------------|
| code      | String | <b>Definition</b><br>Result code.<br><b>Range</b><br>N/A |

| Parameter | Type   | Description                                                     |
|-----------|--------|-----------------------------------------------------------------|
| message   | String | <b>Definition</b><br>Result description.<br><b>Range</b><br>N/A |

- Example normal response

```
{
 "code" : 0,
 "message" : ""
}
```
- Abnormal response  
For details, see [Abnormal Request Results](#).

## Status Code

- Normal  
200
- Abnormal  
For details, see [Status Codes](#).

## Error Code

For details, see [Error Codes](#).

## 5.16.18 Querying the pg\_hba.conf Change History of a DB Instance

### Function

This API is used to query the **pg\_hba.conf** change history of a DB instance.

- Before calling this API, learn how to [authenticate](#) it.
- Before calling this API, learn about [request header parameters](#).

### URI

- URI format  
GET /v3/{project\_id}/instances/{instance\_id}/hba-info/history
- Parameter description

**Table 5-517** Parameters

| Parameter   | Mandatory | Description                                                                                                                                                                                                                             |
|-------------|-----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| project_id  | Yes       | <p><b>Definition</b><br/>Project ID of a tenant in a region.<br/>To obtain the value, see <a href="#">Obtaining a Project ID</a>.</p> <p><b>Constraints</b><br/>N/A</p> <p><b>Range</b><br/>N/A</p> <p><b>Default Value</b><br/>N/A</p> |
| instance_id | Yes       | <p><b>Definition</b><br/>Instance ID.</p> <p><b>Constraints</b><br/>N/A</p> <p><b>Range</b><br/>N/A</p> <p><b>Default Value</b><br/>N/A</p>                                                                                             |

**Table 5-518** Request parameters

| Parameter  | Mandatory | Type   | Description                                                                                                                                                                                                                             |
|------------|-----------|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| start_time | No        | String | <p><b>Definition</b><br/>Start time.</p> <p><b>Constraints</b><br/>N/A</p> <p><b>Range</b><br/>N/A</p> <p><b>Default Value</b><br/>If this parameter is not specified, 00:00 (UTC time zone) on the current day is used by default.</p> |

| Parameter | Mandatory | Type   | Description                                                                                                                                                                                                                   |
|-----------|-----------|--------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| end_time  | No        | String | <p><b>Definition</b><br/>End time.</p> <p><b>Constraints</b><br/>N/A</p> <p><b>Range</b><br/>N/A</p> <p><b>Default Value</b><br/>If this parameter is not specified, the current time (UTC time zone) is used by default.</p> |

# 5.17 Database and Account Management (Microsoft SQL Server)

## 5.17.1 Querying the Available SQL Server Character Set

### Function

This API is used to query the SQL Server character set list.

- Before calling this API, learn how to **authenticate** it.
- Before calling this API, learn about **request header parameters**.

## URI

- URI format  
GET /v3/{project\_id}/collations
- Parameter description

**Table 5-523** Parameters

| Parameter  | Mandatory | Description                                                                                                                                                                                                      |
|------------|-----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| project_id | Yes       | <b>Definition</b><br>Project ID of a tenant in a region.<br>To obtain the value, see <a href="#">Obtaining a Project ID</a> .<br><b>Constraints</b><br>N/A<br><b>Range</b><br>N/A<br><b>Default Value</b><br>N/A |

## Request

- Request parameters  
None
- URI example  
GET https://{endpoint}/v3/0483b6b16e954cb88930a360d2c4e663/collations

## Response

- Normal response

**Table 5-524** Parameters

| Parameter | Type         | Description                                                                               |
|-----------|--------------|-------------------------------------------------------------------------------------------|
| charSets  | List<String> | <b>Definition</b><br>Indicates the character set information list.<br><b>Range</b><br>N/A |

- Example normal response

```
{
 "charSets": ["Chinese_PRC_CI_AS", "SQL_Latin1_General_CI_AS", "French_BIN",
 "Chinese_PRC_Stroke_BIN", "Chinese_PRC_CI_AI"]
}
```

## Status Code

- Normal

200

- Abnormal

For details, see [Status Codes](#).

## Error Code

For details, see [Error Codes](#).

## 5.17.2 Creating a Database

### Function

This API is used to create a database in a specified DB instance.

- Before calling this API, learn how to [authenticate](#) it.
- Before calling this API, learn about [request header parameters](#).

### Constraints

This operation cannot be performed when the DB instance is in any of the following statuses: creating, changing instance class, changing port, frozen, or abnormal.

### URI

- URI format

POST /v3/{project\_id}/instances/{instance\_id}/database

- Parameter description

**Table 5-525** Parameters

| Parameter   | Mandatory | Description                                                                                                                                                                                                      |
|-------------|-----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| project_id  | Yes       | <b>Definition</b><br>Project ID of a tenant in a region.<br>To obtain the value, see <a href="#">Obtaining a Project ID</a> .<br><b>Constraints</b><br>N/A<br><b>Range</b><br>N/A<br><b>Default Value</b><br>N/A |
| instance_id | Yes       | <b>Definition</b><br>Instance ID.<br><b>Constraints</b><br>N/A<br><b>Range</b><br>N/A<br><b>Default Value</b><br>N/A                                                                                             |

## Request

**Table 5-526 Parameters**

| Parameter | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|-----------|-----------|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| name      | Yes       | String | <b>Definition</b><br>Specifies the database name.<br><b>Constraints</b><br>N/A<br><b>Range</b><br>The database name can contain 1 to 64 characters, and can include letters, digits, hyphens (-), underscores (_), and periods (.). It cannot start or end with an RDS for SQL Server system database name.<br>RDS for SQL Server system databases include master, msdb, model, tempdb, resource, and rdsadmin.<br><b>Default Value</b><br>N/A |

## Example Request

Create a database named **rds-test**.

```
POST https://[endpoint]/v3/0483b6b16e954cb88930a360d2c4e663/instances/
a8abe84a41364097be7c233c39275087in04/database
{

## 5.17.4 Creating a Database Account

### Function

This API is used to create a database account for a specified DB instance.

- Before calling this API, learn how to [authenticate](#) it.
- Before calling this API, learn about [request header parameters](#).

### Constraints

- This operation cannot be performed when the DB instance is in any of the following statuses: creating, changing instance class, changing port, frozen, or abnormal.
- If you want to call this API repeatedly to create database accounts for your DB instance, call it in serial.

### URI

- URI format  
`POST /v3/{project_id}/instances/{instance_id}/db_user`
- Parameter description

**Table 5-531** Parameters

| Parameter  | Mandatory | Description                                                                                                                                                                                                      |

## Status Code

- Normal  
202
- Abnormal  
For details, see [Status Codes](#).

## Error Code

For details, see [Error Codes](#).

## 5.17.5 Configuring a Password for a Database Account

### Function

This API is used to configure a password for a database account.

- Before calling this API, learn how to [authenticate](#) it.
- Before calling this API, learn about [request header parameters](#).

### Constraints

- This operation cannot be performed when the DB instance is in any of the following statuses: creating, changing instance class, changing port, frozen, or abnormal.
- For any database and account created using methods other than the RDS console and APIs, if the database name and account name do not meet the database naming rules (see [Table 5-532](#)) and account naming rules (see [Table 5-535](#)), for example, containing Chinese characters or unsupported special characters, the database and account cannot be managed through the RDS console or APIs.

### URI

- URI format  
`POST /v3/{project_id}/instances/{instance_id}/db_user/resetpwd`
- Parameter description

**Table 5-534** Parameters

| Parameter   | Mandatory | Description                                                                                                                                                                                                                             |
|-------------|-----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| project_id  | Yes       | <p><b>Definition</b><br/>Project ID of a tenant in a region.<br/>To obtain the value, see <a href="#">Obtaining a Project ID</a>.</p> <p><b>Constraints</b><br/>N/A</p> <p><b>Range</b><br/>N/A</p> <p><b>Default Value</b><br/>N/A</p> |
| instance_id | Yes       | <p><b>Definition</b><br/>Instance ID.</p> <p><b>Constraints</b><br/>N/A</p> <p><b>Range</b><br/>N/A</p> <p><b>Default Value</b><br/>N/A</p>                                                                                             |

## Request

**Table 5-535** Parameters

| Parameter | Mandatory | Type   | Description                                                                                                                                                      |

## 5.17.8 Deleting a Database Account

### Function

This API is used to delete a database account from a specified DB instance.

- Before calling this API, learn how to **authenticate** it.
- Before calling this API, learn about **request header parameters**.

## Constraints

This operation cannot be performed when the DB instance is in any of the following statuses: creating, changing instance class, changing port, frozen, or abnormal.

## URI

- URI format  
`DELETE /v3/{project_id}/instances/{instance_id}/db_user/{user_name}`
- Parameter description

**Table 5-543** Parameters

| Parameter   | Mandatory | Description                                                                                                                                                                                                      |
|-------------|-----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| project_id  | Yes       | <b>Definition</b><br>Project ID of a tenant in a region.<br>To obtain the value, see <a href="#">Obtaining a Project ID</a> .<br><b>Constraints</b><br>N/A<br><b>Range</b><br>N/A<br><b>Default Value</b><br>N/A |
| instance_id | Yes       | <b>Definition</b><br>Instance ID.<br><b>Constraints</b><br>N/A<br><b>Range</b><br>N/A<br><b>Default Value</b><br>N/A                                                                                             |

| Parameter | Mandatory | Description                                                                                                                                                                         |

# 5.18 Parameter Management

## 5.18.1 Obtaining a Parameter Template List

### Function

This API is used to obtain the parameter template list, including default parameter templates of all databases and those created by users.

- Before calling this API, learn how to [authenticate](#) it.
- Before calling this API, learn about [request header parameters](#).

### Constraints

- The following DB engines are supported: MySQL, PostgreSQL, and Microsoft SQL Server.

### URI

- URI format  
GET /v3/{*project\_id*}/configurations
- Parameter description

**Table 5-560** Parameters

| Parameter  | Mandatory | Description                                                                                                                                                                                                      |
|------------|-----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| project_id | Yes       | <b>Definition</b><br>Project ID of a tenant in a region.<br>To obtain the value, see <a href="#">Obtaining a Project ID</a> .<br><b>Constraints</b><br>N/A<br><b>Range</b><br>N/A<br><b>Default Value</b><br>N/A |

## Request

## 5.18.2 Creating a Parameter Template

### Function

This API is used to create a parameter template and configure the name, description, DB engine, and parameter values in the parameter template.

- Before calling this API, learn how to **authenticate** it.
- Before calling this API, learn about **request header parameters**.

## Constraints

- The following DB engines are supported: MySQL, PostgreSQL, and Microsoft SQL Server.
- The new parameter template cannot have the same name as any existing parameter template.

## URI

- URI format  
POST /v3/{project\_id}/configurations
- Parameter description

**Table 5-563** Parameters

| Parameter  | Mandatory | Description                                                                                                                                                                                                      |

## Example Request

Create a parameter template named **configuration\_test**.

```
POST https://{endpoint}/v3/0483b6b16e954cb88930a360d2c4e663/configurations
{
 "name": "configuration_test",
 "description": "configuration_test",
 "values": {
 "div_precision_increment": "6",
 "connect_timeout": "20"
 },
 "datastore": {
 "type": "mysql",
 "version": "5.7"
 }
}
```

## Response

- Normal response

### 5.18.3 Modifying a Parameter Template

#### Function

This API is used to modify a specified parameter template, including the name, description, and values of specified parameters in the parameter template.

- Before calling this API, learn how to [authenticate](#) it.
- Before calling this API, learn about [request header parameters](#).

## Constraints

- The following DB engines are supported: MySQL, PostgreSQL, and Microsoft SQL Server.
- The new parameter template name must be different from the name of an existing or a default parameter template. Default parameter templates cannot be modified.
- The values of the edited parameters must be within the default value range of the specified database version. For details about the range of parameter values, see "Modifying Parameters" in the *Relational Database Service User Guide*.
- Modifying sensitive parameters, for example, `lower_case_table_names`, is risky. For details, see "[Suggestions on RDS for MySQL Parameter Tuning](#)" in the *Relational Database Service User Guide*.
- The parameter values to be changed cannot be left blank at the same time.

## URI

- URI format  
`PUT /v3/{project_id}/configurations/{config_id}`
- Parameter description

**Table 5-568** Parameters

| name        | Yes       | String | <p><b>Definition</b><br/>Name of the new parameter template.</p> <p><b>Constraints</b><br/>The name can contain 1 to 64 characters. It is case-sensitive and can contain only letters, digits, periods (.), underscores (_), and hyphens (-).</p> <p><b>Range</b><br/>N/A</p> <p><b>Default Value</b><br/>N/A</p> |
| description | No        | String | <p><b>Definition</b><br/>Description of the new parameter template.</p> <p><b>Constraints</b><br/>The description can contain 0 to 256 characters and cannot contain the following characters: ! &lt; &gt; = &amp; " '</p> <p><b>Range</b><br/>N/A</p> <p><b>Default Value</b><br/>N/A</p>                        |

## Example Request

Replicate a parameter template and name the new template **copy\_by\_v31**.

```
POST https://[endpoint]/v3/054e292c9880d4992f02c0196d3ea468/configurations/
66251c9024774eeb9edd8663a4cbb0a1pr04/copy
{
 "name" : "copy_by_v31",
 "description" : "copy"
}
```

# 5.19 Extension Management (RDS for PostgreSQL)

## 5.19.1 Creating an Extension

### Function

This API is used to create an extension for a specified database.

- Before calling this API, learn how to [authenticate](#) it.
- Before calling this API, learn about [request header parameters](#).

### Constraints

This operation cannot be performed when the DB instance is in any of the following statuses: creating, changing instance class, changing port, frozen, or abnormal.

### URI

- URI format  
POST /v3/{project\_id}/instances/{instance\_id}/extensions
- Parameter description

**Table 5-585** Parameters

| Parameter  | Mandatory | Description                                                                                                                                                                                                      |
|------------|-----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| project_id | Yes       | <b>Definition</b><br>Project ID of a tenant in a region.<br>To obtain the value, see <a href="#">Obtaining a Project ID</a> .<br><b>Constraints</b><br>N/A<br><b>Range</b><br>N/A<br><b>Default Value</b><br>N/A |

| Parameter   | Mandatory | Description                                                                                                          |
|-------------|-----------|----------------------------------------------------------------------------------------------------------------------|
| instance_id | Yes       | <b>Definition</b><br>Instance ID.<br><b>Constraints</b><br>N/A<br><b>Range</b><br>N/A<br><b>Default Value</b><br>N/A |

## Request

**Table 5-586** Parameters

| Parameter      | Mandatory | Type   | Description                                                                                                             |
|----------------|-----------|--------|-------------------------------------------------------------------------------------------------------------------------|
| database_name  | Yes       | String | <b>Definition</b><br>Database name.<br><b>Constraints</b><br>N/A<br><b>Range</b><br>N/A<br><b>Default Value</b><br>N/A  |
| extension_name | Yes       | String | <b>Definition</b><br>Extension name.<br><b>Constraints</b><br>N/A<br><b>Range</b><br>N/A<br><b>Default Value</b><br>N/A |

## Example Request

Create the extension **pg\_stat\_statements** for database **db1**.

