GaussDB starts a transaction using **START TRANSACTION** and **BEGIN**. For details, see [START TRANSACTION](#) and [BEGIN](#).

### Setting a Transaction

GaussDB sets a transaction using **SET TRANSACTION** or **SET LOCAL TRANSACTION**. For details, see [SET TRANSACTION](#).

### Committing a Transaction

GaussDB commits all operations of a transaction using **COMMIT** or **END**. For details, see [COMMIT](#) | [END](#).

### Rolling Back a Transaction

If a fault occurs during a transaction and the transaction cannot proceed, the system performs rollback to cancel all the completed database operations related to the transaction. See [ROLLBACK](#).

#### NOTE

If an execution request (not in a transaction block) received in the database contains multiple statements, the request is packed into a transaction. If one of the statements fails, the entire request will be rolled back.

## 7.11 DDL Syntax Overview

Data definition language (DDL) is used to define or modify an object in a database, such as a table, an index, or a view.

#### NOTE

GaussDB does not support DDL if its CN is unavailable. For example, if the primary node of the database is faulty, creating a database or a table will fail.

### Defining a CMK

Client master keys (CMKs) are used to encrypt column encryption keys (CEKs) for the encrypted database feature. CMK definition includes creating and deleting a CMK. For details about related SQL statements, see [Table 7-117](#).

**Table 7-117** SQL statements for defining a CMK

Function	SQL Statement
Creating a CMK	<a href="#">CREATE CLIENT MASTER KEY</a>
Deleting a CMK	<a href="#">DROP CLIENT MASTER KEY</a>

## Defining a CEK

CEKs are used to encrypt data for the encrypted database feature. You can create a CEK, change the client master key specified by a CEK, and delete a CEK. For details about related SQL statements, see [Table 7-117](#).

**Table 7-118** SQL statements for defining a CEK

Function	SQL Statement
Creating a CEK	<a href="#">CREATE COLUMN ENCRYPTION KEY</a>
Changing the client master key specified by a CEK	<a href="#">8.14.191-ALTER COLUMN ENCRYPTION KEY</a>
Deleting a CEK	<a href="#">DROP COLUMN ENCRYPTION KEY</a>

## Defining a Database

A database is the warehouse for organizing, storing, and managing data. Defining a database includes: creating a database, altering the database attributes, and dropping the database. For details about related SQL statements, see [Table 7-119](#).

**Table 7-119** SQL statements for defining a database

Function	SQL Statement
Creating a database	<a href="#">CREATE DATABASE</a>
Altering database attributes	<a href="#">ALTER DATABASE</a>
Dropping a Database	<a href="#">DROP DATABASE</a>

## Defining a Schema

A schema is the set of a group of database objects and is used to control the access to the database objects. For details about related SQL statements, see [Table 7-120](#).

**Table 7-120** SQL statements for defining a schema

Function	SQL Statement
Creating a schema	<a href="#">CREATE SCHEMA</a>
Altering schema attributes	<a href="#">ALTER SCHEMA</a>
Dropping a schema	<a href="#">DROP SCHEMA</a>

## Defining a Tablespace

A tablespace is used to manage data objects and corresponds to a catalog on a disk. For details about related SQL statements, see [Table 7-121](#).

**Table 7-121** SQL statements for defining a tablespace

Function	SQL Statement
Creating a tablespace	<a href="#">CREATE TABLESPACE</a>
Altering tablespace attributes	<a href="#">ALTER TABLESPACE</a>
Dropping a tablespace	<a href="#">DROP TABLESPACE</a>

## Defining a Table

A table is a special data structure in a database and is used to store data objects and relationship between data objects. For details about related SQL statements, see [Table 7-122](#).

**Table 7-122** SQL statements for defining a table

Function	SQL Statement
Creating a table	<a href="#">CREATE TABLE</a>
Altering table attributes	<a href="#">ALTER TABLE</a>
Dropping a table	<a href="#">DROP TABLE</a>

## Defining a Partitioned Table

A partitioned table is a logical table used to improve query performance and does not store data (data is stored in ordinary tables). For details about related SQL statements, see [Table 7-123](#).

**Table 7-123** SQL statements for defining a partitioned table

Function	SQL Statement
Creating a partitioned table	<a href="#">CREATE TABLE PARTITION</a>
Create a partition	<a href="#">ALTER TABLE PARTITION</a>
Altering partitioned table attributes	<a href="#">ALTER TABLE PARTITION</a>
Deleting a partition	<a href="#">ALTER TABLE PARTITION</a>
Dropping a partitioned table	<a href="#">DROP TABLE</a>

## Defining an Index

An index indicates the sequence of values in one or more columns in a database table. It is a data structure that improves the speed of data access to specific information in a database table. For details about related SQL statements, see [Table 7-124](#).

**Table 7-124** SQL statements for defining an index

Function	SQL Statement
Creating an index	<a href="#">CREATE INDEX</a>
Altering index attributes	<a href="#">ALTER INDEX</a>
Dropping an index	<a href="#">DROP INDEX</a>
Rebuilding an index	<a href="#">REINDEX</a>

## Defining a Stored Procedure

A stored procedure is a set of SQL statements for achieving specific functions and is stored in the database after compiling. Users can specify a name and provide parameters (if necessary) to execute the stored procedure. For details about related SQL statements, see [Table 7-125](#).

**Table 7-125** SQL statements for defining a stored procedure

Function	SQL Statement
Creating a stored procedure	<a href="#">CREATE PROCEDURE</a>
Dropping a stored procedure	<a href="#">DROP PROCEDURE</a>
Recompiling a stored procedure	<a href="#">ALTER PROCEDURE</a>

## Defining a Function

In GaussDB, a function is similar to a stored procedure, which is a set of SQL statements. The function and stored procedure are used the same. For details about related SQL statements, see [Table 7-126](#).

**Table 7-126** SQL statements for defining a function

Function	SQL Statement
Creating a function	<a href="#">CREATE FUNCTION</a>
Altering a function attribute	<a href="#">ALTER FUNCTION</a>
Dropping a function	<a href="#">DROP FUNCTION</a>

## Defining a Package

A package consists of the package specification and package body. It is used to manage stored procedures and functions by class, which is similar to classes in languages such as Java and C++.

**Table 7-127** SQL statements for defining a package

Function	SQL Statement
Creating a package	<a href="#">CREATE PACKAGE</a>
Deleting a package	<a href="#">DROP PACKAGE</a>
Altering a package attribute	<a href="#">ALTER PACKAGE</a>

## Defining a View

A view is a virtual table exported from one or more basic tables. It is used to control data accesses of users. [Table 7-128](#) lists the related SQL statements.

**Table 7-128** SQL statements for defining a view

Function	SQL Statement
Creating a view	<a href="#">CREATE VIEW</a>
Dropping a view	<a href="#">DROP VIEW</a>

## Defining a Cursor

To process SQL statements, the stored procedure process assigns a memory segment to store context association. Cursors are handles or pointers to context

regions. With a cursor, the stored procedure can control alterations in context areas. For details, see [Table 7-129](#).

**Table 7-129** SQL statements for defining a cursor

Function	SQL Statement
Creating a cursor	<b>CURSOR</b>
Moving a cursor	<b>MOVE</b>
Fetching data from a cursor	<b>FETCH</b>
Closing a cursor	<b>CLOSE</b>

## Defining an Aggregate Function

**Table 7-130** SQL statements for defining an aggregate function

Function	SQL Statement
Creating an aggregate function	<b>CREATE AGGREGATE</b>
Modifying an aggregate function	<b>ALTER AGGREGATE</b>
Deleting an aggregate function	<b>DROP AGGREGATE</b>

## Defining Data Type Conversion

**Table 7-131** SQL statements for defining a data type

Function	SQL Statement
Creating user-defined data type conversion	<b>CREATE CAST</b>
Deleting user-defined data type conversion	<b>DROP CAST</b>

## Defining a Plug-in Extension

---

### NOTICE

The extended function is for internal use only. You are advised not to use it.

---

**Table 7-132** SQL statements for defining a plug-in extension

Function	SQL Statement
Creating a plug-in extension	<b>CREATE EXTENSION</b>
Modifying a plug-in extension	<b>ALTER EXTENSION</b>
Deleting a plug-in extension	<b>DROP EXTENSION</b>

## Defining an Operator

**Table 7-133** SQL statements for defining an operator

Function	SQL Statement
Creating an operator	<b>CREATE OPERATOR</b>
Modifying an operator	<b>ALTER OPERATOR</b>
Deleting an operator	<b>DROP OPERATOR</b>

## Defining a Data Type

**Table 7-134** SQL statements for defining a data type

Function	SQL Statement
Creating a data type	<b>CREATE TYPE</b>
Modifying a data type	<b>ALTER TYPE</b>
Deleting a data type	<b>DROP TYPE</b>

## Defining a Scheduled Task

**Table 7-135** SQL statements for defining a scheduled task

Function	SQL Statement
Creating a scheduled task	<b>CREATE EVENT</b>
Modifying a scheduled task	<b>ALTER EVENT</b>
Deleting a scheduled task	<b>DROP EVENT</b>

## Defining a Database Link

A database link can be used to remotely operate a database object. For details about corresponding SQL statements, see [Table 7-136](#).

**Table 7-136** Database link-related SQL statements

Function	SQL Statement
Creating a database link	<a href="#">CREATE DATABASE LINK</a>
Modifying a database link	<a href="#">ALTER DATABASE LINK</a>
Deleting a database link	<a href="#">DROP DATABASE LINK</a>

## Defining a Foreign Data Wrapper

**Table 7-137** SQL statements related to the foreign data wrapper

Function	SQL Statement
Creating a foreign data wrapper	<a href="#">CREATE FOREIGN DATA WRAPPER</a>
Modifying a foreign data wrapper	<a href="#">ALTER FOREIGN DATA WRAPPER</a>
Deleting a foreign data wrapper	<a href="#">DROP FOREIGN DATA WRAPPER</a>

## 7.12 DML Syntax Overview

Data manipulation language (DML) is used to perform operations on data in database tables, such as inserting, updating, querying, or deleting data.

### Inserting Data

Inserting data refers to adding one or multiple records to a database table. For details, see [INSERT](#).

### Updating Data

Updating data refers to modifying one or multiple records in a database table. For details, see [UPDATE](#).

### Querying Data

The database query statement **SELECT** is used to search required information in a database. For details, see [SELECT](#).

## Deleting Data

GaussDB provides two statements for deleting data from database tables. To delete data meeting specified conditions from a database table, see [DELETE](#). To delete all data from a database table, see [TRUNCATE](#).

**TRUNCATE** can quickly delete all data from a database table, which achieves the effect same as that running **DELETE** to delete data without specifying conditions from each table. Deletion efficiency using **TRUNCATE** is faster because **TRUNCATE** does not scan tables. Therefore, **TRUNCATE** is useful in large tables.

## Copying Data

GaussDB provides a statement for copying data between tables and files. For details, see [COPY](#).

## Locking a Table

GaussDB provides multiple lock modes to control concurrent accesses to table data. For details, see [LOCK](#).

## Calling a Function

GaussDB provides three statements for calling functions. These statements are the same in the syntax structure. For details, see [CALL](#).

## Session Management

A session is a connection established between the user and the database. [Table 7-138](#) lists the related SQL statements.

**Table 7-138** SQL statements related to sessions

Function	SQL Statement
Altering a session	<a href="#">ALTER SESSION</a>
Killing a session	<a href="#">ALTER SYSTEM KILL SESSION</a>

## 7.13 DCL Syntax Overview

Data control language (DCL) is used to create users and roles and set or modify database users or role rights.

### Defining a Role

A role is used to manage permissions. For database security, management and operation permissions can be granted to different roles. For details about related SQL statements, see [Table 7-139](#).

**Table 7-139** SQL statements for defining a role

Description	SQL Statement
Creating a role	<a href="#">CREATE ROLE</a>
Altering role attributes	<a href="#">ALTER ROLE</a>
Dropping a role	<a href="#">DROP ROLE</a>

## Defining a User

A user is used to log in to a database. Different permissions can be granted to users for managing data accesses and operations of the users. For details about related SQL statements, see [Table 7-140](#).

**Table 7-140** SQL statements for defining a user

Description	SQL Statement
Creating a User	<a href="#">CREATE USER</a>
Altering user attributes	<a href="#">ALTER USER</a>
Dropping a user	<a href="#">DROP USER</a>

## Granting Rights

GaussDB provides a statement for granting rights to data objects and roles. For details, see [GRANT](#).

## Revoking Rights

GaussDB provides a statement for revoking rights. For details, see [REVOKE](#).

## Setting Default Rights

GaussDB allows users to set rights for objects that will be created. For details, see [ALTER DEFAULT PRIVILEGES](#)

## Shutting Down The Current Node

GaussDB allows users to run the **shutdown** command to shut down the current database node. For details, see [SHUTDOWN](#).

# 7.14 SQL Syntax

## 7.14.1 SQL Syntax

**Table 7-141** SQL syntax

Format	Description
[ ]	The part enclosed in brackets ([]) is optional.
...	Preceding elements can appear repeatedly.
[ x   y   ... ]	One item is selected from two or more options or no item is selected.
{ x   y   ... }	One item is selected from two or more options.
[ x   y   ... ] [ ... ]	Multiple parameters or no parameter can be selected. If multiple parameters are selected, separate them with spaces.
[ x   y   ... ] [ ,... ]	Multiple parameters or no parameter can be selected. If multiple parameters are selected, separate them with commas (,).
{ x   y   ... } [ ... ]	At least one parameter can be selected. If multiple parameters are selected, separate them with spaces.
{ x   y   ... } [ ,... ]	At least one parameter can be selected. If multiple parameters are selected, separate them with commas (,).

## 7.14.2 ABORT

### Description

Rolls back the current transaction and cancels the changes in the transaction.

It is equivalent to **ROLLBACK**, and is present only for historical reasons. Now ROLLBACK is recommended.

### Precautions

ABORT has no impact outside a transaction, but will throw a NOTICE message.

### Syntax

```
ABORT [ WORK | TRANSACTION ] ;
```

### Parameters

**WORK | TRANSACTION**

Optional keyword has no effect except increasing readability.

### Examples

```
-- Create the customer_demographics_t1 table.  
gaussdb=# CREATE TABLE customer_demographics_t1
```

```
(
  CD_DEMO_SK          INTEGER          NOT NULL,
  CD_GENDER           CHAR(1)          ,
  CD_MARITAL_STATUS   CHAR(1)          ,
  CD_EDUCATION_STATUS CHAR(20)         ,
  CD_PURCHASE_ESTIMATE INTEGER          ,
  CD_CREDIT_RATING    CHAR(10)         ,
  CD_DEP_COUNT        INTEGER          ,
  CD_DEP_EMPLOYED_COUNT INTEGER        ,
  CD_DEP_COLLEGE_COUNT INTEGER
)
;

-- Insert data.
gaussdb=# INSERT INTO customer_demographics_t1 VALUES(1920801,'M', 'U', 'DOCTOR DEGREE', 200,
'GOOD', 1, 0,0);

-- Start a transaction.
gaussdb=# START TRANSACTION;

-- Update the column.
gaussdb=# UPDATE customer_demographics_t1 SET cd_education_status= 'Unknow';

-- Abort the transaction. All updates are rolled back.
gaussdb=# ABORT;

-- Query data.
gaussdb=# SELECT * FROM customer_demographics_t1 WHERE cd_demo_sk = 1920801;
cd_demo_sk | cd_gender | cd_marital_status | cd_education_status | cd_purchase_estimate | cd_credit_rating
| cd_dep_count | cd_dep_employed_count | cd_dep_college_count
-----+-----+-----+-----+-----+-----+-----+-----+-----
| 1920801 | M | U | DOCTOR DEGREE | 200 | GOOD | 1
| 0 | 0
(1 row)

-- Delete the table.
gaussdb=# DROP TABLE customer_demographics_t1;
```

## Helpful Links

[SET TRANSACTION](#), [COMMIT | END](#), and [ROLLBACK](#)

## 7.14.3 ALTER AGGREGATE

### Function

**ALTER AGGREGATE** modifies the definition of an aggregate function.

### Precautions

To use **ALTER AGGREGATE**, you must be the owner of the aggregate function. To change the schema of an aggregate function, you must have the **CREATE** permission on the new schema. To change the owner, you must be a direct or indirect member of the new role, and the role must have the **CREATE** permission on the aggregate function's schema. (This restricts the owner from doing anything except for deleting and recreating aggregate functions. However, a user with the **SYSADMIN** permission can change the ownership of an aggregate function in any way.)

## Syntax

```
ALTER AGGREGATE name ( argtype [ , ... ] ) RENAME TO new_name  
ALTER AGGREGATE name ( argtype [ , ... ] ) OWNER TO new_owner  
ALTER AGGREGATE name ( argtype [ , ... ] ) SET SCHEMA new_schema
```

## Parameter Description

- **name**  
Name (optionally schema-qualified) of an existing aggregate function.
- **argtype**  
Input data type of the aggregate function. To reference a zero-parameter aggregate function, you can write an asterisk (\*) instead of a list of input data types.
- **new\_name**  
New name of the aggregate function.
- **new\_owner**  
New owner of the aggregate function.
- **new\_schema**  
New schema of the aggregate function.

## Examples

Rename the aggregate function **myavg** that accepts integer-type parameters to **my\_average**.

```
ALTER AGGREGATE myavg(integer) RENAME TO my_average;
```

Change the owner of the aggregate function **myavg** that accepts integer-type parameters to **joe**.

```
ALTER AGGREGATE myavg(integer) OWNER TO joe;
```

Move the aggregate function **myavg** that accepts integer-type parameters to **myschema**.

```
ALTER AGGREGATE myavg(integer) SET SCHEMA myschema;
```

## Compatibility

The SQL standard does not contain the **ALTER AGGREGATE** statement.

## 7.14.4 ALTER AUDIT POLICY

### Description

Modifies the unified audit policy.

### Precautions

- Only the poladmin, sysadmin, or initial user can perform this operation.
- The unified audit policy takes effect only after **enable\_security\_policy** is set to **on**.

## Syntax

Add or delete an operation type in the audit policy.

```
ALTER AUDIT POLICY [ IF EXISTS ] policy_name { ADD | REMOVE } { privilege_audit_clause | access_audit_clause };
```

Modify the filter criteria in the audit policy.

```
ALTER AUDIT POLICY [ IF EXISTS ] policy_name MODIFY ( filter_group_clause );
```

Delete the filter criteria from the audit policy.

```
ALTER AUDIT POLICY [ IF EXISTS ] policy_name DROP FILTER;
```

Modify the description of the audit policy.

```
ALTER AUDIT POLICY [ IF EXISTS ] policy_name COMMENTS policy_comments;
```

Enable or disable the audit policy.

```
ALTER AUDIT POLICY [ IF EXISTS ] policy_name { ENABLE | DISABLE };
```

- **privilege\_audit\_clause**

DDL operation type and target resource label in the audit policy.

```
PRIVILEGES ( { DDL | ALL } [ ON LABEL ( resource_label_name [, ... ] ) ] )
```

- **access\_audit\_clause**

DML operation type and target resource label in the audit policy.

```
ACCESS ( { DML | ALL } [ ON LABEL ( resource_label_name [, ... ] ) ] )
```

- **filter\_group\_clause**

Filter criteria in the audit policy.

```
FILTER ON { filter_type ( filter_value [, ... ] ) } [, ... ]
```

## Parameters

- **policy\_name**

Specifies the audit policy name, which must be unique.

Value range: a string. It must comply with the [naming convention](#).

- **DDL**

Specifies the operations that are audited in the database: CREATE, ALTER, DROP, ANALYZE, COMMENT, GRANT, REVOKE, SET, and SHOW.

- **ALL**

Specifies all operations supported by the specified DDL statements in the database.

- **DML**

Specifies the operations that are audited in the database: SELECT, COPY, DEALLOCATE, DELETE, EXECUTE, INSERT, PREPARE, REINDEX, TRUNCATE, and UPDATE.

- **FILTER\_TYPE**

Specifies a type of information to be filtered by the audit policy. The value can be **IP**, **ROLES**, or **APP**.

- **filter\_value**

Specifies the detailed information to be filtered.

- **policy\_comments**

- Records description information of the audit policy.
- **ENABLE|DISABLE**  
Enables or disables the unified audit policy.

## Examples

See [Examples](#) in section "CREATE AUDIT POLICY."

## Helpful Links

[CREATE AUDIT POLICY](#) and [DROP AUDIT POLICY](#)

## 7.14.5 ALTER COLUMN ENCRYPTION KEY

### Function

**ALTER COLUMN ENCRYPTION KEY** encrypts the CMKs of CEKs in round robin (RR) mode and encrypts the plaintext of CEKs.

### Precautions

- This syntax is specific to the fully-encrypted database. When connecting to the database server, enable the fully-encrypted database before using this syntax.
- This syntax takes effect on CMKs only. Encrypting the plaintext of CEKs does not change the ciphertext of the encrypted columns.

### Syntax

```
ALTER COLUMN ENCRYPTION KEY column_encryption_key_name WITH VALUES ( CLIENT_MASTER_KEY = client_master_key_name );
```

### Parameter Description

- **column\_encryption\_key\_name**  
Specifies the key name. In the same namespace, the value of this parameter must be unique.  
Value range: a string. It must comply with the [naming convention](#).
- **client\_master\_key\_name**  
Specifies the CMK used to encrypt the CEK. The value is the CMK name, which is created using the CREATE CLIENT MASTER KEY syntax. The encrypted CMKs are different from those specified before RR encryption.

---

#### NOTICE

The constraints of using Chinese cryptographic algorithms are as follows:  
SM2, SM3, and SM4 are Chinese cryptographic algorithms. To avoid legal risks, these algorithms must be used together. The Chinese cryptographic algorithms used for the RR encryption must be the same as those used before RR encryption.

---

## Example

For details, see [8.15.63-Examples](#) in section "CREATE COLUMN ENCRYPTION KEY."

## 7.14.6 ALTER EVENT

### Description

Modifies the parameters in the created scheduled event.

### Precautions

- Operations related to scheduled events are supported only when **sql\_compatibility** is set to 'B'.
- Only the owner has the permission to modify the scheduled event to be modified. By default, the system administrator has the permission to modify all scheduled events.
- You can execute **SHOW EVENTS** or view the **log\_user** column in PG\_JOB to obtain the event owner information.
- Each time a scheduled event is modified, the owner of the modified event is changed to the current user. If a definer is specified during modification, the owner is changed to the specified definer.
- The restrictions for the definer are the same as those described in [CREATE EVENT](#).

---

#### NOTICE

If a system administrator modifies a scheduled event created by another user, the owner of the modified event is changed to the system administrator. The statements to be executed are executed by the system administrator.

---

### Syntax

```
ALTER
  [DEFINER = user]
EVENT event_name
  [ON SCHEDULE schedule]
  [ON COMPLETION [NOT] PRESERVE]
  [RENAME TO new_event_name]
  [ENABLE | DISABLE | DISABLE ON SLAVE]
  [COMMENT 'string']
  [DO event_body]
```

### Parameters

- **DEFINER**  
Specifies the permission for the scheduled event statement to be executed during execution. By default, the permission of the user who creates the scheduled event is used. When definer is specified, the permission of the specified user is used.  
Only users with the sysadmin permission can specify the definer.

- **ON SCHEDULE**  
Specifies the time when a scheduled event is executed. The **SCHEDULE** clause is the same as that in **CREATE EVENT**.
- **RENAME TO**  
Specifies the updated scheduled event name.
- **ON COMPLETION [NOT] PRESERVE**  
Once a transaction is complete, the scheduled event is deleted from the system catalog immediately by default. You can overwrite the default behavior by setting **ON COMPLETION PRESERVE**.
- **ENABLE | DISABLE | DISABLE ON SLAVE**  
The scheduled event is in the **ENABLE** state by default after it is created. That is, the statement to be executed is executed immediately at the specified time. You can use the keyword **DISABLE** to change the **ENABLE** state. The performance of **DISABLE ON SLAVE** is the same as that of **DISABLE**.
- **COMMENT**  
You can add comments to a scheduled event. The comments can be viewed in the **GS\_JOB\_ATTRIBUTE** table.
- **DO**  
Specifies the statement to be executed for a scheduled event.

## Example

```
-- Create a scheduled event.
gaussdb=# CREATE TABLE t_ev(num int);

gaussdb=# CREATE EVENT IF NOT EXISTS event_e1 ON SCHEDULE AT sysdate + interval 5 second +
interval 33 minute DISABLE DO insert into t_ev values(0);

-- Modify the scheduled event status and statements to be executed.
gaussdb=# ALTER EVENT event_e1 ENABLE DO select 1;

-- Change the name of a scheduled event.
gaussdb=# ALTER EVENT event_e1 RENAME TO event_ee;
```

## 7.14.7 ALTER DATABASE

### Description

Modifies a database, including its name, owner, connection limitation, and object isolation.

### Precautions

- Only the database owner or a user granted with the **ALTER DATABASE** permission can run the **ALTER DATABASE** command. The system administrator has this permission by default. The following are permission constraints depending on attributes to be modified:
  - To modify the database name, you must have the **CREATEDB** permission.
  - To modify a database owner, you must be a database owner or system administrator and a member of the new owner role, with the **CREATEDB** permission.

- To modify the default tablespace of a database, a user must have the permission to create a tablespace. This statement physically migrates tables and indexes in a default tablespace to a new tablespace. Note that tables and indexes outside the default tablespace are not affected.
- You are not allowed to rename a database in use. To rename it, connect to another database.

## Syntax

- Modify the maximum number of connections to the database.

```
ALTER DATABASE database_name  
[ [ WITH ] CONNECTION LIMIT connlimit ];
```

- Rename the database.

```
ALTER DATABASE database_name  
RENAME TO new_name;
```

- Change the database owner.

```
ALTER DATABASE database_name  
OWNER TO new_owner;
```

- Change the default tablespace of the database.

```
ALTER DATABASE database_name  
SET TABLESPACE new_tablespace;
```

### NOTE

If some tables or objects in the database have been created in `new_tablespace`, the default tablespace of the database cannot be changed to **new\_tablespace**. An error will be reported during the execution.

- Modify the session parameter value of the database.

```
ALTER DATABASE database_name  
SET configuration_parameter { { TO | = } { value | DEFAULT } | FROM CURRENT };
```

- Reset the database configuration parameter.

```
ALTER DATABASE database_name RESET  
{ configuration_parameter | ALL };
```

- Modify the object isolation attribute of the database.

```
ALTER DATABASE database_name [ WITH ] { ENABLE | DISABLE } PRIVATE OBJECT;
```

### NOTE

- To modify the object isolation attribute of a database, the database must be connected. Otherwise, the modification will fail.
- For a new database, the object isolation attribute is disabled by default. After this attribute is enabled, common users can view only the objects (such as tables, functions, views, and columns) that they have the permission to access. This attribute does not take effect for administrators. After this attribute is enabled, administrators can still view all database objects.
- Change the database time zone.  
ALTER DATABASE database\_name SET DBTIMEZONE = time\_zone;

## Parameters

- **database\_name**

Specifies the name of the database whose attributes are to be modified.

Value range: a string. It must comply with the [naming convention](#).

- **connlimit**

Specifies the maximum number of concurrent connections that can be made to this database (excluding administrators' connections).

Value range: an integer ranging from  $-1$  to  $2^{31} - 1$ . You are advised to set this parameter to an integer ranging from 1 to 50. The default value **-1** indicates that there is no restriction on the number of concurrent connections.

- **new\_name**  
Specifies the new name of a database.  
Value range: a string. It must comply with the [naming convention](#).
- **new\_owner**  
Specifies the new owner of a database.  
Value range: a string. It must be a valid username.
- **new\_tablespace**  
Specifies the new default tablespace of a database. The tablespace exists in the database. The default tablespace is **pg\_default**.  
Value range: a string. It must be a valid tablespace name.
- **configuration\_parameter value**  
Sets a specified database session parameter to a specified value. If the value is **DEFAULT** or **RESET**, the default setting is used in the new session. **OFF** closes the setting.  
Value range: a string
  - **DEFAULT**
  - **OFF**
  - **RESET**
- **time\_zone**  
Sets the time zone of the database specified by **database\_name**. You must have the permission on the corresponding database.  
Value range: a string
  - Time zones supported by the system and their abbreviations
  - From - 15:59 to + 15:00
- **FROM CURRENT**  
Sets the value of the database based on the current connected session.
- **RESET configuration\_parameter**  
Resets the specified database session parameter.
- **RESET ALL**  
Resets all database session parameters.

 **NOTE**

- Modify the default tablespace of a database by moving the table or index in the old tablespace into the new tablespace. This operation does not affect the tables or indexes in other non-default tablespaces.
- The modified database session parameter values will take effect in the next session.

## Examples

See [Examples](#) in section " CREATE DATABASE."

## Helpful Links

[CREATE DATABASE](#) and [DROP DATABASE](#)

## 7.14.8 ALTER DATABASE LINK

### Description

Modifies database link objects. For details about database links, see [DATABASE LINK](#).

### Precautions

Currently, only the username and password can be modified for database links.

### Syntax

```
ALTER [ PUBLIC ] DATABASE LINK dblink  
{ CONNECT TO user IDENTIFIED BY password };
```

### Parameters

- **dblink**  
Name of a connection.
- **user**  
Username for connecting to a remote database.
- **password**  
Password for connecting to a remote database.
- **PUBLIC**  
Connection type. If **PUBLIC** is not specified, the database link is private by default.

## 7.14.9 ALTER DEFAULT PRIVILEGES

### Function

Allows you to set the permissions that will be applied to objects created in the future. (It does not affect permissions granted to existing objects.)

### Precautions

Currently, you can change only the permissions for tables (including views), sequences, functions, client master keys of encrypted databases, column encryption keys, and types.

### Syntax

```
ALTER DEFAULT PRIVILEGES  
[ FOR { ROLE | USER } target_role [, ...] ]  
[ IN SCHEMA schema_name [, ...] ]  
abbreviated_grant_or_revoke;
```

- **abbreviated\_grant\_or\_revoke** grants or revokes permissions on some objects.

```
grant_on_tables_clause
| grant_on_sequences_clause
| grant_on_functions_clause
| grant_on_types_clause
| grant_on_client_master_keys_clause
| grant_on_column_encryption_keys_clause
| revoke_on_tables_clause
| revoke_on_sequences_clause
| revoke_on_functions_clause
| revoke_on_types_clause
| revoke_on_client_master_keys_clause
| revoke_on_column_encryption_keys_clause
```

- grant\_on\_tables\_clause** grants permissions on tables.

```
GRANT { { SELECT | INSERT | UPDATE | DELETE | TRUNCATE | REFERENCES | ALTER | DROP |
COMMENT | INDEX | VACUUM }
[, ...] | ALL [ PRIVILEGES ] }
ON TABLES
TO { [ GROUP ] role_name | PUBLIC } [, ...]
[ WITH GRANT OPTION ]
```
- grant\_on\_sequences\_clause** grants permissions on sequences.

```
GRANT { { SELECT | UPDATE | USAGE | ALTER | DROP | COMMENT }
[, ...] | ALL [ PRIVILEGES ] }
ON SEQUENCES
TO { [ GROUP ] role_name | PUBLIC } [, ...]
[ WITH GRANT OPTION ]
```
- grant\_on\_functions\_clause** grants permissions on functions.

```
GRANT { { EXECUTE | ALTER | DROP | COMMENT } [, ...] | ALL [ PRIVILEGES ] }
ON FUNCTIONS
TO { [ GROUP ] role_name | PUBLIC } [, ...]
[ WITH GRANT OPTION ]
```
- grant\_on\_types\_clause** grants permissions on types.

```
GRANT { { USAGE | ALTER | DROP | COMMENT } [, ...] | ALL [ PRIVILEGES ] }
ON TYPES
TO { [ GROUP ] role_name | PUBLIC } [, ...]
[ WITH GRANT OPTION ]
```
- grant\_on\_client\_master\_keys\_clause** grants permissions on CMKs.

```
GRANT { { USAGE | DROP } [, ...] | ALL [ PRIVILEGES ] }
ON CLIENT_MASTER_KEYS
TO { [ GROUP ] role_name | PUBLIC } [, ...]
[ WITH GRANT OPTION ]
```
- grant\_on\_column\_encryption\_keys\_clause** grants permissions on column encryption keys.

```
GRANT { { USAGE | DROP } [, ...] | ALL [ PRIVILEGES ] }
ON COLUMN_ENCRYPTION_KEYS
TO { [ GROUP ] role_name | PUBLIC } [, ...]
[ WITH GRANT OPTION ]
```
- revoke\_on\_tables\_clause** revokes permissions on tables.

```
REVOKE [ GRANT OPTION FOR ]
{ { SELECT | INSERT | UPDATE | DELETE | TRUNCATE | REFERENCES | ALTER | DROP | COMMENT |
INDEX | VACUUM }
[, ...] | ALL [ PRIVILEGES ] }
ON TABLES
FROM { [ GROUP ] role_name | PUBLIC } [, ...]
[ CASCADE | RESTRICT | CASCADE CONSTRAINTS ]
```
- revoke\_on\_sequences\_clause** revokes permissions on sequences.

```
REVOKE [ GRANT OPTION FOR ]
{ { SELECT | UPDATE | USAGE | ALTER | DROP | COMMENT }
[, ...] | ALL [ PRIVILEGES ] }
ON SEQUENCES
FROM { [ GROUP ] role_name | PUBLIC } [, ...]
[ CASCADE | RESTRICT | CASCADE CONSTRAINTS ]
```
- revoke\_on\_functions\_clause** revokes permissions on functions.

```
REVOKE [ GRANT OPTION FOR ]
{ { EXECUTE | ALTER | DROP | COMMENT } [, ...] | ALL [ PRIVILEGES ] }
```

```
ON FUNCTIONS
FROM { [ GROUP ] role_name | PUBLIC } [, ...]
[ CASCADE | RESTRICT | CASCADE CONSTRAINTS ]
```

- **revoke\_on\_types\_clause** revokes permissions on types.

```
REVOKE [ GRANT OPTION FOR ]
{ { USAGE | ALTER | DROP | COMMENT } [, ...] | ALL [ PRIVILEGES ] }
ON TYPES
FROM { [ GROUP ] role_name | PUBLIC } [, ...]
[ CASCADE | RESTRICT | CASCADE CONSTRAINTS ]
```

- **revoke\_on\_client\_master\_keys\_clause** revokes permissions on CMKs.

```
REVOKE [ GRANT OPTION FOR ]
{ { USAGE | DROP } [, ...] | ALL [ PRIVILEGES ] }
ON CLIENT_MASTER_KEYS
FROM { [ GROUP ] role_name | PUBLIC } [, ...]
[ CASCADE | RESTRICT | CASCADE CONSTRAINTS ]
```

- **revoke\_on\_column\_encryption\_keys\_clause** revokes permissions on CEKs.

```
REVOKE [ GRANT OPTION FOR ]
{ { USAGE | DROP } [, ...] | ALL [ PRIVILEGES ] }
ON COLUMN_ENCRYPTION_KEYS
FROM { [ GROUP ] role_name | PUBLIC } [, ...]
[ CASCADE | RESTRICT | CASCADE CONSTRAINTS ]
```

## Parameter Description

- **target\_role**  
Specifies the name of an existing role. If **FOR ROLE/USER** is omitted, the current role is assumed.  
Value range: an existing role name
- **schema\_name**  
Specifies the name of an existing schema.  
**target\_role** must have the **CREATE** permission for **schema\_name**.  
Value range: an existing schema name
- **role\_name**  
Specifies the name of an existing role to grant or revoke permissions for.  
Value range: an existing role name

### NOTICE

To drop a role for which the default permissions have been granted, reverse the changes in its default permissions or use **DROP OWNED BY** to get rid of the default permission entry for the role.

## Examples

```
-- Grant the SELECT permission on all the tables (and views) in tpcds to every user.
gaussdb=# ALTER DEFAULT PRIVILEGES IN SCHEMA tpcds GRANT SELECT ON TABLES TO PUBLIC;

-- Create a common user jack.
gaussdb=# CREATE USER jack PASSWORD '*****';

-- Grant the INSERT permission on all the tables in tpcds to the user jack.
gaussdb=# ALTER DEFAULT PRIVILEGES IN SCHEMA tpcds GRANT INSERT ON TABLES TO jack;

-- Revoke the preceding permissions.
gaussdb=# ALTER DEFAULT PRIVILEGES IN SCHEMA tpcds REVOKE SELECT ON TABLES FROM PUBLIC;
```

```
gaussdb=# ALTER DEFAULT PRIVILEGES IN SCHEMA tpcds REVOKE INSERT ON TABLES FROM jack;  
-- Delete user jack.  
gaussdb=# DROP USER jack;
```

## Helpful Links

[GRANT](#) and [REVOKE](#)

## 7.14.10 ALTER DIRECTORY

### Function

**ALTER DIRECTORY** modifies a directory.

### Precautions

- Currently, only the directory owner can be changed.
- When **enable\_access\_server\_directory** is set to **off**, only the initial user is allowed to change the directory owner. When **enable\_access\_server\_directory** is set to **on**, users with the **SYSADMIN** permission and the directory object owner can change the directory object owner, and the user who changes the owner is required to be a member of the new owner.

### Syntax

```
ALTER DIRECTORY directory_name  
OWNER TO new_owner;
```

### Parameter Description

#### **directory\_name**

Specifies the name of a directory to be modified. The value must be an existing directory name.

### Examples

```
-- Create a directory.  
gaussdb=# CREATE OR REPLACE DIRECTORY dir as '/tmp/';  
  
-- Change the owner of the directory.  
gaussdb=# ALTER DIRECTORY dir OWNER TO system;  
  
-- Delete a directory.  
gaussdb=# DROP DIRECTORY dir;
```

## Helpful Links

[CREATE DIRECTORY](#) and [DROP DIRECTORY](#)

## 7.14.11 ALTER FOREIGN DATA WRAPPER

### Description

Modifies the definition of a foreign data wrapper.

## Precautions

- Only initial users and system administrators can modify the foreign data wrapper.
- The alter statement can be successfully executed only when **support\_extended\_features** is set to **on**.

## Syntax

- Set the attributes of the foreign data wrapper.

```
ALTER FOREIGN DATA WRAPPER name  
[ HANDLER handler_function | NO HANDLER ]  
[ VALIDATOR validator_function | NO VALIDATOR ]  
[ OPTIONS ( [ ADD | SET | DROP ] option ['value'] [, ... ] ) ];
```

- Set a new owner.

```
ALTER FOREIGN DATA WRAPPER name OWNER TO new_owner;
```

- Set a new name.

```
ALTER FOREIGN DATA WRAPPER name RENAME TO new_name;
```

## Parameters

- **name**  
Specifies a name of an existing foreign data wrapper.
- **HANDLER handler\_function**  
Specifies a new handler function for a foreign data wrapper.
- **NO HANDLER**  
Specifies that the foreign data wrapper no longer has the handler function.

---

### CAUTION

Foreign tables that use foreign data wrapper but do not have handlers cannot be accessed.

- **VALIDATOR validator\_function**  
Specifies a new validator function for a foreign data wrapper.

---

### CAUTION

Depending on the new validator, an existing option for the foreign data wrapper or dependent server, user mapping, or foreign table may be invalid. Before using foreign data wrapper, ensure that these options are correct. However, any options specified in the **ALTER FOREIGN DATA WRAPPER** command will be checked using the new validator function.

- **NO VALIDATOR**  
Specifies that the foreign data wrapper no longer has the validator function.
- **OPTIONS ( [ ADD | SET | DROP ] option ['value'] [, ... ] )**  
Modifies the options of a foreign data wrapper. ADD, SET, and DROP specify the actions to be performed. If no operation is specified, the default operation

is ADD. The option name must be unique. When foreign data is used to wrap validator functions, names and values are also validated.

- **new\_owner**  
Specifies the username of the new owner for a foreign data wrapper.
- **new\_name**  
Specifies the new name of a foreign data wrapper.

## Example

```
-- Modify a foreign data wrapper dbi, add the foo option, and delete bar.
gaussdb=# ALTER FOREIGN DATA WRAPPER dbi OPTIONS (ADD foo '1', DROP 'bar');

-- Change the validator of the foreign data wrapper dbi to bob.myvalidator.
gaussdb=# ALTER FOREIGN DATA WRAPPER dbi VALIDATOR bob.myvalidator;
```

## Helpful Links

[CREATE FOREIGN DATA WRAPPER](#) and [DROP FOREIGN DATA WRAPPER](#)

## 7.14.12 ALTER FUNCTION

### Function

**ALTER FUNCTION** modifies the attributes of a user-defined function or recompiles a function.

### Precautions

- Only the function owner or a user granted with the **ALTER** permission can run the **ALTER FUNCTION** command. The system administrator has this permission by default. The following are permission constraints depending on the attributes to be modified:
  - If a function involves operations on temporary tables, **ALTER FUNCTION** cannot be used.
  - To modify the owner or schema of a function, you must be a function owner or system administrator and a member of the new owner role.
  - Only the system administrator and initial user can change the schema of a function to public.
- The **plpgsql\_dependency** parameter must be set for function recompilation.
- Only the initial user or the user who creates the stored procedure can modify the stored procedure to a stored procedure that has the definer permission.
- When separation-of-duties is enabled, to modify the owner of a function, users must have the user group permission, even a system administrator.
- Only the initial user can change the owner of a function to the initial user.

### Syntax

- Modify the additional parameters of the customized function.  

```
ALTER FUNCTION function_name ( [ { [ argname ] [ argmode ] argtype} [, ...] ] )  
action [ ... ] [ RESTRICT ];
```

The syntax of the **action** clause is as follows:

```
{CALLED ON NULL INPUT | RETURNS NULL ON NULL INPUT | STRICT}
| {IMMUTABLE | STABLE | VOLATILE}
| {SHIPPABLE | NOT SHIPPABLE}
| {NOT FENCED | FENCED}
| [ NOT ] LEAKPROOF
| { [ EXTERNAL ] SECURITY INVOKER | [ EXTERNAL ] SECURITY DEFINER }
| AUTHID { DEFINER | CURRENT_USER }
| COST execution_cost
| ROWS result_rows
| SET configuration_parameter { { TO | = } { value | DEFAULT } } FROM CURRENT}
| RESET {configuration_parameter | ALL}
```

- Rename the customized function.  
ALTER FUNCTION funname ( [ { [ argname ] [ argmode ] argtype } [, ...] ] )  
RENAME TO new\_name;
- Change the owner of the customized function.  
ALTER FUNCTION funname ( [ { [ argname ] [ argmode ] argtype } [, ...] ] )  
OWNER TO new\_owner;
- Modify the schema of the customized function.  
ALTER FUNCTION funname ( [ { [ argname ] [ argmode ] argtype } [, ...] ] )  
SET SCHEMA new\_schema;
- Recompile the function.  
ALTER FUNCTION **function\_name** COMPILE;

## Parameter Description

- **function\_name**  
Specifies the name of the function to be modified.  
Value range: an existing function name
- **argmode**  
Specifies whether a parameter is an input or output parameter.  
Value range: **IN**, **OUT**, **INOUT**, and **VARIADIC**
- **argname**  
Parameter name.  
Value range: a string. It must comply with the [naming convention](#).
- **argtype**  
Specifies the data type of a function parameter.
- **CALLED ON NULL INPUT**  
Declares that some parameters of the function can be called in normal mode if the parameter values are null. Omitting this parameter is the same as specifying it.
- **RETURNS NULL ON NULL INPUT**  
**STRICT**  
Specifies that the function always returns **NULL** whenever any of its parameters is **NULL**. If **STRICT** is specified, the function will not be executed when there are null parameters; instead a null result is assumed automatically.  
**RETURNS NULL ON NULL INPUT** and **STRICT** have the same functions.
- **IMMUTABLE**  
Specifies that the function always returns the same result if the parameter values are the same.

- **STABLE**  
Specifies that the function cannot modify the database, and that within a single table scan it will consistently return the same result for the same parameter value, but its result varies by SQL statements.
- **VOLATILE**  
Specifies that the function value can change in a single table scan and no optimization is performed.
- **LEAKPROOF**  
Specifies that the function has no side effect and the parameter contains only the return value. **LEAKPROOF** can be set only by the system administrator.
- **EXTERNAL**  
(Optional) The purpose is to be compatible with SQL. This feature applies to all functions, not only external functions.
- **SECURITY INVOKER**  
**AUTHID CURRENT\_USER**  
Specifies that the function will be executed with the permissions of the user who calls it. Omitting this parameter is the same as specifying it.  
**SECURITY INVOKER** and **AUTHID CURRENT\_USER** have the same functions.
- **SECURITY DEFINER**  
**AUTHID DEFINER**  
Specifies that the function will be executed with the permissions of the user who created it.  
**AUTHID DEFINER** and **SECURITY DEFINER** have the same functions.
- **COST execution\_cost**  
Estimates the execution cost of a function.  
The unit of **execution\_cost** is **cpu\_operator\_cost**.  
Value range: a positive integer
- **ROWS result\_rows**  
Estimates the number of rows returned by the function. This is only allowed when the function is declared to return a set.  
Value range: a positive number. The default value is **1000**.
- **configuration\_parameter**
  - **value**  
Sets a specified database session parameter to a specified value. If the value is **DEFAULT** or **RESET**, the default setting is used in the new session. **OFF** closes the setting.  
Value range: a string
    - **DEFAULT**
    - **OFF**
    - **RESET**Specifies the default value.

- **from current**  
Uses the value of **configuration\_parameter** of the current session.
- **new\_name**  
Specifies the new name of a function. To change the schema of a function, you must have the **CREATE** permission on the new schema.  
Value range: a string. It must comply with the **naming convention**.
- **new\_owner**  
Specifies the new owner of a function. To change the owner of a function, the new owner must have the **CREATE** permission on the schema to which the function belongs. Note that only the initial user can set the function owner to another initial user.  
Value range: an existing user role
- **new\_schema**  
Specifies the new schema of a function.  
Value range: an existing schema

## Examples

See [Examples](#) in section "CREATE FUNCTION."

Recompilation examples:

```
-- Enable the dependency function.
gaussdb=# set behavior_compat_options ='plpgsql_dependency';

-- Create a function.
gaussdb=# create or replace function test_func(a int) return int
is
    proc_var int;
gaussdb=# begin
    proc_var := a;
    return 1;
end;
/

-- Recompile the function with a function name.
gaussdb=# alter procedure test_func compile;

-- Recompile the stored procedure with a signed int type function.
gaussdb=# alter procedure test_func(int) compile;
```

## Helpful Links

[CREATE FUNCTION](#) and [DROP FUNCTION](#)

## 7.14.13 ALTER GLOBAL CONFIGURATION

### Function

**ALTER GLOBAL CONFIGURATION** adds and modifies the **gs\_global\_config** system catalog and adds the value of **key-value**.

### Precautions

- Only the initial database user can run this command.

- The keyword cannot be changed to **weak\_password**.

## Syntax

```
ALTER GLOBAL CONFIGURATION with(paraname=value, paraname=value...);
```

## Parameter Description

The parameter name and value are of the text type.

## 7.14.14 ALTER GROUP

### Function

Modifies the attributes of a user group.

### Precautions

**ALTER GROUP** is an alias for **ALTER ROLE**, and it is not a standard SQL syntax and not recommended. Users can use **ALTER ROLE** directly.

### Syntax

- Add users to a group.  

```
ALTER GROUP group_name  
  ADD USER user_name [, ... ];
```
- Remove users from a group.  

```
ALTER GROUP group_name  
  DROP USER user_name [, ... ];
```
- Change the name of the group.  

```
ALTER GROUP group_name  
  RENAME TO new_name;
```

### Parameter Description

See [Parameters](#) in **ALTER ROLE**.

### Examples

```
-- Create a user group.  
gaussdb=# CREATE GROUP super_users WITH PASSWORD "*****";  
  
-- Create a user.  
gaussdb=# CREATE ROLE lche WITH PASSWORD "*****";  
  
-- Create a user.  
gaussdb=# CREATE ROLE jim WITH PASSWORD "*****";  
  
-- Add users to a user group.  
gaussdb=# ALTER GROUP super_users ADD USER lche, jim;  
  
-- Remove users from a user group.  
gaussdb=# ALTER GROUP super_users DROP USER jim;  
  
-- Change the name of a user group.  
gaussdb=# ALTER GROUP super_users RENAME TO normal_users;  
  
-- Delete a user.  
gaussdb=# DROP ROLE lche, jim;
```

```
-- Delete a user group.  
gaussdb=# DROP GROUP normal_users;
```

## Helpful Links

[ALTER GROUP](#), [DROP GROUP](#), and [ALTER ROLE](#)

## 7.14.15 ALTER INDEX

### Description

ALTER INDEX modifies the definition of an existing index.

It has the following forms:

- **IF EXISTS**  
Sends a notice instead of an error if the specified index does not exist.
- **RENAME TO**  
Changes only the name of the index. The stored data is not affected.
- **SET TABLESPACE**  
Changes the index tablespace to the specified tablespace and moves index-related data files to the new tablespace.
- **SET ( { STORAGE\_PARAMETER = value } [, ...] )**  
Changes one or more index-method-specific storage parameters of an index. Note that the index content will not be modified immediately by this statement. You may need to use **REINDEX** to rebuild the index based on different parameters to achieve the expected effect.
- **RESET ( { storage\_parameter } [, ...] )**  
Resets one or more index-method-specific storage parameters of an index to the default value. Similar to the **SET** statement, **REINDEX** may be used to completely update the index.
- **[ MODIFY PARTITION index\_partition\_name ] UNUSABLE**  
Sets the indexes on a table or index partition to be unavailable.
- **REBUILD [ PARTITION index\_partition\_name ]**  
Rebuilds indexes on a table or an index partition.
- **RENAME PARTITION**  
Renames an index partition.
- **MOVE PARTITION**  
Modifies the tablespace to which an index partition belongs.

### Precautions

Only the index owner, a user who has the INDEX permission on the table where the index resides, or a user who has the ALTER ANY INDEX permission can run the **ALTER INDEX** command. The system administrator has this permission by default.

## Syntax

- Rename a table index.  

```
ALTER INDEX [ IF EXISTS ] index_name  
  RENAME TO new_name;
```
- Change the tablespace to which a table index belongs.  

```
ALTER INDEX [ IF EXISTS ] index_name  
  SET TABLESPACE tablespace_name;
```
- Modify the storage parameter of a table index.  

```
ALTER INDEX [ IF EXISTS ] index_name  
  SET ( {storage_parameter = value} [, ... ] );
```
- Reset the storage parameter of a table index.  

```
ALTER INDEX [ IF EXISTS ] index_name  
  RESET ( storage_parameter [, ... ] );
```
- Set a table index or an index partition to be unavailable.  

```
ALTER INDEX [ IF EXISTS ] index_name  
  [ MODIFY PARTITION index_partition_name ] UNUSABLE;
```
- Rebuild a table index or index partition.  

```
ALTER INDEX index_name  
  REBUILD [ PARTITION index_partition_name ];
```
- Rename an index partition.  

```
ALTER INDEX [ IF EXISTS ] index_name  
  RENAME PARTITION index_partition_name TO new_index_partition_name;
```
- Modify the tablespace to which an index partition belongs.  

```
ALTER INDEX [ IF EXISTS ] index_name  
  MOVE PARTITION index_partition_name TABLESPACE new_tablespace;
```

## Parameters

- **index\_name**  
Specifies the index name to be modified.
- **new\_name**  
Specifies the new name of the index.  
Value range: a string. It must comply with the [naming convention](#).
- **tablespace\_name**  
Specifies the tablespace name.  
Value range: an existing tablespace name
- **storage\_parameter**  
Specifies the name of an index-method-specific parameter. **ACTIVE\_PAGES** indicates the number of index pages, which may be less than the actual number of physical file pages and can be used for optimization. Currently, this parameter is valid only for the local index of the Ustore partitioned table and will be updated by VACUUM and ANALYZE (including AUTOVACUUM). You are not advised to manually set this parameter.
- **value**  
Specifies the new value for an index-method-specific storage parameter. This might be a number or a word depending on the parameter.
- **new\_index\_partition\_name**  
Specifies the new name of the index partition.
- **index\_partition\_name**  
Specifies the name of an index partition.

- **new\_tablespace**  
Specifies a new tablespace.

## Examples

See [Examples](#) in section "CREATE INDEX."

## Helpful Links

[CREATE INDEX](#), [DROP INDEX](#), and [REINDEX](#)

## 7.14.16 ALTER LANGUAGE

This version does not support this syntax.

## 7.14.17 ALTER MASKING POLICY

### Function

Modifies a masking policy.

### Precautions

- Only user **poladmin**, user **sysadmin**, or the initial user can perform this operation.
- The masking policy takes effect only after **enable\_security\_policy** is set to **on**.

### Syntax

- Modify the policy description.  
`ALTER MASKING POLICY policy_name COMMENTS policy_comments;`
- Modify the masking method.  
`ALTER MASKING POLICY policy_name [ADD | REMOVE | MODIFY] masking_actions[, ...];`  
The syntax of **masking\_action**.  
`masking_function ON LABEL(label_name[, ...])`
- Modify the scenarios where the masking policies take effect.  
`ALTER MASKING POLICY policy_name MODIFY(FILTER ON FILTER_TYPE(filter_value[, ...])[, ...]);`
- Remove the filters of the masking policies.  
`ALTER MASKING POLICY policy_name DROP FILTER;`
- Enable or disable the masking policies.  
`ALTER MASKING POLICY policy_name [ENABLE | DISABLE];`

### Parameter Description

- **policy\_name**  
Specifies the masking policy name, which must be unique.  
Value range: a string. It must comply with the [naming convention](#).
- **policy\_comments**  
Adds or modifies description of masking policies.
- **masking\_function**  
Specifies eight preset masking methods or user-defined functions. Schema is supported.

**maskall** is not a preset function. It is hard-coded and cannot be displayed by running `\df`.

The masking methods during presetting are as follows:

```
maskall | randommasking | creditcardmasking | basicemailmasking | fullemailmasking |  
shufflemasking | alldigitsmasking | regexpmasking
```

- **label\_name**  
Specifies the resource label name.
- **FILTER\_TYPE**  
Specifies the types of information to be filtered by the policies: **IP**, **ROLES**, and **APP**.
- **filter\_value**  
Indicates the detailed information to be filtered, such as the IP address, app name, and username.
- **ENABLE|DISABLE**  
Enables or disables the masking policy. If **ENABLE|DISABLE** is not specified, **ENABLE** is used by default.

## Examples

```
-- Create users dev_mask and bob_mask.  
gaussdb=# CREATE USER dev_mask PASSWORD '*****';  
gaussdb=# CREATE USER bob_mask PASSWORD '*****';  
  
-- Create table tb_for_masking.  
gaussdb=# CREATE TABLE tb_for_masking(col1 text, col2 text, col3 text);  
  
-- Create a resource label for sensitive column col1.  
gaussdb=# CREATE RESOURCE LABEL mask_lb1 ADD COLUMN(tb_for_masking.col1);  
  
-- Create a resource label for sensitive column col2.  
gaussdb=# CREATE RESOURCE LABEL mask_lb2 ADD COLUMN(tb_for_masking.col2);  
  
-- Create a masking policy for the operation of accessing sensitive column col1.  
gaussdb=# CREATE MASKING POLICY maskpol1 maskall ON LABEL(mask_lb1);  
  
-- Add description for masking policy maskpol1.  
gaussdb=# ALTER MASKING POLICY maskpol1 COMMENTS 'masking policy for tb_for_masking.col1';  
  
-- Modify masking policy maskpol1 to add a masking method.  
gaussdb=# ALTER MASKING POLICY maskpol1 ADD randommasking ON LABEL(mask_lb2);  
  
-- Modify masking policy maskpol1 to remove a masking method.  
gaussdb=# ALTER MASKING POLICY maskpol1 REMOVE randommasking ON LABEL(mask_lb2);  
  
-- Modify masking policy maskpol1 to modify a masking method.  
gaussdb=# ALTER MASKING POLICY maskpol1 MODIFY randommasking ON LABEL(mask_lb1);  
  
-- Modify masking policy maskpol1 so that it takes effect only for scenarios where users are dev_mask and  
bob_mask, the client tool is gsq, and the IP addresses are 10.20.30.40 and 127.0.0.24.  
gaussdb=# ALTER MASKING POLICY maskpol1 MODIFY (FILTER ON ROLES(dev_mask, bob_mask),  
APP(gsq), IP('10.20.30.40', '127.0.0.24'));  
  
-- Modify masking policy maskpol1 so that it takes effect for all user scenarios.  
gaussdb=# ALTER MASKING POLICY maskpol1 DROP FILTER;  
  
-- Disable masking policy maskpol1.  
gaussdb=# ALTER MASKING POLICY maskpol1 DISABLE;  
  
-- Delete a masking policy.  
gaussdb=# DROP MASKING POLICY maskpol1;
```

```
-- Delete a resource label.  
gaussdb=# DROP RESOURCE LABEL mask_lb1, mask_lb2;  
  
- Delete the tb_for_masking table.  
gaussdb=# DROP TABLE tb_for_masking;  
  
-- Delete the dev_mask and bob_mask users.  
gaussdb=# DROP USER dev_mask, bob_mask;
```

## Helpful Links

[CREATE MASKING POLICY](#) and [DROP MASKING POLICY](#)

## 7.14.18 ALTER MATERIALIZED VIEW

### Description

Changes multiple auxiliary attributes of an existing materialized view.

Statements and actions that can be used for ALTER MATERIALIZED VIEW are a subset of ALTER TABLE and have the same meaning when used for materialized views. For details, see [ALTER TABLE](#).

### Precautions

- Only the owner of a materialized view or a system administrator has the ALTER TMATERIALIZED VIEW permission.
- The materialized view structure cannot be modified.

### Syntax

- Change the owner of a materialized view.  

```
ALTER MATERIALIZED VIEW [ IF EXISTS ] mv_name  
OWNER TO new_owner;
```
- Modify the column of a materialized view.  

```
ALTER MATERIALIZED VIEW [ IF EXISTS ] mv_name  
RENAME [ COLUMN ] column_name TO new_column_name;
```
- Rename a materialized view.  

```
ALTER MATERIALIZED VIEW [ IF EXISTS ] mv_name  
RENAME TO new_name;
```

### Parameters

- **mv\_name**  
Specifies the name of an existing materialized view, which can be schema-qualified.  
Value range: a string. It must comply with the [naming convention](#).
- **column\_name**  
Specifies the name of a new or existing column.  
Value range: a string. It must comply with the [naming convention](#).
- **new\_column\_name**  
Specifies the new name of an existing column.
- **new\_owner**

Specifies the username of the new owner of a materialized view.

- **new\_name**

Specifies the new name of a materialized view.

## Examples

```
-- Create a table.
gaussdb=# CREATE TABLE my_table (c1 int, c2 int)
WITH(STORAGE_TYPE=ASTORE);

-- Create a complete-refresh materialized view.
gaussdb=# CREATE MATERIALIZED VIEW foo AS SELECT * FROM my_table;

-- Rename the materialized view foo to bar.
gaussdb=# ALTER MATERIALIZED VIEW foo RENAME TO bar;

-- Delete the complete-refresh materialized view.
gaussdb=# DROP MATERIALIZED VIEW bar;

-- Delete the my_table table.
gaussdb=# DROP TABLE my_table;
```

and [REFRESH MATERIALIZED VIEW](#)

## 7.14.19 ALTER OPERATOR

### Description

ALTER OPERATOR modifies the definition of an operator.

### Precautions

To use ALTER OPERATOR, you must be the owner of the operator. To modify the owner, you must also be a direct or indirect member of the new owning role, and that member must have CREATE permission on the operator's schema. (These restrictions force the owner to do nothing that cannot be done by deleting and recreating the operator. However, a user with the SYSADMIN permission can modify the ownership of any operator in any way.)

### Syntax

- Change the owner of the operator.  
ALTER OPERATOR name ( { left\_type | NONE } , { right\_type | NONE } ) OWNER TO new\_owner;
- Change the schema of the operator.  
ALTER OPERATOR name ( { left\_type | NONE } , { right\_type | NONE } ) SET SCHEMA new\_schema;

### Parameters

- **name**  
Name of an existing operator.
- **left\_type**

Data type of the left operand for the operator; if there is no left operand, write NONE.

- **right\_type**  
Data type of the right operand for the operator; if there is no right operand, write NONE.
- **new\_owner**  
New owner of the operator.
- **new\_schema**  
New schema name of the operator.

## Example

Change a user-defined operator for text a @@ b:

```
gaussdb=# ALTER OPERATOR @@ (text, text) OWNER TO joe;
```

## Compatibility

The SQL standard does not contain the ALTER OPERATOR statement.

## 7.14.20 ALTER PACKAGE

### Description

**ALTER PACKAGE** modifies the attributes of a package or recompiles a package.

### Precautions

- Currently, only users with the **ALTER PACKAGE OWNER** permission can run this command. The system administrator has this permission by default. The restrictions are as follows:
  - The current user must be the owner of the package or the system administrator and a member of the new owner role.
- The **plpgsql\_dependency** parameter must be set for package recompilation.
- Only the initial user can modify the owner of the package that has the definer permission.
- When separation-of-duties is enabled, to modify the owner of a package, users must have the user group permission, even a system administrator.
- Only the initial user can change the owner of a package to the initial user.
- In separation-of-duties mode, the owner of a package of the DEFINER type cannot be changed. In non-separation-of-duties mode., only the system administrator or user with a higher permission can change the owner of a package.
- The system administrator is not allowed to change the owner of a package of the DEFINER type to the initial user or O&M administrator.

### Syntax

- Change the owner of a package.  
`ALTER PACKAGE package_name OWNER TO new_owner;`

- Recompile the package.  
`ALTER PACKAGE package_name COMPILE [PACKAGE | BODY | SPECIFICATION];`

## Parameters

- **package\_name**  
Specifies the name of the package to be modified.  
Value range: an existing package name. Only one package can be modified at a time.
- **new\_owner**  
Specifies the new owner of a package. To change the owner of a package, the new owner must have the **CREATE** permission on the schema to which the package belongs.  
Value range: an existing user role.

## Example

For details, see [CREATE PACKAGE](#).

Recompilation examples:

```
-- Enable the dependency function.
gaussdb=# set behavior_compat_options='plpgsql_dependency';

-- Create a function.
gaussdb=# create or replace package test_pkg as
    pkg_var int := 1;
    procedure test_pkg_proc(var int);
end test_pkg;
/

gaussdb=# create or replace package body test_pkg as
    procedure test_pkg_proc(var int)
is
begin
    pkg_var := 1;
end;
end test_pkg;
/

-- Recompile the package.
gaussdb=# alter package test_pkg compile;
```

## Helpful Links

[CREATE PACKAGE](#) and [DROP PACKAGE](#)

## 7.14.21 ALTER PROCEDURE

### Description

Modifies the attributes of a user-defined stored procedure or recompiles a stored procedure.

### Precautions

- Only the owner of a stored procedure or a user granted with the **ALTER** permission can run the **ALTER PROCEDURE** command. The system

administrator has this permission by default. The following are permission constraints depending on the attributes to be modified:

- If a stored procedure involves operations on temporary tables, **ALTER PROCEDURE** cannot be used.
  - To modify the owner or schema of a stored procedure, you must be the owner of the stored procedure or system administrator and a member of the new owner role.
  - Only the system administrator and initial user can change the schema of a stored procedure to a public schema.
- The **plpgsql\_dependency** parameter must be set for stored procedure compilation.

## Syntax

- Modify the additional parameters of a user-defined stored procedure.

```
ALTER PROCEDURE procedure_name ( [ { [ argname ] [ argmode ] argtype} [, ...] ] )  
    action [ ... ] [ RESTRICT ];
```

The syntax of the ACTION clause is as follows:

```
{CALLED ON NULL INPUT | STRICT}  
| {IMMUTABLE | STABLE | VOLATILE}  
| {SHIPPABLE | NOT SHIPPABLE}  
| {NOT FENCED | FENCED}  
| [ NOT ] LEAKPROOF  
| { [ EXTERNAL ] SECURITY INVOKER | [ EXTERNAL ] SECURITY DEFINER }  
| AUTHID { DEFINER | CURRENT_USER }  
| COST execution_cost  
| ROWS result_rows  
| SET configuration_parameter { { TO | = } { value | DEFAULT } FROM CURRENT }  
| RESET {configuration_parameter | ALL}
```

- Modify the name of a user-defined stored procedure.  

```
ALTER PROCEDURE proname ( [ { [ argname ] [ argmode ] argtype} [, ...] ] )  
    RENAME TO new_name;
```
- Modify the owner of a user-defined stored procedure.  

```
ALTER PROCEDURE proname ( [ { [ argname ] [ argmode ] argtype} [, ...] ] )  
    OWNER TO new_owner;
```
- Modify the schema of a user-defined stored procedure.  

```
ALTER PROCEDURE proname ( [ { [ argname ] [ argmode ] argtype} [, ...] ] )  
    SET SCHEMA new_schema;
```
- Recompile a stored procedure.  

```
ALTER PROCEDURE procedure_name COMPILE;
```

## Parameters

- **procedure\_name**  
Specifies the name of the stored procedure to be modified.  
Value range: an existing stored procedure name
- **argmode**  
Specifies whether a parameter is an input or output parameter.  
Value range: **IN**, **OUT**, **INOUT**, and **VARIADIC**
- **argname**  
Specifies the parameter name.  
Value range: a string. It must comply with the [naming convention](#).

- **argtype**  
Specifies the type of the stored procedure parameter.
- **CALLED ON NULL INPUT**  
Declares that some parameters of the stored procedure can be called in normal mode if the parameter values are null. Omitting this parameter is the same as specifying it.
- **IMMUTABLE**  
Specifies that the stored procedure always returns the same result if the parameter values are the same.
- **STABLE**  
Specifies that the stored procedure cannot modify the database, and that within a single table scan it will consistently return the same result for the same parameter value, but its result varies by SQL statements.
- **VOLATILE**  
Specifies that the stored procedure value can change in a single table scan and no optimization is performed.
- **LEAKPROOF**  
Specifies that the stored procedure has no side effect and the parameter contains only the return value. **LEAKPROOF** can be set only by the system administrator.
- **EXTERNAL**  
(Optional) The purpose is to be compatible with SQL. This feature applies to all functions, not only external functions.
- **SECURITY INVOKER**  
**AUTHID CURRENT\_USER**  
Specifies that the stored procedure will be executed with the permissions of the user who calls it. Omitting this parameter is the same as specifying it.  
**SECURITY INVOKER** and **AUTHID CURRENT\_USER** have the same functions.
- **SECURITY DEFINER**  
**AUTHID DEFINER**  
Specifies that the stored procedure will be executed with the permissions of the user who created it.  
**AUTHID DEFINER** and **SECURITY DEFINER** have the same functions.
- **COST execution\_cost**  
Estimates the execution cost of the stored procedure.  
The unit of **execution\_cost** is **cpu\_operator\_cost**.  
Value range: a positive integer
- **ROWS result\_rows**  
Estimates the number of rows returned by the stored procedure. This is only allowed when the stored procedure is declared to return a set.  
Value range: a positive number. The default value is **1000**.
- **configuration\_parameter**
  - **value**

Sets a specified database session parameter to a specified value. If the value is **DEFAULT** or **RESET**, the default setting is used in the new session. **OFF** disables the setting.

Value range: a string.

- **DEFAULT**
- **OFF**
- **RESET**

Specifies the default value.

– **from current**

Uses the value of **configuration\_parameter** of the current session.

- **new\_name**

Specifies the new name of the stored procedure. To change the schema of a stored procedure, you must have the CREATE permission on the new schema.

Value range: a string. It must comply with the [naming convention](#).

- **new\_owner**

Specifies the new owner of the stored procedure. To change the owner of a stored procedure, the new owner must have the CREATE permission on the schema to which the stored procedure belongs.

Value range: an existing user role

- **new\_schema**

Specifies the new schema of the stored procedure.

Value range: an existing schema

## Examples

See [Examples](#) in section "CREATE FUNCTION."

Recompilation examples:

```
-- Enable the dependency function.
gaussdb=# set behavior_compat_options='plpgsql_dependency';
-- Create a stored procedure.
gaussdb=# create or replace procedure test_proc(a int)
is
    proc_var int;
begin
    proc_var := a;
end;
/
-- Recompile a stored procedure with the stored procedure name.
gaussdb=# alter procedure test_proc compile;

-- Recompile a stored procedure with a signed int type stored procedure.
gaussdb=# alter procedure test_proc(int) compile;
```

## Helpful Links

[CREATE PROCEDURE](#) and [DROP PROCEDURE](#)

## 7.14.22 ALTER RESOURCE LABEL

### Description

Modifies resource labels.

### Precautions

Only users with the POLADMIN or SYSADMIN permission, or the initial user can perform this operation.

### Syntax

```
ALTER RESOURCE LABEL label_name (ADD|REMOVE)
label_item_list[, ...];
```

- **label\_item\_list**  
resource\_type(resource\_path[, ...])
- **resource\_type**  
TABLE | COLUMN | SCHEMA | VIEW | FUNCTION

### Parameters

- **label\_name**  
Specifies the resource label name.  
Value range: a string. It must comply with the [naming convention](#).
- **resource\_type**  
Specifies the type of database resources to be labeled.
- **resource\_path**  
Specifies the path of database resources.

### Examples

```
-- Create basic table table_for_label.
gaussdb=# CREATE TABLE table_for_label(col1 int, col2 text);

-- Create resource label table_label.
gaussdb=# CREATE RESOURCE LABEL table_label ADD COLUMN(table_for_label.col1);

-- Attach resource label table_label to col2.
gaussdb=# ALTER RESOURCE LABEL table_label ADD COLUMN(table_for_label.col2)

-- Remove an item from table_label.
gaussdb=# ALTER RESOURCE LABEL table_label REMOVE COLUMN(table_for_label.col1);

-- Delete the resource label table_label.
gaussdb=# DROP RESOURCE LABEL table_label;

-- Delete the base table table_for_label.
gaussdb=# DROP TABLE table_for_label;
```

### Helpful Links

[CREATE RESOURCE LABEL](#) and [DROP RESOURCE LABEL](#)

## 7.14.23 ALTER RESOURCE POOL

### Description

Modifies the Cgroup of a resource pool.

### Precautions

Only a user with the ALTER permission on the current database can perform this operation.

### Syntax

```
ALTER RESOURCE POOL pool_name  
WITH ({MEM_PERCENT= pct | CONTROL_GROUP="group_name" | ACTIVE_STATEMENTS=stmt |  
MAX_DOP = dop | MEMORY_LIMIT='memory_size' | io_limits=io_limits | io_priority='io_priority'}[, ... ]);
```

### Parameters

- **pool\_name**  
Specifies the name of a resource pool.  
The resource pool must already exist.  
Value range: a string. It must comply with the [naming convention](#).

- **group\_name**  
Specifies the name of a Cgroup.

#### NOTE

- You can use either double quotation marks ("" ) or single quotation marks ( ' ' ) in the syntax when setting the name of a Cgroup.
- The value of **group\_name** is case-sensitive.
- If an administrator specifies a Workload Cgroup under Class, for example, **control\_group** set to **class1:workload1**, the resource pool will be associated with the **workload1** Cgroup under **class1**. The level of **Workload** can also be specified. For example, **control\_group** is set to **class1:workload1:1**.
- If a database user specifies the Timeshare string (**Rush**, **High**, **Medium**, or **Low**) in the syntax, for example, **control\_group** is set to **High**, the resource pool will be associated with the **High** Timeshare Cgroup under **DefaultClass**.

Value range: an existing Cgroup.

- **stmt**  
Specifies the maximum number of statements that can be concurrently executed in a resource pool.  
Value range: numeric data ranging from -1 to 2147483647. -1 indicates no restriction and 0 indicates that no statement can be executed.
- **dop**  
Specifies the maximum statement concurrency degree for a resource pool, equivalent to the number of threads that can be created for executing a statement.  
Value range: numeric data ranging from 1 to 2147483647
- **memory\_size**  
Specifies the maximum memory size of a resource pool.

Value range: a string of 1 KB to 2047 GB case-sensitive characters.

- **mem\_percent**

Specifies the proportion of available resource pool memory to the total memory or group user memory.

In multi-tenant scenarios, **mem\_percent** of group users or service users ranges from 1 to 100. The default value is **20**.

In common scenarios, **mem\_percent** of common users is an integer ranging from 0 to 100. The default value is **0**.

 **NOTE**

When both of **mem\_percent** and **memory\_limit** are specified, only **mem\_percent** takes effect.

- **io\_limits**

Specifies the upper limit of IOPS in a resource pool.

It is counted by 10 thousands per second.

Value range: numeric data ranging from 0 to 2147483647

- **io\_priority**

Specifies the I/O priority for jobs that consume many I/O resources. It takes effect when the I/O usage reaches 90%.

There are three priorities: **Low**, **Medium**, and **High**. If you do not want to control I/O resources, set this parameter to **None**, which is the default value.

Value range: enumerated type. The options are **None**, **Low**, **Medium**, and **High**.

 **NOTE**

The settings of **io\_limits** and **io\_priority** are valid only for complex jobs, such as batch import (using **INSERT INTO SELECT**, **COPY FROM**, or **CREATE TABLE AS**), complex queries involving over 500 MB data on each DN, and **VACUUM FULL**.

- **max\_workers**

Concurrency in a table during data redistribution. This column is used only for scaling.

- **max\_connections**

Maximum number of connections that can be used by a resource pool.

 **NOTE**

The total maximum number of connections in all resource pools cannot exceed the maximum number of connections specified by **max\_connections** of the entire GaussDB process.

## Examples

The following example assumes that the user has created the **class1** Cgroup and three Workload Cgroups under **class1**: **Low**, **wg1**, and **wg2**.

```
-- Create a resource pool.
gaussdb=# CREATE RESOURCE POOL pool1 WITH (CONTROL_GROUP="Medium");

-- Specify the High Timeshare Workload Cgroup under the DefaultClass Cgroup.
gaussdb=# ALTER RESOURCE POOL pool1 WITH (CONTROL_GROUP="High");
```

```
-- Specify the Low Timeshare Workload Cgroup under the class1 Cgroup.
gaussdb=# ALTER RESOURCE POOL pool1 WITH (CONTROL_GROUP="class1:Low");

-- Specify the wg1 Workload Cgroup under the class1 Cgroup.
gaussdb=# ALTER RESOURCE POOL pool1 WITH (CONTROL_GROUP="class1:wg1");

-- Specify the wg2 Workload Cgroup under the class1 Cgroup.
gaussdb=# ALTER RESOURCE POOL pool1 WITH (CONTROL_GROUP="class1:wg2:3");

-- Delete the resource pool pool1.
gaussdb=# DROP RESOURCE POOL pool1;
```

## Helpful Links

[CREATE RESOURCE POOL](#) and [DROP RESOURCE POOL](#)

## 7.14.24 ALTER ROLE

### Description

Modifies role attributes.

