high_value	text	Limit of a level-2 partition. <ul style="list-style-type: none"> <li>For range partitioning and interval partitioning, the upper limit of each partition is displayed.</li> <li>For list partitioning, the value list of each partition is displayed.</li> <li>For hash partitioning, the number of each partition is displayed.</li> </ul>
tablespace_name	name	Tablespace name of a level-2 partitioned table.
schema	character varying(64)	Name of a namespace.
high_value_length	integer	Character length of the limit of a level-2 partition.

### 12.3.50 ADM\_TABLES

ADM\_TABLES displays all tables in the database. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in both PG\_CATALOG and SYS schema.

**Table 12-156** ADM\_TABLES columns

Name	Type	Description
owner	character varying(64)	Table owner.
table_name	character varying(64)	Table name.
tablespace_name	character varying(64)	Tablespace name of the table.
dropped	character varying	Specifies whether the current table is deleted. <ul style="list-style-type: none"> <li><b>YES:</b> It is deleted.</li> <li><b>NO:</b> It is not deleted.</li> </ul>

Name	Type	Description
num_rows	numeric	Estimated number of rows in the table.
status	character varying(8)	Specifies whether the current table is valid. <ul style="list-style-type: none"> <li>• <b>VALID</b>: The current table is valid.</li> <li>• <b>UNUSABLE</b>: The current table is unavailable.</li> </ul>
sample_size	numeric	Number of samples used for analyzing the table.
temporary	character(1)	Specifies whether a table is a temporary table. <ul style="list-style-type: none"> <li>• <b>Y</b>: The table is a temporary table.</li> <li>• <b>N</b>: The table is not a temporary table.</li> </ul>
pct_free	numeric	Minimum percentage of free space in a block.
ini_trans	numeric	Initial number of transactions.
max_trans	numeric	Maximum number of transactions.
avg_row_len	integer	Average number of bytes in each row.
partitioned	character varying(3)	Specifies whether a table is a partitioned table. <ul style="list-style-type: none"> <li>• <b>YES</b>: The table is a partitioned table.</li> <li>• <b>NO</b>: The table is not a partitioned table.</li> </ul>
last_analyzed	timestamp with time zone	Last time when the table was analyzed.

Name	Type	Description
row_movement	character varying(8)	<p>Specifies whether to allow partition row movement.</p> <ul style="list-style-type: none"> <li>• <b>ENABLED:</b> The partition row movement is allowed.</li> <li>• <b>DISABLED:</b> The partition row movement is not allowed.</li> </ul>
compression	character varying(8)	<p>Specifies whether to enable a table compression.</p> <ul style="list-style-type: none"> <li>• <b>ENABLED:</b> A table compression is enabled.</li> <li>• <b>DISABLED:</b> A table compression is disabled.</li> </ul>
duration	character varying(15)	<p>Time elapsed when a temporary table is processed.</p> <ul style="list-style-type: none"> <li>• <b>NULL:</b> The table is not a temporary table.</li> <li>• <b>sys\$session:</b> The table is a temporary session table.</li> <li>• <b>sys\$transaction:</b> The table is a temporary transaction table.</li> </ul>
logical_replication	character varying(8)	<p>Specifies whether logical replication is enabled for a table.</p> <ul style="list-style-type: none"> <li>• <b>ENABLED:</b> Logical replication is enabled.</li> <li>• <b>DISABLED:</b> Logical replication is disabled.</li> </ul>
external	character varying(3)	<p>Specifies whether the table is an external table.</p> <ul style="list-style-type: none"> <li>• <b>YES:</b> The table is an external table.</li> <li>• <b>NO:</b> The table is not an external table.</li> </ul>

Name	Type	Description
logging	character varying(3)	Specifies whether changes to a table are logged. <ul style="list-style-type: none"> <li>● <b>YES:</b> Logs are recorded for table changes.</li> <li>● <b>NO:</b> Logs are not recorded for table changes.</li> </ul>
default_collation	character varying(100)	Default collation of a table. <ul style="list-style-type: none"> <li>● default</li> </ul>
degree	character varying(10)	Number of instances in a scanned table.
table_lock	character varying(8)	Specifies whether to enable a table lock. <ul style="list-style-type: none"> <li>● <b>ENABLED:</b> The table lock is enabled.</li> <li>● <b>DISABLED:</b> The table lock is disabled.</li> </ul>
nested	character varying(3)	Specifies whether a table is a nested table. <ul style="list-style-type: none"> <li>● <b>YES:</b> The table is a nested table.</li> <li>● <b>NO:</b> The table is not a nested table.</li> </ul>
buffer_pool	character varying(7)	Default buffer pool of a table.
flash_cache	character varying(7)	Not supported. Its value is <b>NULL</b> .
cell_flash_cache	character varying(7)	Not supported. Its value is <b>NULL</b> .
skip_corrupt	character varying(8)	Specifies whether to skip corrupted blocks during table scanning. <ul style="list-style-type: none"> <li>● <b>ENABLED:</b> The corrupted block is skipped.</li> <li>● <b>DISABLED:</b> The corrupted block is not skipped.</li> </ul>

Name	Type	Description
has_identity	character varying(3)	Specifies whether a table has an identifier column. <ul style="list-style-type: none"> <li>• <b>YES</b>: There is an identifier column.</li> <li>• <b>NO</b>: There is no identifier column.</li> </ul>
segment_created	character varying(3)	Specifies whether a table segment has been created. <ul style="list-style-type: none"> <li>• <b>YES</b>: The table segment has been created.</li> <li>• <b>NO</b>: The table segment is not created.</li> </ul>
monitoring	character varying(3)	Specifies whether to monitor the modification of a table. <ul style="list-style-type: none"> <li>• <b>YES</b>: The modification of the table is monitored.</li> <li>• <b>NO</b>: The modification of the table is not monitored.</li> </ul>
cluster_name	character varying(128)	Not supported. Its value is <b>NULL</b> .
iot_name	character varying(128)	Not supported. Its value is <b>NULL</b> .
pct_used	numeric	Not supported. Its value is <b>NULL</b> .
initial_extent	numeric	Not supported. Its value is <b>NULL</b> .
next_extent	numeric	Not supported. Its value is <b>NULL</b> .
min_extents	numeric	Not supported. Its value is <b>NULL</b> .
max_extents	numeric	Not supported. Its value is <b>NULL</b> .
pct_increase	numeric	Not supported. Its value is <b>NULL</b> .

Name	Type	Description
freelists	numeric	Not supported. Its value is <b>NULL</b> .
freelist_groups	numeric	Not supported. Its value is <b>NULL</b> .
backed_up	character varying(1)	Not supported. Its value is <b>NULL</b> .
blocks	numeric	Not supported. Its value is <b>NULL</b> .
empty_blocks	numeric	Not supported. Its value is <b>NULL</b> .
avg_space	numeric	Not supported. Its value is <b>NULL</b> .
chain_cnt	numeric	Not supported. Its value is <b>NULL</b> .
avg_space_freelist_blocks	numeric	Not supported. Its value is <b>NULL</b> .
num_freelist_blocks	numeric	Not supported. Its value is <b>NULL</b> .
instances	character varying(10)	Not supported. Its value is <b>NULL</b> .
cache	character varying(5)	Not supported. Its value is <b>NULL</b> .
iot_type	character varying(12)	Not supported. Its value is <b>NULL</b> .
secondary	character varying(1)	Not supported. Its value is <b>NULL</b> .
global_stats	character varying(3)	Not supported. Its value is <b>NULL</b> .
user_stats	character varying(3)	Not supported. Its value is <b>NULL</b> .
cluster_owner	character varying(30)	Not supported. Its value is <b>NULL</b> .
dependencies	character varying(8)	Not supported. Its value is <b>NULL</b> .
compression_for	character varying(30)	Not supported. Its value is <b>NULL</b> .
read_only	character varying(3)	Not supported. Its value is <b>NULL</b> .

Name	Type	Description
result_cache	character varying(7)	Not supported. Its value is <b>NULL</b> .
clustering	character varying(3)	Not supported. Its value is <b>NULL</b> .
activity_tracking	character varying(23)	Not supported. Its value is <b>NULL</b> .
dml_timestamp	character varying(25)	Not supported. Its value is <b>NULL</b> .
container_data	character varying(3)	Not supported. Its value is <b>NULL</b> .
inmemory_priority	character varying(8)	Not supported. Its value is <b>NULL</b> .
inmemory_distribute	character varying(15)	Not supported. Its value is <b>NULL</b> .
inmemory_compression	character varying(17)	Not supported. Its value is <b>NULL</b> .
inmemory_duplicate	character varying(13)	Not supported. Its value is <b>NULL</b> .
duplicated	character varying(1)	Not supported. Its value is <b>NULL</b> .
sharded	character varying(1)	Not supported. Its value is <b>NULL</b> .
hybrid	character varying(3)	Not supported. Its value is <b>NULL</b> .
cellmemory	character varying(24)	Not supported. Its value is <b>NULL</b> .
containers_default	character varying(3)	Not supported. Its value is <b>NULL</b> .
container_map	character varying(3)	Not supported. Its value is <b>NULL</b> .
extended_data_link	character varying(3)	Not supported. Its value is <b>NULL</b> .
extended_data_link_map	character varying(3)	Not supported. Its value is <b>NULL</b> .
inmemory_service	character varying(12)	Not supported. Its value is <b>NULL</b> .
inmemory_service_name	character varying(1000)	Not supported. Its value is <b>NULL</b> .

Name	Type	Description
container_map_object	character varying(3)	Not supported. Its value is <b>NULL</b> .
memoptimize_read	character varying(8)	Not supported. Its value is <b>NULL</b> .
memoptimize_write	character varying(8)	Not supported. Its value is <b>NULL</b> .
has_sensitive_column	character varying(3)	Not supported. Its value is <b>NULL</b> .
admit_null	character varying(3)	Not supported. Its value is <b>NULL</b> .
data_link_dml_enabled	character varying(3)	Not supported. Its value is <b>NULL</b> .
object_id_type	character varying(16)	Not supported. Its value is <b>NULL</b> .
table_type_owner	character varying(128)	Not supported. Its value is <b>NULL</b> .
table_type	character varying(128)	Not supported. Its value is <b>NULL</b> .
compress_for	character varying(30)	Not supported. Its value is <b>NULL</b> .

## 12.3.51 ADM\_TABLESPACES

ADM\_TABLESPACES displays information about all tablespaces. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in both PG\_CATALOG and SYS schema. The logical structure features of the GaussDB are different from those of the A database.

**Table 12-157** ADM\_TABLESPACES columns

Name	Type	Description
tablespace_name	character varying(64)	Tablespace name
block_size	numeric	Not supported. Its value is <b>NULL</b> .
initial_extent	numeric	Not supported. Its value is <b>NULL</b> .
next_extent	numeric	Not supported. Its value is <b>NULL</b> .

Name	Type	Description
min_extents	numeric	Not supported. Its value is <b>NULL</b> .
max_extents	numeric	Not supported. Its value is <b>NULL</b> .
max_size	numeric	Not supported. Its value is <b>NULL</b> .
pct_increase	numeric	Not supported. Its value is <b>NULL</b> .
min_extlen	numeric	Not supported. Its value is <b>NULL</b> .
contents	character varying(9)	Not supported. Its value is <b>NULL</b> .
status	character varying(9)	Not supported The default value is <b>ONLINE</b> .
logging	character varying(9)	Not supported. Its value is <b>NULL</b> .
force_logging	character varying(3)	Not supported. Its value is <b>NULL</b> .
extent_management	character varying(10)	Not supported. Its value is <b>NULL</b> .
allocation_type	character varying(9)	Not supported. Its value is <b>NULL</b> .
plugged_in	character varying(3)	Not supported. Its value is <b>NULL</b> .
segment_space_management	character varying(6)	Not supported. Its value is <b>NULL</b> .
def_tab_compression	character varying(8)	Not supported. Its value is <b>NULL</b> .
retention	character varying(11)	Not supported. Its value is <b>NULL</b> .
bigfile	character varying(3)	Not supported. Its value is <b>NULL</b> .
predicate_evaluation	character varying(7)	Not supported. Its value is <b>NULL</b> .
encrypted	character varying(3)	Not supported. Its value is <b>NULL</b> .
compress_for	character varying(30)	Not supported. Its value is <b>NULL</b> .

Name	Type	Description
def_inmemory	character varying(8)	Not supported. Its value is <b>NULL</b> .
def_inmemory_priority	character varying(8)	Not supported. Its value is <b>NULL</b> .
def_inmemory_distribute	character varying(15)	Not supported. Its value is <b>NULL</b> .
def_inmemory_compression	character varying(17)	Not supported. Its value is <b>NULL</b> .
def_inmemory_duplicate	character varying(13)	Not supported. Its value is <b>NULL</b> .
shared	character varying(12)	Not supported. Its value is <b>NULL</b> .
def_index_compression	character varying(8)	Not supported. Its value is <b>NULL</b> .
index_compress_for	character varying(13)	Not supported. Its value is <b>NULL</b> .
def_cellmemory	character varying(14)	Not supported. Its value is <b>NULL</b> .
def_inmemory_service	character varying(12)	Not supported. Its value is <b>NULL</b> .
def_inmemory_service_name	character varying(1000)	Not supported. Its value is <b>NULL</b> .
lost_write_protect	character varying(7)	Not supported. Its value is <b>NULL</b> .
chunk_tablespace	character varying(1)	Not supported. Its value is <b>NULL</b> .

### 12.3.52 ADM\_TAB\_COLUMNS

ADM\_TAB\_COLUMNS displays information about the columns of tables and views. Each column of each table and view in the database has a row of data in ADM\_TAB\_COLUMNS. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in both PG\_CATALOG and SYS schema.

**Table 12-158** ADM\_TAB\_COLUMNS columns

Name	Type	Description
owner	character varying(64)	Table owner.

Name	Type	Description
table_name	character varying(64)	Table name.
column_name	character varying(64)	Column name.
data_type	character varying(128)	Data type of a column.
data_type_mod	character varying(3)	Not supported. Its value is <b>NULL</b> .
data_type_owner	character varying(128)	Owner of the data type of a column.
data_length	integer	Length of a column, in bytes.
data_precision	integer	Precision of a data type. This column is valid for the numeric data type and <b>NULL</b> for other data types.
data_scale	integer	Number of decimal places. This column is valid for the numeric data type and is set to <b>0</b> for other data types.
nullable	bpchar	Specifies whether the column can be null. <ul style="list-style-type: none"> <li>• <b>y</b>: yes.</li> <li>• <b>n</b>: no. For primary key constraints and non-null constraints, the value is <b>n</b>.</li> </ul>
column_id	integer	Sequence number of a column when a table is created.
default_length	numeric	Length of the default value of a column, in bytes. This column is left blank if no default value left.
data_default	text	Default value of a column.
num_distinct	numeric	Number of different values in a column.
low_value	raw	Minimum value in a column.
high_value	raw	Maximum value in a column.
density	numeric	Column density.
num_nulls	numeric	Number of empty values in a column.
num_buckets	numeric	Number of buckets in the histogram of a column.

Name	Type	Description
last_analyzed	timestamp(0) without time zone	Last analysis date.
sample_size	numeric	Sample size used to analyze a column.
character_set_name	character varying(44)	Not supported. Its value is <b>NULL</b> .
char_col_decl_length	numeric	Declaration length of a column of the character type.
global_stats	character varying(3)	Not supported. Its value is <b>NO</b> .
user_stats	character varying(3)	Not supported. Its value is <b>NO</b> .
avg_col_len	numeric	Average length of a column, in bytes.
char_length	numeric	Column length (in bytes) which is valid only for the varchar, nvarchar2, bpchar, and char types.
char_used	character varying(1)	Not supported. Set it to <b>B</b> if the data type is varchar, nvarchar2, bpchar, or char, and to <b>NULL</b> for other data types.
v80_fmt_image	character varying(3)	Not supported. Its value is <b>NULL</b> .
data_upgraded	character varying(3)	Not supported. Its value is <b>YES</b> .
histogram	character varying(15)	Specifies whether the histogram exists and the type of the histogram. <ul style="list-style-type: none"> <li>• <b>NONE</b>: no histogram.</li> <li>• <b>FREQUENCY</b>: frequency histogram.</li> <li>• <b>EQUI_WIDTH</b>: equal-width histogram.</li> </ul>
default_on_null	character varying(3)	Not supported. Its value is <b>NULL</b> .
identity_column	character varying(3)	Not supported. Its value is <b>NULL</b> .
sensitive_column	character varying(3)	Not supported. Its value is <b>NULL</b> .
evaluation_edition	character varying(128)	Not supported. Its value is <b>NULL</b> .
unusable_before	character varying(128)	Not supported. Its value is <b>NULL</b> .
unusable_beginning	character varying(128)	Not supported. Its value is <b>NULL</b> .

Name	Type	Description
collation	character varying(100)	Collation rule of a column. This column conflicts with reserved keywords. Therefore, add the view name when calling this column.
comments	text	Comment of a column.
schema	character varying(64)	Name of the namespace to which the column belongs.

### 12.3.53 ADM\_TAB\_COMMENTS

ADM\_TAB\_COMMENTS displays comments about all tables and views in the database. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in both PG\_CATALOG and SYS schema.

**Table 12-159** ADM\_TAB\_COMMENTS columns

Name	Type	Description
owner	character varying(64)	Owner of a table or view.
table_name	character varying(64)	Name of the table or view.
comments	text	Comments.
schema	character varying(64)	Name of the namespace to which the table belongs.

### 12.3.54 ADM\_TAB\_PARTITIONS

ADM\_TAB\_PARTITIONS displays information about level-1 partitions (including level-2 partitioned tables) in the database. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in both PG\_CATALOG and SYS schema.

**Table 12-160** ADM\_TAB\_PARTITIONS columns

Name	Type	Description
table_owner	character varying(64)	Table owner.
table_name	character varying(64)	Relational table name.
partition_name	character varying(64)	Partition name.

Name	Type	Description
high_value	text	Limit of a partition. <ul style="list-style-type: none"> <li>For range partitioning and interval partitioning, the upper limit of each partition is displayed.</li> <li>For list partitioning, the value list of each partition is displayed.</li> <li>For hash partitioning, the number of each partition is displayed.</li> </ul>
tablespace_name	name	Tablespace name of the partitioned table.
schema	character varying(64)	Name of a namespace.
subpartition_count	bigint	Number of level-2 partitions.
high_value_length	integer	Length of the binding value expression in a partition.
composite	character varying(3)	Specifies whether the table is a level-2 partitioned table.
partition_position	numeric	Position of the partition in the table.
pct_free	numeric	Minimum percentage of available space in a block.
pct_used	numeric	Not supported. Its value is <b>NULL</b> .
ini_trans	numeric	Initial number of transactions. The default value is <b>4</b> . The value is <b>NULL</b> for non-Ustore partitioned tables.
max_trans	numeric	Maximum number of transactions. The default value is <b>128</b> . The value is <b>NULL</b> for non-Ustore partitioned tables.
initial_extent	numeric	Not supported. Its value is <b>NULL</b> .
next_extent	numeric	Not supported. Its value is <b>NULL</b> .
min_extent	numeric	Not supported. Its value is <b>NULL</b> .
max_extent	numeric	Not supported. Its value is <b>NULL</b> .
max_size	numeric	Not supported. Its value is <b>NULL</b> .

Name	Type	Description
pct_increase	numeric	Not supported. Its value is <b>NULL</b> .
freelists	numeric	Not supported. Its value is <b>NULL</b> .
freelist_groups	numeric	Not supported. Its value is <b>NULL</b> .
logging	character varying(7)	Specifies whether changes to a table are logged.
compression	character varying(8)	Actual compression attribute of a partitioned table.
compress_for	character varying(30)	Not supported. Its value is <b>NULL</b> .
num_rows	numeric	Number of rows in a partition.
blocks	numeric	Not supported. Its value is <b>NULL</b> .
empty_blocks	numeric	Not supported. Its value is <b>NULL</b> .
avg_space	numeric	Not supported. Its value is <b>NULL</b> .
chain_cnt	numeric	Not supported. Its value is <b>NULL</b> .
avg_row_len	numeric	Not supported. Its value is <b>NULL</b> .
sample_size	numeric	Not supported. Its value is <b>NULL</b> .
last_analyzed	timestamp with time zone	Last date when the partition was analyzed.
buffer_pool	character varying(7)	Buffer pool allocated to a partitioned block.
flash_cache	character varying(7)	Not supported. Its value is <b>NULL</b> .
cell_flash_cache	character varying(7)	Not supported. Its value is <b>NULL</b> .
global_stats	character varying(3)	Not supported. Its value is <b>NULL</b> .
user_stats	character varying(3)	Not supported. Its value is <b>NULL</b> .
is_nested	character varying(3)	Specifies whether this partitioned table is a nested partitioned table.
parent_table_partition	character varying(128)	Not supported. Its value is <b>NULL</b> .
interval	character varying(3)	Specifies whether the partition is a partition in an interval partitioned table.
segment_created	character varying(4)	Specifies whether a partitioned table has segments created or has not been created.

Name	Type	Description
indexing	character varying(4)	Not supported. Its value is <b>NULL</b> .
read_only	character varying(4)	Not supported. Its value is <b>NULL</b> .
inmemory	character varying(8)	Not supported. Its value is <b>NULL</b> .
inmemory_priority	character varying(8)	Not supported. Its value is <b>NULL</b> .
inmemory_distribute	character varying(15)	Not supported. Its value is <b>NULL</b> .
inmemory_compression	character varying(17)	Not supported. Its value is <b>NULL</b> .
inmemory_duplicate	character varying(13)	Not supported. Its value is <b>NULL</b> .
cellmemory	character varying(24)	Not supported. Its value is <b>NULL</b> .
inmemory_service	character varying(12)	Not supported. Its value is <b>NULL</b> .
inmemory_service_name	character varying(100)	Not supported. Its value is <b>NULL</b> .
memoptimize_read	character varying(8)	Not supported. Its value is <b>NULL</b> .
memoptimize_write	character varying(8)	Not supported. Its value is <b>NULL</b> .

### 12.3.55 ADM\_TRIGGERS

ADM\_TRIGGERS displays information about triggers in the database. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in both PG\_CATALOG and SYS schema.

**Table 12-161** ADM\_TRIGGERS columns

Name	Type	Description
owner	character varying(128)	Trigger owner.
trigger_name	character varying(64)	Trigger name.

Name	Type	Description
trigger_type	character varying	Time when a trigger is triggered. Value range: <b>before statement</b> , <b>before each row</b> , <b>after statement</b> , <b>after each row</b> , and <b>instead of</b> .
triggering_event	character varying	Event that triggers a trigger: <b>update</b> , <b>insert</b> , <b>delete</b> , and <b>truncate</b> .
table_owner	character varying(64)	Owner of the table that defines a trigger.
base_object_type	character varying(18)	Defines the basic object of a trigger. Value range: <b>table</b> and <b>view</b> .
table_name	character varying(64)	Name of the table or view that defines a trigger.
column_name	character varying(4000)	Not supported. Its value is <b>NULL</b> .
referencing_name	character varying(422)	Not supported. Its value is <b>referencing new as new old as old</b> .
when_clause	character varying(4000)	Content of the WHEN clause. <b>trigger_body</b> can be executed only when the value is <b>true</b> .
status	character varying(64)	Trigger status: <ul style="list-style-type: none"> <li>● <b>O</b>: The trigger is enabled in origin or local mode.</li> <li>● <b>D</b>: The trigger is disabled.</li> <li>● <b>R</b>: The trigger is enabled in replica mode.</li> <li>● <b>A</b>: The trigger is always enabled.</li> </ul>
description	character varying(4000)	Trigger description, which is used to rebuild a trigger creation statement.
action_type	character varying(11)	Action type of a trigger, which only supports <b>call</b> .
trigger_body	text	Statement executed when a trigger is triggered.
crossedition	character varying(7)	Not supported. Its value is <b>NULL</b> .
before_statement	character varying(3)	Not supported. Its value is <b>NULL</b> .
before_row	character varying(3)	Not supported. Its value is <b>NULL</b> .
after_row	character varying(3)	Not supported. Its value is <b>NULL</b> .

Name	Type	Description
after_statement	character varying(3)	Not supported. Its value is <b>NULL</b> .
instead_of_row	character varying(3)	Not supported. Its value is <b>NULL</b> .
fire_once	character varying(3)	Not supported. Its value is <b>NULL</b> .
apply_server_only	character varying(3)	Not supported. Its value is <b>NULL</b> .

## 12.3.56 ADM\_TYPE\_ATTRS

ADM\_TYPE\_ATTRS displays the attributes of the current database object type. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in both PG\_CATALOG and SYS schema.

**Table 12-162** ADM\_TYPE\_ATTRS columns

Name	Type	Description
owner	oid	Owner of the type.
type_name	name	Data type name.
attr_name	name	Column name.
attr_type_mod	integer	Type-specific data supplied at the table creation time (for example, the maximum length of a <b>varchar</b> column). This column is used as the third parameter when passing to type-specific input functions and length coercion functions. The value will generally be <b>-1</b> for types that do not need ATTTYPMOD.
attr_type_owner	oid	Owner of an attribute of this type.
attr_type_name	name	Data type attribute name, which records the type name after conversion.
length	smallint	Number of bytes in the internal representation of the type for a fixed-size type. It is a negative number for a variable-length type. <ul style="list-style-type: none"> <li>The value <b>-1</b> indicates a "varlena" type (one that has a length word).</li> <li>The value <b>-2</b> indicates a NULL-terminated C string.</li> </ul>

Name	Type	Description
precision	integer	Precision of the numeric type.
scale	integer	Range of the numeric type
character_set_name	character(1)	Character set name of an attribute ( <b>c</b> or <b>n</b> ). <ul style="list-style-type: none"><li>• <b>c</b>: CHAR_CS.</li><li>• <b>n</b>: NCHAR_CS.</li></ul>
attr_no	smallint	Attribute number
inherited	character(1)	Specifies whether the attribute is inherited from the super type ( <b>Y</b> or <b>N</b> ).
attr_length	integer	Type-specific data supplied at the table creation time (for example, the maximum length of a <b>varchar</b> column). The raw type is not recorded due to kernel implementation.

### 12.3.57 ADM\_TYPES

ADM\_TYPES describes all object types in the database. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in both PG\_CATALOG and SYS schema.

**Table 12-163** ADM\_TYPES columns

Name	Type	Description
owner	character varying(128)	Owner of the type.
type_name	character varying(128)	Type name.
type_oid	raw	Type OID.
typecode	character varying(128)	Type code.
attributes	numeric	Number of attributes in a type.
methods	numeric	Not supported. Its value is <b>0</b> .
predefined	character varying(3)	Specifies whether the type is a predefined type.
incomplete	character varying(3)	Specifies whether the type is an incomplete type.
final	character varying(3)	Not supported. Its value is <b>NULL</b> .

Name	Type	Description
instantiable	character varying(3)	Not supported. Its value is <b>NULL</b> .
persistable	character varying(3)	Not supported. Its value is <b>NULL</b> .
supertype_owner	character varying(128)	Not supported. Its value is <b>NULL</b> .
supertype_name	character varying(128)	Not supported. Its value is <b>NULL</b> .
local_attributes	numeric	Not supported. Its value is <b>NULL</b> .
local_methods	numeric	Not supported. Its value is <b>NULL</b> .
typeid	raw	Not supported. Its value is <b>NULL</b> .

## 12.3.58 ADM\_USERS

ADM\_USERS displays information about all database users. This view is accessible only to system administrators. This view exists in both PG\_CATALOG and SYS schema.

**Table 12-164** ADM\_USERS columns

Name	Type	Description
username	character varying(128)	Username.
user_id	oid	User ID.
account_status	character varying(32)	Account status. <ul style="list-style-type: none"> <li>• <b>NULL</b>: The account is the initial system administrator with the highest permission.</li> <li>• <b>0</b>: normal.</li> <li>• <b>1</b>: The account is locked for a specific period of time because the number of failed login attempts exceeds the threshold.</li> <li>• <b>2</b>: The account is locked by the administrator.</li> </ul>

Name	Type	Description
lock_date	timestamp with time zone	By default, the creation date of the account is displayed. If the account is locked by the administrator or the account is locked because the number of login failures exceeds the threshold, the date when the account is locked is displayed. The value is <b>null</b> for the initial system administrator.
expiry_date	timestamp with time zone	Account expiration date.
default_tablespace	character varying(4000)	Default tablespace for storing data.
temporary_tablespace	character varying(4000)	Name of the default tablespace or tablespace group of a temporary table.
local_temp_tablespace	character varying(30)	Not supported. The default value is <b>NULL</b> .
created	timestamp with time zone	Date when a user is created.
profile	character varying(128)	Not supported. The default value is <b>NULL</b> .
initial_rsrc_consumer_group	character varying(128)	Not supported. The default value is <b>NULL</b> .
external_name	character varying(4000)	Not supported. The default value is <b>NULL</b> .
password_versions	character varying(12)	Specifies the encryption type of account passwords. Value range: <b>MD5, SHA256, or SM3</b> .
editions_enabled	character varying(1)	Not supported. The default value is <b>NULL</b> .
authentication_type	text	Authentication mechanism of the user.
proxy_only_connect	character varying(1)	Not supported. The default value is <b>NULL</b> .
common	character varying(3)	Not supported. The default value is <b>NULL</b> .
last_login	timestamp with time zone	Last login.

Name	Type	Description
oracle_maintained	character varying(1)	Not supported. The default value is <b>NULL</b> .
inherited	character varying(3)	Not supported. The default value is <b>NULL</b> .
default_collation	character varying(100)	Default collation of the user schema.
implicit	character varying(3)	Not supported. The default value is <b>NULL</b> .
all_shard	character varying(3)	Not supported. The default value is <b>NULL</b> .
password_change_date	timestamp with time zone	Date when the user password was set last time.

## 12.3.59 ADM\_VIEWS

ADM\_VIEWS displays views in the database. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in both PG\_CATALOG and SYS schema.

**Table 12-165** ADM\_VIEWS columns

Name	Type	Description
owner	character varying(64)	Owner of a view.
view_name	character varying(64)	View name.
text	text	View text.
text_length	integer	Text length of the view.
text_vc	character varying(4000)	View creation statement. This column may truncate the view text. The BEQUEATH clause will not appear as part of the <b>TEXT_VC</b> column in this view.
type_text_length	numeric	Not supported. Its value is <b>NULL</b> .
type_text	character varying(4000)	Not supported. Its value is <b>NULL</b> .
oid_text_length	numeric	Not supported. Its value is <b>NULL</b> .

Name	Type	Description
oid_text	character varying(4000)	Not supported. Its value is <b>NULL</b> .
view_type_owner	character varying(128)	Not supported. Its value is <b>NULL</b> .
view_type	character varying(128)	Not supported. Its value is <b>NULL</b> .
superview_name	character varying(128)	Not supported. Its value is <b>NULL</b> .
editioning_view	character varying(1)	Not supported. Its value is <b>NULL</b> .
read_only	character varying(1)	Not supported. Its value is <b>NULL</b> .
container_data	character varying(1)	Not supported. Its value is <b>NULL</b> .
bequeath	character varying(12)	Not supported. Its value is <b>NULL</b> .
origin_con_id	character varying(256)	Not supported. Its value is <b>NULL</b> .
default_collation	character varying(100)	Not supported. Its value is <b>NULL</b> .
containers_default	character varying(3)	Not supported. Its value is <b>NULL</b> .
container_map	character varying(3)	Not supported. Its value is <b>NULL</b> .
extended_data_link	character varying(3)	Not supported. Its value is <b>NULL</b> .
extended_data_link_map	character varying(3)	Not supported. Its value is <b>NULL</b> .
has_sensitive_column	character varying(3)	Not supported. Its value is <b>NULL</b> .
admit_null	character varying(3)	Not supported. Its value is <b>NULL</b> .
pdb_local_only	character varying(3)	Not supported. Its value is <b>NULL</b> .

## 12.3.60 DB\_ALL\_TABLES

DB\_ALL\_TABLES displays tables or views accessible to the current user. This view exists in both PG\_CATALOG and SYS schema.

**Table 12-166** DB\_ALL\_TABLES columns

Name	Type	Description
owner	name	Owner of a table or view.
table_name	name	Name of the table or view.
tablespace_name	name	Tablespace where a table or view is located

## 12.3.61 DB\_ARGUMENTS

DB\_ARGUMENTS displays parameter information about stored procedures and functions accessible to the current user. This view exists in both PG\_CATALOG and SYS schema. This view is accessible to all users and displays all information accessible to the current user.

**Table 12-167** DB\_ARGUMENTS columns

Name	Type	Description
owner	character varying(128)	Owner of a function or stored procedure.
object_name	character varying(128)	Name of a function or stored procedure.
package_name	character varying(128)	Package name.
object_id	oid	OID of a function or stored procedure.
overload	character varying(40)	<i>n</i> th overloaded function of the name.
subprogram_id	numeric	Location of a function or stored procedure in a package.
argument_name	character varying(128)	Parameter name.
position	numeric	Position of the parameter in the parameter list. The value is <b>0</b> for the return value of the function by default.

Name	Type	Description
sequence	numeric	Sequence of a parameter, which starts from 1, with the return type before all parameters.
data_level	numeric	Nesting depth of parameters of the composite type. The value is fixed at <b>0</b> because only one line is displayed for each parameter.
data_type	character varying(64)	Data type of a parameter.
defaulted	character varying(1)	Specifies whether a parameter has a default value: <ul style="list-style-type: none"> <li>• <b>Y</b>: yes.</li> <li>• <b>N</b>: no.</li> </ul>
default_value	text	Not supported. Its value is <b>NULL</b> .
default_length	numeric	Not supported. Its value is <b>NULL</b> .
in_out	character varying(9)	Input and output attributes of a parameter: <ul style="list-style-type: none"> <li>• <b>IN</b>: input parameter.</li> <li>• <b>OUT</b>: output parameter.</li> <li>• <b>IN_OUT</b>: input and output parameters.</li> <li>• <b>VARIADIC</b>: VARIADIC parameter.</li> </ul>
data_length	numeric	Not supported. Its value is <b>NULL</b> .
data_precision	numeric	Not supported. Its value is <b>NULL</b> .
data_scale	numeric	Not supported. Its value is <b>NULL</b> .

Name	Type	Description
radix	numeric	Radix of a number, which is <b>10</b> when the data type is smallint, integer, bigint, numeric, or float, and null for other data types.
character_set_name	character varying(44)	Not supported. Its value is <b>NULL</b> .
type_owner	character varying(128)	Owner of the data type.
type_name	character varying(128)	Parameter type name. Only the customized type is displayed.
type_subname	character varying(128)	Not supported. Its value is <b>NULL</b> .
type_link	character varying(128)	Not supported. Its value is <b>NULL</b> .
type_object_type	character varying(7)	Types of types of the <b>type_owner</b> , <b>type_name</b> , and <b>type_subname</b> columns: <ul style="list-style-type: none"> <li>• <b>TABLE</b>: The parameter is of the table type.</li> <li>• <b>VIEW</b>: The parameter is of the view type.</li> <li>• Set this column to <b>NULL</b> for other types.</li> </ul>
pls_type	character varying(128)	Name of the PL/SQL type for parameters of the number type. Otherwise, this column is empty.
char_length	numeric	Not supported. Its value is <b>NULL</b> .
char_used	character varying(1)	Not supported. Set it to <b>B</b> if the data type is varchar, nvarchar2, bpchar, or char, and to <b>NULL</b> for other data types.
origin_con_id	character varying(256)	Not supported. Its value is <b>0</b> .

## 12.3.62 DB\_COL\_COMMENTS

DB\_COL\_COMMENTS displays comment information about table columns accessible to the current user. This view exists in both PG\_CATALOG and SYS schema.

**Table 12-168** DB\_COL\_COMMENTS columns

Name	Type	Description
owner	character varying(64)	Table owner.
table_name	character varying(64)	Table name.
column_name	character varying(64)	Column name.
comments	text	Comments.
schema	character varying(64)	Name of the namespace to which the column belongs.

## 12.3.63 DB\_COL\_PRIVS

DB\_COL\_PRIVS displays the following granting information:

- Column permission granting information when the current user is the object owner, grantor, or grantee.
- Column permission granting information when the enabled role or PUBLIC role is the grantee.

By default, it is accessible to all users. This view exists in both PG\_CATALOG and SYS schema.

**Table 12-169** DB\_COL\_PRIVS columns

Name	Type	Description
grantor	character varying(128)	Name of the user who grants the permission.
owner	character varying(128)	Object owner.
grantee	character varying(128)	Name of the user or role to which the permission is granted.
table_schema	character varying(128)	Schema of an object.
table_name	character varying(128)	Object name.
column_name	character varying(128)	Column name.
privilege	character varying(40)	Permission on a column.

Name	Type	Description
grantable	character varying(3)	Specifies whether to grant privileges. <ul style="list-style-type: none"> <li>• YES</li> <li>• NO</li> </ul>
common	character varying(3)	Not supported. Its value is <b>NULL</b> .
inherited	character varying(3)	Not supported. Its value is <b>NULL</b> .

### 12.3.64 DB\_COLL\_TYPES

DB\_COLL\_TYPES displays information about collection types that can be accessed by the current user. By default, it is accessible to all users. This view exists in both PG\_CATALOG and SYS schema.

**Table 12-170** DB\_COLL\_TYPES columns

Name	Type	Description
owner	character varying(128)	Owner of a cluster.
type_name	character varying(128)	Name of a collection.
coll_type	character varying(128)	Description of a set.
upper_bound	numeric	Not supported. Its value is <b>NULL</b> .
elem_type_mod	character varying(7)	Type modifier of an element.
elem_type_owner	character varying(128)	Owner of the element type on which the collection is based. This parameter is mainly used for user-defined types.
elem_type_name	character varying(128)	Name of the data type or user-defined type on which the collection is based.
length	numeric	Not supported. Its value is <b>NULL</b> .
precision	numeric	Not supported. Its value is <b>NULL</b> .

Name	Type	Description
scale	numeric	Not supported. Its value is <b>NULL</b> .
character_set_name	character varying(44)	Not supported. Its value is <b>NULL</b> .
elem_storage	character varying(7)	Not supported. Its value is <b>NULL</b> .
nulls_stored	character varying(3)	Not supported. Its value is <b>NULL</b> .
char_used	character varying(1)	Not supported. Its value is <b>NULL</b> .

### 12.3.65 DB\_CONS\_COLUMNS

DB\_CONS\_COLUMNS displays information about constraint columns accessible to the current user. This view exists in both PG\_CATALOG and SYS schema.

**Table 12-171** DB\_CONS\_COLUMNS columns

Name	Type	Description
owner	character varying(64)	Constraint creator.
constraint_name	character varying(64)	Constraint name.
table_name	character varying(64)	Name of a constraint-related table.
column_name	character varying(64)	Name of a constraint-related column.
position	smallint	Position of a column in a table.

### 12.3.66 DB\_CONSTRAINTS

DB\_CONSTRAINTS displays information about constraints accessible to the current user. This view exists in both PG\_CATALOG and SYS schema.

**Table 12-172** DB\_CONSTRAINTS columns

Name	Type	Description
owner	character varying(64)	Constraint creator.

Name	Type	Description
constraint_name	character varying(64)	Constraint name.
constraint_type	text	Constraint type. <ul style="list-style-type: none"> <li>• <b>c</b>: check constraint.</li> <li>• <b>f</b>: foreign key constraint.</li> <li>• <b>p</b>: primary key constraint.</li> <li>• <b>u</b>: unique constraint.</li> </ul>
table_name	character varying(64)	Name of a constraint-related table.
index_owner	character varying(64)	Owner of a constraint-related index (only for the unique constraint and primary key constraint).
index_name	character varying(64)	Name of a constraint-related index (only for the unique constraint and primary key constraint).

### 12.3.67 DB\_DEPENDENCIES

DB\_DEPENDENCIES displays the dependency relationship between types, tables, views, stored procedures, functions, and triggers accessible to the current user. It is accessible to all users. This view exists in both PG\_CATALOG and SYS schema.

**Table 12-173** DB\_DEPENDENCIES columns

Name	Type	Description
owner	name	Object owner.
name	name	Object name.
type	character varying(18)	Object type.
referenced_owner	name	Owner of the referenced object.
referenced_name	name	Name of the referenced object.
referenced_type	character varying(18)	Type of the referenced object.
referenced_link_name	character varying(128)	Not supported. Its value is <b>NULL</b> .
dependency_type	character varying(4)	Not supported. Its value is <b>NULL</b> .

## 12.3.68 DB\_ERRORS

DB\_ERRORS displays the latest compilation error information about storage objects accessible to users. By default, it is accessible to all users. This view exists in both PG\_CATALOG and SYS schema.

**Table 12-174** DB\_ERRORS columns

Name	Type	Description
owner	character varying(128)	Object owner.
name	character varying(128)	Object name.
type	character varying(12)	Object type.
sequence	numeric	Serial number.
line	numeric	Row where an error occurs.
position	numeric	Not supported. Its value is <b>NULL</b> .
text	character varying(4000)	Error text.
attribute	character varying(9)	Attribute tag: ERROR.
message_number	numeric	Not supported. Its value is <b>NULL</b> .

## 12.3.69 DB\_IND\_COLUMNS

DB\_IND\_COLUMNS stores all index columns accessible to the current user. This view exists in both PG\_CATALOG and SYS schema.

**Table 12-175** DB\_IND\_COLUMNS columns

Name	Type	Description
index_owner	character varying(64)	Index owner.
index_name	character varying(64)	Index name.
table_owner	character varying(64)	Table owner.
table_name	character varying(64)	Table name.
column_name	name	Column name.
column_position	smallint	Position of a column in an index.
column_length	numeric	Column length

Name	Type	Description
char_length	numeric	Length of a column (character type).
descend	character varying(4)	Sorting mode of a column. The value can be <b>DESC</b> or <b>ASC</b> .
collated_column_id	numeric	Provides the internal serial number of the language sorting columns.

### 12.3.70 DB\_IND\_EXPRESSIONS

DB\_IND\_EXPRESSIONS displays information about expression indexes accessible to the current user. This view exists in both PG\_CATALOG and SYS schema.

**Table 12-176** DB\_IND\_EXPRESSIONS columns

Name	Type	Description
index_owner	character varying(64)	Index owner.
index_name	character varying(64)	Index name.
table_owner	character varying(64)	Table owner.
table_name	character varying(64)	Table name.
column_expression	text	Function-based index expression of a specified column.
column_position	smallint	Position of a column in an index.

### 12.3.71 DB\_IND\_PARTITIONS

DB\_IND\_PARTITIONS displays partition information about local indexes of level-1 partitioned table accessible to the current user (excluding global indexes of partitioned tables). It is accessible to all users. This view exists in both PG\_CATALOG and SYS schema.

**Table 12-177** DB\_IND\_PARTITIONS columns

Name	Type	Description
index_owner	character varying(64)	Owner name of the partitioned table index to which an index partition belongs.
index_name	character varying(64)	Index name of the partitioned table index to which an index partition belongs.
partition_name	character varying(64)	Name of an index partition.
def_tablespace_name	name	Tablespace name of an index partition.
high_value	text	Upper limit of the partition corresponding to the index partition.
index_partition_usable	boolean	Specifies whether an index partition is available. <ul style="list-style-type: none"> <li>• <b>t</b> (true): yes.</li> <li>• <b>f</b> (false): no.</li> </ul>
schema	character varying(64)	Schema of the partitioned table index to which an index partition belongs.
high_value_length	integer	Character length of the limit of the partition corresponding to an index partition.
composite	character varying(3)	Specifies whether the index is a local index on the level-2 partitioned table. This table does not store level-2 partition information. Therefore, the value is <b>NO</b> .
subpartition_count	numeric	Number of level-2 partitions in a partition. This table does not store level-2 partition information. Therefore, the value is <b>0</b> .

Name	Type	Description
partition_position	numeric	Position of an index partition in the index.
status	character varying(8)	Specifies whether the index partition is available.
tablespace_name	name	Name of the tablespace that contains the partition.
pct_free	numeric	Minimum percentage of available space in a block.
ini_trans	numeric	Initial number of transactions. The default value is <b>4</b> . The value is <b>NULL</b> for non-Ustore partitioned tables.
max_trans	numeric	Maximum number of transactions. The default value is <b>128</b> . The value is <b>NULL</b> for non-Ustore partitioned tables.
initial_extent	numeric	Not supported. Its value is <b>NULL</b> .
next_extent	numeric	Not supported. Its value is <b>NULL</b> .
min_extent	numeric	Not supported. Its value is <b>NULL</b> .
max_extent	numeric	Not supported. Its value is <b>NULL</b> .
max_size	numeric	Not supported. Its value is <b>NULL</b> .
pct_increase	numeric	Not supported. Its value is <b>NULL</b> .
freelists	numeric	Not supported. Its value is <b>NULL</b> .
freelist_groups	numeric	Not supported. Its value is <b>NULL</b> .
logging	character varying(7)	Specifies whether changes to an index are recorded.

Name	Type	Description
compression	character varying(13)	Specifies whether an index compression is enabled for a partitioned index.
blevel	numeric	Not supported. Its value is <b>NULL</b> .
leaf_blocks	numeric	Not supported. Its value is <b>NULL</b> .
distinct_keys	numeric	Not supported. Its value is <b>NULL</b> .
avg_leaf_blocks_per_key	numeric	Not supported. Its value is <b>NULL</b> .
avg_data_blocks_per_key	numeric	Not supported. Its value is <b>NULL</b> .
clustering_factor	numeric	Sequence of a row in the table based on the value of the index. You need to run the analyze command to collect statistics.
num_rows	numeric	Number of rows in a partition. You need to run the vacuum command to collect statistics.
sample_size	numeric	Not supported. Its value is <b>NULL</b> .
last_analyzed	timestamp with time zone	Last date when the partition was analyzed.
buffer_pool	character varying(7)	Actual buffer pool of a partition.
flash_cache	character varying(7)	Not supported. Its value is <b>NULL</b> .
cell_flash_cache	character varying(7)	Not supported. Its value is <b>NULL</b> .
user_stats	character varying(3)	Not supported. Its value is <b>NULL</b> .
pct_direct_access	numeric	Not supported. Its value is <b>NULL</b> .

Name	Type	Description
global_stats	character varying(3)	Not supported. Its value is <b>NULL</b> .
domidx_opstatus	character varying(6)	Not supported. Its value is <b>NULL</b> .
parameters	character varying(1000)	Not supported. Its value is <b>NULL</b> .
interval	character varying(3)	Specifies whether the partition is a partition in an interval partitioned table.
segment_created	character varying(3)	Specifies whether an index partition segment has been created.
orphaned_entries	character varying(3)	Not supported. Its value is <b>NULL</b> .

## 12.3.72 DB\_IND\_SUBPARTITIONS

DB\_IND\_SUBPARTITIONS displays partition information about local indexes of level-2 partitioned table accessible to the current user (excluding global indexes of partitioned tables). It is accessible to all users. This view exists in both PG\_CATALOG and SYS schema.

**Table 12-178** DB\_IND\_SUBPARTITIONS columns

Name	Type	Description
index_owner	character varying(64)	Owner name of the partitioned table index to which an index partition belongs.
index_name	character varying(64)	Index name of the partitioned table index to which an index partition belongs.
partition_name	character varying(64)	Name of the level-1 partition where an index is located.
subpartition_name	character varying(64)	Name of the level-2 partition where an index is located.

Name	Type	Description
def_tablespace_name	name	Tablespace name of an index partition.
high_value	text	Limit of the partition corresponding to an index partition.
index_partition_usable	boolean	Specifies whether an index partition is available. <ul style="list-style-type: none"> <li>• <b>t</b> (true): yes.</li> <li>• <b>f</b> (false): no.</li> </ul>
schema	character varying(64)	Schema of the partitioned table index to which an index partition belongs.
high_value_length	integer	Character length of the limit of the partition corresponding to an index partition.
partition_position	numeric	Position of an index partition in the index.
subpartition_position	numeric	Position of the level-2 partition in the partition.
status	character varying(8)	Specifies whether the index partition is available.
tablespace_name	name	Tablespace name of an index partition.
pct_free	numeric	Minimum percentage of available space in a block.
ini_trans	numeric	Initial number of transactions. The default value is <b>4</b> . The value is <b>NULL</b> for non-Ustore partitioned tables.
max_trans	numeric	Maximum number of transactions. The default value is <b>128</b> . The value is <b>NULL</b> for non-Ustore partitioned tables.

Name	Type	Description
initial_extent	numeric	Not supported. Its value is <b>NULL</b> .
next_extent	numeric	Not supported. Its value is <b>NULL</b> .
min_extent	numeric	Not supported. Its value is <b>NULL</b> .
max_extent	numeric	Not supported. Its value is <b>NULL</b> .
max_size	numeric	Not supported. Its value is <b>NULL</b> .
pct_increase	numeric	Not supported. Its value is <b>NULL</b> .
freelists	numeric	Not supported. Its value is <b>NULL</b> .
freelist_groups	numeric	Not supported. Its value is <b>NULL</b> .
logging	character varying(7)	Specifies whether changes to an index are recorded.
compression	character varying(13)	Compression type used for level-2 partitions.
blevel	numeric	Not supported. Its value is <b>NULL</b> .
leaf_blocks	numeric	Not supported. Its value is <b>NULL</b> .
distinct_keys	numeric	Not supported. Its value is <b>NULL</b> .
avg_leaf_blocks_per_key	numeric	Not supported. Its value is <b>NULL</b> .
avg_data_blocks_per_key	numeric	Not supported. Its value is <b>NULL</b> .
clustering_factor	numeric	Sequence of a row in the table based on the value of the index. You need to run the analyze command to collect statistics.

Name	Type	Description
num_rows	numeric	Number of rows in a level-2 partition. You need to run the vacuum command to collect statistics.
sample_size	numeric	Not supported. Its value is <b>NULL</b> .
last_analyzed	timestamp with time zone	Last date when the partition was analyzed.
buffer_pool	character varying(7)	Buffer pool of a level-2 partition.
flash_cache	character varying(7)	Not supported. Its value is <b>NULL</b> .
cell_flash_cache	character varying(7)	Not supported. Its value is <b>NULL</b> .
user_stats	character varying(3)	Not supported. Its value is <b>NULL</b> .
global_stats	character varying(3)	Not supported. Its value is <b>NULL</b> .
interval	character varying(3)	Specifies whether the partition is a partition in an interval partitioned table.
segment_created	character varying(3)	Specifies whether an index partition segment has been created.
domidx_opstatus	character varying(6)	Not supported. Its value is <b>NULL</b> .
parameters	character varying(1000)	Not supported. Its value is <b>NULL</b> .

### 12.3.73 DB\_INDEXES

DB\_INDEXES displays information about indexes accessible to the current user. This view exists in both PG\_CATALOG and SYS schema.

**Table 12-179** DB\_INDEXES columns

Name	Type	Description
owner	character varying(64)	Index owner.

Name	Type	Description
index_name	character varying(64)	Index name.
table_name	character varying(64)	Name of a table corresponding to an index.
uniqueness	text	Specifies whether the index is a unique index. <ul style="list-style-type: none"> <li>● <b>UNIQUE</b>: unique index.</li> <li>● <b>NONUNIQUE</b>: non-unique index.</li> </ul>
partitioned	character(3)	Specifies whether the index has the property of partitioned tables. <ul style="list-style-type: none"> <li>● <b>Yes</b>: The index has the property of a partitioned table.</li> <li>● <b>No</b>: The index does not have the property of a partitioned table.</li> </ul>
generated	character varying(1)	Specifies whether the index name is generated by the system. <ul style="list-style-type: none"> <li>● <b>y</b>: The index name is generated by the system.</li> <li>● <b>n</b>: The index name is not generated by the system.</li> </ul>
index_type	character varying(27)	Index type. <ul style="list-style-type: none"> <li>● <b>NORMAL</b>: Index attributes are simple references, and the expression tree is empty.</li> <li>● <b>FUNCTION-BASED NORMAL</b>: Expression trees are used for index attributes that are not simple column references.</li> </ul>
table_owner	character varying(128)	Owner of an index object.

Name	Type	Description
table_type	character(11)	Type of an index object <ul style="list-style-type: none"> <li>• <b>TABLE</b>: The index object is of the table type.</li> </ul>
tablespace_name	character varying(30)	Name of the tablespace that contains the index.
status	character varying(8)	Status of a non-partitioned index. <ul style="list-style-type: none"> <li>• <b>VALID</b>: Non-partitioned indexes can be used for query.</li> <li>• <b>UNUSABLE</b>: The non-partitioned index is unavailable.</li> <li>• <b>N/A</b>: The index has the property of a partitioned table.</li> </ul>
compression	character varying(13)	Not supported. Its value is <b>NULL</b> .
prefix_length	numeric	Not supported. Its value is <b>NULL</b> .
ini_trans	numeric	Not supported. Its value is <b>NULL</b> .
max_trans	numeric	Not supported. Its value is <b>NULL</b> .
initial_extent	numeric	Not supported. Its value is <b>NULL</b> .
next_extent	numeric	Not supported. Its value is <b>NULL</b> .
min_extents	numeric	Not supported. Its value is <b>NULL</b> .
max_extents	numeric	Not supported. Its value is <b>NULL</b> .
pct_increase	numeric	Not supported. Its value is <b>NULL</b> .
pct_threshold	numeric	Not supported. Its value is <b>NULL</b> .
include_column	numeric	Not supported. Its value is <b>NULL</b> .

Name	Type	Description
freelists	numeric	Not supported. Its value is <b>NULL</b> .
freelist_groups	numeric	Not supported. Its value is <b>NULL</b> .
pct_free	numeric	Not supported. Its value is <b>NULL</b> .
logging	character varying(3)	Not supported. Its value is <b>NULL</b> .
blevel	numeric	Not supported. Its value is <b>NULL</b> .
leaf_blocks	numeric	Not supported. Its value is <b>NULL</b> .
distinct_keys	numeric	Not supported. Its value is <b>NULL</b> .
avg_leaf_blocks_per_key	numeric	Not supported. Its value is <b>NULL</b> .
avg_data_blocks_per_key	numeric	Not supported. Its value is <b>NULL</b> .
clustering_factor	numeric	Not supported. Its value is <b>NULL</b> .
num_rows	numeric	Not supported. Its value is <b>NULL</b> .
sample_size	numeric	Not supported. Its value is <b>NULL</b> .
last_analyzed	timestamp(0) without time zone	Not supported. Its value is <b>NULL</b> .
degree	character varying(40)	Not supported. Its value is <b>NULL</b> .
instances	character varying(40)	Not supported. Its value is <b>NULL</b> .
temporary	character varying(1)	Not supported. Its value is <b>NULL</b> .
secondary	character varying(1)	Not supported. Its value is <b>NULL</b> .
buffer_pool	character varying(7)	Not supported. Its value is <b>NULL</b> .
flash_cache	character varying(7)	Not supported. Its value is <b>NULL</b> .

Name	Type	Description
cell_flash_cache	character varying(7)	Not supported. Its value is <b>NULL</b> .
user_stats	character varying(3)	Not supported. Its value is <b>NULL</b> .
duration	character varying(15)	Not supported. Its value is <b>NULL</b> .
pct_direct_access	numeric	Not supported. Its value is <b>NULL</b> .
ityp_owner	character varying(128)	Not supported. Its value is <b>NULL</b> .
ityp_name	character varying(128)	Not supported. Its value is <b>NULL</b> .
parameters	character varying(1000)	Not supported. Its value is <b>NULL</b> .
global_stats	character varying(3)	Not supported. Its value is <b>NULL</b> .
domidx_status	character varying(12)	Not supported. Its value is <b>NULL</b> .
domidx_opstatus	character varying(6)	Not supported. Its value is <b>NULL</b> .
funcidx_status	character varying(8)	Not supported. Its value is <b>NULL</b> .
join_index	character varying(3)	Not supported. Its value is <b>NULL</b> .
iot_redundant_pkey_elim	character varying(3)	Not supported. Its value is <b>NULL</b> .
dropped	character varying(3)	Not supported. Its value is <b>NULL</b> .
visibility	character varying(9)	Not supported. Its value is <b>NULL</b> .
domidx_management	character varying(14)	Not supported. Its value is <b>NULL</b> .
segment_created	character varying(3)	Not supported. Its value is <b>NULL</b> .
orphaned_entries	character varying(3)	Not supported. Its value is <b>NULL</b> .
indexing	character varying(7)	Not supported. Its value is <b>NULL</b> .

Name	Type	Description
auto	character varying(3)	Not supported. Its value is <b>NULL</b> .

## 12.3.74 DB\_OBJECTS

DB\_OBJECTS displays all database objects accessible to the current user. This view exists in both PG\_CATALOG and SYS schema.

**Table 12-180** DB\_OBJECTS columns

Name	Type	Description
owner	name	Object owner.
object_name	name	Object name.
object_id	oid	Object OID.
object_type	name	Object type.
namespace	oid	ID of the namespace where an object resides.
temporary	character(1)	Specifies whether an object is a temporary object.
status	character varying(7)	Object status.
subobject_name	name	Subobject name of an object.
generated	character(1)	Specifies whether an object name is generated by the system.
created	timestamp with time zone	Creation time of an object.
last_ddl_time	timestamp with time zone	Last modification time of an object.
default_collation	character varying(100)	Default collation of objects.
data_object_id	numeric	Not supported. Its value is <b>NULL</b> .
timestamp	character varying(19)	Not supported. Its value is <b>NULL</b> .
secondary	character varying(1)	Not supported. Its value is <b>NULL</b> .
edition_name	character varying(128)	Not supported. Its value is <b>NULL</b> .

Name	Type	Description
sharing	character varying(18)	Not supported. Its value is <b>NULL</b> .
editionable	character varying(1)	Not supported. Its value is <b>NULL</b> .
oracle_maintained	character varying(1)	Not supported. Its value is <b>NULL</b> .
application	character varying(1)	Not supported. Its value is <b>NULL</b> .
duplicated	character varying(1)	Not supported. Its value is <b>NULL</b> .
sharded	character varying(1)	Not supported. Its value is <b>NULL</b> .
created_appid	numeric	Not supported. Its value is <b>NULL</b> .
modified_appid	numeric	Not supported. Its value is <b>NULL</b> .
created_vsnid	numeric	Not supported. Its value is <b>NULL</b> .
modified_vsnid	numeric	Not supported. Its value is <b>NULL</b> .

**NOTICE**

For details on the value ranges of **created** and **last\_ddl\_time**, see [PG\\_OBJECT](#).

### 12.3.75 DB\_PART\_COL\_STATISTICS

DB\_PART\_COL\_STATISTICS displays column statistics and histogram information about table partitions accessible to the current user. All users can access this view. This view exists in both PG\_CATALOG and SYS schema.

**Table 12-181** DB\_PART\_COL\_STATISTICS columns

Name	Type	Description
owner	character varying(128)	Owner of the partitioned table.
table_name	character varying(128)	Table name.
partition_name	character varying(128)	Table partition name.
column_name	character varying(4000)	Column name.
num_distinct	numeric	Not supported. Its value is <b>NULL</b> .

Name	Type	Description
low_value	raw	Not supported. Its value is <b>NULL</b> .
high_value	raw	Not supported. Its value is <b>NULL</b> .
density	numeric	Not supported. Its value is <b>NULL</b> .
num_nulls	numeric	Not supported. Its value is <b>NULL</b> .
num_buckets	numeric	Not supported. Its value is <b>NULL</b> .
sample_size	numeric	Not supported. Its value is <b>NULL</b> .
last_analyzed	date	Not supported. Its value is <b>NULL</b> .
global_stats	character varying(3)	Not supported. Its value is <b>NULL</b> .
user_stats	character varying(3)	Not supported. Its value is <b>NULL</b> .
notes	character varying(63)	Not supported. Its value is <b>NULL</b> .
avg_col_len	numeric	Not supported. Its value is <b>NULL</b> .
histogram	character varying(15)	Not supported. Its value is <b>NULL</b> .
schema	character varying(64)	Name of the namespace to which the column belongs.

## 12.3.76 DB\_PART\_INDEXES

**DB\_PART\_INDEXES** displays information about partitioned table indexes (excluding global indexes of partitioned tables) accessible to the current user. This view exists in the **PG\_CATALOG** and **SYS** schemas.

**Table 12-182** DB\_PART\_INDEXES columns

Name	Type	Description
def_tablespace_name	name	Tablespace name of a partitioned table index

Name	Type	Description
index_owner	character varying(64)	Owner name of a partitioned table index
index_name	character varying(64)	Name of a partitioned table index
partition_count	bigint	Number of index partitions of a partitioned table index
partitioning_key_count	integer	Number of partition keys of a partitioned table
partitioning_type	text	Partitioning policy of a partitioned table <b>NOTE</b> For details about the supported partitioning policies of the current partitioned table, see <a href="#">CREATE TABLE PARTITION</a> .
schema	character varying(64)	Name of the schema to which a partitioned table index belongs
table_name	character varying(64)	Name of the partitioned table to which a partitioned table index belongs
subpartitioning_type	text	Partitioning policy of a level-2 partitioned table. If the partitioned table is a level-1 partitioned table, <b>NONE</b> is displayed. <b>NOTE</b> For details about the supported partitioning policies of the current level-2 partitioned table, see <a href="#">CREATE TABLE SUBPARTITION</a> .
def_subpartition_count	integer	Default number of level-2 partitions to be created. The value is <b>1</b> for a level-2 partitioned table and <b>0</b> for a level-1 partitioned table.
subpartitioning_key_count	integer	Number of level-2 partition keys of a partitioned table

### 12.3.77 DB\_PART\_KEY\_COLUMNS

DB\_PART\_KEY\_COLUMNS displays information about the partition key columns of partitioned tables or partitioned indexes accessible to the current user. This view is accessible to all users and displays all information accessible to the current user. This view exists in both PG\_CATALOG and SYS schema.

**Table 12-183** DB\_PART\_KEY\_COLUMNS columns

Name	Type	Description
owner	character varying(128)	Owner of a partitioned table or index.
name	character varying(128)	Name of a partitioned table or index.
object_type	character varying(128)	Object type. <ul style="list-style-type: none"> <li>Its value is <b>table</b> for a partitioned table.</li> <li>Its value is <b>index</b> for a partitioned index.</li> </ul>
column_name	character varying(4000)	Partition key column name of a partitioned table or index
column_position	numeric	Position of a column in a partition.
collated_column_id	numeric	Not supported. Its value is <b>NULL</b> .

## 12.3.78 DB\_PART\_TABLES

DB\_PART\_TABLES displays information about partitioned tables accessible to the current user. This view exists in both PG\_CATALOG and SYS schema.

**Table 12-184** DB\_PART\_TABLES columns

Name	Type	Description
table_owner	character varying(64)	Owner name of a partitioned table.
table_name	character varying(64)	Name of the partitioned table.
partitioning_type	text	Partitioning policy of the partitioned table. <b>NOTE</b> For details about the supported partitioning policies of the current partitioned table, see <a href="#">CREATE TABLE PARTITION</a> .
partition_count	bigint	Number of partitions of the partitioned table.
partitioning_key_count	integer	Number of partition keys of the partitioned table.

Name	Type	Description
def_tablespace_name	name	Tablespace name of the partitioned table.
schema	character varying(64)	Schema of the partitioned table.
subpartitioning_type	text	Partitioning policy of a level-2 partitioned table. If the partitioned table is a level-1 partitioned table, <b>NONE</b> is displayed.  <b>NOTE</b> For details about the supported partitioning policies of the current level-2 partitioned table, see <a href="#">CREATE TABLE SUBPARTITION</a> .
def_subpartition_count	integer	Default number of level-2 partitions to be created. The value is <b>1</b> for a level-2 partitioned table and <b>0</b> for a level-1 partitioned table.
subpartitioning_key_count	integer	Number of level-2 partition keys of a partitioned table.
status	character varying(8)	Not supported. Its value is <b>valid</b> .
def_pct_free	numeric	Default value of <b>PCTFREE</b> used when a partition is added.
def_pct_used	numeric	Not supported. Its value is <b>NULL</b> .
def_ini_trans	numeric	Default value of <b>INITRANS</b> used when a partition is added.
def_max_trans	numeric	Default value of <b>MAXTRANS</b> used when a partition is added.
def_initial_extent	character varying(40)	Not supported. Its value is <b>NULL</b> .
def_next_extent	character varying(40)	Not supported. Its value is <b>NULL</b> .
def_min_extents	character varying(40)	Not supported. Its value is <b>NULL</b> .

Name	Type	Description
def_max_extents	character varying(40)	Not supported. Its value is <b>NULL</b> .
def_max_size	character varying(40)	Not supported. Its value is <b>NULL</b> .
def_pct_increase	character varying(40)	Not supported. Its value is <b>NULL</b> .
def_freelists	numeric	Not supported. Its value is <b>NULL</b> .
def_freelist_groups	numeric	Not supported. Its value is <b>NULL</b> .
def_logging	character varying(7)	Not supported. Its value is <b>NULL</b> .
def_compression	character varying(8)	Default compression mode used when a partition is added. Value range: <ul style="list-style-type: none"> <li>• NONE</li> <li>• ENABLED</li> <li>• DISABLED</li> </ul>
def_compress_for	character varying(30)	Default compression mode used when a partition is added. <p><b>NOTE</b> For available compression modes and compression levels, see <a href="#">WITH ( { storage_paramet...</a></p>
def_buffer_pool	character varying(7)	Not supported. Its value is <b>DEFAULT</b> .
def_flash_cache	character varying(7)	Not supported. Its value is <b>NULL</b> .
def_cell_flash_cache	character varying(7)	Not supported. Its value is <b>NULL</b> .
ref_ptn_constraint_name	character varying(128)	Not supported. Its value is <b>NULL</b> .
interval	character varying(1000)	Interval.
autolist	character varying(3)	Not supported. Its value is <b>NO</b> .
interval_subpartition	character varying(1000)	Not supported. Its value is <b>NULL</b> .
autolist_subpartition	character varying(3)	Not supported. Its value is <b>NO</b> .

Name	Type	Description
is_nested	character varying(3)	Not supported. Its value is <b>NO</b> .
def_segment_creation	character varying(4)	Currently, the segment page mode is not supported. When the segment page mode is enabled, the value is <b>YES</b> .
def_indexing	character varying(3)	Not supported. Its value is <b>ON</b> .
def_inmemory	character varying(8)	Not supported. Its value is <b>NONE</b> .
def_inmemory_priority	character varying(8)	Not supported. Its value is <b>NULL</b> .
def_inmemory_distribut e	character varying(15)	Not supported. Its value is <b>NULL</b> .
def_inmemory_compres sion	character varying(17)	Not supported. Its value is <b>NULL</b> .
def_inmemory_duplicat e	character varying(13)	Not supported. Its value is <b>NULL</b> .
def_read_only	character varying(3)	Not supported. Its value is <b>NO</b> .
def_cellmemory	character varying(24)	Not supported. Its value is <b>NULL</b> .
def_inmemory_service	character varying(12)	Not supported. Its value is <b>NULL</b> .
def_inmemory_service_ name	character varying(1000)	Not supported. Its value is <b>NULL</b> .

## 12.3.79 DB\_PROCEDURES

DB\_PROCEDURES displays information about all stored procedures or functions accessible to the current user. This view exists in both PG\_CATALOG and SYS schema.

**Table 12-185** DB\_PROCEDURES columns

Name	Type	Description
owner	name	Object owner.
object_name	name	Object name.

## 12.3.80 DB\_SCHEDULER\_JOB\_ARGS

DB\_SCHEDULER\_JOB\_ARG displays the parameters related to the tasks accessible to the current user. This view is accessible to all users and displays all information accessible to the current user. This view exists in both PG\_CATALOG and SYS schema.

**Table 12-186** DB\_SCHEDULER\_JOB\_ARGS columns

Name	Type	Description
owner	character varying(128)	Owner of the job to which the parameter belongs.
job_name	character varying(128)	Name of the job to which the parameter belongs.
argument_name	character varying(128)	Parameter name.
argument_position	numeric	Position of the parameter in the parameter list.
argument_type	character varying(257)	Data type of a parameter, which can be a user-defined data type.
value	character varying(4000)	Parameter value.
anydata_value	character varying(4000)	Not supported. Its value is <b>NULL</b> .
out_argument	character varying(5)	Reserved column. Its value is <b>NULL</b> .

## 12.3.81 DB\_SCHEDULER\_PROGRAM\_ARGS

DB\_SCHEDULER\_PROGRAM\_ARG displays the parameters related to the programs accessible to the current user. This view is accessible to all users and displays all information accessible to the current user. This view exists in both PG\_CATALOG and SYS schema.

**Table 12-187** DB\_SCHEDULER\_PROGRAM\_ARGS columns

Name	Type	Description
owner	character varying(128)	Owner of the program to which the parameter belongs.
program_name	character varying(128)	Name of the program to which the parameter belongs.

Name	Type	Description
argument_name	character varying(128)	Parameter name.
argument_position	numeric	Position of the parameter in the parameter list.
argument_type	character varying(257)	Data type of a parameter, which can be a user-defined data type.
metadata_attribute	character varying(19)	Not supported. Its value is <b>NULL</b> .
default_value	character varying(4000)	Default parameter value.
anydata_default_value	character varying(4000)	Not supported. Its value is <b>NULL</b> .
out_argument	character varying(5)	Reserved column. Its value is <b>NULL</b> .

## 12.3.82 DB\_SEQUENCES

DB\_SEQUENCES displays all sequences accessible to the current user. This view exists in both PG\_CATALOG and SYS schema.

**Table 12-188** DB\_SEQUENCES columns

Name	Type	Description
sequence_owner	name	Owner of a sequence.
sequence_name	name	Name of the sequence.
min_value	int16	Minimum value of the sequence.
max_value	int16	Maximum value of the sequence.
increment_by	int16	Value by which the sequence is incremented.
cycle_flag	character(1)	Specifies whether a sequence is a cyclic sequence. Value range: <ul style="list-style-type: none"> <li>• <b>Y</b>: It is a cyclic sequence.</li> <li>• <b>N</b>: It is not a cyclic sequence.</li> </ul>
order_flag	character varying(1)	Specifies whether a sequence occurs in a request sequence. This parameter is not supported. Set it to <b>NULL</b> .

Name	Type	Description
last_number	int16	Value of the previous sequence.
cache_size	int16	Size of the sequence disk cache.
scale_flag	character varying(1)	Specifies whether a sequence is a scalable sequence. Not supported. Its value is <b>NULL</b> .
extend_flag	character varying(1)	Specifies whether the value generated by a scalable sequence exceeds the maximum or minimum value of the sequence. Not supported. Its value is <b>NULL</b> .
sharded_flag	character varying(1)	Specifies whether a sequence is a shard sequence. Not supported. Its value is <b>NULL</b> .
session_flag	character varying(1)	Specifies whether a sequence has a private session. Not supported. Its value is <b>NULL</b> .
keep_value	character varying(1)	Specifies whether to retain the sequence value during replay after a failure. This parameter is not supported. Set it to <b>NULL</b> .

### 12.3.83 DB\_SOURCE

DB\_SOURCE displays the definition information about stored procedures, functions, triggers, and packages accessible to the current user. This view exists in both PG\_CATALOG and SYS schema.

**Table 12-189** DB\_SOURCE columns

Name	Type	Description
owner	name	Object owner.
name	name	Object name.
type	name	Object type. Its values can be <b>function</b> , <b>package</b> , <b>package body</b> , <b>procedure</b> , and <b>trigger</b> .
line	numeric	Number of the line in the definition information.
text	text	Text source of the storage object.
origin_con_id	character varying(256)	Not supported. Its value is <b>0</b> .

## 12.3.84 DB\_SUBPART\_COL\_STATISTICS

DB\_SUBPART\_COL\_STATISTICS displays column statistics and histogram information about level-2 partitions of partitioned objects accessible to the current user. This view exists in both PG\_CATALOG and SYS schema and all users can access this view.

Name	Type	Description
owner	character varying(128)	Table owner.
table_name	character varying(128)	Table name.
subpartition_name	character varying(128)	Name of a level-2 partition in a table.
column_name	character varying(4000)	Column name.
num_distinct	numeric	Not supported. Its value is <b>NULL</b> .
low_value	raw	Not supported. Its value is <b>NULL</b> .
high_value	raw	Not supported. Its value is <b>NULL</b> .
density	numeric	Not supported. Its value is <b>NULL</b> .
num_nulls	numeric	Not supported. Its value is <b>NULL</b> .
num_buckets	numeric	Not supported. Its value is <b>NULL</b> .
sample_size	numeric	Not supported. Its value is <b>NULL</b> .
last_analyzed	timestamp(0) without time zone	Not supported. Its value is <b>NULL</b> .
global_stats	character varying(3)	Not supported. Its value is <b>NULL</b> .
user_stats	character varying(3)	Not supported. Its value is <b>NULL</b> .
notes	character varying(41)	Not supported. Its value is <b>NULL</b> .
avg_col_len	numeric	Not supported. Its value is <b>NULL</b> .
histogram	character varying(15)	Not supported. Its value is <b>NULL</b> .

Name	Type	Description
schema	character varying(64)	Name of the namespace to which the column belongs.

### 12.3.85 DB\_SUBPART\_KEY\_COLUMNS

DB\_SUBPART\_KEY\_COLUMNS displays information about the partition key columns of level-2 partitioned tables or partitioned indexes accessible to the current user. This view is accessible to all users and displays all information accessible to the current user. This view exists in both PG\_CATALOG and SYS schema.

**Table 12-190** DB\_SUBPART\_KEY\_COLUMNS columns

Name	Type	Description
owner	character varying(128)	Owner of a level-2 partitioned table or index.
name	character varying(128)	Name of a level-2 partitioned table or index.
object_type	character varying(128)	Object type. <ul style="list-style-type: none"> <li>Its value is <b>table</b> for a partitioned table.</li> <li>Its value is <b>index</b> for a partitioned index.</li> </ul>
column_name	character varying(4000)	Partition key column name of a level-2 partitioned table or index.
column_position	numeric	Position of a column in a partition.
collated_column_id	numeric	Not supported. Its value is <b>NULL</b> .

### 12.3.86 DB\_SYNONYMS

DB\_SYNONYMS displays all synonyms accessible to the current user.

**Table 12-191** DB\_SYNONYMS columns

Name	Type	Description
owner	text	Owner of a synonym.
schema_name	text	Name of the schema to which the synonym belongs.

Name	Type	Description
synonym_name	text	Synonym name.
table_owner	text	Owner of the associated object. Although the column is called <b>table_owner</b> , its associated object is not necessarily a table. It can be any common database object, such as a view, stored procedure, or synonym.
table_name	text	Name of the associated object. Although the column is called <b>table_name</b> , its associated object is not necessarily a table. It can be any common database object, such as a view, stored procedure, or synonym.
table_schema_name	text	Schema name of the associated object. Although the column is called <b>table_schema_name</b> , its associated object is not necessarily a table. It can be any common database object, such as a view, stored procedure, or synonym.
db_link	character varying(128)	Reserved column. Its value is <b>NULL</b> .
origin_con_id	character varying(256)	Not supported. Its value is <b>0</b> .

### 12.3.87 DB\_TAB\_COL\_STATISTICS

DB\_TAB\_COL\_STATISTICS displays column statistics and histogram information extracted from DB\_TAB\_COLUMNS. All users can access this view. This view exists in both PG\_CATALOG and SYS schema. The values of the **LOW\_VALUE** and **HIGH\_VALUE** columns in this view are different from those in database A due to different underlying table structures. When the value of **LOW\_VALUE** is a high-frequency value, the value of **LOW\_VALUE** in GaussDB is the second smallest value. When **HIGH\_VALUE** is a high-frequency value, **HIGH\_VALUE** of GaussDB is the second highest value. The value of the **HISTOGRAM** column is different from that of database A due to different statistical methods. GaussDB supports only two types of histograms: frequency and equi-width. The value of the **SCOPE** column in GaussDB is different from that in database A because GaussDB does not support global temporary table statistics. GaussDB database supports only local temporary table statistics, and the default value is **SHARED**.

**Table 12-192** DB\_TAB\_COL\_STATISTICS columns

Name	Type	Description
owner	character varying(128)	Table owner.

Name	Type	Description
table_name	character varying(128)	Table name.
column_name	character varying(128)	Column name.
num_distinct	numeric	Number of different values in a column.
low_value	raw	Low value in a column.
high_value	raw	High value in a column.
density	numeric	<ul style="list-style-type: none"> <li>If there is a histogram on <b>COLUMN_NAME</b>, this column displays the selectivity of values in the histogram that span less than two endpoints. It does not represent the selectivity of values that span two or more endpoints.</li> <li>If no histogram is available on <b>COLUMN_NAME</b>, the value of this column is <b>1/NUM_DISTINCT</b>.</li> </ul>
num_nulls	numeric	Number of empty values in a column.
num_buckets	numeric	Number of buckets in the histogram of a column.
sample_size	numeric	Sample size used to analyze a column.
last_analyzed	timestamp(0) without time zone	Date when a column was last analyzed. Database restart is not supported. Otherwise, data loss will occur.
global_stats	character varying(3)	Not supported. Its value is <b>NULL</b> .
user_stats	character varying(3)	Not supported. Its value is <b>NULL</b> .
notes	character varying(99)	Not supported. Its value is <b>NULL</b> .
avg_col_len	numeric	Average length of a column, in bytes.
histogram	character varying(15)	<p>Specifies whether the histogram exists and the type of the histogram.</p> <ul style="list-style-type: none"> <li><b>NONE</b>: no histogram.</li> <li><b>FREQUENCY</b>: frequency histogram.</li> <li><b>EQUI-WIDTH</b>: equal-width histogram.</li> </ul>

Name	Type	Description
scope	character varying(7)	This value <b>SHARED</b> is used to collect statistics on any table other than global temporary tables. Set it to <b>SHARED</b> .
schema	character varying(64)	Name of the namespace to which the column belongs.

## 12.3.88 DB\_TAB\_COLUMNS

DB\_TAB\_COLUMNS displays description information about columns of tables and views accessible to the current user. This view exists in both PG\_CATALOG and SYS schema. This view is accessible to all users and displays all information accessible to the current user.

**Table 12-193** DB\_TAB\_COLUMNS columns

Name	Type	Description
owner	character varying(64)	Table owner.
table_name	character varying(64)	Table name.
column_name	character varying(64)	Column name.
data_type	character varying(128)	Data type of a column.
data_type_mod	character varying(3)	Not supported. Its value is <b>NULL</b> .
data_type_owner	character varying(128)	Owner of the data type of a column.
data_length	integer	Length of a column, in bytes.
data_precision	integer	Precision of a data type. This column is valid for the numeric data type and <b>NULL</b> for other data types.
data_scale	integer	Number of decimal places. This column is valid for the numeric data type and is set to <b>0</b> for other data types.
nullable	bpchar	Specifies whether a column can be empty ( <b>n</b> for the primary key constraint and non-null constraint).

Name	Type	Description
column_id	integer	Sequence number of a column when a table is created.
default_length	numeric	Length of the default value of a column, in bytes.
data_default	text	Default value of a column.
num_distinct	numeric	Number of different values in a column.
low_value	raw	Minimum value in a column.
high_value	raw	Maximum value in a column.
density	numeric	Column density.
num_nulls	numeric	Number of empty values in a column.
num_buckets	numeric	Number of buckets in the histogram of a column.
last_analyzed	timestamp(0) without time zone	Last analysis date.
sample_size	numeric	Sample size used to analyze a column.
character_set_name	character varying(44)	Not supported. Its value is <b>NULL</b> .
char_col_decl_length	numeric	Declaration length of a column of the character type.
global_stats	character varying(3)	Not supported. Its value is <b>NO</b> .
user_stats	character varying(3)	Not supported. Its value is <b>NO</b> .
avg_col_len	numeric	Average length of a column, in bytes.
char_length	numeric	Column length (in bytes) which is valid only for the varchar, nvarchar2, bpchar, and char types.
char_used	character varying(1)	Not supported. Set it to <b>B</b> if the data type is varchar, nvarchar2, bpchar, or char, and to <b>NULL</b> for other data types.
v80_fmt_image	character varying(3)	Not supported. Its value is <b>NULL</b> .
data_upgraded	character varying(3)	Not supported. Its value is <b>YES</b> .

Name	Type	Description
histogram	character varying(15)	Specifies whether the histogram exists and the type of the histogram. <ul style="list-style-type: none"> <li>• <b>NONE</b>: no histogram.</li> <li>• <b>FREQUENCY</b>: frequency histogram.</li> <li>• <b>EQUI_WIDTH</b>: equal-width histogram.</li> </ul>
default_on_null	character varying(3)	Not supported. Its value is <b>NULL</b> .
identity_column	character varying(3)	Not supported. Its value is <b>NULL</b> .
evaluation_edition	character varying(128)	Not supported. Its value is <b>NULL</b> .
unusable_before	character varying(128)	Not supported. Its value is <b>NULL</b> .
unusable_beginning	character varying(128)	Not supported. Its value is <b>NULL</b> .
collation	character varying(100)	Collation rule of a column. This column conflicts with reserved keywords. Therefore, add the view name when calling this column.
comments	text	Comments.
schema	character varying(64)	Name of the namespace to which the column belongs.

### 12.3.89 DB\_TAB\_COMMENTS

DB\_TAB\_COMMENTS displays comments about all tables and views accessible to the current user. This view exists in both PG\_CATALOG and SYS schema.

**Table 12-194** DB\_TAB\_COMMENTS columns

Name	Type	Description
owner	character varying(128)	Owner of a table or view.
table_name	character varying(128)	Name of the table or view.
table_type	character varying(11)	Object type.
comments	text	Comments.
origin_con_id	numeric	Not supported. Its value is <b>0</b> .

Name	Type	Description
schema	character varying(64)	Name of the namespace to which the table belongs.

## 12.3.90 DB\_TAB\_HISTOGRAMS

DB\_TAB\_HISTOGRAMS displays histogram statistics about the tables or views accessible to the current user, that is, the distribution of data in each column of the table. All users can access this view. This view exists in both PG\_CATALOG and SYS schema.

**Table 12-195** DB\_TAB\_HISTOGRAMS columns

Name	Type	Description
owner	character varying(128)	Table owner
table_name	character varying(128)	Table name.
column_name	character varying(4000)	Column name.
endpoint_number	numeric	Bucket ID of the histogram
endpoint_value	numeric	Not supported. Its value is <b>NULL</b> .
endpoint_actual_value	character varying(4000)	Actual value of the bucket endpoint
endpoint_actual_value_raw	raw	Not supported. Its value is <b>NULL</b> .
endpoint_repeat_count	numeric	Not supported. Its value is <b>NULL</b> .
scope	character varying(7)	Not supported. Its value is <b>SHARED</b> .

## 12.3.91 DB\_TAB\_PARTITIONS

DB\_TAB\_PARTITIONS displays information about level-1 partitions (including level-2 partitioned tables) accessible to the current user. It is accessible to all users. This view exists in both PG\_CATALOG and SYS schema.

**Table 12-196** DB\_TAB\_PARTITIONS columns

Name	Type	Description
table_owner	character varying(64)	Table owner.

Name	Type	Description
table_name	character varying(64)	Relational table name.
partition_name	character varying(64)	Partition name.
high_value	text	Limit of a partition. <ul style="list-style-type: none"> <li>For range partitioning and interval partitioning, the upper limit of each partition is displayed.</li> <li>For list partitioning, the value list of each partition is displayed.</li> <li>For hash partitioning, the number of each partition is displayed.</li> </ul>
tablespace_name	name	Tablespace name of the partitioned table.
schema	character varying(64)	Name of a namespace.
subpartition_count	bigint	Number of level-2 partitions.
high_value_length	integer	Length of the binding value expression in a partition.
composite	character varying(3)	Specifies whether the table is a level-2 partitioned table.
partition_position	numeric	Position of the partition in the table.
pct_free	numeric	Minimum percentage of available space in a block.
pct_used	numeric	Not supported. Its value is <b>NULL</b> .
ini_trans	numeric	Initial number of transactions. The default value is <b>4</b> . The value is <b>NULL</b> for non-Ustore partitioned tables.
max_trans	numeric	Maximum number of transactions. The default value is <b>128</b> . The value is <b>NULL</b> for non-Ustore partitioned tables.
initial_extent	numeric	Not supported. Its value is <b>NULL</b> .
next_extent	numeric	Not supported. Its value is <b>NULL</b> .
min_extent	numeric	Not supported. Its value is <b>NULL</b> .

Name	Type	Description
max_extent	numeric	Not supported. Its value is <b>NULL</b> .
max_size	numeric	Not supported. Its value is <b>NULL</b> .
pct_increase	numeric	Not supported. Its value is <b>NULL</b> .
freelists	numeric	Not supported. Its value is <b>NULL</b> .
freelist_groups	numeric	Not supported. Its value is <b>NULL</b> .
logging	character varying(7)	Specifies whether changes to a table are logged.
compression	character varying(8)	Actual compression attribute of a partitioned table.
compress_for	character varying(30)	Not supported. Its value is <b>NULL</b> .
num_rows	numeric	Number of rows in a partition.
blocks	numeric	Not supported. Its value is <b>NULL</b> .
empty_blocks	numeric	Not supported. Its value is <b>NULL</b> .
avg_space	numeric	Not supported. Its value is <b>NULL</b> .
chain_cnt	numeric	Not supported. Its value is <b>NULL</b> .
avg_row_len	numeric	Not supported. Its value is <b>NULL</b> .
sample_size	numeric	Not supported. Its value is <b>NULL</b> .
last_analyzed	timestamp with time zone	Last date when the partition was analyzed.
buffer_pool	character varying(7)	Buffer pool allocated to a partitioned block.
flash_cache	character varying(7)	Not supported. Its value is <b>NULL</b> .
cell_flash_cache	character varying(7)	Not supported. Its value is <b>NULL</b> .
global_stats	character varying(3)	Not supported. Its value is <b>NULL</b> .
user_stats	character varying(3)	Not supported. Its value is <b>NULL</b> .
is_nested	character varying(3)	Specifies whether this partitioned table is a nested partitioned table.
parent_table_partition	character varying(128)	Not supported. Its value is <b>NULL</b> .
interval	character varying(3)	Specifies whether the partition is a partition in an interval partitioned table.

Name	Type	Description
segment_created	character varying(4)	Specifies whether a partitioned table has segments created or has not been created.
indexing	character varying(4)	Not supported. Its value is <b>NULL</b> .
read_only	character varying(4)	Not supported. Its value is <b>NULL</b> .
inmemory	character varying(8)	Not supported. Its value is <b>NULL</b> .
inmemory_priority	character varying(8)	Not supported. Its value is <b>NULL</b> .
inmemory_distribute	character varying(15)	Not supported. Its value is <b>NULL</b> .
inmemory_compression	character varying(17)	Not supported. Its value is <b>NULL</b> .
inmemory_duplicate	character varying(13)	Not supported. Its value is <b>NULL</b> .
cellmemory	character varying(24)	Not supported. Its value is <b>NULL</b> .
inmemory_service	character varying(12)	Not supported. Its value is <b>NULL</b> .
inmemory_service_name	character varying(100)	Not supported. Its value is <b>NULL</b> .
memoptimize_read	character varying(8)	Not supported. Its value is <b>NULL</b> .
memoptimize_write	character varying(8)	Not supported. Its value is <b>NULL</b> .

### 12.3.92 DB\_TAB\_STATS\_HISTORY

DB\_TAB\_STATS\_HISTORY displays the tables, partitions, and subpartitions involved in table statistics and the time when table statistics are collected. All users can access this view. This view exists in both PG\_CATALOG and SYS schema.

**Table 12-197** DB\_TAB\_STATS\_HISTORY columns

Name	Type	Description
owner	character varying(128)	Object owner
table_name	character varying(128)	Table name.
partition_name	character varying(128)	Not supported. Its value is <b>NULL</b> .

Name	Type	Description
subpartition_name	character varying(128)	Not supported. Its value is <b>NULL</b> .
stats_update_time	timestamp(6) with time zone	Time when statistics are updated. Database restart is not supported. Otherwise, data loss will occur.

### 12.3.93 DB\_TAB\_SUBPARTITIONS

DB\_TAB\_SUBPARTITIONS displays information about level-2 partitioned tables accessible to the current user. It is accessible to all users. This view exists in both PG\_CATALOG and SYS schema.

**Table 12-198** DB\_TAB\_SUBPARTITIONS columns

Name	Type	Description
table_owner	character varying(64)	Table owner.
table_name	character varying(64)	Relational table name.
partition_name	character varying(64)	Partition name.
subpartition_name	character varying(64)	Name of a level-2 partition.
high_value	text	Limit of a level-2 partition. <ul style="list-style-type: none"> <li>For range partitioning and interval partitioning, the upper limit of each partition is displayed.</li> <li>For list partitioning, the value list of each partition is displayed.</li> <li>For hash partitioning, the number of each partition is displayed.</li> </ul>
tablespace_name	name	Tablespace name of a level-2 partitioned table.
schema	character varying(64)	Name of a namespace.
high_value_length	integer	Character length of the limit of a level-2 partition.
partition_position	numeric	Position of the partition in the table.

Name	Type	Description
subpartition_position	numeric	Position of the level-2 partition in the partition.
pct_free	numeric	Minimum percentage of available space in a block.
pct_used	numeric	Not supported. Its value is <b>NULL</b> .
ini_trans	numeric	Initial number of transactions. The default value is <b>4</b> . The value is <b>NULL</b> for non-Ustore partitioned tables.
max_trans	numeric	Maximum number of transactions. The default value is <b>128</b> . The value is <b>NULL</b> for non-Ustore partitioned tables.
initial_extent	numeric	Not supported. Its value is <b>NULL</b> .
next_extent	numeric	Not supported. Its value is <b>NULL</b> .
min_extent	numeric	Not supported. Its value is <b>NULL</b> .
max_extent	numeric	Not supported. Its value is <b>NULL</b> .
max_size	numeric	Not supported. Its value is <b>NULL</b> .
pct_increase	numeric	Not supported. Its value is <b>NULL</b> .
freelists	numeric	Not supported. Its value is <b>NULL</b> .
freelist_groups	numeric	Not supported. Its value is <b>NULL</b> .
logging	character varying(3)	Specifies whether changes to a table are logged.
compression	character varying(8)	Actual compression attribute of a partitioned table.
compress_for	character varying(30)	Not supported. Its value is <b>NULL</b> .
num_rows	numeric	Number of rows in a level-2 partition.
blocks	numeric	Not supported. Its value is <b>NULL</b> .
empty_blocks	numeric	Not supported. Its value is <b>NULL</b> .
avg_space	numeric	Not supported. Its value is <b>NULL</b> .
chain_cnt	numeric	Not supported. Its value is <b>NULL</b> .
avg_row_len	numeric	Not supported. Its value is <b>NULL</b> .
sample_size	numeric	Not supported. Its value is <b>NULL</b> .

Name	Type	Description
last_analyzed	timestamp with time zone	Last date when the partition was analyzed.
buffer_pool	character varying(7)	Buffer pool of a level-2 partition.
flash_cache	character varying(7)	Not supported. Its value is <b>NULL</b> .
cell_flash_cache	character varying(7)	Not supported. Its value is <b>NULL</b> .
global_stats	character varying(3)	Not supported. Its value is <b>NULL</b> .
user_stats	character varying(3)	Not supported. Its value is <b>NULL</b> .
interval	character varying(3)	Specifies whether the partition is a partition in an interval partitioned table.
segment_created	character varying(3)	Specifies whether a segment is created in a level-2 partitioned table.
indexing	character varying(3)	Not supported. Its value is <b>NULL</b> .
read_only	character varying(3)	Not supported. Its value is <b>NULL</b> .
inmemory	character varying(8)	Not supported. Its value is <b>NULL</b> .
inmemory_priority	character varying(8)	Not supported. Its value is <b>NULL</b> .
inmemory_distribute	character varying(15)	Not supported. Its value is <b>NULL</b> .
inmemory_compression	character varying(17)	Not supported. Its value is <b>NULL</b> .
inmemory_duplicate	character varying(13)	Not supported. Its value is <b>NULL</b> .
inmemory_service	character varying(12)	Not supported. Its value is <b>NULL</b> .
inmemory_service_name	character varying(1000)	Not supported. Its value is <b>NULL</b> .
cellmemory	character varying(24)	Not supported. Its value is <b>NULL</b> .
memoptimize_read	character varying(8)	Not supported. Its value is <b>NULL</b> .
memoptimize_write	character varying(8)	Not supported. Its value is <b>NULL</b> .

## 12.3.94 DB\_TABLES

DB\_TABLES displays all tables accessible to the current user. This view exists in both PG\_CATALOG and SYS schema.

**Table 12-199** DB\_TABLES columns

Name	Type	Description
owner	character varying(64)	Table owner.
table_name	character varying(64)	Table name.
tablespace_name	character varying(64)	Tablespace name of the table.
num_rows	numeric	Estimated number of rows in the table.
status	character varying(8)	Specifies whether the current table is valid. <ul style="list-style-type: none"> <li>• <b>VALID</b>: The current table is valid.</li> <li>• <b>UNUSABLE</b>: The current table is unavailable.</li> </ul>
sample_size	numeric	Number of samples used for analyzing the table.
temporary	character(1)	Specifies whether the table is a temporary table. <ul style="list-style-type: none"> <li>• <b>Y</b>: The table is a temporary table.</li> <li>• <b>N</b>: The table is not a temporary table.</li> </ul>
dropped	character varying	Specifies whether the current table is deleted. <ul style="list-style-type: none"> <li>• <b>YES</b>: It is deleted.</li> <li>• <b>NO</b>: It is not deleted.</li> </ul>
pct_free	numeric	Minimum percentage of free space in a block.
ini_trans	numeric	Initial number of transactions.
max_trans	numeric	Maximum number of transactions.
avg_row_len	integer	Average number of bytes in each row.

Name	Type	Description
partitioned	character varying(3)	Specifies whether a table is a partitioned table. <ul style="list-style-type: none"> <li>● <b>YES:</b> The table is a partitioned table.</li> <li>● <b>NO:</b> The table is not a partitioned table.</li> </ul>
last_analyzed	timestamp with time zone	Last time when the table was analyzed.
row_movement	character varying(8)	Specifies whether to allow partition row movement. <ul style="list-style-type: none"> <li>● <b>ENABLED:</b> The partition row movement is allowed.</li> <li>● <b>DISABLED:</b> The partition row movement is not allowed.</li> </ul>
compression	character varying(8)	Specifies whether to enable a table compression. <ul style="list-style-type: none"> <li>● <b>ENABLED:</b> A table compression is enabled.</li> <li>● <b>DISABLED:</b> A table compression is disabled.</li> </ul>
duration	character varying(15)	Time elapsed when a temporary table is processed. <ul style="list-style-type: none"> <li>● <b>NULL:</b> The table is not a temporary table.</li> <li>● <b>sys\$session:</b> The table is a temporary session table.</li> <li>● <b>sys\$transaction:</b> The table is a temporary transaction table.</li> </ul>
logical_replication	character varying(8)	Specifies whether logical replication is enabled for a table. <ul style="list-style-type: none"> <li>● <b>ENABLED:</b> Logical replication is enabled.</li> <li>● <b>DISABLED:</b> Logical replication is disabled.</li> </ul>

Name	Type	Description
external	character varying(3)	Specifies whether the table is an external table. <ul style="list-style-type: none"> <li>• <b>YES:</b> The table is an external table.</li> <li>• <b>NO:</b> The table is not an external table.</li> </ul>
logging	character varying(3)	Specifies whether changes to a table are logged. <ul style="list-style-type: none"> <li>• <b>YES:</b> Logs are recorded for table changes.</li> <li>• <b>NO:</b> Logs are not recorded for table changes.</li> </ul>
default_collation	character varying(100)	Default collation of a table. <ul style="list-style-type: none"> <li>• default</li> </ul>
degree	character varying(10)	Number of instances in a scanned table.
table_lock	character varying(8)	Specifies whether to enable a table lock. <ul style="list-style-type: none"> <li>• <b>ENABLED:</b> The table lock is enabled.</li> <li>• <b>DISABLED:</b> The table lock is disabled.</li> </ul>
nested	character varying(3)	Specifies whether a table is a nested table. <ul style="list-style-type: none"> <li>• <b>YES:</b> The table is a nested table.</li> <li>• <b>NO:</b> The table is not a nested table.</li> </ul>
buffer_pool	character varying(7)	Default buffer pool of a table.
flash_cache	character varying(7)	Not supported. Its value is <b>NULL</b> .
cell_flash_cache	character varying(7)	Not supported. Its value is <b>NULL</b> .
skip_corrupt	character varying(8)	Specifies whether to skip corrupted blocks during table scanning. <ul style="list-style-type: none"> <li>• <b>ENABLED:</b> The corrupted block is skipped.</li> <li>• <b>DISABLED:</b> The corrupted block is not skipped.</li> </ul>

Name	Type	Description
has_identity	character varying(3)	Specifies whether a table has an identifier column. <ul style="list-style-type: none"> <li>• <b>YES</b>: There is an identifier column.</li> <li>• <b>NO</b>: There is no identifier column.</li> </ul>
segment_created	character varying(3)	Specifies whether a table segment has been created. <ul style="list-style-type: none"> <li>• <b>YES</b>: The table segment has been created.</li> <li>• <b>NO</b>: The table segment is not created.</li> </ul>
monitoring	character varying(3)	Specifies whether to monitor the modification of a table. <ul style="list-style-type: none"> <li>• <b>YES</b>: The modification of the table is monitored.</li> <li>• <b>NO</b>: The modification of the table is not monitored.</li> </ul>
cluster_name	character varying(128)	Not supported. Its value is <b>NULL</b> .
iot_name	character varying(128)	Not supported. Its value is <b>NULL</b> .
pct_used	numeric	Not supported. Its value is <b>NULL</b> .
initial_extent	numeric	Not supported. Its value is <b>NULL</b> .
next_extent	numeric	Not supported. Its value is <b>NULL</b> .
min_extents	numeric	Not supported. Its value is <b>NULL</b> .
max_extents	numeric	Not supported. Its value is <b>NULL</b> .
pct_increase	numeric	Not supported. Its value is <b>NULL</b> .
freelists	numeric	Not supported. Its value is <b>NULL</b> .
freelist_groups	numeric	Not supported. Its value is <b>NULL</b> .

Name	Type	Description
backed_up	character varying(1)	Not supported. Its value is <b>NULL</b> .
blocks	numeric	Not supported. Its value is <b>NULL</b> .
empty_blocks	numeric	Not supported. Its value is <b>NULL</b> .
avg_space	numeric	Not supported. Its value is <b>NULL</b> .
chain_cnt	numeric	Not supported. Its value is <b>NULL</b> .
avg_space_freelist_blocks	numeric	Not supported. Its value is <b>NULL</b> .
num_freelist_blocks	numeric	Not supported. Its value is <b>NULL</b> .
instances	character varying(10)	Not supported. Its value is <b>NULL</b> .
cache	character varying(5)	Not supported. Its value is <b>NULL</b> .
iot_type	character varying(12)	Not supported. Its value is <b>NULL</b> .
secondary	character varying(1)	Not supported. Its value is <b>NULL</b> .
global_stats	character varying(3)	Not supported. Its value is <b>NULL</b> .
user_stats	character varying(3)	Not supported. Its value is <b>NULL</b> .
cluster_owner	character varying(30)	Not supported. Its value is <b>NULL</b> .
dependencies	character varying(8)	Not supported. Its value is <b>NULL</b> .
compression_for	character varying(30)	Not supported. Its value is <b>NULL</b> .
read_only	character varying(3)	Not supported. Its value is <b>NULL</b> .
result_cache	character varying(7)	Not supported. Its value is <b>NULL</b> .
clustering	character varying(3)	Not supported. Its value is <b>NULL</b> .

Name	Type	Description
activity_tracking	character varying(23)	Not supported. Its value is <b>NULL</b> .
dml_timestamp	character varying(25)	Not supported. Its value is <b>NULL</b> .
container_data	character varying(3)	Not supported. Its value is <b>NULL</b> .
inmemory_priority	character varying(8)	Not supported. Its value is <b>NULL</b> .
inmemory_distribute	character varying(15)	Not supported. Its value is <b>NULL</b> .
inmemory_compression	character varying(17)	Not supported. Its value is <b>NULL</b> .
inmemory_duplicate	character varying(13)	Not supported. Its value is <b>NULL</b> .
duplicate	character varying(1)	Not supported. Its value is <b>NULL</b> .
sharded	character varying(1)	Not supported. Its value is <b>NULL</b> .
hybrid	character varying(3)	Not supported. Its value is <b>NULL</b> .
cellmemory	character varying(24)	Not supported. Its value is <b>NULL</b> .
containers_default	character varying(3)	Not supported. Its value is <b>NULL</b> .
container_map	character varying(3)	Not supported. Its value is <b>NULL</b> .
extended_data_link	character varying(3)	Not supported. Its value is <b>NULL</b> .
extended_data_link_map	character varying(3)	Not supported. Its value is <b>NULL</b> .
inmemory_service	character varying(12)	Not supported. Its value is <b>NULL</b> .
inmemory_service_name	character varying(1000)	Not supported. Its value is <b>NULL</b> .
container_map_object	character varying(3)	Not supported. Its value is <b>NULL</b> .
memoptimize_read	character varying(8)	Not supported. Its value is <b>NULL</b> .

Name	Type	Description
memoptimize_write	character varying(8)	Not supported. Its value is <b>NULL</b> .
has_sensitive_column	character varying(3)	Not supported. Its value is <b>NULL</b> .
admit_null	character varying(3)	Not supported. Its value is <b>NULL</b> .
data_link_dml_enabled	character varying(3)	Not supported. Its value is <b>NULL</b> .
object_id_type	character varying(16)	Not supported. Its value is <b>NULL</b> .
table_type_owner	character varying(128)	Not supported. Its value is <b>NULL</b> .
table_type	character varying(128)	Not supported. Its value is <b>NULL</b> .
compress_for	character varying(30)	Not supported. Its value is <b>NULL</b> .

### 12.3.95 DB\_TRIGGERS

DB\_TRIGGERS displays information about triggers accessible to the current user. This view exists in both PG\_CATALOG and SYS schema.

**Table 12-200** DB\_TRIGGERS columns

Name	Type	Description
trigger_name	character varying(64)	Trigger name.
table_owner	character varying(64)	Role name.
table_name	character varying(64)	Relational table name.
status	character varying(64)	Trigger status: <ul style="list-style-type: none"> <li>● <b>O</b>: The trigger is enabled in origin or local mode.</li> <li>● <b>D</b>: The trigger is disabled.</li> <li>● <b>R</b>: The trigger is enabled in replica mode.</li> <li>● <b>A</b>: The trigger is always enabled.</li> </ul>

## 12.3.96 DB\_TYPES

DB\_TYPES displays all object types accessible to the current user. All users can access this view. This view exists in both PG\_CATALOG and SYS schema.

**Table 12-201** DB\_TYPES columns

Name	Type	Description
owner	character varying(128)	Owner of the type.
type_name	character varying(128)	Type name.
type_oid	raw	Type OID.
typecode	character varying(128)	Type code.
attributes	numeric	Number of attributes in a type.
methods	numeric	Not supported. Its value is <b>0</b> .
predefined	character varying(3)	Specifies whether the type is a predefined type.
incomplete	character varying(3)	Specifies whether the type is incomplete.
final	character varying(3)	Not supported. Its value is <b>NULL</b> .
instantiable	character varying(3)	Not supported. Its value is <b>NULL</b> .
persistable	character varying(3)	Not supported. Its value is <b>NULL</b> .
supertype_owner	character varying(128)	Not supported. Its value is <b>NULL</b> .
supertype_name	character varying(128)	Not supported. Its value is <b>NULL</b> .
local_attributes	numeric	Not supported. Its value is <b>NULL</b> .
local_methods	numeric	Not supported. Its value is <b>NULL</b> .
typeid	raw	Not supported. Its value is <b>NULL</b> .

## 12.3.97 DB\_USERS

DB\_USERS displays all users of the database visible to the current user. However, it does not describe the users. By default, only the system administrator can access this view. This view exists in both PG\_CATALOG and SYS schema.

**Table 12-202** DB\_USERS columns

Name	Type	Description
user_id	oid	OID of a user
username	name	Username

## 12.3.98 DB\_VIEWS

DB\_VIEWS displays the description about all views accessible to the current user. This view exists in both PG\_CATALOG and SYS schema.

**Table 12-203** DB\_VIEWS columns

Name	Type	Description
owner	name	Owner of a view.
view_name	name	View name.
text	text	Text in the view.
text_length	integer	Text length of the view.
TEXT_VC	character varying(4000)	View creation statement. This column may truncate the view text. The BEQUEATH clause will not appear as part of the <b>TEXT_VC</b> column in this view.
type_text_length	numeric	Not supported. Its value is <b>NULL</b> .
type_text	character varying(4000)	Not supported. Its value is <b>NULL</b> .
oid_text_length	numeric	Not supported. Its value is <b>NULL</b> .
oid_text	character varying(4000)	Not supported. Its value is <b>NULL</b> .
view_type_owner	character varying(128)	Not supported. Its value is <b>NULL</b> .
view_type	character varying(128)	Not supported. Its value is <b>NULL</b> .

Name	Type	Description
superview_name	character varying(128)	Not supported. Its value is <b>NULL</b> .
editioning_view	character varying(1)	Not supported. Its value is <b>NULL</b> .
read_only	character varying(1)	Not supported. Its value is <b>NULL</b> .
container_data	character varying(1)	Not supported. Its value is <b>NULL</b> .
bequeath	character varying(12)	Not supported. Its value is <b>NULL</b> .
origin_con_id	character varying(256)	Not supported. Its value is <b>NULL</b> .
default_collation	character varying(100)	Not supported. Its value is <b>NULL</b> .
containers_default	character varying(3)	Not supported. Its value is <b>NULL</b> .
container_map	character varying(3)	Not supported. Its value is <b>NULL</b> .
extended_data_link	character varying(3)	Not supported. Its value is <b>NULL</b> .
extended_data_link_map	character varying(3)	Not supported. Its value is <b>NULL</b> .
has_sensitive_column	character varying(3)	Not supported. Its value is <b>NULL</b> .
admit_null	character varying(3)	Not supported. Its value is <b>NULL</b> .
pdb_local_only	character varying(3)	Not supported. Its value is <b>NULL</b> .

## 12.3.99 DICT

DICT displays the description of data dictionary tables and system views in the database. This view exists in the PG\_CATALOG and SYS schema and all users can access this view.

**Table 12-204** DICT columns

Name	Type	Description
table_name	character varying(128)	Object name.
comments	character varying(4000)	Comment on an object

## 12.3.100 DICTIONARY

DICTIONARY displays the description of data dictionary tables and system views in the database. This view exists in the PG\_CATALOG and SYS schema and all users can access this view.

**Table 12-205** DICTIONARY columns

Name	Type	Description
table_name	character varying(128)	Object name.
comments	character varying(4000)	Comment on an object

## 12.3.101 DV\_SESSION\_LONGOPS

DV\_SESSION\_LONGOPS displays the progress of ongoing operations. The view can be accessed only after being authorized.

**Table 12-206** DV\_SESSION\_LONGOPS columns

Name	Type	Description
sid	bigint	OID of the running backend process
serial#	integer	Sequence number of the running backend process, which is 0 in GaussDB
sofar	integer	Completed workload, which is null in GaussDB
totalwork	integer	Total workload, which is null in GaussDB

## 12.3.102 DV\_SESSIONS

DV\_SESSIONS displays information about all active backend threads. By default, only the system administrator can access this view. Common users can access the view only after being authorized.

**Table 12-207** DV\_SESSIONS columns

Name	Type	Description
sid	bigint	OID of the active backend thread of the current session
serial#	integer	Sequence number of the backend thread of the current activity, which is <b>0</b> in GaussDB
user#	oid	OID of the user who has logged in to the backend thread. The OID is <b>0</b> if the backend thread is a global auxiliary thread.
username	name	Name of the user logged in to the backend process. <b>username</b> is null if the backend thread is a global auxiliary thread. <b>application_name</b> can be identified by associating with pg_stat_get_activity(). Example: SELECT s.*,a.application_name FROM DV_SESSIONS AS s LEFT JOIN pg_stat_get_activity(NULL) AS a ON s.sid=a.sessionid;

## 12.3.103 GS\_ALL\_CONTROL\_GROUP\_INFO

GS\_ALL\_CONTROL\_GROUP\_INFO displays all Cgroup information in a database.

**Table 12-208** GS\_ALL\_CONTROL\_GROUP\_INFO columns

Name	Type	Description
name	text	Cgroup name.
type	text	Cgroup type. <ul style="list-style-type: none"> <li>● <b>GROUP_NONE</b>: no group.</li> <li>● <b>GROUP_TOP</b>: top group.</li> <li>● <b>GROUP_CLASS</b>: Class Cgroup, which does not control any thread.</li> <li>● <b>GROUP_BAKWD</b>: backend thread Cgroup.</li> <li>● <b>GROUP_DEFWD</b>: default Cgroup, which controls only the query threads at this level.</li> <li>● <b>GROUP_TSWD</b>: time-sharing Cgroup of each user, which controls the query threads at the bottom layer.</li> </ul>

Name	Type	Description
gid	bigint	Cgroup ID.
classgid	bigint	ID of the class Cgroup where a workload Cgroup belongs.
class	text	Class Cgroup.
workload	text	Workload Cgroup.
shares	bigint	CPU quota allocated to the Cgroup.
limits	bigint	Limit of CPU resources allocated to a Cgroup.
wdlevel	bigint	Workload Cgroup level.
cpucore	text	Information about the CPU cores used by a Cgroup.

### 12.3.104 GS\_ALL\_PREPARED\_STATEMENTS

GS\_ALL\_PREPARED\_STATEMENTS displays information about prepared statements that are available in all sessions. Only the system administrator can access this view.

**Table 12-209** GS\_ALL\_PREPARED\_STATEMENTS columns

Name	Type	Description
pid	bigint	Backend thread ID. <b>NOTE</b> In thread pool mode, <b>pid</b> indicates the ID of the thread bound to the current session. When a session is executed on different threads, <b>pid</b> changes accordingly. In thread pool mode, statements are associated with <i>sessionid</i> but not <i>pid</i> . You are advised to use <i>sessionid</i> for associated query.
sessionid	bigint	Current session ID.
global_sessionid	text	Global session ID.
name	text	Prepared statement identifier.
statement	text	Query string for creating this prepared statement. <ul style="list-style-type: none"> <li>The column is the PREPARE statements submitted by the client for prepared statements created from SQL.</li> <li>The column is the text of the prepared statements for prepared statements created through a front-end/back-end protocol.</li> </ul>

Name	Type	Description
prepare_time	timestamp with time zone	Timestamp when the prepared statement is created.
parameter_types	regtype[]	Expected parameter types for the prepared statement in the form of an array of <b>regtype</b> . The OID corresponding to an element of this array can be obtained by converting the <b>regtype</b> value to an OID value.
from_sql	boolean	<ul style="list-style-type: none"> <li>• <b>True</b> if the prepared statement was created through the PREPARE statement.</li> <li>• <b>False</b> if the statement was prepared through the frontend/backend protocol.</li> </ul>

### 12.3.105 GS\_AUDITING

GS\_AUDITING displays all audit information about database-related operations. Only the users with system administrator or security policy administrator permission can access this view.

**Table 12-210** GS\_AUDITING columns

Name	Type	Description
polname	name	Policy name, which must be unique.
pol_type	text	Audit policy type. Value range: <ul style="list-style-type: none"> <li>• <b>access</b>: DML operations are audited.</li> <li>• <b>privilege</b>: DDL operations are audited.</li> </ul>
polenabed	boolean	Specifies whether the policy is enabled. <ul style="list-style-type: none"> <li>• <b>t</b> (true): enabled.</li> <li>• <b>f</b> (false): disabled.</li> </ul>
access_type	name	DML database operation type. For example, SELECT, INSERT, and DELETE.
label_name	name	Resource label name. This column corresponds to the <b>polname</b> column in the GS_AUDITING_POLICY system catalog.
priv_object	text	Path of the database asset.
filter_name	text	Logical character string of a filter criterion

## 12.3.106 GS\_AUDITING\_ACCESS

GS\_AUDITING\_ACCESS displays all audit information about database DML-related operations. Only the users with system administrator or security policy administrator permission can access this view.

**Table 12-211** GS\_AUDITING\_ACCESS columns

Name	Type	Description
polname	name	Policy name, which must be unique.
pol_type	text	Audit policy type. The value <b>access</b> indicates that DML operations are audited.
polenabled	boolean	Specifies whether the policy is enabled. <ul style="list-style-type: none"> <li>• <b>t</b> (true): enabled.</li> <li>• <b>f</b> (false): disabled.</li> </ul>
access_type	name	DML database operation type. For example, SELECT, INSERT, and DELETE.
label_name	name	Resource label name. This column corresponds to the <b>polname</b> column in the <b>GS_AUDITING_POLICY</b> system catalog.
access_object	text	Path of the database asset.
filter_name	text	Logical character string of a filter criterion

## 12.3.107 GS\_AUDITING\_PRIVILEGE

GS\_AUDITING\_PRIVILEGE displays all audit information about database DDL-related operations. Only the users with system administrator or security policy administrator permission can access this view.

**Table 12-212** GS\_AUDITING\_PRIVILEGE columns

Name	Type	Description
polname	name	Policy name, which must be unique.
pol_type	text	Audit policy type. The value ' <b>privilege</b> ' indicates that DDL operations are audited.
polenabled	boolean	Specifies whether the policy is enabled. <ul style="list-style-type: none"> <li>• <b>t (true)</b>: enabled.</li> <li>• <b>f (false)</b>: disabled.</li> </ul>
access_type	name	DDL database operation type. For example, CREATE, ALTER, and DROP.

Name	Type	Description
label_name	name	Resource label name. This column corresponds to the <b>polname</b> column in the <b>GS_AUDITING_POLICY</b> system catalog.
priv_object	text	Full domain name of a database object.
filter_name	text	Logical character string of a filter criterion

### 12.3.108 GS\_CLUSTER\_RESOURCE\_INFO

This view is not supported in the centralized system.

### 12.3.109 GS\_COMM\_LISTEN\_ADDRESS\_EXT\_INFO

GS\_COMM\_LISTEN\_ADDRESS\_EXT\_INFO queries DFX information, such as threads, sessions, and sockets, for connecting the extended IP addresses. Currently, this view cannot be queried.

**Table 12-213** GS\_COMM\_LISTEN\_ADDRESS\_EXT\_INFO columns

Name	Type	Description
node_name	text	Name of the current instance.
app	text	Client connected to the DN.
tid	bigint	Thread ID of the current thread.
lwtid	integer	Lightweight thread ID of the current thread.
query_id	bigint	Query ID of the current thread.
socket	integer	Socket FD of the current physical connection.
remote_ip	text	Peer IP address of the current connection.
remote_port	text	Peer port of the current connection.
local_ip	text	Local IP address of the current connection.
local_port	text	Local port of the current connection.

### 12.3.110 GS\_COMM\_PROXY\_THREAD\_STATUS

GS\_COMM\_PROXY\_THREAD\_STATUS displays statistics on packets sent and received by the proxy communication library **comm\_proxy**. This view displays statistics about data sent and received by **comm\_proxy** only when the user-mode network deployment mode is enabled during the installation of the centralized

database and **enable\_dfx** of **comm\_proxy\_attr** is set to **true**. In other scenarios, this view cannot be queried.

**Table 12-214** GS\_COMM\_PROXY\_THREAD\_STATUS columns

Name	Type	Description
ProxyThreadId	bigint	ID of the current network proxy thread <b>comm_proxy</b> .
ProxyCpuAffinity	text	NUMA-CPU affinity of the current network proxy thread <b>comm_proxy</b> , indicating the NUMA and CPU ID.
ThreadStartTime	text	Start time of the current network proxy thread <b>comm_proxy</b> .
RxPckNums	bigint	Number of packets received by the current network proxy thread <b>comm_proxy</b> .
TxPckNums	bigint	Number of packets sent by the current network proxy thread <b>comm_proxy</b> .
RxPcks	float	Number of packets received by the network proxy thread <b>comm_proxy</b> per second.
TxPcks	float	Number of packets sent by the network proxy thread <b>comm_proxy</b> per second.

### 12.3.111 GS\_DB\_LINKS

GS\_DB\_LINKS displays information about database links. You can view information about your own database links and database links at the PUBLIC level.

**Table 12-215** GS\_DB\_LINKS columns

Name	Type	Description
dblinkid	oid	OID of the current DATABASE LINK object.
dlname	name	Name of the current DATABASE LINK object.
downer	oid	Owner ID of the current database link. If the object owner is <b>public</b> , the value is <b>0</b> .
downername	name	Name of the owner of the current DATABASE LINK object.
options	text[]	Connection information of the current DATABASE LINK object. The value is a character string in the "keyword=value" format.
useroptions	text	Information of the remote end user to which the current DATABASE LINK object connects.

Name	Type	Description
heterogeneous	text	Not supported. Its value is <b>NULL</b> .
protocol	text	Not supported. Its value is <b>NULL</b> .
openursors	text	Not supported. Its value is <b>NULL</b> .
intransaction	boolean	Determines whether the current DATABASE LINK object exists in a transaction.
updatesent	boolean	Determines whether the current DATABASE LINK object uses statements for updating data.

### 12.3.112 GS\_DB\_PRIVILEGES

**GS\_DB\_PRIVILEGES** displays the granting of ANY permissions. Each record corresponds to a piece of authorization information.

**Table 12-216** GS\_DB\_PRIVILEGES columns

Name	Type	Description
rolename	name	Username.
privilege_type	text	ANY permission of a user. For details about the value, see <a href="#">Table 7-148</a> .
admin_option	text	Whether the ANY permission recorded in the <b>privilege_type</b> column can be re-granted. <ul style="list-style-type: none"> <li>• <b>yes</b></li> <li>• <b>no</b></li> </ul>

### 12.3.113 GS\_FILE\_STAT

**GS\_FILE\_STAT** records statistics about data file I/Os to indicate I/O performance and detect performance problems such as abnormal I/O operations.

**Table 12-217** GS\_FILE\_STAT columns

Name	Type	Description
filenum	oid	File identifier
dbid	oid	Database ID
spcid	oid	Tablespace ID

Name	Type	Description
phyrds	bigint	Number of times of reading physical files
phywrts	bigint	Number of times of writing into physical files
phyblkrd	bigint	Number of times of reading physical file blocks
phyblkwrt	bigint	Number of times of writing into physical file blocks
readtim	bigint	Total duration of reading, in microseconds
writetim	bigint	Total duration of writing, in microseconds
avgiotim	bigint	Average duration of reading and writing, in microseconds
lstiotim	bigint	Duration of the last file reading, in microseconds
miniotim	bigint	Minimum duration of reading and writing, in microseconds
maxiowtm	bigint	Maximum duration of reading and writing, in microseconds

### 12.3.114 GS\_GET\_CONTROL\_GROUP\_INFO

This view is not supported in the centralized system.

**Table 12-218** GS\_GET\_CONTROL\_GROUP\_INFO columns

Name	Type	Description
group_name	text	Cgroup name.
group_type	text	Cgroup type. <ul style="list-style-type: none"> <li>● <b>GROUP_NONE</b>: no group.</li> <li>● <b>GROUP_TOP</b>: top group.</li> <li>● <b>GROUP_CLASS</b>: Class Cgroup, which does not control any thread.</li> <li>● <b>GROUP_BAKWD</b>: backend thread Cgroup.</li> <li>● <b>GROUP_DEFWD</b>: default Cgroup, which controls only the query threads at this level.</li> <li>● <b>GROUP_TSWD</b>: time-sharing Cgroup of each user, which controls the query threads at the bottom layer.</li> </ul>

Name	Type	Description
gid	bigint	Cgroup ID.
classgid	bigint	ID of the class Cgroup where a workload Cgroup belongs.
class	text	Class Cgroup.
group_workload	text	Workload Cgroup.
shares	bigint	CPU quota allocated to the Cgroup.
limits	bigint	Limit of CPU resources allocated to a Cgroup.
wdlevel	bigint	Workload Cgroup level.
cpucores	text	Information about the CPU cores used by a Cgroup.
nodegroup	text	Node group name.
group_kind	text	Node group type. The value must be one of the following: <ul style="list-style-type: none"> <li>• <b>i</b>: installation node group</li> <li>• <b>n</b>: node group in a common non-logical cluster</li> <li>• <b>e</b>: elastic cluster</li> </ul>

### 12.3.115 GS\_GET\_LISTEN\_ADDRESS\_EXT\_INFO

GS\_GET\_LISTEN\_ADDRESS\_EXT\_INFO queries the extended IP address configured for the current instance. Currently, this view cannot be queried.

**Table 12-219** GS\_GET\_LISTEN\_ADDRESS\_EXT\_INFO columns

Name	Type	Description
node_name	text	Name of the current instance.
host	text	Listening IP address of the current instance.
port	bigint	Listening port of the current instance.
ext_listen_ip	text	Extended IP address configured for the current instance.

### 12.3.116 GS\_GLC\_MEMORY\_DETAIL

GS\_GLC\_MEMORY\_DETAIL displays the memory usage of the global PL/pgSQL cache in all databases. This view is available only when **enable\_global\_plsqlcache** is set to **on**.

**Table 12-220** GS\_GLC\_MEMORY\_DETAIL columns

Name	Type	Description
contextname	text	Name of a memory object.
database	text	Database to which the memory object belongs. "pkg_bucket" and "func_bucket" are displayed as "NULL".
schema	text	Database to which the memory object belongs. "pkg_bucket" and "func_bucket" are displayed as "NULL".
type	text	Object type. <ul style="list-style-type: none"> <li>"pkg_bucket": indicates that the object is the parent node of a package object.</li> <li>"func_bucket": indicates that the object is the parent node of a function or stored procedure.</li> <li>"pkg": indicates that the object is a package object.</li> <li>"func": indicates that the object is a function or stored procedure.</li> </ul>
status	text	Status of the cache object. "valid" indicates that the cache object is available, and 'invalid' indicates that the cache object is unavailable. The "pkg_bucket" and "func_bucket" objects have no status and are displayed as "NULL".
location	text	Current location of a cached object. It is displayed as "in_global_hash_table" in the cache hash table and "in_global_expired_list" in the invalid linked list. The "pkg_bucket" and "func_bucket" objects are displayed as "NULL".
env	int8	Environment parameter when an object is created, that is, the value of <b>behavior_compat_flags</b> . The "pkg_bucket" and "func_bucket" objects are displayed as 0.
usedsize	int8	Size of a cached object.
usecount	int8	Number of objects that are referencing the global cache. When no object references the global compilation product, the number is 0.

### 12.3.117 GS\_GLOBAL\_ARCHIVE\_STATUS

GS\_GLOBAL\_ARCHIVE\_STATUS describes the archiving progress of DNs and all shards, including the shard name (**node\_name**), archiving location (**restart\_lsn**), name of the primary or standby node (**archive\_node**), and current log location (**current\_xlog\_location**). To query this view, you need to enable the archiving function of the database and query the view from the primary DN.

**Table 12-221** GS\_GLOBAL\_ARCHIVE\_STATUS columns

Name	Type	Description
node_name	text	Shard name.
restart_lsn	text	Archiving location.
archive_node	text	Name of the primary or standby node where archiving is performed.
current_xlog_location	text	Current log position.

### 12.3.118 GS\_GSC\_MEMORY\_DETAIL

GS\_GSC\_MEMORY\_DETAIL displays the memory usage of the global system cache of the current process on the current node. The data is displayed only when GSC is enabled.

Note that the query is separated by the database memory context. Therefore, some memory statistics are missing. The memory context corresponding to the missing memory statistics is **GlobalSysDBCache**.

**Table 12-222** GS\_GSC\_MEMORY\_DETAIL columns

Name	Type	Description
db_id	text	Database ID.
totalsize	numeric	Total size of the shared memory, in bytes.
freesize	numeric	Remaining size of the shared memory, in bytes.
usedsize	numeric	Used size of the shared memory, in bytes.

### 12.3.119 GS\_INSTANCE\_TIME

GS\_INSTANCE\_TIME records time consumption information of the current node. The time consumption information is classified into the following types:

- DB\_TIME: effective time spent by jobs in multi-core scenarios.
- CPU\_TIME: CPU time cost.
- EXECUTION\_TIME: time spent in the executor.
- PARSE\_TIME: time spent on parsing SQL statements.
- PLAN\_TIME: time spent on generating plans.
- REWRITE\_TIME: time spent on rewriting SQL statements.
- PL\_EXECUTION\_TIME: execution time of the PL/SQL stored procedure.
- PL\_COMPILATION\_TIME: compilation time of the PL/SQL stored procedure.

- NET\_SEND\_TIME: time spent on the network.
- DATA\_IO\_TIME: time spent on I/Os.

**Table 12-223** GS\_INSTANCE\_TIME columns

Name	Type	Description
stat_id	integer	Statistics ID
stat_name	text	Type name
value	bigint	Time value, in $\mu$ s

### 12.3.120 GS\_LABELS

GS\_LABELS displays all configured resource labels. Only the users with system administrator or security policy administrator permission can access this view.

**Table 12-224** GS\_LABELS columns

Name	Type	Description
labelname	name	Resource label name.
labeltype	name	Resource label type This parameter corresponds to the <b>labeltype</b> column in the <a href="#">GS_POLICY_LABEL</a> system catalog.
fqdtype	name	Database resource type. Such as table, schema, and index.
schemaname	name	Name of the schema to which the database resource belongs.
fqdnname	name	Database resource name.
columnname	name	Name of the database resource column. If the marked database resource is not a column, this parameter is left blank.

### 12.3.121 GS\_LSC\_MEMORY\_DETAIL

GS\_LSC\_MEMORY\_DETAIL displays statistics about the local SysCache memory usage of all threads based on the MemoryContext node. The statistics are available only when GSC is enabled.

**Table 12-225** GS\_LSC\_MEMORY\_DETAIL columns

Name	Type	Description
threadid	text	Thread start time and ID (string: <i>timestamp.sessionid</i> ).
tid	bigint	Thread ID.
thrdtype	text	Thread type. It can be any thread type in the system, such as postgresql and wlmmonitor.
contextname	text	Name of the memory context.
level	smallint	Hierarchy of the memory context.
parent	text	Name of the parent memory context.
totalsize	bigint	Total size of the memory context, in bytes.
freesize	bigint	Total size of released memory in the current memory context, in bytes.
usedsize	bigint	Total size of used memory in the current memory context, in bytes.

## 12.3.122 GS\_MASKING

GS\_MASKING displays all configured dynamic masking policies. Only the users with system administrator or security policy administrator permission can access this view.

**Table 12-226** GS\_MASKING columns

Name	Type	Description
polname	name	Name of the masking policy
polenabed	boolean	Specifies whether to enable the masking policy.
maskaction	name	Masking function
labelname	name	Name of the label to which the masking function applies.
masking_object	text	Masking database resource object
filter_name	text	Logical expression of a filter criterion

## 12.3.123 GS\_MATVIEWS

GS\_MATVIEWS provides information about each materialized view in the database.

**Table 12-227** GS\_MATVIEWS columns

Name	Type	Reference	Description
schemaname	name	<a href="#">PG_NAMESPACE</a> .nspname	Name of the schema of a materialized view
matviewname	name	<a href="#">PG_CLASS</a> .relname	Name of a materialized view
matviewowner	name	<a href="#">PG_AUTHID</a> .Erolname	Owner of a materialized view
tablespace	name	<a href="#">PG_TABLESPACE</a> .spcname	Tablespace name of a materialized view. If the default tablespace of the database is used, the value is null.
hasindexes	boolean	-	This column is true if a materialized view has (or has recently had) any indexes.
definition	text	-	Definition of a materialized view (a reconstructed SELECT query)

### 12.3.124 GS\_MY\_PLAN\_TRACE

GS\_MY\_PLAN\_TRACE is a view of the GS\_PLAN\_TRACE system catalog. This view displays the plan traces of the current user.

**Table 12-228** GS\_MY\_PLAN\_TRACE columns

Name	Type	Description
query_id	text	Unique ID of the current request
query	text	SQL statement of the current request. The value of this column cannot exceed the value of <b>track_activity_query_size</b> .
unique_sql_id	bigint	Unique ID of the SQL statement of the current request
plan	text	Query plan text corresponding to the SQL statement of the current request. The size of this column cannot exceed 10 KB.
plan_trace	text	Details about the query plan generation process corresponding to the SQL statement of the current request. The value of this column cannot exceed 300 MB.

Name	Type	Description
modifydate	timestamp with time zone	Time when the current plan trace is updated (that is, time when the plan trace is created)

### 12.3.125 GS\_OS\_RUN\_INFO

GS\_OS\_RUN\_INFO displays the running status of the OS.

**Table 12-229** GS\_OS\_RUN\_INFO columns

Name	Type	Description
id	integer	ID
name	text	Name of the OS running status.
value	numeric	Value of the OS running status.
comments	text	Remarks of the OS running status.
cumulative	boolean	Specifies whether the value of the OS running status is cumulative.

### 12.3.126 GS\_REDO\_STAT

GS\_REDO\_STAT displays the log replay of session threads.

**Table 12-230** GS\_REDO\_STAT columns

Name	Type	Description
phywrts	bigint	Number of times that data is written during log replay.
phyblkwrt	bigint	Number of data blocks written during log replay.
writetim	bigint	Total time required for writing data during log replay.
avgiotim	bigint	Average time required for writing data during log replay.
lstiotim	bigint	Time consumed by the last data write operation during log replay.
miniotim	bigint	Minimum time consumed by a single data write operation during log replay.

Name	Type	Description
maxiowtm	bigint	Maximum time consumed by a single data write operation during log replay.

### 12.3.127 GS\_SESSION\_ALL\_SETTINGS

GS\_SESSION\_ALL\_SETTINGS displays the full GUC parameter settings of all sessions on the local node. Only users with the sysadmin or monadmin permissions can query this view.

**Table 12-231** GS\_SESSION\_ALL\_SETTINGS columns

Name	Type	Description
sessionid	bigint	Session ID.
pid	bigint	Backend thread ID.
name	text	Parameter name.
setting	text	Current parameter value.
unit	text	Implicit unit of a parameter.

### 12.3.128 GS\_SESSION\_MEMORY

GS\_SESSION\_MEMORY displays the memory usage at the session level, including all the memory allocated to GaussDB and Stream threads on DN for jobs currently executed by users. If the GUC parameter **enable\_memory\_limit** is set to **off**, this view is unavailable.

**Table 12-232** GS\_SESSION\_MEMORY columns

Name	Type	Description
sessid	text	Thread start time and ID
init_mem	integer	Memory allocated to the currently executed jobs before they enter the executor, in MB
used_mem	integer	Memory allocated to the currently executed jobs, in MB
peak_mem	integer	Peak memory allocated to the currently executed jobs, in MB

## 12.3.129 GS\_SESSION\_MEMORY\_CONTEXT

GS\_SESSION\_MEMORY\_CONTEXT displays the memory usage of all sessions based on the MemoryContext node. If the GUC parameter **enable\_memory\_limit** or **enable\_thread\_pool** is set to **off**, this view is unavailable.

The memory context **TempSmallContextGroup** collects information about all memory contexts whose value in the **totalsize** column is less than 8192 bytes in the current thread, and the number of the collected memory contexts is recorded in the **usedsize** column. Therefore, the **totalsize** and **freesize** columns for **TempSmallContextGroup** in the view display the corresponding information about all the memory contexts whose value in the **totalsize** column is less than 8192 bytes in the current thread, and the **usedsize** column displays the number of these memory contexts.

**Table 12-233** GS\_SESSION\_MEMORY\_CONTEXT columns

Name	Type	Description
sessid	text	Session start time and ID (string: <i>timestamp.sessionid</i> ).
threadid	bigint	ID of the thread bound to a session (-1 if no thread is bound).
contextname	text	Name of the memory context.
level	smallint	Hierarchy of the memory context.
parent	text	Name of the parent memory context.
totalsize	bigint	Total size of the memory context, in bytes.
freesize	bigint	Total size of released memory in the memory context, in bytes.
usedsize	bigint	Size of used memory in the memory context, in bytes. For <b>TempSmallContextGroup</b> , this parameter specifies the number of collected memory contexts.

### CAUTION

This view is an O&M view and is used to locate memory problems. Do not query this view concurrently. If you query this view concurrently, the waiting time for new connections increases as the number of concurrent connections increases. As a result, new connections cannot be connected for a long time.

## 12.3.130 GS\_SESSION\_MEMORY\_DETAIL

GS\_SESSION\_MEMORY\_DETAIL displays the session memory usage based on the MemoryContext node. When **enable\_thread\_pool** is set to **on**, this view contains

memory usage of all threads and sessions. If the GUC parameter **enable\_memory\_limit** is set to **off**, this view is unavailable.

The memory context **TempSmallContextGroup** collects information about all memory contexts whose value in the **totalsize** column is less than 8192 bytes in the current thread, and the number of the collected memory contexts is recorded in the **usedsize** column. Therefore, the **totalsize** and **freesize** columns for **TempSmallContextGroup** in the view display the corresponding information about all the memory contexts whose value in the **totalsize** column is less than 8192 bytes in the current thread, and the **usedsize** column displays the number of these memory contexts.

You can run the `SELECT * FROM gs_session_memctx_detail(threadid, '');` statement to record information about all memory contexts of a thread into the `threadid_timestamp.log` file in the `$GAUSSLOG/pg_log/${node_name}/dumppmem` directory. `threadid` can be obtained from **sessid** in the following table.

**Table 12-234** GS\_SESSION\_MEMORY\_DETAIL columns

Name	Type	Description
sessid	text	<ol style="list-style-type: none"> <li>When the thread pool is disabled (<b>enable_thread_pool</b> is set to <b>off</b>), this column indicates the thread start time + session ID (string: <code>timestamp.sessionid</code>).</li> <li>When the thread pool is enabled (<b>enable_thread_pool</b> is set to <b>on</b>): If the memory context is at the thread level, this column indicates the thread start time + thread ID (string: <code>timestamp.threadid</code>). If the memory context is at the session level, the column indicates the thread start time + session ID (string: <code>timestamp.sessionid</code>).</li> </ol>
sesstype	text	Thread name.
contextname	text	Name of the memory context.
level	smallint	Hierarchy of the memory context.
parent	text	Name of the parent memory context.
totalsize	bigint	Total size of the memory context, in bytes.
freesize	bigint	Total size of released memory in the memory context, in bytes.
usedsize	bigint	Size of used memory in the memory context, in bytes. For <b>TempSmallContextGroup</b> , this parameter specifies the number of collected memory contexts.

 CAUTION

This view is an O&M view and is used to locate memory problems. Do not query this view concurrently. If you query this view concurrently, the waiting time for new connections increases as the number of concurrent connections increases. As a result, new connections cannot be connected for a long time.

### 12.3.131 GS\_SESSION\_STAT

GS\_SESSION\_STAT displays the session states based on session threads or the AutoVacuum thread.

**Table 12-235** GS\_SESSION\_STAT columns

Name	Type	Description
sessid	text	Thread ID and start time.
statid	integer	ID of the statistics session.
statname	text	Name of the statistics session.
statunit	text	Unit of the statistics session.
value	bigint	Value of the statistics session.

### 12.3.132 GS\_SESSION\_TIME

GS\_SESSION\_TIME collects statistics about the running time of session threads and time consumed in each execution phase.

**Table 12-236** GS\_SESSION\_TIME columns

Name	Type	Description
sessid	text	Thread ID and start time
stat_id	integer	Statistics ID
stat_name	text	Session type
value	bigint	Session value

### 12.3.133 GS\_SQL\_COUNT

GS\_SQL\_COUNT displays statistics about five types of running statements (SELECT, INSERT, UPDATE, DELETE, and MERGE INTO) on the current node of the database.