```
POST https://{endpoint}/v3/0483b6b16e954cb88930a360d2c4e663/instances/f569f1358436479dbcba8603c32cc4aein03/extensions
```

```
{
```

```
 "database_name" : "db1",
 "extension_name" : "pg_stat_statements"
}
```

## Response

- Example normal response  
{}  
• Abnormal response  
For details, see [Abnormal Request Results](#).

## Status Code

- Normal  
200
- Abnormal  
For details, see [Status Codes](#).

## Error Code

For details, see [Error Codes](#).

## 5.19.2 Querying Extensions

### Function

This API is used to obtain extension information of a specified database.

- Before calling this API, learn how to [authenticate](#) it.
- Before calling this API, learn about [request header parameters](#).

### Constraints

This operation cannot be performed when the DB instance is in any of the following statuses: creating, changing instance class, changing port, frozen, or abnormal.

### URI

- URI format  
`GET /v3/{project_id}/instances/{instance_id}/extensions?  
database_name={database_name}&offset={offset}&limit={limit}`
- Parameter description

**Table 5-587** Parameters

| Parameter     | Mandatory | Description                                                                                                                                                                                                                                                                                                                 |
|---------------|-----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| project_id    | Yes       | <b>Definition</b><br>Project ID of a tenant in a region.<br>To obtain the value, see <a href="#">Obtaining a Project ID</a> .<br><b>Constraints</b><br>N/A<br><b>Range</b><br>N/A<br><b>Default Value</b><br>N/A                                                                                                            |
| instance_id   | Yes       | <b>Definition</b><br>Instance ID.<br><b>Constraints</b><br>N/A<br><b>Range</b><br>N/A<br><b>Default Value</b><br>N/A                                                                                                                                                                                                        |
| database_name | Yes       | <b>Definition</b><br>Database name.<br><b>Constraints</b><br>N/A<br><b>Range</b><br>N/A<br><b>Default Value</b><br>N/A                                                                                                                                                                                                      |
| offset        | No        | <b>Definition</b><br>Index offset. The query starts from the next piece of data indexed by this parameter.<br><b>Constraints</b><br>N/A<br><b>Range</b><br>The value must be a non-negative number.<br><b>Default Value</b><br>The default value is <b>0</b> , indicating that the query starts from the first data record. |

| Parameter | Mandatory | Description                                                                                                                                                       |
|-----------|-----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| limit     | No        | <p><b>Definition</b><br/>Number of records to be queried.</p> <p><b>Constraints</b><br/>N/A</p> <p><b>Range</b><br/>1–100</p> <p><b>Default Value</b><br/>100</p> |

## Request

- Request parameters  
None
- URI example  
GET `https://{endpoint}/v3/0483b6b16e954cb88930a360d2c4e663/instances/f569f1358436479dbcba8603c32cc4aein03/extensions?database_name=db1`

## Response

- Normal response

**Table 5-588** Parameters

| Parameter   | Type             | Description                                                                                    |
|-------------|------------------|------------------------------------------------------------------------------------------------|

## 5.19.5 Modifying the Value of a Specified Parameter for an Instance

### Function

This API is used to modify the value of a specified parameter for an instance.

- Before calling this API, learn how to [authenticate](#) it.
- Before calling this API, learn about [request header parameters](#).

### Constraints

- This operation cannot be performed when the DB instance is in the abnormal or frozen state.
- Parameters of read replicas cannot be modified.
- Only the value of [shared\\_preload\\_libraries](#) can be modified.

### URI

- URI format  
`PUT /v3/{project_id}/instances/{instance_id}/parameter/{name}`
- Parameter description

**Table 5-594** Parameters

| Parameter  | Mandatory | Description                                                                                                                                                                                                      |
|------------|-----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| project_id | Yes       | <b>Definition</b><br>Project ID of a tenant in a region.<br>To obtain the value, see <a href="#">Obtaining a Project ID</a> .<br><b>Constraints</b><br>N/A<br><b>Range</b><br>N/A<br><b>Default Value</b><br>N/A |

| Parameter   | Mandatory | Description                                                                                                                                                                                                  |
|-------------|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| instance_id | Yes       | <b>Definition</b><br>Instance ID.<br><b>Constraints</b><br>N/A<br><b>Range</b><br>N/A<br><b>Default Value</b><br>N/A                                                                                         |
| name        | Yes       | <b>Definition</b><br>Parameter name.<br><b>Constraints</b><br>N/A<br><b>Range</b><br>Only the <b>shared_preload_libraries</b> parameter can be modified.<br><b>Default Value</b><br>shared_preload_libraries |

## Request

**Table 5-595** Parameters

| Parameter | Mandatory | Type   | Description                                                                                                              |
|-----------|-----------|--------|--------------------------------------------------------------------------------------------------------------------------|
| value     | Yes       | String | <b>Definition</b><br>Parameter value.<br><b>Constraints</b><br>N/A<br><b>Range</b><br>N/A<br><b>Default Value</b><br>N/A |

## Example Request

Change the value of **shared\_preload\_libraries** for a DB instance.

```
PUT https://[endpoint]/v3/054e292c9880d4992f02c0196d3ea468/instances/
f569f1358436479dbcba8603c32cc4aein03/parameter/shared_preload_libraries
```

```
{
 "value" : "passwordcheck.so,pg_stat_statements,pg_sql_history"
}
```

## Response

- Normal response

**Table 5-596** Parameters

| Parameter        | Type    | Description                                                                                                                                                                                                                                              |

## 5.19.6 Obtaining the Value of a Specified Parameter for an Instance

### Function

This API is used to obtain the value of a specified parameter for an instance.

- Before calling this API, learn how to [authenticate](#) it.
- Before calling this API, learn about [request header parameters](#).

### Constraints

- This operation cannot be performed when the instance is in the abnormal or frozen state.
- Only the value of **shared\_preload\_libraries** can be queried.

### URI

- URI format  
`GET /v3/{project_id}/instances/{instance_id}/parameter/{name}`
- Parameter description

**Table 5-597** Parameters

| Parameter   | Mandatory | Description                                                                                                                                                                                                      |
|-------------|-----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| project_id  | Yes       | <b>Definition</b><br>Project ID of a tenant in a region.<br>To obtain the value, see <a href="#">Obtaining a Project ID</a> .<br><b>Constraints</b><br>N/A<br><b>Range</b><br>N/A<br><b>Default Value</b><br>N/A |

## 5.20.2 Querying the Recovery Time Window of WAL Logs

### Function

This API is used to query the recovery time window of WAL logs for a read replica. After this API is called, a recovery time window (**recovery\_min\_time**, **recovery\_max\_time**) is returned. The interval is left-open and right-closed. You can change the value of **recovery\_target\_time** to a time point in the time window to set the target replay time. For details about how to modify instance parameters, see [Modifying Parameters of a Specified Instance](#).

- Before calling this API, learn how to [authenticate](#) it.
- Before calling this API, learn about [request header parameters](#).

## Constraints

- To use this function, contact customer service to obtain the permission required for configuring replication delay for a read replica.
- This API is available only to read replicas of RDS for PostgreSQL 12 or later.

## URI

- URI format  
GET /v3/{project\_id}/instances/{instance\_id}/recovery-time
- Parameter description

**Table 5-601** Parameters

| Parameter   | Mandatory | Description                                                                                                                                                                                                                             |
|-------------|-----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

### 5.20.3 Pausing or Resuming WAL Log Replay

#### Function

This API is used to pause or resume WAL replay on a read replica.

If WAL replay is paused but streaming replication is still in progress, WAL data will continue to be received by the read replica and will eventually fill up the storage. This depends on how long the replay is paused for, how quick WAL logs are generated, and how much available storage there is in your instance.

- Before calling this API, learn how to [authenticate](#) it.

- Before calling this API, learn about [request header parameters](#).

## Constraints

- To use this function, contact customer service to obtain required permissions.
- This function is only available to read replicas of RDS for PostgreSQL 12 and later versions.

## URI

- URI format  
`PUT /v3/{project_id}/instances/{instance_id}/log-replay/update`
- Parameter description

**Table 5-603** Parameters

| Parameter   | Mandatory | Description                                                                                                                                                                                                      |
|-------------|-----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| project_id  | Yes       | <b>Definition</b><br>Project ID of a tenant in a region.<br>To obtain the value, see <a href="#">Obtaining a Project ID</a> .<br><b>Constraints</b><br>N/A<br><b>Range</b><br>N/A<br><b>Default Value</b><br>N/A |

### 5.21.3 Querying Instances in the Recycle Bin

#### Function

This API is used to query instances in the recycle bin.

- Before calling this API, learn how to [authenticate](#) it.
- Before calling this API, learn about [request header parameters](#).

#### URI

- URI format  
GET /v3/{project\_id}/recycle-instances?offset={offset}&limit={limit}

- Parameter description

**Table 5-621** Parameters

| Parameter  | Mandatory | Description                                                                                                                                                                                                                                               |
|------------|-----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| project_id | Yes       | <p><b>Definition</b><br/>Project ID of a tenant in a region.<br/>To obtain the value, see <a href="#">Obtaining a Project ID</a>.</p> <p><b>Constraints</b><br/>N/A</p> <p><b>Range</b><br/>N/A</p> <p><b>Default Value</b><br/>N/A</p>                   |
| offset     | Yes       | <p><b>Definition</b><br/>Index offset. The query starts from the next piece of data indexed by this parameter.</p> <p><b>Constraints</b><br/>N/A</p> <p><b>Range</b><br/>The value must be a non-negative number.</p> <p><b>Default Value</b><br/>N/A</p> |
| limit      | Yes       | <p><b>Definition</b><br/>Number of records on each page.</p> <p><b>Constraints</b><br/>N/A</p> <p><b>Range</b><br/>[1, 50]</p> <p><b>Default Value</b><br/>N/A</p>                                                                                        |

## Request

- Parameter description
  - None
- URI example
  - GET `https://rds.ap-southeast-1.myhuaweicloud.com/v3/054ea741f700d4a32f1bc00f5c80dd4c/recycle-instances?offset=0&limit=10`

## Response

- Normal response

| action    | Yes       | String           | <b>Definition</b><br>Operation identifier.<br><b>Constraints</b><br>N/A<br><b>Range</b><br>The value is case-sensitive and is <b>create</b> for tag creation.<br><b>Default Value</b><br>N/A |
| tags      | Yes       | Array of objects | <b>Definition</b><br>Tag list. A maximum of 20 tags can be added for each instance.<br>For details, see <a href="#">Table 5-626</a> .<br><b>Constraints</b><br>N/A                           |

**Table 5-626** tags field data structure description

| Parameter | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                      |
|-----------|-----------|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| key       | Yes       | String | <b>Definition</b><br>Tag key.<br><b>Constraints</b><br>N/A<br><b>Range</b><br>The value must consist of 1 to 128 Unicode characters.<br>It can contain letters, digits, spaces, and special characters _.:=-@. However, it cannot start or end with a space, or start with _sys_.<br><b>Default Value</b><br>N/A |
| value     | Yes       | String | <b>Definition</b><br>Tag value.<br><b>Constraints</b><br>N/A<br><b>Range</b><br>It can be left blank or contain a maximum of 255 Unicode characters.<br>It can contain letters, digits, spaces, and special characters _.:=-@.<br><b>Default Value</b><br>N/A                                                    |

## Example Request

Add tags **key1** and **key2** for a DB instance.

```
POST https://{endpoint}/v3/0483b6b16e954cb88930a360d2c4e663/instances/
cee5265e1e5845649e354841234567dfin01/tags/action
```

```
{
 "action": "create",
 "tags": [
 {"key": "key1",
 "value": "value1"},
 {"key": "key2",
 "value": "value2"}
]
}
```

## Response

- Parameter description

**Table 5-640** Parameters

| Parameter  | Mandatory | Type    | Description                                                                                                                                                                                                                                                                                                              |
|------------|-----------|---------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| project_id | Yes       | String  | <p><b>Definition</b><br/>Project ID of a tenant in a region.<br/>To obtain the value, see <a href="#">Obtaining a Project ID</a>.</p> <p><b>Constraints</b><br/>N/A</p> <p><b>Range</b><br/>N/A</p> <p><b>Default Value</b><br/>N/A</p>                                                                                  |
| offset     | No        | Integer | <p><b>Definition</b><br/>Index offset.</p> <p><b>Constraints</b><br/>N/A</p> <p><b>Range</b><br/>The query starts from the next piece of data indexed by this parameter. The value must be a number and cannot be a negative number.</p> <p><b>Default Value</b><br/>0: The query starts from the first data record.</p> |
| limit      | No        | Integer | <p><b>Definition</b><br/>Number of records returned by a query.</p> <p><b>Constraints</b><br/>N/A</p> <p><b>Range</b><br/>The value must be a positive integer ranging from 1 to 50.</p> <p><b>Default Value</b><br/>10</p>                                                                                              |

| Parameter     | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|---------------|-----------|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| instance_id   | No        | String | <p><b>Definition</b><br/>Instance ID, which can be used for filtering.</p> <p><b>Constraints</b><br/>N/A</p> <p><b>Range</b><br/>N/A</p> <p><b>Default Value</b><br/>N/A</p>                                                                                                                                                                                                                                                                                                                                                                                                      |
| instance_name | No        | String | <p><b>Definition</b><br/>Instance name, which can be used for filtering.</p> <p><b>Constraints</b><br/>N/A</p> <p><b>Range</b><br/>N/A</p> <p><b>Default Value</b><br/>N/A</p>                                                                                                                                                                                                                                                                                                                                                                                                    |
| status        | No        | String | <p><b>Definition</b><br/>Task status, which can be used for filtering.</p> <p><b>Constraints</b><br/>N/A</p> <p><b>Range</b></p> <ul style="list-style-type: none"> <li>• <b>Initing:</b> The task is being initialized.</li> <li>• <b>Pending:</b> The task is pending.</li> <li>• <b>Running:</b> The task is running.</li> <li>• <b>Completed:</b> The task is complete.</li> <li>• <b>Failed:</b> The task failed.</li> <li>• <b>Unauthorized:</b> The task is unauthorized.</li> <li>• <b>Canceled:</b> The task is canceled.</li> </ul> <p><b>Default Value</b><br/>N/A</p> |

| Parameter  | Mandatory | Type   | Description                                                                                                                                                                                                                                            |
|------------|-----------|--------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| start_time | No        | String | <p><b>Definition</b><br/>Task start time.</p> <p><b>Constraints</b><br/>If <b>start_time</b> is specified, <b>end_time</b> is mandatory. The value is in the UTC timestamp format.</p> <p><b>Range</b><br/>N/A</p> <p><b>Default Value</b><br/>N/A</p> |
| end_time   | No        | String | <p><b>Definition</b><br/>Task end time.</p> <p><b>Constraints</b><br/>If <b>start_time</b> is specified, <b>end_time</b> is mandatory. The value is in the UTC timestamp format.</p> <p><b>Range</b><br/>N/A</p> <p><b>Default Value</b><br/>N/A</p>   |

## Request

None

## Example Request