### Precautions

None

### Syntax

- Modify the permissions of a role.  
ALTER ROLE role\_name [ [ WITH ] option [ ... ] ];

The option clause for granting permissions is as follows:

```
{CREATEDB | NOCREATEDB}
| {CREATEROLE | NOCREATEROLE}
| {INHERIT | NOINHERIT}
| {AUDITADMIN | NOAUDITADMIN}
| {SYSADMIN | NOSYSADMIN}
| {MONADMIN | NOMONADMIN}
| {OPRADMIN | NOOPRADMIN}
| {POLADMIN | NOPOLADMIN}
| {USEFT | NOUSEFT}
| {LOGIN | NOLOGIN}
| {REPLICATION | NOREPLICATION}
| {VCADMIN | NOVCADMIN}
| {PERSISTENCE | NOPERSISTENCE}
| CONNECTION LIMIT connlimit
| [ ENCRYPTED | UNENCRYPTED ] PASSWORD 'password' [ EXPIRED ]
| [ ENCRYPTED | UNENCRYPTED ] IDENTIFIED BY 'password' [ REPLACE 'old_password' | EXPIRED ]
| [ ENCRYPTED | UNENCRYPTED ] PASSWORD { 'password' | DISABLE | EXPIRED }
| [ ENCRYPTED | UNENCRYPTED ] IDENTIFIED BY { 'password' [ REPLACE 'old_password' ] |
DISABLE }
| VALID BEGIN 'timestamp'
| VALID UNTIL 'timestamp'
| RESOURCE POOL 'respool'
| PERM SPACE 'spacelimit'
| PGUSER
```

- Rename a role.  
ALTER ROLE role\_name  
RENAME TO new\_name;
- Lock or unlock.  
ALTER ROLE role\_name  
ACCOUNT { LOCK | UNLOCK };

- Set parameters for a role.  

```
ALTER ROLE role_name [ IN DATABASE database_name ]  
    SET configuration_parameter {{ TO | = } { value | DEFAULT } | FROM CURRENT};
```
- Reset parameters for a role.  

```
ALTER ROLE role_name  
    [ IN DATABASE database_name ] RESET {configuration_parameter|ALL};
```

## Parameters

- **role\_name**  
Specifies a role name.  
Value range: an existing username. If a role name contains uppercase letters, enclose the name with double quotation marks ("").
- **IN DATABASE database\_name**  
Modifies the parameters of a role in a specified database.
- **SET configuration\_parameter**  
Sets parameters for a role. Session parameters modified by ALTER ROLE apply to a specified role and take effect in the next session triggered by the role.  
Value range:  
For details about the values of **configuration\_parameter** and **value**, see [SET](#).  
**DEFAULT**: clears the value of **configuration\_parameter**.  
**configuration\_parameter** will inherit the default value of the new session generated for the role.  
**FROM CURRENT**: uses the value of **configuration\_parameter** of the current session.
- **RESET configuration\_parameter/ALL**  
Clears the value of **configuration\_parameter**. The statement has the same effect as that of **SET configuration\_parameter TO DEFAULT**.  
Value range: **ALL** indicates that the values of all parameters are cleared.
- **ACCOUNT LOCK | ACCOUNT UNLOCK**
  - **ACCOUNT LOCK**: locks an account to forbid login to databases.
  - **ACCOUNT UNLOCK**: unlocks an account to allow login to databases.
- **PGUSER**  
In the current version, the PGUSER permission of a role cannot be modified.
- **PASSWORD/IDENTIFIED BY 'password'**  
Resets or changes the user password. Except the initial user, other administrators and common users need to enter the correct old password when changing their own passwords. Only the initial user, the system administrator (**sysadmin**), or users who have the permission to create users (CREATEROLE) can reset the password of a common user without entering the old password. The initial user can reset passwords of system administrators. A system administrator cannot reset passwords of other system administrators. The user password should be enclosed by single quotation marks.
- **EXPIRED**  
Invalidates the password. Only initial users, system administrators (**sysadmin**), and users who have the permission to create users

(CREATEROLE) can invalidate user passwords. System administrators can invalidate their own passwords or the passwords of other system administrators. The password of the initial user cannot be invalidated.

The user whose password is invalid can log in to the database but cannot perform the query operation. The query operation can be performed only after the password is changed or the administrator resets the password.

For details about other parameters, see [Parameters](#) in section "CREATE ROLE."

## Examples

See [Examples](#) in section "CREATE ROLE."

## Helpful Links

[CREATE ROLE](#), [DROP ROLE](#), and [SET](#)

## 7.14.25 ALTER ROW LEVEL SECURITY POLICY

### Function

Modifies an existing row-level security policy, including the policy name and the users and expressions affected by the policy.

### Precautions

Only the table owner or a system administrator can perform this operation.

### Syntax

Change the name of an existing row-level security policy.

```
ALTER [ ROW LEVEL SECURITY ] POLICY policy_name ON table_name RENAME TO new_policy_name;
```

Change the specified user and policy expression of an existing row-level security policy.

```
ALTER [ ROW LEVEL SECURITY ] POLICY policy_name ON table_name  
[ TO { role_name | PUBLIC } [, ...] ]  
[ USING ( using_expression ) ];
```

### Parameter Description

- `policy_name`  
Specifies the name of a row-level security policy.
- `table_name`  
Specifies the name of a table to which a row-level security policy is applied.
- `new_policy_name`  
Specifies the new name of a row-level security policy.
- `role_name`  
Specifies names of users affected by a row-level security policy. PUBLIC indicates that the row-level security policy will affect all users.
- `using_expression`

Specifies a row-level security policy, which is similar to a Boolean expression in the WHERE clause.

## Examples

```
-- Create the data table all_data.
gaussdb=# CREATE TABLE all_data(id int, role varchar(100), data varchar(100));

-- Create a row-level security policy to specify that the current user can view only their own data.
gaussdb=# CREATE ROW LEVEL SECURITY POLICY all_data_rls ON all_data USING(role = CURRENT_USER);
gaussdb=# \d+ all_data
          Table "public.all_data"
Column |      Type      | Modifiers | Storage | Stats target | Description
-----+-----+-----+-----+-----+-----
id     | integer        |           |         |              |
role   | character varying(100) |         | extended |              |
data   | character varying(100) |         | extended |              |
Row Level Security Policies:
  POLICY "all_data_rls" FOR ALL
    TO public
    USING ((role)::name = "current_user"())
Has OIDs: no
Options: orientation=row, compression=no

-- Create users alice and bob.
gaussdb=# CREATE ROLE alice WITH PASSWORD "*****";
gaussdb=# CREATE ROLE bob WITH PASSWORD "*****";

-- Change the name of the all_data_rls policy.
gaussdb=# ALTER ROW LEVEL SECURITY POLICY all_data_rls ON all_data RENAME TO all_data_new_rls;

-- Change the users affected by the row-level security policy.
gaussdb=# ALTER ROW LEVEL SECURITY POLICY all_data_new_rls ON all_data TO alice, bob;
gaussdb=# \d+ all_data
          Table "public.all_data"
Column |      Type      | Modifiers | Storage | Stats target | Description
-----+-----+-----+-----+-----+-----
id     | integer        |           |         |              |
role   | character varying(100) |         | extended |              |
data   | character varying(100) |         | extended |              |
Row Level Security Policies:
  POLICY "all_data_new_rls" FOR ALL
    TO alice,bob
    USING (((role)::name = "current_user"()))
Has OIDs: no
Options: orientation=row, compression=no, enable_rowsecurity=true

-- Modify the expression defined for the row-level security policy.
gaussdb=# ALTER ROW LEVEL SECURITY POLICY all_data_new_rls ON all_data USING (id > 100 AND role =
current_user);
gaussdb=# \d+ all_data
          Table "public.all_data"
Column |      Type      | Modifiers | Storage | Stats target | Description
-----+-----+-----+-----+-----+-----
id     | integer        |           |         |              |
role   | character varying(100) |         | extended |              |
data   | character varying(100) |         | extended |              |
Row Level Security Policies:
  POLICY "all_data_new_rls" FOR ALL
    TO alice,bob
    USING (((id > 100) AND ((role)::name = "current_user"()))))
Has OIDs: no
Options: orientation=row, compression=no, enable_rowsecurity=true

-- Delete users alice and bob.
gaussdb=# DROP ROLE alice, bob;

-- Delete the policy.
gaussdb=# DROP ROW LEVEL SECURITY POLICY all_data_new_rls ON all_data;
```

```
-- Delete the all_data table.  
gaussdb=# DROP TABLE all_data;
```

## Helpful Links

[CREATE ROW LEVEL SECURITY POLICY](#) and [DROP ROW LEVEL SECURITY POLICY](#)

## 7.14.26 ALTER SCHEMA

### Description

Modifies schema attributes.

### Precautions

- Only the owner of a schema or users granted with the ALTER permission on the schema can run the **ALTER SCHEMA** command. The system administrator has this permission by default. To change the owner of a schema, you must be the owner of the schema or system administrator and a member of the new owner role.
- For system schemas other than public, such as pg\_catalog and sys, only the initial user is allowed to change the owner of a schema. Changing the names of the built-in system schemas may make some functions unavailable or even affect the normal running of the database. By default, the names of the built-in system schemas cannot be changed. To ensure forward compatibility, you can change the names of the built-in system schemas only when the system is being started or upgraded or when **allow\_system\_table\_mods** is set to **on**.
- Only the initial user can change the owner of a schema to an O&M administrator. Other users cannot change the owner of a schema to an O&M administrator.

### Syntax

- Rename a schema.  

```
ALTER SCHEMA schema_name  
  RENAME TO new_name;
```
- Change the owner of a schema.  

```
ALTER SCHEMA schema_name  
  OWNER TO new_owner;
```
- Modify the default character set and collation of the schema.  

```
ALTER SCHEMA schema_name  
  [ [DEFAULT] CHARACTER SET | CHARSET [=] default_charset ] [ [DEFAULT] COLLATE [=]  
  default_collation ];
```

### Parameters

- **schema\_name**  
Specifies the name of an existing schema.  
Value range: an existing schema name.
- **RENAME TO new\_name**  
Rename a schema. If a non-administrator user wants to change the schema name, the user must have the CREATE permission on the database.

**new\_name:** new name of the schema.

#### NOTICE

- The schema name must be unique in the current database.
- The schema name cannot be the same as the initial username of the current database.
- The schema name cannot start with pg\_.
- The schema name cannot start with gs\_role\_.

Value range: a string. It must comply with the [naming convention](#).

- **OWNER TO new\_owner**

Change the owner of a schema. To do this as a non-administrator, you must be a direct or indirect member of the new owner role, and that role must have the CREATE permission on the database.

**new\_owner:** new owner of the schema.

Value range: an existing username or role name.

- **default\_charset**

This syntax is supported only when **sql\_compatibility** is set to 'B'. This command is used to modify the default character set of a schema. If you specify a schema separately, the default collation of the schema is set to the default collation of the specified character set.

- **default\_collate**

This syntax is supported only when **sql\_compatibility** is set to 'B'. This command is used to change the default collation of a schema. If you specify a collation separately, the default character set of the schema is set to the character set corresponding to the specified collation.

For details about the supported collation, see [Table 7-145](#).

## Examples

```
-- Create the ds schema.
gaussdb=# CREATE SCHEMA ds;

-- Rename the current schema ds to ds_new.
gaussdb=# ALTER SCHEMA ds RENAME TO ds_new;

-- Create user jack.
gaussdb=# CREATE USER jack PASSWORD '*****';

-- Change the owner of ds_new to jack.
gaussdb=# ALTER SCHEMA ds_new OWNER TO jack;

-- Change the default character set of DS_NEW to utf8mb4 and the default collation to utf8mb4_bin.
gaussdb=# ALTER SCHEMA ds_new CHARACTER SET utf8mb4 COLLATE utf8mb4_bin;

-- Delete user jack and schema ds_new.
gaussdb=# DROP SCHEMA ds_new;
gaussdb=# DROP USER jack;
```

## 7.14.27 ALTER SEQUENCE

### Function

**ALTER SEQUENCE** modifies the parameters of an existing sequence.

### Precautions

- Only the owner of a sequence, a user granted the ALTER permission on a sequence, or a user granted the ALTER ANY SEQUENCE permission on a sequence can run the **ALTER SEQUENCE** command. The system administrator has this permission by default. To modify a sequence owner, you must be the sequence owner or system administrator and a member of the new owner role.
- In the current version, you can modify only the owner, owning column, and maximum value. To modify other parameters, delete the sequence and create it again. Then, use the **Setval** function to restore parameter values.
- **ALTER SEQUENCE MAXVALUE** cannot be used in transactions, functions, and stored procedures.
- After the maximum value of a sequence is changed, the cache of the sequence in all sessions is cleared.
- If the LARGE identifier is used when a sequence is created, the LARGE identifier must be used when the sequence is altered.
- The **ALTER SEQUENCE** statement blocks the invocation of **nextval**, **setval**, **currval**, and **lastval**.

### Syntax

- Change the owning column of a sequence.  

```
ALTER [ LARGE ] SEQUENCE [ IF EXISTS ] name  
    [MAXVALUE maxvalue | NO MAXVALUE | NOMAXVALUE | CACHE cache]  
    [ OWNED BY { table_name.column_name | NONE } ] ;
```
- Change the owner of a sequence.  

```
ALTER [ LARGE ] SEQUENCE [ IF EXISTS ] name OWNER TO new_owner;
```

### Parameter Description

- name  
Specifies the name of the sequence to be modified.
- IF EXISTS  
Sends a notice instead of an error when you are modifying a nonexisting sequence.
- CACHE  
Specifies the number of sequences stored in the memory for quick access purposes. If this parameter is not specified, the old cache value is retained.
- OWNED BY  
Associates a sequence with a specified column included in a table. In this way, the sequence will be deleted when you delete its associated column or the table where the column belongs to.  
  
If the sequence has been associated with another table before you use this option, the new association will overwrite the old one.

The associated table and sequence must be owned by the same user and in the same schema.

If **OWNED BY NONE** is used, all existing associations will be deleted.

- **new\_owner**

Specifies the username of the new owner of the sequence. To change the owner, you must also be a direct or indirect member of the new role, and this role must have **CREATE** permission on the sequence's schema.

## Examples

```
-- Create an ascending sequence named serial, which starts from 101.
gaussdb=# CREATE SEQUENCE serial START 101;

-- Create a table and specify default values for the sequence.
gaussdb=# CREATE TABLE T1(C1 bigint default nextval('serial'));

-- Change the owning column of serial to T1.C1.
gaussdb=# ALTER SEQUENCE serial OWNED BY T1.C1;

-- Delete a sequence and a table.
gaussdb=# DROP SEQUENCE serial cascade;
gaussdb=# DROP TABLE T1;
```

[CREATE SEQUENCE](#) and [DROP SEQUENCE](#)

## 7.14.28 ALTER SERVER

### Description

Adds, modifies, or deletes the parameters of an existing server. You can query existing servers from the `pg_foreign_server` system catalog.

### Precautions

- Only the server owner or a user granted with the ALTER permission can run the **ALTER SERVER** command. By default, system administrators have the permission. To modify a server owner, you must be the server owner or system administrator and a member of the new owner role.
- When multi-layer quotation marks are used for sensitive columns (such as **password** and **secret\_access\_key**) in **OPTIONS**, the semantics is different from that in the scenario where quotation marks are not used. Therefore, sensitive columns are not identified for anonymization.

### Syntax

- Change the parameters for a foreign server.  

```
ALTER SERVER server_name [ VERSION 'new_version' ]
  [ OPTIONS ( {[ ADD | SET | DROP ] option ['value']} [, ... ] ) ];
```

In **OPTIONS**, **ADD**, **SET**, and **DROP** are operations to be performed. If these operations are not specified, ADD operations will be performed by default. **option** and **value** are the parameters of the corresponding operation.

- Change the owner of a foreign server.  

```
ALTER SERVER server_name
  OWNER TO new_owner;
```

- Change the name of a foreign server.

```
ALTER SERVER server_name  
  RENAME TO new_name;
```

## Parameters

- **server\_name**  
Specifies the name of the server to be modified.
- **new\_version**  
Specifies the new version of the server.
- **OPTIONS**  
Change options of the server. **ADD**, **SET**, and **DROP** are operations to be performed. If the operation is not set explicitly, **ADD** is used. The option name must be unique, and the name and value are also validated with the foreign data wrapper library of the server.  
In addition to the connection parameters supported by libpq, the following parameters are provided:
  - **fdw\_startup\_cost**  
Estimates the startup time required for a foreign table scan, including the time to establish a connection, analyze the request at the remote server, and generate a plan. The default value is **100**. The value is a real number greater than 0.
  - **fdw\_tycle\_cost**  
Specifies the additional consumption when each tuple is scanned on a remote server. The value specifies the extra consumption of data transmission between servers. The default value is **0.01**. The value is a real number greater than 0.
- **new\_name**  
Specifies the new name of the server.

## Examples

```
-- Create my_server.  
gaussdb=# CREATE SERVER my_server FOREIGN DATA WRAPPER log_fdw;  
  
-- Change the name of an external service.  
gaussdb=# ALTER SERVER my_server  
  RENAME TO my_server_1;  
  
-- Delete my_server_1.  
gaussdb=# DROP SERVER my_server_1;
```

## Helpful Links

[CREATE SERVER](#) and [DROP SERVER](#)

## 7.14.29 ALTER SESSION

### Description

ALTER SESSION defines or modifies the conditions or parameters that affect the current session. Modified session parameters are kept until the current session is disconnected.

### Precautions

- If the **START TRANSACTION** statement is not executed before the **SET TRANSACTION** statement, the transaction is ended instantly and the statement does not take effect.
- You can use the **transaction\_mode(s)** method declared in the **START TRANSACTION** statement to avoid using the **SET TRANSACTION** statement.

### Syntax

- Set transaction parameters of a session.  

```
ALTER SESSION SET [ SESSION CHARACTERISTICS AS ] TRANSACTION  
{ ISOLATION LEVEL { READ COMMITTED } | { READ ONLY | READ WRITE } } [, ...];
```
- Set other GUC parameters of a session.  

```
ALTER SESSION SET  
{{config_parameter { { TO | = } { value | DEFAULT }  
| FROM CURRENT }}  
| TIME_ZONE time_zone  
| CURRENT_SCHEMA schema  
| NAMES encoding_name  
| ROLE role_name PASSWORD 'password'  
| SESSION AUTHORIZATION { role_name PASSWORD 'password' | DEFAULT }  
| XML OPTION { DOCUMENT | CONTENT }  
};
```

### Parameters

- **config\_parameter**  
Specifies the name of a configurable GUC parameter. You can use SHOW ALL to view available GUC parameters.
  - **value**  
Specifies the new value of **config\_parameter**. This parameter can be specified as string constants, identifiers, numbers, or comma-separated lists of these. **DEFAULT** is used to set default values for parameters.
    - **DEFAULT**
    - **OFF**
    - **RESET**
    - User-specified value: The value must meet the restriction of the modified parameter.
  - **FROM CURRENT**  
Uses the value of **configuration\_parameter** of the current session.
- **TIME\_ZONE timezone**

Specifies the local time zone for the current session.

Value range: a valid local time zone. The corresponding GUC parameter is **TimeZone**. The default value is **PRC**.

- **CURRENT\_SCHEMA**

**schema**

Specifies the current schema.

Value range: an existing schema name. If the schema name does not exist, the value of **CURRENT\_SCHEMA** will be empty.

- **SCHEMA schema**

Specifies the current schema. Here the schema is a string.

- **NAMES encoding\_name**

Specifies the client character encoding. This statement is equivalent to **set client\_encoding to encoding\_name**.

Value range: a valid character encoding name. The GUC parameter corresponding to this option is **client\_encoding**. The default encoding is **UTF8**.

- **role\_name**

Value range: a string. It must comply with the **naming convention**.

- **password**

Specifies the password of a role. It must comply with the password convention.

- **SESSION AUTHORIZATION**

Sets the session user identifier of the current session.

- **XML OPTION { DOCUMENT | CONTENT }**

Specifies the XML parsing mode.

Value range: **CONTENT** (default) and **DOCUMENT**

## Examples

```
-- Create the ds schema.
gaussdb=# CREATE SCHEMA ds;

-- Set the search path of a schema.
gaussdb=# SET SEARCH_PATH TO ds, public;

-- Set the time/date type to the traditional postgres format (date before month).
gaussdb=# SET DATESTYLE TO postgres, dmy;

-- Set the character code of the current session to UTF8.
gaussdb=# ALTER SESSION SET NAMES 'UTF8';

-- Set the time zone to Berkeley of California.
gaussdb=# SET TIME ZONE 'PST8PDT';

-- Set the time zone to Italy.
gaussdb=# SET TIME ZONE 'Europe/Rome';

-- Set the current schema.
gaussdb=# ALTER SESSION SET CURRENT_SCHEMA TO tpceds;

-- Set XML OPTION to DOCUMENT.
gaussdb=# ALTER SESSION SET XML OPTION DOCUMENT;
```

```
-- Create the role joe, and set the session role to joe.
gaussdb=# CREATE ROLE joe WITH PASSWORD '*****';
gaussdb=# ALTER SESSION SET SESSION AUTHORIZATION joe PASSWORD '*****';

-- Switch to the default user.
gaussdb=> ALTER SESSION SET SESSION AUTHORIZATION default;

-- Delete the ds schema.
gaussdb=# DROP SCHEMA ds;

-- Delete the role joe.
gaussdb=# DROP ROLE joe;
```

## Helpful Links

[SET](#)

## 7.14.30 ALTER SYNONYM

### Description

Modifies the attributes of the SYNONYM object.

### Precautions

- Currently, only the owner of the SYNONYM object can be changed.
- Only the system administrator has the permission to modify the owner of the SYNONYM object.
- The new owner must have the CREATE permission on the schema where the SYNONYM object resides.

### Syntax

```
ALTER SYNONYM synonym_name
OWNER TO new_owner;
```

### Parameters

- **synonym**  
Specifies the name of the synonym to be modified, which can contain the schema name.  
Value range: a string. It must comply with the [naming convention](#).
- **new\_owner**  
Specifies the new owner of the SYNONYM object.  
Value range: a string. It must be a valid username.

### Examples

```
-- Create a system administrator.
gaussdb=# CREATE USER sysadmin WITH SYSADMIN PASSWORD '*****';

-- Switch the system administrator.
gaussdb=# \c - sysadmin

-- Create synonym t1.
gaussdb=# CREATE OR REPLACE SYNONYM t1 FOR ot.t1;
```

```
-- Create user u1.
gaussdb=# CREATE USER u1 PASSWORD '*****';

-- Assign permissions to the new system administrator.
gaussdb=# GRANT ALL ON SCHEMA sysadmin TO u1;

-- Change the owner of synonym t1 to u1.
gaussdb=# ALTER SYNONYM t1 OWNER TO u1;

-- Delete synonym t1.
gaussdb=# DROP SYNONYM t1;

-- Revoke permissions from user u1.
gaussdb=# REVOKE ALL ON SCHEMA sysadmin FROM u1;

-- Delete user u1.
gaussdb=# DROP USER u1;
```

## Helpful Links

[CREATE SYNONYM](#) and [DROP SYNONYM](#)

## 7.14.31 ALTER SYSTEM KILL SESSION

### Description

ALTER SYSTEM KILL SESSION ends a session.

### Precautions

None

### Syntax

```
ALTER SYSTEM KILL SESSION 'session_sid, serial' [ IMMEDIATE ];
```

### Parameters

- **session\_sid, serial**  
Specifies the SID and SERIAL of a session (To obtain the values, see the example.) You can use the pg\_stat\_activity system catalog to query the current active threads (see the examples). However, when you run the **ALTER SYSTEM KILL SESSION** command, the threads may have ended.  
Value range: SIDs and SERIALs of all sessions that can be queried from the system catalog dv\_sessions.
- **IMMEDIATE**  
Specifies that a session will be ended instantly after the statement is executed.

### Examples

```
-- Query session information.
gaussdb=# SELECT sa.sessionid AS sid,0::integer AS serial#,ad.rolname AS username FROM
pg_stat_get_activity(NULL) AS sa
LEFT JOIN pg_authid ad ON(sa.usesysid = ad.oid)WHERE sa.application_name <> 'JobScheduler';
 sid | serial# | username
-----+-----+-----
140131075880720 | 0 | omm
```

```
140131025549072 | 0 | omm
140131073779472 | 0 | omm
140131071678224 | 0 | omm
140131125774096 | 0 |
140131127875344 | 0 |
140131113629456 | 0 |
140131094742800 | 0 |
(8 rows)

-- End the session whose SID is 140131075880720.
gaussdb=# ALTER SYSTEM KILL SESSION '140131075880720,0' IMMEDIATE;
```

## 7.14.32 ALTER TABLE

### Description

Modifies tables, including modifying table definitions, renaming tables, renaming specified columns in tables, renaming table constraints, setting table schemas, enabling or disabling row-level security policies, and adding or updating multiple columns.

### Precautions

- The owner of a table, users granted with the ALTER permission on the table, or users granted with the ALTER ANY TABLE permission can run the **ALTER TABLE** statement. The system administrator has the permission to run the command by default. To modify the owner or schema of a table, you must be the table owner or system administrator and a member of the new owner role.
- The tablespace of a partitioned table cannot be modified, but the tablespace of the partition can be modified.
- The storage parameter **ORIENTATION** cannot be modified.
- Currently, SET SCHEMA can only set schemas to user schemas. It cannot set a schema to a system internal schema.
- A column whose **DEFAULT** value contains the nextval() expression cannot be added.
- Row-level security cannot be enabled for foreign tables and temporary tables.
- When you delete a PRIMARY KEY constraint by constraint name, the NOT NULL constraint is not deleted. If necessary, manually delete the NOT NULL constraint.
- When JDBC is used, the **DEFAULT** value can be set through PreparedStatement.
- If you add a column using ADD COLUMN, all existing rows in the table are initialized to the column's default value (**NULL** if no **DEFAULT** value is specified).

If no **DEFAULT** value is specified for the new column, **NULL** is used, and no full table update is triggered.

If the new column has the **DEFAULT** value, the column must meet all the following requirements. Otherwise, the entire table is updated, leading to additional overheads and affecting online services.

1. The data type is BOOL, BYTEA, SMALLINT, BIGINT, SMALLINT, INTEGER, NUMERIC, FLOAT, DOUBLE PRECISION, CHAR, VARCHAR, TEXT, TIMESTAMPTZ, TIMESTAMP, DATE, TIME, TIMETZ, INTERVAL, SERIAL, BIGSERIAL, or SMALLSERIAL.

2. The length of the **DEFAULT** value of the added column cannot exceed 128 bytes.
3. The **DEFAULT** value of the added column does not contain the volatile function.
4. The **DEFAULT** value is required and cannot be **NULL**.

If you are not sure whether condition 3 is met, check whether the **provolatile** attribute of the function in the PG\_RPOC system catalog is **v**.

5. If the PostgreSQL compatibility mode is enabled, the data type of the new column can be SERIAL, BIGSERIAL, or SMALLSERIAL. Only ordinary tables are supported, and partitioned tables, temporary tables, unlogged permanent tables are not supported. The Astore and Ustore storage engines are supported.

- If **FIRST | AFTER column\_name** is used to modify the character set of a column, add or modify a column, the update overhead of entire table is generated and affects online services.
- The number of table constraints cannot exceed 32,767.

## Syntax

- Modify the definition of a table.

```
ALTER TABLE [ IF EXISTS ] { table_name [*] | ONLY table_name | ONLY ( table_name ) }  
    action [, ... ];  
ALTER TABLE [ IF EXISTS ] table_name  
    ADD ( { column_name data_type [ compress_mode ] [ COLLATE collation ] [ column_constraint  
[ ... ] ] } [, ... ] );  
ALTER TABLE [ IF EXISTS ] table_name  
    MODIFY ( { column_name data_type | column_name [ CONSTRAINT constraint_name ] NOT NULL  
[ ENABLE ] | column_name [ CONSTRAINT constraint_name ] NULL } [, ... ] );  
ALTER TABLE [ IF EXISTS ] table_name  
    RENAME TO new_table_name;  
ALTER TABLE [ IF EXISTS ] { table_name [*] | ONLY table_name | ONLY ( table_name ) }  
    RENAME [ COLUMN ] column_name TO new_column_name;  
ALTER TABLE [ IF EXISTS ] { table_name [*] | ONLY table_name | ONLY ( table_name ) }  
    RENAME CONSTRAINT constraint_name TO new_constraint_name;  
ALTER TABLE [ IF EXISTS ] table_name  
    SET SCHEMA new_schema;
```

There are several clauses of **action**:

```
column_clause  
| ADD table_constraint [ NOT VALID ]  
| ADD table_constraint_using_index  
| VALIDATE CONSTRAINT constraint_name  
| DROP CONSTRAINT [ IF EXISTS ] constraint_name [ RESTRICT | CASCADE ]  
| CLUSTER ON index_name  
| SET WITHOUT CLUSTER  
| SET ( {storage_parameter = value} [, ... ] )  
| RESET ( storage_parameter [, ... ] )  
| OWNER TO new_owner  
| SET TABLESPACE new_tablespace  
| SET {COMPRESS|NOCOMPRESS}  
| TO { GROUP groupname | NODE ( nodename [, ... ] ) }  
| ADD NODE ( nodename [, ... ] )  
| DELETE NODE ( nodename [, ... ] )  
| UPDATE SLICE LIKE table_name  
| DISABLE TRIGGER [ trigger_name | ALL | USER ]  
| ENABLE TRIGGER [ trigger_name | ALL | USER ]  
| ENABLE REPLICA TRIGGER trigger_name  
| ENABLE ALWAYS TRIGGER trigger_name  
| ENABLE ROW LEVEL SECURITY  
| DISABLE ROW LEVEL SECURITY  
  
| FORCE ROW LEVEL SECURITY
```

```
| NO FORCE ROW LEVEL SECURITY  
| ENCRYPTION KEY ROTATION  
  
| REPLICATION { DEFAULT | USING INDEX index_name | FULL | NOTHING }  
| AUTO_INCREMENT [=] value  
| [ [ DEFAULT ] CHARACTER SET | CHARSET [=] default_charset ] [ [ DEFAULT ] COLLATE [=]  
default_collation ]  
| CONVERT TO CHARACTER SET | CHARSET charset | DEFAULT [ COLLATE collation ]
```

 NOTE

- **ADD table\_constraint [ NOT VALID ]**  
Adds a table constraint.
- **ADD table\_constraint\_using\_index**  
Adds a primary key constraint or unique constraint to a table based on the existing unique index.
- **VALIDATE CONSTRAINT constraint\_name**  
Validates a check-class constraint created with the **NOT VALID** option, and scans the entire table to ensure that all rows meet the constraint. Nothing happens if the constraint is already marked valid.
- **DROP CONSTRAINT [ IF EXISTS ] constraint\_name [ RESTRICT | CASCADE ]**  
Deletes a table constraint.
- **CLUSTER ON index\_name**  
Selects the default index for future CLUSTER operations. Actually, the table is not re-clustered.
- **SET WITHOUT CLUSTER**  
Deletes the most recently used CLUSTER index from the table. This affects future CLUSTER operations that do not specify an index.
- **SET ( {storage\_parameter = value} [, ... ] )**  
Changes one or more storage parameters for the table. If the value of **table\_name** is an index name, **ACTIVE\_PAGES** specifies the number of index pages, which may be less than the actual number of physical file pages and can be used for optimizer optimization. Currently, this parameter is valid only for the local index of the Ustore partitioned table and will be updated by VACUUM and ANALYZE (including AUTOVACUUM). You are advised not to manually set this parameter.
- **RESET ( storage\_parameter [, ... ] )**  
Resets one or more storage parameters to their defaults. As with SET, a table rewrite might be needed to update the table entirely.
- **OWNER TO new\_owner**  
Changes the owner of a table, sequence, or view to the specified user.
- **SET TABLESPACE new\_tablespace**  
Changes the table's tablespace to the specified tablespace and moves the data files associated with the table to the new tablespace. Indexes on the table, if any, are not moved; but they can be moved separately with additional **SET TABLESPACE** option in ALTER INDEX.
- **SET {COMPRESS|NOCOMPRESS}**  
Sets the compression feature of a table. The table compression feature affects only the storage mode of data inserted in a batch subsequently and does not affect storage of existing data. Setting the table compression feature will result in the fact that there are both compressed and uncompressed data in the table. Row-store tables do not support compression.
- **TO { GROUP groupname | NODE ( nodename [, ... ] ) }**  
The syntax is only available in extended mode (when GUC parameter **support\_extended\_features** is **on**). Exercise caution when enabling the mode. It is mainly used for tools like internal dilatation tools. Common users should not use the mode.
- **ADD NODE ( nodename [, ... ] )**  
It is only available for internal scale-out tools. Common users should not use the syntax.
- **DELETE NODE ( nodename [, ... ] )**

It is only available for internal scale-in tools. Common users should not use the syntax.

- **UPDATE SLICE LIKE table\_name**

This syntax is used by internal scaling tools and cannot be used by common users.

- **DISABLE TRIGGER [ trigger\_name | ALL | USER ]**

Disables a single trigger specified by **trigger\_name**, disables all triggers, or disables only user triggers (excluding internally generated constraint triggers, for example, deferrable unique constraint triggers and exclusion constraints triggers).

Exercise caution when using this function because data integrity cannot be ensured as expected if the triggers are not executed.

- **| ENABLE TRIGGER [ trigger\_name | ALL | USER ]**

Enables a single trigger specified by **trigger\_name**, enables all triggers, or enables only user triggers.

- **| ENABLE REPLICA TRIGGER trigger\_name**

Determines that the trigger firing mechanism is affected by the GUC variable *session\_replication\_role*. When the replication role is **origin** (default value) or **local**, a simple trigger is fired.

When **ENABLE REPLICA** is configured for a trigger, it is triggered only when the session is in replica mode.

- **| ENABLE ALWAYS TRIGGER trigger\_name**

Determines that all triggers are fired regardless of the current replica mode.

- **| DISABLE/ENABLE ROW LEVEL SECURITY**

Enables or disables row-level security for a table.

If row-level security is enabled for a data table but no row-level security policy is defined, the row-level access to the data table is not affected. If row-level security for a table is disabled, the row-level access to the table is not affected even if a row-level security policy has been defined. For details, see [CREATE ROW LEVEL SECURITY POLICY](#).

- **| NO FORCE/FORCE ROW LEVEL SECURITY**

Forcibly enables or disables row-level security for a table.

By default, the table owner is not affected by the row-level security feature. However, if row-level security is forcibly enabled, the table owner (excluding system administrators) will be affected. System administrators are not affected by any row-level security policies.

- **| ENCRYPTION KEY ROTATION**

Rotation of the transparent data encryption key.

The data encryption key rotation of a table can be performed only when the TDE function is enabled for the database and **enable\_tde** of the table is set to **on**. After the key rotation operation is performed, the system automatically applies for a new KMS key. After the key rotation, the data encrypted using the old key is decrypted using the old key, and the newly written data is encrypted using the new key. To ensure the security of encrypted data, you can periodically update the key based on the amount of new data in the encrypted table. It is recommended that the key be updated every two to three years.

- **REPLICA IDENTITY { DEFAULT | USING INDEX index\_name | FULL | NOTHING }**

Specifies the record level of old tuples in UPDATE and DELETE statements on a table in logical replication scenarios.

- **DEFAULT** records the old value of the primary key column. If there is no primary key, **DEFAULT** does not record the old value.
- **USING INDEX** records the old values of columns covered by the named indexes. These values must be unique, non-local, and non-deferrable, and contain the values of columns marked **NOT NULL**.

- **FULL** records the old values of all columns in the row.
- **NOTHING** does not record information in old rows.

In logical replication scenarios, when the UPDATE and DELETE statements of a table are parsed, the parsed old tuples consist of the information recorded in this method. For tables with primary keys, this option can be set to **DEFAULT** or **FULL**. For a table without a primary key, set this parameter to **FULL**. Otherwise, the old tuple will be parsed as empty during decoding. You are advised not to set this parameter to **NOTHING** in common scenarios because old tuples are always parsed as empty.

Even if **DEFAULT** or **USING INDEX** is specified, the old values of the columns in the current Ustore table may contain the old values of all columns in the row. This configuration option takes effect only when the old values involve TOAST values. For the ustore table, the **NOTHING** option is invalid, and the actual effect is the same as that of **FULL**.

- **AUTO\_INCREMENT [ = ] value**

Sets the next auto-increment value of the auto-increment column. The configured value takes effect only when it is greater than the current auto-increment counter.

The value must be a non-negative integer and cannot be greater than  $2^{127} - 1$ .

This clause takes effect only when **sql\_compatibility** is set to **B**.

- **[ [ DEFAULT ] CHARACTER SET | CHARSET [ = ] default\_charset ] [ [ DEFAULT ] COLLATE [ = ] default\_collation ]**

Modifies the default character set and default collation of a table to the specified values. The modification does not affect the existing columns in the table.

This clause takes effect only when **sql\_compatibility** is set to **B**.

- **CONVERT TO CHARACTER SET | CHARSET charset [ COLLATE collation ]**

Modifies the default character set and default collation of a table to the specified values, sets the character set and collation of all columns with character type to the specified value and converts the data in the column to new character set encoding.

- The **column\_clause** can be one of the following clauses:

```
ADD [ COLUMN ] column_name data_type [ CHARACTER SET | CHARSET charset ]
[ compress_mode ] [ COLLATE collation ] [ column_constraint [ ... ] ] [ FIRST | AFTER
column_name ]
| MODIFY column_name data_type
| MODIFY column_name [ CONSTRAINT constraint_name ] NOT NULL [ ENABLE ]
| MODIFY column_name [ CONSTRAINT constraint_name ] NULL
| MODIFY [ COLUMN ] column_name data_type [ CHARACTER SET | CHARSET charset ]
[ [ COLLATE collation ] | [ column_constraint ] [ ... ] ] [ FIRST | AFTER column_name ]
| CHANGE [ COLUMN ] column_name new_column_name data_type [ CHARACTER SET |
CHARSET charset ] [ [ COLLATE collation ] | [ column_constraint ] [ ... ] ] [ FIRST | AFTER
column_name ]
| DROP [ COLUMN ] [ IF EXISTS ] column_name [ RESTRICT | CASCADE ]
| ALTER [ COLUMN ] column_name [ SET DATA ] TYPE data_type [ COLLATE collation ] [ USING
expression ]
| ALTER [ COLUMN ] column_name { SET DEFAULT expression | DROP DEFAULT }
| ALTER [ COLUMN ] column_name { SET | DROP } NOT NULL
| ALTER [ COLUMN ] column_name SET STATISTICS [PERCENT] integer
| ADD STATISTICS (( column_1_name, column_2_name [, ... ] ))
| DELETE STATISTICS (( column_1_name, column_2_name [, ... ] ))
| ALTER [ COLUMN ] column_name SET ( {attribute_option = value} [, ... ] )
| ALTER [ COLUMN ] column_name RESET ( attribute_option [, ... ] )
| ALTER [ COLUMN ] column_name SET STORAGE { PLAIN | EXTERNAL | EXTENDED | MAIN }
```

 NOTE

- **ADD [ COLUMN ] column\_name data\_type [ CHARACTER SET | CHARSET [ = ] charset ] [ compress\_mode ] [ COLLATE collation ] [ column\_constraint [ ... ] ] [ FIRST | AFTER column\_name]**  
Adds a column to a table. If a column is added using ADD COLUMN, all existing rows in the table are initialized with the column's default value (NULL if no DEFAULT clause is specified). FIRST | AFTER column\_name indicates that a column is added to a certain position.
- **ADD ( { column\_name data\_type [ compress\_mode ] } [, ...] )**  
Adds columns in the table.
- **MODIFY ( { column\_name data\_type | column\_name [ CONSTRAINT constraint\_name ] NOT NULL [ ENABLE ] | column\_name [ CONSTRAINT constraint\_name ] NULL } [, ...] )**  
Modifies the data type of an existing column in the table. Running this command will clear the statistics of this column. You are advised to collect the statistics of this column again after the modification.
- **MODIFY [ COLUMN ] column\_name data\_type [ CHARACTER SET | CHARSET charset ] [{{ COLLATE collation } | [ column\_constraint ]} [ ... ] ] [FIRST | AFTER column\_name]**  
Replaces the definition of existing field in a table with a new definition. The indexes and independent object constraints, such as primary keys, unique key and CHECK constraints in the previous field are not deleted. The [FIRST | AFTER column\_name] syntax indicates that the position of a column in a table is changed when the column definition is modified.  
  
This syntax can be used only when **sql\_compatibility** is set to 'B'. Foreign tables are not supported. Encrypted columns cannot be modified. The data type and collation rule of partition key columns cannot be modified. The data type and collation rule of columns referenced by rules and materialized views cannot be modified.  
  
If a column whose data type or collation rule is modified is referenced by a generated column, the data in the generated column is regenerated.  
  
If some objects (such as indexes, independent object constraints, views, triggers, and row-level security policies) depend on a modified column, these objects are re-created during column modification. If the definition of the modified column violates the constraints of this type of object, the modification fails. For example, the data type of the column that is used as the view result column cannot be modified. Pay attention on the failure impact before modification.  
  
If a modified column is called by some objects (such as user-defined functions and stored procedures), the modified column does not process these objects. After the columns are modified, these objects may be unavailable. Please evaluate the impact before modification.  
  
Changing the character set or collation of a column converts the data in the column to the new character set for encoding.  
  
The syntax of this clause is the same as that of **MODIFY column\_name data\_type** in the previous clause, but the semantic function is different. When the GUC parameter **b\_format\_behavior\_compat\_options** contains the 'enable\_modify\_column' option, the function of this clause is used.  
  
Running this command will clear the statistics of this column. You are advised to collect the statistics of this column again after the modification.
- **CHANGE [ COLUMN ] old\_column\_name new\_column\_name data\_type [ CHARACTER SET | CHARSET charset ] [{{ COLLATE collation } | [ column\_constraint ]} [ ... ] ] [FIRST | AFTER column\_name]**  
Replaces the definition and name of existing column in a table with a new definition and name. The new column name must be different from the

previous. The indexes and independent object constraints, such as primary keys, unique key and CHECK constraints in the previous column are not deleted. The **[FIRST | AFTER column\_name]** syntax indicates that the position of a column in a table is changed when the name and definition of the column are modified.

This syntax can be used only when **sql\_compatibility** is set to 'B'. Foreign tables are not supported. Encrypted columns cannot be modified. The data type and collation rule of partition key columns cannot be modified. The data type and collation rule of columns referenced by rules and materialized views cannot be modified.

If a column whose data type or collation rule is modified is referenced by a generated column, the data in the generated column is regenerated.

If some objects (such as indexes, independent object constraints, views, triggers, and row-level security policies) depend on a modified column, these objects are re-created during column modification. If the definition of the modified column violates the constraints of this type of object, the modification fails. For example, the data type of the column that is used as the view result column cannot be modified. Pay attention on the failure impact before modification.

If a modified column is called by some objects (such as user-defined functions and stored procedures), the modified column does not process these objects. After the column names are modified, these objects may be unavailable. Please evaluate the impact before modification.

Modifying the character set or collation of a column converts the data in the column to the new character set for encoding.

- **DROP [ COLUMN ] [ IF EXISTS ] column\_name [ RESTRICT | CASCADE ]**

Drops a column from a table. Indexes and constraints related to the column are automatically dropped. If an object not belonging to the table depends on the column, **CASCADE** must be specified, such as a view.

The DROP COLUMN statement does not physically remove the column, but simply makes it invisible to SQL operations. Subsequent INSERT and UPDATE operations in the table will store a **NULL** value for the column. Therefore, column deletion takes a short period of time but does not immediately release the tablespace on the disks, because the space occupied by the deleted column is not recycled. The space will be recycled when VACUUM is executed.

- **ALTER [ COLUMN ] column\_name [ SET DATA ] TYPE data\_type [ COLLATE collation ] [ USING expression ]**

Modifies the type of a column in a table. Indexes and simple table constraints on the column will automatically use the new data type by reparsing the originally supplied expression.

If the original data type of a column and the modified data type are binary compatible, you do not need to rewrite the entire table when running this statement. In other scenarios, the entire table is rewritten. You can check whether the original type and target type are binary compatible in the PG\_CAST system catalog. If **castmethod** is 'b', they are binary compatible. For example, if the data type of the source table is text and is converted to int, table rewriting is triggered. If it is converted to clob, table rewriting is not triggered. If table rewriting is triggered, the deleted space on the table is recycled immediately.

Running this command will clear the statistics of this column. You are advised to collect the statistics of this column again after the modification.

- **ALTER [ COLUMN ] column\_name { SET DEFAULT expression | DROP DEFAULT }**

Sets or removes the default value for a column. The default values only apply to subsequent INSERT operations; they do not cause rows already in the table to change. Defaults can also be created for views, in which case they are

inserted into INSERT statements on the view before the view's ON INSERT rule is applied.

- **ALTER [ COLUMN ] column\_name { SET | DROP } NOT NULL**  
Changes whether a column is marked to allow null values or to reject null values. You can only use SET NOT NULL when the column contains no null values.
- **ALTER [ COLUMN ] column\_name SET STATISTICS [PERCENT] integer**  
Specifies the per-column statistics-gathering target for subsequent ANALYZE operations. The target can be set in the range from 0 to 10000. Set it to -1 to revert to using the default system statistics target.
- **{ADD | DELETE} STATISTICS ((column\_1\_name, column\_2\_name [, ...]))**  
Adds or deletes the declaration of collecting multi-column statistics to collect multi-column statistics as needed when ANALYZE is performed for a table or a database. If the GUC parameter **enable\_functional\_dependency** is disabled, the statistics about a maximum of 32 columns can be collected at a time. If the GUC parameter **enable\_functional\_dependency** is enabled, the statistics about a maximum of 4 columns can be collected at a time. You are not allowed to add or delete such declaration for system catalogs or foreign tables.
- **{ENABLE | DISABLE } STATISTICS ((column\_1\_name, column\_2\_name [, ...]))**  
Enables or disables multi-column statistics. When automatic statistics creation is enabled (the GUC parameter **auto\_statistic\_ext\_columns** is required), you can disable specific multi-column combinations to prevent them from being automatically created and used.
- **ALTER [ COLUMN ] column\_name SET ( {attribute\_option = value} [, ... ] )**  
**ALTER [ COLUMN ] column\_name RESET ( attribute\_option [, ... ] )**  
Sets or resets per-attribute options.  
Currently, the only defined attribute options are **n\_distinct** and **n\_distinct\_inherited**. **n\_distinct** affects statistics of a table, while **n\_distinct\_inherited** affects the statistics of the table and its subtables. Currently, only **SET/RESET n\_distinct** is supported, and **SET/RESET n\_distinct\_inherited** is forbidden.
- **ALTER [ COLUMN ] column\_name SET STORAGE { PLAIN | EXTERNAL | EXTENDED | MAIN }**  
Sets the storage mode for a column. It specifies whether this column is held inline or in an attached table, and whether the data should be compressed. SET STORAGE itself does not change anything in the table. It sets the strategy to be pursued during future table updates.
- **column\_constraint** is as follows:  

```
[ CONSTRAINT constraint_name ]
{ NOT NULL |
  NULL |
  CHECK ( expression ) |
  DEFAULT default_expr |
  GENERATED ALWAYS AS ( generation_expr ) [STORED] |
  AUTO_INCREMENT |
  UNIQUE [KEY] index_parameters |
  PRIMARY KEY index_parameters |
  ENCRYPTED WITH ( COLUMN_ENCRYPTION_KEY = column_encryption_key,
  ENCRYPTION_TYPE = encryption_type_value )
|
  REFERENCES reftable [ ( refcolumn ) ] [ MATCH FULL | MATCH PARTIAL | MATCH
SIMPLE ]
  [ ON DELETE action ] [ ON UPDATE action ] } [ DEFERRABLE | NOT DEFERRABLE
| INITIALLY DEFERRED | INITIALLY IMMEDIATE ]
```

- **compress\_mode** of a column is as follows:  
{ DELTA | PREFIX | DICTIONARY | NUMSTR | NOCOMPRESS }
- **table\_constraint\_using\_index** used to add the primary key constraint or unique constraint based on the unique index is as follows:  
[ CONSTRAINT constraint\_name ]  
{ UNIQUE | PRIMARY KEY } USING INDEX index\_name  
[ DEFERRABLE | NOT DEFERRABLE | INITIALLY DEFERRED | INITIALLY IMMEDIATE ]
- **table\_constraint** is as follows:  
[ CONSTRAINT [ constraint\_name ] ]  
{ CHECK ( expression ) |  
UNIQUE [ idx\_name ] [ USING method ] ( { { column\_name | ( expression ) } [ ASC |  
DESC ] } [, ... ] ) index\_parameters |  
PRIMARY KEY [ USING method ] ( { column\_name [ ASC | DESC ] } [, ... ] ) index\_parameters  
)|  
FOREIGN KEY [ idx\_name ] ( column\_name [, ... ] ) REFERENCES reftable [ ( refcolumn  
[, ... ] ) ]  
[ MATCH FULL | MATCH PARTIAL | MATCH SIMPLE ] [ ON DELETE action ] [ ON UPDATE  
action ] }  
[ DEFERRABLE | NOT DEFERRABLE | INITIALLY DEFERRED | INITIALLY IMMEDIATE ]
- index\_parameters** is as follows:  
[ WITH ( {storage\_parameter = value} [, ... ] ) ]  
[ USING INDEX TABLESPACE tablespace\_name ] [BY GLOBAL INDEX]
- Rename a table. The renaming does not affect stored data.  
ALTER TABLE [ IF EXISTS ] table\_name  
RENAME TO new\_table\_name;
- Rename the specified column in the table.  
ALTER TABLE [ IF EXISTS ] { table\_name [\*] | ONLY table\_name | ONLY ( table\_name ) }  
RENAME [ COLUMN ] column\_name TO new\_column\_name;
- Rename the constraint of the table.  
ALTER TABLE [ IF EXISTS ] { table\_name [\*] | ONLY table\_name | ONLY ( table\_name ) }  
RENAME CONSTRAINT constraint\_name TO new\_constraint\_name;
- Set the schema of the table.  
ALTER TABLE [ IF EXISTS ] table\_name  
SET SCHEMA new\_schema;

#### NOTE

- The schema setting moves the table into another schema. Associated indexes and constraints owned by table columns are migrated as well. Currently, the schema for sequences cannot be changed. If the table has sequences, delete the sequences, and create them again or delete the ownership between the table and sequences. In this way, the table schema can be changed.
- To change the schema of a table, you must also have the CREATE permission on the new schema. To add the table as a new child of a parent table, you must own the parent table as well. To alter the owner, you must also be a direct or indirect member of the new owning role, and that role must have the CREATE permission on the table's schema. These restrictions enforce that the user can only re-create and delete the table. However, a system administrator can alter the ownership of any table anyway.
- All the actions except for RENAME and SET SCHEMA can be combined into a list of multiple alterations to apply in parallel. For example, it is possible to add several columns or alter the type of several columns in a single command. This is useful with large tables, since only one pass over the tables need be made.
- Adding a CHECK or NOT NULL constraint will scan the table to validate that existing rows meet the constraint.
- Adding a column with a non-NULL default or changing the type of an existing column will rewrite the entire table. Rewriting a large table may take much time and temporarily needs doubled disk space.

- Add columns.  

```
ALTER TABLE [ IF EXISTS ] table_name  
  ADD ( { column_name data_type [ compress_mode ] [ COLLATE collation ] [ column_constraint  
  [ ... ] } [ , ... ] );
```
- Update columns.  

```
ALTER TABLE [ IF EXISTS ] table_name  
  MODIFY ( { column_name data_type | column_name [ CONSTRAINT constraint_name ] NOT NULL  
  [ ENABLE ] | column_name [ CONSTRAINT constraint_name ] NULL } [ , ... ] );
```

## Parameters

- **IF EXISTS**  
Sends a notice instead of an error if no tables have identical names. The notice prompts that the table you are querying does not exist.
- **table\_name [\*] | ONLY table\_name | ONLY ( table\_name )**  
**table\_name** is the name of the table that you need to modify.  
If **ONLY** is specified, only the table is modified. If **ONLY** is not specified, the table and all subtables are modified. You can add the asterisk (\*) option following the table name to specify that all subtables are scanned, which is the default operation.
- **constraint\_name**
  - Specifies the name of an existing constraint to drop in the DROP CONSTRAINT operation.
  - Specifies the name of a new constraint in the ADD CONSTRAINT operation.

---

### NOTICE

For a new constraint, **constraint\_name** is optional in B-compatible mode (that is, **sql\_compatibility** set to 'B'). For other modes, **constraint\_name** is required.

---

- **index\_name**  
Specifies the index name.
- **idx\_name**  
Index name

---

### NOTICE

In the ADD CONSTRAINT operation:

- **index\_name** is supported only in B-compatible databases (that is, **sql\_compatibility** set to 'B').
  - For foreign key constraints, if **constraint\_name** and **index\_name** are specified at the same time, **constraint\_name** is used as the index name.
  - For a unique key constraint, if both **constraint\_name** and **index\_name** are specified, **index\_name** is used as the index name.
- 
- **USING method**

Specifies the name of the index method to be used.

For details about the value range, see USING method in [Parameters](#).

---

#### NOTICE

In the ADD CONSTRAINT operation:

- The USING method is supported only in B-compatible databases (that is, **sql\_compatibility** set to 'B').
- In B-compatible mode, if USING method is not specified, the default index method is B-tree for Astore or UB-tree for Ustore.

---

- **ASC | DESC**

**ASC** specifies an ascending (default) sort order. **DESC** specifies a descending sort order.

---

#### NOTICE

In ADD CONSTRAINT, ASC|DESC is supported only in B-compatible databases (that is, **sql\_compatibility** set to 'B').

---

- **expression**

Specifies an expression index constraint based on one or more columns of the table. It must be written in parentheses.

---

#### NOTICE

Expression indexes in the UNIQUE constraint are supported only in B-compatible databases (that is, **sql\_compatibility** set to 'B').

---

- **storage\_parameter**

Specifies the name of a storage parameter.

TDE options:

- **enable\_tde** (Boolean type)

Specifies whether transparent data encryption is enabled for a table. Before enabling this function, ensure that the GUC parameter **enable\_tde** has been enabled, the KMS has been enabled, and the database instance master key ID in the GUC parameter **tde\_cmek\_id** has been correctly configured.

This parameter supports only row-store tables. Temporary tables are not supported. The Ustore storage engine is not supported. The Ustore storage engine is not supported. This parameter can be modified only when **enable\_tde** is specified during table creation. Switching the encryption switch status does not change the encryption algorithm and key information.

Value range: **on** and **off**. **on** indicates that transparent data encryption is enabled. After the value is switched from **off** to **on**, new data is automatically encrypted when being written to the data page, and old

data is automatically encrypted when the data page is updated. **off** indicates that transparent data encryption is disabled. After the value is switched from **on** to **off**, newly written data is not encrypted, old encrypted data can be automatically decrypted when being read, and data is not encrypted when being written back to the data page.

Default value: **off**

The following option is added for creating an index:

– **parallel\_workers** (int type)

Number of bgworker threads started when an index is created. For example, value **2** indicates that two bgworker threads are started to create indexes concurrently.

Value range: [0,32]. The value **0** indicates that concurrent index creation is disabled.

Default value: If this parameter is not set, the concurrent index creation function is disabled.

– **hasuids** (Boolean type)

Default value: **off**

If this parameter is set to **on**, a unique table-level ID is allocated to a tuple when the tuple is updated.

• **new\_owner**

Specifies the name of the new table owner.

• **new\_tablespace**

Specifies the new name of the tablespace to which the table belongs.

• **column\_name, column\_1\_name, column\_2\_name**

Specifies the name of a new or existing column.

• **data\_type**

Specifies the type of a new column or a new type of an existing column.

• **compress\_mode**

Specifies whether to compress a table column. The clause specifies the compression algorithm preferentially used by the column. Row-store tables do not support compression.

• **charset**

This syntax is supported only in B-compatible databases (that is, **sql\_compatibility** set to 'B'). It specifies the character set of a table column. If this parameter is specified separately, the collation of the table column is set to the default collation of the specified character set.

• **collation**

Specifies the collation rule name of a column. The optional COLLATE clause specifies a collation for the new column; if omitted, the collation is the default for the new column. You can run the **select \* from pg\_collation;** command to query collation rules from the **pg\_collation** system catalog. The default collation rule is the row starting with **default** in the query result.

In a B-compatible database (that is, **sql\_compatibility** set to 'B'), the **utf8mb4\_bin**, **utf8mb4\_general\_ci**, **utf8mb4\_unicode\_ci**, and binary collations are also supported. For details, see [Table 7-145](#).

 **NOTE**

- Only the character type supports the specified character set. If the binary character set or collation is specified, the character type is converted to the corresponding binary type. If the type mapping does not exist, an error is reported. Currently, only the mapping from the TEXT type to the BLOB type is available.
  - Except the binary character set and collation, only the character set that is the same as the database encoding can be specified.
  - If the character set or collation of a column is not explicitly specified and the default character set or collation of the table is specified, the character set or collation of the column is inherited from the table. If the default character set or collation of a table does not exist, the character set and collation of table columns inherit the character set and collation of the current database when **b\_format\_behavior\_compat\_options** is set to **'default\_collation'**.
  - If the character set corresponding to the modified character set or collation is different from the character set of current column, the data in the column is converted to the specified character set for encoding.
- **USING expression**  
Specifies how to compute the new column value from the old; if omitted, the default conversion is an assignment cast from old data type to new. A USING clause must be provided if there is no implicit or assignment cast from the old to new type.

 **NOTE**

USING in ALTER TYPE can specify any expression involving the old values of the row; that is, it can refer to any columns other than the one being cast. This allows general casting to be done with the ALTER TYPE syntax. Because of this flexibility, the USING expression is not applied to the column's default value (if any); the result might not be a constant expression as required for a default. This means that when there is no implicit or assignment cast from old to new type, ALTER TYPE might fail to convert the default even though a USING clause is supplied. In such cases, drop the default with DROP DEFAULT, perform ALTER TYPE, and then use SET DEFAULT to add a suitable new default. Similar considerations apply to indexes and constraints involving the column.

- **NOT NULL | NULL**  
Sets whether the column allows null values.
- **ENABLE**  
Specifies that the constraint is enabled. By default, the constraint is enabled.
- **integer**  
Specifies the constant value of a signed integer. When using **PERCENT**, the range of **integer** is from 0 to 100.
- **attribute\_option**  
Specifies an attribute option.
- **PLAIN | EXTERNAL | EXTENDED | MAIN**  
Specifies a column-store mode.
  - **PLAIN** must be used for fixed-length values (such as integers). It must be inline and uncompressed.
  - **MAIN** is for inline, compressible data.
  - **EXTERNAL** is for external, uncompressed data. Use of **EXTERNAL** will make substring operations on **text** and **bytea** values run faster, at the penalty of increased storage space.

- **EXTENDED** is for external, compressed data. **EXTENDED** is the default for most data types that support non-**PLAIN** storage.
- **CHECK ( expression )**

New rows or rows to be updated must satisfy for an expression to be true. If any row produces a false result, an error is raised and the database is not modified.

A check constraint specified as a column constraint should reference only the column's values, while an expression in a table constraint can reference multiple columns.

Currently, **CHECK ( expression )** does not include subqueries and cannot use variables apart from the current column.
- **DEFAULT default\_expr**

Assigns a default data value to a column.

The data type of the default expression must match the data type of the column.

The default expression will be used in any insert operation that does not specify a value for the column. If there is no default value for a column, then the default value is **NULL**.
- **COLUMN\_ENCRYPTION\_KEY = column\_encryption\_key**

Specifies the name of the column encryption key in the ENCRYPTED WITH constraint.

Value range: a string. It must comply with the naming convention.
- **ENCRYPTION\_TYPE = encryption\_type\_value**

For the encryption type in the ENCRYPTED WITH constraint, the value of **encryption\_type\_value** is **DETERMINISTIC** or **RANDOMIZED**.
- **GENERATED ALWAYS AS ( generation\_expr ) [STORED]**

This clause creates a column as a generated column. The value of the generated column is calculated by **generation\_expr** when data is written (inserted or updated). **STORED** indicates that the value of the generated column is stored as a common column.

 NOTE

- The STORED keyword can be omitted, which has the same semantics as not omitting STORED.
- The generation expression cannot refer to data other than the current row in any way. The generation expression cannot reference other generation columns or system columns. The generation expression cannot return a result set. No subquery, aggregate function, or window function can be used. The function called by the generation expression can only be an immutable function.
- Default values cannot be specified for generated columns.
- The generated column cannot be used as a part of the partition key.
- Do not specify the generated column and the CASCADE, SET NULL, and SET DEFAULT actions of the ON UPDATE constraint clause together. Do not specify the generated column and the SET NULL, and SET DEFAULT actions of the ON DELETE constraint clause together.
- The method of modifying and deleting generated columns is the same as that of common columns. If you delete a common column that a generated column depends on, the generated column is automatically deleted. The type of the column on which the generated column depends cannot be changed.
- The generated column cannot be directly written. In the INSERT or UPDATE statement, values cannot be specified for generated columns, but the keyword DEFAULT can be specified.
- The permission control for generated columns is the same as that for common columns.
  - Only **postgres\_fdw** in the foreign table can generate columns.
- **AUTO\_INCREMENT**  
Specifies an auto-increment column.  
For details, see [AUTO\\_INCREMENT](#).
- **UNIQUE [KEY] index\_parameters**  
**UNIQUE ( column\_name [, ... ] ) index\_parameters**  
UNIQUE specifies that a group of one or more columns of a table can contain only unique values.  
UNIQUE KEY can be used only when **sql\_compatibility** is set to 'B', which has the same semantics as UNIQUE.
- **PRIMARY KEY index\_parameters**  
**PRIMARY KEY ( column\_name [, ... ] ) index\_parameters**  
Specifies that a column or columns of a table can contain only unique (non-duplicate) and non-null values.
- **REFERENCES reftable [ ( refcolumn ) ] [ MATCH matchtype ] [ ON DELETE action ] [ ON UPDATE action ] (column constraint)**  
**FOREIGN KEY ( column\_name [, ... ] ) REFERENCES reftable [ ( refcolumn [, ... ] ) ] [ MATCH matchtype ] [ ON DELETE action ] [ ON UPDATE action ] (table constraint)**  
The foreign key constraint requires that the group consisting of one or more columns in the new table should contain and match only the referenced column values in the referenced table. If **refcolumn** is omitted, the primary key of **reftable** is used. The referenced column should be the only column or primary key in the referenced table. A foreign key constraint cannot be defined between a temporary table and a permanent table.

There are three types of matching between a reference column and a referenced column:

- **MATCH FULL**: A column with multiple foreign keys cannot be **NULL** unless all foreign key columns are **NULL**.
- **MATCH SIMPLE** (default): Any unexpected foreign key column can be **NULL**.
- **MATCH PARTIAL**: This option is not supported currently.

In addition, when certain operations are performed on the data in the referenced table, the operations are performed on the corresponding columns in the new table. **ON DELETE**: specifies the operations to be executed after a referenced row in the referenced table is deleted. **ON UPDATE**: specifies the operation to be performed when the referenced column data in the referenced table is updated. Possible responses to the **ON DELETE** and **ON UPDATE** clauses are as follows:

- **NO ACTION** (default): When a foreign key is deleted or updated, an error indicating that the foreign key constraint is violated is created. If the constraint is deferrable and there are still any referenced rows, this error will occur when the constraint is checked.
- **RESTRICT**: When a foreign key is deleted or updated, an error indicating that the foreign key constraint is violated is created. It is the same as **NO ACTION** except that the constraint is not deferrable.
- **CASCADE**: deletes any row that references the deleted row from the new table, or update the field value of the referenced row in the new table to the new value of the referenced column.
- **SET NULL**: sets the referenced columns to **NULL**.
- **SET DEFAULT**: sets the referenced columns to their default values.
- **DEFERRABLE | NOT DEFERRABLE | INITIALLY DEFERRED | INITIALLY IMMEDIATE**  
Sets whether the constraint can be deferrable.
  - **DEFERRABLE**: deferrable to the end of the transaction and checked using **SET CONSTRAINTS**.
  - **NOT DEFERRABLE**: checks immediately after the execution of each command.
  - **INITIALLY IMMEDIATE**: checks immediately after the execution of each statement.
  - **INITIALLY DEFERRED**: checks when the transaction ends.
- **WITH ( {storage\_parameter = value} [, ... ] )**  
Specifies an optional storage parameter for a table or an index.
- **tablespace\_name**  
Specifies the name of the tablespace where the index locates.
- **COMPRESS|NOCOMPRESS**
  - **NOCOMPRESS**: If the **NOCOMPRESS** keyword is specified, the existing compression feature of the table will not be changed.
  - **COMPRESS**: If the **COMPRESS** keyword is specified, the table compression feature will be triggered by batch tuple insertion. Row-store tables do not support compression.

- **new\_table\_name**  
Specifies the new table name.
- **new\_column\_name**  
Specifies the new name of a specific column in a table.
- **new\_constraint\_name**  
Specifies the new name of a table constraint.
- **new\_schema**  
Specifies the new schema name.
- **CASCADE**  
Automatically drops objects that depend on the dropped column or constraint (for example, views referencing the column).
- **RESTRICT**  
Refuses to drop the column if the column is referenced by other columns or constraints. **RESTRICT** is the default option. If **CASCADE** is not specified, the value is **RESTRICT**. An example of the statement is as follows:  

```
alter table <Table name>[drop [column] <Column name> [cascade | restrict]];
```
- **FIRST**  
Adds or changes the column to the first place.
- **AFTER column\_name**  
Adds or changes the column after the column specified by **column\_name**.

 **NOTE**

- It is supported only in B-compatible databases (that is, **sql\_compatibility** = 'B').
- **FIRST** | **AFTER column\_name** cannot be used in the encrypted column.
- The position of a column in a table that depends on rules cannot be changed (including the addition and change of the column position).
- **FIRST** | **AFTER column\_name** cannot be used in the foreign table.
- Columns of the SET type cannot be changed to the specified position.
- **schema\_name**  
Specifies the schema name of a table.
- **[DEFAULT] CHARACTER SET | CHARSET [= ] default\_charset**  
This syntax is supported only when **sql\_compatibility** is set to 'B'. It modifies the default character set of a table. If you specify a character set separately, the default collation of the table is set to the default collation of the specified character set.
- **[DEFAULT] COLLATE [= ] default\_collation**  
This syntax is supported only when **sql\_compatibility** is set to 'B'. It modifies the default collation of a table. If you specify a collation separately, the default character set of the table is set to the character set corresponding to the specified collation. For details about the collation, see [Table 7-145](#).

 NOTE

If the character set or collation of a table is not explicitly specified and the default character set or collation of the schema is specified, the character set or collation of the table is inherited from the schema. If the default character set or collation of a schema does not exist, the character set and collation of the table inherit the character set and collation of the current database when **b\_format\_behavior\_compat\_options** is set to **"default\_collation"**.

## Examples of Modifying a Table

- Rename a table.

```
gaussdb=# CREATE TABLE aa(c1 int, c2 int);
gaussdb=# ALTER TABLE IF EXISTS aa RENAME TO test_alt1;
```
- Modify the schema of a table.

```
-- Create the test_schema schema.
gaussdb=# CREATE SCHEMA test_schema;

-- Change the schema of the test_alt1 table to test_schema.
gaussdb=# ALTER TABLE test_alt1 SET SCHEMA test_schema;

-- Query table information.
gaussdb=# SELECT schemaname,tablename FROM pg_tables WHERE tablename = 'test_alt1';
schemaname | tablename
-----+-----
test_schema | test_alt1
(1 row)
```
- Change the owner of a table.

```
-- Create user test_user.
gaussdb=# CREATE USER test_user PASSWORD 'XXXXXXXXXX';

-- Change the owner of the test_alt1 table to test_user.
gaussdb=# ALTER TABLE IF EXISTS test_schema.test_alt1 OWNER TO test_user;

-- Query.
gaussdb=# SELECT tablename, schemaname, tableowner FROM pg_tables WHERE tablename = 'test_alt1';
tablename | schemaname | tableowner
-----+-----+-----
test_alt1 | test_schema | test_user
(1 row)
```
- Modify the tablespace of a table.

```
-- Create the tbs_data1 tablespace.
gaussdb=# CREATE TABLESPACE tbs_data1 RELATIVE LOCATION 'tablespace1/tbs_data1';

-- Change the tablespace of the test_alt1 table to tbs_data1.
gaussdb=# ALTER TABLE test_schema.test_alt1 SET TABLESPACE tbs_data1;

-- Query.
gaussdb=# SELECT tablename, tablespace FROM pg_tables WHERE tablename = 'test_alt1';
tablename | tablespace
-----+-----
test_alt1 | tbs_data1
(1 row)

-- Delete.
gaussdb=# DROP TABLE test_schema.test_alt1;
gaussdb=# DROP TABLESPACE tbs_data1;
gaussdb=# DROP SCHEMA test_schema;
gaussdb=# DROP USER test_user;
```

## Examples of Modifying a Column

- Change column names.

```
-- Create a table.
gaussdb=# CREATE TABLE test_alt2(c1 INT,c2 INT);

-- Change column names.
gaussdb=# ALTER TABLE test_alt2 RENAME c1 TO id;
gaussdb=# ALTER TABLE test_alt2 RENAME COLUMN c2 to areaid;

-- Query.
gaussdb=# \d test_alt1
Table "public.test_alt1"
Column | Type | Modifiers
-----+-----+-----
id | integer |
areaid | integer |
```

- **Add columns.**

```
-- Add a column to the test_alt1 table.
gaussdb=# ALTER TABLE IF EXISTS test_alt2 ADD COLUMN name VARCHAR(20);

-- Query.
gaussdb=# \d test_alt2
Table "public.test_alt1"
Column | Type | Modifiers
-----+-----+-----
id | integer |
areacode | integer |
name | character varying(20) |
```

- **Modify the data type of a column.**

```
-- Change the type of the name column in the test_alt1 table.
gaussdb=# ALTER TABLE test_alt1 MODIFY name VARCHAR(50);

-- Query.
gaussdb=# \d test_alt1
Table "public.test_alt2"
Column | Type | Modifiers
-----+-----+-----
id | integer |
areaid | integer |
name | character varying(50) |
-- Change the type of the name column in the test_alt1 table.
gaussdb=# ALTER TABLE test_alt2 ALTER COLUMN name TYPE VARCHAR(25);

-- Query.
gaussdb=# \d test_alt2
Table "public.test_alt2"
Column | Type | Modifiers
-----+-----+-----
id | integer |
areaid | integer |
name | character varying(25) |
```

- **Delete a column.**

```
-- Delete the areaid column from test_alt1.
gaussdb=# ALTER TABLE test_alt2 DROP COLUMN areaid;

-- Query.
gaussdb=# \d test_alt2
Table "public.test_alt2"
Column | Type | Modifiers
-----+-----+-----
id | integer |
name | character varying(25) |
```

- **Modify the column-store mode.**

```
-- View table details.
gaussdb=# \d+ test_alt2
Table "public.test_alt2"
Column | Type | Modifiers | Storage | Stats target | Description
-----+-----+-----+-----+-----+-----
id | integer | | plain | |
```

```

name | character varying(25) |          | extended |          |
Has OIDs: no
Options: orientation=row, compression=no, storage_type=USTORE

-- Change the storage mode of the name column in the test_alt2 table.
gaussdb=# ALTER TABLE test_alt2 ALTER COLUMN name SET STORAGE PLAIN;

-- Query.
gaussdb=# \d+ test_alt2
          Table "public.test_alt2"
Column |      Type      | Modifiers | Storage | Stats target | Description
-----+-----+-----+-----+-----+-----
id     | integer        |          | plain   |              |
name   | character varying(25) |          | plain   |              |
Has OIDs: no
Options: orientation=row, compression=no, storage_type=USTORE

-- Delete.
gaussdb=# DROP TABLE test_alt2;

```

- Move a column to a specified position.

```

-- Create a B-compatible database.
gaussdb=# CREATE DATABASE test DBCOMPATIBILITY 'B';

-- Connect to the test database and create the tbl_test table.
gaussdb=# \c test
gaussdb=# CREATE TABLE tbl_test(id int, name varchar(20));

-- Change the type of the name column in the tbl_test table and move it to the beginning.
gaussdb=# ALTER TABLE tbl_test MODIFY COLUMN name varchar(25) FIRST;

-- Query.
gaussdb=# \d tbl_test;
          Table "public.tbl_test"
Column |      Type      | Modifiers
-----+-----+-----
name   | character varying(25) |
id     | integer        |

-- Change the type of the name column in the tbl_test table and move it after the id column.
gaussdb=# ALTER TABLE tbl_test MODIFY COLUMN name varchar(10) AFTER id;

-- Query.
gaussdb=# \d tbl_test;
          Table "public.tbl_test"
Column |      Type      | Modifiers
-----+-----+-----
id     | integer        |
name   | character varying(10) |

-- Delete the tbl_test table.
gaussdb=# DROP TABLE tbl_test;

-- Switch to the default database and delete the test database. (Switch to the corresponding
database as required.)
gaussdb=# \c postgres
gaussdb=# DROP DATABASE test;

```

## Examples of Modifying a Constraint

- Add a not-null constraint to a column.

```

-- Create a table.
gaussdb=# CREATE TABLE test_alt3(pid INT, areaid CHAR(5), name VARCHAR(20));

Add a not-null constraint to pid.
gaussdb=# ALTER TABLE test_alt3 MODIFY pid NOT NULL;

-- Query.
gaussdb=# \d test_alt3

```

```

Table "public.test_alt3"
Column |      Type      | Modifiers
-----+-----+-----
pid    | integer        | not null
areaid | character(5)   |
name   | character varying(20) |

```

- Cancel the not-null constraint on a column.

```

gaussdb=# ALTER TABLE test_alt3 MODIFY pid NULL;
-- Query.

```

```

gaussdb=# \d test_alt3
Table "public.test_alt3"
Column |      Type      | Modifiers
-----+-----+-----
pid    | integer        |
areaid | character(5)   |
name   | character varying(20) |

```

- Modify the default value of a column.

```

-- Modify the default value of id in the test_alt1 table.

```

```

gaussdb=# ALTER TABLE test_alt3 ALTER COLUMN areaid SET DEFAULT '00000';

```

```

-- Query.

```

```

gaussdb=# \d test_alt3
Table "public.test_alt3"
Column |      Type      | Modifiers
-----+-----+-----
pid    | integer        |
areaid | character(5)   | default '00000'::bpchar
name   | character varying(20) |

```

```

-- Delete the default value of id.

```

```

gaussdb=# ALTER TABLE test_alt3 ALTER COLUMN areaid DROP DEFAULT;

```

```

-- Query.

```

```

gaussdb=# \d test_alt3
Table "public.test_alt3"
Column |      Type      | Modifiers
-----+-----+-----
pid    | integer        |
areaid | character(5)   |
name   | character varying(20) |

```

- Add a table-level constraint.

- Directly add a constraint.

```

-- Add a primary key constraint to the table.