- When a common user queries the GS\_SQL\_COUNT view, statistics about the current node of the user are displayed. When an administrator queries the

GS\_SQL\_COUNT view, statistics about the current node of all users are displayed.

- When the database or the node is restarted, the statistics are cleared and the counting restarts.
- The system counts when a node receives a query, including a query inside the database.

**Table 12-237** GS\_SQL\_COUNT columns

Name	Type	Description
node_name	name	Node name.
user_name	name	Username.
select_count	bigint	Statistical result of the SELECT statement.
update_count	bigint	Statistical result of the UPDATE statement.
insert_count	bigint	Statistical result of the INSERT statement.
delete_count	bigint	Statistical result of the DELETE statement.
mergeinto_count	bigint	Statistical result of the <b>MERGE INTO</b> statement
ddl_count	bigint	Number of DDL statements
dml_count	bigint	Number of DML statements
dcl_count	bigint	Number of DML statements
total_select_elapse	bigint	Total response time of SELECT statements (unit: $\mu$ s).
avg_select_elapse	bigint	Average response time of SELECT statements (unit: $\mu$ s).
max_select_elapse	bigint	Maximum response time of SELECT statements (unit: $\mu$ s).
min_select_elapse	bigint	Minimum response time of SELECT statements (unit: $\mu$ s).
total_update_elapse	bigint	Total response time of UPDATE statements (unit: $\mu$ s).
avg_update_elapse	bigint	Average response time of UPDATE statements (unit: $\mu$ s).
max_update_elapse	bigint	Maximum response time of UPDATE statements (unit: $\mu$ s).

Name	Type	Description
min_update_elapse	bigint	Minimum response time of UPDATE statements (unit: μs).
total_insert_elapse	bigint	Total response time of INSERT statements (unit: μs).
avg_insert_elapse	bigint	Average response time of INSERT statements (unit: μs).
max_insert_elapse	bigint	Maximum response time of INSERT statements (unit: μs).
min_insert_elapse	bigint	Minimum response time of INSERT statements (unit: μs).
total_delete_elapse	bigint	Total response time of DELETE statements (unit: μs).
avg_delete_elapse	bigint	Average response time of DELETE statements (unit: μs).
max_delete_elapse	bigint	Maximum response time of DELETE statements (unit: μs).
min_delete_elapse	bigint	Minimum response time of DELETE statements (unit: μs).

## 12.3.134 GS\_STAT\_ALL\_PARTITIONS

GS\_STAT\_ALL\_PARTITIONS contains information about each partition in all partitioned tables in the current database. Each partition occupies one row, showing the access statistics of the partition. The information can be queried by using the `gs_stat_get_all_partitions_stats()` function.

**Table 12-238** GS\_STAT\_ALL\_PARTITIONS columns

Name	Type	Description
partition_oid	oid	Partition OID.
schemaname	name	Schema name of a table where the partition is located.
relname	name	Name of the table where the partition is located.
partition_name	name	Name of the level-1 partition to which the partition belongs.
sub_partition_name	name	Name of the level-2 partition to which the partition belongs.

Name	Type	Description
seq_scan	bigint	Number of sequential scans initiated by the partition.
seq_tup_read	bigint	Number of live rows fetched by sequential scans.
idx_scan	bigint	Number of index scans initiated by the partition.
idx_tup_fetch	bigint	Number of live rows fetched by index scans.
n_tup_ins	bigint	Number of rows inserted.
n_tup_upd	bigint	Number of rows updated.
n_tup_del	bigint	Number of rows deleted.
n_tup_hot_upd	bigint	Number of rows HOT updated (with no separate index update required)
n_live_tup	bigint	Estimated number of live rows.
n_dead_tup	bigint	Estimated number of inactive rows.
last_vacuum	timestamp with time zone	Time when the partition was last cleared.
last_autovacuum	timestamp with time zone	Time when the partition was last cleared by the autovacuum daemon thread.
last_analyze	timestamp with time zone	Time when the partition was last analyzed.
last_autoanalyze	timestamp with time zone	Time when the partition was last analyzed by the autovacuum daemon thread.
vacuum_count	bigint	Number of times that the partition is cleared.
autovacuum_count	bigint	Number of times that the partition is cleared by the autovacuum daemon thread.
analyze_count	bigint	Number of times that the partition is analyzed.
autoanalyze_count	bigint	Number of times that the partition is analyzed by the autovacuum daemon thread.

## 12.3.135 GS\_STAT\_XACT\_ALL\_PARTITIONS

GS\_STAT\_XACT\_ALL\_PARTITIONS displays the transaction status about all partitions of partitioned tables in a namespace. The information can be queried by using the `gs_stat_get_xact_all_partitions_stats()` function.

**Table 12-239** GS\_STAT\_XACT\_ALL\_PARTITIONS columns

Name	Type	Description
partition_oid	oid	Partition OID.
schemaname	name	Schema name of the partition.
relname	name	Name of the table where the partition is located.
partition_name	name	Name of the level-1 partition to which the partition belongs.
sub_partition_name	name	Name of the level-2 partition to which the partition belongs.
seq_scan	bigint	Number of sequential scans initiated by the partition.
seq_tup_read	bigint	Number of live rows fetched by sequential scans.
idx_scan	bigint	Number of index scans initiated by the partition.
idx_tup_fetch	bigint	Number of live rows fetched by index scans.
n_tup_ins	bigint	Number of rows inserted.
n_tup_upd	bigint	Number of rows updated.
n_tup_del	bigint	Number of rows deleted.
n_tup_hot_upd	bigint	Number of rows HOT updated (with no separate index update required)

## 12.3.136 GS\_STATIO\_ALL\_PARTITIONS

GS\_STATIO\_ALL\_PARTITIONS contains I/O statistics about each partition in a partitioned table of the current database. The information can be queried by using the `gs_statio_get_all_partitions_stats()` function.

**Table 12-240** GS\_STATIO\_ALL\_PARTITIONS columns

Name	Type	Description
partition_oid	oid	Partition OID.
schemaname	name	Name of the schema that the partition is in.

Name	Type	Description
relname	name	Name of the table where the partition is located.
partition_name	name	Name of the level-1 partition to which the partition belongs.
sub_partition_name	name	Name of the level-2 partition to which the partition belongs.
heap_blks_read	bigint	Number of disk blocks read from the partition.
heap_blks_hit	bigint	Number of cache hits in the partition.
idx_blks_read	bigint	Number of disk blocks read from all indexes on the partition.
idx_blks_hit	bigint	Number of cache hits of all indexes in a partition.
toast_blks_read	bigint	Number of disk blocks read from the partition's TOAST table partition (if any).
toast_blks_hit	bigint	Number of buffer hits in the partition's TOAST table partition (if any).
tidx_blks_read	bigint	Number of disk blocks read from the partition's TOAST table partitioned indexes (if any).
tidx_blks_hit	bigint	Number of buffer hits in the partition's TOAST table partitioned indexes (if any).

### 12.3.137 GS\_THREAD\_MEMORY\_CONTEXT

GS\_THREAD\_MEMORY\_CONTEXT displays the memory usage of all threads based on the MemoryContext node. This view is equivalent to the GS\_SESSION\_MEMORY\_DETAIL view when **enable\_thread\_pool** is set to **off**. If the GUC parameter **enable\_memory\_limit** is set to **off**, this view is unavailable.

The memory context **TempSmallContextGroup** collects information about all memory contexts whose value in the **totalsize** column is less than 8192 bytes in the current thread, and the number of the collected memory contexts is recorded in the **usedsize** column. Therefore, the **totalsize** and **freesize** columns for **TempSmallContextGroup** in the view display the corresponding information about all the memory contexts whose value in the **totalsize** column is less than 8192 bytes in the current thread, and the **usedsize** column displays the number of these memory contexts.

**Table 12-241** GS\_THREAD\_MEMORY\_CONTEXT columns

Name	Type	Description
threadid	text	Thread start time and ID (string: <i>timestamp.sessionid</i> ).
tid	bigint	Thread ID.
thrdtype	text	Thread type.
contextname	text	Name of the memory context.
level	smallint	Hierarchy of the memory context.
parent	text	Name of the parent memory context.
totalsize	bigint	Total size of the memory context, in bytes.
freesize	bigint	Total size of released memory in the current memory context, in bytes.
usedsize	bigint	Size of used memory in the memory context, in bytes. For <b>TempSmallContextGroup</b> , this parameter specifies the number of collected memory contexts.

### 12.3.138 GS\_TOTAL\_MEMORY\_DETAIL

GS\_TOTAL\_MEMORY\_DETAIL displays the memory usage of the current database node, in MB. If the GUC parameter **enable\_memory\_limit** is set to **off**, this view is unavailable.

**Table 12-242** GS\_TOTAL\_MEMORY\_DETAIL columns

Name	Type	Description
nodename	text	Node name.

Name	Type	Description
memorytype	text	<p>Memory type. The value must be one of the following:</p> <ul style="list-style-type: none"> <li>• <b>max_process_memory</b>: memory occupied by the GaussDB instance.</li> <li>• <b>process_used_memory</b>: memory occupied by the GaussDB process.</li> <li>• <b>max_dynamic_memory</b>: maximum dynamic memory.</li> <li>• <b>dynamic_used_memory</b>: used dynamic memory.</li> <li>• <b>dynamic_peak_memory</b>: dynamic peak memory.</li> <li>• <b>dynamic_used_shrctx</b>: maximum dynamic shared memory context.</li> <li>• <b>dynamic_peak_shrctx</b>: dynamic peak value of the shared memory context.</li> <li>• <b>max_backend_memory</b>: maximum memory that can be used when the HA port is used to execute services.</li> <li>• <b>backend_used_memory</b>: memory that has been used when the HA port is used to execute services.</li> <li>• <b>max_shared_memory</b>: maximum shared memory.</li> <li>• <b>shared_used_memory</b>: used shared memory.</li> <li>• <b>max_sctpcomm_memory</b>: maximum memory allowed for the communications library.</li> <li>• <b>sctpcomm_used_memory</b>: memory used by the communications library.</li> <li>• <b>sctpcomm_peak_memory</b>: memory peak of the communications library.</li> <li>• <b>other_used_memory</b>: other used memory.</li> </ul>
memorybytes	integer	Size of allocated memory-typed memory.

### 12.3.139 GS\_TOTAL\_NODEGROUP\_MEMORY\_DETAIL

GS\_TOTAL\_NODEGROUP\_MEMORY\_DETAIL returns the memory usage (in MB) of the current logical instance of the database. If the GUC parameter **enable\_memory\_limit** is set to **off**, this view is unavailable.

**Table 12-243** GS\_TOTAL\_NODEGROUP\_MEMORY\_DETAIL columns

Name	Type	Description
ngname	text	Logical instance name.
memorytype	text	Memory type. The value must be one of the following: <ul style="list-style-type: none"> <li>• <b>ng_total_memory</b>: total memory of the logical instance.</li> <li>• <b>ng_used_memory</b>: memory usage of the logical instance.</li> <li>• <b>ng_estimate_memory</b>: estimated memory usage of the logical instance.</li> <li>• <b>ng_foreignrp_memsize</b>: total memory of the external resource pool of the logical instance.</li> <li>• <b>ng_foreignrp_usedsize</b>: memory usage of the external resource pool of the logical instance.</li> <li>• <b>ng_foreignrp_peaksize</b>: peak memory usage of the external resource pool of the logical instance.</li> <li>• <b>ng_foreignrp_mempct</b>: percentage of the external resource pool of the logical instance to the total memory of the logical instance.</li> <li>• <b>ng_foreignrp_estmsize</b>: estimated memory usage of the external resource pool of the logical instance.</li> </ul>
memorybytes	integer	Size of allocated memory-typed memory.

### 12.3.140 GS\_WLM\_WORKLOAD\_RECORDS

This view is not supported in the centralized system.

### 12.3.141 GS\_WORKLOAD\_RULE\_STAT

GS\_WORKLOAD\_RULE\_STAT displays information about SQL concurrency control rules. Only the sysadmin user can access the system view.

**Table 12-244** GS\_WORKLOAD\_RULE\_STAT columns

Name	Type	Description
rule_id	bigint	Concurrency control rule ID.
rule_name	name	Name of a concurrency control rule, which is used to search for the concurrency control rule.

Name	Type	Description
databases	name[]	List of databases on which the concurrency control rule takes effect. If the value is <b>NULL</b> , the concurrency control rule takes effect for all databases.
rule_type	text	Concurrency control rule type. Currently, only "sqlid", "select", "insert", "update", "delete", "merge", and "resource" are supported. Other values are invalid.
start_time	timestamp with time zone	Start time of the concurrency control rules. The value <b>NULL</b> indicates that the rules take effect from now on.
end_time	timestamp with time zone	End time of the concurrency control rules. The value <b>NULL</b> indicates that the rules are always effective.
max_workload	bigint	Maximum number of concurrent rule settings.
option_val	text[]	Parameter values of a concurrency control rule, including SQL ID, keyword list, and resource restriction.  For details, see the description of the <a href="#">gs_add_workload_rule</a> API.
is_valid	Boolean	Determines whether the concurrency control rules take effect. If the concurrency control rules time out, the value is set to <b>false</b> .
validate_count	bigint	Number of SQL statements intercepted by the concurrency control rule.
node_names	text[]	List of nodes on which the concurrency control rules take effect. This parameter is reserved and does not take effect currently.
user_names	text[]	List of users for which the concurrency control rules take effect. This parameter is reserved and does not take effect currently.

## 12.3.142 GV\_INSTANCE

GV\_INSTANCE displays information about the current database instance. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in both PG\_CATALOG and SYS schema.

**Table 12-245** GV\_INSTANCE columns

Name	Type	Description
inst_id	oid	OID of the current database.
instance_number	oid	OID of the current database.
instance_name	character varying(16)	Name of the current database.
host_name	character varying(64)	Not supported. Its value is <b>NULL</b> .
version	character varying(17)	Not supported. Its value is <b>NULL</b> .
version_legacy	character varying(17)	Not supported. Its value is <b>NULL</b> .
version_full	character varying(17)	Not supported. Its value is <b>NULL</b> .
startup_time	timestamp(0) without time zone	Not supported. Its value is <b>NULL</b> .
status	character varying(12)	Not supported. Its value is <b>NULL</b> .
parallel	character varying(3)	Not supported. Its value is <b>NULL</b> .
thread#	numeric	Not supported. Its value is <b>NULL</b> .
archiver	character varying(7)	Not supported. Its value is <b>NULL</b> .
log_switch_wait	character varying(15)	Not supported. Its value is <b>NULL</b> .
logins	character varying(10)	Not supported. Its value is <b>NULL</b> .
shutdown_pending	character varying(3)	Not supported. Its value is <b>NULL</b> .
database_status	character varying(17)	Not supported. Its value is <b>NULL</b> .
instance_role	character varying(18)	Not supported. Its value is <b>NULL</b> .
active_state	character varying(9)	Not supported. Its value is <b>NULL</b> .
blocked	character varying(3)	Not supported. Its value is <b>NULL</b> .

Name	Type	Description
con_id	numeric	Not supported. Its value is <b>NULL</b> .
instance_mode	character varying(11)	Not supported. Its value is <b>NULL</b> .
edition	character varying(7)	Not supported. Its value is <b>NULL</b> .
family	character varying(80)	Not supported. Its value is <b>NULL</b> .
database_type	character varying(15)	Not supported. Its value is <b>NULL</b> .

### 12.3.143 GV\_SESSION

GV\_SESSION displays all session information about the current session. Only administrators can access this view. Common users can access the view only after being authorized. This view exists in both PG\_CATALOG and SYS schema.

**Table 12-246** GV\_SESSION columns

Name	Type	Description
inst_id	numeric	Not supported. Its value is <b>NULL</b> .
saddr	raw	Not supported. Its value is <b>NULL</b> .
sid	bigint	Session ID.
serial#	integer	Sequence number of the active backend thread.
audsid	numeric	Not supported. Its value is <b>NULL</b> .
paddr	raw	Not supported. Its value is <b>NULL</b> .
schema#	numeric	Not supported. Its value is <b>NULL</b> .
schemaname	name	Name of the user logged in to the backend.
user#	oid	OID of the user logged in to the backend thread. The OID is <b>0</b> if the backend thread is a global auxiliary thread.
username	name	Name of the user logged in to the backend process. <b>username</b> is null if the backend thread is a global auxiliary thread.
command	numeric	Not supported. Its value is <b>NULL</b> .
ownerid	numeric	Not supported. Its value is <b>NULL</b> .

Name	Type	Description
taddr	character varying(16)	Not supported. Its value is <b>NULL</b> .
lockwait	character varying(16)	Not supported. Its value is <b>NULL</b> .
machine	text	Host name of the connected client, as reported by a reverse DNS lookup of <b>client_addr</b> . This column will be non-null only for IP connections and only when <b>log_hostname</b> is enabled.
sql_id	bigint	SQL OID.
client_info	text	Client information.
event	text	Queuing status of a statement. The value must be one of the following: <ul style="list-style-type: none"> <li>• <b>waiting in queue</b>: The statement is in the queue.</li> <li>• <b>Empty</b>: The statement is running.</li> </ul>
sql_exec_start	timestamp with time zone	Start time of SQL statement execution.
program	text	Name of the application connected to the backend.
status	text	Overall status of this backend. The value must be one of the following: <ul style="list-style-type: none"> <li>• <b>active</b>: The backend is executing a query.</li> <li>• <b>idle</b>: The backend is waiting for a new client command.</li> <li>• <b>idle in transaction</b>: The backend is in a transaction, but there is no statement being executed in the transaction.</li> <li>• <b>idle in transaction (aborted)</b>: The backend is in a transaction, but there are statements failed in the transaction.</li> <li>• <b>fastpath function call</b>: The backend is executing a fast-path function.</li> <li>• <b>disabled</b>: This state is reported if <b>track_activities</b> is disabled in this backend.</li> </ul>
server	character varying(9)	Not supported. Its value is <b>NULL</b> .
pdml_status	character varying(8)	Specifies whether to enable a DML parallel execution in the current session.
port	numeric	Port number of the current session.

Name	Type	Description
process	character varying(24)	Process ID of the current session.
logon_time	timestamp(0 ) without time zone	Login time of the current session.
last_call_et	integer	Duration when the status of the current session changes last time.
osuser	character varying(128)	Not supported. Its value is <b>NULL</b> .
terminal	character varying(30)	Not supported. Its value is <b>NULL</b> .
type	character varying(10)	Not supported. Its value is <b>NULL</b> .
sql_address	raw	Not supported. Its value is <b>NULL</b> .
sql_hash_value	numeric	Not supported. Its value is <b>NULL</b> .
sql_child_number	numeric	Not supported. Its value is <b>NULL</b> .
sql_exec_id	numeric	Not supported. Its value is <b>NULL</b> .
prev_sql_address	raw	Not supported. Its value is <b>NULL</b> .
prev_hash_value	numeric	Not supported. Its value is <b>NULL</b> .
prev_sql_id	character varying(13)	Not supported. Its value is <b>NULL</b> .
prev_child_number	numeric	Not supported. Its value is <b>NULL</b> .
prev_exec_start	timestamp(0 ) without time zone	Not supported. Its value is <b>NULL</b> .
prev_exec_id	numeric	Not supported. Its value is <b>NULL</b> .
plsql_entry_object_id	numeric	Not supported. Its value is <b>NULL</b> .
plsql_entry_subprogram_id	numeric	Not supported. Its value is <b>NULL</b> .
plsql_object_id	numeric	Not supported. Its value is <b>NULL</b> .

Name	Type	Description
plsql_subprogram_id	numeric	Not supported. Its value is <b>NULL</b> .
module	character varying(64)	Not supported. Its value is <b>NULL</b> .
module_hash	numeric	Not supported. Its value is <b>NULL</b> .
action	character varying(64)	Not supported. Its value is <b>NULL</b> .
action_hash	numeric	Not supported. Its value is <b>NULL</b> .
fixed_table_sequence	numeric	Not supported. Its value is <b>NULL</b> .
row_wait_obj#	numeric	Not supported. Its value is <b>NULL</b> .
row_wait_file#	numeric	Not supported. Its value is <b>NULL</b> .
row_wait_block#	numeric	Not supported. Its value is <b>NULL</b> .
row_wait_row#	numeric	Not supported. Its value is <b>NULL</b> .
top_level_call#	numeric	Not supported. Its value is <b>NULL</b> .
pdml_enabled	character varying(3)	Not supported. Its value is <b>NULL</b> .
failover_type	character varying(13)	Not supported. Its value is <b>NULL</b> .
failover_method	character varying(10)	Not supported. Its value is <b>NULL</b> .
failed_over	character varying(3)	Not supported. Its value is <b>NULL</b> .
resource_consumer_group	character varying(32)	Not supported. Its value is <b>NULL</b> .
pddl_status	character varying(8)	Not supported. Its value is <b>NULL</b> .
pq_status	character varying(8)	Not supported. Its value is <b>NULL</b> .
current_queue_duration	numeric	Not supported. Its value is <b>NULL</b> .

Name	Type	Description
client_identifier	character varying(64)	Not supported. Its value is <b>NULL</b> .
blocking_session_status	character varying(11)	Not supported. Its value is <b>NULL</b> .
blocking_instance	numeric	Not supported. Its value is <b>NULL</b> .
blocking_session	numeric	Not supported. Its value is <b>NULL</b> .
final_blocking_session_status	character varying(11)	Not supported. Its value is <b>NULL</b> .
final_blocking_instance	numeric	Not supported. Its value is <b>NULL</b> .
final_blocking_session	numeric	Not supported. Its value is <b>NULL</b> .
seq#	numeric	Not supported. Its value is <b>NULL</b> .
event#	numeric	Not supported. Its value is <b>NULL</b> .
p1text	character varying(64)	Not supported. Its value is <b>NULL</b> .
p1	numeric	Not supported. Its value is <b>NULL</b> .
p1raw	raw	Not supported. Its value is <b>NULL</b> .
p2text	character varying(64)	Not supported. Its value is <b>NULL</b> .
p2	numeric	Not supported. Its value is <b>NULL</b> .
p2raw	raw	Not supported. Its value is <b>NULL</b> .
p3text	character varying(64)	Not supported. Its value is <b>NULL</b> .
p3	numeric	Not supported. Its value is <b>NULL</b> .
p3raw	raw	Not supported. Its value is <b>NULL</b> .
wait_class_id	numeric	Not supported. Its value is <b>NULL</b> .
wait_class#	numeric	Not supported. Its value is <b>NULL</b> .
wait_class	character varying(64)	Not supported. Its value is <b>NULL</b> .
wait_time	numeric	Not supported. Its value is <b>NULL</b> .

Name	Type	Description
seconds_in_wait	numeric	Not supported. Its value is <b>NULL</b> .
state	character varying(19)	Not supported. Its value is <b>NULL</b> .
wait_time_micro	numeric	Not supported. Its value is <b>NULL</b> .
time_remaining_micro	numeric	Not supported. Its value is <b>NULL</b> .
time_since_last_wait_micro	numeric	Not supported. Its value is <b>NULL</b> .
service_name	character varying(64)	Not supported. Its value is <b>NULL</b> .
sql_trace	character varying(8)	Not supported. Its value is <b>NULL</b> .
sql_trace_waits	character varying(5)	Not supported. Its value is <b>NULL</b> .
sql_trace_binds	character varying(5)	Not supported. Its value is <b>NULL</b> .
sql_trace_plan_stats	character varying(10)	Not supported. Its value is <b>NULL</b> .
session_editon_id	numeric	Not supported. Its value is <b>NULL</b> .
creator_addr	raw	Not supported. Its value is <b>NULL</b> .
creator_serial#	numeric	Not supported. Its value is <b>NULL</b> .
ecid	character varying(64)	Not supported. Its value is <b>NULL</b> .
sql_translation_profile_id	numeric	Not supported. Its value is <b>NULL</b> .
pga_tunable_mem	numeric	Not supported. Its value is <b>NULL</b> .
shard_ddl_status	character varying(8)	Not supported. Its value is <b>NULL</b> .
con_id	numeric	Not supported. Its value is <b>NULL</b> .
external_name	character varying(1024)	Not supported. Its value is <b>NULL</b> .

Name	Type	Description
plsql_debugger_connected	character varying(5)	Not supported. Its value is <b>NULL</b> .

### 12.3.144 MPP\_TABLES

The following information is displayed in the MPP\_TABLES view.

**Table 12-247** MPP\_TABLES columns

Name	Type	Description
schemaname	name	Name of the schema that contains a table.
tablename	name	Table name.
tableowner	name	Table owner.
tablespace	name	Tablespace containing the table
pgroup	name	Name of a node cluster
nodeoids	oidvector_extend	List of distributed table node OIDs

### 12.3.145 MY\_COL\_COMMENTS

MY\_COL\_COMMENTS displays column comments of the table accessible to the current user. This view exists in both PG\_CATALOG and SYS schema.

**Table 12-248** MY\_COL\_COMMENTS columns

Name	Type	Description
owner	character varying(128)	Table owner
table_name	character varying(128)	Table name.
column_name	character varying(128)	Column name.
comments	text	Comments
origin_con_id	numeric	Not supported. Its value is <b>0</b> .

Name	Type	Description
schema	character varying(64)	Name of the namespace to which the column belongs.

### 12.3.146 MY\_COL\_PRIVS

MY\_COL\_PRIVS displays the column permission granting information of the current user as the object owner, grantor, or grantee. By default, it is accessible to all users. This view exists in both PG\_CATALOG and SYS schema.

**Table 12-249** MY\_COL\_PRIVS columns

Name	Type	Description
grantor	character varying(128)	Name of the user who grants the permission.
owner	character varying(128)	Object owner
grantee	character varying(128)	Name of the user or role to which the permission is granted.
table_schema	character varying(128)	Schema of an object.
table_name	character varying(128)	Object name.
column_name	character varying(128)	Column name.
privilege	character varying(40)	Permission on a column.
grantable	character varying(3)	Specifies whether to grant privileges. <ul style="list-style-type: none"> <li>• YES</li> <li>• NO</li> </ul>
common	character varying(3)	Not supported. Its value is <b>NULL</b> .
inherited	character varying(3)	Not supported. Its value is <b>NULL</b> .

### 12.3.147 MY\_COLL\_TYPES

MY\_COLL\_TYPES displays information about types of collections created by the current user. By default, it is accessible to all users. This view exists in both PG\_CATALOG and SYS schema.

**Table 12-250 MY\_COLL\_TYPES** columns

Name	Type	Description
owner	character varying(128)	Owner of a cluster.
type_name	character varying(128)	Name of a collection.
coll_type	character varying(128)	Description of a set.
upper_bound	numeric	Not supported. Its value is <b>NULL</b> .
elem_type_mod	character varying(7)	Type modifier of an element.
elem_type_owner	character varying(128)	Owner of the element type on which the collection is based. This parameter is mainly used for user-defined types.
elem_type_name	character varying(128)	Name of the data type or user-defined type on which the collection is based.
length	numeric	Not supported. Its value is <b>NULL</b> .
precision	numeric	Not supported. Its value is <b>NULL</b> .
scale	numeric	Not supported. Its value is <b>NULL</b> .
character_set_name	character varying(44)	Not supported. Its value is <b>NULL</b> .
elem_storage	character varying(7)	Not supported. Its value is <b>NULL</b> .
nulls_stored	character varying(3)	Not supported. Its value is <b>NULL</b> .
char_used	character varying(1)	Not supported. Its value is <b>NULL</b> .

### 12.3.148 MY\_CONS\_COLUMNS

MY\_CONS\_COLUMNS displays information about primary key constraint columns in tables accessible to the current user. This view exists in both PG\_CATALOG and SYS schema.

**Table 12-251 MY\_CONS\_COLUMNS** columns

Name	Type	Description
owner	character varying(64)	Constraint creator.
table_name	character varying(64)	Name of a constraint-related table.
column_name	character varying(64)	Name of a constraint-related column.
constraint_name	character varying(64)	Constraint name.
position	smallint	Position of a column in a table.

## 12.3.149 MY\_CONSTRAINTS

MY\_CONSTRAINTS displays table constraint information accessible to the current user. This view exists in both PG\_CATALOG and SYS schema.

**Table 12-252 MY\_CONSTRAINTS** columns

Name	Type	Description
owner	character varying(64)	Constraint creator.
constraint_name	vcharacter varying(64)	Constraint name.
constraint_type	text	Constraint type. <ul style="list-style-type: none"> <li>● <b>c</b>: check constraint.</li> <li>● <b>f</b>: foreign key constraint.</li> <li>● <b>p</b>: primary key constraint.</li> <li>● <b>u</b>: unique constraint.</li> </ul>
table_name	character varying(64)	Name of a constraint-related table.
index_owner	character varying(64)	Owner of a constraint-related index (only for the unique constraint and primary key constraint).
index_name	character varying(64)	Name of a constraint-related index (only for the unique constraint and primary key constraint).

## 12.3.150 MY\_DEPENDENCIES

MY\_DEPENDENCIES displays the dependencies between objects that are accessible to the current user. This view exists in the PG\_CATALOG and SYS schema and all users can access this view.

**Table 12-253** MY\_DEPENDENCIES columns

Name	Type	Description
name	character varying(128)	Object name.
type	character varying(18)	Object type
referenced_owner	character varying(128)	Owner of the referenced object.
referenced_name	character varying(128)	Name of the referenced object.
referenced_type	character varying(18)	Type of the referenced object.
referenced_link_name	character varying(128)	Name of the link to the parent object (if remote).
dependency_type	character varying(4)	Specifies whether the dependency is an REF dependency.

## 12.3.151 MY\_ERRORS

MY\_ERRORS displays the latest compilation error information about user-owned storage objects. This view can be accessed by all users. Only the information about the current user can be viewed. This view exists in both PG\_CATALOG and SYS schema.

**Table 12-254** MY\_ERRORS columns

Name	Type	Description
name	character varying(128)	Object name.

Name	Type	Description
type	character varying(12)	Object type. <ul style="list-style-type: none"> <li>PROCEDURE</li> <li>FUNCTION</li> <li>PACKAGE</li> <li>PACKAGE BODY</li> </ul>
sequence	numeric	Serial number.
line	numeric	Row where an error occurs.
position	numeric	Position in the row where an error occurs.
text	character varying(4000)	Error text.
attribute	character varying(9)	Attribute tag: ERROR.
message_number	numeric	Not supported. Its value is <b>NULL</b> .

### 12.3.152 MY\_IND\_COLUMNS

MY\_IND\_COLUMNS displays column information about all indexes accessible to the current user. It is accessible to all users. This view exists in both PG\_CATALOG and SYS schema.

**Table 12-255** MY\_IND\_COLUMNS columns

Name	Type	Description
index_owner	character varying(64)	Index owner.
index_name	character varying(64)	Index name.
table_owner	character varying(64)	Table owner.
table_name	character varying(64)	Table name.
column_name	name	Column name.
column_position	smallint	Position of the column in the index.
column_length	numeric	Length of the column. For the variable-length type, its value is <b>NULL</b> .
char_length	numeric	Maximum length of a column, in bytes.

Name	Type	Description
descend	character varying	Specifies whether columns are sorted in descending ( <b>DESC</b> ) or ascending ( <b>ASC</b> ) order.
collated_column_id	numeric	Not supported. Its value is <b>NULL</b> .

### 12.3.153 MY\_IND\_EXPRESSIONS

MY\_IND\_EXPRESSIONS displays information about function-based expression indexes accessible to the current user. It is accessible to all users. This view exists in both PG\_CATALOG and SYS schema.

**Table 12-256** MY\_IND\_EXPRESSIONS columns

Name	Type	Description
table_owner	character varying(64)	Table owner.
table_name	character varying(64)	Table name.
index_owner	character varying(64)	Index owner.
index_name	character varying(64)	Index name.
column_expression	text	Function-based index expression of a specified column.
column_position	smallint	Position of the column in the index.

### 12.3.154 MY\_IND\_PARTITIONS

MY\_IND\_PARTITIONS displays the partition information about local indexes of level-1 partitioned table accessible to the current user (excluding global indexes of partitioned tables). It is accessible to all users. This view exists in both PG\_CATALOG and SYS schema.

**Table 12-257** MY\_IND\_PARTITIONS columns

Name	Type	Description
index_owner	character varying(64)	Owner name of the partitioned table index to which an index partition belongs.

Name	Type	Description
index_name	character varying(64)	Index name of the partitioned table index to which the index partition belongs.
partition_name	character varying(64)	Name of the index partition.
def_tablespace_name	name	Tablespace name of the index partition.
high_value	text	Upper limit of the partition corresponding to the index partition.
index_partition_usable	boolean	Specifies whether an index partition is available: <ul style="list-style-type: none"> <li>• <b>t</b> (true): yes.</li> <li>• <b>f</b> (false): no.</li> </ul>
schema	character varying(64)	Schema of the partitioned table index to which the index partition belongs.
high_value_length	integer	Character length of the limit of the partition corresponding to an index partition.
composite	character varying(3)	Specifies whether the index is a local index on the level-2 partitioned table. This table does not store level-2 partition information. Therefore, the value is <b>NO</b> .
subpartition_count	numeric	Number of level-2 partitions in a partition. This table does not store level-2 partition information. Therefore, the value is <b>0</b> .
partition_position	numeric	Position of an index partition in the index.
status	character varying(8)	Specifies whether an index partition is available.

Name	Type	Description
tablespace_name	name	Name of the tablespace that contains the partition.
pct_free	numeric	Minimum percentage of available space in a block.
ini_trans	numeric	Initial number of transactions. The default value is <b>4</b> . The value is <b>NULL</b> for non-Ustore partitioned tables.
max_trans	numeric	Maximum number of transactions. The default value is <b>128</b> . The value is <b>NULL</b> for non-Ustore partitioned tables.
initial_extent	numeric	Not supported. Its value is <b>NULL</b> .
next_extent	numeric	Not supported. Its value is <b>NULL</b> .
min_extent	numeric	Not supported. Its value is <b>NULL</b> .
max_extent	numeric	Not supported. Its value is <b>NULL</b> .
max_size	numeric	Not supported. Its value is <b>NULL</b> .
pct_increase	numeric	Not supported. Its value is <b>NULL</b> .
freelists	numeric	Not supported. Its value is <b>NULL</b> .
freelist_groups	numeric	Not supported. Its value is <b>NULL</b> .
logging	character varying(7)	Specifies whether changes to an index are recorded.
compression	character varying(13)	Specifies whether an index compression is enabled for a partitioned index.
blevel	numeric	Not supported. Its value is <b>NULL</b> .

Name	Type	Description
leaf_blocks	numeric	Not supported. Its value is <b>NULL</b> .
distinct_keys	numeric	Not supported. Its value is <b>NULL</b> .
avg_leaf_blocks_per_key	numeric	Not supported. Its value is <b>NULL</b> .
avg_data_blocks_per_key	numeric	Not supported. Its value is <b>NULL</b> .
clustering_factor	numeric	Sequence of a row in the table based on the value of the index. You need to run the analyze command to collect statistics.
num_rows	numeric	Number of rows in a partition. You need to run the vacuum command to collect statistics.
sample_size	numeric	Not supported. Its value is <b>NULL</b> .
last_analyzed	timestamp with time zone	Last date when the partition was analyzed. Database restart is not supported. Otherwise, data loss will occur.
buffer_pool	character varying(7)	Actual buffer pool of a partition.
flash_cache	character varying(7)	Not supported. Its value is <b>NULL</b> .
cell_flash_cache	character varying(7)	Not supported. Its value is <b>NULL</b> .
user_stats	character varying(3)	Not supported. Its value is <b>NULL</b> .
pct_direct_access	numeric	Not supported. Its value is <b>NULL</b> .
global_stats	character varying(3)	Not supported. Its value is <b>NULL</b> .
domidx_opstatus	character varying(6)	Not supported. Its value is <b>NULL</b> .

Name	Type	Description
parameters	character varying(1000)	Not supported. Its value is <b>NULL</b> .
interval	character varying(3)	Specifies whether the partition is a partition in an interval partitioned table.
segment_created	character varying(3)	Specifies whether an index partition segment has been created.
orphaned_entries	character varying(3)	Not supported. Its value is <b>NULL</b> .

### 12.3.155 MY\_IND\_SUBPARTITIONS

MY\_IND\_SUBPARTITIONS displays the partition information about local indexes of level-2 partitioned table owned by the current user (excluding global indexes of partitioned tables). It is accessible to all users. This view exists in both PG\_CATALOG and SYS schema.

**Table 12-258** MY\_IND\_SUBPARTITIONS columns

Name	Type	Description
index_owner	character varying(64)	Owner name of the partitioned table index to which an index partition belongs.
index_name	character varying(64)	Index name of the partitioned table index to which an index partition belongs.
partition_name	character varying(64)	Name of the level-1 partition where an index is located.
subpartition_name	character varying(64)	Name of the level-2 partition where an index is located.
def_tablespace_name	name	Tablespace name of an index partition.
high_value	text	Limit of the partition corresponding to an index partition.

Name	Type	Description
index_partition_usable	boolean	Specifies whether an index partition is available: <ul style="list-style-type: none"> <li>• <b>t</b> (true): yes.</li> <li>• <b>f</b> (false): no.</li> </ul>
schema	character varying(64)	Schema of the partitioned table index to which an index partition belongs.
high_value_length	integer	Character length of the limit of the partition corresponding to an index partition.
partition_position	numeric	Position of an index partition in the index.
subpartition_position	numeric	Position of the level-2 partition in the partition.
status	character varying(8)	Specifies whether an index partition is available.
tablespace_name	name	Tablespace name of an index partition.
pct_free	numeric	Minimum percentage of available space in a block.
ini_trans	numeric	Initial number of transactions. The default value is <b>4</b> . The value is <b>NULL</b> for non-Ustore partitioned tables.
max_trans	numeric	Maximum number of transactions. The default value is <b>128</b> . The value is <b>NULL</b> for non-Ustore partitioned tables.
initial_extent	numeric	Not supported. Its value is <b>NULL</b> .
next_extent	numeric	Not supported. Its value is <b>NULL</b> .
min_extent	numeric	Not supported. Its value is <b>NULL</b> .

Name	Type	Description
max_extent	numeric	Not supported. Its value is <b>NULL</b> .
max_size	numeric	Not supported. Its value is <b>NULL</b> .
pct_increase	numeric	Not supported. Its value is <b>NULL</b> .
freelists	numeric	Not supported. Its value is <b>NULL</b> .
freelist_groups	numeric	Not supported. Its value is <b>NULL</b> .
logging	character varying(7)	Specifies whether changes to an index are recorded.
compression	character varying(13)	Compression type used for level-2 partitions.
blevel	numeric	Not supported. Its value is <b>NULL</b> .
leaf_blocks	numeric	Not supported. Its value is <b>NULL</b> .
distinct_keys	numeric	Not supported. Its value is <b>NULL</b> .
avg_leaf_blocks_per_key	numeric	Not supported. Its value is <b>NULL</b> .
avg_data_blocks_per_key	numeric	Not supported. Its value is <b>NULL</b> .
clustering_factor	numeric	Sequence of a row in the table based on the value of the index. You need to run the analyze command to collect statistics.
num_rows	numeric	Number of rows in a level-2 partition. You need to run the vacuum command to collect statistics.
sample_size	numeric	Not supported. Its value is <b>NULL</b> .

Name	Type	Description
last_analyzed	timestamp with time zone	Last date when the partition was analyzed Database restart is not supported. Otherwise, data loss will occur.
buffer_pool	character varying(7)	Buffer pool of a level-2 partition.
flash_cache	character varying(7)	Not supported. Its value is <b>NULL</b> .
cell_flash_cache	character varying(7)	Not supported. Its value is <b>NULL</b> .
user_stats	character varying(3)	Not supported. Its value is <b>NULL</b> .
global_stats	character varying(3)	Not supported. Its value is <b>NULL</b> .
interval	character varying(3)	Specifies whether the partition is a partition in an interval partitioned table.
segment_created	character varying(3)	Specifies whether an index partition segment has been created.
domidx_opstatus	character varying(6)	Not supported. Its value is <b>NULL</b> .
parameters	character varying(1000)	Not supported. Its value is <b>NULL</b> .

### 12.3.156 MY\_INDEXES

MY\_INDEXES displays index information about the current user. This view exists in both PG\_CATALOG and SYS schema.

**Table 12-259** MY\_INDEXES columns

Name	Type	Description
owner	character varying(64)	Index owner.
index_name	character varying(64)	Index name.
table_name	character varying(64)	Name of a table corresponding to an index.

Name	Type	Description
uniqueness	text	Specifies whether the index is a unique index. <ul style="list-style-type: none"> <li>• <b>UNIQUE</b>: unique index.</li> <li>• <b>NONUNIQUE</b>: non-unique index.</li> </ul>
partitioned	character(3)	Specifies whether the index has the property of partitioned tables. <ul style="list-style-type: none"> <li>• <b>Yes</b>: The index has the property of a partitioned table.</li> <li>• <b>No</b>: The index does not have the property of a partitioned table.</li> </ul>
generated	character varying(1)	Specifies whether the index name is generated by the system. <ul style="list-style-type: none"> <li>• <b>y</b>: The index name is generated by the system.</li> <li>• <b>n</b>: The index name is not generated by the system.</li> </ul>
index_type	character varying(27)	Index type. <ul style="list-style-type: none"> <li>• <b>NORMAL</b>: Index attributes are simple references, and the expression tree is empty.</li> <li>• <b>FUNCTION-BASED NORMAL</b>: Expression trees are used for index attributes that are not simple column references.</li> </ul>
table_owner	character varying(128)	Owner of the index object.
table_type	character(11)	Type of an index object <ul style="list-style-type: none"> <li>• <b>TABLE</b>: The index object is of the table type.</li> </ul>

Name	Type	Description
tablespace_name	character varying(30)	Name of the tablespace that contains the index.
status	character varying(8)	Status of a non-partitioned index. <ul style="list-style-type: none"> <li>• <b>VALID</b>: Non-partitioned indexes can be used for query.</li> <li>• <b>UNUSABLE</b>: The non-partitioned index is unavailable.</li> <li>• <b>N/A</b>: The index has the property of a partitioned table.</li> </ul>
compression	character varying(13)	Not supported. Its value is <b>NULL</b> .
prefix_length	numeric	Not supported. Its value is <b>NULL</b> .
ini_trans	numeric	Not supported. Its value is <b>NULL</b> .
max_trans	numeric	Not supported. Its value is <b>NULL</b> .
initial_extent	numeric	Not supported. Its value is <b>NULL</b> .
next_extent	numeric	Not supported. Its value is <b>NULL</b> .
min_extents	numeric	Not supported. Its value is <b>NULL</b> .
max_extents	numeric	Not supported. Its value is <b>NULL</b> .
pct_increase	numeric	Not supported. Its value is <b>NULL</b> .
pct_threshold	numeric	Not supported. Its value is <b>NULL</b> .
include_column	numeric	Not supported. Its value is <b>NULL</b> .
freelists	numeric	Not supported. Its value is <b>NULL</b> .
freelist_groups	numeric	Not supported. Its value is <b>NULL</b> .

Name	Type	Description
pct_free	numeric	Not supported. Its value is <b>NULL</b> .
logging	character varying(3)	Not supported. Its value is <b>NULL</b> .
blevel	numeric	Not supported. Its value is <b>NULL</b> .
leaf_blocks	numeric	Not supported. Its value is <b>NULL</b> .
distinct_keys	numeric	Not supported. Its value is <b>NULL</b> .
avg_leaf_blocks_per_key	numeric	Not supported. Its value is <b>NULL</b> .
avg_data_blocks_per_key	numeric	Not supported. Its value is <b>NULL</b> .
clustering_factor	numeric	Not supported. Its value is <b>NULL</b> .
num_rows	numeric	Not supported. Its value is <b>NULL</b> .
sample_size	numeric	Not supported. Its value is <b>NULL</b> .
last_analyzed	timestamp(0) without time zone	Not supported. Its value is <b>NULL</b> .
degree	character varying(40)	Not supported. Its value is <b>NULL</b> .
instances	character varying(40)	Not supported. Its value is <b>NULL</b> .
temporary	character varying(1)	Not supported. Its value is <b>NULL</b> .
secondary	character varying(1)	Not supported. Its value is <b>NULL</b> .
buffer_pool	character varying(7)	Not supported. Its value is <b>NULL</b> .
flash_cache	character varying(7)	Not supported. Its value is <b>NULL</b> .
cell_flash_cache	character varying(7)	Not supported. Its value is <b>NULL</b> .
user_stats	character varying(3)	Not supported. Its value is <b>NULL</b> .

Name	Type	Description
duration	character varying(15)	Not supported. Its value is <b>NULL</b> .
pct_direct_access	numeric	Not supported. Its value is <b>NULL</b> .
ityp_owner	character varying(128)	Not supported. Its value is <b>NULL</b> .
ityp_name	character varying(128)	Not supported. Its value is <b>NULL</b> .
parameters	character varying(1000)	Not supported. Its value is <b>NULL</b> .
global_stats	character varying(3)	Not supported. Its value is <b>NULL</b> .
domidx_status	character varying(12)	Not supported. Its value is <b>NULL</b> .
domidx_opstatus	character varying(6)	Not supported. Its value is <b>NULL</b> .
funcidx_status	character varying(8)	Not supported. Its value is <b>NULL</b> .
join_index	character varying(3)	Not supported. Its value is <b>NULL</b> .
iot_redundant_pkey_elim	character varying(3)	Not supported. Its value is <b>NULL</b> .
dropped	character varying(3)	Not supported. Its value is <b>NULL</b> .
visibility	character varying(9)	Not supported. Its value is <b>NULL</b> .
domidx_management	character varying(14)	Not supported. Its value is <b>NULL</b> .
segment_created	character varying(3)	Not supported. Its value is <b>NULL</b> .
orphaned_entries	character varying(3)	Not supported. Its value is <b>NULL</b> .
indexing	character varying(7)	Not supported. Its value is <b>NULL</b> .
auto	character varying(3)	Not supported. Its value is <b>NULL</b> .

## 12.3.157 MY\_JOBS

MY\_JOBS displays details about the scheduled jobs owned by the current user. This view exists in both PG\_CATALOG and SYS schema.

**Table 12-260** MY\_JOBS columns

Name	Type	Description
job	bigint	Job ID.
log_user	name	Username of a job creator.
priv_user	name	Username of a job executor.
dbname	name	Name of the database where the job is created.
schema_user	name	Default schema name of a scheduled job.
start_date	timestamp without time zone	Time when a job starts to be executed for the first time.
start_suc	text	Time when a job is successfully executed for the first time.
last_date	timestamp without time zone	Start time of the last job execution.
last_suc	text	Start time of the last successful job execution.
last_sec	text	Start time of the last successful job execution. Compatibility is supported.
this_date	timestamp without time zone	Start time of this ongoing job execution.
this_suc	text	Start time of this ongoing job execution.
this_sec	text	Start time of this ongoing job execution. Compatibility is supported.
next_date	timestamp without time zone	Schedule time of the next job execution.
next_suc	text	Schedule time of the next job execution.
next_sec	text	Schedule time of the next job execution. Compatibility is supported.
total_time	numeric	Latest execution duration of a job.

Name	Type	Description
broken	text	The value is 'y' if the job state is <b>d</b> and 'n' if otherwise.
status	"char"	Status of the current job. The value can be <b>r</b> , <b>s</b> , <b>f</b> , or <b>d</b> . The default value is <b>r</b> . <ul style="list-style-type: none"> <li>• <b>r</b>: running</li> <li>• <b>s</b>: successful execution</li> <li>• <b>f</b>: failed execution</li> <li>• <b>d</b>: canceling an execution</li> </ul>
interval	text	Time expression used to calculate the next time the job will be executed. If this parameter is set to <b>null</b> , the job will be executed once only.
failures	smallint	Number of times the job has started and failed. If a job fails to be executed for 16 consecutive times, no more attempt will be made on it.
what	text	Executable job.
nls_env	character varying(4000)	Not supported. Its value is <b>NULL</b> .
misc_env	raw	Not supported. Its value is <b>NULL</b> .
instance	numeric	Not supported. Its value is <b>NULL</b> .

## 12.3.158 MY\_OBJECTS

MY\_OBJECTS displays the information about database objects accessible to the current user. This view exists in both PG\_CATALOG and SYS schema.

**Table 12-261** MY\_OBJECTS columns

Name	Type	Description
object_name	name	Object name.
object_id	oid	Object OID.
object_type	name	Object type ( <b>TABLE</b> , <b>INDEX</b> , <b>SEQUENCE</b> , or <b>VIEW</b> )
namespace	oid	Namespace that an object belongs to.

Name	Type	Description
temporary	character(1)	Specifies whether an object is a temporary object.
status	character varying(7)	Object status.
subobject_name	name	Subobject name of an object.
generated	character(1)	Specifies whether an object name is generated by the system.
created	timestamp with time zone	Creation time of an object.
last_ddl_time	timestamp with time zone	Last modification time of an object.
default_collation	character varying(100)	Default collation of objects.
data_object_id	numeric	Not supported. Its value is <b>NULL</b> .
timestamp	character varying(19)	Not supported. Its value is <b>NULL</b> .
secondary	character varying(1)	Not supported. Its value is <b>NULL</b> .
edition_name	character varying(128)	Not supported. Its value is <b>NULL</b> .
sharing	character varying(18)	Not supported. Its value is <b>NULL</b> .
editionable	character varying(1)	Not supported. Its value is <b>NULL</b> .
oracle_maintained	character varying(1)	Not supported. Its value is <b>NULL</b> .
application	character varying(1)	Not supported. Its value is <b>NULL</b> .
duplicated	character varying(1)	Not supported. Its value is <b>NULL</b> .
sharded	character varying(1)	Not supported. Its value is <b>NULL</b> .
created_appid	numeric	Not supported. Its value is <b>NULL</b> .

Name	Type	Description
modified_appid	numeric	Not supported. Its value is <b>NULL</b> .
created_vsnid	numeric	Not supported. Its value is <b>NULL</b> .
modified_vsnid	numeric	Not supported. Its value is <b>NULL</b> .

**NOTICE**

For details on the value ranges of **created** and **last\_ddl\_time**, see [PG\\_OBJECT](#).

### 12.3.159 MY\_PART\_COL\_STATISTICS

MY\_PART\_COL\_STATISTICS displays column statistics and histogram information about table partitions owned by the current user. It is accessible to all users. This view exists in both PG\_CATALOG and SYS schema.

**Table 12-262** MY\_PART\_COL\_STATISTICS columns

Name	Type	Description
table_name	character varying(128)	Table name
partition_name	character varying(128)	Table partition name.
column_name	character varying(4000)	Column name.
num_distinct	numeric	Not supported. Its value is <b>NULL</b> .
low_value	raw	Not supported. Its value is <b>NULL</b> .
high_value	raw	Not supported. Its value is <b>NULL</b> .
density	numeric	Not supported. Its value is <b>NULL</b> .
num_nulls	numeric	Not supported. Its value is <b>NULL</b> .
num_buckets	numeric	Not supported. Its value is <b>NULL</b> .
sample_size	numeric	Not supported. Its value is <b>NULL</b> .
last_analyzed	date	Not supported. Its value is <b>NULL</b> .

Name	Type	Description
global_stats	character varying(3)	Not supported. Its value is <b>NULL</b> .
user_stats	character varying(3)	Not supported. Its value is <b>NULL</b> .
notes	character varying(63)	Not supported. Its value is <b>NULL</b> .
avg_col_len	numeric	Not supported. Its value is <b>NULL</b> .
histogram	character varying(15)	Not supported. Its value is <b>NULL</b> .
schema	character varying(64)	Name of the namespace to which the column belongs.

## 12.3.160 MY\_PART\_INDEXES

**MY\_PART\_INDEXES** displays information about partitioned table indexes accessible to the current user. This view exists in both **PG\_CATALOG** and **SYS schema**.

**Table 12-263** MY\_PART\_INDEXES columns

Name	Type	Description
def_tablespace_name	name	Tablespace name of a partitioned table index
index_owner	character varying(64)	Owner name of a partitioned table index
index_name	character varying(64)	Name of a partitioned table index
partition_count	bigint	Number of index partitions of a partitioned table index
partitioning_key_count	integer	Number of partition keys of a partitioned table
partitioning_type	text	Partitioning policy of a partitioned table <b>NOTE</b> For details about the supported partitioning policies of the current partitioned table, see <b>CREATE TABLE PARTITION</b> .

Name	Type	Description
schema	character varying(64)	Schema of a partitioned table index
table_name	character varying(64)	Name of the partitioned table to which a partitioned table index belongs
subpartitioning_type	text	Partitioning policy of a level-2 partitioned table. If the partitioned table is a level-1 partitioned table, <b>NONE</b> is displayed. <b>NOTE</b> For details about the supported partitioning policies of the current level-2 partitioned table, see <a href="#">CREATE TABLE SUBPARTITION</a> .
def_subpartition_count	integer	Default number of level-2 partitions to be created. The value is <b>1</b> for a level-2 partitioned table and <b>0</b> for a level-1 partitioned table.
subpartitioning_key_count	integer	Number of level-2 partition keys of the partitioned table.

### 12.3.161 MY\_PART\_KEY\_COLUMNS

MY\_PART\_KEY\_COLUMNS displays information about the partition key columns of partitioned tables or partitioned indexes owned by the current user. This view can be accessed by all users. Only the information about the current user can be viewed. This view exists in both PG\_CATALOG and SYS schema.

**Table 12-264** MY\_PART\_KEY\_COLUMNS columns

Name	Type	Description
name	character varying(128)	Name of a partitioned table or index.
object_type	character varying(128)	Object type. <ul style="list-style-type: none"> <li>Its value is <b>table</b> for a partitioned table.</li> <li>Its value is <b>index</b> for a partitioned index.</li> </ul>
column_name	character varying(4000)	Partition key column name of a partitioned table or index.
column_position	numeric	Position of a column in a partition.

Name	Type	Description
collated_column_id	numeric	Not supported. Its value is <b>NULL</b> .

## 12.3.162 MY\_PART\_TABLES

MY\_PART\_TABLES displays information about partitioned tables accessible to the current user. This view exists in both PG\_CATALOG and SYS schema.

**Table 12-265** MY\_PART\_TABLES columns

Name	Type	Description
table_owner	character varying(64)	Owner name of a partitioned table.
table_name	character varying(64)	Name of the partitioned table.
partitioning_type	text	Partitioning policy of the partitioned table. <b>NOTE</b> For details about the supported partitioning policies of the current partitioned table, see <a href="#">CREATE TABLE PARTITION</a> .
partition_count	bigint	Number of partitions of the partitioned table.
partitioning_key_count	integer	Number of partition keys of the partitioned table.
def_tablespace_name	name	Tablespace name of the partitioned table.
schema	character varying(64)	Schema of the partitioned table.
subpartitioning_type	text	Partitioning policy of a level-2 partitioned table. If the partitioned table is a level-1 partitioned table, <b>NONE</b> is displayed. <b>NOTE</b> For details about the supported partitioning policies of the current level-2 partitioned table, see <a href="#">CREATE TABLE SUBPARTITION</a> .

Name	Type	Description
def_subpartition_count	integer	Default number of level-2 partitions to be created. The value is <b>1</b> for a level-2 partitioned table and <b>0</b> for a level-1 partitioned table.
subpartitioning_key_count	integer	Number of level-2 partition keys of the partitioned table.
status	character varying(8)	Not supported. Its value is <b>valid</b> .
def_pct_free	numeric	Default value of <b>PCTFREE</b> used when a partition is added.
def_pct_used	numeric	Not supported. Its value is <b>NULL</b> .
def_ini_trans	numeric	Default value of <b>INITRANS</b> used when a partition is added.
def_max_trans	numeric	Default value of <b>MAXTRANS</b> used when a partition is added.
def_initial_extent	character varying(40)	Not supported. Its value is <b>NULL</b> .
def_next_extent	character varying(40)	Not supported. Its value is <b>NULL</b> .
def_min_extents	character varying(40)	Not supported. Its value is <b>NULL</b> .
def_max_extents	character varying(40)	Not supported. Its value is <b>NULL</b> .
def_max_size	character varying(40)	Not supported. Its value is <b>NULL</b> .
def_pct_increase	character varying(40)	Not supported. Its value is <b>NULL</b> .
def_freelists	numeric	Not supported. Its value is <b>NULL</b> .
def_freelist_groups	numeric	Not supported. Its value is <b>NULL</b> .
def_logging	character varying(7)	Not supported. Its value is <b>NULL</b> .

Name	Type	Description
def_compression	character varying(8)	Default compression mode used when a partition is added. Value range: <ul style="list-style-type: none"> <li>• <b>NONE</b></li> <li>• <b>ENABLED</b></li> <li>• <b>DISABLED</b></li> </ul>
def_compress_for	character varying(30)	Default compression mode used when a partition is added. <p><b>NOTE</b> For available compression modes and compression levels, see <a href="#">WITH ( { storage_paramet...</a></p>
def_buffer_pool	character varying(7)	Not supported. Its value is <b>DEFAULT</b> .
def_flash_cache	character varying(7)	Not supported. Its value is <b>NULL</b> .
def_cell_flash_cache	character varying(7)	Not supported. Its value is <b>NULL</b> .
ref_ptn_constraint_name	character varying(128)	Not supported. Its value is <b>NULL</b> .
interval	character varying(1000)	Interval.
autolist	character varying(3)	Not supported. Its value is <b>NO</b> .
interval_subpartition	character varying(1000)	Not supported. Its value is <b>NULL</b> .
autolist_subpartition	character varying(3)	Not supported. Its value is <b>NO</b> .
is_nested	character varying(3)	Not supported. Its value is <b>NO</b> .
def_segment_creation	character varying(4)	Currently, the segment page mode is not supported. When the segment page mode is enabled, set it to <b>YES</b> .
def_indexing	character varying(3)	Not supported. Its value is <b>ON</b> .
def_inmemory	character varying(8)	Not supported. Its value is <b>NONE</b> .
def_inmemory_priority	character varying(8)	Not supported. Its value is <b>NULL</b> .
def_inmemory_distribute	character varying(15)	Not supported. Its value is <b>NULL</b> .

Name	Type	Description
def_inmemory_compression	character varying(17)	Not supported. Its value is <b>NULL</b> .
def_inmemory_duplicate	character varying(13)	Not supported. Its value is <b>NULL</b> .
def_read_only	character varying(3)	Not supported. Its value is <b>NO</b> .
def_cellmemory	character varying(24)	Not supported. Its value is <b>NULL</b> .
def_inmemory_service	character varying(12)	Not supported. Its value is <b>NULL</b> .
def_inmemory_service_name	character varying(1000)	Not supported. Its value is <b>NULL</b> .

### 12.3.163 MY\_PROCEDURES

MY\_PROCEDURES displays information about stored procedures, functions, or triggers owned by the current user. This view exists in both PG\_CATALOG and SYS schema. This view can be accessed by all users. Only the information about the current user can be viewed.

**Table 12-266** MY\_PROCEDURES columns

Name	Type	Description
owner	character varying(64)	Owner of a stored procedure, function, trigger, or package.
object_name	character varying(64)	Name of a stored procedure, function, or trigger. This column will be a package name if the object is a function in a package or a stored procedure.
procedure_name	character varying(128)	This column will be the name of a function or stored procedure in a package if <b>object_name</b> is a package name.
object_id	oid	OID of a stored procedure, function, trigger, or package.
subprogram_id	numeric	Location of a function or stored procedure in a package
overload	character varying(40)	The Nth overloaded function

Name	Type	Description
object_type	character varying(13)	Object type.
aggregate	character varying(3)	Specifies whether the function is an aggregate function: <ul style="list-style-type: none"> <li>• <b>YES</b></li> <li>• <b>NO</b></li> </ul>
pipelined	character varying(3)	Not supported. Its value is <b>NO</b> .
impltypeowner	character varying(128)	Owner of an implementation type.
impltypename	character varying(128)	Name of an implementation type.
parallel	character varying(3)	Not supported. Its value is <b>NO</b> .
interface	character varying(3)	Not supported. Its value is <b>NO</b> .
deterministic	character varying(3)	Not supported. Its value is <b>NO</b> .
authid	character varying(12)	Specifies whether to use the creator permission or caller permission: <ul style="list-style-type: none"> <li>• <b>DEFINER</b>: The creator permission is used.</li> <li>• <b>CURRENT_USER</b>: The caller permission is used.</li> </ul> This column conflicts with reserved keywords. Therefore, add the view name when calling this column.
result_cache	character varying(3)	Not supported. Its value is <b>NULL</b> .
origin_con_id	character varying(256)	Not supported. Its value is <b>0</b> .
polymorphic	character varying(5)	Not supported. Its value is <b>NULL</b> .
argument_number	smallint	Number of input parameters in a stored procedure.

### 12.3.164 MY\_RECYCLEBIN

MY\_RECYCLEBIN displays information about the recycle bin owned by the current user. This view exists in the PG\_CATALOG and SYS schema and all users can access this view.

**Table 12-267** MY\_RECYCLEBIN columns

Name	Type	Description
object_name	character varying(128)	New name of an object.
original_name	character varying(128)	Original name of an object.
operation	character varying(9)	Operation performed on an object. The options are as follows: <ul style="list-style-type: none"> <li>● <b>DROP</b>: The object is deleted (the object is no longer required).</li> <li>● <b>TRUNCATE</b>: The object is truncated.</li> </ul>
type	character varying(25)	Object type.
ts_name	character varying(30)	Name of the tablespace to which the object belongs.
createtime	character varying(19)	Timestamp when an object is created.
droptime	character varying(19)	Timestamp when an object is deleted.
dropscn	numeric	System change number (SCN) of the transaction that moves an object to the recycle bin.
partition_name	character varying(128)	Name of a deleted partition.
can_undrop	character varying(3)	Determines whether to flash back an object.
can_purge	character varying(3)	Determines whether to purge the object.
related	numeric	ID of the parent object.
base_object	numeric	ID of a base object.
purge_object	numeric	ID of the purged object.
space	numeric	Number of blocks used by an object.

## 12.3.165 MY\_ROLE\_PRIVS

MY\_ROLE\_PRIVS displays permission information about roles (including the public role) granted to the current user. By default, it is accessible to all users. This view exists in both PG\_CATALOG and SYS schema.

**Table 12-268** MY\_ROLE\_PRIVS columns

Name	Type	Description
grantee	character varying(128)	Name of the user or role to which the permission is granted.
granted_role	character varying(128)	Role to be granted.
admin_option	character varying(3)	Specifies whether the grant contains the <b>ADMIN</b> option. <ul style="list-style-type: none"> <li>• YES</li> <li>• NO</li> </ul>
delegate_option	character varying(3)	Not supported. Its value is <b>NULL</b> .
default_role	character varying(3)	Not supported. Its value is <b>NULL</b> .
os_granted	character varying(3)	Not supported. Its value is <b>NULL</b> .
common	character varying(3)	Not supported. Its value is <b>NULL</b> .
inherited	character varying(3)	Not supported. Its value is <b>NULL</b> .

## 12.3.166 MY\_SCHEDULER\_JOB\_ARGS

MY\_SCHEDULER\_JOB\_ARG displays the parameters related to the jobs owned by the current user. This view can be accessed by all users. Only the information about the current user can be viewed. This view exists in both PG\_CATALOG and SYS schema.

**Table 12-269** MY\_SCHEDULER\_JOB\_ARGS columns

Name	Type	Description
job_name	character varying(128)	Name of the job to which the parameter belongs.

Name	Type	Description
argument_name	character varying(128)	Parameter name.
argument_position	numeric	Position of the parameter in the parameter list.
argument_type	character varying(257)	Data type of the parameter.
value	character varying(4000)	Parameter value.
anydata_value	character varying(4000)	Not supported. Its value is <b>NULL</b> .
out_argument	character varying(5)	Reserved column. Its value is <b>NULL</b> .

## 12.3.167 MY\_SCHEDULER\_PROGRAM\_ARGS

MY\_SCHEDULER\_PROGRAM\_ARG displays the parameters related to the programs owned by the current user. This view can be accessed by all users. Only the information about the current user can be viewed. This view exists in both PG\_CATALOG and SYS schema.

**Table 12-270** MY\_SCHEDULER\_PROGRAM\_ARGS columns

Name	Type	Description
program_name	character varying(128)	Name of the program to which the parameter belongs.
argument_name	character varying(128)	Parameter name.
argument_position	numeric	Position of the parameter in the parameter list.
argument_type	character varying(257)	Data type of the parameter.
metadata_attribute	character varying(19)	Not supported. Its value is <b>NULL</b> .
default_value	character varying(4000)	Default parameter value.
default_anydata_value	character varying(4000)	Not supported. Its value is <b>NULL</b> .
out_argument	character varying(5)	Reserved column. Its value is <b>NULL</b> .

## 12.3.168 MY\_SEQUENCES

MY\_SEQUENCES displays the sequence information about the current user. This view exists in both PG\_CATALOG and SYS schema.

**Table 12-271** MY\_SEQUENCES columns

Name	Type	Description
sequence_owner	name	Owner of a sequence.
sequence_name	name	Name of a sequence.
min_value	int16	Minimum value of the sequence.
max_value	int16	Maximum value of the sequence.
increment_by	int16	Value by which the sequence is incremented.
cycle_flag	character(1)	Specifies whether the sequence is a cyclic sequence. The value can be <b>Y</b> or <b>N</b> . <ul style="list-style-type: none"><li>• <b>Y</b>: It is a cyclic sequence.</li><li>• <b>N</b>: It is not a cyclic sequence.</li></ul>
order_flag	character varying(1)	Specifies whether a sequence occurs in a request sequence. This parameter is not supported. Set it to <b>NULL</b> .
last_number	int16	Value of the previous sequence.
cache_size	int16	Size of the sequence disk cache.
scale_flag	character varying(1)	Specifies whether a sequence is a scalable sequence. This parameter is not supported. Set it to <b>NULL</b> .
extend_flag	character varying(1)	Specifies whether the value generated by a scalable sequence exceeds the maximum or minimum value of the sequence. This parameter is not supported. Set it to <b>NULL</b> .

Name	Type	Description
sharded_flag	character varying(1)	Specifies whether a sequence is a shard sequence. This parameter is not supported. Set it to <b>NULL</b> .
session_flag	character varying(1)	Specifies whether a sequence has a private session. This parameter is not supported. Set it to <b>NULL</b> .
keep_value	character varying(1)	Specifies whether to retain the sequence value during replay after a failure. This parameter is not supported. Set it to <b>NULL</b> .

### 12.3.169 MY\_SOURCE

MY\_SOURCE displays the definition information about stored procedures, functions, triggers, and packages accessible to the current user. This view exists in both PG\_CATALOG and SYS schema.

**Table 12-272** MY\_SOURCE columns

Name	Type	Description
owner	name	Object owner.
name	name	Object name.
type	name	Object types: <b>function, package, package body, procedure, and trigger</b> .
line	numeric	Number of the source line.
text	text	Text source of the storage object.
origin_con_id	character varying(256)	Not supported. Its value is <b>0</b> .

### 12.3.170 MY\_SUBPART\_COL\_STATISTICS

MY\_SUBPART\_COL\_STATISTICS displays column statistics and histogram information about level-2 partitions of partitioned objects owned by the current user. All users can access this view. This view exists in both PG\_CATALOG and SYS schema.

Name	Type	Description
table_name	character varying(128)	Table name.
subpartition_name	character varying(128)	Name of a level-2 partition in a table.
column_name	character varying(4000)	Column name.
num_distinct	numeric	Not supported. Its value is <b>NULL</b> .
low_value	raw	Not supported. Its value is <b>NULL</b> .
high_value	raw	Not supported. Its value is <b>NULL</b> .
density	numeric	Not supported. Its value is <b>NULL</b> .
num_nulls	numeric	Not supported. Its value is <b>NULL</b> .
num_buckets	numeric	Not supported. Its value is <b>NULL</b> .
sample_size	numeric	Not supported. Its value is <b>NULL</b> .
last_analyzed	date	Not supported. Its value is <b>NULL</b> .
global_stats	character varying(3)	Not supported. Its value is <b>NULL</b> .
user_stats	character varying(3)	Not supported. Its value is <b>NULL</b> .
notes	character varying(41)	Not supported. Its value is <b>NULL</b> .
avg_col_len	numeric	Not supported. Its value is <b>NULL</b> .
histogram	character varying(15)	Not supported. Its value is <b>NULL</b> .
schema	character varying(64)	Name of the namespace to which the column belongs.

### 12.3.171 MY\_SUBPART\_KEY\_COLUMNS

MY\_SUBPART\_KEY\_COLUMNS displays information about the partition key columns of level-2 partitioned tables or partitioned indexes owned by the current

user. This view can be accessed by all users. Only the information about the current user can be viewed. This view exists in both PG\_CATALOG and SYS schema.

**Table 12-273** MY\_SUBPART\_KEY\_COLUMNS columns

Name	Type	Description
name	character varying(128)	Name of a level-2 partitioned table or index.
object_type	character varying(128)	Object type. <ul style="list-style-type: none"> <li>• Its value is <b>table</b> for a partitioned table.</li> <li>• Its value is <b>index</b> for a partitioned index.</li> </ul>
column_name	character varying(4000)	Partition key column name of a level-2 partitioned table or index.
column_position	numeric	Position of a column in a partition.
collated_column_id	numeric	Not supported. Its value is <b>NULL</b> .

### 12.3.172 MY\_SYNONYMS

MY\_SYNONYMS displays synonyms in the current schema. This view can be accessed by all users. Only the information about the current user can be viewed. This view exists in both PG\_CATALOG and SYS schema.

**Table 12-274** MY\_SYNONYMS columns

Name	Type	Description
schema_name	text	Name of the schema to which the synonym belongs.
synonym_name	text	Synonym name.
table_owner	text	Owner of the associated object. Although the column is called <b>table_owner</b> , its associated object is not necessarily a table. It can be any common database object, such as a view, stored procedure, or synonym.

Name	Type	Description
table_name	text	Name of the associated object. Although the column is called <b>table_name</b> , its associated object is not necessarily a table. It can be any common database object, such as a view, stored procedure, or synonym.
table_schema_name	text	Schema name of the associated object. Although the column is called <b>table_schema_name</b> , its associated object is not necessarily a table. It can be any common database object, such as a view, stored procedure, or synonym.
db_link	character varying(128)	Reserved column. Its value is <b>NULL</b> .
origin_con_id	character varying(256)	Not supported. Its value is <b>0</b> .

### 12.3.173 MY\_SYS\_PRIVS

MY\_SYS\_PRIVS displays information about system permissions granted to the current user. By default, it is accessible to all users. This view exists in both PG\_CATALOG and SYS schema.

**Table 12-275** MY\_SYS\_PRIVS columns

Name	Type	Description
grantee	character varying(128)	Name of the user or role to which the permission is granted.
privilege	character varying(40)	System permission
admin_option	character varying(3)	Specifies whether the grant contains the <b>ADMIN</b> option. <ul style="list-style-type: none"> <li>• <b>YES</b></li> <li>• <b>NO</b></li> </ul>
common	character varying(3)	Not supported. Its value is <b>NULL</b> .
inherited	character varying(3)	Not supported. Its value is <b>NULL</b> .

## 12.3.174 MY\_TAB\_COL\_STATISTICS

MY\_TAB\_COL\_STATISTICS displays column statistics and histogram information extracted from MY\_TAB\_COLUMNS. All users can access this view. This view exists in both PG\_CATALOG and SYS schema. The values of the **LOW\_VALUE** and **HIGH\_VALUE** columns in this view are different from those in database A due to different underlying table structures. When the value of **LOW\_VALUE** is a high-frequency value, the value of **LOW\_VALUE** in GaussDB is the second smallest value. When **HIGH\_VALUE** is a high-frequency value, **HIGH\_VALUE** of GaussDB is the second highest value. The value of the **HISTOGRAM** column is different from that of database A due to different statistical methods. GaussDB supports only two types of histograms: frequency and equi-width. The value of the **SCOPE** column in GaussDB is different from that in database A because GaussDB does not support global temporary table statistics. GaussDB database supports only local temporary table statistics, and the default value is **SHARED**.

**Table 12-276** MY\_TAB\_COL\_STATISTICS columns

Name	Type	Description
table_name	character varying(128)	Table name.
column_name	character varying(128)	Column name.
num_distinct	numeric	Number of different values in a column.
low_value	raw	Low value in a column.
high_value	raw	High value in a column.
density	numeric	<ul style="list-style-type: none"> <li>If there is a histogram on <b>COLUMN_NAME</b>, this column displays the selectivity of values in the histogram that span less than two endpoints. It does not represent the selectivity of values that span two or more endpoints.</li> <li>If no histogram is available on <b>COLUMN_NAME</b>, the value of this column is <b>1/NUM_DISTINCT</b>.</li> </ul>
num_nulls	numeric	Number of empty values in a column.
num_buckets	numeric	Number of buckets in the histogram of a column.
sample_size	numeric	Sample size used to analyze a column. Database restart is not supported. Otherwise, data loss will occur.
last_analyzed	timestamp(0) without time zone	Date when a column was last analyzed.

Name	Type	Description
global_stats	character varying(3)	Not supported. Its value is <b>NULL</b> .
user_stats	character varying(3)	Not supported. Its value is <b>NULL</b> .
notes	character varying(99)	Not supported. Its value is <b>NULL</b> .
avg_col_len	numeric	Average length of a column, in bytes.
histogram	character varying(15)	Specifies whether the histogram exists and the type of the histogram if it exists. <ul style="list-style-type: none"> <li>• <b>NONE</b>: no histogram.</li> <li>• <b>FREQUENCY</b>: frequency histogram.</li> <li>• <b>EQUI-WIDTH</b>: equal-width histogram.</li> </ul>
scope	character varying(7)	For statistics collected on any table other than global temporary tables, the value is SHARED (indicating that the statistics are shared among all sessions).
schema	character varying(64)	Name of the namespace to which the column belongs.

### 12.3.175 MY\_TAB\_COLUMNS

MY\_TAB\_COLUMNS displays the columns of the tables and views owned by the current user. This view exists in both PG\_CATALOG and SYS schema. All users can access this view. Only the information about the user is displayed.

**Table 12-277** MY\_TAB\_COLUMNS columns

Name	Type	Description
owner	character varying(64)	Table owner.
table_name	character varying(64)	Table name.
column_name	character varying(64)	Column name.
data_type	character varying(128)	Data type of a column.
data_type_mod	character varying(3)	Not supported. Its value is <b>NULL</b> .
data_type_owner	character varying(128)	Owner of the data type of a column.
data_length	integer	Length of a column, in bytes.

Name	Type	Description
data_precision	integer	Precision of a data type. This column is valid for the numeric data type and <b>NULL</b> for other data types.
data_scale	integer	Number of decimal places. This column is valid for the numeric data type and is set to <b>0</b> for other data types.
nullable	bpchar	Specifies whether a column can be empty ( <b>n</b> for the primary key constraint and non-null constraint).
column_id	integer	Sequence number of a column when a table is created.
default_length	numeric	Length of the default value of a column, in bytes.
data_default	text	Default value of a column.
num_distinct	numeric	Number of different values in a column.
low_value	raw	Minimum value in a column.
high_value	raw	Maximum value in a column.
density	numeric	Column density.
num_nulls	numeric	Number of empty values in a column.
num_buckets	numeric	Number of buckets in the histogram of a column.
last_analyzed	timestamp(0) without time zone	Last analysis date.
sample_size	numeric	Sample size used to analyze a column.
character_set_name	character varying(44)	Not supported. Its value is <b>NULL</b> .
char_col_decl_length	numeric	Declaration length of a column of the character type.
global_stats	character varying(3)	Not supported. Its value is <b>NO</b> .
user_stats	character varying(3)	Not supported. Its value is <b>NO</b> .

Name	Type	Description
avg_col_len	numeric	Average length of a column, in bytes.
char_length	numeric	Length of a column, in characters. This parameter is valid only for the varchar, nvarchar2, bpchar, and char types.
char_used	character varying(1)	Not supported. Set it to <b>B</b> if the data type is varchar, nvarchar2, bpchar, or char, and to <b>NULL</b> for other data types.
v80_fmt_image	character varying(3)	Not supported. Its value is <b>NULL</b> .
data_upgraded	character varying(3)	Not supported. Its value is <b>YES</b> .
histogram	character varying(15)	Specifies whether the histogram exists and the type of the histogram if it exists. <ul style="list-style-type: none"> <li>• <b>NONE</b>: no histogram.</li> <li>• <b>FREQUENCY</b>: frequency histogram.</li> <li>• <b>EQUI_WIDTH</b>: equal-width histogram.</li> </ul>
default_on_null	character varying(3)	Not supported. Its value is <b>NULL</b> .
identity_column	character varying(3)	Not supported. Its value is <b>NULL</b> .
sensitive_column	character varying(3)	Not supported. Its value is <b>NULL</b> .
evaluation_edition	character varying(128)	Not supported. Its value is <b>NULL</b> .
unusable_before	character varying(128)	Not supported. Its value is <b>NULL</b> .
unusable_beginning	character varying(128)	Not supported. Its value is <b>NULL</b> .
collation	character varying(100)	Collation rule of a column. This column conflicts with reserved keywords. Therefore, add the view name when calling this column.

Name	Type	Description
comments	text	Comment of a column.
schema	character varying(64)	Name of the namespace to which the column belongs.

### 12.3.176 MY\_TAB\_COMMENTS

MY\_TAB\_COMMENTS displays comments on all tables and views owned by the current user. This view exists in both PG\_CATALOG and SYS schema.

Table 12-278 MY\_TAB\_COMMENTS columns

Name	Type	Description
owner	character varying(64)	Owner of a table or view.
table_name	character varying(64)	Name of the table or view.
comments	text	Comments
schema	character varying(64)	Name of the namespace to which the table belongs.

### 12.3.177 MY\_TAB\_HISTOGRAMS

MY\_TAB\_HISTOGRAMS displays histogram information about the tables or views owned by the current user. All users can access this view. This view exists in both PG\_CATALOG and SYS schema.

Name	Type	Description
table_name	character varying(128)	Table name.
column_name	character varying(4000)	Column name or attribute of an object column
endpoint_number	numeric	Bucket ID of the histogram
endpoint_value	numeric	Not supported. Its value is <b>NULL</b> .
endpoint_actual_value	character varying(4000)	Actual value of the bucket endpoint
endpoint_actual_value_raw	raw	Not supported. Its value is <b>NULL</b> .

Name	Type	Description
endpoint_repeat_count	numeric	Not supported. Its value is <b>NULL</b> .
scope	character varying(7)	Not supported. Its value is <b>SHARED</b> .

## 12.3.178 MY\_TAB\_PARTITIONS

MY\_TAB\_PARTITIONS displays all level-1 partitions accessible to the current user. Each level-1 table partition of a partitioned table accessible to the current user has one record in MY\_TAB\_PARTITIONS. It is accessible to all users. This view exists in both PG\_CATALOG and SYS schema.

**Table 12-279** MY\_TAB\_PARTITIONS columns

Name	Type	Description
table_owner	character varying(64)	Table owner.
table_name	character varying(64)	Relational table name.
partition_name	character varying(64)	Partition name.
high_value	text	Limit of a partition. <ul style="list-style-type: none"> <li>For range partitioning and interval partitioning, the upper limit of each partition is displayed.</li> <li>For list partitioning, the value list of each partition is displayed.</li> <li>For hash partitioning, the number of each partition is displayed.</li> </ul>
tablespace_name	name	Tablespace name of the partitioned table.
schema	character varying(64)	Name of a namespace.
subpartition_count	bigint	Number of level-2 partitions.
high_value_length	integer	Length of the binding value expression in a partition.
composite	character varying(3)	Specifies whether the table is a level-2 partitioned table.

Name	Type	Description
partition_position	numeric	Position of the partition in the table.
pct_free	numeric	Minimum percentage of available space in a block.
pct_used	numeric	Not supported. Its value is <b>NULL</b> .
ini_trans	numeric	Initial number of transactions. The default value is <b>4</b> . The value is <b>NULL</b> for non-Ustore partitioned tables.
max_trans	numeric	Maximum number of transactions. The default value is <b>128</b> . The value is <b>NULL</b> for non-Ustore partitioned tables.
initial_extent	numeric	Not supported. Its value is <b>NULL</b> .
next_extent	numeric	Not supported. Its value is <b>NULL</b> .
min_extent	numeric	Not supported. Its value is <b>NULL</b> .
max_extent	numeric	Not supported. Its value is <b>NULL</b> .
max_size	numeric	Not supported. Its value is <b>NULL</b> .
pct_increase	numeric	Not supported. Its value is <b>NULL</b> .
freelists	numeric	Not supported. Its value is <b>NULL</b> .
freelist_groups	numeric	Not supported. Its value is <b>NULL</b> .
logging	character varying(7)	Specifies whether changes to a table are logged.
compression	character varying(8)	Actual compression attribute of a partitioned table.
compress_for	character varying(30)	Not supported. Its value is <b>NULL</b> .
num_rows	numeric	Number of rows in a partition.
blocks	numeric	Not supported. Its value is <b>NULL</b> .
empty_blocks	numeric	Not supported. Its value is <b>NULL</b> .
avg_space	numeric	Not supported. Its value is <b>NULL</b> .
chain_cnt	numeric	Not supported. Its value is <b>NULL</b> .
avg_row_len	numeric	Not supported. Its value is <b>NULL</b> .
sample_size	numeric	Not supported. Its value is <b>NULL</b> .

Name	Type	Description
last_analyzed	timestamp with time zone	Last date when the partition was analyzed.
buffer_pool	character varying(7)	Buffer pool allocated to a partitioned block.
flash_cache	character varying(7)	Not supported. Its value is <b>NULL</b> .
cell_flash_cache	character varying(7)	Not supported. Its value is <b>NULL</b> .
global_stats	character varying(3)	Not supported. Its value is <b>NULL</b> .
user_stats	character varying(3)	Not supported. Its value is <b>NULL</b> .
is_nested	character varying(3)	Specifies whether this partitioned table is a nested partitioned table.
parent_table_partition	character varying(128)	Not supported. Its value is <b>NULL</b> .
interval	character varying(3)	Specifies whether the partition is a partition in an interval partitioned table.
segment_created	character varying(4)	Specifies whether a partitioned table has segments created or has not been created.
indexing	character varying(4)	Not supported. Its value is <b>NULL</b> .
read_only	character varying(4)	Not supported. Its value is <b>NULL</b> .
inmemory	character varying(8)	Not supported. Its value is <b>NULL</b> .
inmemory_priority	character varying(8)	Not supported. Its value is <b>NULL</b> .
inmemory_distribute	character varying(15)	Not supported. Its value is <b>NULL</b> .
inmemory_compression	character varying(17)	Not supported. Its value is <b>NULL</b> .
inmemory_duplicate	character varying(13)	Not supported. Its value is <b>NULL</b> .
cellmemory	character varying(24)	Not supported. Its value is <b>NULL</b> .
inmemory_service	character varying(12)	Not supported. Its value is <b>NULL</b> .
inmemory_service_name	character varying(100)	Not supported. Its value is <b>NULL</b> .
memoptimize_read	character varying(8)	Not supported. Its value is <b>NULL</b> .

Name	Type	Description
memoptimize_write	character varying(8)	Not supported. Its value is <b>NULL</b> .

### 12.3.179 MY\_TAB\_STATISTICS

MY\_TAB\_STATISTICS displays statistics about tables owned by the current user in the database. This view exists in both PG\_CATALOG and SYS schema and all users can access this view.

**Table 12-280** MY\_TAB\_STATISTICS columns

Name	Type	Description
table_name	character varying(128)	Table name.
partition_name	character varying(128)	Not supported. Its value is <b>NULL</b> .
partition_position	numeric	Not supported. Its value is <b>NULL</b> .
subpartition_name	character varying(128)	Not supported. Its value is <b>NULL</b> .
subpartition_position	numeric	Not supported. Its value is <b>NULL</b> .
object_type	character varying(12)	Object type. <ul style="list-style-type: none"> <li>• TABLE</li> <li>• PARTITION</li> <li>• SUBPARTITION</li> </ul>
num_rows	numeric	Number of rows in an object.
blocks	numeric	Not supported. Its value is <b>NULL</b> .
empty_blocks	numeric	Not supported. Its value is <b>NULL</b> .
avg_space	numeric	Not supported. Its value is <b>NULL</b> .
chain_cnt	numeric	Not supported. Its value is <b>NULL</b> .
avg_row_len	numeric	Average row length, including the row overhead.
avg_space_freelist_blocks	numeric	Not supported. Its value is <b>NULL</b> .
num_freelist_blocks	numeric	Not supported. Its value is <b>NULL</b> .

Name	Type	Description
avg_cached_blocks	numeric	Not supported. Its value is <b>NULL</b> .
avg_cache_hit_ratio	numeric	Not supported. Its value is <b>NULL</b> .
im_imcu_count	numeric	Not supported. Its value is <b>NULL</b> .
im_block_count	numeric	Not supported. Its value is <b>NULL</b> .
im_stat_update_time	timestamp(9) without time zone	Not supported. Its value is <b>NULL</b> .
scan_rate	numeric	Not supported. Its value is <b>NULL</b> .
sample_size	numeric	Number of samples used for analyzing a table.
last_analyzed	timestamp with time zone	Date when a table was last analyzed. Database restart is not supported. Otherwise, data loss will occur.
global_stats	character varying(3)	Not supported. Its value is <b>NULL</b> .
user_stats	character varying(3)	Not supported. Its value is <b>NULL</b> .
stattype_locked	character varying(5)	Not supported. Its value is <b>NULL</b> .
stale_stats	character varying(7)	Not supported. Its value is <b>NULL</b> .
notes	character varying(25)	Not supported. Its value is <b>NULL</b> .
scope	character varying(7)	Not supported. The default value is <b>SHARED</b> .

### 12.3.180 MY\_TAB\_STATS\_HISTORY

MY\_TAB\_STATS\_HISTORY provides the table statistics history of the tables owned by the current user. All users can access this view. This view exists in both PG\_CATALOG and SYS schema.

**Table 12-281** MY\_TAB\_STATS\_HISTORY columns

Name	Type	Description
table_name	character varying(128)	Table name

Name	Type	Description
partition_name	character varying(128)	Not supported. Its value is <b>NULL</b> .
subpartition_name	character varying(128)	Not supported. Its value is <b>NULL</b> .
stats_update_time	timestamp(6) with time zone	Time when statistics are updated. Database restart is not supported. Otherwise, data loss will occur.

### 12.3.181 MY\_TAB\_SUBPARTITIONS

MY\_TAB\_SUBPARTITIONS displays information about all level-2 partitioned tables accessible to the current user, including level-2 partition names, names of the tables and partitions to which the level-2 partitions belong, their storage attributes, and statistics generated by the DBMS\_STATS package. This view can be accessed by all users. Only the information about the current user can be viewed. This view exists in both PG\_CATALOG and SYS schema.

**Table 12-282** MY\_TAB\_SUBPARTITIONS columns

Name	Type	Description
table_owner	character varying(64)	Table owner.
schema	character varying(64)	Specifies the schema name.
table_name	character varying(64)	Table name.
partition_name	character varying(64)	Partition name.
subpartition_name	character varying(64)	Name of a level-2 partition.
high_value	text	Binding value expression in a level-2 partition.
high_value_length	integer	Length of the binding value expression in level-2 partition.
partition_position	numeric	Position of the partition in the table.
subpartition_position	numeric	Position of the level-2 partition in the partition.

Name	Type	Description
tablespace_name	name	Name of the tablespace where the level-2 partition is located.
pct_free	numeric	Minimum percentage of available space in a block.
pct_used	numeric	Not supported. Its value is <b>NULL</b> .
ini_trans	numeric	Initial number of transactions.
max_trans	numeric	Maximum number of transactions.
initial_extent	numeric	Not supported. Its value is <b>NULL</b> .
next_extent	numeric	Not supported. Its value is <b>NULL</b> .
min_extent	numeric	Not supported. Its value is <b>NULL</b> .
max_extent	numeric	Not supported. Its value is <b>NULL</b> .
max_size	numeric	Not supported. Its value is <b>NULL</b> .
pct_increase	numeric	Not supported. Its value is <b>NULL</b> .
freelists	numeric	Not supported. Its value is <b>NULL</b> .
freelist_groups	numeric	Not supported. Its value is <b>NULL</b> .
logging	character varying(7)	Specifies whether changes to a table are logged. <ul style="list-style-type: none"> <li>• <b>YES</b></li> <li>• <b>NO</b></li> </ul>
compression	character varying(8)	Specifies whether a subpartition is compressed. Value range: <b>ENABLED</b> and <b>DISABLED</b> .
compress_for	character varying(30)	Not supported. Its value is <b>NULL</b> .
num_rows	numeric	Not supported. Its value is <b>NULL</b> .
blocks	numeric	Not supported. Its value is <b>NULL</b> .
empty_blocks	numeric	Not supported. Its value is <b>NULL</b> .
avg_space	numeric	Not supported. Its value is <b>NULL</b> .
chain_cnt	numeric	Not supported. Its value is <b>NULL</b> .
avg_row_len	numeric	Not supported. Its value is <b>NULL</b> .
sample_size	numeric	Not supported. Its value is <b>NULL</b> .
last_analyzed	timestamp with time zone	Date when the table was last analyzed. Database restart is not supported. Otherwise, data loss will occur.

Name	Type	Description
buffer_pool	character varying(7)	Buffer pool of a level-2 partition. <ul style="list-style-type: none"> <li>• DEFAULT</li> <li>• KEEP</li> <li>• RECYCLE</li> <li>• NULL</li> </ul>
flash_cache	character varying(7)	Not supported. Its value is <b>NULL</b> .
cell_flash_cache	character varying(7)	Not supported. Its value is <b>NULL</b> .
global_stats	character varying(3)	Not supported. Its value is <b>NULL</b> .
user_stats	character varying(3)	Not supported. Its value is <b>NULL</b> .
interval	character varying(3)	Specifies whether the partition is in the interval section of an interval partitioned table ( <b>YES</b> ) or whether the partition is in the range section ( <b>NO</b> ).
segment_created	character varying(3)	Specifies whether the level-2 partition segment of the table has been created. <ul style="list-style-type: none"> <li>• <b>YES</b>: created.</li> <li>• <b>NO</b>: not created.</li> <li>• <b>N/A</b>: The table does not have level-2 partitions.</li> </ul>
indexing	character varying(3)	Not supported. Its value is <b>NULL</b> .
read_only	character varying(5)	Not supported. Its value is <b>NULL</b> .
inmemory	character varying(8)	Not supported. Its value is <b>NULL</b> .
inmemory_priority	character varying(8)	Not supported. Its value is <b>NULL</b> .
inmemory_distribute	character varying(15)	Not supported. Its value is <b>NULL</b> .
inmemory_compression	character varying(17)	Not supported. Its value is <b>NULL</b> .
inmemory_duplicate	character varying(13)	Not supported. Its value is <b>NULL</b> .

Name	Type	Description
inmemory_service	character varying(12)	Not supported. Its value is <b>NULL</b> .
inmemory_service_name	character varying(1000)	Not supported. Its value is <b>NULL</b> .
cellmemory	character varying(24)	Not supported. Its value is <b>NULL</b> .
memoptimize_read	character varying(8)	Not supported. Its value is <b>NULL</b> .
memoptimize_write	character varying(8)	Not supported. Its value is <b>NULL</b> .

## 12.3.182 MY\_TABLES

MY\_TABLES displays information about the tables owned by the current user. This view exists in both PG\_CATALOG and SYS schema.

**Table 12-283** MY\_TABLES columns

Name	Type	Description
owner	character varying(64)	Table owner.
table_name	character varying(64)	Table name.
tablespace_name	character varying(64)	Tablespace name of the table.
dropped	character varying	Specifies whether the current record is deleted. <ul style="list-style-type: none"> <li>• <b>yes</b>: deleted.</li> <li>• <b>no</b>: not deleted.</li> </ul>
num_rows	numeric	Estimated number of rows in the table.
status	character varying(8)	Specifies whether the current record is valid. <ul style="list-style-type: none"> <li>• <b>valid</b>: valid.</li> </ul>
sample_size	numeric	Number of samples used for analyzing the table.

Name	Type	Description
temporary	character(1)	Specifies whether the table is a temporary table. <ul style="list-style-type: none"> <li>• <b>y</b>: The table is a temporary table.</li> <li>• <b>n</b>: The table is not a temporary table.</li> </ul>
pct_free	numeric	Minimum percentage of free space in a block.
ini_trans	numeric	Initial number of transactions.
max_trans	numeric	Maximum number of transactions.
avg_row_len	integer	Average number of bytes in each row.
partitioned	character varying(3)	Specifies whether a table is a partitioned table.
last_analyzed	timestamp with time zone	Last time when the table was analyzed. Database restart is not supported. Otherwise, data loss will occur.
row_movement	character varying(8)	Specifies whether to allow partition row movement.
compression	character varying(8)	Specifies whether to enable a table compression.
duration	character varying(15)	Time elapsed when a temporary table is processed.
logical_replication	character varying(8)	Specifies whether logical replication is enabled for a table.
external	character varying(3)	Specifies whether the table is an external table.
logging	character varying(3)	Specifies whether changes to a table are logged.
default_collation	character varying(100)	Default collation of a table.
degree	character varying(10)	Number of instances in a scanned table.
table_lock	character varying(8)	Specifies whether to enable a table lock.
nested	character varying(3)	Specifies whether a table is a nested table.

Name	Type	Description
buffer_pool	character varying(7)	Default buffer pool of a table.
flash_cache	character varying(7)	Not supported. Its value is <b>NULL</b> .
cell_flash_cache	character varying(7)	Not supported. Its value is <b>NULL</b> .
skip_corrupt	character varying(8)	Specifies whether to skip corrupted blocks during table scanning.
has_identity	character varying(3)	Specifies whether a table has an identifier column.
segment_created	character varying(3)	Specifies whether a table segment has been created.
monitoring	character varying(3)	Specifies whether to monitor the modification of a table.
cluster_name	character varying(128)	Not supported. Its value is <b>NULL</b> .
iot_name	character varying(128)	Not supported. Its value is <b>NULL</b> .
pct_used	numeric	Not supported. Its value is <b>NULL</b> .
initial_extent	numeric	Not supported. Its value is <b>NULL</b> .
next_extent	numeric	Not supported. Its value is <b>NULL</b> .
min_extents	numeric	Not supported. Its value is <b>NULL</b> .
max_extents	numeric	Not supported. Its value is <b>NULL</b> .
pct_increase	numeric	Not supported. Its value is <b>NULL</b> .
freelists	numeric	Not supported. Its value is <b>NULL</b> .
freelist_groups	numeric	Not supported. Its value is <b>NULL</b> .
backed_up	character varying(1)	Not supported. Its value is <b>NULL</b> .
blocks	numeric	Not supported. Its value is <b>NULL</b> .
empty_blocks	numeric	Not supported. Its value is <b>NULL</b> .
avg_space	numeric	Not supported. Its value is <b>NULL</b> .
chain_cnt	numeric	Not supported. Its value is <b>NULL</b> .
avg_space_freelists_blocks	numeric	Not supported. Its value is <b>NULL</b> .
num_freelist_blocks	numeric	Not supported. Its value is <b>NULL</b> .
instances	character varying(10)	Not supported. Its value is <b>NULL</b> .
cache	character varying(5)	Not supported. Its value is <b>NULL</b> .

Name	Type	Description
iot_type	character varying(12)	Not supported. Its value is <b>NULL</b> .
secondary	character varying(1)	Not supported. Its value is <b>NULL</b> .
global_stats	character varying(3)	Not supported. Its value is <b>NULL</b> .
user_stats	character varying(3)	Not supported. Its value is <b>NULL</b> .
cluster_owner	character varying(30)	Not supported. Its value is <b>NULL</b> .
dependencies	character varying(8)	Not supported. Its value is <b>NULL</b> .
compression_for	character varying(30)	Not supported. Its value is <b>NULL</b> .
read_only	character varying(3)	Not supported. Its value is <b>NULL</b> .
result_cache	character varying(7)	Not supported. Its value is <b>NULL</b> .
clustering	character varying(3)	Not supported. Its value is <b>NULL</b> .
activity_tracking	character varying(23)	Not supported. Its value is <b>NULL</b> .
dml_timestamp	character varying(25)	Not supported. Its value is <b>NULL</b> .
container_data	character varying(3)	Not supported. Its value is <b>NULL</b> .
inmemory_priority	character varying(8)	Not supported. Its value is <b>NULL</b> .
inmemory_distribute	character varying(15)	Not supported. Its value is <b>NULL</b> .
inmemory_compression	character varying(17)	Not supported. Its value is <b>NULL</b> .
inmemory_duplicate	character varying(13)	Not supported. Its value is <b>NULL</b> .
duplicated	character varying(1)	Not supported. Its value is <b>NULL</b> .
sharded	character varying(1)	Not supported. Its value is <b>NULL</b> .
hybrid	character varying(3)	Not supported. Its value is <b>NULL</b> .
cellmemory	character varying(24)	Not supported. Its value is <b>NULL</b> .
containers_default	character varying(3)	Not supported. Its value is <b>NULL</b> .
container_map	character varying(3)	Not supported. Its value is <b>NULL</b> .
extended_data_link	character varying(3)	Not supported. Its value is <b>NULL</b> .
extended_data_link_map	character varying(3)	Not supported. Its value is <b>NULL</b> .

Name	Type	Description
inmemory_service	character varying(12)	Not supported. Its value is <b>NULL</b> .
inmemory_service_name	character varying(1000)	Not supported. Its value is <b>NULL</b> .
container_map_object	character varying(3)	Not supported. Its value is <b>NULL</b> .
memoptimize_read	character varying(8)	Not supported. Its value is <b>NULL</b> .
memoptimize_write	character varying(8)	Not supported. Its value is <b>NULL</b> .
has_sensitive_column	character varying(3)	Not supported. Its value is <b>NULL</b> .
admit_null	character varying(3)	Not supported. Its value is <b>NULL</b> .
data_link_dml_enabled	character varying(3)	Not supported. Its value is <b>NULL</b> .
object_id_type	character varying(16)	Not supported. Its value is <b>NULL</b> .
table_type_owner	character varying(128)	Not supported. Its value is <b>NULL</b> .
table_type	character varying(128)	Not supported. Its value is <b>NULL</b> .
compress_for	character varying(30)	Not supported. Its value is <b>NULL</b> .

## 12.3.183 MY\_TABLESPACES

MY\_TABLESPACES displays the description of tablespaces that store objects owned by users. By default, it is accessible to all users. This view exists in both PG\_CATALOG and SYS schema. The logical structure features of the GaussDB are different from those of the A database.

**Table 12-284** MY\_TABLESPACES columns

Name	Type	Description
tablespace_name	character varying(64)	Tablespace name
block_size	numeric	Not supported. Its value is <b>NULL</b> .
initial_extent	numeric	Not supported. Its value is <b>NULL</b> .
next_extent	numeric	Not supported. Its value is <b>NULL</b> .

Name	Type	Description
min_extents	numeric	Not supported. Its value is <b>NULL</b> .
max_extents	numeric	Not supported. Its value is <b>NULL</b> .
max_size	numeric	Not supported. Its value is <b>NULL</b> .
pct_increase	numeric	Not supported. Its value is <b>NULL</b> .
min_extlen	numeric	Not supported. Its value is <b>NULL</b> .
contents	character varying(9)	Not supported. Its value is <b>NULL</b> .
status	character varying(9)	Tablespace status. The default value is <b>ONLINE</b> .
logging	character varying(9)	Not supported. Its value is <b>NULL</b> .
force_logging	character varying(3)	Not supported. Its value is <b>NULL</b> .
extent_management	character varying(10)	Not supported. Its value is <b>NULL</b> .
allocation_type	character varying(9)	Not supported. Its value is <b>NULL</b> .
segment_space_management	character varying(6)	Not supported. Its value is <b>NULL</b> .
def_tab_compression	character varying(8)	Not supported. Its value is <b>NULL</b> .
retention	character varying(11)	Not supported. Its value is <b>NULL</b> .
bigfile	character varying(3)	Not supported. Its value is <b>NULL</b> .
predicate_evaluation	character varying(7)	Not supported. Its value is <b>NULL</b> .
encrypted	character varying(3)	Not supported. Its value is <b>NULL</b> .
compress_for	character varying(30)	Not supported. Its value is <b>NULL</b> .
def_inmemory	character varying(8)	Not supported. Its value is <b>NULL</b> .

Name	Type	Description
def_inmemory_priority	character varying(8)	Not supported. Its value is <b>NULL</b> .
def_inmemory_distribute	character varying(15)	Not supported. Its value is <b>NULL</b> .
def_inmemory_compression	character varying(17)	Not supported. Its value is <b>NULL</b> .
def_inmemory_duplicate	character varying(13)	Not supported. Its value is <b>NULL</b> .
shared	character varying(12)	Not supported. Its value is <b>NULL</b> .
def_index_compression	character varying(8)	Not supported. Its value is <b>NULL</b> .
index_compress_for	character varying(13)	Not supported. Its value is <b>NULL</b> .
def_cellmemory	character varying(14)	Not supported. Its value is <b>NULL</b> .
def_inmemory_service	character varying(12)	Not supported. Its value is <b>NULL</b> .
def_inmemory_service_name	character varying(1000)	Not supported. Its value is <b>NULL</b> .
lost_write_protect	character varying(7)	Not supported. Its value is <b>NULL</b> .
chunk_tablespace	character varying(1)	Not supported. Its value is <b>NULL</b> .

## 12.3.184 MY\_TRIGGERS

MY\_TRIGGERS displays information about the triggers owned by the current user. This view exists in both PG\_CATALOG and SYS schema.

**Table 12-285** MY\_TRIGGERS columns

Name	Type	Description
owner	character varying(128)	Trigger owner.
trigger_name	character varying(64)	Trigger name.
trigger_type	character varying	Trigger types: <b>before statement, before each row, after statement, after each row, and instead of.</b>

Name	Type	Description
triggering_event	character varying	Event that triggers a trigger: <b>update, insert, delete, and truncate.</b>
table_owner	character varying(64)	Owner of the table that defines a trigger.
base_object_type	character varying(18)	Basic object type of a trigger, which can be <b>table</b> or <b>view</b> .
table_name	character varying(64)	Name of the table or view that defines a trigger.
column_name	character varying(4000)	Not supported. Its value is <b>NULL</b> .
referencing_name	character varying(422)	Not supported. Its value is <b>referencing new as new old as old</b> .
when_clause	character varying(4000)	Content of <b>when</b> . <b>TRUE</b> must be evaluated as <b>TRIGGER_BODY</b> to execute.
status	character varying(64)	<ul style="list-style-type: none"> <li>● <b>O</b>: The trigger is enabled in origin or local mode.</li> <li>● <b>D</b>: The trigger is disabled.</li> <li>● <b>R</b>: The trigger is enabled in replica mode.</li> <li>● <b>A</b>: The trigger is always enabled.</li> </ul>
description	character varying(4000)	Trigger description, which is used to rebuild a trigger creation statement.
action_type	character varying(11)	Action type of a trigger, which only supports <b>call</b> .
trigger_body	text	Statement executed when a trigger is triggered.
crossedition	character varying(7)	Not supported. Its value is <b>NULL</b> .
before_statement	character varying(3)	Not supported. Its value is <b>NULL</b> .
before_row	character varying(3)	Not supported. Its value is <b>NULL</b> .
after_row	character varying(3)	Not supported. Its value is <b>NULL</b> .
after_statement	character varying(3)	Not supported. Its value is <b>NULL</b> .
instead_of_row	character varying(3)	Not supported. Its value is <b>NULL</b> .
fire_once	character varying(3)	Not supported. Its value is <b>NULL</b> .

Name	Type	Description
apply_server_only	character varying(3)	Not supported. Its value is <b>NULL</b> .

### 12.3.185 MY\_TYPE\_ATTRS

MY\_TYPE\_ATTRS displays all types of attributes owned by the current user in the database. This view exists in both PG\_CATALOG and SYS schema and all users can access this view.

**Table 12-286** MY\_TYPE\_ATTRS columns

Name	Type	Description
type_name	character varying(128)	Data type name.
attr_name	character varying(128)	Attribute name.
attr_type_mod	character varying(7)	Type modifier of an attribute: <ul style="list-style-type: none"> <li>• REF</li> <li>• POINT</li> </ul>
attr_type_owner	character varying(128)	Owner of an attribute type.
attr_type_name	character varying(128)	Name of an attribute type.
length	numeric	Length of the CHAR attribute, or the maximum length of the VARCHAR and character varying attribute
precision	numeric	Decimal precision of a number or DECIMAL attribute, or binary precision of a FLOAT attribute
scale	numeric	Decimal places for a numeric or DECIMAL attribute
character_set_name	character varying(44)	Character set name of an attribute ( <b>Char_CS</b> or <b>NCHAR_CS</b> )
attr_no	numeric	Syntax order number or location (not used as an ID number) of an attribute specified in the type specification or CREATE TYPE statement.

Name	Type	Description
inherited	character varying(3)	Specifies whether an attribute is inherited from a supertype. <ul style="list-style-type: none"> <li>• <b>YES:</b> It is inherited from a supertype.</li> <li>• <b>NO:</b> It is not inherited from a supertype.</li> </ul>

## 12.3.186 MY\_TYPES

MY\_TYPES describes all object types owned by the current user. All users can access this view. This view exists in both PG\_CATALOG and SYS schema.

**Table 12-287** MY\_TYPES columns

Name	Type	Description
type_name	character varying(128)	Type name.
type_oid	raw	Type OID.
typecode	character varying(128)	Type code.
attributes	numeric	Number of attributes in a type.
methods	numeric	Not supported. Its value is <b>0</b> .
predefined	character varying(3)	Specifies whether the type is a predefined type.
incomplete	character varying(3)	Specifies whether the type is incomplete.
final	character varying(3)	Not supported. Its value is <b>NULL</b> .
instantiable	character varying(3)	Not supported. Its value is <b>NULL</b> .
persistable	character varying(3)	Not supported. Its value is <b>NULL</b> .
supertype_owner	character varying(128)	Not supported. Its value is <b>NULL</b> .
supertype_name	character varying(128)	Not supported. Its value is <b>NULL</b> .
local_attributes	numeric	Not supported. Its value is <b>NULL</b> .

Name	Type	Description
local_methods	numeric	Not supported. Its value is <b>NULL</b> .
typeid	raw	Not supported. Its value is <b>NULL</b> .

## 12.3.187 MY\_VIEWS

MY\_VIEWS displays information about all views of the current user. This view exists in both PG\_CATALOG and SYS schema.

**Table 12-288** MY\_VIEWS columns

Name	Type	Description
owner	character varying(64)	Owner of a view.
view_name	character varying(64)	View name.
text	text	View text.
text_length	integer	Text length of the view.
TEXT_VC	character varying(4000)	View creation statement. This column may truncate the view text. The BEQUEATH clause will not appear as part of the <b>TEXT_VC</b> column in this view.
type_text_length	numeric	Not supported. Its value is <b>NULL</b> .
type_text	character varying(4000)	Not supported. Its value is <b>NULL</b> .
oid_text_length	numeric	Not supported. Its value is <b>NULL</b> .
oid_text	character varying(4000)	Not supported. Its value is <b>NULL</b> .
view_type_owner	character varying(128)	Not supported. Its value is <b>NULL</b> .
view_type	character varying(128)	Not supported. Its value is <b>NULL</b> .
superview_name	character varying(128)	Not supported. Its value is <b>NULL</b> .

Name	Type	Description
editioning_view	character varying(1)	Not supported. Its value is <b>NULL</b> .
read_only	character varying(1)	Not supported. Its value is <b>NULL</b> .
container_data	character varying(1)	Not supported. Its value is <b>NULL</b> .
bequeath	character varying(12)	Not supported. Its value is <b>NULL</b> .
origin_con_id	character varying(256)	Not supported. Its value is <b>NULL</b> .
default_collation	character varying(100)	Not supported. Its value is <b>NULL</b> .
containers_default	character varying(3)	Not supported. Its value is <b>NULL</b> .
container_map	character varying(3)	Not supported. Its value is <b>NULL</b> .
extended_data_link	character varying(3)	Not supported. Its value is <b>NULL</b> .
extended_data_link_map	character varying(3)	Not supported. Its value is <b>NULL</b> .
has_sensitive_column	character varying(3)	Not supported. Its value is <b>NULL</b> .
admit_null	character varying(3)	Not supported. Its value is <b>NULL</b> .
pdb_local_only	character varying(3)	Not supported. Its value is <b>NULL</b> .

### 12.3.188 NLS\_DATABASE\_PARAMETERS

NLS\_DATABASE\_PARAMETERS lists the permanent NLS parameters of the database server. This view exists in both PG\_CATALOG and SYS schema. It is accessible to all users. Due to different database kernels and parameter setting formats, the query results of the same parameters in this view may be obviously different from those in the database A.

**Table 12-289** NLS\_DATABASE\_PARAMETERS columns

Name	Type	Description
parameter	character varying(128)	Parameter name.

Name	Type	Description
value	character varying(64)	Parameter value.

### 12.3.189 NLS\_INSTANCE\_PARAMETERS

NLS\_INSTANCE\_PARAMETERS lists the permanent NLS parameters of the database client. This view exists in both PG\_CATALOG and SYS schema. It is accessible to all users. Due to different database kernels and parameter setting formats, the query results of the same parameters in this view may be obviously different from those in the database A.

**Table 12-290** NLS\_INSTANCE\_PARAMETERS columns

Name	Type	Description
parameter	character varying(128)	Parameter name.
value	character varying(64)	Parameter value.

### 12.3.190 PG\_AVAILABLE\_EXTENSION\_VERSIONS

PG\_AVAILABLE\_EXTENSION\_VERSIONS displays extension versions of certain database features. This view is for internal use only. You are advised not to use it.

**Table 12-291** PG\_AVAILABLE\_EXTENSION\_VERSIONS columns

Name	Type	Description
name	name	Extension name.
version	text	Version name.
installed	boolean	Specifies whether this extension version is installed.
superuser	boolean	Specifies whether only system administrators are allowed to install the extension.
relocatable	boolean	Specifies whether the extension can be relocated to another schema.
schema	name	Name of the schema that the extension must be installed into ( <b>NULL</b> if the extension is partially or fully relocatable).
requires	name[]	Names of prerequisite extensions ( <b>NULL</b> if none).

Name	Type	Description
comment	text	Comment from the extension's control file.

## 12.3.191 PG\_AVAILABLE\_EXTENSIONS

PG\_AVAILABLE\_EXTENSIONS displays the extension information about certain database features. This view is for internal use only. You are advised not to use it.

**Table 12-292** PG\_AVAILABLE\_EXTENSIONS columns

Name	Type	Description
name	name	Extension name.
default_version	text	Name of the default version ( <b>NULL</b> if none is specified).
installed_version	text	Currently installed version of the extension ( <b>NULL</b> if no version is installed).
comment	text	Comment from the extension's control file.

## 12.3.192 PG\_COMM\_DELAY

PG\_COMM\_DELAY displays the communications library delay status for a single DN.

**Table 12-293** PG\_COMM\_DELAY columns

Name	Type	Description
node_name	text	Node name
remote_name	text	Name of the peer node
remote_host	text	IP address of the peer node
stream_num	integer	Number of logical stream connections used by the current physical connection
min_delay	integer	Minimum delay of the current physical connection within 1 minute, in microsecond. <b>NOTE</b> A negative result is invalid. Wait until the delay status is updated and query again.
average	integer	Average delay of the current physical connection within 1 minute, in microsecond.

Name	Type	Description
max_delay	integer	Maximum delay of the current physical connection within 1 minute, in microsecond.

### 12.3.193 PG\_COMM\_RECV\_STREAM

PG\_COMM\_RECV\_STREAM displays the receiving stream status of all the communications libraries for a single DN.

**Table 12-294** PG\_COMM\_RECV\_STREAM columns

Name	Type	Description
node_name	text	Node name
local_tid	bigint	ID of the thread using this stream
remote_name	text	Name of the peer node
remote_tid	bigint	Peer thread ID
idx	integer	Peer DN ID in the local DN
sid	integer	Stream ID in the physical connection
tcp_sock	integer	TCP socket used in the stream
state	text	Status of the stream <ul style="list-style-type: none"> <li>• <b>UNKNOWN</b>: The logical connection status is unknown.</li> <li>• <b>READY</b>: The logical connection is ready.</li> <li>• <b>RUN</b>: The logical connection sends packets normally.</li> <li>• <b>HOLD</b>: The logical connection is waiting to send packets.</li> <li>• <b>CLOSED</b>: The logical connection is closed.</li> <li>• <b>TO_CLOSED</b>: The logical connection will be closed.</li> </ul>
query_id	bigint	<b>debug_query_id</b> corresponding to the stream
pn_id	integer	<b>plan_node_id</b> of the query executed by the stream
send_smp	integer	<b>smpid</b> of the sender of the query executed by the stream
recv_smp	integer	<b>smpid</b> of the receiver of the query executed by the stream

Name	Type	Description
recv_bytes	bigint	Total data volume received from the stream, in byte
time	bigint	Current lifecycle service duration of the stream, in ms
speed	bigint	Average receiving rate of the stream, in byte/s
quota	bigint	Current communication quota value of the stream, in byte
buff_usize	bigint	Current size of the data cache of the stream, in byte

### 12.3.194 PG\_COMM\_SEND\_STREAM

PG\_COMM\_SEND\_STREAM displays the sending stream status of all the communication libraries for a single DN.

**Table 12-295** PG\_COMM\_SEND\_STREAM columns

Name	Type	Description
node_name	text	Node name
local_tid	bigint	ID of the thread using this stream
remote_name	text	Name of the peer node
remote_tid	bigint	Peer thread ID
idx	integer	Peer DN ID in the local DN
sid	integer	Stream ID in the physical connection
tcp_sock	integer	TCP socket used in the stream
state	text	Status of the stream <ul style="list-style-type: none"> <li>• <b>UNKNOWN</b>: The logical connection status is unknown.</li> <li>• <b>READY</b>: The logical connection is ready.</li> <li>• <b>RUN</b>: The logical connection sends packets normally.</li> <li>• <b>HOLD</b>: The logical connection is waiting to send packets.</li> <li>• <b>CLOSED</b>: The logical connection is closed.</li> <li>• <b>TO_CLOSED</b>: The logical connection will be closed.</li> </ul>

Name	Type	Description
query_id	bigint	<b>debug_query_id</b> corresponding to the stream
pn_id	integer	<b>plan_node_id</b> of the query executed by the stream
send_smp	integer	<b>smpid</b> of the sender of the query executed by the stream
recv_smp	integer	<b>smpid</b> of the receiver of the query executed by the stream
send_bytes	bigint	Total data volume sent by the stream, in byte
time	bigint	Current lifecycle service duration of the stream, in ms
speed	bigint	Average sending rate of the stream, in byte/s
quota	bigint	Current communication quota value of the stream, in byte
wait_quota	bigint	Extra time generated when the stream waits the quota value, in ms

### 12.3.195 PG\_COMM\_STATUS

PG\_COMM\_STATUS displays the communications library status for a single DN.

**Table 12-296** PG\_COMM\_STATUS columns

Name	Type	Description
node_name	text	Node name.
rxpck_rate	integer	Receiving rate of the communications library on the node, in byte/s.
txpck_rate	integer	Sending rate of the communications library on the node, in byte/s.
rxkbyte_rate	bigint	Receiving rate of the communications library on the node, in kbyte/s.
txkbyte_rate	bigint	Sending rate of the communications library on the node, in kbyte/s.
buffer	bigint	Size of the buffer of the Cmailbox.
memkbyte_libcomm	bigint	Communication memory size of the <b>libcomm</b> process, in bytes.

Name	Type	Description
memkbyte_libpq	bigint	Communication memory size of the <b>libpq</b> process, in bytes.
used_pm	integer	Real-time usage of the <b>postmaster</b> thread.
used_sflow	integer	Real-time usage of the <b>gs_sender_flow_controller</b> thread.
used_rflow	integer	Real-time usage of the <b>gs_receiver_flow_controller</b> thread.
used_rloop	integer	Highest real-time usage among multiple <b>gs_receivers_loop</b> threads.
stream	integer	Total number of used logical connections.

### 12.3.196 PG\_CONTROL\_GROUP\_CONFIG

PG\_CONTROL\_GROUP\_CONFIG displays Cgroup configuration information in the system. Only the user with sysadmin permission can query this view.

**Table 12-297** PG\_CONTROL\_GROUP\_CONFIG columns

Name	Type	Description
pg_control_group_config	text	Configuration information of the Cgroup

### 12.3.197 PG\_CURSORS

PG\_CURSORS displays cursors that are currently available.

**Table 12-298** PG\_CURSORS columns

Name	Type	Description
name	text	Cursor name
statement	text	Query statement when the cursor is declared to change.
is_holdable	boolean	<b>True</b> if the cursor is holdable (it can be accessed after the transaction that declared the cursor has committed); <b>false</b> otherwise
is_binary	boolean	Specifies whether the cursor is declared BINARY. If it is, the value is <b>TRUE</b> . Otherwise, the value is <b>FALSE</b> .

Name	Type	Description
is_scrollable	boolean	Specifies whether the cursor is scrollable (it allows rows to be retrieved in a nonsequential manner). If it is, the value is <b>TRUE</b> . Otherwise, the value is <b>FALSE</b> .
creation_time	timestamp with time zone	Timestamp at which the cursor is declared

## 12.3.198 PG\_EXT\_STATS

PG\_EXT\_STATS displays extended statistics stored in [PG\\_STATISTIC\\_EXT](#). The extension statistics means multiple columns of statistics.

**Table 12-299** PG\_EXT\_STATS columns

Name	Type	Reference	Description
schemaname	name	<b>nspname</b> in <a href="#">PG_NAMESPACE</a>	Name of the schema that contains a table.
tablename	name	<b>relname</b> in <a href="#">PG_CLASS</a>	Table name
attname	int2vector	<b>stakey</b> in <a href="#">PG_STATISTIC_EXT</a>	Columns to be combined for collecting statistics
inherited	boolean	-	Inherited tables are not supported currently. The value of this column is <b>false</b> .
null_frac	real	-	Percentage of column combinations that are null to all records.
avg_width	integer	-	Average width of column combinations, in byte.

Name	Type	Reference	Description
n_distinct	real	-	<ul style="list-style-type: none"> <li>• Estimated number of distinct values in a column combination if the value is greater than 0.</li> <li>• Negative number obtained by multiplying the result calculated by dividing the number of distinct values by the number of rows by -1 if the value is less than 0. For example, <b>-1</b> indicates that the number of distinct values is the same as the number of rows for a column combination.               <ol style="list-style-type: none"> <li>1. The negated form is used when <b>ANALYZE</b> believes that the number of distinct values is likely to increase as the table grows.</li> <li>2. The positive form is used when the column seems to have a fixed number of possible values.</li> </ol> </li> <li>• The number of distinct values is unknown if the value is <b>0</b>.</li> </ul>
n_dndistinct	real	-	<p>Number of not-null distinct values in the <b>dn1</b> column combination.</p> <ul style="list-style-type: none"> <li>• Exact number of distinct values if the value is greater than <b>0</b>.</li> <li>• Negative number obtained by multiplying the result calculated by dividing the number of distinct values by the number of rows by -1 if the value is less than 0. For example, if a value in a column combination appears twice in average, <b>n_dndistinct</b> equals <b>-0.5</b>.</li> <li>• The number of distinct values is unknown if the value is <b>0</b>.</li> </ul>

Name	Type	Reference	Description
most_common_vals	anyarray	-	List of the most common values in a column combination. If this combination does not have the most common values, this column will be <b>NULL</b> . None of the most common values in the column is <b>NULL</b> .
most_common_freqs	real[]	-	List of the frequencies of the most common values in a column combination. The frequencies are obtained by dividing the number of occurrences of each value by the number of rows. If the value of <b>most_common_vals</b> is <b>NULL</b> , the value of this column is <b>NULL</b> .
most_common_vals_null	anyarray	-	List of the most common values in a column combination. If this combination does not have the most common values, this column will be <b>NULL</b> . At least one of the common values in the column is <b>NULL</b> .
most_common_freqs_null	real[]	-	List of the frequencies of the most common values in a column combination. The frequencies are obtained by dividing the number of occurrences of each value by the number of rows. If the value of <b>most_common_vals_null</b> is <b>NULL</b> , the value of this column is <b>NULL</b> .
histogram_bounds	anyarray	-	Boundary value list of the histogram.

### 12.3.199 PG\_GET\_SENDERS\_CATCHUP\_TIME

PG\_GET\_SENDERS\_CATCHUP\_TIME provides catchup information of the currently active primary/standby instance sender thread on the database node.

**Table 12-300** PG\_GET\_SENDERS\_CATCHUP\_TIME columns

Name	Type	Description
pid	bigint	Current sender thread ID
lwpid	integer	Current sender lwpid
local_role	text	Local role
peer_role	text	Peer role
state	text	Current sender's replication status <ul style="list-style-type: none"> <li>• <b>Startup</b>: startup state.</li> <li>• <b>Backup</b>: backup state.</li> <li>• <b>Catchup</b>: catch-up state, which indicates that the standby node is catching up with the primary node.</li> <li>• <b>Streaming</b>: streaming replication state. When the standby node catches up with the primary node, the replication remains in this state.</li> </ul>
type	text	Current sender type <ul style="list-style-type: none"> <li>• <b>Wal</b>: type that logs are written in advance.</li> <li>• <b>Data</b>: data type.</li> </ul>
catchup_start	timestamp with time zone	Startup time of a catchup task.
catchup_end	timestamp with time zone	End time of a catchup task.

## 12.3.200 PG\_GROUP

PG\_GROUP displays the database role authentication and the relationship between group members.

**Table 12-301** PG\_GROUP columns

Name	Type	Description
groname	name	Group name
grosysid	oid	Group ID
grolist	oid[]	Array containing the IDs of all roles in the group.

## 12.3.201 PG\_GTT\_ATTACHED\_PIDS

PG\_GTT\_ATTACHED\_PIDS is used to check which sessions are using global temporary tables by calling the `pg_get_attached_pid()` function.

**Table 12-302** PG\_GTT\_ATTACHED\_PIDS columns

Name	Type	Description
schemaname	name	Schema name.
tablename	name	Name of a global temporary table.
relid	oid	OID of a global temporary table.
pids	bigint[]	Thread PID list.
sessionids	bigint[]	Session ID list.

## 12.3.202 PG\_GTT\_RELSTATS

PG\_GTT\_RELSTATS displays basic information about all global temporary tables of the current session by calling `pg_get_gtt_relstats()`.

**Table 12-303** PG\_GTT\_RELSTATS columns

Name	Type	Description
schemaname	name	Schema name.
tablename	name	Name of a global temporary table.
relfilenode	oid	ID of a file object.
relpages	integer	Number of disk pages of a global temporary table.
reltuples	real	Number of records in a global temporary table.
relallvisible	integer	Number of pages that are marked as all visible.
relfrozenxid	xid	All transaction IDs before this one have been replaced with a permanent (frozen) transaction ID in the table.
relminmxid	xid	Reserved.

## 12.3.203 PG\_GTT\_STATS

PG\_GTT\_STATS displays statistics about a single column in all global temporary tables of the current session by calling `pg_get_gtt_statistics()`.

**Table 12-304** PG\_GTT\_STATS columns

Name	Type	Description
schemaname	name	Schema name.
tablename	name	Name of a global temporary table.
attname	name	Attribute name.
inherited	boolean	Specifies whether to collect statistics for objects that have inheritance relationship.
null_frac	real	Percentage of column entries that are null.
avg_width	integer	Average stored width, in bytes, of non-null entries.
n_distinct	real	Number of distinct, non-null data values in the column.
most_common_val s	text[]	List of the most common values, which is sorted by occurrence frequency.
most_common_fre qs	real[]	Frequencies of the most common values.
histogram_boun ds	text[]	Data distribution (excluding the most common values) in a frequency histogram description column.
correlation	real	Correlation coefficient.
most_common_ele ms	text[]	List of the most common element values, which is used for the array type or some other type.
most_common_ele m_freqs	real[]	Frequencies of the most common element values.
elem_count_histo gram	real[]	Array type histogram.

## 12.3.204 PG\_INDEXES

PG\_INDEXES displays information about each index in the database.

**Table 12-305** PG\_INDEXES columns

Name	Type	Reference	Description
schemaname	name	<b>nspname</b> in <b>PG_NAMESPACE</b>	Name of the schema that contains tables and indexes.

Name	Type	Reference	Description
tablename	name	relname in <a href="#">PG_CLASS</a>	Name of the table where the index is located.
indexname	name	relname in <a href="#">PG_CLASS</a>	Index name
tablespace	name	nspname in <a href="#">PG_TABLESPACE</a>	Name of the tablespace that contains the index.
indexdef	text	-	Index definition (a reconstructed <b>CREATE INDEX</b> command).

## 12.3.205 PG\_LOCKS

PG\_LOCKS displays information about locks held by open transactions.

**Table 12-306** PG\_LOCKS columns

Name	Type	Reference	Description
locktype	text	-	Type of the locked object. The value can be <b>relation</b> , <b>extend</b> , <b>page</b> , <b>tuple</b> , <b>transactionid</b> , <b>virtualxid</b> , <b>object</b> , <b>userlock</b> , or <b>advisory</b> .
database	oid	oid in <a href="#">PG_DATABASE</a>	OID of the database in which the locked target exists. <ul style="list-style-type: none"> <li>The OID is <b>0</b> if the target is a shared object.</li> <li>The OID is <b>NULL</b> if the locked object is a transaction.</li> </ul>
relation	oid	oid in <a href="#">PG_CLASS</a>	OID of the relationship targeted by the lock. The value is <b>NULL</b> if the object is not a relationship or part of a relationship.
page	integer	-	Page number targeted by the lock within the relation ( <b>NULL</b> if the object is not a relation page or row page)
tuple	smallint	-	Row number targeted by the lock within the page ( <b>NULL</b> if the object is not a row)

Name	Type	Reference	Description
bucket	integer	-	Bucket number corresponding to the child table. The value is <b>NULL</b> if the target is not a table.
virtualxid	text	-	ID of the virtual transaction. The value is <b>NULL</b> if the object is not a virtual transaction.
transactionid	xid	-	ID of the transaction. The value is <b>NULL</b> if the object is not a transaction.
classid	oid	<b>oid</b> in <a href="#">PG_CLASS</a>	OID of the system catalog that contains the object ( <b>NULL</b> if the object is not a general database object).
objid	oid	-	OID of the lock target within its system table ( <b>NULL</b> if the target is not a general database object)
objsubid	smallint	-	Column number for a column in the table ( <b>0</b> if the object is of other object type and <b>NULL</b> if the object is not a general database object)
virtualtransaction	text	-	ID of the virtual transaction holding or awaiting this lock.
pid	bigint	-	ID of the server logic thread that holds or waits for the lock. ( <b>NULL</b> if the lock is held by a prepared transaction)
sessionid	bigint	-	ID of the session that holds or waits for the lock.
mode	text	-	Lock mode held or desired by this thread
granted	boolean	-	<ul style="list-style-type: none"> <li>The value is <b>TRUE</b> if the lock is a held lock.</li> <li>The value is <b>FALSE</b> if the lock is an awaited lock.</li> </ul>
fastpath	boolean	-	The value is <b>TRUE</b> if the lock is obtained through <b>fast-path</b> , and is <b>FALSE</b> if the lock is obtained through the main lock table.
locktag	text	-	Lock information that the session waits for. It can be parsed using the locktag_decode() function.

Name	Type	Reference	Description
global_session_id	text	-	Global session ID

### 12.3.206 PG\_NODE\_ENV

PG\_NODE\_ENV displays the environment variable information of the current node.

**Table 12-307** PG\_NODE\_ENV columns

Name	Type	Description
node_name	text	Current node name.
host	text	Host name of the node
process	integer	Number of the node process
port	integer	Port ID of the node
installpath	text	Installation directory of the node
datapath	text	Data directory of the node
log_directory	text	Log directory of the node

### 12.3.207 PG\_OS\_THREADS

PG\_OS\_THREADS provides status information about all the threads under the current node.

**Table 12-308** PG\_OS\_THREADS columns

Name	Type	Description
node_name	text	Current node name
pid	bigint	PID of the thread running under the current node process
lwpid	integer	Lightweight thread ID corresponding to the PID
thread_name	text	Thread name corresponding to the PID
creation_time	timestamp with time zone	Thread creation time corresponding to the PID

## 12.3.208 PG\_PREPARED\_STATEMENTS

PG\_PREPARED\_STATEMENTS displays information about all prepared statements that are available in the current session.

**Table 12-309** PG\_PREPARED\_STATEMENTS columns

Name	Type	Description
name	text	Prepared statement identifier.
statement	text	Query string for creating this prepared statement. For prepared statements created through SQL, this is the PREPARE statement submitted by the client. For prepared statements created through the frontend/backend protocol, this is the text of the prepared statement itself.
prepare_time	timestamp with time zone	Timestamp when the prepared statement is created.
parameter_types	regtype[]	Expected parameter types for the prepared statement in the form of an array of <b>regtype</b> . The OID corresponding to an element of this array can be obtained by converting the <b>regtype</b> value to an OID value.
from_sql	boolean	<ul style="list-style-type: none"> <li>• <b>True</b> if the prepared statement was created through the PREPARE statement</li> <li>• <b>False</b> if the statement was prepared through the frontend/backend protocol</li> </ul>

## 12.3.209 PG\_PREPARED\_XACTS

PG\_PREPARED\_XACTS displays information about transactions that are currently prepared for two-phase commit.

**Table 12-310** PG\_PREPARED\_XACTS columns

Name	Type	Reference	Description
transaction	xid	-	Numeric identifier of the prepared transaction.
gid	text	-	Global identifier of the prepared transaction.

Name	Type	Reference	Description
prepared	timestamp with time zone	-	Time at which the transaction is prepared for commit
owner	name	<a href="#">PG_AUTHID</a> .rol name	Name of the user who executes the transaction.
database	name	<a href="#">PG_DATABASE</a> .datname	Name of the database that executes the transaction.

### 12.3.210 PG\_REPLICATION\_ORIGIN\_STATUS

PG\_REPLICATION\_ORIGIN\_STATUS displays the replication status of the replication source.

**Table 12-311** PG\_REPLICATION\_ORIGIN\_STATUS columns

Name	Type	Description
local_id	oid	Replication source ID.
external_id	text	Name of the replication source.
remote_lsn	text	Remote LSN of the replication source.
local_lsn	text	Local LSN of the replication source.

### 12.3.211 PG\_REPLICATION\_SLOTS

PG\_REPLICATION\_SLOTS displays replication slot information.

**Table 12-312** PG\_REPLICATION\_SLOTS columns

Name	Type	Description
slot_name	text	Replication slot name.
plugin	text	Name of the output plug-in corresponding to the logical replication slot.
slot_type	text	Replication slot type. <ul style="list-style-type: none"> <li>• <b>physical</b>: physical replication slot.</li> <li>• <b>logical</b>: logical replication slot.</li> </ul>

## 12.3.212 PG\_RLSPOLICIES

PG\_RLSPOLICIES displays information about row-level security policies. The initial user and users with the sysadmin attribute can view all policy information. Other users can view only the policy information in their own tables.

**Table 12-313** PG\_RLSPOLICIES columns

Name	Type	Description
schemaname	name	Name of the schema of the table object to which a row-level security policy is applied.
tablename	name	Name of the table object to which the row-level security policy is applied.
policyname	name	Name of a row-level security policy.
policypermissive	text	Expression concatenation mode of a row-level security policy. Value range: <ul style="list-style-type: none"><li>• <b>PERMISSIVE</b>: permissive policy, which is concatenated using the OR expression.</li><li>• <b>RESTRICTIVE</b>: restrictive policy, which is concatenated using the AND expression.</li></ul>
policyroles	name[]	List of users affected by the row-level security policy. If this parameter is not specified, all users are affected.
polycmd	text	SQL operations affected by a row-level security policy.
policyqual	text	Expression of a row-level security policy.

## 12.3.213 PG\_ROLES

PG\_ROLES displays information about database roles. Initialization users and users with the sysadmin or createrole attribute can view information about all roles. Other users can view only their own information.

**Table 12-314** PG\_ROLES columns

Name	Type	Reference	Description
rolname	name	N/A	Role name.
rolsuper	boolean	N/A	Specifies whether a role is the initial system administrator with the highest permissions.

Name	Type	Reference	Description
rolinherit	boolean	N/A	Specifies whether the role inherits the permissions for this type of roles.
rolcreatorole	boolean	N/A	Specifies whether the role can create other roles.
rolcreatedb	boolean	N/A	Specifies whether the role can create databases.
rolcatupdate	boolean	N/A	Specifies whether the role can update system tables directly. Only the initial system administrator whose <b>usesysid</b> is <b>10</b> has this permission. It is unavailable for other users.
rolcanlogin	boolean	N/A	Specifies whether the role can log in to the database.
rolreplication	boolean	N/A	Specifies whether the role can be replicated.
rolauditadmin	boolean	N/A	Specifies whether the role is an audit administrator.
rolsystemadmin	boolean	N/A	Specifies whether the role is a system administrator.
rolconnlimit	integer	N/A	Sets the maximum number of concurrent connections that this role can initiate if this role can log in. The value <b>-1</b> indicates no limit.
rolpassword	text	N/A	Encrypted user password. The value is displayed as <b>*****</b> .
rolvalidbegin	timestamp with time zone	N/A	Start time for account validity ( <b>NULL</b> if no start time).
rolvaliduntil	timestamp with time zone	N/A	End time for account validity ( <b>NULL</b> if end time is not specified).
rolrespool	name	N/A	Resource pool that can be used by a user.
rolparentid	oid	<a href="#">PG_AUTHID.rolparentid</a>	OID of a group user to which the user belongs
roltabspace	text	N/A	Storage space limit of the user permanent table, in KB.

Name	Type	Reference	Description
roltemp space	text	N/A	Storage space of the user temporary table, in KB.
rolspill space	text	N/A	Operator disk spill space of the user, in KB.
rolconfig	text[]	<a href="#">PG_DB_ROLE_SETTING.setconfig</a>	Default value of runtime configuration items.
oid	oid	<a href="#">oid</a> in <a href="#">PG_AUTHID</a>	Role ID
roluseft	boolean	<a href="#">PG_AUTHID.roluseft</a>	Specifies whether the role can perform operations on foreign tables
rolkind	"char"	N/A	Role type <ul style="list-style-type: none"> <li>• <b>n</b>: common user, that is, non-permanent user</li> <li>• <b>p</b>: permanent user.</li> </ul>
nodegroup	name	N/A	Unsupported currently.
rolmonitoradmin	boolean	N/A	Specifies whether the role is a monitor administrator.
roloperatoradmin	boolean	N/A	Specifies whether the role is an O&M administrator.
rolpolicyadmin	boolean	N/A	Specifies whether the role is a security policy administrator.

### 12.3.214 PG\_RULES

PG\_RULES is used to query useful information about rewriting rules.

**Table 12-315** PG\_RULES columns

Name	Type	Description
schemaname	name	Name of the schema that contains a table.
tablename	name	Name of the table to which the rule applies
rulename	name	Name of a rule

Name	Type	Description
definition	text	Rule definition (reconstructed by the CREATE statement).

### 12.3.215 PG\_RUNNING\_XACTS

PG\_RUNNING\_XACTS displays information about running transactions on the current node.

**Table 12-316** PG\_RUNNING\_XACTS columns

Name	Type	Description
handle	integer	Slot handle in the transaction manager corresponding to a transaction. The value is fixed at <b>-1</b> .
gxid	xid	Transaction ID
state	tinyint	Transaction status. <ul style="list-style-type: none"> <li><b>3</b>: prepared.</li> <li><b>0</b>: starting.</li> </ul>
node	text	Node name.
xmin	xid	Minimum transaction ID on the node.
vacuum	boolean	Specifies whether the current transaction is lazy vacuum. <ul style="list-style-type: none"> <li><b>t</b> (true): yes.</li> <li><b>f</b> (false): no.</li> </ul>
timeline	bigint	Number of database restart times.
prepare_xid	xid	ID of the transaction in the prepared state; otherwise, the value is <b>0</b> .
pid	bigint	Thread ID corresponding to the transaction
next_xid	xid	Transaction ID sent from a CN to a DN.