```
GET https://{{Endpoint}}/v3/54623db08b174c858ba779d2aa7923a3/schedule-tasks?
offset=1&limit=3&instance_id=43e4feaab48f11e89039fa163ebaa7e4in04&instance_name=sqlserver_instance
&start_time=1747919701390&end_time=1748524501390
```

## Response

- Normal response

**Table 5-641** Parameters

| Parameter      | Type             | Description                                                                                     |
|----------------|------------------|-------------------------------------------------------------------------------------------------|
| schedule_tasks | Array of objects | <p><b>Definition</b><br/>Scheduled task list. For details, see <a href="#">Table 5-642</a>.</p> |

| Parameter   | Type    | Description                                                        |
|-------------|---------|--------------------------------------------------------------------|
| total_count | Integer | <b>Definition</b><br>Total number of tasks.<br><b>Range</b><br>N/A |

**Table 5-642** schedule\_tasks field description

| Parameter     | Type   | Description                                                 |
|---------------|--------|-------------------------------------------------------------|
| id            | String | <b>Definition</b><br>Task ID.<br><b>Range</b><br>N/A        |
| name          | String | <b>Definition</b><br>Task name.<br><b>Range</b><br>N/A      |
| instance_id   | String | <b>Definition</b><br>Instance ID.<br><b>Range</b><br>N/A    |
| instance_name | String | <b>Definition</b><br>Instance name.<br><b>Range</b><br>N/A  |
| engine_name   | String | <b>Definition</b><br>DB engine name.<br><b>Range</b><br>N/A |

| Parameter       | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|-----------------|--------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| instance_status | String | <p><b>Definition</b><br/>Instance status.</p> <p><b>Range</b></p> <ul style="list-style-type: none"> <li>• <b>BUILD</b>: The instance is being created.</li> <li>• <b>CREATE FAIL</b>: The instance failed to be created.</li> <li>• <b>ACTIVE</b>: The instance is normal.</li> <li>• <b>FAILED</b>: The instance is abnormal.</li> <li>• <b>FROZEN</b>: The instance is frozen.</li> <li>• <b>MODIFYING</b>: The instance is being scaled up.</li> <li>• <b>REBOOTING</b>: The instance is being rebooted.</li> <li>• <b>RESTORING</b>: The instance is being restored.</li> <li>• <b>MODIFYING INSTANCE TYPE</b>: The instance is being changed to primary/standby.</li> <li>• <b>SWITCHOVER</b>: A primary/standby switchover is being performed.</li> <li>• <b>MIGRATING</b>: The instance is being migrated.</li> <li>• <b>BACKING UP</b>: The instance is being backed up.</li> <li>• <b>MODIFYING DATABASE PORT</b>: The database port is being changed.</li> <li>• <b>STORAGE FULL</b>: The instance storage is full.</li> </ul> |
| project_id      | String | <p><b>Definition</b><br/>Project ID.</p> <p><b>Range</b><br/>N/A</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| Parameter   | Type   | Description                                                                                                                                                                                                                                                                                                                               |
|-------------|--------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| create_time | String | <p><b>Definition</b><br/>Task creation time in the "yyyy-mm-ddThh:mm:ssZ" format.<br/><b>T</b> is the separator between the calendar and the hourly notation of time. <b>Z</b> indicates the time zone offset. For example, in the Beijing time zone, the time zone offset is shown as <b>+0800</b>.</p> <p><b>Range</b><br/>N/A</p>      |
| start_time  | String | <p><b>Definition</b><br/>Planned task start time in the "yyyy-mm-ddThh:mm:ssZ" format.<br/><b>T</b> is the separator between the calendar and the hourly notation of time. <b>Z</b> indicates the time zone offset. For example, in the Beijing time zone, the time zone offset is shown as <b>+0800</b>.</p> <p><b>Range</b><br/>N/A</p> |
| end_time    | String | <p><b>Definition</b><br/>Planned task end time in the "yyyy-mm-ddThh:mm:ssZ" format.<br/><b>T</b> is the separator between the calendar and the hourly notation of time. <b>Z</b> indicates the time zone offset. For example, in the Beijing time zone, the time zone offset is shown as <b>+0800</b>.</p> <p><b>Range</b><br/>N/A</p>   |
| order       | String | <p><b>Definition</b><br/>Task priority.</p> <p><b>Range</b><br/>An integer ranging from 1 to 100. A smaller value indicates a higher priority.</p>                                                                                                                                                                                        |

| Parameter      | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|----------------|--------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| status         | String | <p><b>Definition</b><br/>Task status.</p> <p><b>Range</b></p> <ul style="list-style-type: none"> <li>• <b>Initing</b>: The task is being initialized.</li> <li>• <b>Pending</b>: The task is pending.</li> <li>• <b>Running</b>: The task is running.</li> <li>• <b>Completed</b>: The task is complete.</li> <li>• <b>Failed</b>: The task failed.</li> <li>• <b>Unauthorized</b>: The task is unauthorized.</li> <li>• <b>Canceled</b>: The task is canceled.</li> <li>• <b>Deleted</b>: The task is deleted.</li> </ul> |

### 5.24.3 Obtaining Information About a Task with a Specified ID

#### Function

This API is used to obtain information about a task with a specified ID in the task center.

- Before calling this API, learn how to [authenticate](#) it.
- Before calling this API, learn about [request header parameters](#).

#### Constraints

- RDS jobs are asynchronous. After a job is generated, it takes several seconds to query the job ID.
- This API is used to query only asynchronous tasks of the last one month in the task center.
- Information of the following asynchronous tasks can be obtained: creating a single-node or primary/standby DB instance, creating a read replica, deleting a DB instance, changing a single-node DB instance to primary/standby DB instance, switching a primary/standby DB instance, scaling up storage space, binding or unbinding an EIP, restoring data to a new DB instance, migrating a standby RDS for MySQL DB instance to another AZ, upgrading a minor version of an RDS for MySQL DB instance, restoring table data to a specified time point for an RDS for MySQL DB instance, and changing an instance class.

#### URI

- URI format  
GET /v3/{project\_id}/jobs?id={id}
- Parameter description

**Table 5-647** Parameters

| Parameter  | Mandatory | Description                                                                                                                                                                                                      |

### NOTE

In the response example, some tasks in the task center are used as examples.

- Example normal response

Creating a DB instance:

```
{
 "job": {
 "id": "31b8ae23-c687-4d80-b7b4-42a66c9bb886",
 "name": "CreateMysqlSingleHAIInstance",
 "status": "Completed",
 "created": "2018-08-06T10:41:14+0000",
 "ended": "2018-08-06T16:41:14+0000",
 "process": "",
 "instance": {
 "id": "a48e43ff268f4c0e879652d65e63d0fb01",
 "name": "DO-NOT-TOUCH-mgr2-mysql-single"
 },
 "entities": {
 "instance": {
 "endpoint": "192.168.1.203:3306",
 "type": "Single",
 "datastore": {
 "type": "mysql",
 "version": "5.7"
 }
 },
 "resource_ids": ["a48e43ff268f4c0e879652d65e63d0fb01.vm",
 "a48e43ff268f4c0e879652d65e63d0fb01.volume"]
 }
 }
}
```

Creating a read replica:

```
{
 "job": {
 "id": "31b8ae23-c687-4d80-b7b4-42a66c9bb886",
 "name": "CreateMysqlReplicaInstance",
 "status": "Completed",
 "created": "2018-08-06T10:41:14+0000",
 "ended": "2018-08-06T16:41:14+0000",
 "process": "",
 "instance": {
 "id": "288caaa9d05f4ec1a1f58de2e0945685in01",
 "name": "mysql-replica"
 }
 }
}
```

```
"entities": {
 "instance": {
 "endpoint": "192.168.1.203:3306",
 "type": "replica",
 "datastore": {
 "type": "mysql",
 "version": "5.7"
 },
 "replica_of": "a48e43ff268f4c0e879652d65e63d0fb01"
 },
 "resource_ids": ["288caaa9d05f4ec1a1f58de2e0945685in01.vm",
 "288caaa9d05f4ec1a1f58de2e0945685in01.volume"]
}
}
```

#### Binding an EIP:

```
{
 "job": {
 "id": "31b8ae23-c687-4d80-b7b4-42a66c9bb886",
 "name": "MysqlBindEIP",
 "status": "Completed",
 "created": "2018-08-06T10:41:14+0000",
 "ended": "2018-08-06T16:41:14+0000",
 "process": "",
 "instance": {
 "id": "a48e43ff268f4c0e879652d65e63d0fb01",
 "name": "DO-NOT-TOUCH-mgr2-mysql-single"
 },
 "entities": {
 "public_ip": "10.10.10.1"
 }
 }
}
```

#### Rebooting a DB instance:

```
{
 "job": {
 "id": "31b8ae23-c687-4d80-b7b4-42a66c9bb886",
 "name": "RestartMysqlInstance",
 "status": "Completed",
 "created": "2018-08-06T10:41:14+0000",
 "ended": "2018-08-06T16:41:14+0000",
 "process": "",
 "instance": {
 "id": "a48e43ff268f4c0e879652d65e63d0fb01",
 "name": "DO-NOT-TOUCH-mgr2-mysql-single"
 },
 "entities": {}
 }
}
```

#### Task being executed:

```
{
 "job": {
 "id": "31 b8ae23 - c687 - 4 d80 - b7b4 - 42 a66c9bb886",
 "name": "CreateMysqlSingleHAIInstance", "status": "Running",
 "created": "2018-08-06T10:41:14+0000",
 "process": "60% ",
 "instance": {
 "id": "a48e43ff268f4c0e879652d65e63d0fb01",
 "name": "DO-NOT-TOUCH-mgr2-mysql-single"
 },
 "entities": {
 "instance": {
 "type": "Single",
 "datastore": {
 "type": "mysql",
 "version": "5.7"
 }
 }
 }
}
```

```
 }
 }
}

Task fails to be executed:
{
 "job": {
 "id": "31 b8ae23 - c687 - 4 d80 - b7b4 - 42 a66c9bb886",
 "name": "CreateMysqlSingleHAIInstance",
 "status": "Failed",
 "created": "2018-08-06T10:41:14+0000",
 "ended": "2018-08-06T16:41:14+0000",
 "process": "",
 "instance": {
 "id": "a48e43ff268f4c0e879652d65e63d0fb01",
 "name": "DO-NOT-TOUCH-mgr2-mysql-single"
 },
 "entities": {
 "instance": {
 "type": "Single",
 "datastore": {
 "type": "mysql",
 "version": "5.7"
 }
 }
 },
 "fail_reason": "createVM failed."
 }
}
{
 "job": {
 "id": "31 b8ae23 - c687 - 4 d80 - b7b4 - 42 a66c9bb886",
 "name": "CreatePostgresqlSingleHAIInstance",
 "status": "Failed",
 "created": "2018-08-06T10:41:14+0000",
 "ended": "2018-08-06T16:41:14+0000",
 "process": "",
 "instance": {
 "id": "a48e43ff268f4c0e879652d65e63d0fb01",
 "name": "DO-NOT-TOUCH-mgr2-postgresql-single"
 },
 "entities": {

## 5.24.4 Obtaining Task Information of a Specified DB Instance in a Specified Time Range (RDS for SQL Server)

### Function

This API is used to obtain the task information list of a specified SQL Server DB instance ID within a specified time range.

- Before calling this API, learn how to [authenticate](#) it.
- Before calling this API, learn about [request header parameters](#).

### Constraints

- This API is used to query asynchronous tasks of the last one month in the task center.
- Information of the following asynchronous tasks can be obtained: creating single or primary/standby DB instances, creating read replicas, changing single DB instances to primary/standby instances, switching primary/standby DB instances, scaling up storage space, creating automated or manual backups, restoring data to original, existing, or new DB instances.

### URI

- URI format  
`GET /v3/{project_id}/instances/{instance_id}/tasklist/detail?  
start_time={start_time}&end_time={end_time}`
- Parameter description

**Table 5-655** Parameters

| Parameter  | Mandatory | Description                                                                                                                                                                                                      |
|------------|-----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| project_id | Yes       | <b>Definition</b><br>Project ID of a tenant in a region.<br>To obtain the value, see <a href="#">Obtaining a Project ID</a> .<br><b>Constraints</b><br>N/A<br><b>Range</b><br>N/A<br><b>Default Value</b><br>N/A |

| Parameter   | Mandatory | Description                                                                                                                                     |
|-------------|-----------|-------------------------------------------------------------------------------------------------------------------------------------------------|

# 6 Historical APIs

## 6.1 API v3

### 6.1.1 Querying API Versions

#### Function

This API is used to query the API versions supported by RDS.

**This API will be unavailable on March 31, 2025. You are advised to switch workloads to the new API ([Querying API Versions](#)) before then.**

- Before calling this API, learn how to [authenticate](#) it.
- Before calling this API, learn about [request header parameters](#).

#### URI

- URI format  
GET /rds
- Parameter description  
None

#### Request

- Request parameters  
None
- URI example  
GET https://{{endpoint}}/rds

#### Response

- Normal response

**Table 6-1** Parameters

| Parameter | Type             | Description                                                                                             |
|-----------|------------------|---------------------------------------------------------------------------------------------------------|
| versions  | Array of objects | Indicates the list of detailed API version information.<br>For details, see <a href="#">Table 6-2</a> . |

**Table 6-2** versions field data structure description

| Parameter | Type             | Description                                                                                                                                                                                                                        |
|-----------|------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| id        | String           | Indicates the API version.<br>Valid values: <ul style="list-style-type: none"><li>• <b>v1</b>: indicates the API v1 version.</li><li>• <b>v3</b>: indicates the API v3 version.</li></ul>                                          |
| links     | Array of objects | Indicates the API link information. The value is empty when the version is v1 or v3.<br>For details, see <a href="#">Table 6-3</a> .                                                                                               |
| status    | String           | Indicates the version status. <ul style="list-style-type: none"><li>• <b>CURRENT</b>: indicates that the version is recommended.</li><li>• <b>DEPRECATED</b>: indicates a deprecated version which may be deleted later.</li></ul> |

| Parameter | Type   | Description                                                                                                                                                                                                |
|-----------|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| updated   | String | Indicates the version update time in the "yyyy-mm-dd Thh:mm:ssZ" format.<br><br>T is the separator between the calendar and the hourly notation of time. Z indicates the Coordinated Universal Time (UTC). |

**Table 6-3** links field data structure description

| Parameter | Type   | Description                                                             |
|-----------|--------|-------------------------------------------------------------------------|
| href      | String | Indicates the API URL and the value is "".                              |
| rel       | String | Its value is <b>self</b> , indicating that <b>href</b> is a local link. |

### 6.1.2 Upgrading a Minor Version

#### Function

This API is used to upgrade minor versions of RDS for MySQL or RDS for PostgreSQL instances.

**This API will be unavailable on September 14, 2025. You are advised to switch workloads to the new API ([Upgrading the Minor Version of a DB Instance](#)) before then.**

- Before calling this API, learn how to [authenticate](#) it.
- Before calling this API, learn about [request header parameters](#).

#### Constraints

This API is supported for MySQL and PostgreSQL DB engines.

The constraints on minor version upgrades for RDS for PostgreSQL are as follows:

- The minor version cannot be upgraded for instances with abnormal nodes.
- The following minor versions cannot be upgraded:
  - Versions earlier than 11.2 for RDS for PostgreSQL 11
  - The upgrade will be performed immediately upon the submission of your request. Delayed upgrade of minor versions is not supported.

#### URI

- URI format  
POST /v3/{project\_id}/instances/{instance\_id}/action/db-upgrade
- Parameter description

**Table 6-4** Parameters

| Parameter   | Mandatory | Description                                                                                              |
|-------------|-----------|----------------------------------------------------------------------------------------------------------|
| project_id  | Yes       | Project ID of a tenant in a region.<br>To obtain the value, see <a href="#">Obtaining a Project ID</a> . |
| instance_id | Yes       | Instance ID.                                                                                             |

#### Request

Parameter description

**Table 6-5** Parameters

| Parameter | Mandatory | Type    | Description                                                                                                                                                                                                                                                                                   |
|-----------|-----------|---------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| delay     | No        | Boolean | Whether to delay the upgrade until the maintenance window. <ul style="list-style-type: none"><li>• <b>true</b>: Delay the upgrade. The instance will be upgraded during the specified maintenance window.</li><li>• <b>false</b>: Upgrade the instance immediately (default value).</li></ul> |

## Example Request

Upgrading the minor version of a DB instance

```
POST https://[endpoint]/v3/054ea741f700d4a32f1bc00f5c80dd4c/instances/
5b409baece064984a1b3eef6addae50cin01/action/db-upgrade
{
 "delay":false
}
```

## Response

- Normal response

**Table 6-6** Parameters

| Parameter | Type   | Description |
|-----------|--------|-------------|
| job_id    | String | Job ID.     |

- Example normal response

```
{
 "job_id": "2b414788a6004883a02390e2eb0ea227"
}
```
- Abnormal response

## 6.1.3 Applying a Parameter Template

### Function

This API is used to apply a parameter template to one or more DB instances.

**This API will be unavailable on March 31, 2025. You are advised to switch workloads to the new API ([Applying a Parameter Template](#)) before then.**

- Before calling this API, learn how to [authenticate](#) it.
- Before calling this API, learn about [request header parameters](#).

### Constraints

- The following DB engines are supported: MySQL, PostgreSQL, and Microsoft SQL Server.