```

```

gaussdb=# ALTER TABLE test_alt3 ADD CONSTRAINT pk_test3_pid PRIMARY KEY (pid);

```

```

-- Query.

```

```

gaussdb=# \d test_alt3
Table "public.test_alt3"
Column |      Type      | Modifiers
-----+-----+-----
pid    | integer        | not null
areaid | integer        |
name   | character varying(20) |
Indexes:
    "pk_test3_pid" PRIMARY KEY, btree (pid) TABLESPACE pg_default

```

- Create an index and then add constraints.

```

-- Create a table.

```

```

gaussdb=# CREATE TABLE test_alt4(c1 INT, c2 INT);

```

```

-- Create an index.

```

```

gaussdb=# CREATE UNIQUE INDEX pk_test4_c1 ON test_alt4(c1);

```

```

-- Associate the created index when adding a constraint.

```

```

gaussdb=# ALTER TABLE test_alt4 ADD CONSTRAINT pk_test4_c1 PRIMARY KEY USING INDEX
pk_test4_c1;

```

```

-- Query.

```

```
gaussdb=# \d test_alt4
Table "public.test_alt4"
Column | Type | Modifiers
-----+-----+-----
c1     | integer | not null
c2     | integer |
Indexes:
"pk_test4_c1" PRIMARY KEY, btree (c1) TABLESPACE pg_default

-- Delete.
gaussdb=# DROP TABLE test_alt4;
```

- Delete a table-level constraint.

```
-- Delete a constraint.
gaussdb=# ALTER TABLE test_alt3 DROP CONSTRAINT IF EXISTS pk_test3_pid;

-- Query.
gaussdb=# \d test_alt3
Table "public.test_alt3"
Column | Type | Modifiers
-----+-----+-----
pid    | integer | not null
areaid | integer |
name   | character varying(20) |

-- Delete.
gaussdb=# DROP TABLE test_alt3;
```

## 7.14.33 ALTER TABLE PARTITION

### Description

Modifies table partitions, including adding, deleting, splitting, merging, clearing, swapping, and renaming partitions, moving partition tablespaces, and modifying partition attributes.

### Precautions

- The tablespace of the added partition cannot be PG\_GLOBAL.
- The name of the added partition must be different from names of existing partitions in the partitioned table.
- The key value of the added partition must be consistent with the type of partition keys in the partitioned table.
- If a range partition is added, the key value of the added partition must be greater than the upper limit of the last range partition in the partitioned table.
- If a list partition is added, the key value of the added partition cannot be the same as that of an existing partition.
- Hash partitions cannot be added.
- If the number of partitions in the target partitioned table has reached the maximum (**1048575**), partitions cannot be added.
- If a partitioned table has only one partition, the partition cannot be deleted.
- Use PARTITION FOR() to choose partitions. The number of specified values in the brackets should be the same as the column number in customized partition, and they must be consistent.
- The **Value** partitioned table does not support the ALTER PARTITION operation.

- Partitions cannot be added to an interval partitioned table.
- Hash partitioned tables do not support splitting, combination, addition, and deletion of partitions.
- Only the partitioned table owner or a user granted with the ALTER permission can run the **ALTER TABLE PARTITION** command. The system administrator has this permission by default.
- Deleting, splitting, merging, clearing, and exchanging partitions will invalidate global indexes. The UPDATE GLOBAL INDEX clause can be used to update the indexes synchronously.
- If the UPDATE GLOBAL INDEX clause is not used when you delete, split, merge, clear, or exchange partitions, concurrent DML services may report errors due to invalidated indexes.
- If **enable\_gpi\_auto\_update** is set to **on**, the global index is automatically updated even if the UPDATE GLOBAL INDEX clause is not declared.

## Syntax

Modifying a partition in a partitioned table includes modifying the table partition itself and the table partition name, and resetting the partition ID.

- Modify the syntax of the table partition.

```
ALTER TABLE [ IF EXISTS ] { table_name [*] | ONLY table_name | ONLY ( table_name ) }  
action [, ... ];
```

**action** indicates the following clauses for maintaining partitions. For the partition continuity when multiple clauses are used for partition maintenance, GaussDB executes DROP PARTITION and ADD PARTITION first, and then the rest clauses in sequence.

```
move_clause |  
exchange_clause |  
row_clause |  
merge_clause |  
modify_clause |  
split_clause |  
add_clause |  
drop_clause |  
truncate_clause
```

- The **move\_clause** syntax is used to move the partition to a new tablespace.

```
MOVE PARTITION { partition_name | FOR ( partition_value [, ...] ) } TABLESPACE tablespacename
```

- The **exchange\_clause** syntax is used to move the data from a general table to a specified partition.

```
EXCHANGE PARTITION { ( partition_name ) | FOR ( partition_value [, ...] ) }  
WITH TABLE {[ ONLY ] ordinary_table_name | ordinary_table_name * | ONLY  
( ordinary_table_name )}  
[ { WITH | WITHOUT } VALIDATION ] [ VERBOSE ] [ UPDATE GLOBAL INDEX ]
```

The ordinary table and partition whose data is to be exchanged must meet the following requirements:

- The number of columns of the ordinary table is the same as that of the partition, and their information should be consistent, including: column name, data type, constraint, collation information, storage parameter, and compression information.
- The compression information of the ordinary table and partition should be consistent.

- The number of ordinary table indexes is the same as that of local indexes of the partition, and the index information is the same.
- The number and information of constraints of the ordinary table and partition should be consistent.
- An ordinary table cannot be a temporary table. A partitioned table can only be a range partitioned table, list partitioned table, hash partitioned table, or interval partitioned table.
- Ordinary tables and partitioned tables do not support dynamic data masking and row-level security constraints.

---

#### NOTICE

- When the exchange is done, the data and tablespace of the ordinary table and partition are exchanged. The statistics of the ordinary table and partition are no longer inaccurate after the exchange, and they should be analyzed again.
- A non-partition key cannot be used to create a local unique index. Therefore, if an ordinary table contains a unique index, data cannot be exchanged.

To exchange data, you can create an intermediate table, insert partition data into the intermediate table, truncate partitions, insert ordinary table data into the partitioned table, drop the ordinary table, and rename the intermediate table.

- If the DROP COLUMN operation is performed on an ordinary or partitioned table, the deleted column still exists physically. Therefore, you need to ensure that the deleted column of the ordinary table is strictly aligned with that of the partition.

- 
- The row\_clause syntax is used to set row movement of a partitioned table.
  - The merge\_clause syntax is used to merge partitions into one. The maximum number of source partitions that can be merged in a command is 300.

```
{ ENABLE | DISABLE } ROW MOVEMENT  
MERGE PARTITIONS { partition_name } [, ...] INTO PARTITION partition_name  
[ TABLESPACE tablespacename ] [ UPDATE GLOBAL INDEX ]
```

---

#### NOTICE

For range partitioning and interval partitioning, the ranges of the source partitions must increase continuously, and the partition name after MERGE can be the same as the name of the last source partition. For list partitioning, there is no such range requirement on the source partitions, and the partition name after MERGE can be the same as that of any source partition. If the partition name after MERGE is the same as that of a source partition, they are considered as the same partition.

---

---

 **CAUTION**

Ustore tables do not support ALTER TABLE MERGE PARTITIONS in transaction blocks and stored procedures.

- 
- The `modify_clause` syntax is used to set whether a partitioned index is usable.

```
MODIFY PARTITION partition_name { UNUSABLE LOCAL INDEXES | REBUILD UNUSABLE LOCAL INDEXES }
```

- The `split_clause` syntax is used to split one partition into partitions.

```
SPLIT PARTITION { partition_name | FOR ( partition_value [, ...] ) } { split_point_clause | no_split_point_clause } [ UPDATE GLOBAL INDEX ]
```

---

**NOTICE**

- The partition name after SPLIT can be the same as the source partition name, but they are regarded as different partitions.

- 
- The syntax for specifying the split point for range partitioned tables and interval partitioned tables is as follows:

```
AT ( partition_value ) INTO ( PARTITION partition_name [ TABLESPACE tablespacename ] , PARTITION partition_name [ TABLESPACE tablespacename ] )
```

---

**NOTICE**

The size of the split point should be in the range of partition keys of the partition of to be split. The split point can only split one partition into two new partitions.

- 
- The syntax for not specifying the split point for range partitioned tables and interval partitioned tables is as follows:

```
INTO { ( partition_less_than_item [, ...] ) | ( partition_start_end_item [, ...] ) }
```

**NOTICE**

- The first new partition key specified by **partition\_less\_than\_item** should be greater than that of the previously split partition (if any), and the last partition key specified by **partition\_less\_than\_item** should equal that of the partition being split.
  - The first new partition key specified by **partition\_start\_end\_item** should equal that of the former partition (if any), and the last partition key specified by **partition\_start\_end\_item** should equal that of the partition being split.
  - **partition\_less\_than\_item** supports a maximum of 16 partition keys, while **partition\_start\_end\_item** supports only one partition key. For details about the supported data types, see **PARTITION BY RANGE(parti...**
  - **partition\_less\_than\_item** and **partition\_start\_end\_item** cannot be used in the same statement. There is no restriction on different SPLIT statements.
- 
- The syntax of **partition\_less\_than\_item** is as follows (the range of the last partition is not defined, that is, the VALUES LESS THAN (partition\_value) part is not defined; by default, the last partition inherits the upper boundary value of the range defined for the source partition):

```
PARTITION partition_name VALUES LESS THAN ( { partition_value | MAXVALUE } [, ...] )  
[ TABLESPACE tablespacename ]
```
  - The syntax of **partition\_start\_end\_item** is as follows. For details about the constraints, see **START END**.

```
PARTITION partition_name {  
  {START(partition_value) END (partition_value) EVERY (interval_value)} |  
  {START(partition_value) END ({partition_value | MAXVALUE})} |  
  {START(partition_value)} |  
  {END({partition_value | MAXVALUE})}  
} [TABLESPACE tablespace_name]
```
  - The syntax for specifying the split point for a list partitioned table is as follows:

```
VALUES ( partition_value_list ) INTO ( PARTITION partition_name [ TABLESPACE  
tablespacename ] , PARTITION partition_name [ TABLESPACE tablespacename ] )
```

**NOTICE**

The split point must be a non-empty true subset of the source partition. Specifying a split point can only split one partition into two partitions.

- The syntax for not specifying the split point for a list partitioned table is as follows:

```
INTO ( PARTITION partition_name VALUES (partition_value_list) [ TABLESPACE  
tablespacename ][, ...] )
```

**NOTICE**

- The range of the last partition is not defined, that is, the VALUES (partition\_value\_list) part is not defined; the partition range is equal to the remaining set of the source partition excluding other level-2 partitions.
- If no split point is specified, each new partition must be a non-empty true subset of the source partition and does not overlap with each other.

- The **add\_clause** syntax is used to add one or more partitions to a specified partitioned table.

```
ADD {partition_less_than_item | partition_start_end_item| partition_list_item }
```

The syntax of **partition\_list\_item** is as follows:

```
PARTITION partition_name VALUES (list_values_clause)  
[ TABLESPACE tablespacename ]
```

**NOTICE**

- **partition\_list\_item** supports a maximum of 16 partition keys. For details about the supported data types, see [PARTITION BY LIST \[partit...](#)
- Interval and hash partitioned tables do not support partition addition.

- The **drop\_clause** syntax is used to remove a partition from a specified partitioned table.

```
DROP PARTITION { partition_name | FOR ( partition_value [, ...] ) } [ UPDATE GLOBAL INDEX ]
```

**NOTICE**

- Hash partitioned table does not support partition deletion.
- If a partitioned table has only one partition, the partition cannot be deleted.

- The **truncate\_clause** syntax is used to remove a specified partition from a partitioned table.

```
TRUNCATE PARTITION { partition_name | FOR ( partition_value [, ...] ) } [ UPDATE GLOBAL INDEX ]
```

- The syntax for modifying the name of a partition is as follows:  

```
ALTER TABLE [ IF EXISTS ] { table_name [*] | ONLY table_name | ONLY ( table_name ) }  
RENAME PARTITION { partion_name | FOR ( partition_value [, ...] ) } TO partition_new_name;
```
- Reset a partition ID.  

```
ALTER TABLE [ IF EXISTS ] { table_name [*] | ONLY table_name | ONLY ( table_name ) } RESET PARTITION;
```

## Parameters

- **table\_name**  
Specifies the name of a partitioned table.  
Value range: an existing table name

- **partition\_name**  
Specifies the name of a partition.  
Value range: an existing partition name
- **tablespacename**  
Specifies which tablespace the partition moves to.  
Value range: an existing tablespace name
- **partition\_value**  
Specifies the key value of a partition.  
The value specified by **PARTITION FOR ( partition\_value [, ...] )** can uniquely identify a partition.  
Value range: partition keys for the partition to be operated.
- **UNUSABLE LOCAL INDEXES**  
Sets all the indexes unusable in the partition.
- **REBUILD UNUSABLE LOCAL INDEXES**  
Rebuilds all the indexes in the partition.
- **ENABLE/DISABLE ROW MOVEMENT**  
Sets row movement.  
If the tuple value is updated on the partition key during the **UPDATE** action, the partition where the tuple is located is altered. Setting this parameter enables error messages to be reported or movement of the tuple between partitions.  
Value range:
  - **ENABLE**: Row movement is enabled.
  - **DISABLE**: Row movement is disabled.The default value is **ENABLE**.
- **ordinary\_table\_name**  
Specifies the name of the ordinary table whose data is to be migrated.  
Value range: an existing table name
- **{ WITH | WITHOUT } VALIDATION**  
Checks whether the ordinary table data meets the specified partition key range of the partition to be migrated.  
Value range:
  - **WITH**: checks whether the ordinary table data meets the partition key range of the partition to be migrated. If any data does not meet the required range, an error is reported.
  - **WITHOUT**: does not check whether the ordinary table data meets the partition key range of the partition to be migrated.The default value is **WITH**.  
The check is time consuming, especially when the data volume is large. Therefore, use **WITHOUT** when you are sure that the current ordinary table data meets the partition key range of the partition to be migrated.
- **VERBOSE**

When **VALIDATION** is **WITH**, if the ordinary table contains data that is out of the partition key range, insert the data to the correct partition. If there is no correct partition where the data can be inserted to, an error is reported.

---

**NOTICE**

Only when **VALIDATION** is **WITH**, **VERBOSE** can be specified.

---

- **partition\_new\_name**  
Specifies the new name of a partition.  
Value range: a string. It must comply with the [naming convention](#).
- **UPDATE GLOBAL INDEX**  
If this parameter is used, all global indexes in the partitioned table are updated to ensure that data can be queried correctly using global indexes. If this parameter is not used, all global indexes in the partitioned table will become invalid.

## Examples

See [Examples](#) in section "CREATE TABLE PARTITION."

## Helpful Links

[CREATE TABLE PARTITION](#) and [DROP TABLE](#)

## 7.14.34 ALTER TABLE SUBPARTITION

### Description

Modifies partitions of a level-2 partitioned table, including adding, deleting, clearing, splitting, merging, exchanging, renaming partitions, moving partition tablespaces, and modifying partition attributes.

### Precautions

- The tablespace of the added partition cannot be PG\_GLOBAL.
- The name of the added partition must be different from the names of the existing level-1 and level-2 partitions in the partitioned table.
- The key value of the added partition must be consistent with the type of partition keys in the partitioned table.
- If a range partition is added, the key value of the added partition must be greater than the upper limit of the last range partition in the partitioned table. To add a partition to a table with the **MAXVALUE** partition, you are advised to use the SPLIT syntax.
- If a list partition is added, the key value of the added partition cannot be the same as that of an existing partition. To add a partition to a table with the **DEFAULT** partition, you are advised to use the SPLIT syntax.
- Hash partitions cannot be added. However, if the level-2 partition mode of an level-2 partitioned table is hash but the level-1 partition mode is not hash, you can add a level-1 partition and create the corresponding level-2 partition.

- If the number of partitions in the target partitioned table has reached the maximum (**1048575**), partitions cannot be added.
- If the partitioned table contains only one level-1 or level-2 partition, the partition cannot be deleted.
- Hash partitions cannot be deleted.
- PARTITION FOR() and SUBPARTITION FOR() can be used to select partitions. The number of specified values in the brackets must be the same as the number of columns defined in partition creation.
- Only level-2 partitions (leaf nodes) can be split. Only range and list partitioning policies can be used and hash partitioning policies are not supported.
- Only level-2 partitions (leaf nodes) can be merged, and the source partitions must belong to the same level-1 partition.
- Only the owner of a partitioned table or users granted with the ALTER permission on the partitioned table can run the **ALTER TABLE PARTITION** command. The system administrator has the permission to run the command by default.
- Deleting, splitting, clearing, and exchanging partitions will invalidate the global index. The UPDATE GLOBAL INDEX clause can be used to update the index synchronously.
- If the UPDATE GLOBAL INDEX clause is not used when you delete, split, clear, or exchange partitions, concurrent DML services may report errors due to invalidated indexes.
- If **enable\_gpi\_auto\_update** is set to **on**, the global index is automatically updated even if the UPDATE GLOBAL INDEX clause is not declared.

## Syntax

Modifying a partition in a level-2 partitioned table includes modifying the table partition itself and the table partition name, and resetting the partition ID.

- Modify the syntax of the table partition.  
ALTER TABLE [ IF EXISTS ] { table\_name [\*] | ONLY table\_name | ONLY ( table\_name ) }  
action [, ... ];

**action** indicates the following clauses for maintaining partitions. For the partition continuity when multiple clauses are used for partition maintenance, GaussDB executes DROP PARTITION and ADD PARTITION first, and then the rest clauses in sequence.

```
move_clause |
exchange_clause |
row_clause |
merge_clause |
modify_clause |
add_clause |
drop_clause |
split_clause |
truncate_clause
```

- The **move\_clause** syntax is used to move the partition to a new tablespace.  
MOVE SUBPARTITION { subpartition\_name | FOR ( subpartition\_value [, ...] ) } TABLESPACE tablespacename
- The **exchange\_clause** syntax is used to move the data from a general table to a specified partition.

```
EXCHANGE SUBPARTITION { ( subpartition_name ) | FOR ( subpartition_value [, ...] ) }  
WITH TABLE {[ ONLY ] ordinary_table_name | ordinary_table_name * | ONLY  
( ordinary_table_name )}  
[ { WITH | WITHOUT } VALIDATION ] [ VERBOSE ] [ UPDATE GLOBAL INDEX ]
```

The ordinary table and partition whose data is to be exchanged must meet the following requirements:

- The number of columns of the ordinary table is the same as that of the partition, and their information should be consistent, including: column name, data type, constraint, collation information, storage parameter, and compression information.
- The compression information of the ordinary table and partitioned table should be consistent.
- The number of ordinary table indexes is the same as that of local indexes of the partition, and the index information is the same.
- The number and information of constraints of the ordinary table and partition should be consistent.
- The ordinary table cannot be a temporary table, and the partitioned table should be a level-2 partitioned table.
- Ordinary tables and partitioned tables do not support dynamic data masking and row-level security constraints.

#### NOTICE

- When the exchange is done, the data and tablespace of the ordinary table and partitioned table are exchanged. In this case, the statistics on the ordinary table and partition become unreliable, and they should be analyzed again.
- A non-partition key cannot be used to create a local unique index. Therefore, if an ordinary table contains a unique index, data cannot be exchanged.

To exchange data, you can create an intermediate table, insert partition data into the intermediate table, truncate partitions, insert ordinary table data into the partitioned table, drop the ordinary table, and rename the intermediate table.

- If the DROP COLUMN operation is performed on an ordinary or partitioned table, the deleted column still exists physically. Therefore, you need to ensure that the deleted column of the ordinary table is strictly aligned with that of the partition. Otherwise, the exchange will fail.

- The row\_clause syntax is used to set row movement of a partitioned table.
- The merge\_clause syntax is used to merge partitions into one. The maximum number of source partitions that can be merged in a command is 300.

```
MERGE SUBPARTITIONS { subpartition_name } [, ...] INTO SUBPARTITION partition_name  
[ TABLESPACE tablespacename ] [ UPDATE GLOBAL INDEX ]
```

**NOTICE**

For range partitioning, the ranges of the source partitions must increase continuously, and the partition name after MERGE can be the same as the name of the last source partition. For list partitioning, there is no such range requirement on the source partitions, and the partition name after MERGE can be the same as that of any source partition. If the partition name after MERGE is the same as that of a source partition, they are considered as the same partition.

**CAUTION**

Ustore tables do not support ALTER TABLE MERGE SUBPARTITIONS in transaction blocks and stored procedures.

- The `modify_clause` syntax is used to set whether a partitioned index is usable. The syntax can be used in level-1 partitions.

```
MODIFY PARTITION partition_name { UNUSABLE LOCAL INDEXES | REBUILD UNUSABLE LOCAL INDEXES }
```

It can also be used in level-2 partitions.

```
MODIFY SUBPARTITION partition_name { UNUSABLE LOCAL INDEXES | REBUILD UNUSABLE LOCAL INDEXES }
```

- The `add_clause` syntax is used to add one or more partitions to a specified partitioned table. The syntax can be used in level-1 partitions.

```
ADD {partition_less_than_item | partition_list_item } [ ( subpartition_definition_list ) ]
```

It can also be used in level-2 partitions.

```
MODIFY PARTITION partition_name ADD subpartition_definition
```

**partition\_less\_than\_item** defines a range partition. The syntax is as follows:

```
PARTITION partition_name VALUES LESS THAN ( partition_value | MAXVALUE ) [ TABLESPACE tablespacename ]
```

**partition\_list\_item** defines a list partition. The syntax is as follows:

```
PARTITION partition_name VALUES ( partition_value [, ...] | DEFAULT ) [ TABLESPACE tablespacename ]
```

**subpartition\_definition\_list** contains the **subpartition\_definition** object of one or more level-2 partitions. The syntax is as follows:

```
SUBPARTITION subpartition_name [ VALUES LESS THAN ( partition_value | MAXVALUE ) | VALUES ( partition_value [, ...] | DEFAULT ) ] [ TABLESPACE tablespace ]
```

**NOTICE**

If the level-1 partition is a hash partition, you cannot use ADD to add a level-1 partition. If the level-2 partition is a hash partition, you cannot use MODIFY to add a level-2 partition.

- The `drop_clause` syntax is used to remove a partition from a specified partitioned table. The syntax can be used in level-1 partitions.

```
DROP PARTITION { partition_name | FOR ( partition_value ) } [ UPDATE GLOBAL INDEX ]
```

It can also be used in level-2 partitions.

```
DROP SUBPARTITION { subpartition_name | FOR ( partition_value, subpartition_value ) }  
[ UPDATE GLOBAL INDEX ]
```

---

#### NOTICE

- If the level-1 partition is a hash partition, the level-1 partition cannot be deleted. If the level-2 partition is a hash partition, the level-2 partition cannot be deleted.
  - At least one sub-partition must be retained.
- 
- The `split_clause` syntax is used to split one partition into partitions.
- ```
SPLIT SUBPARTITION { subpartition_name | FOR ( subpartition_value [, ...] ) } { split_point_clause  
| no_split_point_clause } [ UPDATE GLOBAL INDEX ]
```

---

#### NOTICE

- The partition name after SPLIT can be the same as the source partition name, but they are regarded as different partitions.
- 
- The syntax for specifying the split point for range partitioning is as follows:  

```
AT ( subpartition_value ) INTO ( SUBPARTITION subpartition_name [ TABLESPACE  
tablespacename ] , SUBPARTITION subpartition_name [ TABLESPACE tablespacename ] )
```

---

#### NOTICE

The split point must be in the range of partition keys of the partition to be split. Specifying a split point can only split one partition into two partitions.

- 
- The syntax of not specifying the split point for range partitioning is as follows (the range of the last partition is not defined, that is, the `VALUES LESS THAN (subpartition_value)` part is not defined; by default, the last partition inherits the upper boundary value of the range defined for the source partition):  

```
INTO ( SUBPARTITION subpartition_name VALUES LESS THAN (subpartition_value)  
[ TABLESPACE tablespacename ] [, ...] )
```

---

#### NOTICE

- The range defined for the first new partition must be greater than that of the previous partition (if any) of the partition being split.
  - The range of the last new partition cannot be defined and it inherits the upper boundary value of the range defined for the source partition by default.
  - The new partition must meet the constraint of continuously increasing range.
-

- The syntax for specifying the split point for list-range partitioning is as follows:

```
VALUES ( subpartition_value ) INTO ( SUBPARTITION subpartition_name [ TABLESPACE
tablespacename ] , SUBPARTITION subpartition_name [ TABLESPACE tablespacename ] )
```

#### NOTICE

The split point must be a non-empty true subset of the source partition. Specifying a split point can only split one partition into two partitions.

- The syntax for not specifying the split point for a list partitioned table is as follows:

```
INTO ( SUBPARTITION subpartition_name VALUES (subpartition_value_list) [ TABLESPACE
tablespacename ][, ...] )
```

#### NOTICE

- The range of the last partition is not defined, that is, the VALUES (partition\_value\_list) part is not defined; the partition range is equal to the remaining set of the source partition excluding other level-2 partitions.
- If no split point is specified, each new partition must be a non-empty true subset of the source partition and does not overlap with each other.

- The truncate\_clause syntax is used to remove a specified partition from a partitioned table. The syntax can be used in level-1 partitions.

```
TRUNCATE PARTITION { partition_name | FOR ( partition_value [, ...] ) } [ UPDATE GLOBAL
INDEX ]
```

It can also be used in level-2 partitions.

```
TRUNCATE SUBPARTITION { subpartition_name | FOR ( subpartition_value [, ...] ) } [ UPDATE
GLOBAL INDEX ]
```

- Modify the name of a partition. This syntax can be used to modify level-1 partitions of a partitioned table.

```
ALTER TABLE [ IF EXISTS ] { table_name [*] | ONLY table_name | ONLY ( table_name )}
RENAME PARTITION { partition_name | FOR ( partition_value [, ...] ) } TO partition_new_name;
```

It can also be used to modify level-2 partitions of a partitioned table.

```
ALTER TABLE [ IF EXISTS ] { table_name [*] | ONLY table_name | ONLY ( table_name )}
RENAME SUBPARTITION { subpartition_name | FOR ( subpartition_value [, ...] ) } TO
subpartition_new_name;
```

- Reset a partition ID.

```
ALTER TABLE [ IF EXISTS ] { table_name [*] | ONLY table_name | ONLY ( table_name )} RESET
PARTITION;
```

## Parameters

- **table\_name**

Specifies the name of a partitioned table.

Value range: an existing partitioned table name.

- **subpartition\_name**  
Specifies the name of a level-2 partition name.  
Value range: an existing level-2 partition name.
- **tablespacename**  
Specifies which tablespace the partition moves to.  
Value range: an existing tablespace name.
- **partition\_value**  
Specifies the key value of the level-1 partition.  
The value specified by PARTITION FOR ( partition\_value [, ...] ) can uniquely identify a level-1 partition.  
Value range: partition keys for the level-1 partition to be operated.
- **subpartition\_value**  
Specifies the level-1 and level-2 partition key values.  
The value specified by SUBPARTITION FOR ( subpartition\_value [, ...] ) can uniquely identify a level-2 partition.  
Value range: partition key values of the level-1 and level-2 partitions for the level-2 partition to be operated.
- **UNUSABLE LOCAL INDEXES**  
Sets all the indexes unusable in the partition.
- **REBUILD UNUSABLE LOCAL INDEXES**  
Rebuilds all the indexes in the partition.
- **ENABLE/DISABLE ROW MOVEMENT**  
Specifies whether to enable row movement.  
If the tuple value is updated on the partition key during the UPDATE operation, the partition where the tuple is located is altered. Setting this parameter enables error messages to be reported or movement of the tuple between partitions.  
Value range:
  - **ENABLE**: Row movement is enabled.
  - **DISABLE**: Row movement is disabled.By default, this function is enabled.
- **ordinary\_table\_name**  
Specifies the name of the ordinary table whose data is to be migrated.  
Value range: an existing table name.
- **{ WITH | WITHOUT } VALIDATION**  
Checks whether the ordinary table data meets the specified partition key range of the partition to be migrated.  
Value range:
  - **WITH**: checks whether the ordinary table data meets the partition key range of the partition to be migrated. If any data does not meet the required range, an error is reported.
  - **WITHOUT**: does not check whether the ordinary table data meets the partition key range of the partition to be migrated.

The default value is **WITH**.

The check is time consuming, especially when the data volume is large. Therefore, use **WITHOUT** when you are sure that the current ordinary table data meets the partition key range of the partition to be migrated.

- **VERBOSE**

When **VALIDATION** is **WITH**, if the ordinary table contains data that is out of the partition key range, insert the data to the correct partition. If there is no correct partition where the data can be inserted to, an error is reported.

---

**NOTICE**

Only when **VALIDATION** is **WITH**, **VERBOSE** can be specified.

- **partition\_new\_name**

Specifies the new name of a partition.

Value range: a string. It must comply with the [naming convention](#).

- **subpartition\_new\_name**

Specifies the new name of a level-2 partition.

Value range: a string. It must comply with the [naming convention](#).

- **UPDATE GLOBAL INDEX**

If this parameter is used, all global indexes in the partitioned table are updated to ensure that data can be queried correctly using global indexes. If this parameter is not used, all global indexes in the partitioned table will become invalid.

## Examples

See the examples in section "CREATE TABLE SUBPARTITION."

## 7.14.35 ALTER TABLESPACE

### Description

Modifies the attributes of a tablespace.

### Precautions

- Only the tablespace owner or a user granted with the ALTER permission can run the **ALTER TABLESPACE** command. The system administrator has this permission by default. To modify a tablespace owner, you must be the tablespace owner or system administrator and a member of the new owner role.
- To change the owner, you must also be a direct or indirect member of the new owning role.

 **NOTE**

If **new\_owner** is the same as **old\_owner**, the current user will not be verified. A message indicating successful ALTER execution is displayed.

## Syntax

- The syntax of renaming a tablespace is as follows:  

```
ALTER TABLESPACE tablespace_name  
  RENAME TO new_tablespace_name;
```
- The syntax of setting the owner of a tablespace is as follows:  

```
ALTER TABLESPACE tablespace_name  
  OWNER TO new_owner;
```
- The syntax of setting the attributes of a tablespace is as follows:  

```
ALTER TABLESPACE tablespace_name  
  SET ( { tablespace_option = value } [, ... ] );
```
- The syntax of resetting the attributes of a tablespace is as follows:  

```
ALTER TABLESPACE tablespace_name  
  RESET ( { tablespace_option } [, ... ] );
```
- The syntax of setting the quota of a tablespace is as follows:  

```
ALTER TABLESPACE tablespace_name  
  RESIZE MAXSIZE { UNLIMITED | 'space_size'};
```

## Parameters

- **tablespace\_name**  
Specifies the tablespace to be modified.  
Value range: an existing table name
- **new\_tablespace\_name**  
Specifies the new name of a tablespace.  
The new name cannot start with PG\_.  
Value range: a string. It must comply with the [naming convention](#).
- **new\_owner**  
Specifies the new owner of the tablespace.  
Value range: an existing username
- **tablespace\_option**  
Sets or resets the parameters of a tablespace.  
Value range:
  - **seq\_page\_cost**: sets the optimizer to calculate the cost of obtaining disk pages in sequence. The default value is **1.0**.
  - **random\_page\_cost**: sets the optimizer to calculate the cost of obtaining disk pages in a non-sequential manner. The default value is **4.0**.

### NOTE

- The value of **random\_page\_cost** is relative to that of **seq\_page\_cost**. It is meaningless when the value is equal to or less than the value of **seq\_page\_cost**.
- The prerequisite for the default value **4.0** is that the optimizer uses indexes to scan table data and the hit ratio of table data in the cache is about 90%.
- If the size of the table data space is smaller than that of the physical memory, decrease the value to a proper level. On the contrary, if the hit ratio of table data in the cache is lower than 90%, increase the value.
- If random-access memory like SSD is adopted, the value can be decreased to a certain degree to reflect the cost of true random scan.

Value range: a positive floating point number

- **RESIZE MAXSIZE**

Resets the maximum size of tablespace.

Value range:

- **UNLIMITED**: No limit is set for the tablespace.
- Determined by **space\_size**. For details about the format, see [CREATE TABLESPACE](#).

 **NOTE**

- If the adjusted quota is smaller than the current tablespace usage, the adjustment is successful. You need to decrease the tablespace usage to a value less than the new quota before writing data to the tablespace.
- You can also use the following statement to change the value of **MAXSIZE**:

```
ALTER TABLESPACE tablespace_name RESIZE MAXSIZE  
{ 'UNLIMITED' | 'space_size'};
```

## Examples

See [Examples](#) in section "CREATE TABLESPACE."

## Helpful Links

[CREATE TABLESPACE](#) and [DROP TABLESPACE](#)

## 7.14.36 ALTER TRIGGER

### Description

Renames a trigger.

 **NOTE**

Currently, only the name can be modified.

### Precautions

The owner of the table where a trigger resides or a user granted the ALTER ANY SEQUENCE permission can perform the ALTER TRIGGER operation. A system administrator has this permission by default.

### Syntax

```
ALTER TRIGGER trigger_name ON table_name RENAME TO new_name;
```

### Parameters

- **trigger\_name**  
Specifies the name of the trigger to be modified.  
Value range: an existing trigger
- **table\_name**  
Specifies the name of the table where the trigger to be modified is located.  
Value range: an existing table having a trigger

- **new\_name**  
Specifies the new name after modification.  
Value range: a string, which complies with the [naming convention](#). A value contains a maximum of 63 characters and cannot be the same as other triggers on the same table.

## Examples

For details, see [CREATE TRIGGER](#).

## Helpful Links

[CREATE TRIGGER](#), [DROP TRIGGER](#), and [ALTER TABLE](#)

## 7.14.37 ALTER TYPE

### Description

Modifies the definition of a type.

### Precautions

Only the owner of a type, a user granted the ALTER permission on a type, or a user granted the ALTER ANY TYPE permission on a sequence can run the **ALTER TYPE** command. The system administrator has this permission by default. To modify the owner or schema of a type, you must be a type owner or system administrator and a member of the new owner role.

### Syntax

- **Modify a type.**  

```
ALTER TYPE name action [, ... ]  
ALTER TYPE name OWNER TO { new_owner | CURRENT_USER | SESSION_USER }  
ALTER TYPE name RENAME ATTRIBUTE attribute_name TO new_attribute_name [ CASCADE |  
RESTRICT ]  
ALTER TYPE name RENAME TO new_name  
ALTER TYPE name SET SCHEMA new_schema  
ALTER TYPE name ADD VALUE [ IF NOT EXISTS ] new_enum_value [ { BEFORE | AFTER }  
neighbor_enum_value ]  
ALTER TYPE name RENAME VALUE existing_enum_value TO new_enum_value
```

where action is one of:

```
ADD ATTRIBUTE attribute_name data_type [ COLLATE collation ] [ CASCADE | RESTRICT ]  
DROP ATTRIBUTE [ IF EXISTS ] attribute_name [ CASCADE | RESTRICT ]  
ALTER ATTRIBUTE attribute_name [ SET DATA ] TYPE data_type [ COLLATE collation ] [ CASCADE |  
RESTRICT ]
```
- **Add a new attribute to a composite type.**  

```
ALTER TYPE name ADD ATTRIBUTE attribute_name data_type [ COLLATE collation ] [ CASCADE |  
RESTRICT ]
```
- **Delete an attribute from a composite type.**  

```
ALTER TYPE name DROP ATTRIBUTE [ IF EXISTS ] attribute_name [ CASCADE | RESTRICT ]
```
- **Change the type of an attribute in a composite type.**  

```
ALTER TYPE name ALTER ATTRIBUTE attribute_name [ SET DATA ] TYPE data_type [ COLLATE  
collation ] [ CASCADE | RESTRICT ]
```
- **Change the owner of a type.**  

```
ALTER TYPE name OWNER TO { new_owner | CURRENT_USER | SESSION_USER }
```

- Change the name of a type or the name of an attribute in a composite type.  
`ALTER TYPE name RENAME TO new_name`  
`ALTER TYPE name RENAME ATTRIBUTE attribute_name TO new_attribute_name [ CASCADE | RESTRICT ]`
- Move a type to a new schema.  
`ALTER TYPE name SET SCHEMA new_schema`
- Add a new value to an enumerated type.  
`ALTER TYPE name ADD VALUE [ IF NOT EXISTS ] new_enum_value [ { BEFORE | AFTER } neighbor_enum_value ]`
- Change an enumerated value in the value list.  
`ALTER TYPE name RENAME VALUE existing_enum_value TO new_enum_value`

## Parameters

- **name**  
Specifies the name of an existing type that needs to be modified (optionally schema-qualified).
- **new\_name**  
Specifies the new name of the type.
- **new\_owner**  
Specifies the new owner of the type.
- **new\_schema**  
Specifies the new schema of the type.
- **attribute\_name**  
Specifies the name of the attribute to be added, modified, or deleted.
- **new\_attribute\_name**  
Specifies the new name of the attribute to be renamed.
- **data\_type**  
Specifies the data type of the attribute to be added, or the new type of the attribute to be modified.
- **new\_enum\_value**  
Specifies a new enumerated value. It is a non-null string with a maximum length of 63 bytes.
- **neighbor\_enum\_value**  
Specifies an existing enumerated value before or after which a new enumerated value will be added.
- **existing\_enum\_value**  
Specifies an enumerated value to be changed. It is a non-null string with a maximum length of 63 bytes.
- **CASCADE**  
Determines that the type to be modified, its associated records, and subtables that inherit the type will all be updated.
- **RESTRICT**  
Refuses to update the associated records of the modified type. This is the default option.

#### NOTICE

- **ADD ATTRIBUTE**, **DROP ATTRIBUTE**, and **ALTER ATTRIBUTE** can be combined for processing. For example, it is possible to add several attributes or change the types of several attributes at the same time in one command.
- To modify a schema of a type, you must have the **CREATE** permission on the new schema. To change the owner, you must be a direct or indirect member of the new owning role, and the member must have the **CREATE** permission on the schema of this type. (These restrictions enforce that the user can only re-create and delete the type. However, the system administrator can change ownership of any type in any way.) To add an attribute or modify the type of an attribute, you must also have the **USAGE** permission of this type.

- **CURRENT\_USER**  
Specifies the current user.
- **SESSION\_USER**  
Specifies the current system user.
- **COLLATE collation**  
Assigns a collation to the column, which must be a sortable data type. If the collation is not specified, the default collation for the column's data type is used.

## Examples

See [Examples](#) in section "CREATE TYPE."

## Helpful Links

[CREATE TYPE](#) and [DROP TYPE](#)

## 7.14.38 ALTER USER

### Description

Modifies the attributes of a database user.

### Precautions

Session parameters modified by ALTER USER apply to a specified user and take effect in the next session.

### Syntax

- Modify user permissions or other information.

```
ALTER USER user_name [ [ WITH ] option [ ... ] ];
```

The **option** clause is as follows:

```
{ CREATEDB | NOCREATEDB }  
| { CREATEROLE | NOCREATEROLE }
```

```

| { INHERIT | NOINHERIT }
| { AUDITADMIN | NOAUDITADMIN }
| { SYSADMIN | NOSYSADMIN }
| { MONADMIN | NOMONADMIN }
| { OPRADMIN | NOOPRADMIN }
| { POLADMIN | NOPOLADMIN }
| { USEFT | NOUSEFT }
| { LOGIN | NOLOGIN }
| { REPLICATION | NOREPLICATION }
| { VCADMIN | NOVCADMIN }
| { PERSISTENCE | NOPERSISTENCE }
| CONNECTION LIMIT connlimit
| [ ENCRYPTED | UNENCRYPTED ] PASSWORD { 'password' [ EXPIRED ] | DISABLE | EXPIRED }
| [ ENCRYPTED | UNENCRYPTED ] IDENTIFIED BY { 'password' [ REPLACE 'old_password' |
EXPIRED ] | DISABLE }
| VALID BEGIN 'timestamp'
| VALID UNTIL 'timestamp'
| RESOURCE POOL 'respool'
| PERM SPACE 'spacelimit'
| PGUSER

```

- **Change the username.**  
ALTER USER user\_name  
RENAME TO new\_name;
- **Lock or unlock.**  
ALTER USER user\_name  
ACCOUNT { LOCK | UNLOCK };
- **Change the value of a specified parameter associated with the user.**  
ALTER USER user\_name  
SET configuration\_parameter { { TO | = } { value | DEFAULT } | FROM CURRENT };
- **Reset the value of a specified parameter associated with the user.**  
ALTER USER user\_name  
RESET { configuration\_parameter | ALL };

## Parameters

- **user\_name**  
Specifies the current username.  
Value range: an existing username
- **new\_password**  
Specifies a new password.  
The new password must:
  - Differ from the old password.
  - Contain at least eight characters. This is the default length.
  - Differ from the username or the username spelled backward.
  - Contain at least three types of the following four types of characters: uppercase characters (A to Z), lowercase characters (a to z), digits (0 to 9), and special characters, including: ~!@#%&\*( )- \_ = + \ | [ { } ; : , < . > / ?
  - Be enclosed by single quotation marks.
Value range: a string
- **old\_password**  
Specifies the old password.
- **ACCOUNT LOCK | ACCOUNT UNLOCK**
  - **ACCOUNT LOCK:** locks an account to forbid login to databases.

- **ACCOUNT UNLOCK**: unlocks an account to allow login to databases.
- **PGUSER**  
In the current version, the **PGUSER** attribute of a user cannot be modified.

For details about other parameters, see "Parameters" in [CREATE ROLE](#) and [ALTER ROLE](#).

## Examples

```
-- Create user jim whose login password is *****.  
gaussdb=# CREATE USER jim PASSWORD '*****';  
  
-- Change the login password of user jim.  
gaussdb=# ALTER USER jim IDENTIFIED BY '*****' REPLACE '*****';  
  
-- Set enable_seqscan to on. (The setting will take effect in the next session.)  
gaussdb=# ALTER USER jim SET enable_seqscan TO on;  
  
-- Reset the enable_seqscan parameter for jim.  
gaussdb=# ALTER USER jim RESET enable_seqscan;  
  
-- Lock jim.  
gaussdb=# ALTER USER jim ACCOUNT LOCK;  
  
-- Unlock jim.  
gaussdb=# ALTER USER jim ACCOUNT UNLOCK;  
  
-- Change the username.  
gaussdb=# ALTER USER jim RENAME TO lisa;  
  
-- Delete the user.  
gaussdb=# DROP USER lisa CASCADE;
```

## Helpful Links

[CREATE ROLE](#), [CREATE USER](#), and [DROP USER](#)

## 7.14.39 ALTER USER MAPPING

### Description

Alters the definition of a user mapping.

The owner of a foreign server can change the user mapping of that server for any user. In addition, if the USAGE permission on the server has been granted to a user, the user can change the user mapping of its own username.

### Precautions

- If the **password** option is displayed, ensure that the **usermapping.key.cipher** and **usermapping.key.rand** files exist in the *\$GAUSSHOME/bin* directory of each node in GaussDB. If the two files do not exist, use the **gs\\_guc** tool to generate them and use the **gs\\_ssh** tool to release them to the *\$GAUSSHOME/bin* directory on each node. For details, see the description in [OPTIONS](#).
- When multi-layer quotation marks are used for sensitive columns (such as **password**) in **OPTIONS**, the semantics is different from that in the scenario where quotation marks are not used. Therefore, sensitive columns are not identified for anonymization.

## Syntax

```
ALTER USER MAPPING FOR { user_name | USER | CURRENT_USER | PUBLIC }  
    SERVER server_name  
    OPTIONS ( [ ADD | SET | DROP ] option ['value' ] [, ... ] )
```

In **OPTIONS**, **ADD**, **SET**, and **DROP** are operations to be performed. If these operations are not specified, **ADD** operations will be performed by default. **option** and **value** are the parameters and values of the corresponding operation.

## Parameters

- **user\_name**  
Specifies username of the mapping.  
**CURRENT\_USER** and **USER** match the name of the current user. **PUBLIC** is used to match all current and future usernames in the system.
- **server\_name**  
Specifies name of the server to which the user is mapped.
- **OPTIONS**  
Changes an option for the user mapping. The new option overwrites any previously specified option. **ADD**, **SET**, and **DROP** are operations to be performed. If the operation is not set explicitly, **ADD** is used. The option name must be unique and will be validated with the foreign data wrapper of the server.

### NOTE

- User passwords are encrypted and stored in the system catalog **PG\_USER\_MAPPING**. During the encryption, **usermapping.key.cipher** and **usermapping.key.rand** are used as the encryption password file and encryption factor. Before using the tool for the first time, run the following command to create the two files, save the files to the **\$GAUSSHOME/bin** directory on each node, and ensure that you have the read permission on the files. **gs\_ssh** helps you quickly place files in the specified directory of each node.  

```
gs_ssh -c "gs_guc generate -o usermapping -S default -D $GAUSSHOME/bin"
```
- If the **-S** parameter is set to default, a password is randomly generated. You can also specify a password for the **-S** parameter to ensure the security and uniqueness of the generated password file. You do not need to save or memorize the password. For details about other parameters, see the description of the **gs\_guc** tool in the *Tool Reference*.

## Examples

See [8.15.104-Examples](#) in "CREATE USER MAPPING."

## Helpful Links

[CREATE USER MAPPING](#) and [DROP USER MAPPING](#)

## 7.14.40 ALTER VIEW

### Description

ALTER VIEW modifies all auxiliary attributes of a view. (To modify the query definition of a view, use CREATE OR REPLACE VIEW.)

## Precautions

Only the view owner or a user granted with the ALTER permission can run the **ALTER VIEW** command. The system administrator has this permission by default. The following are permission constraints depending on the attributes to be modified:

- To modify the schema of a view, you must be the owner of the view or system administrator and have the CREATE permission on the new schema.
- To modify the owner of a view, you must be the owner of the view or system administrator and a member of the new owner role, with the CREATE permission on the schema of the view.
- Do not change the type of a column in a view.

## Syntax

- Set the default value of a view column.  

```
ALTER VIEW [ IF EXISTS ] view_name  
ALTER [ COLUMN ] column_name SET DEFAULT expression;
```
- Remove the default value of a view column.  

```
ALTER VIEW [ IF EXISTS ] view_name  
ALTER [ COLUMN ] column_name DROP DEFAULT;
```
- Change the owner of a view.  

```
ALTER VIEW [ IF EXISTS ] view_name  
OWNER TO new_owner;
```
- Rename a view.  

```
ALTER VIEW [ IF EXISTS ] view_name  
RENAME TO new_name;
```
- Set the schema of a view.  

```
ALTER VIEW [ IF EXISTS ] view_name  
SET SCHEMA new_schema;
```
- Set the options of a view.  

```
ALTER VIEW [ IF EXISTS ] view_name  
SET ( { view_option_name [ = view_option_value ] } [, ... ] );
```
- Reset the options of a view.  

```
ALTER VIEW [ IF EXISTS ] view_name  
RESET ( view_option_name [, ... ] );
```

## Parameters

- **IF EXISTS**  
If this option is used, no error is generated when the view does not exist, and only a message is displayed.
- **view\_name**  
Specifies the view name, which can be schema-qualified.  
Value range: a string. It must comply with the [naming convention](#).
- **column\_name**  
Specifies an optional list of names to be used for columns of the view. If not given, the column names are deduced from the query.  
Value range: a string. It must comply with the [naming convention](#).
- **SET/DROP DEFAULT**  
Sets or deletes the default value of a column. This parameter does not take effect.

- **new\_owner**  
Specifies the new owner of a view.
- **new\_name**  
Specifies the new view name.
- **new\_schema**  
Specifies the new schema of the view.
- **view\_option\_name [ = view\_option\_value ]**  
Specifies an optional parameter for a view.  
Currently, **view\_option\_name** supports only the **security\_barrier** parameter.  
This parameter is used when the view attempts to provide row-level security.  
Value range: Boolean type, **TRUE**, and **FALSE**.

## Examples

```
-- Create a schema.
gaussdb=# CREATE SCHEMA tpcds;

-- Create the tpcds.customer table.
gaussdb=# CREATE TABLE tpcds.customer
(
  c_customer_sk      INTEGER      NOT NULL,
  c_customer_id     CHARACTER(16) NOT NULL
);

-- Insert multiple records into the table.
gaussdb=# INSERT INTO tpcds.customer VALUES (1, 'AAAAAAAAABAAAAAAA'),(100,
'AAAAAAAAACAAAAAAA'),(150, 'AAAAAADAAAAAAA');

-- Create a view consisting of rows with c_customer_sk less than 150.
gaussdb=# CREATE VIEW tpcds.customer_details_view_v1 AS
  SELECT * FROM tpcds.customer
  WHERE c_customer_sk < 150;

-- Rename a view.
gaussdb=# ALTER VIEW tpcds.customer_details_view_v1 RENAME TO customer_details_view_v2;

-- Change the schema of a view.
gaussdb=# ALTER VIEW tpcds.customer_details_view_v2 SET schema public;

-- Delete a view.
gaussdb=# DROP VIEW public.customer_details_view_v2;

-- Delete the pcds.customer table.
gaussdb=# DROP TABLE tpcds.customer;

-- Delete a schema.
gaussdb=# DROP SCHEMA tpcds CASCADE;
```

## Helpful Links

[CREATE VIEW](#) and [DROP VIEW](#)

## 7.14.41 ANALYZE | ANALYSE

### Description

ANALYZE collects statistics about ordinary tables in a database and stores the results in the PG\_STATISTIC and PG\_STATISTIC\_EXT system catalogs. After you run

the **ANALYZE** command, you can query the collected statistics in the preceding system catalogs or system views PG\_STATS and PG\_EXT\_STATS. The execution plan generator uses these statistics to generate the most effective execution plan.

If no parameters are specified, ANALYZE analyzes each table and partitioned table in the database. You can also specify the **table\_name**, **column**, and **partition\_name** parameters to restrict the analysis to a specific table, column, or partitioned table.

ANALYZE | ANALYZE VERIFY checks whether data files of ordinary tables in a database are damaged.

## Precautions

- Non-temporary tables cannot be analyzed in an anonymous block, transaction block, function, or stored procedure. Temporary tables in a stored procedure can be analyzed but their statistics updates cannot be rolled back.
- Remote read is not involved in the ANALYZE VERIFY scenario. Therefore, the remote read parameter does not take effect. If the system detects that a page is damaged due to an error in a key system table, the system directly reports an error and does not continue the detection.
- With no table specified, **ANALYZE** processes all the tables that the current user has permission to analyze in the current database. With tables specified, **ANALYZE** processes only the specified tables.
- To perform ANALYZE operation to a table, you must be a table owner or a user granted the VACUUM permission on the table. By default, the system administrator has this permission. However, database owners are allowed to analyze all tables in their databases, except shared catalogs. (The restriction for shared catalogs means that a true database-wide analyze operation can only be executed by the system administrator). ANALYZE skips tables on which users do not have permissions.
- ANALYZE does not collect columns for which comparison or equivalent operations cannot be performed, for example, columns of the cursor type.

## Syntax

- Collect statistics information about a table.  

```
{ ANALYZE | ANALYZE } [ VERBOSE ]  
  [ table_name [ ( column_name [, ...] ) ] ] ;
```
- Collect partition statistics information about a partitioned table. This syntax is not supported currently.  

```
{ ANALYZE | ANALYZE } [ VERBOSE ]  
  table_name [ ( column_name [, ...] ) ] PARTITION ( partition_name ) ;
```

### NOTE

An ordinary partitioned table supports the syntax but not the function of collecting statistics about specified partitions.

- Collect statistics about multiple columns manually.  

```
{ANALYZE | ANALYZE} [ VERBOSE ]  
  table_name (( column_1_name, column_2_name [, ...] ));
```

 NOTE

- If the GUC parameter **enable\_functional\_dependency** is disabled, the statistics about a maximum of 32 columns can be collected at a time. If the GUC parameter **enable\_functional\_dependency** is enabled, the statistics about a maximum of 4 columns can be collected at a time.
- You are not allowed to collect statistics about multiple columns in system catalogs and global temporary tables.
- Collect statistics about multiple columns automatically.

After the **auto\_statistic\_ext\_columns** parameter is enabled and analyzed, multi-column statistics are automatically created based on the index prefix of the table. The number of columns in the multi-column statistics cannot exceed the value of **auto\_statistic\_ext\_columns**.

For example, if index (a, b, c, d) exists in table **t** and **auto\_statistic\_ext\_columns** is set to **4**, multi-column statistics about (a, b), (a, b, c), and (a, b, c, d) are created after table **t** is analyzed.

```
{ ANALYZE | ANALYSE } [ VERBOSE ] table_name;
```

- Check the data files in the current database.

```
{ANALYZE | ANALYSE} VERIFY {FAST|COMPLETE};
```

 NOTE

- In fast mode, DML operations need to be performed on the tables to be verified concurrently. As a result, an error is reported during the verification. In the current fast mode, data is directly read from the disk. When other threads modify files concurrently, the obtained data is incorrect. Therefore, you are advised to perform the verification offline.
- You can perform operations on the entire database. Because a large number of tables are involved, you are advised to save the results in redirection mode.  

```
gsql -d database -p port -f sqlfile> sqllog.txt 2>&1
```
- NOTICE is used to check only tables that are visible to external systems. The detection of internal tables is included in the external tables on which NOTICE depends and is not displayed externally.
- This statement can be executed with error tolerance.
- If a key system table is damaged during a full database operation, an error is reported and the operation stops.
- Check data files of tables and indexes.

```
{ANALYZE | ANALYSE} VERIFY {FAST|COMPLETE} { table_name|index_name } [CASCADE];
```

 NOTE

- Operations on ordinary tables and index tables are supported, but CASCADE operations on indexes of index tables are not supported. The CASCADE mode is used to process all index tables of the main table. When the index tables are checked separately, the CASCADE mode is not required.
- When the main table is checked, the internal tables of the main table, such as the TOAST table, are also checked.
- When the system displays a message indicating that the index table is damaged, you are advised to run the **reindex** command to rebuild the index.
- Check the data files of the table partition.

```
{ANALYZE | ANALYSE} VERIFY {FAST|COMPLETE} table_name PARTITION (partition_name) [CASCADE];
```

 NOTE

You can check a single partition of a table, but cannot perform the CASCADE operation on the indexes of an index table.

## Parameters

- **VERBOSE**

Enables the display of progress messages.

 **NOTE**

If **VERBOSE** is specified, **ANALYZE** displays the progress information, indicating the table that is being processed. Statistics about tables are also displayed.

- **table\_name**

Specifies the name (possibly schema-qualified) of a specific table to analyze. If omitted, all regular tables (but not foreign tables) in the current database are analyzed.

Currently, you can use **ANALYZE** to collect statistics only from row-store tables.

Value range: an existing table name.

- **column\_name**, **column\_1\_name**, **column\_2\_name**

Specifies the name of a specific column to analyze. All columns are analyzed by default.

Value range: an existing column name

- **partition\_name**

Assumes the table is a partitioned table. You can specify **partition\_name** following the keyword **PARTITION** to analyze the statistics of this table. Currently, **ANALYZE** can be performed on partitioned tables, but statistics of specified partitions cannot be analyzed.

Value range: a partition name of a table

- **index\_name**

Specifies the name of the specific index table to be analyzed (possibly schema-qualified).

Value range: an existing table name

- **FAST|COMPLETE**

The **FAST** mode verifies the CRC and page header of the table. If the verification fails, an alarm is generated. In **COMPLETE** mode, the pointer and tuple of the table are parsed and verified.

- **CASCADE**

In **CASCADE** mode, all indexes of the current table are verified.

## Examples

```
-- Create a table.
gaussdb=# CREATE TABLE customer_info
(
  WR_RETURNED_DATE_SK    INTEGER           ,
  WR_RETURNED_TIME_SK    INTEGER           ,
  WR_ITEM_SK             INTEGER          NOT NULL,
  WR_REFUNDED_CUSTOMER_SK INTEGER
)
;
```

```
-- Create a partitioned table.
gaussdb=# CREATE TABLE customer_par
```

```
(
  WR_RETURNED_DATE_SK    INTEGER          ,
  WR_RETURNED_TIME_SK    INTEGER          ,
  WR_ITEM_SK             INTEGER          NOT NULL,
  WR_REFUNDED_CUSTOMER_SK INTEGER          )
)
PARTITION BY RANGE(WR_RETURNED_DATE_SK)
(
  PARTITION P1 VALUES LESS THAN(2452275),
  PARTITION P2 VALUES LESS THAN(2452640),
  PARTITION P3 VALUES LESS THAN(2453000),
  PARTITION P4 VALUES LESS THAN(MAXVALUE)
)
ENABLE ROW MOVEMENT;
```

```
-- Run the ANALYZE statement to update statistics.
gaussdb=# ANALYZE customer_info;
gaussdb=# ANALYZE customer_par;
```

```
-- Run the ANALYZE VERBOSE statement to update statistics and display table information.
gaussdb=# ANALYZE VERBOSE customer_info;
INFO: ANALYZE INFO : estimate total rows of "customer_info": scanned 0 pages of total 0 pages with 1
retry times, containing 0 live rows and 0 dead rows, estimated 0 total rows(datanode pid=38661)
INFO: ANALYZE INFO : "customer_info": scanned 0 of 0 pages, containing 0 live rows and 0 dead rows; 0
rows in sample, 0 estimated total rows(datanode pid=38661)
ANALYZE
```

#### NOTE

If any environment-related fault occurs, check the logs of CN.

```
-- Delete the tables.
gaussdb=# DROP TABLE customer_info;
gaussdb=# DROP TABLE customer_par;
```

## 7.14.42 BEGIN

### Description

BEGIN may be used to initiate an anonymous block or a single transaction. This section describes the syntax of BEGIN used to initiate an anonymous block. For details about the BEGIN syntax that initiates transactions, see [START TRANSACTION](#).

An anonymous block is a structure that can dynamically create and execute stored procedure code instead of permanently storing code as a database object in the database.

### Precautions

None

### Syntax

- Enable an anonymous block.

```
[DECLARE [declare_statements]]
BEGIN
execution_statements
END;
/
```

- Start a transaction.

```
BEGIN [ WORK | TRANSACTION ]  
[  
  {  
    ISOLATION LEVEL { READ COMMITTED | SERIALIZABLE | REPEATABLE READ }  
    | { READ WRITE | READ ONLY }  
  } [, ...]  
];
```

## Parameters

- **declare\_statements**  
Declares a variable, including its name and type, for example, **sales\_cnt int**.
- **execution\_statements**  
Specifies the statement to be executed in an anonymous block.  
Value range: DML operations (such as select, insert, delete, and update) or registered functions in the system catalog.

## Examples

None

## Helpful Links

[START TRANSACTION](#)

## 7.14.43 CALL

### Function

**CALL** calls defined functions and stored procedures.

### Precautions

The owner of a function or stored procedure, users granted with the **EXECUTE** permission on the function or stored procedure, or users granted with the **EXECUTE ANY FUNCTION** permission can call the function or stored procedure. The system administrator has the permission to call the function or stored procedure by default.

### Syntax

```
CALL [schema.|package.] {func_name| procedure_name} ( param_expr );
```

### Parameter Description

- **schema**  
Specifies the name of the schema where a function or stored procedure is located.
- **package**  
Specifies the name of the package where a function or stored procedure is located.

- **func\_name**  
Specifies the name of the function or stored procedure to be called.  
Value range: an existing role name
- **param\_expr**  
Specifies a list of parameters. Use := or => to separate a parameter name and its value. This method allows parameters to be placed in any order. If only parameter values are in the list, the value order must be the same as that defined in the function or stored procedure.  
Value range: an existing function parameter name or stored procedure parameter name

 **NOTE**

The parameters include input parameters (whose name and type are separated by **IN**) and output parameters (whose name and type are separated by **OUT**). When you run the **CALL** statement to call a function or stored procedure, the parameter list must contain an output parameter for non-overloaded functions. You can set the output parameter to a variable or any constant. For details, see [Examples](#). For an overloaded package function, the parameter list can have no output parameter, but the function may not be found. If an output parameter is contained, it must be a constant.

## Examples

```
-- Create a function func_add_sql, calculate the sum of two integers, and return the result.
gaussdb=# CREATE FUNCTION func_add_sql(num1 integer, num2 integer) RETURN integer
AS
BEGIN
RETURN num1 + num2;
END;
/

-- Transfer by parameter value.
gaussdb=# CALL func_add_sql(1, 3);

-- Transfer by naming tag method.
gaussdb=# CALL func_add_sql(num1 => 1,num2 => 3);
gaussdb=# CALL func_add_sql(num2 := 2, num1 := 3);

-- Delete the function.
gaussdb=# DROP FUNCTION func_add_sql;

-- Create a function with output parameters.
gaussdb=# CREATE FUNCTION func_increment_sql(num1 IN integer, num2 IN integer, res OUT integer)
RETURN integer
AS
BEGIN
res := num1 + num2;
END;
/

-- Transfer a constant as an output parameter.
gaussdb=# CALL func_increment_sql(1,2,1);

-- Delete the function.
gaussdb=# DROP FUNCTION func_increment_sql;
```

## 7.14.44 CHECKPOINT

### Function

A checkpoint is a point in the transaction log sequence at which all data files have been updated to reflect the information in the log. All data files will be flushed to a disk.

**CHECKPOINT** forces a transaction log checkpoint. By default, WALs periodically specify checkpoints in a transaction log. You may use **gs\_guc** to specify run-time parameters **checkpoint\_segments**, **checkpoint\_timeout**, and **incremental\_checkpoint\_timeout** to adjust the atomized checkpoint intervals.

### Precautions

- Only the system administrator and O&M administrator can invoke **CHECKPOINT**.
- **CHECKPOINT** forces an immediate checkpoint when the related command is issued, without waiting for a regular checkpoint scheduled by the system.

### Syntax

```
CHECKPOINT;
```

### Parameter Description

None

### Examples

```
-- Set a checkpoint.  
gaussdb=# CHECKPOINT;
```

## 7.14.45 CLEAN CONNECTION

### Function

Clears database connections. You may use this statement to delete a specific user's connections to a specified database.

### Precautions

- GaussDB does not support specified nodes and supports only TO ALL.
- This function can be used to clear the normal connections that are being used only in fore mode.

### Syntax

```
CLEAN CONNECTION  
TO { COORDINATOR ( nodename [, ... ] ) | NODE ( nodename [, ... ] ) | ALL [ CHECK ] [ FORCE ] }  
[ FOR DATABASE dbname ]  
[ TO USER username ];
```

## Parameter Description

- **CHECK**  
This parameter can be specified only when the node list is specified as **TO ALL**. Setting this parameter will check whether a database is accessed by other sessions before its connections are cleared. If any sessions are detected before **DROP DATABASE** is executed, an error will be reported and the database will not be deleted.
- **FORCE**  
This parameter can be specified only when the node list is specified as **TO ALL**. Setting this parameter will send **SIGTERM** signals to all the threads related to the specified **dbname** and **username** and forcibly shut them down.
- **COORDINATOR ( nodename [ , ... ] ) | NODE ( nodename [ , ... ] ) | ALL**  
Only **TO ALL** is supported. This parameter must be specified. All specified connections on the node will be deleted.
- **dbname**  
Deletes connections to a specified database. If this parameter is not specified, connections to all databases will be deleted.  
Value range: an existing database name
- **username**  
Deletes connections of a specific user. If this parameter is not specified, connections of all users will be deleted.  
Value range: an existing username

## Examples

```
-- Create user jack.  
CREATE USER jack PASSWORD '*****';  
  
-- Clean the user jack's connections to the template1 database.  
CLEAN CONNECTION TO ALL FOR DATABASE template1 TO USER jack;  
  
-- Delete all connections of user jack.  
CLEAN CONNECTION TO ALL TO USER jack;  
  
-- Clean all the connections to the gaussdb database.  
CLEAN CONNECTION TO ALL FORCE FOR DATABASE gaussdb;  
  
-- Delete user jack.  
DROP USER jack;
```

## 7.14.46 CLOSE

### Function

**CLOSE** frees the resources associated with an open cursor.

### Precautions

- After a cursor is closed, no subsequent operations are allowed on it.
- A cursor should be closed when it is no longer needed.
- Every non-holdable open cursor is implicitly closed when a transaction is terminated by **COMMIT** or **ROLLBACK**.

- A holdable cursor is implicitly closed if the transaction that created it aborts by **ROLLBACK**.
- If the cursor creation transaction is successfully committed, the holdable cursor remains open until an explicit **CLOSE** operation is executed, or the client disconnects.
- GaussDB does not have an explicit **OPEN** cursor statement. A cursor is considered open when it is declared. You can view all available cursors by querying the **pg\_cursors** system view.

## Syntax

```
CLOSE { cursor_name | ALL } ;
```

## Parameter Description

- **cursor\_name**  
Specifies the name of a cursor to be closed.
- **ALL**  
Closes all open cursors.

## Examples

See [Examples](#) in **FETCH**.

## Helpful Links

[FETCH](#) and [MOVE](#)

## 7.14.47 CLUSTER

### Description

- Clusters a table based on an index.
- **CLUSTER** instructs GaussDB to cluster the table specified by **table\_name** based on the index specified by **index\_name**. The index must have been defined by **table\_name**.
- When a table is clustered, it is physically reordered based on the index information. Clustering is a one-time operation. When the table is subsequently updated, the changes are not clustered. That is, no attempt is performed to store new or updated rows according to their index order.
- When a table is clustered, GaussDB records which index the table was clustered by. **CLUSTER table\_name** reclusters the clustered index that was previously recorded in the table. You can also use **ALTER TABLE table\_name CLUSTER on index\_name** to set the index of a specified table for subsequent cluster operations, or use **ALTER TABLE table\_name SET WITHOUT CLUSTER** to clear the previously clustered index of a specified table.
- **CLUSTER** without any parameter reclusters all the previously-clustered tables in the current database that the calling user owns, or all such tables if called by an administrator.

- When a table is being clustered, an ACCESS EXCLUSIVE lock is acquired on it. This prevents any other database operations (both read and write) from being performed on the table until the **CLUSTER** is finished.

## Precautions

- Only row-store B-tree indexes support **CLUSTER**.
- In the case where you are accessing single rows randomly within a table, the actual order of the data in the table is unimportant. However, if there are many accesses to some data and an index groups the data, using the CLUSTER index improves performance.
- If an index you request from a table is a range, or a single indexed value that has multiple rows that match, CLUSTER will help because once the index identifies the table page for the first row that matches, all other rows that match are probably already on the same table page, and so you save disk accesses and speed up the query.
- During clustering, the system creates a temporary backup of the table created in the index sequence and a temporary backup of each index in the table. Therefore, ensure that the disk has sufficient free space during clustering, which is at least the sum of the table size and all index sizes.
- CLUSTER records which indexes have been used for clustering. Therefore, you can manually specify indexes for the first time, cluster specified tables, and set a maintenance script that will be executed periodically. You only need to run the **CLUSTER** command without parameters. In this way, tables that you want to periodically cluster can be automatically updated.
- The optimizer records table clustering statistics. After clustering a table, you need to execute the ANALYZE operation to ensure that the optimizer has the latest clustering information. Otherwise, the optimizer may select a non-optimal query plan.
- CLUSTER cannot be executed in transactions.
- If the **xc\_maintenance\_mode** parameter is not enabled, the CLUSTER operation will skip all system catalogs.

## Syntax

- Cluster a table.  
`CLUSTER [ VERBOSE ] table_name [ USING index_name ];`
- Cluster a partition.  
`CLUSTER [ VERBOSE ] table_name PARTITION ( partition_name ) [ USING index_name ];`
- Recluster a table.  
`CLUSTER [ VERBOSE ];`

## Parameters

- **VERBOSE**  
Enables the display of progress messages.
- **table\_name**  
Specifies the table name.  
Value range: an existing table name
- **index\_name**

Specifies the index name.

Value range: an existing index name

- **partition\_name**

Specifies the partition name.

Value range: an existing partition name

## Examples

```
-- Create a partitioned table.
gaussdb=# CREATE TABLE tpcds.inventory_p1
(
  INV_DATE_SK          INTEGER          NOT NULL,
  INV_ITEM_SK          INTEGER          NOT NULL,
  INV_WAREHOUSE_SK     INTEGER          NOT NULL,
  INV_QUANTITY_ON_HAND INTEGER
)
PARTITION BY RANGE(INV_DATE_SK)
(
  PARTITION P1 VALUES LESS THAN(2451179),
  PARTITION P2 VALUES LESS THAN(2451544),
  PARTITION P3 VALUES LESS THAN(2451910),
  PARTITION P4 VALUES LESS THAN(2452275),
  PARTITION P5 VALUES LESS THAN(2452640),
  PARTITION P6 VALUES LESS THAN(2453005),
  PARTITION P7 VALUES LESS THAN(MAXVALUE)
);

-- Create an index named ds_inventory_p1_index1.
gaussdb=# CREATE INDEX ds_inventory_p1_index1 ON tpcds.inventory_p1 (INV_ITEM_SK) LOCAL;

-- Cluster the tpcds.inventory_p1 table.
gaussdb=# CLUSTER tpcds.inventory_p1 USING ds_inventory_p1_index1;

-- Cluster the p3 partition.
gaussdb=# CLUSTER tpcds.inventory_p1 PARTITION (p3) USING ds_inventory_p1_index1;

-- Cluster the tables that can be clustered in the database.
gaussdb=# CLUSTER;

-- Delete the index.
gaussdb=# DROP INDEX tpcds.ds_inventory_p1_index1;

-- Drop the partitioned table.
gaussdb=# DROP TABLE tpcds.inventory_p1;
```

## Suggestions

- cluster
  - It is recommended that you run **ANALYZE** on a newly clustered table. Otherwise, the optimizer might make poor choices of query plans.
  - **CLUSTER** cannot be executed in transactions.

## 7.14.48 COMMENT

### Description

Defines or changes the comment of an object.

## Precautions

- Each object stores only one comment. Therefore, you need to modify a comment and issue a new **COMMENT** command to the same object. To delete the comment, write **NULL** at the position of the text string. When an object is deleted, the comment is automatically deleted.
- Currently, there is no security protection for viewing comments. Any user connected to a database can view all the comments for objects in the database. For shared objects such as databases, roles, and tablespaces, comments are stored globally so any user connected to any database in the cluster can see all the comments for shared objects. Therefore, do not put security-critical information in comments.
- To comment objects, you must be an object owner or user granted the **COMMENT** permission. The system administrator has this permission by default.
- Roles do not have owners, so the rule for **COMMENT ON ROLE** is that you must be an administrator to comment on an administrator role, or have the **CREATEROLE** permission to comment on non-administrator roles. A system administrator can comment on all objects.

## Syntax

```
COMMENT ON
{
  AGGREGATE agg_name (agg_type [, ...] ) |
  CAST (source_type AS target_type) |
  COLLATION object_name |
  COLUMN { table_name.column_name | view_name.column_name } |
  CONSTRAINT constraint_name ON table_name |
  CONVERSION object_name |
  DATABASE object_name |
  DOMAIN object_name |
  EXTENSION object_name |
  FOREIGN DATA WRAPPER object_name |

  FUNCTION function_name ( [ [ argname ] [ argmode ] argtype] [, ...] ) |
  INDEX object_name |
  LARGE OBJECT large_object_oid |
  OPERATOR operator_name (left_type, right_type) |
  OPERATOR CLASS object_name USING index_method |
  OPERATOR FAMILY object_name USING index_method |
  [ PROCEDURAL ] LANGUAGE object_name |
  ROLE object_name |
  RULE rule_name ON table_name |
  SCHEMA object_name |
  SERVER object_name |
  TABLE object_name |
  TABLESPACE object_name |
  TEXT SEARCH CONFIGURATION object_name |
  TEXT SEARCH DICTIONARY object_name |
  TEXT SEARCH PARSER object_name |
  TEXT SEARCH TEMPLATE object_name |
  TYPE object_name |
  VIEW object_name |
  TRIGGER trigger_name ON table_name
}
IS 'text';
```

## Parameters

- **agg\_name**  
Specifies the new name of an aggregate function.

- **agg\_type**  
Specifies the data type of the aggregate function parameters.
- **source\_type**  
Specifies the source data type of the cast.
- **target\_type**  
Specifies the target data type of the cast.
- **object\_name**  
Specifies the name of an object.
- **table\_name.column\_name**  
**view\_name.column\_name**  
Specifies the column whose comment is defined or modified. You can add the table name or view name as the prefix.
- **constraint\_name**  
Specifies the table constraint whose comment is defined or modified.
- **table\_name**  
Specifies the name of a table.
- **function\_name**  
Specifies the function whose comment is defined or modified.
- **argname,argmode,argtype**  
Specifies the name, schema, and type of the function parameters.
- **large\_object\_oid**  
Specifies the OID of the large object whose comment is defined or modified.
- **operator\_name**  
Specifies the name of the operator.
- **left\_type,right\_type**  
Specifies the data type of the operator parameters (optionally schema-qualified). If the prefix or suffix operator does not exist, the **NONE** option can be added.
- **trigger\_name**  
Specifies the trigger name.
- **text**  
Specifies the comment content.

## Examples

```
-- Create a schema.
gaussdb=# CREATE SCHEMA tpcds;

-- Create the tpcds.customer table.
gaussdb=# CREATE TABLE tpcds.customer
(
  c_customer_sk      INTEGER      NOT NULL,
  c_customer_id     CHAR(16)     NOT NULL
);

-- Insert multiple records into the table.
gaussdb=# INSERT INTO tpcds.customer VALUES (50, 'AAAAAAAAABAAAAAAA'),(100,
'AAAAAAAAACAAAAAAA'),(150, 'AAAAAAAADAAAAAAA');
```

```
-- Create the tpcds.customer_demographics_t2 table.
gaussdb=# CREATE TABLE tpcds.customer_demographics_t2
(
  CD_DEMO_SK          INTEGER          NOT NULL,
  CD_GENDER           CHAR(1)         ,
  CD_MARITAL_STATUS  CHAR(1)         ,
  CD_EDUCATION_STATUS CHAR(20)       ,
  CD_PURCHASE_ESTIMATE INTEGER        ,
  CD_CREDIT_RATING   CHAR(10)        ,
  CD_DEP_COUNT        INTEGER        ,
  CD_DEP_EMPLOYED_COUNT INTEGER      ,
  CD_DEP_COLLEGE_COUNT INTEGER
)
;

-- Comment out the tpcds.customer_demographics_t2.cd_demo_sk column.
gaussdb=# COMMENT ON COLUMN tpcds.customer_demographics_t2.cd_demo_sk IS 'Primary key of
customer demographics table.';

-- Create a view consisting of rows with c_customer_sk less than 150.
gaussdb=# CREATE VIEW tpcds.customer_details_view_v2 AS
SELECT *
FROM tpcds.customer
WHERE c_customer_sk < 150;

-- Comment out the tpcds.customer_details_view_v2 view.
gaussdb=# COMMENT ON VIEW tpcds.customer_details_view_v2 IS 'View of customer detail';

-- Delete the view.
gaussdb=# DROP VIEW tpcds.customer_details_view_v2;

-- Delete the tpcds.customer_demographics_t2 table.
gaussdb=# DROP TABLE tpcds.customer_demographics_t2;

-- Delete the tpcds.customer table.
gaussdb=# DROP TABLE tpcds.customer;

-- Delete a schema.
gaussdb=# DROP SCHEMA tpcds CASCADE;
```

## 7.14.49 COMMIT | END

### Description

COMMIT or END commits all operations of a transaction.