### 12.3.216 PG\_SECLABELS

PG\_SECLABELS provides information about security labels.

**Table 12-317** PG\_SECLABELS columns

Name	Type	Reference	Description
objoid	oid	Any OID column	OID of the object that this security label pertains to.
classoid	oid	<b>oid</b> in <a href="#">PG_CLASS</a>	OID of the system catalog where the object to which the security label belongs is located.
objsubid	integer	-	Column number for the security label on a table column ( <b>objoid</b> and <b>classoid</b> refer to the table itself). The value is <b>0</b> for all other object types.
objtype	text	-	Type of the object to which the label belongs, in text format. Example: <ul style="list-style-type: none"> <li><b>table</b>: table type.</li> <li><b>column</b>: column type.</li> </ul>
objnamespace	oid	<b>oid</b> in <a href="#">PG_NAMESPACE</a>	OID of the namespace for the object, if applicable; otherwise, <b>NULL</b> .
objname	text	-	Name of the object to which the label belongs, in text format.
provider	text	<b>provider</b> in <a href="#">PG_SECLABEL</a>	Provider of the label.
label	text	<b>label</b> in <a href="#">PG_SECLABEL</a>	Security label name.

## 12.3.217 PG\_SETTINGS

PG\_SETTINGS displays information about parameters of the running database.

**Table 12-318** PG\_SETTINGS columns

Name	Type	Description
name	text	Parameter name.
setting	text	Current parameter value.
unit	text	Unit of the parameter.
category	text	Logical group of the parameter.

Name	Type	Description
short_desc	text	Brief description of the parameter.
extra_desc	text	Detailed description of the parameter.
context	text	Context required to set the parameter value, including <b>internal</b> , <b>postmaster</b> , <b>siguhp</b> , <b>backend</b> , <b>superuser</b> , and <b>user</b> .
vartype	text	Parameter type, including <b>bool</b> , <b>enum</b> , <b>integer</b> , <b>real</b> , or <b>string</b> .
source	text	Method of assigning the parameter value.
min_val	text	Minimum value of the parameter. If the parameter type is not numeric, the value of this column is <b>null</b> .
max_val	text	Maximum value of the parameter. If the parameter type is not numeric, the value of this column is <b>null</b> .
enumvals	text[]	Valid values of an enum-type parameter. If the parameter type is not enum, the value of this column is <b>null</b> .
boot_val	text	Default parameter value used upon the database startup.
reset_val	text	Default parameter value used upon the database reset.
sourcefile	text	Configuration file used to set parameter values. If parameter values are not configured using the configuration file, the value of this column is <b>null</b> .
sourceline	integer	Row number of the configuration file for setting parameter values. If parameter values are not configured using the configuration file, the value of this column is <b>null</b> .

### 12.3.218 PG\_SHADOW

PG\_SHADOW displays the attributes of all roles marked with rolcanlogin in [PG\\_AUTHID](#). Only the system administrator can access this system view.

The information in this view is basically the same as that of the view in [PG\\_USER](#). The difference is that passwords are sensitive and displayed as **\*\*\*\*\*** in the latter.

**Table 12-319** PG\_SHADOW columns

Name	Type	Reference	Description
username	name	<b>rolname</b> in <b>PG_AUTHID</b>	Username.
usesysid	oid	<b>oid</b> in <b>PG_AUTHID</b>	ID of this user.
usecreatedb	boolean	-	Specifies whether a user has the permissions to create databases. <ul style="list-style-type: none"> <li>• <b>t</b> (true): yes.</li> <li>• <b>f</b> (false): no.</li> </ul>
usesuper	boolean	-	Specifies whether the user is a system administrator. <ul style="list-style-type: none"> <li>• <b>t</b> (true): yes.</li> <li>• <b>f</b> (false): no.</li> </ul>
usecatupd	boolean	-	Specifies whether the user can update a view. Even the system administrator cannot update the view if the value of this column is <b>f</b> (false). <ul style="list-style-type: none"> <li>• <b>t</b> (true): yes.</li> <li>• <b>f</b> (false): no.</li> </ul>
userepl	boolean	-	Specifies whether the user has the permissions to duplicate data streams. <ul style="list-style-type: none"> <li>• <b>t</b> (true): yes.</li> <li>• <b>f</b> (false): no.</li> </ul>
passwd	text	<b>rolpassword</b> in <b>PG_AUTHID</b>	Password ciphertext ( <b>NULL</b> if there is no password).
valbegin	timestamp with time zone	-	Start time for account validity ( <b>NULL</b> if no start time).
valuntil	timestamp with time zone	-	End time for account validity ( <b>NULL</b> if end time is not specified).
respool	name	-	Resource pool where the user is in.
parent	oid	-	Parent user OID.
spacelimit	text	-	Storage space of the permanent table, in KB.

Name	Type	Reference	Description
useconfig	text[]	<b>setconfig</b> in <b>PG_DB_ROLE_SETTING</b>	Default value of runtime configuration items.
tempspacelimit	text	-	Storage space of the temporary table, in KB.
spillspacelimit	text	-	Operator disk spill space, in KB.
usemonitoradmin	boolean	-	Specifies whether the user is a monitor administrator. <ul style="list-style-type: none"> <li>• <b>t</b> (true): yes.</li> <li>• <b>f</b> (false): no.</li> </ul>
useoperatoradmin	boolean	-	Specifies whether the user is an O&M administrator. <ul style="list-style-type: none"> <li>• <b>t</b> (true): yes.</li> <li>• <b>f</b> (false): no.</li> </ul>
usepolicyadmin	boolean	-	Specifies whether the user is a security policy administrator. <ul style="list-style-type: none"> <li>• <b>t</b> (true): yes.</li> <li>• <b>f</b> (false): no.</li> </ul>

## 12.3.219 PG\_STAT\_ACTIVITY

PG\_STAT\_ACTIVITY shows information about the current user's queries. The columns save information about the last query.

**Table 12-320** PG\_STAT\_ACTIVITY columns

Name	Type	Description
datid	oid	OID of the database that the user session connects to in the backend.
datname	name	Name of the database that the user session connects to in the backend.
pid	bigint	Backend thread ID.
sessionid	bigint	Session ID.
usesysid	oid	OID of the user logged in to the backend.
username	name	Name of the user logged in to the backend.

Name	Type	Description
application_name	text	Name of the application connected to the backend.
client_addr	inet	IP address of the client connected to the backend. If this column is <b>null</b> , it indicates either the client is connected through a Unix socket on the server or this is an internal process, such as autovacuum.
client_hostname	text	Host name of the connected client, as reported by a reverse DNS lookup of <b>client_addr</b> . This column will be non-null only for IP connections and only when <b>log_hostname</b> is enabled.
client_port	integer	TCP port number that the client uses for communication with the backend (-1 if a Unix socket is used).
backend_start	timestamp with time zone	Time when this session was started, that is, when the client connected to the server.
xact_start	timestamp with time zone	Time when the current active transaction was started ( <b>null</b> if no transaction is active). If the current query is the first of its transaction, the value of this column is the same as that of the <b>query_start</b> column.
query_start	timestamp with time zone	Time when the current active query was started, or time when the last query was started if the value of <b>state</b> is not <b>active</b> . For a stored procedure, function, or package, the first query time is displayed and does not change with the running of statements in the stored procedure.
state_change	timestamp with time zone	Time when <b>state</b> was last modified.
waiting	boolean	Specifies whether the backend is currently waiting for a lock. If yes, the value is <b>true</b> .
enqueue	text	Unsupported currently.

Name	Type	Description
state	text	<p>Overall status of the backend. The value must be one of the following:</p> <ul style="list-style-type: none"> <li>● <b>active</b>: The backend is executing a query.</li> <li>● <b>idle</b>: The backend is waiting for a new client command.</li> <li>● <b>idle in transaction</b>: The backend is in a transaction, but there is no statement being executed in the transaction.</li> <li>● <b>idle in transaction (aborted)</b>: The backend is in a transaction, but there are statements failed in the transaction.</li> <li>● <b>fastpath function call</b>: The backend is executing a fast-path function.</li> <li>● <b>disabled</b>: This state is reported if <b>track_activities</b> is disabled in this backend.</li> </ul> <p><b>NOTE</b> Common users can view their own session status only. The state information of other accounts is empty. For example, after user <b>judy</b> is connected to the database, the state information of user <b>joe</b> and the initial user omm in <b>pg_stat_activity</b> is empty.</p> <pre>SELECT datname, username, usesysid, state,pid FROM pg_stat_activity;  datname   username   usesysid   state    pid -----+-----+-----+-----+-----  testdb   omm        10                 139968752121616  testdb   omm        10                 139968903116560  db_tpcc   judy       16398      active    139968391403280  testdb   omm        10                 139968643069712  testdb   omm        10                 139968680818448  testdb   joe        16390              139968563377936 (6 rows)</pre>
resource_pool	name	Resource pool used by the user.
query_id	bigint	Query ID.

Name	Type	Description
query	text	Latest query at the backend. If the value of <b>state</b> is <b>active</b> , this column shows the ongoing query. In all other states, it shows the last query that was executed.
connection_info	text	A string in JSON format recording the driver type, driver version, driver deployment path, and process owner of the connected database. For details, see the GUC parameter <b>connection_info</b> .
unique_sql_id	bigint	Unique SQL statement ID.
trace_id	text	Driver-specific trace ID, which is associated with an application request.

### 12.3.220 PG\_STAT\_ACTIVITY\_NG

PG\_STAT\_ACTIVITY\_NG displays information about all queries in the logical database instance of the current user.

**Table 12-321** PG\_STAT\_ACTIVITY\_NG columns

Name	Type	Description
datid	oid	OID of the database that the user session connects to in the backend.
datname	name	Name of the database that the user session connects to in the backend.
pid	bigint	Backend thread ID.
sessionid	bigint	Session ID.
usesysid	oid	OID of the user logged in to the backend.
username	name	Name of the user logged in to the backend.
application_name	text	Name of the application connected to the backend.

Name	Type	Description
client_addr	inet	IP address of the client connected to the backend. If this column is <b>null</b> , it indicates either the client is connected via a Unix socket on the server or this is an internal thread, such as <b>autovacuum</b> .
client_hostname	text	Host name of the connected client, as reported by a reverse DNS lookup of <b>client_addr</b> . This column will be non-null only for IP connections and only when <b>log_hostname</b> is enabled.
client_port	integer	TCP port number that the client uses for communication with the backend (-1 if a Unix socket is used).
backend_start	timestamp with time zone	Time when this session was started, that is, when the client connected to the server.
xact_start	timestamp with time zone	Time when the current active transaction was started ( <b>null</b> if no transaction is active). If the current query is the first of its transaction, the value of this column is the same as that of the <b>query_start</b> column.
query_start	timestamp with time zone	Time when the current active query was started, or time when the last query was started if the value of <b>state</b> is not <b>active</b> . For a stored procedure, function, or package, the first query time is displayed and does not change with the running of statements in the stored procedure.
state_change	timestamp with time zone	Time when <b>state</b> was last modified.
waiting	boolean	Specifies whether the backend is currently waiting for a lock. If yes, the value is <b>true</b> . Otherwise, the value is <b>false</b> .
enqueue	text	Queuing status of a statement. Possible values are: <ul style="list-style-type: none"> <li><b>waiting in queue</b>: The statement is in the queue.</li> <li><b>Empty</b>: The statement is running.</li> </ul>

Name	Type	Description
state	text	<p>Overall status of the backend. Its value can be:</p> <ul style="list-style-type: none"> <li>● <b>active</b>: The backend is executing a query.</li> <li>● <b>idle</b>: The backend is waiting for a new client command.</li> <li>● <b>idle in transaction</b>: The backend is in a transaction, but there is no statement being executed in the transaction.</li> <li>● <b>idle in transaction (aborted)</b>: The backend is in a transaction, but there are statements failed in the transaction.</li> <li>● <b>fastpath function call</b>: The backend is executing a fast-path function.</li> <li>● <b>disabled</b>: This state is reported if <b>track_activities</b> is disabled in this backend.</li> </ul> <p><b>NOTE</b> Common users can view their own session status only. The state information of other accounts is empty. For example, after user <b>judy</b> is connected to the database, the state information of user <b>joe</b> and the initial user <b>omm</b> in <b>pg_stat_activity</b> is empty.</p> <pre>SELECT datname, username, usesysid, state,pid FROM pg_stat_activity_ng;  datname   username   usesysid   state    pid -----+-----+-----+-----+-----  testdb   omm             10          139968752121616  testdb   omm             10          139968903116560  db_tpcds   judy         16398   active   139968391403280  testdb   omm             10          139968643069712  testdb   omm             10          139968680818448  testdb   joe          16390          139968563377936 (6 rows)</pre>
resource_pool	name	Resource pool used by the user.
query_id	bigint	Query ID.

Name	Type	Description
query	text	Latest query at the backend. If the value of <b>state</b> is <b>active</b> , this column shows the ongoing query. In all other states, it shows the last query that was executed.
node_group	text	Logical database instance of the user to which the statement belongs.

### 12.3.221 PG\_STAT\_ALL\_INDEXES

PG\_STAT\_ALL\_INDEXES is used to query statistics about accesses to a specific index by querying each index row in the current database.

Indexes can be used via either simple index scans or bitmap index scans. In a bitmap scan the output of several indexes can be combined via AND or OR rules, so it is difficult to associate individual heap row fetches with specific indexes when a bitmap scan is used. Therefore, each bitmap scan increments the **pg\_stat\_all\_indexes.idx\_tup\_read** count(s) for the index(es) it uses, and it increments the **pg\_stat\_all\_tables.idx\_tup\_fetch** count for the table, but it does not affect **pg\_stat\_all\_indexes.idx\_tup\_fetch**.

**Table 12-322** PG\_STAT\_ALL\_INDEXES columns

Name	Type	Description
relid	oid	OID of the table that the index is created for.
indexrelid	oid	OID of the index.
schemaname	name	Name of the schema that the index is in.
relname	name	Name of the table for the index.
indexrelname	name	Index name.
idx_scan	bigint	Number of index scans initiated on the index.
idx_tup_read	bigint	Number of index entries returned by scans on the index.
idx_tup_fetch	bigint	Number of live rows fetched in the original table by a simple index scan that uses the index.

## 12.3.222 PG\_STAT\_ALL\_TABLES

PG\_STAT\_ALL\_TABLES is used to query one row for each table in the current database (including TOAST tables), showing statistics about a specific table.

**Table 12-323** PG\_STAT\_ALL\_TABLES columns

Name	Type	Description
relid	oid	OID of a table.
schemaname	name	Name of the schema that the table is in.
relname	name	Table name.
seq_scan	bigint	Number of sequential scans initiated on the table.
seq_tup_read	bigint	Number of live rows fetched by sequential scans.
idx_scan	bigint	Number of index scans initiated on the table.
idx_tup_fetch	bigint	Number of live rows fetched by index scans.
n_tup_ins	bigint	Number of rows inserted.
n_tup_upd	bigint	Number of rows updated.
n_tup_del	bigint	Number of rows deleted.
n_tup_hot_upd	bigint	Number of rows HOT updated (with no separate index update required).
n_live_tup	bigint	Estimated number of live rows.
n_dead_tup	bigint	Estimated number of inactive rows.
last_vacuum	timestamp with time zone	Last time when the table was cleared.
last_autovacuum	timestamp with time zone	Last time when the table was vacuumed by the autovacuum daemon thread.
last_analyze	timestamp with time zone	Last time when the table was analyzed.
last_autoanalyze	timestamp with time zone	Last time when the table was analyzed by the autovacuum daemon thread.

Name	Type	Description
vacuum_count	bigint	Number of times the table is cleared.
autovacuum_count	bigint	Number of times the table has been vacuumed by the autovacuum daemon.
analyze_count	bigint	Number of times the table is analyzed.
autoanalyze_count	bigint	Number of times the table has been analyzed by the autovacuum daemon.
last_data_changed	timestamp with time zone	Last time when the data in the table changes (modifications that cause data changes on tables (insert/update/delete/truncate) and partitioned or subpartitioned tables (exchange/truncate/drop)). Data in this column is recorded only in the local database primary node.

### 12.3.223 PG\_STAT\_BAD\_BLOCK

PG\_STAT\_BAD\_BLOCK displays statistics about page verification failures after a node is started.

**Table 12-324** PG\_STAT\_BAD\_BLOCK columns

Name	Type	Description
nodename	text	Node name.
databaseid	integer	OID of a database.
tablespaceid	integer	Tablespace OID.
relfilenode	integer	File object ID.
bucketid	smallint	ID of the bucket for consistent hashing.
forknum	integer	File type. The values are as follows: <b>0</b> : main data file. <b>1</b> : FSM file. <b>2</b> : VM file. <b>3</b> : BCM file.
error_count	integer	Number of verification failures.

Name	Type	Description
first_time	timestamp with time zone	Time of the first verification failure.
last_time	timestamp with time zone	Time of the latest verification failure.

## 12.3.224 PG\_STAT\_BGWRITER

PG\_STAT\_BGWRITER displays statistics about the activity of the background writer process.

**Table 12-325** PG\_STAT\_BGWRITER columns

Name	Type	Description
checkpoints_timed	bigint	Number of scheduled checkpoints that have been performed.
checkpoints_req	bigint	Number of checkpoints that have been performed actively.
checkpoint_write_time	double precision	Total time spent in the checkpoint processing portion when writing files to disk, in milliseconds.
checkpoint_sync_time	double precision	Total time spent in the checkpoint processing portion when synchronizing files to disk, in milliseconds.
buffers_checkpoint	bigint	Number of buffers written by checkpoints.
buffers_clean	bigint	Number of buffers written by the background writer process.
maxwritten_clean	bigint	Number of times that cleanup scanning stops because the background writer process writes too many buffers.
buffers_backend	bigint	Number of buffers written directly by the backend.

Name	Type	Description
buffers_backend_fsync	bigint	Number of times that the backend calls fsync (usually, even if the backend executes these write actions, the background writer process processes them again).
buffers_alloc	bigint	Number of buffers allocated.
stats_reset	timestamp with time zone	Time at which these statistics were last reset.

### 12.3.225 PG\_STAT\_DATABASE

PG\_STAT\_DATABASE displays statistics about each database in the cluster.

**Table 12-326** PG\_STAT\_DATABASE columns

Name	Type	Description
datid	oid	OID of a database
datname	name	Database name.
numbackends	integer	Number of backends currently connected to this database. This is the only column in the view that returns the current status value. Other columns return the accumulated value since the last reset.
xact_commit	bigint	Number of transactions in this database that have been committed.
xact_rollback	bigint	Number of transactions in this database that have been rolled back.
blks_read	bigint	Number of disk blocks read in this database.
blks_hit	bigint	Number of times that disk blocks have been found in the buffer cache and therefore the disk blocks do not need to be read (only those found in the buffer cache are counted, excluding those found in the file system cache of the OS).
tup_returned	bigint	Number of rows returned by queries in this database
tup_fetched	bigint	Number of rows fetched by queries in this database

Name	Type	Description
tup_inserted	bigint	Number of rows inserted by queries in this database
tup_updated	bigint	Number of rows updated by queries in this database
tup_deleted	bigint	Number of rows deleted by queries in this database
conflicts	bigint	Number of queries canceled due to database recovery conflicts (conflicts occurring only on the standby node). For details, see <a href="#">PG_STAT_DATABASE_CONFLICTS</a> .
temp_files	bigint	Number of all temporary files created by queries in this database, regardless of why the temporary files are created (such as sorting or hashing) or how the <b>log_temp_files</b> parameter is set.
temp_bytes	bigint	Total amount of data written to all temporary files by queries in this database, regardless of why the temporary files are created or how the <b>log_temp_files</b> parameter is set.
deadlocks	bigint	Number of deadlocks detected in the database.
blk_read_time	double precision	Time spent in reading data file blocks by backends in this database (unit: ms).
blk_write_time	double precision	Time spent in writing data file blocks by backends in this database (unit: ms).
stats_reset	timestamp with time zone	Time when the current status statistics are reset.

## 12.3.226 PG\_STAT\_DATABASE\_CONFLICTS

**PG\_STAT\_DATABASE\_CONFLICTS** displays statistics about database conflicts.

**Table 12-327** PG\_STAT\_DATABASE\_CONFLICTS columns

Name	Type	Description
datid	oid	Database ID
datname	name	Database name

Name	Type	Description
confl_tablespace	bigint	Number of conflicting tablespaces
confl_lock	bigint	Number of conflicting locks
confl_snapshot	bigint	Number conflicting snapshots
confl_bufferpin	bigint	Number of conflicting buffers
confl_deadlock	bigint	Number of conflicting deadlocks

### 12.3.227 PG\_STAT\_REPLICATION

PG\_STAT\_REPLICATION displays information about the log synchronization thread, such as the locations where the sender sends logs and where the receiver receives logs.

**Table 12-328** PG\_STAT\_REPLICATION columns

Name	Type	Description
pid	bigint	PID of the thread.
usesysid	oid	User system ID.
username	name	Username.
application_name	text	Program name.
client_addr	inet	Client address.
client_hostname	text	Client name.
client_port	integer	Port of the client.
backend_start	timestamp with time zone	Start time of the program.

Name	Type	Description
state	text	Status of the log synchronization thread: <ul style="list-style-type: none"> <li>● <b>startup</b>: The thread is being started.</li> <li>● <b>catchup</b>: The thread is establishing a connection between the standby node and the primary node.</li> <li>● <b>streaming</b>: The thread has established a connection between the standby node and the primary node and is replicating data streams.</li> <li>● <b>backup</b>: The thread is sending a backup.</li> <li>● <b>stopping</b>: The thread is being stopped.</li> </ul>
sender_sent_location	text	Location where the sender sends logs.
receiver_write_location	text	Location where the receiver writes logs.
receiver_flush_location	text	Location where the receive end flushes logs.
receiver_replay_location	text	Location where the receive end replays logs.
sync_priority	integer	Priority of synchronous duplication ( <b>0</b> indicates asynchronization).

Name	Type	Description
sync_state	text	<p>Synchronization state:</p> <ul style="list-style-type: none"> <li>• <b>async</b>: asynchronous replication.</li> <li>• <b>sync</b>: synchronous replication.</li> <li>• <b>potential</b>: The standby node is asynchronous currently, but if a current synchronization node fails, the standby node becomes synchronous.</li> <li>• <b>quorum</b>: switches between synchronous and asynchronous state to ensure that there are more than a certain number of synchronous standby nodes. Generally, the number of synchronous standby nodes is <math>(n+1)/2-1</math>, where <math>n</math> indicates the total number of copies. Whether the standby node is synchronous depends on whether logs are received first. For details, see the description of the <b>synchronous_standby_names</b> parameter.</li> </ul>

### 12.3.228 PG\_STAT\_SYS\_INDEXES

PG\_STAT\_SYS\_INDEXES displays index status information about all the system catalogs in pg\_catalog and information\_schema.

**Table 12-329** PG\_STAT\_SYS\_INDEXES columns

Name	Type	Description
relid	oid	OID of the table for this index.

Name	Type	Description
indexrelid	oid	OID of the index.
schemaname	name	Name of the schema that the index is in.
relname	name	Name of the table for the index.
indexrelname	name	Index name.
idx_scan	bigint	Number of index scans initiated on the index.
idx_tup_read	bigint	Number of index entries returned by scans on the index.
idx_tup_fetch	bigint	Number of live rows fetched in the original table by a simple index scan that uses the index.

### 12.3.229 PG\_STAT\_SYS\_TABLES

PG\_STAT\_SYS\_TABLES displays statistics about the system catalogs of all the namespaces in pg\_catalog and information\_schema.

**Table 12-330** PG\_STAT\_SYS\_TABLES columns

Name	Type	Description
relid	oid	OID of a table.
schemaname	name	Schema name of the table.
relname	name	Table name.
seq_scan	bigint	Number of sequential scans initiated on the table.
seq_tup_read	bigint	Number of live rows fetched by sequential scans.
idx_scan	bigint	Number of index scans initiated on the table.
idx_tup_fetch	bigint	Number of live rows fetched by index scans.
n_tup_ins	bigint	Number of rows inserted.
n_tup_upd	bigint	Number of rows updated.
n_tup_del	bigint	Number of rows deleted.
n_tup_hot_upd	bigint	Number of rows HOT updated (with no separate index update required).

Name	Type	Description
n_live_tup	bigint	Estimated number of live rows.
n_dead_tup	bigint	Estimated number of inactive rows.
last_vacuum	timestamp with time zone	Last time when this table was manually vacuumed (excluding VACUUM FULL).
last_autovacuum	timestamp with time zone	Last time when the table was vacuumed by the autovacuum daemon.
last_analyze	timestamp with time zone	Last time when the table was manually analyzed.
last_autoanalyze	timestamp with time zone	Last time when the table was analyzed by the autovacuum daemon.
vacuum_count	bigint	Number of times the table has been manually vacuumed (not counting VACUUM FULL).
autovacuum_count	bigint	Number of times the table has been vacuumed by the autovacuum daemon.
analyze_count	bigint	Number of times the table has been manually analyzed.
autoanalyze_count	bigint	Number of times the table has been analyzed by the autovacuum daemon.
last_data_changed	timestamp with time zone	Last modification time of the table data.

### 12.3.230 PG\_STAT\_USER\_FUNCTIONS

PG\_STAT\_USER\_FUNCTIONS shows user-defined function status information in the namespace. (The language of the function is non-internal language.)

**Table 12-331** PG\_STAT\_USER\_FUNCTIONS columns

Name	Type	Description
funcid	oid	OID of a function
schemaname	name	Schema name
funcname	name	Function name

Name	Type	Description
calls	bigint	Number of times the function has been called
total_time	double precision	Total time spent in the function and all other functions called by it
self_time	double precision	Total time spent in the function itself, excluding other functions called by it

### 12.3.231 PG\_STAT\_USER\_INDEXES

PG\_STAT\_USER\_INDEXES displays information about the index status of user-defined ordinary tables and TOAST tables.

**Table 12-332** PG\_STAT\_USER\_INDEXES columns

Name	Type	Description
relid	oid	OID of the table for an index.
indexrelid	oid	OID of the index.
schemaname	name	Name of the schema that the index is in.
relname	name	Name of the table for the index.
indexrelname	name	Index name.
idx_scan	bigint	Number of index scans initiated on the index.
idx_tup_read	bigint	Number of index entries returned by scans on the index.
idx_tup_fetch	bigint	Number of live rows fetched in the original table by a simple index scan that uses the index.

### 12.3.232 PG\_STAT\_USER\_TABLES

PG\_STAT\_USER\_TABLES displays status information about user-defined ordinary tables and TOAST tables in the namespaces.

**Table 12-333** PG\_STAT\_USER\_TABLES columns

Name	Type	Description
relid	oid	OID of a table.

Name	Type	Description
schemaname	name	Name of the schema that this table is in.
relname	name	Table name.
seq_scan	bigint	Number of sequential scans initiated on this table.
seq_tup_read	bigint	Number of live rows fetched by sequential scans.
idx_scan	bigint	Number of index scans initiated on this table.
idx_tup_fetch	bigint	Number of live rows fetched by index scans.
n_tup_ins	bigint	Number of rows inserted.
n_tup_upd	bigint	Number of rows updated.
n_tup_del	bigint	Number of rows deleted.
n_tup_hot_upd	bigint	Number of rows HOT updated (with no separate index update required).
n_live_tup	bigint	Estimated number of live rows.
n_dead_tup	bigint	Estimated number of inactive rows.
last_vacuum	timestamp with time zone	Last time when this table was manually vacuumed (excluding <b>VACUUM FULL</b> ).
last_autovacuum	timestamp with time zone	Last time when this table was vacuumed by the autovacuum daemon thread.
last_analyze	timestamp with time zone	Last time when the table was manually analyzed.
last_autoanalyze	timestamp with time zone	Last time when this table was analyzed by the autovacuum daemon thread.
vacuum_count	bigint	Number of times this table has been manually vacuumed (not counting <b>VACUUM FULL</b> ).
autovacuum_count	bigint	Number of times this table has been vacuumed by the autovacuum daemon.

Name	Type	Description
analyze_count	bigint	Number of times this table has been manually analyzed.
autoanalyze_count	bigint	Number of times this table has been analyzed by the autovacuum daemon.
last_data_change_d	timestamp with time zone	Last modification time of the table data.

### 12.3.233 PG\_STAT\_XACT\_ALL\_TABLES

**PG\_STAT\_XACT\_ALL\_TABLES** displays transaction status information about all ordinary tables and TOAST tables in the namespaces.

**Table 12-334** PG\_STAT\_XACT\_ALL\_TABLES columns

Name	Type	Description
relid	oid	OID of the table
schemaname	name	Name of the schema that the table is in
relname	name	Table name
seq_scan	bigint	Number of sequential scans initiated on the table
seq_tup_read	bigint	Number of live rows fetched by sequential scans
idx_scan	bigint	Number of index scans initiated on the table
idx_tup_fetch	bigint	Number of live rows fetched by index scans
n_tup_ins	bigint	Number of rows inserted
n_tup_upd	bigint	Number of rows updated
n_tup_del	bigint	Number of rows deleted
n_tup_hot_upd	bigint	Number of rows HOT updated (with no separate index update required)

### 12.3.234 PG\_STAT\_XACT\_SYS\_TABLES

**PG\_STAT\_XACT\_SYS\_TABLES** displays transaction status information of the system catalog in the namespace.

**Table 12-335** PG\_STAT\_XACT\_SYS\_TABLES columns

Name	Type	Description
relid	oid	OID of the table
schemaname	name	Name of the schema that the table is in
relname	name	Table name
seq_scan	bigint	Number of sequential scans initiated on the table
seq_tup_read	bigint	Number of live rows fetched by sequential scans
idx_scan	bigint	Number of index scans initiated on the table
idx_tup_fetch	bigint	Number of live rows fetched by index scans
n_tup_ins	bigint	Number of rows inserted
n_tup_upd	bigint	Number of rows updated
n_tup_del	bigint	Number of rows deleted
n_tup_hot_upd	bigint	Number of rows HOT updated (with no separate index update required)

### 12.3.235 PG\_STAT\_XACT\_USER\_FUNCTIONS

**PG\_STAT\_XACT\_USER\_FUNCTIONS** contains statistics on the execution of each function.

**Table 12-336** PG\_STAT\_XACT\_USER\_FUNCTIONS columns

Name	Type	Description
funcid	oid	OID of a function
schemaname	name	Schema name
funcname	name	Function name
calls	bigint	Number of times the function has been called
total_time	double precision	Total time spent in the function and all other functions called by it
self_time	double precision	Total time spent in the function itself, excluding other functions called by it

## 12.3.236 PG\_STAT\_XACT\_USER\_TABLES

**PG\_STAT\_XACT\_USER\_TABLES** displays transaction status information of the user table in the namespace.

**Table 12-337** PG\_STAT\_XACT\_USER\_TABLES columns

Name	Type	Description
relid	oid	OID of the table
schemaname	name	Name of the schema that the table is in
relname	name	Table name
seq_scan	bigint	Number of sequential scans initiated on the table
seq_tup_read	bigint	Number of live rows fetched by sequential scans
idx_scan	bigint	Number of index scans initiated on the table
idx_tup_fetch	bigint	Number of live rows fetched by index scans
n_tup_ins	bigint	Number of rows inserted
n_tup_upd	bigint	Number of rows updated
n_tup_del	bigint	Number of rows deleted
n_tup_hot_upd	bigint	Number of rows HOT updated (with no separate index update required)

## 12.3.237 PG\_STATS

**PG\_STATS** displays single-column statistics stored in the `pg_statistic` table. The **autovacuum\_naptime** parameter specifies the interval for updating statistics recorded in the view.

**Table 12-338** PG\_STATS columns

Name	Type	Reference	Description
schemaname	name	<b>nspname</b> in <b>PG_NAMESPACE</b>	Name of the schema that contains a table
tablename	name	<b>relname</b> in <b>PG_CLASS</b>	Table name.
attname	name	<b>PG_ATTRIBUTE.a</b> ttname	Field name.
inherited	boolean	-	Inherited tables are not supported currently. The value of this column is <b>false</b> .

Name	Type	Reference	Description
null_frac	real	-	Percentage of column entries that are null.
avg_width	integer	-	Average width in bytes of column's entries.
n_distinct	real	-	<ul style="list-style-type: none"> <li>Estimated number of distinct values in the column if the value is greater than 0.</li> <li>Negative number obtained by multiplying the result calculated by dividing the number of distinct values by the number of rows by -1 if the value is less than 0. For example, -1 indicates that the number of distinct values is the same as the number of rows for a column combination. <ol style="list-style-type: none"> <li>The negated form is used when <b>ANALYZE</b> believes that the number of distinct values is likely to increase as the table grows.</li> <li>The positive form is used when the column seems to have a fixed number of possible values.</li> </ol> </li> <li>The number of distinct values is unknown if the value is 0.</li> </ul>
n_dndistinct	real	-	<p>Number of not-null distinct values in the <b>dn1</b> column.</p> <ul style="list-style-type: none"> <li>Exact number of distinct values if the value is greater than 0.</li> <li>Negative number obtained by multiplying the result calculated by dividing the number of distinct values by the number of rows by -1 if the value is less than 0. For example, if the value of a column appears twice in average, set <b>n_dndistinct</b> to -0.5.</li> <li>The number of distinct values is unknown if the value is 0.</li> </ul>

Name	Type	Reference	Description
most_common_vals	anyarray	-	List of the most common values in a column. If this column does not have the most common value, the value is <b>NULL</b> .
most_common_freqs	real[]	-	List of the frequencies of the most common values in a column. The frequencies are obtained by dividing the number of occurrences of each value by the number of rows. ( <b>NULL</b> if <b>most_common_vals</b> is <b>NULL</b> )
histogram_bounds	anyarray	-	Frequency histogram consisting of values excluding null values and MVC values. If a value appears in the value of <b>most_common_vals</b> , it does not appear in the histogram. If the column data type does not have the < operator or the list specified by <b>most_common_vals</b> contains all values of the column, the histogram information of the column is <b>NULL</b> .
correlation	real	-	Correlation between the physical row sequence and logical row sequence of a column value. The value ranges from -1 to +1. When the value is close to -1 or +1, the index scan overhead is less than that when the value is close to 0 because random access to the disk is reduced. This column is <b>NULL</b> if the column data type does not have a < operator.
most_common_elems	anyarray	-	A list of non-null element values most often appearing.
most_common_elem_freqs	real[]	-	List that records the frequency of the most commonly used non-null elements.
elem_count_histogram	real[]	-	A histogram of the counts of distinct non-null element values.

### 12.3.238 PG\_STATIO\_ALL\_INDEXES

PG\_STATIO\_ALL\_INDEXES is used to query information about one row for each index in the current database, showing statistics about I/O on that specific index.

**Table 12-339** PG\_STATIO\_ALL\_INDEXES columns

Name	Type	Description
relid	oid	OID of the table for an index.
indexrelid	oid	OID of the index.
schemaname	name	Name of the schema that the index is in.
relname	name	Name of the table that the index is created for.
indexrelname	name	Index name.
idx_blks_read	bigint	Number of disk blocks read from the index.
idx_blks_hit	bigint	Number of cache hits in the index.

### 12.3.239 PG\_STATIO\_ALL\_SEQUENCES

PG\_STATIO\_ALL\_SEQUENCES displays the I/O statistics of each sequence in the current database.

**Table 12-340** PG\_STATIO\_ALL\_SEQUENCES columns

Name	Type	Description
relid	oid	OID of this sequence.
schemaname	name	Name of the schema that this sequence is in.
relname	name	Name of the sequence.
blks_read	bigint	Number of disk blocks read from the sequence.
blks_hit	bigint	Number of cache hits in this sequence.

### 12.3.240 PG\_STATIO\_ALL\_TABLES

PG\_STATIO\_ALL\_TABLES is used to query I/O statistics of each table (including TOAST tables) in the current database.

**Table 12-341** PG\_STATIO\_ALL\_TABLES columns

Name	Type	Description
relid	oid	OID of a table.
schemaname	name	Name of the schema that this table is in.
relname	name	Table name.
heap_blks_read	bigint	Number of disk blocks read from this table.
heap_blks_hit	bigint	Number of cache hits in this table.
idx_blks_read	bigint	Number of disk blocks read from all indexes in this table.
idx_blks_hit	bigint	Number of cache hits of all indexes in this table.
toast_blks_read	bigint	Number of disk blocks (if any) read from the TOAST table of this table.
toast_blks_hit	bigint	Number of cache hits (if any) in the TOAST table of this table.
tidx_blks_read	bigint	Number of disk blocks (if any) read from the TOAST table indexes of this table.
tidx_blks_hit	bigint	Number of cache hits (if any) in the TOAST table indexes of this table.

### 12.3.241 PG\_STATIO\_SYS\_INDEXES

PG\_STATIO\_SYS\_INDEXES displays I/O status information about all system catalog indexes in the namespaces.

**Table 12-342** PG\_STATIO\_SYS\_INDEXES columns

Name	Type	Description
relid	oid	OID of the table for the index.
indexrelid	oid	OID of the index.
schemaname	name	Name of the schema that the index is in.
relname	name	Name of the table that the index is created for.
indexrelname	name	Index name.
idx_blks_read	bigint	Number of disk blocks read from the index.
idx_blks_hit	bigint	Number of cache hits in the index.

## 12.3.242 PG\_STATIO\_SYS\_SEQUENCES

PG\_STATIO\_SYS\_SEQUENCES displays I/O status information about all the sequences in the namespaces.

**Table 12-343** PG\_STATIO\_SYS\_SEQUENCES columns

Name	Type	Description
relid	oid	OID of this sequence.
schemaname	name	Name of the schema that this sequence is in.
relname	name	Name of this sequence.
blks_read	bigint	Number of disk blocks read from this sequence.
blks_hit	bigint	Number of cache hits in this sequence.

## 12.3.243 PG\_STATIO\_SYS\_TABLES

PG\_STATIO\_SYS\_TABLES shows I/O status information about all the system catalogs in the namespaces.

**Table 12-344** PG\_STATIO\_SYS\_TABLES columns

Name	Type	Description
relid	oid	OID of a table.
schemaname	name	Name of the schema that this table is in.
relname	name	Table name.
heap_blks_read	bigint	Number of disk blocks read from this table.
heap_blks_hit	bigint	Number of cache hits in this table.
idx_blks_read	bigint	Number of disk blocks read from all indexes in this table.
idx_blks_hit	bigint	Number of cache hits of all indexes in this table.
toast_blks_read	bigint	Number of disk blocks (if any) read from the TOAST table of this table.
toast_blks_hit	bigint	Number of cache hits (if any) in the TOAST table of this table.

Name	Type	Description
tidx_blks_read	bigint	Number of disk blocks (if any) read from the TOAST table indexes of this table.
tidx_blks_hit	bigint	Number of cache hits (if any) in the TOAST table indexes of this table.

### 12.3.244 PG\_STATIO\_USER\_INDEXES

PG\_STATIO\_USER\_INDEXES displays I/O status information about all the user relationship table indexes in the namespaces.

**Table 12-345** PG\_STATIO\_USER\_INDEXES columns

Name	Type	Description
relid	oid	OID of the table for the index.
indexrelid	oid	OID of the index.
schemaname	name	Name of the schema that the index is in.
relname	name	Name of the table for the index.
indexrelname	name	Index name.
idx_blks_read	bigint	Number of disk blocks read from the index.
idx_blks_hit	bigint	Number of cache hits in the index.

### 12.3.245 PG\_STATIO\_USER\_SEQUENCES

PG\_STATIO\_USER\_SEQUENCES shows I/O status information about all the user relationship table sequences in the namespaces.

**Table 12-346** PG\_STATIO\_USER\_SEQUENCES columns

Name	Type	Description
relid	oid	OID of this sequence.
schemaname	name	Name of the schema where the sequence is in.
relname	name	Name of the sequence.

Name	Type	Description
blks_read	bigint	Number of disk blocks read from the sequence.
blks_hit	bigint	Number of cache hits in this sequence.

### 12.3.246 PG\_STATIO\_USER\_TABLES

PG\_STATIO\_USER\_TABLES displays I/O status information about all the user relationship tables in the namespaces.

**Table 12-347** PG\_STATIO\_USER\_TABLES columns

Name	Type	Description
relid	oid	OID of a table.
schemaname	name	Name of the schema that this table is in.
relname	name	Table name
heap_blks_read	bigint	Number of disk blocks read from this table.
heap_blks_hit	bigint	Number of cache hits in this table.
idx_blks_read	bigint	Number of disk blocks read from all indexes in this table.
idx_blks_hit	bigint	Number of cache hits of all indexes in this table.
toast_blks_read	bigint	Number of disk blocks (if any) read from the TOAST table of this table.
toast_blks_hit	bigint	Number of cache hits (if any) in the TOAST table of this table.
tidx_blks_read	bigint	Number of disk blocks (if any) read from the TOAST table indexes of this table.
tidx_blks_hit	bigint	Number of cache hits (if any) in the TOAST table indexes of this table.

### 12.3.247 PG\_TABLES

PG\_TABLES is used to query useful information about each table in the database.

**Table 12-348** PG\_TABLES columns

Name	Type	Reference	Description
schemaname	name	<b>nspname</b> in <a href="#">PG_NAMESPACE</a>	Name of the schema that contains a table.
tablename	name	<b>relname</b> in <a href="#">PG_CLASS</a>	Table name.
tableowner	name	<b>pg_get_userbyid(relowner)</b> in <a href="#">PG_CLASS</a>	Table owner.
tablespace	name	<b>spcname</b> in <a href="#">PG_TABLESPACE</a>	Tablespace that contains the table (default value: <b>NULL</b> ).
hasindexes	boolean	<b>relhasindex</b> in <a href="#">PG_CLASS</a>	Specifies whether the table has (or recently had) an index. If it does, the value is <b>TRUE</b> . Otherwise, the value is <b>FALSE</b> .
hasrules	boolean	<b>relhasruls</b> in <a href="#">PG_CLASS</a>	Specifies whether the table has rules. If it does, the value is <b>TRUE</b> . Otherwise, the value is <b>FALSE</b> .
hastriggers	boolean	<b>RELHASTRIGGERS</b> in <a href="#">PG_CLASS</a>	Specifies whether the table has triggers. If it does, the value is <b>TRUE</b> . Otherwise, the value is <b>FALSE</b> .
tablecreator	name	<b>pg_get_userbyid(creator)</b> in <a href="#">PG_OBJECT</a>	Table creator.
created	timestamp with time zone	<b>ctime</b> in <a href="#">PG_OBJECT</a>	Time when the table is created.
last_ddl_time	timestamp with time zone	<b>mtime</b> in <a href="#">PG_OBJECT</a>	Time when the last DDL operation is performed on the table.

## 12.3.248 PG\_TDE\_INFO

PG\_TDE\_INFO displays encryption information of the entire database.

**Table 12-349** PG\_TDE\_INFO columns

Name	Type	Description
is_encrypt	boolean	Specifies whether to encrypt the database. <ul style="list-style-type: none"> <li>• <b>f</b>: The database is not encrypted.</li> <li>• <b>t</b>: The database is encrypted.</li> </ul>
g_tde_algo	text	Encryption algorithm. <ul style="list-style-type: none"> <li>• <b>SM4-CTR-128</b></li> <li>• <b>AES-CTR-128</b></li> </ul>
remain	text	Reserved column.

## 12.3.249 PG\_THREAD\_WAIT\_STATUS

PG\_THREAD\_WAIT\_STATUS allows you to test the block waiting status about the backend thread and auxiliary thread of the current instance.

**Table 12-350** PG\_THREAD\_WAIT\_STATUS columns

Name	Type	Description
node_name	text	Current node name.
db_name	text	Database name.
thread_name	text	Thread name.
query_id	bigint	Query ID. It is equivalent to <b>debug_query_id</b> .
tid	bigint	Thread ID of the current thread.
sessionid	bigint	Current session ID.
lwtid	integer	Lightweight thread ID of the current thread.
psessionid	bigint	Parent session ID.
tlevel	integer	Level of the streaming thread.
smpid	integer	Concurrent thread ID.
wait_status	text	Waiting status of the current thread. For details about the waiting status, see <a href="#">Table 12-351</a> .
wait_event	text	If <b>wait_status</b> is set to <b>acquire lock</b> , <b>acquire lwlock</b> , or <b>wait io</b> , this column describes the lock, lightweight lock, and I/O information, respectively. Otherwise, this column is empty.
locktag	text	Information about the lock that the current thread is waiting to obtain.

Name	Type	Description
lockmode	text	Lock mode that the current thread is waiting to obtain. The values include modes in the table-level lock, row-level lock, and page-level lock.
block_session id	bigint	ID of the session that blocks the current thread from obtaining the lock
global_sessio nid	text	Global session ID

The following table lists the waiting states in the **wait\_status** column.

**Table 12-351** Waiting state list

Value	Description
none	Waiting for no event
acquire lock	Waiting for locking until the locking succeeds or times out
acquire lwlock	Waiting for a lightweight lock
wait io	Waiting for I/O completion
wait cmd	Waiting for reading network communication packets to complete
wait pooler get conn	Waiting for pooler to obtain connections
wait pooler abort conn	Waiting for pooler to terminate connections
wait pooler clean conn	Waiting for pooler to clear connections
pooler create conn: [nodename], total N	Waiting for the pooler to set up a connection. The connection is being established with the node specified by <i>nodename</i> , and there are <i>N</i> connections waiting to be set up.
get conn	Obtaining the connection to other nodes
set cmd: [nodename]	Waiting for running the <b>SET</b> , <b>RESET</b> , <b>TRANSACTION BLOCK LEVEL PARA SET</b> , or <b>SESSION LEVEL PARA SET</b> statement on the connection. The statement is being executed on the node specified by <i>nodename</i> .
cancel query	Canceling the SQL statement that is being executed through the connection

Value	Description
stop query	Stopping the query that is being executed through the connection
wait node: [nodename](plevel), total N, [phase]	<p>Waiting for receiving data from a connected node. The thread is waiting for data from the plevel thread of the node specified by <i>nodename</i>. The data of <i>N</i> connections is waiting to be returned. If <i>phase</i> is included, the possible phases are as follows:</p> <ul style="list-style-type: none"> <li>● <b>begin</b>: The transaction is being started.</li> <li>● <b>commit</b>: The transaction is being committed.</li> <li>● <b>rollback</b>: The transaction is being rolled back.</li> </ul>
wait transaction sync: xid	Waiting for synchronizing the transaction specified by <i>xid</i>
wait wal sync	Waiting for the completion of WAL of synchronization from the specified LSN to the standby instance
wait data sync	Waiting for the completion of data page synchronization to the standby instance
wait data sync queue	Waiting for putting the data pages that are in the row-store into the synchronization queue.
flush data: [nodename](plevel), [phase]	<p>Waiting for sending data to the plevel thread of the node specified by <i>nodename</i>. If <i>phase</i> is included, the possible phase is <b>wait quota</b>, indicating that the current communication flow is waiting for the quota value.</p> <p>A quota indicates the size of data that can be received by the network channel. <b>wait quota</b> indicates that the sender (data producer) waits for the receiver (data consumer) to send the quota information of the current connection.</p>
stream get conn: [nodename], total N	Waiting for connecting to the consumer object of the node specified by <i>nodename</i> when the stream flow is initialized. There are <i>N</i> consumers waiting to be connected.
wait producer ready: [nodename] (plevel), total N	Waiting for each producer to be ready when the stream flow is initialized. The thread is waiting for the procedure of the plevel thread on the <i>nodename</i> node to be ready. There are <i>N</i> producers waiting to be ready.

Value	Description
synchronize quit	Waiting for the threads in the stream thread group to quit when the stream plan ends
wait stream nodegroup destroy	Waiting for destroying the stream node group when the stream plan ends
wait active statement	Waiting for job execution under resource and load control.
analyze: [relname], [phase]	The thread is doing <b>ANALYZE</b> to the <i>relname</i> table. If <i>phase</i> is included, the possible phase is <b>autovacuum</b> , indicating that the database automatically enables the AutoVacuum thread to execute <b>ANALYZE</b> .
vacuum: [relname], [phase]	The thread is doing <b>VACUUM</b> to the <i>relname</i> table. If <i>phase</i> is included, the possible phase is <b>autovacuum</b> , indicating that the database automatically enables the AutoVacuum thread to execute <b>VACUUM</b> .
vacuum full: [relname]	The thread is doing <b>VACUUM FULL</b> to the <i>relname</i> table.
create index	An index is being created
HashJoin - [ build hash   write file ]	The <b>HashJoin</b> operator is being executed. In this phase, you need to pay attention to the execution time-consuming. <ul style="list-style-type: none"> <li>● <b>build hash</b>: The <b>HashJoin</b> operator is creating a hash table.</li> <li>● <b>write file</b>: The <b>HashJoin</b> operator is writing data to disks.</li> </ul>
HashAgg - [ build hash   write file ]	The <b>HashAgg</b> operator is being executed. In this phase, you need to pay attention to the execution time-consuming. <ul style="list-style-type: none"> <li>● <b>build hash</b>: The <b>HashAgg</b> operator is creating a hash table.</li> <li>● <b>write file</b>: The <b>HashAgg</b> operator is writing data to disks.</li> </ul>
HashSetop - [build hash   write file ]	The <b>HashSetop</b> operator is being executed. In this phase, you need to pay attention to the execution time-consuming. <ul style="list-style-type: none"> <li>● <b>build hash</b>: The <b>HashSetop</b> operator is creating a hash table.</li> <li>● <b>write file</b>: The <b>HashSetop</b> operator is writing data to disks.</li> </ul>

Value	Description
Sort   Sort - [fetch tuple   write file]	The <b>Sort</b> operator is used for sorting. <b>fetch tuple</b> indicates that the <b>Sort</b> operator is obtaining tuples, and <b>write file</b> indicates that the <b>Sort</b> operator is writing data to disks.
Material   Material - write file	The <b>Material</b> operator is being executed. <b>write file</b> indicates that the <b>Material</b> operator is writing data to disks.
NestLoop	The <b>NestLoop</b> operator is being executed.
wait memory	Waiting for obtaining the memory.
wait sync consumer next step	Waiting for the consumer to execute the stream operator
wait sync producer next step	Waiting for the producer to execute the stream operator
vacuum gpi	Clearing the global partitioned index in the vacuum or autovacuum process.
standby read recovery conflict	The read-only mode of the standby node conflicts with the log replay mode.
standby get snapshot	The standby node obtains the snapshot in read-only mode.
prune table	Waiting for a heap table to clear historical deleted data.
prune index	Waiting for an index to clear historical deleted data.
wait reserve td	Waiting for a Ustore transaction slot allocation.
wait td rollback	Waiting for a Ustore transaction slot to roll back transactions.
wait available td	Waiting for an available transaction slot.
wait transaction rollback	Waiting for a transaction roll back.
wait sync bgworkers	Waiting for an index subthread created in parallel to complete local scanning and sorting.
security audit write pipe	Waiting for an audit log to be written to the pipe.

If **wait\_status** is **acquire lwlock**, **acquire lock**, or **wait io**, there is an event performing I/O operations or waiting for obtaining the corresponding lightweight lock or transaction lock.

The following table describes the corresponding wait events when **wait\_status** is **acquire lwlock**. If **wait\_event** is **extension**, the lightweight lock is dynamically allocated and is not monitored.

**Table 12-352** List of wait events corresponding to lightweight locks

<b>wait_event</b>	<b>Description</b>
ShmemIndexLock	Used to protect the primary index table, a hash table, in shared memory.
OidGenLock	Used to prevent different threads from generating the same OID.
XidGenLock	Used to prevent two transactions from obtaining the same XID.
ProcArrayLock	Used to prevent concurrent access to or concurrent modification on the ProcArray shared array.
SInvalReadLock	Used to prevent concurrent execution with invalid message deletion.
SInvalWriteLock	Used to prevent concurrent execution with invalid message write and deletion.
WALInsertLock	Used to prevent concurrent execution with WAL insertion.
WALWriteLock	Used to prevent concurrent write from a WAL buffer to a disk.
ControlFileLock	Used to prevent concurrent read/write or concurrent write/write on the <b>pg_control</b> file.
CheckpointLock	Used to prevent multi-checkpoint concurrent execution.
CLogControlLock	Used to prevent concurrent access to or concurrent modification on the Clog control data structure.
SubtransControlLock	Used to prevent concurrent access to or concurrent modification on the subtransaction control data structure.
MultiXactGenLock	Used to allocate a unique MultiXact ID in serial mode.
MultiXactOffsetControlLock	Used to prevent concurrent read/write or concurrent write/write on <b>pg_multixact/offset</b> .

<b>wait_event</b>	<b>Description</b>
MultiXactMemberControlLock	Used to prevent concurrent read/write or concurrent write/write on <b>pg_multixact/members</b> .
RelCacheInitLock	Used to add a lock before any operations are performed on the <b>init</b> file when messages are invalid.
CheckpointCommLock	Used to send file flush requests to a checkpointer. The request structure needs to be inserted to a request queue in serial mode.
TwoPhaseStateLock	Used to prevent concurrent access to or modification on two-phase information sharing arrays.
TablespaceCreateLock	Used to check whether a tablespace exists.
BtreeVacuumLock	Used to prevent <b>VACUUM</b> from clearing pages that are being used by B-tree indexes.
AutovacuumLock	Used to access the autovacuum worker array in serial mode.
AutovacuumScheduleLock	Used to distribute tables requiring <b>VACUUM</b> in serial mode.
AutoanalyzeLock	Used to obtain and release resources related to a task that allows for autoanalyze execution.
SyncScanLock	Used to determine the start position of a relfilenode during heap scanning.
NodeTableLock	Used to protect a shared structure that stores database node information.
PoolerLock	Used to prevent two threads from simultaneously obtaining the same connection from a connection pool.
RelationMappingLock	Used to wait for the mapping file between system catalogs and storage locations to be updated.
Async Ctl	Used to protect asynchronization buffers.
AsyncCtlLock	Used to prevent concurrent access to or concurrent modification on the sharing notification status.
AsyncQueueLock	Used to prevent concurrent access to or concurrent modification on the sharing notification queue.

<b>wait_event</b>	<b>Description</b>
SerializableXactHashLock	Used to prevent concurrent read/write or concurrent write/write on a sharing structure for serializable transactions.
SerializableFinishedListLock	Used to prevent concurrent read/write or concurrent write/write on a shared linked list for completed serial transactions.
SerializablePredicateLockList-Lock	Used to protect a linked list of serializable transactions that have locks.
OldSerXidLock	Used to protect a structure that records serializable transactions that have conflicts.
FileStatLock	Used to protect a data structure that stores statistics file information.
SyncRepLock	Used to protect Xlog synchronization information during primary-standby replication.
DataSyncRepLock	Used to protect data page synchronization information during primary-standby replication.
MetaCacheSweepLock	Used to add a lock when metadata is cyclically washed out.
ExtensionConnectorLibLock	Used to add a lock when a specific dynamic library is loaded or uninstalled in ODBC connection initialization scenarios.
SearchServerLibLock	Used to add a lock on the file read operation when a specific dynamic library is initially loaded in GPU-accelerated scenarios.
LsnXlogChkFileLock	Used to serially update the Xlog flush points for primary and standby servers recorded in a specific structure.
ReplicationSlotAllocationLock	Used to add a lock when a primary node allocates streaming replication slots during primary-standby replication.
ReplicationSlotControlLock	Used to prevent concurrent update of replication slot status during primary-standby replication.
ResourcePoolHashLock	Used to prevent concurrent access to or concurrent modification on a resource pool table, a hash table.

<b>wait_event</b>	<b>Description</b>
WorkloadStatHashLock	Used to prevent concurrent access to or concurrent modification on a hash table that contains SQL requests from primary database node.
WorkloadIoStatHashLock	Used to prevent concurrent access to or concurrent modification on a hash table that contains I/O information of the current database node.
WorkloadCGroupHashLock	Used to prevent concurrent access to or concurrent modification on a hash table that contains Cgroup information.
OBSGetPathLock	Used to prevent concurrent read/write or concurrent write/write on an OBS path.
WorkloadRecordLock	Used to prevent concurrent access to or concurrent modification on a hash table that contains requests received by primary database node during adaptive memory management.
WorkloadIOUtilLock	Used to protect a structure that records <b>iostat</b> and CPU load information.
WorkloadNodeGroupLock	Used to prevent concurrent access to or concurrent modification on a hash table that contains node group information in memory.
JobShmemLock	Used to protect global variables in the shared memory that is periodically read during a scheduled job.
OBSRuntimeLock	Used to obtain environment variables, for example, <i>GASSHOME</i> .
CriticalCacheBuildLock	Used to load caches from a shared or local cache initialization file.
WaitCountHashLock	Used to protect a shared structure in user statement counting scenarios.
BufMappingLock	Used to protect operations on a table mapped to shared buffer.
LockMgrLock	Used to protect a common lock structure.
PredicateLockMgrLock	Used to protect a lock structure that has serializable transactions.
OperatorRealTLock	Used to prevent concurrent access to or concurrent modification on a global structure that contains real-time data at the operator level.

wait_event	Description
OperatorHistLock	Used to prevent concurrent access to or concurrent modification on a global structure that contains historical data at the operator level.
SessionRealTLock	Used to prevent concurrent access to or concurrent modification on a global structure that contains real-time data at the query level.
SessionHistLock	Used to prevent concurrent access to or concurrent modification on a global structure that contains historical data at the query level.
BarrierLock	Used to ensure that only one thread is creating a barrier at a time.
dummyServerInfoCacheLock	Used to protect a global hash table where the information about database connections is cached.
RPNumberLock	Used by a database node on a computing GaussDB to count the number of threads for a task where plans are being executed.
CBMParseXlogLock	Used to protect the lock used when CBM parses Xlogs.
RelfilenodeReuseLock	Used to prevent the link to a reused column attribute file from being canceled by mistake.
RcvWriteLock	Used to prevent concurrent call of <b>WalDataRcvWrite</b> .
PercentileLock	Used to protect global percentile buffers.
CSNBufMappingLock	Used to protect CSN pages.
UniqueSQLMappingLock	Used to protect a unique SQL hash table.
DelayDDLLock	Used to prevent concurrent DDL operations.
CLOG Ctl	Used to prevent concurrent access to or concurrent modification on the Clog control data structure.
Async Ctl	Used to protect asynchronization buffers.
MultiXactOffset Ctl	Used to protect SLRU buffers of a MultiXact offset.
MultiXactMember Ctl	Used to protect SLRU buffers of a MultiXact member.
OldSerXid SLRU Ctl	Used to protect SLRU buffers of old transaction IDs.

<b>wait_event</b>	<b>Description</b>
ReplicationSlotLock	Used to protect a replication slot.
PGPROClock	Used to protect the PGPROC structure.
MetaCacheLock	Used to protect meta caches.
DataCacheLock	Used to protect data caches.
InstrUserLock	Used to protect InstrUserHTAB.
BadBlockStatHashLock	Used to protect the hash table <b>global_bad_block_stat</b> .
BufFreelistLock	Used to ensure the atomicity of free list operations in the shared buffer.
AddinShmemInitLock	Used to protect the initialization of the shared memory object.
AlterPortLock	Used to protect the coordinator node from changing the registration port number.
FdwPartitionCaheLock	Management lock of the buffer of the HDFS partitioned table.
DfsConnectorCacheLock	Management lock of the DFSCorrelator buffer.
DfsSpaceCacheLock	Management lock of the HDFS tablespace management buffer.
FullBuildXlogCopyStartPtrLock	Used to protect Xlog copy operations in the full build.
DfsUserLoginLock	Used for HDFS user login and authentication.
LogicalReplicationSlotPersistentDataLock	Used to protect data in the replication slot during logical replication.
PgfdwLock	Used by the management instance to establish a connection to the foreign server.
InstanceTimeLock	Used to obtain time information of sessions in an instance.
XlogRemoveSegLock	Used to protect Xlog segment file recycling.
DnUsedSpaceHashLock	Used to update space usage information corresponding to a session.
CsnMinLock	Used to calculate CSNmin.
GPCCommitLock	Used to protect the addition of the global Plan Cache hash table.
GPCClearLock	Used to protect the clearing of the global plan cache hash table.

<b>wait_event</b>	<b>Description</b>
GPCTimelineLock	Used to protect the timeline check of the global plan cache hash table.
InstanceRealTLock	Used to protect the update of the hash table that stores shared instance statistics.
CLogBufMappingLock	Used to manage the cache of commit logs.
GPCMappingLock	Used to manage the global plan cache.
GPCPrepareMappingLock	Used to manage the global plan cache.
BufferIOLock	Used to protect I/O operations on pages in the shared buffer.
BufferContentLock	Used to protect the read and modification of the page content in the shared buffer.
CSNLOG Ctl	Used for CSN log management.
DoubleWriteLock	Used to manage doublewrite operations.
RowPageReplicationLock	Used to manage data page replication of row-store.
MatviewSeqnoLock	Used to manage the cache of materialized views.
GPRCMappingLock	Used to manage the access and modification operations of the global cache hash table of autonomous transactions.
extension	Other lightweight locks.
wait active statement	Waiting for job execution under resource and load control.
wait memory	Waiting for obtaining the memory.
IOStatLock	Used to concurrently maintain the hash table of resource management I/O statistics.
StartBlockMappingLock	Used by globalstat to obtain information such as startblockarray from pgstat.
PldebugLock	Used to debug stored procedures and perform concurrent maintenance operations.
DataFileIdCacheLock	Used to manage the concurrent access and storage of hash table that stores data file descriptor in the shared memory.
GTMHostInfoLock	Used to protect the concurrent access and storage of shared GTM host information.
TwoPhaseStatePartLock	Used to protect the status information of two-phase transactions (in each partition).

<b>wait_event</b>	<b>Description</b>
WALBufMappingLock	Used to protect the mapping between WAL buffer page and LSN offset.
UndoZoneLock	Used to protect the concurrent access and storage of undo zone.
RollbackReqHashLock	Used to protect the concurrent access and storage of hash table that stores the rollback request in the shared memory.
UHeapStatLock	Used to protect the concurrent access and storage of Ustore statistics.
WALWritePaxosLock	Used to protect the concurrent sequence of WALs written to the paxos replication component.
SyncPaxosLock	Used to protect the concurrent access and storage of paxos synchronization queue.
BackgroundWorkerLock	Used to protect the concurrent sequence of background workers.
HadrSwitchoverLock	Used to protect the concurrent sequence of DR switchover.
HashUidLock	Used to protect the concurrent sequence of UID allocation.
ParallelDecodeLock	Used to protect the concurrent sequence of parallel decoding.
XLogMaxCSNLock	Used to protect the maximum volume of CSNs that can be restored locally in DR mode.
DisasterCacheLock	Used to protect the concurrent access and storage of DR cache information in the shared memory.
MaxCSNArrayLock	Used to protect the restoration progress of standby node CSNs in each shard in the shared memory.
RepairBadBlockStatHashLock	Used to protect the concurrent access and storage of the hash table that stores damaged pages in the shared memory.
HypoIndexLock	Used to create, delete and reset the virtual index by the lightweight lock.
XGBoostLibLock	Used by DB4AI to call the XGBoost library.
DropArchiveSlotLock	Used to protect the concurrent sequence of deleting the archive slot.

<b>wait_event</b>	<b>Description</b>
ProcXactMappingLock	Used to protect the concurrent access and storage of the hash table that stores the mapping information between transaction IDs and threads.
UndoPerZoneLock	Used to protect the concurrent access and storage of each information in undo zone.
UndoSpaceLock	Used to protect the concurrent access and storage of undo space.
SnapshotBlockLock	Used to control the concurrent sequence of snapshot-based backup and disk flushing.
DWSingleFlushFirstLock	Used to control the concurrent sequence of segment-pages and single-page doublewrite files.
RestartPointQueueLock	Used to control the concurrent access and storage of restart point arrays on the standby node.
UnlinkRelHashTblLock	Used to protect the concurrent access and storage of the hash table that restores files to be deleted.
UnlinkRelForkHashTblLock	Used to protect the concurrent access and storage of the hash table that restores the fork files to be deleted.
WALFlushWait	Used to protect the concurrent sequence of log flushing.
WALConsensusWait	Used to protect the transaction commit or log replay which is performed only when the logs are consistent.
WALBufferInitWait	Used to protect the initialization and disk flushing sequence of WAL pages in the shared memory.
WALInitSegment	Used to protect the initialization sequence of WAL segment files.
PgwrSyncQueueLock	Used to protect the concurrent access and storage of file queues to be flushed to disks.
BarrierHashTblLock	Used to protect the concurrent access and storage of barrier tables in the shared memory.
PageRepairHashTblLock	Used to protect the concurrent access and storage of hash table that stores repaired pages.

wait_event	Description
FileRepairHashTblLock	Used to protect the concurrent access and storage of the hash table that stores repaired files.
InstrUserLockId	Used to protect the concurrent modification of the hash table that stores user login and logout records.
GsStackLock	Used to ensure that the gs_tack function is not concurrently called.
InstrStmtTrackCtlLock	Used to protect the concurrent access and storage of the hash table when full SQL statements are dynamically enabled.
CaptureViewFileHashLock	Used to protect the concurrent access and storage of the hash table when capturing the performance view.
UniqueSqlEvictLock	Used to protect the concurrent access and storage of the hash table when the unique SQL reclamation is enabled.
gtt_shared_ctl	Used to protect concurrent read and write of the hash table that stores the global temporary tables.
AuditIndexFileLock	Used to protect concurrent read and write of index files in the audit log.
TDEKeyCacheLock	Used to control the concurrent read and write of cached data keys encrypted transparently.
LWTRANCHE_ACCOUNT_TABLE	Used to control the concurrent read and write of the hash table that stores the account locking status.

The following table describes the corresponding wait events when **wait\_status** is **wait io**.

**Table 12-353** List of wait events corresponding to I/Os

wait_event	Description
BufFileRead	Reads data from a temporary file to a specified buffer.
BufFileWrite	Writes the content of a specified buffer to a temporary file.

<b>wait_event</b>	<b>Description</b>
ControlFileRead	Reads the <b>pg_control</b> file, mainly during database startup, checkpoint execution, and primary/standby verification.
ControlFileSync	Flushes the <b>pg_control</b> file to a disk, mainly during database initialization.
ControlFileSyncUpdate	Flushes the <b>pg_control</b> file to a disk, mainly during database startup, checkpoint execution, and primary/standby verification.
ControlFileWrite	Writes the <b>pg_control</b> file, during database initialization.
ControlFileWriteUpdate	Updates the <b>pg_control</b> file, mainly during database startup, checkpoint execution, and primary/standby verification.
CopyFileRead	Reads a file during file copying.
CopyFileWrite	Writes a file during file copying.
DataFileExtend	Writes a file during file name extension.
DataFileFlush	Flushes a table data file to a disk.
DataFileImmediateSync	Flushes a table data file to a disk immediately.
DataFilePrefetch	Reads a table data file asynchronously.
DataFileRead	Reads a table data file synchronously.
DataFileSync	Flushes table data file modifications to a disk.
DataFileTruncate	Truncates a table data file.
DataFileWrite	Writes a table data file.
LockFileAddToDataDirRead	Reads the <b>postmaster.pid</b> file.
LockFileAddToDataDirSync	Flushes the <b>postmaster.pid</b> file to a disk.
LockFileAddToDataDirWrite	Writes PID information into the <b>postmaster.pid</b> file.
LockFileCreateRead	Reads the LockFile file <b>%s.lock</b> .
LockFileCreateSync	Flushes the LockFile file <b>%s.lock</b> to a disk.
LockFileCreateWRITE	Writes PID information into the LockFile file <b>%s.lock</b> .
RelationMapRead	Reads the mapping file between system catalogs and storage locations.
RelationMapSync	Flushes the mapping file between system catalogs and storage locations to a disk.

<b>wait_event</b>	<b>Description</b>
RelationMapWrite	Writes the mapping file between system catalogs and storage locations.
ReplicationSlotRead	Reads a streaming replication slot file. during a restart.
ReplicationSlotRestoreSync	Flushes a streaming replication slot file to a disk during a restart.
ReplicationSlotSync	Persists a temporary streaming replication slot file to a disk during checkpoint execution.
ReplicationSlotWrite	Writes a temporary streaming replication slot file during checkpoint execution.
SLRUFlushSync	Flushes the <b>pg_clog</b> , <b>pg_subtrans</b> , and <b>pg_multixact</b> files to a disk, mainly during checkpoint execution and database shutdown.
SLRURead	Reads the <b>pg_clog</b> , <b>pg_subtrans</b> , and <b>pg_multixact</b> files.
SLRUSync	Writes dirty pages into the <b>pg_clog</b> , <b>pg_subtrans</b> , and <b>pg_multixact</b> files, and flushes the files to a disk, mainly during checkpoint execution and database shutdown.
SLRUWrite	Writes the <b>pg_clog</b> , <b>pg_subtrans</b> , and <b>pg_multixact</b> files.
TimelineHistoryRead	Reads the timeline history file during database startup.
TimelineHistorySync	Flushes the timeline history file to a disk during database startup.
TimelineHistoryWrite	Writes to the timeline history file during database startup.
TwophaseFileRead	Reads the <b>pg_twophase</b> file, mainly during two-phase transaction commit and restoration.
TwophaseFileSync	Flushes the <b>pg_twophase</b> file to a disk, mainly during two-phase transaction commit and restoration.
TwophaseFileWrite	Writes the <b>pg_twophase</b> file, mainly during two-phase transaction commit and restoration.
WALBootstrapSync	Flushes an initialized WAL file to a disk during database initialization.
WALBootstrapWrite	Writes an initialized WAL file during database initialization.

wait_event	Description
WALCopyRead	Reads operation generated when an existing WAL file is read for replication after archiving and restoration.
WALCopySync	Flushes a replicated WAL file to a disk after archiving and restoration.
WALCopyWrite	Writes operation generated when an existing WAL file is read for replication after archiving and restoration.
WALInitSync	Flushes a newly initialized WAL file to a disk during log reclaiming or writing.
WALInitWrite	Initializes a newly created WAL file to 0 during log reclaiming or writing.
WALRead	Reads data from Xlogs during redo operations on two-phase files.
WALSyncMethodAssign	Flushes all open WAL files to a disk.
WALWrite	Writes a WAL file.
WALBufferAccess	Used to access WAL buffer (To ensure performance, only the number of access times is counted in the kernel code, and the access duration is not counted.).
WALBufferFull	Used to write WAL files when the WAL buffer is full.
DoubleWriteFileRead	Doublewrites and reads a file.
DoubleWriteFileSync	Doublewrites a file and forcibly flushes files to disks.
DoubleWriteFileWrite	Doublewrites a file and writes a file.
PredoProcessPending	Waits for the replay of other records to complete during parallel log replay.
PredoApply	Waits for the replay of other threads to the LSN of the current thread during parallel log replay.
DisableConnectFileRead	Reads the HA lock fragment logic file.
DisableConnectFileSync	Forcibly flushes the HA lock fragment logic file to disks.
DisableConnectFileWrite	Writes the HA lock fragment logic file.
BufHashTableSearch	Used to search the hash table in the shared buffer (page eviction may be triggered).

wait_event	Description
StrategyGetBuffer	Used to obtain pages from strategy buffer (page eviction may be triggered).
UndoFileExtend	Used to extend an undo file.
UndoFilePrefetch	Used to prefetch an undo file.
UndoFileRead	Used to read an undo file.
UndoFileWrite	Used to write an undo file.
UndoFileSync	Used to flush an undo file to disks.
UndoFileUnlink	Used to delete an undo file.
UndoMetaSync	Used to flush an undo metadata file to disks.
DWSingleFlushGetPos	Used by a single-page doublewrite file to search for available location.
DWSingleFlushWrite	Used to flush a single-page doublewrite file to disks.
MPFL_INIT	Used to initiate max_page_flush_lsn.
MPFL_READ	Used to read max_page_flush_lsn.
MPFL_WRITE	Used to write max_page_flush_lsn.
OBSList	Used to traverse an OBS directory.
OBSRead	Used to read an OBS object.
OBSWrite	Used to write an OBS object.
LOGCTRL_SLEEP	Waiting for the standby node to catch up with logs.
ShareStorageWalRead	Used to read log files from the shared disk.
ShareStorageWalWrite	Used to write log files to the shared disk.
ShareStorageCtlInfoRead	Used to read control information from the shared disk.
ShareStorageCtlInfoWrite	Used to write control information to the shared disk.

The following table describes the corresponding wait events when **wait\_status** is **acquire lock**.

**Table 12-354** List of wait events corresponding to transaction locks

wait_event	Description
relation	Adds a lock to a table.
extend	Adds a lock to a table being scaled out.
partition	Adds a lock to a partitioned table.
partition_seq	Adds a lock to a partition of a partitioned table.
page	Adds a lock to a table page.
tuple	Adds a lock to a tuple on a page.
transactionid	Adds a lock to a transaction ID.
virtualxid	Adds a lock to a virtual transaction ID.
object	Adds a lock to an object.
userlock	Adds a lock to a user.
advisory	Adds an advisory lock.
filenode	Adds a lock to a file name and controls the concurrent sequence of file-level operations.
subtransactionid	Used to add a lock to a sub-transaction ID.
tuple_uid	Adds a lock to the hidden column of a tuple UID.

### 12.3.250 PG\_TIMEZONE\_ABBREVS

PG\_TIMEZONE\_ABBREVS displays information about all available time zones.

**Table 12-355** PG\_TIMEZONE\_ABBREVS columns

Name	Type	Description
abbrev	text	Abbreviation of the time zone name.
utc_offset	interval	Offset from UTC.
is_dst	boolean	Specifies whether the DST is being used. If yes, the value is <b>TRUE</b> ; otherwise, the value is <b>FALSE</b> .

### 12.3.251 PG\_TIMEZONE\_NAMES

PG\_TIMEZONE\_NAMES displays all time zone names that can be recognized by SET TIMEZONE, along with their abbreviations, UTC offsets, and daylight saving time (DST) statuses.

**Table 12-356** PG\_TIMEZONE\_NAMES columns

Name	Type	Description
name	text	Name of the time zone.
abbrev	text	Abbreviation of the time zone name.
utc_offset	interval	Offset from UTC.
is_dst	boolean	Specifies whether the DST is being used. If yes, the value is <b>TRUE</b> ; otherwise, the value is <b>FALSE</b> .

### 12.3.252 PG\_TOTAL\_MEMORY\_DETAIL

**PG\_TOTAL\_MEMORY\_DETAIL** displays memory usage of a node in the database.

**Table 12-357** PG\_TOTAL\_MEMORY\_DETAIL columns

Name	Type	Description
nodename	text	Specifies the node name.
memorytype	text	Memory name
memorybytes	integer	Size of the used memory in the unit of MB.

### 12.3.253 PG\_TOTAL\_USER\_RESOURCE\_INFO

**PG\_TOTAL\_USER\_RESOURCE\_INFO** displays resource usage of all users. Only administrators can query this view. This view is valid only when the GUC parameter **use\_workload\_manager** is set to **on**. I/O monitoring items are valid only when **enable\_logical\_io\_statistics** is set to **on**.

**Table 12-358** PG\_TOTAL\_USER\_RESOURCE\_INFO columns

Name	Type	Description
username	name	Username
used_memory	integer	Used memory, in MB
total_memory	integer	Available memory, in MB. The value <b>0</b> indicates that the available memory is not limited and depends on the maximum memory available in the database.

Name	Type	Description
used_cpu	double precision	Number of CPU cores in use. CPU usage data is collected only in complex jobs, and the value is the CPU usage of the related Cgroup.
total_cpu	integer	Total number of CPU cores of the Cgroup associated with the user on the node
used_space	bigint	Used permanent table storage space, in KB
total_space	bigint	Available permanent table storage space, in KB (-1 if the storage space is not limited)
used_temp_space	bigint	Used temporary space, in KB
total_temp_space	bigint	Total available temporary space, in KB (-1 if the temporary space is not limited)
used_spill_space	bigint	Size of the used operator flushing space, in KB
total_spill_space	bigint	Total size of the available operator flushing space, in KB (-1 if the space is not limited)
read_kbytes	bigint	Primary database node: total bytes read by the user's complex jobs on all database nodes in the last 5 seconds, in KB  Database node: total bytes read by the user's complex jobs from the instance startup time to the current time, in KB
write_kbytes	bigint	Primary database node: total bytes written by the user's complex jobs on all database nodes in the last 5 seconds, in KB  Database node: total bytes written by the user's complex jobs from the instance startup time to the current time, in KB
read_counts	bigint	Primary database node: total number of read times of the user's complex jobs on all database nodes in the last 5 seconds  Database node: total number of read times of the user's complex jobs from the instance startup time to the current time
write_counts	bigint	Primary database node: total number of write times of the user's complex jobs on all database nodes in the last 5 seconds  Database node: total number of write times of the user's complex jobs from the instance startup time to the current time

Name	Type	Description
read_speed	double precision	Primary database node: average read rate of the user's complex jobs on a single database node in the last 5 seconds, in KB/s Database node: average read rate of the user's complex jobs on the database node in the last 5 seconds, in KB/s
write_speed	double precision	Primary database node: average write rate of the user's complex jobs on a single database node in the last 5 seconds, in KB/s Database node: average write rate of the user's complex jobs on the database node in the last 5 seconds, in KB/s

### 12.3.254 PG\_TOTAL\_USER\_RESOURCE\_INFO\_OID

**PG\_TOTAL\_USER\_RESOURCE\_INFO\_OID** displays resource usage of all users. Only administrators can query this view. This view is valid only when the GUC parameter **use\_workload\_manager** is set to **on**.

**Table 12-359** PG\_TOTAL\_USER\_RESOURCE\_INFO\_OID columns

Name	Type	Description
userid	oid	User ID.
used_memory	integer	Size of the memory being used, in MB.
total_memory	integer	Available memory (unit: MB) The value <b>0</b> indicates that the available memory is not limited and depends on the maximum memory available in the database.
used_cpu	double precision	Number of CPU cores in use.
total_cpu	integer	Total number of CPU cores of the Cgroup associated with the user on the node.
used_space	bigint	Used storage space, in KB.
total_space	bigint	Available storage space (unit: KB). The value <b>-1</b> indicates that the space is not limited.
used_temp_space	bigint	Used temporary storage space, in KB.
total_temp_space	bigint	Total available temporary space, in KB ( <b>-1</b> if the temporary space is not limited).

Name	Type	Description
used_spill_space	bigint	Used disk space for spilling, in KB.
total_spill_space	bigint	Total available disk space for spilling, in KB. The value -1 indicates that the space is not limited.
read_kbytes	bigint	Amount of data read from the disk, in KB.
write_kbytes	bigint	Amount of data written to the disk, in KB.
read_counts	bigint	Number of disk read times.
write_counts	bigint	Number of disk write times.
read_speed	double precision	Disk read rate, in B/ms.
write_speed	double precision	Disk write rate, in B/ms.

## 12.3.255 PG\_USER

PG\_USER displays information about database users. By default, only the initial user and users with the sysadmin attribute can view the information. Other users can view the information only after being granted with permissions.

**Table 12-360** PG\_USER columns

Name	Type	Description
username	name	Username.
usesysid	oid	ID of this user.
usecreatedb	boolean	Specifies whether a user has the permissions to create databases. <ul style="list-style-type: none"> <li>• <b>t</b> (true): yes.</li> <li>• <b>f</b> (false): no.</li> </ul>
usesuper	boolean	Specifies whether the user is the initial system administrator with the highest permissions. <ul style="list-style-type: none"> <li>• <b>t</b> (true): yes.</li> <li>• <b>f</b> (false): no.</li> </ul>

Name	Type	Description
usecatupd	boolean	Specifies whether the user can directly update system tables. Only the initial system administrator whose <b>usesysid</b> is <b>10</b> has this permission. It is unavailable for other users. <ul style="list-style-type: none"> <li>• <b>t</b> (true): yes.</li> <li>• <b>f</b> (false): no.</li> </ul>
userepl	boolean	Specifies whether the user has the permissions to duplicate data streams. <ul style="list-style-type: none"> <li>• <b>t</b> (true): yes.</li> <li>• <b>f</b> (false): no.</li> </ul>
passwd	text	Encrypted user password. The value is displayed as <b>*****</b> .
valbegin	timestamp with time zone	Start time for account validity ( <b>NULL</b> if no start time).
valuntil	timestamp with time zone	End time for account validity ( <b>NULL</b> if end time is not specified).
respool	name	Resource pool where the user is in.
parent	oid	Parent user OID.
spacelimit	text	Storage space of the permanent table, in KB.
useconfig	text[]	Default value of runtime configuration items.
tempspacelimit	text	Storage space of the temporary table, in KB.
spillspacelimit	text	Operator disk spill space, in KB.
nodegroup	name	Name of the logical database associated with the user. If the user does not manage the logical database, this column is left blank.
usemonitoradmin	boolean	Specifies whether the user is a monitor administrator. <ul style="list-style-type: none"> <li>• <b>t</b> (true): yes.</li> <li>• <b>f</b> (false): no.</li> </ul>

Name	Type	Description
useoperatoradmin	boolean	Specifies whether the user is an O&M administrator. <ul style="list-style-type: none"> <li>• <b>t</b> (true): yes.</li> <li>• <b>f</b> (false): no.</li> </ul>
usepolicyadmin	boolean	Specifies whether the user is a security policy administrator. <ul style="list-style-type: none"> <li>• <b>t</b> (true): yes.</li> <li>• <b>f</b> (false): no.</li> </ul>

### 12.3.256 PG\_USER\_MAPPINGS

PG\_USER\_MAPPINGS displays user mapping information.

This is essentially a publicly readable view of [PG\\_USER\\_MAPPING](#) that leaves out the options column if the user has no rights to use the system catalog and query the view. Common users must be authorized to access this view.

**Table 12-361** PG\_USER\_MAPPINGS columns

Name	Type	Reference	Description
umid	oid	<a href="#">PG_USER_MAPPING</a> .oid	OID of the user mapping.
srvid	oid	<a href="#">PG_FOREIGN_SERVER</a> .oid	OID of the foreign server that contains the mapping.
srvname	name	<a href="#">PG_FOREIGN_SERVER</a> .srvname	Name of the foreign server.
umuser	oid	<a href="#">PG_AUTHID</a> .oid	OID of the local role being mapped ( <b>0</b> if the user mapping is public)
username	name	-	Name of the local user to be mapped
umoptions	text[]	-	User mapping specific options. If the current user is the owner of the foreign server, the value is <b>keyword=value strings</b> . Otherwise, the value is <b>NULL</b> .

### 12.3.257 PG\_VARIABLE\_INFO

PG\_VARIABLE\_INFO records information about transaction IDs and OIDs of the current node in the database.

**Table 12-362** PG\_VARIABLE\_INFO columns

Name	Type	Description
node_name	text	Node name
next_oid	oid	OID generated next time for the node
next_xid	xid	Transaction ID generated next time for the node
oldest_xid	xid	Oldest transaction ID on the node
xid_vac_limit	xid	Critical point (transaction ID) that triggers forcible autovacuum
oldest_xid_db	oid	OID of the database that has the minimum datafrozenxid on the node
last_extend_cs n_logpage	xid	Number of the last extended cslog page
start_extend_cs n_logpage	xid	Number of the page from which cslog extending starts
next_commit_s eqno	xid	CSN generated next time for the node
latest_complet ed_xid	xid	Latest transaction ID on the node after the transaction commission or rollback
startup_max_xi d	xid	Last transaction ID before the node is powered off

## 12.3.258 PG\_VIEWS

**PG\_VIEWS** provides access to basic information about each view in the database.

**Table 12-363** PG\_VIEWS columns

Name	Type	Reference	Description
schemaname	name	<a href="#">PG_NAMESPACE</a> .nspname	Name of the schema that contains the view
viewname	name	<a href="#">PG_CLASS</a> .relname	View name
viewowner	name	<a href="#">PG_AUTHID</a> .Erolname	Owner of the view
definition	text	-	Definition of the view

## 12.3.259 PGXC\_PREPARED\_XACTS

PGXC\_PREPARED\_XACTS displays two-phase transactions in the prepared phase. Only users with the system admin or monitor admin permission can view the information.

**Table 12-364** PGXC\_PREPARED\_XACTS columns

Name	Type	Description
pgxc_prepared_xact	text	Displays the two-phase transaction in the prepared phase.

## 12.3.260 PGXC\_THREAD\_WAIT\_STATUS

This view is not supported in the centralized system.

## 12.3.261 PLAN\_TABLE

PLAN\_TABLE displays plan information collected by **EXPLAIN PLAN**. Plan information is in a session-level lifecycle. After a session exits, the data will be deleted. Data is isolated between sessions and between users. This view exists in both PG\_CATALOG and SYS schema.

**Table 12-365** PLAN\_TABLE columns

Name	Type	Description
statement_id	character varying(30)	Query tag specified by a user.
plan_id	bigint	Query ID.
id	integer	ID of each operator in a generated plan.
operation	character varying(30)	Operation description of an operator in a plan.
options	character varying(255)	Operation option.
object_name	name	Object name corresponding to the operation, which is not the object alias used in the query. The object name is defined by users.
object_type	character varying(30)	Object type.
object_owner	name	Schema to which the object belongs. It is defined by users.

Name	Type	Description
projection	character varying(4000)	Returned column information.
cost	double precision	Execution cost estimated by the optimizer for an operator.
cardinality	double precision	Number of rows estimated by the optimizer for an operator.
remarks	character varying(4000)	Not supported. Its value is <b>NULL</b> .
timestamp	timestamp(0) without time zone	Not supported. Its value is <b>NULL</b> .
object_node	character varying(128)	Not supported. Its value is <b>NULL</b> .
object_alias	character varying(261)	Not supported. Its value is <b>NULL</b> .
object_instance	numeric	Not supported. Its value is <b>NULL</b> .
optimizer	character varying(255)	Not supported. Its value is <b>NULL</b> .
search_columns	numeric	Not supported. Its value is <b>NULL</b> .
parent_id	numeric	Not supported. Its value is <b>NULL</b> .
depth	numeric	Not supported. Its value is <b>NULL</b> .
position	numeric	Not supported. Its value is <b>NULL</b> .
bytes	numeric	Not supported. Its value is <b>NULL</b> .
other_tag	character varying(255)	Not supported. Its value is <b>NULL</b> .
partition_start	character varying(255)	Not supported. Its value is <b>NULL</b> .
partition_stop	character varying(255)	Not supported. Its value is <b>NULL</b> .
partition_id	numeric	Not supported. Its value is <b>NULL</b> .
other	character varying	Not supported. Its value is <b>NULL</b> .
other_xml	clob	Not supported. Its value is <b>NULL</b> .
distribution	character varying(20)	Not supported. Its value is <b>NULL</b> .
cpu_cost	numeric	Not supported. Its value is <b>NULL</b> .
io_cost	numeric	Not supported. Its value is <b>NULL</b> .

Name	Type	Description
temp_space	numeric	Not supported. Its value is <b>NULL</b> .
access_predicates	character varying(4000)	Not supported. Its value is <b>NULL</b> .
filter_predicates	character varying(4000)	Not supported. Its value is <b>NULL</b> .
time	numeric	Not supported. Its value is <b>NULL</b> .
qblock_name	character varying(128)	Not supported. Its value is <b>NULL</b> .

 **NOTE**

- A valid **object\_type** value consists of a relkind type defined in **PG\_CLASS** (**TABLE**, **INDEX**, **SEQUENCE**, **VIEW**, **COMPOSITE TYPE**, or **TOASTVALUE TOAST**) and the rtekind type used in the plan (**SUBQUERY**, **JOIN**, **FUNCTION**, **VALUES**, **CTE**, or **REMOTE\_QUERY**).
- For RangeTableEntry (RTE), **object\_owner** is the object description used in the plan. Non-user-defined objects do not have **object\_owner**.
- Information in the **statement\_id**, **object\_name**, **object\_owner**, and **projection** columns is stored in letter cases specified by users and information in other columns is stored in uppercase.
- **PLAN\_TABLE** supports only **SELECT** and **DELETE** and does not support other DML operations.

## 12.3.262 ROLE\_ROLE\_PRIVS

ROLE\_ROLE\_PRIVS displays roles granted to other roles and provides only information about the roles that the user has access to. By default, it is accessible to all users. This view exists in both PG\_CATALOG and SYS schema.

**Table 12-366** ROLE\_ROLE\_PRIVS columns

Name	Type	Description
role	character varying(128)	Role name.
granted_role	character varying(128)	Role to be granted.
admin_option	character varying(3)	Specifies whether the grant contains the <b>ADMIN</b> option. <ul style="list-style-type: none"> <li>• <b>YES</b></li> <li>• <b>NO</b></li> </ul>
common	character varying(3)	Not supported. Its value is <b>NULL</b> .

Name	Type	Description
inherited	character varying(3)	Not supported. Its value is <b>NULL</b> .

### 12.3.263 ROLE\_SYS\_PRIVS

ROLE\_SYS\_PRIVS displays information about system privileges granted to roles (only roles accessible to the user are displayed). By default, it is accessible to all users. This view exists in both PG\_CATALOG and SYS schema.

**Table 12-367** ROLE\_SYS\_PRIVS columns

Name	Type	Description
role	character varying(128)	Role name.
privilege	character varying(40)	System permission granted to a role.  System permissions include rolsuper, rolinherit, rolcreatorole, rolcreatedb, rolcatupdate, rolcanlogin, rolreplication, rolauditadmin, rolsystemadmin, roluseft, rolmonitoradmin, roloperatoradmin, and rolpolicyadmin.
admin_option	character varying(3)	Specifies whether the grant contains the <b>ADMIN</b> option. <ul style="list-style-type: none"> <li>• <b>YES</b></li> <li>• <b>NO</b></li> </ul>
common	character varying(3)	Not supported. Its value is <b>NULL</b> .
inherited	character varying(3)	Not supported. Its value is <b>NULL</b> .

### 12.3.264 ROLE\_TAB\_PRIVS

ROLE\_TAB\_PRIVS displays information about object permissions granted to roles (only roles accessible to the user are displayed). By default, it is accessible to all users. This view exists in both PG\_CATALOG and SYS schema.

**Table 12-368** ROLE\_TAB\_PRIVS columns

Name	Type	Description
role	character varying(128)	Role name.
owner	character varying(128)	Object owner
table_name	character varying(128)	Object name. Object types include tables, packages, indexes, and sequences.
column_name	character varying(128)	Not supported. Its value is <b>NULL</b> .
privilege	character varying(40)	Permissions on an object, including USAGE, UPDATE, DELETE, INSERT, CONNECT, SELECT, and EXECUTE.
grantable	character varying(3)	Specifies whether the grant contains the <b>GRANT</b> option. <ul style="list-style-type: none"><li>• <b>YES</b></li><li>• <b>NO</b></li></ul>
common	character varying(3)	Not supported. Its value is <b>NULL</b> .
inherited	character varying(3)	Not supported. Its value is <b>NULL</b> .

### 12.3.265 SYS\_DUMMY

SYS\_DUMMY is automatically created by the database based on the data dictionary. It has only one text column in only one row for storing expression calculation results. This view is accessible to all users. This view exists in both PG\_CATALOG and SYS schema.

**Table 12-369** SYS\_DUMMY columns

Name	Type	Description
dummy	text	Expression calculation result

### 12.3.266 V\_INSTANCE

V\_INSTANCE displays instance information in current database. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in both PG\_CATALOG and SYS schema.

**Table 12-370** V\_INSTANCE columns

Name	Type	Description
instance_number	oid	OID of the current database.
instance_name	character varying(16)	Name of the current database.
host_name	character varying(64)	Host name.
version	character varying(17)	Not supported. Its value is <b>NULL</b> .
version_legacy	character varying(17)	Not supported. Its value is <b>NULL</b> .
version_full	character varying(17)	Not supported. Its value is <b>NULL</b> .
startup_time	timestamp(0) without time zone	Not supported. Its value is <b>NULL</b> .
status	character varying(12)	Not supported. Its value is <b>NULL</b> .
parallel	character varying(3)	Not supported. Its value is <b>NULL</b> .
thread#	numeric	Not supported. Its value is <b>NULL</b> .
archiver	character varying(7)	Not supported. Its value is <b>NULL</b> .
log_switch_wait	character varying(15)	Not supported. Its value is <b>NULL</b> .
logins	character varying(10)	Not supported. Its value is <b>NULL</b> .
shutdown_pending	character varying(3)	Not supported. Its value is <b>NULL</b> .
database_status	character varying(17)	Not supported. Its value is <b>NULL</b> .
instance_role	character varying(18)	Not supported. Its value is <b>NULL</b> .
active_state	character varying(9)	Not supported. Its value is <b>NULL</b> .
blocked	character varying(3)	Not supported. Its value is <b>NULL</b> .
con_id	numeric	Not supported. Its value is <b>NULL</b> .

Name	Type	Description
instance_mode	character varying(11)	Not supported. Its value is <b>NULL</b> .
edition	character varying(7)	Not supported. Its value is <b>NULL</b> .
family	character varying(80)	Not supported. Its value is <b>NULL</b> .
database_type	character varying(15)	Not supported. Its value is <b>NULL</b> .

### 12.3.267 V\_MYSTAT

V\_MYSTAT displays statistics about all sessions in the database. Only the system administrator can access this view. Common users can access this view only after being authorized. This view exists in both PG\_CATALOG and SYS schema.

**Table 12-371** V\_MYSTAT columns

Name	Type	Description
sid	numeric	Current session ID
statistic#	numeric	Not supported. Its value is <b>NULL</b> .
value	numeric	Not supported. Its value is <b>NULL</b> .
con_id	numeric	Not supported. Its value is <b>NULL</b> .

### 12.3.268 V\_SESSION

V\_SESSION displays information about all current sessions. Only the system administrator can access this view. Common users can access this view only after being authorized. This view exists in both pg\_catalog and sys schema.

**Table 12-372** V\_SESSION columns

Name	Type	Description
saddr	raw	Not supported. Its value is <b>NULL</b> .
sid	bigint	Session ID.
serial#	integer	Sequence number of the active backend thread, which is <b>0</b> in GaussDB

Name	Type	Description
audsid	numeric	Not supported. Its value is <b>NULL</b> .
paddr	raw	Not supported. Its value is <b>NULL</b> .
schema#	numeric	Not supported. Its value is <b>NULL</b> .
schemaname	name	Name of the user logged in to the backend.
user#	oid	OID of the user who has logged in to the backend thread. Its value is <b>0</b> if the backend thread is a global auxiliary thread.
username	name	Name of the user logged in to the backend process. <b>username</b> is null if the backend thread is a global auxiliary thread.
command	numeric	Not supported. Its value is <b>NULL</b> .
ownerid	numeric	Not supported. Its value is <b>NULL</b> .
taddr	character varying(16)	Not supported. Its value is <b>NULL</b> .
lockwait	character varying(16)	Not supported. Its value is <b>NULL</b> .
machine	text	Host name of the connected client, as reported by a reverse DNS lookup of <b>client_addr</b> . This column will be non-null only for IP connections and only when <b>log_hostname</b> is enabled.
sql_id	bigint	Query ID.
client_info	text	Client information.
event	text	Queuing status of a statement. Its value can be: <ul style="list-style-type: none"> <li>• <b>waiting in queue</b>: The statement is in the queue.</li> <li>• <b>Empty</b>: The statement is running.</li> </ul>
sql_exec_start	timestamp with time zone	Time when the current active query was started, or time when the last query was started if the value of <b>state</b> is not <b>active</b> .
program	text	Name of the application connected to the backend.

Name	Type	Description
status	text	Overall status of this backend. Its value can be: <ul style="list-style-type: none"> <li>● <b>active</b>: The backend is executing a query.</li> <li>● <b>idle</b>: The backend is waiting for a new client command.</li> <li>● <b>idle in transaction</b>: The backend is in a transaction, but there is no statement being executed in the transaction.</li> <li>● <b>idle in transaction (aborted)</b>: The backend is in a transaction, but there are statements failed in the transaction.</li> <li>● <b>fastpath function call</b>: The backend is executing a fast-path function.</li> <li>● <b>disabled</b>: This state is reported if <b>track_activities</b> is disabled in this backend.</li> </ul>
server	character varying(9)	Not supported. Its value is <b>NULL</b> .
pdml_status	character varying(8)	Specifies whether to enable a DML parallel execution in the current session.
port	numeric	Port number of the current session.
process	character varying(24)	Process ID of the current session.
logon_time	timestamp(0 ) without time zone	Login time of the current session.
last_call_et	integer	Duration when the status of the current session changes last time.
osuser	character varying(128)	Not supported. Its value is <b>NULL</b> .
terminal	character varying(30)	Not supported. Its value is <b>NULL</b> .
type	character varying(10)	Not supported. Its value is <b>NULL</b> .
sql_address	raw	Not supported. Its value is <b>NULL</b> .
sql_hash_value	numeric	Not supported. Its value is <b>NULL</b> .
sql_child_number	numeric	Not supported. Its value is <b>NULL</b> .
sql_exec_id	numeric	Not supported. Its value is <b>NULL</b> .

Name	Type	Description
prev_sql_add r	raw	Not supported. Its value is <b>NULL</b> .
prev_hash_v alue	numeric	Not supported. Its value is <b>NULL</b> .
prev_sql_id	character varying(13)	Not supported. Its value is <b>NULL</b> .
prev_child_n umber	numeric	Not supported. Its value is <b>NULL</b> .
prev_exec_st art	timestamp(0 ) without time zone	Not supported. Its value is <b>NULL</b> .
prev_exec_id	numeric	Not supported. Its value is <b>NULL</b> .
plsql_entry_ object_id	numeric	Not supported. Its value is <b>NULL</b> .
plsql_entry_s ubprogram_i d	numeric	Not supported. Its value is <b>NULL</b> .
plsql_object_ id	numeric	Not supported. Its value is <b>NULL</b> .
plsql_subpro gram_id	numeric	Not supported. Its value is <b>NULL</b> .
module	character varying(64)	Not supported. Its value is <b>NULL</b> .
module_has h	numeric	Not supported. Its value is <b>NULL</b> .
action	character varying(64)	Not supported. Its value is <b>NULL</b> .
action_hash	numeric	Not supported. Its value is <b>NULL</b> .
fixed_table_s equence	numeric	Not supported. Its value is <b>NULL</b> .
row_wait_ob j#	numeric	Not supported. Its value is <b>NULL</b> .
row_wait_fil e#	numeric	Not supported. Its value is <b>NULL</b> .
row_wait_bl ock#	numeric	Not supported. Its value is <b>NULL</b> .
row_wait_ro w#	numeric	Not supported. Its value is <b>NULL</b> .

Name	Type	Description
top_level_call#	numeric	Not supported. Its value is <b>NULL</b> .
pdml_enabled	character varying(3)	Not supported. Its value is <b>NULL</b> .
failover_type	character varying(13)	Not supported. Its value is <b>NULL</b> .
failover_method	character varying(10)	Not supported. Its value is <b>NULL</b> .
failed_over	character varying(3)	Not supported. Its value is <b>NULL</b> .
resource_consumer_group	character varying(32)	Not supported. Its value is <b>NULL</b> .
pddl_status	character varying(8)	Not supported. Its value is <b>NULL</b> .
pq_status	character varying(8)	Not supported. Its value is <b>NULL</b> .
current_queue_duration	numeric	Not supported. Its value is <b>NULL</b> .
client_identifier	character varying(64)	Not supported. Its value is <b>NULL</b> .
blocking_session_status	character varying(11)	Not supported. Its value is <b>NULL</b> .
blocking_instance	numeric	Not supported. Its value is <b>NULL</b> .
blocking_session	numeric	Not supported. Its value is <b>NULL</b> .
final_blocking_session_status	character varying(11)	Not supported. Its value is <b>NULL</b> .
final_blocking_instance	numeric	Not supported. Its value is <b>NULL</b> .
final_blocking_session	numeric	Not supported. Its value is <b>NULL</b> .
seq#	numeric	Not supported. Its value is <b>NULL</b> .
event#	numeric	Not supported. Its value is <b>NULL</b> .
p1text	character varying(64)	Not supported. Its value is <b>NULL</b> .

Name	Type	Description
p1	numeric	Not supported. Its value is <b>NULL</b> .
p1raw	raw	Not supported. Its value is <b>NULL</b> .
p2text	character varying(64)	Not supported. Its value is <b>NULL</b> .
p2	numeric	Not supported. Its value is <b>NULL</b> .
p2raw	raw	Not supported. Its value is <b>NULL</b> .
p3text	character varying(64)	Not supported. Its value is <b>NULL</b> .
p3	numeric	Not supported. Its value is <b>NULL</b> .
p3raw	raw	Not supported. Its value is <b>NULL</b> .
wait_class_id	numeric	Not supported. Its value is <b>NULL</b> .
wait_class#	numeric	Not supported. Its value is <b>NULL</b> .
wait_class	character varying(64)	Not supported. Its value is <b>NULL</b> .
wait_time	numeric	Not supported. Its value is <b>NULL</b> .
seconds_in_wait	numeric	Not supported. Its value is <b>NULL</b> .
state	character varying(19)	Not supported. Its value is <b>NULL</b> .
wait_time_micro	numeric	Not supported. Its value is <b>NULL</b> .
time_remaining_micro	numeric	Not supported. Its value is <b>NULL</b> .
time_since_last_wait_micro	numeric	Not supported. Its value is <b>NULL</b> .
service_name	character varying(64)	Not supported. Its value is <b>NULL</b> .
sql_trace	character varying(8)	Not supported. Its value is <b>NULL</b> .
sql_trace_waits	character varying(5)	Not supported. Its value is <b>NULL</b> .
sql_trace_binds	character varying(5)	Not supported. Its value is <b>NULL</b> .
sql_trace_plan_stats	character varying(10)	Not supported. Its value is <b>NULL</b> .

Name	Type	Description
session_editi on_id	numeric	Not supported. Its value is <b>NULL</b> .
creator_addr	raw	Not supported. Its value is <b>NULL</b> .
creator_seria l#	numeric	Not supported. Its value is <b>NULL</b> .
ecid	character varying(64)	Not supported. Its value is <b>NULL</b> .
sql_translati on_profile_id	numeric	Not supported. Its value is <b>NULL</b> .
pga_tunable _mem	numeric	Not supported. Its value is <b>NULL</b> .
shard_ddl_st atus	character varying(8)	Not supported. Its value is <b>NULL</b> .
con_id	numeric	Not supported. Its value is <b>NULL</b> .
external_na me	character varying(102 4)	Not supported. Its value is <b>NULL</b> .
plsql_debug ger_connect ed	character varying(5)	Not supported. Its value is <b>NULL</b> .

## 12.3.269 V\$GLOBAL\_TRANSACTION

V\$GLOBAL\_TRANSACTION displays information about currently active global transactions. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in both PG\_CATALOG and SYS schema.

**Table 12-373** V\$GLOBAL\_TRANSACTION columns

Name	Type	Description
formatid	numeric	Global transaction format identifier. Not supported. Its value is <b>NULL</b> .
globalid	raw	Global transaction identifier.
branchid	raw	Global transaction branch identifier. Not supported. Its value is <b>NULL</b> . Each individual transaction of a global transaction is called a branch.
branches	numeric	Total number of global transaction branches.

Name	Type	Description
refcount	numeric	Number of siblings for the global transaction (must be the same as branches).
preparecount	numeric	Number of prepared global transaction branches. If the value of <b>system_view_version</b> is greater than <b>0</b> and no prepared global transaction branch exists, the value is <b>0</b> . Otherwise, the value is <b>NULL</b> .
state	character varying(38)	Status of the global transaction branch.
flags	numeric	Numeric representation of the status.
coupling	character varying(15)	Specifies whether the branch is free ('FREE'), loosely coupled ('LOOSELY COUPLED'), or tightly coupled (TIGHTLY COUPLED). Not supported. Its value is <b>NULL</b> .
con_id	numeric	ID of the container related to data. Not supported. Its value is <b>0</b> .

### 12.3.270 V\$NLS\_PARAMETERS

V\$NLS\_PARAMETERS displays the National Language Support (NLS) parameters and parameter values configured for the database. This view exists in the PG\_CATALOG and SYS schema and all users can access this view.

**Table 12-374** V\$NLS\_PARAMETERS columns

Name	Type	Description
parameter	character varying(64)	NLS parameter name.
value	character varying(64)	NLS parameter value.
con_id	numeric	Not supported. Its value is <b>0</b> .

### 12.3.271 V\$SESSION\_WAIT

V\$SESSION\_WAIT displays the current wait event or the last wait event of each session of each user. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in both PG\_CATALOG and SYS schema.

**Table 12-375** V\$SESSION\_WAIT columns

Name	Type	Description
sid	numeric	Session ID, which is mapped to the <b>V \$SESSION.SID</b> column.
seq#	numeric	Not supported. Its value is <b>NULL</b> .
event	character varying(64 )	If the session is waiting, the resource or event that is waiting for is displayed. If the session is not waiting, the resource or event that is waiting for the last time is displayed.
p1text	character varying(64 )	Not supported. Its value is <b>NULL</b> .
p1	numeric	Not supported. Its value is <b>NULL</b> .
p1raw	raw	Not supported. Its value is <b>NULL</b> .
p2text	character varying(64 )	Not supported. Its value is <b>NULL</b> .
p2	numeric	Not supported. Its value is <b>NULL</b> .
p2raw	raw	Not supported. Its value is <b>NULL</b> .
p3text	character varying(64 )	Not supported. Its value is <b>NULL</b> .
p3	numeric	Not supported. Its value is <b>NULL</b> .
p3raw	raw	Not supported. Its value is <b>NULL</b> .
wait_class_id	numeric	Not supported. Its value is <b>NULL</b> .
wait_class#	numeric	Not supported. Its value is <b>NULL</b> .
wait_class	character varying(64 )	Name of a wait event type

Name	Type	Description
wait_time	numeric	<p>If the session is waiting, the value is <b>0</b>. If the session is not waiting, the options are as follows:</p> <ul style="list-style-type: none"> <li>• <b>&gt;0</b>: duration of the last wait (unit: centisecond).</li> <li>• <b>-1</b>: The duration of the last wait is less than a centisecond.</li> <li>• <b>-2</b>: The <b>TIMED_STATISTICS</b> parameter is set to <b>false</b>.</li> </ul> <p>This column has been deprecated and replaced by <b>WAIT_TIME_MICRO</b> and <b>STATE</b>.</p>
seconds_in_wait	numeric	<p>If the session is waiting, the value is the amount of time to wait. If the session is not waiting, the value is the amount of time since the last wait started.</p> <p>This column has been deprecated and replaced by the <b>WAIT_TIME_MICRO</b> and <b>TIME_SINCE_LAST_WAIT_MICRO</b> columns.</p>
state	character varying(19)	<p>Waiting state. The options are as follows:</p> <ul style="list-style-type: none"> <li>• <b>WAITING</b>: The session is waiting.</li> <li>• <b>WAITED UNKNOWN TIME</b>: The duration of the last wait is unknown. This value is used when <b>TIMED_STATISTICS</b> is set to <b>false</b>.</li> <li>• <b>WAITED SHORT TIME</b>: The duration of the last wait is less than a centisecond.</li> <li>• <b>WAITED KNOWN TIME</b>: duration of the last wait specified in the <b>WAIT_TIME</b> column.</li> </ul>
wait_time_micro	numeric	<p>Wait time, in microseconds. If the session is waiting, the value is the time spent in the current wait. If the session is not waiting, the value is the time spent for the last wait.</p>
time_remaining_micro	numeric	<p>Not supported. Its value is <b>NULL</b>.</p>
time_since_last_wait_micro	numeric	<p>Time elapsed since the last wait ended, in microseconds. If the session is waiting, the value is <b>0</b>.</p>
con_id	numeric	<p>Not supported. Its value is <b>0</b>.</p>

## 12.3.272 V\$SYSSTAT

V\$SYSSTAT displays the resource usage of the entire database instance since the database instance is started. By default, only the initial user or monitoring administrator can access the database. Other users can access the database only after being granted the MONADMIN permission. This view exists in both PG\_CATALOG and SYS schema.

**Table 12-376** V\$SYSSTAT columns

Name	Type	Description
statistic#	numeric	Statistics ID.
name	character varying(64)	Statistical item name.
class	numeric	Not supported. Its value is <b>NULL</b> .
value	numeric	Statistical item value.
stat_id	numeric	Not supported. Its value is <b>NULL</b> .
con_id	numeric	Not supported. Its value is <b>0</b> .

## 12.3.273 V\$SYSTEM\_EVENT

V\$SYSTEM\_EVENT displays information about all the wait events (summary of each wait event since the instance is started). By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in both PG\_CATALOG and SYS schema.

**Table 12-377** V\$SYSTEM\_EVENT columns

Name	Type	Description
event	character varying(64)	Wait event name
total_waits	numeric	Total number of wait events
total_timeouts	numeric	Total number of timeout events
time_waited	numeric	Total time (in centiseconds) of wait events
average_wait	numeric	Average time (in centiseconds) of wait events
time_waited_micro	numeric	Total time (in microseconds) of wait events
total_waits_fg	numeric	Not supported. Its value is <b>NULL</b> .
total_timeouts_fg	numeric	Not supported. Its value is <b>NULL</b> .

Name	Type	Description
time_waited_fg	numeric	Not supported. Its value is <b>NULL</b> .
average_wait_fg	numeric	Not supported. Its value is <b>NULL</b> .
time_waited_micro_fg	numeric	Not supported. Its value is <b>NULL</b> .
event_id	numeric	Not supported. Its value is <b>NULL</b> .
wait_class_id	numeric	Not supported. Its value is <b>NULL</b> .
wait_class#	numeric	Not supported. Its value is <b>NULL</b> .
wait_class	character varying(64)	Class name of a wait event
con_id	numeric	Not supported. Its value is <b>0</b> .

## 12.3.274 V\$VERSION

V\$VERSION displays the version number of the database. This view exists in both PG\_CATALOG and SYS schema and all users can access this view.

**Table 12-378** V\$VERSION columns

Name	Type	Description
banner	character varying(80)	Component name and version number
banner_full	character varying(160)	Database version and specific version number
banner_legacy	character varying(80)	Database version
con_id	numeric	Not supported. Its value is <b>0</b> .

## 12.4 Discarded

### 12.4.1 System Views

### 12.4.1.1 GET\_GLOBAL\_PREPARED\_XACTS

This view is not supported in the centralized system.

### 12.4.1.2 PG\_GET\_INVALID\_BACKENDS

The view cannot be queried, and the error message "Un-support feature" is displayed.

# 13 Schemas

The following table describes the schemas supported by GaussDB.

 **NOTE**

Do not create service data of users in a schema that provides functional APIs, including but not limited to tables and functions (such as `dbe_*` and `pkg_*`).

**Table 13-1** Schemas supported by GaussDB

Schema	Description
db4ai	Manages data of different versions in AI training.
dbe_perf	Diagnoses performance issues and is also the data source of WDR snapshots. After a database is installed, only the initial user and monitoring administrator have permission to view views and functions in this schema by default.
dbe_pldebugger	Debugs PL/SQL functions and stored procedures.
snapshot	Manages data related to WDR snapshots. By default, the initial user or monitoring administrator can access the data.
sqladvisor	Is used for distribution key recommendation and is unavailable in centralized deployment.
sys	Provides the system information view APIs.
pg_catalog	Maintains system catalog information, including system catalogs and all built-in data types, functions, and operators.
pg_toast	Stores large objects (for internal use).
public	Public schema, which is used to store public objects. If <b>search_path</b> is not specified and a schema with the same name exists, new tables (and other objects) are created in the schema by default. If no schema with the same name exists, new tables (and other objects) are automatically placed in this public schema.

Schema	Description
pkg_service	Manages information about the package service.
pkg_util	Manages information about the package tool.
dbe_raw	Advanced function package dbe_raw, which is used to convert raw data, obtain substrings, and calculate the length.
dbe_session	Advanced function package dbe_session, which is used to set the value of a specified attribute and support user query and verification.
dbe_lob	Advanced function package dbe_lob, which is used to read, write, and copy large files (CLOB/BLOB).
dbe_match	Advanced function package dbe_match, which is used to compare character string similarity.
dbe_task	Advanced function package dbe_task, which is used to schedule job tasks, including submitting tasks, canceling tasks, synchronizing task status, and updating task information, so that the database can periodically execute specific tasks.
dbe_sql	Advanced function package dbe_sql, which is used to execute dynamic SQL statements and construct query and other commands during application running.
dbe_file	Advanced function package <b>dbe_file</b> , which is used to read, copy, write, delete, and rename external database files.
dbe_output	Advanced function package dbe_output, which is used to print output information.
dbe_random	Advanced function package dbe_random, which is used to generate random seeds and random numbers.
dbe_application_info	Advanced function package dbe_application_info, which is used for recording client information.
dbe_utility	Advanced function package <b>dbe_utility</b> , which is used to call the debugging tool in a stored procedure, for example, to print error stacks.
dbe_scheduler	Advanced function package <b>dbe_scheduler</b> , which is used to create scheduled jobs and enable the database to periodically execute specified tasks through programs and schedules. You can also perform external database tasks by authorizing and providing certificates.
information_schema	Stores information about objects defined in the current database.
dbe_pldeveloper	Compiles and debugs user stored procedures.
dbe_sql_util	SQL O&M function, including the O&M API of SQL patches.

## 13.1 Information Schema

An information schema named INFORMATION\_SCHEMA automatically exists in all databases. An information schema consists of a group of views that contain information about objects defined in the current database. The owner of this schema is the initial database user. However, all users have only the permission to use this schema and do not have the permission to create objects such as tables and functions.

Information schemas are compatible with PG, including constraint\_table\_usage, domain\_constraints, domain\_udt\_usage, domains, enabled\_roles, key\_column\_usage, parameters, referential\_constraints, applicable\_roles, administrable\_role\_authorizations, attributes, character\_sets, check\_constraint\_routine\_usage, check\_constraints, collations, collation\_character\_set\_applicability, column\_domain\_usage, column\_privileges, column\_udt\_usage, columns, constraint\_column\_usage, role\_column\_grants, routine\_privileges, role\_routine\_grants, routines, schemata, sequences, table\_constraints, table\_privileges, role\_table\_grants, tables, triggered\_update\_columns, triggers, udt\_privileges, role\_udt\_grants, usage\_privileges, role\_usage\_grants, user\_defined\_types, view\_column\_usage, view\_routine\_usage, view\_table\_usage, views, data\_type\_privileges, element\_types, column\_options, foreign\_data\_wrapper\_options, foreign\_data\_wrappers, foreign\_server\_options, foreign\_servers, foreign\_table\_options, foreign\_tables, user\_mapping\_options, user\_mappings, sql\_features, sql\_implementation\_info, sql\_languages, sql\_packages, sql\_parts, sql\_sizing, and sql\_sizing\_profiles.

The following sections display only the views that are not listed in the preceding description.

### 13.1.1 \_PG\_FOREIGN\_DATA\_WRAPPERS

**\_PG\_FOREIGN\_DATA\_WRAPPERS** displays information about a foreign-data wrapper. Only the sysadmin user has the permission to view this view.

**Table 13-2** \_PG\_FOREIGN\_DATA\_WRAPPERS columns

Name	Type	Description
oid	oid	OID of the foreign-data wrapper
fdwowner	oid	OID of the owner of the foreign-data wrapper
fdwoptions	text[]	Foreign-data wrapper specific option, expressed in a string in the format of <i>keyword=value</i>

foreign_data_wrapper_catalog	information_schema.sql_identifier	Name of the database where the foreign-data wrapper is located (always the current database)
foreign_data_wrapper_name	information_schema.sql_identifier	Name of the foreign-data wrapper
authorization_identifier	information_schema.sql_identifier	Role of the owner of the foreign-data wrapper
foreign_data_wrapper_language	information_schema.character_data	Programming language of the foreign-data wrapper

## 13.1.2 \_PG\_FOREIGN\_SERVERS

**\_PG\_FOREIGN\_SERVERS** displays information about a foreign server. Only the sysadmin user has the permission to view this view.

**Table 13-3** \_PG\_FOREIGN\_SERVERS columns

Name	Type	Description
oid	oid	OID of the foreign server
srvoptions	text[]	Foreign server specific options, expressed in a string in the format of <i>keyword=value</i>
foreign_server_catalog	information_schema.sql_identifier	Name of the database where the foreign server is located (always the current database)
foreign_server_name	information_schema.sql_identifier	Name of the foreign server
foreign_data_wrapper_catalog	information_schema.sql_identifier	Name of the database where the foreign-data wrapper is located (always the current database)
foreign_data_wrapper_name	information_schema.sql_identifier	Name of the foreign-data wrapper
foreign_server_type	information_schema.character_data	Type of the foreign server
foreign_server_version	information_schema.character_data	Version of the foreign server

authorization_identifier	information_schema.sql_identifier	Role of the owner of the foreign server
--------------------------	-----------------------------------	-----------------------------------------

### 13.1.3 \_PG\_FOREIGN\_TABLE\_COLUMNS

**\_PG\_FOREIGN\_TABLE\_COLUMNS** displays column information about a foreign table. Only the sysadmin user has the permission to view this view.

**Table 13-4** \_PG\_FOREIGN\_TABLE\_COLUMNS columns

Name	Type	Description
nspname	name	Schema name
relname	name	Table name
attname	name	Column name
attdwoptions	text[]	Attribute-level foreign data wrapper options, expressed in a string in the format of <i>keyword=value</i>

### 13.1.4 \_PG\_FOREIGN\_TABLES

**\_PG\_FOREIGN\_TABLES** stores information about all foreign tables defined in the current database, whereas displays information about foreign tables accessible to the current user. Only the sysadmin user has the permission to view this view.

**Table 13-5** \_PG\_FOREIGN\_TABLES columns

Name	Type	Description
foreign_table_catalog	information_schema.sql_identifier	Name of the database where the foreign table is located (always the current database)
foreign_table_schema	name	Name of the schema that the foreign table is in
foreign_table_name	name	Name of the foreign table
ftoptions	text[]	Foreign table options
foreign_server_catalog	information_schema.sql_identifier	Name of the database where the foreign server is located (always the current database)
foreign_server_name	information_schema.sql_identifier	Name of the foreign server

authorization_identifier	information_schema.sql_identifier	Role of the owner
--------------------------	-----------------------------------	-------------------

### 13.1.5 \_PG\_USER\_MAPPINGS

Stores mappings from local users to remote users. Only the sysadmin user has the permission to view this view.

**Table 13-6** \_PG\_USER\_MAPPINGS columns

Name	Type	Description
oid	oid	OID of the mapping from the local user to a remote user.
umoptions	text[]	User mapping specific options, expressed in a string in the format of <i>keyword=value</i> .
umuser	oid	OID of the local user being mapped ( <b>0</b> if the user mapping is public).
authorization_identifier	information_schema.sql_identifier	Role of the local user.
foreign_server_catalog	information_schema.sql_identifier	Name of the database where the foreign server is located (always the current database).
foreign_server_name	information_schema.sql_identifier	Name of the foreign server.
srvowner	information_schema.sql_identifier	Owner of the foreign server.

### 13.1.6 INFORMATION\_SCHEMA\_CATALOG\_NAME

Displays the name of the current database.

**Table 13-7** INFORMATION\_SCHEMA\_CATALOG\_NAME columns

Name	Type	Description
catalog_name	information_schema.sql_identifier	Current database name.

## 13.2 DBE\_PERF Schema

In the **DBE\_PERF** schema, views are used to diagnose performance issues and are also the data source of WDR snapshots. After the database is installed, only the initial user and monitoring administrator have the permission for the **DBE\_PERF** schema by default. If the database is upgraded from an earlier version, permissions for the **DBE\_PERF** schema are the same as those of the earlier version to ensure forward compatibility. Organization views are divided based on multiple dimensions, such as OS, instance, and memory. These views comply with the following naming rules:

- Views starting with **GLOBAL\_**: Request data from database nodes and return the data without processing them.
- Views starting with **SUMMARY\_**: Summarize data in the database. In most cases, data from database nodes (sometimes only the primary database node) is processed and collected.
- Views that do not start with **GLOBAL\_** or **SUMMARY\_**: Local views that do not request data from other database nodes.

### 13.2.1 OS

#### 13.2.1.1 OS\_RUNTIME

**OS\_RUNTIME** displays the running status of the current OS.

**Table 13-8** OS\_RUNTIME columns

Name	Type	Description
id	integer	ID
name	text	Name of the OS running status
value	numeric	Value of the OS running status
comments	text	Remarks of the OS running status
cumulative	boolean	Whether the value of the OS running status is cumulative

#### 13.2.1.2 GLOBAL\_OS\_RUNTIME

Provides OS running status information about all normal nodes in the database.

**Table 13-9** GLOBAL\_OS\_RUNTIME columns

Name	Type	Description
node_name	name	Node name
id	integer	ID
name	text	Name of the OS running status
value	numeric	Value of the OS running status
comments	text	Remarks of the OS running status
cumulative	boolean	Whether the value of the OS running status is cumulative

### 13.2.1.3 OS\_THREADS

Provides information about the status of all threads under the current node.

**Table 13-10** OS\_THREADS columns

Name	Type	Description
node_name	text	Current node name.
pid	bigint	ID of the thread running within the current node process
lwpid	integer	Lightweight thread ID corresponding to <b>pid</b>
thread_name	text	Name of the thread corresponding to <b>pid</b>
creation_time	timestamp with time zone	Creation time of the thread corresponding to <b>pid</b>

### 13.2.1.4 GLOBAL\_OS\_THREADS

Provides status information about threads on all normal nodes in the database.

**Table 13-11** GLOBAL\_OS\_THREADS columns

Name	Type	Description
node_name	text	Node name
pid	bigint	ID of the thread running under the current node process

Name	Type	Description
lwpid	integer	Lightweight thread ID corresponding to <b>pid</b>
thread_name	text	Name of the thread corresponding to <b>pid</b>
creation_time	timestamp with time zone	Creation time of the thread corresponding to <b>pid</b>

### 13.2.1.5 NODE\_NAME

Provides the names of all normal nodes in the database.

**Table 13-12** NODE\_NAME columns

Name	Type	Description
node_name	name	Node name

## 13.2.2 Instance

### 13.2.2.1 INSTANCE\_TIME

**INSTANCE\_TIME** records time consumption information on the current database node. The time consumption information is classified into the following types:

- **DB\_TIME**: effective time spent by jobs in multi-core scenarios
- **CPU\_TIME**: CPU time cost.
- **EXECUTION\_TIME**: time spent in the executor.
- **PARSE\_TIME**: time spent on parsing SQL statements
- **PLAN\_TIME**: time spent on generating plans
- **REWRITE\_TIME**: time spent on rewriting SQL statements
- **PL\_EXECUTION\_TIME**: execution time of the PL/SQL stored procedure.
- **PL\_COMPILATION\_TIME**: compilation time of the PL/SQL stored procedure.
- **NET\_SEND\_TIME**: time spent on the network
- **DATA\_IO\_TIME**: time spent on I/Os.

**Table 13-13** INSTANCE\_TIME columns

Name	Type	Description
stat_id	integer	Statistics ID

Name	Type	Description
stat_name	text	Type name
value	bigint	Time value (unit: $\mu$ s)

### 13.2.2.2 GLOBAL\_INSTANCE\_TIME

Provides time consumption information about all normal nodes in the database. For details about the time types, see the INSTANCE\_TIME view.

**Table 13-14** GLOBAL\_INSTANCE\_TIME columns

Name	Type	Description
node_name	name	Node name
stat_id	integer	Statistics ID
stat_name	text	Type name
value	bigint	Duration (unit: $\mu$ s)

## 13.2.3 Memory

### 13.2.3.1 GS\_SHARED\_MEMORY\_DETAIL

Queries the usage information about shared memory contexts on the current node.

**Table 13-15** GS\_SHARED\_MEMORY\_DETAIL columns

Name	Type	Description
contextname	text	Name of the memory context.
level	smallint	Level of the memory context.
parent	text	Name of the parent memory context.
totalsize	bigint	Total size of the shared memory (unit: byte).
freesize	bigint	Remaining size of the shared memory (unit: byte).
usedsize	bigint	Used size of the shared memory (unit: byte).

### 13.2.3.2 GLOBAL\_MEMORY\_NODE\_DETAIL

Displays the memory usage of all normal nodes in the database.

**Table 13-16** GLOBAL\_MEMORY\_NODE\_DETAIL columns

Name	Type	Description
nodename	text	Node name.
memorytype	text	Memory name. <ul style="list-style-type: none"> <li>• <b>max_process_memory</b>: maximum available memory of the database node.</li> <li>• <b>process_used_memory</b>: memory occupied by a process.</li> <li>• <b>max_dynamic_memory</b>: maximum dynamic memory.</li> <li>• <b>dynamic_used_memory</b>: used dynamic memory.</li> <li>• <b>dynamic_peak_memory</b>: dynamic peak memory.</li> <li>• <b>dynamic_used_shrctx</b>: context of the used dynamic shared memory.</li> <li>• <b>dynamic_peak_shrctx</b>: dynamic peak value of the shared memory context.</li> <li>• <b>max_shared_memory</b>: maximum shared memory.</li> <li>• <b>shared_used_memory</b>: used shared memory.</li> <li>• <b>max_sctpcomm_memory</b>: maximum memory allowed for TCP proxy communications.</li> <li>• <b>sctpcomm_used_memory</b>: used memory for TCP proxy communications.</li> <li>• <b>sctpcomm_peak_memory</b>: memory peak of TCP proxy communications.</li> <li>• <b>other_used_memory</b>: other used memory.</li> <li>• <b>gpu_max_dynamic_memory</b>: maximum dynamic GPU memory.</li> <li>• <b>gpu_dynamic_used_memory</b>: used dynamic GPU memory.</li> <li>• <b>gpu_dynamic_peak_memory</b>: dynamic peak GPU memory.</li> <li>• <b>pooler_conn_memory</b>: applied memory in the connection pool.</li> <li>• <b>pooler_freeconn_memory</b>: memory occupied by idle connections in the connection pool.</li> <li>• <b>storage_compress_memory</b>: memory used by the storage module for compression.</li> <li>• <b>udf_reserved_memory</b>: reserved memory for the UDF.</li> </ul>

Name	Type	Description
memorybytes	integer	Size of the used memory in the unit of MB.

### 13.2.3.3 GLOBAL\_SHARED\_MEMORY\_DETAIL

Queries the usage of shared memory contexts on all normal nodes in the database.

**Table 13-17** GLOBAL\_SHARED\_MEMORY\_DETAIL columns

Name	Type	Description
node_name	name	Node name
contextname	text	Name of the memory context
level	smallint	Level of the memory context
parent	text	Name of the parent memory context
totalsize	bigint	Total size of the shared memory (unit: byte)
freesize	bigint	Remaining size of the shared memory (unit: byte)
usedsize	bigint	Used size of the shared memory (unit: byte)

### 13.2.3.4 MEMORY\_NODE\_DETAIL

Displays memory usage of the current database node.

**Table 13-18** MEMORY\_NODE\_DETAIL columns

Name	Type	Description
nodename	text	Node name.

Name	Type	Description
memorytype	text	<p>Memory name</p> <ul style="list-style-type: none"> <li>● <b>max_process_memory</b>: maximum available memory of the database node.</li> <li>● <b>process_used_memory</b>: memory occupied by a process.</li> <li>● <b>max_dynamic_memory</b>: maximum dynamic memory.</li> <li>● <b>dynamic_used_memory</b>: used dynamic memory.</li> <li>● <b>dynamic_peak_memory</b>: dynamic peak memory.</li> <li>● <b>dynamic_used_shrctx</b>: context of the used dynamic shared memory.</li> <li>● <b>dynamic_peak_shrctx</b>: dynamic peak value of the shared memory context.</li> <li>● <b>max_shared_memory</b>: maximum shared memory.</li> <li>● <b>shared_used_memory</b>: used shared memory.</li> <li>● <b>max_sctpcomm_memory</b>: maximum memory allowed for TCP proxy communications.</li> <li>● <b>sctpcomm_used_memory</b>: used memory for TCP proxy communications.</li> <li>● <b>sctpcomm_peak_memory</b>: memory peak of TCP proxy communications.</li> <li>● <b>other_used_memory</b>: other used memory.</li> <li>● <b>gpu_max_dynamic_memory</b>: maximum dynamic GPU memory.</li> <li>● <b>gpu_dynamic_used_memory</b>: used dynamic memory of GPU.</li> <li>● <b>gpu_dynamic_peak_memory</b>: dynamic peak value of the GPU memory.</li> <li>● <b>pooler_conn_memory</b>: applied memory in the connection pool.</li> <li>● <b>pooler_freeconn_memory</b>: memory occupied by idle connections in the connection pool.</li> <li>● <b>storage_compress_memory</b>: memory used by the storage module for compression.</li> <li>● <b>udf_reserved_memory</b>: reserved memory for the UDF.</li> </ul>
memorybytes	integer	Size of the used memory in the unit of MB.

### 13.2.3.5 SHARED\_MEMORY\_DETAIL

**SHARED\_MEMORY\_DETAIL** queries the usage information about shared memory contexts on the current node.

**Table 13-19 Table 1 SHARED\_MEMORY\_DETAIL columns**

Name	Type	Description
contextname	text	Name of the memory context
level	smallint	Level of the memory context
parent	text	Name of the parent memory context
totalsize	bigint	Total size of the shared memory (unit: byte)
freesize	bigint	Remaining size of the shared memory (unit: byte)
usedsize	bigint	Used size of the shared memory (unit: byte)

## 13.2.4 File

### 13.2.4.1 FILE\_IOSTAT

Records statistics about data file I/Os to indicate I/O performance and detect performance problems such as abnormal I/O operations.

**Table 13-20 FILE\_IOSTAT columns**

Name	Type	Description
filenum	oid	File identifier
dbid	oid	Database ID
spcid	oid	Tablespace ID
phyrds	bigint	Number of times of reading physical files
phywrts	bigint	Number of times of writing into physical files
phyblkrd	bigint	Number of times of reading physical file blocks
phyblkwrt	bigint	Number of times of writing into physical file blocks

Name	Type	Description
readtim	bigint	Total duration of reading (unit: $\mu$ s)
writetim	bigint	Total duration of writing (unit: $\mu$ s)
avgiotim	bigint	Average duration of reading and writing (unit: $\mu$ s)
lstiotim	bigint	Duration of the last file reading (unit: $\mu$ s)
miniotim	bigint	Minimum duration of reading and writing (unit: $\mu$ s)
maxiowtm	bigint	Maximum duration of reading and writing (unit: $\mu$ s)

### 13.2.4.2 SUMMARY\_FILE\_IOSTAT

Records statistics about data file I/Os in the database to indicate I/O performance and detect performance problems such as abnormal I/O operations.

The values of **phyrds**, **phywrts**, **phyblkrd**, **phyblkwrt**, **readtim** and **writetim** are summed up based on the data of each node. **avgiotim** is the average value (total duration/total times) of each node. **lstiotim** and **maxiowtm** are the maximum values of each node. **miniotim** is the minimum value of each node.

**Table 13-21** SUMMARY\_FILE\_IOSTAT columns

Name	Type	Description
filenum	oid	File ID.
dbid	oid	Database ID.
spcid	oid	Tablespace ID.
phyrds	numeric	Number of times of reading physical files.
phywrts	numeric	Number of times of writing into physical files.
phyblkrd	numeric	Number of times of reading physical file blocks.
phyblkwrt	numeric	Number of times of writing into physical file blocks.
readtim	numeric	Total duration of reading (unit: $\mu$ s).
writetim	numeric	Total duration of writing (unit: $\mu$ s).

Name	Type	Description
avgiotim	bigint	Average duration of reading and writing (unit: $\mu$ s).
lstiotim	bigint	Duration of the last file reading (unit: $\mu$ s).
miniotim	bigint	Minimum duration of reading and writing (unit: $\mu$ s).
maxiowtm	bigint	Maximum duration of reading and writing (unit: $\mu$ s).

### 13.2.4.3 GLOBAL\_FILE\_IOSTAT

Displays the data file I/O statistics of all nodes in the database.

**Table 13-22** GLOBAL\_FILE\_IOSTAT columns

Name	Type	Description
node_name	name	Node name.
filenum	oid	File ID.
dbid	oid	Database ID.
spcid	oid	Tablespace ID.
phyrds	bigint	Number of times of reading physical files.
phywrts	bigint	Number of times of writing into physical files.
phyblkrd	bigint	Number of times of reading physical file blocks.
phyblkwrt	bigint	Number of times of writing into physical file blocks.
readtim	bigint	Total duration of reading (unit: $\mu$ s).
writetim	bigint	Total duration of writing (unit: $\mu$ s).
avgiotim	bigint	Average duration of reading and writing (unit: $\mu$ s).
lstiotim	bigint	Duration of the last file reading (unit: $\mu$ s).
miniotim	bigint	Minimum duration of reading and writing (unit: $\mu$ s).

Name	Type	Description
maxiowtm	bigint	Maximum duration of reading and writing (unit: $\mu$ s).

### 13.2.4.4 FILE\_REDO\_IOSTAT

**FILE\_REDO\_IOSTAT** records statistics about redo logs (WALs) on the current node.

**Table 13-23** FILE\_REDO\_IOSTAT columns

Name	Type	Description
phywrts	bigint	Number of times writing into the WAL buffer
phyblkwrt	bigint	Number of blocks written into the WAL buffer
wrietim	bigint	Duration of writing into Xlog files (unit: $\mu$ s)
avgiotim	bigint	Average duration of writing into Xlog files (unit: $\mu$ s). <b>avgiotim = wrietim/phywrts</b>
lstiotim	bigint	Duration of the last writing into Xlog files (unit: $\mu$ s)
miniotim	bigint	Minimum duration of writing into Xlog files (unit: $\mu$ s)
maxiowtm	bigint	Maximum duration of writing into Xlog files (unit: $\mu$ s)

### 13.2.4.5 SUMMARY\_FILE\_REDO\_IOSTAT

Records statistics about all redo logs and WALs on all nodes in the database. The values of the **phywrts**, **phyblkwrt**, and **wrietim** columns are accumulated based on the data of each node. The value of **avgiotim** is the average value of each node (summed up **wrietim** or **phywrts**). The values of **lstiotim** and **maxiowtm** are the maximum values of each node, and the value of **miniotim** is the minimum value of each node.

**Table 13-24** SUMMARY\_FILE\_REDO\_IOSTAT columns

Name	Type	Description
phywrts	numeric	Number of times writing into the WAL buffer.

Name	Type	Description
phyblkwrt	numeric	Number of blocks written into the WAL buffer.
writetim	numeric	Duration of writing into Xlog files (unit: $\mu$ s).
avgiotim	bigint	Average duration of writing into Xlog files (unit: $\mu$ s). <b>avgiotim = writetim/phywrts.</b>
lstiotim	bigint	Duration of the last writing into Xlog files (unit: $\mu$ s).
miniotim	bigint	Minimum duration of writing into Xlog files (unit: $\mu$ s).
maxiowtm	bigint	Maximum duration of writing into Xlog files (unit: $\mu$ s).

### 13.2.4.6 GLOBAL\_FILE\_REDO\_IOSTAT

Displays statistics about redo logs (WALs) on nodes in the database.

**Table 13-25** GLOBAL\_FILE\_REDO\_IOSTAT columns

Name	Type	Description
node_name	name	Node name
phywrts	bigint	Number of times writing into the WAL buffer
phyblkwrt	bigint	Number of blocks written into the WAL buffer
writetim	bigint	Duration of writing into Xlog files (unit: $\mu$ s)
avgiotim	bigint	Average duration of writing into Xlog files (unit: $\mu$ s). <b>avgiotim = writetim/phywrts</b>
lstiotim	bigint	Duration of the last writing into Xlog files (unit: $\mu$ s)
miniotim	bigint	Minimum duration of writing into Xlog files (unit: $\mu$ s)
maxiowtm	bigint	Maximum duration of writing into Xlog files (unit: $\mu$ s)

### 13.2.4.7 LOCAL\_REL\_IOSTAT

Displays the accumulated I/O status of all data files on the current node.