### URI

- URI format  
`PUT /v3/{project_id}/configurations/{config_id}/apply`
- Parameter description

**Table 6-7** Parameters

| Parameter  | Mandatory | Description                                                                                              |
|------------|-----------|----------------------------------------------------------------------------------------------------------|
| project_id | Yes       | Project ID of a tenant in a region.<br>To obtain the value, see <a href="#">Obtaining a Project ID</a> . |
| config_id  | Yes       | Parameter template ID.                                                                                   |

### Request

Parameter description

**Table 6-8** Parameters

| Parameter    | Mandatory | Type             | Description   |
|--------------|-----------|------------------|---------------|
| instance_ids | Yes       | Array of strings | Instance IDs. |

### Example Request

```
https://{endpoint}/v3/0483b6b16e954cb88930a360d2c4e663/configurations/463b4b58-d0e8-4e2b-9560-5dea4552fde9/apply
```

```
{
```

```

### 6.1.4 Modifying Parameters of a Specified DB Instance

#### Function

This API is used to modify parameters in the parameter template of a specified DB instance.

**This API will be unavailable on March 31, 2025. You are advised to switch workloads to the new API ([Modifying Parameters of a Specified Instance](#)) before then.**

- Before calling this API, learn how to **authenticate** it.
- Before calling this API, learn about **request header parameters**.

## Constraints

- The following DB engines are supported: MySQL, PostgreSQL, and Microsoft SQL Server.
- The values of the edited parameters must be within the default value range of the specified database version. For details about the range of parameter values, see "Modifying Parameters" in the *Relational Database Service User Guide*.
- Modifying sensitive parameters, for example, `lower_case_table_names`, is risky. For details, see "**Suggestions on RDS for MySQL Parameter Tuning**" in the *Relational Database Service User Guide*.

## URI

- URI format  
`PUT /v3/{project_id}/instances/{instance_id}/configurations`
- Parameter description

**Table 6-11** Parameters

| Parameter   | Mandatory | Description                                                                                                            |
|-------------|-----------|------------------------------------------------------------------------------------------------------------------------|
| project_id  | Yes       | Specifies the project ID of a tenant in a region.<br>To obtain the value, see <a href="#">Obtaining a Project ID</a> . |
| instance_id | Yes       | Specifies the DB instance ID.                                                                                          |

## 6.1.5 Restoring Data to an Existing DB Instance

### Function

This API is used to restore a database to an existing DB instance.

**This API will be unavailable on March 31, 2025. You are advised to switch workloads to the new API ([Restoring Data to an Existing DB Instance](#)) before then.**

- Before calling this API, learn how to [authenticate](#) it.

- Before calling this API, learn about [request header parameters](#).

## Constraints

- Microsoft SQL Server supports batch calling of this API to restore one database to an existing DB instance.
- This API does not support RDS for PostgreSQL instance restoration.
- When data is restored to an existing DB instance, the API has the following constraints:
  - The DB engine of the original DB instance must be the same as that of the target DB instance. For example, if the original DB instance is running MySQL, the target DB instance must also run MySQL.
  - The target DB instance version must be later than or equal to that of the source instance. For example, MySQL 5.7.25 DB instance can be restored to MySQL 5.7.27 DB instance. For constraints of Microsoft SQL Server, see [Table 6-14](#).
  - For RDS for MySQL, the total storage space of the target DB instance must be greater than or equal to that of the original DB instance.
  - Cross-region restoration is not supported.
  - For RDS for MySQL DB instances, when data is restored to an existing DB instance, the case sensitivity setting of the existing DB instance must be the same as that of the original DB instance. Otherwise, the restoration may fail.
- When data is restored to an original DB instance:  
This API is supported only for MySQL and Microsoft SQL Server DB engines.

**Table 6-14** Restoring to the DB engine versions supported by RDS for SQL Server

| Original DB Engine Version | Restore To                                                           |

| Parameter    | Mandatory | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                        |
|--------------|-----------|---------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| instance_id  | Yes       | String  | Specifies the DB instance ID.                                                                                                                                                                                                                                                                                                                                                                      |
| type         | No        | String  | Specifies the restoration mode. Enumerated values include: <ul style="list-style-type: none"><li>● <b>backup</b>: indicates using backup files for restoration. In this mode, <b>type</b> is not mandatory and <b>backup_id</b> is mandatory.</li><li>● <b>timestamp</b>: indicates the point-in-time restoration mode. In this mode, <b>type</b> and <b>restore_time</b> are mandatory.</li></ul> |
| backup_id    | No        | String  | Specifies the ID of the backup used to restore data. This parameter must be specified when the backup file is used for restoration.                                                                                                                                                                                                                                                                |
| restore_time | No        | Integer | Specifies the time point of data restoration in the UNIX timestamp. The unit is millisecond and the time zone is UTC.                                                                                                                                                                                                                                                                              |

| Parameter     | Mandatory | Type                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|---------------|-----------|---------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| database_name | No        | Map<String, String> | <p>This parameter applies only to the Microsoft SQL Server DB engine.</p> <ul style="list-style-type: none"><li>• If this parameter is specified, you can restore all or specific databases and rename new databases.</li><li>• If this parameter is not specified, all databases are restored by default.</li><li>• You can enter multiple new database names and separate them with commas (,). The new database names can contain but cannot be the same as the original database names.</li><li>• Note the following when you are specifying new database names:<ul style="list-style-type: none"><li>- New database names must be different from the original database names. If they are left blank, the original database names will be used for restoration by default.</li><li>- Check whether new database names are case sensitive based on the character set selected during instance creation and make sure each new database name is unique.</li><li>- The total number of new and existing databases on the existing or original DB instances where data is restored cannot exceed the database quota specified by <b>rds_databases_quota</b>.</li><li>- New database names cannot contain the following fields (case-insensitive): rdsadmin, master, msdb, tempdb, model, and resource.</li><li>- New database names must consist of 1 to 64 characters, including only letters, digits, underscores (_), and hyphens (-). If you want to restore data to multiple new databases, separate them with commas (,).</li><li>- New database names must be different from any database names on the original DB instance.</li><li>- New database names must be different from any database names on the existing or original DB instances where data is restored.</li></ul></li></ul> |

| Parameter | Mandatory | Type | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

|           |           |      | <p>Example:<br/>         "database_name": {"Original database name": "New database name"}</p> <p>Correct example: "database_name": {"A": "A,A1,A2", "B": "B1,B2", "C": ""}</p> <p>Wrong example: "database_name": {"A": "A", "B": "B1,B2", "C": "B1,C1", "D": "D1,d1"},<br/>         Error causes are as follows:</p> <ol style="list-style-type: none"> <li>1. The new database name (A) is the same as the original database name (A).</li> <li>2. The new database name (B1) is not unique.</li> <li>3. When the database name is case insensitive, the database names D1 and d1 conflict.</li> </ol> <ul style="list-style-type: none"> <li>• Exercise caution when restoring data to an existing or original DB instance.</li> </ul> <p><b>NOTICE</b><br/>         Before the restoration, make sure that the size of the restored data does not exceed the purchased disk capacity. Expand disk capacity, if necessary.</p> |

**Table 6-18** target field data structure description

| Parameter   | Mandatory | Type   | Description                                                               |
|-------------|-----------|--------|---------------------------------------------------------------------------|
| instance_id | Yes       | String | Specifies the ID of the DB instance where the backup will be restored to. |

## Example Request

Use backup files for restoration:

MySQL:

```
https://{{endpoint}}/v3/0483b6b16e954cb88930a360d2c4e663/instances/recovery
{
 "source": {
 "instance_id": "d8e6ca5a624745bcb546a227aa3ae1cf01",
 "type": "backup",
 "backup_id": "2f4ddb93-b901-4b08-93d8-1d2e472f30fe"
 },
 "target": {
 "instance_id": "d8e6ca5a624745bcb546a227aa3ae1cf01"
 }
}
```

Microsoft SQL Server:

```
{
 "source": {
 "instance_id": "61879e6085bc44d1831b0ce62d988fd9in04",
 "type": "backup",
 "backup_id": "b021670e69ba4538b7b2ed07257306aebr04",
 "database_name": {
 "db1": "dbtest1",
 "db2": ""
 }
 },
 "target": {
 "instance_id": "d8e6ca5a624745bcb546a227aa3ae1cf04"
 }
}
```

Use PITR for restoration:

MySQL:

```
{
 "source": {
 "instance_id": "d8e6ca5a624745bcb546a227aa3ae1cf01",
 "type": "timestamp",
 "restore_time": 1532001446987
 },
 "target": {
 "instance_id": "d8e6ca5a624745bcb546a227aa3ae1cf01"
 }
}
```

Microsoft SQL Server:

```
{
 "source": {
 "instance_id": "61879e6085bc44d1831b0ce62d988fd9in04",
 "type": "timestamp",
 "restore_time": 1532001446987,
 "database_name": {
 "db1": "dbtest1,dbtest2",
 "db2": "db2,db02",
 "db3": ""
 }
 },
 "target": {
 "instance_id": "d8e6ca5a624745bcb546a227aa3ae1cf04"
 }
}
```

## Response

- Normal response

**Table 6-19** Parameters

| Parameter | Type   | Description           |
|-----------|--------|-----------------------|
| job_id    | String | Indicates the job ID. |

- Example normal response

```
{
 "job_id": "ff80808157127d9301571bf8160c001d"
}
```

- Abnormal response

For details, see [Status Codes](#).

## Error Code

For details, see [Error Codes](#).

## 6.1.6 Restoring Tables to a Specified Point in Time (RDS for MySQL)

### Function

To ensure data integrity and reduce impact on the original instance performance, the system restores the full and incremental data at the selected time point to a temporary DB instance, automatically exports the tables to be restored, and then restores the tables to the original DB instance.

**This API will be unavailable on September 14, 2025. You are advised to switch workloads to the new API ([Restoring Tables to a Specified Point in Time \(RDS for MySQL\)](#)) before then.**

- Before calling this API, learn how to [authenticate](#) it.
- Before calling this API, learn about [request header parameters](#).

### Constraints

- This API is supported for RDS for MySQL only.
- This operation will generate restored tables on the original DB instance. Ensure that the original DB instance has sufficient storage capacity.
- This API is not supported for RDS for MySQL 8.0 DB instances.

### URI

- URI format  
POST /v3/{project\_id}/instances/{instance\_id}/restore/tables
- Parameter description

**Table 6-20** Parameters

| Parameter   | Mandatory | Description                                                                                              |
|-------------|-----------|----------------------------------------------------------------------------------------------------------|
| project_id  | Yes       | Project ID of a tenant in a region.<br>To obtain the value, see <a href="#">Obtaining a Project ID</a> . |
| instance_id | Yes       | Specifies the DB instance ID.                                                                            |

## Request

**Table 6-21** Parameters

| Parameter       | Mandatory | Type             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|-----------------|-----------|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| restoreTime     | Yes       | Long             | Backup time point.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| restoreTables   | Yes       | Array of objects | Database information. For details, see <a href="#">Table 6-22</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| is_fast_restore | No        | Boolean          | <p>Whether to use fast restoration. The value can be <b>true</b> or <b>false</b>.</p> <ul style="list-style-type: none"><li>To set this parameter, check whether fast restoration is supported by referring to <a href="#">Checking Whether Fast Restoration Can Be Used for Restoring Databases or Tables (RDS for MySQL)</a>. If fast restoration is supported, but there are XA transactions in the DB instance, set this parameter to <b>false</b> to prevent data loss.</li><li>If this parameter is not specified, the system determines whether to use fast restoration based on the query result of <a href="#">Checking Whether Fast Restoration Can Be Used for Restoring Databases or Tables (RDS for MySQL)</a>. If fast restoration is supported, but there are XA transactions in the DB instance, set this parameter to <b>false</b>.</li></ul> |

**Table 6-22** restoreTables field data structure description

| Parameter | Mandatory | Type             | Description                                                                    |
|-----------|-----------|------------------|--------------------------------------------------------------------------------|
| database  | Yes       | String           | Specifies the database name.                                                   |
| tables    | Yes       | Array of objects | Specifies the table information. For details, see <a href="#">Table 6-23</a> . |

**Table 6-23** tables field data structure description

| Parameter | Mandatory | Type   | Description                                               |
|-----------|-----------|--------|-----------------------------------------------------------|
| oldName   | Yes       | String | Specifies the original table name before the restoration. |
| newName   | Yes       | String | Specifies the table name after the restoration.           |

## Example Request

Restoring table data to a specific point in time

```
POST https://{endpoint}/v3/0483b6b16e954cb88930a360d2c4e663/instances/dsfae23fsfdsae3435in01/
restore/tables

{
 "restoreTime": 1583720991838,
 "restoreTables": [
 {
 "database": "restoretst",
 "tables": [
 {
 "oldName": "test",
 "newName": "test_1583720991838"
 }
]
 }
]
}
```

## Response

- Normal response

**Table 6-24** Response body parameters

| Parameter | Type   | Description            |
|-----------|--------|------------------------|
| jobId     | String | Indicates the task ID. |

- Example normal response

```
{
 "jobId": "7b55d6ca-dc8e-4844-a9da-6c53a1506db3"
}
```

- Abnormal response

### 6.1.7 Deleting a Database (RDS for SQL Server)

#### Function

This API is used to delete a database from a specified DB instance.

**This API will be unavailable on March 31, 2025. You are advised to switch workloads to the new API ([Deleting a Database \(RDS for SQL Server\)](#)) before then.**

- Before calling this API, learn how to [authenticate](#) it.
- Before calling this API, learn about [request header parameters](#).

#### Constraints

This operation cannot be performed when the DB instance is in any of the following statuses: creating, changing instance class, changing port, frozen, or abnormal.

#### URI

- URI format  
`DELETE /v3/{project_id}/instances/{instance_id}/database/{db_name}`
- Parameter description

**Table 6-25 Parameters**

| Parameter   | Mandatory | Description                                                                                                            |
|-------------|-----------|------------------------------------------------------------------------------------------------------------------------|
| project_id  | Yes       | Specifies the project ID of a tenant in a region.<br>To obtain the value, see <a href="#">Obtaining a Project ID</a> . |
| instance_id | Yes       | Specifies the DB instance ID.                                                                                          |
| db_name     | Yes       | Specifies the name of the database to be deleted.                                                                      |

#### Request

Parameter description

**Table 6-26** Parameters

| Parameter       | Mandatory | Type    | Description                                                                          |
|-----------------|-----------|---------|--------------------------------------------------------------------------------------|
| is_force_delete | No        | Boolean | Specifies whether to forcibly delete a database. The default value is <b>false</b> . |

## Example Request

```
https://{{endpoint}}/v3/0483b6b16e954cb88930a360d2c4e663/instances/
a8abe84a41364097be7c233c39275087in04/database/rds-test
{
 "is_force_delete" : false
}
```

## Response

- Normal response

**Table 6-27** Parameters

| Parameter | Type   | Description                                              |
|-----------|--------|----------------------------------------------------------|
| resp      | String | Returns <b>successful</b> if the invoking is successful. |

- Example normal response  
{  
 "resp": "successful"  
}
- Abnormal response  
For details, see [Abnormal Request Results](#).

## Status Code

- Normal  
200
- Abnormal  
For details, see [Status Codes](#).

For details, see [Error Codes](#).

## 6.1.8 Shrinking Database Logs (Not Recommended)

### Function

This API is used to shrink database logs of an RDS for SQL Server instance.

**This API will be unavailable on December 30, 2024. You are advised to switch workloads to the new API ([Shrinking Database Logs](#)) before then.**

- Before calling this API, learn how to [authenticate](#) it.
- Before calling this API, learn about [request header parameters](#).

### URI

- URI format  
POST /v3/{project\_id}/instances/{instance\_id}/db\_shrink
- Parameter description

**Table 6-28** Parameters

| Parameter   | Mandatory | Description                                                                                              |
|-------------|-----------|----------------------------------------------------------------------------------------------------------|
| project_id  | Yes       | Project ID of a tenant in a region.<br>To obtain the value, see <a href="#">Obtaining a Project ID</a> . |
| instance_id | Yes       | Instance ID.                                                                                             |

### Request

**Table 6-29** Parameters

| Parameter | Mandatory | Type   | Description    |
|-----------|-----------|--------|----------------|
| db_name   | Yes       | String | Database name. |

### Example Request

Shrinking database logs

```
POST https://{endpoint}/v3/0483b6b16e954cb88930a360d2c4e663/instances/161e33e453954e21acfff65bfa3dbfebin04/db_shrink
{
 "db_name": "test1"
}
```

## Response

- Normal response

**Table 6-30** Parameters

| Parameter | Type   | Description                                                                                              |
|-----------|--------|----------------------------------------------------------------------------------------------------------|
| resp      | String | Returns <b>successful</b> if the invoking is successful, or returns <b>failed</b> if the invoking fails. |

- Example normal response

```
{ "resp": "successful"
```
- Abnormal response  
For details, see [Abnormal Request Results](#).

## Status Code

- Normal  
200
- Abnormal  
For details, see [Status Codes](#).

## Error Code

For details, see [Error Codes](#).

## 6.1.9 Database Proxy (PostgreSQL)

### 6.1.9.1 Enabling Database Proxy

#### Function

This API is used to enable database proxy for a specified DB instance.

**This API will be unavailable on April 30, 2024.**

- Before calling this API, learn how to [authenticate](#) it.
- Before calling this API, learn about [request header parameters](#).

#### Constraints

- To use database proxy, contact customer service to apply for the required permissions.
- Only RDS for PostgreSQL 11 and 12 are supported.
- DB instances must be deployed in primary/standby mode, and at least one read replica is available.

## URI

- URI format  
POST /v3/{*project\_id*}/instances/{*instance\_id*}/proxy
- Parameter description

**Table 6-31** Parameters

| Parameter   | Mandatory | Description                                                                                                            |
|-------------|-----------|------------------------------------------------------------------------------------------------------------------------|
| project_id  | Yes       | Specifies the project ID of a tenant in a region.<br>To obtain the value, see <a href="#">Obtaining a Project ID</a> . |
| instance_id | Yes       | Specifies the DB instance ID.                                                                                          |

## Request

Parameter description

**Table 6-32** Parameters

| Parameter | Mandatory | Type    | Description                                                                             |
|-----------|-----------|---------|-----------------------------------------------------------------------------------------|
| flavor_id | No        | String  | Flavor ID.                                                                              |
| node_num  | No        | Integer | Number of nodes.<br>This parameter can be only set to <b>2</b> if it is not left blank. |

## Example Request

```
https://{{endpoint}}/v3/0483b6b16e954cb88930a360d2c4e663/instances/
f569f1358436479dbcba8603c32cc4aein03/proxy
{
 "flavor_id": "rds.pg.proxy.c6.large.2.ha",
 "node_num": 2
}
```

## Response

- Normal response

**Table 6-33** Parameters

| Parameter   | Type   | Description                |
|-------------|--------|----------------------------|
| workflow_id | String | Indicates the workflow ID. |

- Example normal response