### Precautions

Only the creator of a transaction or a system administrator can run the **COMMIT** command. The creation and commit operations must be in different sessions.

### Syntax

```
{ COMMIT | END } [ WORK | TRANSACTION ] ;
```

### Parameters

- **COMMIT | END**  
Commits the current transaction and makes all changes made by the transaction become visible to others.
- **WORK | TRANSACTION**

Specifies an optional keyword, which has no effect except increasing readability.

## Examples

```
-- Create a table.
gaussdb=# CREATE TABLE tpcds.customer_demographics_t2
(
  CD_DEMO_SK          INTEGER          NOT NULL,
  CD_GENDER           CHAR(1)         ,
  CD_MARITAL_STATUS  CHAR(1)         ,
  CD_EDUCATION_STATUS CHAR(20)       ,
  CD_PURCHASE_ESTIMATE INTEGER        ,
  CD_CREDIT_RATING   CHAR(10)        ,
  CD_DEP_COUNT       INTEGER          ,
  CD_DEP_EMPLOYED_COUNT INTEGER      ,
  CD_DEP_COLLEGE_COUNT INTEGER
)
;

-- Start a transaction.
gaussdb=# START TRANSACTION;

-- Insert data.
gaussdb=# INSERT INTO tpcds.customer_demographics_t2 VALUES(1,'M', 'U', 'DOCTOR DEGREE', 1200,
'GOOD', 1, 0, 0);
gaussdb=# INSERT INTO tpcds.customer_demographics_t2 VALUES(2,'F', 'U', 'MASTER DEGREE', 300, 'BAD',
1, 0, 0);

-- Commit the transaction to make all changes permanent.
gaussdb=# COMMIT;

-- Query data.
gaussdb=# SELECT * FROM tpcds.customer_demographics_t2;

-- Delete the tpcds.customer_demographics_t2 table.
gaussdb=# DROP TABLE tpcds.customer_demographics_t2;
```

## Helpful Links

[ROLLBACK](#)

## 7.14.50 COMMIT PREPARED

### Description

Commits a prepared two-phase transaction.

### Precautions

- The function is only available in maintenance mode (when the GUC parameter **xc\_maintenance\_mode** is **on**). Exercise caution when enabling the mode. It is used by maintenance engineers for troubleshooting. Common users should not use the mode.
- Only the transaction creators or system administrators can run the command. The creation and commit operations must be in different sessions.
- The transaction function is maintained automatically by the database, and should be not visible to users.

## Syntax

```
COMMIT PREPARED transaction_id [WITH commit_sequence_number];
```

## Parameters

- **transaction\_id**  
Specifies the identifier of the transaction to be committed. The identifier must be different from those for current prepared transactions.
- **commit\_sequence\_number**  
Specifies the sequence number of the transaction to be committed. It is a 64-bit, incremental, unsigned number.

## Examples

```
-- Start.
gaussdb=# begin;

-- Prepare a transaction whose identifier is trans_test.
gaussdb=# PREPARE TRANSACTION 'trans_test';

-- Create a table.
gaussdb=# CREATE TABLE item1(id int);

--Commit the transaction whose identifier is trans_test.
gaussdb=# COMMIT PREPARED 'trans_test';

-- Delete a table.
gaussdb=# DROP TABLE item1;
```

[PREPARE TRANSACTION](#) and [ROLLBACK PREPARED](#)

## 7.14.51 COPY

### Description

Copies data between tables and files.

COPY FROM copies data from a file to a table, and COPY TO copies data from a table to a file.

### Precautions

- When the **enable\_copy\_server\_files** parameter is disabled, only the initial user is allowed to run the **COPY FROM FILENAME** or **COPY TO FILENAME** statement. When the **enable\_copy\_server\_files** parameter is enabled, users with the **SYSADMIN** permission or users who inherit the built-in role permission **gs\_role\_copy\_files** are allowed to run the **COPY FROM FILENAME** or **COPY TO FILENAME** statement. By default, database configuration files and key files are not allowed, and you can run **COPY FROM FILENAME** or **COPY TO FILENAME** for certificate files and audit logs to prevent unauthorized users from viewing or modifying sensitive files. When **enable\_copy\_server\_files** is enabled, the administrator can use the GUC parameter **safe\_data\_path** to set the path for common users to import and export to the subpath of the set path. If this GUC parameter is not set (by

default), the path used by common users is not blocked. This parameter reports an error for ... in the path of the COPY statement.

- COPY applies only to tables but not views.
- **COPY TO** requires the select permission on the table to be read, and **COPY FROM** requires the insert permission on the table to be inserted.
- If a list of columns is specified, **COPY** copies only the data of the specified columns between the file and the table. If a table has any columns that are not in the column list, **COPY FROM** inserts default values for those columns.
- If a data source file is specified, the server must be able to access the file. If **STDIN** is specified, data flows between the client and the server. When entering data, use the **TAB** key to separate the columns of the table and use a backslash and a period (\.) in a new row to indicate the end of the input.
- **COPY FROM** throws an error if any row in the data file contains more or fewer columns than expected.
- The end of the data can be represented by a line that contains only backslashes and periods (\.). If data is read from a file, the end flag is unnecessary. If data is copied between client applications, an end tag must be provided.
- In COPY FROM, \N is an empty string. To enter the actual value \N, use \\N.
- COPY FROM can preprocess data using column expressions, but column expressions do not support subqueries.
- When a data format error occurs during COPY FROM execution, the transaction is rolled back. However, the error information is insufficient, making it difficult to locate the error data from a large amount of raw data.
- **COPY FROM** and **COPY TO** apply to low concurrency and local import and export of a small amount of data.
- If the target table has triggers, **COPY** is supported.
- Ensure that the generated column is not in the list of the specified column in the **COPY** statement. When **COPY... TO** is used to export data, if no column list is specified, all columns except the generated columns in the table are exported. When **COPY... FROM** is used to import data, the generated columns are automatically updated and saved as common columns.
- COPY is a server command and its operating environment is the same as that of the database server process. \COPY is a client meta-command and its operating environment is the same as that of gsql on the client. Note that when the database and gsql are used in the sandbox environment, the **COPY** and \COPY commands both use the paths in the sandbox. When the database is used in the sandbox environment and gsql is used outside the sandbox, the **COPY** command uses the path inside the sandbox, and the \COPY command uses the path outside the sandbox.
- During the export using COPY TO, if the column data in the table contains the '\0' character, the column data will be truncated during the export. Only the data before '\0' will be exported.

## Syntax

- Copy data from a file to a table.  

```
COPY table_name [ ( column_name [, ...] ) ]  
FROM { 'filename' | STDIN }
```

```
[ [ USING ] DELIMITERS 'delimiters' ]
[ WITHOUT ESCAPING ]
[ LOG ERRORS ]
[ LOG ERRORS DATA ]
[ REJECT LIMIT 'limit' ]
[ [ WITH ] ( option [, ...] ) ]
| copy_option
| [ TRANSFORM ( { column_name [ data_type ] [ AS transform_expr ] } [, ...] ) ]
| [ FIXED FORMATTER ( { column_name( offset, length ) } [, ...] ) [ ( option [, ...] ) | copy_option
[ ...] ] ];
```

 **NOTE**

The **fixed formatter** syntax is compatible with **copy\_option** but incompatible with **option**. **copy\_option** is incompatible with **option**. **transform** is compatible with **copy\_option** and **fixed formatter**.

- Copy data from a table to a file.

```
COPY table_name [ ( column_name [, ...] ) ]
TO { 'filename' | STDOUT }
[ [ USING ] DELIMITERS 'delimiters' ]
[ WITHOUT ESCAPING ]
[ [ WITH ] ( option [, ...] ) ]
| copy_option
| [ FIXED FORMATTER ( { column_name( offset, length ) } [, ...] ) [ ( option [, ...] ) | copy_option
[ ...] ] ];
```

```
COPY query
TO { 'filename' | STDOUT }
[ WITHOUT ESCAPING ]
[ [ WITH ] ( option [, ...] ) ]
| copy_option
| [ FIXED FORMATTER ( { column_name( offset, length ) } [, ...] ) [ ( option [, ...] ) | copy_option
[ ...] ] ];
```

 **NOTE**

1. The syntax constraints of COPY TO are as follows:
  - (**query**) is incompatible with **[USING] DELIMITERS**. If the data comes from a query result, **COPY TO** cannot specify **[USING] DELIMITERS**.
2. Use spaces to separate **copy\_option** following **FIXED FORMATTER**.
3. **copy\_option** is the native parameter, while **option** is the parameter imported by a compatible foreign table.

The syntax of the optional parameter **option** is as follows:

```
FORMAT 'format_name'
| FORMAT binary
| OIDS [ boolean ]
| DELIMITER 'delimiter_character'
| NULL 'null_string'
| HEADER [ boolean ]
| USEEOF [ boolean ]
| FILEHEADER 'header_file_string'
| FREEZE [ boolean ]
| QUOTE 'quote_character'
| ESCAPE 'escape_character'
| EOL 'newline_character'
| NOESCAPING [ boolean ]
| FORCE_QUOTE { ( column_name [, ...] ) | * }
| FORCE_NOT_NULL ( column_name [, ...] )
| ENCODING 'encoding_name'
| IGNORE_EXTRA_DATA [ boolean ]
| FILL_MISSING_FIELDS [ boolean ]
| COMPATIBLE_ILLEGAL_CHARS [ boolean ]
| DATE_FORMAT 'date_format_string'
| TIME_FORMAT 'time_format_string'
| TIMESTAMP_FORMAT 'timestamp_format_string'
| SMALLDATETIME_FORMAT 'smalldatetime_format_string'
```

The syntax of the optional parameter **copy\_option** is as follows:

```
oids
| NULL 'null_string'
| HEADER
| USEEOF
| FILEHEADER 'header_file_string'
| FREEZE
| FORCE_NOT_NULL column_name [, ...]
| FORCE_QUOTE { column_name [, ...] | * }
| BINARY
| CSV
| QUOTE [ AS ] 'quote_character'
| ESCAPE [ AS ] 'escape_character'
| EOL 'newline_character'
| ENCODING 'encoding_name'
| IGNORE_EXTRA_DATA
| FILL_MISSING_FIELDS [ { 'one' | 'multi' } ]
| COMPATIBLE_ILLEGAL_CHARS
| DATE_FORMAT 'date_format_string'
| TIME_FORMAT 'time_format_string'
| TIMESTAMP_FORMAT 'timestamp_format_string'
| SMALLDATETIME_FORMAT 'smalldatetime_format_string'
| SKIP int_number
| WHEN { ( start - end ) | column_name } { = | != } 'string'
| SEQUENCE ( { column_name ( integer [, incr] ) [, ...] } )
| FILLER ( { column_name [, ...] } )
| CONSTANT ( { column_name 'constant_string' [, ...] } )
```

## Parameters

- **query**  
Specifies that the results are to be copied.  
Valid value: a **SELECT** or **VALUES** command in parentheses
- **table\_name**  
Specifies the name (possibly schema-qualified) of an existing table.  
Value range: an existing table name
- **column\_name**  
Specifies an optional list of columns to be copied.  
Value range: any columns. All columns will be copied if no column list is specified.
- **STDIN**  
Specifies that input comes from the standard input.
- **STDOUT**  
Specifies that output goes to the standard output.
- **FIXED**  
Fixes column length. When the column length is fixed, **DELIMITER**, **NULL**, and **CSV** cannot be specified. When **FIXED** is specified, **BINARY**, **CSV**, and **TEXT** cannot be specified by **option** or **copy\_option**.

 **NOTE**

The definition of fixed length is as follows:

1. The column length of each record is the same.
2. Spaces are used for column padding. Columns of the numeric type are left-aligned and columns of the string type are right-aligned.
3. No delimiters are used between columns.

- **[USING] DELIMITERS 'delimiters'**

String that separates columns within each row (line) of the file. It cannot be larger than 10 bytes.

Value range: The delimiter in text format cannot include any of the following characters: \.abcdefghijklmnopqrstuvwxyz0123456789, but has no restriction for the CSV format.

Value range: The default value is a tab character in text format and a comma in CSV format.

 **NOTE**

Both **DELIMITER** and **DELIMITERS** can specify separators. However, **DELIMITERS** can be followed by syntax with bracket, but **DELIMITER** cannot be directly followed by bracket. Otherwise, a syntax error is reported.

- **WITHOUT ESCAPING**

Specifies, in the TEXT format, whether to escape the backslash (\) and its following characters.

Value range: text only

- **LOG ERRORS**

If this parameter is specified, the error tolerance mechanism for data type errors in the **COPY FROM** statement is enabled.

Value range: a value set while data is imported using **COPY FROM**.

 **NOTE**

The restrictions of this error tolerance parameter are as follows:

- This error tolerance mechanism captures only the data type errors (**DATA\_EXCEPTION**) that occur during data parsing of **COPY FROM** on the primary node of the database.
- If existing error tolerance parameters (for example, **IGNORE\_EXTRA\_DATA**) of the **COPY** statement are enabled, the error of the corresponding type will be processed as specified by the parameters and no error will be reported. Therefore, the error table does not contain such error data.

- **LOG ERRORS DATA**

The differences between **LOG ERRORS DATA** and **LOG ERRORS** are as follows:

- a. **LOG ERRORS DATA** fills the **rawrecord** column in the error tolerance table.
- b. Only users with the super permission can use the **LOG ERRORS DATA** parameter.

 **CAUTION**

- If error content is too complex, it may fail to be written to the error tolerance table by using **LOG ERRORS DATA**, causing the task failure.
- For errors that cannot be read in certain code, the error codes are `ERRCODE_CHARACTER_NOT_IN_REPERTOIRE` and `ERRCODE_UNTRANSLATABLE_CHARACTER`. The `rawrecord` column is not recorded.

- **REJECT LIMIT 'limit'**

Used with the **LOG ERROR** parameter to set the upper limit of the tolerated errors in the **COPY FROM** statement. If the number of errors exceeds the limit, later errors will be reported based on the original mechanism.

Value range: a positive integer (1 to `INTMAX`) or **unlimited**

Default value: If **LOG ERRORS** is not specified, an error will be reported. If **LOG ERRORS** is specified, the default value is **0**.

 **NOTE**

In the error tolerance mechanism described in the description of **LOG ERRORS**, the count of **REJECT LIMIT** is calculated based on the number of data parsing errors on the primary node of the database where the **COPY FROM** statement is executed, not based on the number of all errors on the primary node.

- **FORMATTER**

Defines the place of each column in the data file in fixed length mode.

Defines the place of each column in the data file in the **column(offset,length)** format.

Value range:

- The value of **offset** must be larger than 0. The unit is byte.
- The value of **length** must be larger than 0. The unit is byte.

The total length of all columns must be less than 1 GB.

Replace columns that are not in the file with null.

- **OPTION { option\_name ' value ' }**

Specifies all types of parameters of a compatible foreign table.

- **FORMAT**

Specifies the format of the source data file in the foreign table.

Value range: **CSV**, **TEXT**, **FIXED**, and **BINARY**

- The **CSV** file can process newline characters efficiently, but cannot process certain special characters well.
- The **TEXT** file can process certain special characters efficiently, but cannot process newline characters well.
- In **FIXED** files, the column length of each record is the same. Spaces are used for padding, and the excessive part will be truncated.
- All data in the **BINARY** file is stored/read as binary format rather than as text. It is faster than the text and **CSV** formats, but a binary-format file is less portable.

Default value: **TEXT**

– DELIMITER

Specifies the character that separates columns within each row (line) of the file.

 NOTE

- The value of **delimiter** cannot be `\r` or `\n`.
- A delimiter cannot be the same as the null value. The delimiter for the CSV format cannot be same as the **quote** value.
- The delimiter for the TEXT format data cannot contain lowercase letters, digits, or special characters (.,\).
- The data length of a single row should be less than 1 GB. A row that has many columns using long delimiters cannot contain much valid data.
- You are advised to use multi-character delimiters or invisible delimiters. For example, you can use multi-characters (such as `$$^&`) and invisible characters (such as `0x07`, `0x08`, and `0x1b`).

Value range: a multi-character delimiter within 10 bytes

Default value:

- A tab character in text format
- A comma (,) in CSV format
- No delimiter in FIXED format

– NULL

Specifies the string that represents a null value.

Value range:

- A null value cannot be `\r` or `\n`. The maximum length is 100 characters.
- A null value cannot be the same as the **delimiter** or **quote** value.

Default value:

- The default value for the CSV format is an empty string without quotation marks.
- The default value for the TEXT format is `\N`.

– HEADER

Specifies whether a file contains a header with the names of each column in the file. **header** is available only for CSV and FIXED files.

When data is imported, if **header** is **on**, the first row of the data file will be identified as the header and ignored. If **header** is **off**, the first row will be identified as a data row.

When data is exported, if header is **on**, **fileheader** must be specified. If **header** is **off**, an exported file does not contain a header.

Value range: **true/on** or **false/off**.

Default value: **false**

– USEEOF

The system does not report an error for "\" in the imported data.

Value range: **true/on** or **false/off**.

Default value: **false**

– QUOTE

Specifies a quoted character string for a CSV file.

Default value: double quotation marks ("" )

 NOTE

- The value of **quote** cannot be the same as that of the **delimiter** or **null** parameter.
- The value of **quote** must be a single-byte character.
- You are advised to set **quote** to an invisible character, such as **0x07**, **0x08**, or **0x1b**.

– ESCAPE

Specifies an escape character for a CSV file. The value must be a single-byte character.

Default value: quotation mark ("). If the value is the same as that of **quote**, it will be replaced by '\0'.

– EOL 'newline\_character'

Specifies the newline character style of the imported or exported data file.

Value range: multi-character newline characters within 10 bytes. Common newline characters include \r (0x0D), \n (0x0A), and \r\n (0x0D0A). Special newline characters include \$ and #.

 NOTE

- The **EOL** parameter supports only the TEXT format for data import and export and does not support the CSV or FIXED format for data import. For forward compatibility, the EOL parameter can be set to **0x0D** or **0x0D0A** for data export in the CSV or FIXED format.
- The value of **EOL** cannot be the same as that of the **delimiter** or **null** parameter.
- The EOL parameter value cannot contain the following characters: .abcdefghijklmnopqrstuvwxyz0123456789.

– FORCE\_QUOTE { ( column\_name [, ...] ) | \* }

In **CSV COPY TO** mode, forces quotation marks to be used for all non-null values in each specified column. Null values are not quoted.

Value range: an existing column name

– FORCE\_NOT\_NULL ( column\_name [, ...] )

Assigns a value to a specified column in **CSV COPY FROM** mode.

Value range: an existing column name

– ENCODING

Specifies the encoding format of a data file. The default value is the current client encoding format.

---

 **CAUTION**

When COPY FROM is executed, **ENCODING** in the control file must be the same as the encoding format of the file. Otherwise, an error is reported or garbled characters are displayed in the imported data.

---

- **IGNORE\_EXTRA\_DATA**

Specifies whether to ignore excessive columns when the number of data source files exceeds the number of foreign table columns. This parameter is used only during data import.

Value range: **true/on** or **false/off**

- **true/on**: If the number of columns in a data source file is greater than that defined by the foreign table, the extra columns at the end of a row are ignored.
- **false/off**: If the number of columns in a data source file is greater than that defined by the foreign table, the following error message is reported:

extra data after last expected column

Default value: **false**

---

**NOTICE**

If a newline character at the end of a row is missing and the row and another row are integrated into one, data in another row is ignored after the parameter is set to **true**.

---

- **COMPATIBLE\_ILLEGAL\_CHARS**

Specifies whether to tolerate invalid characters during data import. The parameter is valid only for data import using **COPY FROM**.

Value range: **true/on** or **false/off**.

- **true/on**: No error message is reported and data import is not interrupted when there are invalid characters. Invalid characters are converted into valid ones, and then imported to the database.
- **false/off**: An error occurs when there are invalid characters, and the import stops.

Default value: **false** or **off**

 **NOTE**

The rules for converting invalid characters are as follows:

1. **\0** is converted to a space.
2. Other invalid characters are converted to question marks.
3. When **compatible\_illegal\_chars** is set to **true/on**, after invalid characters such as **NULL**, **DELIMITER**, **QUOTE**, and **ESCAPE** are converted to spaces or question marks, an error message stating "illegal chars conversion may confuse COPY escape 0x20" will be displayed to remind you of possible parameter confusion caused by the conversion.

- FILL\_MISSING\_FIELDS  
Specifies how to handle the problem that the last column of a row in a source data file is lost during data import.  
Value range: **true/on** or **false/off**.  
Default value: **false** or **off**
- DATE\_FORMAT  
Specifies the DATE format for data import. The BINARY format is not supported. When data of such format is imported, error "cannot specify bulkload compatibility options in BINARY mode" will occur. The parameter is valid only for data import using **COPY FROM**.  
Value range: a valid DATE value For details, see [Date and Time Processing Functions and Operators](#).  
 **NOTE**  
You can use the **TIMESTAMP\_FORMAT** parameter to set the DATE format to **TIMESTAMP** for data import. For details, see **TIMESTAMP\_FORMAT** below.
- TIME\_FORMAT  
Specifies the TIME format for data import. The BINARY format is not supported. When data of such format is imported, error "cannot specify bulkload compatibility options in BINARY mode" will occur. The parameter is valid only for data import using **COPY FROM**.  
Value range: a valid TIME value. Time zones cannot be used. For details, see [Date and Time Processing Functions and Operators](#).
- TIMESTAMP\_FORMAT  
Specifies the TIMESTAMP format for data import. The BINARY format is not supported. When data of such format is imported, error "cannot specify bulkload compatibility options in BINARY mode" will occur. The parameter is valid only for data import using **COPY FROM**.  
Value range: a valid TIMESTAMP value. Time zones cannot be used. For details, see [Date and Time Processing Functions and Operators](#).
- SMALLDATETIME\_FORMAT  
Specifies the SMALLDATETIME format for data import. The BINARY format is not supported. When data of such format is imported, error "cannot specify bulkload compatibility options in BINARY mode" will occur. The parameter is valid only for data import using **COPY FROM**.  
Value range: a valid SMALLDATETIME value. For details, see [Date and Time Processing Functions and Operators](#).
- **COPY\_OPTION { option\_name ' value ' }**  
Specifies all types of native parameters of **COPY**.
  - NULL null\_string  
Specifies the string that represents a null value.

---

**NOTICE**

When using **COPY FROM**, any data item that matches this string will be stored as a null value, so make sure that you use the same string as you used with **COPY TO**.

---

Value range:

- A null value cannot be `\r` or `\n`. The maximum length is 100 characters.
- A null value cannot be the same as the **delimiter** or **quote** value.

Default value:

- The default value for the TEXT format is `\N`.
- The default value for the CSV format is an empty string without quotation marks.

– **HEADER**

Specifies whether a file contains a header with the names of each column in the file. **header** is available only for CSV and FIXED files.

When data is imported, if **header** is **on**, the first row of the data file will be identified as the header and ignored. If **header** is **off**, the first row will be identified as a data row.

When data is exported, if header is **on**, **fileheader** must be specified. If **header** is **off**, an exported file does not contain a header.

– **USEEOF**

The system does not report an error for `\"` in the imported data.

– **FILEHEADER**

Specifies a file that defines the content in the header for exported data. The file contains data description of each column.

---

**NOTICE**

- This parameter is available only when **header** is **on** or **true**.
- **fileheader** specifies an absolute path.
- The file can contain only one row of header information, and ends with a newline character. Excess rows will be discarded. (Header information cannot contain newline characters.)
- The length of the file including the newline character cannot exceed 1 MB.

---

– **FREEZE**

Sets the **COPY** loaded data row as **frozen**, like these data have executed **VACUUM FREEZE**.

This is a performance option of initial data loading. The data will be frozen only when the following three requirements are met:

- The table being loaded has been created or truncated in the same transaction before copying.
- There are no cursors open in the current transaction.
- There are no original snapshots in the current transaction.

 NOTE

When **COPY** is completed, all the other sessions will see the data immediately. However, this violates the general principle of MVCC visibility, and users should understand that this may cause potential risks.

- **FORCE NOT NULL** column\_name [, ...]  
Assigns a value to a specified column in **CSV COPY FROM** mode. If the column is null, its value is regarded as a string of 0 characters.  
Value range: an existing column name
- **FORCE QUOTE** { column\_name [, ...] | \* }  
In **CSV COPY TO** mode, forces quotation marks to be used for all non-null values in each specified column. Null values are not quoted.  
Value range: an existing column name
- **BINARY**  
Specifies that data is stored and read in binary mode instead of text mode. In binary mode, you cannot declare **DELIMITER**, **NULL**, or **CSV**. When **BINARY** is specified, **CSV**, **FIXED**, and **TEXT** cannot be specified through **option** or **copy\_option**.
- **CSV**  
Enables the CSV mode. When **CSV** is specified, **BINARY**, **FIXED**, and **TEXT** cannot be specified through **option** or **copy\_option**.
- **QUOTE** [AS] 'quote\_character'  
Specifies a quoted character string for a CSV file.  
Default value: quotation mark (").

 NOTE

- The value of **quote** cannot be the same as that of the **delimiter** or **null** parameter.
  - The value of **quote** must be a single-byte character.
  - You are advised to set **quote** to an invisible character, such as **0x07**, **0x08**, or **0x1b**.
- **ESCAPE** [AS] 'escape\_character'  
Specifies an escape character for a CSV file. The value must be a single-byte character.  
Default value: quotation mark ("). If the value is the same as that of **quote**, it will be replaced by '\0'.
- **EOL** 'newline\_character'  
Specifies the newline character style of the imported or exported data file.  
Value range: multi-character newline characters within 10 bytes. Common newline characters include **\r** (0x0D), **\n** (0x0A), and **\r\n** (0x0D0A). Special newline characters include **\$** and **#**.

 NOTE

- The **EOL** parameter supports only the TEXT format for data import and export and does not support the CSV or FIXED format. For forward compatibility, the **EOL** parameter can be set to **0x0D** or **0x0D0A** for data export in the CSV or FIXED format.
  - The value of **EOL** cannot be the same as that of the **delimiter** or **null** parameter.
  - The EOL parameter value cannot contain the following characters: .abcdefghijklmnopqrstuvwxyz0123456789.
- ENCODING 'encoding\_name'  
Specifies the name of a file encoding format.  
Value range: a valid encoding format  
Default value: current encoding format

---

 CAUTION

When COPY FROM is executed, **ENCODING** in the control file must be the same as the encoding format of the file. Otherwise, an error is reported or garbled characters are displayed in the imported data.

- 
- IGNORE\_EXTRA\_DATA  
Specifies that when the number of data source files exceeds the number of foreign table columns, excess columns at the end of the row are ignored. This parameter is used only during data import.  
If this parameter is not used and the number of columns in the data source file is greater than that defined in the foreign table, the following error information is displayed:  
extra data after last expected column
- COMPATIBLE\_ILLEGAL\_CHARS  
Specifies that invalid characters are tolerated during data import. Invalid characters are converted and then imported to the database. No error is reported and the import is not interrupted. The BINARY format is not supported. When data of such format is imported, error "cannot specify bulkload compatibility options in BINARY mode" will occur. The parameter is valid only for data import using **COPY FROM**.  
If this parameter is not used, an error is reported when invalid characters are encountered during the import, and the import is interrupted.

 NOTE

The rules for converting invalid characters are as follows:

1. **\0** is converted to a space.
  2. Other invalid characters are converted to question marks.
  3. When **compatible\_illegal\_chars** is set to **true/on**, after invalid characters such as **NULL**, **DELIMITER**, **QUOTE**, and **ESCAPE** are converted to spaces or question marks, an error message stating "illegal chars conversion may confuse COPY escape 0x20" will be displayed to remind you of possible parameter confusion caused by the conversion.
- FILL\_MISSING\_FIELDS [ { 'one' | 'multi' } ]

Specifies how to handle the problem that the last column of a row in a source data file is lost during data import. If **one** or **multi** is not specified or **one** is specified, the missing of the last column is handled in the default mode. If **multi** is specified, the missing of the last multiple columns are handled in the default mode.

Value range: **true/on** or **false/off**.

Default value: **false** or **off**

---

#### NOTICE

Do not specify this option. Currently, it does not enable error tolerance, but will make the parser ignore the said errors during data parsing on primary database node. Such errors will not be recorded in the COPY error table (enabled using LOG ERRORS REJECT LIMIT) but will be reported later by database node. Therefore, do not specify this option.

- 
- DATE\_FORMAT 'date\_format\_string'  
Specifies the DATE format for data import. The BINARY format is not supported. When data of such format is imported, error "cannot specify bulkload compatibility options in BINARY mode" will occur. The parameter is valid only for data import using **COPY FROM**.

Value range: a valid DATE value For details, see [Date and Time Processing Functions and Operators](#).

#### NOTE

You can use the **TIMESTAMP\_FORMAT** parameter to set the DATE format to **TIMESTAMP** for data import. For details, see **TIMESTAMP\_FORMAT** below.

- TIME\_FORMAT 'time\_format\_string'  
Specifies the TIME format for data import. The BINARY format is not supported. When data of such format is imported, error "cannot specify bulkload compatibility options in BINARY mode" will occur. The parameter is valid only for data import using **COPY FROM**.

Value range: a valid TIME value. Time zones cannot be used. For details, see [Date and Time Processing Functions and Operators](#).

- TIMESTAMP\_FORMAT 'timestamp\_format\_string'  
Specifies the TIMESTAMP format for data import. The BINARY format is not supported. When data of such format is imported, error "cannot specify bulkload compatibility options in BINARY mode" will occur. The parameter is valid only for data import using **COPY FROM**.

Value range: a valid TIMESTAMP value. Time zones cannot be used. For details, see [Date and Time Processing Functions and Operators](#).

- SMALLDATETIME\_FORMAT 'smalldatetime\_format\_string'  
Specifies the SMALLDATETIME format for data import. The BINARY format is not supported. When data of such format is imported, error "cannot specify bulkload compatibility options in BINARY mode" will occur. The parameter is valid only for data import using **COPY FROM**.

Value range: a valid SMALLDATETIME value. For details, see [Date and Time Processing Functions and Operators](#).

- TRANSFORM ( { column\_name [ data\_type ] [ AS transform\_expr ] } [, ...] )  
Specify the conversion expression of each column in the table. **data\_type** specifies the data type of the column in the expression parameter. **transform\_expr** is the target expression that returns the result value whose data type is the same as that of the target column in the table. For details about the expression, see [Expressions](#).
- SKIP int\_number  
Specifies that the first *int\_number* rows of the data file are skipped during data import.
- WHEN { ( start - end ) | column\_name } { = | != } 'string'  
When data is imported, each row of data is checked. Only the rows that meet the WHEN condition are imported to the table.
- SEQUENCE ( { column\_name ( integer [, incr] ) [, ...] } )  
During data import, columns modified by SEQUENCE do not read data from the data file. The values are incremented by the value of **incr** based on the specified integer. If **incr** is not specified, the values are incremented from 1 by default.
- FILLER ( { column\_name [, ...] } )  
When data is imported, the column modified by FILLER is discarded after being read from the data file.

#### NOTE

To use FILLER, you need to specify the list of columns to be copied. During data processing, data is processed based on the position of the **filler** column in the column list.

- CONSTANT ( { column\_name 'constant\_string' [, ...] } )  
When data is imported, the column modified by CONSTANT is not read from the data file, and **constant\_string** is used to assign a value to the column.

The following special backslash sequences are recognized by **COPY FROM**:

- **\b**: Backslash (ASCII 8)
- **\f**: Form feed (ASCII 12)
- **\n**: Newline character (ASCII 10)
- **\r**: Carriage return character (ASCII 13)
- **\t**: Tab (ASCII 9)
- **\v**: Vertical tab (ASCII 11)
- **\digits**: Backslash followed by one to three octal digits specifies that the ASCII value is the character with that numeric code.
- **\xdigits**: Backslash followed by an x and one or two hex digits specifies the character with that numeric code.

## Permission Control Examples

```
gaussdbs=> copy t1 from '/home/xy/t1.csv';  
ERROR: COPY to or from a file is prohibited for security concerns  
HINT: Anyone can COPY to stdout or from stdin. gsql's \copy command also works for anyone.  
gaussdbs=> grant gs_role_copy_files to xxx;
```

This error occurs because a non-initial user does not have the COPY permission. To solve this problem, enable the **enable\_copy\_server\_files** parameter. Then, the administrator can use the COPY function, and common users need to join the **gs\_role\_copy\_files** group.

## Examples

```
-- Copy data from the tpcds.ship_mode file to the /home/omm/ds_ship_mode.dat file:
gaussdb=# COPY tpcds.ship_mode TO '/home/omm/ds_ship_mode.dat';

-- Output tpcds.ship_mode to stdout.
gaussdb=# COPY tpcds.ship_mode TO stdout;

-- Create the tpcds.ship_mode_t1 table.
gaussdb=# CREATE TABLE tpcds.ship_mode_t1
(
  SM_SHIP_MODE_SK      INTEGER      NOT NULL,
  SM_SHIP_MODE_ID     CHAR(16)     NOT NULL,
  SM_TYPE              CHAR(30)     ,
  SM_CODE              CHAR(10)     ,
  SM_CARRIER          CHAR(20)     ,
  SM_CONTRACT         CHAR(20)
)
;

-- Copy data from stdin to the tpcds.ship_mode_t1 table.
gaussdb=# COPY tpcds.ship_mode_t1 FROM stdin;

-- Copy data from the /home/omm/ds_ship_mode.dat file to the tpcds.ship_mode_t1 table.
gaussdb=# COPY tpcds.ship_mode_t1 FROM '/home/omm/ds_ship_mode.dat';

-- Copy data from the /home/omm/ds_ship_mode.dat file to the tpcds.ship_mode_t1 table, convert the
data using the TRANSFORM expression, and insert the 10 characters on the left of the SM_TYPE column
into the table.
gaussdb=# COPY tpcds.ship_mode_t1 FROM '/home/omm/ds_ship_mode.dat' TRANSFORM (SM_TYPE AS
LEFT(SM_TYPE, 10));

-- Copy data from the /home/omm/ds_ship_mode.dat file to the tpcds.ship_mode_t1 table, with the
import format set to TEXT (format 'text'), the delimiter set to \t (delimiter E'\t'), excessive columns
ignored (ignore_extra_data 'true'), and characters not escaped (noescaping 'true').
gaussdb=# COPY tpcds.ship_mode_t1 FROM '/home/omm/ds_ship_mode.dat' WITH(format 'text', delimiter
E'\t', ignore_extra_data 'true', noescaping 'true');

-- Copy data from the /home/omm/ds_ship_mode.dat file to the tpcds.ship_mode_t1 table, with the
import format set to FIXED, fixed-length format specified (FORMATTER(SM_SHIP_MODE_SK(0, 2),
SM_SHIP_MODE_ID(2,16), SM_TYPE(18,30), SM_CODE(50,10), SM_CARRIER(61,20),
SM_CONTRACT(82,20))), excessive columns ignored (ignore_extra_data), and headers included (header).
gaussdb=# COPY tpcds.ship_mode_t1 FROM '/home/omm/ds_ship_mode.dat' FIXED
FORMATTER(SM_SHIP_MODE_SK(0, 2), SM_SHIP_MODE_ID(2,16), SM_TYPE(18,30), SM_CODE(50,10),
SM_CARRIER(61,20), SM_CONTRACT(82,20)) header ignore_extra_data;

-- Delete the tpcds.ship_mode_t1 table.
gaussdb=# DROP TABLE tpcds.ship_mode_t1;
```

## 7.14.52 CREATE AGGREGATE

### Description

Defines a new aggregate function.

### Syntax

```
CREATE AGGREGATE name ( input_data_type [ , ... ] ) (
  SFUNC = sfunc,
  STYPE = state_data_type
```

```
[ , FINALFUNC = ffunc ]  
[ , INITCOND = initial_condition ]  
[ , SORTOP = sort_operator ]  
[ , CFUNC = collection_func ]  
)  
  
or the old syntax  
  
CREATE AGGREGATE name (  
  BASETYPE = base_type,  
  SFUNC = sfunc,  
  STYPE = state_data_type  
  [ , FINALFUNC = ffunc ]  
  [ , INITCOND = initial_condition ]  
  [ , SORTOP = sort_operator ]  
  [ , CFUNC = collection_func ]  
)
```

## Parameters

- **name**  
Name (optionally schema-qualified) of the aggregate function to be created.
- **input\_data\_type**  
Data type of the input to be processed by the aggregate function. To create a zero-parameter aggregate function, you can use an asterisk (\*) instead of a list of input data types. (count(\*) is an instance of this aggregate function.)
- **base\_type**  
In the CREATE AGGREGATE syntax, the input data type is specified by the **basetype** parameter instead of following **name**. Note that the previous syntax allows only one input parameter. To create a zero-parameter aggregate function, you can set **basetype** to **ANY** instead of \*.
- **sfunc**  
Name of the state conversion function that will be called on each input line. For an aggregate function with N parameters, **sfunc** must have more than one parameter. The first parameter is of the **state\_data\_type** type, and the other parameters match the declared input data types. The function must return a value of the **state\_data\_type** type. This function accepts the current state value and the current input data, and returns the next state value.
- **state\_data\_type**  
Data type of the aggregation status value.
- **ffunc**  
Final processing function called after all the input lines have been converted, which calculates the result of aggregation. This function must accept a parameter of **state\_data\_type**. The output data type of the aggregation is defined as the return type of this function. If **ffunc** is not specified, the state value of the aggregation result is used as the aggregation result, and the output type is **state\_data\_type**.
- **initial\_condition**  
Initial setting (value) of a state value. It must be a text constant value acceptable to **state\_data\_type**. If not specified, the initial state value is **NULL**.
- **sort\_operator**

Sort operator used for MIN or MAX aggregation. This is just an operator name (optionally schema-qualified). This operator assumes that the input data type is the same as that of aggregation.

- **collection\_func**

Currently, this parameter does not take effect in centralized mode.

## Examples

```
gaussdb=# CREATE AGGREGATE sum (complex)
(
  sfunc = complex_add,
  stype = complex,
  initcond = '(0,0)'
);
gaussdb=# SELECT sum(a) FROM test_complex;
sum
-----
(34,53.9)
```

## 7.14.53 CREATE AUDIT POLICY

### Description

Creates a unified audit policy.

### Precautions

Only users with the poladmin or sysadmin permission, or the initial user can perform this operation.

The masking policy takes effect only after the security policy is enabled, that is, **enable\_security\_policy** is set to **on**.

---

 **CAUTION**

When you use database links to perform operations on remote objects, the client initiates a database link request. The actual sender is the server, and the attributes such as the IP address of the sender are the values of the server. For details, see [DATABASE LINK](#).

---

### Syntax

```
CREATE AUDIT POLICY [ IF NOT EXISTS ] policy_name { { privilege_audit_clause | access_audit_clause }
[ filter_group_clause ] [ ENABLE | DISABLE ] };
```

- **privilege\_audit\_clause**  
PRIVILEGES { DDL | ALL } [ ON LABEL ( resource\_label\_name [, ... ] ) ]
- **access\_audit\_clause**  
ACCESS { DML | ALL } [ ON LABEL ( resource\_label\_name [, ... ] ) ]
- **filter\_group\_clause**  
FILTER ON { FILTER\_TYPE ( filter\_value [, ... ] ) } [, ... ]

## Parameters

- **policy\_name**  
Specifies the audit policy name, which must be unique.  
Value range: a string. It must comply with the [naming convention](#).
- **DDL**  
Specifies the operations that are audited in the database: CREATE, ALTER, DROP, ANALYZE, COMMENT, GRANT, REVOKE, SET, and SHOW.  
If this parameter is set to **ANALYZE**, both ANALYZE and VACUUM operations are audited.
- **ALL**  
Indicates all operations supported by the specified DDL statements in the database.
- **resource\_label\_name**  
Specifies the resource label name.
- **DML**  
Specifies the operations that are audited in the database: SELECT, COPY, DEALLOCATE, DELETE, EXECUTE, INSERT, PREPARE, REINDEX, TRUNCATE, and UPDATE.
- **FILTER\_TYPE**  
Specifies the types of information to be filtered by the policy, including **IP**, **APP**, and **ROLES**.
- **filter\_value**  
Indicates the detailed information to be filtered.
- **ENABLE|DISABLE**  
Enables or disables the unified audit policy. If **ENABLE|DISABLE** is not specified, **ENABLE** is used by default.

## Examples

```
-- Create users dev_audit and bob_audit.
gaussdb=# CREATE USER dev_audit PASSWORD '*****';
gaussdb=# CREATE USER bob_audit password '*****';

-- Create the tb_for_audit table.
gaussdb=# CREATE TABLE tb_for_audit(col1 text, col2 text, col3 text);

-- Create a resource label.
gaussdb=# CREATE RESOURCE LABEL adt_lb0 add TABLE(tb_for_audit);

-- Perform the CREATE operation on the database to create an audit policy.
gaussdb=# CREATE AUDIT POLICY adt1 PRIVILEGES CREATE;

-- Perform the SELECT operation on the database to create an audit policy.
gaussdb=# CREATE AUDIT POLICY adt2 ACCESS SELECT;

-- Create an audit policy to audit only the CREATE operations performed on the adt_lb0 resource by users dev_audit and bob_audit.
gaussdb=# CREATE AUDIT POLICY adt3 PRIVILEGES CREATE ON LABEL(adt_lb0) FILTER ON ROLES(dev_audit, bob_audit);

-- Create an audit policy to audit only the SELECT, INSERT, and DELETE operations performed on the adt_lb0 resource by users dev_audit and bob_audit using client tool gsql on the servers whose IP addresses are 10.20.30.40 and 127.0.0.0/24.
```

```
gaussdb=# CREATE AUDIT POLICY adt4 ACCESS SELECT ON LABEL(adtlb0), INSERT ON LABEL(adtlb0),  
DELETE FILTER ON ROLES(dev_audit, bob_audit), APP(gsql), IP('10.20.30.40', '127.0.0.0/24');  
  
-- Delete an audit policy.  
gaussdb=# DROP AUDIT POLICY adt1, adt2, adt3, adt4;  
  
-- Delete a resource label.  
gaussdb=# DROP RESOURCE LABEL adtlb0;  
  
-- Delete the tb_for_audit table.  
gaussdb=# DROP TABLE tb_for_audit;  
  
-- Delete the dev_audit and bob_audit users.  
gaussdb=# DROP USER dev_audit, bob_audit;
```

## Helpful Links

[ALTER AUDIT POLICY](#) and [DROP AUDIT POLICY](#)

## 7.14.54 CREATE CAST

### Description

Defines a conversion.

### Syntax

- Define the CAST as a conversion with function.  
CREATE CAST (source\_type AS target\_type)  
WITH FUNCTION function\_name (argument\_type [, ...])  
[ AS ASSIGNMENT | AS IMPLICIT ];
- Define the CAST as a conversion without function.  
CREATE CAST (source\_type AS target\_type)  
WITHOUT FUNCTION  
[ AS ASSIGNMENT | AS IMPLICIT ];
- Defines the CAST as a conversion with I/O.  
CREATE CAST (source\_type AS target\_type)  
WITH INOUT  
[ AS ASSIGNMENT | AS IMPLICIT ];

### Parameters

- **source\_type**  
Type of the source data to be converted.
- **target\_type**  
Type of the target data to be converted.
- **function\_name(argument\_type [, ...])**  
Function used for conversion. The function name can be modified with a schema name. If it is not modified with a schema name, the function will be found in the schema search path. The result data type of the function must match the target type of the conversion. Its parameters are discussed below.
- **WITHOUT FUNCTION**  
Indicates that the source type is a binary castable to the target type, so no function is needed to perform this conversion.
- **WITH INOUT**

Indicates that the conversion is an I/O conversion, which is performed by calling the output function of the source data type and transferring the result to the input function of the target data type.

- **AS ASSIGNMENT**

Indicates that the conversion can be implicitly called in assignment mode.

- **AS IMPLICIT**

Indicates that the transformation can be implicitly called in any environment. A conversion implementation function can have one to three parameters. The type of the first parameter must be the same as that of the source type to be converted, or can be forcibly converted from the binary of the source type to be converted. If the second parameter exists, it must be of the integer type. It receives these type modifiers associated with the target type, or **-1** if nothing is present. If the third parameter exists, it must be of the Boolean type. If the conversion is an explicit type conversion, **true** is received. Otherwise, **false** is received.

The return type of a conversion function must be the same as the target type of the conversion, or the two types can be binary coercible.

Typically, a transformation must have different source and target data types. However, if there is a conversion implementation function with more than one parameter, it is allowed to declare a conversion with the same source and target types. This is used to represent a length enforcement function of a specific type in the system catalog. The named function is used to force a value of this type to be the type modifier value given by the second parameter.

If the source type and target type of a type conversion are different and more than one parameter is received, it indicates that only one step is required to convert one type to another and the length conversion is performed at the same time. If no such conversion is available, converting to a type that uses a type modifier involves two steps, one to convert between data types, and the other to apply a conversion specified by the modifier.

Currently, domain type conversion does not take effect. Transformations are typically targeted to the domain-related data types to which they belong.

 **NOTE**

Cast is executed depending on the permission of the user who calls it. When calling a cast created by others, check the execution content of the cast function to prevent the cast creator from performing unauthorized operations with the permission of the executor.

## Examples

To create an assignment mapping from type bigint to type int4, use the int4(bigint) function:

```
gaussdb=# CREATE CAST (bigint AS int4) WITH FUNCTION int4(bigint) AS ASSIGNMENT;
```

(The conversion has been predefined in the system.)

## Compatibility

The CREATE CAST instruction complies with the SQL standard. Except that the SQL does not have extra parameters that can be forcibly converted to binary types or implement functions.

## 7.14.55 CREATE CLIENT MASTER KEY

### Description

The encrypted equality query feature adopts a multi-level encryption model. The master key encrypts the column key, and the column key encrypts data. This syntax is used to create a master key object.

### Precautions

- This syntax is specific to a fully-encrypted database.
- When connecting to the database, you need to enable the connection parameters of the encrypted equality query feature on the database driver side before running this syntax.
- The master key is provided by an external key manager. This syntax processes only information such as the key source and key ID. The following external key managers are supported:
  - a. Huawei Cloud KMS huawei\_kms
- Before using this syntax, set environment variables for the external key manager on the database driver side. For details, see section "Setting Encrypted Equality Query" in *Feature Guide*.

### Syntax

```
CREATE CLIENT MASTER KEY client_master_key_name WITH (KEY_STORE = key_store_name, KEY_PATH = "key_path_value", ALGORITHM = algorithm_type)
```

### Parameters

- **client\_master\_key\_name**

This parameter is used as the name of a key object. In the same namespace, the value of this parameter must be unique.

Value range: a string. It must comply with the [naming convention](#).
- **KEY\_STORE**

External key manager. For details about the value, see [Table 7-142](#).
- **KEY\_PATH**

Each key is managed by an external key manager and the key path format varies depending on the key manager. The value is a character string. For details, see [Table 7-142](#). A character string is enclosed in single or double quotation marks. If the length of a character string exceeds 64 characters, only single quotation marks can be used.
- **ALGORITHM**

Encryption algorithm used by the key. For details about the value, see [Table 7-142](#).

**Table 7-142** Parameter values for different key managers

| KEY_STORE  | KEY_PATH                                                                                                                                                                                                                                                                                         | ALGORITHM |
|------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------|
| huawei_kms | Format: '{KmsApiUrl}/{Key ID}'<br>Reference: 'https://kms.<br>{Project}.myhuaweicloud.com/v1.0/<br>{Project ID}/kms/{Key ID}'<br>Example: 'https://kms.cn-<br>north-4.myhuaweicloud.com/<br>v1.0/00000000000000000000000000000000/<br>0000000/kms/<br>00000000-0000-0000-0000-00000000<br>00000' | AES_256   |

## 7.14.56 CREATE COLUMN ENCRYPTION KEY

### Description

Creates a CEK that can be used to encrypt a specified column in a table.

### Precautions

This syntax is specific to a fully-encrypted database.

When using gsql to connect to a database server, you need to use the **-C** parameter to enable the fully-encrypted database.

The CEK object created using this syntax can be used for column-level encryption. When defining a column in a table, you can specify a CEK object to encrypt the column.

### Syntax

```
CREATE COLUMN ENCRYPTION KEY column_encryption_key_name WITH VALUES(CLIENT_MASTER_KEY = client_master_key_name, ALGORITHM = algorithm_type, ENCRYPTED_VALUE = encrypted_value);
```

### Parameters

- column\_encryption\_key\_name**  
 This parameter is used as the name of a key object. In the same namespace, the value of this parameter must be unique.  
 Value range: a string. It must comply with the [naming convention](#).
- CLIENT\_MASTER\_KEY**  
 Specifies the CMK used to encrypt the CEK. The value is the CMK object name, which is created using the CREATE CLIENT MASTER KEY syntax.
- ALGORITHM**

Encryption algorithm to be used by the CEK. The value can be **AEAD\_AES\_256\_CBC\_HMAC\_SHA256**, **AEAD\_AES\_128\_CBC\_HMAC\_SHA256**, **AEAD\_AES\_256\_CTR\_HMAC\_SHA256**, **AES\_256\_GCM**, or **SM4\_SM3**.

The data expansion rates of different encryption algorithms are sorted as follows: **AEAD\_AES\_256\_CTR\_HMAC\_SHA256** < **AES\_256\_GCM** < **AEAD\_AES\_256\_CBC\_HMAC\_SHA256** = **AEAD\_AES\_128\_CBC\_HMAC\_SHA256** = **SM4\_SM3**. The **AEAD\_AES\_256\_CTR\_HMAC\_SHA256** and **AES\_256\_GCM** encryption algorithms are recommended.

- **ENCRYPTED\_VALUE (optional)**

A key password specified by a user. The key password length ranges from 28 to 256 characters. The derived 28-character key meets the AES128 security requirements. If the user needs to use AES256, the key password length must be 39 characters. If the user does not specify the key password length, a 256-character key is automatically generated.

---

**NOTICE**

- SM algorithm constraints: SM2, SM3, and SM4 are Chinese national cryptography standards. To avoid legal risks, these algorithms must be used together. If you specify the SM4 algorithm to encrypt CEKs when creating a CMK, you must specify the SM3 and SM4 algorithms (**SM4\_SM3**) to encrypt data when creating CEKs.
- Constraints on the **ENCRYPTED\_VALUE** column: If the CMK generated by Huawei KMS is used to encrypt the CEK and the **ENCRYPTED\_VALUE** column is used to transfer the key in the CREATE COLUMN ENCRYPTION KEY syntax, the length of the input key must be an integer multiple of 16 bytes.

---

## Example (Using gsql to Connect to the Database Server)

Before using this syntax, you need to enable KMS and configure parameters for accessing KMS. For details, see "Setting Encrypted Equality Queries" in *Feature Guide*.

## 7.14.57 CREATE CONVERSION

### Description

Defines a new conversion between two character set encodings. This function is for internal use only. You are not advised to use it.

### Precautions

- The **DEFAULT** parameter indicates that the conversion between the source encoding and the target encoding is executed by default between the client and the server. To support this usage, bidirectional conversion must be defined, that is, both conversion from A to B and conversion from B to A are supported.
- To perform conversion, you must have the EXECUTE permission on function and the CREATE permission on the target schema.

- SQL\_ASCII cannot be used for either source encoding or target encoding because the server behavior is hardwired when SQL\_ASCII "encoding" is involved.
- You can remove user-defined conversions using DROP CONVERSION.

## Syntax

```
CREATE [ DEFAULT ] CONVERSION name  
FOR 'source_encoding' TO 'dest_encoding' FROM function_name
```

## Parameters

- **DEFAULT**  
Specifies that the conversion is the default conversion from the source encoding to the target encoding. There should be only one default conversion for each encoding pair in a schema.
- **name**  
Specifies the name of the conversion, which can be restricted by the schema. If not restricted by a schema, the conversion is defined in the current schema. The conversion name must be unique in a schema.
- **source\_encoding**  
Source encoding name.
- **dest\_encoding**  
Target encoding name.
- **function\_name**  
Function used for conversion. A function name can be restricted by a schema. If not, the function is found in the path.

The function must be in the following format:

```
conv_proc(  
    integer, -- Source encoding ID  
    integer, -- Target encoding ID  
    cstring, -- Source character string (a null-terminated C character string)  
    internal, -- Target (filled with a null-terminated C character string)  
    integer -- Length of the source string  
) RETURNS void;
```

Currently, only internal creation is supported.

---

## 7.14.58 CREATE DATABASE

### Description

Creates a database. By default, the new database will be created only by cloning the standard system database **template0**.

### Precautions

- A user who has the CREATEDB permission or a system administrator can create a database.

- It cannot be executed inside a transaction block.
- During the database creation, an error message indicating that permission denied is displayed, possibly because the permission on the data directory in the file system is insufficient. If an error message, indicating no space left on device is displayed, the possible cause is that the disk space is used up.

## Syntax

```
CREATE DATABASE database_name
  [ [ WITH ] { [ OWNER [=] user_name ] |
    [ TEMPLATE [=] template ] |
    [ ENCODING [=] 'encoding' ] |
    [ LC_COLLATE [=] 'lc_collate' ] |
    [ LC_CTYPE [=] 'lc_ctype' ] |
    [ DBCOMPATIBILITY [=] 'compatibility_type' ] |
    [ TABLESPACE [=] tablespace_name ] |
    [ CONNECTION LIMIT [=] conlimit ] |
    [ DBTIMEZONE [=] 'time_zone'] } [...] ];
```

## Parameters

- **database\_name**  
Specifies the database name.  
Value range: a string. It must comply with the [naming convention](#).
- **OWNER [= ] user\_name**  
Specifies the owner of the new database. If omitted, the default owner is the current user.  
Value range: an existing username
- **TEMPLATE [= ] template**  
Specifies a template name. That is, the template from which the database is created. GaussDB creates a database by copying data from a template database. GaussDB has two default template databases **template0** and **template1** and a default user database **postgres**.  
Value range: **template0**
- **ENCODING [= ] 'encoding'**  
Specifies the character encoding used by the database. The value can be a string (for example, **SQL\_ASCII**) or an integer.  
If this parameter is not specified, the encoding of the template database is used by default. By default, the codes of the template databases **template0** and **template1** are related to the OS environment. The character encoding of **template1** cannot be changed. To change the encoding, use **template0** to create a database.  
Common values are **GBK**, **UTF8**, **Latin1**, and **GB18030**. The supported character sets are as follows:

**Table 7-143** GaussDB character set

| Name         | Description                       | Language            | Server-side Encoding | ICU Support | Number of Bytes/Characters | Alias              |
|--------------|-----------------------------------|---------------------|----------------------|-------------|----------------------------|--------------------|
| BIG5         | Big Five                          | Traditional Chinese | No                   | No          | 1-2                        | WIN950, Windows950 |

---

 **CAUTION**

- Note that not all client APIs support the preceding character sets.
  - The `SQL_ASCII` setting performs quite differently from other settings. If the character set of the server is `SQL_ASCII`, the server interprets the byte values 0 to 127 according to the ASCII standard. The byte values 128 to 255 are regarded as the characters that cannot be parsed. If this parameter is set to `SQL_ASCII`, no code conversion occurs. Therefore, this setting is not basically used to declare the specified encoding used, because this declaration ignores the encoding. In most cases, if you use any non-ASCII data, it is unwise to use the `SQL_ASCII` setting because the database will not be able to help you convert or verify non-ASCII characters.
- 

---

**NOTICE**

- The character set encoding of the new database must be compatible with the local settings (`LC_COLLATE` and `LC_CTYPE`).
  - When the specified character encoding set is **GBK**, some uncommon Chinese characters cannot be directly used as object names. This is because the byte encoding overlaps with the ASCII characters `@A-Z[\]^_`a-z{}` when the second byte of the GBK ranges from 0x40 to 0x7E. `@[\]^_{'}` is an operator in the database. If it is directly used as an object name, a syntax error will be reported. For example, the GBK hexadecimal code is **0x8240**, and the second byte is **0x40**, which is the same as the ASCII character `@`. Therefore, the character cannot be used as an object name. If you need to use this function, you can add double quotation marks ("" ) to avoid this problem when creating and accessing objects.
  - If the client code is A and the server code is B, the conversion between encoding formats A and B must exist in the database. For details about encoding format conversion supported by the database, see the system catalog [PG\\_CONVERSION](#). (If the encoding format cannot be converted, it is recommended that the encoding format on the client be the same as that on the server. You can change the encoding format on the client by setting the `client_encoding` parameter.)
  - If you want to set the database character set encoding to `GB18030_2022` and the client encoding to `GB18030`, ensure that the client OS supports `GB18030_2022`. If the `GB18030` character set versions are incompatible with each other, data inconsistency may occur. In addition, if historical data needs to be switched to the `GB18030_2022` database, follow the database switching process to migrate data.
- 
- **LC\_COLLATE [ = ] 'lc\_collate'**  
Specifies the character set used by the new database. For example, set this parameter by using `lc_collate = 'zh_CN.gbk'`.  
The use of this parameter affects the sort order of strings (for example, the order of using **ORDER BY** for execution and the order of using indexes on text columns). By default, the sorting order of the template database is used.  
Value range: character sets supported by the OS.

- **LC\_CTYPE [ = ] 'lc\_ctype'**

Specifies the character class used by the new database. For example, set this parameter by using **lc\_ctype = 'zh\_CN.gb18030'**. The use of this parameter affects the classification of characters, such as uppercase letters, lowercase letters, and digits. By default, the character classification of the template database is used.

Value range: character classes supported by the OS.

 **NOTE**

- The value ranges of **lc\_collate** and **lc\_ctype** depend on the character sets supported by the local environment. For example, in the Linux OS, you can run the **locale -a** command to obtain the list of character sets supported by the OS. When using the **lc\_collate** and **lc\_ctype** parameters, you can select the required character sets and character classes.
  - If the specified character encoding set is GB18030\_2022, the value ranges of **LC\_COLLATE** and **LC\_CTYPE** are the same as those of GB18030.
- **DBCMPATIBILITY [ = ] 'compatibility\_type'**

Specifies the compatible database type. The default database is an O-compatible database.

Value range: **A**, **B**, **C**, and **PG**, indicating O-, MY-, TD- and POSTGRES-compatible databases, respectively.

 **NOTE**

- For A compatibility, the database treats empty strings as **NULL** and replaces **DATE** with **TIMESTAMP(0) WITHOUT TIME ZONE**.
  - When a character string is converted to an integer, if the input is invalid, the input will be converted to 0 due to B compatibility, and an error will be reported due to other compatibility issues.
  - For PG compatibility, CHAR and VARCHAR are counted by character. For other compatibility types, they are counted by byte. For example, for the UTF-8 character set, CHAR(3) can store three Chinese characters in PG compatibility scenarios, but can store only one Chinese character in other compatibility scenarios.
- **TABLESPACE [ = ] tablespace\_name**

Specifies the tablespace of the database.

Value range: an existing tablespace name

- **CONNECTION LIMIT [ = ] connlimit**

Specifies the maximum number of concurrent connections that can be made to the new database.

---

**NOTICE**

- The system administrator is not restricted by this parameter.
- **connlimit** is calculated separately for each primary database node.  
Number of connections of the database = Value of **connlimit** x Number of normal primary database nodes.

---

Value range: an integer in the range  $[-1, 2^{31} - 1]$ . The default value is **-1**, indicating that there is no limit.

The restrictions on character encoding are as follows:

- If the locale is set to **C** (or **POSIX**), all encoding types are allowed. For other locale settings, the character encoding must be the same as that of the locale.
- If the character encoding mode is **SQL\_ASCII** and the modifier is an administrator, the character encoding mode can be different from the locale setting.
- The encoding and region settings must match the template database, except that **template0** is used as a template. This is because other databases may contain data that does not match the specified encoding, or may contain indexes whose sorting order is affected by **LC\_COLLATE** and **LC\_CTYPE**. Copying this data will invalidate the indexes in the new database. **template0** does not contain any data or indexes that may be affected.
- **DBTIMEZONE [ = ] 'time\_zone'**  
Specifies the time zone of the new database. For example, you can set this parameter by setting **DBTIMEZONE** to **'+00:00'**. This parameter affects the time zone of the new database. The **PRC** is used by default.  
Value range: name and abbreviation of the time zone supported by the OS, or the timestamp ranges from -15:59 to +15:00.

## Examples

```
-- Create users jim and tom.
gaussdb=# CREATE USER jim PASSWORD '*****';
gaussdb=# CREATE USER tom PASSWORD '*****';

-- Create database music using GBK (the local encoding type is also GBK).
gaussdb=# CREATE DATABASE music ENCODING 'GBK' template = template0;

-- Create database music2 and specify user jim as its owner.
gaussdb=# CREATE DATABASE music2 OWNER jim;

-- Create database music3 using template template0 and specify user jim as its owner.
gaussdb=# CREATE DATABASE music3 OWNER jim TEMPLATE template0;

-- Set the maximum number of connections to database music to 10.
gaussdb=# ALTER DATABASE music CONNECTION LIMIT= 10;

-- Rename database music to music4.
gaussdb=# ALTER DATABASE music RENAME TO music4;

-- Change the owner of database music2 to user tom.
gaussdb=# ALTER DATABASE music2 OWNER TO tom;

-- Set the tablespace of database music3 to PG_DEFAULT.
gaussdb=# ALTER DATABASE music3 SET TABLESPACE PG_DEFAULT;

-- Disable the default index scan on database music3.
gaussdb=# ALTER DATABASE music3 SET enable_indexscan TO off;

-- Reset the enable_indexscan parameter.
gaussdb=# ALTER DATABASE music3 RESET enable_indexscan;

-- Delete the database.
gaussdb=# DROP DATABASE music2;
gaussdb=# DROP DATABASE music3;
gaussdb=# DROP DATABASE music4;

-- Delete the jim and tom users.
gaussdb=# DROP USER jim;
gaussdb=# DROP USER tom;

-- Create a database compatible with the TD format.
gaussdb=# CREATE DATABASE td_compatible_db DBCOMPATIBILITY 'C';
```

```
-- Create a database compatible with the A format.  
gaussdb=# CREATE DATABASE ora_compatible_db DBCOMPATIBILITY 'A';  
  
-- Delete the databases that are compatible with the TD and A formats.  
gaussdb=# DROP DATABASE td_compatible_db;  
gaussdb=# DROP DATABASE ora_compatible_db;
```

## Helpful Links

[ALTER DATABASE](#) and [DROP DATABASE](#)

## Suggestions

- **create database**  
Database cannot be created in a transaction.
- **ENCODING LC\_COLLATE LC\_CTYPE**  
If the new database Encoding does not match the template database (SQL\_ASCII) ('GBK', 'UTF8', 'LATIN1', 'GB18030', or 'GB18030\_2022'), **template [=] template0** must be specified.

## 7.14.59 CREATE DATABASE LINK

### Description

Creates a database link object. For details about database links, see [DATABASE LINK](#).

### Syntax

```
CREATE [ PUBLIC ] DATABASE LINK dblink  
[ CONNECT TO { CURRENT_USER | user IDENTIFIED BY password } ] [ USING ( option 'value' [...] ) ];
```

### Parameters

- **PUBLIC**  
Creates a public database link visible to all users. If this clause is omitted, the database link is private and available only to the current user.
- **dblink**  
Indicates the name of the database link to be created.
- **user**  
Indicates the name of the user for connecting to the remote end of the created database link.
- **password**  
Indicates the password of the user for connecting to the remote end of the created database link.
- **CURRENT\_USER**  
Uses the initial username and empty password of the current database for connection.
- **USING ( option 'value' [, ... ] )**

Specifies parameters such as the IP address, port number, and remote database name of the database to be connected. The supported options are as follows:

- **host**: specifies the IP addresses to be connected. IPv6 addresses are not supported. Multiple IP addresses can be specified using character strings separated by commas (,). Currently, SSL settings, encrypted databases, and certificate authentication are not supported. If no IP address is specified, this parameter is left empty by default.
- **port**: specifies the port number for connection. If this parameter is not specified, the default value **5432** is used.
- **dbname**: specifies the name of the database to be connected. If this parameter is not specified, the username used for connecting to the remote end is used by default.
- **fetch\_size**: specifies the amount of data obtained from the remote end each time. The value of **fetch\_size** ranges from 0 to 2147483647. The default value is **100**.

---

#### NOTICE

- You can write only part of the preceding options in the brackets after USING.
  - If the keyword USING is not written, the content in the brackets is not written as well.
  - When a database link is created, the system does not check whether the connection is successful. If related keywords are missing, an error may be reported.
- 

## Example

```
gaussdb=# create public database link test_link1 connect to 'user1' identified by '*****' using (port '54399',dbname 'db01');
```

---

#### NOTICE

- Do not use database links to connect to the initial user.
  - Initial users are not allowed to create, modify, or delete database links.
  - If the upgrade is not committed, the database link cannot be created.
  - If the CURRENT\_USER is used or the CONNECT TO connection string is omitted, the initial username and empty password of the current database are used for connection, resulting in connection failure.
- 

## 7.14.60 CREATE DIRECTORY

### Description

Creates a directory. The directory defines an alias for a path in the server file system and is used to store data files used by users.

## Precautions

- When **enable\_access\_server\_directory** is set to **off**, only the initial user is allowed to create directory objects. When **enable\_access\_server\_directory** is set to **on**, the user with the SYSADMIN permission and the user who inherits the **gs\_role\_directory\_create** permission of the built-in role can create directory objects.
- By default, the user who creates a directory has the read and write permissions on the directory.
- The default owner of a directory is the user who creates the directory.
- A directory cannot be created for the following paths:
  - The path contains special characters.
  - The path is a relative path.
- The following validity check is performed during directory creation:
  - Check whether the path exists in the OS. If it does not exist, a message is displayed, indicating the potential risks.
  - Check whether the database initial user **omm** has the R/W/X permissions for the OS path. If the user does not have all the permissions, a message is displayed, indicating the potential risks.
- Ensure that the path is the same on all the database nodes. Otherwise, the path may fail to be found on some nodes when the directory is used.

## Syntax

```
CREATE [OR REPLACE] DIRECTORY directory_name  
AS 'path_name';
```

## Parameters

- **directory\_name**  
Specifies the name of a directory.  
Value range: a string. It must comply with the [naming convention](#).
- **path\_name**  
Specifies the OS path for which a directory is to be created.  
Value range: a valid OS path

## Examples

```
-- Create a directory.  
gaussdb=# CREATE OR REPLACE DIRECTORY dir as '/tmp/';
```

## Helpful Links

[ALTER DIRECTORY](#) and [DROP DIRECTORY](#)

## 7.14.61 CREATE EVENT

### Description

Creates a scheduled event.

## Precautions

- Operations related to scheduled events are supported only when **sql\_compatibility** is set to 'B'.
- A user without the sysadmin permission must obtain the permission from the user who has the sysadmin permission to create, modify or delete the scheduled event. The operation permissions of the scheduled event are the same as those of creating scheduled events for the advanced package **DBE\_SCHEDULER**.
- Currently, the interval expression of a scheduled event is compatible with the syntax of floating-point number, for example, interval 0.5 minute. However, the floating-point number is rounded up during calculation. Therefore, you are not advised to use the floating-point number for the interval.
- Scheduled events with the same name are not supported in the same database.
- The statements to be executed in a scheduled event are any SQL statements except security-related operations. However, some statements with restrictions fail to be executed. For example, a database cannot be created by using composite statements.
- The security-related operations are as follows.
  - Use the encryption function.
  - Create and set users and groups.
  - Connect to a database.
  - Encrypt the function.
- The definer fails to be specified for a scheduled event in the following scenarios:
  - The user who operates the scheduled event does not have the sysadmin permission.
  - The current user is inconsistent with the specified definer.
    - An initial user is specified as the definer.
    - An O&M administrator or monitoring administrator is specified as the definer.
    - The parameter **enableSeparationOfDuty** is set to **on** to enable the separation of duties.

## Syntax

```
CREATE
  [DEFINER = user]
EVENT
  [IF NOT EXISTS]
  event_name
  ON SCHEDULE schedule
  [ON COMPLETION [NOT] PRESERVE]
  [ENABLE | DISABLE | DISABLE ON SLAVE]
  [COMMENT 'string']
  DO event_body,
schedule: {
  AT timestamp [+ INTERVAL interval] ...
  | EVERY interval
  [STARTS timestamp [+ INTERVAL interval] ...]
```

```
[ENDS timestamp [+ INTERVAL interval] ...]  
}  
interval:  
  quantity {YEAR | MONTH | DAY | HOUR | MINUTE | SECOND |  
            YEAR TO MONTH | DAY TO HOUR | DAY TO MINUTE |  
            DAY TO SECOND | HOUR TO MINUTE | HOUR TO SECOND |  
            MINUTE TO SECOND}
```

## Parameters

- **DEFINER**

Specifies the permission for the scheduled event statement to be executed during execution. By default, the permission of the user who creates the scheduled event is used. When definer is specified, the permission of the specified user is used.

Only users with the sysadmin permission can specify the definer.
- **ON SCHEDULE**

Specifies the time when a scheduled event is executed. A scheduled event can be set to be executed once or multiple times through SCHEDULE.

  - **AT *timestamp* [+ INTERVAL *interval*]** indicates that the scheduled event is executed only once at ***timestamp* [+ INTERVAL *interval*]**.
  - **EVERY *interval*** indicates that the scheduled event is executed at the interval specified by ***interval***.
    - **STARTS *timestamp* [+ INTERVAL *interval*]** indicates that user can specify the start time for a scheduled event that can be executed repeatedly. That is, the scheduled event is executed since ***timestamp* [+ INTERVAL *interval*]**. If this parameter is left blank, the task is executed from the current time by default.
    - **ENDS *timestamp* [+ INTERVAL *interval*]** indicates that user can specify the end time for a scheduled event that can be executed repeatedly. That is, the scheduled event ends at ***timestamp* [+ INTERVAL *interval*]**. If this parameter is left empty, the default value **3999-12-31 16:00:00** is used.
- **INTERVAL**

Specifies the interval. The value of **INTERVAL** consists of a number and a time unit specified by **quantity**, for example, **1 YEAR**.
- **ON COMPLETION [NOT] PRESERVE**

Once a transaction is complete, the scheduled event is deleted from the system catalog immediately by default. You can overwrite the default behavior by setting **ON COMPLETION PRESERVE**.
- **ENABLE | DISABLE | DISABLE ON SLAVE**

The scheduled event is in the **ENABLE** state by default after it is created. That is, the statement to be executed is executed immediately at the specified time. You can use the keyword **DISABLE** to change the **ENABLE** state. The performance of **DISABLE ON SLAVE** is the same as that of **DISABLE**.
- **COMMENT**

You can add comments to the scheduled event. The comments can be viewed in the **GS\_JOB\_ATTRIBUTE** table.

- **DO**  
Specifies the statement to be executed for a scheduled event.

## Example

```
-- Create a table.
gaussdb=# CREATE TABLE t_ev(num int);

-- Create a scheduled event that is executed once.
gaussdb=# CREATE EVENT IF NOT EXISTS event_e1 ON SCHEDULE AT sysdate + interval 5 second +
interval 33 minute DISABLE DO insert into t_ev values(0);

-- Create a scheduled event that is executed every minute.
gaussdb=# CREATE EVENT IF NOT EXISTS event_e1 ON SCHEDULE EVERY 1 minute DO insert into t_ev
values(1);
```

### NOTICE

- If a scheduled event fails to be executed after being created, you can view the failure cause in the **SHOW EVENTS** or **PG\_JOB** table.
- When operations related to user passwords (such as creating weak passwords) are performed in the statements to be executed for a scheduled event, system catalog records the password in plaintext. Therefore, you are advised not to perform operations related to user passwords in the statements to be executed for the scheduled event.

## 7.14.62 CREATE FOREIGN DATA WRAPPER

### Description

Creates a foreign data wrapper. The user who created the foreign data wrapper becomes its owner.

### Precautions

- The name of the foreign data wrapper must be unique in the database.
- Only initial users and system administrators can create foreign data wrappers.

### Syntax

```
CREATE FOREIGN DATA WRAPPER name
[ HANDLER handler_function | NO HANDLER ]
[ VALIDATOR validator_function | NO VALIDATOR ]
[ OPTIONS ( option 'value' [, ... ] ) ];
```

### Parameters

- **name**  
Specifies the name of the foreign data wrapper to be created.
- **HADNLER handler\_function**  
**handler\_function** is the name of a registered function used to retrieve execution functions for foreign tables. The handler function must have no arguments, and its return type must be `fdw_handler`.

It is possible to create foreign data wrappers without processor functions, but foreign tables that use such wrappers can only be declared and cannot be accessed.

- **VALIDATOR validator\_function**

**validator\_function** is the name of a registered function used to check the common options provided to the foreign data wrapper, as well as the options for the foreign server, user mapping, and foreign table that use the foreign data wrapper. If there is no validator function or **NO VALIDATOR** is declared, the option is not checked during creation. (The foreign data wrapper may ignore or reject invalid option descriptions at runtime, depending on the implementation.) The validator function must accept two arguments: one is of text[] type, which will contain an array of options stored in the system directory, and the other is of OID type, which will be the OID of the system directory that contains the options. The return type is ignored. The function should report invalid options using the ereport(ERROR) function.

- **OPTIONS ( option 'value' [, ... ] )**

This clause declares options for the new foreign data wrapper. The allowed option names and values are specific to each foreign data wrapper and are validated by the validator function of the foreign data wrapper. The option name must be unique.

## Example

```
-- Create a useless foreign-data wrapper dummy.
gaussdb=# CREATE FOREIGN DATA WRAPPER dummy;

-- Create a foreign data wrapper file with the handler function file_fdw_handler.
gaussdb=# CREATE FOREIGN DATA WRAPPER file HANDLER file_fdw_handler;

-- Create a foreign data wrapper mywrapper with some options.
gaussdb=# CREATE FOREIGN DATA WRAPPER mywrapper OPTIONS (debug 'true');
```

## Helpful Links

[ALTER FOREIGN DATA WRAPPER](#) and [DROP FOREIGN DATA WRAPPER](#)

## 7.14.63 CREATE FUNCTION

### Description

Creates a function.

### Precautions

- If the parameters or return values of a function have precision, the precision is not checked.
- When creating a function, you are advised to explicitly specify the schemas of tables in the function definition. Otherwise, the function may fail to be executed.
- When a stored procedure is created, a write lock is added only to the CREATE stored procedure or package, and a read lock is added only to the functions and packages on which the functions depend during compilation and execution.