**Table 13-26** LOCAL\_REL\_IOSTAT columns

Name	Type	Description
phyrds	bigint	Number of times of reading physical files
phywrts	bigint	Number of times of writing into physical files
phyblkrd	bigint	Number of times of reading physical file blocks
phyblkwrt	bigint	Number of times of writing into physical file blocks

### 13.2.4.8 GLOBAL\_REL\_IOSTAT

Displays statistics about data file I/Os on all nodes.

**Table 13-27** GLOBAL\_REL\_IOSTAT columns

Name	Type	Description
node_name	name	Node name
phyrds	bigint	Number of times of reading physical files
phywrts	bigint	Number of times of writing into physical files
phyblkrd	bigint	Number of times of reading physical file blocks
phyblkwrt	bigint	Number of times of writing into physical file blocks

### 13.2.4.9 SUMMARY\_REL\_IOSTAT

Obtains the summary of data file I/O statistics of all nodes.

**Table 13-28** SUMMARY\_REL\_IOSTAT columns

Name	Type	Description
phyrds	numeric	Number of times of reading physical files.

Name	Type	Description
phywrts	numeric	Number of times of writing into physical files.
phyblkrd	numeric	Number of times of reading physical file blocks.
phyblkwrt	numeric	Number of times of writing into physical file blocks.

## 13.2.5 Object

### 13.2.5.1 STAT\_USER\_TABLES

Displays the status information about user-defined ordinary tables in all schemas on the current node.

**Table 13-29** STAT\_USER\_TABLES columns

Name	Type	Description
relid	oid	Table OID
schemaname	name	Name of the schema where the table is located.
relname	name	Table name
seq_scan	bigint	Number of sequential scans initiated on the table
seq_tup_read	bigint	Number of live rows fetched by sequential scans
idx_scan	bigint	Number of index scans initiated on the table
idx_tup_fetch	bigint	Number of live rows fetched by index scans
n_tup_ins	bigint	Number of rows inserted
n_tup_upd	bigint	Number of rows updated
n_tup_del	bigint	Number of rows deleted
n_tup_hot_upd	bigint	Number of rows updated by HOT (that is, the number of rows whose index columns are not updated).
n_live_tup	bigint	Estimated number of live rows
n_dead_tup	bigint	Estimated number of inactive rows.

Name	Type	Description
last_vacuum	timestamp with time zone	Last time at which this table was manually vacuumed (not counting <b>VACUUM FULL</b> )
last_autovacuum	timestamp with time zone	Last time when the table was vacuumed by the autovacuum daemon thread.
last_analyze	timestamp with time zone	Last time at which the table was manually analyzed
last_autoanalyze	timestamp with time zone	Last time when the table was analyzed by the autovacuum daemon thread.
vacuum_count	bigint	Number of times the table has been manually vacuumed (not counting <b>VACUUM FULL</b> )
autovacuum_count	bigint	Number of times this table has been vacuumed by the autovacuum daemon
analyze_count	bigint	Number of times the table has been manually analyzed
autoanalyze_count	bigint	Number of times the table has been analyzed by the autovacuum daemon thread.

### 13.2.5.2 SUMMARY\_STAT\_USER\_TABLES

Displays the sum of the status information about user-defined ordinary tables in all schemas of each database node. The timestamp column is not summed up and only the latest value of this column on all nodes is used.

**Table 13-30** SUMMARY\_STAT\_USER\_TABLES columns

Name	Type	Description
schemaname	name	Name of the schema where the table is located.
relname	name	Table name
seq_scan	numeric	Number of sequential scans initiated on this table
seq_tup_read	numeric	Number of live rows fetched by sequential scans

Name	Type	Description
idx_scan	numeric	Number of index scans initiated on the table
idx_tup_fetch	numeric	Number of live rows fetched by index scans
n_tup_ins	numeric	Number of rows inserted
n_tup_upd	numeric	Number of rows updated
n_tup_del	numeric	Number of rows deleted
n_tup_hot_upd	numeric	Number of rows updated by HOT (that is, the number of rows whose index columns are not updated).
n_live_tup	numeric	Estimated number of live rows
n_dead_tup	numeric	Estimated number of inactive rows.
last_vacuum	timestamp with time zone	Last time at which this table was manually vacuumed (not counting <b>VACUUM FULL</b> )
last_autovacuum	timestamp with time zone	Last time when the table was vacuumed by the autovacuum daemon thread.
last_analyze	timestamp with time zone	Last time at which this table was manually analyzed
last_autoanalyze	timestamp with time zone	Last time when the table was analyzed by the autovacuum daemon thread.
vacuum_count	numeric	Number of times the table has been manually vacuumed (not counting <b>VACUUM FULL</b> )
autovacuum_count	numeric	Number of times the table has been vacuumed by the autovacuum daemon
analyze_count	numeric	Number of times the table has been manually analyzed
autoanalyze_count	numeric	Number of times the table has been analyzed by the autovacuum daemon thread.

### 13.2.5.3 GLOBAL\_STAT\_USER\_TABLES

Displays the status information (not summed up) about user-defined ordinary tables in all schemas on each database node.

**Table 13-31** GLOBAL\_STAT\_USER\_TABLES columns

Name	Type	Description
node_name	name	Node name
relid	oid	OID of the table
schemaname	name	Name of the schema where the table is located.
relname	name	Table name
seq_scan	bigint	Number of sequential scans initiated on this table
seq_tup_read	bigint	Number of live rows fetched by sequential scans
idx_scan	bigint	Number of index scans initiated on the table
idx_tup_fetch	bigint	Number of live rows fetched by index scans
n_tup_ins	bigint	Number of rows inserted
n_tup_upd	bigint	Number of rows updated
n_tup_del	bigint	Number of rows deleted
n_tup_hot_upd	bigint	Number of rows updated by HOT (that is, the number of rows whose index columns are not updated).
n_live_tup	bigint	Estimated number of live rows
n_dead_tup	bigint	Estimated number of inactive rows.
last_vacuum	timestamp with time zone	Last time at which this table was manually vacuumed (not counting <b>VACUUM FULL</b> )
last_autovacuum	timestamp with time zone	Last time when the table was vacuumed by the autovacuum daemon thread.
last_analyze	timestamp with time zone	Last time at which this table was manually analyzed
last_autoanalyze	timestamp with time zone	Last time when the table was analyzed by the autovacuum daemon thread.
vacuum_count	bigint	Number of times the table has been manually vacuumed (not counting <b>VACUUM FULL</b> )

Name	Type	Description
autovacuum_count	bigint	Number of times the table has been vacuumed by the autovacuum daemon
analyze_count	bigint	Number of times the table has been manually analyzed
autoanalyze_count	bigint	Number of times the table has been analyzed by the autovacuum daemon thread.

### 13.2.5.4 STAT\_USER\_INDEXES

Displays the status information about the index of user-defined ordinary tables in the current database node.

**Table 13-32** STAT\_USER\_INDEXES columns

Name	Type	Description
relid	oid	OID of the table for this index
indexrelid	oid	OID of the index
schemaname	name	Name of the schema where the index is located.
relname	name	Name of the table for the index
indexrelname	name	Index name
idx_scan	bigint	Number of index scans performed on the index.
idx_tup_read	bigint	Number of index entries returned by scans on the index.
idx_tup_fetch	bigint	Number of live rows fetched in the original table by a simple index scan that uses the index.

### 13.2.5.5 SUMMARY\_STAT\_USER\_INDEXES

Displays the sum of the index status information about user-defined ordinary tables in all schemas on each database node.

**Table 13-33** SUMMARY\_STAT\_USER\_INDEXES columns

Name	Type	Description
schemaname	name	Name of the schema where the index is located.

Name	Type	Description
relname	name	Name of the table for the index
indexrelname	name	Index name
idx_scan	numeric	Number of index scans performed on the index.
idx_tup_read	numeric	Number of index entries returned by scans on the index.
idx_tup_fetch	numeric	Number of active rows fetched in the original table by a simple index scan that uses the index.

### 13.2.5.6 GLOBAL\_STAT\_USER\_INDEXES

Displays the index status information about user-defined ordinary tables in all schemas of each database node. Data on different nodes is not summed up.

**Table 13-34** GLOBAL\_STAT\_USER\_INDEXES columns

Name	Type	Description
node_name	name	Node name.
relid	oid	OID of the table for this index.
indexrelid	oid	OID of the index.
schemaname	name	Name of the schema where the index is located.
relname	name	Name of the table for the index.
indexrelname	name	Index name.
idx_scan	bigint	Number of index scans initiated on the index.
idx_tup_read	bigint	Number of index entries returned by scans on the index.
idx_tup_fetch	bigint	Number of active rows fetched in the original table by a simple index scan that uses the index.

### 13.2.5.7 STAT\_SYS\_TABLES

Displays status information about all the system catalogs in the pg\_catalog, information\_schema, and pg\_toast schemas on the current node.

**Table 13-35** STAT\_SYS\_TABLES columns

Name	Type	Description
relid	oid	Table OID
schemaname	name	Name of the schema where the table is located.
relname	name	Table name
seq_scan	bigint	Number of sequential scans initiated on the table
seq_tup_read	bigint	Number of live rows fetched by sequential scans
idx_scan	bigint	Number of index scans initiated on the table
idx_tup_fetch	bigint	Number of live rows fetched by index scans
n_tup_ins	bigint	Number of rows inserted
n_tup_upd	bigint	Number of rows updated
n_tup_del	bigint	Number of rows deleted
n_tup_hot_upd	bigint	Number of rows updated by HOT (that is, the number of rows whose index columns are not updated).
n_live_tup	bigint	Estimated number of live rows
n_dead_tup	bigint	Estimated number of inactive rows.
last_vacuum	timestamp with time zone	Last time at which this table was manually vacuumed (not counting <b>VACUUM FULL</b> )
last_autovacuum	timestamp with time zone	Last time when the table was vacuumed by the autovacuum daemon thread.
last_analyze	timestamp with time zone	Last time at which this table was manually analyzed
last_autoanalyze	timestamp with time zone	Last time when the table was analyzed by the autovacuum daemon thread.
vacuum_count	bigint	Number of times this table has been manually vacuumed (not counting <b>VACUUM FULL</b> )
autovacuum_count	bigint	Number of times this table has been vacuumed by the autovacuum daemon

Name	Type	Description
analyze_count	bigint	Number of times this table has been manually analyzed
autoanalyze_count	bigint	Number of times the table has been analyzed by the autovacuum daemon thread.

### 13.2.5.8 SUMMARY\_STAT\_SYS\_TABLES

Displays the sum of the status information in all system catalogs on each node in pg\_catalog, information\_schema, and pg\_toast schemas. The status information in the system catalogs on each node is summed up. Columns of the timestamp type are not summed up, and only the latest values of these columns on all nodes are used.

**Table 13-36** SUMMARY\_STAT\_SYS\_TABLES columns

Name	Type	Description
schemaname	name	Name of the schema where the table is located.
relname	name	Table name
seq_scan	numeric	Number of sequential scans initiated on this table
seq_tup_read	numeric	Number of live rows fetched by sequential scans
idx_scan	numeric	Number of index scans initiated on the table
idx_tup_fetch	numeric	Number of live rows fetched by index scans
n_tup_ins	numeric	Number of rows inserted
n_tup_upd	numeric	Number of rows updated
n_tup_del	numeric	Number of rows deleted
n_tup_hot_upd	numeric	Number of rows updated by HOT (that is, the number of rows whose index columns are not updated).
n_live_tup	numeric	Estimated number of live rows
n_dead_tup	numeric	Estimated number of inactive rows.
last_vacuum	timestamp with time zone	Last time at which this table was manually vacuumed (not counting <b>VACUUM FULL</b> )

Name	Type	Description
last_autovacuum	timestamp with time zone	Last time when the table was vacuumed by the autovacuum daemon thread.
last_analyze	timestamp with time zone	Last time at which this table was manually analyzed
last_autoanalyze	timestamp with time zone	Last time when the table was analyzed by the autovacuum daemon thread.
vacuum_count	numeric	Number of times the table has been manually vacuumed (not counting <b>VACUUM FULL</b> )
autovacuum_count	numeric	Number of times the table has been vacuumed by the autovacuum daemon
analyze_count	numeric	Number of times the table has been manually analyzed
autoanalyze_count	numeric	Number of times the table has been analyzed by the autovacuum daemon thread.

### 13.2.5.9 GLOBAL\_STAT\_SYS\_TABLES

Displays the statistics information about all system catalogs in pg\_catalog, information\_schema, and pg\_toast schemas on each database node. Data on different nodes is not summed up.

**Table 13-37** GLOBAL\_STAT\_SYS\_TABLES columns

Name	Type	Description
node_name	name	Node name
relid	oid	Table OID
schemaname	name	Name of the schema where the table is located.
relname	name	Table name
seq_scan	bigint	Number of sequential scans initiated on this table
seq_tup_read	bigint	Number of live rows fetched by sequential scans

Name	Type	Description
idx_scan	bigint	Number of index scans initiated on the table
idx_tup_fetch	bigint	Number of live rows fetched by index scans
n_tup_ins	bigint	Number of rows inserted
n_tup_upd	bigint	Number of rows updated
n_tup_del	bigint	Number of rows deleted
n_tup_hot_upd	bigint	Number of rows updated by HOT (that is, the number of rows whose index columns are not updated).
n_live_tup	bigint	Estimated number of live rows
n_dead_tup	bigint	Estimated number of inactive rows.
last_vacuum	timestamp with time zone	Last time at which this table was manually vacuumed (not counting <b>VACUUM FULL</b> )
last_autovacuum	timestamp with time zone	Last time when the table was vacuumed by the autovacuum daemon thread.
last_analyze	timestamp with time zone	Last time at which this table was manually analyzed
last_autoanalyze	timestamp with time zone	Last time when the table was analyzed by the autovacuum daemon thread.
vacuum_count	bigint	Number of times the table has been manually vacuumed (not counting <b>VACUUM FULL</b> )
autovacuum_count	bigint	Number of times the table has been vacuumed by the autovacuum daemon
analyze_count	bigint	Number of times the table has been manually analyzed
autoanalyze_count	bigint	Number of times the table has been analyzed by the autovacuum daemon thread.

### 13.2.5.10 STAT\_SYS\_INDEXES

Displays the index status information about all system catalogs in the pg\_catalog, information\_schema, and pg\_toast schemas on the current node.

**Table 13-38** STAT\_SYS\_INDEXES columns

Name	Type	Description
relid	oid	OID of the table for this index
indexrelid	oid	OID of the index
schemaname	name	Name of the schema where the index is located.
relname	name	Name of the table that the index is created for
indexrelname	name	Index name
idx_scan	bigint	Number of index scans performed on the index.
idx_tup_read	bigint	Number of index entries returned by scans on the index.
idx_tup_fetch	bigint	Number of live rows fetched in the original table by a simple index scan that uses the index.

### 13.2.5.11 SUMMARY\_STAT\_SYS\_INDEXES

Displays the summary of the index status information of all system catalogs in the pg\_catalog, information\_schema, and pg\_toast schemas on each database node.

**Table 13-39** SUMMARY\_STAT\_SYS\_INDEXES columns

Name	Type	Description
schemaname	name	Name of the schema where the index is located.
relname	name	Name of the table for the index
indexrelname	name	Index name
idx_scan	numeric	Number of index scans performed on the index.
idx_tup_read	numeric	Number of index entries returned by scans on the index.
idx_tup_fetch	numeric	Number of live rows fetched in the original table by a simple index scan that uses the index.

### 13.2.5.12 GLOBAL\_STAT\_SYS\_INDEXES

Displays the index status information about all system catalogs in pg\_catalog, information\_schema, and pg\_toast schemas on each database node. Data on different nodes is not summed up.

**Table 13-40** GLOBAL\_STAT\_SYS\_INDEXES columns

Name	Type	Description
node_name	name	Node name.
relid	oid	OID of the table for this index.
indexrelid	oid	OID of the index.
schemaname	name	Name of the schema where the index is located.
relname	name	Name of the table for the index.
indexrelname	name	Index name.
idx_scan	bigint	Number of index scans performed on the index.
idx_tup_read	bigint	Number of index entries returned by scans on the index.
idx_tup_fetch	bigint	Number of live rows fetched in the original table by a simple index scan that uses the index.

### 13.2.5.13 STAT\_ALL\_TABLES

Displays the status of each table (including the TOAST table) on the current node of the database.

**Table 13-41** STAT\_ALL\_TABLES columns

Name	Type	Description
relid	oid	Table OID
schemaname	name	Name of the schema where the table is located.
relname	name	Table name
seq_scan	bigint	Number of sequential scans initiated on the table
seq_tup_read	bigint	Number of live rows fetched by sequential scans
idx_scan	bigint	Number of index scans initiated on the table
idx_tup_fetch	bigint	Number of live rows fetched by index scans
n_tup_ins	bigint	Number of rows inserted

Name	Type	Description
n_tup_upd	bigint	Number of rows updated
n_tup_del	bigint	Number of rows deleted
n_tup_hot_upd	bigint	Number of rows updated by HOT (that is, the number of rows whose index columns are not updated).
n_live_tup	bigint	Estimated number of live rows
n_dead_tup	bigint	Estimated number of inactive rows.
last_vacuum	timestamp with time zone	Last time at which this table was manually vacuumed (not counting <b>VACUUM FULL</b> )
last_autovacuum	timestamp with time zone	Last time when the table was vacuumed by the autovacuum daemon thread.
last_analyze	timestamp with time zone	Last time at which the table was manually analyzed
last_autoanalyze	timestamp with time zone	Last time when the table was analyzed by the autovacuum daemon thread.
vacuum_count	bigint	Number of times the table has been manually vacuumed (not counting <b>VACUUM FULL</b> )
autovacuum_count	bigint	Number of times this table has been vacuumed by the autovacuum daemon
analyze_count	bigint	Number of times the table has been manually analyzed
autoanalyze_count	bigint	Number of times the table has been analyzed by the autovacuum daemon thread.

### 13.2.5.14 SUMMARY\_STAT\_ALL\_TABLES

Displays the sum of the statistics information of each table (including the TOAST table) on each node of the database. The timestamp column is not summed up and only the latest value of this column on all nodes is used.

**Table 13-42** SUMMARY\_STAT\_ALL\_TABLES columns

Name	Type	Description
schemaname	name	Name of the schema where the table is located.
relname	name	Table name

Name	Type	Description
seq_scan	numeric	Number of sequential scans initiated on this table
seq_tup_read	numeric	Number of live rows fetched by sequential scans
idx_scan	numeric	Number of index scans initiated on the table
idx_tup_fetch	numeric	Number of live rows fetched by index scans
n_tup_ins	numeric	Number of rows inserted
n_tup_upd	numeric	Number of rows updated
n_tup_del	numeric	Number of rows deleted
n_tup_hot_upd	numeric	Number of rows updated by HOT (that is, the number of rows whose index columns are not updated).
n_live_tup	numeric	Estimated number of live rows
n_dead_tup	numeric	Estimated number of inactive rows.
last_vacuum	timestamp with time zone	Last time at which this table was manually vacuumed (not counting <b>VACUUM FULL</b> )
last_autovacuum	timestamp with time zone	Last time when the table was vacuumed by the autovacuum daemon thread.
last_analyze	timestamp with time zone	Last time at which this table was manually analyzed
last_autoanalyze	timestamp with time zone	Last time when the table was analyzed by the autovacuum daemon thread.
vacuum_count	numeric	Number of times the table has been manually vacuumed (not counting <b>VACUUM FULL</b> )
autovacuum_count	numeric	Number of times the table has been vacuumed by the autovacuum daemon
analyze_count	numeric	Number of times the table has been manually analyzed
autoanalyze_count	numeric	Number of times the table has been analyzed by the autovacuum daemon thread.

### 13.2.5.15 GLOBAL\_STAT\_ALL\_TABLES

Displays the statistics of each table (including the TOAST table) on each node of the database. Data on different nodes is not summed up.

**Table 13-43** GLOBAL\_STAT\_ALL\_TABLES columns

Name	Type	Description
node_name	name	Node name
relid	oid	OID of the table
schemaname	name	Name of the schema where the table is located.
relname	name	Table name
seq_scan	bigint	Number of sequential scans initiated on this table
seq_tup_read	bigint	Number of live rows fetched by sequential scans
idx_scan	bigint	Number of index scans initiated on the table
idx_tup_fetch	bigint	Number of live rows fetched by index scans
n_tup_ins	bigint	Number of rows inserted
n_tup_upd	bigint	Number of rows updated
n_tup_del	bigint	Number of rows deleted
n_tup_hot_upd	bigint	Number of rows updated by HOT (that is, the number of rows whose index columns are not updated).
n_live_tup	bigint	Estimated number of live rows
n_dead_tup	bigint	Estimated number of inactive rows.
last_vacuum	timestamp with time zone	Last time at which this table was manually vacuumed (not counting <b>VACUUM FULL</b> )
last_autovacuum	timestamp with time zone	Last time when the table was vacuumed by the autovacuum daemon thread.
last_analyze	timestamp with time zone	Last time at which this table was manually analyzed
last_autoanalyze	timestamp with time zone	Last time when the table was analyzed by the autovacuum daemon thread.

Name	Type	Description
vacuum_count	bigint	Number of times the table has been manually vacuumed (not counting <b>VACUUM FULL</b> )
autovacuum_count	bigint	Number of times the table has been vacuumed by the autovacuum daemon
analyze_count	bigint	Number of times the table has been manually analyzed
autoanalyze_count	bigint	Number of times the table has been analyzed by the autovacuum daemon thread.

### 13.2.5.16 STAT\_ALL\_INDEXES

Displays the access information about each index on the current database node.

**Table 13-44** STAT\_ALL\_INDEXES columns

Name	Type	Description
relid	oid	OID of the table for this index.
indexrelid	oid	OID of the index.
schemaname	name	Name of the schema where the index is located.
relname	name	Name of the table for the index.
indexrelname	name	Index name.
idx_scan	bigint	Number of index scans performed on the index.
idx_tup_read	bigint	Number of index entries returned by scans on the index.
idx_tup_fetch	bigint	Number of live rows fetched in the original table by a simple index scan that uses the index.

### 13.2.5.17 SUMMARY\_STAT\_ALL\_INDEXES

Displays the sum of the access information of each index on each GaussDB database node.

**Table 13-45** SUMMARY\_STAT\_ALL\_INDEXES columns

Name	Type	Description
schemaname	name	Name of the schema where the index is located.
relname	name	Name of the table for the index.
indexrelname	name	Index name.
idx_scan	numeric	Number of index scans performed on the index.
idx_tup_read	numeric	Number of index entries returned by scans on the index.
idx_tup_fetch	numeric	Number of live rows fetched by scans in the original table using the simple index of the index.

### 13.2.5.18 GLOBAL\_STAT\_ALL\_INDEXES

Displays the access information about each index on each node of the database. The status information of each index on each node is not summed up.

**Table 13-46** GLOBAL\_STAT\_ALL\_INDEXES columns

Name	Type	Description
node_name	name	Node name
relid	oid	OID of the table for this index
indexrelid	oid	OID of the index
schemaname	name	Name of the schema where the index is located.
relname	name	Name of the table for the index
indexrelname	name	Index name
idx_scan	bigint	Number of index scans performed on the index.
idx_tup_read	bigint	Number of index entries returned by scans on the index.
idx_tup_fetch	bigint	Number of active rows fetched in the original table by a simple index scan that uses the index.

### 13.2.5.19 STAT\_DATABASE

Displays the statistics of the current node in the database.

**Table 13-47** STAT\_DATABASE columns

Name	Type	Description
datid	oid	OID of a database
datname	name	Database name
numbackends	integer	Number of backends currently connected to this database.
xact_committed	bigint	Number of transactions in this database that have been committed
xact_rollback	bigint	Number of transactions in this database that have been rolled back
blks_read	bigint	Number of disk blocks read in this database
blks_hit	bigint	Number of disk blocks that have been hit in the cache. In this case, data does not need to be read from disks. (The cache includes only the database buffer cache and does not include the file system cache of the OS.)
tup_returned	bigint	Number of live rows fetched by sequential scans and number of index rows returned by index scans in the database.
tup_fetched	bigint	Number of rows returned by the current database through indexes.
tup_inserted	bigint	Number of rows inserted.
tup_updated	bigint	Number of rows updated.
tup_deleted	bigint	Number of rows deleted.
conflicts	bigint	Number of queries canceled due to conflicts with database replay (conflicts occur only on the standby node). For details, see <a href="#">STAT_DATABASE_CONFLICTS</a> .
temp_files	bigint	Number of temporary files created by queries in this database. All temporary files are counted, which is not affected by the value of the GUC parameter <b>log_temp_files</b> .
temp_bytes	bigint	Total amount of data written to temporary files by queries in this database. All temporary files are counted, which is not affected by the value of the GUC parameter <b>log_temp_files</b> .
deadlocks	bigint	Number of deadlocks detected in this database

Name	Type	Description
blk_read_time	double precision	Time spent reading data file blocks by backends in this database (unit: ms)
blk_write_time	double precision	Time spent reading data file blocks by backends in this database (unit: ms)
stats_reset	timestamp with time zone	Time at which the current statistics were reset

### 13.2.5.20 SUMMARY\_STAT\_DATABASE

Displays the summary of the status statistics of each database node. The timestamp column is not summed up and only the latest value of this column on all nodes is used.

**Table 13-48** SUMMARY\_STAT\_DATABASE

Name	Type	Description
datname	name	Database name.
numbackends	bigint	Number of backends currently connected to this database.
xact_commit	numeric	Number of transactions in this database that have been committed.
xact_rollback	numeric	Number of transactions in this database that have been rolled back.
blks_read	numeric	Number of disk blocks read in this database.
blks_hit	numeric	Number of disk blocks that have been hit in the cache. In this case, data does not need to be read from disks. (The cache includes only GaussDB buffer cache and does not include the file system cache of the OS.)
tup_returned	numeric	Number of live rows fetched by sequential scans and number of index rows returned by index scans in the database.
tup_fetched	numeric	Number of rows returned by the current database through indexes.
tup_inserted	bigint	Number of rows inserted.
tup_updated	bigint	Number of rows updated.

Name	Type	Description
tup_deleted	bigint	Number of rows deleted.
conflicts	bigint	Number of queries canceled due to conflicts with database replay (conflicts occur only on the standby node). For details, see <a href="#">STAT_DATABASE_CONFLICTS</a> .
temp_files	numeric	Number of temporary files created by queries in this database. All temporary files are counted, which is not affected by the value of the GUC parameter <b>log_temp_files</b> .
temp_bytes	numeric	Total amount of data written to temporary files by queries in this database. All temporary files are counted, which is not affected by the value of the GUC parameter <b>log_temp_files</b> .
deadlocks	bigint	Number of deadlocks detected in this database.
blk_read_time	double precision	Time spent in reading data file blocks by backends in this database (unit: ms).
blk_write_time	double precision	Time spent in writing data file blocks by backends in this database (unit: ms).
stats_reset	timestamp with time zone	Time at which the current statistics were reset.

### 13.2.5.21 GLOBAL\_STAT\_DATABASE

Displays the statistics of each database node. The database status information on different nodes is not summed up.

**Table 13-49** GLOBAL\_STAT\_DATABASE columns

Name	Type	Description
node_name	name	Node name.
datid	oid	Database OID.
datname	name	Database name.
numbackends	integer	Number of backends currently connected to this database.
xact_commit	bigint	Number of transactions in this database that have been committed.

Name	Type	Description
xact_rollback	bigint	Number of transactions in this database that have been rolled back.
blks_read	bigint	Number of disk blocks read in this database.
blks_hit	bigint	Number of disk blocks that have been hit in the cache. In this case, data does not need to be read from disks. (The cache includes only the database buffer cache and does not include the file system cache of the OS.)
tup_returned	bigint	Number of live rows fetched by sequential scans and number of index rows returned by index scans in the database.
tup_fetched	bigint	Number of rows returned by the current database through indexes.
tup_inserted	bigint	Number of rows inserted.
tup_updated	bigint	Number of rows updated.
tup_deleted	bigint	Number of rows deleted.
conflicts	bigint	Number of queries canceled due to conflicts with database replay (conflicts occur only on the standby node). For details, see <a href="#">STAT_DATABASE_CONFLICTS</a> .
temp_files	bigint	Number of temporary files created by queries in this database. All temporary files are counted, which is not affected by the value of the GUC parameter <b>log_temp_files</b> .
temp_bytes	bigint	Total amount of data written to temporary files by queries in this database. All temporary files are counted, which is not affected by the value of the GUC parameter <b>log_temp_files</b> .
deadlocks	bigint	Number of deadlocks detected in this database.
blk_read_time	double precision	Time spent in reading data file blocks by backends in this database (unit: ms).
blk_write_time	double precision	Time spent in writing data file blocks by backends in this database (unit: ms).

Name	Type	Description
stats_reset	timestamp with time zone	Time at which the current statistics were reset.

### 13.2.5.22 STAT\_DATABASE\_CONFLICTS

Displays statistics about the conflict status of the current database node.

**Table 13-50** STAT\_DATABASE\_CONFLICTS columns

Name	Type	Description
datid	oid	Database ID
datname	name	Database name
confl_tablespace	bigint	Number of conflicting tablespaces
confl_lock	bigint	Number of conflicting locks
confl_snapshot	bigint	Number of conflicting snapshots
confl_bufferpin	bigint	Number of conflicting buffers
confl_deadlock	bigint	Number of conflicting deadlocks

### 13.2.5.23 SUMMARY\_STAT\_DATABASE\_CONFLICTS

Displays the summary of the conflict status statistics of each node in the database.

**Table 13-51** SUMMARY\_STAT\_DATABASE\_CONFLICTS columns

Name	Type	Description
datname	name	Database name
confl_tablespace	bigint	Number of conflicting tablespaces
confl_lock	bigint	Number of conflicting locks
confl_snapshot	bigint	Number of conflicting snapshots
confl_bufferpin	bigint	Number of conflicting buffers
confl_deadlock	bigint	Number of conflicting deadlocks

### 13.2.5.24 GLOBAL\_STAT\_DATABASE\_CONFLICTS

Displays the conflict status statistics of each database node. The status information of each database node is not summed up.

**Table 13-52** GLOBAL\_STAT\_DATABASE\_CONFLICTS columns

Name	Type	Description
node_name	name	Node name
datid	oid	Database ID
datname	name	Database name
confl_tablespace	bigint	Number of conflicting tablespaces
confl_lock	bigint	Number of conflicting locks
confl_snapshot	bigint	Number of conflicting snapshots
confl_bufferpin	bigint	Number of conflicting buffers
confl_deadlock	bigint	Number of conflicting deadlocks

### 13.2.5.25 STAT\_XACT\_ALL\_TABLES

Displays transaction status information about all ordinary tables and TOAST tables in all schemas on the current node.

**Table 13-53** STAT\_XACT\_ALL\_TABLES columns

Name	Type	Description
relid	oid	Table OID
schemaname	name	Name of the schema where the table is located.
relname	name	Table name
seq_scan	bigint	Number of sequential scans initiated on the table
seq_tup_read	bigint	Number of live rows fetched by sequential scans
idx_scan	bigint	Number of index scans initiated on the table
idx_tup_fetched	bigint	Number of live rows fetched by index scans

Name	Type	Description
n_tup_ins	bigint	Number of rows inserted
n_tup_upd	bigint	Number of rows updated
n_tup_del	bigint	Number of rows deleted
n_tup_hot_upd	bigint	Number of HOT updated rows (that is, the number of rows whose index columns are not updated).

### 13.2.5.26 SUMMARY\_STAT\_XACT\_ALL\_TABLES

Displays the summary of transaction status information about all ordinary tables and TOAST tables in all schemas of each database node.

**Table 13-54** SUMMARY\_STAT\_XACT\_ALL\_TABLES columns

Name	Type	Description
schemaname	name	Name of the schema where the table is located.
relname	name	Table name.
seq_scan	numeric	Number of sequential scans initiated on this table.
seq_tup_read	numeric	Number of live rows fetched by sequential scans.
idx_scan	numeric	Number of index scans initiated on the table
idx_tup_fetch	numeric	Number of live rows fetched by index scans.
n_tup_ins	numeric	Number of rows inserted.
n_tup_upd	numeric	Number of rows updated.
n_tup_del	numeric	Number of rows deleted.
n_tup_hot_upd	numeric	Number of HOT updated rows (that is, the number of rows whose index columns are not updated).

### 13.2.5.27 GLOBAL\_STAT\_XACT\_ALL\_TABLES

Displays the transaction status information about all ordinary tables and TOAST tables in all schemas of each database node. The transaction status information about tables on different nodes is not summed up.

**Table 13-55** GLOBAL\_STAT\_XACT\_ALL\_TABLES columns

Name	Type	Description
node_name	name	Node name

Name	Type	Description
relid	oid	OID of the table
schemaname	name	Name of the schema where the table is located.
relname	name	Table name.
seq_scan	bigint	Number of sequential scans initiated on this table.
seq_tup_read	bigint	Number of live rows fetched by sequential scans.
idx_scan	bigint	Number of index scans initiated on the table
idx_tup_fetched	bigint	Number of live rows fetched by index scans.
n_tup_ins	bigint	Number of rows inserted.
n_tup_upd	bigint	Number of rows updated.
n_tup_del	bigint	Number of rows deleted.
n_tup_hot_upd	bigint	Number of HOT updated rows (that is, the number of rows whose index columns are not updated).

### 13.2.5.28 STAT\_XACT\_SYS\_TABLES

Displays transaction status information about the system catalogs in namespaces on the current node.

**Table 13-56** STAT\_XACT\_SYS\_TABLES columns

Name	Type	Description
relid	oid	Table OID
schemaname	name	Name of the schema where the table is located.
relname	name	Table name.
seq_scan	bigint	Number of sequential scans initiated on the table.
seq_tup_read	bigint	Number of live rows fetched by sequential scans.
idx_scan	bigint	Number of index scans initiated on the table.
idx_tup_fetched	bigint	Number of live rows fetched by index scans.
n_tup_ins	bigint	Number of rows inserted.

Name	Type	Description
n_tup_upd	bigint	Number of rows updated.
n_tup_del	bigint	Number of rows deleted.
n_tup_hot_upd	bigint	Number of HOT updated rows (that is, the number of rows whose index columns are not updated).

### 13.2.5.29 SUMMARY\_STAT\_XACT\_SYS\_TABLES

Displays the summary of the transaction status information about system catalogs in all the schemas of each database node.

**Table 13-57** SUMMARY\_STAT\_XACT\_SYS\_TABLES columns

Name	Type	Description
schemaname	name	Name of the schema where the table is located.
relname	name	Table name.
seq_scan	numeric	Number of sequential scans initiated on this table.
seq_tup_read	numeric	Number of live rows fetched by sequential scans.
idx_scan	numeric	Number of index scans initiated on the table
idx_tup_fetch	numeric	Number of live rows fetched by index scans.
n_tup_ins	numeric	Number of rows inserted.
n_tup_upd	numeric	Number of rows updated.
n_tup_del	numeric	Number of rows deleted.
n_tup_hot_u pd	numeric	Number of HOT updated rows (that is, the number of rows whose index columns are not updated).

### 13.2.5.30 GLOBAL\_STAT\_XACT\_SYS\_TABLES

Displays the transaction status information about the system catalogs in all the schemas of each database node. The transaction status information of the tables on different nodes is not summed up.

**Table 13-58** GLOBAL\_STAT\_XACT\_SYS\_TABLES columns

Name	Type	Description
node_name	name	Node name.
relid	oid	OID of the table

Name	Type	Description
schemaname	name	Name of the schema where the table is located.
relname	name	Table name.
seq_scan	bigint	Number of sequential scans initiated on this table.
seq_tup_read	bigint	Number of live rows fetched by sequential scans.
idx_scan	bigint	Number of index scans initiated on the table
idx_tup_fetch	bigint	Number of live rows fetched by index scans.
n_tup_ins	bigint	Number of rows inserted.
n_tup_upd	bigint	Number of rows updated.
n_tup_del	bigint	Number of rows deleted.
n_tup_hot_upd	bigint	Number of HOT updated rows (that is, the number of rows whose index columns are not updated).

### 13.2.5.31 STAT\_XACT\_USER\_TABLES

Displays transaction status information about the user tables in schemas on the current node.

**Table 13-59** STAT\_XACT\_USER\_TABLES columns

Name	Type	Description
relid	oid	Table OID
schemaname	name	Name of the schema where the table is located.
relname	name	Table name.
seq_scan	bigint	Number of sequential scans initiated on the table.
seq_tup_read	bigint	Number of live rows fetched by sequential scans.
idx_scan	bigint	Number of index scans initiated on the table.
idx_tup_fetch	bigint	Number of live rows fetched by index scans.
n_tup_ins	bigint	Number of rows inserted.
n_tup_upd	bigint	Number of rows updated.

Name	Type	Description
n_tup_del	bigint	Number of rows deleted.
n_tup_hot_upd	bigint	Number of HOT updated rows (that is, the number of rows whose index columns are not updated).

### 13.2.5.32 SUMMARY\_STAT\_XACT\_USER\_TABLES

Displays the summary of the transaction status information about user tables in all the schemas of each database node.

**Table 13-60** SUMMARY\_STAT\_XACT\_USER\_TABLES columns

Name	Type	Description
schemaname	name	Name of the schema where the table is located.
relname	name	Table name.
seq_scan	numeric	Number of sequential scans initiated on this table.
seq_tup_read	numeric	Number of live rows fetched by sequential scans.
idx_scan	numeric	Number of index scans initiated on the table
idx_tup_fetch	numeric	Number of live rows fetched by index scans.
n_tup_ins	numeric	Number of rows inserted.
n_tup_upd	numeric	Number of rows updated.
n_tup_del	numeric	Number of rows deleted.
n_tup_hot_u pd	numeric	Number of HOT updated rows (that is, the number of rows whose index columns are not updated).

### 13.2.5.33 GLOBAL\_STAT\_XACT\_USER\_TABLES

Displays the transaction status information about the user tables in all the schemas of each database node. The transaction status information of the tables on different nodes is not summed up.

**Table 13-61** GLOBAL\_STAT\_XACT\_USER\_TABLES columns

Name	Type	Description
node_name	name	Node name.
relid	oid	OID of the table

Name	Type	Description
schemaname	name	Name of the schema where the table is located.
relname	name	Table name.
seq_scan	bigint	Number of sequential scans initiated on this table.
seq_tup_read	bigint	Number of live rows fetched by sequential scans.
idx_scan	bigint	Number of index scans initiated on the table.
idx_tup_fetch	bigint	Number of live rows fetched by index scans.
n_tup_ins	bigint	Number of rows inserted.
n_tup_upd	bigint	Number of rows updated.
n_tup_del	bigint	Number of rows deleted.
n_tup_hot_upd	bigint	Number of HOT updated rows (that is, the number of rows whose index columns are not updated).

### 13.2.5.34 STAT\_XACT\_USER\_FUNCTIONS

Displays statistics about function executions in the current transaction on the current database node.

**Table 13-62** STAT\_XACT\_USER\_FUNCTIONS columns

Name	Type	Description
funcid	oid	OID of a function
schemaname	name	Name of the schema where the function is located.
funcname	name	Function name.
calls	bigint	Number of times the function has been called.
total_time	double precision	Total time spent in this function and all other functions called by it.
self_time	double precision	Time spent in this function, excluding other functions called by it.

### 13.2.5.35 SUMMARY\_STAT\_XACT\_USER\_FUNCTIONS

Displays the summary of function execution statistics in a transaction on each database node.

**Table 13-63** SUMMARY\_STAT\_XACT\_USER\_FUNCTIONS columns

Name	Type	Description
schemaname	name	Name of the schema where the function is located.
funcname	name	Function name.
calls	numeric	Number of times that the function has been called.
total_time	double precision	Total time spent in this function and all other functions called by it.
self_time	double precision	Time spent in this function, excluding other functions called by it.

### 13.2.5.36 GLOBAL\_STAT\_XACT\_USER\_FUNCTIONS

Displays statistics about function execution in a transaction on each database node. Data on different nodes is not summed up.

**Table 13-64** GLOBAL\_STAT\_XACT\_USER\_FUNCTIONS columns

Name	Type	Description
node_name	name	Node name.
funcid	oid	OID of a function.
schemaname	name	Name of the schema where the function is located.
funcname	name	Function name.
calls	bigint	Number of times that the function has been called.
total_time	double precision	Total time spent in this function and all other functions called by it.
self_time	double precision	Total time spent in this function, excluding other functions called by it.

### 13.2.5.37 STAT\_BAD\_BLOCK

**STAT\_BAD\_BLOCK** displays information about table and index read failures on the current node.

**Table 13-65** STAT\_BAD\_BLOCK columns

Name	Type	Description
nodename	text	Node name.
databaseid	integer	OID of the database
tablespaceid	integer	OID of the tablespace
relfilenode	integer	File node of this relation
bucketid	smallint	ID of the bucket for consistent hashing
forknum	integer	Fork number
error_count	integer	Number of errors
first_time	timestamp with time zone	Time when the page damage occurs for the first time.
last_time	timestamp with time zone	Time when the page damage occurs for the last time.

### 13.2.5.38 SUMMARY\_STAT\_BAD\_BLOCK

Obtains the summary of the table and index read failure information of each database node in a period specified by **first\_time** and **last\_time**. The value of **first\_time** is the start time and the value of **last\_time** is the end time.

**Table 13-66** SUMMARY\_STAT\_BAD\_BLOCK columns

Name	Type	Description
databaseid	integer	OID of the database.
tablespaceid	integer	OID of the tablespace.
relfilenode	integer	File node of this relation.
forknum	bigint	Fork number.
error_count	bigint	Number of errors.
first_time	timestamp with time zone	Time when the page damage occurs for the first time.
last_time	timestamp with time zone	Time when the page damage occurs for the last time.

### 13.2.5.39 GLOBAL\_STAT\_BAD\_BLOCK

Obtains the table and index read failure information of each database node. The read failure information of different nodes is not summed up.

**Table 13-67** GLOBAL\_STAT\_BAD\_BLOCK columns

Name	Type	Description
node_name	text	Node name.
databaseid	integer	OID of the database.
tablespaceid	integer	OID of the tablespace.
relfilenode	integer	File node of this relation.
forknum	integer	Fork number.
error_count	integer	Number of errors.
first_time	timestamp with time zone	Time when the page damage occurs for the first time.
last_time	timestamp with time zone	Time when the page damage occurs for the last time.

### 13.2.5.40 STAT\_USER\_FUNCTIONS

Displays user-defined function status information in the schemas of the current node. (The language of the function is non-internal language.)

**Table 13-68** STAT\_USER\_FUNCTIONS columns

Name	Type	Description
funcid	oid	Function ID.
schemaname	name	Schema name.
funcname	name	UDF name.
calls	bigint	Number of times the function has been called.
total_time	double precision	Total time spent in this function, including other functions called by it (unit: ms).
self_time	double precision	Time spent in this function, excluding other functions called by it (unit: ms).

### 13.2.5.41 SUMMARY\_STAT\_USER\_FUNCTIONS

Displays the summary of statistics about user-defined functions on each database node.

**Table 13-69** SUMMARY\_STAT\_USER\_FUNCTIONS columns

Name	Type	Description
schemaname	name	Schema name.
funcname	name	UDF name.
calls	numeric	Number of times the function has been called.
total_time	double precision	Total time spent in this function and all other functions called by it (unit: ms).
self_time	double precision	Time spent in this function, excluding other functions called by it (unit: ms).

### 13.2.5.42 GLOBAL\_STAT\_USER\_FUNCTIONS

Displays the statistics of UDFs on each database node. The statistics on different nodes are not summed up.

**Table 13-70** GLOBAL\_STAT\_USER\_FUNCTIONS columns

Name	Type	Description
node_name	name	Node name.
funcid	oid	ID of the function.
schemaname	name	Name of the schema where the function is located.
funcname	name	UDF name.
calls	bigint	Number of times the function has been called.
total_time	double precision	Total time spent in this function, including other functions called by it (unit: ms).
self_time	double precision	Time spent in this function, excluding other functions called by it (unit: ms).

## 13.2.6 Workload

### 13.2.6.1 WORKLOAD\_SQL\_COUNT

Displays the distribution of SQL statements in workloads on the current node.

**Table 13-71** WORKLOAD\_SQL\_COUNT columns

Name	Type	Description
workload	name	Workload name.
select_count	bigint	Number of SELECT statements.
update_count	bigint	Number of UPDATE statements.
insert_count	bigint	Number of INSERT statements.
delete_count	bigint	Number of DELETE statements.
ddl_count	bigint	Number of DDL statements.
dml_count	bigint	Number of DML statements.
dcl_count	bigint	Number of DCL statements.

### 13.2.6.2 SUMMARY\_WORKLOAD\_SQL\_COUNT

Displays the distribution of SQL statements in workloads on the primary database node in the database.

**Table 13-72** SUMMARY\_WORKLOAD\_SQL\_COUNT columns

Name	Type	Description
node_name	name	Node name.
workload	name	Workload name.
select_count	bigint	Number of SELECT statements.
update_count	bigint	Number of UPDATE statements.
insert_count	bigint	Number of INSERT statements.
delete_count	bigint	Number of DELETE statements.
ddl_count	bigint	Number of DDL statements.

Name	Type	Description
dml_count	bigint	Number of DML statements.
dcl_count	bigint	Number of DCL statements.

### 13.2.6.3 WORKLOAD\_TRANSACTION

**WORKLOAD\_TRANSACTION** displays information about transactions loaded on the current node.

**Table 13-73** WORKLOAD\_TRANSACTION columns

Name	Type	Description
workload	name	Workload name
commit_counter	bigint	Number of user transactions committed
rollback_counter	bigint	Number of user transactions rolled back
resp_min	bigint	Minimum response time of user transactions (unit: $\mu$ s)
resp_max	bigint	Maximum response time of user transactions (unit: $\mu$ s)
resp_avg	bigint	Average response time of user transactions (unit: $\mu$ s)
resp_total	bigint	Total response time of user transactions (unit: $\mu$ s)
bg_commit_counter	bigint	Number of background transactions committed
bg_rollback_counter	bigint	Number of background transactions rolled back
bg_resp_min	bigint	Minimum response time of background transactions (unit: $\mu$ s)
bg_resp_max	bigint	Maximum response time of background transactions (unit: $\mu$ s)
bg_resp_avg	bigint	Average response time of background transactions (unit: $\mu$ s)
bg_resp_total	bigint	Total response time of background transactions (unit: $\mu$ s)

### 13.2.6.4 SUMMARY\_WORKLOAD\_TRANSACTION

Displays information about transactions loaded in the database.

**Table 13-74** SUMMARY\_WORKLOAD\_TRANSACTION columns

Name	Type	Description
workload	name	Workload name
commit_counter	numeric	Number of user transactions committed
rollback_counter	numeric	Number of user transactions rolled back
resp_min	bigint	Minimum response time of user transactions (unit: $\mu$ s)
resp_max	bigint	Maximum response time of user transactions (unit: $\mu$ s)
resp_avg	bigint	Average response time of user transactions (unit: $\mu$ s)
resp_total	numeric	Total response time of user transactions (unit: $\mu$ s)
bg_commit_counter	numeric	Number of background transactions committed
bg_rollback_counter	numeric	Number of background transactions rolled back
bg_resp_min	bigint	Minimum response time of background transactions (unit: $\mu$ s)
bg_resp_max	bigint	Maximum response time of background transactions (unit: $\mu$ s)
bg_resp_avg	bigint	Average response time of background transactions (unit: $\mu$ s)
bg_resp_total	numeric	Total response time of background transactions (unit: $\mu$ s)

### 13.2.6.5 GLOBAL\_WORKLOAD\_TRANSACTION

**GLOBAL\_WORKLOAD\_TRANSACTION** displays load information about workloads on each node.

**Table 13-75** GLOBAL\_WORKLOAD\_TRANSACTION columns

Name	Type	Description
node_name	name	Node name
workload	name	Workload name
commit_counter	bigint	Number of user transactions committed
rollback_counter	bigint	Number of user transactions rolled back

Name	Type	Description
resp_min	bigint	Minimum response time of user transactions (unit: $\mu$ s)
resp_max	bigint	Maximum response time of user transactions (unit: $\mu$ s)
resp_avg	bigint	Average response time of user transactions (unit: $\mu$ s)
resp_total	bigint	Total response time of user transactions (unit: $\mu$ s)
bg_commit_counter	bigint	Number of background transactions committed
bg_rollback_counter	bigint	Number of background transactions rolled back
bg_resp_min	bigint	Minimum response time of background transactions (unit: $\mu$ s)
bg_resp_max	bigint	Maximum response time of background transactions (unit: $\mu$ s)
bg_resp_avg	bigint	Average response time of background transactions (unit: $\mu$ s)
bg_resp_total	bigint	Total response time of background transactions (unit: $\mu$ s)

### 13.2.6.6 WORKLOAD\_SQL\_ELAPSE\_TIME

WORKLOAD\_SQL\_ELAPSE\_TIME collects SELECT, UPDATE, INSERT, and DELETE (SUID) statistics.

**Table 13-76** WORKLOAD\_SQL\_ELAPSE\_TIME columns

Name	Type	Description
workload	name	Workload name.
total_select_elapse	bigint	Total response time of SELECT statements (unit: $\mu$ s).
max_select_elapse	bigint	Maximum response time of SELECT statements (unit: $\mu$ s).
min_select_elapse	bigint	Minimum response time of SELECT statements (unit: $\mu$ s).
avg_select_elapse	bigint	Average response time of SELECT statements (unit: $\mu$ s).

Name	Type	Description
total_update_elapsed	bigint	Total response time of UPDATE statements (unit: $\mu$ s).
max_update_elapsed	bigint	Maximum response time of UPDATE statements (unit: $\mu$ s).
min_update_elapsed	bigint	Minimum response time of UPDATE statements (unit: $\mu$ s).
avg_update_elapsed	bigint	Average response time of UPDATE statements (unit: $\mu$ s).
total_insert_elapsed	bigint	Total response time of INSERT statements (unit: $\mu$ s).
max_insert_elapsed	bigint	Maximum response time of INSERT statements (unit: $\mu$ s).
min_insert_elapsed	bigint	Minimum response time of INSERT statements (unit: $\mu$ s).
avg_insert_elapsed	bigint	Average response time of INSERT statements (unit: $\mu$ s).
total_delete_elapsed	bigint	Total response time of DELETE statements (unit: $\mu$ s).
max_delete_elapsed	bigint	Maximum response time of DELETE statements (unit: $\mu$ s).
min_delete_elapsed	bigint	Minimum response time of DELETE statements (unit: $\mu$ s).
avg_delete_elapsed	bigint	Average response time of DELETE statements (unit: $\mu$ s).

### 13.2.6.7 SUMMARY\_WORKLOAD\_SQL\_ELAPSE\_TIME

SUMMARY\_WORKLOAD\_SQL\_ELAPSE\_TIME collects SELECT, UPDATE, INSERT, and DELETE (SUID) statistics on workloads (services) of the primary database node.

**Table 13-77** SUMMARY\_WORKLOAD\_SQL\_ELAPSE\_TIME columns

Name	Type	Description
node_name	name	Database process name.
workload	name	Workload name.
total_select_elapsed	bigint	Total response time of SELECT statements (unit: $\mu$ s).

Name	Type	Description
max_select_elapse	bigint	Maximum response time of SELECT statements (unit: $\mu$ s).
min_select_elapse	bigint	Minimum response time of SELECT statements (unit: $\mu$ s).
avg_select_elapse	bigint	Average response time of SELECT statements (unit: $\mu$ s).
total_update_elapse	bigint	Total response time of UPDATE statements (unit: $\mu$ s).
max_update_elapse	bigint	Maximum response time of UPDATE statements (unit: $\mu$ s).
min_update_elapse	bigint	Minimum response time of UPDATE statements (unit: $\mu$ s).
avg_update_elapse	bigint	Average response time of UPDATE statements (unit: $\mu$ s).
total_insert_elapse	bigint	Total response time of INSERT statements (unit: $\mu$ s).
max_insert_elapse	bigint	Maximum response time of INSERT statements (unit: $\mu$ s).
min_insert_elapse	bigint	Minimum response time of INSERT statements (unit: $\mu$ s).
avg_insert_elapse	bigint	Average response time of INSERT statements (unit: $\mu$ s).
total_delete_elapse	bigint	Total response time of DELETE statements (unit: $\mu$ s).
max_delete_elapse	bigint	Maximum response time of DELETE statements (unit: $\mu$ s).
min_delete_elapse	bigint	Minimum response time of DELETE statements (unit: $\mu$ s).
avg_delete_elapse	bigint	Average response time of DELETE statements (unit: $\mu$ s).

### 13.2.6.8 USER\_TRANSACTION

**USER\_TRANSACTION** collects statistics about transactions executed by users. The monadmin user can view information about transactions executed by all users.

**Table 13-78** USER\_TRANSACTION columns

Name	Type	Description
username	name	Username
commit_counter	bigint	Number of user transactions committed
rollback_counter	bigint	Number of user transactions rolled back
resp_min	bigint	Minimum response time of user transactions (unit: $\mu$ s)
resp_max	bigint	Maximum response time of user transactions (unit: $\mu$ s)
resp_avg	bigint	Average response time of user transactions (unit: $\mu$ s)
resp_total	bigint	Total response time of user transactions (unit: $\mu$ s)
bg_commit_counter	bigint	Number of background transactions committed
bg_rollback_counter	bigint	Number of background transactions rolled back
bg_resp_min	bigint	Minimum response time of background transactions (unit: $\mu$ s)
bg_resp_max	bigint	Maximum response time of background transactions (unit: $\mu$ s)
bg_resp_avg	bigint	Average response time of background transactions (unit: $\mu$ s)
bg_resp_total	bigint	Total response time of background transactions (unit: $\mu$ s)

### 13.2.6.9 GLOBAL\_USER\_TRANSACTION

**GLOBAL\_USER\_TRANSACTION** collects statistics about transactions executed by all users.

**Table 13-79** GLOBAL\_USER\_TRANSACTION columns

Name	Type	Description
node_name	name	Node name
username	name	Username
commit_counter	bigint	Number of user transactions committed
rollback_counter	bigint	Number of user transactions rolled back

Name	Type	Description
resp_min	bigint	Minimum response time of user transactions (unit: μs)
resp_max	bigint	Maximum response time of user transactions (unit: μs)
resp_avg	bigint	Average response time of user transactions (unit: μs)
resp_total	bigint	Total response time of user transactions (unit: μs)
bg_commit_counter	bigint	Number of background transactions committed
bg_rollback_counter	bigint	Number of background transactions rolled back
bg_resp_min	bigint	Minimum response time of background transactions (unit: μs)
bg_resp_max	bigint	Maximum response time of background transactions (unit: μs)
bg_resp_avg	bigint	Average response time of background transactions (unit: μs)
bg_resp_total	bigint	Total response time of background transactions (unit: μs)

## 13.2.7 Session/Thread

### 13.2.7.1 SESSION\_STAT

**SESSION\_STAT** collects statistics about session status on the current node based on session threads or the **AutoVacuum** thread.

**Table 13-80** SESSION\_STAT columns

Name	Type	Description
sessid	text	Thread start time and ID
statid	integer	Statistics ID
statname	text	Name of the statistics session
statunit	text	Unit of the statistics session
value	bigint	Value of the statistics session

### 13.2.7.2 GLOBAL\_SESSION\_STAT

**GLOBAL\_SESSION\_STAT** collects statistics about session status on each node based on session threads or the **AutoVacuum** thread.

**Table 13-81** GLOBAL\_SESSION\_STAT columns

Name	Type	Description
node_name	name	Node name
sessid	text	Thread start time and ID
statid	integer	Statistics ID
statname	text	Name of the statistics session
statunit	text	Unit of the statistics session
value	bigint	Value of the statistics session

### 13.2.7.3 SESSION\_TIME

**SESSION\_TIME** collects statistics about the running time of session threads and time consumed in each execution phase on the current node.

**Table 13-82** SESSION\_TIME columns

Name	Type	Description
sessid	text	Thread start time and ID
stat_id	integer	Statistics ID
stat_name	text	Session type name
value	bigint	Session value

### 13.2.7.4 GLOBAL\_SESSION\_TIME

**GLOBAL\_SESSION\_TIME** collects statistics about the running time of session threads and time consumed in each execution phase on each node.

**Table 13-83** GLOBAL\_SESSION\_TIME columns

Name	Type	Description
node_name	name	Node name
sessid	text	Thread start time and ID
stat_id	integer	Statistics ID

Name	Type	Description
stat_name	text	Session type
value	bigint	Session value

### 13.2.7.5 SESSION\_MEMORY

**SESSION\_MEMORY** collects statistics about memory usage at the session level in the unit of MB, including all the memory allocated to GaussDB and stream threads on DN for jobs currently executed by users.

**Table 13-84** SESSION\_MEMORY columns

Name	Type	Description
sessid	text	Thread start time and ID
init_mem	integer	Memory allocated to the currently executed job before the job enters the executor
used_mem	integer	Memory allocated to the currently executed job
peak_mem	integer	Peak memory allocated to the currently executed job

### 13.2.7.6 GLOBAL\_SESSION\_MEMORY

**GLOBAL\_SESSION\_MEMORY** collects statistics about memory usage at the session level on each node in the unit of MB, including all the memory allocated to GaussDB and stream threads on DN for jobs currently executed by users.

**Table 13-85** GLOBAL\_SESSION\_MEMORY columns

Name	Type	Description
node_name	name	Node name
sessid	text	Thread start time and ID
init_mem	integer	Memory allocated to the currently executed job before the job enters the executor
used_mem	integer	Memory allocated to the currently executed job
peak_mem	integer	Peak memory allocated to the currently executed job

### 13.2.7.7 SESSION\_MEMORY\_DETAIL

**SESSION\_MEMORY\_DETAIL** collects statistics about thread memory usage by MemoryContext node.

**Table 13-86** SESSION\_MEMORY\_DETAIL columns

Name	Type	Description
sessid	text	Thread start time and ID
sesstype	text	Thread name
contextname	text	Name of the memory context
level	smallint	Level of memory context importance
parent	text	Name of the parent memory context
totalsize	bigint	Size of the allocated memory (unit: byte)
freesize	bigint	Size of the idle memory (unit: byte)
usedsize	bigint	Size of the used memory (unit: byte)

### 13.2.7.8 GLOBAL\_SESSION\_MEMORY\_DETAIL

**GLOBAL\_SESSION\_MEMORY\_DETAIL** collects statistics about thread memory usage on each node by MemoryContext node.

**Table 13-87** GLOBAL\_SESSION\_MEMORY\_DETAIL columns

Name	Type	Description
node_name	name	Node name
sessid	text	Thread start time and ID
sesstype	text	Thread name
contextname	text	Name of the memory context
level	smallint	Level of memory context importance
parent	text	Name of the parent memory context
totalsize	bigint	Size of the allocated memory (unit: byte)
freesize	bigint	Size of the idle memory (unit: byte)
usedsize	bigint	Size of the used memory (unit: byte)

### 13.2.7.9 SESSION\_STAT\_ACTIVITY

Displays information about threads that are running on the current node.

**Table 13-88** SESSION\_STAT\_ACTIVITY columns

Name	Type	Description
datid	oid	OID of the database that the user session connects to in the backend
datname	name	Name of the database that the user session connects to in the backend
pid	bigint	Backend thread ID
usesysid	oid	OID of the user logged in to the backend
username	name	Name of the user logged in to the backend
application_name	text	Name of the application connected to the backend
client_addr	inet	IP address of the client connected to the backend. If this column is null, it indicates either the client is connected via a Unix socket on the server or this is an internal process, such as autovacuum.
client_hostname	text	Host name of the connected client, as reported by a reverse DNS lookup of <b>client_addr</b> . This column will be non-null only for IP connections and only when <b>log_hostname</b> is enabled.
client_port	integer	TCP port number that the client uses for communication with the backend (-1 if a Unix socket is used)
backend_start	timestampwith time zone	Time when this process was started, that is, when the client connected to the server
xact_start	timestampwith time zone	Time when the current transaction was started (null if no transactions are active). If the current query is the first of its transaction, the value of this column is the same as that of the <b>query_start</b> column.
query_start	timestampwith time zone	Time when the currently active query was started, or time when the last query was started if <b>state</b> is not <b>active</b> . For a stored procedure, function, or package, the first query time is queried and does not change with the running of statements in the stored procedure.
state_change	timestampwith time zone	Time when the <b>state</b> was last changed
waiting	boolean	Whether the backend is currently waiting on a lock. If yes, the value is <b>true</b> .

Name	Type	Description
enqueue	text	Unsupported currently.
state	text	<p>Overall status of this backend. Its value can be:</p> <ul style="list-style-type: none"> <li>• <b>active</b>: The backend is executing a query.</li> <li>• <b>idle</b>: The backend is waiting for a new client command.</li> <li>• <b>idle in transaction</b>: The backend is in a transaction, but is not currently executing a query.</li> <li>• <b>idle in transaction (aborted)</b>: This state is similar to <b>idle in transaction</b>, except that one of the statements in the transaction caused an error.</li> <li>• <b>fastpath function call</b>: The backend is executing a fast-path function.</li> <li>• <b>disabled</b>: This state is reported if <b>track_activities</b> is disabled in this backend.</li> </ul> <p><b>NOTE</b> Common users can view their own session status only. The state information of other accounts is empty. For example, after the <b>judy</b> user is connected to the database, the state information of the <b>joe</b> user and the initial user <b>omm</b> in <b>pg_stat_activity</b> is empty.</p> <pre>gaussdb=# SELECT datname, username, usesysid,state,pid FROM pg_stat_activity;  datname   username   usesysid   state   pid -----+-----+-----+-----+----- +-----+-----+-----+-----+----- +-----+-----+-----+-----+----- 139968752121616 testdb   omm   10     139968903116560 db_tpcds   judy   16398   active   139968391403280 testdb   omm   10     139968643069712 testdb   omm   10     139968680818448 testdb   joe   16390     139968563377936 (6 rows)</pre>
resource_pool	name	Resource pool used by the user
query_id	bigint	ID of a query
query	text	Text of this backend's latest query. If the value of <b>state</b> is <b>active</b> , this column shows the ongoing query. In all other states, it shows the last query that was executed.

Name	Type	Description
unique_sql_id	bigint	Unique SQL statement ID
trace_id	text	Driver-specific trace ID, which is associated with an application request

### 13.2.7.10 GLOBAL\_SESSION\_STAT\_ACTIVITY

Displays information about threads that are running on each node in the database.

**Table 13-89** GLOBAL\_SESSION\_STAT\_ACTIVITY columns

Name	Type	Description
coorname	text	Database process name
datid	oid	OID of the database that the user session connects to in the backend
datname	text	Name of the database that the user session connects to in the backend
pid	bigint	Backend thread ID
usesysid	oid	OID of the user logged in to the backend
username	text	Name of the user logged in to the backend
application_name	text	Name of the application connected to the backend
client_addr	inet	IP address of the client connected to the backend. If this column is null, it indicates either the client is connected via a Unix socket on the server or this is an internal process, such as autovacuum.
client_hostname	text	Host name of the connected client, as reported by a reverse DNS lookup of <b>client_addr</b> . This column will be non-null only for IP connections and only when <b>log_hostname</b> is enabled.
client_port	integer	TCP port number that the client uses for communication with the backend (-1 if a Unix socket is used)
backend_start	timestampwith time zone	Time when this process was started, that is, when the client connected to the server

Name	Type	Description
xact_start	timestampwith time zone	Time when the current transaction was started (null if no transactions are active). If the current query is the first of its transaction, the value of this column is the same as that of the <b>query_start</b> column.
query_start	timestampwith time zone	Time when the currently active query was started, or time when the last query was started if the value of <b>state</b> is not <b>active</b> . For a stored procedure, function, or package, the first query time is queried and does not change with the running of statements in the stored procedure.
state_change	timestampwith time zone	Time when the <b>state</b> was last changed
waiting	Boolean	Whether the backend is currently waiting on a lock. If yes, the value is <b>true</b> .
enqueue	text	Unsupported currently.

Name	Type	Description
trace_id	text	Driver-specific trace ID, which is associated with an application request

### 13.2.7.11 THREAD\_WAIT\_STATUS

**THREAD\_WAIT\_STATUS** allows you to test the block waiting status of the backend thread and auxiliary thread in the current instance. For details about events, see [Table 12-351](#), [Table 12-352](#), [Table 12-353](#), and [Table 12-354](#).

**Table 13-90** THREAD\_WAIT\_STATUS columns

Name	Type	Description
node_name	text	Database process name
db_name	text	Database name
thread_name	text	Thread name
query_id	bigint	Query ID. The value of this column is the same as that of <b>debug_query_id</b> .
tid	bigint	Thread ID of the current thread
sessionid	bigint	Session ID
lwtid	integer	Lightweight thread ID of the current thread
psessionid	bigint	Parent thread of the streaming thread
tlevel	integer	Level of the streaming thread
smpid	integer	Concurrent thread ID
wait_status	text	Waiting status of the current thread. For details about the waiting status, see <a href="#">Table 12-351</a> .
wait_event	text	If <b>wait_status</b> is <b>acquire lock</b> , <b>acquire lwlock</b> , or <b>wait io</b> , this column describes the lock, lightweight lock, or I/O information. Otherwise, this column is empty.
locktag	text	Information about the lock that the current thread is waiting for
lockmode	text	Lock mode that the current thread is waiting to obtain. The values include modes in the table-level lock, row-level lock, and page-level lock.
block_sessionid	bigint	ID of the session that blocks the current thread from obtaining the lock

Name	Type	Description
global_sessionid	text	Global session ID

### 13.2.7.12 GLOBAL\_THREAD\_WAIT\_STATUS

In this view, you can check the blocking and waiting status of backend threads and auxiliary threads on all nodes. For details about events, see [15.3.67-Table 2 Waiting state list](#), [15.3.67-Table 3 List of wait events corresponding to lightweight locks](#), [15.3.67-Table 4 List of wait events corresponding to I/Os](#), and [15.3.67-Table 5 List of wait events corresponding to transaction locks](#).

In GLOBAL\_THREAD\_WAIT\_STATUS, you can see all the call hierarchy relationships between threads of the SQL statements on all nodes in the database, and the block waiting status for each thread. With this view, you can easily locate the causes of process hang and similar issues.

The definitions of GLOBAL\_THREAD\_WAIT\_STATUS and THREAD\_WAIT\_STATUS are the same, because the GLOBAL\_THREAD\_WAIT\_STATUS view is essentially the query summary of the THREAD\_WAIT\_STATUS view on each node in the database.

**Table 13-91** GLOBAL\_THREAD\_WAIT\_STATUS columns

Name	Type	Description
node_name	text	Database process name
db_name	text	Database name
thread_name	text	Thread name
query_id	bigint	Query ID. The value of this column is the same as that of <b>debug_query_id</b> .
tid	bigint	Thread ID of the current thread
sessionid	bigint	Session ID
lwtid	integer	Lightweight thread ID of the current thread
psessionid	bigint	Parent thread of the streaming thread
tlevel	integer	Level of the streaming thread
smpid	integer	Concurrent thread ID
wait_status	text	Waiting status of the current thread. For details about the waiting status, see <a href="#">Table 12-351</a> .
wait_event	text	If <b>wait_status</b> is <b>acquire lock</b> , <b>acquire lwlock</b> , or <b>wait io</b> , this column describes the lock, lightweight lock, or I/O information. Otherwise, this column is empty.

Name	Type	Description
locktag	text	Information about the lock that the current thread is waiting for
lockmode	text	Lock mode that the current thread is waiting to obtain The values include modes in the table-level lock, row-level lock, and page-level lock.
block_sessionid	bigint	ID of the session that blocks the current thread from obtaining the lock
global_sessionid	text	Global session ID

### 13.2.7.13 LOCAL\_THREADPOOL\_STATUS

**LOCAL\_THREADPOOL\_STATUS** displays the status of worker threads and sessions in a thread pool. This view is valid only when **enable\_thread\_pool** is set to **on**.

**Table 13-92** LOCAL\_THREADPOOL\_STATUS columns

Name	Type	Description
node_name	text	Database process name
group_id	integer	ID of the thread pool group
bind_numa_id	integer	NUMA ID to which the thread pool group is bound
bind_cpu_number	integer	Information about the CPU to which the thread pool group is bound. If no CPUs are bound, the value is <b>NULL</b> .
listener	integer	Number of listener threads in the thread pool group

Name	Type	Description
worker_info	text	Information about threads in the thread pool, including: <ul style="list-style-type: none"> <li>● <b>default</b>: Number of initial threads in the thread pool group</li> <li>● <b>new</b>: Number of new threads in the thread pool group</li> <li>● <b>expect</b>: Expected number of threads in the thread pool group</li> <li>● <b>actual</b>: Actual number of threads in the thread pool group</li> <li>● <b>idle</b>: Number of idle threads in the thread pool group</li> <li>● <b>pending</b>: Number of pending threads in the thread pool group</li> </ul>
session_info	text	Information about sessions in the thread pool, including: <ul style="list-style-type: none"> <li>● <b>total</b>: Total number of sessions in the thread pool group</li> <li>● <b>waiting</b>: Number of sessions pending scheduling in the thread pool group</li> <li>● <b>running</b>: Number of running sessions in the thread pool group</li> <li>● <b>idle</b>: Number of idle sessions in the thread pool group</li> </ul>
stream_info	text	Stream pool information, including: <ul style="list-style-type: none"> <li>● <b>total</b>: total number of threads in the stream pool group.</li> <li>● <b>running</b>: number of threads that are being executed in the stream pool.</li> <li>● <b>idle</b>: number of idle threads in the stream pool.</li> </ul>

### 13.2.7.14 GLOBAL\_THREADPOOL\_STATUS

**GLOBAL\_THREADPOOL\_STATUS** displays the status of worker threads and sessions in thread pools on all nodes. Columns in this view are the same as those in [Table 13-92](#).

### 13.2.7.15 LOCAL\_ACTIVE\_SESSION

**LOCAL\_ACTIVE\_SESSION** displays samples in the **ACTIVE SESSION PROFILE** memory on the current node.

**Table 13-93** LOCAL\_ACTIVE\_SESSION columns

Name	Type	Description
sampleid	bigint	Sample ID
sample_time	timestamp with time zone	Sampling time
need_flush_sample	boolean	Specifies whether the sample needs to be flushed to disks.
databaseid	oid	Database ID
thread_id	bigint	Thread ID
sessionid	bigint	Session ID
start_time	timestamp with time zone	Start time of a session
event	text	Event name
lwtid	integer	Lightweight thread ID of the current thread
psessionid	bigint	Parent thread of the streaming thread
tlevel	integer	Level of the streaming thread, which corresponds to the level ( <b>id</b> ) of the execution plan
smpid	integer	Concurrent thread ID in SMP execution mode
userid	oid	ID of a session user
application_name	text	Name of an application
client_addr	inet	IP address of a client
client_hostname	text	Name of a client
client_port	integer	TCP port number used by a client to communicate with the backend
query_id	bigint	debug query id
unique_query_id	bigint	unique query id
user_id	oid	User ID in the key of the unique query

Name	Type	Description
cn_id	integer	CN ID. On a DN, this parameter indicates the ID of the node that delivers the unique SQL statement, that is, the value of <b>cn_id</b> in the key of the unique query.
unique_query	text	Standardized text string of the unique SQL statement
locktag	text	Information of a lock that the session waits for, which can be parsed using <b>locktag_decode</b>
lockmode	text	Mode of a lock that the session waits for
block_sessionid	bigint	Blocks a session from obtaining the session ID of a lock if the session is waiting for the lock.
final_block_sessionid	bigint	ID of the blocked session at the source end
wait_status	text	Provides more details about an event column.
global_sessionid	text	Global session ID
xact_start_time	timestamp with time zone	Start time of the transaction
query_start_time	timestamp with time zone	Time when the statement starts to be executed
state	text	Current statement state The value can be <b>active</b> , <b>idle in transaction</b> , <b>fastpath function call</b> , <b>idle in transaction (aborted)</b> , <b>disabled</b> , or <b>retrying</b> .

## 13.2.8 Transaction

### 13.2.8.1 TRANSACTIONS\_PREPARED\_XACTS

**TRANSACTIONS\_PREPARED\_XACTS** displays information about transactions that are currently prepared for two-phase commit.

**Table 13-94** TRANSACTIONS\_PREPARED\_XACTS columns

Name	Type	Description
transaction	xid	Numeric transaction identifier of the prepared transaction
gid	text	Global transaction identifier that was assigned to the transaction
prepared	timestamp with time zone	Time at which the transaction is prepared for commit
owner	name	Name of the user that executes the transaction
database	name	Name of the database in which the transaction is executed

### 13.2.8.2 SUMMARY\_TRANSACTIONS\_PREPARED\_XACTS

Displays information about transactions that are currently prepared for two-phase commit on the primary database node in the database.

**Table 13-95** SUMMARY\_TRANSACTIONS\_PREPARED\_XACTS columns

Name	Type	Description
transaction	xid	Numeric transaction identifier of the prepared transaction
gid	text	Global transaction identifier that was assigned to the transaction
prepared	timestamp with time zone	Time at which the transaction is prepared for commit
owner	name	Name of the user that executes the transaction
database	name	Name of the database in which the transaction is executed

### 13.2.8.3 GLOBAL\_TRANSACTIONS\_PREPARED\_XACTS

**GLOBAL\_TRANSACTIONS\_PREPARED\_XACTS** displays information about transactions that are currently prepared for two-phase commit on each node.

**Table 13-96** GLOBAL\_TRANSACTIONS\_PREPARED\_XACTS columns

Name	Type	Description
transaction	xid	Numeric transaction identifier of the prepared transaction
gid	text	Global transaction identifier that was assigned to the transaction
prepared	timestamp with time zone	Time at which the transaction is prepared for commit
owner	name	Name of the user that executes the transaction
database	name	Name of the database in which the transaction is executed

### 13.2.8.4 TRANSACTIONS\_RUNNING\_XACTS

**TRANSACTIONS\_RUNNING\_XACTS** displays information about running transactions on the current node.

**Table 13-97** TRANSACTIONS\_RUNNING\_XACTS columns

Name	Type	Description
handle	integer	Slot handle in the transaction manager corresponding to a transaction. The value is fixed at <b>-1</b> .
gxid	xid	Transaction ID
state	tinyint	Transaction status ( <b>3</b> : prepared or <b>0</b> : starting)
node	text	Node name
xmin	xid	Minimum transaction ID on the node
vacuum	boolean	Whether the current transaction is lazy vacuum
timeline	bigint	Number of database restarts
prepare_xid	xid	Transaction ID in the <b>prepared</b> state. If the state is not <b>prepared</b> , the value is <b>0</b> .
pid	bigint	Thread ID corresponding to the transaction
next_xid	xid	Transaction ID sent by other nodes to the current node. The value is fixed at <b>0</b> .

### 13.2.8.5 SUMMARY\_TRANSACTIONS\_RUNNING\_XACTS

**SUMMARY\_TRANSACTIONS\_RUNNING\_XACTS** displays information about the running transactions on each node in the cluster. The column content is the same as that of **TRANSACTIONS\_RUNNING\_XACTS**.

**Table 13-98** SUMMARY\_TRANSACTIONS\_RUNNING\_XACTS columns

Name	Type	Description
handle	integer	Slot handle in the transaction manager corresponding to a transaction. The value is fixed at <b>-1</b> .
gxid	xid	Transaction ID
state	tinyint	Transaction status ( <b>3</b> : prepared or <b>0</b> : starting)
node	text	Node name
xmin	xid	Minimum transaction ID on the node
vacuum	boolean	Whether the current transaction is lazy vacuum
timeline	bigint	Number of database restarts
prepare_xid	xid	Transaction ID in the <b>prepared</b> state. If the state is not <b>prepared</b> , the value is <b>0</b> .
pid	bigint	Thread ID corresponding to the transaction
next_xid	xid	Transaction ID sent by other nodes to the current node. The value is fixed at <b>0</b> .

### 13.2.8.6 GLOBAL\_TRANSACTIONS\_RUNNING\_XACTS

**GLOBAL\_TRANSACTIONS\_RUNNING\_XACTS** displays information about the running transactions on each node in the cluster.

**Table 13-99** GLOBAL\_TRANSACTIONS\_RUNNING\_XACTS columns

Name	Type	Description
handle	integer	Slot handle in the transaction manager corresponding to a transaction. The value is fixed at <b>-1</b> .
gxid	xid	Transaction ID
state	tinyint	Transaction status ( <b>3</b> : prepared or <b>0</b> : starting)
node	text	Node name
xmin	xid	Minimum transaction ID on the node

Name	Type	Description
vacuum	boolean	Whether the current transaction is lazy vacuum
timeline	bigint	Number of database restarts
prepare_xid	xid	Transaction ID in the <b>prepared</b> state. If the state is not <b>prepared</b> , the value is <b>0</b> .
pid	bigint	Thread ID corresponding to the transaction
next_xid	xid	Transaction ID sent by other nodes to the current node. The value is fixed at <b>0</b> .

## 13.2.9 Query

### 13.2.9.1 STATEMENT

Obtains information about executed statements (normalized SQL statements) on the current node. You can view all statistics about normalized SQL statements received by the primary database node and other database nodes, whereas you can view only the statistics about normalized SQL statements executed on other database nodes.

---

**⚠ CAUTION**

The **unique\_sql\_id** generated by different **savepoint\_name** values is different. When a large number of **savepoint\_name** is used, the number of **unique\_sql\_id** values generated in the system increases rapidly. If the number of **unique\_sql\_id** values is greater than the number of **instr\_unique\_sql\_count** values, the newly generated **unique\_sql\_id** information is not counted.

---

**Table 13-100** STATEMENT columns

Name	Type	Description
node_name	name	Database process name
node_id	integer	ID of a node
user_name	name	Username
user_id	oid	OID of the user
unique_sql_id	bigint	ID of the normalized SQL statement
query	text	Normalized SQL statement Note: The length is controlled by <b>track_activity_query_size</b> .

Name	Type	Description
n_calls	bigint	Number of calls
min_elapse_time	bigint	Minimum execution time of the SQL statement in the kernel (unit: $\mu$ s)
max_elapse_time	bigint	Maximum execution time of the SQL statement in the kernel (unit: $\mu$ s)
total_elapse_time	bigint	Total execution time of the SQL statement in the kernel (unit: $\mu$ s)
n_returned_rows	bigint	Number of rows in the result set returned by the <b>SELECT</b> statement
n_tuples_fetched	bigint	Number of rows randomly scanned
n_tuples_returned	bigint	Number of rows sequentially scanned
n_tuples_inserted	bigint	Number of rows inserted
n_tuples_updated	bigint	Number of rows updated
n_tuples_deleted	bigint	Number of rows deleted
n_blocks_fetched	bigint	Number of buffer block access times
n_blocks_hit	bigint	Number of buffer block hits
n_soft_parse	bigint	Number of soft parsing times. The value of <b>n_soft_parse</b> plus the value of <b>n_hard_parse</b> may be greater than the value of <b>n_calls</b> because the number of subqueries is not counted in the value of <b>n_calls</b> .
n_hard_parse	bigint	Number of hard parsing times. The value of <b>n_soft_parse</b> plus the value of <b>n_hard_parse</b> may be greater than the value of <b>n_calls</b> because the number of subqueries is not counted in the value of <b>n_calls</b> .
db_time	bigint	Valid DB time, which is accumulated if multiple threads are involved (unit: $\mu$ s)
cpu_time	bigint	CPU time (unit: $\mu$ s)
execution_time	bigint	Execution time in the executor (unit: $\mu$ s)
parse_time	bigint	SQL parsing time (unit: $\mu$ s)
plan_time	bigint	SQL plan generation time (unit: $\mu$ s)
rewrite_time	bigint	SQL rewriting time (unit: $\mu$ s)
pl_execution_time	bigint	Execution time of PL/pgSQL (unit: $\mu$ s)

Name	Type	Description
pl_compilation_time	bigint	Compilation time of PL/pgSQL (unit: $\mu$ s)
data_io_time	bigint	I/O time (unit: $\mu$ s)
net_send_info	text	Network status of messages sent through a physical connection, including the time (unit: $\mu$ s), number of calls, and throughput (unit: byte). This column is not supported in standalone mode.
net_rcv_info	text	Network status of messages received through a physical connection, including the time (unit: $\mu$ s), number of calls, and throughput (unit: byte). This column is not supported in standalone mode.
net_stream_send_info	text	Network status of messages sent through a logical connection, including the time (unit: $\mu$ s), number of calls, and throughput (unit: byte). This column is not supported in standalone mode.
net_stream_rcv_info	text	Network status of messages received through a logical connection, including the time (unit: $\mu$ s), number of calls, and throughput (unit: byte). This column is not supported in standalone mode.
last_updated	timestamp with time zone	Last time when the statement was updated
sort_count	bigint	Sorting count
sort_time	bigint	Sorting duration (unit: $\mu$ s)
sort_mem_used	bigint	Size of work memory used during sorting (unit: KB)
sort_spill_count	bigint	Count of file writing when data is flushed to disks during sorting
sort_spill_size	bigint	File size used when data is flushed to disks during sorting (unit: KB)
hash_count	bigint	Hashing count
hash_time	bigint	Hashing duration (unit: $\mu$ s)
hash_mem_used	bigint	Size of work memory used during hashing (unit: KB)
hash_spill_count	bigint	Count of file writing when data is flushed to disks during hashing

Name	Type	Description
hash_spill_size	bigint	File size used when data is flushed to disks during hashing (unit: KB)
parent_unique_sql_id	bigint	Unique ID of the parent SQL statement. The value is <b>0</b> for a non-stored procedure substatement.

 NOTE

**n\_calls** indicates the actual number of calling times. For the FETCH statement in the stored procedure, the actual number of triggering times of the FETCH statement is the increase times of **n\_calls** of the statement actually executed by the cursor.

### 13.2.9.2 SUMMARY\_STATEMENT

**SUMMARY\_STATEMENT** obtains all information about executed statements (normalized SQL statements) on the primary database node and other database nodes.

**Table 13-101** SUMMARY\_STATEMENT columns

Name	Type	Description
node_name	name	Database process name
node_id	integer	ID of a node
user_name	name	Username
user_id	oid	OID of the user
unique_sql_id	bigint	ID of the normalized SQL statement
query	text	Normalized SQL statement Note: The length is controlled by <b>track_activity_query_size</b> .
n_calls	bigint	Number of calls
min_elapse_time	bigint	Minimum execution time of the SQL statement in the kernel (unit: $\mu$ s)
max_elapse_time	bigint	Maximum execution time of the SQL statement in the kernel (unit: $\mu$ s)
total_elapse_time	bigint	Total execution time of the SQL statement in the kernel (unit: $\mu$ s)
n_returned_rows	bigint	Number of rows in the result set returned by the <b>SELECT</b> statement
n_tuples_fetched	bigint	Number of rows randomly scanned

Name	Type	Description
n_tuples_returned	bigint	Number of rows sequentially scanned
n_tuples_inserted	bigint	Number of rows inserted
n_tuples_updated	bigint	Number of rows updated
n_tuples_deleted	bigint	Number of rows deleted
n_blocks_fetched	bigint	Number of buffer block access times
n_blocks_hit	bigint	Number of buffer block hits
n_soft_parse	bigint	Number of soft parsing times
n_hard_parse	bigint	Number of hard parsing times
db_time	bigint	Valid DB time, which is accumulated if multiple threads are involved (unit: $\mu$ s)
cpu_time	bigint	CPU time (unit: $\mu$ s)
execution_time	bigint	Execution time in the executor (unit: $\mu$ s)
parse_time	bigint	SQL parsing time (unit: $\mu$ s)
plan_time	bigint	SQL plan generation time (unit: $\mu$ s)
rewrite_time	bigint	SQL rewriting time (unit: $\mu$ s)
pl_execution_time	bigint	Execution time of PL/pgSQL (unit: $\mu$ s)
pl_compilation_time	bigint	Compilation time of PL/pgSQL (unit: $\mu$ s)
data_io_time	bigint	I/O time (unit: $\mu$ s)
net_send_info	text	Network status of messages sent through a physical connection, including the time (unit: $\mu$ s), number of calls, and throughput (unit: byte). This column is not supported in standalone mode.
net_rcv_info	text	Network status of messages received through a physical connection, including the time (unit: $\mu$ s), number of calls, and throughput (unit: byte). This column is not supported in standalone mode.
net_stream_send_info	text	Network status of messages sent through a logical connection, including the time (unit: $\mu$ s), number of calls, and throughput (unit: byte). This column is not supported in standalone mode.

Name	Type	Description
net_stream_rcv_info	text	Network status of messages received through a logical connection, including the time (unit: $\mu$ s), number of calls, and throughput (unit: byte). This column is not supported in standalone mode.
last_updated	timestamp with time zone	Last time when the statement was updated
sort_count	bigint	Sorting count
sort_time	bigint	Sorting duration (unit: $\mu$ s)
sort_mem_used	bigint	Size of work memory used during sorting (unit: KB)
sort_spill_count	bigint	Count of file writing when data is flushed to disks during sorting
sort_spill_size	bigint	File size used when data is flushed to disks during sorting (unit: KB)
hash_count	bigint	Hashing count
hash_time	bigint	Hashing duration (unit: $\mu$ s)
hash_mem_used	bigint	Size of work memory used during hashing (unit: KB)
hash_spill_count	bigint	Count of file writing when data is flushed to disks during hashing
hash_spill_size	bigint	File size used when data is flushed to disks during hashing (unit: KB)
parent_unique_sql_id	bigint	Unique ID of the parent SQL statement. The value is <b>0</b> for a non-stored procedure substatement.

### 13.2.9.3 STATEMENT\_COUNT

Displays statistics about five types of running statements (SELECT, INSERT, UPDATE, DELETE, and MERGE INTO) as well as DDL, DML, and DCL statements on the current node of the database.

#### NOTE

An administrator can query the STATEMENT\_COUNT view to view the statistics of all users on the current node. When the database or the node is restarted, the statistics are cleared and the counting restarts. The system counts when a node receives a query, including queries inside the database. For example, when the primary database node receives a query, it is counted on the database node though multiple queries are delivered the database node.

**Table 13-102** STATEMENT\_COUNT columns

Name	Type	Description
node_name	text	Database process name
user_name	text	Username
select_count	bigint	Statistical result of the <b>SELECT</b> statement
update_count	bigint	Statistical result of the <b>UPDATE</b> statement
insert_count	bigint	Statistical result of the <b>INSERT</b> statement
delete_count	bigint	Statistical result of the <b>DELETE</b> statement
mergeinto_count	bigint	Statistical result of the <b>MERGE INTO</b> statement
ddl_count	bigint	Number of DDL statements
dml_count	bigint	Number of DML statements
dcl_count	bigint	Number of DCL statements
total_select_elapse	bigint	Total response time of <b>SELECT</b> statements (unit: $\mu$ s)
avg_select_elapse	bigint	Average response time of <b>SELECT</b> statements (unit: $\mu$ s)
max_select_elapse	bigint	Maximum response time of <b>SELECT</b> statements (unit: $\mu$ s)
min_select_elapse	bigint	Minimum response time of <b>SELECT</b> statements (unit: $\mu$ s)
total_update_elapse	bigint	Total response time of <b>UPDATE</b> statements (unit: $\mu$ s)
avg_update_elapse	bigint	Average response time of <b>UPDATE</b> statements (unit: $\mu$ s)
max_update_elapse	bigint	Maximum response time of <b>UPDATE</b> statements (unit: $\mu$ s)
min_update_elapse	bigint	Minimum response time of <b>UPDATE</b> statements (unit: $\mu$ s)
total_insert_elapse	bigint	Total response time of <b>INSERT</b> statements (unit: $\mu$ s)
avg_insert_elapse	bigint	Average response time of <b>INSERT</b> statements (unit: $\mu$ s)
max_insert_elapse	bigint	Maximum response time of <b>INSERT</b> statements (unit: $\mu$ s)
min_insert_elapse	bigint	Minimum response time of <b>INSERT</b> statements (unit: $\mu$ s)

Name	Type	Description
total_delete_elapse	bigint	Total response time of <b>DELETE</b> statements (unit: $\mu$ s)
avg_delete_elapse	bigint	Average response time of <b>DELETE</b> statements (unit: $\mu$ s)
max_delete_elapse	bigint	Maximum response time of <b>DELETE</b> statements (unit: $\mu$ s)
min_delete_elapse	bigint	Minimum response time of <b>DELETE</b> statements (unit: $\mu$ s)

### 13.2.9.4 GLOBAL\_STATEMENT\_COUNT

**GLOBAL\_STATEMENT\_COUNT** displays statistics about five types of running statements (**SELECT**, **INSERT**, **UPDATE**, **DELETE**, and **MERGE INTO**) as well as DDL, DML, and DCL statements on each node of the database.

**Table 13-103** GLOBAL\_STATEMENT\_COUNT columns

Name	Type	Description
node_name	text	Node name
user_name	text	Username
select_count	bigint	Statistical result of the <b>SELECT</b> statement
update_count	bigint	Statistical result of the <b>UPDATE</b> statement
insert_count	bigint	Statistical result of the <b>INSERT</b> statement
delete_count	bigint	Statistical result of the <b>DELETE</b> statement
mergeinto_count	bigint	Statistical result of the <b>MERGE INTO</b> statement
ddl_count	bigint	Number of DDL statements
dml_count	bigint	Number of DML statements
dcl_count	bigint	Number of DCL statements
total_select_elapse	bigint	Total response time of <b>SELECT</b> statements (unit: $\mu$ s)
avg_select_elapse	bigint	Average response time of <b>SELECT</b> statements (unit: $\mu$ s)
max_select_elapse	bigint	Maximum response time of <b>SELECT</b> statements (unit: $\mu$ s)

Name	Type	Description
min_select_elapse	bigint	Minimum response time of <b>SELECT</b> statements (unit: $\mu$ s)
total_update_elapse	bigint	Total response time of <b>UPDATE</b> statements (unit: $\mu$ s)
avg_update_elapse	bigint	Average response time of <b>UPDATE</b> statements (unit: $\mu$ s)
max_update_elapse	bigint	Maximum response time of <b>UPDATE</b> statements (unit: $\mu$ s)
min_update_elapse	bigint	Minimum response time of <b>UPDATE</b> statements (unit: $\mu$ s)
total_insert_elapse	bigint	Total response time of <b>INSERT</b> statements (unit: $\mu$ s)
avg_insert_elapse	bigint	Average response time of <b>INSERT</b> statements (unit: $\mu$ s)
max_insert_elapse	bigint	Maximum response time of <b>INSERT</b> statements (unit: $\mu$ s)
min_insert_elapse	bigint	Minimum response time of <b>INSERT</b> statements (unit: $\mu$ s)
total_delete_elapse	bigint	Total response time of <b>DELETE</b> statements (unit: $\mu$ s)
avg_delete_elapse	bigint	Average response time of <b>DELETE</b> statements (unit: $\mu$ s)
max_delete_elapse	bigint	Maximum response time of <b>DELETE</b> statements (unit: $\mu$ s)
min_delete_elapse	bigint	Minimum response time of <b>DELETE</b> statements (unit: $\mu$ s)

### 13.2.9.5 SUMMARY\_STATEMENT\_COUNT

**SUMMARY\_STATEMENT\_COUNT** displays statistics about five types of running statements (**SELECT**, **INSERT**, **UPDATE**, **DELETE**, and **MERGE INTO**) as well as DDL, DML, and DCL statements on all nodes (database nodes) of the database.

**Table 13-104** SUMMARY\_STATEMENT\_COUNT columns

Name	Type	Description
user_name	text	Username
select_count	numeric	Statistical result of the <b>SELECT</b> statement

Name	Type	Description
update_count	numeric	Statistical result of the <b>UPDATE</b> statement
insert_count	numeric	Statistical result of the <b>INSERT</b> statement
delete_count	numeric	Statistical result of the <b>DELETE</b> statement
mergeinto_count	numeric	Statistical result of the <b>MERGE INTO</b> statement
ddl_count	numeric	Number of DDL statements
dml_count	numeric	Number of DML statements
dcl_count	numeric	Number of DCL statements
total_select_elapse	numeric	Total response time of <b>SELECT</b> statements (unit: $\mu$ s)
avg_select_elapse	bigint	Average response time of <b>SELECT</b> statements (unit: $\mu$ s)
max_select_elapse	bigint	Maximum response time of <b>SELECT</b> statements (unit: $\mu$ s)
min_select_elapse	bigint	Minimum response time of <b>SELECT</b> statements (unit: $\mu$ s)
total_update_elapse	numeric	Total response time of <b>UPDATE</b> statements (unit: $\mu$ s)
avg_update_elapse	bigint	Average response time of <b>UPDATE</b> statements (unit: $\mu$ s)
max_update_elapse	bigint	Maximum response time of <b>UPDATE</b> statements (unit: $\mu$ s)
min_update_elapse	bigint	Minimum response time of <b>UPDATE</b> statements (unit: $\mu$ s)
total_insert_elapse	numeric	Total response time of <b>INSERT</b> statements (unit: $\mu$ s)
avg_insert_elapse	bigint	Average response time of <b>INSERT</b> statements (unit: $\mu$ s)
max_insert_elapse	bigint	Maximum response time of <b>INSERT</b> statements (unit: $\mu$ s)
min_insert_elapse	bigint	Minimum response time of <b>INSERT</b> statements (unit: $\mu$ s)
total_delete_elapse	numeric	Total response time of <b>DELETE</b> statements (unit: $\mu$ s)

Name	Type	Description
avg_delete_elapse	bigint	Average response time of <b>DELETE</b> statements (unit: $\mu$ s)
max_delete_elapse	bigint	Maximum response time of <b>DELETE</b> statements (unit: $\mu$ s)
min_delete_elapse	bigint	Minimum response time of <b>DELETE</b> statements (unit: $\mu$ s)

### 13.2.9.6 STATEMENT\_RESPONSETIME\_PERCENTILE

Obtains the response times of 80% and 95% SQL statements in the database.

**Table 13-105** STATEMENT\_RESPONSETIME\_PERCENTILE columns

Name	Type	Description
p80	bigint	Response time of 80% SQL statements in the database (unit: $\mu$ s).
p95	bigint	Response time of 95% SQL statements in the database (unit: $\mu$ s).

### 13.2.9.7 STATEMENT\_HISTORY

Displays information about statements executed on the current node. The result can be queried only in the system database but cannot be queried in the user database.

**Table 13-106** STATEMENT\_HISTORY columns

Name	Type	Description
db_name	name	Database name.
schema_name	name	Schema name.
origin_node	integer	Node name.
user_name	name	Username.
application_name	text	Name of the application that sends a request.
client_addr	text	IP address of the client that sends a request.
client_port	integer	Port number of the client that sends a request.

Name	Type	Description
unique_query_id	bigint	ID of the normalized SQL statement.
debug_query_id	bigint	ID of the unique SQL statement.
query	text	Normalized SQL statement.
start_time	timestamp with time zone	Time when a statement starts.
finish_time	timestamp with time zone	Time when a statement ends.
slow_sql_threshold	bigint	Standard for slow SQL statement execution.
transaction_id	bigint	Transaction ID.
thread_id	bigint	ID of an execution thread.
session_id	bigint	Session ID of a user.
n_soft_parse	bigint	Number of soft parsing times. The value of <b>n_soft_parse</b> plus the value of <b>n_hard_parse</b> may be greater than the value of <b>n_calls</b> because the number of subqueries is not counted in the value of <b>n_calls</b> .
n_hard_parse	bigint	Number of hard parsing times. The value of <b>n_soft_parse</b> plus the value of <b>n_hard_parse</b> may be greater than the value of <b>n_calls</b> because the number of subqueries is not counted in the value of <b>n_calls</b> .
query_plan	text	Statement execution plan.
n_returned_rows	bigint	Number of rows in the result set returned by the <b>SELECT</b> statement.
n_tuples_fetched	bigint	Number of rows randomly scanned.
n_tuples_returned	bigint	Number of rows sequentially scanned.
n_tuples_inserted	bigint	Number of rows inserted.
n_tuples_updated	bigint	Number of rows updated.
n_tuples_deleted	bigint	Number of rows deleted.

Name	Type	Description
n_blocks_fetched	bigint	Number of buffer block access times.
n_blocks_hit	bigint	Number of buffer block hits.
db_time	bigint	Valid DB time, which is accumulated if multiple threads are involved (unit: $\mu$ s).
cpu_time	bigint	CPU time (unit: $\mu$ s).
execution_time	bigint	Execution time in the executor (unit: $\mu$ s).
parse_time	bigint	SQL parsing time (unit: $\mu$ s).
plan_time	bigint	SQL plan generation time (unit: $\mu$ s).
rewrite_time	bigint	SQL rewriting time (unit: $\mu$ s).
pl_execution_time	bigint	Execution time of PL/pgSQL (unit: $\mu$ s).
pl_compilation_time	bigint	Compilation time of PL/pgSQL (unit: $\mu$ s).
data_io_time	bigint	I/O time (unit: $\mu$ s).
net_send_info	text	Network status of messages sent through a physical connection, including the time (unit: $\mu$ s), number of calls, and throughput (unit: byte). This can be used to analyze the network overhead of SQL statements in a distributed system and is not supported in standalone system. Example: {"time":xxx, "n_calls":xxx, "size":xxx}.
net_rcv_info	text	Network status of messages received through a physical connection, including the time (unit: $\mu$ s), number of calls, and throughput (unit: byte). This can be used to analyze the network overhead of SQL statements in a distributed system and is not supported in standalone system. Example: {"time":xxx, "n_calls":xxx, "size":xxx}.
net_stream_send_info	text	Network status of messages sent through a logical connection, including the time (unit: $\mu$ s), number of calls, and throughput (unit: byte). This can be used to analyze the network overhead of SQL statements in a distributed system and is not supported in standalone system. Example: {"time":xxx, "n_calls":xxx, "size":xxx}.

Name	Type	Description
net_stream_rec v_info	text	Network status of messages received through a logical connection, including the time (unit: $\mu$ s), number of calls, and throughput (unit: byte). This can be used to analyze the network overhead of SQL statements in a distributed system and is not supported in standalone system. Example: {"time":xxx, "n_calls":xxx, "size":xxx}.
lock_count	bigint	Number of locks.
lock_time	bigint	Time required for locking.
lock_wait_count	bigint	Number of lock waits.
lock_wait_time	bigint	Time required for lock waiting.
lock_max_count	bigint	Maximum number of locks.
lwlock_count	bigint	Number of lightweight locks (reserved).
lwlock_wait_co unt	bigint	Number of lightweight lock waits.
lwlock_time	bigint	Time required for lightweight locking (reserved).
lwlock_wait_tim e	bigint	Time required for lightweight locking.

Name	Type	Description
details	bytea	<p>List of wait events and statement lock events.</p> <p>When the value of <b>track_stmt_stat_level</b> is greater than or equal to <b>L0</b>, the list of wait events starts to be recorded. Statistics about the wait events of the current statement are displayed. For details about events, see <a href="#">15.3.67-Table 2 Waiting state list</a>, <a href="#">15.3.67-Table 3 List of wait events corresponding to lightweight locks</a>, <a href="#">15.3.67-Table 4 List of wait events corresponding to I/Os</a>, and <a href="#">15.3.67-Table 5 List of wait events corresponding to transaction locks</a>. For details about the impact of each transaction lock on services, see <a href="#">LOCK</a>.</p> <p>When the value of <b>track_stmt_stat_level</b> is <b>L2</b>, the list of statement lock events starts to be recorded. The list records events in chronological order. The number of records is determined by the <b>track_stmt_details_size</b> parameter.</p> <p>Events include:</p> <ul style="list-style-type: none"> <li>• Start locking.</li> <li>• Complete locking.</li> <li>• Start lock waiting.</li> <li>• Complete lock waiting.</li> <li>• Start unlocking.</li> <li>• Complete unlocking.</li> <li>• Start lightweight lock waiting.</li> <li>• Complete lightweight lock waiting.</li> </ul>
is_slow_sql	boolean	Whether the SQL statement is a slow SQL statement.
trace_id	text	Driver-specific trace ID, which is associated with an application request.
advise	text	Risk information that may cause the SQL statement to be a slow SQL statement.
parent_unique_sql_id	bigint	Normalized SQL ID of the outer SQL statement. For statements executed in a stored procedure, the value is the normalized SQL ID of the statement that invokes the stored procedure. For statements outside the stored procedure, the value is <b>0</b> .

## 13.2.10 Cache/IO

### 13.2.10.1 STATIO\_USER\_TABLES

**STATIO\_USER\_TABLES** displays I/O status information about all user relationship tables in the namespace.

**Table 13-107** STATIO\_USER\_TABLES columns

Name	Type	Description
relid	oid	Table OID
schemaname	name	Name of the schema that the table is in
relname	name	Table name
heap_blks_read	bigint	Number of disk blocks read from the table
heap_blks_hit	bigint	Number of cache hits in the table
idx_blks_read	bigint	Number of disk blocks read from indexes in the table
idx_blks_hit	bigint	Number of cache hits in indexes in the table
toast_blks_read	bigint	Number of disk blocks read from the TOAST table (if any) in the table
toast_blks_hit	bigint	Number of buffer hits in the TOAST table (if any) in the table
tidx_blks_read	bigint	Number of disk blocks read from the TOAST table index (if any) in the table
tidx_blks_hit	bigint	Number of buffer-hits in the TOAST table index (if any) in the table

### 13.2.10.2 SUMMARY\_STATIO\_USER\_TABLES

**SUMMARY\_STATIO\_USER\_TABLES** displays I/O status information about all user relationship tables in namespaces in the database.

**Table 13-108** SUMMARY\_STATIO\_USER\_TABLES columns

Name	Type	Description
schemaname	name	Name of the schema that contains the table
relname	name	Table name.
heap_blks_read	numeric	Number of disk blocks read from the table
heap_blks_hit	numeric	Number of cache hits in the table
idx_blks_read	numeric	Number of disk blocks read from all indexes in the table
idx_blks_hit	numeric	Number of cache hits in the table
toast_blks_read	numeric	Number of disk blocks read from the TOAST table (if any) in the table
toast_blks_hit	numeric	Number of buffer hits in the TOAST table (if any) in the table
tidx_blks_read	numeric	Number of disk blocks read from the TOAST table index (if any) in the table
tidx_blks_hit	numeric	Number of buffer-hits in the TOAST table index (if any) in the table

### 13.2.10.3 GLOBAL\_STATIO\_USER\_TABLES

**GLOBAL\_STATIO\_USER\_TABLES** displays I/O status information about all user relationship tables in namespaces on each node.

**Table 13-109** GLOBAL\_STATIO\_USER\_TABLES columns

Name	Type	Description
node_name	name	Node name
relid	oid	Table OID
schemaname	name	Name of the schema that contains the table
relname	name	Table name
heap_blks_read	bigint	Number of disk blocks read from the table
heap_blks_hit	bigint	Number of cache hits in the table
idx_blks_read	bigint	Number of disk blocks read from all indexes in the table

Name	Type	Description
idx_blks_hit	bigint	Number of cache hits in the table
toast_blks_read	bigint	Number of disk blocks read from the TOAST table (if any) in the table
toast_blks_hit	bigint	Number of buffer hits in the TOAST table (if any) in the table
tidx_blks_read	bigint	Number of disk blocks read from the TOAST table index (if any) in the table
tidx_blks_hit	bigint	Number of buffer-hits in the TOAST table index (if any) in the table

### 13.2.10.4 STATIO\_USER\_INDEXES

**STATIO\_USER\_INDEXES** displays I/O status information about all user relationship table indexes in namespaces on the current node.

**Table 13-110** STATIO\_USER\_INDEXES columns

Name	Type	Description
relid	oid	OID of the table that the index is created for
indexrelid	oid	OID of the index
schemaname	name	Name of the schema that the index is in
relname	name	Name of the table that the index is created for
indexrelname	name	Index name
idx_blks_read	bigint	Number of disk blocks read from the index
idx_blks_hit	bigint	Number of cache hits in the index

### 13.2.10.5 SUMMARY\_STATIO\_USER\_INDEXES

**SUMMARY\_STATIO\_USER\_INDEXES** displays I/O status information about all user relationship table indexes in namespaces in the database.

**Table 13-111** SUMMARY\_STATIO\_USER\_INDEXES columns

Name	Type	Description
schemaname	name	Name of the schema that the index is in

Name	Type	Description
relname	name	Name of the table that the index is created for
indexrelname	name	Index name
idx_blks_read	numeric	Number of disk blocks read from the index
idx_blks_hit	numeric	Number of cache hits in the index

### 13.2.10.6 GLOBAL\_STATIO\_USER\_INDEXES

**GLOBAL\_STATIO\_USER\_INDEXES** displays I/O status information about all user relationship table indexes in namespaces on each node.

**Table 13-112** GLOBAL\_STATIO\_USER\_INDEXES columns

Name	Type	Description
node_name	name	Node name
relid	oid	OID of the table that the index is created for
indexrelid	oid	OID of the index
schemaname	name	Name of the schema that the index is in
relname	name	Name of the table that the index is created for
indexrelname	name	Index name
idx_blks_read	numeric	Number of disk blocks read from the index
idx_blks_hit	numeric	Number of cache hits in the index

### 13.2.10.7 STATIO\_USER\_SEQUENCES

**STATIO\_USER\_SEQUENCE** displays I/O status information about all user relationship table sequences in namespaces on the current node.

**Table 13-113** STATIO\_USER\_SEQUENCE columns

Name	Type	Description
relid	oid	OID of the sequence
schemaname	name	Name of the schema that the sequence is in

Name	Type	Description
relname	name	Sequence name
blks_read	bigint	Number of disk blocks read from the sequence
blks_hit	bigint	Number of cache hits in the sequence

### 13.2.10.8 SUMMARY\_STATIO\_USER\_SEQUENCES

SUMMARY\_STATIO\_USER\_SEQUENCES displays I/O status information about all user relationship table sequences in namespaces in the database.

**Table 13-114** SUMMARY\_STATIO\_USER\_SEQUENCES columns

Name	Type	Description
schemaname	name	Name of the schema that the sequence is in
relname	name	Sequence name
blks_read	numeric	Number of disk blocks read from the sequence
blks_hit	numeric	Number of cache hits in the sequence

### 13.2.10.9 GLOBAL\_STATIO\_USER\_SEQUENCES

GLOBAL\_STATIO\_USER\_SEQUENCES displays I/O status information about all user relationship table sequences in namespaces on each node.

**Table 13-115** GLOBAL\_STATIO\_USER\_SEQUENCES columns

Name	Type	Description
node_name	name	Node name
relid	oid	OID of the sequence
schemaname	name	Name of the schema that the sequence is in
relname	name	Sequence name
blks_read	bigint	Number of disk blocks read from the sequence
blks_hit	bigint	Number of cache hits in the sequence

### 13.2.10.10 STATIO\_SYS\_TABLES

**STATIO\_SYS\_TABLES** displays I/O status information about all system catalogs in the current namespace.

**Table 13-116** STATIO\_SYS\_TABLES columns

Name	Type	Description
relid	oid	Table OID
schemaname	name	Name of the schema that the table is in
relname	name	Table name
heap_blks_read	bigint	Number of disk blocks read from the table
heap_blks_hit	bigint	Number of cache hits in the table
idx_blks_read	bigint	Number of disk blocks read from indexes in the table
idx_blks_hit	bigint	Number of cache hits in indexes in the table
toast_blks_read	bigint	Number of disk blocks read from the TOAST table (if any) in the table
toast_blks_hit	bigint	Number of buffer hits in the TOAST table (if any) in the table
tidx_blks_read	bigint	Number of disk blocks read from the TOAST table index (if any) in the table
tidx_blks_hit	bigint	Number of buffer-hits in the TOAST table index (if any) in the table

### 13.2.10.11 SUMMARY\_STATIO\_SYS\_TABLES

**SUMMARY\_STATIO\_SYS\_TABLES** displays I/O status information about all system catalogs in namespaces in the database.

**Table 13-117** SUMMARY\_STATIO\_SYS\_TABLES columns

Name	Type	Description
schemaname	name	Name of the schema that contains the table
relname	name	Table name.
heap_blks_read	numeric	Number of disk blocks read from the table

Name	Type	Description
heap_blks_hit	numeric	Number of cache hits in the table
idx_blks_read	numeric	Number of disk blocks read from all indexes in the table
idx_blks_hit	numeric	Number of cache hits in the table
toast_blks_read	numeric	Number of disk blocks read from the TOAST table (if any) in the table
toast_blks_hit	numeric	Number of buffer hits in the TOAST table (if any) in the table
tidx_blks_read	numeric	Number of disk blocks read from the TOAST table index (if any) in the table
tidx_blks_hit	numeric	Number of buffer-hits in the TOAST table index (if any) in the table

### 13.2.10.12 GLOBAL\_STATIO\_SYS\_TABLES

**GLOBAL\_STATIO\_SYS\_TABLES** displays I/O status information about all system catalogs in namespaces on each node.

**Table 13-118** GLOBAL\_STATIO\_SYS\_TABLES columns

Name	Type	Description
node_name	name	Node name
relid	oid	Table OID
schemaname	name	Name of the schema that contains the table
relname	name	Table name
heap_blks_read	bigint	Number of disk blocks read from the table
heap_blks_hit	bigint	Number of cache hits in the table
idx_blks_read	bigint	Number of disk blocks read from all indexes in the table
idx_blks_hit	bigint	Number of cache hits in the table
toast_blks_read	bigint	Number of disk blocks read from the TOAST table (if any) in the table
toast_blks_hit	bigint	Number of buffer hits in the TOAST table (if any) in the table

Name	Type	Description
tidx_blks_read	bigint	Number of disk blocks read from the TOAST table index (if any) in the table
tidx_blks_hit	bigint	Number of buffer-hits in the TOAST table index (if any) in the table

### 13.2.10.13 STATIO\_SYS\_INDEXES

**STATIO\_SYS\_INDEXES** displays the I/O status information about all system catalog indexes in the current namespace.

**Table 13-119** STATIO\_SYS\_INDEXES columns

Name	Type	Description
relid	oid	OID of the table that the index is created for
indexrelid	oid	OID of the index
schemaname	name	Name of the schema that the index is in
relname	name	Name of the table that the index is created for
indexrelname	name	Index name
idx_blks_read	bigint	Number of disk blocks read from the index
idx_blks_hit	bigint	Number of cache hits in the index

### 13.2.10.14 SUMMARY\_STATIO\_SYS\_INDEXES

**SUMMARY\_STATIO\_SYS\_INDEXES** displays I/O status information about all system catalog indexes in namespaces in the database.

**Table 13-120** SUMMARY\_STATIO\_SYS\_INDEXES columns

Name	Type	Description
schemaname	name	Name of the schema that the index is in
relname	name	Name of the table that the index is created for
indexrelname	name	Index name
idx_blks_read	numeric	Number of disk blocks read from the index

Name	Type	Description
idx_blks_hit	numeric	Number of cache hits in the index

### 13.2.10.15 GLOBAL\_STATIO\_SYS\_INDEXES

**GLOBAL\_STATIO\_SYS\_INDEXES** displays I/O status information about all system catalog indexes in namespaces on each node.

**Table 13-121** GLOBAL\_STATIO\_SYS\_INDEXES columns

Name	Type	Description
node_name	name	Node name
relid	oid	OID of the table that the index is created for
indexrelid	oid	OID of the index
schemaname	name	Name of the schema that the index is in
relname	name	Name of the table that the index is created for
indexrelname	name	Index name
idx_blks_read	numeric	Number of disk blocks read from the index
idx_blks_hit	numeric	Number of cache hits in the index

### 13.2.10.16 STATIO\_SYS\_SEQUENCES

**STATIO\_SYS\_SEQUENCES** shows the I/O status information about all the system sequences in the current namespace.

**Table 13-122** STATIO\_SYS\_SEQUENCES columns

Name	Type	Description
relid	oid	OID of the sequence
schemaname	name	Name of the schema that the sequence is in
relname	name	Sequence name
blks_read	bigint	Number of disk blocks read from the sequence
blks_hit	bigint	Number of cache hits in the sequence

### 13.2.10.17 SUMMARY\_STATIO\_SYS\_SEQUENCES

**SUMMARY\_STATIO\_SYS\_SEQUENCES** displays I/O status information about all system sequences in namespaces in the database.

**Table 13-123** SUMMARY\_STATIO\_SYS\_SEQUENCES columns

Name	Type	Description
schemaname	name	Name of the schema that the sequence is in
relname	name	Sequence name
blks_read	numeric	Number of disk blocks read from the sequence
blks_hit	numeric	Number of cache hits in the sequence

### 13.2.10.18 GLOBAL\_STATIO\_SYS\_SEQUENCES

**GLOBAL\_STATIO\_SYS\_SEQUENCES** displays I/O status information about all system sequences in namespaces on each node.

**Table 13-124** GLOBAL\_STATIO\_SYS\_SEQUENCES columns

Name	Type	Description
node_name	name	Node name
relid	oid	OID of the sequence
schemaname	name	Name of the schema that the sequence is in
relname	name	Sequence name
blks_read	bigint	Number of disk blocks read from the sequence
blks_hit	bigint	Number of cache hits in the sequence

### 13.2.10.19 STATIO\_ALL\_TABLES

**STATIO\_ALL\_TABLES** contains one row for each table (including TOAST tables) in the current database, showing I/O statistics about specific tables.

**Table 13-125** STATIO\_ALL\_TABLES columns

Name	Type	Description
relid	oid	Table OID

Name	Type	Description
schemaname	name	Name of the schema that the table is in
relname	name	Table name
heap_blks_read	bigint	Number of disk blocks read from the table
heap_blks_hit	bigint	Number of cache hits in the table
idx_blks_read	bigint	Number of disk blocks read from all indexes in the table
idx_blks_hit	bigint	Number of cache hits in indexes in the table
toast_blks_read	bigint	Number of disk blocks read from the TOAST table (if any) in the table
toast_blks_hit	bigint	Number of buffer hits in the TOAST table (if any) in the table
tidx_blks_read	bigint	Number of disk blocks read from the TOAST table index (if any) in the table
tidx_blks_hit	bigint	Number of buffer-hits in the TOAST table index (if any) in the table

### 13.2.10.20 SUMMARY\_STATIO\_ALL\_TABLES

SUMMARY\_STATIO\_ALL\_TABLES contains I/O statistics about each table (including TOAST tables) in databases in the database.

**Table 13-126** SUMMARY\_STATIO\_ALL\_TABLES columns

Name	Type	Description
schemaname	name	Name of the schema that contains the table
relname	name	Table name.
heap_blks_read	numeric	Number of disk blocks read from the table
heap_blks_hit	numeric	Number of cache hits in the table
idx_blks_read	numeric	Number of disk blocks read from all indexes in the table
idx_blks_hit	numeric	Number of cache hits in the table
toast_blks_read	numeric	Number of disk blocks read from the TOAST table (if any) in the table

Name	Type	Description
toast_blks_hit	numeric	Number of buffer hits in the TOAST table (if any) in the table
tidx_blks_read	numeric	Number of disk blocks read from the TOAST table index (if any) in the table
tidx_blks_hit	numeric	Number of buffer-hits in the TOAST table index (if any) in the table

### 13.2.10.21 GLOBAL\_STATIO\_ALL\_TABLES

**GLOBAL\_STATIO\_ALL\_TABLES** contains I/O statistics about each table (including TOAST tables) in databases on each node.

**Table 13-127** GLOBAL\_STATIO\_ALL\_TABLES columns

Name	Type	Description
node_name	name	Node name
relid	oid	Table OID
schemaname	name	Name of the schema that contains the table
relname	name	Table name
heap_blks_read	bigint	Number of disk blocks read from the table
heap_blks_hit	bigint	Number of cache hits in the table
idx_blks_read	bigint	Number of disk blocks read from all indexes in the table
idx_blks_hit	bigint	Number of cache hits in the table
toast_blks_read	bigint	Number of disk blocks read from the TOAST table (if any) in the table
toast_blks_hit	bigint	Number of buffer hits in the TOAST table (if any) in the table
tidx_blks_read	bigint	Number of disk blocks read from the TOAST table index (if any) in the table
tidx_blks_hit	bigint	Number of buffer-hits in the TOAST table index (if any) in the table

### 13.2.10.22 STATIO\_ALL\_INDEXES

**STATIO\_ALL\_INDEXES** contains one row for each index in the current database, showing I/O statistics about specific indexes.

**Table 13-128** STATIO\_ALL\_INDEXES columns

Name	Type	Description
relid	oid	OID of the table that the index is created for
indexrelid	oid	OID of the index
schemaname	name	Name of the schema that the index is in
relname	name	Name of the table that the index is created for
indexrelname	name	Index name
idx_blks_read	bigint	Number of disk blocks read from the index
idx_blks_hit	bigint	Number of cache hits in the index

### 13.2.10.23 SUMMARY\_STATIO\_ALL\_INDEXES

**SUMMARY\_STATIO\_ALL\_INDEXES** contains every row of each index in a database, showing I/O statistics about specific indexes.

**Table 13-129** SUMMARY\_STATIO\_ALL\_INDEXES columns

Name	Type	Description
schemaname	name	Name of the schema that the index is in
relname	name	Name of the table that the index is created for
indexrelname	name	Index name
idx_blks_read	numeric	Number of disk blocks read from the index
idx_blks_hit	numeric	Number of cache hits in the index

### 13.2.10.24 GLOBAL\_STATIO\_ALL\_INDEXES

**GLOBAL\_STATIO\_ALL\_INDEXES** contains one row for each index in databases on each node, showing I/O statistics about specific indexes.

**Table 13-130** GLOBAL\_STATIO\_ALL\_INDEXES columns

Name	Type	Description
node_name	name	Node name
relid	oid	OID of the table that the index is created for
indexrelid	oid	OID of the index
schemaname	name	Name of the schema that the index is in
relname	name	Name of the table that the index is created for
indexrelname	name	Index name
idx_blks_read	numeric	Number of disk blocks read from the index
idx_blks_hit	numeric	Number of cache hits in the index

### 13.2.10.25 STATIO\_ALL\_SEQUENCES

**STATIO\_ALL\_SEQUENCES** contains one row for each sequence in the current database, showing I/O statistics about specific sequences.

**Table 13-131** STATIO\_ALL\_SEQUENCES columns

Name	Type	Description
relid	oid	OID of this sequence
schemaname	name	Name of the schema where the sequence is in
relname	name	Sequence name
blks_read	bigint	Number of disk blocks read from the sequence
blks_hit	bigint	Cache hits in the sequence

### 13.2.10.26 SUMMARY\_STATIO\_ALL\_SEQUENCES

**SUMMARY\_STATIO\_ALL\_SEQUENCES** contains each row for all sequences in the entire database, showing I/O statistics about specific sequences.

**Table 13-132** SUMMARY\_STATIO\_ALL\_SEQUENCES columns

Name	Type	Description
schemaname	name	Name of the schema that the sequence is in
relname	name	Sequence name
blks_read	numeric	Number of disk blocks read from the sequence
blks_hit	numeric	Number of cache hits in the sequence

### 13.2.10.27 GLOBAL\_STATIO\_ALL\_SEQUENCES

**GLOBAL\_STATIO\_ALL\_SEQUENCES** contains every row of each sequence in databases on each node, showing I/O statistics about specific sequences.

**Table 13-133** GLOBAL\_STATIO\_ALL\_SEQUENCES columns

Name	Type	Description
node_name	name	Node name
relid	oid	OID of the sequence
schemaname	name	Name of the schema that the sequence is in
relname	name	Sequence name
blks_read	bigint	Number of disk blocks read from the sequence
blks_hit	bigint	Number of cache hits in the sequence

## 13.2.11 Utility

### 13.2.11.1 REPLICATION\_STAT

**REPLICATION\_STAT** describes information about log synchronization status, such as the locations where the sender sends logs and where the receiver receives logs.

**Table 13-134** REPLICATION\_STAT columns

Name	Type	Description
pid	bigint	Process ID of the thread
usesysid	oid	User system ID
username	name	Username
application_name	text	Program name

Name	Type	Description
client_addr	inet	Client address
client_hostname	text	Client name
client_port	integer	Port of the client
backend_start	timestamp with time zone	Start time of the program
state	text	Log replication state: <ul style="list-style-type: none"> <li>• Catch-up state</li> <li>• Consistent streaming state</li> </ul>
sender_sent_location	text	Location where the sender sends logs
receiver_write_location	text	Location where the receiver writes logs
receiver_flush_location	text	Location where the receiver flushes logs
receiver_replay_location	text	Location where the receiver replays logs
sync_priority	integer	Priority of synchronous duplication ( <b>0</b> indicates asynchronization.)
sync_state	text	Synchronization state: <ul style="list-style-type: none"> <li>• Asynchronous replication</li> <li>• Synchronous replication</li> <li>• Potential synchronization</li> </ul>

### 13.2.11.2 GLOBAL\_REPLICATION\_STAT

**GLOBAL\_REPLICATION\_STAT** displays information about log synchronization status on each node, such as the locations where the sender sends logs and where the receiver receives logs.

**Table 13-135** GLOBAL\_REPLICATION\_STAT columns

Name	Type	Description
node_name	name	Node name
pid	bigint	PID of the thread
usesysid	oid	User system ID
username	name	Username
application_name	text	Program name

Name	Type	Description
client_addr	inet	Client address
client_hostname	text	Client name
client_port	integer	Port of the client
backend_start	timestamp with time zone	Start time of the program
state	text	Log replication state: <ul style="list-style-type: none"> <li>• Catch-up state</li> <li>• Consistent streaming state</li> </ul>
sender_sent_location	text	Location where the transmit sends logs
receiver_write_location	text	Location where the receive end writes logs
receiver_flush_location	text	Location where the receive end flushes logs
receiver_replay_location	text	Location where the receive end replays logs
sync_priority	integer	Priority of synchronous duplication ( <b>0</b> indicates asynchronization.)
sync_state	text	Synchronization state: <ul style="list-style-type: none"> <li>• Asynchronous replication</li> <li>• Synchronous replication</li> <li>• Potential synchronization</li> </ul>

### 13.2.11.3 REPLICATION\_SLOTS

**REPLICATION\_SLOTS** displays replication slot information.

**Table 13-136** REPLICATION\_SLOTS columns

Name	Type	Description
slot_name	text	Replication slot name.
plugin	text	Name of the output plug-in corresponding to the logical replication slot.
slot_type	text	Replication slot type. <ul style="list-style-type: none"> <li>• <b>physical</b>: physical replication slot.</li> <li>• <b>logical</b>: logical replication slot.</li> </ul>

Name	Type	Description
datoid	oid	OID of the database where the replication slot resides.
database	name	Name of the database where the replication slot resides.
active	boolean	Determines whether the replication slot is activated. <ul style="list-style-type: none"> <li>• <b>t</b> (true): yes</li> <li>• <b>f</b> (false): no</li> </ul>
xmin	xid	XID of the earliest transaction that the database must reserve for the replication slot.
catalog_xmin	xid	XID of the earliest system catalog-involved transaction that the database must reserve for the logical replication slot.
restart_lsn	text	Physical location of the earliest Xlog required by the replication slot.
dummy_standby	boolean	Reserved parameter.

### 13.2.11.4 GLOBAL\_REPLICATION\_SLOTS

GLOBAL\_REPLICATION\_SLOTS displays replication slot information of each node in the database.

**Table 13-137** GLOBAL\_REPLICATION\_SLOTS columns

Name	Type	Description
node_name	name	Node name.
slot_name	text	Replication slot name.
plugin	text	Name of the output plug-in corresponding to the logical replication slot.
slot_type	text	Replication slot type. <ul style="list-style-type: none"> <li>• <b>physical</b>: physical replication slot.</li> <li>• <b>logical</b>: logical replication slot.</li> </ul>
datoid	oid	OID of the database where the replication slot resides.
database	name	Name of the database where the replication slot resides.

Name	Type	Description
active	boolean	Determines whether the replication slot is activated. <ul style="list-style-type: none"> <li>• <b>t</b> (true): yes</li> <li>• <b>f</b> (false): no</li> </ul>
x_min	xid	XID of the earliest transaction that the database must reserve for the replication slot.
catalog_xmin	xid	XID of the earliest system catalog-involved transaction that the database must reserve for the logical replication slot.
restart_lsn	text	Physical location of the earliest Xlog required by the replication slot.
dummy_standby	boolean	Reserved parameter.

### 13.2.11.5 BGWRITER\_STAT

**BGWRITER\_STAT** displays statistics about the background writer process's activities.

**Table 13-138** BGWRITER\_STAT columns

Name	Type	Description
checkpoints_timed	bigint	Number of scheduled checkpoints that have been performed
checkpoints_req	bigint	Number of requested checkpoints that have been performed
checkpoint_write_time	double precision	Total time that has been spent in the portion of checkpoint processing where files are written to disk (unit: ms)
checkpoint_sync_time	double precision	Total time that has been spent in the portion of checkpoint processing where files are synchronized to disk (unit: ms)
buffers_checkpoint	bigint	Number of buffers written during checkpoints
buffers_clean	bigint	Number of buffers written by the background writer
maxwritten_clean	bigint	Number of times the background writer stopped a cleaning scan because it had written too many buffers

Name	Type	Description
buffers_backend	bigint	Number of buffers written directly by a backend
buffers_backend_fsync	bigint	Number of times a backend had to execute its own fsync call (normally the background writer handles those even when the backend does its own write)
buffers_alloc	bigint	Number of buffers allocated
stats_reset	timestamp with time zone	Time at which these statistics were last reset

### 13.2.11.6 GLOBAL\_BGWRITER\_STAT

**GLOBAL\_BGWRITER\_STAT** displays statistics about the background writer process's activities on each node.

**Table 13-139** GLOBAL\_BGWRITER\_STAT columns

Name	Type	Description
node_name	name	Node name
checkpoints_timed	bigint	Number of scheduled checkpoints that have been performed
checkpoints_req	bigint	Number of requested checkpoints that have been performed
checkpoint_write_time	double precision	Total time that has been spent in the portion of checkpoint processing where files are written to disk (unit: ms)
checkpoint_sync_time	double precision	Total time that has been spent in the portion of checkpoint processing where files are synchronized to disk (unit: ms)
buffers_checkpoint	bigint	Number of buffers written during checkpoints
buffers_clean	bigint	Number of buffers written by the background writer
maxwritten_clean	bigint	Number of times the background writer stopped a cleaning scan because it had written too many buffers

Name	Type	Description
buffers_backend	bigint	Number of buffers written directly by a backend
buffers_backend_fsync	bigint	Number of times the backend had to execute its own fsync call (normally the background writer handles those even when the backend does its own write)
buffers_alloc	bigint	Number of buffers allocated
stats_reset	timestamp with time zone	Time at which these statistics were last reset

### 13.2.11.7 GLOBAL\_CKPT\_STATUS

GLOBAL\_CKPT\_STATUS displays the checkpoint information and log flushing information about all instances in the database.

**Table 13-140** GLOBAL\_CKPT\_STATUS columns

Name	Type	Description
node_name	text	Node name.
ckpt_redo_point	test	Checkpoint of the current instance
ckpt_clog_flush_num	bigint	Number of Clog flushing pages from the startup time to the current time
ckpt_csnlog_flush_num	bigint	Number of CSN log flushing pages from the startup time to the current time
ckpt_multixact_flush_num	bigint	Number of MultiXact flushing pages from the startup time to the current time
ckpt_predicate_flush_num	bigint	Number of predicate flushing pages from the startup time to the current time
ckpt_twophase_flush_num	bigint	Number of two-phase flushing pages from the startup time to the current time

### 13.2.11.8 GLOBAL\_DOUBLE\_WRITE\_STATUS

GLOBAL\_DOUBLE\_WRITE\_STATUS displays doublewrite file status of all instances in the database. It consists of the local\_double\_write\_stat view of each node. Columns in the view on each node are the same.

**Table 13-141** GLOBAL\_DOUBLE\_WRITE\_STATUS columns

Name	Type	Description
node_name	text	Node name.
curr_dwn	bigint	Sequence number of the doublewrite file
curr_start_page	bigint	Start page for restoring the doublewrite file
file_trunc_num	bigint	Number of times that the doublewrite file is reused
file_reset_num	bigint	Number of reset times after the doublewrite file is full
total_writes	bigint	Total number of I/Os of the doublewrite file
low_threshold_writes	bigint	Number of I/Os for writing doublewrite files with low efficiency (the number of I/O flushing pages at a time is less than 16)
high_threshold_writes	bigint	Number of I/Os for writing doublewrite files with high efficiency (the number of I/O flushing pages at a time is more than 421)
total_pages	bigint	Total number of pages that are flushed to the doublewrite file area
low_threshold_pages	bigint	Number of pages that are flushed with low efficiency
high_threshold_pages	bigint	Number of pages that are flushed with high efficiency
file_id	bigint	ID of the current doublewrite file

### 13.2.11.9 GLOBAL\_PAGEWRITER\_STATUS

GLOBAL\_PAGEWRITER\_STATUS displays the page flushing information and checkpoint information about all instances in the database.

**Table 13-142** GLOBAL\_PAGEWRITER\_STATUS columns

Name	Type	Description
node_name	text	Node name.

Name	Type	Description
pgwr_actual_flush_total_num	bigint	Total number of dirty pages flushed from the startup time to the current time
pgwr_last_flush_num	integer	Number of dirty pages flushed in the previous batch
remain_dirty_page_num	bigint	Estimated number of dirty pages that are not flushed
queue_head_page_rec_lsn	text	<b>recovery_lsn</b> of the first dirty page in the dirty page queue of the current instance
queue_rec_lsn	text	<b>recovery_lsn</b> of the dirty page queue of the current instance
current_xlog_insert_lsn	text	The write position of Xlogs in the current instance
ckpt_redo_point	text	Checkpoint of the current instance

### 13.2.11.10 GLOBAL\_RECORD\_RESET\_TIME

GLOBAL\_RECORD\_RESET\_TIME displays statistics about reset time in the database. Restart, primary/standby switchover, and database deletion will cause the time to be reset.

**Table 13-143** GLOBAL\_RECORD\_RESET\_TIME columns

Name	Type	Description
node_name	text	Node name.
reset_time	timestamp with time zone	Time to be reset

### 13.2.11.11 GLOBAL\_REDO\_STATUS

GLOBAL\_REDO\_STATUS displays the log replay status of all instances in the database.

**Table 13-144** GLOBAL\_REDO\_STATUS columns

Name	Type	Description
node_name	text	Node name.
redo_start_ptr	bigint	Start point for replaying the instance logs
redo_start_time	bigint	Start time (UTC) when the instance logs are replayed

Name	Type	Description
redo_done_time	bigint	End time (UTC) when the instance logs are replayed
curr_time	bigint	Current time (UTC) of the instance
min_recovery_point	bigint	Position of the minimum consistency point for the instance logs
read_ptr	bigint	Position for reading the instance logs
last_replayed_read_ptr	bigint	Position for replaying the instance logs
recovery_done_ptr	bigint	Replay position after the instance is started
read_xlog_io_counter	bigint	Number of I/Os when the current instance reads and replays logs
read_xlog_io_total_dur	bigint	Total I/O latency when the current instance reads and replays logs
read_data_io_counter	bigint	Number of data page I/O reads during replay in the current instance
read_data_io_total_dur	bigint	Total I/O latency of data page reads during replay in the current instance
write_data_io_counter	bigint	Number of data page I/O writes during replay in the current instance
write_data_io_total_dur	bigint	Total I/O latency of data page writes during replay in the current instance
process_pending_counter	bigint	Number of synchronization times of log distribution threads during replay in the instance
process_pending_total_dur	bigint	Total synchronization latency of log distribution threads during replay in the instance
apply_counter	bigint	Number of synchronization times of replay threads during replay in the instance
apply_total_dur	bigint	Total synchronization latency of replay threads during replay in the instance
speed	bigint	Log replay rate of the current instance
local_max_ptr	bigint	Maximum number of replay logs received by the local host after the instance is started
primary_flush_ptr	bigint	Log point where the host flushes logs to a disk

Name	Type	Description
worker_info	text	Replay thread information of the instance. If concurrent replay is not enabled, the value is <b>NULL</b> .

### 13.2.11.12 GLOBAL\_RECOVERY\_STATUS

**GLOBAL\_RECOVERY\_STATUS** displays log flow control information about the primary and standby nodes.

**Table 13-145** GLOBAL\_RECOVERY\_STATUS columns

Name	Type	Description
node_name	text	Node name (including the primary and standby nodes)
standby_node_name	text	Name of the standby node
source_ip	text	IP address of the primary node
source_port	integer	Port number of the primary node
dest_ip	text	IP address of the standby node
dest_port	integer	Port number of the standby node
current_rto	bigint	Current log flow control time of the standby node (unit: s)
target_rto	bigint	Expected flow control time of the standby node specified by the corresponding GUC parameter (unit: s)
current_sleep_time	bigint	Sleep time required to achieve the expected flow control time (unit: $\mu$ s)

### 13.2.11.13 CLASS\_VITAL\_INFO

**CLASS\_VITAL\_INFO** is used to check whether the OIDs of the same table or index are consistent for WDR snapshots.

**Table 13-146** CLASS\_VITAL\_INFO columns

Name	Type	Description
relid	oid	Table OID
schemaname	name	Schema name

Name	Type	Description
relname	name	Table name
relkind	"char"	Object type. Its value can be: <ul style="list-style-type: none"> <li>• r: ordinary table</li> <li>• t: TOAST table</li> <li>• i: index</li> </ul>

### 13.2.11.14 USER\_LOGIN

**USER\_LOGIN** records the number of user logins and logouts.

**Table 13-147** USER\_LOGIN columns

Name	Type	Description
node_name	text	Database process name
user_name	text	Username
user_id	integer	User OID (Its value is the same as that of <b>oid</b> in <b>pg_authid</b> .)
login_counter	bigint	Number of logins
logout_counter	bigint	Number of logouts

### 13.2.11.15 SUMMARY\_USER\_LOGIN

**SUMMARY\_USER\_LOGIN** records information about user logins and logouts on the primary database node.

**Table 13-148** SUMMARY\_USER\_LOGIN columns

Name	Type	Description
node_name	text	Database process name
user_name	text	Username
user_id	integer	User OID (Its value is the same as that of <b>oid</b> in <b>pg_authid</b> .)
login_counter	bigint	Number of logins
logout_counter	bigint	Number of logouts

### 13.2.11.16 GLOBAL\_SINGLE\_FLUSH\_DW\_STATUS

GLOBAL\_SINGLE\_FLUSH\_DW\_STATUS displays information about doublewrite files eliminated on a single page of all instances in the database. In the displayed information, the information before the slash (/) indicates the page flushing status of the first version, and the information after the slash (/) indicates the page flushing status of the second version.

**Table 13-149** GLOBAL\_SINGLE\_FLUSH\_DW\_STATUS columns

Name	Type	Description
node_name	text	Instance name
curr_dwn	text	Sequence number of the doublewrite file
curr_start_page	text	Start position of the current doublewrite file
total_writes	text	Total number of data write pages in the current doublewrite file
file_trunc_num	text	Number of times that the doublewrite file is reused
file_reset_num	text	Number of reset times after the doublewrite file is full

### 13.2.11.17 GLOBAL\_CANDIDATE\_STATUS

GLOBAL\_CANDIDATE\_STATUS displays the number of candidate buffers and buffer eviction information of all instances in the database.