```
{ "workflow_id": "e7a7535b-eb9b-45ac-a83a-020dc5016d94"}
}
```
- Abnormal response  
For details, see [Abnormal Request Results](#).

## Status Code

- Normal  
202
- Abnormal  
For details, see [Status Codes](#).

## Error Code

For details, see [Error Codes](#).

### 6.1.9.2 Disabling Database Proxy

#### Function

This API is used to disable database proxy for a specified DB instance.

**This API will be unavailable on April 30, 2024.**

- Before calling this API, learn how to [authenticate](#) it.
- Before calling this API, learn about [request header parameters](#).

#### Constraints

- Only RDS for PostgreSQL 11 and 12 are supported.
- Database proxy of DB instance has been enabled.

#### URI

- URI format  
`DELETE /v3/{project_id}/instances/{instance_id}/proxy`
- URI example  
`https://[endpoint]/v3/0483b6b16e954cb88930a360d2c4e663/instances/f569f1358436479dbcba8603c32cc4aein03/proxy`
- Parameter description

**Table 6-34** Parameters

| Parameter  | Mandatory | Description                                                                                                            |
|------------|-----------|------------------------------------------------------------------------------------------------------------------------|
| project_id | Yes       | Specifies the project ID of a tenant in a region.<br>To obtain the value, see <a href="#">Obtaining a Project ID</a> . |

| Parameter   | Mandatory | Description                   |
|-------------|-----------|-------------------------------|
| instance_id | Yes       | Specifies the DB instance ID. |

## Request

None

## Response

- Normal response

**Table 6-35** Parameters

| Parameter   | Type   | Description                |
|-------------|--------|----------------------------|
| workflow_id | String | Indicates the workflow ID. |

- Example normal response

```
{ "workflow_id": "e7a7535b-eb9b-45ac-a83a-020dc5016d94" }
```
- Abnormal response  
For details, see [Abnormal Request Results](#).

## Status Code

- Normal  
202
- Abnormal  
For details, see [Status Codes](#).

## Error Code

For details, see [Error Codes](#).

### 6.1.9.3 Querying Information About Database Proxy

#### Function

This API is used to query information about the database proxy of a specified DB instance.

**This API will be unavailable on April 30, 2024.**

- Before calling this API, learn how to [authenticate](#) it.
- Before calling this API, learn about [request header parameters](#).

## Constraints

- Only PostgreSQL 11 and PostgreSQL 12 are supported.
- A database proxy must have been enabled for the DB instance.

## URI

- URI format  
GET /v3/{*project\_id*}/instances/{*instance\_id*}/proxy
- URI example  
[https://\[endpoint\]/v3/0483b6b16e954cb88930a360d2c4e663/instances/f569f1358436479dbcba8603c32cc4aein03/proxy](https://[endpoint]/v3/0483b6b16e954cb88930a360d2c4e663/instances/f569f1358436479dbcba8603c32cc4aein03/proxy)
- Parameter description

**Table 6-36** Parameters

| Parameter          | Mandatory | Description                                                                                                            |
|--------------------|-----------|------------------------------------------------------------------------------------------------------------------------|
| <i>project_id</i>  | Yes       | Specifies the project ID of a tenant in a region.<br>To obtain the value, see <a href="#">Obtaining a Project ID</a> . |
| <i>instance_id</i> | Yes       | Specifies the DB instance ID.                                                                                          |

## Request

None

## Response

- Normal response

**Table 6-37** Parameters

| Parameter          | Type             | Description                                                                                |
|--------------------|------------------|--------------------------------------------------------------------------------------------|
| proxy              | Object           | Indicates the proxy instance information.<br>For details, see <a href="#">Table 6-38</a> . |
| master_instance    | Object           | Indicates the primary instance information.<br>For details, see <a href="#">Table 6-39</a> |
| readonly_instances | Array of objects | Indicates read replica information.<br>For details, see <a href="#">Table 6-40</a> .       |

| Parameter                     | Type             | Description                                                                                                                                                                                                                                                                                                   |
|-------------------------------|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| pool_id                       | String           | Indicates the proxy instance ID.                                                                                                                                                                                                                                                                              |
| status                        | String           | Indicates whether the proxy instance is enabled. The value can be any of the following: <ul style="list-style-type: none"><li>• <b>open</b></li><li>• <b>closed</b></li><li>• <b>frozen</b></li><li>• <b>opening</b></li><li>• <b>closing</b></li><li>• <b>freezing</b></li><li>• <b>unfreezing</b></li></ul> |
| address                       | String           | Indicates the proxy read/write splitting address.                                                                                                                                                                                                                                                             |
| elb_vip                       | String           | Indicates the virtual IP address in ELB mode.                                                                                                                                                                                                                                                                 |
| eip                           | String           | Indicates the EIP.                                                                                                                                                                                                                                                                                            |
| port                          | Integer          | Indicates the proxy port.                                                                                                                                                                                                                                                                                     |
| pool_status                   | String           | Indicates the proxy instance status. The value can be any of the following: <ul style="list-style-type: none"><li>• <b>abnormal</b></li><li>• <b>normal</b></li><li>• <b>creating</b></li><li>• <b>deleted</b></li></ul>                                                                                      |
| delay_threshold_in_kilo bytes | Integer          | Indicates the delay threshold (KB).                                                                                                                                                                                                                                                                           |
| cpu                           | String           | Indicates the number of CPUs of a proxy instance.                                                                                                                                                                                                                                                             |
| mem                           | String           | Indicates the memory of a proxy instance.                                                                                                                                                                                                                                                                     |
| node_num                      | Integer          | Indicates the number of a proxy node.                                                                                                                                                                                                                                                                         |
| nodes                         | Array of objects | Indicates the proxy node information.<br>For details, see <a href="#">Table 6-41</a> .                                                                                                                                                                                                                        |

| Parameter | Type   | Description                                                                   |
|-----------|--------|-------------------------------------------------------------------------------|
| mode      | String | Indicates the proxy in the primary/standby mode. The value can be <b>Ha</b> . |

**Table 6-39** master\_instance element data structure description

| Parameter       | Type             | Description                                                                    |
|-----------------|------------------|--------------------------------------------------------------------------------|
| id              | String           | Indicates the primary DB instance ID.                                          |
| status          | String           | Indicates the primary DB instance status.                                      |
| name            | String           | Indicates the primary DB instance name.                                        |
| weight          | Integer          | Indicates the read weight of a primary DB instance.                            |
| available_zones | Array of objects | Indicates the AZ information.<br>For details, see <a href="#">Table 6-42</a> . |
| cpu_num         | Integer          | Indicates the number of CPUs of a primary DB instance.                         |

**Table 6-40** readonly\_instances element data structure description

| Parameter       | Type             | Description                                                                    |
|-----------------|------------------|--------------------------------------------------------------------------------|
| id              | String           | Indicates the read replica ID.                                                 |
| status          | String           | Indicates the read replica status.                                             |
| name            | String           | Indicates the read replica name.                                               |
| weight          | Integer          | Indicates the read weight of a read replica.                                   |
| available_zones | Array of objects | Indicates the AZ information.<br>For details, see <a href="#">Table 6-42</a> . |
| cpu_num         | Integer          | Indicates the number of CPUs of a read replica.                                |

**Table 6-41** nodes element data structure description

| Parameter   | Type    | Description                                                                                                                                                                                                          |
|-------------|---------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| id          | String  | Indicates the proxy node ID.                                                                                                                                                                                         |
| name        | String  | Indicates the proxy node name.                                                                                                                                                                                       |
| role        | String  | Indicates the proxy node role. The value can be either of the following: <ul style="list-style-type: none"><li>• <b>master</b></li><li>• <b>slave</b></li></ul>                                                      |
| az_code     | String  | Indicates the AZ.                                                                                                                                                                                                    |
| status      | String  | Indicates the proxy node status. The value can be any of the following: <ul style="list-style-type: none"><li>• <b>normal</b></li><li>• <b>abnormal</b></li><li>• <b>creating</b></li><li>• <b>deleted</b></li></ul> |
| frozen_flag | Integer | Indicates whether the proxy node is frozen. <ul style="list-style-type: none"><li>• <b>0:</b> unfrozen.</li><li>• <b>1:</b> frozen</li><li>• <b>2:</b> deleted after being frozen.</li></ul>                         |

## 6.1.9.4 Modifying Read Weight

### Function

This API is used to modify the read weight of a specified DB instance.

**This API will be unavailable on April 30, 2024.**

- Before calling this API, learn how to [authenticate](#) it.
- Before calling this API, learn about [request header parameters](#).

### Constraints

- Only RDS for PostgreSQL 11 and 12 are supported.
- The database proxy of DB instances has been enabled.

### URI

- URI format  
`PUT /v3/{project_id}/instances/{instance_id}/proxy/weight`
- Parameter description

**Table 6-43** Parameters

| Parameter   | Mandatory | Description                                                                                                            |
|-------------|-----------|------------------------------------------------------------------------------------------------------------------------|
| project_id  | Yes       | Specifies the project ID of a tenant in a region.<br>To obtain the value, see <a href="#">Obtaining a Project ID</a> . |
| instance_id | Yes       | Specifies the DB instance ID.                                                                                          |

### Request

Parameter description

**Table 6-44** Parameters

| Parameter          | Mandatory | Type             | Description                                                                                    |
|--------------------|-----------|------------------|------------------------------------------------------------------------------------------------|
| master_weight      | Yes       | String           | Specifies the weight distributed to the primary DB instance. It can be a value from 0 to 1000. |
| readonly_instances | Yes       | Array of objects | Specifies the read replica information.<br>For details, see <a href="#">Table 6-45</a> .       |

**Table 6-45** readonly\_instances field data structure description

| Parameter | Mandatory | Type    | Description                                                                           |
|-----------|-----------|---------|---------------------------------------------------------------------------------------|
| id        | Yes       | String  | Specifies the read replica ID.                                                        |
| weight    | Yes       | Integer | Specifies the weight distributed to a read replica. It can be a value from 0 to 1000. |

### 6.1.9.6 Changing the Instance Class of a DB Proxy Instance

#### Function

This API is used to change the instance class of a DB proxy instance.

**This API will be unavailable on April 30, 2024.**

- Before calling this API, learn how to [authenticate](#) it.
- Before calling this API, learn about [request header parameters](#).

## Constraints

- You need to contact customer service to apply for the required permissions.
- This API is supported only for RDS for PostgreSQL 11 and 12.
- The database proxy must have been enabled for the DB instance.

## URI

- URI format  
POST /v3/{project\_id}/instances/{instance\_id}/proxy/scale
- Parameter description

**Table 6-50** Parameters

| Parameter   | Mandatory | Description                                                                                                            |
|-------------|-----------|------------------------------------------------------------------------------------------------------------------------|
| project_id  | Yes       | Specifies the project ID of a tenant in a region.<br>To obtain the value, see <a href="#">Obtaining a Project ID</a> . |
| instance_id | Yes       | Specifies the DB instance ID.                                                                                          |

### 6.1.9.7 Querying Available Instance Classes for a DB Proxy Instance (v3.1)

#### Function

This API is used to query available instance classes for a DB proxy instance.

**This API will be unavailable on April 30, 2024.**

- Before calling this API, learn how to [authenticate](#) it.
- Before calling this API, learn about [request header parameters](#).

#### Constraints

- You need to contact customer service to apply for the required permissions.
- This API is supported only for RDS for PostgreSQL 11 and 12.
- Database proxy has been enabled for the DB instance.

#### URI

- URI format
  - GET /v3/{project\_id}/instances/{instance\_id}/proxy/scale/flavors
  - GET /v3.1/{project\_id}/instances/{instance\_id}/proxy/scale/flavors
- URI example
  - [https://\[endpoint\]/v3.1/0483b6b16e954cb88930a360d2c4e663/instances/f569f1358436479dbcba8603c32cc4aein03/proxy/scale/flavors](https://[endpoint]/v3.1/0483b6b16e954cb88930a360d2c4e663/instances/f569f1358436479dbcba8603c32cc4aein03/proxy/scale/flavors)
- Parameter description

**Table 6-53** Parameters

| Parameter   | Mandatory | Description                                                                                                                                                                                                                                    |
|-------------|-----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| project_id  | Yes       | Project ID of a tenant in a region.<br>To obtain the value, see <a href="#">Obtaining a Project ID</a> .                                                                                                                                       |
| instance_id | Yes       | Instance ID.                                                                                                                                                                                                                                   |
| offset      | No        | Index offset. If <b>offset</b> is set to $N$ , the resource query starts from the $N+1$ piece of data. The value is <b>0</b> by default, indicating that the query starts from the first piece of data. The value cannot be a negative number. |
| limit       | No        | Number of records to be queried. The default value is <b>100</b> . The value cannot be a negative number. The minimum value is <b>1</b> and the maximum value is <b>100</b> .                                                                  |

# 7

# Permissions and Supported Actions

## 7.1 Introduction

You can use Identity and Access Management (IAM) for fine-grained permissions management of your RDS. If your Huawei account does not need individual IAM users, you can skip this section.

New IAM users do not have any permissions assigned by default. You need to first add them to one or more groups and attach policies or roles to these groups. The users then inherit permissions from the groups and can perform specified operations on cloud services based on the permissions they have been assigned.

You can grant users permissions using **roles** and **policies**. Roles are provided by IAM to define service-based permissions that match users' job responsibilities. Policies define API-based permissions for operations on specific resources under certain conditions, allowing for more fine-grained, secure access control of cloud resources.

### NOTE

If you want to allow or deny the access to an API, use policy-based authorization.

Each account has all the permissions required to call all APIs, but IAM users must be assigned the required permissions. The permissions required for calling an API are determined by the actions supported by the API. Only users who have been granted permissions allowing the actions can call the API successfully. For example, if an IAM user wants to query RDS DB instances using an API, the user must have been granted permissions that allow the **rds:instance:list** action.

## Supported Actions

RDS provides system-defined policies that can be directly used in IAM. You can also create custom policies to supplement system-defined policies for more refined access control. Operations supported by policies are specific to APIs. The following are common concepts related to policies:

- Permissions: statements in a policy that allow or deny certain operations
- APIs: REST APIs that can be called by a user who has been granted specific permissions

- Actions: specific operations that are allowed or denied
- Dependencies: actions which a specific action depends on. When allowing an action for a user, you also need to allow any existing action dependencies for that user.
- IAM projects/Enterprise projects: the authorization scope of a custom policy. A custom policy can be applied to IAM projects or enterprise projects or both. Policies that contain actions for both IAM and enterprise projects can be used and applied for both IAM and Enterprise Management. Policies that contain actions only for IAM projects can be used and applied to IAM only. For details about the differences between IAM and enterprise management, see [Differences Between IAM and Enterprise Management](#).

 NOTE

The check mark (✓) indicates that an action takes effect. The cross mark (✗) indicates that an action does not take effect.

## 7.2 RDS Actions

**Table 7-1** Common query actions

| Permission                       | API                                                                           | Action             | IAM Project | Enterprise Project | Authorization by Instance |
|----------------------------------|-------------------------------------------------------------------------------|--------------------|-------------|--------------------|---------------------------|
| Querying the DB engine version   | GET /v3/{projectId}/datastores/{database_name}                                | No action required | ✓           | ✓                  | ✗                         |
| Querying database specifications | GET /v3/{project_id}/flavors/{database_name}?version_name={version_name}      | No action required | ✓           | ✓                  | ✗                         |
| Querying the storage type        | GET /v3/{project_id}/storage-type/{database_name}?version_name={version_name} | No action required | ✓           | ✓                  | ✗                         |

**Table 7-2** Instance management actions

| Permission                         | API                                                                                 | Action                                                                                                                              | IAM Project | Enterprise Project | Authorization by Instance |
|------------------------------------|-------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------|-------------|--------------------|---------------------------|

| Modifying remarks of a database user | PUT /v3/{project_id}/instances/{instance_id}/db-users/{user_name}/comment                           | rds:databaseUser:update     | ✓           | ✓                  | ✓                         |

**Table 7-9** Recycle bin actions

| Permission                     | API                                                                      | Action                     | IAM Project | Enterprise Project | Authorization by Instance |
|--------------------------------|--------------------------------------------------------------------------|----------------------------|-------------|--------------------|---------------------------|
| Modifying the recycling policy | PUT https:// <i>{Endpoint}</i> /v3/{project_id}/instances/recycle-policy | rds:instance:setRecycleBin | ✓           | ✗                  | ✗                         |

**Table 7-10** Tag management actions

| Permission                         | API                                                       | Action                 | IAM Project | Enterprise Project | Authorization by Instance |
|------------------------------------|-----------------------------------------------------------|------------------------|-------------|--------------------|---------------------------|
| Adding or deleting tags in batches | POST /v3/{project_id}/instances/{instance_id}/tags/action | rds:instance:deleteTag | ✓           | ✓                  | ✓                         |
| Querying project tags              | GET /v3/{project_id}/tags                                 | rds:tag:list           | ✓           | ✓                  | ✗                         |

**Table 7-11** Quota management actions

| Permission               | API                                                    | Action            | IAM Project | Enterprise Project | Authorization by Instance |
|--------------------------|--------------------------------------------------------|-------------------|-------------|--------------------|---------------------------|
| Querying resource quotas | GET https:// <i>{Endpoint}</i> /v3/{project_id}/quotas | rds:instance:list | ✓           | ✓                  | ✓                         |

**Table 7-12** Task actions

| Permission                 | API                               | Action        | IAM Project | Enterprise Project | Authorization by Instance |
|----------------------------|-----------------------------------|---------------|-------------|--------------------|---------------------------|
| Obtaining task information | GET /v3/{project_id}/jobs?id={id} | rds:task:list | /           | /                  | ✗                         |

# 8 Appendix

## 8.1 Abnormal Request Results

### v3 APIs

#### Abnormal response description

**Table 8-1** Abnormal response description

| Name       | Type   | Description                                                                              |
|------------|--------|------------------------------------------------------------------------------------------|
| error_code | String | Specifies the error returned when a task submission exception occurs.                    |
| error_msg  | String | Specifies the description of the error returned when a task submission exception occurs. |

#### Response example