- **current\_schema** and **search\_path** specified by SET during function creation are invalid. **search\_path** and **current\_schema** before and after function execution should be the same.
- If a function has output parameters, the GUC parameter **set behavior\_compat\_options** must be set to '**proc\_outparam\_override**' for the output parameters to take effect. When the function is called using SELECT or CALL, an actual parameter must be provided in the position of the output parameter. Otherwise, the function fails to be called.
- Only the functions compatible with PostgreSQL or those with the **PACKAGE** attribute can be overloaded. After **REPLACE** is specified, a new function is created instead of replacing a function if the number of parameters, parameter type, or return value is different.
- You cannot create overloaded functions with different formal parameter names (the function name and parameter list type are the same).
- You cannot create a function that has the same name and parameter list as a stored procedure.
- Formal parameters cannot be overloaded if only the custom ref cursor type is different from the sys\_refcursor type.
- Function overloading is not supported if only the returned data types are different.
- Function overloading is not supported if only the default values are different.
- When an overloaded function is called, the variable type must be specified.
- If an undeclared variable is used in a function, an error is reported when the function is called.
- You can use the SELECT statement to specify different parameters using identical functions. The syntax does not support calling identical functions without the **PACKAGE** attribute.
- When you create a function, you cannot insert other agg functions out of the avg function or other functions.
- By default, the permissions to execute new functions are granted to PUBLIC users. For details, see **GRANT**. By default, a user inherits the permissions of the PUBLIC role. Therefore, the user has the permission to execute a function and view the definition of the function. In addition, to execute the function, the user must have the USAGE permission on the schema to which the function locates. You can revoke the default execution permissions from the PUBLIC role when creating a function and grant the function execution permission to users as needed. To avoid the time window during which new functions can be accessed by all users, create functions and set function execution permissions in a transaction. After the database object isolation attribute is enabled, common users can view only the definitions of functions that they have permission to execute.
- When functions without parameters are called inside another function, you can omit brackets and call functions using their names directly.
- When other functions with output parameters are called in a function and an assignment expression, set the GUC parameter **set behavior\_compat\_options** to '**proc\_outparam\_override**', define variables of the same type as the output parameters in advance, and use the variables as output parameters to call other functions with output parameters for the output parameters to take

effect. Otherwise, the output parameters of the called functions will be ignored.

- Oracle-compatible functions support viewing, exporting, and importing parameter comments.
- Oracle-compatible functions support viewing, exporting, and importing comments between IS/AS and `plsql_body`.
- Users granted with the `CREATE ANY FUNCTION` permission can create or replace functions in the user schemas.
- The default permission on a function is `SECURITY INVOKER`. To change the permission to `SECURITY DEFINER`, set the GUC parameter **`behavior_compat_options`** to `'plsql_security_definer'`.
- If the parameter **`set behavior_compat_options`** is not set to **`proc_outparam_override`**, the **`OUT`** and **`IN OUT`** output parameters of the function directly called by an anonymous block or stored procedure cannot be of the composite type, and the return value is used as the first value of the **`OUT`** output parameter. As a result, the calling fails. To correctly use the **`OUT`** and **`IN OUT`** output parameters, set the parameter **`set behavior_compat_options`** to **`proc_outparam_override`**. For details, see [Examples](#).
- For PL/SQL functions, after **`behavior_compat_options`** is set to `'proc_outparam_override'`, the behavior of **`out/inout`** changes. In the functions, **`return`** and **`out/inout`** can be returned at the same time. Before the parameter is set to `'proc_outparam_override'`, only **`return`** is returned. For details, see [Examples](#).
- For PL/SQL functions, after **`behavior_compat_options`** is set to `'proc_outparam_override'`, the restrictions are as follows:
  - a. If a function with the **`out/inout`** parameter already exists in the same schema or package, you cannot create another function with the same name with the **`out/inout`** parameter.
  - b. The **`out`** parameter must be added no matter whether the `SELECT` or `CALL` statement is used to call a stored procedure.
  - c. In some scenarios, functions cannot be used in expressions (compared with those before the parameter is enabled), for example, left assignment in a stored procedure and the call function. For details, see [Examples](#).
  - d. Functions without `return` cannot be called. The `perform` function can be used to call functions.
  - e. When a function is called in a stored procedure, **`out/inout`** cannot be set to a constant. For details, see [Examples](#).
  - f. After the GUC parameter **`behavior_compat_options`** is set to `'proc_outparam_override'`, if the return type of the function is `setof`, the output parameter will not take effect.
- When a function is created, it depends on an undefined object. If **`behavior_compat_options`** is set to `'plpgsql_dependency'`, the creation can be executed and a warning message is displayed. If **`behavior_compat_options`** is not set to `'plpgsql_dependency'`, the creation cannot be executed.
- When **`behavior_compat_options`** is set to `'plpgsql_dependency'`, if function A is called in the function and function B is contained in the input and output

parameters of function A, function B will not establish a dependency. For example, **functionA(functionB())**. **gs\_dependencies** only creates dependency with function A.

- If a view directly depends on an O-style function and the **behavior\_compat\_options** parameter is set to '**plpgsql\_dependency**', the view can be accessed when the function is created again. However, if the **behavior\_compat\_options** parameter is not set to '**plpgsql\_dependency**', the view cannot be accessed.
- When creating a function, you cannot use the function itself as the default value of input parameter.
- The function with **OUT** parameter cannot be called by SQL statement.
- The function with **OUT** parameter cannot be called by SELECT INTO syntax.
- Functions with **OUT** parameters cannot be called in nested mode.

Example:

```
b := func(a,func(c,1));
```

Should be changed to:

```
tmp := func(c,1); b := func(a,tmp);
```

- When a function is created, the type of the return value of the function is not checked.
- If a function with the definer specified is created in a schema of another user, the function will be executed by another user, which may cause unauthorized operations. Therefore, exercise caution when performing this operation.
- In the schema of the O&M administrator, only the initial user and schema owner can create objects. The schema that does not allow other users to create and modify objects is the schema of the O&M administrator.
- If the **out** parameter is used as the output parameter in an expression, the expression does not take effect in the following scenarios: (a) The execute immediate sqlv using func syntax is used to execute a function. (b) The select func into syntax is used to execute a function. (c) DML statements such as INSERT and UPDATE are used to execute a function. (d) The select where a=func() statement is used. (e) When a function with the **out** output parameter is used as an input parameter, that is, **fun (func (out b), a)**, the **out b** parameter does not take effect.
- When a stored procedure with the out parameter is called, you can set the GUC parameter **set behavior\_compat\_options = 'proc\_outparam\_transfer\_length'** to transfer the parameter length. The specifications and constraints are as follows:
  - a. The following types are supported: CHAR(n), CHARACTER(n), NCHAR(n), VARCHAR(n), VARYING(n), VARCHAR2(n), and NVARCHAR2(n).
  - b. If the out parameter does not take effect (for example, **perform**), the length does not need to be transferred.
  - c. The following types do not support precision transfer: NUMERIC, DECIMAL, NUMBER, FLOAT, DEC, INTEGER, TIME, TIMESTAMP, INTERVAL, TIME WITH TIME ZONE, TIMESTAMP WITH TIME ZONE, TIME WITHOUT TIME ZONE, and TIMESTAMP WITHOUT TIME ZONE.
  - d. The parameter length can be transferred regardless of whether the GUC parameter **set behavior\_compat\_options** is set to **proc\_outparam\_override**.

- e. If you need to transfer the length of elements of the collection type and the length of elements of the array type nested by the collection type, you need to set the GUC parameter **behavior\_compat\_options** to **tableof\_lem\_constraints**.

## Syntax

- Syntax (compatible with PostgreSQL) for creating a user-defined function:

```
CREATE [ OR REPLACE ] FUNCTION function_name
  [ ( [ { argname [ argmode ] argtype [ { DEFAULT | := | = } expression ] } [, ...] ] ) ]
  [ RETURNS rettype [ DETERMINISTIC ] | RETURNS TABLE ( { column_name column_type }
  [, ...] ) ]
  LANGUAGE lang_name
  [
    {IMMUTABLE | STABLE | VOLATILE }
    | {SHIPPABLE | NOT SHIPPABLE}
    | WINDOW
    | [ NOT ] LEAKPROOF
    | {CALLED ON NULL INPUT | RETURNS NULL ON NULL INPUT | STRICT }
    | {[ EXTERNAL ] SECURITY INVOKER | [ EXTERNAL ] SECURITY DEFINER | AUTHID DEFINER |
  AUTHID CURRENT_USER}
    | {fenced | not fenced}
    | {PACKAGE}
    | COST execution_cost
    | ROWS result_rows
    | SET configuration_parameter { {TO | =} value | FROM CURRENT } }
  ][...]
  {
    AS 'definition'
  }
}
```

- A-compatible syntax for creating a user-defined function:

```
CREATE [ OR REPLACE ] FUNCTION function_name
  ( [ { argname [ argmode ] argtype [ { DEFAULT | := | = } expression ] } [, ...] ] )
  RETURN rettype [ DETERMINISTIC ]
  [
    {IMMUTABLE | STABLE | VOLATILE }
    | {SHIPPABLE | NOT SHIPPABLE}
    | {PACKAGE}
    | {FENCED | NOT FENCED}
    | [ NOT ] LEAKPROOF
    | {CALLED ON NULL INPUT | RETURNS NULL ON NULL INPUT | STRICT }
    | {[ EXTERNAL ] SECURITY INVOKER | [ EXTERNAL ] SECURITY DEFINER |
  AUTHID DEFINER | AUTHID CURRENT_USER}
  ]
  {
    COST execution_cost
    | ROWS result_rows
    | SET configuration_parameter { {TO | =} value | FROM CURRENT
    | LANGUAGE lang_name }
  ][...]
  {
    IS | AS
  } plsql_body
/
```

## Parameters

- **function\_name**

Specifies the name of the function to be created (optionally schema-qualified).

Value range: a string. It must comply with the [naming convention](#), and can contain a maximum of 63 characters. If the value contains more than 63 characters, the database truncates it and retains the first 63 characters as the function name.

- **argname**

Specifies the parameter name of the function.

Value range: a string. It must comply with the [naming convention](#). and can contain a maximum of 63 characters. If the value contains more than 63 characters, the database truncates it and retains the first 63 characters as the function parameter name.

- **argmode**

Specifies the parameter mode of the function.

Value range: **IN**, **OUT**, **INOUT**, and **VARIADIC**. The default value is **IN**. Only the parameter of the **OUT** mode can be followed by **VARIADIC**. The parameters of **OUT** and **INOUT** cannot be used in the function definition of RETURNS TABLE.

 **NOTE**

**VARIADIC** specifies parameters of the array type.

- **argtype**

Specifies the data type of a function parameter. **%TYPE** or **%ROWTYPE** can be used to indirectly reference a variable or table type. For details, see [Variable Definition Statements](#).

- **expression**

Specifies the default expression of a parameter.

 **NOTE**

- If **a\_format\_version** is set to **10c** and **a\_format\_dev\_version** is set to **s2**, the default expression is not supported when the parameter is in INOUT mode.
- It is recommended that you define all default parameters after all non-default parameters.
- If a function with default parameters is called, input parameters are added to the function from left to right. If inputs of non-default parameters are missing, an error is reported.
- If **proc\_uncheck\_default\_param** is enabled and a function with default parameters is called, input parameters are added to the function from left to right. The number of defaulted inputs depends on the number of default parameters. If an input of a non-default parameter is missing, the previous default value is used to fill this parameter.
- When **a\_format\_version** is set to **10c**, **a\_format\_dev\_version** is set to **s1**, **proc\_outparam\_override** is disabled, and the function parameters include the output parameter **out** and **default**, the default value cannot be used.

- **rettype**

Specifies the return data type.

When there is **OUT** or **INOUT** parameter, the RETURNS clause can be omitted. If the clause is not omitted, the result type of the clause must be the same as that of the output parameter. If there are multiple output parameters, the result type of the clause is RECORD. Otherwise, the result type of the clause is the same as that of a single output parameter.

The SETOF modifier indicates that the function will return a set of items, rather than a single item.

Same as **argtype**, **%TYPE** or **%ROWTYPE** can also be used to indirectly reference types.

 **NOTE**

In **FUNCTION** **argtype** and **rettype** outside **PACKAGE**, **%TYPE** cannot reference the type of the *PACKAGE* variable.

- **column\_name**  
Specifies the column name.
- **column\_type**  
Specifies the column type.
- **definition**  
Specifies a string constant defining a function. Its meaning depends on the language. It can be an internal function name, a path pointing to a target file, an SQL query, or text in a procedural language.
- **DETERMINISTIC**  
Specifies an API compatible with the SQL syntax. You are advised not to use it.
- **LANGUAGE lang\_name**  
Specifies the name of the language that is used to implement the function. It can be **SQL**, **internal**, or the name of a customized process language. To ensure downward compatibility, the name can use single quotation marks. Contents in single quotation marks must be capitalized.  
Due to compatibility issues, no matter which language is specified when an A-style database is created, the language used is plpgsql.

 **NOTE**

- When an internal function is defined, if AS specifies the function as an internal system function, the parameter type, number of parameters, and return value type of the new function must be the same as those of the internal system function, and the user who creates the internal function must have the permission to execute the internal system function.
- Only users with the sysadmin permission can create internal functions.
- **WINDOW**  
Indicates that this function is a window function. The **WINDOW** attribute cannot be changed when replacing an existing function definition.

---

**NOTICE**

For a customized window function, the value of **LANGUAGE** can only be **internal**, and the referenced internal function must be a window function.

---

- **IMMUTABLE**  
Specifies that the function always returns the same result if the parameter values are the same.
- **STABLE**  
Specifies that the function cannot modify the database, and that within a single table scan it will consistently return the same result for the same parameter value, but its result varies by SQL statements.
- **VOLATILE**

Specifies that the function value can change in a single table scan and no optimization is performed.

- **SHIPPABLE|NOT SHIPPABLE**

Specifies whether the function can be pushed down for execution. This port is reserved and is not recommended.

- **PACKAGE**

Specifies whether the function can be overloaded. PostgreSQL-style functions can be overloaded, and this parameter is designed for functions of other styles.

- All PACKAGE and non-PACKAGE functions cannot be overloaded or replaced.
- PACKAGE functions do not support parameters of the VARIADIC type.
- The PACKAGE attribute of functions cannot be modified.

- **LEAKPROOF**

Specifies that the function has no side effects. LEAKPROOF can be set only by the system administrator.

- **CALLED ON NULL INPUT**

Declares that some parameters of the function can be called in normal mode if the parameter values are null. This parameter can be omitted.

- **RETURNS NULL ON NULL INPUT**

**STRICT**

Specifies that the function always returns null whenever any of its parameters is null. If this parameter is specified, the function is not executed when there are null parameters; instead a null result is returned automatically.

RETURNS NULL ON NULL INPUT and STRICT have the same functions.

- **EXTERNAL**

The purpose is to be compatible with SQL statements and it is optional. This feature applies to all functions, not only external functions.

- **SECURITY INVOKER**

**AUTHID CURRENT\_USER**

Specifies that the function will be executed with the permissions of the user who calls it. This parameter can be omitted.

SECURITY INVOKER and AUTHID CURRENT\_USER have the same functions.

- **SECURITY DEFINER**

**AUTHID DEFINER**

Specifies that the function will be executed with the permissions of the user who created it.

AUTHID DEFINER and SECURITY DEFINER have the same functions.

- **COST execution\_cost**

Estimates the execution cost of a function.

The unit of execution\_cost is cpu\_operator\_cost.

Value range: a positive integer

- **ROWS result\_rows**

Estimates the number of rows returned by the function. This is only allowed when the function is declared to return a set.

Value range: a positive number. The default value is **1000**.

- **configuration\_parameter**

- **value**

Sets a specified database session parameter to a specified value. If the value is **DEFAULT** or **RESET**, the default setting is used in the new session. **OFF** disables the setting.

Value range: a string

- **DEFAULT**

- **OFF**

- **RESET**

Specifies the default value.

- **from current**

Uses the value of **configuration\_parameter** of the current session.

- **plsql\_body**

Specifies the PL/SQL stored procedure body.

---

**NOTICE**

When you are performing operations in the function body related to password or key, such as creating a user, changing a password, encrypting or decrypting, the system catalog and log record plaintext information about the password or key. To prevent sensitive information leakage, you are advised not to perform operations on the function body related to sensitive information, such as passwords or keys.

---

## Examples

```
-- Define a function as SQL query.
gaussdb=# CREATE FUNCTION func_add_sql(integer, integer) RETURNS integer
AS 'select $1 + $2;'
LANGUAGE SQL
IMMUTABLE
RETURNS NULL ON NULL INPUT;

-- Add an integer by parameter name using PL/pgSQL.
gaussdb=# CREATE OR REPLACE FUNCTION func_increment_plsql(i integer) RETURNS integer AS $$
BEGIN
    RETURN i + 1;
END;
$$ LANGUAGE plpgsql;

-- Return the RECORD type.
gaussdb=# CREATE OR REPLACE FUNCTION func_increment_sql(i int, out result_1 bigint, out result_2 bigint)
returns SETOF RECORD
as $$
begin
    result_1 = i + 1;
    result_2 = i * 10;
return next;
```

```
end;
$$language plpgsql;

-- Return a record containing multiple output parameters.
gaussdb=# CREATE FUNCTION func_dup_sql(in int, out f1 int, out f2 text)
AS $$ SELECT $1, CAST($1 AS text) || ' is text' $$
LANGUAGE SQL;

## 7.14.64 CREATE GROUP

### Description

Creates a user group.

### Precautions

CREATE GROUP is an alias for CREATE ROLE, and it is not a standard SQL syntax and not recommended. Users can use CREATE ROLE directly.

### Syntax

```
CREATE GROUP group_name [ [ WITH ] option [ ... ] ] [ ENCRYPTED | UNENCRYPTED ] { PASSWORD | IDENTIFIED BY } { 'password' [ EXPIRED ] | DISABLE };
```

The syntax of the option clause is as follows:

```
{SYSADMIN | NOSYSADMIN}  
| {MONADMIN | NOMONADMIN}  
| {OPRADMIN | NOOPRADMIN}  
| {POLADMIN | NOPOLADMIN}  
| {AUDITADMIN | NOAUDITADMIN}  
| {CREATEDB | NOCREATEDB}  
| {USEFT | NOUSEFT}  
| {CREATEROLE | NOCREATEROLE}  
| {INHERIT | NOINHERIT}  
| {LOGIN | NOLOGIN}  
| {REPLICATION | NOREPLICATION}  
| {VCADMIN | NOVADMIN}  
| {PERSISTENCE | NOPERSISTENCE}  
| CONNECTION LIMIT connlimit  
| VALID BEGIN 'timestamp'  
| VALID UNTIL 'timestamp'  
| RESOURCE POOL 'respool'  
| PERM SPACE 'spacelimit'  
| TEMP SPACE 'tmpspacelimit'  
| SPILL SPACE 'spillspacelimit'  
| IN ROLE role_name [, ...]  
| IN GROUP role_name [, ...]  
| ROLE role_name [, ...]  
| ADMIN role_name [, ...]  
| USER role_name [, ...]  
| SYSID uid  
| DEFAULT TABLESPACE tablespace_name  
| PROFILE DEFAULT  
| PROFILE profile_name  
| PGUSER
```

## Parameters

See [Parameters](#) in section "CREATE ROLE."

## Examples

```
-- Create group my_group.  
gaussdb=# CREATE GROUP my_group PASSWORD '*****';  
  
-- Delete a group.  
gaussdb=# DROP GROUP my_group;
```

## 7.14.65 CREATE INCREMENTAL MATERIALIZED VIEW

### Description

CREATE INCREMENTAL MATERIALIZED VIEW creates a fast-refresh materialized view, and you can refresh the data of the materialized view by using REFRESH MATERIALIZED VIEW (complete-refresh) and REFRESH INCREMENTAL MATERIALIZED VIEW (fast-refresh).

CREATE INCREMENTAL MATERIALIZED VIEW is similar to CREATE TABLE AS, but it remembers the query used to initialize the view, so it can refresh data later. A materialized view has many attributes that are the same as those of a table, but does not support temporary materialized views.

## Precautions

- Incremental materialized views cannot be created on database link tables, temporary tables, or global temporary tables.
- Fast-refresh materialized views support only simple filter queries and UNION ALL queries of base tables.
- Distribution columns cannot be specified when an incremental MV is created.
- After a fast-refresh materialized view is created, most DDL operations in the base table are no longer supported.
- IUD operations cannot be performed on fast-refresh materialized views.
- After a fast-refresh materialized view is created, you need to run the **REFRESH** command to synchronize the materialized view with the base table when the base table data changes.
- The Ustore engine does not support the creation and use of materialized views.

## Syntax

```
CREATE INCREMENTAL MATERIALIZED VIEW mv_name  
  [ (column_name [, ...] ) ]  
  [ TABLESPACE tablespace_name ]  
  AS query;
```

## Parameters

- **mv\_name**  
Name (optionally schema-qualified) of the materialized view to be created.  
Value range: a string. It must comply with the [naming convention](#).
- **column\_name**  
Column name in the new materialized view. The materialized view supports specified columns. The number of specified columns must be the same as the number of columns in the result of the subsequent query statement. If no column name is provided, the column name is obtained from the output column name of the query.  
Value range: a string. It must comply with the [naming convention](#).
- **TABLESPACE tablespace\_name**  
Tablespace to which the new materialized view belongs. If not specified, the default tablespace is used.
- **AS query**  
**SELECT** or **TABLE** command. This query will be run in a security-constrained operation.

## Examples

```
-- Create an ordinary table.  
gaussdb=# CREATE TABLE my_table (c1 int, c2 int)  
WITH(STORAGE_TYPE=ASTORE);  
  
-- Create a fast-refresh materialized view.  
gaussdb=# CREATE INCREMENTAL MATERIALIZED VIEW my_imv AS SELECT * FROM my_table;  
  
-- Write data to the base table.  
gaussdb=# INSERT INTO my_table VALUES(1,1),(2,2);
```

```
-- Fast refresh the fast-refresh materialized view my_imv.
gaussdb=# REFRESH INCREMENTAL MATERIALIZED VIEW my_imv;

-- Delete a fast-refresh materialized view.
gaussdb=# DROP MATERIALIZED VIEW my_imv;

-- Delete the ordinary table my_table.
gaussdb=# DROP TABLE my_table;
```

## 7.14.66 CREATE INDEX

### Description

Defines a new index.

Indexes are primarily used to enhance database performance (though inappropriate use can result in database performance deterioration). You are advised to create indexes on:

- Columns that are often queried
- Join conditions. For a query on joined columns, you are advised to create a composite index on the columns. For example, for **select \* from t1 join t2 on t1.a=t2.a and t1.b=t2.b**, you can create a composite index on columns **a** and **b** in table **t1**.
- Columns having filter criteria (especially scope criteria) of a WHERE clause
- Columns that appear after ORDER BY, GROUP BY, and DISTINCT

Partitioned tables do not support partial index creation (when indexes contain the GLOBAL or LOCAL keyword or the created index is a GLOBAL index). If the GLOBAL or LOCAL keyword is declared during index creation, the index of the corresponding type is created. Otherwise, if the partition name is specified during index creation, the LOCAL index is created. If a unique index contains non-partition keys, a GLOBAL index is created. If a unique index contains all partition keys, a LOCAL index is created. Otherwise, a GLOBAL index is created by default.

### Precautions

- Indexes consume storage and computing resources. Creating too many indexes has negative impact on database performance (especially the performance of data import. Therefore, you are advised to import the data before creating indexes). Therefore, create indexes only when they are necessary.
- All functions and operators used in an index definition must be immutable, that is, their results must depend only on their parameters and never on any outside influence (such as the contents of another table or the current time). This restriction ensures that the behavior of the index is well-defined. To use a user-defined function in an index or WHERE clause, mark it as an immutable function.

- Partitioned table indexes are classified into local indexes and global indexes. A local index binds to a specific partition, and a global index corresponds to the entire partitioned table.
- A user granted with the CREATE ANY INDEX permission can create indexes in both the public and user schemas.
- If a user-defined function is called in the expression index, the expression index function is executed based on the permission of the function creator.
- Data of the XML type cannot be used as common indexes, unique indexes, global indexes, local indexes, or partial indexes.
- Only B-tree and UB-tree indexes can be created online and only common, global, and local indexes are supported. Online concurrent index creation supports only Astore common indexes, global indexes, and local indexes. Ustore indexes are not supported.

## Syntax

- **Create an index on a table.**

```
CREATE [ UNIQUE ] INDEX [ CONCURRENTLY ] [ [schema_name.] index_name ] ON table_name
[ USING method ]
( ( { column_name [ ( length ) ] | ( expression ) } [ COLLATE collation ] [ opclass ] [ ASC | DESC ]
[ NULLS { FIRST | LAST } } ], ... )
[ INCLUDE ( column_name [, ...] ) ]
[ WITH ( { storage_parameter = value } [, ...] ) ]
[ TABLESPACE tablespace_name ]
[ WHERE predicate ];
```
- **Create an index on a partitioned table.**

```
CREATE [ UNIQUE ] INDEX [ CONCURRENTLY ] [ [schema_name.] index_name ] ON table_name
[ USING method ]
( ( { column_name [ ( length ) ] | ( expression ) } [ COLLATE collation ] [ opclass ] [ ASC | DESC ]
[ NULLS LAST } } ], ... )
[ LOCAL [ ( { PARTITION index_partition_name | SUBPARTITION index_subpartition_name
[ TABLESPACE index_partition_tablespace ] } [, ...] ) ] | GLOBAL ]
[ INCLUDE ( column_name [, ...] ) ]
[ WITH ( { storage_parameter = value } [, ...] ) ]
[ TABLESPACE tablespace_name ];
```

## Parameters

- **UNIQUE**

Creates a unique index. In this way, the system checks whether new values are unique in the index column. Attempts to insert or update data which would result in duplicate entries will generate an error.

Currently, only B-tree indexes and UB-tree indexes support unique indexes.
- **CONCURRENTLY**

Creates an index (with ShareUpdateExclusiveLock) in a mode that does not block DML statements. When an index is created, other statements cannot access the table on which the index depends. If this keyword is specified, DML is not blocked during the creation.

  - This option can only specify a name of one index.
  - The CREATE INDEX statement can be run within a transaction, but CREATE INDEX CONCURRENTLY cannot.
  - For temporary tables, you can use CONCURRENTLY to create indexes. However, indexes are created in blocking mode because no other sessions concurrently access the temporary tables and the blocking mode is more cost-effective.

 NOTE

- This keyword is specified when an index is created. For Astore, the entire table needs to be scanned twice and then built. When the table is scanned for the first time, an index is created and the read and write operations are not blocked. During the second scan, changes that have occurred since the first scan are merged and updated. For Ustore, only one scan is required to create indexes.
- For Astore, the table needs to be scanned and built twice, and all existing transactions that may modify the table must be completed. This means that the index creation takes a longer time than normal. In addition, the CPU and I/O consumption affects other services. Although the Ustore only needs to scan the entire table once to complete the index creation, the preceding consumption still exists.
- If an index build fails, it leaves an "unusable" index. This index is ignored by queries, but it still consumes the update overhead. In this case, you are advised to delete the index and create the index again using CONCURRENTLY, or rebuild the index by using CLUSTER, TRUNCATE, VACUUM FULL, or REINDEX. Note that if ALTER TABLE involves table and index rebuild, residual "unusable" indexes will be automatically cleared.
- After the second scan, index creation must wait for any transaction that holds a snapshot earlier than the snapshot taken by the second scan to terminate. In addition, the ShareUpdateExclusiveLock (level 4) added during index creation conflicts with a lock whose level is greater than or equal to 4. Therefore, when such an index is created, the system is prone to hang or deadlock. Example:
  - If two sessions create an index by using CONCURRENTLY for the same table, a deadlock occurs.
  - If a session creates an index by using **CONCURRENTLY** for a table and another session drops a table, a deadlock occurs.
  - There are three sessions. Session 1 locks table **a** and does not commit it. Session 2 creates an index by using CONCURRENTLY for table **b**. Session 3 writes data to table **a**. Before the transaction of session 1 is committed, session 2 is blocked.
  - The transaction isolation level is set to repeatable read (read committed by default). Two sessions are started. Session 1 writes data to table **a** and does not commit it. Session 2 creates an index by using CONCURRENTLY for table **b**. Before the transaction of session 1 is committed, session 2 is blocked.
- When the I/O and CPU resources are not limited, the service performance deterioration caused by online index creation can be controlled within 10%. However, in special scenarios, the service performance deterioration may exceed 10%. This is because online index creation is a long transaction that consumes a large number of I/O and CPU resources. It consumes more resources than offline index creation. The longer the online index creation transaction lasts, the greater the impact on service performance. The time for creating indexes online is positively correlated with the data volume of base tables and the data volume generated by concurrent DMLs. When the I/O and CPU resources are not limited, the time for creating indexes online is about two to six times that for creating indexes offline. However, when the number of concurrent transactions is large (> 10000 TPS) or resource contention occurs, the time may be even longer. In Astore mode, you can create indexes in parallel to shorten the index creation time. The performance of online parallel index creation increases to a certain value and becomes stable as the number of parallel worker threads increases. Compared with the performance of creating indexes in serial mode, the performance of creating indexes in parallel online is improved by about 30%. You are advised to create indexes online during off-peak hours to avoid great impact on services. Although online index creation provides the capability of uninterrupted services to some extent, it still needs to be implemented with caution.
- **schema\_name**  
Specifies the schema name.

Value range: an existing schema name

- **index\_name**

Specifies the name of the index to be created. The schema of the index is the same as that of the table.

Value range: a string. It must comply with the [naming convention](#).

- **table\_name**

Specifies the name of the table to be indexed (optionally schema-qualified).

Value range: an existing table name

- **USING method**

Specifies the name of the index method to be used.

Value range:

- **btree**: B-tree indexes store key values of data in a B+ tree structure. This structure helps users to quickly search for indexes. B-tree supports comparison query and query range. When an index is created in a Ustore table, the index is automatically changed to UB-tree.
- **ubtree**: Multi-version B-tree index used only for Ustore tables. The index page contains transaction information and can be recycled. By default, the INSERTPT function is enabled for UB-tree indexes.

Row-store tables (Astore storage engine) support the following index types: **btree** (default). Row-store tables (Ustore storage engine) support the following index type: **ubtree**.

- **column\_name**

Specifies the name of the column on which an index is to be created.

Multiple columns can be specified if the index method supports composite indexes. A global index supports a maximum of 31 columns, and other indexes support a maximum of 32 columns.

- **column\_name ( length )**

Creates a prefix key index based on a column in the table. **column\_name** indicates the column name of the prefix key, and **length** indicates the prefix length.

The prefix key uses the prefix of the specified column data as the index key value, which reduces the storage space occupied by the index. Indexes can be used for partial filter and join conditions that contain prefix key columns.

 **NOTE**

- The prefix key supports the following index methods: btree and ubtree.
  - The data type of the prefix key column must be binary or character (excluding special characters).
  - The prefix length must be a positive integer that does not exceed 2676 and cannot exceed the maximum length of the column. For the binary type, the prefix length is measured in bytes. For non-binary character types, the prefix length is measured in characters. The actual length of the key value is restricted by the internal page. If a column contains multi-byte characters or an index has multiple keys, the length of the index line may exceed the upper limit. As a result, an error is reported. Consider this situation when setting a long prefix length.
  - In the CREATE INDEX syntax, the following keywords cannot be used as prefix keys for column names: COALESCE, EXTRACT, GREATEST, LEAST, LNNVL, NULLIF, NVL, NVL2, OVERLAY, POSITION, REGEXP\_LIKE, SUBSTRING, TIMESTAMPDIFF, TREAT, TRIM, XMLCONCAT, XMLELEMENT, XMLEXISTS, XMLFOREST, XMLPARSE, XMLPI, XMLROOT and XMLSERIALIZE.
  - The prefix key is a special expression key. Some constraints and restrictions that are not described are the same as those of the expression key. For details, see the description of the expression index.
- **expression**  
Specifies an expression based on one or more columns of the table. The expression usually must be written with surrounding parentheses, as shown in the syntax. However, the parentheses can be omitted if the expression has the form of a function call.  
  
Expression can be used to obtain fast access to data based on some transformation of the basic data. For example, an index computed on upper(col) would allow the clause WHERE upper(col) = 'JIM' to use an index. If an expression contains IS NULL, the index for this expression is invalid. In this case, you are advised to create a partial index.
  - **COLLATE collation**  
Assigns a collation to the column (which must be of a collatable data type). If no collation is specified, the default collation is used. You can run the **select \* from pg\_collation** command to query collation rules from the **pg\_collation** system catalog. The default collation rule is the row starting with **default** in the query result.
  - **opclass**  
Specifies the name of an operator class. An operator class can be specified for each column of an index. The operator class identifies the operators to be used by the index for that column. For example, a B-tree index on the type int4 would use the **int4\_ops** class; this operator class includes comparison functions for values of type int4. In practice, the default operator class for the column's data type is sufficient. The operator class applies to data with multiple sorts. For example, users might want to sort a complex-number data type either by absolute value or by real part. They could do this by defining two operator classes for the data type and then selecting the proper class when making an index.
  - **ASC**  
Specifies an ascending (default) sort order.
  - **DESC**  
Specifies a descending sort order.

- **NULLS FIRST**  
Specifies that null values appear before non-null values in the sort ordering. This is the default when **DESC** is specified.
- **NULLS LAST**  
Specifies that null values appear after non-null values in the sort ordering. This is the default when **DESC** is not specified.
- **LOCAL**  
Specifies that the partitioned index to be created is a local index.
- **GLOBAL**  
Specifies the partitioned index to be created as a global index. If no keyword is specified, a global index is created by default.
- **INCLUDE ( column\_name [, ...] )**  
The optional **INCLUDE** clause specifies that some non-key columns are included in indexes. Non-key columns cannot be used as search criteria for accelerating index scans, and they are omitted when the unique constraints of the indexes are checked.  
  
An index-only scan can directly return content in the non-key columns without accessing the heap table corresponding to the indexes.  
  
Exercise caution when adding non-key columns as **INCLUDE** columns, especially for wide columns. If the size of an index tuple exceeds the maximum size allowed by the index type, data insertion fails. Note that in any case, adding non-key columns to an index increases the space occupied by the index, which may slow down the search speed.  
  
Currently, only UB-tree indexes access mode supports this feature. Non-key columns are stored in the index leaf tuple corresponding to the heap tuple and are not included in the tuple on the upper-layer index page.
- **WITH ( {storage\_parameter = value} [, ... ] )**  
Specifies the storage parameter used for an index.  
Value range:  
For indexes other than Psort, set it to **FILLFACTOR**. Only UB-tree indexes support **INDEXSPLIT**. Only non-partitioned B-tree indexes support the **DEDUPLICATION** parameter.
  - **FILLFACTOR**  
The fill factor of an index is a percentage from 10 to 100. In the scenario where a large number of concurrent insertions are performed and the key value range is dense, select a smaller fill factor when the contention of the same index page is high during the insertion.  
Value range: 10–100
  - **INDEXSPLIT**  
Specifies the splitting policy of UB-tree indexes. The **DEFAULT** policy is the same as the splitting policy of B-tree indexes. The **INSERTPT** policy can significantly reduce the index space usage in some scenarios.  
Value range: **INSERTPT** and **DEFAULT**  
Default value: **INSERTPT**
  - **ACTIVE\_PAGES**

Specifies the number of index pages, which may be less than the actual number of physical file pages and can be used for optimization. Currently, this parameter is valid only for the local index of the Ustore partitioned table and will be updated by VACUUM and ANALYZE (including AUTOVACUUM). You are advised not to manually set this parameter.

– **DEDUPLICATION**

Specifies whether to deduplicate and compress tuples with duplicate key values. This is an index parameter. When there are a large number of indexes with duplicate key values, enabling this parameter can effectively reduce the space occupied by indexes. This parameter does not take effect for primary key indexes and unique indexes. If non-unique indexes are used and the index key value duplication rate is low or the index key values are unique, enabling this parameter will slightly deteriorate the index insertion performance. Currently, local and global indexes of partitioned tables are not supported.

Value range: Boolean value. The default value is the value of the **enable\_default\_index\_deduplication** GUC parameter (the default value is **off**).

● **TABLESPACE tablespace\_name**

Specifies the tablespace for an index. If no tablespace is specified, the default tablespace is used.

Value range: an existing table name

● **WHERE predicate**

Creates a partial index. A partial index is an index that contains entries for only a portion of a table, usually a portion that is more useful for indexing than the rest of the table. For example, if you have a table that contains both billed and unbilled orders where the unbilled orders take up a small fraction of the total table and yet that is an often used portion, you can improve performance by creating an index on just that portion. In addition, WHERE with UNIQUE can be used to enforce uniqueness over a subset for a table.

Value range: The predicate expression can only refer to columns of the underlying table, but it can use all columns, not just the ones being indexed. Currently, subqueries and aggregate expressions are forbidden in WHERE. You are advised not to use numeric types such as int for predicate, because such types can be implicitly converted to bool values (non-zero values are implicitly converted to **true** and **0** is implicitly converted to **false**), which may cause unexpected results.

For a partitioned table index, if the created index contains the GLOBAL or LOCAL keyword or the created index is a GLOBAL index, the WHERE clause cannot be used to create an index.

● **PARTITION index\_partition\_name**

Specifies the name of an index partition.

Value range: a string. It must comply with the [naming convention](#).

● **SUBPARTITION index\_subpartition\_name**

Specifies the name of a level-2 index partition.

Value range: a string. It must comply with the [naming convention](#).

● **TABLESPACE index\_partition\_tablespace**

Specifies the tablespace of an index partition.

Value range: If this parameter is not specified, the value of **index\_tablespace** is used.

## Examples

```
-- Create the tpcds.ship_mode_t1 table.
gaussdb=# create schema tpcds;
gaussdb=# CREATE TABLE tpcds.ship_mode_t1
(
  SM_SHIP_MODE_SK      INTEGER      NOT NULL,
  SM_SHIP_MODE_ID     CHAR(16)     NOT NULL,
  SM_TYPE              CHAR(30)     ,
  SM_CODE              CHAR(10)     ,
  SM_CARRIER          CHAR(20)     ,
  SM_CONTRACT         CHAR(20)
)
;

-- Create a common unique index on the SM_SHIP_MODE_SK column in the tpcds.ship_mode_t1 table.
gaussdb=# CREATE UNIQUE INDEX ds_ship_mode_t1_index1 ON tpcds.ship_mode_t1(SM_SHIP_MODE_SK);

-- Create a B-tree index on the SM_SHIP_MODE_SK column in the tpcds.ship_mode_t1 table.
gaussdb=# CREATE INDEX ds_ship_mode_t1_index4 ON tpcds.ship_mode_t1 USING
btree(SM_SHIP_MODE_SK);

-- Create an expression index on the SM_CODE column in the tpcds.ship_mode_t1 table:
gaussdb=# CREATE INDEX ds_ship_mode_t1_index2 ON tpcds.ship_mode_t1(SUBSTR(SM_CODE,1,4));

-- Create a partial index on the SM_SHIP_MODE_SK column where SM_SHIP_MODE_SK is greater than 10
in the tpcds.ship_mode_t1 table.
gaussdb=# CREATE UNIQUE INDEX ds_ship_mode_t1_index3 ON tpcds.ship_mode_t1(SM_SHIP_MODE_SK)
WHERE SM_SHIP_MODE_SK>10;

-- Create an index online on the SM_SHIP_MODE_SK column in the tpcds.ship_mode_t1 table.
gaussdb=# CREATE INDEX CONCURRENTLY ds_ship_mode_t1_index6 ON
tpcds.ship_mode_t1(SM_SHIP_MODE_SK);

-- Create a prefix key index on the SM_TYPE column in the tpcds.ship_mode_t1 table.
gaussdb=# CREATE INDEX ds_ship_mode_t1_prefix_index ON tpcds.ship_mode_t1(SM_TYPE(4));

-- Rename an existing index.
gaussdb=# ALTER INDEX tpcds.ds_ship_mode_t1_index1 RENAME TO ds_ship_mode_t1_index5;

-- Set the index as unusable.
gaussdb=# ALTER INDEX tpcds.ds_ship_mode_t1_index2 UNUSABLE;

-- Rebuild an index.
gaussdb=# ALTER INDEX tpcds.ds_ship_mode_t1_index2 REBUILD;

-- Delete an existing index.
gaussdb=# DROP INDEX tpcds.ds_ship_mode_t1_index2;

-- Delete the table.
gaussdb=# DROP TABLE tpcds.ship_mode_t1;

-- Create a tablespace.
gaussdb=# CREATE TABLESPACE example1 RELATIVE LOCATION 'tablespace1/tablespace_1';
gaussdb=# CREATE TABLESPACE example2 RELATIVE LOCATION 'tablespace2/tablespace_2';
gaussdb=# CREATE TABLESPACE example3 RELATIVE LOCATION 'tablespace3/tablespace_3';
gaussdb=# CREATE TABLESPACE example4 RELATIVE LOCATION 'tablespace4/tablespace_4';
-- Create the tpcds.customer_address_p1 table.
gaussdb=# CREATE TABLE tpcds.customer_address_p1
(
  CA_ADDRESS_SK      INTEGER      NOT NULL,
  CA_ADDRESS_ID     CHAR(16)     NOT NULL,
  CA_STREET_NUMBER  CHAR(10)     ,
  CA_STREET_NAME    VARCHAR(60)  ,
  CA_STREET_TYPE    CHAR(15)     ,

gaussdb=# DROP TABLE tpcds.customer_address_p1;
-- Delete the tablespace.
gaussdb=# DROP TABLESPACE example1;
gaussdb=# DROP TABLESPACE example2;
gaussdb=# DROP TABLESPACE example3;
gaussdb=# DROP TABLESPACE example4;
```

## Helpful Links

[ALTER INDEX](#) and [DROP INDEX](#)

## Suggestions

- create index

You are advised to create indexes on:

- Columns that are often queried
- Join conditions. For a query on joined columns, you are advised to create a composite index on the columns. For example, for **select \* from t1 join t2 on t1.a=t2.a and t1.b=t2.b**, you can create a composite index on columns **a** and **b** in table **t1**.
- Columns having filter criteria (especially scope criteria) of a **where** clause
- Columns that appear after **order by**, **group by**, and **distinct**

Constraints:

- An index of an ordinary table supports a maximum of 32 columns. A GLOBAL index of a partitioned table supports a maximum of 31 columns.
- The size of a single index cannot exceed the size of the index page (8 KB). The size of a B-tree or UB-tree index cannot exceed one-third of the page size.
- Partial indexes cannot be created in a partitioned table.
- When a GLOBAL index is created on a partitioned table, the following constraints apply:
  - Expression indexes and partial indexes are not supported.
  - Only B-tree indexes are supported.
- In the same attribute column, the local index and global index of a partition cannot coexist.
- If the **ALTER** statement does not contain **UPDATE GLOBAL INDEX**, the original GLOBAL index is invalid. In this case, other indexes are used for query. If the ALTER statement contains UPDATE GLOBAL INDEX, the original GLOBAL index is still valid and the index function is correct.

## 7.14.67 CREATE LANGUAGE

This version does not support this syntax.

## 7.14.68 CREATE MASKING POLICY

### Description

Creates a masking policy.

### Precautions

Only users with the poladmin or sysadmin permission, or the initial user can perform this operation.

The masking policy takes effect only after the security policy is enabled, that is, **enable\_security\_policy** is set to **on**.

---

**⚠ CAUTION**

When you use database links to perform operations on remote objects, the client initiates a database link request. The actual sender is the server, and the attributes such as the IP address of the sender are the values of the server. For details, see [DATABASE LINK](#).

---

## Syntax

```
CREATE MASKING POLICY policy_name masking_clause[, ...] [ policy_filter_clause ] [ENABLE | DISABLE];
```

- **masking\_clause**  
masking\_function ON LABEL(label\_name[, ...])
- **masking\_function**  
**maskall** is not a preset function. It is hard-coded and cannot be displayed by running `\df`.  
The masking methods during presetting are as follows:  
{ maskall | randommasking | creditcardmasking | basicemailmasking | fullemailmasking | shufflemasking | alldigitsmasking | regexprmasking }
- **policy\_filter\_clause**:  
FILTER ON { FILTER\_TYPE ( filter\_value [, ...] ) } [, ...]
- **FILTER\_TYPE**:  
IP | APP | ROLES

## Parameters

- **policy\_name**  
Specifies the audit policy name, which must be unique.  
Value range: a string. It must comply with the [naming convention](#).
- **label\_name**  
Specifies the resource label name.
- **masking\_clause**  
Specifies the masking function to be used to anonymize database resources labeled by **label\_name**. **schema.function** can be used to specify the masking function.
- **policy\_filter**  
Specifies the users for which the masking policy takes effect. If this parameter is left empty, the masking policy takes effect for all users.
- **FILTER\_TYPE**  
Specifies the types of information to be filtered by the policy, including **IP**, **APP**, and **ROLES**.
- **filter\_value**  
Indicates the detailed information to be filtered, such as the IP address, app name, and username.
- **ENABLE|DISABLE**

Enables or disables the masking policy. If **ENABLE|DISABLE** is not specified, **ENABLE** is used by default.

## Examples

```
-- Create users dev_mask and bob_mask.
gaussdb=# CREATE USER dev_mask PASSWORD '*****';
gaussdb=# CREATE USER bob_mask PASSWORD '*****';

-- Create table tb_for_masking.
gaussdb=# CREATE TABLE tb_for_masking(idx int, col1 text, col2 text, col3 text, col4 text, col5 text, col6

## 7.14.69 CREATE MATERIALIZED VIEW

CREATE MATERIALIZED VIEW creates a complete-refresh materialized view, and you can use REFRESH MATERIALIZED VIEW (full refresh) to refresh the data in the materialized view.

CREATE MATERIALIZED VIEW is similar to CREATE TABLE AS, but it remembers the query used to initialize the view, so it can refresh data later. A materialized view has many attributes that are the same as those of a table, but does not support temporary materialized views.

## Precautions

- Complete-refresh materialized views cannot be created in temporary tables or global temporary tables.
- Complete-refresh materialized views do not support NodeGroups.
- After a complete-refresh materialized view is created, most DDL operations in the base table are no longer supported.
- The IUD operation cannot be performed on complete-refresh materialized views.
- After a complete-refresh materialized view is created, if the base table data changes, you need to run the **REFRESH** command to synchronize the materialized view with the base table.
- The Ustore engine does not support the creation and use of materialized views.

## Syntax

```
CREATE MATERIALIZED VIEW mv_name
  [ (column_name [, ...] ) ]
  [ WITH ( {storage_parameter = value} [, ...] ) ]
  [ TABLESPACE tablespace_name ]
  AS query
  [ WITH [ NO ] DATA ];
```

## Parameters

- **mv\_name**  
Name (optionally schema-qualified) of the materialized view to be created.  
Value range: a string. It must comply with the [naming convention](#).
- **column\_name**  
Specifies a column name in the new materialized view. The materialized view supports specified columns. The number of specified columns must be the same as the number of columns in the result of the subsequent query statement. If no column name is provided, the column name is obtained from the output column name of the query.  
Value range: a string. It must comply with the [naming convention](#).
- **WITH ( storage\_parameter [= value] [, ... ] )**  
Specifies an optional storage parameter for a table or an index. For details, see [CREATE TABLE](#).
- **TABLESPACE tablespace\_name**  
Tablespace to which the new materialized view belongs. If not specified, the default tablespace is used.
- **AS query**  
Specifies the **SELECT**, **TABLE**, or **VALUES** command. This query will be run in a security-constrained operation.

## Examples

```
-- Create an ordinary table.
gaussdb=# CREATE TABLE my_table (c1 int, c2 int);
WITH(STORAGE_TYPE=ASTORE);

-- Create a complete-refresh materialized view.
gaussdb=# CREATE MATERIALIZED VIEW my_mv AS SELECT * FROM my_table;

-- Write data to the base table.
gaussdb=# INSERT INTO my_table VALUES(1,1),(2,2);

-- Completely refresh the complete-refresh materialized view my_mv.
gaussdb=# REFRESH MATERIALIZED VIEW my_mv;

-- Delete the complete-refresh materialized view.
gaussdb=# DROP MATERIALIZED VIEW my_mv;

-- Delete the ordinary table my_table.
gaussdb=# DROP TABLE my_table;
```

## 7.14.70 CREATE MODEL

### Description

Trains a machine learning model and saves the model.

## Precautions

- The model name must be unique. Pay attention to the naming format.
- The AI training duration fluctuates greatly, and in some cases, the training duration is long. If the duration specified by the GUC parameter **statement\_timeout** is too long, the training will be interrupted. You are advised to set **statement\_timeout** to **0** so that the statement execution duration is not limited.

## Syntax

```
CREATE MODEL model_name USING architecture_name
FEATURES { {attribute_list} }
[TARGET attribute_name, [,attribute_name]*],
FROM ([schema.]table_name | subquery)
WITH (hyper_parameter_name [= {hp_value | DEFAULT}]) [, ...]*
```

## Parameters

- **model\_name**  
Name of the training model, which must be unique.  
Value range: a string. It must comply with the [naming convention](#).
- **architecture\_name**  
Algorithm type of the training model.  
Value range: a string. Currently, the value can be **logistic\_regression**, **linear\_regression**, **svm\_classification**, or **kmeans**.
- **attribute\_list**  
Enumerated input column name of the training model.  
Value range: a string. It must comply with the naming convention of data attributes.
- **attribute\_name**  
Target column name of the retraining model in a supervised learning task (simple expression processing can be performed).  
Value range: a string. It must comply with the naming convention of data attributes.
- **subquery**  
Data source.  
Value range: a string. It must comply with the SQL syntax of databases.
- **hyper\_parameter\_name**  
Hyperparameter name of the machine learning model.  
Value range: a string. The value range varies depending on the algorithm. For details, see "Hyperparameters supported by operators" in section "DB4AI: Database-driven AI > Native DB4AI Engine" in *Feature Guide*.
- **hp\_value**  
Hyperparameter value.  
Value range: a string. The value range varies depending on the algorithm. For details, see "Default values and value ranges of hyperparameters" in section "DB4AI: Database-driven AI > Native DB4AI Engine" in *Feature Guide*.

## Examples

```
gaussdb=# CREATE TABLE houses (  
id INTEGER,  
tax INTEGER,  
bedroom INTEGER,  
bath DOUBLE PRECISION,  
price INTEGER,  
size INTEGER,  
lot INTEGER,  
mark text  
);  
insert into houses(id, tax, bedroom, bath, price, size, lot, mark) VALUES  
(1,590,2,1,50000,770,22100,'a+'),  
(2,1050,3,2,85000,1410,12000,'a+'),  
(3,20,2,1,22500,1060,3500,'a-'),  
(4,870,2,2,90000,1300,17500,'a+'),  
(5,1320,3,2,133000,1500,30000,'a+'),  
(6,1350,2,1,90500,850,25700,'a-'),  
(7,2790,3,2.5,260000,2130,25000,'a+'),  
(8,680,2,1,142500,1170,22000,'a-'),  
(9,1840,3,2,160000,1500,19000,'a+'),  
(10,3680,4,2,240000,2790,20000,'a-'),  
(11,1660,3,1,87000,1030,17500,'a+'),  
(12,1620,3,2,118500,1250,20000,'a-'),  
(13,3100,3,2,140000,1760,38000,'a+'),  
(14,2090,2,3,148000,1550,14000,'a-'),  
(15,650,3,1.5,65000,1450,12000,'a-');  
gaussdb=# CREATE MODEL price_model USING logistic_regression  
FEATURES size, lot  
TARGET mark  
FROM HOUSES  
WITH learning_rate=0.88, max_iterations=default;
```

## Helpful Links

[DROP MODEL](#) and [PREDICT BY](#)

## 7.14.71 CREATE OPERATOR

### Description

CREATE OPERATOR defines a new operator.

### Precautions

CREATE OPERATOR defines a new name operator. The user who defines the operator becomes the owner of the operator. If a schema name is given, the operator is created in the specified schema. Otherwise, it will be created in the current schema.

The operator name is a character string consisting of the following characters:

+ - \* / < > = ~ ! @ # % ^ & | ` ?

When selecting a name, note the following restrictions:

- -- and /\* cannot appear anywhere in the operator name, because they are regarded as the beginning of a comment.
- A multi-character operator cannot end with + or - unless the name contains at least one of the following characters:

~ ! @ # % ^ & | ` ?

- => The operator name is no longer used.

Operator! = is mapped to <> when being entered. Therefore, the two names are always equivalent.

At least one LEFTARG and one RIGHTARG must be defined. For binocular operators, both need to be defined. For the right operator, only LEFTARG needs to be defined. For the left operator, only RIGHTARG needs to be defined.

Also, the function\_name procedure must have been defined with CREATE FUNCTION, and must be defined to accept the correct number of specified type parameters (one or two).

Other clauses declare optional operator optimization clauses. Their meanings are defined in [Section 35.13](#).

To create an operator, you must have the USAGE permission on the parameter type and return type, and the EXECUTE permission on the underlying function. If exchange or negative operators are specified, you must have them.

## Syntax

```
CREATE OPERATOR name (  
  PROCEDURE = function_name  
  [, LEFTARG = left_type ] [, RIGHTARG = right_type ]  
  [, COMMUTATOR = com_op ] [, NEGATOR = neg_op ]  
  [, RESTRICT = res_proc ] [, JOIN = join_proc ]  
  [, HASHES ] [, MERGES ]  
)
```

## Parameters

- **name**  
Operator to be defined. The available characters are listed above. The name can be schema-qualified, for example, CREATE OPERATOR myschema.+ (...). If there is no schema, the operator is created in the current schema. Two operators in the same schema can have the same name as long as they operate on different data types. This is a reloading process.
- **function\_name**  
Function used to implement the operator.
- **left\_type**  
Parameter data type on the left of the operator, if any. This parameter can be omitted if the left operator is used.
- **right\_type**  
Parameter data type on the right of the operator, if any. This parameter can be omitted if the right-view operator is used.
- **com\_op**  
Exchange operator corresponding to the operator.
- **neg\_op**  
Negative operator corresponding to the operator.
- **res\_proc**  
This operator constrains the selectivity evaluation function.

- **join\_proc**  
This operator joins the selectivity evaluation function.
- **HASHES**  
Indicates that the operator supports hash joins.
- **MERGES**  
Indicates that this operator supports a merge join.  
Use the OPERATOR() syntax to provide a schema-qualified operator name in com\_op or other optional parameters. For example:  
COMMUTATOR = OPERATOR(myschema.===) ,

## Example

The following command defines a new operator: equal area for the box data type.

```
gaussdb=# CREATE OPERATOR === (  
LEFTARG = box,  
RIGHTARG = box,  
PROCEDURE = area_equal_procedure,  
COMMUTATOR = ===,  
NEGATOR = !==,  
RESTRICT = area_restriction_procedure,  
JOIN = area_join_procedure,  
HASHES, MERGES  
);
```

## 7.14.72 CREATE OPERATOR CLASS

### Description

Defines a new operator class. This function is for internal use only. You are advised not to use it.

### Precautions

- **CREATE OPERATOR CLASS** defines a new operator class. An operator class defines how to use a specified data type together with an index. The operator class declares that certain operators will provide particular roles or "strategies" for this data type and this index method. The operator class also declares the supported programs used by the index method when the operator class is selected for an index column. All the operators and functions used by an operator class must be defined before the operator class is created.
- If a schema name is given, then the operator class is created in the specified schema. Otherwise, it is created in the current schema. Two operator classes in the same schema can have the same name only if they are for different index methods.
- The user who defines an operator class becomes the owner. Currently, the creator must be a super user.
- **CREATE OPERATOR CLASS** does not check whether the class definition includes all the operators and functions required by the index method, nor whether the operators and functions form a self-contained set.
- Related operator classes can be grouped into operator families. To add a new operator class to an existing family, specify a FAMILY option in CREATE

OPERATOR CLASS. Without this option, the new class is placed into a family with the same name (a family is created if it does not exist).

## Syntax

```
CREATE OPERATOR CLASS
name [ DEFAULT ] FOR TYPE data_type
USING index_method [
FAMILY family_name ] AS
{ OPERATOR strategy_number operator_name [ (
op_type, op_type ) ] [ FOR SEARCH | FOR ORDER BY sort_family_name ]
| FUNCTION
support_number [ ( op_type [ , op_type ] ) ] function_name ( argument_type [,
... ] )
| STORAGE storage_type
} [, ... ]
```

## Parameters

- **name**  
Specifies the name of the operator class to be created (which can be schema-qualified).
- **default**  
Specifies that the operator class will become the default operator class for its data type. At most one operator class can be the default for a specific data type and index method.
- **data\_type**  
Specifies the column data type processed by the operator class.
- **index\_method**  
Specifies the name of the index method processed by the operator class.
- **family\_name**  
Specifies the name of an existing operator family where an operator class is added. If not specified, the class is placed into a family with the same name (a family is created if it does not exist).
- **strategy\_number**  
Specifies the strategy number of the index method associated with the operator class.
- **operator\_name**  
Specifies the name (which can be schema-qualified) of the operator associated with the operator class.
- **op\_type**  
Specifies the data type of the operator's operand in an OPERATOR clause. The value **NONE** represents a left unary operator or right unary operator. The data type of the operand can be omitted if it is the same as that of the operator class.  
  
In a FUNCTION clause, if the data type of the function's operand is different from the input data type of the function (such as B-tree comparison functions and hash functions) or the class's data type, the data type of the operand supported by this function must be included in this clause. These default values are correct. Therefore, **op\_type** need not be specified in FUNCTION clauses, except in cases where the B-tree sort support function supports cross-type comparisons.

- **sort\_family\_name**  
Specifies the name of an existing B-tree operator family that describes the sort ordering associated with a sort operator.  
The default value is **FOR SEARCH**.
- **support\_number**  
Specifies the number of an index method for a function associated with the operator class.
- **function\_name**  
Specifies a function name of an index method for an operator class.
- **argument\_type**  
Specifies a data type of a function parameter.
- **storage\_type**  
Specifies the data type stored in the index. Normally, this is the same as the column data type, but some index methods allow it to be different. The **STORAGE** clause must be omitted unless the index method allows a different type to be used.

## Examples

```
-- Define a function.
gaussdb=# CREATE FUNCTION func_add_sql(num1 integer, num2 integer) RETURN integer AS BEGIN
RETURN num1 + num2;
END;
/
-- Create an operator class and associate it with the preceding function.
gaussdb=# CREATE OPERATOR CLASS oc1 DEFAULT FOR TYPE _int4 USING btree AS FUNCTION 1
func_add_sql (integer, integer);
```

## 7.14.73 CREATE PACKAGE

### Description

Creates a package.

### Precautions

- The functions or stored procedures declared in the package specification must be defined in the package body.
- During instantiation, the stored procedure with **commit** or **rollback** cannot be called.
- When a stored procedure is created, a write lock is added only to the **CREATE** stored procedure or package, and a read lock is added only to the functions and packages on which the functions depend during compilation and execution.
- Package functions cannot be called in triggers.
- Variables in a package cannot be directly used in external SQL statements.
- Private variables and stored procedures in a package cannot be called outside the package.
- Usage that other stored procedures do not support are not supported. For example, if **commit** or **rollback** cannot be called in a function, **commit** or **rollback** cannot be called in the function of a package.

- The name of a schema cannot be the same as that of a package.
- Only A-version stored procedures and function definitions are supported.
- Variables with the same name in a package, including parameters with the same name in a package, are not supported.
- The global variables in a package are at the session level. The variables in packages cannot be shared in different sessions.
- When a function of an autonomous transaction is called in a package, the cursor variables in the package and recursive functions that use the cursor variables in the package are not allowed.
- The package does not declare the ref cursor variables.
- The default permission on a package is **SECURITY INVOKER**. To change the default permission to **SECURITY DEFINER**, set the GUC parameter **behavior\_compat\_options** to **'plsql\_security\_definer'**.
- A user granted with the **CREATE ANY PACKAGE** permission can create packages in the public and user schemas.
- If the name of a package to be created contains special characters, the special characters cannot contain spaces. You are advised to set the GUC parameter **behavior\_compat\_options** to **"skip\_insert\_gs\_source"**. Otherwise, an error may occur.
- When a package is created, it depends on an undefined object. If **behavior\_compat\_options** is set to **'plpgsql\_dependency'**, the creation can be executed and a warning message is displayed. If **behavior\_compat\_options** is not set to **'plpgsql\_dependency'**, the creation cannot be executed.
- If a view directly depends on an A-compatible function in a package and the **behavior\_compat\_options** parameter is set to **'plpgsql\_dependency'**, the view can be accessed if the package is created again. However, if the **behavior\_compat\_options** parameter is not set to **'plpgsql\_dependency'**, the view cannot be accessed.
- When you create a package function, the default parameter value cannot contain variables.
- The package specification in PG\_OBJECT is set to **'S'**, and the package body in PG\_OBJECT is set to **'B'**. When a created package object becomes invalid, you can use the **VALID** column in PG\_OBJECT to search for the OID of the invalid package object and run **ALTER PACKAGE PKG\_NAME COMPILE**; to recompile the package to make it valid.
- When creating a function in a package, if the function name is in the schema.func or package.func format, only the func name is obtained. The schema declaration or package declaration is invalid. To disable this behavior by default, set the GUC parameter **behavior\_compat\_options** to **'forbid\_package\_function\_with\_prefix'**.

## Syntax

- **CREATE PACKAGE SPECIFICATION**

```
CREATE [ OR REPLACE ] PACKAGE [ schema ] package_name  
[ invoker_rights_clause ] { IS | AS } item_list_1 END package_name;
```

**invoker\_rights\_clause** can be declared as **AUTHID DEFINER** or **AUTHID CURRENT\_USER**, which indicate the definer permission and caller permission, respectively.

**item\_list\_1** can be a declared variable, stored procedure, or function.

PACKAGE SPECIFICATION (header) declares public variables, functions, and exceptions in a package, which can be called by external functions or stored procedures. It can only declare stored procedures and functions but cannot define them.

- **CREATE PACKAGE BODY**

```
CREATE [ OR REPLACE ] PACKAGE BODY [ schema ] package_name  
  { IS | AS } declare_section [ initialize_section ] END package_name;
```

The package body defines private variables and functions in a package. If a variable or function is not declared by the package specification, it is a private variable or function.

The package body also has an initialization part to initialize the package. For details, see the example.

## Examples

- Example of CREATE PACKAGE SPECIFICATION

```
gaussdb=# CREATE OR REPLACE PACKAGE emp_bonus IS  
var1 int:=1;-- Public variable  
var2 int:=2;  
PROCEDURE testpro1(var3 int);-- Public stored procedure, which can be called by external systems.  
END emp_bonus;  
/
```

- Example of CREATE PACKAGE BODY

```
gaussdb=# drop table if exists test1;  
gaussdb=# create or replace package body emp_bonus is  
var3 int:=3;  
var4 int:=4;  
procedure testpro1(var3 int)  
is  
begin  
create table if not exists test1(col1 int);  
insert into test1 values(var1);  
insert into test1 values(var4);  
end;  
begin: -- The instantiation starts.  
var4:=9;  
testpro1(var4);  
end emp_bonus;  
/
```

- Example of ALTER PACKAGE OWNER

```
-- Change the owner of PACKAGE emp_bonus to omm.  
gaussdb=# ALTER PACKAGE emp_bonus OWNER TO omm;
```

- Example of calling a package

```
-- Use CALL to call the package stored procedure.  
gaussdb=# call emp_bonus.testpro1(1);  
  
-- Use SELECT to call the package stored procedure.  
gaussdb=# select emp_bonus.testpro1(1);  
-- Call the stored procedure of a package in an anonymous block.  
gaussdb=# begin  
emp_bonus.testpro1(1);  
end;  
/
```

## 7.14.74 CREATE PROCEDURE

### Description

Creates a stored procedure.

## Precautions

- If the parameters or return values of a stored procedure have precision, the precision is not checked.
- When creating a stored procedure, you are advised to explicitly specify the schemas of all operations on table objects in the stored procedure definition. Otherwise, the stored procedure may fail to be executed.
- When a stored procedure is created, a write lock is added only to the CREATE stored procedure or package, and a read lock is added only to the functions and packages on which the functions depend during compilation and execution.
- **current\_schema** and **search\_path** specified by **SET** during stored procedure creation are invalid. **search\_path** and **current\_schema** before and after function execution should be the same.
- When the function is invoked by SELECT or CALL, an argument must be provided in the output parameter. The argument does not take effect.
- A stored procedure with the **PACKAGE** attribute can use overloaded functions.
- Do not create an overloaded stored procedure with different parameter names but same stored procedure name and parameter list type.
- When an overloaded stored procedure is invoked, the variable type must be specified.
- Do not create a stored procedure that has the same name and parameter list as the function.
- Do not overload stored procedures with different default values.
- Only the IN, OUT, and INOUT parameters of the stored procedure cannot be reloaded after the GUC parameter **behavior\_compat\_options** is set to '**proc\_outparam\_override**'. They can be reloaded after the parameter is disabled.
- If an undeclared variable is used in a stored procedure, an error is reported when the stored procedure is invoked.
- When you create a procedure, you cannot insert aggregate functions or other functions out of the average function.
- When stored procedures without parameters are invoked in another stored procedure, you can omit brackets and call stored procedures using their names directly.
- When other functions with output parameters are invoked in a stored procedure and an assignment expression, set the GUC parameter **set behavior\_compat\_options** to '**proc\_outparam\_override**', define variables of the same type as the output parameters in advance, and use the variables as output parameters to invoke other functions with output parameters for the output parameters to take effect. Otherwise, the output parameters of the invoked function will be ignored.
- If the **out** parameter is used as the output parameter in an expression, the expression does not take effect in the following scenarios: The **execute immediate sqlv using func** syntax is used to execute a function. The **select func into** syntax is used to execute a function. DML statements such as INSERT and UPDATE are used to execute a function. The **select where a=func()** statement is used. When a function with the **out** output parameter is used as an input parameter, that is, **fun (func (out b), a)**, the **out b** parameter does not take effect.

- The stored procedure supports viewing, exporting, and importing parameter comments.
- The stored procedure supports viewing, exporting, and importing parameter comments between IS/AS and plsql\_body.
- The default permission on a stored procedure is **SECURITY INVOKER**. To change the default permission to **SECURITY DEFINER**, set the GUC parameter **behavior\_compat\_options** to '**plsql\_security\_definer**'.
- Users granted with the CREATE ANY FUNCTION permission can create or replace stored procedures in the user schemas.
- **out/inout** must be set to a variable but not a constant.
- In a centralized environment, if you want to call a stored procedure with the same in parameters but different out parameters, you need to set the GUC parameter **behavior\_compat\_options** to '**proc\_outparam\_override**'. After the parameter is enabled, you must add the out parameters no matter whether you use the SELECT or CALL statement to call the stored procedure. After the parameter is enabled, you cannot use **perform** to call a stored procedure or function.
- When a stored procedure is created, it depends on an undefined object. If **behavior\_compat\_options** is set to '**plpgsql\_dependency**', the creation can be executed, and a warning message is displayed. If **behavior\_compat\_options** is not set to '**plpgsql\_dependency**', the creation cannot be executed.
- When separation of duties is enabled, stored procedures with the definer specified can be rebuilt only by the current user. Only the initial user can alter the stored procedures to other users.
- If a stored procedure with the definer specified is created in a schema of another user, the stored procedure will be executed by another user, which may cause unauthorized operations. Therefore, exercise caution when performing this operation.
- When a stored procedure with the out parameter is called, you can set the GUC parameter **set behavior\_compat\_options** to '**proc\_outparam\_transfer\_length**' to transfer the parameter length. The specifications and constraints are as follows:
  - a. The following types are supported: CHAR(n), CHARACTER(n), NCHAR(n), VARCHAR(n), VARYING(n), VARCHAR2(n), and NVARCHAR2(n).
  - b. If the out parameter does not take effect (for example, **perform**), the length does not need to be transferred.
  - c. The following types do not support precision transfer: NUMERIC, DECIMAL, NUMBER, FLOAT, DEC, INTEGER, TIME, TIMESTAMP, INTERVAL, TIME WITH TIME ZONE, TIMESTAMP WITH TIME ZONE, TIME WITHOUT TIME ZONE, and TIMESTAMP WITHOUT TIME ZONE.
  - d. The parameter length can be transferred regardless of whether the GUC parameter **set behavior\_compat\_options** is set to **proc\_outparam\_override**.
  - e. To transfer the length of elements of the collection type and the length of elements of the array type nested by the collection type, you need to set the GUC parameter **behavior\_compat\_options** to **tableof\_lem\_constraints**.

## Syntax

```
CREATE [ OR REPLACE ] PROCEDURE procedure_name
  [ ( {[ argname ] [ argmode ] argtype [ { DEFAULT | := | = } expression ]}[,...] ) ]
  [
    { IMMUTABLE | STABLE | VOLATILE }
    | { SHIPPABLE | NOT SHIPPABLE }
    | { PACKAGE }
    | [ NOT ] LEAKPROOF
    | { CALLED ON NULL INPUT | RETURNS NULL ON NULL INPUT | STRICT }
    | {[ EXTERNAL ] SECURITY INVOKER | [ EXTERNAL ] SECURITY DEFINER | AUTHID DEFINER | AUTHID
CURRENT_USER}
    | COST execution_cost
    | SET configuration_parameter { [ TO | = ] value | FROM CURRENT }
  ] [ ... ]
  { IS | AS }
  plsql_body
/
```

## Parameters

- **OR REPLACE**  
Replaces the original definition when two stored procedures are with the same name.
- **procedure\_name**  
Specifies the name of the stored procedure that is created (optionally with schema names).  
Value range: a string. It must comply with the [naming convention](#).
- **argmode**  
Specifies the mode of an argument.

---

### NOTICE

**VARIADIC** specifies parameters of the array type.

---

Value range: **IN**, **OUT**, **INOUT**, and **VARIADIC**. The default value is **IN**. Only the parameters in **OUT** mode can follow the **VARIADIC** parameter.

- **argname**  
Specifies the argument name.  
Value range: a string. It must comply with the [naming convention](#).
  - **argtype**  
Specifies the type of an argument. **%TYPE** or **%ROWTYPE** can be used to indirectly reference a variable or table type. For details, see [Variable Definition Statements](#).  
Value range: a valid data type
-  **NOTE**
- In **PROCEDURE argtype** outside **PACKAGE**, **%TYPE** cannot reference the type of the **PACKAGE** variable.
- **expression**  
Specifies the default expression of a parameter.

 NOTE

- If **a\_format\_version** is set to **10c** and **a\_format\_dev\_version** is set to **s2**, the default expression is not supported when the parameter is in INOUT mode.
- It is recommended that you define all default parameters after all non-default parameters.
- If a function with default parameters is invoked, input parameters are added to the function from left to right. If inputs of non-default parameters are missing, an error is reported.
- If **proc\_uncheck\_default\_param** is enabled and a function with default parameters is invoked, input parameters are added to the function from left to right. The number of defaulted inputs depends on the number of default parameters. If an input of a non-default parameter is missing, the previous default value is used to fill this parameter.
- When **a\_format\_version** is set to **10c**, **a\_format\_dev\_version** is set to **s1**, **proc\_outparam\_override** is disabled, and the function parameters include the output parameter **out** and **default**, the default value cannot be used.
- **configuration\_parameter**
  - **value**

Sets the specified configuration parameter to a specified value. If **value** is **DEFAULT**, the default setting is used in the new session. **OFF** disables the setting.

Value range: a string

    - **DEFAULT**
    - **OFF**
    - Specified default value
  - **from current**

Uses the value of **configuration\_parameter** of the current session.
- **IMMUTABLE, STABLE,...**

Specifies a constraint. The function of each parameter is similar to that of CREATE FUNCTION. For details, see [CREATE FUNCTION](#).
- **plsql\_body**

Specifies the PL/SQL stored procedure body.

---

**NOTICE**

When you perform password-related operations, such as user creation, password change, and encryption/decryption, in a stored procedure, the password will be recorded in the system catalogs and logs in plaintext. To prevent sensitive information leakage, you are not advised to perform password-related operations in a stored procedure.

---

 NOTE

No specific order is applied to **argname** and **argname**. The following order is advised: **argname**, **argmode**, and **argtype**.

## Helpful Links

### [DROP PROCEDURE](#)

## Suggestions

- analyse | analyze
  - Do not run **ANALYZE** in a transaction or anonymous block.
  - Do not run **ANALYZE** in a function or stored procedure.

## 7.14.75 CREATE RESOURCE LABEL

### Description

Creates a resource label.

### Precautions

Only users with the poladmin or sysadmin permission, or the initial user can perform this operation.

### Syntax

```
CREATE RESOURCE LABEL [IF NOT EXISTS] label_name ADD label_item_list[, ...];
```

- **label\_item\_list**  
resource\_type(resource\_path[, ...])
- **resource\_type**  
{ TABLE | COLUMN | SCHEMA | VIEW | FUNCTION }

### Parameters

- **IF NOT EXISTS**  
If a resource label with the same name already exists, no error is generated. Instead, a message is displayed, indicating that the resource label already exists.
- **label\_name**  
Specifies the resource label name, which must be unique.  
Value range: a string. It must comply with the [naming convention](#).
- **resource\_type**  
Specifies the type of database resources to be labeled.  
Value range: **TABLE**, **COLUMN**, **SCHEMA**, **VIEW**, and **FUNCTION**.
- **resource\_path**  
Specifies the path of database resources.

### Examples

```
-- Create table tb_for_label.  
gaussdb=# CREATE TABLE tb_for_label(col1 text, col2 text, col3 text);  
  
-- Create schema schema_for_label.  
gaussdb=# CREATE SCHEMA schema_for_label;
```

```
-- Create view view_for_label.
gaussdb=# CREATE VIEW view_for_label AS SELECT 1;

-- Create function func_for_label.
gaussdb=# CREATE FUNCTION func_for_label RETURNS TEXT AS $$ SELECT col1 FROM tb_for_label; $$
LANGUAGE SQL;

-- Create a resource label based on a table.
gaussdb=# CREATE RESOURCE LABEL IF NOT EXISTS table_label add TABLE(public.tb_for_label);

-- Create a resource label based on columns.
gaussdb=# CREATE RESOURCE LABEL IF NOT EXISTS column_label add COLUMN(public.tb_for_label.col1);

-- Create a resource label based on a schema.
gaussdb=# CREATE RESOURCE LABEL IF NOT EXISTS schema_label add SCHEMA(schema_for_label);

-- Create a resource label based on a view.
gaussdb=# CREATE RESOURCE LABEL IF NOT EXISTS view_label add VIEW(view_for_label);

-- Create a resource label based on a function.
gaussdb=# CREATE RESOURCE LABEL IF NOT EXISTS func_label add FUNCTION(func_for_label);

-- Delete resource labels.
gaussdb=# DROP RESOURCE LABEL func_label, view_label, schema_label, column_label, table_label;

-- Delete the func_for_label function.
gaussdb=# DROP FUNCTION func_for_label;

-- Delete the view_for_label view.
gaussdb=# DROP VIEW view_for_label;

-- Delete the schema_for_label schema.
gaussdb=# DROP SCHEMA schema_for_label;

-- Delete the tb_for_label table.
gaussdb=# DROP TABLE tb_for_label;
```

[ALTER RESOURCE LABEL](#) and [DROP RESOURCE LABEL](#)

## 7.14.76 CREATE RESOURCE POOL

### Description

Creates a resource pool and specifies the Cgroup of the resource pool.