**Table 13-150** GLOBAL\_GET\_BGWRITER\_STATUS columns

Name	Type	Description
node_name	text	Node name
candidate_slots	integer	Number of pages in the candidate buffer chain of the current normal buffer pool
get_buf_from_list	bigint	Number of times that pages are obtained from the candidate buffer chain during buffer eviction in the current normal buffer pool
get_buf_clock_sweep	bigint	Number of times that pages are obtained from the original eviction solution during buffer eviction in the current normal buffer pool
seg_candidate_slots	integer	Number of pages in the candidate buffer chain of the current segment buffer pool

Name	Type	Description
seg_get_buf_from_list	bigint	Number of times that pages are obtained from the candidate buffer chain during buffer eviction in the current segment buffer pool
seg_get_buf_clock_sweep	bigint	Number of times that pages are obtained from the original eviction solution during buffer eviction in the current segment buffer pool

### 13.2.11.18 PARALLEL\_DECODE\_STATUS

PARALLEL\_DECODE\_STATUS displays parallel decoding information about replication slots on the current node.

**Table 13-151** PARALLEL\_DECODE\_STATUS columns

Name	Type	Description
slot_name	text	Specifies the replication slot name.
parallel_decode_number	integer	Specifies the number of parallel decoder threads of the replication slot.
read_change_queue_length	text	Concatenates the current length of the log queue read by each decoder thread and then outputs the result.
decode_change_queue_length	text	Concatenates the current length of the decoding result queue of each decoder thread and then outputs the result.
reader_lsn	text	Specifies the location of the log read by the current reader thread.
working_txn_cnt	bigint	Specifies the number of transactions that are being concatenated in the current sender thread.
working_txn_memory	bigint	Specifies the total memory occupied by concatenation transactions in the sender thread, in bytes.
decoded_time	timestampz	Specifies the time of the latest WAL decoded by the replication slot.

### 13.2.11.19 GLOBAL\_PARALLEL\_DECODE\_STATUS

GLOBAL\_PARALLEL\_DECODE\_STATUS displays parallel decoding information about replication slots on the current node.

**Table 13-152** GLOBAL\_PARALLEL\_DECODE\_STATUS columns

Name	Type	Description
node_name	name	Specifies the node name.
slot_name	text	Specifies the replication slot name.
parallel_decode_num	integer	Specifies the number of parallel decoder threads of the replication slot.
read_change_queue_length	text	Concatenates the current length of the log queue read by each decoder thread and then outputs the result.
decode_change_queue_length	text	Concatenates the current length of the decoding result queue of each decoder thread and then outputs the result.
reader_lsn	text	Specifies the location of the log read by the current reader thread.
working_txn_cnt	bigint	Specifies the number of transactions that are being concatenated in the current sender thread.
working_txn_memory	bigint	Specifies the total memory occupied by concatenation transactions in the sender thread, in bytes.
decoded_time	timestampz	Specifies the time of the latest WAL decoded by the replication slot.

### 13.2.11.20 PARALLEL\_DECODE\_THREAD\_INFO

PARALLEL\_DECODE\_THREAD\_INFO displays information about threads that perform parallel decoding on the current node.

**Table 13-153** PARALLEL\_DECODE\_THREAD\_INFO columns

Name	Type	Description
thread_id	bigint	Thread ID.
slot_name	text	Replication slot name.

Name	Type	Description
thread_type	text	Thread type (sender, reader, or decoder).
seq_number	integer	Sequence number (starting from 1) of threads of the same type in the current replication slot.

### 13.2.11.21 GLOBAL\_PARALLEL\_DECODE\_THREAD\_INFO

GLOBAL\_PARALLEL\_DECODE\_THREAD\_INFO displays information about parallel decoder threads of replication slots on the current node.

**Table 13-154** GLOBAL\_PARALLEL\_DECODE\_THREAD\_INFO columns

Name	Type	Description
node_name	name	Node name.
thread_id	bigint	Thread ID.
slot_name	text	Replication slot name.
thread_type	text	Thread type (sender, reader, or decoder).
seq_number	integer	Sequence number (starting from 1) of threads of the same type in the current replication slot.

## 13.2.12 Lock

### 13.2.12.1 LOCKS

LOCKS displays information about locks held by each open transaction.

**Table 13-155** LOCKS columns

Name	Type	Description
locktype	text	Type of the locked object: <b>relation, extend, page, tuple, transactionid, virtualxid, object, userlock, or advisory</b>

Name	Type	Description
database	oid	OID of the database in which the locked object exists. <ul style="list-style-type: none"> <li>The OID is <b>0</b> if the object is a shared object.</li> <li>The OID is <b>NULL</b> if the object is a transaction ID.</li> </ul>
relation	oid	OID of the relationship targeted by the lock. The value is <b>NULL</b> if the object is not a relationship or part of a relationship.
page	integer	Page number targeted by the lock within the relationship. The value is <b>NULL</b> if the object is not a relationship page or row page.
tuple	smallint	Row number targeted by the lock within the page. The value is <b>NULL</b> if the object is not a row.
bucket	integer	Hash bucket ID.
virtualxid	text	Virtual ID of the transaction targeted by the lock. The value is <b>NULL</b> if the object is not a virtual transaction ID.
transactionid	xid	ID of the transaction targeted by the lock. The value is <b>NULL</b> if the object is not a transaction ID.
classid	oid	OID of the system catalog that contains the object. The value is <b>NULL</b> if the object is not a general database object.
objid	oid	OID of the locked object within its system catalog. The value is <b>NULL</b> if the object is not a general database object.
objsubid	smallint	Column number for a column in the table ( <b>0</b> if the object is of other object type and <b>NULL</b> if the object is not a general database object)
virtualtransaction	text	Virtual ID of the transaction holding or awaiting this lock
pid	bigint	Logical ID of the server thread holding or awaiting this lock. The value is <b>NULL</b> if the lock is held by a prepared transaction.
sessionid	bigint	ID of the session holding or awaiting this lock The value is <b>NULL</b> if the lock is held by a prepared transaction.
mode	text	Lock mode held or desired by this thread

Name	Type	Description
granted	Boolean	<ul style="list-style-type: none"> <li>The value is <b>TRUE</b> if the lock is a held lock.</li> <li>The value is <b>FALSE</b> if the lock is an awaited lock.</li> </ul>
fastpath	Boolean	The value is <b>TRUE</b> if the lock is obtained through <b>fast-path</b> , and is <b>FALSE</b> if the lock is obtained through the main lock table.
locktag	text	Lock information that the session waits for. It can be parsed using the <b>locktag_decode()</b> function.
global_sessionid	text	Global session ID

### 13.2.12.2 GLOBAL\_LOCKS

**GLOBAL\_LOCKS** displays information about locks held by open transactions on each node.

**Table 13-156** GLOBAL\_LOCKS columns

Name	Type	Description
node_name	name	Node name.
locktype	text	Type of the locked object: <b>relation</b> , <b>extend</b> , <b>page</b> , <b>tuple</b> , <b>transactionid</b> , <b>virtualxid</b> , <b>object</b> , <b>userlock</b> , or <b>advisory</b>
database	oid	OID of the database in which the locked object exists. <ul style="list-style-type: none"> <li>The OID is <b>0</b> if the object is a shared object.</li> <li>The OID is <b>NULL</b> if the object is a transaction ID.</li> </ul>
relation	oid	OID of the relationship targeted by the lock. The value is <b>NULL</b> if the object is not a relationship or part of a relationship.
page	integer	Page number targeted by the lock within the relationship. The value is <b>NULL</b> if the object is not a relationship page or row page.
tuple	smallint	Row number targeted by the lock within the page. The value is <b>NULL</b> if the object is not a row.
virtualxid	text	Virtual ID of the transaction targeted by the lock. The value is <b>NULL</b> if the object is not a virtual transaction ID.

Name	Type	Description
transactionid	xid	ID of the transaction targeted by the lock. The value is <b>NULL</b> if the object is not a transaction ID.
classid	oid	OID of the system catalog that contains the object. The value is <b>NULL</b> if the object is not a general database object.
objid	oid	OID of the locked object within its system catalog. The value is <b>NULL</b> if the object is not a general database object.
objsubid	smallint	Column number for a column in the table ( <b>0</b> if the target is of other object type and <b>NULL</b> if the object is not a general database object)
virtualtransaction	text	Virtual ID of the transaction holding or awaiting this lock
pid	bigint	Logical ID of the server thread holding or awaiting this lock The value is <b>NULL</b> if the lock is held by a prepared transaction.
mode	text	Lock mode held or desired by this thread
granted	Boolean	<ul style="list-style-type: none"> <li>The value is <b>TRUE</b> if the lock is a held lock.</li> <li>The value is <b>FALSE</b> if the lock is an awaited lock.</li> </ul>
fastpath	Boolean	The value is <b>TRUE</b> if the lock is obtained through <b>fast-path</b> , and is <b>FALSE</b> if the lock is obtained through the main lock table.

## 13.2.13 Wait Events

### 13.2.13.1 WAIT\_EVENTS

**WAIT\_EVENTS** displays statistics about wait events on the current node. For details about the events, see [Table 12-351](#), [Table 12-352](#), [Table 12-353](#), and [Table 12-354](#). For details about the impact of each transaction lock on services, see [LOCK](#).

**Table 13-157** WAIT\_EVENTS columns

Name	Type	Description
nodename	text	Database process name.
type	text	Event type.

Name	Type	Description
event	text	Event name.
wait	bigint	Number of waiting times.
failed_wait	bigint	Number of waiting failures.
total_wait_time	bigint	Total waiting time (unit: $\mu$ s).
avg_wait_time	bigint	Average waiting time (unit: $\mu$ s).
max_wait_time	bigint	Maximum waiting time (unit: $\mu$ s).
min_wait_time	bigint	Minimum waiting time (unit: $\mu$ s).
last_updated	timestamp with time zone	Last time when the event was updated.

### 13.2.13.2 GLOBAL\_WAIT\_EVENTS

**GLOBAL\_WAIT\_EVENTS** displays statistics about wait events on each node.

**Table 13-158** GLOBAL\_WAIT\_EVENTS columns

Name	Type	Description
nodename	text	Database process name
type	text	Event type
event	text	Event name
wait	bigint	Number of waiting times
failed_wait	bigint	Number of waiting failures
total_wait_time	bigint	Total waiting time (unit: $\mu$ s)
avg_wait_time	bigint	Average waiting time (unit: $\mu$ s)
max_wait_time	bigint	Maximum waiting time (unit: $\mu$ s)
min_wait_time	bigint	Minimum waiting time (unit: $\mu$ s)
last_updated	timestamp with time zone	Last time when the event was updated

## 13.2.14 Configuration

### 13.2.14.1 CONFIG\_SETTINGS

**CONFIG\_SETTINGS** displays information about parameters of the running database.

**Table 13-159** CONFIG\_SETTINGS columns

Name	Type	Description
name	text	Parameter name
setting	text	Current parameter value
unit	text	Implicit unit of the parameter
category	text	Logical group of the parameter
short_desc	text	Brief description of the parameter
extra_desc	text	Detailed description of the parameter
context	text	Context required to set the parameter value, including <b>internal</b> , <b>postmaster</b> , <b>siguhp</b> , <b>backend</b> , <b>superuser</b> , and <b>user</b>
vartype	text	Parameter type, including <b>bool</b> , <b>enum</b> , <b>integer</b> , <b>real</b> , or <b>string</b>
source	text	Method of assigning the parameter value
min_val	text	Maximum value of the parameter. If the parameter type is not numeric, the value of this column is <b>null</b> .
max_val	text	Minimum value of the parameter. If the parameter type is not numeric, the value of this column is <b>null</b> .
enumvals	text[]	Valid values of an enum-type parameter. If the parameter type is not enum, the value of this column is <b>null</b> .
boot_val	text	Default parameter value used upon the database startup
reset_val	text	Default parameter value used upon the database reset
sourcefile	text	Configuration file used to set parameter values. If parameter values are not configured using the configuration file, the value of this column is <b>null</b> .
sourceline	integer	Row number in the configuration file for setting parameter values. If parameter values are not configured using the configuration file, the value of this column is <b>null</b> .

## 13.2.14.2 GLOBAL\_CONFIG\_SETTINGS

**GLOBAL\_CONFIG\_SETTINGS** displays information about parameters of running databases on each node.

**Table 13-160** GLOBAL\_CONFIG\_SETTINGS columns

Name	Type	Description
node_name	text	Node name
name	text	Parameter name
setting	text	Current parameter value
unit	text	Implicit unit of the parameter
category	text	Logical group of the parameter
short_desc	text	Brief description of the parameter
extra_desc	text	Detailed description of the parameter
context	text	Context required to set the parameter value, including <b>internal</b> , <b>postmaster</b> , <b>sighup</b> , <b>backend</b> , <b>superuser</b> , and <b>user</b>
vartype	text	Parameter type, including <b>bool</b> , <b>enum</b> , <b>integer</b> , <b>real</b> , or <b>string</b>
source	text	Method of assigning the parameter value
min_val	text	Minimum value of the parameter. If the parameter type is not numeric, the value of this column is <b>null</b> .
max_val	text	Maximum value of the parameter. If the parameter type is not numeric, the value of this column is <b>null</b> .
enumvals	text[]	Valid values of an enum-type parameter. If the parameter type is not enum, the value of this column is <b>null</b> .
boot_val	text	Default parameter value used upon the database startup
reset_val	text	Default parameter value used upon the database reset
sourcefile	text	Configuration file used to set parameter values. If parameter values are not configured using the configuration file, the value of this column is <b>null</b> .
sourceline	integer	Row number in the configuration file for setting parameter values. If parameter values are not configured using the configuration file, the value of this column is <b>null</b> .

## 13.2.15 Operator

### 13.2.15.1 OPERATOR\_HISTORY\_TABLE

OPERATOR\_HISTORY\_TABLE displays records about operators of completed jobs. Data is dumped from the kernel to this system view.

**Table 13-161** OPERATOR\_HISTORY\_TABLE columns

Name	Type	Description
queryid	bigint	Internal query ID used for statement execution.
pid	bigint	Backend thread ID.
plan_node_id	integer	Plan node ID of the execution plan of a query.
plan_node_name	text	Name of the operator corresponding to the plan node ID.
start_time	timestamp with time zone	Time when the operator starts to process the first data record.
duration	bigint	Total execution time of the operator (unit: ms).
query_dop	integer	DOP of the operator.
estimated_rows	bigint	Number of rows estimated by the optimizer.
tuple_processed	bigint	Number of elements returned by the operator.
min_peak_memory	integer	Minimum peak memory used by the operator on database nodes (unit: MB).
max_peak_memory	integer	Maximum peak memory used by the operator on database nodes (unit: MB).
average_peak_memory	integer	Average peak memory used by the operator on database nodes (unit: MB).
memory_skew_percent	integer	Memory usage skew of the operator among database nodes.
min_spill_size	integer	Minimum spilled data among database nodes when a spill occurs (unit: MB) (default value: 0).
max_spill_size	integer	Maximum spilled data among database nodes when a spill occurs (unit: MB) (default value: 0).

Name	Type	Description
average_spill_size	integer	Average spilled data among database nodes when a spill occurs (unit: MB) (default value: 0).
spill_skew_percent	integer	Database node spill skew when a spill occurs.
min_cpu_time	bigint	Minimum execution time of the operator on database nodes (unit: ms).
max_cpu_time	bigint	Maximum execution time of the operator on database nodes (unit: ms).
total_cpu_time	bigint	Total execution time of the operator on database nodes (unit: ms).
cpu_skew_percent	integer	Execution time skew among database nodes.
warning	text	Warning. The following warnings are displayed: <ul style="list-style-type: none"> <li>• Sort/SetOp/HashAgg/HashJoin spill</li> <li>• Spill file size large than 256MB</li> <li>• Broadcast size large than 100MB</li> <li>• Early spill</li> <li>• Spill times is greater than 3</li> <li>• Spill on memory adaptive</li> <li>• Hash table conflict</li> </ul>

### 13.2.15.2 OPERATOR\_HISTORY

OPERATOR\_HISTORY displays records of operators in jobs that have been executed by the current user on the current primary database node.

### 13.2.15.3 OPERATOR\_RUNTIME

OPERATOR\_RUNTIME displays information about operators of the jobs that are being executed by the current user.

**Table 13-162** OPERATOR\_RUNTIME columns

Name	Type	Description
queryid	bigint	Internal query ID used for statement execution
pid	bigint	Thread ID of the backend
plan_node_id	integer	Plan node ID of the execution plan of a query

Name	Type	Description
plan_node_name	text	Name of the operator corresponding to the plan node ID
start_time	timestamp with time zone	Time when the operator starts to process the first data record
duration	bigint	Total execution time of the operator, in ms
status	text	Execution status of the current operator, which can be <b>finished</b> or <b>running</b> .
query_dop	integer	DOP of the operator
estimated_rows	bigint	Number of rows estimated by the optimizer
tuple_processed	bigint	Number of elements returned by the operator
min_peak_memory	integer	Minimum peak memory used by the operator on database nodes (unit: MB)
max_peak_memory	integer	Maximum peak memory used by the operator on database nodes (unit: MB)
average_peak_memory	integer	Average peak memory used by the operator on database nodes (unit: MB)
memory_skew_percent	integer	Memory usage skew of the operator among database nodes
min_spill_size	integer	Minimum spilled data among database nodes when a spill occurs (unit: MB) (default value: 0)
max_spill_size	integer	Maximum spilled data among database nodes when a spill occurs (unit: MB) (default value: 0)
average_spill_size	integer	Average spilled data among database nodes when a spill occurs (unit: MB) (default value: 0)
spill_skew_percent	integer	Database node spill skew when a spill occurs
min_cpu_time	bigint	Minimum execution time of the operator on database nodes (unit: ms)
max_cpu_time	bigint	Maximum execution time of the operator on database nodes (unit: ms)
total_cpu_time	bigint	Total execution time of the operator on database nodes (unit: ms)

Name	Type	Description
cpu_skew_percent	integer	Execution time skew among database nodes
warning	text	Warning. The following warnings are displayed: <ul style="list-style-type: none"> <li>• Sort/SetOp/HashAgg/HashJoin spill</li> <li>• Spill file size large than 256MB</li> <li>• Broadcast size large than 100MB</li> <li>• Early spill</li> <li>• Spill times is greater than 3</li> <li>• Spill on memory adaptive</li> <li>• Hash table conflict</li> </ul>

#### 13.2.15.4 GLOBAL\_OPERATOR\_HISTORY

**GLOBAL\_OPERATOR\_HISTORY** displays records of operators in jobs that have been executed by the current user on the primary database node.

**Table 13-163** GLOBAL\_OPERATOR\_HISTORY columns

Name	Type	Description
queryid	bigint	Internal query ID used for statement execution
pid	bigint	Thread ID of the backend
plan_node_id	integer	Plan node ID of the execution plan
plan_node_name	text	Name of the operator corresponding to the plan node ID
start_time	timestamp with time zone	Time when the operator starts to process the first data record
duration	bigint	Total execution time of the operator, in ms
query_dop	integer	DOP of the operator
estimated_rows	bigint	Number of rows estimated by the optimizer
tuple_processed	bigint	Number of elements returned by the operator
min_peak_memory	integer	Minimum peak memory used by the operator on database nodes (unit: MB)
max_peak_memory	integer	Maximum peak memory used by the operator on database nodes (unit: MB)

Name	Type	Description
average_peak_memory	integer	Average peak memory used by the operator on database nodes (unit: MB)
memory_skew_percent	integer	Memory usage skew of the operator among database nodes
min_spill_size	integer	Minimum spilled data among database nodes when a spill occurs (unit: MB) (default value: 0)
max_spill_size	integer	Maximum spilled data among database nodes when a spill occurs (unit: MB) (default value: 0)
average_spill_size	integer	Average spilled data among database nodes when a spill occurs (unit: MB) (default value: 0)
spill_skew_percent	integer	Database node spill skew when a spill occurs
min_cpu_time	bigint	Minimum execution time of the operator on database nodes (unit: ms)
max_cpu_time	bigint	Maximum execution time of the operator on database nodes (unit: ms)
total_cpu_time	bigint	Total execution time of the operator on database nodes (unit: ms)
cpu_skew_percent	integer	Execution time skew among database nodes
warning	text	Warning. The following warnings are displayed: <ol style="list-style-type: none"> <li>Sort/SetOp/HashAgg/HashJoin spill</li> <li>Spill file size large than 256MB</li> <li>Broadcast size large than 100MB</li> <li>Early spill</li> <li>Spill times is greater than 3</li> <li>Spill on memory adaptive</li> <li>Hash table conflict</li> </ol>

### 13.2.15.5 GLOBAL\_OPERATOR\_HISTORY\_TABLE

**GLOBAL\_OPERATOR\_HISTORY\_TABLE** displays the records about operators of completed jobs on the primary database node. Data is dumped from the kernel to the system catalog **GS\_WLM\_OPERATOR\_INFO**.

**GLOBAL\_OPERATOR\_HISTORY\_TABLE** is a collection view for querying the system

catalog **GS\_WLM\_OPERATOR\_INFO** on the primary database node. Columns in this view are the same as those in [Table 13-163](#).

### 13.2.15.6 GLOBAL\_OPERATOR\_RUNTIME

**GLOBAL\_OPERATOR\_RUNTIME** displays information about operators of the jobs that are being executed by the current user on the primary database node.

**Table 13-164** GLOBAL\_OPERATOR\_RUNTIME columns

Name	Type	Description
queryid	bigint	Internal query ID used for statement execution
pid	bigint	Thread ID of the backend
plan_node_id	integer	Plan node ID of the execution plan
plan_node_name	text	Name of the operator corresponding to the plan node ID
start_time	timestamp with time zone	Time when the operator starts to process the first data record
duration	bigint	Total execution time of the operator, in ms
status	text	Execution status of the current operator, which can be <b>finished</b> or <b>running</b> .
query_dop	integer	DOP of the operator
estimated_rows	bigint	Number of rows estimated by the optimizer
tuple_processed	bigint	Number of elements returned by the operator
min_peak_memory	integer	Minimum peak memory used by the operator on database nodes (unit: MB)
max_peak_memory	integer	Maximum peak memory used by the operator on database nodes (unit: MB)
average_peak_memory	integer	Average peak memory used by the operator on database nodes (unit: MB)
memory_skew_percent	integer	Memory usage skew of the operator among database nodes
min_spill_size	integer	Minimum spilled data among database nodes when a spill occurs (unit: MB) (default value: <b>0</b> )
max_spill_size	integer	Maximum spilled data among database nodes when a spill occurs (unit: MB) (default value: <b>0</b> )

Name	Type	Description
average_spill_size	integer	Average spilled data among database nodes when a spill occurs (unit: MB) (default value: 0)
spill_skew_percent	integer	Database node spill skew when a spill occurs
min_cpu_time	bigint	Minimum execution time of the operator on database nodes (unit: ms)
max_cpu_time	bigint	Maximum execution time of the operator on database nodes (unit: ms)
total_cpu_time	bigint	Total execution time of the operator on database nodes (unit: ms)
cpu_skew_percent	integer	Execution time skew among database nodes
warning	text	Warning. The following warnings are displayed: <ul style="list-style-type: none"> <li>• Sort/SetOp/HashAgg/HashJoin spill</li> <li>• Spill file size large than 256MB</li> <li>• Broadcast size large than 100MB</li> <li>• Early spill</li> <li>• Spill times is greater than 3</li> <li>• Spill on memory adaptive</li> <li>• Hash table conflict</li> </ul>

## 13.2.16 Workload Manager

### 13.2.16.1 WLM\_USER\_RESOURCE\_CONFIG

**WLM\_USER\_RESOURCE\_CONFIG** displays the resource configuration information of a user.

**Table 13-165** WLM\_USER\_RESOURCE\_CONFIG columns

Name	Type	Description
userid	oid	OID of the user
username	name	Username
sysadmin	boolean	Whether the user has the <b>sysadmin</b> permission
rpoid	oid	OID of the resource pool

Name	Type	Description
respool	name	Name of a resource pool
parentid	oid	OID of the parent user
totalspace	bigint	Size of the occupied space
spacelimit	bigint	Upper limit of the space size
childcount	integer	Number of child users
childlist	text	Child user list

### 13.2.16.2 WLM\_USER\_RESOURCE\_RUNTIME

**WLM\_USER\_RESOURCE\_RUNTIME** displays resource usage of all users. Only administrators can query this view. This view is valid only when the GUC parameter **use\_workload\_manager** is set to **on**.

**Table 13-166** WLM\_USER\_RESOURCE\_RUNTIME columns

Name	Type	Description
username	name	Username
used_memory	integer	Used memory (unit: MB)
total_memory	integer	Available memory (unit: MB) The value <b>0</b> indicates that the available memory is not limited and depends on the maximum memory available in the database.
used_cpu	integer	Number of CPU cores in use
total_cpu	integer	Total number of CPU cores of the Cgroup associated with the user on the node
used_space	bigint	Used storage space (unit: KB)
total_space	bigint	Available storage space (unit: KB) The value <b>-1</b> indicates that the maximum storage space is not limited.
used_temp_space	bigint	Used temporary space (reserved column; unit: KB)
total_temp_space	bigint	Available temporary storage space (reserved column; unit: KB) The value <b>-1</b> indicates that the maximum temporary storage space is not limited.
used_spill_space	bigint	Used space for storing spilled data (reserved column; unit: KB)

Name	Type	Description
total_spill_space	bigint	Available storage space for spilled data (reserved column; unit: KB) The value -1 indicates that the maximum space for spilled data is not limited.

## 13.2.17 Global Plancache

Global plan cache (GPC) views are valid only when **enable\_global\_plancache** is set to **on**.

### 13.2.17.1 GLOBAL\_PLANCACHE\_STATUS

**GLOBAL\_PLANCACHE\_STATUS** displays the GPC status information.

**Table 13-167** GLOBAL\_PLANCACHE\_STATUS columns

Name	Type	Description
nodename	text	Name of the node that the plan cache belongs to
query	text	Text of query statements
refcount	integer	Number of times that the plan cache is referenced
valid	bool	Whether the plan cache is valid
databaseid	oid	ID of the database that the plan cache belongs to
schema_name	text	Schema that the plan cache belongs to
params_num	integer	Number of parameters
func_id	oid	OID of the stored procedure where the plan cache is located. If the plancache does not belong to the stored procedure, the value is <b>0</b> .
pkg_id	oid	Package to which the stored procedure where the plancache is located belongs. If the stored procedure does not belong to a package, the value is <b>0</b> .
stmt_id	integer	Sequence number of the statement plan in the stored procedure.

### 13.2.17.2 GLOBAL\_PLANCACHE\_CLEAN

**GLOBAL\_PLANCACHE\_CLEAN** clears the global plan cache that is not used on all nodes. The return value is of the Boolean type.

## 13.2.18 RTO & RPO

### 13.2.18.1 global\_rto\_status

Displays log flow control information about the primary and standby nodes (except the current node and standby DNs).

**Table 13-168** global\_rto\_status columns

Parameter	Type	Description
node_name	text	Node name (including the primary and standby nodes)
rto_info	text	Flow control information, including the current log flow control time (unit: second) of the standby node, the expected flow control time (unit: second) specified by the GUC parameter, and the primary node sleep time (unit: $\mu$ s) required to reach the expectation

### 13.2.18.2 global\_streaming\_hadr\_rto\_and\_rpo\_stat

**global\_streaming\_hadr\_rto\_and\_rpo\_stat** displays the log flow control information about the primary and standby database instances in the streaming DR scenario. (This schema can be used only on the primary DN of the primary database instance. Statistics cannot be obtained from the standby DN or the standby database instance.)

**Table 13-169** Parameters

Parameter	Type	Description
hadr_sender_node_name	text	Node name, including the primary database instance and the first standby node of the standby database instance.
hadr_receiver_node_name	text	Name of the first standby node of the standby database instance.
current_rto	int	Flow control information, that is, log RTO time of the current primary and standby database instances (unit: second).

Parameter	Type	Description
target_rto	int	Flow control information, that is, the RTO time between the target primary and standby database instances (unit: second).
current_rpo	int	Flow control information, that is, log RPO time of the current primary and standby database instances (unit: second).
target_rpo	int	Flow control information, that is, the RPO time between the target primary and standby database instances (unit: second).
rto_sleep_time	int	RTO flow control information, that is, the expected sleep time (unit: $\mu$ s) required by walsender on the host to reach the specified RTO.
rpo_sleep_time	int	RPO flow control information, that is, the expected sleep time (unit: $\mu$ s) required by xlogInsert on the host to reach the specified RPO.

## 13.2.19 AI Watchdog

### 13.2.19.1 ai\_watchdog\_monitor\_status

**Table 13-170** ai\_watchdog\_monitor\_status parameters

Parameter	Type	Description
metric_name	text	Metric names: <ul style="list-style-type: none"> <li>• <b>tps</b>: TPS.</li> <li>• <b>tps_hourly</b>: average TPS per hour.</li> <li>• <b>shared_used_mem</b>: the used shared memory (MB).</li> <li>• <b>dynamic_used_shrctx</b>: the used shared memory context (MB).</li> <li>• <b>other_used_mem</b>: other used memory (MB).</li> <li>• <b>process_used_mem</b>: the used resident memory (MB).</li> <li>• <b>dynamic_used_mem</b>: the used dynamic memory (MB).</li> <li>• <b>malloc_failures</b>: the number of memory allocation failures in each collection interval.</li> <li>• <b>D_state_rate</b>: percentage of threads in the D state.</li> <li>• <b>R_state_rate</b>: percentage of threads in the R state.</li> <li>• <b>S_state_rate</b>: ratio of threads in the S state.</li> <li>• <b>db_state</b>: database state (<b>68</b> indicates D, <b>82</b> indicates R, and <b>83</b> indicates S).</li> <li>• <b>cpu_usage</b>: CPU usage. The upper limit is 100.</li> <li>• <b>disk_io</b>: disk I/O delay between two collection intervals.</li> <li>• <b>network_io</b>: network I/O delay between two collection intervals.</li> <li>• <b>threadpool_usage</b>: thread pool usage.</li> <li>• <b>threadpool_hang_rate</b>: percentage of the thread pool group in the hang state.</li> </ul>
max_length	int	Collection queue length.
current_length	int	The number of currently collected samples.
collection_interval	int	Collection interval, in seconds.
latest_value	int	Value collected last time. If no value is collected, the value is <b>null</b> .
last_report	timestamp	The last collection time.

### 13.2.19.2 ai\_watchdog\_detection\_warnings

**Table 13-171** ai\_watchdog\_detection\_warnings parameters

Parameter	Type	Description
event	text	Event name.
cause	text	Event cause.
details	text	Event details.
time	timestamp	Reporting time.
need_to_handle	bool	Determines whether automatic processing is required.

### 13.2.19.3 ai\_watchdog\_parameters

Table 13-172 ai\_watchdog\_parameters parameters

Parameter	Type	Description
name	text	<p>Parameter name. The options are as follows:</p> <ul style="list-style-type: none"> <li>• <b>enable_ai_watchdog</b>: determines whether to enable this function.</li> <li>• <b>ai_watchdog_max_consuming_time_ms</b>: specifies the maximum duration.</li> <li>• <b>ai_watchdog_used_memory_kb</b>: specifies the memory used by this function.</li> <li>• <b>ai_watchdog_detection_times</b>: specifies the number of detection times.</li> <li>• <b>enable_self_healing</b>: determines whether self-healing can be performed after a problem is detected.</li> <li>• <b>oom_detected_times</b>: specifies the number of detected OOMs.</li> <li>• <b>hang_detected_times</b>: specifies the number of detected hang times.</li> <li>• <b>enable_oom_detection</b>: determines whether the OOM detection function is automatically enabled.</li> <li>• <b>in_wait_time</b>: determines whether the system is waiting.</li> <li>• <b>other_used_memory_has_risk</b>: determines whether other memory usage is risky.</li> <li>• <b>shared_used_mem_has_risk</b>: determines whether risks exist when the shared memory context is used.</li> <li>• <b>dynamic_used_shrctx_has_risk</b>: determines whether the dynamic memory usage is risky.</li> </ul>
value	text	Parameter value

## 13.2.20 Discarded

### 13.2.20.1 Query

#### 13.2.20.1.1 GS\_SLOW\_QUERY\_INFO

**GS\_SLOW\_QUERY\_INFO** displays the slow query information that has been dumped on the current node. Data is dumped from the kernel to this system catalog. If the GUC parameter **enable\_resource\_record** is set to **on**, the system imports the query information from the kernel to **GS\_WLM\_SESSION\_QUERY\_INFO\_ALL** every 3 minutes. This operation occupies storage space and affects performance. You can check **GS\_SLOW\_QUERY\_INFO** to view the slow query information that has been dumped. This view has been discarded in this version.

**Table 13-173** GS\_SLOW\_QUERY\_INFO columns

Name	Type	Description
dbname	text	Database name
schemaname	text	Schema name
nodename	text	Node name
username	text	Username
queryid	bigint	Normalization ID
query	text	Query statement
start_time	timestamp with time zone	Execution start time
finish_time	timestamp with time zone	Execution end time
duration	bigint	Execution duration (unit: ms)
query_plan	text	Plan information
n_returned_rows	bigint	Number of rows in the result set returned by the SELECT statement
n_tuples_fetched	bigint	Number of rows randomly scanned
n_tuples_returned	bigint	Number of rows sequentially scanned
n_tuples_inserted	bigint	Number of rows inserted
n_tuples_updated	bigint	Number of rows updated

Name	Type	Description
n_tuples_deleted	bigint	Number of rows deleted
n_blocks_fetched	bigint	Number of cache loading times
n_blocks_hit	bigint	Cache hits
db_time	bigint	Valid DB time, which is accumulated if multiple threads are involved (unit: $\mu$ s)
cpu_time	bigint	CPU time (unit: $\mu$ s)
execution_time	bigint	Execution time in the executor (unit: $\mu$ s)
parse_time	bigint	SQL parsing time (unit: $\mu$ s)
plan_time	bigint	SQL plan generation time (unit: $\mu$ s)
rewrite_time	bigint	SQL rewriting time (unit: $\mu$ s)
pl_execution_time	bigint	Execution time of PL/pgSQL (unit: $\mu$ s)
pl_compilation_time	bigint	Compilation time of PL/pgSQL (unit: $\mu$ s)
net_send_time	bigint	Network time (unit: $\mu$ s)
data_io_time	bigint	I/O time (unit: $\mu$ s)

### 13.2.20.1.2 GS\_SLOW\_QUERY\_HISTORY

**GS\_SLOW\_QUERY\_HISTORY** displays the slow query information that is not dumped on the current node. For details, see **GS\_SLOW\_QUERY\_INFO**. This is discarded in the current version.

### 13.2.20.1.3 GLOBAL\_SLOW\_QUERY\_HISTORY

**GS\_SLOW\_QUERY\_HISTORY** displays the slow query information that is not dumped on all nodes. This view is discarded in this version. For details, see **GS\_SLOW\_QUERY\_INFO**.

### 13.2.20.1.4 GLOBAL\_SLOW\_QUERY\_INFO

**GS\_SLOW\_QUERY\_HISTORY** displays the slow query information that has been dumped on all nodes. This view is discarded in this version. For details, see **GS\_SLOW\_QUERY\_INFO**.

## 13.3 WDR Snapshot Schema

After the WDR snapshot function is enabled (the GUC parameter **enable\_wdr\_snapshot** is set to **on**), objects are created in the snapshot schema of user tablespace `pg_default` and database **postgres** to flush WDR snapshot data. By default, the initial user or the **monadmin** user can access and operate the object of the snapshot schema.

You can set the GUC parameter **wdr\_snapshot\_retention\_days** to automatically manage the snapshot lifecycle.

### NOTICE

Do not add, delete, or modify tables in the snapshot schema. Manual modification or damage to these tables may cause WDR exceptions or even WDR unavailability.

### 13.3.1 Original Information of WDR Snapshots

#### 13.3.1.1 SNAPSHOT.SNAPSHOT

**SNAPSHOT** records the index information, start time, and end time of WDR snapshots stored in the current system. The result can be queried only in the system database but cannot be queried in the user database. After the WDR snapshot function is enabled (the GUC parameter **enable\_wdr\_snapshot** is set to **on**), the table is created.

**Table 13-174** SNAPSHOT attributes

Name	Type	Description	Example
snapshot_id	bigint	WDR snapshot ID	1
start_ts	timestam p	Start time of a WDR snapshot	2019-12-28 17:11:27.423742+08
end_ts	timestam p	End time of a WDR snapshot	2019-12-28 17:11:43.67726+08
version	int	Version of a WDR snapshot	1

#### 13.3.1.2 SNAPSHOT.TABLES\_SNAP\_TIMESTAMP

**TABLES\_SNAP\_TIMESTAMP** records the databases, table objects, and start and end time of all WDR snapshots. After the WDR snapshot function is enabled (the GUC parameter **enable\_wdr\_snapshot** is set to **on**), the table is created.

**Table 13-175** TABLES\_SNAP\_TIMESTAMP attributes

Name	Type	Description	Example
snapshot_id	bigint	WDR snapshot ID.	1
node_name	name	Name of the node to which the table information of the WDR snapshot belongs.	dn_6001
db_name	text	Database corresponding to a WDR snapshot.	tpcc1000
tablename	text	Table corresponding to a WDR snapshot.	snap_xc_statio_all_indexes
start_ts	timestamp	Start time of a WDR snapshot.	2019-12-28 17:11:27.425849+08
end_ts	timestamp	End time of a WDR snapshot.	2019-12-28 17:11:27.707398+08

### 13.3.1.3 SNAP\_SEQ

SNAP\_SEQ is an incremental sequence that provides the snapshot IDs for the WDR snapshot. After the WDR snapshot function is enabled (the GUC parameter **enable\_wdr\_snapshot** is set to **on**), the sequence is created.

## 13.3.2 WDR Snapshot Data Table

The naming rule of a WDR Snapshot data table is **snap\_{Source data table}**.

The source of WDR snapshot data tables is the view under **DBE\_PERF Schema**. After the WDR snapshot function is enabled (the GUC parameter **enable\_wdr\_snapshot** is set to **on**), the WDR snapshot data table is created.

## 13.3.3 WDR Information

**Table 13-176** lists the contents of a WDR.

**Table 13-176** Content of WDRs

Item	Description
<b>Database Stat</b>	<ul style="list-style-type: none"> <li>Database performance statistics: transactions, read and write operations, row activities, write conflicts, and deadlocks.</li> <li>Database-wide report, which can be viewed in cluster or node mode.</li> </ul>

Item	Description
<b>Load Profile</b>	<ul style="list-style-type: none"> <li>Database performance statistics: CPU time, DB time, logical or physical read, I/O performance, login and logout, load strength, and load performance.</li> <li>Database-wide report, which can be viewed in cluster or node mode.</li> </ul>
<b>Instance Efficiency Percentages</b>	<ul style="list-style-type: none"> <li>Database-level or node-level cache hit ratio.</li> <li>Database/Node-wide report, which can be viewed in cluster or node mode.</li> </ul>
<b>Top 10 Events by Total Wait Time</b>	<ul style="list-style-type: none"> <li>Most time-consuming event.</li> <li>Node-wide report, which can be viewed in node mode.</li> </ul>
<b>Wait Classes by Total Wait Time</b>	<ul style="list-style-type: none"> <li>Category of the wait time that is most time-consuming.</li> <li>Node-wide report, which can be viewed in node mode.</li> </ul>
<b>Host CPU</b>	<ul style="list-style-type: none"> <li>CPU usage of the host.</li> <li>Node-wide report, which can be viewed in node mode.</li> </ul>
<b>IO Profile</b>	<ul style="list-style-type: none"> <li>I/O usage in the database or node dimension.</li> <li>Database/Node-wide report, which can be viewed in cluster or node mode.</li> </ul>
<b>Memory Statistics</b>	<ul style="list-style-type: none"> <li>Kernel memory usage distribution.</li> <li>Node-wide report, which can be viewed in node mode.</li> </ul>
<b>Time Model</b>	<ul style="list-style-type: none"> <li>Time model data generated by running SQL statements on a node range.</li> <li>Node-wide report, which can be viewed in node mode.</li> </ul>
<b>SQL Statistics</b>	<ul style="list-style-type: none"> <li>SQL statement performance statistics are displayed in the following dimensions: total time, average time, CPU duration, number of returned rows, number of scanned rows, number of execution times, logical read, and physical read.</li> <li>Database/Node-wide report, which can be viewed in cluster or node mode.</li> </ul>
<b>Wait Events</b>	<ul style="list-style-type: none"> <li>Statistics on wait events at the node level.</li> <li>Node-wide report, which can be viewed in node mode.</li> </ul> <p>For details, see the waiting status list, list of wait events corresponding to lightweight locks, list of wait events corresponding to I/Os, and list of wait events corresponding to transaction locks in <a href="#">PG_THREAD_WAIT_STATUS</a>.</p>
<b>Cache IO Stats</b>	<ul style="list-style-type: none"> <li>I/O statistics on user tables and indexes.</li> <li>Database/Node-wide report, which can be viewed in cluster or node mode.</li> </ul>

Item	Description
<b>Utility status</b>	<ul style="list-style-type: none"> <li>• Status information about the replication slot and background checkpoint.</li> <li>• Node-wide report, which can be viewed in node mode.</li> </ul>
<b>Object stats</b>	<ul style="list-style-type: none"> <li>• Performance statistics in the index and table dimensions.</li> <li>• Database/Node-wide report, which can be viewed in cluster or node mode.</li> </ul>
<b>Configuration settings</b>	<ul style="list-style-type: none"> <li>• Node configuration.</li> <li>• Node-wide report, which can be viewed in node mode.</li> </ul>
<b>SQL Detail</b>	<ul style="list-style-type: none"> <li>• SQL statement text details.</li> <li>• Database/Node-wide report, which can be viewed in cluster or node mode.</li> </ul>

### 13.3.3.1 Database Stat

The following table describes columns in the Database Stat report.

**Table 13-177** Columns in the Database Stat report

Column	Description
Node Name	Node name.
DB Name	Database name
Backends	Number of backends connected to this database
Xact Commit	Number of transactions in this database that have been committed
Xact Rollback	Number of transactions in this database that have been rolled back
Blks Read	Number of disk blocks read in this database
Blks Hit	Number of times that disk blocks have been found in the cache
Tuple Returned	Number of rows sequentially scanned
Tuple Fetched	Number of rows randomly scanned
Tuple Inserted	Number of rows inserted by queries in this database

Column	Description
Tuple Updated	Number of rows updated by queries in this database
Tup Deleted	Number of rows deleted by queries in this database
Conflicts	Number of queries canceled due to conflicts
Temp Files	Number of temporary files created by queries in this database
Temp Bytes	Total amount of data written to temporary files by queries in this database
Deadlocks	Number of deadlocks detected in this database
Blk Read Time	Time spent reading data file blocks by backends in this database (unit: ms)
Blk Write Time	Time spent reading data file blocks by backends in this database (unit: ms)
Stats Reset	Time at which the current statistics were reset

### 13.3.3.2 Load Profile

The following table lists metrics in the Load Profile report.

**Table 13-178** Metrics in the Load Profile report

Metric	Description
DB Time(us)	Total elapsed time of a job
CPU Time(us)	Total CPU time used for job running
Redo size(blocks)	Size of the generated WAL (blocks)
Logical read (blocks)	Number of logical reads for a table or an index (number of blocks)
Physical read (blocks)	Number of physical reads for a table or an index (number of blocks)
Physical write (blocks)	Number of physical writes (blocks) on a table or an index
Read IO requests	Number of reads for a table or an index
Write IO requests	Number of writes for a table or an index
Read IO (MB)	Size of reads for a table or an index (in MB)
Write IO (MB)	Size of writes for a table or an index (in MB)

Metric	Description
Logins	Number of logins
Executes (SQL)	Number of times SQL statements are executed
Rollbacks	Number of rolled-back transactions
Transactions	Number of transactions
SQL response time P95(us)	Response time of 95% SQL statements
SQL response time P80(us)	Response time of 80% SQL statements

### 13.3.3.3 Instance Efficiency Percentages

The following table lists metrics in the Instance Efficiency Percentages report.

**Table 13-179** Metrics in the Instance Efficiency Percentages report

Metric	Description
Buffer Hit %	Hit ratio of the buffer pool.
Effective CPU %	Ratio of the CPU time to the DB time.
WalWrite NoWait %	Ratio of the number of events that access the WAL buffer to the total number of wait events.
Soft Parse %	Ratio of the number of soft parsing times to the total number of parsing times.
Non-Parse CPU %	Ratio of the non-parse time to the total execution time.

### 13.3.3.4 Top 10 Events by Total Wait Time

The following table lists columns in the Top 10 Events by Total Wait Time report.

**Table 13-180** Columns in the Top 10 Events by Total Wait Time report

Column	Description
Event	Name of a wait event.
Waits	Number of wait times.

Column	Description
Total Wait Time(us)	Total wait time, in microseconds.
Avg Wait Time(us)	Average wait time, in microseconds.
Type	Wait event type.

### 13.3.3.5 Wait Classes by Total Wait Time

The following table lists columns in the Wait Classes by Total Wait Time report.

**Table 13-181** Columns in the Wait Classes by Total Wait Time report

Column	Description
Type	Wait events are classified as follows: <ul style="list-style-type: none"> <li>• STATUS</li> <li>• LWLOCK_EVENT</li> <li>• LOCK_EVENT</li> <li>• IO_EVENT</li> </ul>
Waits	Number of wait times.
Total Wait Time(us)	Total wait time, in microseconds.
Avg Wait Time(us)	Average wait time, in microseconds.

### 13.3.3.6 Host CPU

The following table describes columns in the Host CPU report.

**Table 13-182** Columns in the Host CPU report

Column	Description
Cpus	Number of CPUs.
Cores	Number of CPU cores.
Sockets	Number of CPU sockets.
Load Average Begin	Average load of the start snapshot.

Column	Description
Load Average End	Average load of the end snapshot.
%User	Percentage of CPU time spent in the user mode.
%System	Percentage of CPU time spent in the kernel mode.
%WIO	Percentage of CPU time spent in wait I/O.
%Idle	Percentage of CPU idle time.

### 13.3.3.7 IO Profile

The following table lists metrics in the IO Profile report.

**Table 13-183** Metrics in the IO Profile report

Metric	Description
Database requests	Number of database I/Os.
Database (MB)	Database I/O data volume.
Database (blocks)	Database I/O data blocks.
Redo requests	Number of redo I/Os.
Redo (MB)	Redo I/O volume.

### 13.3.3.8 Memory Statistics

The following table lists metrics in the Memory Statistics report.

**Table 13-184** Columns in the Memory Statistics report

Metric	Description
shared_used_memory	Size of used shared memory (MB).
max_shared_memory	Maximum shared memory (MB).
process_used_memory	Memory used by processes (MB).

Metric	Description
max_proces s_memory	Maximum memory that can be allocated to a process (MB).

### 13.3.3.9 Time Model

The following table describes metrics in the Time Model report.

**Table 13-185** Metrics in the Time Model report

Metric	Description
DB_TIME	Total end-to-end wall time consumed by all threads (unit: $\mu$ s).
EXECUTION _TIME	Total time consumed on the executor (unit: $\mu$ s).
PL_EXECUTI ON_TIME	Total time consumed for executing PL/pgSQL statements (unit: $\mu$ s).
CPU_TIME	Total CPU time consumed by all threads (unit: $\mu$ s).
PLAN_TIME	Total time consumed for generating an execution plan (unit: $\mu$ s).
REWRITE_TI ME	Total time consumed on query rewriting (unit: $\mu$ s).
PL_COMPIL ATION_TIM E	Total time consumed for SQL compilation (unit: $\mu$ s).
PARSE_TIM E	Total time consumed for parsing SQL statements (unit: $\mu$ s).
NET_SEND_ TIME	Total time consumed for sending data over network (unit: $\mu$ s).
DATA_IO_TI ME	Total time consumed for data read and write (unit: $\mu$ s).

### 13.3.3.10 SQL Statistics

The following table describes columns in the SQL Statistics report.

**Table 13-186** Columns in the SQL Statistics report

Column	Description
Unique SQL Id	ID of the normalized SQL statement.

Column	Description
Parent Unique SQL Id	Normalized SQL ID of the parent statement. The value is <b>0</b> for non-stored procedure substatements.
Node Name	Node name.
User Name	Username.
Avg Tuples Fetched	Average number of rows randomly scanned.
Avg Tuples Returned	Average number of rows sequentially scanned.
Calls	Number of calls.
Total Elapse Time(us)	Total execution time (unit: us).
Avg Elapse Time(us)	Average execution time (unit: us).
Returned Rows	Number of rows returned by SELECT.
Avg Returned Rows	Average number of rows returned by SELECT.
Tuples Affected	Number of rows affected by INSERT, UPDATE, and DELETE.
Avg Tuples Affected	Average number of rows affected by INSERT, UPDATE, and DELETE.
Logical Read	Number of logical reads on the buffer.
Avg Logical Read	Average number of logical reads on the buffer.
Physical Read	Number of physical reads on the buffer.
Avg Physical Read	Average number of physical reads on the buffer.
CPU Time(us)	CPU time (unit: us).
Avg CPU Time(us)	Average CPU time (unit: μs).

Column	Description
Data IO Time(us)	Time spent on I/O (unit: us).
Avg Data IO Time(us)	Average time spent on I/O (unit: us).
Sort Count	Number of sorting execution times.
Sort Time(us)	Sorting execution time (unit: us).
Sort Mem Used(KB)	Size of work memory used during sorting (unit: KB).
Sort Spill Count	Number of file writes when data is flushed to disks during sorting.
Sort Spill Size(KB)	File size used when data is flushed to disks during sorting (unit: KB).
Hash Count	Number of hashing execution times.
Hash Time(us)	Hashing execution time (unit: us).
Hash Mem Used(KB)	Size of work memory used during hashing (unit: KB).
Hash Spill Count	Number of file writes when data is flushed to disks during hashing.
Hash Spill Size(KB)	File size used when data is flushed to disks during hashing (unit: KB).
SQL Text	Normalized SQL character string.

### 13.3.3.11 Wait Events

The following table describes columns in the Wait Events report.

**Table 13-187** Columns in the Wait Events report

Column	Description
Type	Wait events are classified as follows: <ul style="list-style-type: none"> <li>• STATUS</li> <li>• LWLOCK_EVENT</li> <li>• LOCK_EVENT</li> <li>• IO_EVENT</li> </ul>

Column	Description
Event	Name of a wait event.
Total Wait Time (us)	Total wait time (unit: us).
Waits	Total number of wait times.
Failed Waits	Number of wait failures.
Avg Wait Time (us)	Average wait time (unit: us).
Max Wait Time (us)	Maximum wait time (unit: us).

### 13.3.3.12 Cache IO Stats

The Cache IO Stats report consists of two tables, namely, **User table IO activity** and **User index IO activity**. Columns in the tables are described as follows:

#### User table IO activity

**Table 13-188** Columns in the User table IO activity table

Column	Description
Node Name	Node name.
DB Name	Database name
Schema Name	Schema name
Table Name	Table name
%Heap Blks Hit Ratio	Buffer pool hit ratio of the table
Heap Blks Read	Number of disk blocks read from the table
Heap Blks Hit	Number of cache hits in the table
Idx Blks Read	Number of disk blocks read from all indexes in the table
Idx Blks Hit	Number of cache hits of all indexes in the table

Column	Description
Toast Blks Read	Number of disk blocks read from the TOAST table (if any) in the table
Toast Blks Hit	Number of buffer hits in the TOAST table (if any) in the table
Tidx Blks Read	Number of disk blocks read from the TOAST table index (if any) in the table
Tidx Blks Hit	Number of buffer hits in the TOAST table index (if any) in the table

## User index IO activity

**Table 13-189** Columns in the User index IO activity table

Column	Description
Node Name	Node name.
DB Name	Database name
Schema Name	Schema name
Table Name	Table name
Index Name	Index name
%Idx Blks Hit Ratio	Index hit ratio
Idx Blks Read	Number of disk blocks read from all indexes
Idx Blks Hit	Number of cache hits of all indexes

### 13.3.3.13 Utility status

**Utility status** contains two tables: **Replication slot** and **Replication stat**. Columns in the tables are described as follows:

## Replication slot

**Table 13-190** Columns in the Replication slot report

Column	Description
Slot Name	Replication node name.
Slot Type	Type of the replication node.
DB Name	Name of the database on the replication node.
Active	Replication node status.
Xmin	Transaction ID of the replication node.
Restart Lsn	Xlog file information on the replication node
Dummy Standby	Replication node as a dummy standby.

## Replication stat

**Table 13-191** Columns in the Replication stat report

Column	Description
Thread Id	PID of the thread.
Usesys Id	User system ID.
Username	Username.
Application Name	Application name.
Client Addr	Client address.
Client Hostname	Client host name.
Client Port	Port of the client.
Backend Start	Start time of an application.
State	Log replication status.
Sender Sent Location	Location where the sender sends logs.
Receiver Write Location	Location where the receiver writes logs.
Receiver Flush Location	Location where the receiver flushes logs.
Receiver Replay Location	Location where the receiver replays logs.

Column	Description
Sync Priority	Synchronization priority.
Sync State	Synchronization status.

### 13.3.3.14 Object stats

Object stats contains three tables: User Tables stats, User index stats, and Bad lock stats. Columns in the tables are described as follows:

#### User Tables stats

**Table 13-192** Columns in the User Tables stats report

Column	Description
Node Name	Node name.
DB Name	Database name.
Schema	Schema name.
Relname	Relation name.
Seq Scan	Number of sequential scans initiated on this table.
Seq Tup Read	Number of live rows fetched by sequential scans.
Index Scan	Number of index scans initiated on the table.
Index Tup Fetch	Number of live rows fetched by index scans.
Tuple Insert	Number of rows inserted.
Tuple Update	Number of rows updated.
Tuple Delete	Number of rows deleted.
Tuple Hot Update	Number of rows HOT updated (with no separate index updated).
Live Tuple	Estimated number of live rows.
Dead Tuple	Estimated number of dead rows.
Last Vacuum	Last time at which this table was manually vacuumed (not counting <b>VACUUM FULL</b> ).
Last Autovacuum	Last time at which this table was vacuumed by the autovacuum daemon.
Last Analyze	Last time at which this table was manually analyzed.

Column	Description
Last Autoanalyze	Last time at which this table was analyzed by the autovacuum daemon.
Vacuum Count	Number of times the table has been manually vacuumed (not counting <b>VACUUM FULL</b> ).
Autovacuum Count	Number of times the table has been vacuumed by the autovacuum daemon.
Analyze Count	Number of times the table has been manually analyzed.
Autoanalyze Count	Number of times the table has been analyzed by the autovacuum daemon.

## User index stats

**Table 13-193** Columns in the User index stats report

Column	Description
Node Name	Node name.
DB Name	Database name.
Schema	Schema name.
Relname	Relation name.
Index Relname	Index name.
Index Scan	Number of index scans initiated on the index.
Index Tuple Read	Number of index entries returned by scans on the index.
Index Tuple Fetch	Number of live table rows fetched by simple index scans using the index.

## Bad lock stats

**Table 13-194** Columns in the Bad lock stats report

Column	Description
DB Id	OID of the database.
Tablespace Id	Tablespace OID.

Column	Description
Relfilenode	File object ID.
Fork Number	File type.
Error Count	Number of failures.
First Time	First occurrence time.
Last Time	Last occurrence time.

### 13.3.3.15 Configuration settings

The following table describes columns in the Configuration settings report.

**Table 13-195** Columns in the Configuration settings report

Column	Description
Name	GUC name.
Abstract	GUC description.
Type	Data type.
Curent Value	Current value.
Min Value	Valid minimum value.
Max Value	Valid maximum value.
Category	GUC type.
Enum Values	All enumerated values.
Default Value	Default parameter value used upon the database startup.
Reset Value	Default parameter value used upon the database reset.

### 13.3.3.16 SQL Detail

The following table describes columns in the SQL Detail report.

**Table 13-196** Columns in the SQL Detail report

Column	Description
Unique SQL Id	ID of the normalized SQL statement.

Column	Description
Parent Unique SQL Id	Normalized SQL ID of the parent statement. The value is <b>0</b> for a statement that is executed independently.
User Name	Username.
Node Name	Node name. This column is not displayed in node mode.
SQL Text	Normalized SQL text.

## 13.4 DBE\_PLDEBUGGER Schema

DBE\_PLDEBUGGER Schema system functions are used to debug stored procedures. This chapter describes the APIs supported by DBE\_PLDEBUGGER Schema. Only the administrator has the permission to execute these debugging APIs, but does not have the permission to modify or create functions in this schema. Common users can debug only non-system functions in the public schema or user-created schema. Common users are not allowed to debug system functions.

### NOTICE

When a user is created in the function body, the plaintext password is returned when attach, next, continue, info\_code, step, info\_breakpoint, backtrace or finish is called. You are advised not to create a user in the function body.

The administrator can run the following command to grant the **gs\_role\_pldebugger** role and debugger permissions to a user:

```
GRANT gs_role_pldebugger to user;
```

Two clients are required to connect to the database. One client is responsible for executing the debugging API as the debug end, and the other client is responsible for executing the debugging function to control the execution of stored procedures on the server. Example:

- Prepare for debugging.

Use PG\_PROC to find the OID of the stored procedure to be debugged and execute DBE\_PLDEBUGGER.turn\_on(oid). In this case, the client functions as the server.

```
gaussdb=# CREATE OR REPLACE PROCEDURE test_debug ( IN x INT)
AS
BEGIN
  INSERT INTO t1 (a) VALUES (x);
  DELETE FROM t1 WHERE a = x;
END;
/
CREATE PROCEDURE
gaussdb=# SELECT OID FROM PG_PROC WHERE PRONAME='test_debug';
oid
-----
16389
```

```
(1 row)
gaussdb=# SELECT * FROM DBE_PLDEBUGGER.turn_on(16389);
nodename | port
-----+-----
datanode | 0
(1 row)
```

- Start debugging.

When the server executes the stored procedure, the server hangs before the first SQL statement in the stored procedure and waits for the debugging message sent by the debug end. Debugging is supported only by directly executing a stored procedure and cannot be achieved by calling an executed stored procedure through a trigger.

```
gaussdb=# call test_debug(1);
```

Start another client as the debug end and call DBE\_PLDEBUGGER.attach to attach with the stored procedure for debugging based on the data returned by **turn\_on**.

```
gaussdb=# SELECT * FROM DBE_PLDEBUGGER.attach('datanode',0);
funcoid | funcname | lineno | query
-----+-----+-----+-----
16389 | test_debug | 3 | INSERT INTO t1 (a) VALUES (x);
(1 row)
```

Execute the next statement on the client where the attach operation is performed.

```
gaussdb=# SELECT * FROM DBE_PLDEBUGGER.next();
funcoid | funcname | lineno | query
-----+-----+-----+-----
16389 | test_debug | 0 | [EXECUTION FINISHED]
(1 row)
```

Execute the following variable operations on the client where the attach command is performed.

```
gaussdb=# SELECT * FROM DBE_PLDEBUGGER.info_locals(); -- Print all variables.
varname | vartype | value | package_name | isconst
-----+-----+-----+-----+-----
x | int4 | 1 | | f
(1 row)
gaussdb=# SELECT * FROM DBE_PLDEBUGGER.set_var('x', 2); -- Assign a value to a variable.
set_var
-----
t
(1 row)
gaussdb=# SELECT * FROM DBE_PLDEBUGGER.print_var('x'); -- Print a single variable.
varname | vartype | value | package_name | isconst
-----+-----+-----+-----+-----
x | int4 | 2 | | f
(1 row)
```

Directly execute the stored procedure that is being debugged.

```
gaussdb=# SELECT * FROM DBE_PLDEBUGGER.continue();
funcoid | funcname | lineno | query
-----+-----+-----+-----
16389 | test_debug | 0 | [EXECUTION FINISHED]
(1 row)
```

Exit the stored procedure that is being debugged and do not execute statements that have not been executed before.

```
gaussdb=# SELECT * FROM DBE_PLDEBUGGER.abort();
abort
-----
t
(1 row)
```

View the code information on the client and identify the line number of the breakpoint that can be set.

```
gaussdb=# SELECT * FROM DBE_PLDEBUGGER.info_code(16389);
lineno |          query          | canbreak
-----+-----+-----
      1 | CREATE OR REPLACE PROCEDURE public.test_debug( IN x INT) | f
      2 | AS DECLARE              | f
      3 | BEGIN                   | f
      4 |   INSERT INTO t1 (a) VALUES (x);                | t
      5 |   DELETE FROM t1 WHERE a = x;                    | t
      6 | END;   | f
      7 | /   | f
(7 rows)
```

Sets a breakpoint.

```
gaussdb=# SELECT * FROM DBE_PLDEBUGGER.add_breakpoint(16389,4);
breakpointno
-----
          0
(1 row)
```

View the breakpoint information.

```
gaussdb=# SELECT * FROM DBE_PLDEBUGGER.info_breakpoints();
breakpointno | funcoid | lineno |          query          | enable
-----+-----+-----+-----+-----
          0 | 16389 |     4 | DELETE FROM t1 WHERE a = x; | t
(1 row)
```

Execute to the breakpoint.

```
gaussdb=# SELECT * FROM DBE_PLDEBUGGER.continue();
funcoid | funcname | lineno |          query          |
-----+-----+-----+-----+
16389 | test_debug |     4 | DELETE FROM t1 WHERE a = x;
(1 row)
```

After the stored procedure is executed, the debugging automatically exits. To debug the stored procedure again, you need to attach again. If the server does not need to be debugged, run the **turn\_off** command to disable the debugging or exit the session. For details about the debugging APIs, see the following table.

**Table 13-197** DBE\_PLDEBUGGER

API	Description
<a href="#">DBE_PLDEBUGGER.turn_on</a>	Called by the server, indicating that the stored procedure can be debugged. After the API is called, the stored procedure is hung to wait for debugging information.
<a href="#">DBE_PLDEBUGGER.turn_off</a>	Called by the server, indicating that debugging the stored procedure is disabled.
<a href="#">DBE_PLDEBUGGER.local_debug_server_info</a>	Called by the server to print all stored procedures that have been turned on in the current session.
<a href="#">DBE_PLDEBUGGER.attach</a>	Called by the debug end to attach with the stored procedure that is being debugged.

API	Description
<a href="#">DBE_PLDEBUGGER.info_locals</a>	Called by the debug end to print the current values of variables in the stored procedure that is being debugged.
<a href="#">DBE_PLDEBUGGER.next</a>	Called by the debug end to execute the next step.
<a href="#">DBE_PLDEBUGGER.continue</a>	Called by the debug end to continue the execution until the breakpoint or stored procedure ends.
<a href="#">DBE_PLDEBUGGER.abort</a>	Called by the debug end to stop debugging. The server reports a long jump error.
<a href="#">DBE_PLDEBUGGER.print_var</a>	Called by the debug end to print the current values of specified variables in the stored procedure that is being debugged.
<a href="#">DBE_PLDEBUGGER.info_code</a>	Called by the debug end or server to print the source statement of a specified stored procedure and the line number corresponding to each line.
<a href="#">DBE_PLDEBUGGER.step</a>	Called by the debug end to execute step by step.
<a href="#">DBE_PLDEBUGGER.add_breakpoint</a>	Called by the debug end to add a breakpoint.
<a href="#">DBE_PLDEBUGGER.delete_breakpoint</a>	Called by the debug end to delete a breakpoint.
<a href="#">DBE_PLDEBUGGER.info_breakpoints</a>	Called by the debug end to view all breakpoints.
<a href="#">DBE_PLDEBUGGER.backtrace</a>	Called by the debug end to check the current call stack.
<a href="#">DBE_PLDEBUGGER.enable_breakpoint</a>	Called by the debug end to enable breakpoints.
<a href="#">DBE_PLDEBUGGER.disable_breakpoint</a>	Called by the debug end to disable breakpoints.
<a href="#">DBE_PLDEBUGGER.finish</a>	Called by the debug end to continue the debugging until the breakpoint is reached or the upper-layer call stack is returned.
<a href="#">DBE_PLDEBUGGER.set_var</a>	Called by the debug end to assign a value to a variable.

### 13.4.1 DBE\_PLDEBUGGER.turn\_on

This function is used to mark a stored procedure as debuggable. After **turn\_on** is executed, the server can execute the stored procedure for debugging. You need to manually obtain the OID of the stored procedure based on the PG\_PROC system

catalog and transfer it to the function. After **turn\_on** is executed, the execution of the stored procedure in the current session is hung before the first SQL statement to wait for the debugging instruction from the debug end. This setting is cleared by default after the session is disconnected. Currently, stored procedures and functions with autonomous transactions enabled cannot be debugged.

The function prototype is as follows:

```
DBE_PLDEBUGGER.turn_on(Oid)
RETURN Record;
```

**Table 13-198** turn\_on input parameters and return values

Name	Type	Description
func_oid	IN oid	Function OID
nodename	OUT text	Node name
port	OUT integer	Number of the connected port

## 13.4.2 DBE\_PLDEBUGGER.turn\_off

This function is used to remove the debugging flag added by **turn\_on**. The return value indicates success or failure. You can run the **DBE\_PLDEBUGGER.local\_debug\_server\_info** command to query the OID of the stored procedure that has been turned on.

The function prototype is as follows:

```
DBE_PLDEBUGGER.turn_off(Oid)
RETURN boolean;
```

**Table 13-199** turn\_off input parameters and return values

Name	Type	Description
func_oid	IN oid	Function OID
turn_off	OUT boolean	Whether turn-off is successful

## 13.4.3 DBE\_PLDEBUGGER.local\_debug\_server\_info

This function is used to query the OID of the stored procedure that has been turned on in the current connection. You can use **funcoid** and **pg\_proc** together to determine which stored procedures are to be debugged.

**Table 13-200** local\_debug\_server\_info returned input parameters and return values

Name	Type	Description
nodename	OUT text	Node name
port	OUT bigint	Port number
funcoid	OUT oid	Stored procedure OID

### 13.4.4 DBE\_PLDEBUGGER.attach

When the server executes a stored procedure, the server hangs the execution before the first statement and waits for attaching with the debug end. The debug end invokes the attach function and transfers node name and port number to attach with the specified stored procedure.

If an error is reported during debugging, the attach operation automatically becomes invalid. If the debug end is attached to another stored procedure during debugging, the debugging of the attached stored procedure becomes invalid.

**Table 13-201** attach input parameters and return values

Name	Type	Description
nodename	IN text	Node name
port	IN integer	Number of the connected port
funcoid	OUT oid	Function ID
funcname	OUT text	Function name
lineno	OUT integer	Number of the next line in the current debugging process
query	OUT text	Source code of the next line of the function that is being debugged

### 13.4.5 DBE\_PLDEBUGGER.info\_locals

During debugging on the debug end, **info\_locals** is invoked to print the variables in the current stored procedure. The input parameter **frameno** of this function indicates the stack layer to be traversed. This function can be invoked without input parameters. By default, the top-layer stack variable is queried.

**Table 13-202** info\_locals input parameters and return values

Name	Type	Description
frameno	IN integer (optional)	Specified stack layer. The default value is the top layer.
varname	OUT text	Variable name
vartype	OUT text	Variable type
value	OUT text	Variable value
package_name	OUT text	Name of the package corresponding to the variable. If the variable is not a package, the value is null.
isconst	OUT boolean	Whether it is a constant

## 13.4.6 DBE\_PLDEBUGGER.next

This function is used to execute the current SQL statement in a stored procedure and return the number of the next SQL statement and the corresponding query.

**Table 13-203** next input parameters and return values

Name	Type	Description
funcoid	OUT oid	Function ID
funcname	OUT text	Function name
lineno	OUT integer	Number of the next line in the current debugging process
query	OUT text	Source code of the next line of the function that is being debugged

## 13.4.7 DBE\_PLDEBUGGER.continue

Executes the current stored procedure until reaching the next breakpoint or end, and returns the line number of the next execution and the corresponding query.

The function prototype is as follows:

```
DBE_PLDEBUGGER.continue()
RETURN Record;
```

**Table 13-204** continue input parameters and return values

Name	Type	Description
funcoid	OUT oid	Function ID
funcname	OUT text	Function name
lineno	OUT integer	Number of the next line in the current debugging process
query	OUT text	Source code of the next line of the function that is being debugged

### 13.4.8 DBE\_PLDEBUGGER.abort

This function is used to abort the stored procedure executed on the server and report an error. The return value indicates whether the abort message is successfully sent.

The function prototype is as follows:

```
DBE_PLDEBUGGER.abort()  
RETURN boolean;
```

**Table 13-205** abort input parameters and return values

Name	Type	Description
abort	OUT boolean	Success or failure

### 13.4.9 DBE\_PLDEBUGGER.print\_var

During debugging on the debug end, **print\_var** is invoked to print the name and value of the specified variable in the current stored procedure. The input parameter **frameno** of this function indicates the stack layer to be traversed. This function can be invoked without **frameno**. By default, the top-layer stack variable is queried.

**Table 13-206** print\_var input parameters and return values

Name	Type	Description
var_name	IN text	Variable
frameno	IN integer (optional)	Specified stack layer. The default value is the top layer.
varname	OUT text	Variable name

Name	Type	Description
vartype	OUT text	Variable type
value	OUT text	Variable value
package_name	OUT text	Package name corresponding to the variable. This parameter is reserved and is left empty currently.
isconst	OUT boolean	Whether it is a constant

### 13.4.10 DBE\_PLDEBUGGER.info\_code

During debugging on the debug end, **info\_code** is invoked to view the source statement of the specified stored procedure and the line number corresponding to each line. The line number starts from the function body, and the line number in the function header is empty.

**Table 13-207** info\_code input parameters and return values

Name	Type	Description
funcoid	IN oid	Function ID
lineno	OUT integer	Line number
query	OUT text	Source statement
canbreak	OUT bool	Specifies whether the current line supports breakpoints.

### 13.4.11 DBE\_PLDEBUGGER.step

During debugging on the debug end, if a stored procedure is being executed, the stored procedure continues to be executed and information such as the line number in the first line of the stored procedure is returned. If the executed object is not a stored procedure, the return is the same as that for **next**. After the SQL statement is executed, information such as the line number in the next line is returned.

**Table 13-208** step input parameters and return values

Name	Type	Description
funcoid	OUT oid	Function ID

Name	Type	Description
funcname	OUT text	Function name
lineno	OUT integer	Number of the next line in the current debugging process
query	OUT text	Source code of the next line of the function that is being debugged

### 13.4.12 DBE\_PLDEBUGGER.add\_breakpoint

During debugging on the debug end, call **add\_breakpoint** to add a breakpoint. If **-1** is returned, the specified breakpoint is invalid. Determine the proper position of the breakpoint based on the **canbreak** column in [DBE\\_PLDEBUGGER.info\\_code](#).

**Table 13-209** add\_breakpoint input parameters and return values

Name	Type	Description
funcoid	IN text	Function ID
lineno	IN integer	Line number
breakpointno	OUT integer	Breakpoint number

### 13.4.13 DBE\_PLDEBUGGER.delete\_breakpoint

During debugging on the debug end, call **delete\_breakpoint** to delete the existing breakpoint.

**Table 13-210** delete\_breakpoint input parameters and return values

Name	Type	Description
breakpointno	IN integer	Breakpoint number
result	OUT bool	Specifies whether this operation is successful.

### 13.4.14 DBE\_PLDEBUGGER.info\_breakpoints

During debugging on the debug end, call **info\_breakpoints** to view the current function breakpoint.

**Table 13-211** info\_breakpoints input parameters and return values

Name	Type	Description
breakpointno	OUT integer	Breakpoint number
funcoid	OUT oid	Function ID
lineno	OUT integer	Line number
query	OUT text	Breakpoint content
enable	OUT boolean	Valid or not

### 13.4.15 DBE\_PLDEBUGGER.backtrace

During debugging on the debug end, call **backtrace** to view the current call stack.

**Table 13-212** backtrace input parameters and return values

Name	Type	Description
frameno	OUT integer	Call stack ID
funcname	OUT text	Function name
lineno	OUT integer	Line number
query	OUT text	Breakpoint content
funcoid	OUT oid	Function OID

### 13.4.16 DBE\_PLDEBUGGER.enable\_breakpoint

During debugging on the debug end, calls enable\_breakpoint to enable breakpoints.

**Table 13-213** enable\_breakpoint input parameters and return values

Name	Type	Description
breakpointno	IN integer	Breakpoint number
result	OUT bool	Whether this operation is successful

### 13.4.17 DBE\_PLDEBUGGER.disable\_breakpoint

During debugging on the debug end, call disable\_breakpoint to disable breakpoints.

**Table 13-214** disable\_breakpoint input parameters and return values

Name	Type	Description
breakpointno	IN integer	Breakpoint number
result	OUT bool	Whether this operation is successful

### 13.4.18 DBE\_PLDEBUGGER.finish

Executes the current SQL statement in the stored procedure until the next breakpoint is triggered or the next line of the upper-layer stack is executed.

**Table 13-215** finish input parameters and return values

Name	Type	Description
funcoid	OUT oid	Function ID
funcname	OUT text	Function name
lineno	OUT integer	Number of the next line in the current debugging process
query	OUT text	Source code of the next line of the function that is being debugged

### 13.4.19 DBE\_PLDEBUGGER.set\_var

Changes the variable on the top-layer stack in the specified debugging stored procedure to the value of the input parameter. If a stored procedure contains variables with the same name, set\_var supports only the setting of the first variable value.

**Table 13-216** set\_var input parameters and return values

Name	Type	Description
var_name	IN text	Variable name
value	IN text	New value
result	OUT boolean	Result (success or failure)

## 13.5 DB4AI Schema

The DB4AI schema is used to store and manage dataset versions in the AI feature. The schema holds a snapshot of the original view of the data tables, a change record for each data version, and management information for the version snapshot. This schema is intended for common users. In this schema, users can query the snapshot version information created by DB4AI.SNAPSHOT.

### 13.5.1 DB4AI.SNAPSHOT

DB4AI.SNAPSHOT records the snapshots stored by the current user through the DB4AI.SNAPSHOT feature.

**Table 13-217** Attributes of the DB4AI.SNAPSHOT table

Name	Type	Description	Instance
id	bigint	ID of the current snapshot	1
parent_id	bigint	ID of the parent snapshot	0
matrix_id	bigint	Matrix ID of the snapshot in CSS mode. Otherwise, the value is <b>NULL</b> .	0
root_id	bigint	ID of the initial snapshot, which is constructed from the operated data using db4ai.create_snapshot().	0
schema	name	Schema for exporting the snapshot view	public
name	name	Snapshot name, including the version suffix	example0@1.1.0
owner	name	Name of the user who creates the snapshot	nw
commands	text[]	A complete list of SQL statements that record how to generate this snapshot from its root snapshot	{DELETE,"WHERE id > 7"}
comment	text	Snapshot description	inherits from @1.0.0
published	boolean	<b>TRUE</b> , only when the snapshot has been published	f
archived	boolean	<b>TRUE</b> , only when the snapshot has been archived	f

Name	Type	Description	Instance
created	timestamp without time zone	Timestamp marking the snapshot creation date	2021-08-25 10:59:52.955604
row_count	bigint	Number of data rows in the snapshot	8

## 13.5.2 DB4AI.CREATE\_SNAPSHOT

**CREATE\_SNAPSHOT** creates snapshots for the DB4AI feature. You can invoke **CREATE SNAPSHOT** to implement this function.

**Table 13-218** DB4AI.CREATE\_SNAPSHOT input parameters and return values

Parameter	Type	Description
i_schema	IN NAME	Name of the schema storing snapshots. The default value is the current user or <b>PUBLIC</b> .
i_name	IN NAME	Snapshot name
i_commands	IN TEXT[]	SQL commands for obtaining data
i_vers	IN NAME	Version suffix
i_comment	IN TEXT	Snapshot description
res	OUT db4ai.snapshot_name	Result

## 13.5.3 DB4AI.CREATE\_SNAPSHOT\_INTERNAL

**CREATE\_SNAPSHOT\_INTERNAL** is a built-in execution function of the DB4AI.CREATE\_SNAPSHOT function. The function involves information verification and cannot be directly invoked.

**Table 13-219** DB4AI.CREATE\_SNAPSHOT\_INTERNAL input parameters and return values

Parameter	Type	Description
s_id	IN BIGINT	Snapshot ID
i_schema	IN NAME	Namespace storing the snapshot

Parameter	Type	Description
i_name	IN NAME	Snapshot name
i_commands	IN TEXT[]	SQL commands for obtaining data
i_comment	IN TEXT	Snapshot description
i_owner	IN NAME	Snapshot owner

## 13.5.4 DB4AI.PREPARE\_SNAPSHOT

**PREPARE\_SNAPSHOT** prepares data for model training and interprets snapshots for the DB4AI feature. A snapshot provides a complete sequence of data and documents that are changed by all applications. You can invoke **PREPARE\_SNAPSHOT** to implement this function.

**Table 13-220** DB4AI.PREPARE\_SNAPSHOT input parameters and return values

Parameter	Type	Description
i_schema	IN NAME	Name of the schema storing snapshots. The default value is the current user or <b>PUBLIC</b> .
i_parent	IN NAME	Parent snapshot name
i_commands	IN TEXT[]	DDL and DML commands for modifying snapshots
i_vers	IN NAME	Version suffix
i_comment	IN TEXT	Data comment
res	OUT db4ai.snapshot_name	Result

## 13.5.5 DB4AI.PREPARE\_SNAPSHOT\_INTERNAL

**PREPARE\_SNAPSHOT\_INTERNAL** is a built-in execution function of the DB4AI.PREPARE\_SNAPSHOT function. The function involves information verification and cannot be directly invoked.

**Table 13-221** DB4AI.PREPARE\_SNAPSHOT\_INTERNAL input parameters and return values

Parameter	Type	Description
s_id	IN BIGINT	Snapshot ID
p_id	IN BIGINT	Parent snapshot ID
m_id	IN BIGINT	Matrix ID
r_id	IN BIGINT	Root snapshot ID
i_schema	IN NAME	Snapshot schema
i_name	IN NAME	Snapshot name
i_commands	IN TEXT[]	DDL and DML commands for modifying snapshots
i_comment	IN TEXT	Snapshot description
i_owner	IN NAME	Snapshot owner
i_idx	INOUT INT	Command index
i_exec_cmds	INOUT TEXT[]	DDL and DML commands for execution
i_mapping	IN NAME[]	Maps user columns to backup columns. A rule is generated if the value is not <b>NULL</b> .

## 13.5.6 DB4AI.ARCHIVE\_SNAPSHOT

**ARCHIVE\_SNAPSHOT** archives snapshots for the DB4AI feature. You can invoke **ARCHIVE SNAPSHOT** to implement this function. After taking effect, the snapshot cannot be used for training.

**Table 13-222** DB4AI.ARCHIVE\_SNAPSHOT input parameters and return values

Parameter	Type	Description
i_schema	IN NAME	Name of the schema storing snapshots. The default value is the current user.
i_name	IN NAME	Snapshot name
res	OUT db4ai.snapshot_name	Result

## 13.5.7 DB4AI.PUBLISH\_SNAPSHOT

**PUBLISH\_SNAPSHOT** publishes snapshots for the DB4AI feature. You can invoke **PUBLISH SNAPSHOT** to implement this function.

**Table 13-223** DB4AI.PUBLISH\_SNAPSHOT input parameters and return values

Parameter	Type	Description
i_schema	IN NAME	Name of the schema storing snapshots. The default value is the current user or <b>PUBLIC</b> .
i_name	IN NAME	Snapshot name
res	OUT db4ai.snapshot_name	Result

## 13.5.8 DB4AI.MANAGE\_SNAPSHOT\_INTERNAL

**MANAGE\_SNAPSHOT\_INTERNAL** is a built-in execution function of the **DB4AI.PUBLISH\_SNAPSHOT** and **DB4AI.ARCHIVE\_SNAPSHOT** functions. The function involves information verification and cannot be directly invoked.

**Table 13-224** DB4AI.MANAGE\_SNAPSHOT\_INTERNAL input parameters and return values

Parameter	Type	Description
i_schema	IN NAME	Name of the schema storing snapshots
i_name	IN NAME	Snapshot name
publish	IN BOOLEAN	Whether the snapshot is published
res	OUT db4ai.snapshot_name	Result

## 13.5.9 DB4AI.SAMPLE\_SNAPSHOT

**SAMPLE\_SNAPSHOT** samples basic data to generate snapshots for the DB4AI feature. You can invoke **SAMPLE SNAPSHOT** to implement this function.

**Table 13-225** DB4AI.SAMPLE\_SNAPSHOT input parameters and return values

Parameter	Type	Description
i_schema	IN NAME	Name of the schema storing snapshots
i_parent	IN NAME	Parent snapshot name
i_sample_infixes	IN NAME[]	Sample snapshot name infix
i_sample_ratios	IN NUMBER[]	Size of each sample, which is used as the sample set ratio
i_stratify	IN NAME[]	Layering strategy
i_sample_comments	IN TEXT[]	Sample snapshot description
res	OUT db4ai.snapshot_name	Result

### 13.5.10 DB4AI.PURGE\_SNAPSHOT

**PURGE\_SNAPSHOT** deletes snapshots for the DB4AI feature. You can invoke **PURGE\_SNAPSHOT** to implement this function.

**Table 13-226** DB4AI.PURGE\_SNAPSHOT input parameters and return values

Parameter	Type	Description
i_schema	IN NAME	Name of the schema storing snapshots
i_name	IN NAME	Snapshot name
res	OUT db4ai.snapshot_name	Result

### 13.5.11 DB4AI.PURGE\_SNAPSHOT\_INTERNAL

**PURGE\_SNAPSHOT\_INTERNAL** is a built-in execution function of the DB4AI.PURGE\_SNAPSHOT function. The function involves information verification and cannot be directly invoked.

**Table 13-227** DB4AI.PURGE\_SNAPSHOT\_INTERNAL input parameters and return values

Parameter	Type	Description
i_schema	IN NAME	Name of the schema storing snapshots
i_name	IN NAME	Snapshot name

## 13.6 DBE\_PLDEVELOPER

The DBE\_PLDEVELOPER system catalog records information required for compiling PL/SQL packages, functions, and stored procedures.

### 13.6.1 DBE\_PLDEVELOPER.gs\_source

Records PL/SQL object (stored procedure, function, package, and package body) compilation information. For details, see the following column description.

When the **plsql\_show\_all\_error** parameter is enabled, information about PL/SQL object compilation success or failure is recorded in this table. When the **plsql\_show\_all\_error** parameter is disabled, only information about correct compilation is inserted into this table.

#### CAUTION

1. The `gs_source` table records only user-defined original object statements. Even if a user uses ALTER to change the created schema or name, the information in the `gs_source` table does not change. If the user changes the schema or name of an object, the deleted object still exists in the `gs_source` table.
2. The owner in the `gs_source` table is the user who creates the table, not the user specified when the user creates the stored procedure or package.
3. By default, row-level security is not configured for the `gs_source` table in the database. If you want to use the database isolation feature, run the following statement to add row-level security:

```
ALTER TABLE dbe_pldeveloper.gs_source ENABLE ROW LEVEL SECURITY;
CREATE ROW LEVEL SECURITY POLICY all_data_rls ON dbe_pldeveloper.gs_source USING(owner =
(select oid from pg_roles where rolname=current_user));
```

**Table 13-228** DBE\_PLDEVELOPER.gs\_source columns

Name	Type	Description
id	oid	Object ID.
owner	bigint	ID of the user who creates the object.
nspid	oid	Schema ID of an object.
name	name	Object name.

type	text	Object type ( <b>procedure/function/package/package body</b> ).
status	boolean	Determines whether the creation is successful.
src	text	Original statement for creating an object.

## 13.6.2 DBE\_PLDEVELOPER.gs\_errors

Records errors that occur during PL/SQL object (stored procedure, function, package, and package body) compilation. For details, see the following column description.

After the **plsql\_show\_all\_error** parameter is enabled, if an error occurs during compilation, the error is skipped and the compilation continues, and the error information is recorded in **gs\_errors**. If the **plsql\_show\_all\_error** parameter is disabled, and the value of **behavior\_compat\_options** is not **skip\_insert\_gs\_source**, then an error is reported and related information is inserted into this table.

The owner of the table is the user who creates the table. Modifying the owner of the stored procedure or package does not modify the table information.

**Table 13-229** DBE\_PLDEVELOPER.gs\_errors columns

Name	Type	Description
id	oid	Object ID.
owner	bigint	ID of the user who creates the object.
nspid	oid	Schema ID of an object.
name	name	Object name.
type	text	Object type ( <b>procedure/function/package/package body</b> ).
line	integer	Line number.
src	text	Error message.

 **CAUTION**

1. If errors occur before AS/IS and after END when a packet header is created, the errors are not recorded in the **gs\_errors** table. Instead, the error row numbers and content are directly returned on the client. The returned row numbers may be inaccurate. Some IS and END errors are not recorded in the **gs\_errors** table.
2. If errors occur before AS/IS and after END when a packet body is created, the errors are not recorded in the **gs\_errors** table. Instead, the error row numbers and content are directly returned on the client. The returned row numbers may be inaccurate. Some IS and END errors are not recorded in the **gs\_errors** table.
3. If errors occur at the end of functions or stored procedures (after END) when a packet body is created, the errors are not recorded in the **gs\_errors** table. Instead, the error row numbers and content are directly returned on the client. The row numbers may be inaccurate.
4. If errors occur at the beginning of functions or stored procedures (before AS/IS) when a packet body is created, the error row numbers are incorrect.
5. If a semicolon (;) is missing in the variable declaration when a packet header is created, the error is recorded in the **gs\_errors** table but the row number is incorrect. If the parameter is enabled, the error is not recorded.
6. In a stored procedure or function in the package body, the error declared by the autonomous transaction identifier PRAGMA AUTONOMOUS\_TRANSACTION may not be recorded in the **gs\_errors** table.
7. The client directly reports an error, but the **gs\_errors** table does not record the error. If the row number reported by the client is incorrect, this requirement does not correct the row number.
8. For an error in the middle of statements such as IF...THEN, FOR...LOOP, and WHEN... THEN, or an EXCEPTION error, the error row number is in the current row instead of the row where the next semicolon is located.
9. When the BEGIN in the stored procedure or function in the package is incorrect, the error row number is incorrect.

## 13.7 DBE\_SQL\_UTIL Schema

The DBE\_SQL\_UTIL schema stores tools for managing SQL patches, including creating, deleting, enabling, and disabling SQL patches. Common users have only the USAGE permission and do not have the CREATE, ALTER, DROP, and COMMENT permissions.

For details about how to use the DBE\_SQL\_UTIL schema, see [Tuning with SQL PATCH](#).

### 13.7.1 DBE\_SQL\_UTIL.create\_hint\_sql\_patch

create\_hint\_sql\_patch is an interface function used to create SQL patches for hints. It returns whether the execution is successful.

Only the initial user, sysadmin, opradmin, and monadmin have the permission to invoke this interface.

**Table 13-230** DBE\_SQL\_UTIL.create\_hint\_sql\_patch input parameters and return values

Parameter	Type	Description
patch_name	IN name	Patch name.
unique_sql_id	IN bigint	Global unique query ID.
hint_string	IN text	Hint text.
description	IN text	Patch description. The default value is <b>NULL</b> .
enabled	IN bool	Specifies whether the patch takes effect. The default value is <b>true</b> .
result	OUT bool	Specifies whether this operation is successful.

## 13.7.2 DBE\_SQL\_UTIL.create\_abort\_sql\_patch

create\_abort\_sql\_patch is an interface function used to create abort SQL patches. It returns whether the execution is successful.

Only the initial user, sysadmin, opradmin, and monadmin have the permission to invoke this interface.

**Table 13-231** DBE\_SQL\_UTIL.create\_abort\_sql\_patch input parameters and return values

Parameter	Type	Description
patch_name	IN name	Patch name.
unique_sql_id	IN bigint	Global unique ID.
description	IN text	Patch description. The default value is <b>NULL</b> .
enabled	IN bool	Specifies whether the patch takes effect. The default value is <b>true</b> .
result	OUT bool	Specifies whether this operation is successful.

## 13.7.3 DBE\_SQL\_UTIL.drop\_sql\_patch

drop\_sql\_patch is an interface function used to delete SQL patches. It returns whether the execution is successful.

Only the initial user, sysadmin, opradmin, and monadmin have the permission to invoke this interface.

**Table 13-232** DBE\_SQL\_UTIL.drop\_sql\_patch input parameters and return values

Parameter	Type	Description
patch_name	IN name	Patch name.
result	OUT bool	Specifies whether this operation is successful.

### 13.7.4 DBE\_SQL\_UTIL.enable\_sql\_patch

enable\_sql\_patch is an interface function used to enable SQL patches. It returns whether the execution is successful.

Only the initial user, sysadmin, opradmin, and monadmin have the permission to invoke this interface.

**Table 13-233** DBE\_SQL\_UTIL.enable\_sql\_patch input parameters and return values

Parameter	Type	Description
patch_name	IN name	Patch name.
result	OUT bool	Specifies whether this operation is successful.

### 13.7.5 DBE\_SQL\_UTIL.disable\_sql\_patch

disable\_sql\_patch is an interface function used to disable SQL patches. It returns whether the execution is successful.

Only the initial user, sysadmin, opradmin, and monadmin have the permission to invoke this interface.

**Table 13-234** DBE\_SQL\_UTIL.disable\_sql\_patch input parameters and return values

Parameter	Type	Description
patch_name	IN name	Patch name.
result	OUT bool	Specifies whether this operation is successful.

## 13.7.6 DBE\_SQL\_UTIL.show\_sql\_patch

show\_sql\_patch is an interface function used to display the SQL patch corresponding to a specified patch name and return the running result.

Only the initial user, sysadmin, opradmin, and monadmin have the permission to invoke this interface.

**Table 13-235** DBE\_SQL\_UTIL.show\_sql\_patch input parameters and return values

Parameter	Type	Description
patch_name	IN name	Patch name.
unique_sql_id	OUT bigint	Global unique ID.
enabled	OUT bool	Specifies whether the patch takes effect.
abort	OUT bool	Specifies whether the patch is an abort hint.
hint_str	OUT text	Hint text.

## 13.7.7 DBE\_SQL\_UTIL.create\_hint\_sql\_patch

create\_hint\_sql\_patch is an interface function used to create SQL patches for hints. It returns whether the execution is successful. This function is an overloaded function of the original function. The value of **parent\_unique\_sql\_id** can be used to limit the effective range of the hint patch.

Only the initial user, sysadmin, opradmin, and monadmin have the permission to invoke this interface.

**Table 13-236** DBE\_SQL\_UTIL.create\_hint\_sql\_patch input parameters and return values

Parameter	Type	Description
patch_name	IN name	Patch name.
unique_sql_id	IN bigint	Global unique ID.
parent_unique_sql_id	IN bigint	Global unique ID of the outer SQL statement. The value <b>0</b> indicates that the SQL patch statement outside the stored procedure is restricted to take effect. A non-zero value indicates that the specific stored procedure is restricted to take effect.
hint_string	IN text	Hint text.
description	IN text	Patch description. The default value is <b>NULL</b> .

Parameter	Type	Description
enabled	IN bool	Specifies whether the patch takes effect. The default value is <b>true</b> .
result	OUT bool	Specifies whether this operation is successful.

### 13.7.8 DBE\_SQL\_UTIL.create\_abort\_sql\_patch

create\_abort\_sql\_patch is an interface function used to create abort SQL patches. It returns whether the execution is successful. This function is an overloaded function of the original function. The value of **parent\_unique\_sql\_id** can be used to limit the effective range of the abort patch.

Only the initial user, sysadmin, opradmin, and monadmin have the permission to invoke this interface.

**Table 13-237** DBE\_SQL\_UTIL.create\_abort\_sql\_patch input parameters and return values

Parameter	Type	Description
patch_name	IN name	Patch name.
unique_sql_id	IN bigint	Global unique ID.
parent_unique_sql_id	IN bigint	Global unique ID of the outer SQL statement. The value <b>0</b> indicates that the SQL patch statement outside the stored procedure is restricted to take effect. A non-zero value indicates that the specific stored procedure is restricted to take effect.
description	IN text	Patch description. The default value is <b>NULL</b> .
enabled	IN bool	Specifies whether the patch takes effect. The default value is <b>true</b> .
result	OUT bool	Specifies whether this operation is successful.

# 14 Configuring Running Parameters

## 14.1 Viewing Parameters

GaussDB uses a set of default running parameters after it is installed. You can modify the parameters to enable GaussDB to better fit the current service scenarios and data volume.

### Procedure

**Step 1** Connect to the database.

**Step 2** View the parameter values in the database.

- Method 1: Run the **SHOW** command.
  - Run the following command to view the value of a certain parameter:  
`gaussdb=# SHOW server_version;`  
*server\_version* indicates the database version.
  - Run the following command to view values of all parameters:  
`gaussdb=# SHOW ALL;`
- Method 2: Query the **pg\_settings** view.
  - Run the following command to view the value of a certain parameter:  
`gaussdb=# SELECT * FROM pg_settings WHERE NAME='server_version';`
  - Run the following command to view values of all parameters:  
`gaussdb=# SELECT * FROM pg_settings;`

----End

### Example

Check the character encoding type of the client.

```
gaussdb=# SHOW SHOW client_encoding;
SHOW client_encoding
-----
UTF8
(1 row)
```

## 14.2 Setting Parameters

You are advised to modify some parameters on the GaussDB console. If the parameters cannot be modified on the console, evaluate the risks and contact customer service.

### Background

GaussDB provides multiple methods to set the GUC parameters of databases, users, or sessions.

- Parameter names are case-insensitive.
- A parameter value can be an integer, floating point value, string, boolean value, or enumerated value.
  - The Boolean values can be **on/off**, **true/false**, **yes/no**, or **1/0**, and are case-insensitive.
  - The enumerated value range is specified in the **enumvals** column of the **pg\_settings** system catalog.
- For parameters using units, specify their units during the setting. Otherwise, default units are used.
  - The default units are specified in the **unit** column of **pg\_settings**.
  - The unit of memory can be KB, MB, or GB.
  - The unit of time can be ms, s, min, h, or d.

For details about the parameters, see [GUC Parameters](#).

### Setting GUC Parameters

GaussDB provides six types of GUC parameters. For details about parameter types and their setting methods, see [Table 14-1](#).

**Table 14-1** GUC parameters

Category	Description	How to Set
INTERNAL	Fixed parameter. It is set during database creation and cannot be modified. Users can only view the parameter by running the <b>SHOW</b> command or in the <b>pg_settings</b> view.	None
POSTMASTER	Database server parameter. It can be set when the database is started or in the configuration file.	Method 1 in <a href="#">Table 14-2</a> .
SIGHUP	Global database parameter. It can be set when the database is started or be modified later.	Method 1 or 2 in <a href="#">Table 14-2</a> .

Category	Description	How to Set
BACKEND	Session connection parameter. It is specified during session connection creation and cannot be modified after that. The parameter setting becomes invalid when the session is disconnected. This is an internal parameter and not recommended for users to set it.	Method 1 or 2 in <a href="#">Table 14-2</a> . <b>NOTE</b> The parameter setting takes effect when the next session is created.
SUSET	Database administrator parameter. It can be set by common users when or after the database is started. It can also be set by database administrators using SQL statements.	Method 1 or 2 by a common user, or method 3 by a database administrator in <a href="#">Table 14-2</a> .
USERSET	Common user parameter. It can be set by any user at any time.	Method 1, 2, or 3 in <a href="#">Table 14-2</a> .

You can set GUC parameters in GaussDB using the three methods listed in [Table 14-2](#).

**Table 14-2** Methods for setting GUC parameters

No.	How to Set
Method 1	<ol style="list-style-type: none"> <li>Log in to the management console.</li> <li>On the <b>Instances</b> page, click the name of the target instance to go to the <b>Basic Information</b> page.</li> <li>In the navigation pane on the left, click <b>Parameters</b>. On the displayed page, modify parameters. If the parameters cannot be modified on the console, evaluate the modification risks and contact customer service for modification.</li> <li>Reboot the instance to make the modifications take effect.</li> </ol> <p><b>NOTE</b> Rebooting instances will interrupt user operations. Plan a proper execution window before the reboot.</p>
Method 2	<ol style="list-style-type: none"> <li>Log in to the management console.</li> <li>On the <b>Instances</b> page, click the name of the target instance to go to the <b>Basic Information</b> page.</li> <li>In the navigation pane on the left, click <b>Parameters</b>. On the displayed page, modify parameters. If the parameters cannot be modified on the console, evaluate the modification risks and contact customer service for modification.</li> </ol>

No.	How to Set
Method 3:	<p>Modify a session-level parameter.</p> <ul style="list-style-type: none"><li>Set a session-level parameter. <code>openGauss=# SET <i>paraname</i> TO <i>value</i>;</code> Parameter value in the current session is changed. After you exit the session, the setting becomes invalid.</li></ul>

---

**⚠ CAUTION**

If you use method 1 or 2 to set a parameter that does not belong to the current environment, the database displays a message indicating that the parameter is not supported.

If the parameters cannot be modified using the preceding methods, evaluate the risks and contact customer service for modification.

---

## 14.3 GUC Parameters

### 14.3.1 GUC Parameter Usage

A database provides many operation parameters. Configurations of these parameters affect the behavior of the database system. Before modifying these parameters, learn the impact of these parameters on the database. Otherwise, unexpected results may occur.

#### Precautions

- If the value range of a parameter is a string, the string should comply with the naming conventions of the path and file name in the OS running the target database.
- If the maximum value of a parameter is *INT\_MAX*, the maximum parameter value varies by OS.
- If the maximum value of a parameter is *DBL\_MAX*, the maximum parameter value varies by OS.

### 14.3.2 File Location

After a database has been installed, three configuration files (**postgresql.conf**, **pg\_hba.conf**, and **pg\_ident.conf**) are automatically generated and saved in the data directory. You can use the methods described in this section to change the names and save paths of these configuration files.

When changing the storage directory of a configuration file, set **data\_directory** in **postgresql.conf** to the actual data directory.

---

**NOTICE**

If a configuration file is incorrectly modified, the database will be seriously affected. Do not modify the configuration files mentioned in this section after installation.

---

## data\_directory

**Parameter description:** Specifies the GaussDB **data** directory. Only users with the **sysadmin** permission can access this parameter. You can set this parameter using one of the following methods:

- Set it when you install the GaussDB.
- This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string, consisting of one or more characters

**Default value:** Specify this parameter during installation. If this parameter is not specified during installation, the database is not initialized by default.

## config\_file

**Parameter description:** Specifies the configuration file (**postgresql.conf**) of the primary server.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string, consisting of one or more characters

**Default value:** **postgresql.conf** (The absolute directory of this file may be displayed in the actual situation.)

## hba\_file

**Parameter description:** Specifies the configuration file (**pg\_hba.conf**) for host-based authentication (HBA). This parameter can be specified only in the **postgresql.conf** file and can be accessed only by users with the **sysadmin** permission.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string

**Default value:** **pg\_hba.conf** (The absolute directory of this file may be displayed in the actual situation.)

## ident\_file

**Parameter description:** Specifies the name of the configuration file (**pg\_ident.conf**) for client authentication. Only the **sysadmin** user can access this parameter.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string

**Default value:** `pg_ident.conf` (The absolute directory of this file may be displayed in the actual situation.)

## external\_pid\_file

**Parameter description:** Specifies the extra PID file that can be used by the server management program. Only the sysadmin user can access this parameter.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

---

### NOTICE

This parameter takes effect only after the database restarts.

---

**Value range:** a string

**Default value:** empty

## enable\_default\_cfunc\_libpath

**Parameter description:** Specifies whether the default path is used for the .so file when the C function is created in GaussDB.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

**on:** indicates that the .so file must be placed in the specified directory (`$libdir/proc_srclib`) when the C function is created.

**off:** indicates that the .so file can be stored in any accessible directory when the C function is created.

**Default value:** on

---

### NOTICE

If this parameter is set to **off**, the .so file can be placed in any accessible directory or the .so file provided by the system can be used, which poses security risks. Therefore, you are not advised to set this parameter to **off**.

---

## 14.3.3 Connection and Authentication

### 14.3.3.1 Connection Settings

This section describes parameters related to client-server connection modes.

## light\_comm

**Parameter description:** Specifies whether the server uses the lightweight communication mode.

This parameter specifies whether the server uses the communication mode based on lightweight locks and non-blocking sockets. This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **TRUE / ON:** indicates that the lightweight communication mode is used.
- **FALSE / OFF:** indicates that the lightweight communication mode is not used.

**Default value:** FALSE / OFF

## listen\_addresses

**Parameter description:** Specifies the TCP/IP address of the client for a server to listen on.

This parameter specifies the IP address used by the GaussDB server for listening, for example, IPv4. Multiple NICs may exist on the host and each NIC can be bound to multiple IP addresses. This parameter specifies the IP addresses to which GaussDB is bound. The client can use the IP address specified by this parameter to connect to GaussDB or send requests to GaussDB.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:**

- Host name or IP address. Multiple values are separated with commas (,).
- Asterisk (\*) or **0.0.0.0**, indicating that all IP addresses will be listened to, which is not recommended due to potential security risks. This parameter must be used together with valid addresses (for example, the local IP address). Otherwise, the build may fail. In primary/standby mode, if the value is set to \\* or **0.0.0.0**, the value of **localport** in the **postgresql.conf** file of the database on the primary node cannot be the value of **dataPortBase + 1**. Otherwise, the database cannot be started.
- If the parameter value is invalid (for example, the parameter value contains invalid IP addresses or characters, is empty, or is listened repeatedly), the process fails to be started.

**Default value:** After the database instance is installed, the default value is configured according to the IP address of different instances in the **public\_cloud.conf** configuration file. The default value for the DN instance is the IP address of the **data.net** NIC.

 NOTE

- The **public\_cloud.conf** file contains the following NIC information: **mgr.net** (management NIC), **data.net** (data NIC), and **virtual.net** (virtual NIC).
- This parameter can be set in **gs\_guc reload** mode. The GaussDB kernel dynamically listens to the IP address specified by this parameter based on the policy of listening to new IP addresses, keeping listening to duplicate IP addresses, and disabling listening to invalid IP addresses. If an invalid IP address exists (for example, the IP address is not configured on the local host, the IP address is invalid, or the IP address has been listened to), the kernel fails to listen to the IP address. In this case, the value of **listen\_addresses** does not match the actual listening IP address.
- If this parameter is set in **gs\_guc reload** mode and all IP addresses in the parameter value are invalid, listening to new IP addresses fails and listening to all old IP addresses is canceled. If this parameter is left empty, new IP addresses are intercepted and old IP addresses are listened to.
- If **listen\_addresses** is configured in the process startup parameter, this parameter is forcibly set to the configured value and will not be modified by reload.
- If the new parameter value is the same as the old parameter value, the listening action is not performed. Therefore, when the **listen\_addresses** parameter is set and an invalid IP address exists in the list, the kernel fails to listen to the IP address. After the IP address becomes valid and the same parameter is set again, the kernel does not listen to the IP address because the two parameter values are the same. In this case, you need to run the **gs\_guc reload** command to remove the IP address from the parameter value and add the IP address again.
- After this parameter is refreshed in **gs\_guc reload** mode, if an IP address does not need to be listened to, you need to execute the `gs_validate_ext_listen_ip` function to clear the connection. For details about the input parameters and execution, see the function description.
- Do not use `gs_guc` to reload the value of **listen\_addresses** on all DNs in **-N all** mode. This parameter can be set only on a single DN.
- Dynamically modifying **listen\_addresses** is a high-risk operation. If the configuration is incorrect, the database may fail to accept new connections, affecting services. Exercise caution when performing this operation.

## local\_bind\_address

**Parameter description:** Specifies the host IP address bound to the current node for connecting to other nodes in the database.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Default value:** After the database instance is installed, the default value is configured according to the IP address of different instances in the **public\_cloud.conf** configuration file. The default value for the DN instance is the IP address of the **data.net** NIC.

 NOTE

The **public\_cloud.conf** file contains the following NIC information: **mgr.net** (management NIC), **data.net** (data NIC), and **virtual.net** (virtual NIC).

## port

**Parameter description:** Specifies the TCP port listened on by the GaussDB.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

 NOTE

This parameter is specified in the configuration file during installation. Do not modify this parameter unless absolutely necessary. Otherwise, database communication will be affected.

**Value range:** an integer ranging from 1 to 65535

 NOTE

- When setting the port number, ensure that the port number is not in use. When setting the port numbers of multiple instances, ensure that the port numbers do not conflict.
- Ports 1 to 1023 are reserved for the operating system. Do not use them.
- When the database instance is installed using the configuration file, pay attention to the ports reserved in the communication matrix in the configuration file. For example, the port specified by the value of **dataPortBase** plus 1 needs to be reserved for internal tools, and the port specified by the value of **dataPortBase** plus 6 needs to be reserved as the communication port of the flow engine message queue. (Due to specification changes, the current version no longer supports this feature. Do not use it.) Therefore, during database instance installation, the maximum port number is **65529** for DNs. Ensure that the port number does not conflict with each other.

**Default value:** 5432 (The actual value is specified in the configuration file during installation.)

## max\_connections

**Parameter description:** Specifies the maximum number of concurrent connections to the database. This parameter influences the concurrent processing capability of the database.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer. The minimum value is **10** (greater than **max\_wal\_senders**). The theoretical maximum value is **262143**. The actual maximum value is a dynamic value, which is calculated using the formula:  $262143 - \text{job\_queue\_processes} - \text{autovacuum\_max\_workers} - \text{AUXILIARY\_BACKENDS} - \text{AV\_LAUNCHER\_PROCS} - \text{max\_inner\_tool\_connections} - \text{max\_concurrent\_autonomous\_transactions} - \min(\max(\text{newValue}/4,64),1024)$ . The values of [job\\_queue\\_processes](#), [autovacuum\\_max\\_workers](#), [max\\_inner\\_tool\\_connections](#), and [max\\_concurrent\\_autonomous\\_transactions](#) depend on the settings of the corresponding GUC parameters. **AUXILIARY\_BACKENDS** indicates the number of reserved auxiliary threads, which is fixed to **20**. **AV\_LAUNCHER\_PROCS** indicates the number of reserved autovacuum launcher threads, which is fixed to **2**. In  $\min(\max(\text{newValue}/4,64),1024)$ , **newValue** indicates the new value.

For different memory specifications, value range of this parameter in different instances is as follows:

**Table 14-3** Value ranges of memory specifications for different instances

Memory Specifications	Value Range for DNs
< 32 GB	[10,100]

Memory Specifications	Value Range for DN's
[32 GB,64 GB)	[10,200]
[64 GB,128 GB)	[10,2048]
[128 GB,256 GB)	[10,5000]
[256 GB,480 GB)	[10,11000]
[480 GB,512 GB)	[10,24000]
[512 GB,640 GB)	[10,25000]
[640 GB,768 GB)	[10,34000]
[768 GB,1024 GB)	[10,40000]
[1024 GB,1536 GB)	[10,55000]
[1536 GB,2048 GB)	[10,85000]
≥ 2048 GB	[10,110000]

**Default value:**

**85000** (196-core CPU/1536 GB memory); **55000** (128-core CPU/1024 GB memory, 104-core CPU/1024 GB memory, 96-core CPU/1024 GB memory); **40000** (96-core CPU/768 GB memory); **34000** (80-core CPU/640 GB memory); **25000** (64-core CPU/512 GB memory); **24000** (60-core CPU/480 GB memory); **11000** (32-core CPU/256 GB memory); **5000** (16-core CPU/128 GB memory); **2048** (8-core CPU/64 GB memory); **100** (4-core CPU/32 GB memory, 4-core CPU/16 GB memory)

**Setting suggestions:**

Retain the default value of this parameter on the primary node of the databases.

**Impact of incorrect configuration:**

- If the value of **max\_connections** exceeds the maximum dynamic value, the node fails to be started and the following error message is displayed: "invalid value for parameter "max\_connections"". Alternatively, the memory fails to be allocated during the node startup and the following error message is displayed: "Cannot allocate memory."
- If only the value of *max\_connections* is increased while the memory parameter is not adjusted in proportion according to the external egress specifications, when the service load is heavy, the memory may be insufficient, and the error message "memory is temporarily unavailable" is displayed.

 NOTE

- If the number of connections of the administrator exceeds the value of *max\_connections*, the administrator can still connect to the database after the connections are used up by common users. If the number of connections exceeds the value of *sysadmin\_reserved\_connections*, an error is reported. That is, the maximum number of connections of the administrator is equal to the value of *max\_connections* + *sysadmin\_reserved\_connections*.
- For common users, internal jobs use some connections. Therefore, the value of this parameter is slightly less than that of *max\_connections*. The value depends on the number of internal connections.

## max\_inner\_tool\_connections

**Parameter description:** Specifies the maximum number of concurrent connections of a tool which is allowed to connect to the database. This parameter influences the concurrent connection capability of the GaussDB tool.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 1 to *MIN* (which takes the smaller value between **262143** and *max\_connections*). For details about how to calculate the value of *max\_connections*, see the preceding description.

**Default value:**

**50** (196-core CPU/1536 GB memory, 128-core CPU/1024 GB memory, 104-core CPU/1024 GB memory, 96-core CPU/1024 GB memory, 96-core CPU/768 GB memory, 80-core CPU/640 GB memory, 64-core CPU/512 GB memory, 60-core CPU/480 GB memory, 32-core CPU/256 GB memory, 16-core CPU/128 GB memory, 8-core CPU/64 GB memory, 4-core CPU/32 GB memory); **10** (4-core CPU/16 GB memory)

If the default value is greater than the maximum value supported by the kernel (determined when the **gs\_initdb** command is executed), an error message is displayed.

**Setting suggestions:**

Retain the default value of this parameter on the primary node of the databases.

If this parameter is set to a large value, GaussDB requires more System V shared memory or semaphores, which may exceed the default maximum configuration of the OS. In this case, modify the value as needed.

## sysadmin\_reserved\_connections

**Parameter description:** Specifies the minimum number of connections reserved for administrators. You are advised not to set this parameter to a large value. This parameter is used together with the *max\_connections* parameter. The maximum number of connections of the administrator is equal to the value of *max\_connections* + *sysadmin\_reserved\_connections*.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to *MIN* (which takes the smaller value between **262143** and *max\_connections*). For details about how to calculate the value of *max\_connections*, see the preceding description.

**Default value:** 3

**Note:** When the thread pool function is enabled, if the thread pool is fully occupied, a processing bottleneck occurs. As a result, connections reserved by the administrator cannot be established. In this case, you can use `gsql` to establish connections through the primary port number + 1 to clear useless sessions.

## service\_reserved\_connections

**Parameter description:** Specifies the minimum number of connections reserved for background O&M users (with the persistence attribute). A large value is not recommended. This parameter is used together with **max\_connections**. The maximum number of connections of an O&M user can be calculated as follows: **max\_connections** + **service\_reserved\_connections**.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 262143

**Default value:** 10

**Note:** If this parameter is set to a small value, the O&M user (with the persistence attribute) cannot connect to the database and jobs cannot be executed when the number of connections reaches the maximum (**max\_connections**).

## unix\_socket\_directory

**Parameter description:** Specifies the Unix domain socket directory for the GaussDB server to listen to connections from the client.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

The parameter length limit varies by OS. If the length is exceeded, the error "Unix-domain socket path xxx is too long" will be reported.

**Value range:** a string

**Default value:** empty. The actual value is specified by the configuration file during installation.

## unix\_socket\_group

**Parameter description:** Specifies the group of the Unix domain socket (the user of a socket is the user that starts the server). This parameter can work with [unix\\_socket\\_permissions](#) to control socket access.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string. If this parameter is set to an empty string, the default group of the current user is used.

**Default value:** empty

## unix\_socket\_permissions

**Parameter description:** Specifies access permissions on the Unix domain socket.

The Unix domain socket uses the usual permission set of the Unix file system. The value of this parameter should be a number (acceptable for the **chmod** and **umask** commands). If a user-defined octal format is used, the number must start with 0.

You are advised to set it to **0770** (only allowing access from users connecting to the database and users in the same group as them) or **0700** (only allowing access from users connecting to the database).

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** 0000 to 0777

**Default value:** 0700

### NOTE

In the Linux OS, a document has one document attribute and nine permission attributes, which consists of the read (r), write (w), and execute (x) permissions of the Owner, Group, and Others groups.

The r, w, and x permissions are represented by the following numbers:

r: 4

w: 2

x: 1

-: 0

The three attributes in a group are accumulative.

For example, **-rwxrwx---** indicates the following permissions:

owner = rwx = 4+2+1 = 7

group = rwx = 4+2+1 = 7

others = --- = 0+0+0 = 0

The permission of the file is 0770.

## application\_name

**Parameter description:** Specifies the client name used in the current connection request.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

When a standby node requests to replicate logs on the primary node, if this parameter is not an empty string, it is used as the name of the streaming replication slot of the standby node on the primary node. In this case, if the length of this parameter exceeds 61 bytes, only the first 61 bytes are used as the streaming replication slot name.

**Value range:** a string

**Default value:** empty (The actual value is the name of the application connected to the backend.)

## connection\_info

**Parameter description:** Specifies the database connection information, including the driver type, driver version, driver deployment path, and process owner.

This parameter is a USERSET parameter used for O&M. You are advised not to change the parameter value.

**Value range:** a string

**Default value:** empty

### NOTE

- An empty string indicates that the driver connected to the database does not support automatic setting of the **connection\_info** parameter or the parameter is not set by users in applications.
- The following is an example of the concatenated value of **connection\_info**:  

```
{"driver_name":"ODBC","driver_version": "(GaussDB Kernel 503.1.XXX build 290d125f) compiled at 2020-05-08 02:59:43 commit 2143 last mr 131 release","driver_path":"/usr/local/lib/psqlodbcw.so","os_user":"omm"}
```

By default, **driver\_name** and **driver\_version** are displayed. The display of **driver\_path** and **os\_user** is controlled by users. For details, see section "Application Development Guide > Development Based on JDBC > Connecting to the Database" in *Developer Guide* and section "Application Development Guide > Development Based on ODBC > Configuring a Data Source in the Linux OS" in *Developer Guide*.

### 14.3.3.2 Security and Authentication (postgresql.conf)

This section describes parameters about client-to-server authentication.

## authentication\_timeout

**Parameter description:** Specifies the longest duration to wait before the client authentication times out. If a client is not authenticated by the server within the period, the server automatically disconnects from the client so that the client does not occupy connection resources.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 1 to 600. The smallest unit is s.

**Default value:** 1min

## auth\_iteration\_count

**Parameter description:** Specifies the number of iterations during the generation of encryption information for authentication.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 2048 to 134217728

**Default value:** 10000

---

**NOTICE**

If the number of iterations is too small, the password storage security is reduced. If the number of iterations is too large, the performance deteriorates in scenarios involving password encryption, such as authentication and user creation. Set the number of iterations based on actual hardware conditions. You are advised to retain the default value.

---

## session\_authorization

**Parameter description:** Specifies the user ID of the current session.

This is a USERSET parameter and can be set only by following the instructions provided in "SQL Reference > SQL Syntax > SET SESSION AUTHORIZATION" in *Developer Guide*.

**Value range:** a string

**Default value:** NULL

## session\_timeout

**Parameter description:** Specifies the longest duration allowed when no operations are performed on a client after it is connected to the server.

This is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 86400. The smallest unit is s. **0** indicates that the timeout is disabled.

**Default value:** 1800s

---

**NOTICE**

The gsql client of GaussDB has an automatic reconnection mechanism. For local connection of initialized users, the client reconnects to the server if the connection breaks after the timeout.

---

## ssl

**Parameter description:** Specifies whether SSL connections are enabled. Before using this option, read section "Database Quick Start > Connecting to a Database > Using gsql to Connect to a Database" in *Developer Guide*.

This is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that SSL connections are enabled.
- **off** indicates that SSL connections are not enabled.

---

**NOTICE**

To enable this parameter, configure parameters **ssl\_cert\_file**, **ssl\_key\_file**, and **ssl\_ca\_file** as well as the corresponding files. If Chinese cryptographic algorithms are used, ensure that **ssl\_enc\_cert\_file** and **ssl\_enc\_key\_file** are correctly configured. Incorrect configurations may cause database startup failures.

---

**Default value:** on

## require\_ssl

**Parameter description:** Specifies whether the server requires the SSL connection. This parameter is valid only when **ssl** is set to **on**. Before using this option, read section "Database Quick Start > Connecting to a Database > Using gsql to Connect to a Database" in *Developer Guide*.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that the server requires SSL connections.
- **off** indicates that the server does not require SSL connections.

---

**NOTICE**

GaussDB supports SSL when a client connects to a the primary node of the database. It is recommended that the SSL connection be enabled only on the primary node of the databases.

---

**Default value:** off

## ssl\_ciphers

**Parameter description:** Specifies the list of encryption algorithms supported by SSL. Only the sysadmin user can access the list.

This is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string. Separate multiple encryption algorithms by semicolons (;).

**Default value:** ALL

---

**NOTICE**

If **ssl\_ciphers** is set incorrectly, the database cannot be started properly.

---

## ssl\_renegotiation\_limit

**Parameter description:** Specifies the allowed traffic volume over an SSL-encrypted channel before the session key is renegotiated. The renegotiation

mechanism reduces the probability that attackers use the password analysis method to crack the key based on a huge amount of data but causes big performance losses. The traffic indicates the sum of transmitted and received traffic. The SSL renegotiation mechanism has been disabled because of potential risks. This parameter is reserved for version compatibility and does not take effect.

This is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 2147483647. The unit is KB. **0** indicates that the renegotiation mechanism is disabled.

**Default value:** 0

## ssl\_cert\_file

**Parameter description:** Specifies the name of the file that contains the SSL server certificate. The relative path is relative to the data directory.

This is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string

**Default value:** server.crt

## ssl\_key\_file

**Parameter description:** Specifies the name of the file that contains the SSL private key. The relative path is relative to the data directory.

This is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string

**Default value:** server.key

## ssl\_enc\_cert\_file

**Parameter description:** Specifies the name of the SSL server certificate file that is encrypted using Chinese cryptographic algorithms. The path is relative to the data directory.

This is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string

**Default value:** server\_enc.crt

## ssl\_enc\_key\_file

**Parameter description:** Specifies the name of the file that contains the SSL private key. The relative path is relative to the data directory.

This is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string

**Default value:** server\_enc.key

## ssl\_ca\_file

**Parameter description:** Specifies the name of a file that contains CA information. The relative path is relative to the data directory.

This is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string. If it is an empty string, no CA file is loaded and client certificate verification is not performed.

**Default value:** cacert.pem

## ssl\_crl\_file

**Parameter description:** Specifies the certificate revocation list (CRL). If the certificate of a client is in the list, the certificate is invalid. A relative path must be used. The path depends on the data directory.

This is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string. An empty string indicates that there is no CRL.

**Default value:** empty

## krb\_server\_keyfile

**Parameter description:** Specifies the location of the main configuration file of the Kerberos service.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string

**Default value:** empty

## krb\_srvname

**Parameter description:** Specifies the Kerberos service name.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string

**Default value:** postgres

## krb\_caseins\_users

**Parameter description:** Specifies whether the Kerberos username is case-sensitive.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that the Kerberos username is case-insensitive.

- **off** indicates that the Kerberos username is case-sensitive.

**Default value:** off

## modify\_initial\_password

**Parameter description:** After GaussDB is installed, there is only one initial user account (whose UID is 10) in the database. When a user logs in to the database using this initial account for the first time, this parameter determines whether the password of the initial account needs to be modified.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

---

### NOTICE

If the initial user password is not specified during the installation, the initial user password is empty by default after the installation. Before performing other operations, you need to set the initial user password using the gsql client. This parameter no longer takes effect and is reserved only for compatibility with upgrade scenarios.

---

**Value range:** Boolean

- **on** indicates that the password of the initial user needs to be modified upon the first login after the database is successfully installed.
- **off** indicates that the password of the initial user does not need to be modified upon the first login after the database is successfully installed.

**Default value:** off

## password\_policy

**Parameter description:** Specifies whether to check the password complexity when you run the **CREATE ROLE/USER** or **ALTER ROLE/USER** command to create or modify the GaussDB account.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

---

### NOTICE

For security purposes, do not disable the password complexity policy.

---

**Value range:** 0 and 1

- **0** indicates that no password complexity policy is enabled.
- **1** indicates that the default password complexity policy is enabled.

**Default value:** 1

## password\_reuse\_time

**Parameter description:** Specifies whether to check the reuse interval of the new password when you run the **ALTER USER** or **ALTER ROLE** command to change a user password.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

---

### NOTICE

When you change the password, the system checks the values of [password\\_reuse\\_time](#) and [password\\_reuse\\_max](#).

- If the values of [password\\_reuse\\_time](#) and [password\\_reuse\\_max](#) are both positive numbers, an old password can be reused when it meets either of the reuse restrictions.
- If the value of [password\\_reuse\\_time](#) is 0, password reuse is restricted based on the number of reuse times, and not on the reuse interval.
- If the value of [password\\_reuse\\_max](#) is 0, password reuse is restricted based on the reuse interval, and not on the number of reuse times.
- If the values of both [password\\_reuse\\_time](#) and [password\\_reuse\\_max](#) are 0, password reuse is not restricted.

---

**Value range:** a floating point number ranging from 0 to 3650. The unit is day.

- 0 indicates that the password reuse interval is not checked.
- A positive number indicates that a new password cannot be chosen from passwords in history that are newer than the specified number of days.

**Default value:** 0

## password\_reuse\_max

**Parameter description:** Specifies whether to check the reuse times of the new password when you run the **ALTER USER** or **ALTER ROLE** command to change a user password. Only the sysadmin user can access this parameter.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

---

**NOTICE**

When you change the password, the system checks the values of `password_reuse_time` and `password_reuse_max`.

- If the values of `password_reuse_time` and `password_reuse_max` are both positive numbers, an old password can be reused when it meets either of the reuse restrictions.
- If the value of `password_reuse_time` is 0, password reuse is restricted based on the number of reuse times, and not on the reuse interval.
- If the value of `password_reuse_max` is 0, password reuse is restricted based on the reuse interval, and not on the number of reuse times.
- If the values of both `password_reuse_time` and `password_reuse_max` are 0, password reuse is not restricted.

---

**Value range:** an integer ranging from 0 to 1000

- 0 indicates that the password reuse times are not checked.
- A positive number indicates that the new password cannot be the one whose reuse times exceed the specified number.

**Default value:** 0

## password\_lock\_time

**Parameter description:** Specifies the duration before a locked account is automatically unlocked.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

---

**NOTICE**

The locking and unlocking functions take effect only when the values of `password_lock_time` and `failed_login_attempts` are positive numbers.

---

**Value range:** a floating point number ranging from 0 to 365. The unit is day.

- 0 indicates that an account is not automatically locked if the password verification fails.
- A positive number indicates the duration after which a locked account is automatically unlocked.

**Default value:** 1

## failed\_login\_attempts

**Parameter description:** Specifies the maximum number of incorrect password attempts before an account is locked. The account will be automatically unlocked after the time specified by `password_lock_time`. Only the `sysadmin` user can access the account. The automatic account locking policy applies in scenarios such as login and password modification using the `ALTER USER` command.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

---

**NOTICE**

The locking and unlocking functions take effect only when the values of **failed\_login\_attempts** and **password\_lock\_time** are positive numbers.

---

**Value range:** an integer ranging from 0 to 1000

- **0** indicates that the automatic locking function does not take effect.
- A positive number indicates that an account is locked when the number of incorrect password attempts reaches the specified number.

**Default value:** 10

## password\_encryption\_type

**Parameter description:** Specifies the encryption type of a user password. Changing the value of this parameter does not change the password encryption type of existing users. The new encryption type is applied to passwords of new users or passwords modified after the parameter value is changed.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** 0, 1, 2, or 3

- **0** indicates that passwords are encrypted with MD5.
- **1** indicates that passwords are encrypted with SHA-256 and MD5.
- **2** indicates that passwords are encrypted with SHA-256.
- **3** indicates that the passwords are encrypted in sm3 mode.

---

**NOTICE**

The MD5 encryption algorithm is not recommended because it has lower security and poses security risks.

---

**Default value:** 2

## password\_min\_length

**Parameter description:** Specifies the minimum length of an account password. Only the **sysadmin** user can access this parameter.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer. A password can contain 6 to 999 characters.

**Default value:** 8

## password\_max\_length

**Parameter description:** Specifies the maximum length of an account password. Only the **sysadmin** user can access this parameter.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer. A password can contain 6 to 999 characters.

**Default value:** 32

## password\_min\_uppercase

**Parameter description:** Specifies the minimum number of uppercase letters that an account password must contain. Only the **sysadmin** user can access this parameter.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 999

- 0 means no limit.
- A positive integer indicates the minimum number of uppercase letters required in a password when you create an account.

**Default value:** 0

## password\_min\_lowercase

**Parameter description:** Specifies the minimum number of lowercase letters that an account password must contain. Only the **sysadmin** user can access this parameter.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 999

- 0 means no limit.
- A positive integer indicates the minimum number of lowercase letters required in a password when you create an account.

**Default value:** 0

## password\_min\_digital

**Parameter description:** Specifies the minimum number of digits that an account password must contain. Only the **sysadmin** user can access this parameter.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 999

- 0 means no limit.
- A positive integer indicates the minimum number of digits required in a password when you create an account.

**Default value:** 0

## password\_min\_special

**Parameter description:** Specifies the minimum number of special characters that an account password must contain. Only the **sysadmin** user can access this parameter.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 999

- 0 means no limit.
- A positive integer indicates the minimum number of special characters required in a password when you create an account.

**Default value:** 0

### password\_effect\_time

**Parameter description:** Specifies the validity period of an account password.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a floating point number ranging from 0 to 999. The unit is day.

- 0 indicates that the validity period restriction is disabled.
- A floating-point number from 1 to 999 indicates the number of days for which an account password is valid. When the password is about to expire or has expired, the system prompts the user to change the password.

**Default value:** 0

### password\_notify\_time

**Parameter description:** Specifies how many days in advance a user is notified before a password expires.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 999. The unit is day.

- 0 indicates that the reminder is disabled.
- A positive integer indicates the number of days prior to password expiration that a user will receive a reminder.

**Default value:** 7

### ssl\_cert\_notify\_time

**Parameter description:** Specifies the number of days prior to SSL server certificate expiration that a user will receive a reminder. When the SSL certificate is initialized during connection establishment, if the duration from the current time to the certificate expiration time is shorter than the specified value, an expiration notification is recorded in the log.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 7 to 180. The unit is day.

**Default value:** 90

## 14.3.3.3 Communication Library Parameters

This section describes parameter settings and value ranges for communication libraries.

## tcp\_keepalives\_idle

**Parameter description:** Specifies the interval for transmitting keepalive signals on an OS that supports the **TCP\_KEEPIDLE** socket option. If no keepalive signal is transmitted, the connection is in idle mode.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

---

### NOTICE

- If the OS does not support **TCP\_KEEPIDLE**, set this parameter to **0**.
- The parameter is ignored on an OS where connections are established using the Unix domain socket.
- If this parameter is set to **0**, the system value is used.
- This parameter is not shared among different sessions. That is, different session connections may have different values.
- The parameter value in the current session connection, not the value of the GUC copy, is displayed.

---

**Value range:** 0 to 3600. The unit is s.

**Default value:** 60

## tcp\_keepalives\_interval

**Parameter description:** Specifies the response time before retransmission on an OS that supports the **TCP\_KEEPINTVL** socket option.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** 0 to 180. The unit is s.

**Default value:**

---

### NOTICE

- If the OS does not support **TCP\_KEEPINTVL**, set this parameter to **0**.
  - The parameter is ignored on an OS where connections are established using the Unix domain socket.
  - If this parameter is set to **0**, the system value is used.
  - This parameter is not shared among different sessions. That is, different session connections may have different values.
  - The parameter value in the current session connection, not the value of the GUC copy, is displayed.
-

## tcp\_keepalives\_count

**Parameter description:** Specifies the number of keepalive signals that can be waited before the GaussDB server is disconnected from the client on an OS that supports the **TCP\_KEEPCNT** socket option.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

---

### NOTICE

- If the OS does not support **TCP\_KEEPCNT**, set this parameter to **0**.
- The parameter is ignored on an OS where connections are established using the Unix domain socket.
- If this parameter is set to **0**, the system value is used.
- This parameter is not shared among different sessions. That is, different session connections may have different values.
- The parameter value in the current session connection, not the value of the GUC copy, is displayed.

---

**Value range:** 0 to 100. **0** indicates that the connection is immediately broken if GaussDB does not receive a keepalived signal from the client.

**Default value:** 20

## tcp\_user\_timeout

**Parameter description:** Specifies the maximum duration for which the transmitted data can remain in the unacknowledged state before the TCP connection is forcibly closed when the GaussDB sends data on the OS that supports the **TCP\_USER\_TIMEOUT** socket option.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

---

### NOTICE

- If the OS does not support the **TCP\_USER\_TIMEOUT** option, the value of this parameter does not take effect. The default value is **0**.
- The parameter is ignored on an OS where connections are established using the Unix domain socket.

---

**Value Range:** 0 to 3600000. The unit is ms. The value **0** indicates that the value is set based on the OS.

**Default value:** 0

Note that the effective result of this parameter varies according to the OS kernel.

- For AArch64 EulerOS (Linux kernel version: 4.19), the timeout interval is the value of this parameter.

- For x86 EulerOS 2.5 (Linux kernel version: 3.10), the timeout interval is not the set value of this parameter but the maximum value in different ranges. That is, the maximum value of the total Linux TCP retransmission duration range to which the set value of **tcp\_user\_timeout** belongs. For example, if **tcp\_user\_timeout** is set to **40000**, the actual total retransmission duration is 51 seconds.

**Table 14-4** Value of tcp\_user\_timeout for x86 EulerOS 2.5 (Linux kernel version: 3.10)

Number of Linux TCP Retransmission Times	Total Linux TCP Retransmission Duration Range (s)	Example of tcp_user_timeout (ms)	Actual Linux TCP Retransmission Duration (s)
1	(0.2,0.6]	400	0.6
2	(0.6,1.4]	1000	1.4
3	(1.4,3]	2000	3
4	(3,6.2]	4000	6.2
5	(6.2,12.6]	10000	12.6
6	(12.6,25.4]	20000	25.4
7	(25.4,51]	40000	51
8	(51,102.2]	80000	102.2
9	(102.2,204.6]	150000	204.6
10	(204.6,324.6]	260000	324.6
11	(324.6,444.6]	400000	444.6

Note: The duration of each TCP retransmission increases exponentially with the number of retransmission times until it reaches 120s. When the duration of a TCP retransmission reaches 120s, the duration of each subsequent retransmission remains 120s.

### comm\_proxy\_attr

**Parameter description:** Specifies the parameters related to the communication proxy library.

 NOTE

- This parameter applies only to the centralized ARM standalone system running EulerOS 2.9.
- This function takes effect when the thread pool is enabled, that is, **enable\_thread\_pool** is set to **on**.
- When setting this parameter, you need to set the GUC parameter **local\_bind\_address** to the IP address of the NIC of the **libos\_kni**.
- **Parameter template:** `comm_proxy_attr = '{enable_libnet:true, enable_dfx:false, numa_num:4, numa_bind:[[30,31],[62,63],[94,95],[126,127]]}'`
- Parameters that need to be configured include:
  - **enable\_libnet:** whether to enable the user-mode protocol. The options are as follows: **true** and **false**.
  - **enable\_dfx:** whether to enable the communication proxy library view. The options are as follows: **true** and **false**.
  - **numa\_num:** number of NUMA nodes in the system. 2P and 4P servers are supported. The value can be: **4** or **8**.
  - **numa\_bind:** core binding parameter of the agent thread. Each numa has two CPUs. There are a total of **numa\_num** groups. The value range is as follows: [0, Number of CPUs - 1].

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string, consisting of one or more characters

**Default value:** none

## 14.3.4 Resource Consumption

### 14.3.4.1 Memory

This section describes memory parameters.

---

**NOTICE**

These parameters, except **local\_syscache\_threshold**, take effect only after the database restarts.

---

#### **memorypool\_enable**

**Parameter description:** Specifies whether to enable a memory pool.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that the memory pool is enabled.
- **off** indicates that the memory pool is disabled.

**Default value:** off

## memorypool\_size

**Parameter description:** Specifies the memory pool size.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 128 x 1024 to *INT\_MAX*/2. The unit is KB.

**Default value:** 512 MB

## enable\_memory\_limit

**Parameter description:** Specifies whether to enable the logical memory management module.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that the logical memory management module is enabled.
- **off** indicates that the logical memory management module is disabled.

**Default value:** on

---

### CAUTION

- GaussDB forcibly sets `enable_memory_limit` to off. Metadata is the memory used in GaussDB and is related to some concurrent parameters, such as **max\_connections**, **thread\_pool\_attr** and **max\_prepared\_transactions**.
  - If this parameter is set to **off**, the memory used by the database is not limited. When a large number of concurrent or complex queries are performed, too much memory is used, which may cause OS OOM problems.
- 

## max\_process\_memory

**Parameter description:** Specifies the maximum physical memory of a database node.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 2 x 1024 x 1024 to *INT\_MAX*. The unit is KB.

**Default value:**

**1400 GB** (196-core CPU/1536 GB memory); **900 GB** (128-core CPU/1024 GB memory, 104-core CPU/1024 GB memory, 96-core CPU/1024 GB memory); **680 GB** (96-core CPU/768 GB memory); **560 GB** (80-core CPU/640 GB memory); **450 GB** (64-core CPU/512 GB memory); **420 GB** (60-core CPU/480 GB memory); **200 GB** (32-core CPU/256 GB memory); **90 GB** (16-core CPU/128 GB memory); **40 GB** (8-core CPU/64 GB memory); **20 GB** (4-core CPU/32 GB memory); **10 GB** (4-core CPU/16 GB memory)

**Setting suggestions:**

The value on the database node is determined based on the physical memory of the system and the number of primary database nodes deployed on a single node. The recommended calculation formula is as follows:  $(\text{Physical memory} - \text{vm.min\_free\_kbytes}) \times 0.7 / (1 + \text{Number of primary nodes})$ . This parameter is used to prevent node OOM caused by memory usage increase, ensuring system reliability. **vm.min\_free\_kbytes** indicates the OS memory reserved for the kernel to receive and send data. Its value is at least 5% of the total memory. That is,  $\text{max\_process\_memory} = \text{Physical memory} \times 0.665 / (1 + \text{Number of primary nodes})$ .

---

 **CAUTION**

If this parameter is set to a value greater than the physical memory of the server, the OS OOM problem may occur.

---

## enable\_memory\_context\_control

**Parameter description:** Specifies whether to enable the function of checking whether the number of memory contexts exceeds the specified limit. This parameter applies only to the DEBUG version.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that the function of checking the number of memory contexts is enabled.
- **off** indicates that the function of checking the number of memory contexts is disabled.

**Default value:** off

## uncontrolled\_memory\_context

**Parameter description:** Specifies which memory context will not be checked when the **enable\_memory\_context\_control** parameter is enabled. This parameter applies only to the DEBUG version.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

During the query, the title meaning string "MemoryContext white list:" is added to the beginning of the parameter value.

**Value range:** a string

**Default value:** empty

## shared\_buffers

**Parameter description:** Specifies the size of shared memory used by GaussDB. Increasing the value of this parameter causes GaussDB to request more System V shared memory than the default configuration allows.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 16 to 1073741823. The unit is 8 KB.

The value of **shared\_buffers** must be an integer multiple of **BLCKSZ**. Currently, **BLCKSZ** is set to **8 KB**. That is, the value of **shared\_buffers** must be an integer multiple of 8 KB. The minimum value changes according to **BLCKSZ**.