```
{
 "error_code": "DBS.200022",
 "error_msg": "The DB instance name already exists."
}
```

## 8.2 Status Codes

[Table 8-2](#) describes status codes.

**Table 8-2** Status codes

| Status Code | Message                       | Description                                                                                                                                                                                                                              |
|-------------|-------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 100         | Continue                      | The client should continue with its request. This interim response is used to inform the client that the initial part of the request has been received and has not yet been rejected by the server.                                      |
| 101         | Switching Protocols           | The protocol should be switched. The protocol can only be switched to a more advanced protocol.<br>For example, the current HTTP protocol is switched to a later version.                                                                |
| 200         | OK                            | Request succeeded.                                                                                                                                                                                                                       |
| 201         | Created                       | The request for creating a resource or task has been fulfilled.                                                                                                                                                                          |
| 202         | Accepted                      | The request has been accepted, but the processing has not been completed.                                                                                                                                                                |
| 203         | Non-Authoritative Information | Unauthorized information. The request is successful.                                                                                                                                                                                     |
| 204         | NoContent                     | The server has successfully processed the request, but has not returned any content.<br>The status code is returned in response to an HTTP OPTIONS request.                                                                              |
| 205         | Reset Content                 | The server has fulfilled the request, but the requester is required to reset the content.                                                                                                                                                |
| 206         | Partial Content               | The server has processed certain GET requests.                                                                                                                                                                                           |
| 300         | Multiple Choices              | There are multiple options for the location of the requested resource. The response contains a list of resource characteristics and addresses from which the user or user agent (such as a browser) can choose the most appropriate one. |
| 301         | Moved Permanently             | The requested resource has been assigned a new permanent URI, and the new URI is contained in the response.                                                                                                                              |
| 302         | Found                         | The requested resource was temporarily moved.                                                                                                                                                                                            |
| 303         | See Other                     | The response to the request can be found under a different URI and should be retrieved using a GET or POST method.                                                                                                                       |

| Status Code | Message                       | Description                                                                                                                                                        |
|-------------|-------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 304         | Not Modified                  | The requested resource has not been modified. In such a case, there is no need to retransmit the resource since the client still has a previously-downloaded copy. |
| 305         | Use Proxy                     | The requested resource must be accessed through a proxy.                                                                                                           |
| 306         | Unused                        | The HTTP status code is no longer used.                                                                                                                            |
| 400         | BadRequest                    | Invalid request.<br>The client should not repeat the request without modifications.                                                                                |
| 401         | Unauthorized                  | The status code is returned after the client provides the authentication information, indicating that the authentication information is incorrect or invalid.      |
| 402         | Payment Required              | This status code is reserved for future use.                                                                                                                       |
| 403         | Forbidden                     | The server understood the request, but is refusing to fulfill it.<br>The client should not repeat the request without modifications.                               |
| 404         | NotFound                      | The requested resource cannot be found.<br>The client should not repeat the request without modifications.                                                         |
| 405         | MethodNotAllowed              | The method specified in the request is not supported for the requested resource.<br>The client should not repeat the request without modifications.                |
| 406         | Not Acceptable                | The server cannot fulfill the request according to the content characteristics of the request.                                                                     |
| 407         | Proxy Authentication Required | This status code is similar to 401, but indicates that the client must first authenticate itself with the proxy.                                                   |
| 408         | Request Time-out              | The server timed out waiting for the request.<br>The client may repeat the request without modifications at any later time.                                        |

| Status Code | Message                       | Description                                                                                                                                                                                                                                                                                                                                                |
|-------------|-------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 409         | Conflict                      | <p>The request could not be processed due to a conflict.</p> <p>This status code indicates that the resource that the client attempts to create already exists, or the request fails to be processed because of the update of the conflict request.</p>                                                                                                    |
| 410         | Gone                          | <p>The requested resource is no longer available.</p> <p>The requested resource has been deleted permanently.</p>                                                                                                                                                                                                                                          |
| 411         | Length Required               | <p>The server refuses to process the request without a defined Content-Length.</p>                                                                                                                                                                                                                                                                         |
| 412         | Precondition Failed           | <p>The server does not meet one of the preconditions that the requester puts on the request.</p>                                                                                                                                                                                                                                                           |
| 413         | Request Entity Too Large      | <p>The request is larger than that a server is able to process. The server may close the connection to prevent the client from continuing the request. If the server temporarily cannot process the request, the response will contain a Retry-After header field.</p>                                                                                     |
| 414         | Request-URI Too Large         | <p>The URI provided was too long for the server to process.</p>                                                                                                                                                                                                                                                                                            |
| 415         | Unsupported Media Type        | <p>The server is unable to process the media format in the request.</p>                                                                                                                                                                                                                                                                                    |
| 416         | Requested range not satisfied | <p>The requested range is invalid.</p>                                                                                                                                                                                                                                                                                                                     |
| 417         | Expectation Failed            | <p>The server fails to meet the requirements of the Expect request-header field.</p>                                                                                                                                                                                                                                                                       |
| 422         | UnprocessableEntity           | <p>The request is well-formed but is unable to be processed due to semantic errors.</p>                                                                                                                                                                                                                                                                    |
| 429         | TooManyRequests               | <p>The client has sent more requests than its rate limit is allowed within a given amount of time, or the server has received more requests than it is able to process within a given amount of time. In this case, it is advisable for the client to re-initiate requests after the time specified in the Retry-After header of the response expires.</p> |
| 500         | InternalServerError           | <p>The server is able to receive the request but it could not understand the request.</p>                                                                                                                                                                                                                                                                  |

| Status Code | Message                    | Description                                                                                                                              |
|-------------|----------------------------|------------------------------------------------------------------------------------------------------------------------------------------|
| 501         | Not Implemented            | The server does not support the requested function.                                                                                      |
| 502         | Bad Gateway                | The server acting as a gateway or proxy receives an invalid response from a remote server.                                               |
| 503         | ServiceUnavailable         | The requested service is invalid.<br>The client should not repeat the request without modifications.                                     |
| 504         | ServerTimeout              | The request cannot be fulfilled within a given time. The response will reach the client only if the request carries a timeout parameter. |
| 505         | HTTP Version not supported | The server does not support the HTTP protocol version used in the request.                                                               |

## 8.3 Error Codes

If an error code starting with **APIGW** is returned after you call an API, rectify the fault by referring to the instructions provided in [API Gateway Error Codes](#).

The following table describes error codes.

**Table 8-3** V3 error codes

| Status Code | Error Code   | Description                                             |
|-------------|--------------|---------------------------------------------------------|
| 400         | DBS.01010220 | The DB instance is not in the read-only state.          |
| 500         | DBS.01010221 | Failed to remove the read-only status of the node.      |
| 500         | DBS.108000   | Server failure.                                         |
| 500         | DBS.108002   | Server failure.                                         |
| 500         | DBS.108005   | Server failure.                                         |
| 400         | DBS.200001   | Parameter error.                                        |
| 404         | DBS.200002   | The DB instance does not exist.                         |
| 400         | DBS.200004   | Parameter error.                                        |
| 500         | DBS.200005   | Server failure.                                         |
| 400         | DBS.200006   | The request is null. Enter a request parameter.         |
| 404         | DBS.200008   | The ECS information of the DB instance cannot be found. |

| Status Code | Error Code | Description                                                                                       |
|-------------|------------|---------------------------------------------------------------------------------------------------|
| 403         | DBS.200010 | The DB instance ID or user ID may be null, or the operation is not authorized.                    |
| 409         | DBS.200011 | Another operation is being performed on the instance, or the instance is faulty. Try again later. |
| 404         | DBS.200013 | The original DB instance does not exist.                                                          |
| 409         | DBS.200019 | Another operation is being performed on the DB instance or the DB instance is faulty.             |
| 400         | DBS.200021 | Invalid DB instance name.                                                                         |
| 409         | DBS.200022 | The DB instance name already exists.                                                              |
| 400         | DBS.200023 | Storage space is out of range.                                                                    |
| 400         | DBS.200024 | Invalid region.                                                                                   |
| 400         | DBS.200025 | Invalid AZ.                                                                                       |
| 400         | DBS.200026 | Invalid storage type.                                                                             |
| 400         | DBS.200027 | Storage space must be a multiple of 10.                                                           |
| 400         | DBS.200037 | The DB engine version is inconsistent.                                                            |
| 400         | DBS.200038 | Primary/standby replication is abnormal. Try again later.                                         |
| 400         | DBS.200039 | This operation cannot be performed because the replication delay exceeds 5 minutes.               |
| 400         | DBS.200040 | The DB engine or version is not supported.                                                        |
| 400         | DBS.200041 | Invalid database version.                                                                         |
| 400         | DBS.200042 | The DB engine does not exist.                                                                     |
| 400         | DBS.200043 | Invalid HA replication mode.                                                                      |
| 403         | DBS.200044 | Resource not found or permission denied.                                                          |
| 404         | DBS.200045 | The DB instance does not exist.                                                                   |

| 400         | DBS.280262 | Invalid synchronize model.                               |
| 400         | DBS.280270 | The parameter does not exist.                            |
| 400         | DBS.280271 | The parameter value is out of range.                     |
| 400         | DBS.280272 | The tag key must be unique.                              |
| 404         | DBS.280275 | Source instance not found.                               |
| 400         | DBS.280277 | Invalid object name.                                     |
| 400         | DBS.280285 | Invalid AZ.                                              |
| 400         | DBS.280288 | Invalid flavor.                                          |
| 400         | DBS.280311 | Invalid size of the storage space.                       |
| 400         | DBS.280325 | Invalid disk information.                                |
| 400         | DBS.280328 | Operation not allowed by the DB instance type.           |
| 400         | DBS.280342 | Invalid cluster mode.                                    |
| 400         | DBS.280364 | Invalid port number of the database.                     |
| 400         | DBS.280402 | Invalid HA mode.                                         |
| 400         | DBS.280404 | Invalid DB instance ID or node ID format.                |
| 409         | DBS.280406 | Operation not allowed by the DB instance type or status. |
| 400         | DBS.280434 | Invalid specification code.                              |
| 400         | DBS.280448 | The storage type is sold out.                            |
| 400         | DBS.280449 | Operation not allowed on frozen objects.                 |
| 400         | DBS.280450 | The DB instance specifications are sold out.             |
| 400         | DBS.280457 | Invalid number of coordinating nodes.                    |
| 400         | DBS.280458 | Invalid number of shards.                                |

| Status Code | Error Code | Description                                                                                                  |
|-------------|------------|--------------------------------------------------------------------------------------------------------------|
| 400         | DBS.280461 | Invalid number of added shards.                                                                              |
| 400         | DBS.280489 | RDS DB instance associated with DDM instance. Delete the associated schema from the DDM instance first.      |
| 400         | DBS.280490 | RDS DB backup associated with a DDM backup. Delete the associated schema from the DDM backup first.          |
| 400         | DBS.280649 | Invalid DB instance name length.                                                                             |
| 400         | DBS.280810 | Failed to set read/write permissions for the database user. The user may not exist. Check the configuration. |
| 400         | DBS.280812 | The DB instance is already in this state.                                                                    |
| 400         | DBS.280813 | There is a large transaction or DDL in progress.                                                             |
| 400         | DBS.280816 | A DRS migration task is in progress. Try again later.                                                        |
| 400         | DBS.290000 | Parameter error.                                                                                             |
| 400         | DBS.290001 | Invalid parameter letter case.                                                                               |
| 404         | DBS.290002 | The selected specifications do not exist.                                                                    |
| 413         | DBS.290003 | The number of DB instances has reached the quota.                                                            |
| 404         | DBS.290005 | The DB instance does not exist.                                                                              |
| 500         | DBS.290006 | Failed to process the request.                                                                               |
| 404         | DBS.290011 | The DB instance does not exist.                                                                              |
| 404         | DBS.290013 | Resource not found.                                                                                          |
| 500         | DBS.290015 | Failed to process the request.                                                                               |
| 400         | DBS.301051 | The instance has no disaster recovery relationship.                                                          |
| 400         | DBS.301132 | This operation cannot be performed because instance has been stopped.                                        |
| 400         | DBS.301133 | This operation cannot be performed because instance has been started.                                        |

## 8.4 Obtaining a Project ID

### Scenarios

When calling APIs, you need to specify the project ID in some URLs. To do so, you need to obtain the project ID first. Two methods are available:

- [Obtaining the Project ID by Calling an API](#)
- [Obtaining a Project ID from the Console](#)

### Obtaining the Project ID by Calling an API

You can obtain the project ID by calling the API used to [query project information based on the specified criteria](#).

The API used to obtain a project ID is **GET <https://{{Endpoint}}/v3/projects>**. {{Endpoint}} is the IAM endpoint and can be obtained from [Regions and Endpoints](#). For details about API authentication, see [Authentication](#).

The following is an example response. The value of **id** is the project ID.