### Precautions

Only a user with the CREATE permission on the current database can perform this operation.

### Syntax

```
CREATE RESOURCE POOL pool_name
  [WITH (CONTROL_GROUP='group_name',{MEM_PERCENT=pct| ACTIVE_STATEMENTS=stmt | MAX_DOP
= dop | MEMORY_LIMIT='memory_size' | io_limits=io_limits | io_priority='io_priority' |
nodegroup='nodegroupname' | is_foreign=boolean }[, ... ])];
```

### Parameters

- **pool\_name**  
Specifies the name of a resource pool.

The name of the resource pool cannot be same as that of an existing resource pool.

Value range: a string. It must comply with the [naming convention](#).

- **group\_name**

Specifies the name of a Cgroup.

 **NOTE**

- You can use either double quotation marks ("" ) or single quotation marks (") in the syntax when setting the name of a Cgroup.
- The value of **group\_name** is case-sensitive.
- If an administrator specifies a Workload Cgroup under Class, for example, **control\_group** set to **class1:workload1**, the resource pool will be associated with the **workload1** Cgroup under **class1**. The level of **Workload** can also be specified. For example, **control\_group** is set to **class1:workload1:1**.
- If a database user specifies the Timeshare string (**Rush**, **High**, **Medium**, or **Low**) in the syntax, for example, **control\_group** is set to **High**, the resource pool will be associated with the **High** Timeshare Cgroup under **DefaultClass**.
- When creating a resource pool, you must specify an associated Cgroup. The created resource pool cannot be associated with the default Cgroup, that is, the **Medium** Timeshare Cgroup under the **DefaultClass** Cgroup.

Value range: a string. It must comply with the rule in the description, which specifies the created Cgroup.

- **stmt**

Specifies the maximum number of statements that can be concurrently executed in a resource pool.

Value range: numeric data ranging from -1 to 2147483647

- **dop**

Specifies the maximum statement concurrency degree for a resource pool, equivalent to the number of threads that can be created for executing a statement.

Value range: numeric data ranging from 1 to 2147483647

- **memory\_size**

Specifies the maximum memory size of a resource pool.

Value range: a string from 1 KB to 2047 GB

- **mem\_percent**

Specifies the proportion of available resource pool memory to the total memory or group user memory.

In multi-tenant scenarios, **mem\_percent** of group users or service users ranges from 1 to 100. The default value is **20**.

In common scenarios, **mem\_percent** of common users ranges from 0 to 100. The default value is **0**.

 **NOTE**

When both of **mem\_percent** and **memory\_limit** are specified, only **mem\_percent** takes effect.

- **io\_limits**

Specifies the upper limit of IOPS in a resource pool.

It is counted by 10 thousands per second.

- **io\_priority**

Specifies the I/O priority for jobs that consume many I/O resources. It takes effect when the I/O usage reaches 90%.

There are three priorities: **Low**, **Medium**, and **High**. If you do not want to control I/O resources, use the default value **None**.

 **NOTE**

The settings of **io\_limits** and **io\_priority** are valid only for complex jobs, such as batch import (using **INSERT INTO SELECT**, **COPY FROM**, or **CREATE TABLE AS**), complex queries involving over 500 MB data on each DN, and **VACUUM FULL**.

- **nodegroup**

Specifies the name of the logical database instance in logical database instance mode. The value must be an existing logical database instance.

If the logical database instance name contains uppercase letters or special characters or begins with a digit, enclose the name with double quotation marks ("" ) in SQL statements.

- **is\_foreign**

Specifies the current resource pool to control the resources of common users who are not associated with the logical database instance specified by **nodegroup** in logical database instance mode.

 **NOTE**

- **nodegroup** must specify an existing logical database instance, and cannot be **elastic\_group** or the default node group (specified by **group\_version1**), which is generated during database instance installation.
  - If **is\_foreign** is set to **true**, the resource pool cannot be associated with users. That is, **CREATE USER ... RESOURCE POOL** cannot be used to configure resource pools for users. The resource pool automatically checks whether the users are associated with its logical database instance. If they are not, they will be controlled by the resource pool when performing operations on database nodes in the logical database instance.
- **max\_workers**  
Concurrency in a table during data redistribution. This column is used only for scaling.
  - **max\_connections**  
Maximum number of connections that can be used by a resource pool.

 **NOTE**

The total maximum number of connections in all resource pools cannot exceed the maximum number of connections specified by **max\_connections** of the entire GaussDB process.

## Examples

This example assumes that you have created a Cgroup in advance. (Contact the administrator to create a Cgroup.)

```
-- Create a resource pool, and associate it with the Medium Timeshare Cgroup under the class1 Cgroup.  
gaussdb=# CREATE RESOURCE POOL pool1 WITH (CONTROL_GROUP="class1:Medium");
```

```
-- Create a resource pool and specify the High Timeshare Workload Cgroup under the DefaultClass Cgroup.
gaussdb=# CREATE RESOURCE POOL pool2 WITH (CONTROL_GROUP="High");

-- Create a resource pool, and associate it with the Low Timeshare Cgroup under Workload under class1.
gaussdb=# CREATE RESOURCE POOL pool3 WITH (CONTROL_GROUP="class1:Low");

-- Create a resource pool, and associate it with the wg1 Workload Cgroup under class1.
gaussdb=# CREATE RESOURCE POOL pool4 WITH (CONTROL_GROUP="class1:wg1");

-- Create a resource pool, and associate it with the wg2 Workload Cgroup under class1.
gaussdb=# CREATE RESOURCE POOL pool5 WITH (CONTROL_GROUP="class1:wg2:3");

-- Delete the resource pool.
gaussdb=# DROP RESOURCE POOL pool1;
gaussdb=# DROP RESOURCE POOL pool2;
gaussdb=# DROP RESOURCE POOL pool3;
gaussdb=# DROP RESOURCE POOL pool4;
gaussdb=# DROP RESOURCE POOL pool5;
```

## Helpful Links

[ALTER RESOURCE POOL](#) and [DROP RESOURCE POOL](#)

## 7.14.77 CREATE ROLE

### Description

Creates a role.

A role is an entity that owns database objects and permissions. In different environments, a role can be considered a user, a group, or both.

### Precautions

- If a role is added to the database, the role does not have the login permission.
- Only the user who has the CREATE ROLE permission or a system administrator is allowed to create roles.

### Syntax

```
CREATE ROLE role_name [ [ WITH ] option [ ... ] ] [ ENCRYPTED | UNENCRYPTED ] { PASSWORD | IDENTIFIED BY } { 'password' [ EXPIRED ] | DISABLE };
```

The syntax of role information configuration clause option is as follows:

```
{SYSADMIN | NOSYSADMIN}
| {MONADMIN | NOMONADMIN}
| {OPRADMIN | NOOPRADMIN}
| {POLADMIN | NOPOLADMIN}
| {AUDITADMIN | NOAUDITADMIN}
| {CREATEDB | NOCREATEDB}
| {USEFT | NOUSEFT}
| {CREATEROLE | NOCREATEROLE}
| {INHERIT | NOINHERIT}
| {LOGIN | NOLOGIN}
| {REPLICATION | NOREPLICATION}
| {VCADMIN | NOVCADMIN}
| {PERSISTENCE | NOPERSISTENCE}
| CONNECTION LIMIT connlimit
| VALID BEGIN 'timestamp'
| VALID UNTIL 'timestamp'
| RESOURCE POOL 'respool'
| USER GROUP 'groupuser'
| PERM SPACE 'spacelimit'
```

```
| TEMP SPACE 'tmpspacelimit'  
| SPILL SPACE 'spillspacelimit'  
| NODE GROUP logic_cluster_name  
| IN ROLE role_name [, ...]  
| IN GROUP role_name [, ...]  
| ROLE role_name [, ...]  
| ADMIN role_name [, ...]  
| USER role_name [, ...]  
| SYSID uid  
| DEFAULT TABLESPACE tablespace_name  
| PROFILE DEFAULT  
| PROFILE profile_name  
| PGUSER
```

## Parameters

- **role\_name**

Specifies the name of a role.

Value range: a string. It must comply with the [naming convention](#). A value can contain a maximum of 63 characters. If the value contains more than 63 characters, the database truncates it and retains the first 63 characters as the role name. When a role is created, the database will display a message.

 **NOTE**

The identifier must be letters, underscores (\_), digits (0-9), or dollar signs (\$) and must start with a letter (a-z) or underscore (\_).

- **password**

Specifies the login password.

A new password must:

- Contain at least eight characters. This is the default length.
- Differ from the username or the username spelled backward.
- Contain at least three of the following character types: uppercase characters, lowercase characters, digits, and special characters (limited to ~!@#\$%^&\*()-\_+=+|[{}];:;<.>/?).
- The password can also be a ciphertext character string that meets the format requirements. This mode is mainly used to import user data. You are advised not to use it directly. If a ciphertext password is used, the user must know the plaintext corresponding to the ciphertext password and ensure that the plaintext password meets the complexity requirements. The database does not verify the complexity of the ciphertext password. Instead, the security of the ciphertext password is ensured by the user.
- Be enclosed by single quotation marks when a role is created.

Value range: a character string that cannot be empty.

- **EXPIRED**

When creating a user, you can specify the **EXPIRED** parameter to create a user whose password is invalid. The user cannot perform simple or extended queries. The statement can be executed only after the password is changed.

- **DISABLE**

By default, you can change your password unless it is disabled. To disable the password of a user, use this parameter. After the password of a user is disabled, the password will be deleted from the system. The user can connect to the database only through external authentication, for example, Kerberos

authentication. Only administrators can enable or disable a password. Common users cannot disable the password of an initial user. To enable a password, run **ALTER USER** and specify the password.

- **ENCRYPTED | UNENCRYPTED**

Controls whether the password is stored encrypted in the system catalogs. According to product security requirement, the password must be stored encrypted. Therefore, **UNENCRYPTED** is forbidden in GaussDB. If the password string has already been encrypted in the SHA256 format, it is stored encrypted as it was, regardless of whether **ENCRYPTED** or **UNENCRYPTED** is specified (since the system cannot decrypt the specified encrypted password string). This allows reloading of encrypted passwords during dump/restore.

- **SYSADMIN | NOSYSADMIN**

Specifies whether a new role is a system administrator. Roles with the SYSADMIN attribute have the highest permission.

Value range: If not specified, **NOSYSADMIN** is the default.

When separation of duties is disabled, users with the SYSADMIN permission can create users with the SYSADMIN, REPLICATION, CREATEROLE, AUDITADMIN, MONADMIN, POLADMIN, or CREATEDB permission and common users.

When separation of duties is enabled, users with the SYSADMIN permission do not have the permission to create users.

- **MONADMIN | NOMONADMIN**

Specifies whether a role is a monitor administrator.

Value range: If not specified, **NOMONADMIN** is the default.

- **OPRADMIN | NOOPRADMIN**

Specifies whether a role is an O&M administrator.

Value range: If not specified, **NOOPRADMIN** is the default.

- **POLADMIN | NOPOLADMIN**

Specifies whether a role is a security policy administrator.

Value range: If not specified, **NOPOLADMIN** is the default.

- **AUDITADMIN | NOAUDITADMIN**

Specifies whether a role has the audit and management attributes.

If not specified, **NOAUDITADMIN** is the default.

- **CREATEDB | NOCREATEDB**

Specifies a role's permission to create databases.

A new role does not have the permission to create databases.

Value range: If not specified, **NOCREATEDB** is the default.

- **USEFT | NOUSEFT**

This parameter is reserved and not used in this version.

- **CREATEROLE | NOCREATEROLE**

Specifies whether a role will be permitted to create new roles (that is, execute **CREATE ROLE** and **CREATE USER**). A role with the CREATEROLE permission can also modify and delete other roles.

Value range: If not specified, **NOCREATEROLE** is the default.

When separation of duties is disabled, users with the **CREATEROLE** permission can create users with the **CREATEROLE**, **AUDITADMIN**, **MONADMIN**, **POLADMIN**, or **CREATEDB** permission and common users.

When separation of duties is enabled, users with the **CREATEROLE** permission can create users with the **CREATEROLE**, **MONADMIN**, **POLADMIN**, or **CREATEDB** permission and common users.

- **INHERIT | NOINHERIT**

Specifies whether a role "inherits" the permissions of roles in the same group. It is not recommended.

- **LOGIN | NOLOGIN**

Specifies whether a role is allowed to log in to a database. A role having the **LOGIN** attribute can be considered as a user.

Value range: If not specified, **NOLOGIN** is the default.

- **REPLICATION | NOREPLICATION**

Specifies whether a role is allowed to initiate streaming replication or put the system in and out of backup mode. A role having the **REPLICATION** attribute is specific to replication.

If not specified, **NOREPLICATION** is the default.

- **VCADMIN | NOVCADMIN**

This parameter has no actual meaning.

- **PERSISTENCE | NOPERSISTENCE**

Defines a permanent user. Only the initial user is allowed to create, modify, and delete permanent users with the **PERSISTENCE** attribute.

- **CONNECTION LIMIT**

Specifies how many concurrent connections the role can make.

---

**NOTICE**

- The system administrator is not restricted by this parameter.
- **connlimit** is calculated separately for each primary database node.  
Number of connections of the database = Value of **connlimit** x Number of normal primary database nodes.

---

Value range: an integer in the range  $[-1, 2^{31} - 1]$ . The default value **-1** means no limit.

- **VALID BEGIN**

Sets the timestamp when a role takes effect. If this clause is omitted, the role has no valid start time. **timestamp** indicates the start time. The format is 'YYYY-MM-DD HH:mm:ss'.

- **VALID UNTIL**

Sets a date and time after which the role's password is no longer valid. If this clause is omitted, the role has no valid end time. **timestamp** indicates the end time. The format is 'YYYY-MM-DD HH:mm:ss'.

- **RESOURCE POOL**

Sets the name of resource pool used by the role. The name belongs to the system catalog `pg_resource_pool`.

- **USER GROUP**  
Creates a sub-user. This function is not supported in the current version.
- **PERM SPACE**  
Sets the space available for a user.
- **TEMP SPACE**  
Sets the space allocated to the temporary table of a user.
- **SPILL SPACE**  
Sets the operator disk flushing space of a user.
- **IN ROLE**  
Lists one or more existing roles whose permissions will be inherited by a new role. It is not recommended.
- **IN GROUP**  
Specifies an obsolete spelling of IN ROLE. It is not recommended.
- **ROLE**  
Lists one or more existing roles which are automatically added as members of the new role.
- **ADMIN**  
Similar to ROLE. However, ADMIN grants permissions of new roles to other roles.
- **USER**  
Specifies an obsolete spelling of the ROLE clause.
- **SYSID**  
The SYSID clause is ignored.
- **DEFAULT TABLESPACE**  
The DEFAULT TABLESPACE clause is ignored.
- **PROFILE**  
The PROFILE clause is ignored.
- **PGUSER**  
In the current version, this attribute is reserved only for forward compatibility.

## Examples

```
-- Create a role manager whose password is *****.
gaussdb=# CREATE ROLE manager IDENTIFIED BY '*****!';

-- Create a role with its validity from January 1, 2015 to January 1, 2026.
gaussdb=# CREATE ROLE miriam WITH LOGIN PASSWORD '*****!' VALID BEGIN '2015-01-01' VALID UNTIL
'2026-01-01';

-- Change the password of role manager to *****.
gaussdb=# ALTER ROLE manager IDENTIFIED BY '*****!' REPLACE '*****!';

-- Change role manager to the system administrator.
gaussdb=# ALTER ROLE manager SYSADMIN;

-- Delete role manager.
gaussdb=# DROP ROLE manager;
```

```
-- Delete role miriam.  
gaussdb=# DROP ROLE miriam;
```

## 7.14.78 CREATE ROW LEVEL SECURITY POLICY

### Description

Creates a row-level security policy for a table.

The policy takes effect only after row-level security is enabled (by running **ALTER TABLE ... ENABLE ROW LEVEL SECURITY**). Otherwise, this statement does not take effect.

Currently, row-level security affects the read (**SELECT**, **UPDATE**, and **DELETE**) of data tables and does not affect the write (**INSERT** and **MERGE INTO**) of data tables. The table owner or system administrators can create an expression in the **USING** clause. When the client reads the data table, the database server combines the expressions that meet the condition and applies it to the execution plan in the statement rewriting phase of a query. For each tuple in a data table, if the expression returns **TRUE**, the tuple is visible to the current user; if the expression returns **FALSE** or **NULL**, the tuple is invisible to the current user.

A row-level security policy name is specific to a table. A data table cannot have row-level security policies with the same name. Different data tables can have the same row-level security policy.

Row-level security policies can be applied to specified operations (**SELECT**, **UPDATE**, **DELETE**, and **ALL**). **ALL** indicates that **SELECT**, **UPDATE**, and **DELETE** will be affected. For a new row-level security policy, the default value **ALL** will be used if you do not specify the operations that will be affected.

Row-level security policies can be applied to a specified user (role) or to all users (**PUBLIC**). For a new row-level security policy, the default value **PUBLIC** will be used if you do not specify the user that will be affected.

### Precautions

- Row-level security policies can be defined for row-store tables, row-store partitioned tables, unlogged tables, and hash tables.
- Row-level security policies cannot be defined for foreign tables and local temporary tables.
- Row-level security policies cannot be defined for views.
- A maximum of 100 row-level security policies can be defined for a table.
- System administrators are not affected by row-level security policies and can view all data in a table.
- Tables queried by using SQL statements, views, functions, and stored procedures are affected by row-level security policies.
- The data type of a table column to which a row-level security policy has been added cannot be changed.

## Syntax

```
CREATE [ ROW LEVEL SECURITY ] POLICY policy_name ON table_name
[ AS { PERMISSIVE | RESTRICTIVE } ]
[ FOR { ALL | SELECT | UPDATE | DELETE } ]
[ TO { role_name | PUBLIC | CURRENT_USER | SESSION_USER } [, ...] ]
USING ( using_expression )
```

## Parameters

- policy\_name**  
 Specifies the name of a row-level security policy to be created. The names of row-level security policies for a table must be unique.
- table\_name**  
 Specifies the name of a table to which a row-level security policy is applied.
- PERMISSIVE | RESTRICTIVE**  
**PERMISSIVE** enables the permissive policy for row-level security. The conditions of the permissive policy are joined through the OR expression.  
**RESTRICTIVE** enables the restrictive policy for row-level security. The conditions of the restrictive policy are joined through the AND expression. The join methods are as follows:  

```
(using_expression_permissive_1 OR using_expression_permissive_2 ...) AND
(using_expression_restrictive_1 AND using_expression_restrictive_2 ...)
```

 The default value is **PERMISSIVE**.
- command**  
 Specifies the SQL operations affected by a row-level security policy, including **ALL**, **SELECT**, **UPDATE**, and **DELETE**. If this parameter is not specified, the default value **ALL** will be used, covering **SELECT**, **UPDATE**, and **DELETE**.  
 If **command** is set to **SELECT**, only tuple data that meets the condition (the return value of **using\_expression** is **TRUE**) can be queried. The operations that are affected include **SELECT**, **SELECT FOR UPDATE/SHARE**, **UPDATE ... RETURNING**, and **DELETE ... RETURNING**.  
 If **command** is set to **UPDATE**, only tuple data that meets the condition (the return value of **using\_expression** is **TRUE**) can be updated. The operations that are affected include **UPDATE**, **UPDATE ... RETURNING**, and **SELECT ... FOR UPDATE/SHARE**.  
 If **command** is set to **DELETE**, only tuple data that meets the condition (the return value of **using\_expression** is **TRUE**) can be deleted. The operations that are affected include **DELETE** and **DELETE ... RETURNING**.  
 The following table describes the relationship between row-level security policies and SQL statements.

**Table 7-144** Relationship between row-level security policies and SQL statements.

| Command       | SELECT/ALL Policy | UPDATE/ALL Policy | DELETE/ALL Policy |
|---------------|-------------------|-------------------|-------------------|
| <b>SELECT</b> | Existing row      | No                | No                |

| Command                        | SELECT/ALL Policy | UPDATE/ALL Policy | DELETE/ALL Policy |
|--------------------------------|-------------------|-------------------|-------------------|
| <b>SELECT FOR UPDATE/SHARE</b> | Existing row      | Existing row      | No                |
| <b>UPDATE</b>                  | No                | Existing row      | No                |
| <b>UPDATE RETURNING</b>        | Existing row      | Existing row      | No                |
| <b>DELETE</b>                  | No                | No                | Existing row      |
| <b>DELETE RETURNING</b>        | Existing row      | No                | Existing row      |

- **role\_name**

Specifies database users affected by a row-level security policy.

**CURRENT\_USER** indicates the username in the current operating environment. **SESSION\_USER** indicates the session username. If this parameter is not specified, the default value **PUBLIC** is used, indicating that all database users are affected. You can specify multiple affected database users.

---

**NOTICE**

System administrators are not affected by row access control.

---

- **using\_expression**

Specifies an expression defined for a row-level security policy (return type: Boolean).

The expression cannot contain aggregate functions or window functions. In the statement rewriting phase of a query, if row-level security for a data table is enabled, the expressions that meet the specified conditions will be added to the plan tree. The expression is calculated for each tuple in the data table. For **SELECT**, **UPDATE**, and **DELETE**, row data is visible to the current user only when the return value of the expression is **TRUE**. If the expression returns **FALSE**, the tuple is invisible to the current user. In this case, the user cannot view the tuple through the **SELECT** statement, update the tuple through the **UPDATE** statement, or delete the tuple through the **DELETE** statement.

## Examples

```
-- Create user alice.
gaussdb=# CREATE USER alice PASSWORD '*****';

-- Create user bob.
gaussdb=# CREATE USER bob PASSWORD '*****';

-- Create data table all_data.
gaussdb=# CREATE TABLE public.all_data(id int, role varchar(100), data varchar(100));

-- Insert data into the data table.
gaussdb=# INSERT INTO all_data VALUES(1, 'alice', 'alice data');
```

```

gaussdb=# INSERT INTO all_data VALUES(2, 'bob', 'bob data');
gaussdb=# INSERT INTO all_data VALUES(3, 'peter', 'peter data');

-- Grant the read permission on the all_data table to users alice and bob.
gaussdb=# GRANT SELECT ON all_data TO alice, bob;

-- Enable the row-level security policy.
gaussdb=# ALTER TABLE all_data ENABLE ROW LEVEL SECURITY;

-- Create a row-level security policy to specify that the current user can view only their own data.
gaussdb=# CREATE ROW LEVEL SECURITY POLICY all_data_rls ON all_data USING(role = CURRENT_USER);

-- View information about the all_data table.
gaussdb=# \d+ all_data
          Table "public.all_data"
Column |      Type      | Modifiers | Storage | Stats target | Description
-----+-----+-----+-----+-----+-----
id     | integer        |           |         |              |
role   | character varying(100) |           | extended |              |
data   | character varying(100) |           | extended |              |
Row Level Security Policies:
  POLICY "all_data_rls" FOR ALL
    TO public
    USING (((role)::name = "current_user"()))
Has OIDs: no
Options: orientation=row, compression=no, enable_rowsecurity=true

-- Run SELECT.
gaussdb=# SELECT * FROM all_data;
id | role | data
---+---+---
 1 | alice | alice data
 2 | bob   | bob data
 3 | peter | peter data
(3 rows)

gaussdb=# EXPLAIN(COSTS OFF) SELECT * FROM all_data;
          QUERY PLAN
-----
Seq Scan on all_data
(1 row)

-- Switch to user alice and run SELECT.
gaussdb=# SELECT * FROM all_data;
id | role | data
---+---+---
 1 | alice | alice data
(1 row)

gaussdb=# EXPLAIN(COSTS OFF) SELECT * FROM all_data;
          QUERY PLAN
-----
Seq Scan on all_data
  Filter: ((role)::name = 'alice)::name)
Notice: This query is influenced by row level security feature
(3 rows)

-- Delete a row-level security policy.
gaussdb=# DROP ROW LEVEL SECURITY POLICY all_data_rls ON all_data;

-- Delete the all_data table.
gaussdb=# DROP TABLE public.all_data;

-- Delete users alice and bob.
gaussdb=# DROP USER alice, bob;

```

## Helpful Links

[DROP ROW LEVEL SECURITY POLICY](#) and [ALTER ROW LEVEL SECURITY POLICY](#)

## 7.14.79 CREATE RULE

### Description

Defines a new rewriting rule.

### Precautions

- To define or modify rules for a table, you must be the owner of the table.
- If multiple rules of the same type are defined for the same table, the rules are triggered one by one by name in alphabetical order.
- In the view, the **RETURNING** clause can be added to the **INSERT**, **UPDATE**, and **DELETE** rules to return columns by view. If a rule is triggered by the **INSERT RETURNING**, **UPDATE RETURNING**, or **DELETE RETURNING** command, these clauses are used to calculate the output result. If a rule is triggered by a command without **RETURNING**, the **RETURNING** clause of the rule is ignored. Currently, only unconditional **INSTEAD** rules can contain the **RETURNING** clause, and only one **RETURNING** clause can exist in all rules of one event. This ensures that only one **RETURNING** clause can be used for result calculation. If the **RETURNING** clause does not exist in any valid rule, the **RETURNING** query in this view will be rejected.
- Currently, **ON SELECT** rules must be unconditional **INSTEAD** rules and must have actions consisting of a single **SELECT** command. Therefore, an **ON SELECT** rule actually turns a table into a view whose visible content is the content returned by the **SELECT** command of the rule, rather than the content in the table (if any).

### Syntax

```
CREATE [ OR REPLACE ] RULE name AS ON event  
TO table_name [ WHERE condition ]  
DO [ ALSO | INSTEAD ] { NOTHING | command | ( command ; command ... ) }
```

Events include:

```
SELECT  
INSERT  
DELETE  
UPDATE
```

### Parameters

- name  
Name of the created rule. It must be unique among all the rules for the same table.  
Value range: a string, which complies with the [naming convention](#). A value can contain a maximum of 63 characters.
- event  
One of the **SELECT**, **INSERT**, **UPDATE**, and **DELETE** events.
- table\_name  
Name (optionally schema-qualified) of the table or view to which the rule applies.

- **condition**  
SQL condition expression that returns a Boolean value, which determines whether to execute the rule. Expressions cannot reference any table except **NEW** and **OLD**, and cannot have aggregate functions. You are not advised to use numeric types such as int for **condition**, because such types can be implicitly converted to bool values (non-zero values are implicitly converted to **true** and **0** is implicitly converted to **false**), which may cause unexpected results.
- **INSTEAD**  
**INSTEAD** indicates that the initial event is replaced by this command.
- **ALSO**  
**ALSO** indicates that the command should be executed after the initial event. If neither **ALSO** nor **INSTEAD** is specified, **ALSO** is the default value.
- **command**  
Command that composes the rule action. A valid command is one of the **SELECT**, **INSERT**, **UPDATE**, and **DELETE** statements.

## Examples

```
CREATE RULE "_RETURN" AS
ON SELECT TO t1
DO INSTEAD
SELECT * FROM t2;
```

### NOTICE

- The name specified after **ON SELECT** rules must be "\_RETURN".
- Currently, the ON SELECT rule must be INSTEAD SELECT, and the table specified by TO is converted to a view. The prerequisite is that the table is empty and does not have restrictions such as triggers, indexes, and child tables. That is, the table must be an initial empty table. Therefore, you are not advised to use ON SELECT rules. Instead, you can directly create a view.

## 7.14.80 CREATE SCHEMA

### Description

Creates a schema.

Named objects are accessed either by "qualifying" their names with the schema name as a prefix, or by setting a search path that includes the desired schema. When creating named objects, you can also use the schema name as a prefix.

Optionally, **CREATE SCHEMA** can include sub-commands to create objects within the new schema. The sub-commands are treated essentially the same as separate commands issued after creating the schema. If the **AUTHORIZATION** clause is used, all the created objects are owned by this user.

## Precautions

- Only a user with the **CREATE** permission on the current database can perform this operation.
- The owner of an object created by a system administrator in a schema with the same name as a common user is the common user, not the system administrator.

## Syntax

- Create a schema based on a specified name.  

```
CREATE SCHEMA schema_name  
[ AUTHORIZATION user_name ] [ schema_element [ ... ] ];
```
- Create a schema based on a username.  

```
CREATE SCHEMA AUTHORIZATION user_name [ schema_element [ ... ] ];
```
- Create a schema and specify the default character set and collation.  

```
CREATE SCHEMA schema_name  
[ [DEFAULT] CHARACTER SET | CHARSET [ = ] default_charset ] [ [DEFAULT] COLLATE [ = ]  
default_collation ];
```

## Parameters

- **schema\_name**  
Specifies the schema name.

---

### NOTICE

- The schema name must be unique in the current database.
- The schema name cannot be the same as the initial username of the current database.
- The schema name cannot start with pg\_.
- The schema name cannot start with gs\_role\_.

---

Value range: a string. It must comply with the [naming convention](#).

- **AUTHORIZATION user\_name**  
Specifies the owner of a schema. If **schema\_name** is not specified, **user\_name** will be used as the schema name. In this case, **user\_name** can only be a role name.  
Value range: an existing username or role name
- **schema\_element**  
Specifies an SQL statement defining an object to be created within the schema. Currently, only the CREATE TABLE, CREATE VIEW, CREATE INDEX, CREATE PARTITION, CREATE SEQUENCE, CREATE TRIGGER, and GRANT clauses are supported.  
Objects created by sub-commands are owned by the user specified by **AUTHORIZATION**.
- **default\_charset**  
This syntax is supported only when **sql\_compatibility** is set to 'B'. Specifies the default character set of a schema. If you specify a character set separately,

the default collation of the schema is set to the default collation of the specified character set.

- **default\_collation**

This syntax is supported only when **sql\_compatibility** is set to 'B'. Specifies the default collation of a schema. If you specify a collation separately, the default character set of the schema is set to the character set corresponding to the specified collation.

For details about the supported collation, see [Table 1 Character sets and collation supported in mode B \(sql\\_compatibility = 'B'\)](#).

 **NOTE**

If objects in the schema on the current search path are with the same name, specify the schemas for different objects. You can run **SHOW SEARCH\_PATH** to check the schemas on the current search path.

## Examples

```
-- Create the role1 role.
gaussdb=# CREATE ROLE role1 IDENTIFIED BY '*****';

-- Create a schema named role1 for the role1 role. The owner of the films and winners tables created by
the clause is role1.
gaussdb=# CREATE SCHEMA AUTHORIZATION role1
CREATE TABLE films (title text, release date, awards text[])
CREATE VIEW winners AS
SELECT title, release FROM films WHERE awards IS NOT NULL;

-- Create a schema ds and set the default character set of the schema to utf8mb4 and the default collation
to utf8mb4_bin.
gaussdb=# CREATE SCHEMA ds CHARACTER SET utf8mb4 COLLATE utf8mb4_bin;

-- Delete the schema.
gaussdb=# DROP SCHEMA role1 CASCADE;
-- Delete the user.
gaussdb=# DROP USER role1 CASCADE;
```

## Helpful Links

[ALTER SCHEMA](#) and [DROP SCHEMA](#)

## 7.14.81 CREATE SEQUENCE

### Function

**CREATE SEQUENCE** adds a sequence to the current database. The owner of a sequence is the user who creates the sequence.

### Precautions

- A sequence is a special table that stores arithmetic progressions. It has no actual meaning and is usually used to generate unique identifiers for rows or tables.
- If a schema name is given, the sequence is created in the specified schema; otherwise, it is created in the current schema. The sequence name must be different from the names of other sequences, tables, indexes, views in the same schema.

- After the sequence is created, functions **nextval()** and **generate\_series(1,N)** insert data to the table. Make sure that the number of times for invoking **nextval** is greater than or equal to N+1. Otherwise, errors will be reported because the number of times for invoking function **generate\_series()** is N+1.
- By default, the maximum value of **Sequence** is  $2^{63} - 1$ . If a large identifier is used, the maximum value can be  $2^{127} - 1$ .
- A user granted with the CREATE ANY SEQUENCE permission can create sequences in the public and user schemas.

## Syntax

```
CREATE [ LARGE | TEMPORARY | TEMP ] SEQUENCE name [ INCREMENT [ BY ] increment ]  
[ MINVALUE minvalue | NO MINVALUE | NOMINVALUE ] [ MAXVALUE maxvalue | NO MAXVALUE |  
NOMAXVALUE ]  
[ START [ WITH ] start ] [ CACHE cache ] [ [ NO ] CYCLE | NOCYCLE ]  
[ OWNED BY { table_name.column_name | NONE } ];
```

## Parameter Description

- **TEMPORARY | TEMP**

Specifies the keyword of a temporary sequence.

 **NOTE**

- Enable the PostgreSQL compatibility mode for the database before creating a temporary sequence.
- The lifecycle of a temporary sequence is at the session level, and temporary sequence objects are isolated by sessions. Sequences are automatically dropped on session exit.
- Temporary sequences exist in a special schema. Each session has only one temporary schema. If a temporary schema is created in advance, the schema name can be provided when the temporary sequence is created. If a temporary schema is not created in advance, the schema name cannot be provided when the temporary sequence is created; in addition, each session can access only the objects in its own temporary schema and cannot access the objects in the temporary schemas of other sessions. If the accessed temporary schema does not belong to this session, an error is reported.
- If temporary sequences exist, the existing permanent sequences with the same name (in this session) become invisible, but they can be referenced with a schema-limited name.

- **name**

Specifies the name of a sequence to be created.

Value range: a string containing only lowercase letters, uppercase letters, special characters #\_ \$, and digits

- **increment**

Specifies the step for a sequence. A positive number generates an ascending sequence, and a negative number generates a decreasing sequence.

The default value is 1.

 **NOTE**

In B compatibility mode, if the step is a floating point number, the value is automatically converted to an integer. In other modes, this parameter cannot be set to a floating point number.

- **MINVALUE minvalue | NO MINVALUE| NOMINVALUE**  
Specifies the minimum value of the sequence. If **MINVALUE** is not declared, or **NO MINVALUE** is declared, the default value of the ascending sequence is 1, and that of the descending sequence is  $-2^{63}-1$ . **NOMINVALUE** is equivalent to **NO MINVALUE**.
- **MAXVALUE maxvalue | NO MAXVALUE| NOMAXVALUE**  
Specifies the maximum value of the sequence. If **MAXVALUE** is not declared, or **NO MAXVALUE** is declared, the default value of the ascending sequence is  $2^{63}-1$ , and that of the descending sequence is -1. **NOMAXVALUE** is equivalent to **NO MAXVALUE**.
- **start**  
Specifies the start value of the sequence. The default value for an ascending sequence is **minvalue** and that for a descending sequence is **maxvalue**.
- **cache**  
Specifies the number of sequences stored in the memory for quick access purposes.  
Default value 1 indicates that one sequence can be generated each time.

 **NOTE**

It is not recommended that you define **cache** and **maxvalue** or **minvalue** at the same time. The continuity of sequences cannot be ensured after **cache** is defined because unacknowledged sequences may be generated, causing waste of sequences.

- **CYCLE**  
Recycles sequences after the number of sequences reaches **maxvalue** or **minvalue**.  
If **NO CYCLE** is specified, any invocation of **nextval** would return an error after the number of sequences reaches **maxvalue** or **minvalue**.  
**NOCYCLE** is equivalent to **NO CYCLE**.  
The default value is **NO CYCLE**.  
If **CYCLE** is specified, the sequence uniqueness cannot be ensured.
- **OWNED BY**  
Associates a sequence with a specified column included in a table. In this way, the sequence will be deleted when you delete its associated column or the table where the column belongs to. The associated table and sequence must be owned by the same user and in the same schema. **OWNED BY** only establishes the association between a table column and the sequence. Sequences on the column do not increase automatically when data is inserted.  
The default value **OWNED BY NONE** indicates that such association does not exist.

---

**NOTICE**

You are not advised to use the sequence created using **OWNED BY** in other tables. If multiple tables need to share a sequence, the sequence must not belong to a specific table.

---

## Examples

Create a temporary sequence named **test**.

```
gaussdb=# CREATE TEMPORARY SEQUENCE test;
```

Create an ascending sequence named **serial**, which starts from 101.

```
gaussdb=# CREATE SEQUENCE serial  
START 101  
CACHE 20;
```

Select the next number from the sequence.

```
gaussdb=# SELECT nextval('serial');  
nextval  
-----  
101
```

Select the next number from the sequence.

```
gaussdb=# SELECT nextval('serial');  
nextval  
-----  
102
```

Create a sequence associated with the table.

```
gaussdb=# CREATE TABLE customer_address  
(  
  ca_address_sk      integer      not null,  
  ca_address_id     char(16)      not null,  
  ca_street_number  char(10)      ,  
  ca_street_name    varchar(60)   ,  
  ca_street_type    char(15)     ,  
  ca_suite_number   char(10)     ,  
  ca_city           varchar(60)   ,  
  ca_county         varchar(30)   ,  
  ca_state          char(2)      ,  
  ca_zip           char(10)     ,  
  ca_country        varchar(20)   ,  
  ca_gmt_offset     decimal(5,2) ,  
  ca_location_type  char(20)     ,  
);  
  
gaussdb=# CREATE SEQUENCE serial1  
START 101  
CACHE 20  
OWNED BY customer_address.ca_address_sk;  
-- Delete a table and sequences.  
gaussdb=# DROP TABLE customer_address;  
gaussdb=# DROP SEQUENCE serial cascade;  
gaussdb=# DROP SEQUENCE serial1 cascade;
```

## 7.14.82 CREATE SERVER

### Description

**CREATE SERVER** defines a new foreign server.

## Precautions

When multi-layer quotation marks are used for sensitive columns (such as **password**, **secret\_access\_key**) in **OPTIONS**, the semantics is different from that in the scenario where quotation marks are not used. Therefore, sensitive columns are not identified for anonymization.

## Syntax

```
CREATE SERVER server_name  
  FOREIGN DATA WRAPPER fdw_name  
  OPTIONS ( { option_name ' value ' } [, ...] );
```

## Parameters

- **server\_name**  
Specifies the server name.  
Value range: a string containing no more than 63 characters
- **fdw\_name**  
Specifies the name of the foreign data wrapper.  
Value range: **dist\_fdw**, **log\_fdw**, and **file\_fdw**. **log\_fdw** and **file\_fdw** are used only for syntax compatibility in centralized mode. They can be used to create foreign tables but are not actually used.
- **OPTIONS ( { option\_name ' value ' } [, ...] )**  
Specifies options for the server. These options typically define the connection details of the server, but the actual names and values depend on the foreign data wrapper of the server.
  - Specifies the parameters for the foreign server. The detailed parameter description is as follows:
    - **encrypt**  
Specifies whether data is encrypted. This parameter is available only when **type** is **OBS**. The default value is **on**.  
Value range:
      - **on** indicates that data is encrypted and HTTPS is used for communication.
      - **off** indicates that data is not encrypted and HTTP is used for communication.
    - **access\_key**  
Specifies the access key (AK) (obtained by users from the OBS console) used for the OBS access protocol. This parameter is available only when **type** is set to **OBS**.
    - **secret\_access\_key**  
Specifies the secret key (SK) value (obtained by users from the OBS console) used for the OBS access protocol. This parameter is available only when **type** is set to **OBS**.

In addition to the connection parameters supported by libpq, the following parameters are provided:

- **fdw\_startup\_cost**  
Estimates the startup time required for a foreign table scan. This value usually contains the time taken to establish a connection, analyze the request at the remote end, and generate a plan. The default value is **100**.
- **fdw\_tycle\_cost**  
Specifies the additional consumption when each tuple is scanned on a remote server. The value specifies the extra consumption of data transmission between servers. The default value is **0.01**.

## Examples

```
-- Create a server.  
gaussdb=# create server my_server foreign data wrapper log_fdw;  
CREATE SERVER  
  
-- Delete my_server.  
gaussdb=# DROP SERVER my_server;  
DROP SERVER
```

[ALTER SERVER](#) and [DROP SERVER](#)

## 7.14.83 CREATE SYNONYM

### Description

Creates a synonym object. A synonym is an alias of a database object and is used to record the mapping between database object names. You can use synonyms to access associated database objects.

### Precautions

- The user of a synonym should be its owner.
- If the schema name is specified, create a synonym in the specified schema. Otherwise create a synonym in the current schema.
- Database objects that can be accessed using synonyms include tables, views, types, packages, functions, and stored procedures.
- To use synonyms, you must have the required permissions on associated objects.
- The following DML statements support synonyms: SELECT, INSERT, UPDATE, DELETE, EXPLAIN, and CALL.
- You are advised not to create synonyms for temporary tables. To create a synonym, you need to specify the schema name of the target temporary table. Otherwise, the synonym cannot be used normally. In addition, you need to run the **DROP SYNONYM** command before the current session ends.
- After an original object is deleted, the synonym associated with the object will not be deleted in cascading mode. If you continue to access the synonym, for tables, a message is displayed indicating that the synonyms have expired; for functions, stored procedures, and packages, a message is displayed indicating that the objects do not exist.

- Users granted the CREATE ANY SYNONYM permission can create synonyms in user schemas.
- Synonyms cannot be created for encrypted tables that contain encrypted columns and views, functions, and stored procedures based on encrypted tables.
- The object associated with a synonym can be a package or a function under a package. Functions in a package can be accessed by associating with the package. After a synonym is associated with a function in a package, the synonym cannot be used to directly access the functions in the package.
- If the schema of a synonym is the schema to which the user belongs, the owner of the synonym is also the owner of the schema. In other scenarios, the owner of the synonym is the creator of the synonym by default.
- If **SEARCH\_PATH** is set and no synonym schema is specified, for stored procedures and functions, the PG\_PROC table is preferentially searched by name. If no function with the same name exists, synonyms are searched based on **SEARCH\_PATH**. For other objects, **SEARCH\_PATH** is preferentially searched, if their schemas are the same as that of synonyms, the objects are accessed prior to synonyms.
- Objects associated with synonyms cannot be accessed using DDL statements, such as CREATE, DROP, and ALTER.

## Syntax

```
CREATE [ OR REPLACE ] SYNONYM synonym_name  
FOR object_name;
```

## Parameters

- **OR REPLACE**  
(Optional) Redefines the synonym if it already exists.
- **synonym\_name**  
Specifies the name of the synonym to be created, which can contain the schema name.  
Value range: a string. It must comply with the [naming convention](#).
- **object\_name**  
Specifies the name of an object that is associated (optionally with schema names).  
Value range: a string. It must comply with the [naming convention](#).

### NOTE

- **object\_name** can be the name of an object that does not exist.
- **object\_name** can be the name of a remote object accessed by using a database link. For details about how to use database links, see [DATABASE LINK](#).

---

### CAUTION

Do not create aliases for functions that contain passwords and other sensitive information, such as the encryption function `gs_encrypt` and the decryption function `gs_decrypt` or use aliases to call the functions to prevent sensitive information leakage.

---

## Examples

```
-- Create schema ot.
gaussdb=# CREATE SCHEMA ot;

-- Create table ot.t1 and its synonym t1.
gaussdb=# CREATE TABLE ot.t1(id int, name varchar2(10));
gaussdb=# CREATE OR REPLACE SYNONYM t1 FOR ot.t1;

-- Use synonym t1.
gaussdb=# SELECT * FROM t1;
gaussdb=# INSERT INTO t1 VALUES (1, 'ada'), (2, 'bob');
gaussdb=# UPDATE t1 SET t1.name = 'cici' WHERE t1.id = 2;

-- Create synonym v1 and its associated view ot.v_t1.
gaussdb=# CREATE SYNONYM v1 FOR ot.v_t1;
gaussdb=# CREATE VIEW ot.v_t1 AS SELECT * FROM ot.t1;

-- Use synonym v1.
gaussdb=# SELECT * FROM v1;

-- Create overloaded function ot.add and its synonym add.
gaussdb=# CREATE OR REPLACE FUNCTION ot.add(a integer, b integer) RETURNS integer AS
$$
SELECT $1 + $2
$$
LANGUAGE sql;

gaussdb=# CREATE OR REPLACE FUNCTION ot.add(a decimal(5,2), b decimal(5,2)) RETURNS decimal(5,2)
AS
$$
SELECT $1 + $2
$$
LANGUAGE sql;

gaussdb=# CREATE OR REPLACE SYNONYM add FOR ot.add;

-- Use synonym add.
gaussdb=# SELECT add(1,2);
gaussdb=# SELECT add(1.2,2.3);

-- Create stored procedure ot.register and its synonym register.
gaussdb=# CREATE PROCEDURE ot.register(n_id integer, n_name varchar2(10))
SECURITY INVOKER
AS
BEGIN
    INSERT INTO ot.t1 VALUES(n_id, n_name);
END;
/

gaussdb=# CREATE OR REPLACE SYNONYM register FOR ot.register;

-- Use synonym register to call the stored procedure.
gaussdb=# CALL register(3,'mia');

-- Delete the synonym.
gaussdb=# DROP SYNONYM t1;
gaussdb=# DROP SYNONYM IF EXISTS v1;
gaussdb=# DROP SYNONYM IF EXISTS add;
gaussdb=# DROP SYNONYM register;
gaussdb=# DROP SCHEMA ot CASCADE;
```

## Helpful Links

[ALTER SYNONYM](#) and [DROP SYNONYM](#)

## 7.14.84 CREATE TABLE

### Description

Creates an initially empty table in the current database. The table will be owned by the creator.

### Precautions

- If an error occurs during table creation, after it is fixed, the system may fail to delete the empty disk files created before the last automatic clearance. This problem seldom occurs and does not affect system running of the database.
- When JDBC is used, the **DEFAULT** value can be set through **PrepareStatement**.
- A user granted with the CREATE ANY TABLE permission can create tables in the public and user schemas. To create a table that contains serial columns, you must also obtain the CREATE ANY SEQUENCE permission to create sequences.
- The XML type cannot be used as a primary key or foreign key.
- The number of table constraints cannot exceed 32,767.

### Syntax

Create a table.

```
CREATE [ [ GLOBAL | LOCAL ] { TEMPORARY | TEMP } | UNLOGGED ] TABLE [ IF NOT EXISTS ] table_name
    ( { column_name data_type [ CHARACTER SET | CHARSET charset ] [ compress_mode ] [ COLLATE
collation ] [ column_constraint [ ... ] ]
    | table_constraint
    | LIKE source_table [ like_option [...] ] }
    [, ... ] )
    [ AUTO_INCREMENT [=] value ]
    [ [DEFAULT] CHARACTER SET | CHARSET [=] default_charset ] [ [DEFAULT] COLLATE [=]
default_collation ]
    [ WITH ( {storage_parameter = value} [, ... ] ) ]
    [ ON COMMIT { PRESERVE ROWS | DELETE ROWS } ]
    [ COMPRESS | NOCOMPRESS ]
    [ TABLESPACE tablespace_name ];
```

- **column\_constraint** is as follows:

```
[ CONSTRAINT constraint_name ]
{ NOT NULL |
  NULL |
  CHECK ( expression ) |
  DEFAULT default_expr |
  GENERATED ALWAYS AS ( generation_expr ) [STORED] |
  AUTO_INCREMENT |
  UNIQUE [KEY] index_parameters |
  ENCRYPTED WITH ( COLUMN_ENCRYPTION_KEY = column_encryption_key, ENCRYPTION_TYPE =
encryption_type_value ) |
  PRIMARY KEY index_parameters |
  REFERENCES reftable [ ( refcolumn ) ] [ MATCH FULL | MATCH PARTIAL | MATCH SIMPLE ]
  [ ON DELETE action ] [ ON UPDATE action ] }
[ DEFERRABLE | NOT DEFERRABLE | INITIALLY DEFERRED | INITIALLY IMMEDIATE ]
```

- **compress\_mode** of a column is as follows:

```
{ DELTA | PREFIX | DICTIONARY | NUMSTR | NOCOMPRESS }
```

- **table\_constraint** is as follows:

```
[ CONSTRAINT [ constraint_name ] ]
{ CHECK ( expression ) |
  UNIQUE [ index_name ] [ USING method ] ( { { column_name | ( expression ) } [ ASC | DESC ] }
```

```
[, ... ] ) index_parameters |
PRIMARY KEY [ USING method ] ( { column_name [ ASC | DESC ] } [, ... ] ) index_parameters |
FOREIGN KEY [ index_name ] ( column_name [, ... ] ) REFERENCES reftable [ (refcolumn [, ... ] ) ]
[ MATCH FULL | MATCH PARTIAL | MATCH SIMPLE ] [ ON DELETE action ] [ ON UPDATE action ]
}
[ DEFERRABLE | NOT DEFERRABLE | INITIALLY DEFERRED | INITIALLY IMMEDIATE ]
```

- **like\_option** is as follows:  
{ INCLUDING | EXCLUDING } { DEFAULTS | GENERATED | CONSTRAINTS | INDEXES | STORAGE | COMMENTS | PARTITION | REOPTIONS | ALL }
- **index\_parameters** is as follows:  
[ WITH ( {storage\_parameter = value} [, ... ] ) ]  
[ USING INDEX TABLESPACE tablespace\_name ]

## Parameters

- **UNLOGGED**

If this keyword is specified, the created table is an unlogged table. Data written to unlogged tables is not written to the WALs, which makes them considerably faster than ordinary tables. However, an unlogged table is automatically truncated after conflicts, OS restart, database restart, primary/standby switchover, power-off, or abnormal shutdown, incurring data loss risks. Contents of an unlogged table are also not replicated to standby nodes. Any indexes created on an unlogged table are not automatically logged as well.

Usage scenario: Unlogged tables do not ensure data security. Users can back up data before using unlogged tables; for example, users should back up the data before a system upgrade.

Troubleshooting: If data is missing in the indexes of unlogged tables due to some unexpected operations such as an unclean shutdown, users should rebuild the indexes with errors.

- **GLOBAL | LOCAL**

When creating a temporary table, you can specify the **GLOBAL** or **LOCAL** keyword before **TEMP** or **TEMPORARY**. If the keyword **GLOBAL** is specified, GaussDB creates a global temporary table. Otherwise, GaussDB creates a local temporary table.

- **TEMPORARY | TEMP**

If **TEMP** or **TEMPORARY** is specified, the created table is a temporary table. Temporary tables are classified into global temporary tables and local temporary tables. If the keyword **GLOBAL** is specified when a temporary table is created, the table is a global temporary table. Otherwise, the table is a local temporary table.

The metadata of the global temporary table is visible to all sessions. After the sessions end, the metadata still exists. The user data, indexes, and statistics of a session are isolated from those of another session. Each session can only view and modify the data committed by itself. Global temporary tables can be created using **ON COMMIT PRESERVE ROWS** or **ON COMMIT DELETE ROWS**. The former one creates a session-level table, where user data is automatically cleared when a session ends; the latter creates a transaction-level table, where user data is automatically cleared when a commit or rollback operation is performed. If the **ON COMMIT** option is not specified during table creation, the session level is used by default. Different from local temporary tables, you can specify a schema that does not start with **pg\_temp\_** when creating a global temporary table.

A local temporary table is automatically dropped at the end of the current session. Therefore, you can create and use temporary tables in the current session as long as the connected database node in the session is normal. Temporary tables are created only in the current session. If a DDL statement involves operations on temporary tables, a DDL error will be generated. Therefore, you are advised not to perform operations on temporary tables in DDL statements. **TEMP** is equivalent to **TEMPORARY**.

---

#### NOTICE

- Local temporary tables are visible to the current session through the schema starting with **pg\_temp**. Users should not delete schemas starting with **pg\_temp** or **pg\_toast\_temp**.
  - If **TEMPORARY** or **TEMP** is not specified when you create a table but its schema is set to that starting with **pg\_temp\_** in the current session, the table will be created as a temporary table.
  - If global temporary tables and indexes are being used by other sessions, do not perform **ALTER** or **DROP** (except the **ALTER INDEX index\_name REBUILD** command).
  - The DDL of a global temporary table affects only the user data and indexes of the current session. For example, **TRUNCATE**, **REINDEX**, and **ANALYZE** are valid only for the current session.
  - You can set the GUC parameter **max\_active\_global\_temporary\_table** to determine whether to enable the global temporary table function. If **max\_active\_global\_temporary\_table** is set to **0**, the global temporary table function is disabled.
  - A temporary table is visible only to the current session. Therefore, it cannot be used together with **\parallel on**.
  - Temporary tables do not support primary/standby switchover.
  - The global temporary table does not respond to automatic clearance. In persistent connection scenarios, you are advised to use the global temporary table in the ON COMMIT DELETE ROWS clause or periodically and manually execute the VACUUM statement. Otherwise, Clogs may not be reclaimed.
  - Global temporary tables do not support the following scenarios:
    - Global temporary sequences cannot be created. Global temporary tables of each session use shared sequences, which can only ensure uniqueness but not continuity.
    - Global temporary views cannot be created.
    - Partitioned tables cannot be created.
    - Hash bucket tables cannot be created.
    - Extended statistics are not supported.
    - The ON COMMIT DROP attribute is not supported.
- 
- **IF NOT EXISTS**  
Sends a notice, but does not throw an error, if a table with the same name exists.

- **table\_name**  
Specifies the name of the table to be created.

---

**NOTICE**

Some processing logic of materialized views determines whether a table is the log table of a materialized view or a table associated with a materialized view based on the table name prefix. Therefore, do not create a table whose name prefix is **mlog\_** or **matviewmap\_**. Otherwise, some functions of the table are affected.

- 
- **column\_name**  
Specifies the name of a column to be created in the new table.
  - **constraint\_name**  
Specifies the name of the constraint specified during table creation.

---

**NOTICE**

The **constraint\_name** is optional in B-compatible mode (**sql\_compatibility = 'B'**). For other modes, **constraint\_name** must be added.

- 
- **index\_name**  
Index name

---

**NOTICE**

- The **index\_name** is supported only in B-compatible databases (that is, **sql\_compatibility = 'B'**).
- For foreign key constraints, if **constraint\_name** and **index\_name** are specified at the same time, **constraint\_name** is used as the index name.
- For a unique key constraint, if both **constraint\_name** and **index\_name** are specified, **index\_name** is used as the index name.

- 
- **USING method**  
Specifies the name of the index method to be used.  
For details about the value range, see USING method in [Parameters](#).

---

**NOTICE**

- The USING method is supported only in B-compatible databases (that is, **sql\_compatibility = 'B'**).
- In B-compatible mode, if USING method is not specified, the default index method is btree for ASTORE or UB-tree for USTORE.

- 
- **ASC | DESC**

**ASC** specifies an ascending (default) sort order. **DESC** specifies a descending sort order.

---

**NOTICE**

The ASC|DESC is supported only in B-compatible databases (that is, **sql\_compatibility = 'B'**).

---

- **expression**

Specifies an expression index constraint based on one or more columns of the table. It must be written in parentheses.

---

**NOTICE**

Expression indexes in the UNIQUE constraint are supported only in B-compatible databases (that is, **sql\_compatibility = 'B'**).

---

- **data\_type**

Specifies the data type of the column.

- **compress\_mode**

Specifies whether to compress a table column. The option specifies the algorithm preferentially used by table columns. Row-store tables do not support compression.

Value range: **DELTA**, **PREFIX**, **DICTIONARY**, **NUMSTR**, and **NOCOMPRESS**

- **CHARACTER SET | CHARSET charset**

This syntax is supported only in B-compatible databases (that is, **sql\_compatibility = 'B'**). Specifies the character set of a table column. If this parameter is specified separately, the collation of the table column is set to the default collation of the specified character set.

- **COLLATE collation**

Assigns a collation to the column (which must be of a collatable data type). If no collation is specified, the default collation is used. You can run the **select \* from pg\_collation;** command to query collation rules from the **pg\_collation** system catalog. The default collation rule is the row starting with **default** in the query result. In B-compatible databases (that is, **sql\_compatibility = 'B'**), **utf8mb4\_bin**, **utf8mb4\_general\_ci**, **utf8mb4\_unicode\_ci** and **binary** are also supported.

 **NOTE**

- Only the character type supports the specified character set. If the binary character set or collation is specified, the character type is converted to the corresponding binary type. If the type mapping does not exist, an error is reported. Currently, only the mapping from the TEXT type to the BLOB type is available.
- Except the binary character set and collation, only the character set that is the same as the database encoding can be specified.
- If the character set or collation of a column is not explicitly specified and the default character set or collation of the table is specified, the character set or collation of the column is inherited from the table. If the default character set or collation of a table does not exist, the character set and collation of table columns inherit the character set and collation of the current database when **b\_format\_behavior\_compat\_options** is set to **'default\_collation'**.

**Table 7-145** Character sets and collation supported in mode B (sql\_compatibility = 'B')

| Collation          | Character Set  | Description                                               |
|--------------------|----------------|-----------------------------------------------------------|
| utf8mb4_general_ci | utf8mb4 (utf8) | The general collation is used, which is case insensitive. |
| utf8mb4_unicode_ci | utf8mb4 (utf8) | The general collation is used, which is case insensitive. |
| utf8mb4_bin        | utf8mb4 (utf8) | The binary collation is used, which is case sensitive.    |
| binary             | binary         | The binary collation is used.                             |

- **LIKE source\_table [ like\_option ... ]**

Specifies a table from which the new table automatically copies all column names, their data types, and their not-null constraints.

The new table and the original table are decoupled after creation is complete. Changes to the original table will not be applied to the new table, and it is not possible to include data of the new table in scans of the original table.

Columns and constraints copied by **LIKE** are not merged with the same name. If the same name is specified explicitly or in another **LIKE** clause, an error is reported.

- The default expressions are copied from the original table to the new table only if **INCLUDING DEFAULTS** is specified. The default behavior is to exclude default expressions, resulting in the copied columns in the new table having default values **NULL**.
- If **INCLUDING GENERATED** is specified, the generated expression of the source table column is copied to the new table. By default, the generated expression is not copied.
- The **CHECK** constraints are copied from the original table to the new table only when **INCLUDING CONSTRAINTS** is specified. Other types of constraints are never copied to the new table. Not-null constraints are always copied to the new table. These rules also apply to column constraints and table constraints.

- Any indexes on the original table will not be created on the new table, unless the **INCLUDING INDEXES** clause is specified.
- **STORAGE** settings for the source column definitions are copied only if **INCLUDING STORAGE** is specified. The default behavior is to exclude **STORAGE** settings.
- If **INCLUDING COMMENTS** is specified, comments for the copied columns, constraints, and indexes are copied. The default behavior is to exclude comments.
- If **INCLUDING PARTITION** is specified, the partition definitions of the source table are copied to the new table, and the new table no longer uses the **PARTITION BY** clause. The default behavior is to exclude partition definition of the original table. If the source table has an index, you can use the **INCLUDING PARTITION INCLUDING INDEXES** syntax. If only **INCLUDING INDEXES** is used for a partitioned table, the target table will be defined as an ordinary table, but the index is a partitioned index. In this case, an error will be reported because ordinary tables do not support partitioned indexes.
- If **INCLUDING REOPTIONS** is specified, the new table will copy the storage parameter (that is, **WITH** clause) of the source table. The default behavior is to exclude partition definition of the storage parameter of the original table.
- **INCLUDING ALL** contains the meaning of **INCLUDING DEFAULTS**, **INCLUDING GENERATED**, **INCLUDING CONSTRAINTS**, **INCLUDING INDEXES**, **INCLUDING STORAGE**, **INCLUDING COMMENTS**, **INCLUDING PARTITION**, and **INCLUDING REOPTIONS**.

---

#### NOTICE

- If the original table contains a sequence with the SERIAL, BIGSERIAL, SMALLSERIAL, or LARGESERIAL data type, or a column in the original table is a sequence by default and the sequence is created for this table (created by using **CREATE SEQUENCE ... OWNED BY**), these sequences will not be copied to the new table, and another sequence specific to the new table will be created. This is different from earlier versions. To share a sequence between the source table and new table, create a shared sequence (do not use **OWNED BY**) and set a column in the source table to this sequence.
- You are advised not to set a column in the source table to the sequence specific to another table especially when the table is distributed in specific node groups, because doing so may result in CREATE TABLE ... LIKE execution failures. In addition, doing so may cause the sequence to become invalid in the source sequence because the sequence will also be deleted from the source table when it is deleted from the table that the sequence is specific to. To share a sequence among multiple tables, you are advised to create a shared sequence for them.
- **EXCLUDING** of a partitioned table must be used together with **INCLUDING ALL**, for example, **INCLUDING ALL EXCLUDING DEFAULTS**, except for **DEFAULTS** of the source partitioned table.

- 
- **AUTO\_INCREMENT [ = ] value**

This clause specifies an initial value for an auto-increment column. The value must be a positive integer and cannot exceed  $2^{127} - 1$ .

---

**NOTICE**

This clause takes effect only when **sql\_compatibility** is set to 'B'.

---

- **WITH ( { storage\_parameter = value } [, ... ] )**

Specifies an optional storage parameter for a table or an index. The WITH clause used for tables can also contain **OIDS=FALSE** to specify that rows of the new table should not contain OIDs.

 **NOTE**

When using **Numeric** of any precision to define a column, specify precision **p** and scale **s**. When precision and scale are not specified, the input will be displayed.

The description of parameters is as follows:

- **FILLFACTOR**

The fill factor of a table is a percentage from 10 to 100. If the Ustore storage engine is used, the default value is **92**. If the Astore storage engine is used, the default value is **100** (completely filled). When a smaller fill factor is specified, **INSERT** operations fill table pages only to the indicated percentage. The remaining space on each page is reserved for updating rows on that page. This gives **UPDATE** a chance to place the updated copy of a row on the same page, which is more efficient than placing it on a different page. For a table whose entries are never updated, setting the fill factor to **100** (complete filling) is the best choice, but in heavily updated tables a smaller fill factor would be appropriate.

Value range: 10–100

- **ORIENTATION**

Specifies the storage mode of table data. This parameter can be set only once.

Value range:

- **ROW** indicates that table data is stored in rows.

**ROW** applies to OLTP service and scenarios with a large number of point queries or addition/deletion operations.

Default value:

If an ordinary tablespace is specified, the default is **ROW**.

- **STORAGE\_TYPE**

Specifies the storage engine type. This parameter cannot be modified once it is set.

Value range:

- **USTORE** indicates that tables support the inplace-update storage engine. Note that the **track\_counts** and **track\_activities** parameters must be enabled when the Ustore table is used. Otherwise, space bloating may occur.

- **ASTORE** indicates that tables support the append-only storage engine.

Default value:

If no table is specified, data is stored in inplace-update mode by default.

- **INIT\_TD**

Specifies the number of TDs to be initialized when an Ustore table is created. This parameter can be modified by running the **ALTER TABLE** command. Note that this parameter affects the maximum size of a single tuple stored on the data page. The conversion method is  $MAX\_TUPLE\_SIZE = BLCKSZ - INIT\_TD * TD\_SIZE$ . For example, if you change the number of **INIT\_TD** from 4 to 8, the maximum size of a single tuple decreases by 4 x **INIT\_TD**.

Value ranges: 2-128. The default value is **4**.

- **COMPRESSION**

Specifies the compression level of table data. It determines the compression ratio and time. Generally, the higher the level of compression, the higher the ratio, the longer the time; and the lower the level of compression, the lower the ratio, the shorter the time. The actual compression ratio depends on the distribution mode of table data loaded. Row-store tables do not support compression.

Value range:

The default value for row-store tables is **NO**.

- **COMPRESSLEVEL**

Specifies the table data compression ratio and duration at the same compression level. This divides a compression level into sublevels, providing more choices for compression ratio and duration. As the value becomes greater, the compression ratio becomes higher and duration longer at the same compression level.

Value range: 0 to 3. The default value is **0**.

- **segment**

This parameter is reserved and is not supported currently.

- **enable\_tde**

Creates a TDE table. The prerequisite is that the GUC parameter **enable\_tde** is enabled, the KMS service is enabled, and the GUC parameter **tde\_cmk\_id** is correctly configured. This parameter supports only row-store tables. Temporary tables are not supported. The Ustore storage engine is not supported.

Value range: **on** and **off** If this parameter is set to **on**, transparent data encryption is enabled. If this parameter is set to **off**, transparent data encryption is disabled but the encryption function will be enabled later. When a table is created, a data encryption key will be applied from KMS.

Default value: **off**

- **parallel\_workers**

Number of bgworker threads started when an index is created. For example, value **2** indicates that two bgworker threads are started to create indexes concurrently.

Value range: [0,32], int type. If this parameter is not set, concurrent index creation is disabled.

Default value: If this parameter is not set, the concurrent index creation function is disabled.

– encrypt\_algo

Specifies the transparent data encryption algorithm. Before enabling this function, ensure that **enable\_tde** must be set for a table. The encryption algorithm can be specified only when a table is created. Different tables support different encryption algorithms. After the table is created, the encryption algorithm cannot be changed.

Value range: a string. The value can be **AES\_128\_CTR** or **SM4\_CTR**.

If **enable\_tde** is not set, the default value is null. If **enable\_tde** is set to **on** or **off** and **encrypt\_algo** is not set, the value is **AES\_128\_CTR**.

– dek\_cipher

Ciphertext of the key used for transparent data encryption. When **enable\_tde** is enabled, the system automatically applies for ciphertext creation. You cannot specify the ciphertext. The key rotation function can be used to update the key.

Value range: a string.

If encryption is disabled, the default value is null by default.

– cmk\_id

Master key ID of the database instance used for transparent data encryption. When **enable\_tde** is enabled, the value is obtained from the GUC parameter **tde\_cmk\_id** and cannot be specified or modified by users.

Value range: a string.

If encryption is disabled, the default value is null by default.

– hasuids

If this parameter is set to **on**, a unique table-level ID is allocated to a tuple when the tuple is updated.

Value range: **on** and **off**

Default value: **off**

– collate

In B-compatible databases (**sql\_compatibility = 'B'**), this parameter is used to record the default collation of tables. Generally, this parameter is used only for internal storage, import, and export. You are advised not to specify or modify this parameter.

Value range: OIDs in the collation that is independently supported in B-compatible databases.

Default value: **0**.

● **WITHOUT OIDS**

It is equivalent to **WITH(OIDS=FALSE)**.

● **ON COMMIT { PRESERVE ROWS | DELETE ROWS }**

**ON COMMIT** determines what to do when you commit a temporary table creation operation. Currently, **PRESERVE ROWS** and **DELETE ROWS** are supported.

- **PRESERVE ROWS** (default): No special action is taken at the ends of transactions. The temporary table and its table data are unchanged.
- **DELETE ROWS**: All rows in the temporary table will be deleted at the end of each transaction block.
- **COMPRESS | NOCOMPRESS**

If you specify **COMPRESS** in the **CREATE TABLE** statement, the compression feature is triggered in case of a bulk **INSERT** operation. If this feature is enabled, a scan is performed for all tuple data within the page to generate a dictionary and then the tuple data is compressed and stored. If **NOCOMPRESS** is specified, the table is not compressed. Row-store tables do not support compression.

Default value: **NOCOMPRESS**, that is, tuple data is not compressed before storage.
- **TABLESPACE tablespace\_name**

Specifies the tablespace where the new table is created. If not specified, the default tablespace is used.
- **CONSTRAINT constraint\_name**

Specifies the name of a column or table constraint. The optional constraint clauses specify constraints that new or updated rows must satisfy for an **INSERT** or **UPDATE** operation to succeed.

There are two ways to define constraints:

  - A column constraint is defined as part of a column definition, and it is bound to a particular column.
  - A table constraint is not bound to a particular column but can apply to more than one column.
- **NOT NULL**

The column is not allowed to contain null values.
- **NULL**

The column is allowed to contain null values. This is the default setting.

This clause is only provided for compatibility with non-standard SQL databases. It is not recommended.
- **CHECK ( expression )**

Specifies an expression producing a Boolean result where the **INSERT** or **UPDATE** operation of new or updated rows can succeed only when the expression result is **TRUE** or **UNKNOWN**; otherwise, an error is thrown and the database is not altered.

A **CHECK** constraint specified as a column constraint should reference only the column's value, while an expression in a table constraint can reference multiple columns.

 **NOTE**

<>**NULL** and **!=NULL** are invalid in an expression. Change them to **IS NOT NULL**.
- **DEFAULT default\_expr**

Assigns a default data value to a column. The value can be any variable-free expressions. (Subqueries and cross-references to other columns in the current table are not allowed.) The data type of the default expression must match the data type of the column.

The default expression will be used in any insert operation that does not specify a value for the column. If there is no default value for a column, then the default value is null.

- **GENERATED ALWAYS AS ( generation\_expr ) [STORED]**

This clause creates a column as a generated column. The value of the generated column is calculated by **generation\_expr** when data is written (inserted or updated). **STORED** indicates that the value of the generated column is stored as a common column.

 **NOTE**

- The **STORED** keyword can be omitted, which has the same semantics as not omitting **STORED**.
- The generation expression cannot refer to data other than the current row in any way. The generation expression cannot reference other generation columns or system columns. The generation expression cannot return a result set. No subquery, aggregate function, or window function can be used. The function called by the generation expression can only be an immutable function.
- Default values cannot be specified for generated columns.
- The generated column cannot be used as a part of the partition key.
- Do not specify the generated column and the **CASCADE**, **SET NULL**, and **SET DEFAULT** actions of the **ON UPDATE** constraint clause at the same time. Do not specify the generated column and the **SET NULL**, and **SET DEFAULT** actions of the **ON DELETE** constraint clause at the same time.
- The method of modifying and deleting generated columns is the same as that of common columns. Delete the common column that the generated column depends on. The generated column is automatically deleted. The type of the column on which the generated column depends cannot be changed.
- The generated column cannot be directly written. In the **INSERT** or **UPDATE** statement, values cannot be specified for generated columns, but the keyword **DEFAULT** can be specified.
- The permission control for generated columns is the same as that for common columns.

- **AUTO\_INCREMENT**

Specifies an auto-increment column.

If the value of this column is not specified (or the value of this column is set to **0**, **NULL**, or **DEFAULT**), the value of this column is automatically increased by the auto-increment counter.

If this column is inserted or updated to a value greater than the current auto-increment counter, the auto-increment counter is updated to this value after the command is executed successfully.

The initial auto-increment value is set by the **AUTO\_INCREMENT [ = ] value** clause. If it is not set, the default value **1** is used.

 NOTE

- The auto-increment column can be specified only when **sql\_compatibility** is set to 'B'.
  - The data type of the auto-increment column can only be integer, 4-byte or 8-byte floating point, or Boolean.
  - Each table can have only one auto-increment column.
  - The auto-increment column must be the first column of a primary key constraint or unique constraint.
  - The DEFAULT value cannot be specified for an auto-increment column.
  - The expression of the CHECK constraint cannot contain auto-increment columns, and the expression for generating columns cannot contain auto-increment columns.
  - You can specify that the auto-increment column can be NULL. If it is not specified, the auto-increment column contains the NOT NULL constraint by default.
  - When a table containing an auto-increment column is created, a sequence that depends on the column is created as an auto-increment counter. You are not allowed to modify or delete the sequence using sequence-related functions. You can view the value of the sequence.
  - Sequences are not created for auto-increment columns in local temporary tables.
  - The auto-increment and refresh operations of the auto-increment counter are not rolled back.
- **[DEFAULT] CHARACTER SET | CHARSET [=] default\_charset**  
This syntax is supported only when **sql\_compatibility** is set to 'B'. Specifies the default character set of a table. If you specify a character set separately, the default collation of the table is set to the default collation of the specified character set.
  - **[DEFAULT] COLLATE [=] default\_collation**  
This syntax is supported only when **sql\_compatibility** is set to 'B'. Specifies the default collation of a table. If you specify a collation separately, the default character set of the table is set to the character set corresponding to the specified collation. For details about the supported collation, see [Table 1 Character sets and collation supported in mode B \(sql\\_compatibility = 'B'\)](#).

 NOTE

If the character set or collation of a table is not explicitly specified and the default character set or collation of the schema is specified, the character set or collation of the table is inherited from the schema. If the default character set or collation of a schema does not exist, the character set and collation of the table inherit the character set and collation of the current database when **b\_format\_behavior\_compat\_options** is set to 'default\_collation'.

- **UNIQUE [KEY] index\_parameters**  
**UNIQUE ( column\_name [, ... ] ) index\_parameters**  
Specifies that a group of one or more columns of a table can contain only unique values.  
For the purpose of a unique constraint, null is not considered equal.  
UNIQUE KEY can be used only when **sql\_compatibility** is set to 'B', which has the same semantics as UNIQUE.
- **PRIMARY KEY index\_parameters**

### **PRIMARY KEY ( column\_name [, ... ] ) index\_parameters**

Specifies that a column or columns of a table can contain only unique (non-duplicate) and non-null values.

Only one primary key can be specified for a table.

- **REFERENCES reftable [ ( refcolumn ) ] [ MATCH matchtype ] [ ON DELETE action ] [ ON UPDATE action ] (column constraint)**

### **FOREIGN KEY ( column\_name [, ... ] ) REFERENCES reftable [ ( refcolumn [, ... ] ) ] [ MATCH matchtype ] [ ON DELETE action ] [ ON UPDATE action ] (table constraint)**

The foreign key constraint requires that the group consisting of one or more columns in the new table should contain and match only the referenced column values in the referenced table. If **refcolumn** is omitted, the primary key of **reftable** is used. The referenced column should be the only column or primary key in the referenced table. A foreign key constraint cannot be defined between a temporary table and a permanent table.

There are three types of matching between a reference column and a referenced column:

- **MATCH FULL**: A column with multiple foreign keys cannot be **NULL** unless all foreign key columns are **NULL**.
- **MATCH SIMPLE** (default): Any unexpected foreign key column can be **NULL**.
- **MATCH PARTIAL**: This option is not supported currently.

In addition, when certain operations are performed on the data in the referenced table, the operations are performed on the corresponding columns in the new table. **ON DELETE**: specifies the operations to be executed after a referenced row in the referenced table is deleted. **ON UPDATE**: specifies the operation to be performed when the referenced column data in the referenced table is updated. Possible responses to the **ON DELETE** and **ON UPDATE** clauses are as follows:

- **NO ACTION** (default): When a foreign key is deleted or updated, an error indicating that the foreign key constraint is violated is created. If the constraint is deferrable and there are still any referenced rows, this error will occur when the constraint is checked.
  - **RESTRICT**: When a foreign key is deleted or updated, an error indicating that the foreign key constraint is violated is created. It is the same as **NO ACTION** except that the constraint is not deferrable.
  - **CASCADE**: deletes any row that references the deleted row from the new table, or update the column value of the referenced row in the new table to the new value of the referenced column.
  - **SET NULL**: sets the referenced columns to **NULL**.
  - **SET DEFAULT**: sets the referenced columns to their default values.
- **DEFERRABLE | NOT DEFERRABLE**

Controls whether the constraint can be deferred. A constraint that is not deferrable will be checked immediately after every command. Checking of constraints that are deferrable can be postponed until the end of the transaction using the **SET CONSTRAINTS** command. **NOT DEFERRABLE** is the default value. Currently, only **UNIQUE** constraints, primary key constraints,

and foreign key constraints accept this clause. All the other constraints are not deferrable.