**Default value:**

560 GB (196-core CPU/1536 GB memory); 360 GB (128-core CPU/1024 GB memory, 104-core CPU/1024 GB memory, 96-core CPU/1024 GB memory); 270 GB (96-core CPU/768 GB memory); 220 GB (80-core CPU/640 GB memory); 180 GB (64-core CPU/512 GB memory); 160 GB (60-core CPU/480 GB memory); 80 GB (32-core CPU/256 GB memory); 36 GB (16-core CPU/128 GB memory); 16 GB (8-core CPU/64 GB memory); 8 GB (4-core CPU/32 GB memory); 4 GB (4-core CPU/16 GB memory)

**Setting suggestions:**

1. Set **shared\_buffers** to a value less than 40% of the memory.
2. If **shared\_buffers** is set to a larger value, increase the value of **checkpoint\_segments** because a longer period of time is required to write a large amount of new or changed data.
3. If the process fails to be restarted after the value of **shared\_buffers** is changed, perform either of the following operations based on the error information:
  - a. Adjust the **kernel.shmall**, **kernel.shmmax**, and **kernel.shmmin** OS parameters. For details, see section "Configuring Other OS Parameters" in *Installation Guide*.
  - b. Run the **free -g** command to check whether the available memory and swap space of the OS are sufficient. If the memory is insufficient, manually stop other user programs that occupy much memory.
  - c. Do not set **shared\_buffers** to an excessively large or small value.

## segment\_buffers

**Parameter description:** This parameter is reserved and is not supported currently.

## bulk\_write\_ring\_size

**Parameter description:** Specifies the size of the ring buffer used by the operation when a large amount of data is written (for example, the copy operation).

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 16384 to 2147483647. The unit is KB.

**Default value:** 2 GB

**Setting suggestions:** Increase the value of this parameter on database nodes if a huge amount of data will be imported.

## standby\_shared\_buffers\_fraction

**Parameter description:** Specifies the **shared\_buffers** proportion used on the server where a standby instance is deployed.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a double-precision floating-point number ranging from 0.1 to 1.0

**Default value:** 1

## temp\_buffers

**Parameter description:** Specifies the maximum size of local temporary buffers used by a database session.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**temp\_buffers** can be modified only before the first use of temporary tables within each session. Subsequent attempts to change the value of this parameter will not take effect on that session.

A session allocates temporary buffers based on the value of **temp\_buffers**. If a large value is set in a session that does not require many temporary buffers, only the overhead of one buffer descriptor is added. If a buffer is used, additional 8192 bytes will be consumed for it.

**Value range:** an integer ranging from 100 to 1073741823. The unit is 8 KB.

**Default value:** 1 MB

## max\_prepared\_transactions

**Parameter description:** Specifies the maximum number of transactions that can stay in the **prepared** state simultaneously. Increasing the value of this parameter causes GaussDB to request more System V shared memory than the default configuration allows.

When GaussDB is deployed as an HA system, set this parameter on standby servers to a value greater than or equal to that on primary servers. Otherwise, queries will fail on the standby servers.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 262143

**Default value:**

**200** (196-core CPU/1536 GB memory, 128-core CPU/1024 GB memory, 104-core CPU/1024 GB memory, 96-core CPU/1024 GB memory, 96-core CPU/768 GB memory, 80-core CPU/640 GB memory, 64-core CPU/512 GB memory, 60-core CPU/480 GB memory, 32-core CPU/256 GB memory, 16-core CPU/128 GB memory, 8-core CPU/64 GB memory, 4-core CPU/32 GB memory); **0** (4-core CPU/16 GB memory)

 NOTE

Generally, explicit PREPARE operations are not required for transactions. If explicit PREPARE operations are performed for transactions, increase the value of this parameter to be greater than the number of concurrent services that require PREPARE to prevent preparation failures.

## work\_mem

**Parameter description:** Specifies the amount of memory to be used by internal sort operations and hash tables before they write data into temporary disk files. Sort operations are required for **ORDER BY**, **DISTINCT**, and merge joins. Hash tables are used in hash joins, hash-based aggregation, and hash-based processing of **IN** subqueries.

In a complex query, several sort or hash operations may run in parallel; each operation will be allowed to use as much memory as this parameter specifies. If the memory is insufficient, data will be written into temporary files. In addition, several running sessions could be performing such operations concurrently. Therefore, the total memory used may be many times the value of **work\_mem**.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 64 to 2147483647. The unit is KB.

**Default value:**

280 MB (196-core CPU/1536 GB memory); 256 MB (128-core CPU/1024 GB memory, 104-core CPU/1024 GB memory, 96-core CPU/1024 GB memory, 96-core CPU/768 GB memory); 128 MB (80-core CPU/640 GB memory, 64-core CPU/512 GB memory, 60-core CPU/480 GB memory, 32-core CPU/256 GB memory, 16-core CPU/128 GB memory); 64 MB (8-core CPU/64 GB memory) ; 32 MB (4-core CPU/32 GB memory); 16 MB (4-core CPU/16 GB memory)

---

**NOTICE**

**Setting suggestions:**

If the physical memory specified by **work\_mem** is insufficient, additional operator calculation data will be written into temporary tables based on query characteristics and the degree of parallelism. This reduces performance by five to ten times, and prolongs the query response time from seconds to minutes.

- For complex serial queries, each query requires five to ten associated operations. Set **work\_mem** using the following formula: **work\_mem** = 50% of the memory/10.
  - For simple serial queries, each query requires two to five associated operations. Set **work\_mem** using the following formula: **work\_mem** = 50% of the memory/5.
  - For concurrent queries, set **work\_mem** using the following formula: **work\_mem** = **work\_mem** for serial queries/Number of concurrent SQL statements.
  - BitmapScan hash tables are also restricted by **work\_mem**, but will not be forcibly flushed to disks. In the case of complete lossify, every 1 MB memory occupied by the hash table corresponds to a 16 GB page of BitmapHeapScan (32 GB for Ustore). After the upper limit of **work\_mem** is reached, the memory increases linearly with the data access traffic based on this ratio.
- 

## query\_mem

**Parameter description:** Specifies the memory used by a query.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** 0 or an integer greater than 32 MB. The default unit is KB.

**Default value:** 0

---

**NOTICE**

- If the value of **query\_mem** is greater than 0, the optimizer adjusts the memory cost estimate to this value when generating an execution plan.
  - If the value is set to a negative value or a positive integer less than 32 MB, the default value 0 is used. In this case, the optimizer does not adjust the estimated query memory.
- 

## query\_max\_mem

**Parameter description:** Specifies the maximum memory that can be used by a query.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** 0 or an integer greater than 32 MB. The default unit is KB.

**Default value:** 0

---

**NOTICE**

- If the value of **query\_max\_mem** is greater than 0, an error is reported when the query memory usage exceeds the value.
  - If the value is set to a negative value or a positive integer less than 32 MB, the default value 0 is used. In this case, the optimizer does not limit the query memory.
- 

## **maintenance\_work\_mem**

**Parameter description:** Specifies the maximum amount of memory to be used by maintenance operations, such as **VACUUM**, **CREATE INDEX**, and **ALTER TABLE ADD FOREIGN KEY**. This parameter may affect the execution efficiency of **VACUUM**, **VACUUM FULL**, **CLUSTER**, and **CREATE INDEX**.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 1024 to *INT\_MAX*. The unit is KB.

**Default value:**

2 GB (196-core CPU/1536 GB memory, 128-core CPU/1024 GB memory, 104-core CPU/1024 GB memory, 96-core CPU/1024 GB memory, 96-core CPU/768 GB memory, 80-core CPU/640 GB memory, 64-core CPU/512 GB memory, 60-core CPU/480 GB memory); 1 GB (32-core CPU/256 GB memory); 512 MB (16-core CPU/128 GB memory); 256 MB (8-core CPU/64 GB memory); 128 MB (4-core CPU/32 GB memory); 64 MB (4-core CPU/16 GB memory)

---

**NOTICE**

**Setting suggestions:**

- The value of this parameter must be greater than that of **work\_mem** so that database dumps can be cleared or restored more quickly. In a database session, only one maintenance operation can be performed at a time. Maintenance is usually performed when there are not many running sessions.
  - When the **Automatic Vacuuming** process is running, up to **autovacuum\_max\_workers** times this memory may be allocated. In this case, set **maintenance\_work\_mem** to a value greater than or equal to that of **work\_mem**.
  - If a large amount of data is to be clustered, increase the value of this parameter in the session.
- 

## **max\_stack\_depth**

**Parameter description:** Specifies the maximum safe depth of the GaussDB execution stack. The safety margin is required because the stack depth is not

checked in every routine in the server, but only in key potentially-recursive routines, such as expression evaluation.

This parameter is a SUSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 100 to *INT\_MAX*. The unit is KB.

**Default value:**

- If the value of **ulimit -s** minus 640 KB is greater than or equal to 2 MB, the default value of this parameter is 2 MB.
- If the value of **ulimit -s** minus 640 KB is less than 2 MB, the default value of this parameter is the value of **ulimit -s** minus 640 KB.

---

#### NOTICE

When setting this parameter, comply with the following principles:

- The database needs to reserve 640 KB stack depth. Therefore, the ideal value of this parameter is the actual stack size limit enforced by the OS kernel (as set by **ulimit -s**) minus 640 KB.
- If the value of this parameter is greater than the value of **ulimit -s** minus 640 KB before the database is started, the database fails to be started. During database running, if the value of this parameter is greater than the value of **ulimit -s** minus 640 KB, this parameter does not take effect.
- If the value of **ulimit -s** minus 640 KB is less than the minimum value of this parameter, the database fails to be started.
- Setting this parameter to a value greater than the actual kernel limit means that a running recursive function may crash an individual backend process.
- Since not all OSs provide this function, you are advised to set a specific value for this parameter.
- The default value is 2 MB, which is relatively small and does not easily cause system breakdown.

---

## bulk\_read\_ring\_size

**Parameter description:** Specifies the size of the ring buffer used by the operation when a large amount of data is queried (for example, during large table scanning).

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 256 to 2147483647. The unit is KB.

**Default value:** 16 MB

## enable\_early\_free

**Parameter description:** Specifies whether the operator memory can be released in advance.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that the operator memory can be released in advance.
- **off** indicates that the operator memory cannot be released in advance.

**Default value:** on

## local\_syscache\_threshold

**Parameter description:** Specifies the size of system catalog cache in a session.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

If **enable\_global\_plancache** is enabled, **local\_syscache\_threshold** does not take effect when it is set to a value less than 16 MB to ensure that GPC takes effect. The minimum value is 16 MB.

If **enable\_global\_syscache** and **enable\_thread\_pool** are enabled, this parameter indicates the total cache size of the current thread and sessions bound to the current thread.

**Value range:** an integer ranging from 1 x 1024 to 512 x 1024. The unit is KB.

**Default value:**

32 MB (196-core CPU/1536 GB memory); 16 MB (128-core CPU/1024 GB memory, 104-core CPU/1024 GB memory, 96-core CPU/1024 GB memory, 96-core CPU/768 GB memory, 80-core CPU/640 GB memory, 64-core CPU/512 GB memory, 60-core CPU/480 GB memory, 32-core CPU/256 GB memory, 16-core CPU/128 GB memory, 8-core CPU/64 GB memory, 4-core CPU/32 GB memory, 4-core CPU/16 GB memory)

## memory\_trace\_level

**Parameter description:** Specifies the control level for recording memory allocation information after the dynamic memory usage exceeds 90% of the maximum dynamic memory. This parameter takes effect only when **use\_workload\_manager** and **enable\_memory\_limit** are enabled. This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** enumerated values

- **none:** indicates that memory allocation information is not recorded.
- **level1:** After the dynamic memory usage exceeds 90% of the maximum dynamic memory, the following information is recorded and the recorded memory information is saved in the *\$GAUSSLOG/mem\_log* directory.
  - Global memory overview.
  - Memory usage of the top 20 memory contexts of the instance, session, and thread types.
  - The **totalsize** and **freesize** columns for each memory context.
- **level2:** After the dynamic memory usage exceeds 90% of the maximum dynamic memory, the following information is recorded and the recorded memory information is saved in the *\$GAUSSLOG/mem\_log* directory.

- Global memory overview.
- Memory usage of the top 20 memory contexts of the instance, session, and thread types.
- The **totalsize** and **freesize** columns for each memory context.
- Detailed information about all memory allocations in each memory context, including the file where the allocated memory is located, line number, and size.

**Default value:** level1

---

#### NOTICE

- If this parameter is set to **level2**, the memory allocation details (file, line, and size) of each memory context are recorded, which greatly affects the performance. Therefore, exercise caution when setting this parameter.
  - You can use the system function **gs\_get\_history\_memory\_detail(cstring)** to query the recorded memory snapshot information. For details about the function, see section "SQL Reference > Functions and Operators > Statistics Functions" in *Developer Guide*.
  - The recorded memory context is obtained after all memory contexts of the same type with the same name are summarized.
- 

## resilience\_memory\_reject\_percent

**Parameter description:** Specifies the dynamic memory usage percentage for escape from memory overload. This parameter takes effect only when the GUC parameters **use\_workload\_manager** and **enable\_memory\_limit** are enabled. This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string, consisting of one or more characters

This parameter consists of **recover\_memory\_percent** and **overload\_memory\_percent**. The meanings of the two parts are as follows:

- **recover\_memory\_percent:** Percentage of the dynamic memory usage when the memory recovers from overload to the maximum dynamic memory. When the dynamic memory usage is less than the maximum dynamic memory multiplied by the value of this parameter, the overload escape function is disabled and new connections are allowed. The value ranges from 0 to 100. The value indicates a percentage.
- **overload\_memory\_percent:** Percentage of the dynamic memory usage to the maximum dynamic memory when the memory is overloaded. When the dynamic memory usage is greater than the maximum dynamic memory multiplied by the value of this parameter, the current memory is overloaded. In this case, the overload escape function is triggered to kill sessions and new connections are prohibited. The value ranges from 0 to 100. The value indicates a percentage.

**Default value:** '0,0', indicating that the escape from memory overload function is disabled.

**Example:**

```
resilience_memory_reject_percent = '70,90'
```

When the memory usage exceeds 90% of the upper limit, new connections are forbidden and stacked sessions are killed. When the memory usage is less than 70% of the upper limit, session killing is stopped and new connections are allowed.

#### NOTICE

- You can query the maximum dynamic memory and used dynamic memory in the **gs\_total\_memory\_detail** view. **max\_dynamic\_memory** indicates the maximum dynamic memory, and **dynamic\_used\_memory** indicates the used dynamic memory.
- If this parameter is set to a small value, the escape from memory overload process is frequently triggered. As a result, ongoing sessions are forcibly logged out, and new connections fail to be connected for a short period of time. Therefore, exercise caution when setting this parameter based on the actual memory usage.
- The values of **recover\_memory\_percent** and **overload\_memory\_percent** can be **0** at the same time. In addition, the value of **recover\_memory\_percent** must be smaller than that of **overload\_memory\_percent**. Otherwise, the setting does not take effect.

## resilience\_escape\_user\_permissions

**Parameter description:** Specifies the escape permission of users. You can set it for multiple users and separate users by commas (.). The value **sysadmin** indicates that jobs of the sysadmin user can be canceled by the escape function. The value **monadmin** indicates that jobs of the monadmin user can be canceled by the escape function. By default, this parameter is left blank, indicating that the escape function of the sysadmin and monadmin users is disabled. The value can only be **sysadmin**, **monadmin**, or an empty string. This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string, consisting of one or more characters

Currently, this parameter supports only three values: **sysadmin**, **monadmin**, and **"**. The meanings of these values are as follows:

- **sysadmin:** Jobs of the sysadmin user can be canceled by the escape function.
- **monadmin:** Jobs of the monadmin user can be canceled by the escape function.
- **"**: The escape function of the sysadmin and monadmin users is disabled.

**Default value:** **"**, indicating that the escape function of the sysadmin and monadmin users is disabled.

#### Example:

```
resilience_escape_user_permissions = 'sysadmin,monadmin'
```

The escape function is enabled for both the sysadmin and monadmin users.

---

**NOTICE**

- You can set this parameter to multiple values separated by commas (,), for example, **resilience\_escape\_user\_permissions = 'sysadmin,monadmin'**. You can also set this parameter to only one value, for example, **resilience\_escape\_user\_permissions = 'monadmin'**.
  - If this parameter is set for multiple times, the latest setting takes effect.
  - If this parameter is set to any value in the value range, common users support the escape function.
  - If a user has both the sysadmin and monadmin role permissions, the escape function of the user can be triggered only when **resilience\_escape\_user\_permissions** is set to **'sysadmin,monadmin'**.
- 

### 14.3.4.2 Disk Space

This section describes the disk space parameters, which are used to set limits on the disk space for storing temporary files.

#### sql\_use\_spacelimit

**Parameter description:** Specifies the space size for files to be flushed to disks when a single SQL statement is executed on a single database node. The managed space includes the space occupied by ordinary tables, temporary tables, and intermediate result sets to be flushed to disks.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from -1 to 2147483647. The unit is KB. -1 indicates no limit.

**Default value:** -1

#### temp\_file\_limit

**Parameter description:** Specifies the limit on the size of a temporary file spilled to disk in a session. The temporary file can be a sort or hash temporary file, or the storage file for a held cursor.

This is a session-level setting.

This parameter is a SUSER parameter. Set it based on instructions provided in [Table 14-1](#).

---

**NOTICE**

This parameter does not apply to disk space used for temporary tables during the SQL query process.

---

**Value range:** an integer ranging from -1 to 2147483647. The unit is KB. -1 indicates no limit.

**Default value:** -1

### 14.3.4.3 Kernel Resource Usage

This section describes kernel resource parameters. Whether these parameters take effect depends on OS settings.

#### **max\_files\_per\_process**

**Parameter description:** Specifies the maximum number of simultaneously open files allowed by each server process. If the kernel is enforcing a proper limit, setting this parameter is not required.

However, on some platforms, such as most Berkeley Software Distribution (BSD) systems, the kernel allows individual processes to open many more files than the system can support. If the message "Too many open files" is displayed, set this parameter to a smaller value. Generally, the system must meet this requirement:  
Number of file descriptors  $\geq$  Maximum number of concurrent statements  $\times$   
Number of database nodes  $\times$  **max\_files\_per\_process**  $\times$  3

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 25 to 2147483647

**Default value:** 1024

#### **shared\_preload\_libraries**

**Parameter description:** Specifies one or more shared libraries to be preloaded at server start. If multiple libraries are to be loaded, separate their names using commas (.). Only the sysadmin user can access this parameter. For example, **\$libdir/mylib** will cause **mylib.so** (or on some platforms, **mylib.sl**) to be preloaded before the loading of the standard library directory.

You can preinstall the GaussDB's stored procedure library using the **\$libdir/plXXX** syntax as described in the preceding text. **XXX** can only be **pgsql**, **perl**, **tcl**, or **python**.

By preloading a shared library and initializing it as required, the library startup time is avoided when the library is first used. However, the time to start each new server process may increase, even if that process never uses the library. Therefore, set this parameter only for libraries that will be used in most sessions.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

---

#### NOTICE

- If a specified library is not found, the GaussDB service will fail to start.
  - Each GaussDB-supported library has a special mark that is checked to guarantee compatibility. Therefore, libraries that do not support GaussDB cannot be loaded in this way.
-

**Value range:** a string

**Default value:** `security_plugin`

#### 14.3.4.4 Cost-based Vacuum Delay

This feature allows administrators to reduce the I/O impact of the **VACUUM** and **ANALYZE** statements on concurrent database activities. It is often more important to prevent maintenance statements, such as **VACUUM** and **ANALYZE**, from affecting other database operations than to run them quickly. Cost-based vacuum delay provides a way for administrators to achieve this purpose.

---

#### NOTICE

Certain vacuum operations hold critical locks and should be complete as quickly as possible. In GaussDB, cost-based vacuum delays do not take effect during such operations. To avoid uselessly long delays in such cases, the actual delay is the larger of the two calculated values:

- $\text{vacuum\_cost\_delay} \times \text{accumulated\_balance} / \text{vacuum\_cost\_limit}$
  - $\text{vacuum\_cost\_delay} \times 4$
- 

### Background

During the execution of the **ANALYZE | ANALYSE** and **VACUUM** statements, the system maintains an internal counter that keeps track of the estimated cost of the various I/O operations that are performed. For details about **ANALYZE | ANALYSE** and **VACUUM**, see the corresponding sections in "SQL Reference > SQL Syntax" in *Developer Guide*. When the accumulated cost reaches a limit (specified by **vacuum\_cost\_limit**), the process performing the operation will sleep for a short period of time (specified by **vacuum\_cost\_delay**). Then, the counter resets and the operation continues.

By default, this feature is disabled. To enable this feature, set **vacuum\_cost\_delay** to a non-zero value.

### **vacuum\_cost\_delay**

**Parameter description:** Specifies the length of time that a process will sleep when **vacuum\_cost\_limit** has been exceeded.

On many systems, the effective resolution of the sleep length is 10 milliseconds. Therefore, setting this parameter to a value that is not a multiple of 10 has the same effect as setting it to the next higher multiple of 10.

This parameter is usually set to a small value, such as 10 or 20 milliseconds. Adjusting vacuum's resource consumption is best done by changing other vacuum cost parameters.

This parameter is a **USERSET** parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 100. The unit is ms. A positive number enables cost-based vacuum delay and **0** disables cost-based vacuum delay.

**Default value:** 1

### **vacuum\_cost\_page\_hit**

**Parameter description:** Specifies the estimated cost for vacuuming a buffer found in the shared buffer. It represents the cost to lock the buffer pool, look up the shared hash table, and scan the content of the page.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 10000

**Default value:** 1

### **vacuum\_cost\_page\_miss**

**Parameter description:** Specifies the estimated cost for vacuuming a buffer read from the disk. It represents the cost to lock the buffer pool, look up the shared hash table, read the desired block from the disk, and scan the block.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 10000

**Default value:** 10

### **vacuum\_cost\_page\_dirty**

**Parameter description:** Specifies the estimated cost charged when vacuum modifies a block that was previously clean. It represents the extra cost required to update the dirty block out to the disk again.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 10000

**Default value:** 20

### **vacuum\_cost\_limit**

**Parameter description:** Specifies the cost limit. The vacuuming process will sleep if this limit is exceeded.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 1 to 10000

**Default value:** 1000

## **14.3.4.5 Background Writer**

This section describes background writer parameters. The background writer process is used to write dirty data (new or modified data) in shared buffers to

disks. This mechanism ensures that database processes seldom or never need to wait for a write action to occur when handling user queries.

It also mitigates performance deterioration caused by checkpoints because only a few of dirty pages need to be flushed to the disk when the checkpoints arrive. This mechanism, however, increases the overall net I/O load because while a repeatedly-dirtied page may otherwise be written only once per checkpoint interval, the background writer may write it several times as it is dirtied in the same interval. In most cases, continuous light loads are preferred, instead of periodic load peaks. The parameters discussed in this section can be set based on actual requirements.

## bgwriter\_delay

**Parameter description:** Specifies the interval at which the background writer writes dirty shared buffers. Each time, the backend write process initiates write operations for some dirty buffers. In full checkpoint mode, the **bgwriter\_lru\_maxpages** parameter is used to control the amount of data to be written each time, and the process is restarted after *bgwriter\_delay* ms hibernation. In incremental checkpoint mode, the number of target idle buffer pages is calculated based on the value of **candidate\_buf\_percent\_target**. If the number of idle buffer pages is insufficient, a batch of pages is flushed to disks every *bgwriter\_delay* ms. The number of flushed pages is calculated based on the target difference percentage. The maximum number of flushed pages is limited by **max\_io\_capacity**.

In many systems, the effective resolution of sleep delays is 10 milliseconds. Therefore, setting this parameter to a value that is not a multiple of 10 has the same effect as setting it to the next higher multiple of 10.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 10 to 10000. The unit is millisecond.

**Default value:** 2s

**Setting suggestion:** Reduce this value in slow data writing scenarios to reduce the checkpoint load.

## candidate\_buf\_percent\_target

**Parameter description:** Specifies the expected percentage of available buffers in the shared\_buffer memory buffer in the candidate buffer chain when the incremental checkpoint is enabled. If the number of available buffers in the current candidate chain is less than the target value, the bgwriter thread starts flushing dirty pages that meet the requirements.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a double-precision floating point number ranging from 0.1 to 0.85

**Default value:** 0.3

## bgwriter\_lru\_maxpages

**Parameter description:** Specifies the number of dirty buffers the background writer can write in each round.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 1000

 **NOTE**

When this parameter is set to 0, the background writer is disabled. This setting does not affect checkpoints.

**Default value:** 100

## bgwriter\_lru\_multiplier

**Parameter description:** Specifies the coefficient used to estimate the number of dirty buffers the background writer can write in the next round.

The number of dirty buffers written in each round depends on the number of buffers used by server processes during recent rounds. The estimated number of buffers required in the next round is calculated using the following formula: Average number of recently used buffers x **bgwriter\_lru\_multiplier**. The background writer writes dirty buffers until sufficient, clean and reusable buffers are available. The number of buffers the background writer writes in each round is always less than or equal to the value of **bgwriter\_lru\_maxpages**.

Therefore, the value **1.0** of **bgwriter\_lru\_multiplier** represents a just-in-time policy of writing exactly the number of dirty buffers predicted to be required. Larger values provide some cushion against spikes in demand, whereas smaller values intentionally leave more writes to be done by server processes.

Smaller values of **bgwriter\_lru\_maxpages** and **bgwriter\_lru\_multiplier** reduce the extra I/O load caused by the background writer, but make it more likely that server processes will have to issue writes for themselves, delaying interactive queries.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a floating point number ranging from 0 to 10

**Default value:** 2

## pagewriter\_thread\_num

**Parameter description:** Specifies the number of threads for background page flushing after the incremental checkpoint is enabled. Dirty pages are flushed in sequence to disks, promoting recovery points.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 1 to 16

**Default value:** 4

## dirty\_page\_percent\_max

**Parameter description:** Specifies the percentage of dirty pages to **shared\_buffers** after the incremental checkpoint is enabled. When the value of this parameter is

reached, the background page flush thread flushes dirty pages based on the maximum value of `max_io_capacity`.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a floating point number ranging from 0.1 to 1

**Default value:** 0.9

## pagewriter\_sleep

**Parameter description:** Specifies the interval for the pagewriter thread to flush dirty pages to disks after the incremental checkpoint is enabled. When the ratio of dirty pages to `shared_buffers` reaches `dirty_page_percent_max`, the number of pages in each batch is calculated based on the value of `max_io_capacity`. In other cases, the number of pages in each batch decreases proportionally.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 3600000. The unit is ms.

**Default value:** 2000 ms (2s)

## max\_io\_capacity

**Parameter description:** Specifies the maximum I/O per second for the backend write process to flush pages in batches. Set this parameter based on the service scenario and disk I/O capability of the host. If the RTO is short or the data volume is much larger than the shared memory, and the service access data volume is random, the value of this parameter cannot be too small. A small parameter value reduces the number of pages flushed by the backend write process. If a large number of pages are eliminated due to service triggering, the services are affected.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 30720 to 10485760. The unit is KB.

**Default value:** 512000 KB (500 MB)

## enable\_consider\_usecount

**Parameter description:** Specifies whether the backend thread considers the page popularity during page replacement. You are advised to enable this parameter in large-capacity scenarios.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on/true:** The page popularity is considered.
- **off/false:** The page popularity is not considered.

**Default value:** off

## dw\_file\_num

**Parameter description:** Specifies the number of doublewrite files to be written in batches. The value is related to `pagewriter_thread_num` and cannot be greater

than **pagewriter\_thread\_num**. If the value is too large, it will be corrected to the value of **pagewriter\_thread\_num**.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 1 to 16

**Default value:** 1

## dw\_file\_size

**Parameter description:** Specifies the size of each doublewrite file.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer, in the range [32,256]

**Default value:** 256

### 14.3.4.6 Asynchronous I/O

## checkpoint\_flush\_after

**Parameter description:** Specifies the threshold for the number of pages flushed by the checkpoint thread. If the threshold is exceeded, the operating system is instructed to flush the pages cached in the operating system asynchronously. In GaussDB, the disk page size is 8 KB.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 256. **0** indicates that the asynchronous flush function is disabled. For example, if the value is **32**, the checkpoint thread continuously writes 32 disk pages (that is,  $32 \times 8 = 256$  KB) before asynchronous flush.

**Default value:** 256 KB

## bgwriter\_flush\_after

**Parameter description:** Specifies the threshold for the number of pages flushed by the background writer thread. If the threshold is exceeded, the background writer thread instructs the operating system to asynchronously flush the pages cached in the operating system to disks. In GaussDB, the disk page size is 8 KB.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 256. **0** indicates that the asynchronous flush function is disabled. The size of a single page is 8 KB. For example, if the value is **64**, the background writer thread continuously writes 64 disk pages (that is,  $64 \times 8 = 512$  KB) before asynchronous flush.

**Default value:** 512 KB (64 pages)

## backend\_flush\_after

**Parameter description:** Specifies the threshold for the number of pages flushed by the backend thread. If the number of pages exceeds the threshold, the backend thread instructs the OS to asynchronously flush the pages cached in the OS to disks. In GaussDB, the disk page size is 8 KB.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 256. **0** indicates that the asynchronous flush function is disabled. The size of a single page is 8 KB. For example, if the value is **64**, the backend thread continuously writes 64 disk pages (that is, 64 x 8 = 512 KB) before asynchronous flush.

**Default value:** 0

## 14.3.5 Data Import and Export

This section describes the parameters for importing and exporting data.

### raise\_errors\_if\_no\_files

**Parameter description:** Specifies whether to distinguish between the problems "the number of imported file records is empty" and "the imported file does not exist". If this parameter is set to **TRUE** and the problem "the imported file does not exist" occurs, GaussDB will report the error message "file does not exist".

This parameter is a SUSERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that the messages of "the number of imported file records is empty" and "the imported file does not exist" are distinguished when files are imported.
- **off** indicates that the messages of "the number of imported file records is empty" and "the imported file does not exist" are the same when files are imported.

**Default value:** off

### partition\_mem\_batch

**Parameter description:** In order to optimize the inserting of column-store partitioned tables in batches, the data is buffered during the inserting process and then written in the disk. You can specify the number of caches through **partition\_mem\_batch**. If the value is too large, much memory will be consumed. If it is too small, the performance of inserting column-store partitioned tables in batches will deteriorate.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** 1 to 65535

**Default value:** 256

## partition\_max\_cache\_size

**Parameter description:** In order to optimize the inserting of column-store partitioned tables in batches, the data is buffered during the inserting process and then written in the disk. You can specify the data buffer cache size through **partition\_max\_cache\_size**. If the value is too large, much memory will be consumed. If it is too small, the performance of inserting column-store partitioned tables in batches will deteriorate.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:**

4096 to  $INT\_MAX/2$ . The unit is KB.

**Default value:** 2 GB

## enable\_delta\_store

**Parameter description:** Specifies whether to enable delta tables for column-store tables. Delta tables will improve the performance of importing a single piece of data to a column-store table and prevent table bloating. When this parameter is enabled, data is imported to a column-store table, the delta table or the primary table CU, depending on the value of **DELTAROW\_THRESHOLD** in section "SQL Reference > SQL Syntax > CREATE TABLE" in *Developer Guide*. When the data volume is less than the value of **DELTAROW\_THRESHOLD**, the data is stored in the delta table.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:**

- **on** indicates that delta tables are enabled.
- **off** indicates that delta tables are disabled.

**Default value:** off

## safe\_data\_path

**Parameter description:** Specifies the path prefix restriction except for the initial user. Currently, the path prefix restriction applies to the COPY operation and advanced packages.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string of up to 4096 characters

**Default value:** NULL

---

 CAUTION

- If a soft link file exists in the **safe\_data\_path** directory, the system processes the file based on the actual file path to which the soft link points. If the actual path is not in the **safe\_data\_path** directory, an error is reported.
  - If a hard link file exists in the **safe\_data\_path** directory, it can be used properly. For security purposes, exercise caution when using hard link files. Do not create hard link files that point to other directories in the **safe\_data\_path** directory. Ensure that the permission on the **safe\_data\_path** directory is minimized.
- 

## enable\_copy\_server\_files

**Parameter description:** Specifies whether to enable the permission to copy server files.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that the permission to copy server files is enabled.
- **off** indicates that the permission to copy server files is disabled.

**Default value:** off

---

NOTICE

When the **enable\_copy\_server\_files** parameter is disabled, only the initial user is allowed to run the **COPY FROM FILENAME** or **COPY TO FILENAME** statement. When the **enable\_copy\_server\_files** parameter is enabled, users with the SYSADMIN permission or users who inherit the **gs\_role\_copy\_files** permission of the built-in role are allowed to run the **COPY FROM FILENAME** or **COPY TO FILENAME** statement.

---

## 14.3.6 Write Ahead Log

### 14.3.6.1 Settings

#### wal\_level

**Parameter description:** Specifies the level of information to be written to the WAL. The value cannot be empty or commented out.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

#### NOTICE

- To enable WAL archiving and data streaming replication between primary and standby servers, set this parameter to **archive**, **hot\_standby**, or **logical**.
- This parameter can be set to **minimal** only in a single-server system. When the parameter value is **minimal**, **archive\_mode** must be set to **off**, **hot\_standby** must be set to **off**, and **max\_wal\_senders** must be set to **0**. Otherwise, the database startup fails.
- If this parameter is set to **archive**, **hot\_standby** must be set to **off**. Otherwise, the database startup fails. However, **hot\_standby** cannot be set to **off** in a primary-standby deployment. For details, see the description of the **hot\_standby** parameter.

**Value range:** enumerated values

- **minimal**  
Advantages: Certain bulk operations (including creating tables and indexes, executing cluster operations, and copying tables) are safely skipped in logging, which can make those operations much faster.  
Disadvantages: WALs contain only basic information required for recovery from a database server crash or an emergency shutdown. Data cannot be restored from archived WALs.
- **archive**  
Adds logging required for WAL archiving, supporting the database restoration from archives.
- **hot\_standby**
  - Further adds information required to run SQL queries on a standby server and takes effect after a server restart.
  - To enable read-only queries on a standby server, the **wal\_level** parameter must be set to **hot\_standby** on the primary server and the same value must be set on the standby server. There are few measurable differences in performance between using **hot\_standby** and **archive** levels. However, feedback is welcome if any differences in their impacts on product performance are noticeable.
- **logical**  
This parameter indicates that WALs support logical replication.

**Default value:** **hot\_standby**

## fsync

**Parameter description:** Specifies whether the GaussDB server uses the **fsync()** function (see [wal\\_sync\\_method](#)) to ensure that updates can be written to disks in a timely manner.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

#### NOTICE

- Using the **fsync()** function ensures that the data can be recovered to a known state when an OS or a hardware crashes.
- Setting this parameter to **off** may result in unrecoverable data corruption in a system crash.

**Value range:** Boolean

- **on** indicates that the **fsync()** function is used.
- **off** indicates that the **fsync()** function is not used.

**Default value:** on

## synchronous\_commit

**Parameter description:** Specifies the synchronization mode of the current transaction.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

Generally, logs generated by a transaction are synchronized in the following sequence:

1. The primary node writes the log content to the local memory.
2. The primary node writes the logs in the local memory to the local file system.
3. The primary node flushes logs in the local file system to disks.
4. The primary node sends the log content to the standby node.
5. The standby node receives the log content and saves it to the local memory.
6. The standby node writes logs in the local memory to the local file system.
7. The standby node flushes logs in the local file system to disks.
8. The standby node replays logs to complete the incremental update of data files.

**Value range:** enumerated values

- **on:** The primary node waits for the standby node to flush logs to disks before committing a transaction.
- **off:** The primary node commits transactions without waiting for the primary node to flush logs to disks. This mode is also called asynchronous commit.
- **local:** The primary node waits for the primary node to flush logs to disks before committing a transaction. This mode is also called local commit.
- **remote\_write:** The primary node waits for the standby node to write logs to the file system before committing a transaction. (The logs do not need to be flushed to disks.)
- **remote\_receive:** The primary node waits for the standby node to receive logs before committing a transaction. (The logs do not need to be written to the file system.)
- **remote\_apply:** The primary node waits for the standby node to complete log replay before committing a transaction.

- **true**: same as **on**.
- **false**: same as **off**.
- **yes**: same as **on**.
- **no**: same as **off**.
- **1**: same as **on**.
- **0**: same as **off**.
- **2**: same as **remote\_apply**.

**Default value:** on

## wal\_sync\_method

**Parameter description:** Specifies the method used for forcing WAL updates out to disk.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

---

### NOTICE

If **fsync** is set to **off**, the setting of this parameter does not take effect because WAL file updates will not be forced out to disk.

---

**Value range:** enumerated values

- **open\_datasync** indicates that WAL files are opened with the **O\_DSYNC** option.
- **fdasync** indicates that **fdasync()** is called at each commit. (SLES 10 and SLES 11 are supported.)
- **fsync\_writethrough** indicates that **fsync()** is called at each commit to force data in the buffer to be written to the disk.

### NOTE

**wal\_sync\_method** can be set to **fsync\_writethrough** on a Windows platform, but this setting has the same effect as setting the parameter to **fsync** on the Windows platform.

- **fsync** indicates that **fsync()** is invoked at each commit (SLES 10 and SLES 11 are supported).
- **open\_sync** indicates that the **open()** with the **O\_SYNC** option is used to write WAL files (SLES 10 and SLES 11 are supported).

### NOTE

Not all platforms support the preceding parameters.

**Default value:** fdasync

## full\_page\_writes

**Parameter description:** Specifies whether the GaussDB server writes the entire content of each disk page to WALs during the first modification of that page after

a checkpoint. When the incremental checkpoint function and **enable\_double\_write** are enabled at the same time, **full\_page\_writes** is not used. This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

---

**NOTICE**

- This parameter is needed because a page write that is in process during an OS crash might be only partially completed, leading to an on-disk page that contains a mix of old and new data. The row-level change data normally stored in WALs will not be enough to completely restore such a page during post-crash recovery. Storing the full page image guarantees that the page can be correctly restored, but at the price of increasing the amount of data that must be written to WALs.
- Setting this parameter to **off** might lead to unrecoverable data corruption after a system failure. It might be safe to set this parameter to **off** if you have hardware (such as a battery-backed disk controller) or file-system software (such as ReiserFS 4) that reduces the risk of partial page writes to an acceptably low level.

---

**Value range:** Boolean

- **on** indicates that this feature is enabled.
- **off** indicates that this feature is disabled.

**Default value:** on

## wal\_log\_hints

**Parameter description:** Specifies whether to write an entire page to WALs during the first modification of that page after a checkpoint, even for non-critical modifications of so-called hint bits. You are advised not to modify the setting.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that the entire page is written to WALs.
- **off** indicates that the entire page is not written to WALs.

**Default value:** on

## wal\_buffers

**Parameter description:** Specifies the number of **XLOG\_BLCKSZ** used for storing WAL data. The size of each **XLOG\_BLCKSZ** is 8 KB.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** -1 to  $2^{18}$ . The minimum value is -1 and the maximum value is 262144. The unit is 8 KB.

- If this parameter is set to `-1`, the value of `wal_buffers` is automatically adjusted to  $1/64$  of `shared_buffers`. The minimum value is `8 XLOG_BLCKSZ` and the maximum value is `2048 XLOG_BLCKSZ`, if the automatically adjusted value is less than the minimum value, the value is adjusted to the minimum value. If the automatically adjusted value is greater than the maximum value, the value is adjusted to the maximum value.
- If this parameter is set to a value other than `-1` and smaller than `4`, the value `4` is used.

**Default value:**

**1 GB** (196-core CPU/1536 GB memory, 128-core CPU/1024 GB memory, 104-core CPU/1024 GB memory, 96-core CPU/1024 GB memory, 96-core CPU/768 GB memory, 80-core CPU/640 GB memory, 64-core CPU/512 GB memory, 60-core CPU/480 GB memory, 32-core CPU/256 GB memory); **512 MB** (16-core CPU/128 GB memory); **256 MB** (8-core CPU/64 GB memory); **128 MB** (4-core CPU/32 GB memory); **16 MB** (4-core CPU/16 GB memory)

**Setting suggestions:** The content of the WAL buffers is written to disks at every transaction commit, so extremely large values are unlikely to provide a significant increase in system performance. However, setting this parameter to hundreds of megabytes can improve the disk write performance on a server to which a large number of transactions are committed at the same time. The default value meets user requirements in most cases.

## wal\_writer\_delay

**Parameter description:** Specifies the delay between activity rounds for the WAL writer.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

---

**NOTICE**

A longer delay might lead to insufficient WAL buffer and a shorter delay leads to continuously writing of the WALs, thereby increasing the load of disk I/O.

---

**Value range:** an integer ranging from 1 to 10000. The unit is millisecond.

**Default value:** 200 ms

## commit\_delay

**Parameter description:** Specifies the duration for committed data to be stored in the WAL buffer.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

#### NOTICE

- When this parameter is set to a non-zero value, the committed transaction is stored in the WAL buffer instead of being written to the WAL immediately. Then the WAL writer process flushes the buffer out to disks periodically.
- If system load is high, other transactions are probably ready to be committed within the delay. If no other transactions are ready to be committed, the delay is a waste of time.

**Value range:** an integer ranging from 0 to 100000. The unit is  $\mu\text{s}$ . **0** indicates no delay.

**Default value:** 0

## commit\_siblings

**Parameter description:** Specifies a threshold on the number of concurrent open transactions. If the number of concurrent open transactions is greater than the value of this parameter, a transaction that initiates a commit request will wait for a period of time specified by [commit\\_delay](#). Otherwise, this transaction is written into WALs immediately.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 1000

**Default value:** 5

## wal\_block\_size

**Parameter description:** Specifies the size of a WAL disk block.

This parameter is a fixed INTERNAL parameter and cannot be modified.

**Value range:** an integer. The unit is byte.

**Default value:** 8192

## wal\_segment\_size

**Parameter description:** Specifies the size of a WAL segment file.

This parameter is a fixed INTERNAL parameter and cannot be modified.

**Value range:** an integer. The unit is 8 KB.

**Default value:** 16 MB (2048 x 8 KB)

## walwriter\_cpu\_bind

**Parameter description:** Specifies the CPU core bound to the WAL write thread. This parameter is used together with the thread pool parameter.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from -1 to the number of cores minus 1

**Default value:** -1

## wal\_sender\_bind\_cpu\_attr

**Parameter description:** Specifies the core binding operation of the log sender thread. Only the sysadmin user can access this parameter.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

- **'nobind'**: The thread is not bound to a core.
- **'cpuorderbind: 8-12'**: One thread is bound to one core starting from core 8. If the number of cores in the range is insufficient, the remaining threads are not bound. You are advised to set the interval to a value greater than or equal to the value of **max\_wal\_senders**.

**Value range:** a string of more than 0 characters. The value is case-insensitive.

**Default value:** 'nobind'

## walwriteraux\_bind\_cpu

**Parameter description:** Specifies the CPU core bound to the auxiliary log writer thread.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from -1 to the number of cores minus 1

**Default value:** -1

## walwriter\_sleep\_threshold

**Parameter description:** Specifies the number of times that idle Xlogs are refreshed before the xlogflusher enters the sleep state. If the number of times reaches the threshold, the xlogflusher enters the sleep state.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 1 to 50000

**Default value:** **500** (196-core CPU/1536 GB memory, 128-core CPU/1024 GB memory, 104-core CPU/1024 GB memory, 96-core CPU/1024 GB memory, 96-core CPU/768 GB memory, 80-core CPU/640 GB memory, 64-core CPU/512 GB memory, and 60-core CPU/480 GB memory); **50** (32-core CPU/256 GB memory, 16-core CPU/128 GB memory, 8-core CPU/64 GB memory, 4-core CPU/32 GB memory, and 4-core CPU/16 GB memory)

## wal\_file\_init\_num

**Parameter description:** Specifies the number of Xlog segment files to be created by the WAL writer.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 1000000

**Default value:** **10** (196-core CPU/1536 GB memory, 128-core CPU/1024 GB memory, 104-core CPU/1024 GB memory, 96-core CPU/1024 GB memory, 96-core CPU/768 GB memory, 80-core CPU/640 GB memory, 64-core CPU/512 GB memory, and 60-core CPU/480 GB memory); **0** (32-core CPU/256 GB memory, 16-core CPU/128 GB memory, 8-core CPU/64 GB memory, 4-core CPU/32 GB memory, and 4-core CPU/16 GB memory)

## xlog\_file\_path

**Parameter description:** Specifies the path of the Xlog shared disk in dual-database instance shared storage scenarios. This parameter is configured by the OM during database system initialization. You are not advised to modify the configuration.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string

**Default value:** NULL

## xlog\_file\_size

**Parameter description:** Specifies the size of the Xlog shared disk in dual-database instance shared storage scenarios. This parameter is configured by the OM during database system initialization. You are not advised to modify the configuration.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a long integer ranging from 5053733504 to 576460752303423487. The unit is byte.

**Default value:** 549755813888

## xlog\_lock\_file\_path

**Parameter description:** Specifies the path of the lock file preempted by the Xlog shared disk in dual-database instance shared storage scenarios. This parameter is configured by the OM during database system initialization. You are not advised to modify the configuration.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string

**Default value:** NULL

## force\_promote

**Parameter description:** Specifies whether to enable the forcible switchover function on the standby node.

When a database instance is faulty, the forcible switchover enables the database instance to recover services as soon as possible at the cost of losing some data.

This is an escape method used when the database instance is unavailable. You are not advised to trigger this method frequently. You are not advised not to use this function if you are not clear about the impact of data loss on services.

To use this function, you need to enable it on the DN and CM Server and restart the database instance for the setting to take effect. For details about how to enable the forcible switchover function on the standby node, see "Emergency Handling > Performing a Forcible Primary/Standby Switchover" in *Troubleshooting*.

**Value range:** 0 or 1

The value 0 indicates that the function is disabled, and the value 1 indicates that the function is enabled.

**Default value:** 0

## wal\_debug

**Parameter description:** Specifies whether to output WAL-related debugging information. This parameter is available only when **WAL\_DEBUG** is enabled during compilation.

This parameter is a SUSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

**Default value:** false

## wal\_flush\_timeout

**Parameter description:** Specifies the timeout interval for traversing **WallInsertStatusEntryTbl**. It is the maximum wait time for the adaptive Xlog disk flushing I/O to traverse **WallInsertStatusEntryTbl**.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

---

### NOTICE

If the timeout interval is too long, the Xlog flushing frequency may decrease, reducing the Xlog processing performance.

---

**Value range:** an integer ranging from 0 to 90000000 ( $\mu$ s)

**Default value:**

2  $\mu$ s (196-core CPU/1536 GB memory, 128-core CPU/1024 GB memory, 104-core CPU/1024 GB memory, 96-core CPU/1024 GB memory, 96-core CPU/768 GB memory, 80-core CPU/640 GB memory, 64-core CPU/512 GB memory, 60-core CPU/480 GB memory, 32-core CPU/256 GB memory, 16-core CPU/128 GB memory, 8-core CPU/64 GB memory, 4-core CPU/32 GB memory); 800  $\mu$ s (4-core CPU/16 GB memory)

## wal\_flush\_delay

**Parameter description:** Specifies the wait interval when an entry in the **WAL\_NOT\_COPIED** state is encountered during **WalInsertStatusEntryTbl** traversal.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 90000000 ( $\mu$ s)

**Default value:**

**1  $\mu$ s** (196-core CPU/1536 GB memory, 128-core CPU/1024 GB memory, 104-core CPU/1024 GB memory, 96-core CPU/1024 GB memory, 96-core CPU/768 GB memory, 80-core CPU/640 GB memory, 64-core CPU/512 GB memory, 60-core CPU/480 GB memory, 32-core CPU/256 GB memory, 16-core CPU/128 GB memory, 8-core CPU/64 GB memory, 4-core CPU/32 GB memory); **100  $\mu$ s** (4-core CPU/16 GB memory)

## wal\_receiver\_bind\_cpu

**Parameter description:** Specifies the CPU core ID bound to the WAL receiver thread.

The default value is **-1**, which is an invalid value, indicating that cores are not bound.

Although the value range is *INT\_MAX*, the actual value is related to the number of used device cores. If the specified CPU core ID does not exist, an error is reported and core binding is interrupted.

Multiple threads can be bound to one core, but the performance deteriorates. Therefore, you are not advised to bind multiple threads to one core.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a value ranging from **-1** to *INT\_MAX*.

**Default value:** **-1**

## wal\_rec\_writer\_bind\_cpu

**Parameter description:** Specifies the CPU core ID bound to the WAL rec writer thread.

The default value is **-1**, which is an invalid value, indicating that cores are not bound.

Although the value range is *INT\_MAX*, the actual value is related to the number of used device cores. If the specified CPU core ID does not exist, an error is reported and core binding is interrupted.

Multiple threads can be bound to one core, but the performance deteriorates. Therefore, you are not advised to bind multiple threads to one core.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a value ranging from -1 to *INT\_MAX*.

**Default value:** -1

## 14.3.6.2 Checkpoints

### checkpoint\_segments

**Parameter description:** Specifies the minimum number of WAL segment files in the period specified by [checkpoint\\_timeout](#). The size of each log file is 16 MB.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer. The minimum value is 1.

Increasing the value of this parameter speeds up the import of a large amount of data. Set this parameter based on [checkpoint\\_timeout](#) and [shared\\_buffers](#). This parameter affects the number of WAL segment files that can be reused. Generally, the maximum number of reused files in the **pg\_xlog** folder is twice the number of **checkpoint\_segments**. The reused files are not deleted and are renamed to the WAL segment files which will be later used.

**Default value:** 1024

### checkpoint\_timeout

**Parameter description:** Specifies the maximum time between automatic WAL checkpoints.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 30 to 3600. The unit is s.

If the value of [checkpoint\\_segments](#) is increased, you need to increase the value of this parameter. The increase of these two parameters further requires the increase of [shared\\_buffers](#). Consider all these parameters during setting.

**Default value:** 15min

### checkpoint\_completion\_target

**Parameter description:** Specifies the completion target of each checkpoint, as a fraction of total time between checkpoints.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a double-precision floating point number ranging from 0.0 to 1.0

**Default value:** 0.5

#### NOTE

0.5 indicates that each checkpoint should be complete within 50% of the interval between checkpoints.

## checkpoint\_warning

**Parameter description:** Specifies a time in seconds. If the checkpoint interval is close to this time due to filling of checkpoint segment files, a message is sent to the server log to suggest an increase in the value of [checkpoint\\_segments](#).

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to *INT\_MAX*. The unit is second. **0** indicates that the warning is disabled.

**Default value:** 5min

**Recommended value:** 5min

## checkpoint\_wait\_timeout

**Parameter description:** Sets the longest time that the checkpoint waits for the checkpointer thread to start.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 2 to 3600. The unit is s.

**Default value:** 1min

## enable\_incremental\_checkpoint

**Parameter description:** Specifies whether to enable incremental checkpointing.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

**Default value:** on

## enable\_double\_write

**Parameter description:** Specifies whether to enable double writing. When the incremental checkpoint function is enabled and **enable\_double\_write** is enabled, the **enable\_double\_write** dual-write feature is used for protection, and **full\_page\_writes** is not used to prevent half-page write.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

**Default value:** on

## incremental\_checkpoint\_timeout

**Parameter description:** Specifies the maximum interval between automatic WAL checkpoints when the incremental checkpointing is enabled.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 1 to 3600. The unit is s.

**Default value:** 1min

## enable\_xlog\_prune

**Parameter description:** Specifies whether the primary node reclaims logs if the size of Xlogs exceeds the value of **max\_size\_for\_xlog\_prune** when any standby node is disconnected.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- If this parameter is set to **on**, the primary node reclaims logs when any standby node is disconnected.
- If this parameter is set to **off**, the primary node does not reclaim logs when any standby node is disconnected.

**Default value:** on

## max\_size\_for\_xlog\_prune

**Parameter description:** This parameter takes effect when **enable\_xlog\_prune** is enabled. The working mechanism is as follows:

1. If all standby nodes specified by the **replconninfo** series GUC parameters are connected to the primary node, this parameter does not take effect.
2. If any standby node specified by the **replconninfo** series GUC parameters is not connected to the primary node, this parameter takes effect. When the number of historical logs on the primary node is greater than the value of this parameter, the logs are forcibly recycled. Exception: In synchronous commit mode (that is, the value of **synchronous\_commit** is not **local** or **off**), if there are connected standby nodes, the primary node retains the logs that meet the minimum log receiving requirements on the majority of standby nodes. In this case, the number of reserved logs may exceed the value of **max\_size\_for\_xlog\_prune**.
3. If any standby node is being built, this parameter does not take effect. All logs of the primary node are retained to prevent build failures due to log recycling.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 2147483647. The unit is KB.

**Default value:** 256 GB

### 14.3.6.3 Log Replay

#### recovery\_time\_target

**Parameter description:** Specifies the time for a standby server to write and replay logs.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 3600. The unit is s.

**0** indicates that log flow control is disabled. A value from **1** to **3600** indicates that a standby server can write and replay logs within the period specified by the value,

so that the standby server can quickly assume the primary role. If this parameter is set to a small value, the performance of the primary server is affected. If it is set to a large value, the log flow is not effectively controlled.

**Default value:** 60

## recovery\_max\_workers

**Parameter description:** Specifies the maximum number of concurrent replay threads.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 20

**Default value:** 4 (For better performance, the default value in tool installation is 4.)

## queue\_item\_size

**Parameter description:** Specifies the maximum length of the task queue of each redo replayer thread.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a value ranging from 1 to 65535.

**Default value:** 560

## recovery\_parse\_workers

**Parameter description:** Specifies the number of **ParseRedoRecord** threads for the extreme Recovery Time Objective (RTO) feature.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 1 to 16

This parameter can be set to a value greater than 1 only when the ultimate RTO feature is enabled. In addition, it must be used together with **recovery\_redo\_workers**. If both **recovery\_parse\_workers** and **recovery\_max\_workers** are enabled, the ultimate RTO setting of **recovery\_parse\_workers** prevails and the concurrent replay function is disabled. Ultimate RTO does not have flow control anymore, and flow control is controlled by the [recovery\\_time\\_target](#) parameter.

**Default value:** 1

### NOTE

After ultimate RTO is enabled, the standby node will start more worker threads whose value is equal to the value of **recovery\_parse\_workers** x (the value of **recovery\_redo\_workers** + 2) + 5, occupying more CPU, memory, and I/O resources. Set parameters based on the actual hardware configuration. If the parameter value is too large, the CPU and memory usage may be too high and the startup may be abnormal.

## recovery\_redo\_workers

**Parameter description:** Specifies the number of **PageRedoWorker** threads corresponding to each **ParseRedoRecord** thread when the ultimate RTO feature is enabled.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 1 to 8

This parameter must be used together with **recovery\_parse\_workers**. The setting of **recovery\_redo\_workers** takes effect only when **recovery\_parse\_workers** is set to a value greater than 1.

**Default value:** 1

### NOTE

After the database is upgraded from V500R001C00 to V500R001C10 or a later version, you are advised to set parameters based on the number of CPUs in the environment and restart the DN.

**Table 14-5** Parameter settings for different CPUs, memory sizes, and deployment models

No.	CPUs	Memory	Distributed Hybrid Deployment	recovery_parse_workers	recovery_redo_workers	Replayer Threads	Remarks
1	4	-	-	1	1	-	Not recommended
2	8	-	Yes	1	1	-	Not recommended
3	8	64	No	1	1	-	Not recommended
4	16	128	Yes	1	1	-	Not recommended
5	16	128	No	2	3	15	-
6	32	256	Yes	2	2	13	-
7	32	256	No	2	8	25	-
8	64	512	Yes	2	4	17	-
9	64	512	No	2	8	25	Set the parameter to the recommended value for larger specifications.

No.	CPUs	Memory	Distributed Hybrid Deployment	recovery_parse_workers	recovery_redo_workers	Replayer Threads	Remarks
10	96	768	-	2	8	25	Set the parameter to the recommended value for larger specifications.

### recovery\_parallelism

**Parameter description:** Specifies the actual number of replay threads. This parameter is read-only.

This parameter is a POSTMASTER parameter and is affected by `recovery_max_workers` and `recovery_parse_workers`. If any value is greater than 0, `recovery_parallelism` will be recalculated.

**Value range:** an integer ranging from 1 to 2147483647

**Default value:** 1

### enable\_page\_lsn\_check

**Parameter description:** Specifies whether to enable the data page LSN check. During replay, the current LSN of the data page is checked to see if it is the expected one.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

**Default value:** on

### recovery\_min\_apply\_delay

**Parameter description:** Specifies the replay delay of the standby node.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

#### NOTICE

- This parameter does not take effect on the primary node. It must be set on the standby node that requires a delay. You are advised to set this parameter on the asynchronous standby node. If the delay is set on the asynchronous standby node, the RTO will be long after the node is promoted to primary.
- The delay time is calculated based on the transaction commit timestamp on the primary server and the current time on the standby server. Therefore, ensure that the clocks of the primary and standby servers are synchronized.
- If the delay time is too long, the disk where the XLOG file is located on the standby node may be full. Therefore, you need to set the delay time based on the disk size.
- Operations without transactions are not delayed.
- After the primary/standby switchover, if the original primary node needs to be delayed, you need to manually set this parameter.
- When **synchronous\_commit** is set to **remote\_apply**, synchronous replication is affected by the delay. Each commit message is returned only after the replay on the standby server is complete.
- Using this feature also delays **hot\_standby\_feedback**, which may cause the primary server to bloat, so be careful when using both.
- If a DDL operation (such as DROP or TRUNCATE) that holds an AccessExclusive lock is performed on the primary node, the query operation on the operation object on the standby node will be returned only after the lock is released during the delayed replay of the record on the standby node.

**Value range:** an integer ranging from 0 to INT\_MAX. The unit is ms.

**Default value:** 0 (no delay added)

## redo\_bind\_cpu\_attr

**Parameter description:** Specifies the core binding operation of the replayer thread. Only the **sysadmin** user can access this parameter. This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string of more than 0 characters. The value is case-insensitive.

- **'nobind'**: The thread is not bound to a core.
- **'nodebind: 1, 2'**: Use the CPU cores in NUMA groups 1 and 2 to bind threads.
- **'cpubind: 0-30'**: Use the CPU cores 0 to 30 to bind threads.
- **'cpuorderbind: 16-32'**: One thread is bound to one core starting from core 16. If the number of cores in the range is insufficient, the remaining threads are not bound. You are advised to set the interval to a value greater than or equal to the value of **recovery\_parallelism** plus 1.

**Default value:** 'nobind'

## 14.3.6.4 Archiving

### archive\_mode

**Parameter description:** Specifies whether to archive WALs.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

---

#### NOTICE

- When [wal\\_level](#) is set to **minimal**, the **archive\_mode** parameter is unavailable.
- The archiving function can be enabled on both the synchronous and asynchronous standby nodes. The method of enabling the archiving function is the same as that of enabling the archiving function on a single node. To enable the archiving function, set **archive\_mode** to **on** and set **archive\_dest** or **archive\_command** correctly.
- If the maximum availability mode is not enabled and the standby node is disconnected from the primary node, the primary node cannot send the archiving location to the standby node due to service congestion. As a result, the archiving fails.

---

**Value range:** Boolean

- **on** indicates that the archiving is enabled.
- **off** indicates that the archiving is disabled.

**Default value:** **off**

### archive\_command

**Parameter description:** Specifies the command set by the administrator to archive WALs. You are advised to set the archive log path to an absolute path.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

#### NOTICE

- If both **archive\_dest** and **archive\_command** are configured, WALs are preferentially saved to the directory specified by **archive\_dest**. The command configured by **archive\_command** does not take effect.
- Any **%p** in the string is replaced by the absolute path of the file to archive, and any **%f** is replaced by only the file name. (The relative path is relative to the data directory.) Use **%%** to embed an actual **%** character in the command.
- This command returns zero only if it succeeds. The command example is as follows:  

```
archive_command = 'cp --remove-destination %p /mnt/server/archivedir/%f'
```
- **--remove-destination** indicates that files will be overwritten during the archiving.
- If there are multiple archive commands, write them to the shell script file and set **archive\_command** to the command for executing the script. The command example is as follows:  
-- Assume that multiple commands are as follows:  
test ! -f dir/%f && cp %p dir/%f  
-- The content of the **test.sh** script is as follows:  
test ! -f dir/\$2 && cp \$1 dir/\$2  
-- The archive command is as follows:  
archive\_command='sh dir/test.sh %p %f'

**Value range:** a string

**Default value:** (disabled)

## archive\_dest

**Parameter description:** Specifies the path set by the administrator to archive WALs. You are advised to set the archive log path to an absolute path.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

#### NOTICE

- If both **archive\_dest** and **archive\_command** are configured, WALs are preferentially saved to the directory specified by **archive\_dest**. The command configured by **archive\_command** does not take effect.
- If the string is a relative path, it is relative to the data directory. The following is an example:  

```
archive_dest = '/mnt/server/archivedir/'
```

**Value range:** a string

**Default value:** empty

## archive\_timeout

**Parameter description:** Specifies the archiving period.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

---

**NOTICE**

- The server is forced to switch to a new WAL segment file when the period specified by this parameter has elapsed since the last file switch.
- Archived files that are closed early due to a forced switch are still of the same length as full files. Therefore, a very short **archive\_timeout** will bloat the archive storage. You are advised to set **archive\_timeout** to **60s**.

---

**Value range:** an integer ranging from 0 to 1073741823. The unit is s. **0** indicates that archiving timeout is disabled.

**Default value:** 0

## archive\_interval

**Parameter description:** Specifies the archiving interval.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

---

**NOTICE**

- Log files are forcibly archived when the period specified by this parameter has elapsed.
- Archiving involves I/O operations. Therefore, frequent archiving is not allowed. In addition, the RPO cannot be set to a large value; otherwise, the PITR will be affected. You are advised to use the default value.

---

**Value range:** an integer ranging from 1 to 1000. The unit is second.

**Default value:** 1

## time\_to\_target\_rpo

**Parameter description:**

In the remote DR mode of dual database instances, set the allowed *time\_to\_target\_rpo* seconds from the time when an exception occurs on the primary database instance to the time when data is archived to the OBS recovery point.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 3600. The unit is s.

In remote DR mode of dual database instances, logs of the primary database instance are archived to OBS. **0** indicates that log flow control is disabled. 1 to 3600 indicates the maximum *time\_to\_target\_rpo* seconds from the time when an exception occurs on the primary database instance to the time when data is archived to the recovery point of OBS. This ensures that the maximum duration of data loss is within the allowed range when the primary database instance breaks down due to a disaster. If this parameter is set to a small value, the performance of the primary node is affected. If it is set to a large value, the log flow is not effectively controlled.

Default value: 0

## 14.3.7 HA Replication

### 14.3.7.1 Sending Server

#### max\_wal\_senders

**Parameter description:** Specifies the maximum number of simultaneously running WAL sender processes. The value cannot be greater than or equal to that of [max\\_connections](#).

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

---

#### NOTICE

[wal\\_level](#) must be set to **archive**, **hot\_standby**, or **logical** to allow connections from standby servers.

---

**Value range:** an integer ranging from 0 to 1024. The recommended value range is 8 to 100.

#### NOTE

This parameter can be set to 0 only when a single DN is used and there is no primary/standby instance.

**Default value:** 20

#### wal\_keep\_segments

**Parameter description:** Specifies the number of Xlog file segments. Specifies the minimum number of transaction log files stored in the **pg\_xlog** directory. The standby node obtains log files from the primary node for streaming replication.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 2 to *INT\_MAX*

**Default value:** 128

#### Setting suggestions:

- During WAL archiving or recovery from a checkpoint on the server, the system may retain more log files than the number specified by **wal\_keep\_segments**.
- If this parameter is set to an excessively small value, a transaction log may have been overwritten by a new transaction before requested by the standby server. As a result, the request fails and the connection between the primary and standby servers is terminated.
- If the HA system uses asynchronous transmission, increase the value of **wal\_keep\_segments** when data greater than 4 GB is continuously imported in COPY mode. Take T6000 board as an example. If the data to be imported

reaches 50 GB, you are advised to set this parameter to **1000**. You can dynamically restore the setting of this parameter after data import is complete and the WAL synchronization is proper.

- If the `synchronous_commit` level is lower than `LOCAL_FLUSH`, you are advised to set this parameter to 1000 when rebuilding the standby node to prevent rebuilding failures caused by primary node log recycling during the rebuilding.

## wal\_sender\_timeout

**Parameter description:** Specifies the maximum duration that the sending server waits for the WAL reception in the receiver.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

---

### NOTICE

- If the data volume on the primary node is huge, the value of this parameter must be increased for the database rebuilding on a standby node. For example, if the data volume on the primary node reaches 500 GB, you are advised to set this parameter to 600 seconds.
- This parameter cannot be set to a value larger than the value of `wal_receiver_timeout` or the timeout parameter for database rebuilding.

---

**Value range:** an integer ranging from 0 to `INT_MAX`. The unit is ms.

**Default value:** 6s

## max\_replication\_slots

**Parameter description:** Specifies the number of log replication slots on the primary node.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 1024. The recommended value range is 8 to 100.

**Default value:** 20

### Setting suggestions:

When HA replication, backup and restoration, and logical decoding are used, you are advised to set this parameter to: Number of current physical replication slots + Number of backup slots + Number of required logical replication slots. If the actual value is smaller than the recommended value, these functions may be unavailable or abnormal.

- Physical replication slots provide an automatic method to ensure that Xlogs are not removed from a primary node before they are received by all the standby nodes and secondary nodes. That is, physical replication slots are used to support primary/standby HA. The number of physical replication slots required by a database is equal to the ratio of standby and secondary nodes to the primary node. For example, if an HA database has 1 primary node, 1

standby node, and 1 secondary node, the number of required physical replication slots will be 2. If an HA database has 1 primary node and 3 standby nodes, the number of required physical replication slots will be 3.

- Backup slot records replication information during backup execution. Full backup and incremental backup correspond to two independent backup slots.
- Currently, primary/standby/secondary deployment is not supported by default.
- Plan the number of logical replication slots as follows:
  - A logical replication slot can carry changes of only one database for decoding. If multiple databases are involved, create multiple logical replication slots.
  - If logical replication is needed by multiple target databases, create multiple logical replication slots in the source database. Each logical replication slot corresponds to one logical replication link.

## enable\_slot\_log

**Parameter description:** Specifies whether to enable primary/standby synchronization for replication slots. Currently, only archive slots are involved.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that primary/standby synchronization is enabled for replication slots.
- **off** indicates that primary/standby synchronization is disabled for replication slots.

**Default value:** on

## max\_changes\_in\_memory

**Parameter description:** Specifies the maximum number of DML statements cached in memory for a single transaction during logical decoding.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 1 to 2147483647

**Default value:** 4096

## max\_cached\_tuplebufs

**Parameter description:** Specifies the upper limit of the total tuple information cached in the memory during logical decoding. You are advised to set this parameter to a value greater than or equal to twice of [max\\_changes\\_in\\_memory](#).

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 1 to 2147483647

**Default value:** 8192

## logical\_decode\_options\_default

**Parameter description:** Specifies the global default value for unspecified decoding options when logical decoding starts.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

Currently, the following logical decoding options are supported: **parallel-decode-num**, **parallel-queue-size**, **max-txn-in-memory**, **max-reorderbuffer-in-memory**, and **exclude-users**. For details about the options, see "Application Development Guide > Development Based on JDBC > Example: Logical Replication Code" in *Developer Guide*.

**Value range:** a string of key=value characters separated by commas (,), for example, '**parallel-decode-num=4,parallel-queue-size=128,exclude-users=userA**'. An empty string indicates that the default value hardcoded by the program is used.

**Default value:** ""

---

### NOTICE

- The SIGHUP parameter does not affect the started logic decoding process. The options specified by this parameter are used as the default settings for subsequent logic decoding startup, and the settings specified in the startup command are preferentially used.
  - The **exclude-users** option is different from the logic decoding startup option. You are not allowed to specify multiple blacklisted users.
- 

## logical\_sender\_timeout

**Parameter description:** Specifies the maximum waiting time for the sender to wait for the receiver to receive logical logs.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 2147483647. The unit is ms.

**Default value:** 30s

## enable\_wal\_shipping\_compression

**Parameter description:** Specifies whether to enable cross-database instance log compression in streaming DR mode.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

---

### NOTICE

This parameter applies only to a pair of walsender and walreceiver for cross-database instance transmission in streaming DR and is configured on the primary database instance.

---

**Value range:** Boolean

- **true** indicates that cross-database instance log compression is enabled for streaming DR.
- **false** indicates that cross-database instance log compression is disabled for streaming DR.

**Default value:** false

## repl\_auth\_mode

**Parameter description:** Specifies the validation mode for primary/standby replication and standby node rebuilding.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

---

### NOTICE

- If UUID validation is enabled on the primary node and a non-null repl\_uuid validation code is configured, UUID validation must also be enabled on the standby node and the same repl\_uuid validation code must be configured on the standby node. Otherwise, requests for log replication between the primary and standby nodes and standby node rebuilding will be rejected by the primary node.
- The SIGHUP parameter can dynamically load new values. The modification does not affect the established primary/standby connection and takes effect for subsequent primary/standby replication requests and primary/standby rebuilding requests.
- It supports the standby node rebuild validation under the Quorum and DCF protocols and the primary/standby replication validation under the Quorum protocol. It does not support primary/standby replication validation under the DCF protocol.
- Authentication between primary and standby database instances is not supported, including primary and standby Dorado instances and DR instances.
- The UUID validation function is used to prevent data crosstalk and pollution caused by incorrect connection between the primary and standby nodes. It is not used for security purposes.
- This parameter cannot be automatically synchronized between the primary and standby nodes.

---

**Value range:** enumerated values

- **off:** indicates that UUID validation is disabled.
- **default:** indicates that UUID validation is disabled.
- **uuid:** indicates that UUID validation is enabled.

**Default value:** default

## repl\_uuid

**Parameter description:** Specifies the UUID used for primary/standby UUID validation.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

---

**NOTICE**

- If UUID validation is enabled on the primary node and a non-null repl\_uuid validation code is configured, UUID validation must also be enabled on the standby node and the same repl\_uuid validation code must be configured on the standby node. Otherwise, requests for log replication between the primary and standby nodes and standby node rebuilding will be rejected by the primary node.
- The SIGHUP parameter can dynamically load new values. The modification does not affect the established primary/standby connection and takes effect for subsequent primary/standby replication requests and primary/standby rebuilding requests.
- It supports the standby node rebuild validation under the Quorum and DCF protocols and the primary/standby replication validation under the Quorum protocol. It does not support primary/standby replication validation under the DCF protocol.
- Authentication between primary and standby database instances is not supported, including primary and standby Dorado instances and DR instances.
- The UUID validation function is used to prevent data crosstalk and pollution caused by incorrect connection between the primary and standby nodes. It is not used for security purposes.
- This parameter cannot be automatically synchronized between the primary and standby nodes.

---

**Value range:** a string. The value is a string of 0 to 63 case-insensitive letters and digits. It is converted to lowercase letters for storage. An empty string indicates that UUID validation is disabled.

**Default value:** empty

## replconninfo1

**Parameter description:** Specifies the information about the first node to be listened on and authenticated by the current server.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string. An empty string indicates that no information about the first node is configured.

**Default value:** empty

## replconninfo2

**Parameter description:** Specifies the information about the second node to be listened on and authenticated by the current server.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string. An empty string indicates that no information about the second node is configured.

**Default value:** empty

### replconninfo3

**Parameter description:** Specifies the information about the third node to be listened on and authenticated by the current server.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string. An empty string indicates that no information about the third node is configured.

**Default value:** empty

### replconninfo4

**Parameter description:** Specifies the information about the fourth node to be listened on and authenticated by the current server.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string. An empty string indicates that no information about the fourth node is configured.

**Default value:** empty

### replconninfo5

**Parameter description:** Specifies the information about the fifth node to be listened on and authenticated by the current server.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string. An empty string indicates that no information about the fifth node is configured.

**Default value:** empty

### replconninfo6

**Parameter description:** Specifies the information about the sixth node to be listened on and authenticated by the current server.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string. An empty string indicates that no information about the sixth node is configured.

**Default value:** empty

### replconninfo7

**Parameter description:** Specifies the information about the seventh node to be listened on and authenticated by the current server.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string. An empty string indicates that no information about the seventh node is configured.

**Default value:** empty

## replconninfo8

**Parameter description:** Specifies the information about the eighth node to be listened on and authenticated by the current server.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string. An empty string indicates that no information about the eighth node is configured.

**Default value:** empty

## cross\_cluster\_replconninfo1

**Parameter description:** Specifies the information about the local first node to be listened on and authenticated across database instances.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string. An empty string indicates that no information about the first node is configured.

**Default value:** empty

## cross\_cluster\_replconninfo2

**Parameter description:** Specifies the information about the local second node to be listened on and authenticated across database instances.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string. An empty string indicates that no information about the second node is configured.

**Default value:** empty

## cross\_cluster\_replconninfo3

**Parameter description:** Specifies the information about the local third node to be listened on and authenticated across database instances.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string. An empty string indicates that no information about the third node is configured.

**Default value:** empty

## cross\_cluster\_replconninfo4

**Parameter description:** Specifies the information about the local fourth node to be listened on and authenticated across database instances.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string. An empty string indicates that no information about the fourth node is configured.

**Default value:** empty

### cross\_cluster\_replconninfo5

**Parameter description:** Specifies the information about the local fifth node to be listened on and authenticated across database instances.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string. An empty string indicates that no information about the fifth node is configured.

**Default value:** empty

### cross\_cluster\_replconninfo6

**Parameter description:** Specifies the information about the local sixth node to be listened on and authenticated across database instances.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string. An empty string indicates that no information about the sixth node is configured.

**Default value:** empty

### cross\_cluster\_replconninfo7

**Parameter description:** Specifies the information about the local seventh node to be listened on and authenticated across database instances.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string. An empty string indicates that no information about the seventh node is configured.

**Default value:** empty

### cross\_cluster\_replconninfo8

**Parameter description:** Specifies the information about the local eighth node to be listened on and authenticated across database instances.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string. An empty string indicates that no information about the eighth node is configured.

**Default value:** empty

### available\_zone

**Parameter description:** Specifies the region where the local node is located.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string. An empty string indicates that no information about the node is configured.

**Default value:** empty

## enable\_availablezone

**Parameter description:** Specifies whether the local cascaded standby node can connect to standby nodes across AZs.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **true** indicates that the cascaded standby node can only connect to standby nodes in the same AZ.
- **false** indicates that the cascaded standby node can connect to standby nodes across AZs.

**Default value:** false

## max\_keep\_log\_seg

**Parameter description:** Stream control parameter. In logical replication, physical logs are parsed and converted into logical logs locally on the DN. When the number of physical log files that are not parsed is greater than the value of this parameter, stream control is triggered. The value **0** indicates that the stream control function is disabled.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 2147483647

**Default value:** 0

## enable\_time\_report

**Parameter description:** Specifies whether to record the time consumed by each redo log.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that the time when a redo record is generated is recorded.
- **off** indicates that no record is generated.

**Default value:** off

## thread\_top\_level

**Parameter description:** Increases the priority of the WALWRITERAUXILIARY || WALWRITER || STARTUP ||WALRECEIVER || WAL\_NORMAL\_SENDER || PGSTAT threads to the highest.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that the priority of the preceding threads is increased to the highest.
- **off** indicates that the priority of the preceding threads is not increased.

**Default value:** off

## wal\_flush\_size

**Parameter description:** Specifies the threshold for flushing entries in each WAL.

If this parameter is set to a large value for each entry, the flushing frequency is reduced, but the flushing delay increases.

The default value is **-1**, indicating that data is not evenly flushed and data is flushed as many as possible each time. If the parameter is set to a value greater than 0, data is evenly refreshed based on the threshold.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** [-1,16777216]. The unit is byte.

**Default value:** -1

## page\_work\_queue\_size

**Parameter description:** Specifies the length of the blocking queue of each redo worker.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a value ranging from 1 to 100000.

**Default value:** 4096

### 14.3.7.2 Primary Server

## synchronous\_standby\_names

**Parameter description:** Specifies a comma-separated list of names of potential standby nodes that support synchronous replication.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

---

#### NOTICE

- The current synchronous standby node is on the top of the list. If the current synchronous standby node is disconnected, it will be replaced immediately with the next-highest-priority standby node. Name of the next-highest-priority standby node is added to the list.
  - The standby node name can be specified by setting the environment variable **PGAPPNAME**.
-

**Value range:** a string. If this parameter is set to \*, the name of any standby node that provides synchronous replication is matched. The value can be configured in the following format:

- ANY *num\_sync* (*standby\_name* [, ...]) [, ANY *num\_sync* (*standby\_name* [, ...])]
- [FIRST] *num\_sync* (*standby\_name* [, ...])
- *standby\_name* [, ...]

#### NOTE

- In the preceding command, *num\_sync* indicates the number of standby nodes that need to wait for responses from the transaction, *standby\_name* indicates the name of the standby node, and FIRST and ANY specify the policies for selecting standby nodes for synchronous replication from the listed servers.
- **ANY N (dn\_instanceld1, dn\_instanceld2,...)** indicates that any *N* host names in the brackets are selected as the name list of standby nodes for synchronous replication. For example, **ANY 1 (dn\_instanceld1, dn\_instanceld2)** indicates that any one of *dn\_instanceld1* and *dn\_instanceld2* is used as the standby node for synchronous replication.
- **FIRST N (dn\_instanceld1, dn\_instanceld2, ...)** indicates that the first *N* primary node names in the brackets are selected as the standby node name list for synchronous replication based on the priority. For example, **FIRST 1 (dn\_instanceld1, dn\_instanceld2)** indicates that *dn\_instanceld1* is selected as the standby node for synchronous replication.
- The meanings of *dn\_instanceld1*, *dn\_instanceld2*, ... are the same as those of FIRST 1 (*dn\_instanceld1*, *dn\_instanceld2*, ...).

If you use the `gs_guc` tool to set this parameter, perform the following operations:

```
gs_guc reload -Z datanode -N @NODE_NAME@ -D @DN_PATH@ -c "synchronous_standby_names='ANY NODE 1(dn_instanceld1, dn_instanceld2)';"
```

or

```
gs_guc reload -Z datanode -N @NODE_NAME@ -D @DN_PATH@ -c "synchronous_standby_names='ANY 1(AZ1, AZ2)';"
```

**Default value:** \*

## most\_available\_sync

**Parameter description:** Specifies whether transactions on the primary node are not blocked due to faults on synchronous standby nodes. For example, if one of the two synchronous standby nodes is faulty and the other is normal, the primary node waits for the normal synchronous standby node instead of being blocked by the faulty synchronous standby node.

For another example, when the quorum protocol is executed, one primary node and three synchronous standby nodes are configured. ANY 2 (node1, node2, and node3) is configured. When node1 and node3 are faulty and node2 is normal, host services are not blocked.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that the primary node is not blocked when all synchronous standby nodes are faulty.
- **off** indicates that the primary node is blocked when all synchronous standby nodes are faulty.

**Default value:** off

## keep\_sync\_window

**Parameter description:** Specifies the delay for entering the maximum availability mode.

- If **most\_available\_sync** is set to **on**, when synchronous standby nodes are faulty in primary/standby scenarios and the number of configured synchronous standby nodes is insufficient (for details, see the meaning of **synchronous\_standby\_name**), setting **keep\_sync\_window** will retain the maximum protection mode within the time window specified by **keep\_sync\_window**. That is, committing transactions on the primary node is blocked, delay the primary node to enter the maximum availability mode.
- If synchronous standby nodes recover from faults and the number of synchronous standby nodes meets the configuration requirements, transactions are not blocked.
- You are advised to set **keep\_sync\_window** to 5s. This prevents the monitoring system from incorrectly reporting network instability.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to *INT\_MAX*. The unit is second.

- The value **0** indicates that the **keep\_sync\_window** is not set, that is, the maximum availability mode is entered directly.
- Other values indicate the size of the timeout window.

**Default value:** 0

### NOTE

Setting this parameter may affect the RPO. If the primary node is faulty within the configured timeout window, the data generated from the time when the primary node is blocked to the time when the primary node is faulty may be lost.

## enable\_stream\_replication

**Parameter description:** Specifies whether data and logs are synchronized between primary and standby nodes.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

---

### NOTICE

- This parameter is used for performance testing in scenarios where data synchronization to standby nodes is enabled and where it is disabled. If this parameter is set to **off**, tests on abnormal scenarios, such as switchover and faults, cannot be performed to prevent inconsistency between the primary/standby nodes.
  - This parameter is a controlled parameter, and you are advised not to set it to **off** in normal service scenarios.
  - Currently, primary/standby/secondary deployment is not supported by default.
-

**Value range:** Boolean

- **on** indicates that data and log synchronization is enabled.
- **off** indicates that data and log synchronization is disabled.

**Default value:** on

## enable\_mix\_replication

**Parameter description:** Specifies how WAL files and data are replicated between primary and standby nodes.

This parameter is an INTERNAL parameter. Its default value is **off** and cannot be modified.

---

### NOTICE

- This parameter cannot be modified in normal service scenarios. That is, mixed replication of the WAL files and data pages is disabled.
  - Currently, primary/standby/secondary deployment is not supported by default.
- 

**Value range:** Boolean

- **on** indicates that the WAL file and data page mixed replication mode is enabled.
- **off** indicates that the WAL file and data page mixed replication mode is disabled.

**Default value:** off

## vacuum\_defer\_cleanup\_age

**Parameter description:** Specifies the number of transactions by which **VACUUM** will defer the cleanup of invalid row-store table records. That is, **VACUUM** and **VACUUM FULL** do not clean up deleted tuples immediately.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 1000000. **0** means no delay.

**Default value:** 0

## data\_replicate\_buffer\_size

**Parameter description:** Specifies the amount of memory used by queues when the sender sends data pages to the receiver. The value of this parameter affects the buffer size used during the replication from the primary node to the standby node.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 4096 to 1072693248. The unit is KB.

**Default value:**

128 MB (196-core CPU/1536 GB memory, 128-core CPU/1024 GB memory, 104-core CPU/1024 GB memory, 96-core CPU/1024 GB memory, 96-core CPU/768 GB memory, 80-core CPU/640 GB memory, 64-core CPU/512 GB memory, 60-core CPU/480 GB memory, 32-core CPU/256 GB memory, 16-core CPU/128 GB memory, 8-core CPU/64 GB memory, 4-core CPU/32 GB memory); 4 MB (4-core CPU/16 GB memory)

## walsender\_max\_send\_size

**Parameter description:** Specifies the size of the WAL or Sender buffers on the primary node.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 8 to *INT\_MAX*. The unit is KB.

**Default value:** 8 MB (8192 KB)

## enable\_data\_replicate

**Parameter description:** Specifies how data is synchronized between primary and standby nodes when the data is imported to a row-store table.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that the primary and standby nodes synchronize data using data pages when the data is imported to a row-store table. When **replication\_type** is set to **1**, this parameter cannot be set to **on**. If this parameter is set to **on** using the GUC tool, its value will be forcibly changed to **off**.
- **off** indicates that the primary and standby nodes synchronize data using Xlogs when the data is imported to a row-store table.

**Default value:** off

## ha\_module\_debug

**Parameter description:** Specifies the replication status log of a specific data block during data replication.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that the status of each data block is recorded in logs during data replication.
- **off** indicates that the status of each data block is not recorded in logs during data replication.

**Default value:** off

## enable\_incremental\_catchup

**Parameter description:** Specifies the data catchup mode between the primary and standby nodes. Currently, primary/standby/secondary deployment is not supported by default.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that the standby node uses the incremental catchup mode. That is, the standby node scans local data files on the standby node to obtain the list of differential data files between the primary and standby nodes and then performs catchup between the primary and standby nodes.
- **off** indicates that the standby node uses the full catchup mode. That is, the standby node scans all local data files on the primary node to obtain the list of differential data files between the primary and standby nodes and then performs catchup between the primary and standby nodes.

**Default value:** on

## wait\_dummy\_time

**Parameter description:** Specifies the maximum duration for waiting for the secondary nodes to start and send the scanning lists when incremental data catchup is enabled in the database.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 1 to *INT\_MAX*. The unit is second.

**Default value:** 300

### NOTE

- The unit can only be second.
- Currently, primary/standby/secondary deployment is not supported by default.

## catchup2normal\_wait\_time

**Parameter description:** Specifies the maximum duration for the standby node to catch up with the primary node when **most\_available\_sync** is enabled in primary/standby scenarios. The value of this parameter is an estimate and may be different from the actual value.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from -1 to 10000. The unit is ms.

- The value **-1** indicates that the primary node is blocked until the data catchup on the standby node is complete.
- The value **0** indicates that the primary node is not blocked during the data catchup on the standby node.
- Other values indicate the maximum duration that the primary node is blocked during the data catchup on the standby node. For example, if this parameter is set to **5000**, the primary node is blocked until the data catchup on the standby node is complete in 5s.

**Default value:** -1

## check\_sync\_standby

**Parameter description:** Specifies whether to enable the standby node check function. After the **synchronous\_standby\_names** parameter is correctly configured in the primary/standby scenario, if the synchronous standby node is faulty, the write service on the primary node reports a write failure. This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** on or off

- **on** indicates that the standby node check is enabled.
- **off** indicates that the standby node check is disabled.

**Default value:** off

### NOTE

- This parameter cannot be synchronized in job work and autonomous transactions. Otherwise, the check may not take effect.
- If the standby node check is not configured for a specified user or session and the standby node is faulty when the forcible synchronization commit mode is enabled, the write operation on a table causes the query on the same table by another user or in another session to hang. In this case, you need to recover the standby node or manually terminate the hung client.
- The standby node check function cannot be enabled in scenarios (such as VACUUM ANALYZE) where non-write operations trigger log writing. If the standby node does not meet the requirements for synchronizing configurations to the standby node, services will be hung in this scenario. In this case, you need to manually terminate the services.

## sync\_config\_strategy

**Parameter description:** Specifies the policy for synchronizing configuration files between the primary node and standby node, and between the standby node and cascaded standby node.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** enumerated values

- **all\_node:** If this parameter is set to **all\_node** for the primary node, the primary node is allowed to proactively synchronize configuration files to all standby nodes. If this parameter is set to **all\_node** for a standby node, the standby node is allowed to send synchronization requests to its primary node, and the standby node is allowed to proactively synchronize configuration files to all cascaded standby nodes. If this parameter is set to **all\_node** for a cascaded standby node, the current cascaded standby node is allowed to send synchronization requests to its standby node.
- **only\_sync\_node:** If this parameter is set to **only\_sync\_node** for the primary node, the primary node is only allowed to proactively synchronize configuration files to all standby nodes. If this parameter is set to **only\_sync\_node** for a standby node, the standby node is allowed to send synchronization requests to its primary node, and the standby node is not

allowed to proactively synchronize configuration files to all cascaded standby nodes. If this parameter is set to **only\_sync\_node** for a cascaded standby node, the current cascaded standby node is allowed to send synchronization requests to its standby node.

- **none\_node**: If this parameter is set to **none\_node** for the primary node, the primary node is not allowed to proactively synchronize configuration files to all standby nodes. If this parameter is set to **none\_node** for a standby node, the standby node is not allowed to send synchronization requests to its primary node, and the standby node is not allowed to proactively synchronize configuration files to all cascaded standby nodes. If this parameter is set to **none\_node** for a cascaded standby node, the current cascaded standby node is not allowed to send synchronization requests to its standby node.

**Default value:** `all_node`

## `hadr_recovery_time_target`

**Parameter description:** Specifies whether the standby database instance completes log writing and replay in streaming DR mode.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 3600. The unit is second.

**0** indicates that log flow control is disabled. A value from 1 to 3600 indicates that a standby node can write and replay logs within the period specified by the value of **`hadr_recovery_time_target`**. This ensures that the logs can be written and replayed within the period specified by the value of **`hadr_recovery_time_target`** and the standby database instance can be promoted to primary quickly. If this parameter is set to a small value, the performance of the primary node is affected. If it is set to a large value, the log flow is not effectively controlled.

**Default value:** `0`

## `hadr_recovery_point_target`

**Parameter description:** Specifies the RPO time allowed for the standby database instance to flush logs to disks in streaming DR mode.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 3600. The unit is second.

**0** indicates that log flow control is disabled. A value from 1 to 3600 indicates that the standby node can flush logs to disks within the period specified by the value of **`hadr_recovery_point_target`**. This ensures that the log difference between the primary and standby database instances is controlled within the period specified by the value of **`hadr_recovery_point_target`** during the switchover and the standby database instance can be promoted to primary. If this parameter is set to a small value, the performance of the primary node is affected. If it is set to a large value, the log flow is not effectively controlled.

**Default value:** `0`

## hadr\_super\_user\_record\_path

**Parameter description:** Specifies the path for storing encrypted files of the **hadr\_disaster** user in the standby database instance in streaming DR mode. This parameter is a SIGHUP parameter.

Set it based on instructions provided in [Table 14-1](#).

**Modification suggestion:** The value is automatically set by the streaming DR password transfer tool and does not need to be manually added.

**Value range:** a string

**Default value:** NULL

---

### NOTICE

- In a database instance that contains a primary node and a standby node, the primary node is a sender relative to the standby node and the standby node is a receiver relative to the primary node.
  - The sender actively synchronizes the configuration file to the receiver, and the receiver requests the sender to synchronize the configuration file, which are two independent events, so that the configuration files are synchronized. If you do not want to synchronize configuration files, set this parameter to **none\_node** on the receiver. If the sender is a standby node, set this parameter to **none\_node** only. If the sender is a primary node, set this parameter to **none\_node** when the primary node does not synchronize with any standby node; or set this parameter to **only\_sync\_node** when the primary node synchronizes with synchronous standby nodes only and does not synchronize with asynchronous standby nodes.
  - To be specific, the sender sends a configuration file which directly overwrites the corresponding parameter in the configuration file of the receiver. After the policy for synchronizing configuration files is set, even if you modify configuration parameters of the receiver, the modification does not take effect because the sender immediately overwrites these parameters.
  - The following configuration parameters are not synchronized even if the policy for synchronizing configuration files is set: application\_name, archive\_command, audit\_directory, available\_zone, comm\_control\_port, comm\_sctp\_port, listen\_addresses, log\_directory, port, replconninfo1, replconninfo2, replconninfo3, replconninfo4, replconninfo5, replconninfo6, replconninfo7, replconninfo8, replconninfo9, replconninfo10, replconninfo11, replconninfo12, replconninfo13, replconninfo14, replconninfo15, replconninfo16, replconninfo17, replconninfo18, ssl, ssl\_ca\_file, ssl\_cert\_file, ssl\_ciphers, ssl\_crl\_file, ssl\_key\_file, ssl\_renegotiation\_limit, ssl\_cert\_notify\_time, synchronous\_standby\_names, local\_bind\_address, perf\_directory, query\_log\_directory, asp\_log\_directory, streaming\_router\_port, enable\_upsert\_to\_merge, archive\_dest, recovery\_min\_apply\_delay, and sync\_config\_strategy.
-

### 14.3.7.3 Standby Server

#### hot\_standby

**Parameter description:** Specifies whether to allow connections and queries on a standby server during its recovery.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

---

#### NOTICE

- If this parameter is set to **on**, [wal\\_level](#) must be set to **hot\_standby** or higher. Otherwise, the database startup fails.
- In an HA system, **hot\_standby** cannot be set to **off**, because this setting can affect other features of the HA system.
- If the **hot\_standby** parameter was disabled and the [wal\\_level](#) parameter was set to a value lower than **hot\_standby**, perform the following operations to ensure that the logs to be replayed on the standby node can be queried on the standby node before enabling the **hot\_standby** parameter again:
  1. Change the [wal\\_level](#) value of the primary and standby nodes to **hot\_standby** or higher, and restart the instances for the change to take effect.
  2. Perform the checkpoint operation on the primary node and query the [pg\\_stat\\_get\\_wal\\_senders\(\)](#) function to ensure that the [receiver\\_replay\\_location](#) value of each standby node is the same as the [sender\\_flush\\_location](#) value of the primary node. Ensure that the value adjustment of [wal\\_level](#) is synchronized to standby nodes and takes effect, and standby nodes do not need to replay low-level logs.
  3. Set the **hot\_standby** parameter of the primary and standby nodes to **on**, and restart the instances for the setting to take effect.

---

**Value range:** Boolean

- **on** indicates that connections and queries are allowed on the standby server during the recovery.
- **off** indicates that connections and queries are not allowed on the standby server during the recovery.

**Default value:** on

#### max\_standby\_archive\_delay

**Parameter description:** Specifies the wait period before queries on a standby server are canceled when the queries conflict with WAL processing and archiving in hot standby mode. In the current version, the setting does not take effect and is controlled by the [max\\_standby\\_streaming\\_delay](#) parameter.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

---

**NOTICE**

-1 indicates that the standby server waits until the conflicting queries are complete.

---

**Value range:** an integer ranging from -1 to *INT\_MAX*. The unit is ms.

**Default value:** 3s (3000 ms)

## max\_standby\_streaming\_delay

**Parameter description:** Specifies the wait period before queries on a standby server are canceled when the queries conflict with WAL data receiving through streaming replication in hot standby mode. If this parameter is set to a large value or the service load is heavy, an error may be reported for waiting for transaction replay and flushing to disks.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

---

**NOTICE**

-1 indicates that the standby server waits until the conflicting queries are complete.

---

**Value range:** an integer ranging from -1 to *INT\_MAX*. The unit is ms.

**Default value:** 3s (3000 ms)

## wal\_receiver\_status\_interval

**Parameter description:** Specifies the maximum interval for notifying the primary server of the WAL Receiver status.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to *INT\_MAX*. The unit is ms.

**Default value:** 5s (5000 ms)

---

**NOTICE**

If this parameter is set to **0**, the standby server does not send information, such as the log receiving location, to the primary server. As a result, the transaction commit on the primary server may be blocked, and the switchover may fail. In normal service scenarios, you are not advised to set this parameter to **0**.

## hot\_standby\_feedback

**Parameter description:** Specifies whether a standby server is allowed to send the result of a query performed on it to the primary server, preventing a query conflict.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that the ID of the oldest transaction active on standby servers will be sent to the primary server.
- **off** indicates that the ID of the oldest transaction active on standby servers will not be sent to the primary server.

**Default value:** off

---

**NOTICE**

If this parameter is set to **on**, VACUUM on the primary server will not clean up tuples modified in transactions later than the oldest transaction active on standby servers.

Therefore, the performance of the primary server will be affected. If playback conflicts with query on the standby node and a query error is reported, you are advised to increase the value of **max\_standby\_streaming\_delay**.

---

## wal\_receiver\_timeout

**Parameter description:** Specifies the maximum wait period for a standby server to receive data from the primary server.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to *INT\_MAX*. The unit is ms.

**Default value:** 6s (6000 ms)

## wal\_receiver\_connect\_timeout

**Parameter description:** Specifies the timeout period for a standby server to connect to the primary server.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to *INT\_MAX*/1000. The unit is s.

**Default value:** 2s

## wal\_receiver\_connect\_retries

**Parameter description:** Specifies the maximum attempts that a standby server connects to the primary server

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 1 to *INT\_MAX*

**Default value:** 1

## wal\_receiver\_buffer\_size

**Parameter description:** Specifies the size of the memory buffer that stores the Xlogs received by the standby and secondary nodes. Currently, primary/standby/secondary deployment is not supported by default.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 4096 to 1047552. The unit is KB.

**Default value:** 64 MB (65536 KB)

## primary\_slotname

**Parameter description:** Specifies the slot name of the primary server corresponding to a standby server. This parameter is used for the mechanisms to verify the primary-standby relationship and delete WALs.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string

**Default value:** empty

## max\_logical\_replication\_workers

**Parameter description:** Specifies the maximum number of apply worker threads on the subscriber side.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 262143

**Default value:** 4

## max\_standby\_base\_page\_size

**Parameter description:** Specifies the maximum storage space of base page files on the standby node after the ultimate RTO function is enabled.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a long integer ranging from 1048576 to 562949953421311. The unit is KB.

**Default value:** 268435456 (256 GB)

## max\_standby\_lsn\_info\_size

**Parameter description:** Specifies the maximum size of LSN info files on the standby node after the ultimate RTO function is enabled.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a long integer ranging from 1048576 to 562949953421311. The unit is KB.

**Default value:** 268435456 (256 GB)

## base\_page\_saved\_interval

**Parameter description:** Specifies the interval for generating base pages on the standby node after the ultimate RTO function is enabled. For the same page, a base page is generated each time the value of this parameter is replayed.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 5 to 2000.

**Default value:** 400

## standby\_force\_recycle\_ratio

**Parameter description:** Specifies the percentage of files read by the standby node to trigger forcible recycling after the ultimate RTO function is enabled. When the total size of base page files exceeds the value of **max\_standby\_base\_page\_size** x **standby\_force\_recycle\_ratio** or the total size of LSN info files exceeds the value of **max\_standby\_lsn\_info\_size** x **standby\_force\_recycle\_ratio**, forcible recycling is triggered and some queries are canceled. When the value of **standby\_force\_recycle\_ratio** is 0, forcible recycling is not started, and the setting of **max\_standby\_base\_page\_size** and **max\_standby\_lsn\_info\_size** does not take effect.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a double-precision floating point number ranging from 0.0 to 1.0

**Default value:** 0.8

## standby\_recycle\_interval

**Parameter description:** Specifies the interval for the standby node to recycle read files after the ultimate RTO function is enabled. The thread for recycling read resources on the standby node attempts to clear read files on the standby node at the interval specified by this parameter.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 86400. The unit is s.

**Default value:** 10

## standby\_max\_query\_time

**Parameter description:** Specifies the maximum query time supported on the standby node after the ultimate RTO function is enabled. If the query time exceeds the value of this parameter, the query will be canceled. Note: The time when the query is canceled is affected by the interval parameter [standby\\_recycle\\_interval](#) of the recycling thread and the time when the snapshot is obtained. Therefore, the actual execution time of the query on the standby node must be greater than the value of this parameter.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 86400. The unit is s.

**Default value:** 600

## exrto\_standby\_read\_opt

**Parameter description:** Specifies whether to support read optimization of the standby node with ultimate RTO. This parameter is enabled by default. This parameter is not synchronized between the primary and standby nodes.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean. **on** indicates that the optimization is enabled, and **off** indicates that the optimization is disabled.

**Default value:** on

## 14.3.8 Query Planning

This section describes the method configuration, cost constants, planning algorithm, and some configuration parameters for the optimizer.

### NOTE

Two parameters are involved in the optimizer:

- *INT\_MAX* indicates the maximum value of the INT data type. The value is **2147483647**.
- *DBL\_MAX* indicates the maximum value of the FLOAT data type.

In addition to customer services, global query planning parameters also affect database O&M and monitoring services, such as WDR generation, scale-out, redistribution, and data import and export.

### 14.3.8.1 Optimizer Method Configuration

These configuration parameters provide a crude method of influencing the query plans chosen by the query optimizer. If the default plan chosen by the optimizer for a particular query is not optimal, a temporary solution is to use one of these configuration parameters to force the optimizer to choose a different plan. Better ways include adjusting the optimizer cost constants, manually running **ANALYZE**, increasing the value of the **default\_statistics\_target** parameter, and increasing the amount of the statistics collected in specific columns using **ALTER TABLE SET STATISTICS**.

## enable\_broadcast

**Parameter description:** Controls whether the query optimizer uses the broadcast distribution method when it evaluates the cost of stream.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on:** enabled.
- **off:** disabled.

**Default value:** on

 **NOTE**

This parameter does not take effect in the current version.

## enable\_bitmapscan

**Parameter description:** Specifies the query optimizer's use of bitmap-scan plan types.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on:** enabled.
- **off:** disabled.

**Default value:** on

## force\_bitmapand

**Parameter description:** Specifies the query optimizer's use of BitmapAnd plan types.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on:** enabled.
- **off:** disabled.

**Default value:** off

## enable\_hashagg

**Parameter description:** Specifies the query optimizer's use of Hash aggregation plan types.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on:** enabled.
- **off:** disabled.

**Default value:** on

## enable\_hashjoin

**Parameter description:** Specifies the query optimizer's use of hash-join plan types.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on:** enabled.
- **off:** disabled.

**Default value:** on

## enable\_indexscan

**Parameter description:** Specifies the query optimizer's use of index-scan plan types.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on:** enabled.
- **off:** disabled.

**Default value:** on

## enable\_indexonlyscan

**Parameter description:** Specifies the query optimizer's use of index-only-scan plan types.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on:** enabled.
- **off:** disabled.

**Default value:** on

## enable\_material

**Parameter description:** Specifies the query optimizer's use of materialization. It is impossible to suppress materialization entirely, but setting this variable to **off** prevents the optimizer from inserting materialized nodes.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on:** enabled.
- **off:** disabled.

**Default value:** on

## enable\_mergejoin

**Parameter description:** Specifies the query optimizer's use of merge-join plan types.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on:** enabled.
- **off:** disabled.

**Default value:** off

## enable\_nestloop

**Parameter description:** Specifies whether the query optimizer uses the nested-loop join plan type to fully scan internal tables. It is impossible to suppress nested-loop joins entirely, but setting this variable to **off** encourages the optimizer to choose other methods if available.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on:** enabled.
- **off:** disabled.

**Default value:** off

## enable\_index\_nestloop

**Parameter description:** Specifies whether the query optimizer uses the nested-loop join plan type to scan the parameterized indexes of internal tables.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on:** enabled.
- **off:** disabled.

**Default value:** on

## enable\_seqscan

**Parameter description:** Specifies the query optimizer's use of sequential scan plan types. It is impossible to suppress sequential scans entirely, but setting this variable to **off** encourages the optimizer to choose other methods if available.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on:** enabled.
- **off:** disabled.

**Default value:** on

## enable\_sort

**Parameter description:** Specifies the query optimizer's choice of sort methods. It is impossible to suppress explicit sorts entirely, but setting this variable to **off** encourages the optimizer to choose other methods if available.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on:** enabled.
- **off:** disabled.

**Default value:** on

## enable\_tidscan

**Parameter description:** Specifies the query optimizer's use of Tuple ID (TID) scan plan types.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on:** enabled.
- **off:** disabled.

**Default value:** on

## enable\_kill\_query

**Parameter description:** In CASCADE mode, when a user is deleted, all the objects belonging to the user are deleted. This parameter specifies whether the queries of the objects belonging to the user can be unlocked when the user is deleted.

This parameter is a SUSERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that the unlocking is allowed.
- **off** indicates that the unlocking is not allowed.

**Default value:** off

## enforce\_a\_behavior

**Parameter description:** Specifies the rule matching modes of regular expressions.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that the A matching rule is used.

- **off** indicates that the POSIX matching rule is used.

**Default value:** on

## max\_recursive\_times

**Parameter description:** Specifies the maximum number of **WITH RECURSIVE** iterations.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to *INT\_MAX*

**Default value:** 200

## enable\_vector\_engine

**Parameter description:** Specifies the query optimizer's use of vectorized executor.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on:** enabled.
- **off:** disabled.

**Default value:** on

## enable\_change\_hjcost

**Parameter description:** Specifies whether the optimizer excludes internal table running costs when selecting the Hash Join cost path. If it is set to **on**, tables with a few records and high running costs are more possible to be selected.

This parameter is a SUSERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on:** enabled.
- **off:** disabled.

**Default value:** off

## enable\_absolute\_tablespace

**Parameter description:** Specifies whether the tablespace can use the absolute path.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that an absolute path can be used.

- **off** indicates that an absolute path cannot be used.

**Default value:** on

## enable\_valuepartition\_pruning

**Parameter description:** Specifies whether the DFS partitioned table is dynamically or statically optimized.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that the DFS partitioned table is dynamically or statically optimized.
- **off** indicates that the DFS partitioned table is not dynamically or statically optimized.

**Default value:** on

## qrw\_inlist2join\_optmode

**Parameter description:** Specifies whether to enable inlist-to-join (inlist2join) query rewriting.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string

- **disable** indicates that the inlist2join query rewriting is disabled.
- **cost\_base** indicates that the cost-based inlist2join query rewriting is enabled.
- **rule\_base** indicates that the forcible rule-based inlist2join query rewriting is enabled.
- A positive integer indicates the threshold of inlist2join query rewriting. If the number of elements in the list is greater than the threshold, the rewriting is performed.

**Default value:** cost\_base

## skew\_option

**Parameter description:** Specifies whether an optimization policy is used.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string

- **off** indicates that the policy is disabled.
- **normal** indicates that a radical policy is used. All possible skews are optimized.
- **lazy** indicates that a conservative policy is used. Uncertain skews are ignored.

**Default value:** normal

## default\_limit\_rows

**Parameter description:** Specifies the default estimated number of limit rows for generating genericplan. If this parameter is set to a positive value, the positive value is used as the estimated number of limit rows. If this parameter is set to a negative value, the negative value is converted to a percentage and used as default estimated value, that is, -5 indicates 5%.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a floating point number ranging from -100 to DBL\_MAX

**Default value:** -10

## check\_implicit\_conversions

**Parameter description:** Specifies whether to check candidate index paths generated for index columns that have implicit type conversions in a query.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that a check will be performed for candidate index paths generated for index columns that have implicit type conversion in a query.
- **off** indicates that a check will not be performed.

**Default value:** off

## cost\_weight\_index

**Parameter description:** Specifies the cost weight of index\_scan.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a floating point number ranging from 1e-10 to 1e+10.

**Default value:** 1

## enable\_default\_index\_deduplication

**Parameter description:** Specifies whether to deduplicate and compress tuples with duplicate key values for a B-tree index by default. The deduplication and compression functions do not take effect for primary key indexes and unique indexes. When there are a large number of indexes with duplicate key values, the deduplication and compression function can effectively reduce the space occupied by indexes. In scenarios where non-unique indexes are used and index key values are seldom repeated or unique, the deduplication and compression function slightly deteriorates the index insertion performance. If the WITH (**deduplication** set to **on/off**) syntax is used during index creation, the deduplication parameter is preferentially used to determine whether to use deduplication and compression for the index.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **off:** indicates that the deduplication and compression function is disabled for B-tree indexes. This is the default value.
- **on:** indicates that the deduplication and compression function is enabled for B-tree indexes.

**Default value:** off

## enable\_expr\_fusion

**Parameter description:** Specifies whether to enable the SRF, expression flattening, centralized Seq Scan projection cancellation, transition status of shared aggregate functions, and step number optimization features.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **off:** indicates that this function is disabled. This is the default value.
- **on:** indicates that the SRF, expression flattening, centralized Seq Scan projection cancellation, transition status of shared aggregate functions, and step number optimization features are enabled.

**Default value:** off

### NOTE

It is supported only in the scenario where **query\_dop** is set to 1.

## 14.3.8.2 Optimizer Cost Constants

This section describes the optimizer cost constants. The cost variables described here are measured on an arbitrary scale. Only their relative values matter, therefore scaling them all up or down by the same factor will result in no change in the optimizer's choices. By default, these cost variables are based on the cost of sequential page fetches, that is, **seq\_page\_cost** is conventionally set to **1.0** and the other cost variables are set with reference to the parameter. However, you can use a different scale, such as actual execution time in milliseconds.

### seq\_page\_cost

**Parameter description:** Specifies the optimizer's estimated cost of a disk page fetch that is part of a series of sequential fetches.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a floating point number ranging from 0 to *DBL\_MAX*

**Default value:** 1

## random\_page\_cost

**Parameter description:** Specifies the optimizer's estimated cost of an out-of-sequence disk page fetch.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

---

### NOTICE

Although the server allows you to set **random\_page\_cost** to a value less than that of **seq\_page\_cost**, it is not physically sensitive to do so. However, setting them equal makes sense if the database is entirely cached in RAM, because in that case there is no penalty for fetching pages out of sequence. Also, in a heavily-cached database you should lower both values relative to the CPU parameters, since the cost of fetching a page already in RAM is much smaller than it would normally be.

---

**Value range:** a floating point number ranging from 0 to *DBL\_MAX*

**Default value:** 4

### NOTE

- This value can be overwritten for tables and indexes in a particular tablespace by setting the tablespace parameter of the same name.
- Reducing this value relative to **seq\_page\_cost** will cause the system to prefer index scans and raising it will make index scans relatively more expensive. You can increase or decrease both values together to change the disk I/O costs relative to CPU costs.

## cpu\_tuple\_cost

**Parameter description:** Specifies the optimizer's estimated cost of processing each row during a query.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a floating point number ranging from 0 to *DBL\_MAX*

**Default value:** 0.01

## cpu\_index\_tuple\_cost

**Parameter description:** Specifies the optimizer's estimated cost of processing each index entry during an index scan.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a floating point number ranging from 0 to *DBL\_MAX*

**Default value:** 0.005

## cpu\_operator\_cost

**Parameter description:** Specifies the optimizer's estimated cost of processing each operator or function executed during a query.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a floating point number ranging from 0 to *DBL\_MAX*

**Default value:** 0.0025

## effective\_cache\_size

**Parameter description:** Specifies the optimizer's assumption about the effective size of the disk cache that is available to a single query.

When setting this parameter you should consider both GaussDB's shared buffers and the kernel's disk cache. Also, take into account the expected number of concurrent queries on different tables, since they will have to share the available space.

This parameter has no effect on the size of shared memory allocated by GaussDB. It is used only for estimation purposes and does not reserve kernel disk cache. The value is in the unit of disk page. Usually the size of each page is 8192 bytes.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 1 to 2147483647. The unit is 8 KB.

A value greater than the default one makes index scans more likely to be used, whereas a value less than the default one makes sequential scans more likely to be used.

**Default value:**

280 GB (196-core CPU/1536 GB memory); 180 GB (128-core CPU/1024 GB memory, 104-core CPU/1024 GB memory, and 96-core CPU/1024 GB memory); 135 GB (96-core CPU/768 GB memory); 100 GB (80-core CPU/640 GB memory); 90 GB (64-core CPU/512 GB memory); 80 GB (60-core CPU/480 GB memory); 40 GB (32-core CPU/256 GB memory); 18 GB (16-core CPU/128 GB memory); 8 GB (8-core CPU/64 GB memory); 4 GB (4-core CPU/32 GB memory); 2 GB (4-core CPU/16 GB memory)

## allocate\_mem\_cost

**Parameter description:** Specifies the query optimizer's estimated cost of creating a hash table for memory space using hash join. This parameter is used for optimization when the hash join estimation is inaccurate.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a floating point number ranging from 0 to *DBL\_MAX*

**Default value:** 0

### 14.3.8.3 Genetic Query Optimizer

This section describes parameters related to genetic query optimizer. The genetic query optimizer (GEQO) is an algorithm that plans queries by using heuristic searching. This algorithm reduces planning time for complex queries and the costs of producing plans are sometimes inferior to those found by the normal exhaustive-search algorithm.

#### geqo

**Parameter description:** Specifies whether to enable the genetic query optimization.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

---

#### NOTICE

It is best not to turn it off in execution. **geqo\_threshold** provides more subtle control of GEQO.

---

**Value range:** Boolean

- **on** indicates that the genetic query optimization is enabled.
- **off** indicates that the genetic query optimization is disabled.

**Default value:** on

#### geqo\_threshold

**Parameter description:** Specifies the number of **FROM** items. Genetic query optimization is used to plan queries when the number of statements executed is greater than this value.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

---

#### NOTICE

- For simpler queries, it is best to use the regular, exhaustive-search planner; but for queries with many tables, it is better to use GEQO to manage the queries.
  - A **FULL OUTER JOIN** construct counts as only one **FROM** item.
- 

**Value range:** an integer ranging from 2 to *INT\_MAX*

**Default value:** 12

#### geqo\_effort

**Parameter description:** Controls the trade-off between planning time and query plan quality in GEQO.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

---

**NOTICE**

**geqo\_effort** does not do anything directly. This parameter is only used to compute the default values for the other variables that influence GEQO behavior. If you prefer, you can manually set the other parameters instead.

---

**Value range:** an integer ranging from 1 to 10

---

**NOTICE**

Larger values increase the time spent in query planning, but also increase the probability that an efficient query plan is chosen.

---

**Default value:** 5

## geqo\_pool\_size

**Parameter description:** Controls the pool size used by GEQO, that is, the number of individuals in the genetic population.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to *INT\_MAX*

---

**NOTICE**

The value of this parameter must be at least **2**, and useful values are typically from **100** to **1000**. If this parameter is set to **0**, GaussDB selects a proper value based on **geqo\_effort** and the number of tables.

---

**Default value:** 0

## geqo\_generations

**Parameter description:** Specifies the number of iterations of the GEQO.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to *INT\_MAX*

---

**NOTICE**

The value of this parameter must be at least **1**, and useful values are typically from **100** to **1000**. If it is set to **0**, a suitable value is chosen based on **geqo\_pool\_size**.

**Default value:** 0

## geqo\_selection\_bias

**Parameter description:** Specifies the selection bias used by GEQO. The selection bias is the selective pressure within the population.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a floating point number ranging from 1.5 to 2.0

**Default value:** 2

## geqo\_seed

**Parameter description:** Specifies the initial value of the random number generator used by GEQO to select random paths through the join order search space.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a floating point number ranging from 0.0 to 1.0

---

### NOTICE

Varying the value changes the set of join paths explored, and may result in a better or worse best path being found.

---

**Default value:** 0

## 14.3.8.4 Other Optimizer Options

### cost\_model\_version

**Parameter description:** Specifies the version of the optimizer cost model. It can be regarded as a protection parameter to disable the latest optimizer cost model and keep consistent with the plan of the earlier version. If the value of this parameter is changed, many SQL plans may be changed. Therefore, exercise caution when performing this operation.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** 0, 1, 2, or 3

- **0** indicates that the latest cost estimation model is used. The current version is equivalent to **3**.
- **1** indicates that the original cost estimation model is used.
- **2:** indicates that the enhanced COALESCE expression, hash join cost, and semi/anti join cost are used for estimation on the basis of **1**.
- **3:** indicates that the boundary correction estimator is used to estimate the NDV on the basis of **2**. The hint of indexscan can be applied to indexonlyscan.

**Default value:** 0

## explain\_dna\_file

**Parameter description:** Sets [explain\\_perf\\_mode](#) to **run** to export object files in CSV format.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

---

### NOTICE

The value of this parameter must be an absolute path plus a file name with the extension **.csv**.

---

**Value range:** a string

**Default value:** empty

## explain\_perf\_mode

**Parameter description:** Specifies the display format of the **explain** command.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** **normal**, **pretty**, **summary**, and **run**

- **normal** indicates that the default printing format is used.
- **pretty** indicates a new format improved by using GaussDB. The new format contains a plan node ID, directly and effectively analyzing performance.
- **summary** indicates that the analysis result on this information is printed in addition to the printed information specified by **pretty**.
- **run** indicates that the system exports the printed information specified by **summary** as a CSV file for further analysis.

**NOTICE**

The display sequence may vary greatly according to the display format of **explain**. The examples of the **normal** and **pretty** formats are described as follows:

Example of the **normal** format:

```

-----
QUERY PLAN
-----
Sort (cost=21.23..21.23 rows=1 width=306)
  Sort Key: supplier.s_suppkey
  CTE revenue
    -> HashAggregate (cost=12.88..12.88 rows=1 width=76)
      Group By Key: lineitem.l_suppkey
      -> Partition Iterator (cost=0.00..12.87 rows=1 width=44)
        Iterations: 7
        -> Partitioned Seq Scan on lineitem (cost=0.00..12.87 rows=1 width=44)
          Filter: ((l_shipdate >= '1996-01-01 00:00:00'::timestamp(0) without time zone) AND
(l_shipdate < '1996-04-01 00:00:00'::timestamp without time zone))
          Selected Partitions: 1..7
      InitPlan 2 (returns $3)
        -> Aggregate (cost=0.02..0.03 rows=1 width=64)
          -> CTE Scan on revenue (cost=0.00..0.02 rows=1 width=32)
        -> Nested Loop (cost=0.00..8.30 rows=1 width=306)
          -> CTE Scan on revenue (cost=0.00..0.02 rows=1 width=40)
            Filter: (total_revenue = $3)
          -> Partition Iterator (cost=0.00..8.27 rows=1 width=274)
            Iterations: 7
            -> Partitioned Index Scan using supplier_s_suppkey_idx on supplier (cost=0.00..8.27 rows=1
width=274)
              Index Cond: (s_suppkey = revenue.supplier_no)
              Selected Partitions: 1..7
(21 rows)

```

Example of the **pretty** format:

id	operation	E-rows	E-width	E-costs
1	-> Sort	1	306	21.230..21.235
2	-> Nested Loop (3,9)	1	306	0.000..8.303
3	-> CTE Scan on revenue	1	40	0.000..0.022
4	-> <b>HashAggregate [3, CTE revenue]</b>	1	76	12.875..12.885
5	-> <b>Partition Iterator</b>	1	44	0.000..12.865
6	-> <b>Partitioned Seq Scan on lineitem</b>	1	44	0.000..12.865
7	-> <b>Aggregate [4, InitPlan 2 (returns \$3)]</b>	1	64	0.022..0.033
8	-> <b>CTE Scan on revenue</b>	1	32	0.000..0.020
9	-> Partition Iterator	1	274	0.000..8.270
10	-> Partitioned Index Scan using supplier_s_suppkey_idx on supplier	1	274	0.000..8.270

(10 rows)

Predicate Information (identified by plan id)

```

-----
5 --Partition Iterator
  Iterations: 7
6 --Partitioned Seq Scan on lineitem
  Filter: ((l_shipdate >= '1996-01-01 00:00:00'::timestamp(0) without time zone) AND (l_shipdate <
'1996-04-01 00:00:00'::timestamp without time zone))
  Selected Partitions: 1..7
3 --CTE Scan on revenue
  Filter: (total_revenue = $3)
9 --Partition Iterator
  Iterations: 7
10 --Partitioned Index Scan using supplier_s_suppkey_idx on supplier
  Index Cond: (s_suppkey = revenue.supplier_no)
  Selected Partitions: 1..7
(12 rows)

```

**Note:** The plan blocks in the preceding two formats are different display formats of the same plan. In the **pretty** format, the parts in bold are the CET and InitPlan plan blocks, which may be inserted in the middle of the Join connection block. When reading the Join block, skip the CTE and InitPlan blocks to find the internal table of the corresponding Join block.

---

**Default value:** pretty

## analysis\_options

**Parameter description:** Specifies whether to enable function options in the corresponding options to use the corresponding location functions, including data verification and performance statistics. For details, see the options in the value range.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string

- **HASH\_CONFLICT** indicates that the log in the **pg\_log** directory of the database node process displays the statistics of the hash table, including the hash table size, hash link length, and hash conflict.
- **STREAM\_DATA\_CHECK** indicates that a CRC check is performed on data before and after network data transmission.

**Default value:** ALL,on(),off(HASH\_CONFLICT,STREAM\_DATA\_CHECK), which indicates that no location function is enabled.

## cost\_param

**Parameter description:** Specifies use of different estimation methods in specific customer scenarios, allowing estimated values approximating to onsite values. This parameter can control various methods simultaneously by performing AND (&) on the bit of each method. A method is selected if the result value is not 0.

When **cost\_param & 1** is set to a value other than 0, an improved mechanism is used for connecting the selection rate of non-equi-joins. This method is more accurate for estimating the selection rate of joins between two identical tables. At present, **cost\_param & 1=0** is not used. That is, a better formula is selected for calculation.

When **cost\_param & 2** is set to a value other than 0, the selection rate is estimated based on multiple filter criteria. The lowest selection rate among all filter criteria, but not the product of the selection rates for two tables under a specific filter criterion, is used as the total selection rate. This method is more accurate when a close correlation exists between the columns to be filtered.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to *INT\_MAX*

**Default value:** 0

## var\_eq\_const\_selectivity

**Parameter description:** Determines whether to use the new selection rate model to estimate the integer const selection rate.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that the new selection rate model is used to calculate the selection rate of the integer const.
  - If an integer does not fall into the MCV, is not NULL, but falls into the histogram, the left and right boundaries of the histogram are used for estimation. If the integer does not fall into the histogram, the number of rows in the table is used for estimation.
  - If the integer is NULL or falls into the MCV, the original logic is used to calculate the selection rate.
- **off** indicates that the original selection rate calculation model is used.

**Default value:** off

## enable\_partitionwise

**Parameter description:** Specifies whether to select an intelligent algorithm for joining partition tables.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that an intelligent algorithm is selected.
- **off** indicates that an intelligent algorithm is not selected.

**Default value:** off

## partition\_page\_estimation

**Parameter description:** Determines whether to optimize the estimation of partitioned table pages based on the pruning result.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that the pruning result is used to optimize the page estimation.
- **off** indicates that the pruning result is not used to optimize the page estimation.

**Default value:** off

## partition\_iterator\_elimination

**Parameter description:** Determines whether to eliminate the partition iteration operator to improve execution efficiency when the partition pruning result of a partitioned table is a partition.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that the partition iteration operator is eliminated.
- **off** indicates that the partition iteration operator is not eliminated.

**Default value:** off

## enable\_functional\_dependency

**Parameter description:** Determines whether the statistics about multiple columns generated by ANALYZE contain function dependency statistics and whether the function dependency statistics are used to calculate the selection rate.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates the following functions: 1. The statistics about multiple columns generated by ANALYZE contain function dependency statistics. 2. Function dependency statistics are used to calculate the selection rate.
- **off** indicates the following functions: 1. The statistics about multiple columns generated by ANALYZE do not contain function dependency statistics. 2. Function dependency statistics are not used to calculate the selection rate.

**Default value:** off

## rewrite\_rule

**Parameter description:** Specifies the rewriting rule for enabled optional queries. Some query rewrite rules are optional. Enabling them cannot always improve the query efficiency. In a specific customer scenario, you can set the query rewriting rules through this GUC parameter to achieve optimal query efficiency.

This parameter can control the combination of query rewriting rules, for example, there is more than one override rule: rule1, rule2, rule3, and rule4. You can perform the following settings:

```
set rewrite_rule=rule1;      -- Enable query rewriting rule rule1
set rewrite_rule=rule2, rule3; -- Enable the query rewriting rules rule2 and rule3
set rewrite_rule=none;      -- Disable all optional query rewriting rules
```

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string

- **none:** Does not use any optional query rewriting rules.

- **lazyagg**: Uses the Lazy Agg query rewriting rules for eliminating aggregation operations in subqueries.
- **magicset**: The Magic Set query rewriting rules are used to associate subqueries which have aggregation operators with the main query in advance to reduce repeated scanning of sublinks.
- **uniquecheck**: Uses the Unique Check query rewriting rules. Optimize the subquery statements in target columns without agg and check whether the number of returned rows is 1.
- **intargetlist**: Uses the In Target List query rewriting rules (subquery optimization in the target column).
- **predpushnormal**: Uses the Predicate Push query rewriting rule (push the predicate condition to the subquery).
- **predpushforce**: Uses the Predicate Push query rewriting rules. Push down predicate conditions to subqueries and use indexes as much as possible for acceleration.
- **predpush**: Selects the optimal plan based on the cost in **predpushnormal** and **predpushforce**.
- **disable\_pullup\_expr\_sublink**: The optimizer is not allowed to pull up sublinks of the expr\_sublink type. For details about sublink classification and pull-up principles, see section "SQL Tuning Guide > Typical SQL Tuning Methods > Subquery Tuning" in *Developer Guide*.
- **enable\_sublink\_pullup\_enhanced**: Enhanced sublink query rewriting rules are used, including unrelated sublink pull-up of the WHERE and HAVING clauses and WinMagic rewriting optimization.
- **disable\_pullup\_not\_in\_sublink**: The optimizer is not allowed to pull up sublinks related to NOT IN. For details about sublink classification and pull-up principles, see section "SQL Tuning Guide > Typical SQL Tuning Methods > Subquery Tuning" in *Developer Guide*.

**Default value:** magicset

 **NOTE**

The **partialpush** and **disablerep** parameters can be set but do not take effect.

## enable\_pbe\_optimization

**Parameter description:** Specifies whether the optimizer optimizes the query plan for statements executed in Parse Bind Execute (PBE) mode.

This parameter is a SUSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that the optimizer optimizes the query plan of the PBE statement.
- **off** indicates that the optimization is not used.

**Default value:** on

## enable\_global\_plancache

**Parameter description:** Specifies whether to share the cache for the execution plans of statements in PBE queries and stored procedures. Enabling this function can reduce the memory usage of database nodes in high concurrency scenarios.

When **enable\_global\_plancache** is enabled, the default value of **local\_syscache\_threshold** is greater than or equal to 16 MB to ensure that GPC takes effect. If the value of **local\_syscache\_threshold** is less than 16 MB, set it to 16 MB. If the value is greater than 16 MB, do not change it.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that cache sharing is enabled for the execution plans of statements in PBE queries and stored procedures.
- **off** indicates no sharing.

**Default value:** off

## gpc\_clean\_timeout

**Parameter description:** When **enable\_global\_plancache** is set to **on**, if a plan in the shared plan list is not used within the period specified by **gpc\_clean\_timeout**, the plan will be deleted. This parameter is used to control the retention period of a shared plan that is not used.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 300 to 86400

- The unit is second.

**Default value:** 1800, that is, 30 minutes

## enable\_global\_stats

This parameter has been discarded in the current version. Do not set it.

## enable\_opfusion

**Parameter description:** Specifies whether to optimize simple addition, deletion, modification, and query operations.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

The restrictions on simple query are as follows:

- Only indexscan and indexonlyscan are supported, and the filter criteria of all WHERE statements are on indexes.
- Only single tables can be added, deleted, modified, and queried. Join and using are not supported.
- Only row-store tables are supported. Partitioned tables and tables with triggers are not supported.

- Information statistics features such as active sql and QPS are not supported.
- Tables that are being scaled out or in are not supported.
- The system column cannot be queried or modified.
- Only simple **SELECT** statements are supported. For example:  

```
SELECT c3 FROM t1 WHERE c1 = ? and c2 =10;
```

Only columns in the target table can be queried. Columns **c1** and **c2** are index columns, which can be followed by constants or parameters. You can use **for update**.
- Only simple **INSERT** statements are supported. For example:  

```
INSERT INTO t1 VALUES (?,10,?);
```

Only one **VALUES** is supported. The type in **VALUES** can be a constant or a parameter. **RETURNING** is not supported.
- Only simple **DELETE** statements are supported. For example:  

```
DELETE FROM t1 WHERE c1 = ? and c2 = 10;
```

Columns **c1** and **c2** are index columns, which can be followed by constants or parameters.
- Only simple **UPDATE** statements are supported. For example:  

```
UPDATE t1 SET c3 = c3+? WHERE c1 = ? and c2 = 10;
```

The values modified in column **c3** can be constants, parameters, or a simple expression. Columns **c1** and **c2** are index columns, which can be followed by constants or parameters.

**Value range:** Boolean

- **on:** enabled.
- **off:** disabled.

**Default value:** on

## enable\_partition\_opfusion

**Parameter description:** If this parameter is enabled when the **enable\_opfusion** parameter is enabled, the simple query of the partitioned table can be optimized to improve the SQL execution performance. When the **enable\_global\_plancache** parameter is enabled, this parameter does not take effect even if it is set to **on**.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on:** enabled.
- **off:** disabled.

**Default value:** off

## sql\_beta\_feature

**Parameter description:** Specifies the SQL engine's optional beta features to be enabled, including optimization of row count estimation and query equivalence estimation.

These optional features provide optimization for specific scenarios, but performance deterioration may occur in some scenarios for which testing is not

performed. In a specific customer scenario, you can set the query rewriting rules through this GUC parameter to achieve optimal query efficiency.

This parameter determines the combination of the SQL engine's beta features, for example, feature1, feature2, feature3, and feature4. You can perform the following settings:

```
-- Enable beta feature feature1 of the SQL engine.
set sql_beta_feature=feature1;
-- Enable beta features feature2 and feature3 of the SQL engine.
set sql_beta_feature=feature2,feature3;
-- Disable all optional beta features of the SQL engine.
set sql_beta_feature=none;
```

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string

- **none:** None of the beta optimizer features are used.
- **sel\_semi\_poisson:** Uses poisson distribution to calibrate the equivalent semi-join and anti-join selection rates.
- **sel\_expr\_instr:** Uses the matching row count to provide more accurate estimation for **instr(col, 'const') > 0, = 0, = 1**.
- **param\_path\_gen:** Generates more possible parameterized paths.
- **rand\_cost\_opt:** Optimizes the random read cost of tables that have a small amount of data.
- **param\_path\_opt:** Uses the bloat ratio of the table to optimize the analysis information of indexes.
- **page\_est\_opt:** Optimizes the **relpages** estimation for the analysis information of table indexes.
- **no\_unique\_index\_first:** Disables optimization of the primary key index scanning path first.
- **join\_sel\_with\_cast\_func:** Type conversion functions are supported when the number of join rows is estimated.
- **canonical\_pathkey:** The regularization pathkey is generated in advance. (**pathkey:** a set of ordered key values of data.)

---

 **WARNING**

After this parameter is enabled, the semantics of the output data of statements such as ORDER BY may be different from that of the standard ones in the case of outer join. Contact Huawei engineers to determine whether to enable this parameter.

- 
- **index\_cost\_with\_leaf\_pages\_only:** Considers index leaf nodes when the index cost is estimated.
  - **partition\_opfusion:** Enables partitioned table optimization.
  - **a\_style\_coerce:** enables the Decode type conversion rule to be compatible with O. For details, see the part related to case processing in ORA compatibility mode in section "SQL Reference > Type Conversion > UNION, CASE, and Related Constructs" in *Developer Guide*.

- **partition\_fdw\_on**: SQL statements can be created for Postgres foreign tables based on partitioned tables.
- **predpush\_same\_level**: Enables the **predpush** hint to control parameterized paths at the same layer.
- **enable\_plsql\_smp**: Enables parallel execution of queries in stored procedures. Currently, only one query can be executed in parallel at a time, and no parallel execution plan is generated for cursor-related operations, autonomous transactions, and queries in exceptions.
- **disable\_bitmap\_cost\_with\_lossy\_pages**: Disables the computation of the cost of lossy pages in the bitmap path cost.
- **enable\_upsert\_execute\_gplan**: In the PBE scenario, if the UPDATE clause in the on duplicate key update statement contains parameters, set **enable\_upsert\_execute\_gplan** to allow execution through **gplan**.
- **disable\_merge\_append\_partition**: Do not generate the Merge Append path for partitioned tables.

**Default value:**

"sel\_semi\_poisson,sel\_expr\_instr,rand\_cost\_opt,param\_path\_opt,page\_est\_opt"

## ngram\_gram\_size

**Parameter description:** Specifies the length of the ngram parser segmentation.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 1 to 4

**Default value:** 2

## ngram\_grapsymbol\_ignore

**Parameter description:** Specifies whether the ngram parser ignores graphical characters.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on**: The ngram parser ignores graphical characters.
- **off**: The ngram parser does not ignore graphical characters.

**Default value:** off

## ngram\_punctuation\_ignore

**Parameter description:** Specifies whether the ngram parser ignores punctuation marks.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on**: The ngram parser ignores punctuation marks.
- **off**: The ngram parser does not ignore punctuation marks.

**Default value:** on

## default\_statistics\_target

**Parameter description:** Specifies the default statistics target for table columns without a column-specific target set via **ALTER TABLE SET STATISTICS**. If this parameter is set to a positive number, it indicates the number of samples of statistics information. If this parameter is set to a negative number, percentage is used to set the statistic target. The negative number converts to its corresponding percentage, for example, -5 means 5%.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from -100 to 10000

---

### NOTICE

- A larger positive number than the default value increases the time required to do **ANALYZE**, but might improve the quality of the optimizer's estimates.
- Changing settings of this parameter may result in performance deterioration. If query performance deteriorates, you can:
  1. Restore to the default statistics.
  2. Use hints to force the optimizer to use the optimal query plan. For details, see section "SQL Tuning Guide > Tuning Using Plan Hints" in *Developer Guide*.

---

**Default value:** 100

## auto\_statistic\_ext\_columns

**Parameter description:** Collects statistics about multiple columns based on the first  $K$  columns of the composite index in the data table. This GUC parameter indicates  $K$ . For example, if a composite index is (a, b, c, d, e) and the GUC parameter is set to **3**, statistics about multiple columns are generated on columns (a, b) and (a, b, c). Multi-column statistics can make the optimizer estimate the cardinality more accurate when querying with combined conditions.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

---

**NOTICE**

- The system catalog does not take effect.
- The statistics take effect only when the types of all columns support the comparison functions '=' and '<'.
- System pseudocolumns in indexes, such as **tableoid** and **ctid**, are not collected.
- By default, distinct values, MCVs without NULL, and MCVs with NULL are collected. If the AI-based cardinality estimation parameter **enable\_ai\_stats** is enabled, MCVs are not collected. Instead, models for AI-based cardinality estimation are collected.
- If the index for creating multi-column statistics is deleted and no other index contains the multi-column combination, the multi-column statistics will be deleted in the next ANALYZE operation.
- If the value of this parameter decreases, the new index generates multi-column statistics based on the value of this parameter. The generated multi-column statistics that exceed the value of this parameter will not be deleted.
- If you want to disable the multi-column statistics on a specific combination only, you can retain the value of this parameter and run the **ALTER TABLE tablename disable statistics ((column list))** command to disable the statistics on multiple columns in a specific combination.

---

**Value range:** an integer ranging from 1 to 4 The value 1 indicates that statistics about multiple columns are not automatically collected.

**Default value:** 1

## constraint\_exclusion

**Parameter description:** Specifies the query optimizer's use of table constraints to optimize queries.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** enumerated values

- **on** indicates that constraints for all tables are examined.
- **off** indicates that constraints for any table are not examined.
- **partition** indicates that only constraints for inheritance child tables and **UNION ALL** subqueries are examined.

---

**NOTICE**

When **constraint\_exclusion** is set to **on**, the optimizer compares query conditions with the table's **CHECK** constraints, and omits scanning tables for which the conditions contradict the constraints.

---

**Default value:** partition

 NOTE

Currently, **constraint\_exclusion** is enabled by default only for cases that are often used to implement table partitioning. Turning this feature on for all tables imposes extra planning on simple queries, and provides no benefit for simple queries. If you have no partitioned tables, set it to **off**.

## cursor\_tuple\_fraction

**Parameter description:** Specifies the optimizer's estimated fraction of a cursor's rows that are retrieved.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a floating point number ranging from 0.0 to 1.0

---

**NOTICE**

Smaller values of this setting bias the optimizer towards using **fast start** plans for cursors, which will retrieve the first few rows quickly while perhaps taking a long time to fetch all rows. Larger values put more emphasis on the total estimated time. At the maximum setting of **1.0**, cursors are planned exactly like regular queries, considering only the total estimated time and how soon the first rows might be delivered.

---

**Default value:** 0.1

## from\_collapse\_limit

**Parameter description:** Specifies whether the optimizer merges sub-queries into upper queries based on the resulting FROM list. The optimizer merges sub-queries into upper queries if the resulting FROM list would have no more than this many items.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 1 to *INT\_MAX*

---

**NOTICE**

Smaller values reduce planning time but may lead to inferior execution plans.

---

**Default value:** 8

## join\_collapse\_limit

**Parameter description:** Specifies whether the optimizer rewrites **JOIN** constructs (except **FULL JOIN**) into lists of **FROM** items based on the number of the items in the result list.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 1 to *INT\_MAX*

---

**NOTICE**

- Setting this parameter to **1** prevents join reordering. As a result, the join order specified in the query will be the actual order in which the relations are joined. The query optimizer does not always choose the optimal join order. Therefore, advanced users can temporarily set this variable to **1**, and then specify the join order they desire explicitly.
- Smaller values reduce planning time but lead to inferior execution plans.