```
{
 "projects": [
 {
 "domain_id": "65382450e8f64ac0870cd180d14e684b",
 "is_domain": false,
 "parent_id": "65382450e8f64ac0870cd180d14e684b",
 "name": "project_name",
 "description": "",
 "links": {
 "next": null,
 "previous": null,
 "self": "https://www.example.com/v3/projects/a4a5d4098fb4474fa22cd05f897d6b99"
 },
 "id": "a4a5d4098fb4474fa22cd05f897d6b99",
 "enabled": true
 }
],
 "links": {
 "next": null,
 "previous": null,
 "self": "https://www.example.com/v3/projects"
 }
}
```

### Obtaining a Project ID from the Console

**Step 1** Register yourself on the management console and log in to it.

**Step 2** Hover the mouse over the username in the upper right corner and select **My Credentials** from the drop-down list.

On the **API Credentials** page, view the project ID in the project list.

**Figure 8-1** Viewing project IDs

The screenshot shows the 'API Credentials' section of a cloud service interface. At the top, there are fields for 'IAM User Name' (redacted), 'Account Name' (redacted), 'IAM User ID' (redacted), and 'Account ID' (redacted). Below these, a search bar says 'Enter a project name.' A table lists 18 projects, each with a Project ID, Project Name, and Region. The regions listed are AF-Johannesburg, CN-Hong Kong, AP-Bangkok, AP-Singapore, AP-Jakarta, CN-East-Shanghai1, CN-North-Beijing4, CN-South-Guangzhou, CN-Southwest-Guiyang1, LA-Mexico-City2, LA-Santiago, and LA-Mexico-City1.

| Project ID                        | Project Name   | Region                |
|-----------------------------------|----------------|-----------------------|
| 5ed7207f5fa4afed1ba041ab9d470fc   | af-south-1     | AF-Johannesburg       |
| d7b242f59c44699bbdd14e19073fb     | ap-southeast-1 | CN-Hong Kong          |
| 7f95db02a484ff0ff98ac05171ed8584  | ap-southeast-2 | AP-Bangkok            |
| 0f5d9ee3c36005162441c0004b799120  | ap-southeast-3 | AP-Singapore          |

| 84eb1a843f1c43cf960973a015ccab73  | la-south-2     | LA-Santiago           |
| 7b4b8fb644ff08538fffe0e5c47       | na-mexico-1    | LA-Mexico-City1       |

----End

## 8.5 Replication Mode

Replication mode

| Replication Mode | Description      | Remarks |
|------------------|------------------|---------|
| async            | Asynchronous     | N/A     |
| semisync         | Semi-synchronous | N/A     |
| sync             | Synchronous      | N/A     |

## 8.6 Monitoring Metrics

### 8.6.1 RDS for MySQL Metrics

#### Description

This section describes namespaces, descriptions, and dimensions of metrics reported by RDS for MySQL to Cloud Eye. You can use APIs provided by Cloud Eye to retrieve metrics and alarms generated for RDS for MySQL.

#### Namespace

SYS.RDS

## Metrics

**Table 8-4** RDS for MySQL metrics

| Metric ID                | Name                       | Description                                                                  | Value Range   | Monitored Object and Instance Type                                            |
|--------------------------|----------------------------|------------------------------------------------------------------------------|---------------|-------------------------------------------------------------------------------|
| rds001_cp_u_util         | CPU Usage                  | CPU usage of the monitored object                                            | 0–100%        | Monitored object: ECS<br>Monitored instance type: RDS for MySQL instance      |
| rds002_mem_util          | Memory Usage               | Memory usage of the monitored object                                         | 0–100%        | Monitored object: ECS<br>Monitored instance type: RDS for MySQL instance      |
| rds003_iops              | IOPS                       | Average number of I/O requests processed by the system in a specified period | ≥ 0 counts /s | Monitored object: ECS<br>Monitored instance type: RDS for MySQL instance      |
| rds004_bytes_in          | Network Input Throughput   | Incoming traffic in bytes per second                                         | ≥ 0 bytes/s   | Monitored object: ECS<br>Monitored instance type: RDS for MySQL instance      |
| rds005_bytes_out         | Network Output Throughput  | Outgoing traffic in bytes per second                                         | ≥ 0 bytes/s   | Monitored object: ECS<br>Monitored instance type: RDS for MySQL instance      |
| rds006_conn_count        | Total Connections          | Total number of connections that attempt to connect to the MySQL server      | ≥ 0 counts    | Monitored object: database<br>Monitored instance type: RDS for MySQL instance |
| rds007_conn_active_count | Current Active Connections | Number of current active connections                                         | ≥ 0 counts    | Monitored object: database<br>Monitored instance type: RDS for MySQL instance |
| rds008_qps               | QPS                        | Query times of SQL statements (including stored procedures) per second       | ≥ 0 queries/s | Monitored object: database<br>Monitored instance type: RDS for MySQL instance |

| Metric ID                  | Name                          | Description                                                                       | Value Range              | Monitored Object and Instance Type                                            |
|----------------------------|-------------------------------|-----------------------------------------------------------------------------------|--------------------------|-------------------------------------------------------------------------------|
| rds009_tp_s                | TPS                           | Execution times of submitted and rollback transactions per second                 | $\geq 0$ transactions /s | Monitored object: database<br>Monitored instance type: RDS for MySQL instance |
| rds010_in_nodb_buf_usage   | Buffer Pool Usage             | Ratio of idle pages to the total number of buffer pool pages in the InnoDB buffer | 0–1                      | Monitored object: database<br>Monitored instance type: RDS for MySQL instance |
| rds011_in_nodb_buf_hit     | Buffer Pool Hit Ratio         | Ratio of read hits to read requests in the InnoDB buffer                          | 0–1                      | Monitored object: database<br>Monitored instance type: RDS for MySQL instance |
| rds012_in_nodb_buf_dirty   | Buffer Pool Dirty Block Ratio | Ratio of dirty data to used pages in the InnoDB buffer                            | 0–1                      | Monitored object: database<br>Monitored instance type: RDS for MySQL instance |

| rds081_v_m_ioutils                | The time percentage of disk I/O in a non-idle state | Percentage of time when the disk is not idle (there are I/O activities). This parameter indicates how busy the disk is. The disk can process I/O requests in parallel. If the value of this parameter reaches 100%, the disk may not reach its maximum processing capability. | 0–100%               | Monitored object: ECS<br>Monitored instance type: RDS for MySQL instance |
| rds082_semi_sync_tx_avg_wait_time | Transaction Wait Time                               | Average wait time of transactions in semi-synchronous mode                                                                                                                                                                                                                    | $\geq 0 \mu\text{s}$ | Monitored object: ECS<br>Monitored instance type: RDS for MySQL instance |
| sys_swap_usage                    | SWAP Usage                                          | SWAP usage of the monitored object                                                                                                                                                                                                                                            | 0–100%               | Monitored object: ECS<br>Monitored instance type: RDS for MySQL instance |
| rds_innodb_lock_waits             | Row Locks Waits Transactions                        | Number of InnoDB transactions waiting for row lock                                                                                                                                                                                                                            | $\geq 0$ counts      | Monitored object: ECS<br>Monitored instance type: RDS for MySQL instance |
| rds_bytes_recv_rate               | Received Bytes per Second                           | Number of bytes received by the database per second                                                                                                                                                                                                                           | $\geq 0$ bytes/s     | Monitored object: ECS<br>Monitored instance type: RDS for MySQL instance |
| rds_bytes_sent_rate               | Sent Bytes per Second                               | Number of bytes sent from the database per second                                                                                                                                                                                                                             | $\geq 0$ bytes/s     | Monitored object: ECS<br>Monitored instance type: RDS for MySQL instance |
| rds_innodb_pages_read_rate        | Data Volume Read By InnoDB per Second               | Data volume read by InnoDB per second                                                                                                                                                                                                                                         | $\geq 0$ pages/s     | Monitored object: ECS<br>Monitored instance type: RDS for MySQL instance |

| Metric ID                                  | Name                                                | Description                                                               | Value Range   | Monitored Object and Instance Type                                       |
|--------------------------------------------|-----------------------------------------------------|---------------------------------------------------------------------------|---------------|--------------------------------------------------------------------------|
| rds_innodb_pages_written_rate              | Data Volume Written by InnoDB per Second            | Data volume written by InnoDB per second                                  | ≥ 0 pages /s  | Monitored object: ECS<br>Monitored instance type: RDS for MySQL instance |
| rds_innodb_os_log_written_rate             | Redo Log Size Written per Second                    | Size of redo logs written per second                                      | ≥ 0 bytes/s   | Monitored object: ECS<br>Monitored instance type: RDS for MySQL instance |
| rds_innodb_buffer_pool_read_requests_rate  | Innodb_buffer_pool Read Requests per Second         | Number of innodb_buffer_pool read requests per second                     | ≥ 0 counts /s | Monitored object: ECS<br>Monitored instance type: RDS for MySQL instance |
| rds_innodb_buffer_pool_write_requests_rate | Innodb_buffer_pool Write Requests per Second        | Number of innodb_buffer_pool write requests per second                    | ≥ 0 counts /s | Monitored object: ECS<br>Monitored instance type: RDS for MySQL instance |
| rds_innodb_buffer_pool_page_flushed_rate   | Innodb_buffer_pool Page Flushes per Second          | Number of innodb_buffer_pool page flushes per second                      | ≥ 0 counts /s | Monitored object: ECS<br>Monitored instance type: RDS for MySQL instance |
| rds_innodb_log_waits_rate                  | Flush Times to Disks Due to Insufficient Log Buffer | Times of transaction logs flushed to disks due to insufficient log buffer | ≥ 0 counts /s | Monitored object: ECS<br>Monitored instance type: RDS for MySQL instance |

| Metric ID                         | Name                                         | Description                                                                                                                                     | Value Range        | Monitored Object and Instance Type                                       |
|-----------------------------------|----------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------|--------------------|--------------------------------------------------------------------------|
| rds_create_d_tmp_tables_rate      | Temporary Tables Created per Second          | Number of temporary tables created per second                                                                                                   | $\geq 0$ counts /s | Monitored object: ECS<br>Monitored instance type: RDS for MySQL instance |
| rds_wait_thread_count             | Waiting Threads                              | Total number of waiting threads in an instance.                                                                                                 | $\geq 0$ counts    | Monitored object: ECS<br>Monitored instance type: RDS for MySQL instance |
| rds_threadpool_waiting_threads    | Number of Waiting Threads in the Thread Pool | Number of waiting threads in the thread pool                                                                                                    | $\geq 0$ counts    | Monitored object: ECS<br>Monitored instance type: RDS for MySQL instance |
| rds_innodb_row_lock_time_avg      | Average Row Lock Wait Time                   | Average wait time of historical InnoDB row locks                                                                                                | > 0 ms             | Monitored object: ECS<br>Monitored instance type: RDS for MySQL instance |
| rds_innodb_row_lock_current_waits | Current Row Lock Waits                       | Number of current InnoDB row lock waits<br>This metric indicates the number of transactions that are currently waiting for row locks.           | $\geq 0$ counts    | Monitored object: ECS<br>Monitored instance type: RDS for MySQL instance |
| rds_mdl_lock_count                | MDL Locks                                    | Number of MDL locks                                                                                                                             | $\geq 0$ counts    | Monitored object: ECS<br>Monitored instance type: RDS for MySQL instance |
| rds_buffer_pool_wait_free         | Dirty Pages to Be Flushed to Disks           | When InnoDB needs to read or create a page and no clean pages are available, InnoDB flushes some dirty pages first and waits for that operation | $\geq 0$ counts    | Monitored object: ECS<br>Monitored instance type: RDS for MySQL instance |

| Metric ID                  | Name                    | Description                                                                                                                                                                                                          | Value Range | Monitored Object and Instance Type                                       |
|----------------------------|-------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------|--------------------------------------------------------------------------|
| rds_conn_active_usage      | Active Connection Usage | Usage of active connections                                                                                                                                                                                          | 0–100%      | Monitored object: ECS<br>Monitored instance type: RDS for MySQL instance |
| rds_innodb_log_waits_count | Log Waits               | Number of times that the log buffer was too small and a wait was required for it to be flushed before continuing<br><br>The value is an accumulated value and is incremented by 1 each time a wait occurs.           | ≥ 0 counts  | Monitored object: ECS<br>Monitored instance type: RDS for MySQL instance |
| rds_long_transaction       | Long Transaction        | Maximum duration for starting a transaction<br><br>A complete long transaction is counted only when the <b>BEGIN</b> and <b>COMMIT</b> commands exist before and after the related operation commands, respectively. | ≥ 0 seconds | Monitored object: ECS<br>Monitored instance type: RDS for MySQL instance |

## Dimension

| Key            | Value                     |
|----------------|---------------------------|
| rds_cluster_id | RDS for MySQL instance ID |

## API Calling

Use APIs to search for RDS monitoring metrics. For details about calling methods and parameter description, see [Querying Monitoring Data](#) in the *Cloud Eye API Reference*.

Examples:

- Request

```
/V1.0/{project_id}/metric-data?
namespace=SYS.RDS&metric_name=rds001_cpu_util&dim.0=rds_cluster_id,5ea170ad-
```

cc6b-49cd-9020-e94fdbeaa391&from=1484123686000&to=1568188853000&period=300&filter=average

- Response:

```
{

## 8.6.2 RDS for PostgreSQL Metrics

### Description

This section describes namespaces, descriptions, and dimensions of metrics reported by RDS for PostgreSQL to Cloud Eye. You can use APIs provided by Cloud Eye to retrieve metrics and alarms generated for RDS for PostgreSQL.

### Namespace

SYS.RDS

## Metrics

**Table 8-5** RDS for PostgreSQL metrics

| Metric ID              | Name                      | Description                                                                        | Value Range   | Monitored Object and Instance Type                                            |
|------------------------|---------------------------|------------------------------------------------------------------------------------|---------------|-------------------------------------------------------------------------------|
| rds001_cp_u_util       | CPU Usage                 | CPU usage of the monitored object                                                  | 0–100%        | Monitored object: ECS<br>Monitored instance type: RDS for PostgreSQL instance |
| rds002_mem_util        | Memory Usage              | Memory usage of the monitored object                                               | 0–100%        | Monitored object: ECS<br>Monitored instance type: RDS for PostgreSQL instance |
| rds003_iops            | IOPS                      | Average number of I/O requests processed by the system in a specified period       | ≥ 0 counts /s | Monitored object: ECS<br>Monitored instance type: RDS for PostgreSQL instance |
| read_count_per_second  | Read IOPS                 | Average number of read I/O requests processed by the system in a specified period  | ≥ 0 counts /s | Monitored object: ECS<br>Monitored instance type: RDS for PostgreSQL instance |
| write_count_per_second | Write IOPS                | Average number of write I/O requests processed by the system in a specified period | ≥ 0 counts /s | Monitored object: ECS<br>Monitored instance type: RDS for PostgreSQL instance |
| rds004_bytes_in        | Network Input Throughput  | Incoming traffic in bytes per second                                               | ≥ 0 bytes/s   | Monitored object: ECS<br>Monitored instance type: RDS for PostgreSQL instance |
| rds005_bytes_out       | Network Output Throughput | Outgoing traffic in bytes per second                                               | ≥ 0 bytes/s   | Monitored object: ECS<br>Monitored instance type: RDS for PostgreSQL instance |
| rds039_disk_util       | Storage Space Usage       | Storage space usage of the monitored object                                        | 0–100%        | Monitored object: ECS<br>Monitored instance type: RDS for PostgreSQL instance |

| Metric ID                           | Name                         | Description                                                            | Value Range    | Monitored Object and Instance Type                                                 |
|-------------------------------------|------------------------------|------------------------------------------------------------------------|----------------|------------------------------------------------------------------------------------|
| rds040_transaction_logs_usage       | Transaction Logs Usage       | Storage space usage of transaction logs                                | ≥ 0 MB         | Monitored object: database<br>Monitored instance type: RDS for PostgreSQL instance |
| rds041_replication_slot_usage       | Replication Slot Usage       | Storage space usage of replication slot files                          | ≥ 0 MB         | Monitored object: database<br>Monitored instance type: RDS for PostgreSQL instance |
| rds042_database_connections         | Database Connections in Use  | Number of database connections in use                                  | ≥ 0 counts     | Monitored object: database<br>Monitored instance type: RDS for PostgreSQL instance |
| rds043_maximum_used_transaction_ids | Maximum Used Transaction IDs | Maximum number of transaction IDs that have been used                  | ≥ 0 counts     | Monitored object: database<br>Monitored instance type: RDS for PostgreSQL instance |
| rds044_transaction_logs_generations | Transaction Logs Generation  | Size of transaction logs generated per second                          | ≥ 0 MB/s       | Monitored object: database<br>Monitored instance type: RDS for PostgreSQL instance |
| rds045_oldest_replication_slot_lag  | Oldest Replication Slot Lag  | Lagging size of the most lagging replica in terms of WAL data received | ≥ 0 MB         | Monitored object: database<br>Monitored instance type: RDS for PostgreSQL instance |
| rds046_replication_lag              | Replication Lag              | Replication lag                                                        | ≥ 0 ms         | Monitored object: database<br>Monitored instance type: RDS for PostgreSQL instance |
| rds047_disk_total_size              | Total Storage Space          | Total storage space of the monitored object                            | 40–4000, in GB | Monitored object: ECS<br>Monitored instance type: RDS for PostgreSQL instance      |

| Metric ID                    | Name                               | Description                                                                                                      | Value Range   | Monitored Object and Instance Type                                            |
|------------------------------|------------------------------------|------------------------------------------------------------------------------------------------------------------|---------------|-------------------------------------------------------------------------------|
| rds048_disk_used_size        | Used Storage Space                 | Used storage space of the monitored object                                                                       | 0–4000, in GB | Monitored object: ECS<br>Monitored instance type: RDS for PostgreSQL instance |
| rds049_disk_readThroughput   | Disk Read Throughput               | Number of bytes read from the disk per second                                                                    | ≥ 0 bytes/s   | Monitored object: ECS<br>Monitored instance type: RDS for PostgreSQL instance |
| rds050_disk_writeThroughput  | Disk Write Throughput              | Number of bytes written into the disk per second                                                                 | ≥ 0 bytes/s   | Monitored object: ECS<br>Monitored instance type: RDS for PostgreSQL instance |