- **INITIALLY IMMEDIATE | INITIALLY DEFERRED**

If a constraint is deferrable, this clause specifies the default time to check the constraint.

- If the constraint is **INITIALLY IMMEDIATE** (default value), it is checked after each statement.
- If the constraint is **INITIALLY DEFERRED**, it is checked only at the end of the transaction.

The constraint check time can be altered using the **SET CONSTRAINTS** statement.

- **USING INDEX TABLESPACE tablespace\_name**

Allows selection of the tablespace in which the index associated with a **UNIQUE** or **PRIMARY KEY** constraint will be created. If not specified, the index is created in **default\_tablespace**. If **default\_tablespace** is empty, the default tablespace of the database is used.

- **ENCRYPTION\_TYPE = encryption\_type\_value**

For the encryption type in the ENCRYPTED WITH constraint, the value of **encryption\_type\_value** is **DETERMINISTIC** or **RANDOMIZED**.

## Examples

```
-- Create a simple table.
gaussdb=# CREATE TABLE tpcds.warehouse_t1
(
  W_WAREHOUSE_SK      INTEGER      NOT NULL,
  W_WAREHOUSE_ID      CHAR(16)     NOT NULL,
  W_WAREHOUSE_NAME    VARCHAR(20)
  W_WAREHOUSE_SQ_FT   INTEGER
  W_STREET_NUMBER     CHAR(10)
  W_STREET_NAME       VARCHAR(60)
  W_STREET_TYPE       CHAR(15)
  W_SUITE_NUMBER      CHAR(10)
  W_CITY              VARCHAR(60)
  W_COUNTY            VARCHAR(30)
  W_STATE             CHAR(2)
  W_ZIP               CHAR(10)
  W_COUNTRY           VARCHAR(20)
  W_GMT_OFFSET        DECIMAL(5,2)
);

gaussdb=# CREATE TABLE tpcds.warehouse_t2
(
  W_WAREHOUSE_SK      INTEGER      NOT NULL,
  W_WAREHOUSE_ID      CHAR(16)     NOT NULL,
  W_WAREHOUSE_NAME    VARCHAR(20)
  W_WAREHOUSE_SQ_FT   INTEGER
  W_STREET_NUMBER     CHAR(10)
  W_STREET_NAME       VARCHAR(60),
  W_STREET_TYPE       CHAR(15)
  W_SUITE_NUMBER      CHAR(10)
  W_CITY              VARCHAR(60)

CHARSET = utf8mb4 COLLATE = utf8mb4_unicode_ci;
```

## Helpful Links

[ALTER TABLE](#), [DROP TABLE](#), and [CREATE TABLESPACE](#)

## Suggestions

- UNLOGGED
  - The unlogged table and its indexes do not use the WAL log mechanism during data writing. Their write speed is much higher than that of ordinary tables. Therefore, they can be used for storing intermediate result sets of complex queries to improve query performance.
  - The unlogged table has no primary/standby mechanism. In case of system faults or abnormal breakpoints, data loss may occur. Therefore, the unlogged table cannot be used to store basic data.
- TEMPORARY | TEMP
  - A temporary table is automatically dropped at the end of a session.
- LIKE
  - The new table automatically inherits all column names, data types, and not-null constraints from this table. The new table is irrelevant to the original table after the creation.
- LIKE INCLUDING DEFAULTS
  - The default expressions are copied from the original table to the new table only if **INCLUDING DEFAULTS** is specified. The default behavior is

to exclude default expressions, resulting in the copied columns in the new table having default values **NULL**.

- **LIKE INCLUDING CONSTRAINTS**
  - The **CHECK** constraints are copied from the original table to the new table only when **INCLUDING CONSTRAINTS** is specified. Other types of constraints are never copied to the new table. Not-null constraints are always copied to the new table. These rules also apply to column constraints and table constraints.
- **LIKE INCLUDING INDEXES**
  - Any indexes on the original table will not be created on the new table, unless the **INCLUDING INDEXES** clause is specified.
- **LIKE INCLUDING STORAGE**
  - **STORAGE** settings for the copied column definitions are copied only if **INCLUDING STORAGE** is specified. The default behavior is to exclude **STORAGE** settings.
- **LIKE INCLUDING COMMENTS**
  - If **INCLUDING COMMENTS** is specified, comments for the copied columns, constraints, and indexes are copied. The default behavior is to exclude comments.
- **LIKE INCLUDING PARTITION**
  - If **INCLUDING PARTITION** is specified, the partition definitions of the source table are copied to the new table, and the new table no longer uses the **PARTITION BY** clause. The default behavior is to exclude partition definition of the original table.

---

#### NOTICE

List and hash partitioned tables do not support **LIKE INCLUDING PARTITION**.

---

- **LIKE INCLUDING REOPTIONS**
  - If **INCLUDING REOPTIONS** is specified, the new table will copy the storage parameter (that is, **WITH** clause) of the source table. The default behavior is to exclude partition definition of the storage parameter of the original table.
- **LIKE INCLUDING ALL**
  - **INCLUDING ALL** contains the meaning of **INCLUDING DEFAULTS**, **INCLUDING CONSTRAINTS**, **INCLUDING INDEXES**, **INCLUDING STORAGE**, **INCLUDING COMMENTS**, **INCLUDING PARTITION**, and **INCLUDING REOPTIONS**.
- **ORIENTATION ROW**
  - Creates a row-store table. Row-store applies to the OLTP service, which has many interactive transactions. An interaction involves many columns in the table. Using row-store can improve the efficiency.

## 7.14.85 CREATE TABLE AS

### Description

Creates a table from the results of a query.

It creates a table and fills it with data obtained using **SELECT**. The table columns have the names and data types associated with the output columns of **SELECT** (except that you can override the **SELECT** output column names by giving an explicit list of new column names).

**CREATE TABLE AS** queries a source table once and writes the data in a new table. The result in the query view changes with the source table. In contrast, the view re-computes and defines its **SELECT** statement at each query.

### Precautions

- This statement cannot be used to create a partitioned table.
- If an error occurs during table creation, after it is fixed, the system may fail to delete the disk files that are created before the last automatic clearance and whose size is not 0. This problem seldom occurs and does not affect system running of the database.

### Syntax

```
CREATE [ [ GLOBAL | LOCAL ] [ TEMPORARY | TEMP ] | UNLOGGED ] TABLE table_name
  [ (column_name [, ...] ) ]
  [ WITH ( {storage_parameter = value} [, ...] ) ]
  [ ON COMMIT { PRESERVE ROWS | DELETE ROWS } ]
  [ COMPRESS | NOCOMPRESS ]
  [ TABLESPACE tablespace_name ]
  AS query
  [ WITH [ NO ] DATA ];
```

### Parameters

- **UNLOGGED**  
Specifies that the table is created as an unlogged table. Data written to unlogged tables is not written to the WALs, which makes them considerably faster than ordinary tables. However, they are not crash-safe. An unlogged table is automatically truncated after a crash or unclean shutdown. The contents of an unlogged table are also not replicated to standby servers. Any indexes created on an unlogged table are automatically unlogged as well.
  - Usage scenario: Unlogged tables do not ensure data security. Users can back up data before using unlogged tables; for example, users should back up the data before a system upgrade.
  - Troubleshooting: If data is missing in the indexes of unlogged tables due to some unexpected operations such as an unclean shutdown, users should rebuild the indexes with errors.
- **GLOBAL | LOCAL**  
When creating a temporary table, you can specify the **GLOBAL** or **LOCAL** keyword before **TEMP** or **TEMPORARY**. If the keyword **GLOBAL** is specified, GaussDB creates a global temporary table. Otherwise, GaussDB creates a local temporary table.

- **TEMPORARY | TEMP**

If **TEMP** or **TEMPORARY** is specified, the created table is a temporary table. Temporary tables are classified into global temporary tables and local temporary tables. If the keyword **GLOBAL** is specified when a temporary table is created, the table is a global temporary table. Otherwise, the table is a local temporary table.

The metadata of the global temporary table is visible to all sessions. After the sessions end, the metadata still exists. The user data, indexes, and statistics of a session are isolated from those of another session. Each session can only view and modify the data submitted by itself. Global temporary tables can be created using **ON COMMIT PRESERVE ROWS** or **ON COMMIT DELETE ROWS**. The former one creates a session-level table, where user data is automatically cleared when a session ends; the latter creates a transaction-level table, where user data is automatically cleared when a **COMMIT** or **ROLLBACK** operation is performed. If the **ON COMMIT** option is not specified during table creation, the session level is used by default. Different from local temporary tables, you can specify a schema that does not start with **pg\_temp\_** when creating a global temporary table.

A local temporary table is automatically dropped at the end of the current session. Therefore, you can create and use temporary tables in the current session as long as the connected database node in the session is normal. Temporary tables are created only in the current session. If a DDL statement involves operations on temporary tables, a DDL error will be generated. Therefore, you are advised not to perform operations on temporary tables in DDL statements. **TEMP** is equivalent to **TEMPORARY**.

---

**NOTICE**

- Local temporary tables are visible to the current session through the schema starting with **pg\_temp**. Users should not delete schema started with **pg\_temp** or **pg\_toast\_temp**.
- If **TEMPORARY** or **TEMP** is not specified when you create a table and its schema is set to the schema of the **pg\_temp\_** start in the current session, the table will be created as a temporary table.
- If global temporary tables or indexes are being used by other sessions, do not perform **ALTER** or **DROP** on the tables or indexes.
- The DDL of a global temporary table affects only the user data and indexes of the current session. For example, **TRUNCATE**, **REINDEX**, and **ANALYZE** are valid only for the current session.

---

- **table\_name**

Specifies the name of the table to be created.

Value range: a string. It must comply with the [naming convention](#).

- **column\_name**

Specifies the name of a column to be created in the new table.

Value range: a string. It must comply with the [naming convention](#).

- **WITH ( storage\_parameter [= value] [, ... ] )**

Specifies an optional storage parameter for a table or an index. See details of parameters below.

- **FILLFACTOR**

The fill factor of a table is a percentage from 10 to 100. If the Ustore storage engine is used, the default value is **92**. If the Astore storage engine is used, the default value is **100** (completely filled). When a smaller fill factor is specified, **INSERT** operations pack table pages only to the indicated percentage. The remaining space on each page is reserved for updating rows on that page. This gives **UPDATE** a chance to place the updated copy of a row on the same page, which is more efficient than placing it on a different page. For a table whose entries are never updated, setting the fill factor to **100** (complete filling) is the best choice, but in heavily updated tables a smaller fill factor would be appropriate.

Value range: 10–100
- **ORIENTATION**

Value range:

**ROW** (default value): The data will be stored in rows.
- **COMPRESSION**

Specifies the compression level of table data. It determines the compression ratio and time. Generally, the higher the level of compression, the higher the ratio, the longer the time; and the lower the level of compression, the lower the ratio, the shorter the time. The actual compression ratio depends on the distribution mode of table data loaded.

Value range:

Row-store tables do not support compression.
- **ON COMMIT { PRESERVE ROWS | DELETE ROWS }**

**ON COMMIT** determines what to do when you commit a temporary table creation operation. Currently, only **PRESERVE ROWS** and **DELETE ROWS** are supported.

  - **PRESERVE ROWS** (default): No special action is taken at the ends of transactions. The temporary table and its table data are unchanged.
  - **DELETE ROWS**: All rows in the temporary table will be deleted at the end of each transaction block.
- **COMPRESS / NOCOMPRESS**

Specifies keyword **COMPRESS** during the creation of a table, so that the compression feature is triggered in case of **BULK INSERT** operations. If this feature is enabled, a scan is performed for all tuple data within the page to generate a dictionary and then the tuple data is compressed and stored. If **NOCOMPRESS** is specified, the table is not compressed. Row-store tables do not support compression.

Default value: **NOCOMPRESS**, that is, tuple data is not compressed before storage.
- **TABLESPACE tablespace\_name**

Specifies that the new table will be created in the **tablespace\_name** tablespace. If not specified, the default tablespace is used.
- **AS query**

Specifies a **SELECT** or **VALUES** command, or an **EXECUTE** command that runs a prepared **SELECT** or **VALUES** query.

- **[ WITH [ NO ] DATA ]**  
Specifies whether the data produced by the query should be copied to the new table. By default, the data will be copied. If the value **NO** is used, only the table structure will be copied.

## Examples

```
-- Create a schema.
gaussdb=# CREATE SCHEMA tpcds;

-- Create the tpcds.store_returns table.
gaussdb=# CREATE TABLE tpcds.store_returns
(
  W_WAREHOUSE_SK      INTEGER      NOT NULL,
  W_WAREHOUSE_ID      CHAR(16)     NOT NULL,
  sr_item_sk          VARCHAR(20)   ,
  W_WAREHOUSE_SQ_FT   INTEGER
);

-- Insert a record into a table.
gaussdb=# INSERT INTO tpcds.store_returns(W_WAREHOUSE_SK, W_WAREHOUSE_ID, sr_item_sk,
W_WAREHOUSE_SQ_FT) VALUES (1,
'AAAAAAAAABAAAAAAA', '4800', '20');

-- Create the tpcds.store_returns_t1 table and insert numbers that are greater than 16 in the sr_item_sk
column of the tpcds.store_returns table.
gaussdb=# CREATE TABLE tpcds.store_returns_t1 AS SELECT * FROM tpcds.store_returns WHERE sr_item_sk
> '4795';

-- Copy tpcds.store_returns to create the tpcds.store_returns_t2 table.
gaussdb=# CREATE TABLE tpcds.store_returns_t2 AS table tpcds.store_returns;

-- Delete the table.
gaussdb=# DROP TABLE tpcds.store_returns_t1 ;
gaussdb=# DROP TABLE tpcds.store_returns_t2 ;
gaussdb=# DROP TABLE tpcds.store_returns;

-- Delete a schema.
gaussdb=# DROP SCHEMA tpcds CASCADE;
```

[CREATE TABLE](#) and [SELECT](#)

## 7.14.86 CREATE TABLE PARTITION

### Description

Creates a partitioned table. Partitioning refers to splitting what is logically one large table into smaller physical pieces based on specific schemes. The table based on the logic is called a partitioned table, and each physical piece is called a partition. Data is stored on these physical partitions, instead of the logical partitioned table.

The common forms of partitioning include range partitioning, interval partitioning, hash partitioning, list partitioning, and value partitioning. Currently, row-store tables support range partitioning, interval partitioning, hash partitioning, and list partitioning.

In range partitioning, a table is partitioned based on ranges defined by one or more columns, with no overlap between the ranges of values assigned to different partitions. Each range has a dedicated partition for data storage.

The partitioning policy for range partitioning refers to how data is inserted into partitions. Currently, range partitioning only allows the use of the range partitioning policy.

In range partitioning, a table is partitioned based on partition key values. If a record can be mapped to a partition, it is inserted into the partition; if it cannot, an error message is returned. Range partitioning is the most commonly used partitioning policy.

Interval partitioning is a special type of range partitioning. Compared with range partitioning, interval value definition is added. When no matching partition can be found for an inserted record, a partition can be automatically created based on the interval value.

Interval partitioning supports only table-based partitioning of a list where the data type can be `TIMESTAMP[(p)] [WITHOUT TIME ZONE]`, `TIMESTAMP[(p)] [WITH TIME ZONE]` and `DATE`.

Interval partitioning policy: A record is mapped to a created partition based on the partition key value. If the record can be mapped to a created partition, the record is inserted into the corresponding partition. Otherwise, a partition is automatically created based on the partition key value and table definition information, and then the record is inserted into the new partition. The data range of the new partition is equal to the interval value.

In hash partitioning, a modulus and a remainder are specified for each partition based on a column in the table, and records to be inserted into the table are allocated to the corresponding partition, the rows in each partition must meet the following condition: The value of the partition key divided by the specified modulus generates the remainder specified for the partition key.

In hash partitioning, table is partitioned based on partition key values. If a record can be mapped to a partition, it is inserted into the partition; if it cannot, an error message is returned.

List partitioning is to allocate the records to be inserted into a table to the corresponding partition based on the key values in each partition. The key values do not overlap in different partitions. Create a partition for each group of key values to store corresponding data.

In list partitioning, table is partitioned based on partition key values. If a record can be mapped to a partition, it is inserted into the partition; if it cannot, an error message is returned.

Partitioning can provide several benefits:

- Query performance can be improved drastically in certain situations, particularly when most of the heavily accessed rows of the table are in a single partition or a small number of partitions. Partitioning narrows the range of data search and improves data access efficiency.
- In the case of an `INSERT` or `UPDATE` operation on most portions of a single partition, performance can be improved by taking advantage of continuous scan of that partition instead of partitions scattered across the whole table.
- Frequent loading or deletion operations on records in a separate partition can be accomplished by reading or deleting that partition. This not only improves performance but also avoids the `VACUUM` overload caused by bulk `DELETE` operations (hash partitions cannot be deleted).

## Precautions

- If the constraint key of the unique constraint and primary key constraint contains all partition keys, a local index is created for the constraints. Otherwise, a global index is created.
- Currently, hash partitioning supports only single-column partition keys, and does not support multi-column partition keys.
- When you have the INSERT permission on an interval partitioned table, partitions can be automatically created when you run INSERT to write data to the table.
- In the PARTITION FOR (values) syntax for partitioned tables, values can only be constants.
- In the PARTITION FOR (values) syntax for partitioned tables, if data type conversion is required for values, you are advised to use forcible type conversion to prevent the implicit type conversion result from being inconsistent with the expected result.
- The maximum number of partitions is 1048575. Generally, it is impossible to create so many partitions, because too many partitions may cause insufficient memory. Create partitions based on the value of **local\_syscache\_threshold**. The memory used by the partitioned tables is about (number of partitions x 3/1024) MB. Theoretically, the memory occupied by the partitions cannot be greater than the value of **local\_syscache\_threshold**. In addition, some space must be reserved for other functions.
- If the memory is insufficient due to too many partitions, the performance deteriorates sharply.
- Currently, the statement specifying a partition cannot perform global index scan.
- Data of the XML type cannot be used as partition keys or level-2 partition keys.

## Syntax

```
CREATE TABLE [ IF NOT EXISTS ] partition_table_name
( [
  { column_name data_type [ COLLATE collation ] [ column_constraint [ ... ] ]
  | table_constraint
  | LIKE source_table [ like_option [...] ] }, ... ]
)
[ AUTO_INCREMENT [=] value ]
[ WITH ( {storage_parameter = value} [, ... ] ) ]
[ COMPRESS | NOCOMPRESS ]
[ TABLESPACE tablespace_name ]
PARTITION BY {
  {RANGE [COLUMNS] (partition_key) [ INTERVAL ('interval_expr') [ STORE IN (tablespace_name
[, ... ] ) ] ] [ PARTITIONS integer ] ( partition_less_than_item [, ... ] )}} |
  {RANGE [COLUMNS] (partition_key) [ INTERVAL ('interval_expr') [ STORE IN (tablespace_name
[, ... ] ) ] ] [ PARTITIONS integer ] ( partition_start_end_item [, ... ] )}} |
  {LIST [COLUMNS] (partition_key) [ PARTITIONS integer ] ( PARTITION partition_name VALUES [IN]
(list_values) [TABLESPACE [=] tablespace_name][, ... ] )}} |
  {{ HASH | KEY } (partition_key) [ PARTITIONS integer ] ( PARTITION partition_name [TABLESPACE [=]
tablespace_name][, ... ] )}}
} [ { ENABLE | DISABLE } ROW MOVEMENT ];
```

- **column\_constraint** is as follows:

```
[ CONSTRAINT constraint_name ]
{ NOT NULL |
NULL |
CHECK ( expression ) |
```

```

DEFAULT default_e xpr |
GENERATED ALWAYS AS ( generation_expr ) [STORED] |
AUTO_INCREMENT |
UNIQUE [KEY] index_parameters |
PRIMARY KEY index_parameters |
REFERENCES reftable [ ( refcolumn ) ] [ MATCH FULL | MATCH PARTIAL | MATCH SIMPLE ]
[ ON DELETE action ] [ ON UPDATE action ] }
[ DEFERRABLE | NOT DEFERRABLE | INITIALLY DEFERRED | INITIALLY IMMEDIATE ]

```

- **table\_constraint** is as follows:

```

[ CONSTRAINT [ constraint_name ] ]
{ CHECK ( expression ) |
UNIQUE [ index_name ] [ USING method ] ( { column_name [ ASC | DESC ] } [, ... ] )
index_parameters |
PRIMARY KEY [ USING method ] ( { column_name [ ASC | DESC ] } [, ... ] ) index_parameters |
FOREIGN KEY [ index_name ] ( column_name [, ... ] ) REFERENCES reftable [ ( refcolumn [, ... ] ) ]
[ MATCH FULL | MATCH PARTIAL | MATCH SIMPLE ] [ ON DELETE action ] [ ON UPDATE
action ] }
[ DEFERRABLE | NOT DEFERRABLE | INITIALLY DEFERRED | INITIALLY IMMEDIATE ]

```

- **like\_option** is as follows:

```

{ INCLUDING | EXCLUDING } { DEFAULTS | GENERATED | CONSTRAINTS | INDEXES | STORAGE |
COMMENTS | REOPTIONS | ALL }

```

- **index\_parameters** is as follows:

```

[ WITH ( {storage_parameter = value} [, ... ] ) ]
[ USING INDEX TABLESPACE tablespace_name ]

```

- **partition\_less\_than\_item:**

```

PARTITION partition_name VALUES LESS THAN (( { partition_value | MAXVALUE } [, ... ] ) |
MAXVALUE ) [TABLESPACE [=] tablespace_name]

```

- **partition\_start\_end\_item:**

```

PARTITION partition_name {
    {START(partition_value) END (partition_value) EVERY (interval_value)} |
    {START(partition_value) END ({partition_value | MAXVALUE}}) |
    {START(partition_value)} |
    {END({partition_value | MAXVALUE}})
} [TABLESPACE [=] tablespace_name]

```

## Parameters

- **IF NOT EXISTS**

Sends a notice instead of throwing an error, if a table with the same name exists.

- **partition\_table\_name**

Specifies the name of a partitioned table.

Value range: a string. It must comply with the [naming convention](#).

- **column\_name**

Specifies the name of a column to be created in the new table.

Value range: a string. It must comply with the [naming convention](#).

- **data\_type**

Specifies the data type of the column.

- **COLLATE collation**

Assigns a collation to the column (which must be of a collatable data type). If no collation is specified, the default collation is used. You can run the **SELECT \* FROM pg\_collation** command to query collation rules from the pg\_collation system catalog. The default collation rule is the row starting with **default** in the query result.

- **CONSTRAINT constraint\_name**

Specifies the name of a column or table constraint. The optional constraint clauses specify constraints that new or updated rows must satisfy for an INSERT or UPDATE operation to succeed.

There are two ways to define constraints:

- A column constraint is defined as part of a column definition, and it is bound to a particular column.
- A table constraint is not bound to a particular column but can apply to more than one column. The constraint\_name is optional in B-compatible mode (**sql\_compatibility = 'B'**). For other modes, constraint\_name must be added.

- **index\_name**

Index name

---

**NOTICE**

- The index\_name is supported only in B-compatible databases (that is, **sql\_compatibility = 'B'**).
- For foreign key constraints, if constraint\_name and index\_name are specified at the same time, constraint\_name is used as the index name.
- For a unique key constraint, if both constraint\_name and index\_name are specified, index\_name is used as the index name.

- **USING method**

Specifies the name of the index method to be used.

For details about the value range, see USING method in [Parameters](#).

---

**NOTICE**

- The USING method is supported only in B-compatible databases (that is, **sql\_compatibility = 'B'**).
- In B-compatible mode, if USING method is not specified, the default index method is btree for ASTORE or UB-tree for USTORE.

- **ASC | DESC**

**ASC** specifies an ascending (default) sort order. **DESC** specifies a descending sort order.

---

**NOTICE**

The ASC|DESC is supported only in B-compatible databases (that is, **sql\_compatibility = 'B'**).

- **LIKE source\_table [ like\_option ... ]**

Specifies a table from which the new table automatically copies all column names, their data types, and their not-null constraints.

Unlike **INHERITS**, the new table and original table are decoupled after creation is complete. Changes to the original table will not be applied to the new table, and it is not possible to include data of the new table in scans of the original table.

- Default expressions for the copied column definitions will be copied only if **INCLUDING DEFAULTS** is specified. The default behavior is to exclude default expressions, resulting in the copied columns in the new table having default values **NULL**.
  - If **INCLUDING GENERATED** is specified, the generated expression of the original table column is copied to the new table. By default, the generated expression is not copied.
  - Not-null constraints are always copied to the new table. **CHECK** constraints will only be copied if **INCLUDING CONSTRAINTS** is specified; other types of constraints will never be copied. These rules also apply to column constraints and table constraints.
  - Unlike those of **INHERITS**, columns and constraints copied by **LIKE** are not merged with similarly named columns and constraints. If the same name is specified explicitly or in another **LIKE** clause, an error is reported.
  - Any indexes on the original table will not be created on the new table, unless the **INCLUDING INDEXES** clause is specified.
  - **STORAGE** settings for the original columns are copied only if **INCLUDING STORAGE** is specified. The default behavior is to exclude **STORAGE** settings.
  - If **INCLUDING COMMENTS** is specified, comments for the copied original columns, constraints, and indexes are copied. The default behavior is to exclude comments.
  - If **INCLUDING RELOPTIONS** is specified, the new table will copy the storage parameter (that is, **WITH** clause) of the original table. The default behavior is to exclude partition definition of the storage parameter of the original table.
  - **INCLUDING ALL** contains the meaning of **INCLUDING DEFAULTS**, **INCLUDING CONSTRAINTS**, **INCLUDING INDEXES**, **INCLUDING STORAGE**, **INCLUDING COMMENTS**, **INCLUDING PARTITION**, and **INCLUDING RELOPTIONS**.
- **AUTO\_INCREMENT [=] value**  
This clause specifies an initial value for an auto-increment column. The value must be a positive integer and cannot exceed  $2^{127} - 1$ .

---

**NOTICE**

This clause takes effect only when **sql\_compatibility** is set to 'B'.

- **WITH ( storage\_parameter [= value] [, ... ] )**  
Specifies an optional storage parameter for a table or an index. Optional parameters are as follows:
  - **FILLFACTOR**  
The fill factor of a table is a percentage from 10 to 100. If the Ustore storage engine is used, the default value is **92**. If the Astore storage

engine is used, the default value is **100** (completely filled). When a smaller fill factor is specified, **INSERT** operations pack table pages only to the indicated percentage. The remaining space on each page is reserved for updating rows on that page. This gives **UPDATE** a chance to place the updated copy of a row on the same page, which is more efficient than placing it on a different page. For a table whose entries are never updated, setting the fill factor to **100** (complete filling) is the best choice, but in heavily updated tables a smaller fill factor would be appropriate.

Value range: 10–100

– **ORIENTATION**

Determines the data storage mode of the table.

Value range:

- **ROW** (default value): The data will be stored in rows.

---

**NOTICE**

**orientation** cannot be modified.

---

– **STORAGE\_TYPE**

Specifies the storage engine type. This parameter cannot be modified once it is set.

Value range:

- **USTORE** indicates that tables support the inplace-update storage engine. Note that the **track\_counts** and **track\_activities** parameters must be enabled when the Ustore table is used. Otherwise, space bloating may occur.
- **ASTORE** indicates that tables support the append-only storage engine.

Default value:

If no table is specified, data is stored in inplace-update mode by default.

– **COMPRESSION**

- Row-store tables do not support compression.

– **segment**

This parameter is reserved and is not supported currently.

● **COMPRESS / NOCOMPRESS**

Specifies keyword **COMPRESS** during the creation of a table, so that the compression feature is triggered in case of **BULK INSERT** operations. If this feature is enabled, a scan is performed for all tuple data within the page to generate a dictionary and then the tuple data is compressed and stored. If **NOCOMPRESS** is specified, the table is not compressed. Row-store tables do not support compression.

Default value: **NOCOMPRESS**, that is, tuple data is not compressed before storage.

● **TABLESPACE tablespace\_name**

Specifies that the new table will be created in the **tablespace\_name** tablespace. If not specified, the default tablespace is used.

- **PARTITION BY RANGE [COLUMNS] (partition\_key)**

Creates a range partition. **partition\_key** is the name of the partition key.

The COLUMNS keyword can be used only when **sql\_compatibility** is set to 'B'. The semantics of **PARTITION BY RANGE COLUMNS** is the same as that of **PARTITION BY RANGE**.

(1) Assume that the **VALUES LESS THAN** syntax is used.

---

**NOTICE**

If the VALUE LESS THAN clause is used, a range partitioning policy supports a partition key with up to 16 columns.

---

Data types supported by the partition keys are as follows: SMALLINT, INTEGER, BIGINT, DECIMAL, NUMERIC, REAL, DOUBLE PRECISION, CHARACTER VARYING(*n*), VARCHAR(*n*), CHARACTER(*n*), CHAR(*n*), CHARACTER, CHAR, TEXT, NVARCHAR, NVARCHAR2, NAME, TIMESTAMP[(*p*)] [WITHOUT TIME ZONE], TIMESTAMP[(*p*)] [WITH TIME ZONE], and DATE.

(2) Assume that the **START END** syntax is used.

---

**NOTICE**

In this case, only one partition key is supported.

---

Data types supported by the partition key are as follows: **SMALLINT, INTEGER, BIGINT, DECIMAL, NUMERIC, REAL, DOUBLE PRECISION, TIMESTAMP[(*p*)] [WITHOUT TIME ZONE], TIMESTAMP[(*p*)] [WITH TIME ZONE], and DATE.**

(3) Assume that the **INTERVAL** syntax is used.

---

**NOTICE**

In this case, only one partition key is supported.

---

In this case, the data types supported by the partition key are **TIMESTAMP[(*p*)] [WITHOUT TIME ZONE], TIMESTAMP[(*p*)] [WITH TIME ZONE] and DATE.**

- **PARTITION partition\_name VALUES LESS THAN (( { partition\_value | MAXVALUE } [...] ) | MAXVALUE }**

Specifies the information of partitions. **partition\_name** is the name of a range partition. **partition\_value** is the upper limit of a range partition, and the value depends on the type of **partition\_key**. **MAXVALUE** usually specifies the upper limit of the last range partition.

#### NOTICE

- Each partition requires an upper limit.
  - The data type of the upper limit must be the same as that of the partition key.
  - In a partition list, partitions are arranged in ascending order of upper limits. A partition with a smaller upper limit value is placed before another partition with a larger one.
  - MAXVALUE that is not in parentheses can be used only when **sql\_compatibility** is set to 'B' and can have only one partition key.
- 
- **PARTITION partition\_name {START (partition\_value) END (partition\_value) EVERY (interval\_value)} | {START (partition\_value) END (partition\_value|MAXVALUE)} | {START(partition\_value)} | {END (partition\_value | MAXVALUE)}**

Specifies the information of partitions.

    - **partition\_name**: name or name prefix of a range partition. It is the name prefix only in the following cases (assuming that **partition\_name** is **p1**):
      - If **START+END+EVERY** is used, the names of partitions will be defined as **p1\_1**, **p1\_2**, and the like. For example, if **PARTITION p1 START(1) END(4) EVERY(1)** is defined, the generated partitions are [1, 2), [2, 3), and [3, 4), and their names are **p1\_1**, **p1\_2**, and **p1\_3**. In this case, **p1** is a name prefix.
      - If the defined statement is in the first place and has **START** specified, the range (*MINVALUE*, **START**) will be automatically used as the first actual partition, and its name will be **p1\_0**. The other partitions are then named **p1\_1**, **p1\_2**, and the like. For example, if **PARTITION p1 START(1), PARTITION p2 START(2)** is defined, generated partitions are (*MINVALUE*, 1), [1, 2), and [2, *MAXVALUE*), and their names will be **p1\_0**, **p1\_1**, and **p2**. In this case, **p1** is a name prefix and **p2** is a partition name. **MINVALUE** means the minimum value.
    - **partition\_value**: start value or end value of a range partition. The value depends on **partition\_key** and cannot be *MAXVALUE*.
    - **interval\_value**: width of each partition for dividing the [**START**, **END**) range. It cannot be *MAXVALUE*. If the value of (**END** - **START**) divided by **EVERY** has a remainder, the width of only the last partition is less than the value of **EVERY**.
    - *MAXVALUE* usually specifies the upper limit of the last range partition.

## NOTICE

1. If the defined statement is in the first place and has **START** specified, the range (*MINVALUE*, **START**) will be automatically used as the first actual partition.
2. The **START END** syntax must comply with the following rules:
  - The value of **START** (if any, same for the following situations) in each **partition\_start\_end\_item** must be smaller than that of **END**.
  - In two adjacent **partition\_start\_end\_item** statements, the value of the first **END** must be equal to that of the second **START**.
  - The value of **EVERY** in each **partition\_start\_end\_item** must be a positive number (in ascending order) and must be smaller than **END** minus **START**.
  - Each partition includes the start value (unless it is *MINVALUE*) and excludes the end value. The format is as follows: [**START**, **END**).
  - Partitions created by the same **partition\_start\_end\_item** belong to the same tablespace.
  - If **partition\_name** is a name prefix of a partition, the length must not exceed 57 bytes. If there are more than 57 bytes, the prefix will be automatically truncated.
  - When creating or modifying a partitioned table, ensure that the total number of partitions in the table does not exceed the maximum value **1048575**.
3. In statements for creating partitioned tables, **START END** and **LESS THAN** cannot be used together.
4. The **START END** syntax in a partitioned table creation SQL statement will be replaced by the **VALUES LESS THAN** syntax when **gs\_dump** is executed.

- **INTERVAL ('interval\_expr') [ STORE IN (tablespace\_name [, ... ] ) ]**

Defines interval partitioning.

- **interval\_expr**: interval for automatically creating partitions, for example, 1 day or 1 month.
- **STORE IN (tablespace\_name [, ... ] )**: Specifies the list of tablespaces for storing automatically created partitions. If this parameter is specified, the automatically created partitions are cyclically selected from the tablespace list. Otherwise, the default tablespace of the partitioned table is used.

- **PARTITION BY LIST [COLUMNS] (partition\_key)**

Create a list partition. **partition\_key** is the name of the partition key.

The keyword **COLUMNS** can be used only when **sql\_compatibility** is set to **'B'**. The semantics of **PARTITION BY LIST COLUMNS** is the same as that of **PARTITION BY LIST**.

- A list partitioning policy supports a partition key with up to 16 columns.
- For the clause syntax **VALUES [IN] (list\_values)**, if **list\_values** contains the key values of the corresponding partition, it is recommended that the number of key values of each partition be less than or equal to 64.

- The clause **VALUES IN** can be used only when **sql\_compatibility** is set to **'B'**. The semantics is the same as that of **VALUES**.

Partition keys support the following data types: INT1, INT2, INT4, INT8, NUMERIC, VARCHAR(*n*), CHAR, BPCHAR, NVARCHAR, NVARCHAR2, TIMESTAMP[(*p*)] [WITHOUT TIME ZONE], TIMESTAMP[(*p*)] [WITH TIME ZONE], and DATE. The number of partitions cannot exceed 1048575.

- **PARTITION BY HASH(partition\_key)**

Create a hash partition. **partition\_key** is the name of the partition key.

For **partition\_key**, the hash partitioning policy supports only one column of partition keys.

Partition keys support the following data types: INT1, INT2, INT4, INT8, NUMERIC, VARCHAR(*n*), CHAR, BPCHAR, TEXT, NVARCHAR, NVARCHAR2, TIMESTAMP[(*p*)] [WITHOUT TIME ZONE], TIMESTAMP[(*p*)] [WITH TIME ZONE], and DATE. The number of partitions cannot exceed 1048575.

- **PARTITION BY KEY(partition\_key)**

This parameter can be used only when **sql\_compatibility** is set to **'B'**. The semantics is the same as that of **PARTITION BY HASH(partition\_key)**.

- **PARTITIONS integer**

Specifies the number of partitions.

**integer** indicates the number of partitions. The value must be an integer greater than 0 and cannot be greater than 1048575.

- When this clause is specified after the range and list partitions, each partition must be explicitly defined, and the number of defined partitions must be equal to the integer value. This clause can be specified after the range and list partitions only when **sql\_compatibility** is set to **'B'**.
- When this clause is specified after the hash and key partitions, if the definition of each partition is not listed, an *integer* number of partitions are automatically generated. The automatically generated partition name is "p+number", and the number ranges from 0 to *integer* minus 1. The tablespace of the partition is the tablespace of the table by default. If each partition definition is explicitly defined, the number of defined partitions must be the same as the value of *integer*. If neither the partition definition nor the number of partitions is specified, a unique partition is created.

- **{ ENABLE | DISABLE } ROW MOVEMENT**

Sets row movement.

If the tuple value is updated on the partition key during the UPDATE operation, the partition where the tuple is located is altered. Setting this parameter enables error messages to be reported or movement of the tuple between partitions.

Value range:

- **ENABLE** (default value): Row movement is enabled.
- **DISABLE**: Row movement is disabled.

If the row movement is enabled, an error may be reported when UPDATE and DELETE operations are performed concurrently. The causes are as follows:

The old data is marked as deleted in the UPDATE and DELETE operations. If the row movement is enabled, the cross-partition update occurs when the

partition key is updated, the kernel marks the old data in the old partition as deleted and adds a data to the new partition. As a result, the new data cannot be found by querying the old data.

If data in the same row is concurrently operated, the cross-partition and non-cross-partition data results have different behaviors in the following three concurrency scenarios: UPDATE and UPDATE concurrency, DELETE and DELETE concurrency, as well as UPDATE and DELETE concurrency.

- a. For non-cross-partition data, no error is reported for the second operation after the first operation is performed.
  - If the first operation is UPDATE, the latest data can be found and operated after the second operation is performed.
  - If the first operation is DELETE, the second operation is terminated if the current data is deleted and the latest data cannot be found.
- b. For the cross-partition data result, an error is reported for the second operation after the first operation is performed.
  - If the first operation is UPDATE, the second operation cannot find the latest data because the new data is in the new partition. Therefore, the second operation fails and an error is reported.
  - If the first operation is DELETE, performing the second operation can find that the current data is deleted and the latest data cannot be found, but cannot determine whether the operation of deleting the old data is UPDATE or DELETE. If the operation is UPDATE, an error is reported. If the operation is DELETE, the operation is terminated. To ensure the data correctness, an error is reported.

If the UPDATE and UPDATE concurrency, and UPDATE and DELETE concurrency are performed, the error can be solved only when the operations are performed serially. If the DELETE and DELETE concurrency are performed, the error can be solved by disabling the row movement.

- **NOT NULL**

The column is not allowed to contain null values. **ENABLE** can be omitted.

- **NULL**

Specifies that the column is allowed to contain null values. This is the default setting.

This clause is only provided for compatibility with non-standard SQL databases. It is not recommended.

- **CHECK (condition) [ NO INHERIT ]**

Specifies an expression producing a Boolean result where the INSERT or UPDATE operation of new or updated rows can succeed only when the expression result is **TRUE** or **UNKNOWN**; otherwise, an error is thrown and the database is not altered.

A check constraint specified as a column constraint should reference only the column's values, while an expression in a table constraint can reference multiple columns.

A constraint marked with **NO INHERIT** will not propagate to child tables.

**ENABLE** can be omitted.

- **DEFAULT default\_expr**

Assigns a default data value to a column. The value can be any variable-free expressions. (Subqueries and cross-references to other columns in the current table are not allowed.) The data type of the default expression must match the data type of the column.

The default expression will be used in any insert operation that does not specify a value for the column. If there is no default value for a column, then the default value is null.

- **GENERATED ALWAYS AS ( generation\_expr ) [STORED]**

This clause creates a column as a generated column. The value of the generated column is calculated by **generation\_expr** when data is written (inserted or updated). **STORED** indicates that the value of the generated column is stored as a common column.

 **NOTE**

- The **STORED** keyword can be omitted, which has the same semantics as not omitting **STORED**.
  - The generation expression cannot refer to data other than the current row in any way. The generation expression cannot reference other generation columns or system columns. The generation expression cannot return a result set. No subquery, aggregate function, or window function can be used. The function called by the generation expression can only be an immutable function.
  - Default values cannot be specified for generated columns.
  - The generated column cannot be used as a part of the partition key.
  - Do not specify the generated column and the **CASCADE**, **SET NULL**, and **SET DEFAULT** actions of the **ON UPDATE** constraint clause at the same time. Do not specify the generated column and the **SET NULL**, and **SET DEFAULT** actions of the **ON DELETE** constraint clause at the same time.
  - The method of modifying and deleting generated columns is the same as that of common columns. Delete the common column that the generated column depends on. The generated column is automatically deleted. The type of the column on which the generated column depends cannot be changed.
  - The generated column cannot be directly written. In the **INSERT** or **UPDATE** statement, values cannot be specified for generated columns, but the keyword **DEFAULT** can be specified.
  - The permission control for generated columns is the same as that for common columns.
- **AUTO\_INCREMENT**  
Specifies an auto-increment column.  
For details, see [AUTO\\_INCREMENT](#).
  - **UNIQUE [KEY] index\_parameters**  
**UNIQUE ( column\_name [, ... ] ) index\_parameters**  
Specifies that a group of one or more columns of a table can contain only unique values.  
For the purpose of a unique constraint, null is not considered equal.  
**UNIQUE KEY** can be used only when **sql\_compatibility** is set to 'B', which has the same semantics as **UNIQUE**.
  - **PRIMARY KEY index\_parameters**  
**PRIMARY KEY ( column\_name [, ... ] ) index\_parameters**

Specifies that a column or columns of a table can contain only unique (non-duplicate) and non-null values.

Only one primary key can be specified for a table.

- **DEFERRABLE | NOT DEFERRABLE**

Controls whether the constraint can be deferred. A constraint that is not deferrable will be checked immediately after every command. Checking of constraints that are deferrable can be postponed until the end of the transaction using the **SET CONSTRAINTS** command. **NOT DEFERRABLE** is the default value. Currently, only UNIQUE constraints, primary key constraints, and foreign key constraints accept this clause. All the other constraints are not deferrable.

- **INITIALLY IMMEDIATE | INITIALLY DEFERRED**

If a constraint is deferrable, this clause specifies the default time to check the constraint.

- If the constraint is **INITIALLY IMMEDIATE** (default value), it is checked after each statement.
- If the constraint is **INITIALLY DEFERRED**, it is checked only at the end of the transaction.

The constraint check time can be altered using the **SET CONSTRAINTS** statement.

- **USING INDEX TABLESPACE tablespace\_name**

Allows selection of the tablespace in which the index associated with a **UNIQUE** or **PRIMARY KEY** constraint will be created. If not specified, the index is created in **default\_tablespace**. If **default\_tablespace** is empty, the default tablespace of the database is used.

## Examples

- Example 1: Create a range-partitioned table **tpcds.web\_returns\_p1**. The table has eight partitions and their partition keys are of the integer type. The ranges of the partitions are:  $wr\_returned\_date\_sk < 2450815$ ,  $2450815 \leq wr\_returned\_date\_sk < 2451179$ ,  $2451179 \leq wr\_returned\_date\_sk < 2451544$ ,  $2451544 \leq wr\_returned\_date\_sk < 2451910$ ,  $2451910 \leq wr\_returned\_date\_sk < 2452275$ ,  $2452275 \leq wr\_returned\_date\_sk < 2452640$ ,  $2452640 \leq wr\_returned\_date\_sk < 2453005$ , and  $wr\_returned\_date\_sk \geq 2453005$ .

```
-- Create a schema.
gaussdb=# CREATE SCHEMA tpcds;

-- Create the tpcds.web_returns table.
gaussdb=# CREATE TABLE tpcds.web_returns
(
  W_WAREHOUSE_SK      INTEGER      NOT NULL,
  W_WAREHOUSE_ID      CHAR(16)     NOT NULL,
  W_WAREHOUSE_NAME     VARCHAR(20)
  W_WAREHOUSE_SQ_FT    INTEGER
  W_STREET_NUMBER     CHAR(10)
  W_STREET_NAME        VARCHAR(60)
  W_STREET_TYPE        CHAR(15)
  W_SUITE_NUMBER       CHAR(10)
  W_CITY               VARCHAR(60)
  W_COUNTY              VARCHAR(30)
  W_STATE              CHAR(2)
  W_ZIP                CHAR(10)
  W_COUNTRY             VARCHAR(20)
  W_GMT_OFFSET         DECIMAL(5,2)
```

```
);
-- Create a range-partitioned table tpcds.web_returns_p1.
gaussdb=# CREATE TABLE tpcds.web_returns_p1
(
  WR_RETURNED_DATE_SK    INTEGER           ,
  WR_RETURNED_TIME_SK   INTEGER           ,
  WR_ITEM_SK            INTEGER           NOT NULL,
  WR_REFUNDED_CUSTOMER_SK INTEGER         ,

gaussdb=# DROP SCHEMA tpcds CASCADE;
```

- Example 2: Create a range-partitioned table **tpcds.web\_returns\_p2**. The table has eight partitions and their partition keys are of the integer type. The upper limit of the eighth partition is *MAXVALUE*.

The ranges of the partitions are:  $wr\_returned\_date\_sk < 2450815$ ,  $2450815 \leq wr\_returned\_date\_sk < 2451179$ ,  $2451179 \leq wr\_returned\_date\_sk < 2451544$ ,  $2451544 \leq wr\_returned\_date\_sk < 2451910$ ,  $2451910 \leq wr\_returned\_date\_sk < 2452275$ ,  $2452275 \leq wr\_returned\_date\_sk < 2452640$ ,  $2452640 \leq wr\_returned\_date\_sk < 2453005$ , and  $wr\_returned\_date\_sk \geq 2453005$ .

The tablespace of the **tpcds.web\_returns\_p2** partitioned table is **example1**. Partitions **P1** to **P7** have no specified tablespaces, and use the **example1** tablespace of the **tpcds.web\_returns\_p2** partitioned table. The tablespace of the **P8** partitioned table is **example2**.

Assume that the following data directories of the database nodes are empty directories for which user **dwsadmin** has the read and write permissions: **/pg\_location/mount1/path1**, **/pg\_location/mount2/path2**, **/pg\_location/mount3/path3**, and **/pg\_location/mount4/path4**.

```

```
-----+-----  
(0 rows)
```

```
-- Delete the partitioned table.  
gaussdb=# drop table test_hash;
```

- Example 7: Create a list partitioned table **t\_multi\_keys\_list**. The table initially contains 5 partitions and the partition key is of the INT type and VARCHAR type.

```
-- Create the t_multi_keys_list table.  
gaussdb=# CREATE TABLE t_multi_keys_list (a int, b varchar(4), c int)  
PARTITION BY LIST (a,b)  
(  
  PARTITION p1 VALUES ( (0,NULL) ),  
  PARTITION p2 VALUES ( (0,'1'), (0,'2'), (0,'3'), (1,'1'), (1,'2') ),  
  PARTITION p3 VALUES ( (NULL,'0'), (2,'1') ),  
  PARTITION p4 VALUES ( (3,'2'), (NULL,NULL) ),  
  PARTITION pd VALUES ( DEFAULT )  
);
```

## 7.14.87 CREATE TABLESPACE

### Description

Creates a tablespace in a database.

### Precautions

- The system administrator or a user who inherits the **gs\_role\_tablespace** permission of the built-in role can create a tablespace.
- Do not run **CREATE TABLESPACE** in a transaction block.
- If executing **CREATE TABLESPACE** fails but the internal directory (or file) has been created, the directory (or file) will remain. You need to manually clear it before creating the tablespace again. If there are residual files of soft links for the tablespace in the data directory, delete the residual files, and then perform O&M operations.
- **CREATE TABLESPACE** cannot be used for two-phase transactions. If it fails on some nodes, the execution cannot be rolled back.
- You are advised not to use user-defined tablespaces in scenarios such as Huawei Cloud. This is because user-defined tablespaces are usually used with storage media other than the main storage (storage device where the default tablespace is located, such as a disk) to isolate I/O resources that can be used by different services. Storage devices use standard configurations and do not have other available storage media in scenarios such as Huawei Cloud. If the user-defined tablespace is not properly used, the system cannot run stably for a long time and the overall performance is affected. Therefore, you are advised to use the default tablespace.

### Syntax

```
CREATE TABLESPACE tablespace_name  
  [ OWNER user_name ] [ RELATIVE ] LOCATION 'directory' [ MAXSIZE 'space_size' ]  
  [with_option_clause];
```

The **with\_option\_clause** syntax for creating a general tablespace is as follows:

```
WITH ( {filesystem= { ' general ' | " general " | general } | address = { ' ip:port [, ... ] ' | " ip:port [, ... ] " } |  
cfgpath = { ' path ' | " path " } | storepath = { ' rootpath ' | " rootpath " } | random_page_cost = { ' value ' | "  
value " | value } | seq_page_cost = { ' value ' | " value " | value }}, ... )
```

## Parameters

- **tablespace\_name**

Specifies name of a tablespace to be created.

The tablespace name must be distinct from the name of any existing tablespace in the database and cannot start with "pg", which are reserved for system catalogs.

Value range: a string. It must comply with the [naming convention](#).

- **OWNER user\_name**

Specifies the name of the user who will own the tablespace. If omitted, the default owner is the current user.

Only system administrators can create tablespaces, but they can use the **OWNER** clause to assign ownership of tablespaces to non-**Sysadmin** administrators.

Value range: a string. It must be an existing user.

- **RELATIVE**

If this parameter is specified, a relative path is used. The location directory is relative to each CN/DN data directory.

Directory hierarchy: the relative path of the directory **/pg\_location/** A relative path contains a maximum of two levels.

If this parameter is not specified, the absolute tablespace path is used. The location directory must be an absolute path.

- **LOCATION directory**

Specifies the directory for the table space. When creating an absolute tablespace path, ensure that the directory meets the following requirements:

- The GaussDB system user must have the read and write permissions on the directory, and the directory must be empty. If the directory does not exist, the system automatically creates it.
- The directory must be an absolute path, and does not contain special characters, such as dollar sign (\$) and greater-than sign (>).
- The directory cannot be specified under the database data directory.
- The directory must be a local path.

Value range: a string. It must be a valid directory.

- **MAXSIZE 'space\_size'**

Specifies the maximum value of the tablespace in a single database node.

Value range: a string consisting of a positive integer and unit. The unit can be KB, MB, GB, TB, or PB currently. The unit of parsed value is KB and cannot exceed the range that can be expressed in 64 bits, which is 1 KB to 9007199254740991 KB.

- **random\_page\_cost**

Specifies the cost of randomly reading the page overhead.

Value range: 0 to 1.79769e+308

Default value: value of the GUC parameter **random\_page\_cost**

- **seq\_page\_cost**

Specifies the cost of reading the page overhead in specified order.

Value range: 0 to 1.79769e+308

Default value: value of GUC parameter **seq\_page\_cost**

## Examples

```
-- Create a tablespace.
gaussdb=# CREATE TABLESPACE ds_location1 RELATIVE LOCATION 'tablespace/tablespace_1';

-- Create user joe.
gaussdb=# CREATE ROLE joe IDENTIFIED BY '*****';

-- Create user jay.
gaussdb=# CREATE ROLE jay IDENTIFIED BY '*****';

-- Create a tablespace and set its owner to user joe.
gaussdb=# CREATE TABLESPACE ds_location2 OWNER joe RELATIVE LOCATION 'tablespace/tablespace_1';

-- Rename the ds_location1 tablespace to ds_location3.
gaussdb=# ALTER TABLESPACE ds_location1 RENAME TO ds_location3;

-- Change the owner of the ds_location2 tablespace.
gaussdb=# ALTER TABLESPACE ds_location2 OWNER TO jay;

-- Delete the tablespace.
gaussdb=# DROP TABLESPACE ds_location2;
gaussdb=# DROP TABLESPACE ds_location3;

-- Delete users.
gaussdb=# DROP ROLE joe;
gaussdb=# DROP ROLE jay;
```

## Suggestions

- create tablespace  
You are advised not to create tablespaces in a transaction.

## 7.14.88 CREATE TABLE SUBPARTITION

### Description

Creates a level-2 partitioned table. Partitioning refers to splitting what is logically one large table into smaller physical pieces based on specific schemes. The table based on the logic is called a partitioned table, and each physical piece is called a partition. Data is stored on these physical partitions, instead of the logical partitioned table. For a level-2 partitioned table, the top-level node table and level-1 partitioned table are logical tables and do not store data. Only the level-2 partitioned (leaf node) stores data.

The partitioning solution of a level-2 partitioned table is a combination of the partitioning solutions of two level-1 partitions. For details about the partitioning solution of a level-1 partitioned table, see CREATE TABLE PARTITION.

Common combination solutions for level-2 partitioned tables include range-range partitioning, range-list partitioning, range-hash partitioning, list-range partitioning, list-list partitioning, list-hash partitioning, hash-range partitioning, hash-list partitioning, and hash-hash partitioning. Currently, level-2 partitioned tables can only be row-store tables.

## Precautions

- A level-2 partitioned table has two partition keys, and each partition key supports only one column.
- If the constraint key of the unique constraint and primary key constraint contains all partition keys, a local index is created for the constraints. Otherwise, a global index is created. If a local unique index is created, all partition keys must be included.
- When a level-2 partitioned table is created, if the specified level-2 partition is not displayed under the level-1 partition, a level-2 partition with the same range is automatically created.
- The number of level-2 partitions (leaf nodes) in a level-2 partitioned table cannot exceed 1048575. There is no limit on the number of level-1 partitions, but there must be at least one level-2 partition under a level-1 partition.
- The maximum total number of partitions (including level-1 and level-2 partitions) in a level-2 partitioned table is 1048575. Generally, it is impossible for services to create so many partitions and the memory will be insufficient if so. Create partitions based on the value of **local\_syscache\_threshold**. The memory allocated to the level-2 partitioned tables can be calculated as follows: total number of partitions x 3/1024, in MB. Theoretically, the memory occupied by the partitions cannot be greater than the value of **local\_syscache\_threshold**. In addition, some space must be reserved for other functions.
- If the memory is insufficient due to too many partitions, the performance deteriorates sharply.
- Level-2 partitioned tables do not support hash bucket.
- Clusters are not supported.
- When specifying a partition for query, for example, running **SELECT \* FROM tablename PARTITION/SUBPARTITION (partitionname)**, ensure that the keyword PARTITION and SUBPARTITION is correct. If they are incorrect, no error is reported during the query. In this case, the query is performed based on the table alias.
- It does not support: encrypted database; row-level security.
- In the **PARTITION/SUBPARTITION FOR (values)** syntax for level-2 partitioned tables, values can only be constants.
- In the **PARTITION/SUBPARTITION FOR (values)** syntax for level-2 partitioned tables, if data type conversion is required for values, you are advised to use forcible type conversion to prevent the implicit type conversion result from being inconsistent with the expected result.
- Currently, the statement specifying a partition cannot perform global index scan.

## Syntax

```
CREATE TABLE [ IF NOT EXISTS ] subpartition_table_name
(
  { column_name data_type [ COLLATE collation ] [ column_constraint [ ... ] ]
  | table_constraint
  | LIKE source_table [ like_option [...] ] }, ... ]
)
[ AUTO_INCREMENT [ = ] value ]
[ WITH ( {storage_parameter = value} [, ... ] ) ]
[ COMPRESS | NOCOMPRESS ][ COMPRESS | NOCOMPRESS ]
[ TABLESPACE tablespace_name ]
PARTITION BY {RANGE [ COLUMNS ] | LIST [ COLUMNS ] | HASH | KEY} (partition_key) [ PARTITIONS
integer ] SUBPARTITION BY {RANGE | LIST | HASH | KEY} (subpartition_key) [ SUBPARTITIONS integer ]
(
  PARTITION partition_name1 [ VALUES LESS THAN {(val1) | MAXVALUE} | VALUES [IN] (val1[, ...]) ]
  [ TABLESPACE [=] tablespace ]
  [(
    { SUBPARTITION subpartition_name1 [ VALUES LESS THAN (val1_1) | VALUES (val1_1[, ...]) ]
    [ TABLESPACE [=] tablespace ] } [, ...]
  )][, ...]
)[ { ENABLE | DISABLE } ROW MOVEMENT ];
```

- **Column constraint:**

```
[ CONSTRAINT constraint_name ]
{ NOT NULL |
  NULL |
  CHECK ( expression ) |
  DEFAULT default_expr |
  GENERATED ALWAYS AS ( generation_expr ) [STORED] |
  AUTO_INCREMENT |
  UNIQUE [KEY] index_parameters |
  PRIMARY KEY index_parameters |
  REFERENCES reftable [ ( refcolumn ) ] [ MATCH FULL | MATCH PARTIAL | MATCH SIMPLE ]
  [ ON DELETE action ] [ ON UPDATE action ] }
[ DEFERRABLE | NOT DEFERRABLE | INITIALLY DEFERRED | INITIALLY IMMEDIATE ]
```

- **Table constraint:**

```
[ CONSTRAINT [ constraint_name ] ]
{ CHECK ( expression ) |
  UNIQUE [ index_name ][ USING method ] ( { column_name [ ASC | DESC ] } [, ... ] )
  index_parameters |
  PRIMARY KEY [ USING method ] ( { column_name [ ASC | DESC ] } [, ... ] ) index_parameters |
  FOREIGN KEY [ index_name ] ( column_name [, ... ] ) REFERENCES reftable [ ( refcolumn [, ... ] ) ]
  [ MATCH FULL | MATCH PARTIAL | MATCH SIMPLE ] [ ON DELETE action ] [ ON UPDATE
  action ] }
[ DEFERRABLE | NOT DEFERRABLE | INITIALLY DEFERRED | INITIALLY IMMEDIATE ]
```

- **LIKE options:**

```
{ INCLUDING | EXCLUDING } { DEFAULTS | GENERATED | CONSTRAINTS | INDEXES | STORAGE |
  COMMENTS | REOPTIONS | ALL }
```

- **Index parameters:**

```
[ WITH ( {storage_parameter = value} [, ... ] ) ]
[ USING INDEX TABLESPACE tablespace_name ]
```

## Parameters

- **IF NOT EXISTS**

Does not throw an error if a relationship with the same name existed. A notice is issued in this case.

- **subpartition\_table\_name**

Specifies the name of a level-2 partitioned table.

Value range: a string. It must comply with the [naming convention](#).

- **column\_name**

Specifies the name of a column to be created in the new table.

Value range: a string. It must comply with the [naming convention](#).

- **data\_type**  
Specifies the data type of the column.
- **COLLATE collation**  
Assigns a collation to the column (which must be of a collatable data type). If no collation is specified, the default collation is used. You can run the **SELECT \* FROM pg\_collation** command to query collation rules from the pg\_collation system catalog. The default collation rule is the row starting with **default** in the query result.
- **CONSTRAINT constraint\_name**  
Specifies the name of a column or table constraint. The optional constraint clauses specify constraints that new or updated rows must satisfy for an INSERT or UPDATE operation to succeed.  
There are two ways to define constraints:
  - A column constraint is defined as part of a column definition, and it is bound to a particular column.
  - A table constraint applies to multiple columns.

---

**NOTICE**

The constraint\_name is optional in B-compatible mode (**sql\_compatibility = 'B'**). For other modes, constraint\_name must be added.

- 
- **index\_name**  
Index name

---

**NOTICE**

- The index\_name is supported only in B-compatible databases (that is, **sql\_compatibility = 'B'**).
- For foreign key constraints, if constraint\_name and index\_name are specified at the same time, constraint\_name is used as the index name.
- For a unique key constraint, if both constraint\_name and index\_name are specified, index\_name is used as the index name.

- 
- **USING method**  
Specifies the name of the index method to be used.  
For details about the value range, see USING method in [Parameters](#).

---

**NOTICE**

- The USING method is supported only in B-compatible databases (that is, **sql\_compatibility = 'B'**).
  - In B-compatible mode, if USING method is not specified, the default index method is btree for ASTORE or UB-tree for USTORE.
-

- **ASC | DESC**

**ASC** specifies an ascending (default) sort order. **DESC** specifies a descending sort order.

---

**NOTICE**

The ASC|DESC is supported only in B-compatible databases (that is, `sql_compatibility = 'B'`).

---

- **LIKE source\_table [ like\_option ... ]**

Specifies a table from which the new table automatically copies all column names, their data types, and their not-null constraints. Unlike **INHERITS**, the new table and original table are decoupled after creation is complete. Changes to the original table will not be applied to the new table, and it is not possible to include data of the new table in scans of the original table.

- Default expressions for the copied column definitions will be copied only if **INCLUDING DEFAULTS** is specified. The default behavior is to exclude default expressions, resulting in the copied columns in the new table having default values null.
- If **INCLUDING GENERATED** is specified, the generated expression of the original table column is copied to the new table. By default, the generated expression is not copied.
- Non-null constraints are always copied to the new table. **CHECK** constraints will only be copied if **INCLUDING CONSTRAINTS** is specified; other types of constraints will never be copied. These rules also apply to column constraints and table constraints.
- Unlike those of **INHERITS**, columns and constraints copied by **LIKE** are not merged with similarly named columns and constraints. If the same name is specified explicitly or in another **LIKE** clause, an error is reported.
- Any indexes on the original table will not be created on the new table, unless the **INCLUDING INDEXES** clause is specified.
- **STORAGE** settings for the original columns are copied only if **INCLUDING STORAGE** is specified. The default behavior is to exclude **STORAGE** settings.
- If **INCLUDING COMMENTS** is specified, comments for the copied original columns, constraints, and indexes are copied. The default behavior is to exclude comments.
- If **INCLUDING REOPTIONS** is specified, the new table will copy the storage parameter (that is, **WITH** clause) of the original table. The default behavior is to exclude partition definition of the storage parameter of the original table.
- **INCLUDING ALL** contains the meaning of **INCLUDING DEFAULTS**, **INCLUDING CONSTRAINTS**, **INCLUDING INDEXES**, **INCLUDING STORAGE**, **INCLUDING COMMENTS**, **INCLUDING PARTITION**, and **INCLUDING REOPTIONS**.

- **AUTO\_INCREMENT [ = ] value**

This clause specifies an initial value for an auto-increment column. The value must be a positive integer and cannot exceed  $2^{127} - 1$ .

---

**NOTICE**

This clause takes effect only when **sql\_compatibility** is set to 'B'.

---

- **WITH ( storage\_parameter [= value] [, ... ] )**

Specifies an optional storage parameter for a table or an index. Optional parameters are as follows:

- **FILLFACTOR**

The fill factor of a table is a percentage from 10 to 100. If the Ustore storage engine is used, the default value is **92**. If the Astore storage engine is used, the default value is **100** (completely filled). When a smaller fill factor is specified, **INSERT** operations pack table pages only to the indicated percentage. The remaining space on each page is reserved for updating rows on that page. This gives **UPDATE** a chance to place the updated copy of a row on the same page, which is more efficient than placing it on a different page. For a table whose entries are never updated, setting the fill factor to **100** (complete filling) is the best choice, but in heavily updated tables a smaller fill factor would be appropriate.

Value range: 10–100

- **ORIENTATION**

Determines the data storage mode of the table.

Value range:

- **ROW** (default value): The data will be stored in rows.

---

**NOTICE**

**ORIENTATION** cannot be modified.

---

- **STORAGE\_TYPE**

Specifies the storage engine type. This parameter cannot be modified once it is set.

Value range:

- **USTORE** indicates that tables support the inplace-update storage engine. Note that the **track\_counts** and **track\_activities** parameters must be enabled when the Ustore table is used. Otherwise, space bloating may occur.
- **ASTORE** indicates that tables support the append-only storage engine.

Default value:

If no table is specified, data is stored in inplace-update mode by default.

- **COMPRESSION**

- Row-store tables do not support compression.

- **segment**

This parameter is reserved and is not supported currently.

- **COMPRESS / NOCOMPRESS**

Specifies keyword **COMPRESS** during the creation of a table, so that the compression feature is triggered in case of **BULK INSERT** operations. If this feature is enabled, a scan is performed for all tuple data within the page to generate a dictionary and then the tuple data is compressed and stored. If **NOCOMPRESS** is specified, the table is not compressed. Row-store tables do not support compression.

Default value: **NOCOMPRESS**, that is, tuple data is not compressed before storage.
- **TABLESPACE tablespace\_name**

Specifies that the new table will be created in the **tablespace\_name** tablespace. If not specified, the default tablespace is used.
- **PARTITION BY {RANGE [COLUMNS] | LIST [COLUMNS] | HASH | KEY} (partition\_key)**
  - For **partition\_key**, the partitioning policy supports only one column of partition keys.
  - The data types supported by the partition key are the same as those supported by the level-1 partitioned table.
  - The **COLUMNS** keyword can be used only when **sql\_compatibility** is set to **'B'** and can be added only after **RANGE** or **LIST**. The semantics of **RANGE COLUMNS** is the same as that of **RANGE**, and the semantics of **LIST COLUMNS** is the same as that of **LIST**.
  - The **KEY** keyword can be used only when **sql\_compatibility** is set to **'B'**. The meaning of **KEY** is the same as that of **HASH**.
- **SUBPARTITION BY {RANGE | LIST | HASH | KEY} (subpartition\_key)**
  - For **subpartition\_key**, the partitioning policy supports only one column of partition keys.
  - The data types supported by the partition key are the same as those supported by the level-1 partitioned table.
  - The **KEY** keyword can be used only when **sql\_compatibility** is set to **'B'**. The meaning of **KEY** is the same as that of **HASH**.
- **PARTITIONS integer**

Specifies the number of partitions.

**integer** indicates the number of partitions. The value must be an integer greater than 0 and cannot be greater than 1048575.

  - When this clause is specified after the range and list partitions, each partition must be explicitly defined, and the number of defined partitions must be equal to the value of **integer**. This clause can be specified after the range and list partitions only when **sql\_compatibility** is set to **'B'**.
  - When this clause is specified after the hash and key partitions, if the definition of each partition is not listed, *integer* partitions are automatically generated. The automatically generated partition name is "p+number", and the number ranges from 0 to *integer* minus 1. The tablespace of the partition is the tablespace of the table by default. If each partition definition is explicitly defined, the number of defined partitions must be the same as the value of **integer**. If neither the partition definition nor the number of partitions is specified, a unique partition is created.

- **SUBPARTITIONS integer**

Specifies the number of level-2 partitions.

**integer** indicates the number of level-2 partitions. The value must be an integer greater than 0 and cannot be greater than 1048575.

- This clause can be specified only for level-2 HASH and KEY partitions.

- If level-2 partitions are not defined, an *integer* number of level-2 partitions are automatically generated in each level-1 partition. The automatically generated level-2 partitions are named in the format of "level-1 partition name+sp+number", where the number ranges from 0 to *integer* minus 1. The tablespace of the partition is the tablespace of the table by default.

- If level-2 partitions are defined, the number of level-2 partitions must be the same as the value of **integer**.

- If level-2 partitions are not defined and the number of level-2 partitions is not specified, a unique level-2 partition is created.

- **{ ENABLE | DISABLE } ROW MOVEMENT**

Specifies whether to enable row movement.

If the tuple value is updated on the partition key during the UPDATE operation, the partition where the tuple is located is altered. Setting this parameter enables error messages to be reported or movement of the tuple between partitions.

Value range:

- **ENABLE** (default value): Row movement is enabled.

- **DISABLE**: Row movement is disabled.

If the row movement is enabled, an error may be reported when update and delete operations are performed concurrently. The causes are as follows:

The old data is marked as deleted under the update and delete operations. If the row movement is enabled, the cross-partition update occurs when the partition key is updated, the kernel marks the old data in the old partition as deleted and adds a data to the new partition. As a result, the new data cannot be found by querying the old data.

If data in the same row is concurrently operated, the cross-partition and non-cross-partition data results have different behaviors in the following three concurrency scenarios: UPDATE and UPDATE concurrency, DELETE and DELETE concurrency, UPDATE and DELETE concurrency.

- a. For non-cross-partition data, no error is reported for the second operation after the first operation is performed.

- If the first operation is UPDATE, the latest data can be found and operated after the second operation is performed.

- If the first operation is DELETE, the second operation is terminated if the current data is deleted and the latest data cannot be found.

- b. For the cross-partition data result, an error is reported for the second operation after the first operation is performed.

- If the first operation is UPDATE, the second operation cannot find the latest data because the new data is in the new partition. Therefore, the second operation fails and an error is reported.
- If the first operation is DELETE, performing the second operation can find that the current data is deleted and the latest data cannot be found, but cannot determine whether the operation of deleting the old data is UPDATE or DELETE. If the operation is UPDATE, an error is reported. If the operation is DELETE, the operation is terminated. To ensure the data correctness, an error is reported.

If the UPDATE and UPDATE concurrency, and UPDATE and DELETE concurrency are performed, the error can be solved only when the operations are performed serially. If the DELETE and DELETE concurrency are performed, the error can be solved by disabling the row movement.

- **NOT NULL**

The column is not allowed to contain null values. **ENABLE** can be omitted.

- **NULL**

Indicates that the column is allowed to contain **NULL** values. This is the default setting.

This clause is only provided for compatibility with non-standard SQL databases. It is not recommended.

- **CHECK (condition) [ NO INHERIT ]**

Specifies an expression producing a Boolean result where the INSERT or UPDATE operation of new or updated rows can succeed only when the expression result is **TRUE** or **UNKNOWN**; otherwise, an error is thrown and the database is not altered.

A check constraint specified as a column constraint should reference only the column's values, while an expression in a table constraint can reference multiple columns.

A constraint marked with **NO INHERIT** will not propagate to child tables.

**ENABLE** can be omitted.

- **DEFAULT default\_expr**

Assigns a default data value to a column. The value can be any variable-free expressions. (Subqueries and cross-references to other columns in the current table are not allowed.) The data type of the default expression must match that of the column.

The default expression will be used in any INSERT operation that does not specify a value for the column. If there is no default value for a column, then the default value is **NULL**.

- **GENERATED ALWAYS AS ( generation\_expr ) [STORED]**

This clause creates a column as a generated column. The value of the generated column is calculated by **generation\_expr** when data is written (inserted or updated). **STORED** indicates that the value of the generated column is stored as a common column.

 **NOTE**

- The STORED keyword can be omitted, which has the same semantics as not omitting STORED.
  - The generation expression cannot refer to data other than the current row in any way. The generation expression cannot reference other generation columns or system columns. The generation expression cannot return a result set. No subquery, aggregate function, or window function can be used. The function called by the generation expression can only be an immutable function.
  - Default values cannot be specified for generated columns.
  - The generated column cannot be used as a part of the partition key.
  - Do not specify the generated column and the CASCADE, SET NULL, and SET DEFAULT actions of the ON UPDATE constraint clause together. Do not specify the generated column and the SET NULL, and SET DEFAULT actions of the ON DELETE constraint clause together.
  - The method of modifying and deleting generated columns is the same as that of common columns. Delete the common column that the generated column depends on. The generated column is automatically deleted. The type of the column on which the generated column depends cannot be changed.
  - The generated column cannot be directly written. In the INSERT or UPDATE statement, values cannot be specified for generated columns, but the keyword DEFAULT can be specified.
  - The permission control for generated columns is the same as that for common columns.
- **AUTO\_INCREMENT**  
Specifies an auto-increment column.  
For details, see [AUTO\\_INCREMENT](#).
  - **UNIQUE [KEY] index\_parameters**  
**UNIQUE ( column\_name [, ... ] ) index\_parameters**  
Specifies that a group of one or more columns of a table can contain only unique values.  
For the purpose of a unique constraint, null is not considered equal.  
UNIQUE KEY can be used only when **sql\_compatibility** is set to 'B', which has the same semantics as UNIQUE.
  - **PRIMARY KEY index\_parameters**  
**PRIMARY KEY ( column\_name [, ... ] ) index\_parameters**  
Specifies that a column or columns of a table can contain only unique (non-duplicate) and non-null values.  
Only one primary key can be specified for a table.
  - **DEFERRABLE | NOT DEFERRABLE**  
They determine whether the constraint is deferrable. A constraint that is not deferrable will be checked immediately after every command. Checking of constraints that are deferrable can be postponed until the end of the transaction using the **SET CONSTRAINTS** command. **NOT DEFERRABLE** is the default value. Currently, only UNIQUE constraints, primary key constraints, and foreign key constraints accept this clause. All the other constraints are not deferrable.
  - **INITIALLY IMMEDIATE | INITIALLY DEFERRED**  
If a constraint is deferrable, this clause specifies the default time to check the constraint.

- If the constraint is **INITIALLY IMMEDIATE** (default value), it is checked after each statement.
- If the constraint is **INITIALLY DEFERRED**, it is checked only at the end of the transaction.

The constraint check time can be altered using the **SET CONSTRAINTS** statement.

- **USING INDEX TABLESPACE** *tablespace\_name*

Allows selection of the tablespace in which the index associated with a **UNIQUE** or **PRIMARY KEY** constraint will be created. If not specified, the index is created in **default\_tablespace**. If **default\_tablespace** is empty, the default tablespace of the database is used.

## Examples

- Example 1: Create level-2 partitioned tables of various combination types.

```
CREATE TABLE list_list
(
  month_code VARCHAR2 ( 30 ) NOT NULL ,
  dept_code  VARCHAR2 ( 30 ) NOT NULL ,
  user_no   VARCHAR2 ( 30 ) NOT NULL ,
  sales_amt int
)
PARTITION BY LIST (month_code) SUBPARTITION BY LIST (dept_code)
(
  PARTITION p_201901 VALUES ( '201902' )
  (
    SUBPARTITION p_201901_a VALUES ( '1' ),
    SUBPARTITION p_201901_b VALUES ( '2' )
  ),
  PARTITION p_201902 VALUES ( '201903' )
  (
    SUBPARTITION p_201902_a VALUES ( '1' ),
    SUBPARTITION p_201902_b VALUES ( '2' )
  )
);
insert into list_list values('201902', '1', '1', 1);
insert into list_list values('201902', '2', '1', 1);
insert into list_list values('201902', '1', '1', 1);
insert into list_list values('201903', '2', '1', 1);
insert into list_list values('201903', '1', '1', 1);
insert into list_list values('201903', '2', '1', 1);
select * from list_list;
  month_code | dept_code | user_no | sales_amt
-----+-----+-----+-----
201903      | 2         | 1       | 1
201903      | 2         | 1       | 1
201903      | 1         | 1       | 1

## 7.14.89 CREATE TRIGGER

### Description

Creates a trigger. The trigger will be associated with the specified table or view, and will execute the specified function operations are performed.

### Precautions

- Currently, triggers can be created only on ordinary row-store tables, instead of on temporary tables or unlogged tables.
- If multiple triggers of the same kind are defined for the same event, they will be fired in alphabetical order by name.
- Triggers are usually used for data association and synchronization between multiple tables. SQL execution performance is greatly affected. Therefore, you are advised not to use this statement when a large amount of data needs to be synchronized and performance requirements are high.
- To create a trigger, you must have the TRIGGER permission on the specified table or have the CREATE ANY TRIGGER permission.
- A row-level trigger function triggered by BEFORE can return a **NULL** value, indicating that operations on the row are ignored. Subsequent triggers will not be executed and no INSERT, UPDATE, or DELETE action will be generated on the row.
- For a trigger function whose event is INSERT or UPDATE, the normal return value is **NEW**. If a non-NULL row is returned, the inserted or updated row is modified. For a trigger function whose event is DELETE, the normal return value is **OLD**. Note that in the case of a DELETE BEFORE trigger, the return value **NEW** indicates **NULL**.
- INSTEAD OF triggers can only work on views. Their trigger functions can also return **NULL**, indicating that subsequent triggers will not be executed.