---

**Default value:** 8

## plan\_mode\_seed

**Parameter description:** This is a commissioning parameter. Currently, it supports only **OPTIMIZE\_PLAN** and **RANDOM\_PLAN**. The value **0** (for **OPTIMIZE\_PLAN**) indicates the optimized plan using the dynamic planning algorithm. Other values are for **RANDOM\_PLAN**, which indicates that the plan is randomly generated. **-1** indicates that users do not specify the value of the seed identifier. In this case, the optimizer generates a random integer from **1** to **2147483647** and a random execution plan based on the generated integer. A GUC parameter value from **1** to **2147483647** is regarded as the seed identifier, based on which the optimizer generates a random execution plan.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from -1 to 2147483647

**Default value:** 0

---

**NOTICE**

- If this parameter is set to **RANDOM\_PLAN**, the optimizer generates a random execution plan that may not be the optimal one. Therefore, to guarantee the query performance, the default value **0** is recommended during upgrade, scale-out, scale-in, and O&M.
- If this parameter is not set to **0**, the specified plan hint will not be used.

## hashagg\_table\_size

**Parameter description:** Specifies the hash table size during the execution of the HASH JOIN operation.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to *INT\_MAX/2*

**Default value:** 0

## enable\_bloom\_filter

**Parameter description:** Specifies whether the BloomFilter optimization can be used. This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that the BloomFilter optimization can be used.
- **off** indicates that the BloomFilter optimization cannot be used.

**Default value:** on

## enable\_extrapolation\_stats

**Parameter description:** Specifies whether the extrapolation logic is used for data of DATE type based on historical statistics. The logic can increase the accuracy of estimation for tables whose statistics are not collected in time, but will possibly provide an overlarge estimation due to incorrect extrapolation. Enable the logic only in scenarios where the data of DATE type is periodically inserted. This parameter is a SUSERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that the extrapolation logic is used for data of DATE type based on historical statistics.
- **off** indicates that the extrapolation logic is not used for data of DATE type based on historical statistics.

**Default value:** off

## autoanalyze

**Parameter description:** Specifies whether to automatically collect statistics on tables that have no statistics when a plan is generated. **autoanalyze** cannot be used for foreign or temporary tables. To collect statistics, manually perform the ANALYZE operation. If an exception occurs in the database during the execution of autoanalyze on a table, after the database is recovered, the system may still prompt you to collect the statistics of the table when you run the statement again. In this case, manually perform the ANALYZE operation on the table to synchronize statistics. This parameter is a SUSERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that the table statistics are automatically collected.
- **off** indicates that the table statistics are not automatically collected.

**Default value:** off

### NOTE

This parameter does not take effect in centralized mode.

## enable\_analyze\_check

**Parameter description:** Checks whether statistics were collected about tables whose **reltuples** and **relpages** are displayed as **0** in **pg\_class** during plan generation.

This parameter is a SUSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that the tables will be checked.
- **off** indicates that the tables will not be checked.

**Default value:** off

## enable\_sonic\_hashagg

**Parameter description:** Specifies whether to use the hash aggregation operator designed for column-oriented hash tables when certain constraints are met.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that the hash aggregation operator designed for column-oriented hash tables is used when certain constraints are met.
- **off** indicates that the hash aggregation operator designed for column-oriented hash tables is not used.

### NOTE

- When the hash aggregation operator designed for column-oriented hash tables is used, the memory usage of the query can be reduced. However, in scenarios where the performance is significantly improved based on code generation, the performance of the operator may deteriorate.
- If **enable\_sonic\_hashagg** is enabled and the Hash Agg operator designed based on the column-oriented hash table is used when the query meets the constraint condition, the operator is displayed as Sonic Hash Aggregation in the execution plan and execution information of Explain Analyze/Performance; when the query does not meet the constraint condition, the operator is displayed as Hash Aggregation. For details, see section "SQL Tuning Guide > Introduction to the SQL Execution Plan > Description" in *Developer Guide*.

**Default value:** on

## enable\_sonic\_hashjoin

**Parameter description:** Specifies whether to use the hash join operator designed for column-oriented hash tables when certain constraints are met.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that the hash join operator designed for column-oriented hash tables is used when certain constraints are met.

- **off** indicates that the hash join operator designed for column-oriented hash tables is not used.

 **NOTE**

- Currently, the parameter can be used only for Inner Join.
- If **enable\_sonic\_hashjoin** is enabled, the memory usage of query using the Hash Inner operator can be reduced. However, in scenarios where the code generation technology can significantly improve performance, the performance of the operator may deteriorate.
- If **enable\_sonic\_hashjoin** is enabled and the Hash Join operator designed based on the column-oriented hash table is used when the query meets the constraint condition, the operator is displayed as Sonic Hash Join in the execution plan and execution information of Explain Analyze/Performance; when the query does not meet the constraint condition, the operator is displayed as Hash Join. For details, see section "SQL Tuning Guide > Introduction to the SQL Execution Plan > Description" in *Developer Guide*.

**Default value:** on

## enable\_sonic\_optspill

**Parameter description:** Specifies whether to optimize the number of files to be written to disks for the Hash Join operator designed for column-oriented hash tables. If this parameter is set to **on**, the number of files written to disks does not increase significantly when the Hash Join operator writes a large number of files to disks.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that the optimization is enabled.
- **off** indicates that the optimization is disabled.

**Default value:** on

## plan\_cache\_mode

**Parameter description:** Specifies the policy for generating an execution plan in the **prepare** statement.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** enumerated values

- **auto** indicates that the **custom plan** or **generic plan** is selected by default.
- **force\_generic\_plan** indicates that the **generic plan** (soft parse) is forcibly used. The **generic plan** is a plan generated after you run a prepared statement. The plan policy binds parameters to the plan when you run the EXECUTE statement and execute the plan. The advantage of this plan is that repeated optimizer overheads can be avoided in each execution. The disadvantage is that the plan may not be optimal when data skew occurs for the bound parameters and may result in poor plan execution performance.
- **force\_custom\_plan** indicates that the **custom plan** (hard parse) is forcibly used. The **custom plan** is a plan generated after you run a prepared

statement where parameters in the EXECUTE statement are embedded. The **custom plan** generates a plan based on specific parameters in the EXECUTE statement. This plan generates a preferred plan based on specific parameters each time and has good execution performance. The disadvantage is that the plan needs to be regenerated before each execution, resulting in a large amount of repeated optimizer overhead.

 **NOTE**

This parameter is valid only for prepared statements. It is used when the parameterized field in a prepared statement has severe data skew.

**Default value:** auto

## enable\_hypo\_index

**Parameter description:** Determines whether the optimizer considers virtual indexes when executing the **EXPLAIN** command.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on:** enabled.
- **off:** disabled.

**Default value:** off

## enable\_auto\_explain

**Parameter description:** Specifies whether to enable the function of automatically printing execution plans. This parameter is used to locate slow stored procedures or slow queries and is valid only for the currently connected primary database node.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean. The value **true** indicates that the function is enabled, and the value **false** indicates that the function is disabled.

**Default value:** false

## auto\_explain\_level

**Parameter description:** Specifies the log level for automatically printing execution plans.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** enumerated type. The value can be **LOG** or **NOTICE**. **LOG** indicates that the execution plan is printed in logs. **NOTICE** indicates that the execution plan is printed in notification mode.

**Default value:** LOG

## auto\_explain\_log\_min\_duration

**Parameter description:** Specifies the minimum duration of execution plans that are automatically printed. Only execution plans whose duration is greater than the value of **auto\_explain\_log\_min\_duration** will be printed.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 2147483647. The unit is ms.

- **0:** All executed plans are printed.
- **3000:** All execution plans will be printed if the execution of a statement takes more than 3000 ms.

**Default value:** 0

## query\_dop

**Parameter description:** Specifies the user-defined degree of parallelism (DOP). This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 1 to 64. If the fixed SMP function is enabled, the system uses the fixed DOP.

### NOTE

After enabling concurrent queries, ensure you have sufficient CPU, memory, and network to achieve the optimal performance.

**Default value:** 1

## enable\_startwith\_debug

**Parameter description:** Specifies whether to enable the **start with** or **connect by** parameter for debugging. If this parameter is enabled, information about all tail columns related to the **start with** feature is displayed.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean. The value **true** indicates that the function is enabled, and the value **false** indicates that the function is disabled.

**Default value:** false

## enable\_inner\_unique\_opt

**Parameter description:** Specifies that Inner Unique is optimized for nested loop join, hash join, and sort merge join. That is, the number of matching times is reduced when the attribute corresponding to the inner table in the join condition meets the uniqueness constraint.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on**: used.
- **off**: not used.

**Default value:** on

## enable\_indexscan\_optimization

**Parameter description:** Specifies whether to optimize B-tree index scanning (IndexScan and IndexOnlyScan) in the Astore engine.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on**: used.
- **off**: not used.

**Default value:** off

## immediate\_analyze\_threshold

**Parameter description:** Specifies the threshold for automatically analyzing inserted data. When the amount of inserted data reaches the original data amount multiplied by the value of **immediate\_analyze\_threshold**, and the total number of rows exceeds 100, ANALYZE is automatically triggered.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 1000 If this parameter is set to 0, this function is disabled.

**Default value:** 0.

### NOTE

1. This function supports only permanent and unlogged tables. Temporary tables are not supported.
2. ANALYZE is not automatically triggered twice within 10 seconds for the same table.

## enable\_dynamic\_samplesize

**Parameter description:** Specifies whether to dynamically adjust the number of sampled rows. For a large table with more than one million rows, the number of sampled rows is dynamically adjusted during statistics collection to improve statistics accuracy.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on**: indicates that this function is enabled.
- **off**: indicates that the function is disabled.

**Default value:** on

 NOTE

The function of dynamically adjusting the number of sampled rows supports only absolute sampling.

## 14.3.9 Error Reporting and Logging

### 14.3.9.1 Logging Destination

#### log\_destination

**Parameter description:** GaussDB supports several methods of logging server messages. Set this parameter to a list of desired log destinations separated by commas. (For example, log\_destination="stderr, csvlog")

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string

The valid values are **stderr**, **csvlog**, and **syslog**.

- **stderr** indicates that logs are printed to the screen.
- **csvlog** indicates that logs are output in comma-separated value (CSV) format. The prerequisite for generating logs in CSV format is that **logging\_collector** must be set to **on**. For details, see [Using CSV Log Output](#).
- **syslog** indicates that logs are recorded using the syslog of the OS. GaussDB can record logs using syslog from **LOCAL0** to **LOCAL7**. For details, see [syslog facility](#). To record logs using syslog, add the following information to syslog daemon's configuration file:

```
local0.* /var/log/omm
```

**Default value:** **stderr**

#### logging\_collector

**Parameter description:** Specifies whether to enable the logger process to collect logs. This process captures log messages sent to **stderr** or **csvlog** and redirects them into log files.

This method is more effective than recording logs to syslog because some types of messages cannot be displayed in syslog output, such as messages indicating the loading failures of dynamic link libraries and error messages generated by scripts (for example, **archive\_command**).

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

---

**NOTICE**

It is possible to log to **stderr** without using the logging collector and the log messages will go to where the server's **stderr** is directed. However, this method is only suitable for low log volumes due to difficulties in rotating log files.

---

**Value range:** Boolean

- **on** indicates that the log collection is enabled.
- **off** indicates that the log collection is disabled.

**Default value:** on

## log\_directory

**Parameter description:** Specifies the directory for storing log files when **logging\_collector** is set to **on**. The value can be an absolute path, or relative to the data directory. The **log\_directory** parameter can be dynamically modified using the **gs\_guc reload** command. Only users with the **sysadmin** permission can access this parameter.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

---

### NOTICE

- If this parameter is set to an invalid path, the database cannot be started.
- If you modify the **log\_directory** parameter using the **gs\_guc reload** command, and the specified path is valid, the log files are output to this new path. If the specified path is invalid, the log files are output to the valid path set last time and the database operation is not affected. The invalid value is still written into the configuration file.
- In the sandbox environment, the path cannot contain `/var/chroot`. For example, if the absolute path of log is `/var/chroot/var/lib/log/Ruby/pg_log/cn_log`, you only need to set the path to `/var/lib/log/Ruby/pg_log/cn_log`.

---

### NOTE

- Valid path: Users have read and write permissions on the path.
- Invalid path: Users do not have read or write permissions on an invalid path.

**Value range:** a string

**Default value:** specified during installation

## log\_filename

**Parameter description:** Specifies the names of generated log files when **logging\_collector** is set to **on**. The value is treated as a strftime pattern, so %-escapes can be used to specify time-varying file names. Only users with the **sysadmin** permission can access this parameter.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

---

**NOTICE**

- You are advised to use %-escapes to specify the log file names for efficient management of log files.
- If **log\_destination** is set to **csvlog**, log files are output in CSV format with timestamped names, for example, **server\_log.1093827753.csv**.

---

**Value range:** a string

**Default value:** postgresql-%Y-%m-%d\_%H%M%S.log

## log\_file\_mode

**Parameter description:** Specifies the permissions of log files when **logging\_collector** is set to **on**. The parameter value is usually a number in the format acceptable to the **chmod** and **umask** system calls.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

---

**NOTICE**

- Before setting this parameter, set **log\_directory** to store the logs to a directory other than the data directory.
- Do not make the log files world-readable because they might contain sensitive data.

---

**Value range:** an octal integer ranging from 0000 to 0777 (that is, 0 to 511 in the decimal format)

 **NOTE**

- **0600** indicates that log files are readable and writable only to the server administrator.
- **0640** indicates that log files are readable and writable to members of the administrator's group.

**Default value:** 0600

## log\_truncate\_on\_rotation

**Parameter description:** Specifies the writing mode of the log files when **logging\_collector** is set to **on**.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

A setting example is as follows:

Assume that you want logs to be kept for 7 days, a log file generated each day to be named **server\_log.Mon** on Monday, **server\_log.Tue** on Tuesday, and so forth, and this week's log files to be overwritten by next week's log files. Then you can set **log\_filename** to **server\_log.%a**, **log\_truncate\_on\_rotation** to **on**, and **log\_rotation\_age** to **1440** (indicating that the valid duration of the log file is 24 hours).

**Value range:** Boolean

- **on** indicates that GaussDB overwrites the existing log files of the same name on the server.
- **off** indicates that GaussDB appends the logging messages to the existing log files of the same name on the server.

**Default value:** off

## log\_rotation\_age

**Parameter description:** Specifies the interval for creating a log file when **logging\_collector** is set to **on**. If the duration from the time when the last log file was created to the current time is greater than the value of **log\_rotation\_age**, a new log file will be generated.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 35791394. The unit is min. **0** indicates that the time-based creation of new log files is disabled.

**Default value:** 1440

## log\_rotation\_size

**Parameter description:** Specifies the maximum size of a server log file when **logging\_collector** is set to **on**. If the total size of messages in a log file exceeds the specified value, a log file will be generated.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to  $INT\_MAX/1024$ . The unit is KB.

**0** indicates that the capacity-based creation of new log files is disabled.

It is recommended that the unit of the value be MB or bigger, so that log files can be of proper size.

**Default value:** 20 MB

## syslog\_facility

**Parameter description:** Specifies the syslog facility to be used when **log\_destination** is set to **syslog**.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** enumerated values. Valid values are **local0**, **local1**, **local2**, **local3**, **local4**, **local5**, **local6**, and **local7**.

**Default value:** local0

## syslog\_ident

**Parameter description:** Specifies the identifier of GaussDB messages in syslog logs when **log\_destination** is set to **syslog**.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string

**Default value:** postgres

## event\_source

**Parameter description:** This parameter takes effect only in a Windows environment and is not supported in GaussDB. It specifies the identifier of GaussDB messages in logs when **log\_destination** is set to **eventlog**.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string

**Default value:** PostgreSQL

## 14.3.9.2 Logging Time

### client\_min\_messages

**Parameter description:** Specifies which level of messages will be sent to the client. Each level covers all the levels following it. The lower the level is, the fewer messages are sent.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

---

#### NOTICE

A same value for **client\_min\_messages** and **log\_min\_messages** does not indicate the same level.

---

**Value range:** enumerated values. Valid values are **debug**, **debug5**, **debug4**, **debug3**, **debug2**, **debug1**, **info**, **log**, **notice**, **warning**, **error**, **fatal**, and **panic**. For details about the parameter, see [Table 14-6](#). If the configured level is higher than **error**, for example, **fatal** or **panic**, the system changes the level to **error** by default.

**Default value:** notice

### log\_min\_messages

**Parameter description:** Specifies which level of messages will be written into the server log. Each level covers all the levels following it. The lower the level is, the fewer messages will be written into the log.

This parameter is a SUSER parameter. Set it based on instructions provided in [Table 14-1](#).

---

#### NOTICE

A same value for **client\_min\_messages** and **log\_min\_messages** does not indicate the same level. For some log information, after this parameter is enabled, you also need to set **logging\_module** to enable log printing for the corresponding module.

---

**Value range:** enumerated values. Valid values are **debug**, **debug5**, **debug4**, **debug3**, **debug2**, **debug1**, **info**, **log**, **notice**, **warning**, **error**, **fatal**, and **panic**. For details about the parameter, see [Table 14-6](#).

**Default value:** warning

## log\_min\_error\_statement

**Parameter description:** Controls which SQL statements that cause an error condition are recorded in the server log.

This parameter is a SUSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** enumerated values. Valid values are **debug**, **debug5**, **debug4**, **debug3**, **debug2**, **debug1**, **info**, **log**, **notice**, **warning**, **error**, **fatal**, and **panic**. For details about the parameter, see [Table 14-6](#).

### NOTE

- The default is **error**, indicating that statements causing errors, log messages, fatal errors, or panics will be logged.
- **panic** indicates that SQL statements that cause an error condition will not be logged.

**Default value:** error

## log\_min\_duration\_statement

**Parameter description:** Specifies the threshold for logging the duration of a completed statement. If a statement runs for a period greater than or equal to the specified value, its duration will be logged.

Setting this parameter can be helpful in tracking down unoptimized queries. For clients using extended query protocols, the time required for parsing, binding, and executing steps are logged independently.

This parameter is a SUSET parameter. Set it based on instructions provided in [Table 14-1](#).

---

### NOTICE

When using this option together with [log\\_statement](#), the text of statements that are logged because of [log\\_statement](#) will not be repeated in the duration log message. If you are not using [syslog](#), it is recommended that you log the process ID (PID) or session ID using [log\\_line\\_prefix](#) so that you can link the statement message to the later duration message.

---

**Value range:** an integer ranging from -1 to 2147483647. The unit is ms.

- If this parameter is set to **250**, all SQL statements that run for 250 ms or longer will be logged.
- **0** indicates that the execution durations of all the statements are logged.
- **-1** indicates that the duration logging is disabled.

**Default value:** 3s (that is, 3000 ms)

## backtrace\_min\_messages

**Parameter description:** Prints the function's stack information to the server's log file if the information generated is greater than or equal to the level specified by this parameter.

This parameter is a SUSE parameter. Set it based on instructions provided in [Table 14-1](#).

### NOTICE

This parameter is used to locate problems on-site. Frequent stack printing will affect the system's overhead and stability. Therefore, set the value of this parameter to a rank other than **fatal** or **panic** during problem location.

**Value range:** enumerated values

Valid values include **debug**, **debug5**, **debug4**, **debug3**, **debug2**, **debug1**, **info**, **log**, **notice**, **warning**, **error**, **fatal**, and **panic**. For details about the parameter, see [Table 14-6](#).

**Default value:** **panic**

[Table 14-6](#) explains message severities used by GaussDB. If logging output is sent to **syslog** or **eventlog**, the severities are translated as shown in the table. (Note that the translation takes effect only in a Windows environment where GaussDB does not involve this parameter.)

**Table 14-6** Message severity levels

Severity	Description	System Log	Event Log
debug[1-5]	Provides detailed debug information.	DEBUG	INFORMATION
log	Reports information of interest to administrators, for example, checkpoint activity.	INFO	INFORMATION
info	Provides information implicitly requested by users, for example, output from <b>VACUUM VERBOSE</b> .	INFO	INFORMATION
notice	Provides information that might be helpful to users, for example, truncation of long identifiers and index created as part of the primary key.	NOTICE	INFORMATION
warning	Provides warnings of likely problems, for example, <b>COMMIT</b> outside a transaction block.	NOTICE	WARNING

Severity	Description	System Log	Event Log
error	Reports an error that causes a command to terminate.	WARNING	ERROR
fatal	Reports the reason that causes a session to terminate.	ERR	ERROR
panic	Reports an error that caused all database sessions to terminate.	CRIT	ERROR

### 14.3.9.3 Logging Content

#### debug\_print\_parse

**Parameter description:** Specifies whether to print parsing tree results.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that the printing is enabled.
- **off** indicates that the printing is disabled.

**Default value:** off

#### debug\_print\_rewritten

**Parameter description:** Specifies whether to print query rewriting results.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that the printing is enabled.
- **off** indicates that the printing is disabled.

**Default value:** off

#### debug\_print\_plan

**Parameter description:** Specifies whether to print the query execution plan to logs.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that the printing is enabled.
- **off** indicates that the printing is disabled.

**Default value:** off

#### NOTICE

- Debugging information about **debug\_print\_parse**, **debug\_print\_rewritten**, and **debug\_print\_plan** are printed only when the log level is set to **log** or higher. When these parameters are set to **on**, their debugging information will be recorded in server logs and will not be sent to client logs. You can change the log level by setting **client\_min\_messages** and **log\_min\_messages**.
- Do not invoke the **gs\_encrypt\_aes128** and **gs\_decrypt\_aes128** functions when **debug\_print\_plan** is set to **on**, preventing the risk of sensitive information disclosure. You are advised to filter parameter information of the **gs\_encrypt\_aes128** and **gs\_decrypt\_aes128** functions in the log files generated when **debug\_print\_plan** is set to **on** before providing the log files to external maintenance engineers for fault locating. After you finish using the logs, delete them as soon as possible.

## debug\_pretty\_print

**Parameter description:** Indents the logs produced by **debug\_print\_parse**, **debug\_print\_rewritten**, and **debug\_print\_plan**. The output format is more readable but much longer than that generated when this parameter is set to **off**.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that the indentation is enabled.
- **off** indicates that the indentation is disabled.

**Default value:** on

## log\_checkpoints

**Parameter description:** Specifies whether the statistics on checkpoints and restart points are recorded in the server logs. When this parameter is set to **on**, statistics on checkpoints and restart points are recorded in the log messages, including the number of buffers written and the time spent in writing them.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that the statistics on checkpoints and restart points are recorded in the server logs.
- **off** indicates that the statistics on checkpoints and restart points are not recorded in the server logs

**Default value:** off

## log\_connections

**Parameter description:** Specifies whether to record connection request information of the client.

This parameter is a BACKEND parameter. Set it based on instructions provided in [Table 14-1](#).

---

**NOTICE**

Some client programs, such as gsql, attempt to connect twice while determining if a password is required. In this case, duplicate "connection receive" messages do not necessarily indicate a problem.

---

**Value range:** Boolean

- **on** indicates that the request information is recorded.
- **off** indicates that the request information is not recorded.

**Default value:** off

## log\_disconnections

**Parameter description:** Specifies whether to record disconnection request information of the client.

This parameter is a BACKEND parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that the request information is recorded.
- **off** indicates that the request information is not recorded.

**Default value:** off

## log\_duration

**Parameter description:** Specifies whether to record the duration of every completed SQL statement. For clients using extended query protocols, the time required for parsing, binding, and executing steps are logged independently.

This parameter is a SUSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **off:** Compared with this option, [log\\_min\\_duration\\_statement](#) forcibly records the query text.
- If this parameter is set to **on** and [log\\_min\\_duration\\_statement](#) is set to a positive value, the duration of each completed statement is logged but the query text is included only for statements exceeding the threshold. This behavior can be used for gathering statistics in high-load situation.

**Default value:** off

## log\_error\_verbosity

**Parameter description:** Specifies the amount of detail written in the server log for each message that is logged.

This parameter is a SUSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** enumerated values

- **terse** indicates that the output excludes the DETAIL, HINT, QUERY, and CONTEXT error information.
- **verbose** indicates that the output includes the SQLSTATE error code, the source code file name, function name, and number of the line in which the error occurs.
- **default** indicates that the output includes the DETAIL, HINT, QUERY, and CONTEXT error information, and excludes the SQLSTATE error code, the source code file name, function name, and number of the line in which the error occurs.

**Default value:** default

## log\_hostname

**Parameter description:** By default, connection log messages only show the IP address of the connecting host. The host name can be recorded when this parameter is set to **on**. It may take some time to parse the host name. Therefore, the database performance may be affected.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that the host name is simultaneously recorded.
- **off** indicates that the host name is not simultaneously recorded.

**Default value:** off

## log\_line\_prefix

**Parameter description:** Specifies the prefix format of each log information. A prefix is a printf-style string that is output at the beginning of each line of the log. The "escape sequences" which begin with **%** are replaced with status information as listed in [Table 14-7](#).

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Table 14-7** Escape characters

Escape Character	Effect
%a	Application name
%u	Username
%d	Database name
%r	Remote host name or IP address and remote port. If <b>log_hostname</b> is set to <b>off</b> , only the IP address and remote port are displayed.

Escape Character	Effect
%h	Remote host name or IP address. If <b>log_hostname</b> is set to <b>off</b> , only the IP address is displayed.
%p	Thread ID
%t	Time stamp without milliseconds
%m	Timestamp with milliseconds
%n	Node from which an error is reported
%i	Command tag: type of command executed in the current session
%e	SQLSTATE error code
%c	Session ID: For details, see the note below the table.
%l	Number of the log line for each session or thread, starting at 1
%s	Process startup time
%v	Virtual transaction ID (backendID/ localXID)
%x	Transaction ID ( <b>0</b> indicates that no transaction ID is assigned)
%q	Produces no output. If the current thread is a backend thread, this escape sequence is ignored and subsequent escape sequences are processed. Otherwise, this escape sequence and subsequent escape sequences are all ignored.
%S	Session ID
%T	Trace ID
%%	The character %

 **NOTE**

The %c escape character prints a session ID consisting of two 4-byte hexadecimal numbers separated by a period (.). The numbers are the process startup time and the process ID. Therefore, %c can also be used as a space saving way of printing those items. For example, run the following query to generate the session ID from **pg\_stat\_activity**:

```
SELECT to_hex(EXTRACT(EPOCH FROM backend_start)::integer) || '.' ||
       to_hex(pid)
FROM pg_stat_activity;
```

- If you set a nonempty value for **log\_line\_prefix**, you should usually make its last character be a space, to provide visual separation from the rest of the log line. A punctuation character can be used, too.
- Syslog generates its own timestamp and process ID information. Therefore, you do not need to include those escapes characters when you are logging in to syslog.

**Value range:** a string

**Default value:** %m %n %u %d %h %p %S %x %a

 NOTE

`%m %n %u %d %h %p %S %x %a` indicates the session start timestamp, error reporting node, username, database name, remote host name or IP address, thread ID, session ID, transaction ID, and application name.

## log\_lock\_waits

**Parameter description:** If the time for which a session waits to acquire a lock is longer than the value of `deadlock_timeout`, this parameter specifies whether to record this message in the database. This is useful in determining if lock waits are causing poor performance.

This parameter is a SUSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that the information is recorded.
- **off** indicates that the information is not recorded.

**Default value:** off

## log\_statement

**Parameter description:** Specifies which SQL statements are recorded. For clients using extended query protocols, logging occurs when an Execute message is received, and values of the Bind parameters are included (with any embedded single quotation marks doubled).

This parameter is a SUSET parameter. Set it based on instructions provided in [Table 14-1](#).

---

**NOTICE**

- Statements that contain simple syntax errors are not logged even if **log\_statement** is set to **all**, because the log message is emitted only after basic parsing has been completed to determine the statement type. If an extended query protocol is used, statements that fail before the execution phase (during parse analysis or planning) are not logged, either. Set **log\_min\_error\_statement** to **ERROR** or lower to log such statements.
- If this parameter is set to a value other than **none**, the statement audit function is enabled. The database administrator can access server logs to view SQL execution records.

---

**Value range:** enumerated values

- **none** indicates that no statement is recorded.
- **ddl** indicates that all data definition statements, such as CREATE, ALTER, and DROP, are recorded.
- **mod** indicates that all DDL statements and data modification statements, such as INSERT, UPDATE, DELETE, TRUNCATE, and COPY FROM, are recorded.

- **all** indicates that all statements, including the PREPARE, EXECUTE, and EXPLAIN ANALYZE statements, are recorded.

**Default value:** none

## log\_temp\_files

**Parameter description:** Specifies whether to record the deletion information of temporary files. Temporary files can be created for sorting, hashing, and storing temporary querying results. If the recording is enabled, a log entry is generated for each temporary file when it is deleted.

This parameter is a SUSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from -1 to 2147483647. The unit is KB.

- A positive value indicates that the deletion information of temporary files whose size is larger than the specified value of **log\_temp\_files** is recorded.
- **0** indicates that the delete information of all temporary files is recorded.
- **-1** indicates that the delete information of any temporary files is not recorded.

**Default value:** -1

## log\_timezone

**Parameter description:** Specifies the time zone used for timestamps written in the server log. Different from [TimeZone](#), this parameter takes effect for all sessions in the database.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string. You can query the PG\_TIMEZONE\_NAMES view to obtain the value. For details, see section "System Catalogs and System Views > System Views > PG\_TIMEZONE\_NAMES" in the *Developer Guide*.

**Default value:** Set this parameter based on the OS time zone.

### NOTE

The default value will be changed when **gs\_initdb** is used to set system environments.

## logging\_module

**Parameter description:** Specifies whether module logs are output on the server. This parameter is a session-level parameter, and you are advised not to use the gs\_guc tool to set it.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string

**Default value:** Logs of the LOCK module are generated on the server. Logs of other modules are not generated on the server, but can be viewed by running **SHOW logging\_module**.

```
ALL,on(LOCK),off(COMMAND,DFS,GUC,GSCLEAN,HDFS,ORC,SLRU,MEM_CTL,AUTOVAC,CACHE,ADIO,SSL,GD
S,TBLSPC,WLM,OBS,INDEX,EXECUTOR,OPFUSION,GPC,GSC,VEC_EXECUTOR,STREAM,LLVM,OPT,OPT_REWRIT
E,OPT_JOIN,OPT_AGG,OPT_CHOICE,OPT_SUBPLAN,OPT_SETOP,OPT_SKEW,OPT_PLANNER,OPT_STAT_EXT,UD
F,COOP_ANALYZE,WLMCP,ACCELERATE,PLANHINT,PARQUET,PGSTAT,CARBONDATA,SNAPSHOT,XACT,HANDL
E,CLOG,EC,REMOTE,CN_RETRY,PLSQL,TEXTSEARCH,SEQ,REDO,FUNCTION,PARSER,INSTR,WDR_SNAPSHOT,W
DR_REPORT,INCRE_CKPT,INCRE_BG_WRITER,DBL_WRT,RTO_RPO,HEARTBEAT,COMM_IPC,COMM_PARAM,TIM
ESERIES,SCHEMA,SEGMENT_PAGE,LIGHTPROXY,HOTKEY,THREAD_POOL,OPT_AI,WALRECEIVER,USTORE,UPA
GE,UBTREE,UNDO,TIMECAPSULE,GEN_COL,DCF,DB4AI,PLDEBUGGER,ADVISOR,SEC,SEC_FE,SEC_LEGER,SEC_P
OLICY,SEC_SDD,SEC_TDE,COMM_FRAMEWORK,COMM_PROXY,COMM_POOLER,VACUUM,JOB,SPI,NEST_COM
PILE,RESOWNER,GSSTACK,LOGICAL_DECODE,GPRC,DISASTER_READ,STANDBY_READ,REPSYNC,SQLPATCH,PA
RTITION,UBT_NEWPAGE,GPI,GS_DEPENDENCY,LWLOCK)
```

 **CAUTION**

**CN\_RETRY** does not take effect in the current version.

**Setting method:** Run **SHOW logging\_module** to view which modules are controllable. For example, the query output result is as follows:

```
gaussdb=# show logging_module;
logging_module
-----
ALL,on(LOCK),off(COMMAND,DFS,GUC,GSCLEAN,HDFS,ORC,SLRU,MEM_CTL,AUTOVAC,CACHE,ADIO,SSL,GD
S,TBLSPC,WLM,OBS,INDEX,EXECUTOR,OPFUSION,GPC,GSC,VEC_EXECUTOR,STREAM,LLVM,OPT,OPT_REWRIT
E,OPT_JOIN,OPT_AGG,OPT_CHOICE,OPT_SUBPLAN,OPT_SETOP,OPT_SKEW,OPT_PLANNER,OPT_STAT_EXT,UD
F,COOP_ANALYZE,WLMCP,ACCELERATE,PLANHINT,PARQUET,PGSTAT,CARBONDATA,SNAPSHOT,XACT,HANDL
E,CLOG,EC,REMOTE,PLSQL,TEXTSEARCH,SEQ,REDO,FUNCTION,PARSER,INSTR,WDR_SNAPSHOT,WDR_REPOR
T,INCRE_CKPT,INCRE_BG_WRITER,DBL_WRT,RTO_RPO,HEARTBEAT,COMM_IPC,COMM_PARAM,TIMESERIES,SC
HEMA,SEGMENT_PAGE,LIGHTPROXY,HOTKEY,THREAD_POOL,OPT_AI,WALRECEIVER,USTORE,UPAGE,UBTREE,
UNDO,TIMECAPSULE,GEN_COL,DCF,DB4AI,PLDEBUGGER,ADVISOR,SEC,SEC_FE,SEC_LEGER,SEC_POLICY,SEC_S
DD,SEC_TDE,COMM_FRAMEWORK,COMM_PROXY,COMM_POOLER,VACUUM,JOB,SPI,NEST_COMPILE,RESO
WNER,GSSTACK,LOGICAL_DECODE,GPRC,DISASTER_READ,STANDBY_READ,REPSYNC,SQLPATCH,PARTITION,
UBT_NEWPAGE,GPI,GS_DEPENDENCY,LWLOCK)
(1 row)
```

Controllable modules are identified by uppercase letters, and the special ID **ALL** is used for setting all module logs. You can control the output of module logs by setting **logging\_module** to **on** or **off**. Enable log output for SSL:

```
gaussdb=# set logging_module='on(SSL)';
SET
gaussdb=# show
logging_module;
logging_module
-----
ALL,on(SSL,LOCK),off(COMMAND,DFS,GUC,GSCLEAN,HDFS,ORC,SLRU,MEM_CTL,AUTOVAC,CACHE,ADIO,GD
S,TBLSPC,WLM,OBS,INDEX,EXECUTOR,OPFUSION,GPC,GSC,VEC_EXECUTOR,STREAM,LLVM,OPT,OPT_REWRIT
E,OPT_JOIN,OPT_AGG,OPT_CHOICE,OPT_SUBPLAN,OPT_SETOP,OPT_SKEW,OPT_PLANNER,OPT_STAT_EXT,UD
F,COOP_ANALYZE,WLMCP,ACCELERATE,PLANHINT,PARQUET,PGSTAT,CARBONDATA,SNAPSHOT,XACT,HANDL
E,CLOG,EC,REMOTE,PLSQL,TEXTSEARCH,SEQ,REDO,FUNCTION,PARSER,INSTR,WDR_SNAPSHOT,WDR_REPOR
T,INCRE_CKPT,INCRE_BG_WRITER,DBL_WRT,RTO_RPO,HEARTBEAT,COMM_IPC,COMM_PARAM,TIMESERIES,SC
HEMA,SEGMENT_PAGE,LIGHTPROXY,HOTKEY,THREAD_POOL,OPT_AI,WALRECEIVER,USTORE,UPAGE,UBTREE,
UNDO,TIMECAPSULE,GEN_COL,DCF,DB4AI,PLDEBUGGER,ADVISOR,SEC,SEC_FE,SEC_LEGER,SEC_POLICY,SEC_S
DD,SEC_TDE,COMM_FRAMEWORK,COMM_PROXY,COMM_POOLER,VACUUM,JOB,SPI,NEST_COMPILE,RESO
WNER,GSSTACK,LOGICAL_DECODE,GPRC,DISASTER_READ,STANDBY_READ,REPSYNC,SQLPATCH,PARTITION,
UBT_NEWPAGE,GPI,GS_DEPENDENCY,LWLOCK)
(1 row)
```

SSL log output is enabled.

The **ALL** identifier can be used to quickly enable or disable log output for all modules.

```
gaussdb=# set logging_module='off(ALL)';
SET
gaussdb=# show
logging_module;
      logging_module
-----
ALL,on(),off(COMMAND,DFS,GUC,GSCLEAN,HDFS,ORC,SLRU,MEM_CTL,AUTOVAC,CACHE,ADIO,SSL,GDS,TBLS
SPC,WLM,OBS,INDEX,EXECUTOR,OPFUSION,GPC,GSC,VEC_EXECUTOR,STREAM,LLVM,OPT,OPT_REWRITE,OPT

KPT,INCRE_BG_WRITER,DBL_WRT,RTO_RPO,HEARTBEAT,COMM_IPC,COMM_PARAM,TIMESERIES,SCHEMA,SE
GMENT_PAGE,LIGHTPROXY,HOTKEY,THREAD_POOL,OPT_AI,WALRECEIVER,USTORE,UPAGE,UBTREE,UNDO,TI
MECAPSULE,GEN_COL,DCF,DB4AI,PLDEBUGGER,ADVISOR,SEC,SEC_FE,SEC_LEGER,SEC_POLICY,SEC_SDD,SEC_
TDE,COMM_FRAMEWORK,COMM_PROXY,COMM_POOLER,VACUUM,JOB,SPI,NEST_COMPILE,RESOWNER,GS
STACK,LOGICAL_DECODE,GPRC,DISASTER_READ,STANDBY_READ,REPSYNC,SQLPATCH,PARTITION,UBT_NEW
PAGE,GPI,GS_DEPENDENCY,LWLOCK,LOCK),off()
(1 row)
```

**Dependency:** The value of this parameter depends on the settings of `log_min_messages`.

## opfusion\_debug\_mode

**Parameter description:** Checks whether simple queries are optimized for debugging. If this parameter is set to **log**, you can view the specific reasons why queries are not optimized in the database node execution plans.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** enumerated values

- **off** indicates that reasons why queries are not optimized are not included.
- **log** indicates that reasons why queries are not optimized are included in the database node execution plan.

#### NOTICE

To view the reasons why queries are not optimized in the log, set **opfusion\_debug\_mode** to **log**, **log\_min\_messages** to **debug4**, and **logging\_module** to **on(OPFUSION)**. Note that a large number of log messages may be generated. Therefore, execute only a small number of jobs during debugging.

**Default value:** off

### enable\_debug\_vacuum

**Parameter description:** Specifies whether to allow output of some VACUUM-related logs for problem locating. This parameter is used only by developers. Common users are advised not to use it.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** or **true** indicates that generation of ADIO logs is allowed.
- **off** or **false** indicates that generation of ADIO logs is not allowed.

**Default value:** off

### 14.3.9.4 Using CSV Log Output

#### Prerequisites

- The **log\_destination** parameter is set to **csvlog**.
- The **logging\_collector** parameter is set to **on**.

#### Definition of csvlog

Log lines are emitted in comma-separated values (CSV) format.

An example table definition for storing CSV-format log output is shown as follows:

```
CREATE TABLE gaussdb_log
(
  log_time timestamp(3) with time zone,
  node_name text,
  user_name text,
  database_name text,
  process_id bigint,
  connection_from text,
  "session_id" text,
  session_line_num bigint,
  command_tag text,
  session_start_time timestamp with time zone,
  virtual_transaction_id text,
  transaction_id bigint,
  query_id bigint,
  module text,
  error_severity text,
  sql_state_code text,
  message text,
  detail text,
  hint text,
```

```
internal_query text,
internal_query_pos integer,
context text,
query text,
query_pos integer,
location text,
application_name text
);
```

For details, see [Table 14-8](#).

**Table 14-8** Meaning of each csvlog field

Column	Description	Column	Description
log_time	Timestamp in milliseconds	module	Module to which the log belongs
node_name	Node name	error_severity	ERRORSTATE code
user_name	Username	sql_state_code	SQLSTATE code
database_name	Database name	message	Error message
process_id	Process ID	detail	Detailed error message
connection_from	Port number of the client host	hint	Prompt message
session_id	Session ID	internal_query	Internal query (This field is used to query the information leading to errors if any.)
session_line_num	Number of lines in each session	internal_query_pos	Pointer for an internal query
command_tag	Command tag	context	Environment
session_start_time	Start time of a session	query	Character count at the position where errors occur
virtual_transaction_id	Regular transaction	query_pos	Pointer at the position where errors occur

Column	Description	Column	Description
transaction_id	Transaction ID	location	Position where errors occur in the GaussDB source code if <b>log_error_verbosity</b> is set to <b>verbose</b>
query_id	Query ID	application_name	Application name

Run the following command to import a log file to this table:

```
COPY gaussdb_log FROM '/opt/data/pg_log/logfile.csv' WITH csv;
```

#### NOTE

The log name (**logfile.csv**) here needs to be replaced with the name of a log generated.

## Simplifying Input

Simplify importing CSV log files by performing the following operations:

- Set **log\_filename** and **log\_rotation\_age** to provide a consistent, predictable naming solution for log files. By doing this, you can predict when an individual log file is complete and ready to be imported.
- Set **log\_rotation\_size** to **0** to disable size-based log rollback, as it makes the log file name difficult to predict.
- Set **log\_truncate\_on\_rotation** to **on** so that old log data cannot be mixed with the new one in the same file.

### 14.3.10 Alarm Detection

During the running of the database, error scenarios can be detected so that users are informed of the errors in time. You can view the **system\_alarm** log written by the alarm in the *\$GAUSSLOG/cm* directory.

#### enable\_alarm

**Parameter description:** Specifies whether to enable the alarm detection thread to detect fault scenarios that may occur in the database.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that the alarm detection thread is enabled.
- **off** indicates that the alarm detection thread is disabled.

**Default value:** on

#### NOTE

This parameter takes effect only on DNs.

## connection\_alarm\_rate

**Parameter description:** Specifies the ratio restriction on the maximum number of allowed parallel connections to the database. The maximum number of concurrent connections to the database is **max\_connections** x **connection\_alarm\_rate**.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a floating point number ranging from 0.0 to 1.0

**Default value:** 0.9

## alarm\_report\_interval

**Parameter description:** specifies the interval at which an alarm is reported.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer. The unit is s.

**Default value:** 10

## alarm\_component

**Parameter description:** Certain alarms are suppressed during alarm reporting. That is, the same alarm will not be repeatedly reported by an instance within the period specified by **alarm\_report\_interval**. Its default value is **10s**. In this case, the parameter specifies the location of the alarm component that is used to process alarm information. Only the sysadmin user can access this parameter.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string

- If **--alarm-type** in the **gs\_preinstall** script is set to **5**, no third-party component is connected and alarms are written into the **system\_alarm** log. In this case, the value of **alarm\_component** is **/opt/huawei/snas/bin/snas\_cm\_cmd**.
- If **--alarm-type** in the **gs\_preinstall** script is set to **1**, a third-party component is connected. In this case, the value of **alarm\_component** is the absolute path of the executable program of the third-party component.

**Default value:** **/opt/huawei/snas/bin/snas\_cm\_cmd**

## table\_skewness\_warning\_threshold

**Parameter description:** Specifies the threshold for triggering a table skew alarm.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a floating point number ranging from 0 to 1

**Default value:** 1

## table\_skewness\_warning\_rows

**Parameter description:** Specifies the number of rows for triggering a table skew alarm.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to *INT\_MAX*

**Default value:** 100000

## 14.3.11 Statistics During the Database Running

### 14.3.11.1 Query and Index Statistics Collector

The query and index statistics collector is used to collect statistics during database running. The statistics include the times of inserting and updating a table and index, the number of disk blocks and tuples, and the time required for the last cleanup and analysis on each table. The statistics can be viewed by querying system view families `pg_stats` and `pg_statistic`. The following parameters are used to set the statistics collection feature in the server scope.

## track\_activities

**Parameter description:** Collects statistics about the commands that are being executed in each session. For a stored procedure, if this parameter is enabled, you can view the PERFORM statement, stored procedure calling statement, SQL statement, and OPEN CURSOR statement that are being executed in the stored procedure in the `pg_stat_activity` view.

This parameter is a SUSER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that the statistics collection function is enabled.
- **off** indicates that the statistics collection function is disabled.

**Default value:** on

## track\_counts

**Parameter description:** Collects statistics about database activities.

This parameter is a SUSER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that the statistics collection function is enabled.
- **off** indicates that the statistics collection function is disabled.

### NOTE

Database statistics are required when the autovacuum process checks for databases that need to be vacuumed. Therefore, the default value is set to **on**.

**Default value:** on

## track\_io\_timing

**Parameter description:** Collects statistics about I/O timing in the database. The I/O timing statistics can be queried by using the **pg\_stat\_database** parameter.

This parameter is a SUSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- If this parameter is set to **on**, the collection function is enabled. In this case, the collector repeatedly queries the operating system at the current time. As a result, large number of costs may occur on some platforms. Therefore, the default value is set to **off**.
- **off** indicates that the statistics collection function is disabled.

**Default value:** off

## track\_functions

**Parameter description:** Collects statistics of the number and duration of function invocations.

This parameter is a SUSET parameter. Set it based on instructions provided in [Table 14-1](#).

---

### NOTICE

When the SQL functions are set to inline functions queried by the invoking, these SQL functions cannot be traced no matter these functions are set or not.

---

**Value range:** enumerated values

- **pl** indicates that only procedural language functions are traced.
- **all** indicates that SQL language functions area traced.
- **none** indicates that the function tracing function is disabled.

**Default value:** none

## track\_activity\_query\_size

**Parameter description:** Specifies byte counts of the current running commands used to trace each active session.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 100 to 102400, in bytes

**Default value:** 1024

## update\_process\_title

**Parameter description:** Collects statistics updated with a process name each time the server receives a new SQL statement.

The process name can be viewed by running the **ps** command.

This parameter is an INTERNAL parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that the statistics collection function is enabled.
- **off** indicates that the statistics collection function is disabled.

**Default value:** off

## stats\_temp\_directory

**Parameter description:** Specifies the directory for storing temporary statistics. Only the sysadmin user can access this parameter.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

---

### NOTICE

If a RAM-based file system directory is used, the actual I/O cost can be lowered and the performance can be improved.

---

**Value range:** a string

**Default value:** pg\_stat\_tmp

## track\_thread\_wait\_status\_interval

**Parameter description:** Specifies the interval of collecting the thread status information.

This parameter is a SUSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** 0 to 1 day. The unit is min.

**Default value:** 30min

## enable\_save\_datachanged\_timestamp

**Parameter description:** Specifies whether to record the time when **INSERT**, **UPDATE**, **DELETE**, or **EXCHANGE/TRUNCATE/DROP PARTITION** is performed on table data.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that the time when an operation is performed on table data will be recorded.
- **off** indicates that the time when an operation is performed on table data will not be recorded.

**Default value:** on

## enable\_plan\_trace

**Parameter description:** Specifies whether to enable the PLAN TRACE feature for the database. This parameter cannot be set globally by running the **gs\_guc** command. It can be set only using the **set** command in a connected session.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that the PLAN TRACE feature is enabled.
- **off** indicates that the PLAN TRACE feature is disabled.

**Default value:** off

## plan\_collect\_thresh

**Parameter description:** Collects statistics about the plans that are being executed in each session.

This parameter is a SUSERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from -1 to 2147483647

- **-1:** Plans that are being executed are not collected.
- **0:** Plans that are being executed are collected before plan execution.
- A value greater than **0** indicates that when the total number of tuples incrementally returned by all operators in a plan is greater than or equal to the value of this parameter, plans that are being executed are collected once.

**Default value:** 0

## track\_sql\_count

**Parameter description:** Collects statistics about the statements (**SELECT**, **INSERT**, **UPDATE**, **MERGE INTO**, and **DELETE**) that are being executed in a session.

In the x86-based centralized deployment scenario, the hardware configuration specifications are 32-core CPU and 256 GB memory. When the Benchmark SQL 5.0 tool is used to test performance, the performance fluctuates by about 0.8% by enabling or disabling this parameter.

This parameter is a SUSERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that the statistics collection function is enabled.
- **off** indicates that the auditing function is disabled.

**Default value:** on

 **NOTE**

- The **track\_sql\_count** parameter is restricted by the **track\_activities** parameter when the **gs\_sql\_count** or **pgxc\_sql\_count** view is queried.
  - If **track\_activities** is set to **on** and **track\_sql\_count** is set to **off**, a warning message indicating that **track\_sql\_count** is disabled will be displayed in logs when the **gs\_sql\_count** view is queried.
  - If both **track\_activities** and **track\_sql\_count** are set to **off**, two warning messages indicating that **track\_activities** is disabled and **track\_sql\_count** is disabled will be displayed in logs when the views are queried.
  - If **track\_activities** is set to **off** and **track\_sql\_count** is set to **on**, a warning message indicating that **track\_activities** is disabled will be displayed in logs when the views are queried.
- If **track\_sql\_count** is set to **off**, querying the **gs\_sql\_count** or **pgxc\_sql\_count** view returns **0**.

### 14.3.11.2 Performance Statistics

During the running of the database, the lock access, disk I/O operation, and invalid message processing are involved. All these operations are the bottleneck of the database performance. The performance statistics provided by GaussDB can facilitate the performance fault location.

### Generating Performance Statistics Logs

**Parameter description:** For each query, the following four parameters record the performance statistics of corresponding modules in the server log:

- The **log\_parser\_stats** parameter records the performance statistics of a parser in the server log.
- The **log\_planner\_stats** parameter records the performance statistics of a query optimizer in the server log.
- The **log\_executor\_stats** parameter records the performance statistics of an executor in the server log.
- The **log\_statement\_stats** parameter records the performance statistics of the whole statement in the server log.

All these parameters can only provide assistant analysis for administrators, which are similar to the `getrusage()` of the Linux OS.

These parameters are SUSET parameters. Set them based on instructions provided in [Table 14-1](#).

#### NOTICE

- The **log\_statement\_stats** records the total statement statistics whereas other parameters record statistics only about their corresponding modules.
- The **log\_statement\_stats** parameter cannot be enabled together with any parameter recording statistics about a module.

**Value range:** Boolean

- **on** indicates that performance statistics are recorded.
- **off** indicates that performance statistics are not recorded.

**Default value:** off

## 14.3.12 Automatic Vacuuming

The **autovacuum** process automatically runs the **VACUUM** and **ANALYZE** statements to recycle the record space marked as deleted and update statistics about the table.

### autovacuum

**Parameter description:** Specifies whether to start the **autovacuum** process in the database. Ensure that the **track\_counts** parameter is set to **on** before starting the automatic cleanup process.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

#### NOTE

- Set the **autovacuum** parameter to **on** to automatically vacuum two-phase transactions after the system recovers from faults.
- If **autovacuum** is set to **on** and **autovacuum\_max\_workers** to **0**, the autovacuum process is started only when the system recovers from faults to clean up abnormal two-phase transactions.
- If **autovacuum** is set to **on** and the value of **autovacuum\_max\_workers** is greater than **0**, the system will automatically vacuum the two-phase transactions and processes after recovering from faults.

**Value range:** Boolean

- **on** indicates that the **autovacuum** process is started.
- **off** indicates that the **autovacuum** process is not started.

**Default value:** on

### autovacuum\_mode

**Parameter description:** Specifies whether the autoanalyze or autovacuum function is enabled. This parameter is valid only when **autovacuum** is set to **on**.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** enumerated values

- **analyze** indicates that only autoanalyze is performed.
- **vacuum** indicates that only autovacuum is performed.
- **mix** indicates that both autoanalyze and autovacuum are performed.
- **none** indicates that neither of them is performed.

**Default value:** mix

## autoanalyze\_timeout

**Parameter description:** Specifies the timeout period of autoanalyze. If the duration of autoanalyze on a table exceeds the value of **autoanalyze\_timeout**, the autoanalyze is automatically canceled.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 2147483. The unit is s.

**Default value:** 5min (300s)

## autovacuum\_io\_limits

**Parameter description:** Specifies the upper limit of I/Os triggered by the autovacuum process per second.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer. The value can be **-1** or range from 0 to 1073741823. **-1** indicates that the default cgroup is used.

**Default value:** -1

## log\_autovacuum\_min\_duration

**Parameter description:** Records each step performed by the autovacuum process to the server log when the execution time of the autovacuum process is greater than or equal to a certain value. This parameter helps track the autovacuum behavior.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

A setting example is as follows:

Set the **log\_autovacuum\_min\_duration** parameter to 250 ms to record the actions of autovacuum if it runs for 250 ms or longer.

**Value range:** an integer ranging from **-1** to 2147483647. The unit is ms.

- **0** indicates that all autovacuum actions are recorded in the log.
- **-1** indicates that all autovacuum actions are not recorded in the log.
- A value other than **-1** indicates that a message is recorded when an autovacuum action is skipped due to a lock conflict.

**Default value:** -1

## autovacuum\_max\_workers

**Parameter description:** Specifies the maximum number of autovacuum worker threads that can run at the same time. The upper limit of this parameter is related to the values of **max\_connections** and **job\_queue\_processes**.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer. The minimum value is **0**, indicating that autovacuum is not enabled. The theoretical maximum value is **262143**, but the actual maximum value is a dynamic value calculated by the following formula:  $262143 - \text{max\_inner\_tool\_connections} - \text{max\_connections} \text{job\_queue\_processes} - \text{max\_concurrent\_autonomous\_transactions} - \text{Number of auxiliary threads} - \text{Number of autovacuum launcher threads} - 1$ . The number of auxiliary threads and the number of autovacuum launcher threads are specified by two macros. Their default values are **20** and **2** respectively.

**Default value:** 3

## autovacuum\_naptime

**Parameter description:** Specifies the interval between activity rounds for the autovacuum process.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 1 to 2147483. The unit is s.

**Default value:** 10min (600s)

## autovacuum\_vacuum\_threshold

**Parameter description:** Specifies the threshold for triggering the **VACUUM** operation. When the number of deleted or updated records in a table exceeds the specified threshold, the VACUUM operation is executed on this table.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 2147483647.

**Default value:** 50

## autovacuum\_analyze\_threshold

**Parameter description:** Specifies the threshold for triggering the **ANALYZE** operation. When the number of deleted, inserted, or updated records in a table exceeds the specified threshold, the ANALYZE operation is executed on this table.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 2147483647.

**Default value:** 50

## autovacuum\_vacuum\_scale\_factor

**Parameter description:** Specifies a fraction of the table size added to the **autovacuum\_vacuum\_threshold** parameter when deciding whether to vacuum a table.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a floating-point number ranging from 0.0 to 100.0

**Default value:** 0.2

## autovacuum\_analyze\_scale\_factor

**Parameter description:** Specifies a fraction of the table size added to the **autovacuum\_analyze\_threshold** parameter when deciding whether to analyze a table.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a floating-point number ranging from 0.0 to 100.0

**Default value:** 0.1

## autovacuum\_freeze\_max\_age

**Parameter description:** Specifies the maximum age (in transactions) that a table's **pg\_class.relfrozensid** field can attain before a VACUUM operation is performed.

- The old files under the subdirectory of **pg\_clog/** can also be deleted by the **VACUUM** operation.
- Even if the autovacuum process is not started, the system will invoke the process to prevent transaction ID wraparound.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 100000 to 576460752303423487

**Default value:** 400000000

## autovacuum\_vacuum\_cost\_delay

**Parameter description:** Specifies the value of the cost delay used in the autovacuum operation.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from -1 to 100. The unit is ms. -1 indicates that the normal vacuum cost delay is used.

**Default value:** 20 ms

## autovacuum\_vacuum\_cost\_limit

**Parameter description:** Sets the value of the cost limit used in the autovacuum operation.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from -1 to 10000 -1 indicates that the normal vacuum cost limit is used.

**Default value:** -1

## defer\_csn\_cleanup\_time

**Parameter description:** Specifies the local recycling interval.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 2147483647. The unit is ms.

**Default value:** 5000 ms (that is, 5s)

## 14.3.13 Default Settings of Client Connection

### 14.3.13.1 Statement Behavior

This section describes related default parameters involved in the execution of SQL statements.

## search\_path

**Parameter description:** Specifies the order in which schemas are searched when an object is referenced with no schema specified. The value of this parameter consists of one or more schema names. Different schema names are separated by commas (,).

This is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

- If schemas of temporary tables exist in the current session, the schemas can be listed in the search path by using the alias **pg\_temp**, for example, '**pg\_temp,public**'. The schema of temporary tables has the highest search priority and is always searched before all the other schemas specified in **pg\_catalog** and **search\_path**. Therefore, do not explicitly specify **pg\_temp** to be searched after other schemas in **search\_path**. This setting will not take effect and an error message will be displayed. If the alias **pg\_temp** is used, the temporary schema will be searched only for tables, views, and data types, and not for functions or operators.
- The system catalog schema, **pg\_catalog**, has the second highest search priority and is the first to be searched among all the schemas, excluding **pg\_temp**, specified in **search\_path**. Therefore, do not explicitly specify **pg\_catalog** to be searched after other schemas in **search\_path**. This setting will not take effect and an error message will be displayed.
- When an object is created without a specific target schema, the object will be placed in the first valid schema listed in **search\_path**. An error is reported if the search path is empty.
- The current effective value of the search path can be examined through the SQL function **current\_schema**. This is different from examining the value of **search\_path**, because the **current\_schema** function displays the first valid schema name in **search\_path**.

**Value range:** a string

 **NOTE**

- When this parameter is set to "**\$user**", **public**, shared use of a database (where no users have private schemas, and all share use of public), private per-user schemas and combinations of them are supported. Other effects can be obtained by modifying the default search path setting, either globally or per-user.
- When this parameter is set to a null string (""), the system automatically converts it into a pair of double quotation marks ("").
- If the content contains double quotation marks, the system considers them as insecure characters and converts each double quotation mark into a pair of double quotation marks.

**Default value:** "**\$user**",**public**

 **NOTE**

**\$user** indicates the name of the schema with the same name as the current session user. If the schema does not exist, **\$user** will be ignored.

## current\_schema

**Parameter description:** Specifies the current schema.

This is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string

**Default value:** "**\$user**",**public**

 **NOTE**

**\$user** indicates the name of the schema with the same name as the current session user. If the schema does not exist, **\$user** will be ignored.

## default\_tablespace

**Parameter description:** Specifies the default tablespace of the created objects (tables and indexes) when a **CREATE** command does not explicitly specify a tablespace.

- The value of this parameter is either the name of a tablespace, or an empty string that indicates the use of the default tablespace of the current database. If a non-default tablespace is specified, users must have the CREATE permission for it. Otherwise, creation attempts will fail.
- This parameter is not used for temporary tables. For them, [temp tablespaces](#) is used instead.
- This parameter is not used when users create databases. By default, a new database inherits its tablespace setting from the template database.

This is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string. An empty string indicates that the default tablespace is used.

**Default value:** empty

## temp\_tablespaces

**Parameter description:** Specifies one or more tablespaces to which temporary objects (temporary tables and their indexes) will be created when a CREATE command does not explicitly specify a tablespace. Temporary files for sorting large data sets are created in these tablespaces.

The value of this parameter can be a list of names of tablespaces. When there is more than one name in the list, GaussDB chooses a random tablespace from the list upon the creation of a temporary object each time. However, within a transaction, successively created temporary objects are placed in successive tablespaces in the list. If the element selected from the list is an empty string, GaussDB will automatically use the default tablespace of the current database instead.

This is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string. An empty string indicates that all temporary objects are created only in the default tablespace of the current database. For details, see [default tablespace](#).

**Default value:** empty

## check\_function\_bodies

**Parameter description:** Specifies whether to enable validation of the function body string during the execution of **CREATE FUNCTION**. Verification is occasionally disabled to avoid problems, such as forward references when you restore function definitions from a dump. After the function is enabled, the PL/SQL lexical and syntax problems in stored procedures are verified, including the data types, statements, and expressions. The SQL statements in stored procedures are not checked in the CREATE phase. Instead, they are checked during running.

This is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that validation of the function body string is enabled during the execution of **CREATE FUNCTION**.
- **off** indicates that validation of the function body string is disabled during the execution of **CREATE FUNCTION**.

**Default value:** on

## default\_transaction\_isolation

**Parameter description:** Specifies the default isolation level of each transaction.

This is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

### NOTE

The current version does not support the setting of the default transaction isolation level. The default value is **read committed**. Do not change the value.

**Value range:** enumerated values

- **read committed** indicates that the data read by a transaction is committed at the moment it is read.
- **repeatable read** indicates that the data that has been read by the current transaction cannot be modified by other transactions until the current transaction completes, thereby preventing unrepeatable reads.
- **serializable**: Currently, this isolation level is not supported in GaussDB. It is equivalent to **repeatable read**.

**Default value:** read committed

## default\_transaction\_read\_only

**Parameter description:** Specifies whether each new transaction is in read-only state.

This is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

---

 **CAUTION**

If this parameter is set to **on**, the DML operations and write transactions cannot be executed.

---

**Value range:** Boolean

- **on** indicates that the transaction is in read-only state.
- **off** indicates that the transaction is in read/write state.

**Default value:** off

## default\_transaction\_deferrable

**Parameter description:** Specifies the default deferrable status of each new transaction. It currently has no effect on read-only transactions or those running at isolation levels lower than serializable.

GaussDB does not support the serializable isolation level. Therefore, the parameter takes no effect.

This is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that a transaction is delayed by default.
- **off** indicates that a transaction is not delayed by default.

**Default value:** off

## session\_replication\_role

**Parameter description:** Specifies the behavior of replication-related triggers and rules for the current session.

This parameter is a SUSERSET parameter. Set it based on instructions provided in [Table 14-1](#).

---

**NOTICE**

Setting this parameter will discard all the cached execution plans.

---

**Value range:** enumerated values

- **origin** indicates that the system copies operations such as insert, delete, and update from the current session.
- **replica** indicates that the system copies operations such as insert, delete, and update from other places to the current session.
- **local** indicates that the system will detect the role that has logged in to the database when using the function to copy operations and will perform related operations.

**Default value:** origin

## statement\_timeout

**Parameter description:** If the statement execution duration (starting from the time the server receives the command) is longer than the duration specified by the parameter, error information is displayed and the statement exits.

This is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#). The default value is **0**, indicating that the parameter does not take effect.

**Value range:** an integer ranging from 0 to 2147483647. The unit is ms.

**Default value:** 0

## vacuum\_freeze\_min\_age

**Parameter description:** Specifies whether VACUUM replaces the **xmin** column of a record with **FrozenXID** when scanning a table (in the same transaction).

This is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 576460752303423487

 **NOTE**

Although you can set this parameter to any value, **VACUUM** will limit the effective value to half the value of [autovacuum\\_freeze\\_max\\_age](#) by default.

**Default value:** 200000000

## vacuum\_freeze\_table\_age

**Parameter description:** Specifies when VACUUM scans the whole table and freezes old tuples. VACUUM performs a full table scan if the difference between the current transaction ID and the value of **pg\_class.relfrozensid64** is greater than the specified time.

This is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 576460752303423487

 NOTE

Although you can set this parameter to any value, **VACUUM** will limit the effective value to 95% of **autovacuum\_freeze\_max\_age** by default. Therefore, a periodic manual **VACUUM** has a chance to run before an anti-wraparound autovacuum is launched for the table.

**Default value:** 400000000

## bytea\_output

**Parameter description:** Specifies the output format for values of the bytea type.

This is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** enumerated values

- **hex** indicates the binary data is converted to the two hexadecimal digits per byte.
- **escape** indicates that the traditional PostgreSQL format is used. It takes the approach of representing a binary string as a sequence of ASCII characters, while converting those bytes that cannot be represented as an ASCII character into special escape sequences.

**Default value:** hex

## xmlbinary

**Parameter description:** Specifies how binary values are encoded in XML.

This is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** enumerated values

- base64
- hex

**Default value:** base64

## xmloption

**Parameter description:** Specifies whether DOCUMENT or CONTENT is implicit when XML and string values are converted to each other.

This is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** enumerated values

- **document** indicates an HTML document.
- **content** indicates a common string.

**Default value:** content

## max\_compile\_functions

**Parameter description:** Specifies the maximum number of function compilation results stored in the server. Excessive functions and compilation results of stored procedures may occupy large memory space. Setting this parameter to a proper value can reduce the memory usage and improve system performance.

This is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 1 to 2147483647

**Default value:**

**1000** (196-core CPU/1536 GB memory, 128-core CPU/1024 GB memory, 104-core CPU/1024 GB memory, 96-core CPU/1024 GB memory, 96-core CPU/768 GB memory, 80-core CPU/640 GB memory, 64-core CPU/512 GB memory, 60-core CPU/480 GB memory, 32-core CPU/256 GB memory, 16-core CPU/128 GB memory, 8-core CPU/64 GB memory, 4-core CPU/32 GB memory); **10** (4-core CPU/16 GB memory)

### gin\_pending\_list\_limit

**Parameter description:** Specifies the maximum size of the GIN pending list which is used when **fastupdate** is enabled. If the list grows larger than this maximum size, it is cleaned up by moving the entries in it to the main GIN data structure in batches. This setting can be overridden for individual GIN indexes by changing index storage parameters.

This is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 64 to *INT\_MAX*. The unit is KB.

**Default value:** 4 MB

## 14.3.13.2 Locale and Formatting

This section describes parameters related to the time format setting.

### DateStyle

**Parameter description:** Specifies the display format for date and time values, as well as the rules for interpreting ambiguous date input values.

This variable contains two independent components: the output format specifications (ISO, Postgres, SQL, or German) and the input/output order of year/month/day (DMY, MDY, or YMD). The two components can be set separately or together. The keywords Euro and European are synonyms for DMY. The keywords US, NonEuro, and NonEuropean are synonyms for MDY.

This is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string

**Default value:** ISO, MDY

#### NOTE

**gs\_initdb** will initialize this parameter so that its value is the same as that of [lc\\_time](#).

**Setting Suggestions:** The ISO format is recommended. Postgres, SQL, and German use abbreviations for time zones, such as **EST**, **WST**, and **CST**. These abbreviations can be ambiguous. For example, **CST** can represent Central Standard Time (USA) UT-6:00, Central Standard Time (Australia) UT+9:30, and China

Standard Time UT+8:00. This may lead to incorrect time zone conversion and cause errors.

## IntervalStyle

**Parameter description:** Specifies the display format for interval values.

This is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** enumerated values

- **sql\_standard** indicates that output matching SQL standards will be generated.
- **postgres** indicates that output matching PostgreSQL 8.4 will be generated when the **DateStyle** parameter is set to **ISO**.
- **postgres\_verbose** indicates that output matching PostgreSQL 8.4 will be generated when the **DateStyle** parameter is set to **non\_ISO**.
- **iso\_8601** indicates that output matching the time interval "format with designators" defined in ISO 8601 will be generated.
- **a** indicates the output that matches the numtodsinterval function. For details, see "SQL Reference > Functions and Operators > Date and Time Processing Functions and Operators > numtodsinterval" in *Developer Guide*.

---

### NOTICE

The **IntervalStyle** parameter also affects the interpretation of ambiguous interval input.

---

**Default value:** postgres

## TimeZone

**Parameter description:** Specifies the time zone for displaying and interpreting timestamps.

This is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string. You can query the PG\_TIMEZONE\_NAMES view to obtain the value. For details, see section "System Catalogs and System Views > System Views > PG\_TIMEZONE\_NAMES" in *Developer Guide*.

**Default value:** PRC

### NOTE

**gs\_initdb** will set a time zone value that is consistent with the system environment.

## timezone\_abbreviations

**Parameter description:** Specifies the time zone abbreviations that will be accepted by the server.

This is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string. You can obtain it by querying the **pg\_timezone\_names** view.

**Default value:** Default

 **NOTE**

**Default** indicates an abbreviation that works in most of the world, which is applicable to most cases. There are also other abbreviations, such as **Australia** and **India** that can be defined for a particular installation. For other time zone abbreviations, you need to set them in the corresponding configuration files before creating the database.

## extra\_float\_digits

**Parameter description:** Adjusts the number of digits displayed for floating-point values, including float4, float8, and geometric data types. The parameter value is added to the standard number of digits (FLT\_DIG or DBL\_DIG as appropriate).

This is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from -15 to 3

 **NOTE**

- This parameter can be set to **3** to include partially-significant digits. It is especially useful for dumping float data that needs to be restored exactly.
- This parameter can also be set to a negative value to suppress unwanted digits.

**Default value:** 0

## client\_encoding

**Parameter description:** Specifies the client-side encoding (character set).

Set this parameter based on the situation of the front-end services. Try to keep the encoding consistent on the client and server to improve efficiency.

This is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** encoding compatible with PostgreSQL. **UTF8** indicates that the database encoding is used.

 **NOTE**

- You can run the **locale -a** command to check the system-supported locales and the corresponding encodings, and select one as required.
- By default, **gs\_initdb** will initialize the setting of this parameter based on the current system environment. You can also run the **locale** command to check the current configuration environment.
- To use consistent encoding for communication within the database, you are advised to retain the default value of **client\_encoding**. Modification to this parameter in the **postgresql.conf** file (by using the **gs\_guc** tool, for example) does not take effect.

**Default value:** UTF8

**Recommended value:** SQL\_ASCII or UTF8

## lc\_messages

**Parameter description:** Specifies the language in which messages are displayed.

- Acceptable values are system-related.
- On some systems, this locale category does not exist. Setting this variable will still work, but there will be no effect. In addition, translated messages for the desired language may not exist. In this case, you can still see the English messages.

This parameter is a SUSE parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string

### NOTE

- You can run the **locale -a** command to check the system-supported locales and the corresponding encodings, and select one as required.
- By default, **gs\_initdb** will initialize the setting of this parameter based on the current system environment. You can also run the **locale** command to check the current configuration environment.

**Default value:** C

## lc\_monetary

**Parameter description:** Specifies the display format of monetary values. It affects the output of functions such as **to\_char**. Acceptable values are system-related.

This is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string

### NOTE

- You can run the **locale -a** command to check the system-supported locales and the corresponding encodings, and select one as required.
- By default, **gs\_initdb** will initialize the setting of this parameter based on the current system environment. You can also run the **locale** command to check the current configuration environment.

**Default value:** C

## lc\_numeric

**Parameter description:** Specifies the display format of numbers. It affects the output of functions such as **to\_char**. Acceptable values are system-related.

This is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string

 NOTE

- You can run the **locale -a** command to check the system-supported locales and the corresponding encodings, and select one as required.
- By default, **gs\_initdb** will initialize the setting of this parameter based on the current system environment. You can also run the **locale** command to check the current configuration environment.

**Default value:** C

## lc\_time

**Parameter description:** Specifies the display format of time and locale. It affects the output of functions such as **to\_char**. Acceptable values are system-related.

This is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string

 NOTE

- You can run the **locale -a** command to check the system-supported locales and the corresponding encodings, and select one as required.
- By default, **gs\_initdb** will initialize the setting of this parameter based on the current system environment. You can also run the **locale** command to check the current configuration environment.

**Default value:** C

## default\_text\_search\_config

**Parameter description:** Specifies the text search configuration.

If the specified text search configuration does not exist, an error will be reported. If the specified text search configuration is deleted, set

**default\_text\_search\_config** again. Otherwise, an error will be reported, indicating incorrect configuration.

- The text search configuration is used by text search functions that do not have an explicit argument specifying the configuration.
- When a configuration file matching the environment is determined, **gs\_initdb** will initialize the configuration file with a setting that corresponds to the environment.

This is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string

 NOTE

GaussDB supports the following two configurations: **pg\_catalog.english** and **pg\_catalog.simple**.

**Default value:** **pg\_catalog.english**

### 14.3.13.3 Other Default Parameters

This section describes the default database loading parameters.

## dynamic\_library\_path

**Parameter description:** Specifies the path that the system will search for a shared database file that is dynamically loadable. When a dynamically loadable module needs to be opened and the file name specified in the **CREATE FUNCTION** or **LOAD** command does not have a directory component, the system will search this path for the required file. Only the sysadmin user can access this parameter.

The value of **dynamic\_library\_path** must be a list of absolute paths separated by colons (:). When the name of a path starts with the special variable \$libdir, the variable will be replaced with the directory in which the module provided by the GaussDB is installed. For example:

```
dynamic_library_path = '/usr/local/lib/gaussdb:/opt/testgs/lib:$libdir'
```

This parameter is a SUSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string

### NOTE

If the value of this parameter is set to an empty character string, the automatic path search is turned off.

**Default value:** \$libdir

## gin\_fuzzy\_search\_limit

**Parameter description:** Specifies the upper limit of the size of the set returned by GIN indexes.

This is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 2147483647

**Default value:** 0

## local\_preload\_libraries

**Parameter description:** Specifies one or more shared libraries that are to be preloaded at connection start. If multiple libraries are to be loaded, separate their names with commas (.). All library names are converted to lower case unless double-quoted.

- Any user can change this option. Therefore, library files that can be loaded are restricted to those saved in the **plugins** subdirectory of the standard library installation directory. It is the database administrator's responsibility to ensure that libraries in this directory are all safe. Entries in **local\_preload\_libraries** can specify the library directory explicitly, for example, **\$libdir/plugins/mylib**, or just specify the library name, for example, **mylib**. (**mylib** is equivalent to **\$libdir/plugins/mylib**.)
- Unlike **shared\_preload\_libraries**, there are no differences in performance between loading a module at session start or doing this during the session. The intent of this feature is to allow debugging or performance-measurement libraries to be loaded into specific sessions without an explicit **LOAD** command. For example, debugging can be enabled under a given user name by setting this parameter to **ALTER USER SET**.

- If a specified library is not found, the connection attempt will fail.
- Every GaussDB-supported library has a "magic block" that is checked to guarantee compatibility. For this reason, non-GaussDB-supported libraries cannot be loaded in this way.

This parameter is a BACKEND parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string

**Default value:** empty

## 14.3.14 Lock Management

In GaussDB, a deadlock may occur when concurrently executed transactions compete for resources. This section describes parameters used for managing transaction locks.

### deadlock\_timeout

**Parameter description:** Specifies the time, in milliseconds, to wait on a lock before checking whether there is a deadlock condition. When the applied lock exceeds the preset value, the system will check whether a deadlock occurs. This parameter takes effect only for common locks.

- The check for deadlock is relatively expensive. Therefore, the server does not check it when waiting for a lock every time. Deadlocks do not frequently occur when the system is running. Therefore, the system just needs to wait on the lock for a while before checking for a deadlock. Increasing this value reduces the time wasted in needless deadlock checks, but slows down reporting of real deadlock errors. On a heavily loaded server, you may need to raise it. The value you have set needs to exceed the transaction time. By doing this, the possibility that a lock will be checked for deadlocks before it is released will be reduced.
- When [log\\_lock\\_waits](#) is set to **on**, **deadlock\_timeout** determines a waiting time to write the lock waiting time information during query execution to logs. To study the lock delay, you can set **deadlock\_timeout** to a value smaller than the normal value.

This parameter is a SUSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 1 to 2147483647. The unit is ms.

**Default value:** 1s

### lockwait\_timeout

**Parameter description:** Specifies the timeout for attempts to acquire a lock. If the time spent in waiting for a lock exceeds the specified time, an error is reported. This parameter takes effect only for common locks.

This parameter is a SUSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to *INT\_MAX*. The unit is ms.

**Default value:** 20min

## update\_lockwait\_timeout

**Parameter description:** Specifies the maximum duration that a lock waits for concurrent updates on a row to complete when the concurrent update feature is enabled. If the time spent in waiting for a lock exceeds the specified time, an error is reported. This parameter takes effect only for common locks.

This parameter is a SUSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 2147483647. The unit is ms.

**Default value:** 2min (120000 ms)

## max\_locks\_per\_transaction

**Parameter description:** Determines the average number of object locks allocated for each transaction.

- The size of the shared lock table is calculated under the condition that a maximum of  $N$  independent objects need to be locked at any time.  $N = \text{max\_locks\_per\_transaction} \times (\text{max\_connections} + \text{max\_prepared\_transactions})$ . Objects whose amount does not exceed the preset number can be locked simultaneously at any time. You may need to increase this value if many different tables are modified in a single transaction. This parameter can only be set at database start.
- Increasing the value of this parameter may cause GaussDB to request more System V-shared memory than the OS's default configuration allows.
- When running a standby server, you must set this parameter to a value that is no less than that on the primary server. Otherwise, queries will not be allowed on the standby server.

This is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 10 to *INT\_MAX*

**Default value:**

**256** (196-core CPU/1536 GB memory, 128-core CPU/1024 GB memory, 104-core CPU/1024 GB memory, 96-core CPU/1024 GB memory, 96-core CPU/768 GB memory, 80-core CPU/640 GB memory, 64-core CPU/512 GB memory, 60-core CPU/480 GB memory, 32-core CPU/256 GB memory, 16-core CPU/128 GB memory, 8-core CPU/64 GB memory, 4-core CPU/32 GB memory); **64** (4-core CPU/16 GB memory)

## max\_pred\_locks\_per\_transaction

**Parameter description:** Specifies the average number of predicate locks allocated for each transaction.

- The size of the shared predicate lock table is calculated under the condition that a maximum of  $N$  independent objects need to be locked at any time.  $N = \text{max\_pred\_locks\_per\_transaction} \times (\text{max\_connections} +$

**max\_prepared\_transactions**). Objects whose amount does not exceed the preset number can be locked simultaneously at any time. You may need to increase this value if many different tables are modified in a single transaction. This parameter can only be set at server start.

- Increasing the value of this parameter may cause GaussDB to request more System V-shared memory than the OS's default configuration allows.

This is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 10 to *INT\_MAX*

**Default value:** 64

## gs\_clean\_timeout

**Parameter description:** Specifies the average interval for clearing temporary tables on the primary node.

- When the database connection is terminated abnormally, temporary tables may exist. In this case, you need to call the **gs\_clean** tool to clear the temporary tables in the database.
- If this parameter is set to a larger value, the time for clearing GaussDB temporary tables may be prolonged.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 2147483. The unit is s.

**Default value:** 1min

## partition\_lock\_upgrade\_timeout

**Parameter description:** Specifies the timeout for attempts to upgrade an exclusive lock (read allowed) to an access exclusive lock (read/write blocked) on a partitioned table during the execution of some query statements. If there are concurrent read transactions running, the lock upgrade will need to wait. This parameter sets the waiting timeout for lock upgrade attempts.

- When you do **MERGE PARTITION** and **CLUSTER PARTITION** on a partitioned table, temporary tables are used for data rearrangement and file exchange. To concurrently perform as many operations as possible on the partitions, exclusive locks are acquired for the partitions during data rearrangement and access exclusive locks are acquired during file exchange.
- Generally, a partition waits until it acquires a lock, or a timeout occurs if the partition waits for a period longer than the value specified by the [lockwait\\_timeout](#) parameter.
- When doing **MERGE PARTITION** or **CLUSTER PARTITION** on a partitioned table, an access exclusive lock needs to be acquired during file exchange. If the lock fails to be acquired, the acquisition is retried at an interval of 50 ms until timeout occurs. The **partition\_lock\_upgrade\_timeout** parameter specifies the time to wait before the lock acquisition attempt times out.
- If this parameter is set to **-1**, the lock upgrade never times out. The lock upgrade is continuously retried until it succeeds.

This is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from -1 to 3000. The unit is s.

**Default value:** 1800

## fault\_mon\_timeout

**Parameter description:** Specifies the period for detecting lightweight deadlocks. This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 1440. The unit is minute.

**Default value:** 5min

## enable\_online\_ddl\_waitlock

**Parameter description:** Specifies whether to block DDL operations to wait for the release of database locks, such as **pg\_advisory\_lock**. This parameter is mainly used in online OM operations and you are not advised to modify the settings.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that DDL operations will be blocked to wait for the lock release.
- **off** indicates that DDL operations will not be blocked.

**Default value:** off

## xloginsert\_locks

**Parameter description:** Specifies the number of locks on concurrent write-ahead logging. This parameter is used to improve the efficiency of writing write-ahead logs.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 1 to 1000. If the CPU uses the NUMA architecture, the value must be an integer multiple of the number of NUMA nodes.

**Default value:** 16

## num\_internal\_lock\_partitions

**Parameter description:** Specifies the number of internal lightweight lock partitions. It is mainly used for performance optimization in various scenarios. The content is organized in the KV format of keywords and numbers. Different types of locks are separated by commas (.). The sequence does not affect the setting result. For example, **CLOG\_PART=256,CSNLOG\_PART=512** is equivalent to **CSNLOG\_PART=512,CLOG\_PART=256**. If you set the same keyword multiple times, only the latest setting takes effect. For example, if you set **CLOG\_PART** to **256** and **CLOG\_PART** to **2**, the value of **CLOG\_PART** is **2**. If no keyword is set, the

default value is used. The usage description, maximum value, minimum value, and default value of each lock type are as follows:

- **CLOG\_PART**: number of Clog file controllers. Increasing the value of this parameter improves the Clog writing efficiency and transaction submission performance, but increases the memory usage. Decreasing the value of this parameter reduces the memory usage, but may increase the conflict of writing Clogs and affect the performance. The value ranges from 1 to 256.
- **CSNLOG\_PART**: number of CSNLOG file controllers. Increasing the value of this parameter improves the CSNLOG log writing efficiency and transaction submission performance, but increases the memory usage. Decreasing the value of this parameter reduces the memory usage, but may increase the conflict of writing CSNLOG logs and affect the performance. The value ranges from 1 to 512.
- **LOG2\_LOCKTABLE\_PART**: two logarithms of the number of common table lock partitions. Increasing the value can improve the concurrency of obtaining locks in the normal process, but may increase the time required for transferring and clearing locks. When waiting events occur in **LockMgrLock**, you can increase the value to improve the performance. The minimum value is 4, that is, the number of lock partitions is 16. The maximum value is 16, that is, the number of lock partitions is 65536.
- **TWOPHASE\_PART**: number of partitions of the two-phase transaction lock. Increasing the value can increase the number of concurrent two-phase transaction commits. The value ranges from 1 to 64.
- **FASTPATH\_PART**: maximum number of locks that each thread can obtain without using the main lock table. When a partitioned table is read, updated, inserted, or deleted and the waiting event is LockMgrLock, you can increase the value of this parameter to prevent LockMgrLock from being obtained and improve performance. It is recommended that the value be greater than or equal to **Number of partitions x (1 + Number of local indexes) + Number of global indexes + 10**. Increasing the value will increase the memory usage. The value ranges from 20 to 10000.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string

**Default value:**

```
'CLOG_PART=256,CSNLOG_PART=512,LOG2_LOCKTABLE_PART=4,TWOPHASE_P  
ART=1,FASTPATH_PART=20' (196-core CPU/1536 GB memory, 128-core CPU/1024  
GB memory, 104-core CPU/1024 GB memory, 96-core CPU/1024 GB memory, 96-  
core CPU/768 GB memory, 80-core CPU/640 GB memory, 64-core CPU/512 GB  
memory, 60-core CPU/480 GB memory, 32-core CPU/256 GB memory, 16-core  
CPU/128 GB memory, 8-core CPU/64 GB memory, or 4-core CPU/32 GB memory);  
'CLOG_PART=8,CSNLOG_PART=16,LOG2_LOCKTABLE_PART=4,TWOPHASE_PART  
=1,FASTPATH_PART=20' (4-core CPU/16 GB memory)
```

## enable\_wait\_exclusive\_lock

**Parameter description:** Specifies whether to enable the hang detection and cure function for the exclusive lock of ProcArrayLock.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on:** enabled.
- **off:** disabled.

**Default value:** on

## 14.3.15 Version and Platform Compatibility

### 14.3.15.1 Compatibility with Earlier Versions

This section describes the parameters that control the backward compatibility and external compatibility of GaussDB. A backward compatible database supports applications of earlier versions. This section describes parameters used for controlling backward compatibility of a database.

#### array\_nulls

**Parameter description:** Controls whether the array input parser recognizes unquoted NULL as a null array element.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that null values can be entered in arrays.
- **off** indicates backward compatibility with the old behavior. Arrays containing the value **NULL** can still be created when this parameter is set to **off**.

**Default value:** on

#### backslash\_quote

**Parameter description:** Controls whether a single quotation mark can be represented by \' in a string text.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

---

#### NOTICE

When the string text meets the SQL standards, \ has no other meanings. This parameter only affects the handling of non-standard-conforming string texts, including escape string syntax (E'...').

---

**Value range:** enumerated values

- **on** indicates that the use of \' is always allowed.
- **off** indicates that the use of \' is rejected.

- **safe\_encoding** indicates that the use of \ is allowed only when client encoding does not allow ASCII \ within a multibyte character.

**Default value:** safe\_encoding

## escape\_string\_warning

**Parameter description:** Specifies whether to issue a warning when a backslash (\) is used as an escape in an ordinary character string.

- Applications that wish to use a backslash (\) as an escape need to be modified to use escape string syntax (E'...'). This is because the default behavior of ordinary character strings treats the backslash as an ordinary character in each SQL standard.
- This variable can be enabled to help locate codes that need to be changed.
- If E'...' is used as an escape, logs may be incomplete in some scenarios.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

**Default value:** on

## lo\_compat\_privileges

**Parameter description:** Specifies whether to enable backward compatibility for the privilege check of large objects.

This parameter is a SUSERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

**on** indicates that the privilege check is disabled when users read or modify large objects. This setting is compatible with versions earlier than PostgreSQL 9.0.

**Default value:** off

## quote\_all\_identifiers

**Parameter description:** Specifies whether to forcibly quote all identifiers even if they are not keywords when the database generates SQL. This will affect the output of **EXPLAIN** and the results of functions, such as `pg_get_viewdef`. For details, see the **--quote-all-identifiers** parameter of `gs_dump`.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that the forcible quoting is enabled.
- **off** indicates that the forcible quoting is disabled.

**Default value:** off

## sql\_inheritance

**Parameter description:** Controls the inheritance semantics. This parameter specifies the access policy of descendant tables. **off** indicates that subtables cannot be accessed by commands. That is, the ONLY keyword is used by default. This setting is compatible with earlier versions.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that subtables can be accessed.
- **off** indicates that subtables cannot be accessed.

**Default value:** on

## standard\_conforming\_strings

**Parameter description:** Controls whether ordinary string texts ('...') treat backslashes as ordinary texts as specified in the SQL standard.

- Applications can check this parameter to determine how string texts will be processed.
- It is recommended that characters be escaped by using the escape string syntax (E'...').

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that backslashes are treated as ordinary texts.
- **off** indicates that backslashes are not treated as ordinary texts.

**Default value:** on

## synchronize\_seqscans

**Parameter description:** Controls sequential scans of tables to synchronize with each other, so that concurrent scans read the same data block at about the same time and share the I/O workload.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that a scan may start in the middle of the table and then "wrap around" the end to cover all rows to synchronize with the activity of scans already in progress. This may result in unpredictable changes in the row ordering returned by queries that have no ORDER BY clause.
- **off** indicates that the scan always starts from the table heading.

**Default value:** on

## enable\_beta\_features

**Parameter description:** Specifies whether to enable some features that are not officially released and are used only for POC verification. Exercise caution when enabling these extended features because they may cause errors in some scenarios.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that the features are enabled for forward compatibility. Note that enabling them may cause errors in certain scenarios.
- **off** indicates that the features are disabled.

**Default value:** off

## default\_with\_oids

**Parameter description:** Specifies whether **CREATE TABLE** and **CREATE TABLE AS** include an **OID** field in newly-created tables if neither **WITH OIDS** nor **WITHOUT OIDS** is specified. It also determines whether OIDs will be included in tables created by **SELECT INTO**.

It is not recommended that OIDs be used in user tables. Therefore, this parameter is set to **off** by default. When OIDs are required for a particular table, **WITH OIDS** needs to be specified during the table creation.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that **CREATE TABLE** and **CREATE TABLE AS** can include an **OID** field in newly-created tables.
- **off** indicates that **CREATE TABLE** and **CREATE TABLE AS** cannot include any **OID** field in newly-created tables.

**Default value:** off

### 14.3.15.2 Platform and Client Compatibility

Many platforms use the database system. External compatibility of the database system provides a lot of convenience for platforms.

## convert\_string\_to\_digit

**Parameter description:** Specifies the implicit conversion priority, which determines whether to preferentially convert strings into numbers.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that strings are preferentially converted into numbers.

- **off** indicates that strings are not preferentially converted into numbers.

**Default value:** on

---

**NOTICE**

Adjusting this parameter will change the internal data type conversion rule and cause unexpected behaviors. Exercise caution when performing this operation.

---

## nls\_timestamp\_format

**Parameter description:** Specifies the default timestamp format.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string

**Default value:** DD-Mon-YYYY HH:MI:SS.FF AM

## nls\_timestamp\_tz\_format

**Parameter description:** Specifies the default timestamp with time zone format.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string. The supported formats are the same as those of `nls_timestamp_format`.

**Default value:** DD-Mon-YYYY HH:MI:SS.FF AM

 **NOTE**

This parameter is valid only when `a_format_version` is set to `10c` and `a_format_dev_version` is set to `s1`.

## group\_concat\_max\_len

**Parameter description:** This parameter is used together with the `GROUP_CONCAT` function to limit the length of the return value. If the length exceeds the limit, the exceeded part of the return value is truncated.

This is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** 0 to 9223372036854775807

**Default value:** 1024

 **NOTE**

Currently, the maximum length that can be returned is 1073741823. If the length exceeds the limit, the out of memory error is reported.

## max\_function\_args

**Parameter description:** Specifies the maximum number of parameters allowed for a function.

This parameter is a fixed INTERNAL parameter and cannot be modified.

**Value range:** an integer

**Default value:** 8192

## transform\_null\_equals

**Parameter description:** Specifies whether expressions of the form `expr = NULL` (or `NULL = expr`) are treated as `expr IS NULL`. They return true if `expr` evaluates to the **NULL** value, and false otherwise.

- The correct SQL-standard-compliant behavior of **expr = NULL** is to always return **NULL** (unknown).
- Filtered forms in Microsoft Access generate queries that appear to use **expr = NULL** to test for null values. If you enable this option, you can use this interface to access the database.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that expressions of the form **expr = NULL** (or **NULL = expr**) are treated as **expr IS NULL**.
- **off** indicates that **expr = NULL** always returns **NULL** (unknown).

**Default value:** off

### NOTE

New users are always confused about the semantics of expressions involving **NULL** values. Therefore, **off** is used as the default value.

## support\_extended\_features

**Parameter description:** Specifies whether extended database features are supported.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that extended database features are supported.
- **off** indicates that extended database features are not supported.

**Default value:** off

## enable\_extension

**Parameter description:** Specifies whether to support the creation of database extensions.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that the creation of database extensions is supported.
- **off** indicates that the creation of database extensions is not supported.

**Default value:** off

---

**NOTICE**

The extension function is for internal use only. You are not advised to use it.

---

## sql\_compatibility

**Parameter description:** Specifies the type of mainstream database with which the SQL syntax and statement behavior of the database is compatible. This parameter is an INTERNAL parameter. It can be viewed but cannot be modified.

**Value range:** enumerated type

- **A** indicates that the database is compatible with the Oracle database.
- **B** indicates that the database is compatible with the MySQL database.
- **C** indicates that the database is compatible with the Teradata database.
- **PG** indicates that the database is compatible with the PostgreSQL database.

**Default value:** A

---

**NOTICE**

- This parameter can be set only when you run the **CREATE DATABASE** command to create a database. For details, see "SQL Reference > SQL Syntax > CREATE DATABASE" in the *Developer Guide*.
  - In the database, this parameter must be set to a specific value. It can be set to **A** or **B** and cannot be changed. Otherwise, the setting is not consistent with the database behavior.
- 

## b\_format\_behavior\_compat\_options

**Parameter description:** Specifies a B-compatible database configuration item. Multiple items are separated by commas (,).

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string

**Default value:** ""

 NOTE

- Currently, only B-compatible configuration items listed in [Table 14-9](#) are supported.
- Multiple items are separated by commas (,), for example, `set b_format_behavior_compat_options='enable_set_variables,set_session_transaction';`

**Table 14-9** B-compatible configuration items

Item	Behavior
enable_set_variables	<p>Indicates whether to enable the enhancement of the SET syntax.</p> <ul style="list-style-type: none"> <li>• If this parameter is not set, user-defined variables and the SET [GLOBAL   SESSION] syntax are not supported.</li> <li>• If this parameter is set, the preceding syntax is supported in the B-compatible mode, for example, <code>set @v1 = 1;</code></li> </ul>
set_session_transaction	<p>Indicates whether to enable the SET SESSION TRANSACTION syntax.</p> <ul style="list-style-type: none"> <li>• If this parameter is not set, SET SESSION TRANSACTION is equivalent to SET LOCAL TRANSACTION.</li> <li>• If this parameter is set, the preceding syntax can be used in the B-compatible mode to modify the transaction features in the current session.</li> </ul>
enable_modify_column	<p>Indicates whether to enable the ALTER TABLE MODIFY syntax.</p> <ul style="list-style-type: none"> <li>• If this parameter is not set, running <b>ALTER TABLE table_name MODIFY column_name data_type;</b> can change only the data type of the column.</li> <li>• If this parameter is set, running <b>ALTER TABLE table_name MODIFY column_name data_type;</b> can change the entire column definition.</li> </ul>
default_collation	<p>Indicates whether to enable forward compatibility of the default collation.</p> <ul style="list-style-type: none"> <li>• If this parameter is not set, the character set or collation of a column of the character type is not explicitly specified, and the collation of a table is empty, the column uses the default collation.</li> <li>• If this parameter is set, the character collation of a column of the character type inherits the character collation of a table (if it is not empty). If the character collation of a table is empty, the default character collation corresponding to the database is used.</li> </ul>

## behavior\_compat\_options

**Parameter description:** Specifies database compatibility behavior. Multiple items are separated by commas (,).

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string

**Default value:** ""

 NOTE

- Currently, only items in [Table 14-10](#) are supported.
- Multiple items are separated by commas (,), for example, **set behavior\_compat\_options='end\_month\_calculate,display\_leading\_zero'**;

**Table 14-10** Compatibility configuration items

Configuration Item	Behavior
display_leading_zero	<p>Specifies how floating-point numbers are displayed. It controls the display of zeros before the decimal point of all character string types (such as char, character, nchar, varchar, character varying, varchar2, nvarchar2, text, and clob) and any precision types (such as float4, float8, and numeric) in the numeric type. In addition, the length of the calculated number is displayed synchronously.</p> <ul style="list-style-type: none"> <li>• If this item is not specified, for a decimal number between -1 and 1, the 0 before the decimal point is not displayed. For example: <pre> gaussdb=# select 0.1231243 as a, 0.1231243::numeric as b,0.1231243::integer(10,3) as c, length(0.1242343) as d;  a   b   c   d -----+-----+-----+---- .1231243   .1231243   .123   8 (1 row) </pre> </li> <li>• If this item is specified, for a decimal number between -1 and 1, the 0 before the decimal point is displayed. For example: <pre> gaussdb=# select 0.1231243 as a, 0.1231243::numeric as b,0.1231243::integer(10,3) as c, length(0.1242343) as d;  a   b   c   d -----+-----+-----+---- 0.1231243   0.1231243   0.123   9 (1 row) </pre> </li> </ul>

Configuration Item	Behavior
end_month_calculate	<p>Specifies the calculation logic of the add_months function. Assume that the two parameters of the add_months function are <b>param1</b> and <b>param2</b>, and that the month of <b>param1</b> and <b>param2</b> is <b>result</b>.</p> <ul style="list-style-type: none"> <li>• If this item is not specified, and the <b>Day</b> of <b>param1</b> indicates the last day of a month shorter than <b>result</b>, the <b>Day</b> in the calculation result will equal that in <b>param1</b>. For example:  <pre>gaussdb=# select add_months('2018-02-28',3) from sys_dummy; add_months ----- 2018-05-28 00:00:00 (1 row)</pre> </li> <li>• If this item is specified, and the <b>Day</b> of <b>param1</b> indicates the last day of a month shorter than <b>result</b>, the <b>Day</b> in the calculation result will equal that in <b>result</b>. For example:  <pre>gaussdb=# select add_months('2018-02-28',3) from sys_dummy; add_months ----- 2018-05-31 00:00:00 (1 row)</pre> </li> </ul>
compat_analyze_sample	<p>Specifies the sampling behavior of the <b>ANALYZE</b> operation. If this item is specified, the sample collected by the ANALYZE operation will be limited to around 30,000 records, controlling database node memory consumption and maintaining the stability of ANALYZE.</p>
bind_schema_tablespace	<p>Binds a schema with the tablespace with the same name. If a tablespace name is the same as <i>sche_name</i>, <b>default_tablespace</b> will also be set to <i>sche_name</i> if <b>search_path</b> is set to <i>sche_name</i>.</p>
bind_procedure_searchpath	<p>Specifies the search path of the database object in a stored procedure for which no schema name is specified. If no schema name is specified for a stored procedure, the search is performed in the schema to which the stored procedure belongs. If the stored procedure is not found, the following operations are performed:</p> <ul style="list-style-type: none"> <li>• If this item is not specified, the system reports an error and exits.</li> <li>• If this item is specified, the search continues based on the settings of <b>search_path</b>. If the issue persists, the system reports an error and exits.</li> </ul>

Configuration Item	Behavior
correct_to_number	<p>Specifies the compatibility of the to_number() result.</p> <p>If this item is not set, the result of the to_number() function is the same as that in the A database by default.</p> <pre>gaussdb=# select " AS to_number_14, to_number('34,50','999,99'); ERROR:  invalid data. CONTEXT:  referenced column: to_number</pre> <p>If this item is set, the result of the to_number() function is the same as that of pg11.</p> <pre>gaussdb=# select " AS to_number_14, to_number('34,50','999,99'); to_number_14   to_number -----+-----                 3450 (1 row)</pre>
unbind_divide_bound	<p>Specifies the range check on the result of integer division.</p> <p>If this item is not set, the range of the division result is verified. For example, an out-of-bounds error is reported because the output result of <i>INT_MIN/(-1)</i> is greater than <i>INT_MAX</i>.</p> <pre>gaussdb=# select (-2147483648)::int4 / (-1)::int4; ERROR:  integer out of range</pre> <p>If this item is set, the range of the division result does not need to be verified. For example, the output result of <i>INT_MIN/(-1)</i> is <i>INT_MAX+1</i>.</p> <pre>gaussdb=# select (-2147483648)::int4 / (-1)::int4; ?column? ----- 2147483648 (1 row)</pre>
convert_string_digit_to_numeric	<p>Determines whether to convert numeric constants of the character string type to those of the numeric type before these two types are compared.</p> <pre>gaussdb=# create table test1 (c1 int, c2 varchar); gaussdb=# insert into test1 values (2, '1.1'); gaussdb=# set behavior_compat_options=""; gaussdb=# select * from test1 where c2 &gt; 1; ERROR:  invalid input syntax for type bigint: "1.1"</pre> <pre>gaussdb=# set behavior_compat_options='convert_string_digit_to_numeric'; gaussdb=# select * from test1 where c2 &gt; 1; c1   c2 ---+---  2   1.1 (1 row)</pre>

Configuration Item	Behavior
return_null_string	<p>Specifies how to display the empty result (empty string '') of the lpad() and rpad() functions.</p> <ul style="list-style-type: none"> <li>If this item is not specified, the empty string is displayed as <b>NULL</b>.</li> </ul> <pre>gaussdb=# select length(lpad('123',0,'*')) from sys_dummy; length ----- (1 row)</pre> <ul style="list-style-type: none"> <li>If this item is specified, the empty string is displayed as single quotation marks ('').</li> </ul> <pre>gaussdb=# select length(lpad('123',0,'*')) from sys_dummy; length ----- 0 (1 row)</pre>
compat_concat_variadic	<p>Specifies the compatibility of variadic results of the concat() and concat_ws() functions. The B database does not have the variadic type. Therefore, this option has no impact on the B database.</p> <p>If this item is not set and the concat function parameter is of the variadic type, the results of the A and C databases in compatibility mode are the same by default.</p> <pre>gaussdb=# select concat(variadic NULL::int[]) is NULL; ?column? ----- t (1 row)</pre> <p>If this item is set and the concat function parameter is of the variadic type, different result formats of the A and C databases in compatibility mode are retained.</p> <pre>--In the A database: gaussdb=# select concat(variadic NULL::int[]) is NULL; ?column? ----- t (1 row) --In the C database: gaussdb=# select concat(variadic NULL::int[]) is NULL; ?column? ----- f (1 row)</pre>

Configuration Item	Behavior
merge_update_multi	<p>When MERGE INTO ... WHEN MATCHED THEN UPDATE (see "SQL Reference" &gt; "SQL Syntax" &gt; "MERGE INTO" in <i>Developer Guide</i>) and INSERT ... ON DUPLICATE KEY UPDATE (see "SQL Reference" &gt; "SQL Syntax" &gt; "INSERT" in <i>Developer Guide</i>) are used, it controls the UPDATE behavior if a piece of target data in the target table conflicts with multiple pieces of source data.</p> <p>If this item is specified and the preceding scenario exists, the system performs multiple UPDATE operations on the conflicting row. Otherwise, an error is reported by default, that is, the MERGE or INSERT operation fails.</p>
plstmt_implicit_savepoint	<p>Determines whether the execution of an UPDATE statement in a stored procedure has an independent subtransaction.</p> <p>If this parameter is set, the implicit savepoint is enabled before executing each UPDATE statement in the stored procedure, and the subtransaction is rolled backed to the latest savepoint in the EXCEPTION block by default, ensuring that only the modification of failed statements is rolled back. This option is used to be compatible with the <b>EXCEPTION</b> behavior of the O database.</p>
hide_tailing_zero	<p>Configuration item for numeric display. If this parameter is not set, numeric data is displayed in the specified precision. If this parameter is set, the trailing zeros after the decimal point are hidden in all scenarios where numeric values are output, even if the precision format is specified.</p> <pre> gaussdb=# set behavior_compat_options='hide_tailing_zero'; gaussdb=# select cast(123.123 as numeric(15,10)) as a, to_char(cast(123.123 as numeric(15,10)), '999D999999');    a   to_char -----+----- 123.123   123.123 (1 row) gaussdb=# set behavior_compat_options=''; gaussdb=# select cast(123.123 as numeric(15,10)) as a, to_char(cast(123.123 as numeric(15,10)), '999D999999');    a   to_char -----+----- 123.1230000000   123.123000 (1 row) </pre>

Configuration Item	Behavior
rownum_type_compat	<p>Specifies the ROWNUM type. The default value is <b>BIGINT</b>. After this parameter is specified, the value is changed to <b>NUMERIC</b>.</p> <pre> gaussdb=# set behavior_compat_options=""; gaussdb=# create table tb_test(c1 int,c2 varchar2,c3 varchar2); gaussdb=# insert into tb_test values(1,'a','b'); gaussdb=# create or replace view v_test as select rownum from tb_test; gaussdb=# \d+ v_test           View "public.v_test"   Column   Type   Modifiers   Storage   Description -----+-----+-----+-----+----- rownum   bigint              plain   View definition: SELECT ROWNUM AS "rownum" FROM tb_test;  gaussdb=# set behavior_compat_options = 'rownum_type_compat'; gaussdb=# create or replace view v_test1 as select rownum from tb_test; gaussdb=# \d+ v_test1           View "public.v_test1"   Column   Type   Modifiers   Storage   Description -----+-----+-----+-----+----- rownum   numeric              main   View definition: SELECT ROWNUM AS "rownum" FROM tb_test; </pre>
aformat_null_test	<p>Specifies the logic for checking whether <b>rowtype</b> is not null. When this parameter is set, if one column in a row is not empty, <b>true</b> is returned for checking whether <b>rowtype</b> is not null. When this parameter is not set, if all columns in a row are not empty, true is returned for checking whether <b>rowtype</b> is not null. This parameter has no influence on checking whether <b>rowtype</b> is not null.</p> <pre> gaussdb=# set behavior_compat_options='aformat_null_test'; gaussdb=# select r, r is null as isnull, r is not null as isnotnull from (values (1,row(1,2)), (1,row(null,null)), (1,null), (null,row(1,2)), (null,row(null,null)), (null,null) ) r(a,b);    r   isnull   isnotnull -----+-----+----- (1,(1,2))   f   t (1,(,))   f   t (1,)   f   t (,(1,2))   f   t (,(,))   f   t (,)   t   f (6 rows) gaussdb=# set behavior_compat_options=""; gaussdb=# select r, r is null as isnull, r is not null as isnotnull from (values (1,row(1,2)), (1,row(null,null)), (1,null), (null,row(1,2)), (null,row(null,null)), (null,null) ) r(a,b);    r   isnull   isnotnull -----+-----+----- (1,(1,2))   f   t (1,(,))   f   t (1,)   f   f (,(1,2))   f   f (,(,))   f   f (,)   t   f (6 rows) </pre>

Configuration Item	Behavior
<p>aformat_regexp_match</p>	<p>Determines the matching behavior of regular expression functions.</p> <p>When this parameter is set and <b>sql_compatibility</b> is set to <b>A</b> or <b>B</b>, the options supported by the <b>flags</b> parameter of the regular expression are changed as follows:</p> <ol style="list-style-type: none"> <li>1. By default, the character '\n' cannot be matched.</li> <li>2. When <b>flags</b> contains the <b>n</b> option, the character '\n' can be matched.</li> <li>3. The <b>regexp_replace(source, pattern replacement)</b> function replaces all matching substrings.</li> <li>4. <b>regexp_replace(source, pattern, replacement, flags)</b> returns null when the value of <b>flags</b> is '' or null.</li> </ol> <p>Otherwise, the meanings of the options supported by the <b>flags</b> parameter of the regular expression are as follows:</p> <ol style="list-style-type: none"> <li>1. By default, the character '\n' can be matched.</li> <li>2. The <b>n</b> option in <b>flags</b> indicates that the multi-line matching mode is used.</li> <li>3. The <b>regexp_replace(source, pattern replacement)</b> function replaces only the first matched substring.</li> <li>4. If the value of <b>flags</b> is '' or null, the return value of <b>regexp_replace(source, pattern, replacement, flags)</b> is the character string after replacement.</li> </ol>
<p>compat_cursor</p>	<p>Determines the compatibility behavior of implicit cursor states. If this parameter is set and the O compatibility mode is used, the effective scope of implicit cursor states (<b>SQL %FOUND</b>, <b>SQL%NOTFOUND</b>, <b>SQL%ISOPNE</b>, and <b>SQL %ROWCOUNT</b>) is extended from only the currently executed function to all subfunctions invoked by this function.</p>
<p>proc_outparam_override</p>	<p>Determines the overloading of output parameters of a stored procedure. After this parameter is enabled, the stored procedure can be properly created and invoked even if only the output parameters of the stored procedure are different. Currently, this parameter can be used only when gsql and JDBC are used to connect to the database. If this parameter is enabled for other tools to connect to the database, stored procedures with the <b>out</b> parameter cannot be invoked.</p> <p>It supports the functions that contain the <b>out</b> output parameter and returns data of the record type. Besides, a value is assigned to the <b>out</b> parameter.</p>

Configuration Item	Behavior
proc_implicit_for_loop_variable	<p>Controls the behavior of the FOR_LOOP query statement in a stored procedure. When this parameter is set, if <i>rec</i> has been defined in the FOR rec IN query LOOP statement, the defined <i>rec</i> variable is not reused and a new variable is created. Otherwise, the defined <i>rec</i> variable is reused and no variable is created.</p>
allow_procedure_compile_check	<p>Controls the compilation check of the SELECT and OPEN CURSOR statements in a stored procedure. If this parameter is set, when the SELECT, OPEN CURSOR FOR, CURSOR %rowtype, or FOR rec IN statement is executed in a stored procedure, the stored procedure cannot be created if the queried table does not exist, and the compilation check of the trigger function is not supported. If the queried table exists, the stored procedure is successfully created.</p> <p>Note: When creating an encrypted function, you need to disable <b>allow_procedure_compile_check</b>.</p>
char_coerce_compat	<p>Controls the behavior when char(n) types are converted to other variable-length string types. If this parameter is not set, spaces at the end are omitted when the char(n) type is converted to other variable-length string types. If this parameter is set, spaces at the end are not omitted during conversion. In addition, if the length of the char(n) type exceeds the length of other variable-length string types, an error is reported. This parameter is valid only when the <b>sql_compatibility</b> parameter is set to <b>A</b>. After this parameter is enabled, spaces at the end are not omitted in implicit conversion, explicit conversion, or conversion by calling the <b>text(bpchar)</b> function.</p> <pre> gaussdb=# set behavior_compat_options=""; gaussdb=# create table tab_1(col1 varchar(3)); gaussdb=# create table tab_2(col2 char(3)); gaussdb=# insert into tab_2 values(' '); gaussdb=# insert into tab_1 select col2 from tab_2; gaussdb=# select * from tab_1 where col1 is null; col1 ----- (1 row) gaussdb=# select * from tab_1 where col1=' '; col1 ----- (0 rows) gaussdb=# delete from tab_1; gaussdb=# set behavior_compat_options = 'char_coerce_compat'; gaussdb=# insert into tab_1 select col2 from tab_2; gaussdb=# select * from tab_1 where col1 is null; col1 ----- (0 rows) gaussdb=# select * from tab_1 where col1=' '; col1 ----- (1 row) </pre>

Configuration Item	Behavior
truncate_numeric_tail_zero	<p>Configuration item for numeric display. If this parameter is not set, numeric data is displayed in the default precision. When this parameter is set, the trailing zeros after the decimal point are hidden in all numeric output scenarios except to_char(numeric, format). For example:</p> <pre>gaussdb=# set behavior_compat_options='truncate_numeric_tail_zero'; gaussdb=# select cast(123.123 as numeric(15,10)) as a, to_char(cast(123.123 as numeric(15,10)), '999D999999');  a   to_char -----+----- 123.123   123.123000 (1 row) gaussdb=# set behavior_compat_options=""; gaussdb=# select cast(123.123 as numeric(15,10)) as a, to_char(cast(123.123 as numeric(15,10)), '999D999999');  a   to_char -----+----- 123.1230000000   123.123000 (1 row)</pre>
plsql_security_definer	<p>After this parameter is enabled, the definer permission is used by default when a stored procedure is created.</p>

Configuration Item	Behavior
plpgsql_dependency	<p>If this parameter is set, a function, stored procedure, or package containing undefined objects can be created. You can query the dependency in <b>GS_DEPENDENCIES</b> and <b>GS_DEPENDENCIES_OBJ</b>.</p> <p>If this parameter is enabled, when creating a PL/SQL object, the OID that depends on the PL/SQL object is automatically updated.</p> <p>Dependency can be established in the following scenarios:</p> <ol style="list-style-type: none"> <li>1. A function appears at the position of the dependency type and parameter default value in a function header.</li> <li>2. Package, type in the function, and variable dependency type.</li> <li>3. Variable declaration and variable value assignment depend on variables in other packages.</li> <li>4. In the function body, function A is called in the right value expression of the function call or assignment statement. If the input and output parameters of function A contain function B, no dependency is established for function B. For example, <b>functionA(functionB())</b>. Only the dependency for function A is established.</li> <li>5. Dependency function in a view.</li> </ol> <p>Dependency cannot be established in the following scenarios:</p> <ol style="list-style-type: none"> <li>1. A type in a schema depends on other types.</li> <li>2. Dependency on functions, variables, tables, and views in SQL statements. For example, dependency is not recorded for <b>select id into var1 from table1 join view1 on table1.id = pkg1.var1; table1,view1,pkg1</b>.</li> <li>3. Dependency on functions, variables, tables, and views in a view.</li> </ol> <p>Notes:</p> <ol style="list-style-type: none"> <li>1. When PL/SQL objects are concurrently created, deadlocks may occur if competition occurs among the object.</li> <li>2. If the objects to be modified exist in <b>gs_dependencies</b> and <b>gs_dependencies_obj</b>, you cannot rename the objects.</li> <li>3. When a function, stored procedure, or package depends on a synonym, the synonym must be created in advance. OIDs cannot be maintained manually.</li> </ol>
disable_rewrite_nesttable	<p>If this parameter is enabled, rewriting of columns related to the table of type in the <b>pg_type</b> table will be disabled. That is, when reading the <b>pg_type</b> table, the actual stored value of the table of type is displayed.</p>

Configuration Item	Behavior
skip_insert_gs_source	If this parameter is enabled, data is not inserted into the <b>dbep_ldeveloper.gs_source</b> table when the PL/SQL objects are created.
disable_emptystring2null	If this parameter is enabled, the function of converting empty strings to null by default is disabled for the following character types: text, clob, blob, raw, bytea, varchar, nvarchar2, bpchar, char, name, byteawithoutorderwithqualcol, and byteawithoutordercol. This parameter is reserved for emergency. Do not set it unless necessary.
select_into_return_null	This parameter takes effect only in PG-compatible mode. If this parameter is enabled, a <b>NULL</b> value can be assigned to the variables in the stored procedure statement <b>SELECT <i>select_expressions</i> INTO [STRICT] <i>target</i> FROM...</b> without specifying <b>STRICT</b> when the query result is empty.

Configuration Item	Behavior
<p>proc_uncheck_default_param</p>	<p>When a function is called, the system does not check whether the default parameter is omitted.</p> <ul style="list-style-type: none"> <li> <p>If this item is not set and a function with default parameters is invoked, input parameters are added to the function from left to right. If inputs of non-default parameters are missing, an error is reported. For example:</p> <pre>gaussdb=# create or replace function test(f1 int, f2 int default 20, f3 int, f4 int default 40, f5 int default 50) return int gaussdb=# as gaussdb\$\$\$ begin gaussdb\$\$\$ raise info 'f1:%',f1; gaussdb\$\$\$ raise info 'f2:%',f2; gaussdb\$\$\$ raise info 'f3:%',f3; gaussdb\$\$\$ raise info 'f4:%',f4; gaussdb\$\$\$ raise info 'f5:%',f5; gaussdb\$\$\$ return 1; gaussdb\$\$\$ end; gaussdb\$\$\$ / CREATE FUNCTION gaussdb=# select test(1,2); ERROR: function test(integer, integer) does not exist LINE 1: select test(1,2);                 ^ HINT: No function matches the given name and argument types. You might need to add explicit type casts. CONTEXT: referenced column: test</pre> </li> <li> <p>If this item is set and a function with default parameters is invoked, input parameters are added to the function from left to right. The number of defaulted inputs depends on the number of default parameters. If an input of a non-default parameter is missing, the previous default value is used to fill this parameter. For example:</p> <pre>gaussdb=# create or replace function test(f1 int, f2 int default 20, f3 int, f4 int default 40, f5 int default 50) return int gaussdb=# as gaussdb\$\$\$ begin gaussdb\$\$\$ raise info 'f1:%',f1; gaussdb\$\$\$ raise info 'f2:%',f2; gaussdb\$\$\$ raise info 'f3:%',f3; gaussdb\$\$\$ raise info 'f4:%',f4; gaussdb\$\$\$ raise info 'f5:%',f5; gaussdb\$\$\$ return 1; gaussdb\$\$\$ end; gaussdb\$\$\$ / CREATE FUNCTION gaussdb=# select test(1,2); INFO: f1:1 CONTEXT: referenced column: test INFO: f2:2 CONTEXT: referenced column: test INFO: f3:20 CONTEXT: referenced column: test INFO: f4:40 CONTEXT: referenced column: test INFO: f5:50 CONTEXT: referenced column: test test -----</pre> </li> </ul>

Configuration Item	Behavior
	<p>1 (1 row)</p> <p>As shown above, f3 is filled with an incorrect default value.</p> <p><b>WARNING</b> In this scenario, a non-default parameter is filled with the previous default value.</p>
dynamic_sql_compat	<p>After this parameter is enabled, the dynamic statement does not consider the template parameters with the same name in the template SQL statement as the same variable. Instead, the variables in the USING clause are matched in sequence.</p> <p><b>CAUTION</b></p> <ul style="list-style-type: none"> <li>• If a stored procedure is invoked when a dynamic statement executes an anonymous block statement, only the <b>IN</b> parameters are corrected. If <b>OUT</b> parameters need to be checked, set the <b>proc_outparam_override</b> parameter.</li> <li>• If a stored procedure is invoked when a dynamic statement executes an anonymous block statement and this parameter is enabled, the <b>IN</b> and <b>OUT</b> attributes in a stored procedure and the USING clause are not checked.</li> </ul>
dynamic_sql_check	<p>If this parameter is enabled, an error is reported during dynamic statement execution if the number of different template parameters in the dynamic statement template SQL is different from the number of variables in the USING clause.</p> <p><b>CAUTION</b></p> <ul style="list-style-type: none"> <li>• If the <b>dynamic_sql_compat</b> option is enabled, the <b>dynamic_sql_check</b> option does not take effect.</li> <li>• If a stored procedure is invoked when a dynamic statement executes an anonymous block statement, only the <b>IN</b> parameters are checked. If <b>OUT</b> parameters need to be checked, set the <b>proc_outparam_override</b> parameter.</li> <li>• If a stored procedure is invoked when a dynamic statement executes an anonymous block statement and this parameter is enabled, the <b>IN</b> and <b>OUT</b> attributes in a stored procedure and the USING clause are not checked.</li> </ul>

Configuration Item	Behavior
<p>enable_funcname_with_argname</p>	<p>If the parameter is enabled, the projection alias displays the complete function when the SELECT function is invoked.</p> <ul style="list-style-type: none"> <li> <p>If this item is not set, the projection alias displays the function name when the SELECT function is invoked. For example:</p> <pre> gaussdb=# SELECT power(2,3); power -----       8 (1 row)  gaussdb=# SELECT count(*) FROM db_ind_columns; count -----    611 (1 row)  gaussdb=# SELECT count(index_name) FROM db_ind_columns; count -----    611 (1 row)  gaussdb=# SELECT left('abcde', 2); left ----- ab (1 row)  gaussdb=# SELECT pg_client_encoding(); pg_client_encoding ----- UTF8 (1 row) </pre> </li> <li> <p>If the item is set, the projection alias displays the complete function when the SELECT function is invoked. For example:</p> <pre> gaussdb=# SET behavior_compat_options = 'enable_funcname_with_argname'; SET gaussdb=# SELECT power(2,3); power(2,3) -----       8 (1 row)  gaussdb=# SELECT count(*) FROM db_ind_columns; count(*) -----    611 (1 row)  gaussdb=# SELECT count(index_name) FROM db_ind_columns; count(index_name) -----    611 (1 row)  gaussdb=# SELECT left('abcde', 2); left('abcde',2) ----- </pre> </li> </ul>

Configuration Item	Behavior
	<pre>ab (1 row)  gaussdb=# SELECT pg_client_encoding(); pg_client_encoding() ----- UTF8 (1 row)</pre> <p><b>CAUTION</b></p> <ul style="list-style-type: none"> <li>• Currently, only <b>func_name(args_list)</b>, <b>func_name()</b>, and <b>func_name(*)</b> are supported to display complete functions. The <b>args</b> parameter only supports character type, value type, column name, and function. A function name can contain a schema or package name. The parameter cannot contain other clauses (such as the ORDER BY clause) or be an expression. The parameter can contain only the DISTINCT keyword. If the parameter contains other keywords, the complete function cannot be displayed.</li> <li>• Some special functions do not support displaying projection alias, including COLLATION FOR, CURRENT_DATE, CURRENT_TIME, CURRENT_TIMESTAMP, DBTIMEZONE, LOCALTIME, LOCALTIMESTAMP, SYSDATE, SESSIONTIMEZONE, ROWNUM, CURRENT_ROLE, CURRENT_USER, SESSION_USER, USER, CURRENT_CATALOG, CURRENT_SCHEMA, CAST, EXTRACT, TIMESTAMPDIFF, OVERLAY, POSITION, SUBSTRING, TREAT, TRIM, NULLIF, NVL, NVL2, COALESCE, GREATEST, LEAST, LNNVL, REGEXP_LIKE, and XML functions.</li> <li>• Some security encryption and decryption functions, anonymization functions, and projection aliases display functions may have security problems. Therefore, only function names are displayed here, including gs_encrypt_aes128, gs_decrypt_aes128, gs_encrypt, gs_decrypt, aes_encrypt, aes_decrypt, pg_create_physical_replication_slot_extern, dblink_connect, creditcardmasking, "basicemailmasking", fullemailmasking, alldigitsmasking, shufflemasking, randommasking, regexpmasking, and gs_digest.</li> <li>• The parameter transfer mode using =&gt; is not supported for the projection alias to display the complete function. The projection alias cannot contain double quotation marks (""), for example, <b>select "power" (2,3)</b>.</li> <li>• To enable the projection alias to display the complete function, this function is not affected by parameters such as removing 0 at the end.</li> </ul>

Configuration Item	Behavior
allow_rownum_alias	<p>After this parameter is enabled, ROWNUM can be used as a column alias in SQL statements using the AS syntax. ROWNUM is used as a common identifier and cannot be used as a pseudocolumn.</p> <p><b>WARNING</b> You are not advised to change the status of this parameter during service execution. When the parameter is enabled, database objects (such as table names, column names, and database names) created using ROWNUM as the name in the database can be used only when the parameter is enabled. Otherwise, ambiguity occurs and the behavior is unpredictable. When the parameter is disabled, the behavior of using ROWNUM as a pseudocolumn in the database becomes invalid after the parameter is enabled and the behavior is unpredictable.</p>
current_sysdate	<p>If this parameter is enabled, the current OS time is returned when the <b>sysdate</b> command is executed.</p> <pre>gaussdb=# set behavior_compat_options='current_sysdate'; SET gaussdb=# select sysdate; current_sysdate ----- 2023-06-20 20:15:27 (1 row)</pre>

## plsql\_compile\_check\_options

**Parameter description:** Specifies database compatibility behavior. Multiple items are separated by commas (,).

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string

**Default value:** ""

### NOTE

- Currently, only items in [Table 14-10](#) are supported.
- Multiple items are separated by commas (,), for example, **set plsql\_compile\_check\_options='for\_loop,outparam'**;

**Table 14-11** Compatibility configuration items

Configuratio n Item	Behavior
for_loop	Determines the behavior of the <b>FOR_LOOP</b> query statement in a stored procedure. When this parameter is set, if <b>rec</b> has been defined in the <b>FOR rec IN query LOOP</b> statement, the defined <b>rec</b> variable is not reused and a new variable is created. Otherwise, the defined <b>rec</b> variable is reused and no new variable is created. (It is the same as <b>proc_implicit_for_loop_variable</b> and will be incorporated later.)
outparam	When the output parameter overloading condition is met, the output parameters are checked. If the output parameters are constant, an error is reported.
plsql_express ion_check	When the compilation check mode and this parameter are enabled, the output parameter type is checked additionally. If a value cannot be assigned for the output parameter, a warning is reported.

## a\_format\_version

**Parameter description:** Specifies the database platform compatibility configuration item. The value of this parameter is an enumerated string.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string

**Default value:** ""

### NOTE

- Currently, only items in [Table 14-10](#) are supported.
- Set a character string for the compatibility configuration item, for example, **set a\_format\_version='10c'**.

**Table 14-12** Compatibility configuration items

Configuratio n Item	Behavior
10c	Compatible version of platform A

## a\_format\_dev\_version

**Parameter description:** Specifies the database platform minor version compatibility configuration item. The value of this parameter is an enumerated string.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string

**Default value:** ""

 **NOTE**

- Currently, only items in [Table 14-13](#) are supported.
- Set a character string for the compatibility configuration item, for example, `set a_format_dev_version='s1'`.

**Table 14-13** Compatibility configuration items

Configuration Item	Behavior
s1	<ul style="list-style-type: none"> <li>• Compatible minor version of platform A, which affects functions TRUNC(date, fmt), ROUND(date, fmt), NVL2, LPAD, RPAD, ADD_MONTHS, MONTHS_BETWEEN, REGEXP_REPLACE, REGEXP_COUNT, TREAT, EMPTY_CLOB, INSTRB, trunc(number), greatest, least, mod, round(number), cast, to_date, to_timestamp, chr, rtrim, translate, to_char, to_number, and to_timestamp_tz.</li> <li>• Data type conversion: A decimal character string is rounded off when it is converted to an integer (int1/int2/int4/int8/int16).</li> <li>• Data type conversion: Implicit conversion from timestamp with time zone to timestamp without time zone is supported.</li> </ul>
s2	<ul style="list-style-type: none"> <li>• Compatible minor version of platform A, which affects functions dump, to_single_byte, to_multi_byte, nls_upper, nls_lower, initcap, ascii2, asciistr, unistr, vsize, cosh, remainder, sinh, tanh, nanvl, current_date, current_timestamp, dbtimezone, numtodsinterval, numtoyminterval, new_time, sessiontimezone, sys_extract_utc, tz_offset, to_binary_double, to_binary_float, to_dsinterval, to_ymininterval, lnnvl, ora_hash, rawtohex2, bit2coding, and bit4coding.</li> <li>• Supports all behaviors when the compatibility configuration item is set to <b>s1</b>.</li> </ul>

## plpgsql.variable\_conflict

**Parameter description:** Sets the priority of using stored procedure variables and table columns with the same name.

This is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string

- **error** indicates that a compilation error is reported when the name of a stored procedure variable is the same as that of a table column.

- **use\_variable** indicates that if the name of a stored procedure variable is the same as that of a table column, the variable is used preferentially.
- **use\_column** indicates that if the name of a stored procedure variable is the same as that of a table column, the column name is used preferentially.

**Default value:** error

## td\_compatible\_truncation

**Parameter description:** Specifies whether to enable features compatible with a Teradata database. You can set this parameter to **on** when connecting to a database compatible with the Teradata database, so that when you perform the **INSERT** operation, overlong strings are truncated based on the allowed maximum length before being inserted into char- and varchar-type columns in the target table. This ensures all data is inserted into the target table without errors reported.

### NOTE

The string truncation function cannot be used if the **INSERT** statement includes a foreign table.

If inserting multi-byte character data (such as Chinese characters) to database with the character set byte encoding (such as SQL\_ASCII or LATIN1), and the character data crosses the truncation position, the string is truncated based on its bytes instead of characters. Unexpected result will occur in tail after the truncation. If you want correct truncation result, you are advised to adopt encoding set such as UTF8, which has no character data crossing the truncation position.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that overlong strings are truncated.
- **off** indicates that overlong strings are not truncated.

**Default value:** off

## uppercase\_attribute\_name

**Parameter description:** Specifies whether to return column names in uppercase to the client. This parameter is used only in the ORA-compatible mode and centralized environment.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that column names are returned to the client in uppercase.
- **off** indicates that column names are not returned to the client in uppercase.

**Default value:** off

## lastval\_supported

**Parameter description:** Specifies whether the lastval function can be used.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that the lastval function can be used and the nextval function cannot be pushed down.
- **off** indicates that the lastval function cannot be used and the nextval function can be pushed down.

**Default value:** off

### a\_format\_copy\_version

**Parameter description:** Specifies the database platform minor version compatibility configuration item. The value of this parameter is an enumerated string.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#). When using **gs\_loader** to import new features, you need to set the corresponding values.

**Value range:** a string

**Default value:** ''.

 **NOTE**

- Currently, only items in [Table 14-14](#) are supported.
- Supports setting character string for compatibility configuration. For details, see section "Client Tools > gs\_loader" in *Tool Reference*. You can set the **a\_format\_copy\_version** parameter by using **guc\_param**.

**Table 14-14** Compatibility configuration items

Configuration Item	Behavior
s1	<ul style="list-style-type: none"> <li>• Supports gs_loader specifying data type (CHAR[(length)]/INTEGER external[(length)]/FLOAT external[(length)]/DECIMAL external[(length)]/TIMESTAMP/DATE/DATE EXTERNAL/INTEGER/SMALLINT/RAW[(length)]) to import data.</li> <li>• Supports gs_loader converting expressions and extending scenarios for columns.</li> </ul>

## 14.3.16 Fault Tolerance

This section describes parameters used for controlling how the server processes an error occurring in the database system.

## exit\_on\_error

**Parameter description:** If this function is enabled, errors of the ERROR level will be upgraded to PANIC errors, and core stacks will be generated. It is mainly used to locate problems and test services.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-2](#).

**Value range:** Boolean

- **on** indicates that errors of the ERROR level will be upgraded to PANIC errors.
- **off** indicates that errors of the ERROR level will not be upgraded.

**Default value:** off

## restart\_after\_crash

**Parameter description:** If this parameter is set to **on** and a backend process crashes, GaussDB automatically reinitializes the backend process.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-2](#).

**Value range:** Boolean

- **on** maximizes the availability of the database.  
In some circumstances (for example, when a management tool, such as xCAT, is used to manage GaussDB), setting this parameter to **on** maximizes the availability of the database.
- **off** indicates that a management tool is enabled to obtain control permission and take proper measures when a backend process crashes.

**Default value:** on

## omit\_encoding\_error

**Parameter description:** If this parameter is set to **on** and the client character set of the database is encoded in UTF-8 format, character encoding conversion errors will be recorded in logs. Additionally, converted characters that have conversion errors will be ignored and replaced with question marks (?).

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-2](#).

**Value range:** Boolean

- **on** indicates that characters that have conversion errors will be ignored and replaced with question marks (?), and error information will be recorded in logs.
- **off** indicates that characters that have conversion errors cannot be converted and error information will be directly displayed.

**Default value:** off

## cn\_send\_buffer\_size

**Parameter description:** Specifies the size of the data buffer used for data transmission on the primary database node.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-2](#).

**Value range:** an integer ranging from 8 to 128. The unit is KB.

**Default value:** 8 KB

## data\_sync\_retry

**Parameter description:** Specifies whether to keep running the database when updated data fails to be written into disks by using the **fsync** function. In some OSs, no error is reported even if **fsync** fails after the second attempt. As a result, data is lost.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-2](#).

**Value range:** Boolean

- **on** indicates that the database keeps running and **fsync** is executed again after **fsync** fails.
- **off** indicates that a PANIC-level error is reported and the database is stopped after **fsync** fails.

**Default value:** off

## remote\_read\_mode

**Parameter description:** Specifies whether to enable the remote read function. This function allows pages on the standby node to be read when reading pages on the primary node fails.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** enumerated values

- **off** indicates that the remote read function is disabled.
- **non\_authentication** indicates that the remote read function is enabled but certificate authentication is not required.
- **authentication** indicates that the remote read function is enabled and certificate authentication is required.

**Default value:** authentication

## 14.3.17 Connection Pool Parameters

When a connection pool is used to access the database, database connections are established and then stored in the memory as objects during system running. When you need to access the database, no new connection is established. Instead, an existing idle connection is selected from the connection pool. After you finish

accessing the database, the database does not disable the connection but puts it back into the connection pool. The connection can be used for the next access request.

## cache\_connection

**Parameter description:** Specifies whether to recycle the connections of a connection pool.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-2](#).

**Value range:** Boolean

- **on** indicates that the connections of a connection pool will be recycled.
- **off** indicates that the connections of a connection pool will not be recycled.

**Default value:** on

## 14.3.18 Transaction

This section describes the settings and value ranges of database transaction parameters.

### transaction\_isolation

**Parameter description:** specifies the isolation level of the current transaction.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string of case-sensitive characters. The values include:

- **serializable:** This value is equivalent to REPEATABLE READ in GaussDB.
- **read committed** indicates that only the data in committed transactions will be read.
- **repeatable read** indicates that only the data committed before transaction start is read. Uncommitted data or data committed in other concurrent transactions cannot be read.
- **default:** The value is the same as that of **default\_transaction\_isolation**.

**Default value:** read committed

### transaction\_read\_only

**Parameter description:** Specifies whether the current transaction is a read-only transaction.

This parameter has a fixed value **on** during database restoration or on the standby node. Otherwise, set this parameter to the value of **default\_transaction\_read\_only**.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that the current transaction is a read-only transaction.
- **off** indicates that the current transaction can be a read/write transaction.

**Default value:** off

## xc\_maintenance\_mode

**Parameter description:** Specifies whether the system is in maintenance mode.

This parameter is a SUSET parameter. Set it based on method 3 in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that the system is in maintenance mode.
- **off** indicates that the system is not in maintenance mode.

---

### NOTICE

Enable the maintenance mode with caution to avoid database data inconsistencies.

---

**Default value:** off

## allow\_concurrent\_tuple\_update

**Parameter description:** Specifies whether to allow concurrent update.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that the concurrent update is allowed.
- **off** indicates that the system is not in maintenance mode.

**Default value:** on

## transaction\_deferrable

**Parameter description:** Specifies whether to delay the execution of a read-only serial transaction without incurring an execution failure. Assume this parameter is set to **on**. When the server detects that the tuples read by a read-only transaction are being modified by other transactions, it delays the execution of the read-only transaction until the other transactions finish modifying the tuples. This parameter is reserved and does not take effect in this version. Similar to this parameter, the [default\\_transaction\\_deferrable](#) parameter is used to specify whether to allow delayed execution of a transaction.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that the execution of a read-only serial transaction can be delayed.

- **off** indicates that the execution of a read-only serial transaction cannot be delayed.

**Default value:** off

## enable\_show\_any\_tuples

**Parameter description:** This parameter is available only in a read-only transaction and is used for analysis. When this parameter is set to **on** or **true**, all versions of tuples in the table are displayed.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** or **true** indicates that all versions of tuples in the table are displayed.
- **off** or **false** indicates that no versions of tuples in the table are displayed.

**Default value:** off

## replication\_type

**Parameter description:** Specifies whether the current HA mode is standalone, primary/standby/secondary, or one primary multiple standbys.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

This parameter is an internal parameter. Do not set it.

**Value range:** 0 to 2

- **2** Indicates the single primary mode. In this mode, the standby node cannot be expanded.
- **1** Indicates that the one-primary-multiple-standby mode is used, covering all scenarios. This mode is recommended.
- **0** Indicates the primary/standby mode. Currently, this mode is not supported.

**Default value:** 1

## pgxc\_node\_name

**Parameter description:** Specifies the name of a node.

This parameter is a POSTMASTER parameter. Set it based on [Table 14-2](#).

When a standby node requests to replicate logs on the primary node, if the **application\_name** parameter is not set, the **pgxc\_node\_name** parameter is used as the name of the streaming replication slot of the standby node on the primary node. The streaming replication slot is named in the following format: Value of this parameter\_IP address of the standby node\_Port number of the standby node. The IP address and port number of the standby node are obtained from the IP address and port number of the standby node specified by the **replconninfo** parameter. The maximum length of a streaming replication slot name is 61 characters. If the length of the concatenated string exceeds 61 characters, the truncated **pgxc\_node\_name** will be used for concatenation to ensure that the

length of the streaming replication slot name is less than or equal to 61 characters.

---

 **CAUTION**

After this parameter is modified, the database instance will fail to be connected. You are advised not to modify this parameter.

---

**Value range:** a string

**Default value:** current node name

### enable\_defer\_calculate\_snapshot

**Parameter description:** Specifies the delay in calculating **xmin** and **oldestxmin**. Calculation is triggered only when 1000 transactions are executed or the interval is 1s. If this parameter is set to **on**, the overhead of calculating snapshots can be reduced in heavy-load scenarios, but the progress of **oldestxmin** is slow, affecting tuple recycling. If this parameter is set to **off**, **xmin** and **oldestxmin** can be calculated in real time, but the overhead for calculating snapshots increases.

This parameter is a SIGHUP parameter. Set it based on [Table 14-2](#).

**Value range:** Boolean

- **on** indicates that snapshots **xmin** and **oldestxmin** are calculated with a delay.
- **off** indicates that snapshot **xmin** and **oldestxmin** are calculated in real time.

**Default value:** on

## 14.3.19 Replication Parameters of Two Database Instances

### RepOriginId

**Parameter description:** This parameter is a session-level GUC parameter. In bidirectional logical replication, set it to a non-zero value to avoid infinite data replication.

This parameter is a USERSET parameter. Set it based on method 3 provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 2147483647

**Default value:** 0

### stream\_cluster\_run\_mode

**Parameter description:** Specifies whether a DN is in the primary or standby instance in dual-instance streaming DR scenarios. For single-instance scenarios, the DN is in the primary instance by default.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** enumerated values

- **cluster\_primary** indicates that the node is in the primary instance.
- **cluster\_standby** indicates that the node is in the standby instance.