| pgaudit_log_size                      | Audit Log Size                                               | Size of audit logs                                                                                                                                                                                                                                                                  | ≥ 0 GB                                                                          | Monitored object: database<br>Monitored instance type: RDS for PostgreSQL instance |
| slave_replication_status              | Stream Replication Status of Standby Node                    | Stream replication status of the standby node. The value <b>0</b> indicates abnormal stream replication; <b>1</b> indicates normal stream replication; and <b>2</b> means that this node is the primary node.<br><br>For this metric, the standby node also includes read replicas. | <ul style="list-style-type: none"> <li>• 0</li> <li>• 1</li> <li>• 2</li> </ul> | Monitored object: ECS<br>Monitored instance type: RDS for PostgreSQL instance      |
| synchronous_replication_blocking_time | Synchronous Replication Blocking Time                        | Time during which synchronous replication between the primary and standby nodes is blocked                                                                                                                                                                                          | ≥ 0s                                                                            | Monitored object: ECS<br>Monitored instance type: RDS for PostgreSQL instance      |

| Metric ID                           | Name                           | Description                                                                                                    | Value Range         | Monitored Object and Instance Type                                            |
|-------------------------------------|--------------------------------|----------------------------------------------------------------------------------------------------------------|---------------------|-------------------------------------------------------------------------------|
| temporary_files_generation_num      | Temporary Files per Minute     | Number of temporary files generated within 1 minute                                                            | $\geq 0$ counts/min | Monitored object: ECS<br>Monitored instance type: RDS for PostgreSQL instance |
| temporary_files_generation_size     | Temporary File Size per Minute | Size of temporary files generated within 1 minute                                                              | $\geq 0$ bytes/min  | Monitored object: ECS<br>Monitored instance type: RDS for PostgreSQL instance |
| sent_lsn_replication_latency_size   | Size of Not Sent WAL           | Size of WAL logs that have not been sent from the primary node to the standby node                             | $\geq 0$ bytes      | Monitored object: ECS<br>Monitored instance type: RDS for PostgreSQL instance |
| write_lsn_replication_latency_size  | Size of Not Written WAL        | Size of WAL logs that have not been written to the disk by the standby node                                    | $\geq 0$ bytes      | Monitored object: ECS<br>Monitored instance type: RDS for PostgreSQL instance |
| flush_lsn_replication_latency_size  | Size of Not Flushed WAL        | Size of WAL logs that have not been flushed to the disk by the standby node                                    | $\geq 0$ bytes      | Monitored object: ECS<br>Monitored instance type: RDS for PostgreSQL instance |
| replay_lsn_replication_latency_size | Size of Not Replicated WAL     | Size of WAL logs that have not been replayed by the standby node                                               | $\geq 0$ bytes      | Monitored object: ECS<br>Monitored instance type: RDS for PostgreSQL instance |
| data_disk_inode_used                | Inodes                         | Used data disk inodes                                                                                          | $\geq 0$ counts     | Monitored object: ECS<br>Monitored instance type: RDS for PostgreSQL instance |
| user_current_connections            | Connections in Use             | Number of connections in use (excluding built-in connections used for monitoring and O&M)                      | $\geq 0$ counts     | Monitored object: ECS<br>Monitored instance type: RDS for PostgreSQL instance |
| user_active_connections             | Active Connections of Users    | Number of active connections used by users (excluding built-in active connections used for monitoring and O&M) | $\geq 0$ counts     | Monitored object: ECS<br>Monitored instance type: RDS for PostgreSQL instance |

| Metric ID               | Name                                           | Description                                                                                                                                         | Value Range | Monitored Object and Instance Type                                            |
|-------------------------|------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------|-------------|-------------------------------------------------------------------------------|
| wal_size                | WAL Size                                       | Size of WAL logs                                                                                                                                    | ≥ 0 GB      | Monitored object: ECS<br>Monitored instance type: RDS for PostgreSQL instance |
| dbuser_passewd_deadline | The fastest expiration time for database users | Database user password expiration time minus current time<br><b>NOTE</b><br>If no password expiration time is set, this metric cannot be collected. | ≥ 0s        | Monitored object: ECS<br>Monitored instance type: RDS for PostgreSQL instance |
| sys_memory_hit_rate     | Memory Hit Rate                                | Memory hit rate                                                                                                                                     | ≥ 0%        | Monitored object: ECS<br>Monitored instance type: RDS for PostgreSQL instance |

## Dimension

| Key                   | Value                          |
|-----------------------|--------------------------------|
| postgresql_cluster_id | RDS for PostgreSQL instance ID |

## API Calling

Use APIs to search for RDS monitoring metrics. For details about calling methods and parameter description, see [Querying Monitoring Data](#) in the *Cloud Eye API Reference*.

Examples:

- Request

```
/V1.0/{project_id}/metric-data?
namespace=SYS.RDS&metric_name=rds001_cpu_util&dim.0=rds_cluster_id,5ea170ad-
cc6b-49cd-9020-e94fdbea391&from=1484123686000&to=1568188853000&period=300&filter=average
```

- Response:

```
{
 "datapoints": [
 {
 "average": 0.35,
 "timestamp": 1484123400000,
 "unit": "Ratio"
 },
```

```
{
 "average": 0.11,
 "timestamp": 1484123700000,
 "unit": "Ratio"
}
,
"metric_name": "rds001_cpu_util",
"httpcode" : 200,
"header" : {
 "Transfer-Encoding" : "chunked",

}
```

## 8.6.3 RDS for SQL Server Metrics

### Description

This section describes namespaces, descriptions, and dimensions of metrics reported by RDS for SQL Server to Cloud Eye. You can use APIs provided by Cloud Eye to retrieve metrics and alarms generated for RDS for SQL Server.

### Namespace

SYS.RDS

### Metrics

**Table 8-6** RDS for SQL Server metrics

| Metric ID        | Name         | Description                          | Value Range | Monitored Object and Instance Type                                            |
|------------------|--------------|--------------------------------------|-------------|-------------------------------------------------------------------------------|
| rds001_cp_u_util | CPU Usage    | CPU usage of the monitored object    | 0-100%      | Monitored object: ECS<br>Monitored instance type: RDS for SQL Server instance |
| rds002_mem_util  | Memory Usage | Memory usage of the monitored object | 0-100%      | Monitored object: ECS<br>Monitored instance type: RDS for SQL Server instance |

| Metric ID                    | Name                      | Description                                                                  | Value Range        | Monitored Object and Instance Type                                            |
|------------------------------|---------------------------|------------------------------------------------------------------------------|--------------------|-------------------------------------------------------------------------------|
| rds003_iops                  | IOPS                      | Average number of I/O requests processed by the system in a specified period | $\geq 0$ counts /s | Monitored object: ECS<br>Monitored instance type: RDS for SQL Server instance |
| rds004_bytes_in              | Network Input Throughput  | Incoming traffic in bytes per second                                         | $\geq 0$ bytes/s   | Monitored object: ECS<br>Monitored instance type: RDS for SQL Server instance |
| rds005_bytes_out             | Network Output Throughput | Outgoing traffic in bytes per second                                         | $\geq 0$ bytes/s   | Monitored object: ECS<br>Monitored instance type: RDS for SQL Server instance |
| rds039_disk_util             | Storage Space Usage       | Storage space usage of the monitored object                                  | 0–100%             | Monitored object: ECS<br>Monitored instance type: RDS for SQL Server instance |
| rds047_disk_total_size       | Total Storage Space       | Total storage space of the monitored object                                  | 40–4000, in GB     | Monitored object: ECS<br>Monitored instance type: RDS for SQL Server instance |
| rds048_disk_used_size        | Used Storage Space        | Used storage space of the monitored object                                   | 0–4000, in GB      | Monitored object: ECS<br>Monitored instance type: RDS for SQL Server instance |
| rds049_disk_read_throughput  | Disk Read Throughput      | Number of bytes read from the disk per second                                | $\geq 0$ bytes/s   | Monitored object: ECS<br>Monitored instance type: RDS for SQL Server instance |
| rds050_disk_write_throughput | Disk Write Throughput     | Number of bytes written into the disk per second                             | $\geq 0$ bytes/s   | Monitored object: ECS<br>Monitored instance type: RDS for SQL Server instance |
| rds053_avg_disk_queue_length | Average Disk Queue Length | Number of processes to be written into the monitored object                  | $\geq 0$ counts    | Monitored object: ECS<br>Monitored instance type: RDS for SQL Server instance |

| Metric ID                         | Name                          | Description                                                                                  | Value Range   | Monitored Object and Instance Type                                                 |
|-----------------------------------|-------------------------------|----------------------------------------------------------------------------------------------|---------------|------------------------------------------------------------------------------------|
| rds054_db_connections_in_use      | Database Connections in Use   | Number of database connections in use                                                        | ≥ 0 counts    | Monitored object: database<br>Monitored instance type: RDS for SQL Server instance |
| rds055_transactions_per_sec       | Transactions per Second       | Number of transactions started for the database per second                                   | ≥ 0 counts /s | Monitored object: ECS<br>Monitored instance type: RDS for SQL Server instance      |
| rds056_batch_per_sec              | Batches per Second            | Number of Transact-SQL command batches received per second                                   | ≥ 0 counts /s | Monitored object: ECS<br>Monitored instance type: RDS for SQL Server instance      |
| rds057_logins_per_sec             | Logins per Second             | Total number of logins started per second                                                    | ≥ 0 counts /s | Monitored object: ECS<br>Monitored instance type: RDS for SQL Server instance      |
| rds058_logouts_per_sec            | Logouts per Second            | Total number of logouts started per second                                                   | ≥ 0 counts /s | Monitored object: ECS<br>Monitored instance type: RDS for SQL Server instance      |
| rds059_cache_hit_ratio            | Cache Hit Ratio               | Ratio of pages found in the buffer cache without having to read from the disk to total pages | 0–100%        | Monitored object: ECS<br>Monitored instance type: RDS for SQL Server instance      |
| rds060_sql_compilations_per_sec   | SQL Compilations per Second   | Number of SQL compilations per second                                                        | ≥ 0 counts /s | Monitored object: ECS<br>Monitored instance type: RDS for SQL Server instance      |
| rds061_sql_recompilations_per_sec | SQL Recompilations per Second | Number of SQL recompilations per second                                                      | ≥ 0 counts /s | Monitored object: ECS<br>Monitored instance type: RDS for SQL Server instance      |
| rds062_full_scans_per_sec         | Full Scans per Second         | Number of unrestricted full scans per second                                                 | ≥ 0 counts /s | Monitored object: ECS<br>Monitored instance type: RDS for SQL Server instance      |

| Metric ID                       | Name                        | Description                                                                                                                   | Value Range   | Monitored Object and Instance Type                                            |
|---------------------------------|-----------------------------|-------------------------------------------------------------------------------------------------------------------------------|---------------|-------------------------------------------------------------------------------|
| rds063_errors_per_sec           | Errors per Second           | Number of errors per second                                                                                                   | ≥ 0 counts /s | Monitored object: ECS<br>Monitored instance type: RDS for SQL Server instance |
| rds064_latch_waits_per_sec      | Latch Waits per Second      | Number of latch requests that have not been granted immediately                                                               | ≥ 0 counts /s | Monitored object: ECS<br>Monitored instance type: RDS for SQL Server instance |
| rds065_lock_waits_per_sec       | Lock Waits per Second       | Number of lock wait requests per second                                                                                       | ≥ 0 counts /s | Monitored object: ECS<br>Monitored instance type: RDS for SQL Server instance |
| rds066_lock_requests_per_sec    | Lock Requests per Second    | Number of new locks and lock conversions per second requested from the lock manager                                           | ≥ 0 counts /s | Monitored object: ECS<br>Monitored instance type: RDS for SQL Server instance |

| rds077_repli_cation_delay        | Replicati_on Delay         | Delay for replication between primary and standby DB instances. The replication delay of RDS for SQL Server DB instances is at the database level because data is synchronized on each database. The instance-level replication delay refers to the maximum replication delay of the databases (the delay 0s for single-node DB instances). | ≥ 0s          | Monitored object: ECS<br>Monitored instance type: RDS for SQL Server instance |
| mssql_me_m_grant_pendin_g        | Memory Grants Pending      | Total number of processes waiting for a workspace memory grant                                                                                                                                                                                                                                                                              | ≥ 0 counts    | Monitored object: ECS<br>Monitored instance type: RDS for SQL Server instance |
| mssql_laz_y_write_per_sec        | Lazy Writes per Second     | Number of lazy writes per second                                                                                                                                                                                                                                                                                                            | ≥ 0 counts /s | Monitored object: ECS<br>Monitored instance type: RDS for SQL Server instance |
| mssql_pa_ge_life_ex_pectancy     | Page Life Expectancy       | Number of seconds a page will stay in the buffer pool without references                                                                                                                                                                                                                                                                    | ≥ 0s          | Monitored object: ECS<br>Monitored instance type: RDS for SQL Server instance |
| mssql_pa_ge_reads_per_sec        | Page Reads per Second      | Number of page reads per second                                                                                                                                                                                                                                                                                                             | ≥ 0 counts /s | Monitored object: ECS<br>Monitored instance type: RDS for SQL Server instance |
| mssql_te_mpdbsize                | Temporary Tablesp ace Size | Disk space occupied by the current temporary tablespace                                                                                                                                                                                                                                                                                     | ≥ 0 MB        | Monitored object: ECS<br>Monitored instance type: RDS for SQL Server instance |
| mssql_wo_rker_threa_d_usage_rate | Usage of Worker Threads    | Ratio of the total worker threads to the value of <b>Max Worker Threads</b>                                                                                                                                                                                                                                                                 | 0–100%        | Monitored object: ECS<br>Monitored instance type: RDS for SQL Server instance |

## Dimension

| Key                      | Value                          |
|--------------------------|--------------------------------|
| rds_cluster_sqlserver_id | RDS for SQL Server instance ID |

## API Calling

Use APIs to search for RDS monitoring metrics. For details about calling methods and parameter description, see [Querying Monitoring Data](#) in the *Cloud Eye API Reference*.

Examples:

- Request

```
/V1.0/{project_id}/metric-data?
namespace=SYS.RDS&metric_name=rds001_cpu_util&dim.0=rds_cluster_id,5ea170ad-
cc6b-49cd-9020-
e94fdbea391&from=1484123686000&to=1568188853000&period=300&filter=average
```

- Response:

```
{
 "datapoints": [
 {
 "average": 0.35,
 "timestamp": 1484123400000,
 "unit": "Ratio"
 },
 {
 "average": 0.11,
 "timestamp": 1484123700000,
 "unit": "Ratio"
 }
],
 "metric_name": "rds001_cpu_util",
 "httpcode" : 200,

 }
}
```

## 8.7 Idempotent Requests

Idempotency is important in APIs because a resource may be called multiple times if an operation times out or encounters other server issues before it completes. If

the original request and the subsequent retries are successful, the operation is completed multiple times. This means that you might create more resources than you intended.

To solve this problem, idempotent request identifiers are introduced to distinguish the first attempt from subsequent attempts. With an idempotent request, if the original request completes successfully, any subsequent retries complete successfully without performing any further actions.

---

**NOTICE**

Currently, idempotency is only available to the API for creating RDS for MySQL single and primary/standby instances in [Creating a DB Instance](#).

---

## Idempotency

An idempotent operation produces the same result even when the operation is repeated many times.

### Idempotency in RDS APIs

When sending a request, the client can add **X-Client-Token** to the HTTP header as the idempotency identifier. For details, see [Table 8-7](#).

**Table 8-7** Idempotency identifier message header

| Parameter      | Description                                                                                                                                                        | Mandatory | Example Value                        |
|----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------|--------------------------------------|
| X-Client-Token | Identifier that ensures idempotency of client requests.<br>It is a UUID containing 32 hexadecimal digits and is generated by the client. The value must be unique. | No        | 46436810-d999-454c-bd85-e515fd258600 |

Generally, the client resends the request only when the response status code is 5xx due to an internal server exception or connection timeout or when the response result cannot be obtained. If the retry request uses the same idempotent identifier and request parameters, the server will return the same result as the original request.

Description about idempotency identifiers:

- An idempotency identifier is a case-sensitive UUID containing 32 hexadecimal digits. It is in the format of xxxxxxxx-xxxx-xxxx-xxxx-xxxxxxxxxxxx

(8-4-4-4-12), where each x is a hexadecimal digit ranging from 0 to 9 or a to f. If you provide an identifier that is not in UUID format, the server returns error code DBS.280497.

- Idempotency identifiers must be unique. If you reuse an identifier with different parameters, the server returns error code DBS.280495.
- Idempotent identifiers remain valid for eight hours. If an identifier has expired, the server returns error code DBS.280498.
- After an idempotency identifier is used:
  - If the returned status code is 2xx, subsequent retries will return the same result as the original one without affecting the server status.
  - If the returned status code is 4xx, subsequent retries will fail. You need to rectify the fault based on the error information and retry the request.

## Idempotent API

The following API is idempotent with **X-Client-Token**:

- [Creating a DB Instance](#)