**Default value:** cluster\_primary

## enable\_roach\_standby\_cluster

**Parameter description:** Sets the standby database instances to read-only in dual-database instance mode. Only users with the sysadmin permission can access this parameter.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that the read-only mode is enabled for the standby database instances.
- **off** indicates that the read-only mode is disabled for the standby database instances. In this case, the standby database instances can be read and written.

**Default value:** off

## hadr\_process\_type

**Parameter description:** Specifies a process ID for the streaming replication-based remote DR solution or intra-city dual-center HA solution.

This parameter is a SIGHUP parameter. Set it based on [Table 14-2](#).

**Value range:** enumerated values

- **none** indicates that there is no process.
- **failover** indicates that the DR database instance is being upgraded.
- **switchover\_promote** indicates the process of upgrading the DR database instance to the primary database instance during the primary/standby database instance switchover.
- **switchover\_demote** indicates the process of demoting the primary database instance to the DR database instance during the primary/standby database instance switchover.
- **dorado\_failover** indicates the process of promoting Dorado DR database instance.
- **dorado\_switchover\_demote** indicates the process of demoting the primary database instance to the DR database instance during the primary/standby instance of Dorado database switchover.
- **dorado\_failover\_abnormal** indicates the process of promoting the DR database instance to the primary instance when the shared disk of the primary instance in Dorado database is faulty.

**Default value:** none

## 14.3.20 Developer Options

### allow\_system\_table\_mods

**Parameter description:** Specifies whether the structure of a system catalog or the name of a system schema can be modified.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that the structure of the system catalog or the name of the system schema can be modified.
- **off** indicates that the structure of the system catalog or the name of the system schema cannot be modified.

**Default value:** off

You are not advised to change the default value of this parameter. If this parameter is set to **on**, system tables may be damaged and the database may fail to be started.

---

### allow\_create\_sysobject

**Parameter description:** Specifies whether objects such as functions, stored procedures, synonyms, aggregate functions, and operators can be created or modified in the system schema. The system schema refers to the schema provided by the database after initialization, excluding the public schema. The OID of the system schema is usually smaller than 16384.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that the initial user and system administrator can create or modify objects such as functions, stored procedures, synonyms, and aggregate functions in the system schema, and the initial user can create operators in the system schema. The **sysadmin** user has the permission to create or replace, alter, grant, and revoke system objects by default. For details about whether other users are allowed to create these objects, see the permission requirements of the corresponding schema.
- **off** indicates that all users are not allowed to create or modify objects such as functions, stored procedures, synonyms, aggregate functions, and operators in the system schema. The **sysadmin** user does not have the permission to create or replace, alter, grant, or revoke system objects by default.

**Default value:** on

## debug\_assertions

**Parameter description:** Specifies whether to enable various assertion checks. This parameter assists in debugging. If you are experiencing strange problems or crashes, set this parameter to **on** to identify programming defects. To use this parameter, the macro USE\_ASSERT\_CHECKING must be defined (through the configure option **--enable-cassert**) during the GaussDB compilation.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that various assertion checks are enabled.
- **off** indicates that various assertion checks are disabled.

### NOTE

If you compile GaussDB with the assertion check enabled, this parameter is set to **on** by default.

**Default value:** off

## ignore\_checksum\_failure

**Parameter description:** Specifies whether to ignore check failures (but still generates an alarm) and continues reading data. Continuing reading data may result in breakdown, damaged data being transferred or hidden, failure of data recovery from remote nodes, or other serious problems. You are not advised to modify the settings.

This parameter is a SUSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that data check errors are ignored.
- **off** indicates that data check errors are reported.

**Default value:** off

## ignore\_system\_indexes

**Parameter description:** Specifies whether to ignore system indexes when reading system catalog (but still update the indexes when modifying the tables).

This parameter is a BACKEND parameter. Set it based on instructions provided in [Table 14-1](#).

---

### NOTICE

This parameter is useful for recovering data from tables whose system indexes are damaged.

---

**Value range:** Boolean

- **on** indicates that system indexes are ignored.
- **off** indicates that system indexes are not ignored.

**Default value:** off

## post\_auth\_delay

**Parameter description:** Specifies the delay in the connection to the server after a successful authentication. Developers can attach a debugger to the server startup process.

This parameter is a BACKEND parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 2147. The unit is s.

**Default value:** 0

### NOTE

This parameter is used only for commissioning and fault locating. To prevent impact on service running, ensure that the default value **0** is used in the production environment. If this parameter is set to a value other than 0, the cluster status may be abnormal due to a long authentication delay.

## pre\_auth\_delay

**Parameter description:** Specifies the period of delaying authentication after the connection to the server is started. Developers can attach a debugger to the authentication procedure.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 60. The unit is s.

**Default value:** 0

### NOTE

This parameter is used only for commissioning and fault locating. To prevent impact on service running, ensure that the default value **0** is used in the production environment. If this parameter is set to a value other than 0, the cluster status may be abnormal due to a long authentication delay.

## trace\_notify

**Parameter description:** Specifies whether to enable the function of generating debugging output for the **LISTEN** and **NOTIFY** commands. The level of [client\\_min\\_messages](#) or [log\\_min\\_messages](#) must be **debug1** or lower so that debugging output can be recorded in the client or server logs, respectively.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that the function is enabled.

- **off** indicates that the function is disabled.

**Default value:** off

## trace\_recovery\_messages

**Parameter description:** Specifies whether to enable logging of recovery-related debugging output. This parameter allows users to overwrite the normal setting of [log\\_min\\_messages](#), but only for specific messages. This is intended for the use in debugging the standby node.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** enumerated values. Valid values include **debug5**, **debug4**, **debug3**, **debug2**, **debug1**, and **log**. For details about the parameter values, see [log\\_min\\_messages](#).

**Default value:** log

### NOTE

- **log** indicates that recovery-related debugging information will not be logged.
- Except the default value **log**, each of the other values indicates that recovery-related debugging information at the specified level will also be logged. Common settings of [log\\_min\\_messages](#) enable logs to be unconditionally recorded into server logs.

## trace\_sort

**Parameter description:** Specifies whether to print information about resource usage during sorting operations. This parameter is available only when the macro TRACE\_SORT is defined during the GaussDB compilation. However, TRACE\_SORT is currently defined by default.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that the function is enabled.
- **off** indicates that the function is disabled.

**Default value:** off

## zero\_damaged\_pages

**Parameter description:** Specifies whether to detect a damaged page header that causes GaussDB to report an error, aborting the current transaction.

This parameter is a SUSERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

Setting this parameter to **on** causes the system to report a warning, zero out the damaged page, and continue processing. This behavior will destroy data, including all the rows on the damaged page. However, it allows you to bypass the error and retrieve rows from any undamaged pages that may be present in the table.

Therefore, it is useful for restoring data if corruption has occurred due to a hardware or software error. In most cases, you are advised not to set this parameter to **on** if you want to restore data from damaged pages.

**Default value:** off

## remotetype

**Parameter description:** Specifies the remote connection type.

This parameter is a BACKEND parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** enumerated values. Valid values are **application**, **datanode**, and **internaltool**.

**Default value:** application

## max\_user\_defined\_exception

**Parameter description:** Specifies the maximum number of exceptions. The default value cannot be changed.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer. Currently, only the fixed value **1000** is supported.

**Default value:** 1000

## enable\_fast\_numeric

**Parameter description:** Specifies whether to enable optimization for numeric data calculation. Calculation of numeric data is time-consuming. Numeric data is converted into int64- or int128-type data to improve numeric data calculation performance.

This parameter is a SUSERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** or **true** indicates that optimization for numeric data calculation is enabled.
- **off** or **false** indicates that optimization for numeric data calculation is disabled.

**Default value:** on

## enable\_compress\_spill

**Parameter description:** Specifies whether to enable the compression function of writing data to disk.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** or **true** indicates that optimization for writing data to disk is enabled.
- **off** or **false** indicates that optimization for writing data to a disk is disabled.

**Default value:** on

## resource\_track\_log

**Parameter description:** Specifies the log level of self-diagnosis. Currently, this parameter takes effect only on multi-column statistics.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string

- **summary:** Brief diagnosis information is displayed.
- **detail:** Detailed diagnosis information is displayed.

Currently, the two parameter values differ only when there is an alarm about multi-column statistics not collected. If the parameter is set to **summary**, such an alarm will not be displayed. If it is set to **detail**, such an alarm will be displayed.

**Default value:** summary

## show\_acce\_estimate\_detail

**Parameter description:** The evaluation information is generally used by O&M personnel during maintenance, and it may affect the output display of the **EXPLAIN** statement. Therefore, this parameter is disabled by default. The evaluation information is displayed only if the **verbose** option of the **EXPLAIN** statement is enabled. (Due to specification changes, the current version no longer supports this feature. Do not use it.)

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that the evaluation information is displayed in the output of the **EXPLAIN** statement.
- **off** indicates that the evaluation information is not displayed in the output of the **EXPLAIN** statement.

**Default value:** off

### NOTE

The current version does not support database acceleration. Therefore, this parameter does not take effect after being set.

## support\_batch\_bind

**Parameter description:** Specifies whether to batch bind and execute PBE statements through interfaces such as JDBC, ODBC, and libpq.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that batch binding and execution are used.
- **off** indicates that batch binding and execution are not used.

**Default value:** on

## numa\_distribute\_mode

**Parameter description:** Specifies the distribution of some shared data and threads among NUMA nodes. This parameter is used to optimize the performance of large-scale ARM servers with multiple NUMA nodes. Generally, you do not need to set this parameter.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string. The valid values are **none** and **all**.

- **none** indicates that this function is disabled.
- **all** indicates that some shared data and threads are distributed to different NUMA nodes to reduce the number of remote access times and improve performance. Currently, this function applies only to ARM servers with multiple NUMA nodes. All NUMA nodes must be available for database processes. You cannot select only some NUMA nodes.

### NOTE

In the current version, **numa\_distribute\_mode** cannot be set to **all** on the x86 architecture.

**Default value:** none

## log\_pagewriter

**Parameter description:** Specifies whether to display the page refresh information of a thread and details about an incremental check point after the incremental check point is enabled. You are not advised to set this parameter to **true** because a large amount of information will be generated.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

**Default value:** on

## advance\_xlog\_file\_num

**Parameter description:** Specifies the number of Xlog files that are periodically initialized in advance in the background. This parameter is used to prevent the Xlog file initialization from affecting the performance during transaction submission. However, such a fault may occur only when the system is overloaded. Therefore, you do not need to set this parameter.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 1000000. The value **0** indicates that initialization is not performed in advance. For example, the value **10** indicates that

the background thread periodically initializes 10 Xlog files in advance based on the write location of the current Xlog.

**Default value:** 0

## enable\_beta\_opfusion

**Parameter description:** Specifies whether to accelerate the execution of SQL statements, such as aggregate functions and sorting in TPC-C when **enable\_opfusion** is set to **on**.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on:** enabled.
- **off:** disabled.

**Default value:** off

## enable\_csqual\_pushdown

**Parameter description:** Specifies whether to deliver filter criteria for a rough check during query.

This parameter is a SUSERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that a rough check is performed with filter criteria delivered during query.
- **off** indicates that a rough check is performed without filter criteria delivered during query.

**Default value:** on

## string\_hash\_compatible

**Parameter description:** Specifies whether to use the same method to calculate char-type hash values and varchar- or text-type hash values. Based on the setting of this parameter, you can determine whether a redistribution is required when a distribution column is converted from a char-type data distribution into a varchar- or text-type data distribution.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that the same calculation method is used and a redistribution is not required.
- **off** indicates that different calculation methods are used and a redistribution is required.

 NOTE

Calculation methods differ in the length of input strings used for calculating hash values. (For a char-type hash value, spaces following a string are not counted as the length. For a text- or varchar-type hash value, the spaces are counted.) The hash value affects the calculation result of queries. To avoid query errors, do not modify this parameter during database running once it is set.

**Default value:** off

## pldebugger\_timeout

**Parameter description:** Specifies the timeout interval for the pldebugger server to wait for a response from the debug end.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 1 to 86400. The unit is second.

**Default value:** 15min

## plsql\_show\_all\_error

**Parameter description:** Specifies whether to skip errors and continue compiling PLPGSQL objects. For details about the impact, see "Schema > DBE\_PLDEVELOPER" in the *Developer Guide*.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

**Default value:** off

## ustore\_attr

**Parameter description:** This parameter is used to control the information statistics of Ustore tables, rollback type, and data verification during the running of key modules (including data, indexes, rollback segments, and playback). This parameter helps R&D engineers locate faults.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string. This parameter is set in key-value mode. The mapping between keys and values is as follows: If multiple key-value pairs are used, use semicolons (;) to separate them. For example:

```
ustore_attr='ustore_verify_level=FAST;ustore_verify_module=UPAGE:UBTREE:UNDO:REDO'
```

 NOTE

When setting **ustore\_attr**, do not leave spaces or other characters before and after the equal sign (=) between key and value, for example, **ustore\_attr=ustore\_verify\_level = FAST**. Otherwise, the parameter is invalid during kernel code verification and the parameter setting fails.

- **ustore\_verify\_level:** verification level.  
**Value range:** a string of case-insensitive characters. For details, see the following table.

**Table 14-15** Parameter value meaning of `ustore_verify_level`

Parameter Value	Description
NONE	Indicates that the verification function is disabled. You are advised to enable this function to test performance.
FAST	Indicates fast verification. A few contents are verified and the impact on performance is minimized. The value is <b>NORMAL</b> for compatibility with earlier versions.
COMPLETE	Indicates complete verification. The verification content is the largest and the performance is greatly affected. The value is <b>SLOW</b> for compatibility with earlier versions.

**Default value:** **FAST**

- **ustore\_verify\_module:** module that controls verification.  
**Value range:** a string of case-insensitive characters. The value can be one or more of **UPAGE**, **UBTREE**, **UNDO**, **REDO**, and **ROACH**, or it can be **ALL** or **NULL** (case-insensitive).

When more than one of **UPAGE**, **UBTREE**, **UNDO**, **REDO**, and **ROACH** are set, use colons (:) to separate them, for example, **ustore\_verify\_module=UPAGE:UBTREE:UNDO:REDO**.

When the **ROACH** module is enabled by users, the value of the **ustore\_verify\_level** parameter is ignored during the backup of the **ROACH** module. By default, the level of verification is the highest and the performance is greatly affected. Therefore, exercise caution when using the **ustore\_verify\_module** parameter.

**Table 14-16** Parameter value meaning of `ustore_verify_module`

Parameter Value	Description
UPAGE	Indicates that data page verification is enabled.
UBTREE	Indicates that UBtree index verification is enabled.
UNDO	Indicates that rollback segment data verification is enabled.
REDO	Indicates that data page verification for the REDO process is enabled.
ROACH	Indicates that data page verification for the ROACH backup is enabled.

Parameter Value	Description
ALL	Indicates that data verification is enabled for the UPAGE, UBTREE, UNDO, REDO, and ROACH modules.
NULL	Indicates that data verification for the UPAGE, UBTREE, UNDO, REDO, and ROACH modules is disabled.

**Default value:** UPAGE:UBTREE:UNDO

- **index\_trace\_level:** specifies whether to enable index tracing and control the printing level. After this function is enabled, information about index tuples that meet the conditions is printed based on the printing level during index scanning.

**Value range:** a string. The values are described in the following table.

**Default value:** NO

**Table 14-17** Parameter value meaning of index\_trace\_level

Parameter Value	Description
NO	No additional information is printed.
NORMAL	Information about visible index tuples is printed, including: <ul style="list-style-type: none"> <li>• ID and offset of the index page where the current index tuple is located</li> <li>• Current tuple status</li> <li>• TID and partOid corresponding to the current tuple</li> <li>• xmin and xmax information corresponding to the current tuple</li> <li>• Current tuple content (if <b>enable_log_tuple</b> is set to <b>on</b>).</li> </ul>
VISIBILITY	On the basis of <b>NORMAL</b> , the information about the index tuples that do not pass the visibility check is printed and whether the index tuples are visible is marked.
SHOWHIKEY	On the basis of <b>VISIBILITY</b> , the system tries to print the information about the HIKEY tuple on the page.
ALL	Information about all tuples on the scanned index page is printed.

- **enable\_log\_tuple:** specifies whether to print the contents of related tuples when printing log-level prompts for troubleshooting and locating.

**Value range:** on or off (case-insensitive)

**Default value:** off

Note: This parameter has been discarded.

- **enable\_ustore\_sync\_rollback**: indicates whether to enable synchronous rollback for Ustore tables.  
**Value range:** Boolean  
**Default value:** true
  - **enable\_ustore\_async\_rollback**: indicates whether to enable asynchronous rollback for Ustore tables.  
**Value range:** Boolean  
**Default value:** true
  - **enable\_ustore\_page\_rollback**: indicates whether to enable page rollback for Ustore tables.  
**Value range:** Boolean  
**Default value:** true
  - **enable\_ustore\_partial\_seqscan**: indicates whether to enable partial scan for Ustore tables.  
**Value range:** Boolean  
**Default value:** false
  - **enable\_candidate\_buf\_usage\_count**: indicates whether to enable buffer usage statistics.  
**Value range:** Boolean  
**Default value:** false
  - **ustats\_tracker\_naptime**: specifies the interval for collecting statistics on Ustore tables.  
**Value range:** [1,INT\_MAX/1000]  
**Default value:** 20, in seconds
  - **umax\_search\_length\_for\_prune**: specifies the maximum search depth of the prune operation on the Ustore table.  
**Value range:** [1,INT\_MAX/1000]  
**Default value:** 10 (times)
  - **ustore\_unit\_test**: specifies a test parameter for the white-box test.  
**Value range:** a string  
**Default value:** empty
- Default value:** an empty string

---

 **CAUTION**

Exercise caution when setting the **ustore\_attr** parameter. You are advised to modify this parameter with the assistance of engineers.

---

## 14.3.21 Auditing

### 14.3.21.1 Audit Switch

#### audit\_enabled

**Parameter description:** Specifies whether to enable or disable the audit process. After the audit process is enabled, the auditing information written by the background process can be read from the pipe and written into audit files.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that the auditing function is enabled.
- **off** indicates that the auditing function is disabled.

**Default value:** on

#### audit\_directory

**Parameter description:** Specifies the storage directory of audit files. The value can be a path relative to the **data** directory or an absolute path. Only user **sysadmin** can access this parameter.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string

**Default value:** **pg\_audit** If **om** is used for database deployment, audit logs are stored in *\$GAUSSLOG/pg\_audit/Instance name*.

---

#### NOTICE

- You need to set different audit file directories for different DNs. Otherwise, audit logs will be abnormal.
- If the value of **audit\_directory** in the configuration file is an invalid path, the audit function cannot be used.

---

#### NOTE

- Valid path: Users must have read and write permissions on the path.
- Invalid path: Users do not have read or write permissions on an invalid path.

#### audit\_data\_format

**Parameter description:** Audits the format of log files. Currently, only the binary format is supported. Only the sysadmin user can access this parameter.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string

**Default value:** binary

## audit\_rotation\_interval

**Parameter description:** Specifies the interval of creating an audit log file. If the difference between the current time and the time when the previous audit log file is created is greater than the value of **audit\_rotation\_interval**, a new audit log file will be generated.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 1 to *INT\_MAX*/60. The unit is min.

**Default value:** 1d

---

### NOTICE

Adjust this parameter only when required. Otherwise, **audit\_resource\_policy** may fail to take effect. To control the storage space and time of audit logs, set the **audit\_resource\_policy**, **audit\_space\_limit**, and **audit\_file\_remain\_time** parameters.

---

## audit\_rotation\_size

**Parameter description:** Specifies the maximum capacity of an audit log file. If the total number of messages in an audit log exceeds the value of **audit\_rotation\_size**, the server will generate a new audit log file.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 1024 to 1048576. The unit is KB.

**Default value:** 10 MB

---

### NOTICE

- Do not adjust this parameter unless necessary. Otherwise, **audit\_resource\_policy** may fail to take effect. To control the storage space and time of audit logs, set the **audit\_resource\_policy**, **audit\_space\_limit**, and **audit\_file\_remain\_time** parameters.
  - If the space occupied by a single record in an audit log file exceeds the value of this parameter, the log file is regarded as an invalid log file.
- 

## audit\_resource\_policy

**Parameter description:** Specifies the policy for determining whether audit logs are preferentially stored by space or time.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that audit logs are preferentially stored by space. A maximum of **audit\_space\_limit** logs can be stored.

- **off** indicates that audit logs are preferentially stored by time. A minimum duration of **audit\_file\_remain\_time** logs must be stored.

**Default value:** on

## audit\_file\_remain\_time

**Parameter description:** Specifies the minimum duration required for recording audit logs. This parameter is valid only when **audit\_resource\_policy** is set to **off**.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 730. The unit is day. **0** indicates that the storage duration is not limited.

**Default value:** 90

## audit\_space\_limit

**Parameter description:** Specifies the total disk space occupied by audit files.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 1024 KB to 1024 GB. The unit is KB.

**Default value:** 1 GB

---

### NOTICE

In the multi-audit thread scenario, the minimum disk space occupied by audit files is the product of values of **audit\_thread\_num** and **audit\_rotation\_size**. If the value of this parameter is too small, the disk space occupied by audit files may exceed the value of this parameter.

---

## audit\_file\_remain\_threshold

**Parameter description:** Specifies the maximum number of audit files in the audit directory.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 100 to 1048576

**Default value:**

**1048576** (196-core CPU/1536 GB memory, 128-core CPU/1024 GB memory, 104-core CPU/1024 GB memory, 96-core CPU/1024 GB memory, 96-core CPU/768 GB memory, 80-core CPU/640 GB memory, 64-core CPU/512 GB memory, 60-core CPU/480 GB memory, 32-core CPU/256 GB memory, 16-core CPU/128 GB memory, 8-core CPU/64 GB memory, 4-core CPU/32 GB memory); **1024** (4-core CPU/16 GB memory)

---

**NOTICE**

- Ensure that this parameter is set to **1048576**. Do not adjust this parameter unless necessary. Otherwise, **audit\_resource\_policy** may fail to take effect. To control the storage space and time of audit logs, set the **audit\_resource\_policy**, **audit\_space\_limit**, and **audit\_file\_remain\_time** parameters.
  - In the multi-audit thread scenario, do not adjust this parameter unless necessary. Ensure that the value of this parameter is greater than or equal to the value of **audit\_thread\_num**. Otherwise, the audit function cannot be used and the database is abnormal.
- 

## audit\_thread\_num

**Parameter description:** Specifies the number of audit threads.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 1 to 48

**Default value:** 1

---

**NOTICE**

- When **audit\_dml\_state** is enabled and high performance is required, you are advised to increase the value of this parameter to ensure that audit messages can be processed and recorded in a timely manner.
  - Ensure that the value of this parameter is less than or equal to the maximum number of audit files in the audit directory (**audit\_file\_remain\_threshold**). Otherwise, the audit function cannot be used and the database is abnormal.
- 

### 14.3.21.2 User and Permission Audit

## audit\_login\_logout

**Parameter description:** Specifies whether to audit users' login (including login success and failure) and logout.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 7

- **0** indicates that the function of auditing users' logins and logouts is disabled.
- **1** indicates that only successful user logins are audited.
- **2** indicates that only failed user logins are audited.
- **3** indicates that successful and failed user logins are audited.
- **4** indicates that only user logouts are audited.
- **5** indicates that successful user logouts and logins are audited.
- **6** indicates that failed user logouts and logins are audited.

- **7** indicates that successful user logins, failed user logins, and logouts are audited.

**Default value:** 7

## audit\_database\_process

**Parameter description:** Specifies whether to audit the database startup, stop, switchover, and recovery.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** 0 or 1

- **0** indicates that the function of auditing database startup, stop, switchover, and recovery is disabled.
- **1** indicates that the function of auditing database startup, stop, switchover, and recovery is enabled.

**Default value:** 1

---

### NOTICE

When the database is started, the standby DN is promoted to primary. Therefore, the DN type in the audit log is **system\_switch** when the DN is started.

---

## audit\_user\_locked

**Parameter description:** Specifies whether to audit the users' locking and unlocking.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** 0 or 1

- **0** indicates that the function of auditing user's locking and unlocking is disabled.
- **1** indicates that the function of auditing user's locking and unlocking is enabled.

**Default value:** 1

## audit\_user\_violation

**Parameter description:** Specifies whether to audit the access violation operations of a user.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** 0 or 1

- **0** indicates that the function of auditing the access violation operations of a user is disabled.
- **1** indicates that the function of auditing the access violation operations of a user is enabled.

**Default value:** 0

## audit\_grant\_revoke

**Parameter description:** Specifies whether to audit the granting and revoking of user permissions.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** 0 or 1

- 0 indicates that the function of auditing the granting and reclaiming of a user's permission is disabled.
- 1 indicates that the function of auditing the granting and reclaiming of a user's permission is enabled.

**Default value:** 1

## full\_audit\_users

**Parameter description:** Specifies the full audit user list. Audit logs are recorded for all auditable operations performed by users in the list.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string. Use commas (,) to separate multiple usernames.

**Default value:** empty

## no\_audit\_client

**Parameter description:** Specifies the names and IP addresses of clients that do not need to be audited. The parameter format is *client name@IP address*, which is the same as that of the **client\_conninfo** column in the **pg\_query\_audit** function, for example, *cm\_agent@127.0.0.1* or *gs\_clean@127.0.0.1*.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a character string. Use commas (,) to separate multiple configuration items.

**Default value:** empty

---

### NOTICE

- If the executed SQL statement meets the configuration requirements of **full\_audit\_users** and **no\_audit\_client**, the **no\_audit\_client** is preferentially configured.
  - Audit logs are generated for communication among tools or nodes in the database server. To save space occupied by audit logs and improve the query performance of audit logs, the low-risk scenarios cannot be audited by configuring the **no\_audit\_client** parameter.
-

### 14.3.21.3 Operation Audit

#### audit\_system\_object

**Parameter description:** Specifies whether to audit the CREATE, DROP, and ALTER operations on database objects. Database objects include databases, users, schemas, and tables. The operations on the database object can be audited by changing the value of this parameter.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 536870911

- **0** indicates that the function of auditing the CREATE, DROP, and ALTER operations on database objects can be disabled.
- Other values indicate that the CREATE, DROP, and ALTER operations on a certain or some database objects are audited.

**Value description:**

The value of this parameter is calculated by 29 binary bits. The 29 binary bits represent 29 types of database objects. If the corresponding binary bit is set to **0**, the CREATE, DROP, and ALTER operations on corresponding database objects are not audited. If it is set to **1**, the CREATE, DROP, and ALTER operations are audited. For details about the audit contents represented by these 29 binary bits, see [Table 14-18](#).

When SQL patches are audited and **audit\_dml\_state\_select** are enabled, an SQL patch operation will be audited twice and recorded as DML and DDL operations in the audit log, respectively.

**Default value:** 67121159

**Table 14-18** Meaning of each value for the **audit\_system\_object** parameter

Binary Bit	Description	Value Description
Bit 0	Whether to audit the CREATE, DROP, and ALTER operations on databases.	<ul style="list-style-type: none"> <li>• <b>0</b> indicates that the CREATE, DROP, and ALTER operations on these objects are not audited.</li> <li>• <b>1</b> indicates that the CREATE, DROP, and ALTER operations on these objects are audited.</li> </ul>
Bit 1	Whether to audit the CREATE, DROP, and ALTER operations on schemas.	<ul style="list-style-type: none"> <li>• <b>0</b> indicates that the CREATE, DROP, and ALTER operations on these objects are not audited.</li> <li>• <b>1</b> indicates that the CREATE, DROP, and ALTER operations on these objects are audited.</li> </ul>

Binary Bit	Description	Value Description
Bit 2	Whether to audit the CREATE, DROP, and ALTER operations on users.	<ul style="list-style-type: none"> <li>• <b>0</b> indicates that the CREATE, DROP, and ALTER operations on these objects are not audited.</li> <li>• <b>1</b> indicates that the CREATE, DROP, and ALTER operations on these objects are audited.</li> </ul>
Bit 3	Whether to audit the CREATE, DROP, ALTER, and TRUNCATE operations on tables.	<ul style="list-style-type: none"> <li>• <b>0</b> indicates that the CREATE, DROP, ALTER, and TRUNCATE operations on these objects are not audited.</li> <li>• <b>1</b> indicates that the CREATE, DROP, ALTER, and TRUNCATE operations on these objects are audited.</li> </ul>
Bit 4	Whether to audit the CREATE, DROP, and ALTER operations on indexes.	<ul style="list-style-type: none"> <li>• <b>0</b> indicates that the CREATE, DROP, and ALTER operations on these objects are not audited.</li> <li>• <b>1</b> indicates that the CREATE, DROP, and ALTER operations on these objects are audited.</li> </ul>
Bit 5	Whether to audit the CREATE and DROP operations on VIEW and MATVIEW objects.	<ul style="list-style-type: none"> <li>• <b>0</b> indicates that the CREATE and DROP operations on these objects are not audited.</li> <li>• <b>1</b> indicates that the CREATE and DROP operations on these objects are audited.</li> </ul>
Bit 6	Whether to audit the CREATE, DROP, and ALTER operations on triggers.	<ul style="list-style-type: none"> <li>• <b>0</b> indicates that the CREATE, DROP, and ALTER operations on these objects are not audited.</li> <li>• <b>1</b> indicates that the CREATE, DROP, and ALTER operations on these objects are audited.</li> </ul>
Bit 7	Whether to audit the CREATE, DROP, and ALTER operations on procedures/ functions.	<ul style="list-style-type: none"> <li>• <b>0</b> indicates that the CREATE, DROP, and ALTER operations on these objects are not audited.</li> <li>• <b>1</b> indicates that the CREATE, DROP, and ALTER operations on these objects are audited.</li> </ul>
Bit 8	Whether to audit the CREATE, DROP, and ALTER operations on tablespaces.	<ul style="list-style-type: none"> <li>• <b>0</b> indicates that the CREATE, DROP, and ALTER operations on these objects are not audited.</li> <li>• <b>1</b> indicates that the CREATE, DROP, and ALTER operations on these objects are audited.</li> </ul>

Binary Bit	Description	Value Description
Bit 9	Whether to audit the CREATE, DROP, and ALTER operations on resource pools.	<ul style="list-style-type: none"> <li>• <b>0</b> indicates that the CREATE, DROP, and ALTER operations on these objects are not audited.</li> <li>• <b>1</b> indicates that the CREATE, DROP, and ALTER operations on these objects are audited.</li> </ul>
Bit 10	Whether to audit the CREATE, DROP, and ALTER operations on workloads.	<ul style="list-style-type: none"> <li>• <b>0</b> indicates that the CREATE, DROP, and ALTER operations on these objects are not audited.</li> <li>• <b>1</b> indicates that the CREATE, DROP, and ALTER operations on these objects are audited.</li> </ul>
Bit 11	Reserved	-
Bit 12	Whether to audit the CREATE, DROP, and ALTER operations on data sources.	<ul style="list-style-type: none"> <li>• <b>0</b> indicates that the CREATE, DROP, and ALTER operations on these objects are not audited.</li> <li>• <b>1</b> indicates that the CREATE, DROP, and ALTER operations on these objects are audited.</li> </ul>
Bit 13	Reserved	-
Bit 14	Whether to audit the CREATE, DROP, and ALTER operations on ROW LEVEL SECURITY objects.	<ul style="list-style-type: none"> <li>• <b>0</b> indicates that the CREATE, DROP, and ALTER operations on these objects are not audited.</li> <li>• <b>1</b> indicates that the CREATE, DROP, and ALTER operations on these objects are audited.</li> </ul>
Bit 15	Whether to audit the CREATE, DROP, and ALTER operations on types.	<ul style="list-style-type: none"> <li>• <b>0</b> indicates that the CREATE, DROP, and ALTER operations on types are not audited.</li> <li>• <b>1</b> indicates that the CREATE, DROP, and ALTER operations on types are audited.</li> </ul>
Bit 16	Whether to audit the CREATE, DROP, and ALTER operations on text search objects (CONFIGURATION and DICTIONARY).	<ul style="list-style-type: none"> <li>• <b>0</b> indicates that the CREATE, DROP, and ALTER operations on text search objects are not audited.</li> <li>• <b>1</b> indicates that the CREATE, DROP, and ALTER operations on text search objects are audited.</li> </ul>

Binary Bit	Description	Value Description
Bit 17	Whether to audit the CREATE, DROP, and ALTER operations on directories.	<ul style="list-style-type: none"> <li>• <b>0</b> indicates that the CREATE, DROP, and ALTER operations on directories are not audited.</li> <li>• <b>1</b> indicates that the CREATE, DROP, and ALTER operations on directories are audited.</li> </ul>
Bit 18	Whether to audit the CREATE, DROP, and ALTER operations on synonyms.	<ul style="list-style-type: none"> <li>• <b>0</b> indicates that the CREATE, DROP, and ALTER operations on synonyms are not audited.</li> <li>• <b>1</b> indicates that the CREATE, DROP, and ALTER operations on synonyms are audited.</li> </ul>
Bit 19	Whether to audit the CREATE, DROP, and ALTER operations on sequences.	<ul style="list-style-type: none"> <li>• <b>0</b> indicates that the CREATE, DROP, and ALTER operations on sequences are not audited.</li> <li>• <b>1</b> indicates that the operations are audited.</li> </ul>
Bit 20	Whether to audit the CREATE and DROP operations on CMK and CEK objects.	<ul style="list-style-type: none"> <li>• <b>0</b> indicates that the CREATE, ALTER, or DROP operations on CMKs and CEKs are not audited.</li> <li>• <b>1</b> indicates that the CREATE, ALTER, or DROP operations on CMKs and CEKs are audited.</li> </ul>
Bit 21	Whether to audit the CREATE, DROP, and ALTER operations on PACKAGE objects.	<ul style="list-style-type: none"> <li>• <b>0</b> indicates that the CREATE, DROP, and ALTER operations on packages are not audited.</li> <li>• <b>1</b> indicates that the operations are audited.</li> </ul>
Bit 22	Whether to audit the CREATE and DROP operations on MODEL objects.	<ul style="list-style-type: none"> <li>• <b>0</b> indicates that the CREATE and ALTER operations on models are not audited.</li> <li>• <b>1</b> indicates that the CREATE and DROP operations are audited.</li> </ul>
Bit 23	Whether to audit the CREATE, DROP, and ALTER operations on PUBLICATION and SUBSCRIPTION objects.	<ul style="list-style-type: none"> <li>• <b>0</b> indicates that the CREATE, DROP, and ALTER operations on publications and subscriptions are not audited.</li> <li>• <b>1</b> indicates that the CREATE, DROP, and ALTER operations are audited.</li> </ul>

Binary Bit	Description	Value Description
Bit 24	Whether to audit the ALTER and DROP operations on the <b>gs_global_config</b> objects.	<ul style="list-style-type: none"> <li>• <b>0</b> indicates that the ALTER and DROP operations on the <b>gs_global_config</b> objects are not audited.</li> <li>• <b>1</b> indicates that the ALTER and DROP operations are audited.</li> </ul>
Bit 25	Whether to audit the CREATE, DROP, and ALTER operations on FOREIGN DATA WRAPPER objects.	<ul style="list-style-type: none"> <li>• <b>0</b> indicates that the CREATE, DROP, and ALTER operations on foreign data wrappers are not audited.</li> <li>• <b>1</b> indicates that the CREATE, DROP, and ALTER operations are audited.</li> </ul>
Bit 26	Whether to audit the CREATE, ENABLE, DISABLE, and DROP operations on SQL patches.	<ul style="list-style-type: none"> <li>• <b>0</b> indicates that the CREATE, ENABLE, DISABLE, and DROP operations on SQL patches are not audited.</li> <li>• <b>1</b> indicates that the CREATE, ENABLE, DISABLE, and DROP operations on SQL patches are audited.</li> </ul>
Bit 27	Whether to audit the CREATE, ALTER, and DROP operations on event objects.	<ul style="list-style-type: none"> <li>• <b>0</b> indicates that the CREATE, ENABLE, DISABLE, and DROP operations on events are not audited.</li> <li>• <b>1</b> indicates that the CREATE, ENABLE, DISABLE, and DROP operations on events are not audited.</li> </ul>
Bit 28	Whether to audit the CREATE, ALTER, and DROP operations on database links. Currently, the database link function is not supported.	<ul style="list-style-type: none"> <li>• <b>0</b> indicates that the CREATE, ALTER, and DROP operations on database links are not audited.</li> <li>• <b>1</b> indicates that the CREATE, ALTER, and DROP operations on database links are audited.</li> </ul>

## audit\_dml\_state

**Parameter description:** Specifies whether to audit the INSERT, UPDATE, and DELETE operations on a specific table.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** 0 or 1

- **0** indicates that the function of auditing the DML operations (except SELECT) is disabled.
- **1** indicates that the function of auditing the DML operations (except SELECT) is enabled.

**Default value:** 0

### **audit\_dml\_state\_select**

**Parameter description:** Specifies whether to audit the SELECT operation.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** 0 or 1

- **0** indicates that the SELECT auditing function is disabled.
- **1** indicates that the SELECT auditing function is enabled.

**Default value:** 0

### **audit\_function\_exec**

**Parameter description:** Specifies whether to record the audit information during the execution of the stored procedures, anonymous blocks, or user-defined functions (excluding system functions).

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** 0 or 1

- **0** indicates that the function of auditing the procedure or function execution is disabled.
- **1** indicates that the function of auditing the procedure or function execution is enabled.

**Default value:** 0

### **audit\_system\_function\_exec**

**Parameter description:** Specifies whether to record audit logs when system functions in the whitelist are executed.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** 0 or 1

- **0** indicates that the function of auditing the execution of system functions is disabled.
- **1** indicates that the function of auditing system function execution is enabled.

**Default value:** 0

The following table lists the whitelist of system functions that can be recorded and audited.

set_working_grand_version_num_manually	set_config	pg_cancel_backend	pg_cancel_session	pg_reload_conf	pg_rotate_logfile
pg_terminate_session	pg_terminate_backend	pg_create_restore_point	pg_start_backup	pg_stop_backup	pg_switch_xlog
pg_cbm_rotate_file	pg_cbm_get_merged_file	pg_cbm_recycle_file	pg_enable_delay_ddl_recycle	pg_disable_delay_ddl_recycle	gs_roach_stop_backup
gs_roach_enable_delay_ddl_recycle	gs_roach_disable_delay_ddl_recycle	gs_roach_switch_xlog	pg_last_xlog_receive_location	pg_xlog_replay_pause	pg_xlog_replay_resume

## audit\_copy\_exec

**Parameter description:** Specifies whether to audit the COPY operation.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** 0 or 1

- 0 indicates that the COPY auditing function is disabled.
- 1 indicates that the COPY auditing function is enabled.

**Default value:** 1

## audit\_set\_parameter

**Parameter description:** Specifies whether to audit the SET operation.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** 0 or 1

- 0 indicates that the SET auditing function is disabled.
- 1 indicates that the SET auditing function is enabled.

**Default value:** 0

## audit\_xid\_info

**Parameter description:** Specifies whether to record the transaction ID of the SQL statement in the **detail\_info** column of the audit log.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** 0 or 1

- 0 indicates that the function of recording transaction IDs in audit logs is disabled.
- 1 indicates that the function of recording transaction IDs in audit logs is enabled.

**Default value:** 0

---

### NOTICE

If this function is enabled, the **detail\_info** information in audit logs starts with *xid*. For example:

```
detail_info: xid=14619 , create table t1(id int);
```

If transaction IDs do not exist, *xid* is recorded as **NA** in audit logs.

---

## enableSeparationOfDuty

**Parameter description:** Specifies whether the separation of three duties is enabled.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that the separation of three duties is enabled.
- **off** indicates that the separation of three duties is disabled.

**Default value:** off

## **enable\_nonsysadmin\_execute\_direct**

**Parameter description:** Specifies whether non-system administrators and non-monitor administrator are allowed to execute the EXECUTE DIRECT ON statement.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that any user is allowed to execute the EXECUTE DIRECT ON statement.
- **off** indicates that only the system administrators and monitor administrators are allowed to execute the EXECUTE DIRECT ON statement.

**Default value:** off

## **enable\_access\_server\_directory**

**Parameter description:** Specifies whether to allow non-initial users to create, modify, and delete directories.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that non-initial users have the permission to create, modify, and delete directories.
- **off** indicates that non-initial users do not have the permission to create, modify, and delete directories.

**Default value:** off

---

### **NOTICE**

- For security purposes, only the initial user can create, modify, and delete DIRECTORY objects by default.
  - If **enable\_access\_server\_directory** is enabled, users with the SYSADMIN permission and users who inherit the `gs_role_directory_create` permission of the built-in role can create directory objects. A user with the SYSADMIN permission, the owner of a directory, a user who is granted with the DROP permission for the directory, or a user who inherits the `gs_role_directory_drop` permission of the built-in role can delete a directory. A user with the SYSADMIN permission and the owner of a directory object can change the owner of the directory object, and the user must be a member of the new owner.
-

## 14.3.22 CM Parameters

Modifying CM parameters affects the running mechanism of GaussDB. You are advised to ask GaussDB engineers to do it for you. For details about how to modify the CM parameters, see method 1 in [Table 14-2](#).

### 14.3.22.1 Parameters Related to cm\_agent

#### log\_dir

**Parameter description:** Specifies the directory where cm\_agent logs are stored. The value can be an absolute path, or relative to the CM Agent data directory.

**Value range:** a string. Any modification of this parameter takes effect only after cm\_agent is restarted. For details about how to modify this parameter, see [Table 14-2](#).

**Default value:** "log", indicating that CM Agent logs are generated in the CM Agent data directory.

#### log\_file\_size

**Parameter description:** Specifies the size of a log file. If a log file exceeds the specified size, a new one is created to record log information.

**Value range:** an integer ranging from 0 to 2047. The unit is MB. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see [Table 14-2](#).

**Default value:** 16 MB

#### log\_min\_messages

**Parameter description:** Specifies which message levels are written to the cm\_agent log. Each level covers all the levels following it. The lower the level is, the fewer messages will be written into the log.

**Value range:** enumerated type. Valid values are **debug5**, **debug1**, **log**, **warning**, **error**, and **fatal**. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see [Table 14-2](#).

**Default value:** warning

#### incremental\_build

**Parameter description:** Specifies whether a standby DN is incrementally built. If this parameter is enabled, a standby DN is incrementally built.

**Value range:** Boolean. The value can be **on** or **off**. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see [Table 14-2](#).

**Default value:** on

## alarm\_component

**Parameter description:** Specifies the location of the alarm component that processes alarms.

**Value range:** a string. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see [Table 14-2](#).

- If **--alarm-type** in the **gs\_preinstall** script is set to **5**, no third-party component is connected and alarms are written into the **system\_alarm** log. In this case, the value of **alarm\_component** is **/opt/huawei/snas/bin/snas\_cm\_cmd**.
- If **--alarm-type** in the **gs\_preinstall** script is set to **1**, a third-party component is connected. In this case, the value of **alarm\_component** is the absolute path of the executable program of the third-party component.

**Default value:** **/opt/huawei/snas/bin/snas\_cm\_cmd**

## alarm\_report\_interval

**Parameter description:** Specifies the interval at which an alarm is reported. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see [Table 14-2](#).

**Value range:** a non-negative integer (unit: s)

**Default value:** **1**

## alarm\_report\_max\_count

**Parameter description:** Specifies the maximum number of times an alarm is reported. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see [Table 14-2](#).

**Value range:** a non-negative integer

**Default value:** **1**

## agent\_report\_interval

**Parameter description:** Specifies the interval at which cm\_agent reports the instance status.

**Value range:** an integer. The unit is s. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see [Table 14-2](#).

**Default value:** **1**

## agent\_phony\_dead\_check\_interval

**Parameter description:** Specifies the interval at which cm\_agent checks whether the DN process is suspended.

**Value range:** an integer. The unit is s. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see [Table 14-2](#).

**Default value:** 10

## agent\_check\_interval

**Parameter description:** Specifies the interval at which cm\_agent queries for the status of instances, such as the DNs.

**Value range:** an integer. The unit is s. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see [Table 14-2](#).

**Default value:** 2

## agent\_heartbeat\_timeout

**Parameter description:** Specifies the heartbeat timeout interval for CM Agent to connect to CM Server.

**Value range:** an integer ranging from 2 to  $2^{31} - 1$ . The unit is second. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see [Table 14-2](#).

**Default value:** 8

## agent\_connect\_timeout

**Parameter description:** Specifies the time to wait before the attempt of cm\_agent to connect to cm\_server times out.

**Value range:** an integer. The unit is s. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see [Table 14-2](#).

**Default value:** 1

## agent\_connect\_retries

**Parameter description:** Specifies the number of times cm\_agent tries to connect to the cm\_server.

**Value range:** an integer. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see [Table 14-2](#).

**Default value:** 15

## agent\_kill\_instance\_timeout

**Parameter description:** Specifies the interval from the time when cm\_agent fails to connect to the primary cm\_server to the time when cm\_agent kills all instances on the node.

**Value range:** an integer. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see [Table 14-2](#).

**Default value:** 0, indicating that the operation of killing all instances on the node is not initiated.

## security\_mode

**Parameter description:** Specifies whether DNs are started in secure mode. If this parameter is set to **on**, DNs are started in secure mode. Otherwise, DNs are started in non-secure mode.

**Value range:** Boolean. The value can be **on** or **off**. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see [Table 14-2](#).

**Default value:** off

## upgrade\_from

**Parameter description:** Specifies the internal version number of the database before an in-place upgrade. Do not modify the value of this parameter.

**Value range:** a non-negative integer. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see [Table 14-2](#).

**Default value:** 0

## process\_cpu\_affinity

**Parameter description:** Specifies whether to bind a primary DN process to a CPU core before starting the process. If this parameter is set to **0**, core binding will not be performed. If it is set to another value, core binding will be performed, and the number of physical CPU cores is  $2^n$ . Only ARM is supported.

**Value range:** an integer ranging from 0 to 2. The modification of this parameter takes effect only after the database and CM Agent are restarted. For details about how to modify the parameter, see [Table 14-2](#).

**Default value:** 0

## log\_threshold\_check\_interval

**Parameter description:** Specifies the interval for compressing and clearing logs. Logs are compressed and cleared every 1800 seconds.

**Value range:** an integer ranging from 0 to 2147483647. The unit is s. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see [Table 14-2](#).

**Default value:** 1800

## dilatation\_shard\_count\_for\_disk\_capacity\_alarm

**Parameter description:** Specifies the number of shards to be added in the scale-out scenario. This parameter is used to calculate the threshold for reporting a disk capacity alarm.

### NOTE

The parameter value must be the same as the actual number of shards to be added.

**Value range:** an integer ranging from 0 to  $2^{32} - 1$ . If this parameter is set to 0, the disk scale-out alarm is not reported. If this parameter is set to a value greater than 0, the disk scale-out alarm is reported and the threshold is calculated based on the number of shards specified by this parameter. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see [Table 14-2](#).

**Default value:** 1

## log\_max\_size

**Parameter description:** Specifies the maximum size of a log file.

**Value range:** an integer ranging from 0 to 2147483647. The unit is MB. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see [Table 14-2](#).

**Default value:** 10240

## log\_max\_count

**Parameter description:** Specifies the maximum number of logs that can be stored on hard disks.

**Value range:** an integer ranging from 0 to 10000. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see [Table 14-2](#).

**Default value:** 10000

## log\_saved\_days

**Parameter description:** Specifies the number of days for storing logs.

**Value range:** an integer ranging from 0 to 1000. The unit is day. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see [Table 14-2](#).

**Default value:** 90

## enable\_log\_compress

**Parameter description:** Specifies whether to enable log compression.

**Value range:** Boolean. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see [Table 14-2](#).

- **on** indicates that log compression is enabled.
- **off** indicates that log compression is disabled.

**Default value:** on

## agent\_backup\_open

**Parameter description:** Specifies the DR database instance settings. After this parameter is enabled, CM runs in DR database instance mode.

**Value range:** 0 or 1. You need to restart **cm\_agent** for the modification to take effect. For details about how to modify this parameter, see [Table 14-1](#).

- 0: disabled.
- 1: enabled.

**Default value:** 0

## enable\_xc\_maintenance\_mode

**Parameter description:** Specifies whether the **pgxc\_node** system catalog can be modified when the database instance is in read-only mode.

**Value range:** Boolean. Any modification of this parameter takes effect only after **cm\_agent** is restarted. For details about how to modify this parameter, see [Table 14-1](#).

- **on** indicates that the **pgxc\_node** system catalog can be modified.
- **off** indicates that the **pgxc\_node** system catalog cannot be modified.

**Default value:** on

## unix\_socket\_directory

**Parameter description:** Specifies the directory location of the Unix socket.

**Value range:** a string. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see [Table 14-1](#).

**Default value:** "

## enable\_dcf

**Parameter description:** Specifies the status of the DCF mode.

**Value range:** Boolean. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see [Table 14-1](#).

- 0: disabled.
- 1: enabled.

**Default value:** off

## disaster\_recovery\_type

**Parameter description:** Specifies the type of the DR relationship between the primary and standby database instances.

**Value range:** an integer ranging from 0 to 2. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see [Table 14-1](#).

- 0 indicates that no DR relationship is established.
- 1 indicates that the OBS DR relationship is established.
- 2 indicates that the streaming DR relationship is established.

**Default value:** 0

## 14.3.22.2 Parameters Related to cm\_server

### log\_dir

**Parameter description:** Specifies the directory where cm\_server logs are stored. The value can be an absolute path, or relative to the CM Server data directory.

**Value range:** a string. You need to restart cm\_server for the modification to take effect. For details about how to modify this parameter, see [Table 14-2](#).

**Default value:** "log", indicating that CM Server logs are generated in the CM Server data directory.

### log\_file\_size

**Parameter description:** Specifies the size of a log file. If a log file exceeds the specified size, a new one is created to record log information.

**Value range:** an integer ranging from 0 to 2047. The unit is MB. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see [Table 14-2](#).

**Default value:** 16 MB

### log\_min\_messages

**Parameter description:** Specifies which message levels are written to the cm\_server log. Each level covers all the levels following it. The lower the level is, the fewer messages will be written into the log.

**Value range:** enumerated type. Valid values are **debug5**, **debug1**, **log**, **warning**, **error**, and **fatal**. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see [Table 14-2](#).

**Default value:** warning

### thread\_count

**Parameter description:** Specifies the number of threads in the cm\_server thread pool.

**Value range:** an integer ranging from 2 to 1000. You need to restart cm\_server for the modification to take effect. For details about how to modify this parameter, see [Table 14-2](#).

**Default value:** 1000

### alarm\_component

**Parameter description:** Specifies the location of the alarm component that processes alarms.

**Value range:** a string. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see [Table 14-2](#).

- If **--alarm-type** in the **gs\_preinstall** script is set to **5**, no third-party component is connected and alarms are written into the **system\_alarm** log.

In this case, the value of **alarm\_component** is `/opt/huawei/snas/bin/snas_cm_cmd`.

- If `--alarm-type` in the `gs_preinstall` script is set to `1`, a third-party component is connected. In this case, the value of **alarm\_component** is the absolute path of the executable program of the third-party component.

**Default value:** `/opt/huawei/snas/bin/snas_cm_cmd`

## instance\_failover\_delay\_timeout

**Parameter description:** Specifies the delay in `cm_server` failover after the primary `cm_server` breakdown is detected.

**Value range:** an integer. The unit is s. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see [Table 14-2](#).

**Default value:** 0

## instance\_heartbeat\_timeout

**Parameter description:** Specifies the time to wait before the instance heartbeat times out.

**Value range:** an integer. The unit is s. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see [Table 14-2](#).

**Default value:** 6

## cmserver\_ha\_connect\_timeout

**Parameter description:** Specifies the time to wait before the connection between the primary and standby `cm_servers` times out.

**Value range:** an integer. The unit is s. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see [Table 14-2](#).

**Default value:** 2

## cmserver\_ha\_heartbeat\_timeout

**Parameter description:** Specifies the time to wait before the heartbeat between the primary and standby `cm_servers` times out.

**Value range:** an integer. The unit is s. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see [Table 14-2](#).

**Default value:** 6

## phony\_dead\_effective\_time

**Parameter description:** Specifies the maximum number of times DN processes are detected as zombie. If the number of times a process is detected as zombie is

greater than the specified value, the process is considered to be a zombie process and will be restarted.

**Value range:** an integer. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see [Table 14-2](#).

**Default value:** 5

## **enable\_transaction\_read\_only**

**Parameter description:** Specifies whether the database is in read-only mode.

**Value range:** Boolean values **on**, **off**, **true**, **false**, **yes**, **no**, **1**, and **0**. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see [Table 14-2](#).

**Default value:** on

## **datastorage\_threshold\_check\_interval**

**Parameter description:** Specifies the interval for checking the disk usage. The system checks the disk usage at the interval specified by the user.

**Value range:** an integer. The unit is s. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see [Table 14-2](#).

**Default value:** 10

## **datastorage\_threshold\_value\_check**

**Parameter description:** Specifies the usage threshold of a read-only disk in a database. When the disk usage of the data directory exceeds the specified value, the database is automatically set to read-only mode. When adjusting this parameter, you are advised to adjust the **max\_size\_for\_xlog\_retention** parameter of the DN to prevent the instance read-only threshold from being triggered by backup operations.

**Value range:** an integer ranging from 1 to 99, in percentage. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see [Table 14-2](#).

**Default value:** 85

## **max\_datastorage\_threshold\_check**

**Parameter description:** Specifies the maximum interval for checking the disk usage. After you modify the **enable\_transaction\_read\_only** parameter, the system automatically checks whether the disk usage reaches the threshold at the specified interval.

**Value range:** an integer. The unit is s. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see [Table 14-2](#).

**Default value:** 43200

## cmserver\_ha\_status\_interval

**Parameter description:** Specifies the interval between synchronizations of primary and standby CM Server status.

**Value range:** an integer. The unit is s. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see [Table 14-2](#).

**Default value:** 1

## cmserver\_self\_vote\_timeout

**Parameter description:** Specifies the time to wait before the CM Server self-vote times out.

**Value range:** an integer. The unit is s. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see [Table 14-2](#).

**Default value:** 6

## alarm\_report\_interval

**Parameter description:** Specifies the interval at which an alarm is reported.

**Value range:** a non-negative integer. The unit is s. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see [Table 14-2](#).

**Default value:** 3

## alarm\_report\_max\_count

**Parameter description:** Specifies the maximum number of times an alarm is reported.

**Value range:** a non-negative integer. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see [Table 14-2](#).

**Default value:** 1

## enable\_az\_auto\_switchover

**Parameter description:** Specifies whether to enable automatic AZ switchover. If it is set to **1**, cm\_server automatically switches over services among AZs. Otherwise, when a DN is faulty, services will not be automatically switched to another AZ even if the current AZ is unavailable. You can run the switchover command to manually switch services to another AZ.

**Value range:** a non-negative integer. The value **0** indicates that automatic AZ switchover is disabled, and the value **1** indicates that automatic AZ switchover is enabled. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see [Table 14-2](#).

**Default value:** 1

## instance\_keep\_heartbeat\_timeout

**Parameter description:** The cm\_agent periodically checks the instance status and reports the status to the cm\_server. If the instance status cannot be detected for a long time and the accumulated number of times exceeds the value of this parameter, the cm\_server delivers a command to the cm\_agent to restart the instance.

**Value range:** an integer. The unit is s. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see [Table 14-2](#).

**Default value:** 40

## az\_switchover\_threshold

**Parameter description:** If the failure rate of a DN shard in an AZ (Number of faulty DN shards/Total number of DN shards x 100%) exceeds the specified value, automatic AZ switchover is triggered.

**Value range:** an integer ranging from 0 to 100. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see [Table 14-2](#).

**Default value:** 100

## az\_check\_and\_arbitrate\_interval

**Parameter description:** Specifies the interval for checking the AZ status. If the status of an AZ is abnormal, automatic AZ switchover is triggered.

**Value range:** an integer. The unit is s. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see [Table 14-2](#).

**Default value:** 2

## az\_connect\_check\_interval

**Parameter description:** Specifies the interval at which the network connection between AZs is checked.

**Value range:** an integer. The unit is s. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see [Table 14-2](#).

**Default value:** 60

## az\_connect\_check\_delay\_time

**Parameter description:** Specifies the delay between two retries to check the network connection between AZs.

**Value range:** an integer. The unit is s. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see [Table 14-2](#).

**Default value:** 150

## cmserver\_demote\_delay\_on\_etcd\_fault

**Parameter description:** Specifies the interval at which cm\_server switches from the primary state to the standby state due to unhealthy etcd.

**Value range:** an integer. The unit is s. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see [Table 14-2](#).

**Default value:** 8

## instance\_phony\_dead\_restart\_interval

**Parameter description:** Specifies the interval at which the cm\_agent process restarts and kills a zombie DN instance. The interval between two consecutive kill operations cannot be less than the value of this parameter. Otherwise, the cm\_agent process does not deliver commands.

**Value range:** an integer. The unit is s. The minimum value that takes effect is **1800**. If this parameter is set to a value less than **1800**, the value **1800** takes effect. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see [Table 14-2](#).

**Default value:** 21600

## cm\_auth\_method

**Parameter description:** Specifies the port authentication mode of the CM. **trust** indicates that port authentication is not configured. **gss** indicates that Kerberos port authentication is used. Note that you can change the value to **gss** only after the Kerberos server and client are successfully installed. Otherwise, the CM cannot communicate properly, affecting the database status.

**Value range:** **gss** or **trust**. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see [Table 14-2](#).

**Default value:** trust

## cm\_krb\_server\_keyfile

**Parameter description:** Specifies the location of the key file on the Kerberos server. The value must be an absolute path. The file is usually stored in the `GAUSSHOME/kerberos` directory and ends with `keytab`. The file name is the same as the name of the user who runs the database. This parameter is used together with **cm\_auth\_method**. If the **cm\_auth\_method** parameter is changed to **gss**, **cm\_krb\_server\_keyfile** must also be configured as the correct path. Otherwise, the database status will be affected.

**Value range:** a string. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see [Table 14-2](#).

**Default value:** `GAUSSHOME/kerberos/UserName.keytab`. The default value cannot take effect and is used only as a prompt.

## cm\_server\_arbitrate\_delay\_base\_time\_out

**Parameter description:** Specifies the basic delay duration for cm\_server quorum. If cm\_server is disconnected, the quorum starts to be timed. If the disconnection duration exceeds the quorum delay duration, a new cm\_server will be selected. The quorum delay duration is determined by the basic delay duration, the node index (server ID), and the incremental delay duration. The formula is as follows: Quorum delay duration = Basic delay duration + Node index x Incremental delay duration

**Value range:** an integer. The unit is s. The index should be larger than 0. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see [Table 14-2](#).

**Default value:** 10

## cm\_server\_arbitrate\_delay\_incremental\_time\_out

**Parameter description:** Specifies the incremental delay duration for cm\_server quorum. If cm\_server is disconnected, the quorum starts to be timed. If the disconnection duration exceeds the quorum delay duration, a new cm\_server will be selected. The quorum delay duration is determined by the basic delay duration, the node index (server ID), and the incremental delay duration. The formula is as follows: Quorum delay duration = Basic delay duration + Node index x Incremental delay duration

**Value range:** an integer. The unit is s. The index should be larger than 0. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see [Table 14-2](#).

**Default value:** 3

## force\_promote

**Parameter description:** Specifies whether CM Server enables forcible switchover (that is, when the cluster status is unknown, the basic functions of the cluster are available at the cost of data loss). The value **0** indicates that the function is disabled, and the value **1** indicates that the function is enabled. This parameter applies to DNSs.

**Value range:** **0** or **1**. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see [Table 14-2](#).

**Default value:** 0

## switch\_rto

**Parameter description:** Specifies the delay for the forcible switchover of CM Server. When **force\_promote** is set to **1** and a shard in the database does not have primary CM Server, the system starts timing. After the delay, forcible switchover is executed.

**Value range:** an integer ranging from 60 to 2147483647. The unit is s. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see [Table 14-2](#).

**Default value:** 600

## enable\_finishredo\_retrieve

**Parameter description:** Specifies whether to retrieve data of Xlogs that have been cut off by redo after a forcible CM Server switchover. If this parameter is set to **on**, data is automatically retrieved after a forcible switchover.

**Value range:** Boolean. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see [Table 14-2](#).

- **off:** disabled.
- **on:** enabled.

**Default value:** off

## backup\_open

**Parameter description:** Specifies the DR database instance settings. After this parameter is enabled, CM runs in DR database instance mode.

**Value range:** 0 or 1. You need to restart cm\_server for the modification to take effect. This parameter cannot be enabled for a non-DR database instance. For details about how to modify this parameter, see [Table 14-2](#).

- **0:** disabled.
- **1:** enabled.

**Default value:** 0

## enable\_dcf

**Parameter description:** Specifies the status of the DCF mode.

**Value range:** Boolean. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see [Table 14-2](#).

- **0:** disabled.
- **1:** enabled.

**Default value:** off

## install\_type

**Parameter description:** Specifies the settings related to the DR database instance. It is used to distinguish whether the database instance is based on Dorado.

**Value range:** an integer ranging from 0 to 2. You need to restart cm\_server for the modification to take effect. This parameter cannot be enabled for a non-DR database instance. For details about how to modify this parameter, see [Table 14-2](#).

- **0** indicates the database instance for which the DR relationship is not established.
- **1** indicates a Dorado-based database instance.
- **2** indicates a streaming-based database instance.

**Default value:** 0

## enable\_ssl

**Parameter description:** Specifies whether to enable SSL.

**Value range:** Boolean. After this function is enabled, the SSL certificate is used to encrypt communication. Any modification of this parameter takes effect only after CM server is restarted. For details about how to modify this parameter, see [Table 14-2](#).

- **on** indicates that SSL is enabled.
- **off** indicates that SSL is disabled.
- **Default value:** **off**

---

### NOTICE

To ensure security, you are advised not to disable it. After this function is disabled, the CM **does not** use encrypted communication and all information is transmitted in plaintext, which may bring security risks such as eavesdropping, tampering, and spoofing.

---

## ssl\_cert\_expire\_alert\_threshold

**Parameter description:** Specifies the SSL certificate expiration alarm time.

**Value range:** an integer. The unit is day. If the certificate expiration time is less than the value of this parameter, an alarm indicating that the certificate is about to expire is reported. Any modification of this parameter takes effect only after CM server is restarted. For details about how to modify this parameter, see [Table 14-2](#).

**Default value:** 90

## ssl\_cert\_expire\_check\_interval

**Parameter description:** Specifies the period for checking whether the SSL certificate expires.

**Value range:** an integer. The unit is s. Any modification of this parameter takes effect only after CM server is restarted. For details about how to modify this parameter, see [Table 14-2](#).

**Default value:** 86400

## delay\_arbitrate\_timeout

**Parameter description:** Specifies the waiting time for a node in the same AZ as the primary DN to be promoted to primary after redo replay.

**Value range:** an integer, in the range [0,21474836] (unit: second). The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see [Table 14-2](#).

**Default value:** 0

## ddb\_type

**Parameter description:** Specifies whether to switch between ETCD and DCC modes.

**Value range:** an integer. **0:** ETCD; **1:** DCC. You need to restart cm\_server for the modification to take effect. For details about how to modify this parameter, see [Table 14-2](#).

**Default value:** 0

## ddb\_log\_level

**Parameter description:** Sets the DDB log level.

To disable the log function, set this parameter to **NONE**, which cannot be used together with the following log levels:

To enable the log function, set this parameter to one or a combination of the following log levels: **RUN\_ERR|RUN\_WAR|RUN\_INF|DEBUG\_ERR|DEBUG\_WAR|DEBUG\_INF|TRACE|PROFILE|OPER**. If two or more log levels are used together, separate them with vertical bars (|). The log level cannot be set to an empty string.

**Value range:** a string containing one or a combination of the following log levels: **RUN\_ERR|RUN\_WAR|RUN\_INF|DEBUG\_ERR|DEBUG\_WAR|DEBUG\_INF|TRACE|PROFILE|OPER**. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see [Table 14-2](#).

**Default value:** RUN\_ERR|RUN\_WAR|DEBUG\_ERR|OPER|RUN\_INF|PROFILE

## ddb\_log\_backup\_file\_count

**Parameter description:** Specifies the maximum number of log files that can be saved.

**Value range:** an integer ranging from 1 to 100. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see [Table 14-2](#).

**Default value:** 10

## ddb\_max\_log\_file\_size

**Parameter description:** Specifies the maximum number of bytes in a log.

**Value range:** a string, in the range from 1 MB to 1000 MB. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see [Table 14-2](#).

**Default value:** 10 MB

## ddb\_log\_suppress\_enable

**Parameter description:** Specifies whether to enable the log suppression function.

**Value range:** an integer. **0:** disabled; **1:** enabled. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see [Table 14-2](#).

**Default value:** 1

## `ddb_election_timeout`

**Parameter description:** Specifies the DCC election timeout period.

**Value range:** an integer, in the range [1,600], in seconds. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see [Table 14-2](#).

**Default value:** 3

## `enable_synclist_single_inst`

**Parameter description:** Specifies whether to reduce copies to one primary and zero standby.

**Value range:** Boolean. If this function is enabled, the copies are reduced to one primary and zero standby. If this parameter is incorrectly set, the default value is used. The modification of this parameter takes effect after reloading. For details about how to modify parameters, see the **Set cm parameter** table in section "Unified Database Management Tool > cm\_ctl Tool Introduction" in *Tool Reference*.

- **off:** indicates that this function is disabled.
- **on:** indicates that this function is enabled.

**Default value:** off

## 14.3.23 Upgrade Parameters

### `IsInplaceUpgrade`

**Parameter description:** Specifies whether an upgrade is ongoing. This parameter cannot be modified by users. Only the sysadmin user can access this parameter.

This parameter is a SUSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates an upgrade is ongoing.
- **off** indicates no upgrade is ongoing.

**Default value:** off

### `inplace_upgrade_next_system_object_oids`

**Parameter description:** Indicates the OID of a new system object during the in-place upgrade. The value of this parameter cannot be changed.

This parameter is a SUSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string

**Default value:** empty

## upgrade\_mode

**Parameter description:** Specifies the upgrade mode.

This is a fixed INTERNAL parameter. It can be viewed but cannot be modified.

**Value range:** an integer ranging from 0 to *INT\_MAX*

- 0 indicates that no upgrade is ongoing.
- 1 indicates that a local upgrade is ongoing.
- 2 indicates that a grayscale upgrade is ongoing.

**Default value:** 0

### NOTE

Special case: When gray upgrade is used, if the major version upgrade policy is selected, that is, the upgrade script needs to be executed and the binary package needs to be replaced, the value of **upgrade\_mode** is set to 2; if the minor version upgrade policy is selected, that is, only the binary package needs to be replaced, the value of **upgrade\_mode** is not set to 2.

## 14.3.24 Miscellaneous Parameters

### enable\_default\_ustore\_table

**Parameter description:** Specifies whether to enable the Ustore storage engine by default. If this parameter is set to **on**, all created tables are Ustore tables.

This is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#). Note that the **track\_counts** and **track\_activities** parameters must be enabled when the Ustore table is used. Otherwise, space expansion may occur.

**Value range:** [off,on]

**Default value:** on

### enable\_ustore

**Parameter description:** Specifies whether to enable the Ustore storage engine. If this parameter is set to **on**, Ustore tables can be created. Note that the **track\_counts** and **track\_activities** parameters must be enabled when the Ustore table is used. Otherwise, space expansion may occur.

This is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** [off,on]

**Default value:** on

## reserve\_space\_for\_nullable\_atts

**Parameter description:** Specifies whether to reserve space for the nullable attribute of an Ustore table. If this parameter is set to **on**, space is reserved for the nullable attribute of the Ustore table by default.

This is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** [off,on]

**Default value:** on

## server\_version

**Parameter description:** Specifies the server version number.

This is a fixed parameter of the INTERNAL type. It can be viewed but cannot be modified. This parameter is inherited from the PostgreSQL kernel, indicating that the current database kernel is compatible with the *server\_version* version corresponding to PostgreSQL. This parameter is reserved to ensure the ecosystem compatibility of the northbound external tool API (query when the tool is connected). This parameter is not recommended. To query the server version, use the `opengauss_version()` function.

**Value range:** a string

**Default value:** 9.2.4

## server\_version\_num

**Parameter description:** Specifies the server version number.

This is a fixed parameter of the INTERNAL type. It can be viewed but cannot be modified. This parameter is inherited from the PostgreSQL kernel, indicating that the current database kernel is compatible with the *server\_version\_num* version corresponding to PostgreSQL. This parameter is reserved to ensure the ecosystem compatibility of the northbound external tool API (query when the tool is connected).

**Value range:** an integer

**Default value:** 90204

## block\_size

**Parameter description:** Specifies the block size of the current database.

This is a fixed INTERNAL parameter and cannot be modified.

**Value:** 8192

**Default value:** 8192

## segment\_size

**Parameter description:** Specifies the segment file size of the current database.

This is a fixed INTERNAL parameter and cannot be modified.

**Unit:** 8 KB

**Default value:** 131072, that is, 1 GB

## max\_index\_keys

**Parameter description:** Specifies the maximum number of index keys supported by the current database.

This is a fixed INTERNAL parameter and cannot be modified.

**Default value:** 32

## integer\_datetimes

**Parameter description:** Specifies whether the date and time are in the 64-bit integer format.

This is a fixed INTERNAL parameter and cannot be modified.

**Value range:** Boolean

- **on:** yes.
- **off:** no.

**Default value:** on

## lc\_collate

**Parameter description:** Specifies the locale in which sorting of textual data is done.

This is a fixed INTERNAL parameter and cannot be modified.

**Default value:** Determined by the configuration set during the database installation and deployment.

## lc\_ctype

**Parameter description:** Specifies the locale that determines character classifications. For example, it specifies what a letter and its upper-case equivalent are.

This is a fixed INTERNAL parameter and cannot be modified.

**Default value:** Determined by the configuration set during the database installation and deployment.

## max\_identifier\_length

**Parameter description:** Specifies the maximum identifier length.

This is a fixed INTERNAL parameter and cannot be modified.

**Value range:** an integer

**Default value:** 63

## server\_encoding

**Parameter description:** Specifies the database encoding (character set).

By default, `gs_initdb` will initialize the setting of this parameter based on the current system environment. You can also run the `locale` command to check the current configuration environment.

This is a fixed INTERNAL parameter and cannot be modified.

**Default value:** determined by the current system environment when the database is created.

## enable\_upgrade\_merge\_lock\_mode

**Parameter description:** If this parameter is set to **on**, the delta merge operation internally increases the lock level, and errors can be prevented when update and delete operations are performed at the same time.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- If this parameter is set to **on**, the delta merge operation internally increases the lock level. In this way, when the **DELTAMERGE** operation is concurrently performed with the **UPDATE** or **DELETE** operation, one operation can be performed only after the previous one is complete.
- If this parameter is set to **off** and the **DELTAMERGE** operation is concurrently performed with the **UPDATE** or **DELETE** operation to the data in a row in the delta table of the table, errors will be reported during the later operation, and the operation will stop.

**Default value:** off

## transparent\_encrypted\_string

**Parameter description:** This parameter is discarded. It stores a sample string that is transparently encrypted. After the fixed string

**TRANS\_ENCRYPT\_SAMPLE\_STRING** is encrypted using a database encryption key, ciphertext is obtained to check whether the DEK obtained during second startup is correct. If it is incorrect, database nodes will not be started. This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string. An empty string indicates that the entire database is not encrypted.

**Default value:** empty

### NOTE

Do not set this parameter manually. Otherwise, the database may become faulty.

## transparent\_encrypt\_kms\_url

**Parameter description:** This parameter is discarded. It stores the address for obtaining the database key that is transparently encrypted. The content must

contain only the characters specified in RFC3986, and the maximum length is 2047 bytes. The format is **kms://Protocol@KMS host name 1;KMS host name 2:KMS port number/kms**, for example, **kms://https@linux175:29800/**.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string

**Default value:** empty

## transparent\_encrypt\_kms\_region

**Parameter description:** This parameter is discarded. It stores the deployment region of the entire database. The content must contain only the characters specified in RFC3986, and the maximum length is 2047 bytes.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string

**Default value:** empty

## basebackup\_timeout

**Parameter description:** Specifies the timeout interval for a connection that has no read or write operations after a backup transfer is complete.

When the `gs_basebackup` tool is used for transmission and a high compression rate is specified, the transmission of the tablespace may time out (the client needs to compress the transmitted data).

**Value range:** an integer ranging from 0 to `INT_MAX`. The unit is s. **0** indicates that archiving timeout is disabled.

**Default value:** 600s

## datanode\_heartbeat\_interval

**Parameter description:** Specifies the interval at which heartbeat messages are sent between heartbeat threads. You are advised to set this parameter to a value no more than `wal_receiver_timeout/2`.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 1000 to 60000. The unit is ms.

**Default value:** 1s

## max\_concurrent\_autonomous\_transactions

**Parameter description:** Specifies the maximum number of autonomous transaction connections, that is, the maximum number of concurrent autonomous transactions executed at the same time. If this parameter is set to **0**, autonomous transactions cannot be executed.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** 0–10000. The theoretical maximum value is **10000**, and the actual maximum value is a dynamic value. The calculation formula is  $262143 - \text{job\_queue\_processes} - \text{autovacuum\_max\_workers} - \text{max\_inner\_tool\_connections} - \text{max\_connections} - \text{AUXILIARY\_BACKENDS} - \text{AV\_LAUNCHER\_PROCS}$ . The values of [job\\\_queue\\\_processes](#), [autovacuum\\\_max\\\_workers](#), [max\\\_inner\\\_tool\\\_connections](#), and [max\\\_connections](#) depend on the settings of the corresponding GUC parameters. **AUXILIARY\\_BACKENDS** indicates the number of reserved auxiliary threads and is fixed to **20**. **AV\\_LAUNCHER\\_PROCS** indicates the number of reserved launcher threads for autovacuum, which is fixed to **2**.

**Default value:**

**200** (196-core CPU/1536 GB memory, 128-core CPU/1024 GB memory, 104-core CPU/1024 GB memory, 96-core CPU/1024 GB memory); **150** (96-core CPU/768 GB memory); **120** (80-core CPU/640 GB memory) **100** (64-core CPU/512 GB memory); **80** (60-core CPU/480 GB memory); **40** (32-core CPU/256 GB memory); **20** (16-core CPU/128 GB memory); **10** (8-core CPU/64 GB memory, 4-core CPU/32 GB memory, 4-core CPU/16 GB memory)

**Suggestion:** Set this parameter based on actual service requirements and hardware configurations. It is recommended that this parameter be set to a value less than or equal to 1/10 of **max\_connections**. If you only increase the value of this parameter but do not adjust the memory parameters in the same proportion, the memory may be insufficient and the error message "memory is temporarily unavailable" is displayed when the service load is heavy.

#### NOTE

If the value range of this parameter is changed during the upgrade and the value is changed before the commit operation, you need to change the value range to the value allowed before the upgrade if you roll back the upgrade. Otherwise, the database may fail to be started.

## enable\_seqscan\_fusion

**Parameter description:** Specifies whether to enable SeqScan optimization.

This parameter is a SUSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that SeqScan optimization is enabled.
- **off** indicates that SeqScan optimization is disabled.

**Default value:** off

#### NOTE

This parameter can be used to optimize only the execution time of the seqscan operator in the EXPLAIN ANALYZE statement.

## cluster\_run\_mode

**Parameter description:** Specifies whether a DN belongs to the primary or standby database instance in the dual-database instance DR scenario. For a single database instance, use the default primary database instance.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** enumerated values

- **cluster\_primary** indicates the primary database instance.
- **cluster\_standby** indicates the standby database instance.

**Default value:** cluster\_primary

## acceleration\_with\_compute\_pool

**Parameter description:** Determines whether to use the computing resource pool for acceleration when an OBS is queried. (Due to specification changes, the current version no longer supports this feature. Do not use it.)

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that the query covering the OBS is accelerated based on the cost when the computing resource pool is available.
- **off** indicates that no query is accelerated using the computing resource pool.

**Default value:** off

## dfs\_partition\_directory\_length

**Parameter description:** Specifies the maximum directory name length for the partition directory of a table partitioned by VALUE in the HDFS.

This is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** 92 to 7999

**Default value:** 512

## max\_resource\_package

**Parameter description:** Specifies the maximum number of threads that each DN can run concurrently on an acceleration database instance on the cloud.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** 0 to 2147483647

**Default value:** 0

## enable\_gpi\_auto\_update

**Parameter description:** Determines whether global indexes are updated by default in partition DDL commands.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- The value **on** indicates that global indexes are updated regardless of whether the partition DDL commands contain the UPDATE GLOBAL INDEX clause.
- The value **off** indicates that global indexes are not updated unless the partition DDL commands contain the UPDATE GLOBAL INDEX clause.

**Default value:** off

## 14.3.25 Wait Events

### enable\_instr\_track\_wait

**Parameter description:** Specifies whether to enable real-time collection of wait event information.

In the x86-based centralized deployment scenario, the hardware configuration specifications are 32-core CPU and 256 GB memory. When the Benchmark SQL 5.0 tool is used to test performance, the performance fluctuates by about 1.4% by enabling or disabling this parameter.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that the function of collecting wait event information is enabled.
- **off** indicates that the function of collecting wait event information is disabled.

**Default value:** on

## 14.3.26 Query

### instr\_unique\_sql\_count

**Parameter description:** Specifies the maximum number of Unique SQL records to be collected. The value **0** indicates that the function of collecting Unique SQL information is disabled.

If the value is changed from a larger one to a smaller one, the original data in the system will be cleared and re-collected (the standby node does not support this function). There is no impact if the value is changed from a smaller one to a larger one.

When the number of unique SQL records generated in the system (to view the statistics, query **dbperf.statement** or **dbperf.summary\_statement**) is greater than the value of **instr\_unique\_sql\_count**, the extra unique SQL records are not collected.

In the x86-based centralized deployment scenario, the hardware configuration specifications are 32-core CPU and 256 GB memory. When the Benchmark SQL 5.0 tool is used to test performance, the performance fluctuates by about 3% by enabling or disabling this parameter.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 2147483647

**Default value:** 200000

## instr\_unique\_sql\_track\_type

**Parameter description:** Specifies which SQL statements are recorded in Unique SQL.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** enumerated values

- **top:** Only top-level SQL statements are recorded.
- **all:** All SQL statements are recorded.

**Default value:** top

## enable\_instr\_rt\_percentile

**Parameter description:** Specifies whether to enable the function of calculating the response time of 80% and 95% SQL statements in the system.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that the function is enabled.
- **off** indicates that the function is disabled.

**Default value:** on

## percentile

**Parameter description:** Specifies the percentage of SQL statements whose response time is to be calculated by the background calculation thread.

This parameter is an INTERNAL parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string

**Default value:** 80, 95

## instr\_rt\_percentile\_interval

**Parameter description:** Specifies the interval at which the background calculation thread calculates the SQL response time.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 3600. The unit is s.

**Default value:** 10s

## enable\_instr\_cpu\_timer

**Parameter description:** Specifies whether to capture the CPU time consumed during SQL statement execution.

In the x86-based centralized deployment scenario, the hardware configuration specifications are 32-core CPU and 256 GB memory. When the Benchmark SQL 5.0 tool is used to test performance, the performance fluctuates by about 3.5% by enabling or disabling this parameter.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates the CPU time consumed during SQL statement execution is captured.
- **off** indicates the CPU time consumed during SQL statement execution is not captured.

**Default value:** on

## enable\_stmt\_track

**Parameter description:** Specifies whether to enable the full/slow SQL statement feature.

In the x86-based centralized deployment scenario, the hardware configuration specifications are 32-core CPU and 256 GB memory. When the Benchmark SQL 5.0 tool is used to test performance, the performance fluctuates by about 1.2% by enabling or disabling this parameter.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on:** Full/Slow SQL capture is enabled.
- **off:** Full /Slow SQL capture is disabled.

**Default value:** on

## track\_stmt\_parameter

**Parameter description:** After **track\_stmt\_parameter** is enabled, the executed statements recorded in **statement\_history** are not normalized. The complete SQL statement information can be displayed to help the database administrator locate problems. For a simple query, the complete statement information is displayed. For a PBE statement, the complete statement information and information about each variable value are displayed. The format is "query string; parameters: \$1=value1,\$2=value2, ..." This parameter is used to display complete SQL information and is not controlled by the **track\_activity\_query\_size** parameter.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on**: The function of displaying complete SQL statement information is enabled.
- **off**: The function of displaying complete SQL statement information is disabled.

**Default value:** off

## track\_stmt\_session\_slot

**Parameter description:** Specifies the maximum number of full/slow SQL statements that can be cached in a session. If the number of full/slow SQL statements exceeds this value, new statements will not be traced until the flush thread flushes the cached statements to the disk to reserve idle space.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 2147483647

**Default value:** 1000

## track\_stmt\_details\_size

**Parameter description:** Specifies the maximum size of execution events that can be collected by a single statement.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 100000000. The unit is byte.

**Default value:** 4096

## track\_stmt\_retention\_time

**Parameter description:** Specifies the retention period of full/slow SQL statement records. This is a combination of parameters. This parameter is read every 60 seconds and records exceeding the retention period are deleted. Only the sysadmin user can access this parameter.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string consisting of two parts in the format of 'full sql retention time, slow sql retention time'.

- **full sql retention time** indicates the retention period of full SQL statements. The value ranges from 0 to 86400. The unit is second.
- **slow sql retention time** indicates the retention period of slow SQL statements. The value ranges from 0 to 604800. The unit is second.

**Default value:** 3600,604800

## track\_stmt\_stat\_level

**Parameter description:** Determines the level of statement execution tracing.

This is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#). The value is case-insensitive.

**Value range:** a string

This parameter consists of two parts in the format of 'full sql stat level, slow sql stat level'.

The first part indicates the tracing level of full SQL statements. The value can be **OFF, L0, L1, or L2**.

The second part indicates the tracing level of slow SQL statements. The value can be **OFF, L0, L1, or L2**.

 **NOTE**

If the tracing level of full SQL statements is not **OFF**, the current SQL statement tracing level is a higher level (L2 > L1 > L0) of full and slow SQL statements. For details about the levels, see "System Catalogs and System Views > System Catalogs > STATEMENT\_HISTORY > STATEMENT\_HISTORY columns" in the *Developer Guide*.

**Default value:** OFF,L0

## enable\_auto\_clean\_unique\_sql

**Parameter description:** Specifies whether to enable the automatic elimination function of unique SQL statements when the number of unique SQL statements generated in the system is greater than or equal to the value of **instr\_unique\_sql\_count**.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

**Default value:** off

---

 **CAUTION**

Some snapshot information comes from unique SQL statements. Therefore, when automatic elimination is enabled, if the selected start snapshot and end snapshot exceed the elimination time, the WDR report cannot be generated.

---

## asp\_log\_directory

**Parameter description:** Specifies the directory for storing ASP log files on the server when **asp\_flush\_mode** is set to **all** or **file**. The value can be an absolute path, or relative to the **data** directory. Only the sysadmin user can access this parameter.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

---

**NOTICE**

If the value of **asp\_log\_directory** in the configuration file is an invalid path, the database instance cannot be restarted.

---

 NOTE

- Valid path: Users must have read and write permissions on the path.
- Invalid path: Users do not have read or write permissions on an invalid path.

**Value range:** a string

**Default value:** specified during installation

## enable\_slow\_query\_log (Discarded)

**Parameter description:** Specifies whether to write the slow query information to the log file. This parameter is discarded in this version.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on:** indicates that slow query information needs to be written into log files.
- **off:** indicates that slow query information does not need to be written into log files.

**Default value:** on

## query\_log\_file (Discarded)

**Parameter description:** If **enable\_slow\_query\_log** is set to **ON**, slow query records are written into log files. **query\_log\_file** specifies the name of a slow query log file on the server. Only the sysadmin user can access this parameter. Generally, log file names are generated in strftime mode. Therefore, the system time can be used to define log file names, which are implemented using the escape character %. This function has been discarded in this version.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

---

**NOTICE**

You are advised to use %-escapes to specify the log file names for efficient management of log files.

---

**Value range:** a string

**Default value:** `slow_query_log-%Y-%m-%d_%H%M%S.log`

## query\_log\_directory (Discarded)

**Parameter description:** Specifies the directory for storing low query log files when **enable\_slow\_query\_log** is set to **on**. Only the sysadmin user can access this parameter. It can be an absolute path or a relative path (relative to the data directory), which has been discarded in this version.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

#### NOTICE

If the value of **query\_log\_directory** in the configuration file is an invalid path, the database instance cannot be restarted.

#### NOTE

Valid path: Users have read and write permissions on the path.

Invalid path: You do not have read or write permission on the path.

**Value range:** a string

**Default value:** specified during installation

## perf\_directory

**Parameter description:** Specifies the directory of the output file of the performance view dotting task. Only the sysadmin user can access this parameter. The value can be an absolute path, or relative to the data directory.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

#### NOTE

- Valid path: Users must have read and write permissions on the path.
- Invalid path: Users do not have read or write permissions on an invalid path.

**Value range:** a string

**Default value:** specified during installation

## unique\_sql\_retention\_time

**Parameter description:** Specifies the memory cleanup interval for the unique SQL hash table. The default value is 30 minutes.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 1 to 3650. The unit is minute.

**Default value:** 30min

## track\_stmt\_standby\_chain\_size

**Parameter description:** Specifies the maximum memory and disk space occupied by fast/slow SQL statement records on the standby node. This is a combination of parameters. Only the SysAdmin user can access the database.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string

This parameter consists of four parts in the format of 'Full SQL memory size, Full SQL disk size, Slow SQL memory size, Slow SQL disk size'.

Full SQL and slow SQL statement are stored in different locations. Therefore, four additional values are used for control.

- **Full SQL memory size** indicates the maximum memory space reserved for fast SQL statements. The value range is [16,1024], in MB.
- **Full SQL disk size** indicates the maximum disk space occupied by reserved fast SQL statements. The value range is [512,1048576], in MB.
- **Slow SQL memory size** indicates the maximum memory space reserved for slow SQL statements. The value range is [16,1024], in MB.
- **Slow SQL disk size** indicates the maximum disk space reserved for slow SQL statements. The value range is [512,1048576], in MB.

The memory size cannot be greater than the disk size.

**Default value:** 32, 1024, 16, 512

## 14.3.27 System Performance Snapshot

### enable\_wdr\_snapshot

**Parameter description:** Specifies whether to enable the database monitoring snapshot function.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that the database monitoring snapshot function is enabled.
- **off** indicates that the database monitoring snapshot function is disabled.

**Default value:** on

### enable\_wdr\_snapshot\_standby

**Parameter description:** Specifies whether to enable the database monitoring snapshot function on the standby node.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that the database monitoring snapshot function is enabled on the standby node.
- **off** indicates that the database monitoring snapshot function is disabled on the standby node.

**Default value:** off

### enable\_show\_standby\_name

**Parameter description:** Specifies whether to display a name of the standby node to distinguish the primary and standby nodes.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on:** The function of distinguishing primary and standby node names is enabled.
- **off:** The function of distinguishing primary and standby node names is disabled.

**Default value:** off

## wdr\_snapshot\_retention\_days

**Parameter description:** Specifies the number of days for storing database monitoring snapshot data in the system. When the number of snapshots generated during database running exceeds the maximum number of snapshots that can be generated within the retention period, the system clears the snapshot data with the smallest **snapshot\_id** at the interval specified by **wdr\_snapshot\_interval**.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 1 to 30

**Default value:** 8

## wdr\_snapshot\_query\_timeout

**Parameter description:** Specifies the execution timeout for the SQL statements associated with database monitoring snapshot operations. If the SQL statement execution is not complete and no result is returned within the specified time, the snapshot operation fails.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#). The value **0** indicates that this parameter does not take effect.

**Value range:** an integer ranging from 0 to *INT\_MAX*. The unit is second.

**Default value:** 100s

## wdr\_snapshot\_interval

**Parameter description:** Specifies the interval at which the backend thread Snapshot automatically performs snapshot operations on the database monitoring data.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 10 to 60. The unit is min.

**Default value:** 1h

## asp\_flush\_mode

**Parameter description:** Specifies the mode for the ASP to update data to the disk. The value can be **file** (default value), **table** (system catalog), or **all** (system catalog and file). Only the sysadmin user can access this parameter.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string, which can be **table**, **file**, or **all**

**Default value:** **table**

## asp\_flush\_rate

**Parameter description:** When the number of samples reaches the value of **asp\_sample\_num**, the samples in the memory are updated to the disk based on a certain proportion. **asp\_flush\_rate** indicates the update proportion. If this parameter is set to **10**, the update ratio is 10:1.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 1 to 10

**Default value:** **10**

## asp\_log\_filename

**Parameter description:** Specifies the file name format when writing files using ASP. Only the sysadmin user can access this parameter.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string

**Default value:** **asp-%Y-%m-%d\_%H%M%S.log**

## asp\_retention\_days

**Parameter description:** Specifies the maximum number of days for reserving ASP samples when they are written to the system catalog.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 1 to 7

**Default value:** **2**

## asp\_sample\_interval

**Parameter description:** Specifies the sampling interval.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 1 to 10. The unit is s.

**Default value:** **1s**

## asp\_sample\_num

**Parameter description:** Specifies the maximum number of samples allowed in the LOCAL\_ACTIVE\_SESSION view. Only the sysadmin user can access this parameter.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 10 to 100000.

**Default value:**

**100000** (196-core CPU/1536 GB memory, 128-core CPU/1024 GB memory, 104-core CPU/1024 GB memory, 96-core CPU/1024 GB memory, 96-core CPU/768 GB memory, 80-core CPU/640 GB memory, 64-core CPU/512 GB memory, 60-core CPU/480 GB memory, 32-core CPU/256 GB memory, 16-core CPU/128 GB memory, 8-core CPU/64 GB memory, 4-core CPU/32 GB memory); **36000** (4-core CPU/16 GB memory)

## enable\_asp

**Parameter description:** Specifies whether to enable the active session profile function.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on:** The function is enabled.
- **off:** The function is disabled.

**Default value:** on

## 14.3.28 Security Configuration

### enable\_security\_policy

**Parameter description:** Specifies whether the unified audit and dynamic data masking policies take effect.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

**on:** The security policy is enabled.

**off:** The security policy is disabled.

**Default value:** off

### use\_elastic\_search

**Parameter description:** Specifies whether to send unified audit logs to Elasticsearch. If **enable\_security\_policy** and this parameter are enabled, unified audit logs are sent to Elasticsearch through HTTP or HTTPS (used by default). After this parameter is enabled, ensure that the Elasticsearch service corresponding to **elastic\_search\_ip\_addr** can be properly connected. Otherwise, the process fails to be started.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

**on:** Unified audit logs are sent to Elasticsearch.

**off:** Unified audit logs are not sent to Elasticsearch.

**Default value:** off

## elastic\_search\_ip\_addr

**Parameter description:** Specifies the IP address of the Elasticsearch system. If HTTPS is used, the format is **https://ip:port:username**. If HTTP is used, the format is **http://ip:port**. In the preceding command, *ip* indicates the IP address of the Elasticsearch server. *port* indicates the listening port for Elasticsearch HTTP communication, and the value ranges from 9200 to 9299. *username* indicates the username used for registering an Elasticsearch account. The initial user is **elastic**. If HTTPS is used, related certificates need to be configured. For details, see "Unified Auditing" in the *Security Hardening Guide*.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string

**Default value:** "

## is\_sysadmin

**Parameter description:** Specifies whether the current user is an initial user.

This is a fixed INTERNAL parameter and cannot be modified.

**Value range:** Boolean

**on** indicates that the user is an initial user.

**off** indicates that the user is not an initial user.

**Default value:** off

## enable\_tde

**Parameter description:** Specifies whether to enable the TDE function. Set this parameter to **on** before creating an encrypted table. If this parameter is set to **off**, new encrypted tables cannot be created. The created encrypted table is decrypted only when data is read and is not encrypted when the data is written.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

**on:** The TDE function is enabled.

**off:** The TDE function is disabled.

**Default value:** off

## tde\_cmk\_id

**Parameter description:** Specifies the CMK ID of the database instance used by the TDE function. The ID is generated by KMS. The CMK of the database instance is used to encrypt the DEK. When the DEK needs to be decrypted, a request packet

needs to be sent to KMS. The DEK ciphertext and the ID of the corresponding CMK are sent to KMS.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string

**Default value:** ""

## block\_encryption\_mode

**Parameter description:** Specifies the block encryption mode used by the `aes_encrypt` and `aes_decrypt` functions for encryption and decryption.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** enumerated values. Valid values are `aes-128-cbc`, `aes-192-cbc`, `aes-256-cbc`, `aes-128-cfb1`, `aes-192-cfb1`, `aes-256-cfb1`, `aes-128-cfb8`, `aes-192-cfb8`, `aes-256-cfb8`, `aes-128-cfb128`, `aes-192-cfb128`, `aes-256-cfb128`, `aes-128-ofb`, `aes-192-ofb`, and `aes-256-ofb`. `aes` indicates the encryption or decryption algorithm. `128`, `192`, and `256` indicate the key length (unit: bit). `cbc`, `cfb1`, `cfb8`, `cfb128`, and `ofb` indicate the block encryption or decryption mode.

**Default value:** `aes-128-cbc`

## 14.3.29 Global Temporary Table

### max\_active\_global\_temporary\_table

**Parameter description:** Specifies whether global temporary tables can be created. Currently, the Ustore engine does not support global temporary tables. The value of this parameter determines the memory reserved in the shared cache for hash tables required by global temporary tables. The total number of active global temporary tables in all sessions is not forcibly limited.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 1000000

- 0: The global temporary table function is disabled.
- > 0: The global temporary table function is enabled.

**Default value:** 1000

### vacuum\_gtt\_defer\_check\_age

**Parameter description:** Checks the differences between the global temporary table `relfrozenxid` and the ordinary table after `VACUUM` is executed. `WARNING` is generated if the difference value exceeds the specified parameter value. Use the default value for this parameter.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 1000000

**Default value:** 10000

## enable\_gtt\_concurrent\_truncate

**Parameter description:** Specifies whether to support concurrent execution of TRUNCATE TABLE and DML operations on global temporary tables and concurrent execution of TRUNCATE TABLE on global temporary tables.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on/true** indicates that the preceding operations can be performed concurrently.
- **off/false** indicates that the preceding operations cannot be performed concurrently.

**Default value:** on

## 14.3.30 HyperLogLog

### hll\_default\_log2m

**Parameter description:** Specifies the number of buckets for HLL data. The number of buckets affects the precision of distinct values calculated by HLL. The more buckets there are, the smaller the deviation is. The deviation range is as follows:  $[-1.04/2^{\log_2 m^{1/2}}, +1.04/2^{\log_2 m^{1/2}}]$

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 10 to 16

**Default value:** 14

### hll\_default\_log2explicit

**Parameter description:** Specifies the default threshold for switching from the explicit mode to the sparse mode.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 12. The value 0 indicates that the explicit mode is skipped. The value 1 to 12 indicates that the mode is switched when the number of distinct values reaches  $2^{\text{hll\_default\_log2explicit}}$ .

**Default value:** 10

### hll\_default\_log2sparse

**Parameter description:** Specifies the default threshold for switching from the sparse mode to the full mode.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 14. The value **0** indicates that the explicit mode is skipped. The value 1 to 14 indicates that the mode is switched when the number of distinct values reaches  $2^{\text{hll\_default\_log2sparse}}$ .

**Default value:** 12

## hll\_duplicate\_check

**Parameter description:** Specifies whether duplicatecheck is enabled by default.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** **0** or **1**. **0**: disabled; **1**: enabled

**Default value:** 0

## hll\_default\_regwidth (Discarded)

**Parameter description:** Specifies the number of bits in each bucket for HLL data. A larger value indicates more memory occupied by HLL. **hll\_default\_regwidth** and **hll\_default\_log2m** determine the maximum number of distinct values that can be calculated by HLL. Currently, **regwidth** is set to a fixed value and is no longer used.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 1 to 5

**Default value:** 5

## hll\_default\_expthresh (Discarded)

**Parameter description:** Specifies the default threshold for switching from the **explicit** mode to the **sparse** mode. Currently, the **hll\_default\_log2explicit** parameter is used to replace the similar function.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from -1 to 7. **-1** indicates the auto mode; **0** indicates that the **explicit** mode is skipped; a value from 1 to 7 indicates that the mode is switched when the number of distinct values reaches  $2^{\text{hll\_default\_expthresh}}$ .

**Default value:** -1

## hll\_default\_sparseon (Discarded)

**Parameter description:** Specifies whether to enable the **sparse** mode by default. Currently, the **hll\_default\_log2sparse** parameter is used to replace the similar function. When **hll\_default\_log2sparse** is set to **0**, the **sparse** mode is disabled.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** **0** or **1**. **0** indicates that the **sparse** mode is disabled by default. **1** indicates that the **sparse** mode is enabled by default.

**Default value:** 1

### hll\_max\_sparse (Discarded)

**Parameter description:** Specifies the size of **max\_sparse**. Currently, the **hll\_default\_log2sparse** parameter is used to replace the similar function.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from -1 to 2147483647

**Default value:** -1

### enable\_compress\_hll (Discarded)

**Parameter description:** Specifies whether to enable memory optimization for HLL. Currently, the HLL memory has been optimized, and this parameter is no longer used.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** or **true** indicates that memory optimization is enabled.
- **off** or **false** indicates that memory optimization is disabled.

**Default value:** off

## 14.3.31 User-defined Functions

### udf\_memory\_limit

**Parameter description:** Controls the maximum physical memory that can be used when each database node executes UDFs. This parameter does not take effect in the current version. Use **FencedUDFMemoryLimit** and **UDFWorkerMemHardLimit** to control virtual memory used by fenced udf worker.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer. The value range is from 200 x 1024 to *max\_process\_memory* and the unit is KB.

**Default value:** 200 MB

### FencedUDFMemoryLimit

**Parameter description:** Specifies the virtual memory used by each fenced udf worker process.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 KB to 2147483647 KB. The unit can also be MB or GB. **0** indicates that the memory is not limited.

**Default value:** 0

## UDFWorkerMemHardLimit

**Parameter description:** Specifies the maximum value of **fencedUDFMemoryLimit**.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

Value range: an integer ranging from 0 KB to 2147483647 KB. The unit can also be MB or GB.

**Default value:** 1 GB

## 14.3.32 Scheduled Task

### job\_queue\_processes

**Parameter description:** Specifies the number of jobs that can be concurrently executed. This parameter is a POSTMASTER parameter. You can set it using **gs\_guc**, and you need to restart **gaussdb** to make the setting take effect.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** 0 to 1000

Function:

- Setting **job\_queue\_processes** to **0** indicates that the scheduled job function is disabled and that no job will be executed. (Enabling scheduled jobs may affect the system performance. At sites where this function is not required, you are advised to disable it.)
- Setting **job\_queue\_processes** to a value that is greater than **0** indicates that the scheduled job function is enabled and this value is the maximum number of jobs that can be concurrently processed.

After the scheduled job function is enabled, the **job\_scheduler** thread polls the **pg\_job** system catalog at a scheduled interval. The scheduled job check is performed every second by default.

Too many concurrent jobs consume many system resources, so you need to set the number of concurrent jobs to be processed. If the current number of concurrent jobs reaches the value of **job\_queue\_processes** and some of them expire, these jobs will be postponed to the next polling period. Therefore, you are advised to set the polling interval (the **Interval** parameter of the **submit** interface) based on the execution duration of each job to avoid the problem that jobs in the next polling period cannot be properly processed because of overlong job execution time.

Note: If the number of concurrent jobs is large and the value is too small, these jobs will wait in queues. However, a large parameter value leads to large resource consumption. You are advised to set this parameter to **100** and change it based on the system resource condition.

**Default value:** 10

## enable\_prevent\_job\_task\_startup

**Parameter description:** Specifies whether to start the job thread.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that the job thread is not started.
- **off** indicates that the job thread is started.

**Default value:** off

## 14.3.33 Thread Pool

### enable\_thread\_pool

**Parameter description:** Specifies whether to enable the thread pool function. This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that the thread pool function is enabled.
- **off** indicates that the thread pool function is disabled.

**Default value:** on

### thread\_pool\_attr

**Parameter description:** Specifies the detailed attributes of the thread pool function. This parameter is valid only when **enable\_thread\_pool** is set to **on**. Only the sysadmin user can access this parameter. This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string, consisting of one or more characters

This parameter consists of three parts: thread\_num, group\_num, and cpubind\_info. The meanings of the three parts are as follows:

- **thread\_num** indicates the total number of threads in the thread pool. The value ranges from 0 to 4096. The value **0** indicates that the database automatically configures the number of threads in the thread pool based on the number of CPU cores. If the value is greater than **0**, the number of threads in the thread pool is the same as the value of **thread\_num**. You are advised to set the thread pool size based on the hardware configuration. The formula is as follows: Value of **thread\_num** = Number of CPU cores x 3-5. The maximum value of **thread\_num** is **4096**.
- **group\_num** indicates the number of thread groups in the thread pool. The value ranges from 0 to 64. The value **0** indicates that the database automatically configures the number of thread groups in the thread pool based on the number of NUMA groups. If the value is greater than **0**, the number of thread groups in the thread pool is the same as the value of **group\_num**.
- **cpubind\_info** indicates whether the thread pool is bound to a core. The available configuration modes are as follows: 1. '**(nobind)**': The thread is not

bound to a core. 2. '**(allbind)**': Use all CPU cores that can be queried in the current system to bind threads. 3. '**(nodebind: 1, 2)**': Use the CPU cores in NUMA groups 1 and 2 to bind threads. 4. '**(cpubind: 0-30)**': Use CPU cores 0 to 30 to bind threads. 5. '**(numabind: 0-30)**': Use CPU cores 0 to 30 in the NUMA group to bind threads. This parameter is case-insensitive. This parameter does not take effect in the resource multi-tenancy mode.

**Default value:**

'**4096,2,(nobind)**' (196-core CPU/1536 GB memory, 128-core CPU/1024 GB memory, 104-core CPU/1024 GB memory, 96-core CPU/1024 GB memory);  
'**2048,2,(nobind)**' (96-core CPU/768 GB memory, 80-core CPU/640 GB memory);  
'**1024,2,(nobind)**' (64-core CPU/512 GB memory, 60-core CPU/480 GB memory, 32-core CPU/256 GB memory); '**512,2,(nobind)**' (16-core CPU/128 GB memory);  
'**256,2,(nobind)**' (8-core CPU/64 GB memory); '**128,2,(nobind)**' (4-core CPU/32 GB memory); '**32,1,(nobind)**' (4-core CPU/16 GB memory)

## thread\_pool\_stream\_attr

**Parameter description:** Specifies the detailed attributes of the stream thread pool function. This parameter is valid only when **enable\_thread\_pool** is set to **on** and only takes effect on DNs. Only the sysadmin user can access this parameter. This is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string, consisting of one or more characters

This parameter consists of four parts: 'stream\_thread\_num, stream\_proc\_ratio, group\_num, cpubind\_info'. The meanings of the four parts are as follows:

- **stream\_thread\_num** indicates the total number of threads in the stream thread pool. The value ranges from 0 to 4096. The value **0** indicates that the database automatically configures the number of threads in the thread pool based on the number of CPU cores. If the value is greater than **0**, the number of threads in the thread pool is the same as the value of **stream\_thread\_num**. You are advised to set the thread pool size based on the hardware configuration. The formula is as follows: Value of **stream\_thread\_num** = Number of CPU cores x 3–5. The maximum value of **stream\_thread\_num** is **4096**.
- **stream\_proc\_ratio** indicates the ratio of proc resources reserved for stream threads. The value is a floating-point number. The default value is **0.2**. The reserved proc resources are calculated as follows: **stream\_proc\_ratio** x **stream\_thread\_num**.
- **group\_num** indicates the number of thread groups in the thread pool. The value ranges from 0 to 64. The value **0** indicates that the database automatically configures the number of thread groups in the thread pool based on the number of NUMA groups. If the value is greater than **0**, the number of thread groups in the thread pool is the same as the value of **group\_num**. The value of **group\_num** in **thread\_pool\_stream\_attr** must be the same as that in **thread\_pool\_attr**. If they are set to different values, the value of **group\_num** in **thread\_pool\_attr** is used.
- **cpubind\_info** indicates whether the thread pool is bound to a core. The available configuration modes are as follows: 1. '**(nobind)**': The thread is not bound to a core. 2. '**(allbind)**': Use all CPU cores that can be queried in the current system to bind threads. 3. '**(nodebind: 1, 2)**': Use the CPU cores in

NUMA groups 1 and 2 to bind threads. 4. '**cpubind: 0-30**': Use CPU cores 0 to 30 to bind threads. 5. '**numabind: 0-30**': Use CPU cores 0 to 30 in the NUMA group to bind threads. This parameter is case-insensitive. The value of **cpubind\_info** in **thread\_pool\_stream\_attr** must be the same as that in **thread\_pool\_attr**. If they are set to different values, the value of **cpubind\_info** in **thread\_pool\_attr** is used.

**Default value:**

**stream\_thread\_num:** 16

**stream\_proc\_ratio:** 0.2

**group\_num** and **cpubind\_info**: For details, see [thread\\_pool\\_attr](#).

## resilience\_threadpool\_reject\_cond

**Parameter description:** Specifies the percentage of thread pool usage for escape from overload. This parameter takes effect only when the GUC parameters **use\_workload\_manager** and **enable\_thread\_pool** are enabled. This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string, consisting of one or more characters

This parameter consists of **recover\_threadpool\_percent** and **overload\_threadpool\_percent**. The meanings of the two parts are as follows:

- **recover\_threadpool\_percent:** specifies the thread pool usage when the thread pool recovers to the normal state. When the thread pool usage is less than the value of this parameter, the escape from overload function is disabled and new connections are allowed. The value ranges from 0 to *INT\_MAX*. The value indicates a percentage.
- **overload\_threadpool\_percent:** specifies thread pool usage when the thread pool is overloaded. If the thread pool usage is greater than the value of this parameter, the current thread pool is overloaded. In this case, the escape from overload function is enabled to kill sessions and forbid new connections. The value ranges from 0 to *INT\_MAX*. The value indicates a percentage.

**Default value:** '0,0', indicating that the thread pool escape function is disabled.

**Example:**

```
resilience_threadpool_reject_cond = '50,90'
```

When the thread pool usage exceeds 90%, new connections are forbidden and stacked sessions are killed. When the thread pool usage decreases to 50%, session killing is stopped and new connections are allowed.

#### NOTICE

- The thread pool usage can be queried in the DBE\_PERF.local\_threadpool\_status view. The initial number of threads in the thread pool can be obtained by querying the **thread\_pool\_attr** parameter.
- If this parameter is set to a small value, the thread pool escape from overload process is frequently triggered. As a result, ongoing sessions are forcibly logged out, and new connections fail to be connected for a short period of time. Therefore, exercise caution when setting this parameter based on the actual thread pool usage.
- The values of **recover\_threadpool\_percent** and **overload\_threadpool\_percent** can be 0 at the same time. In addition, the value of **recover\_threadpool\_percent** must be smaller than that of **overload\_threadpool\_percent**. Otherwise, the setting does not take effect.

## 14.3.34 Backup and Restoration

### operation\_mode

**Parameter description:** Specifies whether the system enters the backup and restoration mode.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that the system is in the backup and restoration mode.
- **off** indicates that the system is not in the backup and restoration mode.

**Default value:** off

### enable\_cbm\_tracking

**Parameter description:** This parameter must be enabled when Roach is used to perform full and incremental backups. If this parameter is disabled, the backup will fail.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on:** The cbm tracking is enabled.
- **off:** The cbm tracking is disabled.

**Default value:** off

### max\_size\_for\_xlog\_retention

**Parameter description:** Specifies when to forcibly push the backup replication slot to prevent the disk from being full and the instance from being read-only because logs cannot be recycled during backup. It is recommended that the value of this parameter be a little smaller than the value of **datastorage\_threshold\_value\_check** of the CM Server component to prevent the instance from entering the read-only state.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** -100 to 2147483647

- The value **0** indicates that this function is disabled.
- A negative value indicates that the backup replication slot is forcibly pushed when the disk usage exceeds 80% and log recycling is blocked due to backup operations. For example, **-80** indicates that the backup replication slot is forcibly pushed when the disk usage exceeds 80%.
- A positive value indicates that the backup replication slot is triggered based on the size of stacked logs. For example, **32** indicates that the backup replication slot is forcibly pushed when the redo position of the current checkpoint exceeds 32 log segments (the size of each log segment is 16 MB) and logs are recycled because the backup operation is blocked.

**Default value:** 0

## max\_cbm\_retention\_time

**Parameter description:** Specifies the interval at which CBM backup files are forcibly recycled. If CBM files cannot be recycled during backup, the disk will be full and the instance will be read-only. You are advised to set this parameter based on the full backup interval.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** 86400 to 2147483647

- The unit is second.
- The minimum value is 1 day.
- The default value is 2 weeks.

**Default value:** 1209600

## 14.3.35 Undo

### undo\_space\_limit\_size

**Parameter description:** Specifies the threshold for forcibly recycling undo space. When the undo space usage reaches 80% of the threshold, forcible recycling starts. You are advised to set **undo\_space\_limit\_size** to a value greater than or equal to that of **undo\_limit\_size\_per\_transaction**.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 102400 to 2147483647. The unit is 8 KB.

**Default value:** 256 GB

### undo\_limit\_size\_per\_transaction

**Parameter description:** Specifies the undo space threshold of a single transaction. If the threshold is reached, the transaction is rolled back due to an error. You are advised to set **undo\_limit\_size\_per\_transaction** to a value less than or equal to that of **undo\_space\_limit\_size**. If the value of **undo\_limit\_size\_per\_transaction** is

greater than that of **undo\_space\_limit\_size**, the displayed value is the same as the configured value when you run the **show undo\_limit\_size\_per\_transaction** command to query the parameter value. The only difference is that the smaller value between **undo\_space\_limit\_size** and **undo\_limit\_size\_per\_transaction** is used as the actual undo space threshold of a single transaction. If the **undo\_limit\_size\_per\_transaction** is set to a value greater than 1 TB, the system performance and stability may be affected.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 256 to 2147483647. The unit is 8 KB.

**Default value:** 32 GB

## 14.3.36 DCF Parameters Settings

### enable\_dcf

**Parameter description:** Specifies whether to enable the DCF mode.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean. The value can be **on** or **off**. **on** indicates that the current log replication mode is DCF, and **off** indicates that the current log replication mode is not DCF.

**Default value:** off

### dcf\_ssl

**Parameter description:** This parameter is no longer used. The DCF reuses the GUC parameter [ssl](#).

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean. The value can be **on** or **off**. The value **on** indicates that SSL is used, and the value **off** indicates that SSL is not used.

**Default value:** on

### dcf\_config

**Parameter description:** Specifies the customized configuration information during installation.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Default value:** a string, which is specified by users during installation

### dcf\_data\_path

**Parameter description:** Specifies the DCF data path.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Default value:** a string, which is the **dcf\_data** directory under the data directory of the DN

## dcf\_log\_path

**Parameter description:** Specifies the DCF log path.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Default value:** a string, which is the **dcf\_log** directory under the data directory of the DN

## dcf\_node\_id

**Parameter description:** Specifies the ID of the DN where the DCF is located. This parameter is defined by the user during installation and mode switching.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Default value:** an integer, which is specified by users during installation

## dcf\_max\_workers

**Parameter description:** Specifies the number of DCF callback function threads. If the number of nodes exceeds 7, increase the value of this parameter (for example, to **40**). Otherwise, the primary node may remain in the promoting state and the log replication between the primary and standby nodes has no progress.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 10 to 262143

**Default value:** 20

## dcf\_truncate\_threshold

**Parameter description:** Specifies the threshold for a DN to truncate DCF logs.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 1 to 2147483647

**Default value:** 100000

## dcf\_election\_timeout

**Parameter description:** Specifies the timeout interval for selecting the DCF leader and follower. The election timeout interval depends on the status of the network between DNs. If the timeout interval is short and the network quality is poor, timeout occurs. After the network recovers, the election becomes normal. You are advised to set a proper timeout interval based on the current network status. Restriction on the DCF node clock: The maximum clock difference between DCF nodes is less than half of the election timeout period. In DCF manual election mode, to ensure timely CM arbitration, do not modify this parameter. Instead, use the default election timeout period.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 1 to 600, in seconds

**Default value:** 3

## dcf\_enable\_auto\_election\_priority

**Parameter description:** Specifies whether the DCF priority can be automatically adjusted. The value **0** indicates that automatic adjustment is not allowed, and the value **1** indicates that automatic adjustment is allowed.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** 0 or 1.

**Default value:** 1

## dcf\_election\_switch\_threshold

**Parameter description:** Specifies the DCF threshold for preventing frequent switchover to primary. It is recommended that this parameter be set based on the maximum fault duration acceptable for user services.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 2147483647, in seconds.

**Default value:** 0

## dcf\_run\_mode

**Parameter description:** Specifies the DCF election mode. The value **0** indicates the automatic election mode, the value **1** indicates the manual election mode, and the value **2** indicates that the election mode is disabled. Currently, the election mode can be disabled only in minority restoration scenarios. If the election mode is disabled, the database instance will become unavailable.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

Note: The working mode of an instance can be switched only when the instance is running properly. Otherwise, the instance is still abnormal after the switching. The DCF working mode configured in GUC parameters must be the same as that configured by using `cm_ctl`. That is, both DCF working modes must be set to manual or automatic at the same time.

For example, to set the DCF manual mode, run the following command:

```
cm_ctl set --param --server -k dn_arbitrate_mode=quorum
cm_ctl reload --param --server
gs_guc reload -Z datanode -I all -N all -c "dcf_run_mode=1"
```

To set the DCF automatic mode, run the following command:

```
cm_ctl set --param --server -k dn_arbitrate_mode=paxos
cm_ctl reload --param --server
gs_guc reload -Z datanode -I all -N all -c "dcf_run_mode=0"
```

**Value range:** 0, 1, or 2

**Default value:** 1

## dcf\_log\_level

**Parameter description:** Specifies the DCF log level.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string

- Disable the log function: **NONE**, indicating that the log function is disabled and cannot be used for the following log levels:
- Enable the log function: **RUN\_ERR|RUN\_WAR|RUN\_INF|DEBUG\_ERR|DEBUG\_WAR|DEBUG\_INF|TRACE|PROFILE|OPER**

You can select a string from the preceding strings and use vertical bars (|) to combine the strings. The log level cannot be left blank.

**Default value:** **RUN\_ERR|RUN\_WAR|DEBUG\_ERR|OPER|RUN\_INF|PROFILE**

## dcf\_log\_backup\_file\_count

**Parameter description:** Specifies the number of DCF run log backups.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 1 to 1000

**Default value:** 100

## dcf\_max\_log\_file\_size

**Parameter description:** Specifies the maximum size of a DCF run log file.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 1 to 1000, in MB

**Default value:** 10

## dcf\_socket\_timeout

**Parameter description:** Specifies the timeout interval for the DCF communication module to connect to the socket. This parameter takes effect upon the system restart. In an environment where the network quality is poor, if the timeout interval is set to a small value, a connection may fail to be set up. In this case, you need to increase the value.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 10 to 600000, in ms

**Default value:** 5000

## dcf\_connect\_timeout

**Parameter description:** Specifies the timeout interval for the DCF communication module to set up a connection. This parameter takes effect upon the system restart. In an environment where the network quality is poor, if the timeout interval is set to a small value, the connection may fail to be set up. In this case, you need to increase the value.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 10 to 600000, in ms

**Default value:** 60000

### dcf\_mec\_fragment\_size

**Parameter description:** Specifies the fragment size of the DCF communication module. This parameter takes effect upon the system restart.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 32 to 10240, in KB

**Default value:** 64

### dcf\_stg\_pool\_max\_size

**Parameter description:** Specifies the maximum size of the memory pool of the DCF storage module. This parameter takes effect upon the system restart.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 32 to 2147483647, in MB

**Default value:** 2048

### dcf\_stg\_pool\_init\_size

**Parameter description:** Specifies the minimum size of the memory pool of the DCF storage module. This parameter takes effect upon the system restart.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 32 to 2147483647, in MB

**Default value:** 32

### dcf\_mec\_pool\_max\_size

**Parameter description:** Specifies the maximum size of the memory pool of the DCF communication module. This parameter takes effect upon the system restart.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 32 to 2147483647, in MB

**Default value:** 200

### dcf\_flow\_control\_disk\_rawait\_threshold

**Parameter description:** Specifies the disk waiting threshold for DCF flow control.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 2147483647, in  $\mu$ s

**Default value:** 100000

### **dcf\_flow\_control\_net\_queue\_message\_num\_threshold**

**Parameter description:** Specifies the threshold for the number of messages in a network queue for DCF flow control.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 2147483647

**Default value:** 1024

### **dcf\_flow\_control\_cpu\_threshold**

**Parameter description:** Specifies the threshold for DCF CPU flow control.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 2147483647, in percentage (%)

**Default value:** 100

### **dcf\_mec\_batch\_size**

**Parameter description:** Specifies the number of batch messages for DCF communication. When the value is 0, the DCF automatically adjusts the value based on the network and the amount of data to be written. This parameter takes effect upon the system restart.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 1024

**Default value:** 0

### **dcf\_mem\_pool\_max\_size**

**Parameter description:** Specifies the maximum DCF memory. This parameter takes effect upon the system restart.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 32 to 2147483647, in MB

**Default value:** 2048

### **dcf\_mem\_pool\_init\_size**

**Parameter description:** Specifies the initial size of the DCF memory. This parameter takes effect upon the system restart.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 32 to 2147483647, in MB

**Default value:** 32

## dcf\_compress\_algorithm

**Parameter description:** Specifies the compression algorithm for DCF run log transmission. This parameter takes effect upon the system restart.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer

- 0 indicates no compression.
- 1 indicates the ZSTD compression algorithm.
- 2 indicates the LZ4 compression algorithm.

**Default value:** 0

## dcf\_compress\_level

**Parameter description:** Specifies the compression level for DCF log transmission. This parameter takes effect upon the system restart. Before this parameter takes effect, a valid compression algorithm must be configured, that is, the **dcf\_compress\_algorithm** parameter is set.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 1 to 22

If compression is disabled, the configured compression level does not take effect.

**Default value:** 1

## dcf\_mec\_channel\_num

**Parameter description:** Specifies the number of DCF communication channels. This parameter takes effect upon the system restart.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 1 to 64

**Default value:** 1

## dcf\_rep\_append\_thread\_num

**Parameter description:** Specifies the number of DCF log replication threads. This parameter takes effect upon the system restart.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 1 to 1000

**Default value:** 2

## dcf\_mec\_agent\_thread\_num

**Parameter description:** Specifies the number of DCF communication working threads. This parameter takes effect upon the system restart. It is recommended that the value of **dcf\_mec\_agent\_thread\_num** be greater than or equal to 2 x Number of nodes x Value of **dcf\_mec\_channel\_num**.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 1 to 1000

**Default value:** 10

## dcf\_mec\_reactor\_thread\_num

**Parameter description:** Specifies the number of reactor threads used by the DCF. This parameter takes effect upon the system restart. It is recommended that the ratio of the value of **dcf\_mec\_reactor\_thread\_num** to the value of **dcf\_mec\_agent\_thread\_num** be 1:40.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 1 to 100

**Default value:** 1

## dcf\_log\_file\_permission

**Parameter description:** Specifies the attribute of the DCF run log file. The parameter setting takes effect after the system is restarted. This parameter is configured during installation and cannot be modified. To allow other users in the same group to access logs, ensure that all parent directories can be accessed by other users in the same group. That is, if **dcf\_log\_path\_permission** is set to **750**, **dcf\_log\_file\_permission** can only be set to **600** or **640**. If **dcf\_log\_path\_permission** is set to **700**, **dcf\_log\_file\_permission** must be set to **600**.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** enumerated type. The value can be **600** or **640**.

**Default value:** 600

## dcf\_log\_path\_permission

**Parameter description:** Specifies the attribute of the DCF run log directory. The parameter setting takes effect after the system is restarted. This parameter is configured during installation and cannot be modified. To allow other users in the same group to access the log path, set this parameter to **750**. Otherwise, set this parameter to **700**.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** enumerated type. The value can be **700** or **750**.

**Default value:** 700

## dcf\_majority\_groups

**Parameter description:** Sets the DCF policy-based majority function. For a group that requires this parameter, at least one standby node in the group receives logs. That is, there is a synchronous standby node in the group. If nodes are added to or deleted from the DCF instance or the group value of a node in the instance is changed, you need to modify the configuration accordingly.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string

- To disable the policy-based majority function, enter an empty string "".
- To enable the function, configure valid group values separated by commas (,). The group values must exist in **dcf\_config**. For example, if the group values 1 and 2 are added to the DCF policy-based majority configuration, you can set this parameter to "1,2". If the group value does not exist in **dcf\_config** or other characters are configured, the DCF considers the configured group invalid.

**Default value:** empty

---

 CAUTION

If all nodes in a group are faulty after the parameter is configured, you need to remove the group from the parameter list when performing node build operations (node recovery or node replacement without changing the IP address) on a node. After the node recovers, you can configure the group again.

---

## dcf\_node\_id\_map

**Parameter description:** Specifies the dictionary mapping between standby DN names and DCF node IDs. The parameter setting takes effect after the system is restarted. This parameter is configured during installation and cannot be modified. This parameter is used in DCF cluster installation, upgrade, and node replacement scenarios. The value of **standby\_name** configured in the GUC parameter **synchronous\_standby\_names** must be included in this dictionary.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string. The configuration format is 'standby\_name1:dcf\_node\_id1,standby\_name2:dcf\_node\_id2'. The values of standby DN names and the corresponding DCF node IDs are separated by commas (,).

**Default value:** empty

## 14.3.37 Flashback

This section describes parameters related to the flashback function. In this version, only the Ustore engine supports flashback, while the Astore engine does not support flashback.

### enable\_recyclebin

**Parameter description:** Specifies whether the recycle bin is enabled or disabled in real time.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

**Default value:** off

### recyclebin\_retention\_time

**Parameter description:** Specifies the retention period of objects in the recycle bin. The objects will be automatically deleted after the retention period expires.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 1 to 2147483647, in seconds.

**Default value:** 15 min (900s)

### version\_retention\_age

**Parameter description:** Specifies the number of transactions retained in the old version. If the number of transactions exceeds the value of this parameter, the old version will be recycled and cleared.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 576460752303423487. **0** means no delay.

**Default value:** 0

This parameter has been deprecated.

---

### vacuum\_defer\_cleanup\_age

**Parameter description:** Specifies the number of transactions by which **VACUUM** will defer the cleanup of invalid row-store table records, so that **VACUUM** and **VACUUM FULL** do not clean up deleted tuples immediately. You can also set this parameter to configure the retention period of the flashback function in the old version.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 1000000. **0** means no delay. The value range needs to be extended to 100 million.

**Default value:** 0

---

 **CAUTION**

This parameter can be ignored when you use the Ustore engine to flash back. It serves the Astore flashback function of the earlier version and has other functions. The flashback function is not used in this version.

---

## undo\_retention\_time

**Parameter description:** Specifies the period for retaining undo logs of earlier versions.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 259200, in seconds.

**Default value:** 0

---

 **CAUTION**

1. If this parameter is set to **0** during the Ustore flashback query, the snapshot information at the flashback point will be cleared. In earlier versions, no flashback query can be performed. When a flashback query is performed, the error message "cannot find the restore point" is displayed.
  2. If the time within which the undo logs of earlier versions need to be retained is time1 and the SQL statement execution time for the flashback query is time2, you need to set **undo\_retention\_time** to a value greater than time1 + time2. That is, set **undo\_retention\_time** to a value greater than time1 + time2 + 3s. You are advised to set **undo\_retention\_time** to a value equal to time1 + 1.5 x time2. For example, if you want to retain the logs of earlier versions within the latest 3 hours, and the SQL statement execution time for the flashback query is 1 hour, set **undo\_retention\_time** to a value equal to 3 hours + 1.5 x 1 hour, that is, 4.5 hours.
- 

## 14.3.38 Rollback Parameters

### max\_undo\_workers

**Parameter description:** Specifies the number of undo worker threads invoked during asynchronous rollback. The parameter setting takes effect after the system is restarted.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 1 to 100

**Default value:** 5

## 14.3.39 Reserved Parameters

### NOTE

The following parameters are reserved and do not take effect in this version.

acce\_min\_datasize\_per\_thread  
cstore\_insert\_mode  
enable\_constraint\_optimization  
enable\_hadoop\_env  
enable\_hdfs\_predicate\_pushdown  
enable\_orc\_cache  
schedule\_splits\_threshold  
backend\_version  
undo\_zone\_count  
version\_retention\_age  
max\_que\_size

## Discarded Parameters

max\_query\_retry\_times

## 14.3.40 AI Features

### enable\_hypo\_index

**Parameter description:** Specifies whether the database optimizer considers the created virtual index when executing the **EXPLAIN** statement. By executing **EXPLAIN** on a specific query statement, you can evaluate whether the index can improve the execution efficiency of the query statement based on the execution plan provided by the optimizer.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that a virtual index is created during **EXPLAIN** execution.
- **off** indicates that no virtual index is created during **EXPLAIN** execution.

**Default value:** off

### db4ai\_snapshot\_mode

**Parameter description:** There are two snapshot modes: MSS (materialized mode, storing data entities) and CSS (computing mode, storing incremental information).

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string, which can be **MSS** or **CSS**

- **MSS** indicates the materialized mode. The DB4AI stores data entities when snapshots are created.
- **CSS** indicates the computing mode. The DB4AI stores incremental information when creating snapshots.

**Default value:** **MSS**

## **db4ai\_snapshot\_version\_delimiter**

**Parameter description:** Specifies the delimiter for the snapshot version of a data table.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string of 1 character. The exclamation mark (!) is invalid.

**Default value:** @

## **db4ai\_snapshot\_version\_separator**

**Parameter description:** Specifies the subversion delimiter of a data table snapshot.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string of 1 character. The question mark (?) is invalid.

**Default value:** .

## **enable\_ai\_stats**

**Parameter description:** Specifies whether to create or use intelligent statistics.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

**Default value:** on

## **multi\_stats\_type**

**Parameter description:** Specifies the type of statistics to be created when **enable\_ai\_stats** is set to **on**.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** BAYESNET, MCV, or ALL.

- **BAYESNET:** Only intelligent statistics are created.
- **MCV:** Only traditional statistics are created.
- **ALL:** Both traditional statistics and intelligent statistics are created.

**Default value:** BAYESNET

## ai\_stats\_cache\_limit

**Parameter description:** Specifies the maximum number of models that can be cached when **enable\_ai\_stats** is set to **on**.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 30 to 1000

**Default value:** 100

## enable\_operator\_prefer

**Parameter description:** Specifies whether to enable the operator preference rule. If the estimated costs are similar, the parameterized path is preferred for table join. Note: There are two prerequisites for this parameter to take effect: 1. The parameterized path is generated. 2. The estimated cost of the parameterized path is similar to that of other index scan operators.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

**Default value:** off

## enable\_cachedplan\_mgr

**Parameter description:** Specifies whether to enable the adaptive plan selection function.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

**Default value:** on

## max\_stmt\_aplan\_num

**Parameter description:** Specifies the maximum number of candidate plans per query in adaptive plan selection.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 20

**Default value:** 5

## recommend\_session\_aplan\_memory

**Parameter description:** Specifies the maximum memory size of candidate plans of each session in adaptive plan selection. If the size is greater than or equal to

the value of this parameter, no new candidate plan will be inserted into the memory. The unit is KB.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 1024 to 102400

**Default value:** 5120

## repick\_plan\_min\_duration

**Parameter description:** Specifies the lower limit of the detected plan. During policy detection, if the execution time of the detected policy is not less than that of the plan multiplied by the value of **repick\_plan\_min\_duration**, an error is reported. If this parameter is set to **0**, the error reporting mechanism is disabled.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to *INT\_MAX*

**Default value:** 0

## unix\_socket\_directory

**Parameter description:** Specifies the path for storing files in the unix\_socket communication mode. You can set this parameter only in the configuration file **postgresql.conf**. Before enabling the fenced mode, you need to set this GUC parameter.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string of 0 or more characters

**Default value:** "

## enable\_ai\_watchdog

**Parameter description:** Enables or disables the AI watchdog function.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on:** enabled.
- **off:** disabled.

**Default value:** on

## enable\_ai\_watchdog\_forcible\_oom\_detection

**Parameter description:** Forcibly enables or disables OOM detection of the AI watchdog. If this parameter is disabled, the system automatically determines whether to enable OOM detection based on the current database specifications. In automatic determination mode, OOM detection is enabled only when **max\_process\_memory** is set to 64 GB or larger.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on:** enabled.
- **off:** disabled.

**Default value:** off

## enable\_ai\_watchdog\_healing

**Parameter description:** Enables or disables the self-healing function of the AI watchdog. You are advised not to enable this function because it is easy to cause suspension in high-load scenarios with 16-core CPU or lower specifications.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on:** enabled.
- **off:** disabled.

**Default value:** on

## ai\_watchdog\_max\_cpu\_usage

**Parameter description:** Specifies the expected upper limit of the database CPU usage. The value is normalized based on the multi-core situation. If this parameter is set to 0, the system does not check the CPU usage.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a floating-point number ranging from 0 to 1.

**Default value:** 0.8

## ai\_watchdog\_oom\_dynamic\_used\_threshold

**Parameter description:** Specifies the expected upper limit of the dynamic memory usage of the database.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a floating-point number ranging from 0 to 1.

**Default value:** 0.95

## ai\_watchdog\_oom\_growth\_confidence

**Parameter description:** Specifies the confidence level of the OOM detection algorithm.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a floating-point number ranging from 0.1 to 1.

**Default value:** 0.95

## ai\_watchdog\_oom\_malloc\_failures

**Parameter description:** Specifies the maximum number of consecutive memory allocation failures tolerated. If the number of consecutive memory allocation failures exceeds this value, the OOM detection function may be triggered.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 1 to 32000.

**Default value:** 50

## ai\_watchdog\_oom\_other\_used\_memory\_threshold

**Parameter description:** Specifies the expected upper limit of memory usage of other parts of the database, in MB.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 1 to 32000.

**Default value:** 20480

## ai\_watchdog\_oom\_process\_threshold

**Parameter description:** Specifies the expected percentage of the database process usage to the value of **max\_process\_memory**. When the threshold is reached, memory leakage determination is triggered. The value can be greater than 1.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a floating-point number ranging from 0 to 10.

**Default value:** 1.1

## ai\_watchdog\_oom\_shared\_threshold

**Parameter description:** Specifies the expected upper limit of the shared memory usage of the database.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a floating-point number ranging from 0 to 1.

**Default value:** 0.4

## ai\_watchdog\_rto\_restriction\_time

**Parameter description:** Specifies the RTO threshold of the AI watchdog self-healing function. If the RTO threshold is exceeded, self-healing is not performed. The unit is second.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 36000.

**Default value:** 600

## ai\_watchdog\_tolerance\_times

**Parameter description:** Specifies the maximum number of consecutive abnormal events that can be tolerated by the AI watchdog before self-healing is started. This parameter can be used to avoid incorrect operations.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 100.

**Default value:** 4

## ai\_watchdog\_tps\_threshold

**Parameter description:** Specifies the lower limit of the expected TPS usage of the database instance. If the TPS usage is lower than the value of this parameter, the exception determination logic is triggered.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 32000.

**Default value:** 2

## ai\_watchdog\_wait\_time

**Parameter description:** Adjusts the waiting time, in seconds. To prevent the database from frequently performing self-healing operations, the database waits for a period of time after startup.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 36000.

**Default value:** 1800

## ai\_watchdog\_warning\_retention

**Parameter description:** Specifies the maximum number of alarm records that the AI watchdog can retain in the `dbperf.ai_watchdog_detection_warnings` view.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 32000.

**Default value:** 20

## 14.3.41 Global SysCache Parameters

### enable\_global\_syscache

**Parameter description:** Specifies whether to enable the global system cache function. This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that the global system cache function is enabled.
- **off** indicates that the global system cache function is disabled.

**Default value:** on

You are advised to use this parameter together with the thread pool parameter. After this parameter is enabled, you are advised to set **wal\_level** of the standby node to **hot\_standby** or higher if you need to access the standby node.

## global\_syscache\_threshold

**Parameter description:** Specifies the maximum memory usage of the global system cache.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

The **enable\_global\_syscache** parameter must be enabled.

**Value range:** an integer ranging from 16384 to 1073741824. The unit is KB.

**Default value:**

**163840** (196-core CPU/1536 GB memory, 128-core CPU/1024 GB memory, 104-core CPU/1024 GB memory, 96-core CPU/1024 GB memory, 96-core CPU/768 GB memory, 80-core CPU/640 GB memory, 64-core CPU/512 GB memory, 60-core CPU/480 GB memory, 32-core CPU/256 GB memory, 16-core CPU/128 GB memory, 8-core CPU/64 GB memory, 4-core CPU/32 GB memory); **65536** (4-core CPU/16 GB memory)

Recommended calculation formula: MIN(Number of hot databases, Number of threads) x Memory size allocated to each database.

That is, **global\_syscache\_threshold = min(count(hot dbs), count(threads)) x memofdb**.

The number of hot databases refers to the number of frequently accessed databases. In thread pool mode, the number of threads is the sum of the number of threads in the thread pool and the number of background threads. In non-thread pool mode, the number of hot databases is used.

**memofdb** indicates the average memory allocated to each database. The background noise memory of each database is 2 MB. Each time a table or index is added, 11 KB memory is added.

If this parameter is set to a small value, memory is frequently evicted, and a large number of memory fragments cannot be recycled. As a result, memory control fails.

## 14.3.42 Parameters Related to the Efficient Data Compression Algorithm

### pca\_shared\_buffers

**Parameter description:** Similar to **shared\_buffers**, this parameter is used to set the size of the page compression block address mapping management buffer.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** 64 KB to 16 GB.

 **NOTE**

- If the value is less than 64 KB, an error is reported.
- If the value is greater than 16 GB, the parameter can be set successfully. However, in actual running, the automatic memory running is set to 16 GB.
- If the parameter does not contain a unit, the default value is 8 KB (the size of a page is 8 KB) multiplied by the parameter value.

**Default value:** 64 KB

## 14.3.43 Restoring Data on the Standby Node

### standby\_page\_repair

**Parameter description:** Specifies whether to enable page repair during playback on the standby node. This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that the standby node automatically detects and repairs pages during playback.
- **off** indicates that the standby node does not automatically detect and repair pages during playback.

**Default value:** off

## 14.3.44 Delimiter

### delimiter\_name

**Parameter description:** Saves the name of a delimiter.

When the gsql client identifies delimiters, it immediately sends one or more input SQL statements to the server for execution. When there are many input statements and semicolons (;) exist in the statements, you can specify a special symbol as the delimiter. This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

This parameter can be set only on the gsql client by running the **DELIMITER** command.

**Value range:** a string, consisting of one or more characters

**Default value:** ";"

## 14.3.45 Global PL/SQL Cache Parameters

### enable\_global\_plsqlcache

**Parameter description:** Specifies whether to globally cache compilation products of packages, stored procedures, and functions, and cache execution products at

the session level. Enabling this function can save memory usage of database nodes in high concurrency scenarios.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that compilation products are cached globally.
- **off** indicates that global cache is not performed.

**Default value:** off

## max\_execute\_functions

**Parameter description:** Specifies the number of execution products of stored procedures and functions in a session. This parameter must be set when **enable\_global\_plsqlcache** is set to **on**. Otherwise, the setting is invalid.

If the number of execution products is greater than the value of **max\_execute\_functions**, only the most recently invoked execution products (the number is specified by **max\_execute\_functions**) are retained and others are cleared.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a value ranging from 1 to 2147483647.

**Default value:** 1000