### Syntax

```
CREATE [ CONSTRAINT ] TRIGGER name { BEFORE | AFTER | INSTEAD OF } { event [ OR ... ] }
ON table_name
[ FROM referenced_table_name ]
{ NOT DEFERRABLE | [ DEFERRABLE ] { INITIALLY IMMEDIATE | INITIALLY DEFERRED } }
[ FOR [ EACH ] { ROW | STATEMENT } ]
```

```
[ WHEN ( condition ) ]  
EXECUTE PROCEDURE function_name ( arguments );
```

Events include:

```
INSERT  
UPDATE [ OF column_name [, ... ] ]  
DELETE  
TRUNCATE
```

## Parameters

- **CONSTRAINT**

(Optional) Creates a constraint trigger. That is, the trigger is used as a constraint. This is the same as a regular trigger except that the timing of the trigger firing can be adjusted using SET CONSTRAINTS. Constraint triggers must be AFTER ROW triggers.

- **name**

Specifies the name of the trigger to be created. This must be distinct from the name of any other trigger for the same table. The name cannot be schema-qualified — the trigger inherits the schema of its table. For a constraint trigger, this is also the name to use when modifying the trigger's behavior using [SET CONSTRAINTS](#).

Value range: a string, which complies with the [naming convention](#). A value can contain a maximum of 63 characters.

- **BEFORE**

Specifies that the function is called before the event.

- **AFTER**

Specifies that the function is called after the event. A constraint trigger can only be specified as **AFTER**.

- **INSTEAD OF**

Specifies that the function is called instead of the event.

- **event**

Specifies the event that will fire the trigger. Values are **INSERT**, **UPDATE**, **DELETE**, and **TRUNCATE**. Multiple events can be specified using **OR**.

For UPDATE events, it is possible to specify a list of columns using this syntax:

```
UPDATE OF column_name1 [, column_name2 ... ]
```

The trigger will only fire if at least one of the listed columns is mentioned as a target of the UPDATE statement. INSTEAD OF UPDATE events do not support lists of columns. If the column specified by UPDATE OF contains a generated column, the trigger is also fired when the column on which the generated column depends is the target column of the UPDATE statement.

- **table\_name**

Specifies the name of the table for which the trigger is created.

Value range: name of an existing table in the database

- **referenced\_table\_name**

Specifies the name of another table referenced by the constraint. This option is used for foreign-key constraints. It can only be specified for constraint triggers.

Value range: name of an existing table in the database

- **DEFERRABLE | NOT DEFERRABLE**

Specifies the start time of the trigger. It can only be specified for constraint triggers. Determines whether the constraint can be deferred.

For details, see [CREATE TABLE](#).

- **INITIALLY IMMEDIATE | INITIALLY DEFERRED**

If a constraint is deferrable, this clause specifies the default time to check the constraint. It can only be specified for constraint triggers.

For details, see [CREATE TABLE](#).

- **FOR EACH ROW | FOR EACH STATEMENT**

Specifies the frequency of firing the trigger.

- **FOR EACH ROW** indicates that the trigger should be fired once for every row affected by the trigger event.
- **FOR EACH STATEMENT** indicates that the trigger should be fired just once per SQL statement.

If neither is specified, the default is **FOR EACH STATEMENT**. Constraint triggers can only be marked as **FOR EACH ROW**.

- **condition**

Specifies whether the trigger function will actually be executed. If **WHEN** is specified, the function will be called only when **condition** returns **true**.

In **FOR EACH ROW** triggers, the **WHEN** condition can refer to columns of the old and/or new row values by writing **OLD.column name** or **NEW.column name** respectively. In addition, **INSERT** triggers cannot refer to **OLD**, and **DELETE** triggers cannot refer to **NEW**.

**INSTEAD OF** triggers do not support **WHEN** conditions.

Currently, **WHEN** expressions cannot contain subqueries.

Note that for constraint triggers, evaluation of the **WHEN** condition is not deferred, but occurs immediately after the row update operation is performed. If the condition does not evaluate to **true**, then the trigger is not queued for deferred execution.

- **function\_name**

Specifies a user-defined function, which must be declared as taking no parameters and returning type trigger. This is executed when a trigger fires.

- **arguments**

Specifies an optional comma-separated list of parameters to be provided to the function when the trigger is executed. The parameters are literal string constants. Simple names and numeric constants can also be written here, but they will all be converted to strings. Check the description of the implementation language of the trigger function to find out how these parameters can be accessed within the function.

 **NOTE**

The following details trigger types:

- INSTEAD OF triggers must be marked as FOR EACH ROW and can be defined only on views.
- BEFORE and AFTER triggers on a view must be marked as FOR EACH STATEMENT.
- TRUNCATE triggers must be marked as FOR EACH STATEMENT.

**Table 7-146** Types of triggers supported on tables and views

| When       | Event                | Row-Level      | Statement-Level  |
|------------|----------------------|----------------|------------------|
| BEFORE     | INSERT/UPDATE/DELETE | Tables         | Tables and views |
|            | TRUNCATE             | Not supported. | Tables           |
| AFTER      | INSERT/UPDATE/DELETE | Tables         | Tables and views |
|            | TRUNCATE             | Not supported. | Tables           |
| INSTEAD OF | INSERT/UPDATE/DELETE | Views          | Not supported.   |
|            | TRUNCATE             | Not supported. | Not supported.   |

**Table 7-147** Special variables of PL/pgSQL trigger functions

| Variable | Description                                                                                                          |
|----------|----------------------------------------------------------------------------------------------------------------------|
| NEW      | New tuple for <b>INSERT</b> and <b>UPDATE</b> operations. This variable is <b>NULL</b> for <b>DELETE</b> operations. |
| OLD      | Old tuple for <b>UPDATE</b> and <b>DELETE</b> operations. This variable is <b>NULL</b> for <b>INSERT</b> operations. |
| TG_NAME  | Trigger name.                                                                                                        |
| TG_WHEN  | Trigger timing ( <b>BEFORE</b> , <b>AFTER</b> , or <b>INSTEAD OF</b> ).                                              |
| TG_LEVEL | Trigger frequency ( <b>ROW</b> or <b>STATEMENT</b> ).                                                                |
| TG_OP    | Trigger event ( <b>INSERT</b> , <b>UPDATE</b> , <b>DELETE</b> , or <b>TRUNCATE</b> ).                                |
| TG_RELID | OID of the table where the trigger resides.                                                                          |

| Variable        | Description                                                                                              |
|-----------------|----------------------------------------------------------------------------------------------------------|
| TG_RELNAME      | Name of the table where the trigger resides. (This variable has been replaced by <b>TG_TABLE_NAME</b> .) |
| TG_TABLE_NAME   | Name of the table where the trigger resides.                                                             |
| TG_TABLE_SCHEMA | Schema of the table where the trigger resides.                                                           |
| TG_NARGS        | Number of parameters for the trigger function.                                                           |
| TG_ARGV[]       | List of parameters for the trigger function.                                                             |

## Examples

```

-- Create a source table and a destination table.
gaussdb=# CREATE TABLE test_trigger_src_tbl(id1 INT, id2 INT, id3 INT);
gaussdb=# CREATE TABLE test_trigger_des_tbl(id1 INT, id2 INT, id3 INT);

-- Create a trigger function.
gaussdb=# CREATE OR REPLACE FUNCTION tri_insert_func() RETURNS TRIGGER AS
$$
DECLARE
BEGIN
    INSERT INTO test_trigger_des_tbl VALUES(NEW.id1, NEW.id2, NEW.id3);
    RETURN NEW;
END
$$ LANGUAGE plpgsql;

gaussdb=# CREATE OR REPLACE FUNCTION tri_update_func() RETURNS TRIGGER AS
$$
DECLARE
BEGIN
    UPDATE test_trigger_des_tbl SET id3 = NEW.id3 WHERE id1=OLD.id1;
    RETURN OLD;
END
$$ LANGUAGE plpgsql;

gaussdb=# CREATE OR REPLACE FUNCTION TRI_DELETE_FUNC() RETURNS TRIGGER AS
$$

## 7.14.90 CREATE TYPE

### Description

Defines a new data type for use in the current database. The user who defines a type becomes its owner. Types are designed only for row-store tables.

The following data types can be created: composite type, base type, shell type, enumerated type, and set type.

- Composite type

A composite type is specified by a list of attribute names and data types. If the data type of an attribute is collatable, the attribute's collation rule can also be specified. This is essentially the same as the row type of a table, but using **CREATE TYPE** avoids the need to create an actual table when all that is wanted is to define a type. A stand-alone composite type is useful as the parameter or return type of a function.

To create a composite type, you must have the **USAGE** permission on all of its attribute types.

- Base type

You can create a base type (scalar type). Generally, these functions must be written in the underlying language.

- Shell type

A shell type is simply a placeholder for a type to be defined later; it is created by issuing **CREATE TYPE** with no parameters except for the type name. Shell types are needed as forward references when base types are created.

- Enumerated type

An enumerated type is a list of one or more quoted labels, each of which must be 1 to 63 bytes long.

- Set type

It is similar to an array but has no length limit. It is mainly used in stored procedures.

- A user granted with the CREATE ANY TYPE permission can create types in the public and user schemas.

## Precautions

- If a schema name is given then the type is created in the specified schema. Otherwise, it is created in the current schema. The type name must be distinct from the name of any existing type or domain in the same schema. (Because tables have associated data types, the type name must also be distinct from the name of any existing table in the same schema.)
- When creating a non-system type by associating a function, the user needs to understand the definition of the type and the function associated with the type. If this function is not properly used, permissions may be exploited due to the associated function.

## Syntax

```
CREATE TYPE name AS
  ( [ attribute_name data_type [ COLLATE collation ] [, ... ] ] );

CREATE TYPE name (
  INPUT = input_function,
  OUTPUT = output_function
  [ , RECEIVE = receive_function ]
  [ , SEND = send_function ]
  [ , TYPMOD_IN =
type_modifier_input_function ]
  [ , TYPMOD_OUT =
type_modifier_output_function ]
  [ , ANALYZE = analyze_function ]
  [ , INTERNALLENGTH = { internallength |
VARIABLE } ]
  [ , PASSEDBYVALUE ]
  [ , ALIGNMENT = alignment ]
  [ , STORAGE = storage ]
  [ , LIKE = like_type ]
  [ , CATEGORY = category ]
  [ , PREFERRED = preferred ]
  [ , DEFAULT = default ]
  [ , ELEMENT = element ]
  [ , DELIMITER = delimiter ]
  [ , COLLATABLE = collatable ]
);

CREATE TYPE name;
```

```
CREATE TYPE name AS ENUM  
  ( [ 'label' [, ... ] ] );  
  
CREATE TYPE name AS TABLE OF data_type;
```

## Parameters

### Composite type

- **name**  
Specifies the name (optionally schema-qualified) of the type to be created.
- **attribute\_name**  
Specifies the name of an attribute (column) for the composite type.
- **data\_type**  
Specifies the name of an existing data type to become a column of the composite type. You can use **%ROWTYPE** to indirectly reference the type of a table, or **%TYPE** to indirectly reference the type of a column in a table or composite type.
- **collation**  
Specifies the name of an existing collation rule to be associated with a column of the composite type. You can run the **SELECT \* FROM pg\_collation** command to query collation rules from the `pg_collation` system catalog. The default collation rule is the row starting with **default** in the query result.

### Base type

When creating a base type, you can place parameters in any order. The **input\_function** and **output\_function** parameters are mandatory, and other parameters are optional.

- **input\_function**  
Specifies the name of a function that converts data from the type's external textual form to its internal form.  
The input function may be declared as taking one parameter of type `cstring` or taking three parameters of types `cstring`, `oid`, and `integer`.
  - The first parameter is the input text as a C string,
  - the second parameter is the type's own OID (except for array types, which instead receive their element type's OID),
  - and the third is the `typmod` of the destination column, if known (-1 will be passed if not).The input function must return a value of the data type itself. Usually, an input function should be declared **STRICT**; if it is not, it will be called with a **NULL** first parameter when reading a **NULL** input value. The function must still return **NULL** in this case, unless it raises an error. (This case is mainly meant to support domain input functions, which might need to reject **NULL** inputs.)

 **NOTE**

- The input and output functions can be declared to have results or parameters of the new type, when they have to be created before the new type can be created. The type should first be defined as a shell type, which is a placeholder type that has no attributes except a name and an owner. This is done by issuing the **CREATE TYPE *name*** statement, with no additional parameters. Then the I/O functions can be defined referencing the shell type. Finally, CREATE TYPE with a full definition replaces the shell entry with a complete, valid type definition, after which the new type can be used normally.
- If the input and output functions are internal functions and are specified as internal system functions, the parameter types of the input and output functions must be the same, and the parameter types of **INTERNALLENGTH** and **PASSEDBYVALUE** of the new type must be the same as those of the input and output functions.
- **output\_function**  
Specifies the name of a function that converts data from the type's internal form to its external textual form.  
The output function must be declared as taking one parameter of the new data type. The output function must return type cstring. Output functions are not called for **NULL** values.
- **receive\_function**  
(Optional) Specifies the name of a function that converts data from the type's external binary form to its internal form.  
If this function is not supplied, the type cannot participate in binary input. The binary representation should be chosen to be cheap to convert to internal form, while being reasonably portable. (For example, the standard integer data types use network byte order as the external binary representation, while the internal representation is in the machine's native byte order.) The receive function should perform adequate checking to ensure that the value is valid.  
The receive function may be declared as taking one parameter of type internal or taking three parameters of types internal, oid, integer.
  - The first parameter is a pointer to a StringInfo buffer holding the received byte string;
  - the latter two are the same as for the text input function.The receive function must return a value of the data type itself. Usually, a receive function should be declared **STRICT**; if it is not, it will be called with a **NULL** first parameter when reading a **NULL** input value. The function must still return **NULL** in this case, unless it raises an error. (This case is mainly meant to support domain receive functions, which might need to reject **NULL** inputs.)
- **send\_function**  
(Optional) Specifies the name of a function that converts data from the type's internal form to its external binary form.  
If this function is not supplied, the type cannot participate in binary output. The send function must be declared as taking one parameter of the new data type. The send function must return type bytea. Send functions are not called for **NULL** values.
- **type\_modifier\_input\_function**  
(Optional) Specifies the name of a function that converts an array of modifiers for a type to its internal format.

- **type\_modifier\_output\_function**

(Optional) Specifies the name of a function that converts the internal format of modifiers for a type to its external text format.

 **NOTE**

**type\_modifier\_input\_function** and **type\_modifier\_output\_function** are needed if the type supports modifiers, that is optional constraints attached to a type declaration, such as `char(5)` or `numeric(30,2)`. GaussDB allows user-defined types to take one or more simple constants or identifiers as modifiers. However, this information must be capable of being packed into a single non-negative integer value for storage in the system catalogs. Declared modifiers are passed to **type\_modifier\_input\_function** in the `cstring` array format. It must check the values for validity (throwing an error if they are wrong), and if they are correct, return a single non-negative integer value that will be stored as the column "typmod". Type modifiers will be rejected if the type does not have a **type\_modifier\_input\_function**. The **type\_modifier\_output\_function** converts the internal integer typmod value back to the correct form for user display. It must return a `cstring` value that is the exact string to append to the type name; for example `numeric`'s function might return `(30,2)`. It is allowed to omit the **type\_modifier\_output\_function**, in which case the default display format is just the stored typmod integer value enclosed in parentheses.

- **analyze\_function**

(Optional) Specifies the name of a function that performs statistical analysis for the data type.

By default, **ANALYZE** will attempt to gather statistics using the type's "equals" and "less-than" operators, if there is a default B-tree operator class for the type. For non-scalar types, this behavior is likely to be unsuitable, so it can be overridden by specifying a custom analysis function. The analysis function must be declared to take one parameter of type internal and return a boolean result.

- **internallength**

(Optional) Specifies the length in bytes of the new type's internal representation. The default assumption is that it is variable-length.

While the details of the new type's internal representation are only known to the I/O functions and other functions you create to work with the type, there are several attributes of the internal representation that must be declared to GaussDB. Foremost of these is **internallength**. Base data types can be fixed-length, in which case **internallength** is a positive integer, or variable length, indicated by setting **internallength** to **VARIABLE**. (Internally, this is represented by setting **typlen** to **-1**.) The internal representation of all variable-length types must start with a 4-byte integer giving the total length of this value of the type.

- **PASSEDBYVALUE**

(Optional) Indicates that values of this data type are passed by value, rather than by reference. You cannot pass by value types whose internal representation is larger than the size of the Datum type (4 bytes on most machines, 8 bytes on a few).

- **alignment**

(Optional) Specifies the storage alignment requirement of the data type. If specified, it must be **char**, **int2**, **int4**, or **double**; the default is **int4**.

The allowed values equate to alignment on 1, 2, 4, or 8 byte boundaries. Note that variable-length types must have an alignment of at least 4, since they necessarily contain an `int4` as their first component.

- **storage**

(Optional) Specifies the storage strategy for the data type.

If specified, it must be **plain**, **external**, **extended**, or **main**; the default is **plain**.

- **plain** specifies that data of the type will always be stored in-line and not compressed. (Only **plain** is allowed for fixed-length types.)
- **extended** specifies that the system will first try to compress a long data value, and will move the value out of the main table row if it is still too long.
- **external** allows the value to be moved out of the main table, but the system will not try to compress it.
- **main** allows compression, but discourages moving the value out of the main table. (Data items with this storage strategy might still be moved out of the main table if there is no other way to make a row fit, but they will be kept in the main table preferentially over **extended** and **external** items.)

All **storage** values other than **plain** imply that the functions of the data type can handle values that have been toasted. The specific other value given merely determines the default **TOAST** storage strategy for columns of a toastable data type; users can pick other strategies for individual columns using **ALTER TABLE SET STORAGE**.

- **like\_type**

(Optional) Specifies the name of an existing data type that the new type will have the same representation as. The values of **internallength**, **passedbyvalue**, **alignment**, and **storage** are copied from that type, unless overridden by explicit specification elsewhere in this **CREATE TYPE** statement. Specifying representation in this way is especially useful when the low-level implementation of a new type references an existing type.

- **category**

(Optional) Specifies the category code (a single ASCII character) for this type. The default is **U** for a user-defined type. You may also choose other ASCII characters to create custom categories.

- **preferred**

Specifies whether a type is preferred within its type category. If yes, the value will be **TRUE**; if no, the value is **FALSE**. This parameter is optional. The default is **FALSE**. Be very careful about creating a preferred type within an existing type category, as this could cause surprising changes in behavior.

 **NOTE**

The **category** and **preferred** parameters can be used to help control which implicit cast will be applied in ambiguous situations. Each data type belongs to a category named by a single ASCII character, and each type is either preferred or not within its category. The parser will prefer casting to preferred types (but only from other types within the same category) when this rule is helpful in resolving overloaded functions or operators. For types that have no implicit casts to or from any other types, it is sufficient to leave these settings at the defaults. However, for a group of related types that have implicit casts, it is often helpful to mark them all as belonging to a category and select one or two of the most general types as being preferred within the category. The **category** parameter is especially useful when adding a user-defined type to an existing built-in category, such as the numeric or string types. However, it is also possible to create entirely-user-defined type categories. Select any ASCII character other than an uppercase letter to name such a category.

- **default**

(Optional) Specifies the default value for the data type. If this is omitted, the default is null.

A default value can be specified, in case a user wants columns of the data type to default to something other than the null value. Specify the default with the **DEFAULT** keyword. (Such a default can be overridden by an explicit **DEFAULT** clause attached to a particular column.)

- **element**

(Optional) Specifies the type of array elements when an array type is created. For example, to define an array of 4-byte integers (int4), set **ELEMENT** to **int4**.

- **delimiter**

(Optional) Specifies the delimiter character to be used between values in arrays made of this type.

**delimiter** can be set to a specific character. The default delimiter is the comma (,). Note that the delimiter is associated with the array element type, not the array type itself.

- **collatable**

(Optional) Specifies whether this type's operations can use collation information. If they can, the value will be **TRUE**, else **FALSE** (default).

If **collatable** is **TRUE**, column definitions and expressions of the type may carry collation information through use of the **COLLATE** clause. It is up to the implementations of the functions operating on the type to actually make use of the collation information; this does not happen automatically merely by marking the type collatable.

- **label**

(Optional) Represents the textual label associated with one value of an enumerated type. It is a string of 1 to 63 characters.

 **NOTE**

Whenever a user-defined type is created, GaussDB automatically creates an associated array type whose name consists of the element type's name prepended with an underscore (\_).

## Examples

```
-- Create a composite type, create a table, insert data, and make a query.  
gaussdb=# CREATE TYPE compfoo AS (f1 int, f2 text);
```

```
gaussdb=# CREATE TABLE t1_compfoo(a int, b compfoo);
gaussdb=# CREATE TABLE t2_compfoo(a int, b compfoo);
gaussdb=# INSERT INTO t1_compfoo values(1,(1,'demo'));
gaussdb=# INSERT INTO t2_compfoo SELECT * FROM t1_compfoo;
gaussdb=# SELECT (b).f1 FROM t1_compfoo;
gaussdb=# SELECT * FROM t1_compfoo t1 JOIN t2_compfoo t2 ON (t1.b).f1=(t1.b).f1;

-- Rename the data type.
gaussdb=# ALTER TYPE compfoo RENAME TO compfoo1;

-- Change the owner of the user-defined type compfoo1 to usr1.
gaussdb=# CREATE USER usr1 PASSWORD '*****';
gaussdb=# ALTER TYPE compfoo1 OWNER TO usr1;

-- Change the schema of the user-defined type compfoo1 to usr1.
gaussdb=# ALTER TYPE compfoo1 SET SCHEMA usr1;

-- Add a new attribute to the data type.
gaussdb=# ALTER TYPE usr1.compfoo1 ADD ATTRIBUTE f3 int;

-- Delete the compfoo1 type.
gaussdb=# DROP TYPE usr1.compfoo1 cascade;

-- Delete related tables and users.
gaussdb=# DROP TABLE t1_compfoo;
gaussdb=# DROP TABLE t2_compfoo;
gaussdb=# DROP SCHEMA usr1;
gaussdb=# DROP USER usr1;

-- Create an enumerated type.
gaussdb=# CREATE TYPE bugstatus AS ENUM ('create', 'modify', 'closed');

-- Add a label.
gaussdb=# ALTER TYPE bugstatus ADD VALUE IF NOT EXISTS 'regress' BEFORE 'closed';

-- Rename a label.
gaussdb=# ALTER TYPE bugstatus RENAME VALUE 'create' TO 'new';

-- Create a set type.
gaussdb=# CREATE TYPE compfoo_table AS TABLE OF compfoo;
```

## Helpful Links

[ALTER TYPE](#) and [DROP TYPE](#)

## 7.14.91 CREATE USER

### Description

Creates a user.

### Precautions

- A user created using the CREATE USER statement has the LOGIN permission by default.
- When you run the **CREATE USER** command to create a user, the system creates a schema with the same name as the user in the database where the command is executed.
- The owner of an object created by a system administrator in a schema with the same name as a common user is the common user, not the system administrator.

## Syntax

```
CREATE USER user_name [ [ WITH ] option [ ... ] ] [ ENCRYPTED | UNENCRYPTED ] { PASSWORD | IDENTIFIED BY } { 'password' [EXPIRED] | DISABLE };
```

The **option** clause is used to configure information, including permissions and properties.

```
{SYSADMIN | NOSYSADMIN}  
| {MONADMIN | NOMONADMIN}  
| {OPRADMIN | NOOPRADMIN}  
| {POLADMIN | NOPOLADMIN}  
| {AUDITADMIN | NOAUDITADMIN}  
| {CREATEDB | NOCREATEDB}  
| {USEFT | NOUSEFT}  
| {CREATEROLE | NOCREATEROLE}  
| {INHERIT | NOINHERIT}  
| {LOGIN | NOLOGIN}  
| {REPLICATION | NOREPLICATION}  
| {VCADMIN | NOVCAADMIN}  
| {PERSISTENCE | NOPERSISTENCE}  
| CONNECTION LIMIT connlimit  
| VALID BEGIN 'timestamp'  
| VALID UNTIL 'timestamp'  
| RESOURCE POOL 'respool'  
| USER GROUP 'groupuser'  
| PERM SPACE 'spacelimit'  
| TEMP SPACE 'tmpspacelimit'  
| SPILL SPACE 'spillspacelimit'  
| NODE GROUP logic_cluster_name  
| IN ROLE role_name [, ...]  
| IN GROUP role_name [, ...]  
| ROLE role_name [, ...]  
| ADMIN role_name [, ...]  
| USER role_name [, ...]  
| SYSID uid  
| DEFAULT TABLESPACE tablespace_name  
| PROFILE DEFAULT  
| PROFILE profile_name  
| PGUSER
```

## Parameters

- **user\_name**  
Username.  
Value range: a string. It must comply with the [naming convention](#). A value can contain a maximum of 63 characters.
- **password**  
Specifies the login password.  
The new password must:
  - Contain at least eight characters. This is the default length.
  - Differ from the username or the username spelled backward.
  - Contain at least three of the following character types: uppercase characters, lowercase characters, digits, and special characters (limited to ~!@#\$\$%^&\*()-\_+=\|[{]};,;<.>/?).
  - The password can also be a ciphertext character string that meets the format requirements. This mode is mainly used to import user data. You are advised not to use it directly. If a ciphertext password is used, the user must know the plaintext corresponding to the ciphertext password and ensure that the plaintext password meets the complexity requirements.

The database does not verify the complexity of the ciphertext password. Instead, the security of the ciphertext password is ensured by the user.

- Be enclosed by single quotation marks when a user is created.

Value range: a string

For details about other parameter values of CREATE USER, see [CREATE ROLE](#).

## Examples

```
-- Create user jim whose login password is *****.  
gaussdb=# CREATE USER jim PASSWORD '*****';  
  
-- Alternatively, you can run the following statement:  
gaussdb=# CREATE USER kim IDENTIFIED BY '*****';  
  
-- To create a user with the CREATEDB permission, add the CREATEDB keyword.  
gaussdb=# CREATE USER dim CREATEDB PASSWORD '*****';  
  
-- Change the login password of user jim from ***** to *****.  
gaussdb=# ALTER USER jim IDENTIFIED BY '*****' REPLACE '*****';  
  
-- Add the CREATEROLE permission to jim.  
gaussdb=# ALTER USER jim CREATEROLE;  
  
-- Set enable_seqscan to on. (The setting will take effect in the next session.)  
gaussdb=# ALTER USER jim SET enable_seqscan TO on;  
  
-- Reset the enable_seqscan parameter for jim.  
gaussdb=# ALTER USER jim RESET enable_seqscan;  
  
-- Lock jim.  
gaussdb=# ALTER USER jim ACCOUNT LOCK;  
  
-- Delete users.  
gaussdb=# DROP USER kim CASCADE;  
gaussdb=# DROP USER jim CASCADE;  
gaussdb=# DROP USER dim CASCADE;
```

## Helpful Links

[ALTER USER](#), [CREATE ROLE](#), and [DROP USER](#)

## 7.14.92 CREATE USER MAPPING

### Description

**CREATE USER MAPPING** defines a new mapping from a user to a foreign server.

### Precautions

If the **password** option is displayed, ensure that the **usermapping.key.cipher** and **usermapping.key.rand** files exist in the **\$GAUSSHOME/bin** directory of each node in GaussDB. If the two files do not exist, use the **gs\_guc** tool to generate them and use the **gs\_ssh** tool to release them to the **\$GAUSSHOME/bin** directory on each node in GaussDB.

When multi-layer quotation marks are used for sensitive columns (such as **password**) in **OPTIONS**, the semantics is different from that in the scenario where quotation marks are not used. Therefore, sensitive columns are not identified for anonymization.

## Syntax

```
CREATE USER MAPPING FOR { user_name | USER | CURRENT_USER | PUBLIC }  
    SERVER server_name  
    [ OPTIONS ( option 'value' [, ... ] ) ]
```

## Parameters

- **user\_name**  
Specifies the name of an existing user to map to a foreign server.  
**CURRENT\_USER** and **USER** match the name of the current user. When **PUBLIC** is specified, a public mapping is created and used when no mapping for a particular user is available.
- **server\_name**  
Specifies the name of the existing server for which a user mapping will be created.
- **OPTIONS ( { option\_name ' value ' } [, ...] )**  
Specifies options for user mapping. These options typically define the actual user name and password for this mapping. The option name must be unique. The allowed option names and values are related to the foreign data wrapper of the server.

### NOTE

- User passwords are encrypted and stored in the system catalog **PG\_USER\_MAPPING**. During the encryption, **usermapping.key.cipher** and **usermapping.key.rand** are used as the encryption password file and encryption factor. Before using the tool for the first time, run the following command to create the two files, save the files to the **\$GAUSSHOME/bin** directory on each node, and ensure that you have the read permission on the files. **gs\_ssh** helps you quickly place files in the specified directory of each node.  

```
gs_ssh -c "gs_guc generate -o usermapping -S default -D $GAUSSHOME/bin"
```
- If the **-S** parameter is set to default, a password is randomly generated. You can also specify a password for the **-S** parameter to ensure the security and uniqueness of the generated password file. You do not need to save or memorize the password. For details about other parameters, see the description of the **gs\_guc** tool in the "Tool Reference".

## Examples

```
-- Create a role.  
gaussdb=# CREATE ROLE bob PASSWORD '*****';  
  
-- Create a foreign server.  
gaussdb=# CREATE SERVER my_server FOREIGN DATA WRAPPER log_fdw;  
  
-- Create a user mapping.  
gaussdb=# CREATE USER MAPPING FOR bob SERVER my_server OPTIONS (user 'bob', password '*****');  
  
-- Modify the user mapping.  
gaussdb=# ALTER USER MAPPING FOR bob SERVER my_server OPTIONS (SET password '*****');  
  
-- Delete the user mapping.  
gaussdb=# DROP USER MAPPING FOR bob SERVER my_server;  
  
-- Delete the foreign server.  
gaussdb=# DROP SERVER my_server;  
  
-- Delete the role.  
gaussdb=# DROP ROLE bob;
```

## Helpful Links

[ALTER USER MAPPING](#) and [DROP USER MAPPING](#)

## 7.14.93 CREATE VIEW

### Description

Creates a view. A view is a virtual table, not a base table. Only view definition is stored in the database and view data is not. The data is stored in a base table. If data in the base table changes, the data in the view changes accordingly. In this sense, a view is like a window through which users can know their interested data and data changes in the database.

### Precautions

A user granted with the CREATE ANY TABLE permission can create views in the public and user schemas.

### Syntax

```
CREATE [ OR REPLACE ] [ TEMP | TEMPORARY ] VIEW view_name [ ( column_name [, ... ] ) ]  
[ WITH ( {view_option_name [= view_option_value]} [, ... ] ) ]  
AS query;
```

#### NOTE

You can use **WITH(security\_barrier)** to create a relatively secure view. This prevents attackers from printing hidden base table data by using the **RAISE** statement of low-cost functions.

After a view is created, you are not allowed to use REPLACE to modify column names in the view or delete the columns.

### Parameters

- **OR REPLACE**  
Redefines the view if it already exists.
- **TEMP | TEMPORARY**  
Creates a temporary view.
- **view\_name**  
Specifies the name (optionally schema-qualified) of the view to be created.  
Value range: a string. It must comply with the [naming convention](#).
- **column\_name**  
Specifies an optional list of names to be used for columns of the view. If not given, the column names are deduced from the query.  
Value range: a string. It must comply with the [naming convention](#).
- **view\_option\_name [= view\_option\_value]**  
Specifies an optional parameter for a view.  
Currently, **view\_option\_name** supports only the **security\_barrier** parameter. This parameter is used when the view attempts to provide row-level security.  
Value range: Boolean type, **TRUE**, and **FALSE**.

- **query**  
Specifies a **SELECT** or **VALUES** statement that will provide the columns and rows of the view.

#### NOTICE

If **query** contains a clause specifying the partition of a partitioned table, the OID of the specified partition is hardcoded to the system catalog when the view is created. If a DDL operation that will change the OID of the specified partition is used, for example, DROP, SPLIT, or MERGE, the view is unavailable. In this case, you need to create a view.

## Examples

```
-- Create a view consisting of columns whose spcname is pg_default.
gaussdb=# CREATE VIEW myView AS
  SELECT * FROM pg_tablespace WHERE spcname = 'pg_default';

-- Query a view.
gaussdb=# SELECT * FROM myView ;

-- Delete the myView view.
gaussdb=# DROP VIEW myView;
```

## 7.14.94 CREATE WEAK PASSWORD DICTIONARY

### Function

**CREATE WEAK PASSWORD DICTIONARY** inserts one or more weak passwords into the **gs\_global\_config** table.

### Precautions

- Only the initial user, system administrator, and security administrator have the permission to execute this syntax.
- Passwords in the weak password dictionary are stored in the **gs\_global\_config** system catalog.
- The weak password dictionary is empty by default. You can use this syntax to add one or more weak passwords.
- When a user attempts to execute this syntax to insert a weak password that already exists in the **gs\_global\_config** table, only one weak password is retained in the table.

### Syntax

```
CREATE WEAK PASSWORD DICTIONARY
[WITH VALUES] ( {'weak_password'} [, ...] );
```

## Parameter Description

weak\_password

Specifies a weak password.

Value range: a character string

## Examples

```
-- Insert a single weak password into the gs_global_config system catalog.
gaussdb=# CREATE WEAK PASSWORD DICTIONARY WITH VALUES ('password1');

-- Insert multiple weak passwords into the gs_global_config system catalog.
gaussdb=# CREATE WEAK PASSWORD DICTIONARY WITH VALUES ('password2'),('password3');

-- Clear all weak passwords in the gs_global_config system catalog.
gaussdb=# DROP WEAK PASSWORD DICTIONARY;

-- View existing weak passwords.
gaussdb=# SELECT * FROM gs_global_config WHERE NAME LIKE 'weak_password';
```

## Helpful Links

[DROP WEAK PASSWORD DICTIONARY](#)

## 7.14.95 CURSOR

### Function

This statement is used to create a cursor and retrieve specified rows of data from a query.

To process SQL statements, the stored procedure process assigns a memory segment to store context association. Cursors are handles or pointers pointing to context regions. With cursors, stored procedures can control alterations in context regions.

### Precautions

- **CURSOR** is used only in transaction blocks.
- Generally, **CURSOR** and **SELECT** both have text returns. Since data is stored in binary format in the system, the system needs to convert the data from the binary format to the text format. If data is returned in text format, client applications need to convert the data back to the binary format for processing. **FETCH** implements conversion between binary data and text data.
- Binary cursors should be used carefully. Text usually occupies larger space than binary data. A binary cursor returns internal binary data, which is easier to operate. A text cursor returns text, which is easier to retrieve and therefore reduces workload on the client. As an example, if a query returns a value of one from an integer column, you would get a string of 1 with a default cursor, whereas with a binary cursor you would get a 4-byte field containing the internal representation of the value (in big-endian byte order).

## Syntax

```
CURSOR cursor_name  
[ BINARY ] [ NO SCROLL ] [ { WITH | WITHOUT } HOLD ]  
FOR query ;
```

## 7.14.96 DEALLOCATE

### Function

DEALLOCATE deallocates prepared statements.

### Precautions

- If you do not explicitly deallocate a prepared statement, it is deallocated when the session ends.
- The **PREPARE** keyword is always ignored.

### Syntax

```
DEALLOCATE [ PREPARE ] { name | ALL };
```

### Parameters

- **name**  
Specifies the name of the prepared statement to be deallocated.
- **ALL**  
Deallocates all prepared statements.

### Examples

None

## 7.14.97 DECLARE

### Function

**DECLARE** defines a cursor to retrieve a small number of rows at a time out of a larger query and can be the start of an anonymous block.

This section describes usage of cursors. The usage of anonymous blocks is available in **BEGIN**.

To process SQL statements, the stored procedure process assigns a memory segment to store context association. Cursors are handles or pointers pointing to context regions. With cursors, stored procedures can control alterations in context regions.

Generally, **CURSOR** and **SELECT** both have text returns. Since data is stored in binary format in the system, the system needs to convert the data from the binary format to the text format. If data is returned in text format, client applications need to convert the data back to the binary format for processing. **FETCH** implements conversion between binary data and text data.

## Precautions

- **CURSOR** is used only in transaction blocks.
- Binary cursors should be used carefully. Text usually occupies larger space than binary data. A binary cursor returns internal binary data, which is easier to operate. A text cursor returns text, which is easier to retrieve and therefore reduces workload on the client. As an example, if a query returns a value of one from an integer column, you would get a string of 1 with a default cursor, whereas with a binary cursor you would get a 4-byte field containing the internal representation of the value (in big-endian byte order).

## Syntax

- Define a cursor.

```
DECLARE cursor_name [ BINARY ] [ NO SCROLL ]  
CURSOR [ { WITH | WITHOUT } HOLD ] FOR query ;
```
- Enable an anonymous block.

```
[DECLARE [declare_statements]]  
BEGIN  
execution_statements  
END;  
/
```

## Parameter Description

- **cursor\_name**  
Specifies the name of the cursor to be created.  
Value range: a string. It must comply with the naming convention.
- **BINARY**  
Causes the cursor to return data in binary rather than in text format.
- **NO SCROLL**  
Specifies how the cursor retrieves rows.
  - **NO SCROLL**: specifies that the cursor cannot be used to retrieve rows in a nonsequential fashion.
  - Unspecified: Based on the query's execution plan, the system automatically determines whether the cursor can be used to retrieve rows in a nonsequential fashion.
- **WITH HOLD**  
**WITHOUT HOLD**  
Specifies whether the cursor can continue to be used after the transaction that created it successfully commits.
  - **WITH HOLD**: The cursor can continue to be used after the transaction that created it successfully commits.
  - **WITHOUT HOLD**: The cursor cannot be used outside of the transaction that created it.
  - If neither **WITH HOLD** nor **WITHOUT HOLD** is specified, the default is **WITHOUT HOLD**.

---

**NOTICE**

- For a cursor declared as **WITH HOLD**, all data of the cursor is cached when a transaction ends. If the cursor has a large amount of data, this process may take a long time.
- 

- **query**  
Uses a **SELECT** or **VALUES** clause to specify the rows to be returned by the cursor.  
Value range: **SELECT** or **VALUES** clause
- **declare\_statements**  
Declares a variable, including its name and type, for example, **sales\_cnt int**.
- **execution\_statements**  
Specifies the statement to be executed in an anonymous block.  
Value range: an existing function name

## Examples

For details about how to define a cursor, see [Examples](#) in section "FETCH."

## Helpful Links

[BEGIN](#) and [FETCH](#)

## 7.14.98 DELETE

### Description

Deletes rows that satisfy the WHERE clause from the specified table. If the WHERE clause is absent, the effect is to delete all rows in the table. The result is a valid, but an empty table.

### Precautions

- The owner of a table, users granted with the DELETE permission on the table, or users granted with the DELETE ANY TABLE permission can delete data from the table. When separation of duties is disabled, a system administrator has the permission to delete data from the table by default, as well as the SELECT permission on any table in the USING clause or whose values are read in condition.
- For row-store replication tables, DELETE can be performed only in the following two scenarios:
  - Scenarios with primary key constraints.
  - Scenarios where the execution plan can be pushed down.
- The syntax for deleting multiple tables is not applicable to views and tables containing RULE.
- For a DELETE statement whose subquery is a STREAM plan, UPDATE cannot be performed on the deleted row data.

## Syntax

Delete a single table:

```
[ WITH [ RECURSIVE ] with_query [, ...] ]
DELETE [/*+ plan_hint */] [FROM] [ ONLY ] table_name [ * ] [ [ [partition_clause] [ [ AS ] alias ] ] |
[ [ [ AS ] alias ] [partition_clause] ] ]
[ USING using_list ]
[ WHERE condition | WHERE CURRENT OF cursor_name ]
[ ORDER BY {expression [ [ ASC | DESC | USING operator ] ] } [, ...] ]
[ LIMIT { count } ]
[ RETURNING { * | { output_expr [ [ AS ] output_name ] } [, ...] }];
```

Delete multiple tables:

```
[ WITH [ RECURSIVE ] with_query [, ...] ]
DELETE [/*+ plan_hint */] [FROM]
  {[ ONLY ] table_name [ * ] [ [ [partition_clause] [ [ AS ] alias ] ] | [ [ [ AS ] alias ]
[partition_clause] ] ] } [, ...]
[ USING using_list ]
[ WHERE condition ];
```

or

```
[ WITH [ RECURSIVE ] with_query [, ...] ]
DELETE [/*+ plan_hint */]
  {[ ONLY ] table_name [ * ] [ [ [partition_clause] [ [ AS ] alias ] ] | [ [ [ AS ] alias ]
[partition_clause] ] ] } [, ...]
[ FROM using_list ]
[ WHERE condition ];
```

Format of **with\_query**:

```
with_query_name [ ( column_name [, ...] ) ] AS [ [ NOT ] MATERIALIZED ]
( {select | values | insert | update | delete} )
```

## Parameters

- **WITH [ RECURSIVE ] with\_query [, ...]**

Specifies one or more subqueries that can be referenced by name in the main query, which is equivalent to a temporary table.

If RECURSIVE is specified, it allows a SELECT subquery to reference itself by name.

- **with\_query\_name** specifies the name of the result set generated by a subquery. Such names can be used to access the subquery result set.
- **column\_name** specifies the column name displayed in the subquery result set.
- Each subquery can be a **SELECT**, **VALUES**, **INSERT**, **UPDATE** or **DELETE** statement.
- You can use **MATERIALIZED** or **NOT MATERIALIZED** to modify the CTE.
  - If **MATERIALIZED** is specified, the WITH query will be materialized, and a copy of the subquery result set is generated. The copy is directly queried at the reference point. Therefore, the WITH subquery cannot be jointly optimized with the SELECT statement trunk (for example, predicate pushdown and equivalence class transfer). In this scenario, you can use **NOT MATERIALIZED** for modification. If the WITH query can be executed as a subquery inline, the preceding optimization can be performed.

- If the user does not explicitly declare the materialized attribute, comply with the following rules: If the CTE is referenced only once in the trunk statement to which it belongs and semantically supports inline execution, it will be rewritten as subquery inline execution. Otherwise, the materialized execution will be performed in CTE Scan mode.
  - **plan\_hint**  
Follows the **DELETE** keyword in the */\*+ \*/* format. It is used to optimize the plan of a **DELETE** statement block. For details, see [Hint-based Tuning](#). In each statement, only the first */\*+ plan\_hint\*/* comment block takes effect as a hint. Multiple hints can be written.
  - **ONLY**  
If **ONLY** is specified before the table name, matching rows are deleted from the named table only. If **ONLY** is not specified, matching rows are also deleted from any tables inheriting from the named table.
  - **table\_name**  
Specifies the name (optionally schema-qualified) of the target table.  
Value range: an existing table name
-  **NOTE**
- You can use database links to perform operations on remote tables. For details, see [DATABASE LINK](#).
- **partition\_clause**  
Deletes a specified partition.  
PARTITION { ( partition\_name ) | FOR ( partition\_value [, ...] ) } |  
SUBPARTITION { ( subpartition\_name ) | FOR ( subpartition\_value [, ...] ) }  
For details about the keywords, see [SELECT](#).  
For details, see [CREATE TABLE SUBPARTITION](#).
  - **partitions\_clause**  
Deletes multiple partitions.  
PARTITION { ( { partition\_name | subpartition\_name } [, ...] ) }  
This syntax takes effect only when **sql\_compatibility** is set to 'B'.  
For details about the keywords, see [SELECT](#).  
For details, see [CREATE TABLE SUBPARTITION](#).
  - **alias**  
Specifies a substitute name for the target table.  
Value range: a string. It must comply with the [naming convention](#).
  - **using\_list**  
Specifies the **USING** clause.

**NOTICE**

When **sql\_compatibility** is set to 'B' or multiple tables are to be deleted, the target tables can appear at the same time when **using\_list** specifies the set of associated tables. In addition, the aliases of the tables can be defined and used in the target tables. In other situations, the target tables cannot appear repeatedly in **using\_list**.

- **condition**

Specifies an expression that returns a Boolean value. Only rows for which this expression returns **true** will be deleted. You are not advised to use numeric types such as int for **condition**, because such types can be implicitly converted to bool values (non-zero values are implicitly converted to **true** and 0 is implicitly converted to **false**), which may cause unexpected results.

- **WHERE CURRENT OF cursor\_name**

When the cursor points to a row in a table, you can use this syntax to delete the row. For details about the restrictions, see [UPDATE](#).

- **ORDER BY**

For details about the keywords, see [SELECT](#).

- **LIMIT**

For details about the keywords, see [SELECT](#).

- **output\_expr**

Specifies an expression to be computed and returned by the **DELETE** statement after each row is deleted. The expression can use any column names of the table. Write \* to return all columns.

- **output\_name**

Specifies a name to use for a returned column.

Value range: a string. It must comply with the [naming convention](#).

## Examples

```
-- Create a schema.
gaussdb=# CREATE SCHEMA tpcds;

-- Create the tpcds.customer_address table.
gaussdb=# CREATE TABLE tpcds.customer_address
(
ca_address_sk      INTEGER      NOT NULL,
ca_address_id     CHARACTER(16) NOT NULL,
ca_street_number  INTEGER      ,
ca_street_name    CHARACTER (20)
);

-- Insert multiple records into the table.
gaussdb=# INSERT INTO tpcds.customer_address VALUES (1, 'AAAAAAAABAAAAAAA', '18', 'Jackson'),
(10000, 'AAAAAAAACAAAAAAA', '362', 'Washington 6th'),(15000, 'AAAAAAAADAAAAAAA', '585', 'Dogwood
Washington');

-- Create the tpcds.customer_address_bak table.
gaussdb=# CREATE TABLE tpcds.customer_address_bak AS TABLE tpcds.customer_address;

-- Delete employees whose ca_address_sk is smaller than 14888 from the tpcds.customer_address_bak
table.
gaussdb=# DELETE FROM tpcds.customer_address_bak WHERE ca_address_sk < 14888;
```

```
-- Delete all data from the tpcds.customer_address_bak table.
gaussdb=# DELETE FROM tpcds.customer_address_bak;

Delete the tpcds.customer_address_bak table.
gaussdb=# DROP TABLE tpcds.customer_address_bak;

-- Delete employees whose ca_address_sk is less than 50 from tables tpcds.customer_address and
tpcds.customer_address_bak.
gaussdb=# DELETE FROM a,b USING tpcds.customer_address a,tpcds.customer_address_bak b where
a.ca_address_sk = b.ca_address_sk and a.ca_address_sk < 50;
or
gaussdb=# DELETE a,b FROM tpcds.customer_address a,tpcds.customer_address_bak b where
a.ca_address_sk = b.ca_address_sk and a.ca_address_sk < 50;

-- Delete the tpcds.customer_address table.
gaussdb=# DROP TABLE tpcds.customer_address;

-- Delete a schema.
gaussdb=# DROP SCHEMA tpcds CASCADE;
```

## Suggestions

- delete  
To delete all records in a table, use the TRUNCATE syntax.

## 7.14.99 DO

### Function

Executes an anonymous code block.

The code block is treated as though it were the body of a function with no parameters, returning **void**. It is parsed and executed a single time.

### Precautions

- The procedural language to be used must already have been installed into the current database by means of **CREATE LANGUAGE**. **plpgsql** is installed by default, but other languages are not.
- The user must have the **USAGE** permission on the procedural language, or must be a system administrator if the language is untrusted.

### Syntax

```
DO [ LANGUAGE lang_name ] code;
```

### Parameter Description

- **lang\_name**  
Specifies the name of the procedural language the code is written in. If omitted, the default is **plpgsql**.
- **code**  
Specifies the procedural language code to be executed. This must be specified as a string literal.

### Examples

```
-- Create the webuser user.
gaussdb=# CREATE USER webuser PASSWORD '*****';
```

```
-- Grant all permissions on all views in the tpcds schema to the webuser user.
gaussdb=# DO $$DECLARE r record;
BEGIN
  FOR r IN SELECT c.relname table_name,n.nspname table_schema FROM pg_class c,pg_namespace n
    WHERE c.relnamespace = n.oid AND n.nspname = 'tpcds' AND relkind IN ('r','v')
  LOOP
    EXECUTE 'GRANT ALL ON ' || quote_ident(r.table_schema) || '.' || quote_ident(r.table_name) || ' TO
webuser';
  END LOOP;
END$$;

-- Delete the webuser user.
gaussdb=# DROP USER webuser CASCADE;
```

## 7.14.100 DROP AGGREGATE

### Function

**DROP AGGREGATE** deletes an aggregate function.

### Precautions

**DROP AGGREGATE** deletes an existing aggregate function. Only the owner of the aggregate function can run this command.

### Syntax

```
DROP AGGREGATE [ IF EXISTS ] name ( argtype [ , ... ] ) [ CASCADE | RESTRICT ]
```

### Parameter Description

- **IF EXISTS**  
Do not throw an error if the specified aggregation does not exist. A notice is issued in this case.
- **name**  
Existing aggregate function name (optionally schema-qualified).
- **argtype**  
Input data type of the aggregate function. To reference a zero-parameter aggregate function, use \* to replace the input data type list.
- **CASCADE**  
Cascade deletes objects that depend on the aggregate function.
- **RESTRICT**  
Refuses to delete the aggregate function if any objects depend on it. This is a default processing.

### Examples

Delete the aggregate function **myavg** of the integer type:

```
DROP AGGREGATE myavg(integer);
```

## Compatibility

The SQL standard does not provide the **DROP AGGREGATE** statement.

## 7.14.101 DROP AUDIT POLICY

### Description

Deletes an audit policy.

### Precautions

Only users with the poladmin or sysadmin permission, or the initial user can perform this operation.

### Syntax

```
DROP AUDIT POLICY [IF EXISTS] policy_name;
```

### Parameters

policy\_name

Specifies the audit policy name, which must be unique.

Value range: a string. It must comply with the [naming convention](#).

### Examples

See [Examples](#) in section "CREATE AUDIT POLICY."

### Helpful Links

[ALTER AUDIT POLICY](#) and [CREATE AUDIT POLICY](#)

## 7.14.102 DROP CAST

### Description

DROP CAST deletes a type conversion.

### Precautions

To delete a type conversion, you must have a source or destination data type. This is the same permission as creating a type conversion.

### Syntax

```
DROP CAST [ IF EXISTS ] (source_type AS target_type) [ CASCADE | RESTRICT ]
```

### Parameters

- **IF EXISTS**

Do not throw an error if the specified conversion does not exist. A notice is issued in this case.

- **source\_type**  
Source data type in the type conversion.
- **target\_type**  
Type of the target data in the type conversion.
- **CASCADE | RESTRICT**  
These keys have no effect because there is no dependency on type conversion.

## Example

Delete the conversion from text to int.

```
DROP CAST (text AS int);
```

## Compatibility

DROP CAST complies with the SQL standard.

## 7.14.103 DROP CLIENT MASTER KEY

### Description

Deletes a CMK.

### Precautions

- Only the CMK owner or a user who has been granted the DROP permission can run this command. By default, the system administrator has this permission.
- This command can only delete the metadata of key objects recorded in the system catalog of the database, but cannot delete the key entities managed by the client key tool or online key service.

### Syntax

```
DROP CLIENT MASTER KEY [ IF EXISTS ] client_master_key_name [, ...] [ CASCADE | RESTRICT ];
```

### Parameters

- **IF EXISTS**  
If a specified CMK does not exist, a notice rather than an error is issued.
- **client\_master\_key\_name**  
Name of a CMK to be deleted.  
Value range: a string. It is the name of an existing CMK object.
- **CASCADE | RESTRICT**
  - Allows/Restricts to delete objects that depend on the CMK.

### Examples

```
-- Delete a CMK object.  
gaussdb=> DROP CLIENT MASTER KEY imgCMK CASCADE;  
NOTICE: drop cascades to column setting: imgcek  
DROP CLIENT MASTER KEY
```

## 7.14.104 DROP COLUMN ENCRYPTION KEY

### Description

**CREATE COLUMN ENCRYPTION KEY** deletes a column encryption key (CEK).

### Precautions

Only the CEK owner or a user who has been granted the DROP permission can run this command. By default, the system administrator has this permission.

### Syntax

```
DROP COLUMN ENCRYPTION KEY [ IF EXISTS ] client_column_key_name [, ...] [ CASCADE | RESTRICT ];
```

### Parameters

- **IF EXISTS**  
If a specified CEK does not exist, a notice rather than an error is issued.
- **client\_column\_key\_name**  
Name of a CEK to be deleted.  
Value range: a string. It is the name of an existing CEK.
- **CASCADE | RESTRICT**  
For fully-encrypted databases, this syntax is high-risk operation. Actually, encrypted columns that depend on CEKs cannot be deleted.

### Examples

```
-- Delete a CEK.  
gaussdb=# DROP COLUMN ENCRYPTION KEY imgCEK CASCADE;  
ERROR: cannot drop column setting: imgcek cascadelly because encrypted column depend on it.  
HINT: we have to drop encrypted column: name, ... before drop column setting: imgcek cascadelly.
```

## 7.14.105 DROP DATABASE

### Function

Deletes a database.

### Precautions

- Only the database owner or a user granted with the DROP permission can run the **DROP DATABASE** command. The system administrator has this permission by default.
- The preinstalled POSTGRES, TEMPLATE0, and TEMPLATE1 databases are protected and therefore cannot be deleted. To check databases in the current service, run the `gsql` statement `\l`.
- If any users are connected to the database, the database cannot be deleted.
- **DROP DATABASE** cannot be executed within a transaction block.
- If **DROP DATABASE** fails and is rolled back, run **DROP DATABASE IF EXISTS** again.

---

**NOTICE**

**DROP DATABASE** cannot be undone.

---

## Syntax

```
DROP DATABASE [ IF EXISTS ] database_name ;
```

## Parameter Description

- **IF EXISTS**  
Reports a notice instead of an error if the specified database does not exist.
- **database\_name**  
Specifies the name of the database to be deleted.  
Value range: an existing database name

## Examples

See [Examples](#) in section "CREATE DATABASE."

## Helpful Links

[CREATE DATABASE](#)

## Suggestions

- **DROP DATABASE**  
Do not delete databases during transactions.

## 7.14.106 DROP DATABASE LINK

### Description

Deletes database link objects.

### Syntax

```
DROP [ PUBLIC ] DATABASE LINK dblink ;
```

### Parameters

- **dblink**  
Name of a connection object.
- **PUBLIC**  
Specifies the connection type. If **PUBLIC** is not specified, the database link is private by default.

## 7.14.107 DROP DIRECTORY

### Function

Deletes a directory.

### Precautions

- When **enable\_access\_server\_directory** is set to **off**, only the initial user is allowed to delete the directory object.
- When **enable\_access\_server\_directory** is set to **on**, a user with the SYSADMIN permission, a directory object owner, a user granted with the DROP permission for a directory, or a user inherited from the built-in role `gs_role_directory_drop` can delete a directory object.

### Syntax

```
DROP DIRECTORY [ IF EXISTS ] directory_name;
```

### Parameters

- **directory\_name**  
Specifies the name of the directory to be deleted.  
Value range: an existing directory name

### Examples

```
-- Create a directory.  
gaussdb=# CREATE OR REPLACE DIRECTORY dir as '/tmp/';  
  
-- Delete a directory.  
gaussdb=# DROP DIRECTORY dir;
```

### Helpful Links

[CREATE DIRECTORY](#) and [ALTER DIRECTORY](#)

## 7.14.108 DROP EVENT

### Description

Deletes a scheduled task.

### Precautions

Operations related to scheduled tasks are supported only when **sql\_compatibility** is set to **'B'**.

### Syntax

```
DROP EVENT [IF EXISTS] event_name
```

## Parameters

- **IF EXISTS**  
If the scheduled task does not exist, a NOTICE message is displayed.

## Example

```
gaussdb=# DROP EVENT event_e1;
```

## 7.14.109 DROP FOREIGN DATA WRAPPER

### Description

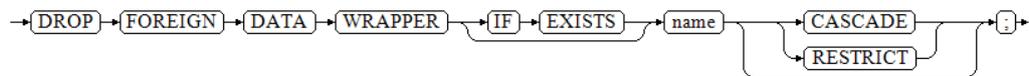

Deletes a specified foreign data wrapper.

### Precautions

The DROP statement can be successfully executed only when **support\_extended\_features** is set to **on**.

### Syntax

```
DROP FOREIGN DATA WRAPPER [ IF EXISTS ] name [ CASCADE | RESTRICT ];
```

### Parameters

- **IF EXISTS**  
Sends a notification instead of throwing an error if the foreign data wrapper does not exist.
- **name**  
Specifies the name of an existing foreign data wrapper.
- **CASCADE**  
Automatically drops objects (such as servers) that depend on the foreign data wrapper.
- **RESTRICT**  
If there are objects that depend on the foreign data wrapper, the foreign data wrapper cannot be deleted. This is the default behavior.

## Example

```
-- Delete the foreign data wrapper dbi.  
gaussdb=# DROP FOREIGN DATA WRAPPER dbi;
```

## Helpful Links

[ALTER FOREIGN DATA WRAPPER](#) and [CREATE FOREIGN DATA WRAPPER](#)

## 7.14.110 DROP FUNCTION

### Function

Deletes a function.

### Precautions

- If a function involves operations on temporary tables, **DROP FUNCTION** cannot be used.
- Only the function owner or a user granted with the DROP permission can run the **DROP FUNCTION** command. The system administrator has this permission by default.

### Syntax

```
DROP FUNCTION [ IF EXISTS ] function_name  
[ ( [ [ argname ] [ argmode ] argtype ] [, ...] ) [ CASCADE | RESTRICT ] );
```

### Parameter Description

- **IF EXISTS**  
Reports a notice instead of an error if the specified function does not exist.
- **function\_name**  
Specifies the name of the function to be deleted.  
Value range: an existing function name
- **argmode**  
Specifies the parameter mode of the function.
- **argname**  
Specifies the parameter name of the function.
- **argtype**  
Specifies the parameter type of the function.
- **CASCADE | RESTRICT**
  - **CASCADE**: automatically deletes the objects that depend on the function.
  - **RESTRICT**: refuses to delete the function if any objects depend on it. This is the default action.

### Examples

For details, see [Examples](#).

### Helpful Links

[ALTER FUNCTION](#) and [CREATE FUNCTION](#)

## 7.14.111 DROP GLOBAL CONFIGURATION

### Function

**DROP GLOBAL CONFIGURATION** deletes parameter values from the **gs\_global\_config** system catalog.

### Precautions

- Only the initial database user can run this command.
- The **weak\_password** keyword cannot be deleted.

### Syntax

```
DROP GLOBAL CONFIGURATION Parameter name, Parameter name...;
```

### Parameter Description

The parameter is a parameter that already exists in the **gs\_global\_config** system catalog. If you delete a parameter that does not exist, an error will be reported.

## 7.14.112 DROP GROUP

### Function

Deletes a user group. DROP GROUP is an alias for DROP ROLE.

### Precautions

DROP GROUP is an API of the GaussDB management tool. You are advised not to use this API, because doing so affects GaussDB.

### Syntax

```
DROP GROUP [ IF EXISTS ] group_name [, ...];
```

### Parameter Description

See [Parameter Description](#) in section "DROP ROLE."

### Helpful Links

[CREATE GROUP](#), [ALTER GROUP](#), and [DROP ROLE](#)

## 7.14.113 DROP INDEX

### Function

Drops an index.

### Precautions

Only the index owner, owner of the schema where the index resides, a user who has the INDEX permission on the table where the index resides, or a user who has

the DROP ANY INDEX permission can run the **DROP INDEX** command. The system administrator has this permission by default.

For a global temporary table, if a session has initialized a global temporary table object (including creating a global temporary table and inserting data into the global temporary table for the first time), other sessions cannot delete indexes from the table.

## Syntax

```
DROP INDEX [ CONCURRENTLY ] [ IF EXISTS ]  
index_name [, ...] [ CASCADE | RESTRICT ];
```

## Parameter Description

- **CONCURRENTLY**

Deletes an index without locking it. When an index is deleted, other statements cannot access the table on which the index depends. With this option, the statement does not lock the table during index deletion.

This parameter can specify only one index name and does not support **CASCADE**.

The **DROP INDEX** statement can be run within a transaction, but **DROP INDEX CONCURRENTLY** cannot.

- **IF EXISTS**

Reports a notice instead of an error if the specified index does not exist.

- **index\_name**

Specifies the index name to be deleted.

Value range: an existing index

- **CASCADE | RESTRICT**

- **CASCADE**: automatically deletes the objects that depend on the index.

- **RESTRICT**: refuses to delete the index if any objects depend on it. This is the default action.

## Examples

See [Examples](#) in section "CREATE INDEX."

## Helpful Links

[ALTER INDEX](#) and [CREATE INDEX](#)

## 7.14.114 DROP LANGUAGE

This version does not support this syntax.

## 7.14.115 DROP MASKING POLICY

### Description

Deletes a masking policy.

## Precautions

Only users with the POLADMIN or SYSADMIN permission, or the initial user can perform this operation.

## Syntax

```
DROP MASKING POLICY [ IF EXISTS ] policy_name;
```

## Parameters

### policy\_name

Specifies the audit policy name, which must be unique.

Value range: a string. It must comply with the [naming convention](#).

## Examples

```
-- Delete a masking policy.  
gaussdb=# DROP MASKING POLICY IF EXISTS maskpol1;  
  
-- Delete a group of masking policies.  
gaussdb=# DROP MASKING POLICY IF EXISTS maskpol1, maskpol2, maskpol3;
```

## Helpful Links

[ALTER MASKING POLICY](#) and [CREATE MASKING POLICY](#)

## 7.14.116 DROP MATERIALIZED VIEW

### Function

Deletes an existing materialized view from the database.

### Precautions

The owner of a materialized view, owner of the schema of the materialized view, users granted with the DROP permission on the materialized view, or users granted with the DROP ANY TABLE permission can run the **DROP MATERIALIZED VIEW** command. By default, the system administrator has the permission to run the command.

### Syntax

```
DROP MATERIALIZED VIEW [ IF EXISTS ] mv_name [, ...] [ CASCADE | RESTRICT ];
```

### Parameter Description

- **IF EXISTS**  
Reports a notice instead of an error if the specified materialized view does not exist.
- **mv\_name**  
Name of the materialized view to be deleted.
- **CASCADE | RESTRICT**

- **CASCADE**: automatically deletes the objects that depend on the materialized view.
- **RESTRICT**: refuses to delete the materialized view if any objects depend on it. This is the default action.

## Examples

```
-- Create a table.
gaussdb=# CREATE TABLE my_table (c1 int, c2 int)
WITH(STORAGE_TYPE=ASTORE);

-- Create a materialized view named my_mv.
gaussdb=# CREATE MATERIALIZED VIEW my_mv AS SELECT * FROM my_table;

-- Delete the materialized view named my_mv.
gaussdb=# DROP MATERIALIZED VIEW my_mv;

-- Delete the table.
gaussdb=# DROP TABLE my_table;
```

## Helpful Links

[ALTER MATERIALIZED VIEW](#), [CREATE INCREMENTAL MATERIALIZED VIEW](#), [CREATE MATERIALIZED VIEW](#), [CREATE TABLE](#), [REFRESH INCREMENTAL MATERIALIZED VIEW](#), and [REFRESH MATERIALIZED VIEW](#)

## 7.14.117 DROP MODEL

### Description

Deletes a model object that has been trained and saved.

### Precautions

The deleted model can be viewed in the `gs_model_warehouse` system catalog.

### Syntax

```
DROP MODEL model_name;
```

### Parameters

`model_name`

Specifies a model name.

Value range: a string. It must comply with the [naming convention](#).

## Helpful Links

[CREATE MODEL](#) and [PREDICT BY](#)

## 7.14.118 DROP OPERATOR

**DROP OPERATOR** drops the definition of an operator.

## Syntax

```
DROP OPERATOR [ IF EXISTS ] name ( { left_type | NONE } , { right_type | NONE } );
```

## Description

- **name**  
Name of an existing operator.
- **left\_type**  
Data type of the left operand for the operator; if there is no left operand, write NONE.
- **right\_type**  
Data type of the right operand for the operator; if there is no right operand, write NONE.

## Examples

Drop a user-defined operator for text a @@ b:

```
DROP OPERATOR @@ (text, text);
```

## 7.14.119 DROP OWNED

### Description

Deletes the database objects owned by a database role.

### Precautions

- This interface will revoke the role's permissions on all objects in the current database and shared objects (databases and tablespaces).
- **DROP OWNED** is often used to prepare for removing one or more roles. Because **DROP OWNED** affects only the objects in the current database, you need to run this statement in each database that contains the objects owned by the role to be removed.
- Using the **CASCADE** option may cause this statement to recursively remove objects owned by other users.
- The databases and tablespaces owned by the role will not be removed.
- Private database links owned by a role can be deleted only after the **CASCADE** option is added.

### Syntax

```
DROP OWNED BY name [, ...] [ CASCADE | RESTRICT ];
```

### Parameters

- **name**  
Specifies the role name.
- **CASCADE | RESTRICT**
  - **CASCADE**: automatically deletes the objects that depend on the objects to be deleted.

- **RESTRICT**: refuses to delete the objects if other objects depend on them. This is the default action.

## Helpful Links

[REASSIGN OWNED](#) and [DROP ROLE](#)

## 7.14.120 DROP PACKAGE

### Function

**DROP PACKAGE** deletes the existing package or package body.

### Precautions

After the package body is deleted, the stored procedures and functions in the package become invalid at the same time.

### Syntax

```
DROP PACKAGE [ IF EXISTS ] package_name;  
DROP PACKAGE BODY [ IF EXISTS ] package_name;
```

## 7.14.121 DROP PROCEDURE

### Function

**DROP PROCEDURE** deletes a stored procedure.

### Precautions

None

### Syntax

```
DROP PROCEDURE [ IF EXISTS ] procedure_name ;
```

### Parameter Description

- **IF EXISTS**  
Reports a notice instead of an error if the specified stored procedure does not exist.
- **procedure\_name**  
Specifies the name of the stored procedure to be deleted.  
Value range: an existing stored procedure name

## Helpful Links

[CREATE PROCEDURE](#)

## 7.14.122 DROP RESOURCE LABEL

### Function

**DROP RESOURCE LABEL** deletes a resource label.

### Precautions

Only users with the POLADMIN or SYSADMIN permission, or the initial user can perform this operation.

### Syntax

```
DROP RESOURCE LABEL [IF EXISTS] label_name[, ...];
```

### Parameter Description

#### label\_name

Specifies the resource label name.

Value range: a string. It must comply with the [naming convention](#).

### Examples

```
-- Delete a resource label.  
gaussdb=# DROP RESOURCE LABEL IF EXISTS res_label1;  
  
-- Delete a group resource label.  
gaussdb=# DROP RESOURCE LABEL IF EXISTS res_label1, res_label2, res_label3;
```

### Helpful Links

[ALTER RESOURCE LABEL](#) and [CREATE RESOURCE LABEL](#)

## 7.14.123 DROP RESOURCE POOL

### Description

Deletes a resource pool.

#### NOTE

The resource pool cannot be deleted if it is associated with a role.

### Precautions

Only a user with the **DROP** permission on the current database can perform this operation.

### Syntax

```
DROP RESOURCE POOL [ IF EXISTS ] pool_name;
```

## Parameters

- **IF EXISTS**  
Reports a notice instead of an error if a specified resource pool does not exist.
- **pool\_name**  
Specifies the name of a created resource pool.  
Value range: a string. It must comply with the [naming convention](#).

## Examples

See [Examples](#) in section "CREATE RESOURCE POOL."

## Helpful Links

[ALTER RESOURCE POOL](#) and [CREATE RESOURCE POOL](#)

## 7.14.124 DROP ROLE

### Function

**DROP ROLE** deletes a role.

### Precautions

None

### Syntax

```
DROP ROLE [ IF EXISTS ] role_name [, ...];
```

### Parameter Description

- **IF EXISTS**  
Reports a notice instead of an error if the specified role does not exist.
- **role\_name**  
Specifies the name of the role to be deleted.  
Value range: an existing role name

## Examples

See [Examples](#) in [CREATE ROLE](#).

## Helpful Links

[CREATE ROLE](#), [ALTER ROLE](#), and [SET ROLE](#)

## 7.14.125 DROP ROW LEVEL SECURITY POLICY

### Function

Deletes a row-level access control policy from a table.

## Precautions

Only the table owner or administrators can delete a row-level access control policy from the table.

## Syntax

```
DROP [ ROW LEVEL SECURITY ] POLICY [ IF EXISTS ] policy_name ON table_name [ CASCADE | RESTRICT ]
```

## Parameter Description

- **IF EXISTS**  
Reports a notice instead of an error if the specified row-level access control policy does not exist.
- **policy\_name**  
Specifies the name of the row-level access control policy to be deleted.
  - **table\_name**  
Specifies the name of the table containing the row-level access control policy.
  - **CASCADE/RESTRICT**  
Currently, no objects depend on row-level access control policies. Therefore, **CASCADE** is equivalent to **RESTRICT**, and they are reserved to ensure backward compatibility.

## Examples

```
-- Create the data table all_data.  
gaussdb=# CREATE TABLE all_data(id int, role varchar(100), data varchar(100));  
  
-- Create a row-level access control policy.  
gaussdb=# CREATE ROW LEVEL SECURITY POLICY all_data_rls ON all_data USING(role = CURRENT_USER);  
  
-- Delete a row-level access control policy.  
gaussdb=# DROP ROW LEVEL SECURITY POLICY all_data_rls ON all_data;  
  
-- Delete the all_data table.  
gaussdb=# DROP TABLE all_data;
```

## Helpful Links

[ALTER ROW LEVEL SECURITY POLICY](#) and [CREATE ROW LEVEL SECURITY POLICY](#)

## 7.14.126 DROP RULE

### Function

**DROP RULE** deletes a rewriting rule.

### Syntax

```
DROP RULE [ IF EXISTS ] name ON table_name [ CASCADE | RESTRICT ]
```

## Parameter Description

- **IF EXISTS**  
If the rule does not exist, a **NOTICE** is thrown.
- **name**  
Name of an existing rule to be deleted.
- **table\_name**  
Name of the table to which the rule applies.
- **CASCADE**  
Automatically cascade deletes objects that depend on this rule.
- **RESTRICT**  
By default, if any objects depend on the rule, the rule cannot be deleted.

## Examples

```
-- Delete a rewriting rule (newrule).  
DROP RULE newrule ON mytable;
```

## 7.14.127 DROP SCHEMA

### Function

Deletes a schema from the current database.

### Precautions

- Only the schema owner or a user granted with the DROP permission can run the **DROP SCHEMA** command. The system administrator has this permission by default.
- Only initial users and O&M administrators can run the **DROP SCHEMA** command for O&M administrators. Other users cannot run **DROP SCHEMA** for O&M administrators.

### Syntax

```
DROP SCHEMA [ IF EXISTS ] schema_name [ , ... ] [ CASCADE | RESTRICT ];
```

## Parameter Description

- **IF EXISTS**  
Reports a notice instead of an error if the specified schema does not exist.
- **schema\_name**  
Specifies the name of the schema to be deleted.  
Value range: an existing schema name
- **CASCADE | RESTRICT**
  - **CASCADE**: automatically deletes all the objects contained in the schema.
  - **RESTRICT**: refuses to delete the schema if the schema contains objects. This is the default action.

### NOTICE

Schemas beginning with **pg\_temp** or **pg\_toast\_temp** are for internal use. Do not delete them. Otherwise, unexpected consequences may be incurred.

### NOTE

The schema currently being used cannot be deleted. To delete it, switch to another schema first.

## Examples

See [Examples](#) in **CREATE SCHEMA**.

## Helpful Links

[ALTER SCHEMA](#) and [CREATE SCHEMA](#)

## 7.14.128 DROP SEQUENCE

### Function

**DROP SEQUENCE** deletes a sequence from the current database.

### Precautions

- Only the owner of a sequence, the owner of the schema to which the sequence belongs, or a user granted the DROP permission on a sequence or a user granted the DROP ANY SEQUENCE permission can delete a sequence. A system administrator has this permission by default.
- If the LARGE identifier is used when a sequence is created, the LARGE identifier must be used when the sequence is dropped.

### Syntax

```
DROP [ LARGE ] SEQUENCE [ IF EXISTS ] {[schema.]sequence_name} [ , ... ] [ CASCADE | RESTRICT ];
```

### Parameters

- **IF EXISTS**  
Reports a notice instead of an error if the specified sequence does not exist.
- **name**  
Specifies the name of the sequence to be deleted.
- **CASCADE**  
Automatically deletes the objects that depend on the sequence.
- **RESTRICT**  
Refuses to delete the sequence if any objects depend on it. This is the default action.

## Examples

```
-- Create an ascending sequence named serial, starting from 101.  
gaussdb=# CREATE SEQUENCE serial START 101;  
  
-- Delete a sequence.  
gaussdb=# DROP SEQUENCE serial;
```

## Helpful Links

[ALTER SEQUENCE](#) and [DROP SEQUENCE](#)

## 7.14.129 DROP SERVER

### Description

Drops an existing data server.

### Precautions

Only the server owner or a user granted with the DROP permission can run the **DROP SERVER** command. A system administrator has this permission by default.

### Syntax

```
DROP SERVER [ IF EXISTS ] server_name [ { CASCADE | RESTRICT } ] ;
```

### Parameters

- **IF EXISTS**  
Reports a notice instead of an error if the specified data server does not exist.
- **server\_name**  
Specifies the name of the data server to be dropped.
- **CASCADE | RESTRICT**
  - **CASCADE**: automatically deletes the objects that depend on the data server.
  - **RESTRICT**: refuses to delete the server if any objects depend on it. This is the default action.

## Helpful Links

[ALTER SERVER](#) and [CREATE SERVER](#)

## 7.14.130 DROP SYNONYM

### Function

**DROP SYNONYM** deletes a synonym.

## Precautions

Only the synonym owner or a user granted with the DROP ANY SEQUENCE permission can run the **DROP SYNONYM** command. The system administrator has this permission by default.

## Syntax

```
DROP SYNONYM [ IF EXISTS ] synonym_name [ CASCADE | RESTRICT ];
```

## Parameter Description

- **IF EXISTS**  
Reports a notice instead of an error if the specified synonym does not exist.
- **synonym\_name**  
Specifies the name (optionally schema-qualified) of the synonym to be deleted.
- **CASCADE | RESTRICT**
  - **CASCADE**: automatically deletes the objects (such as views) that depend on the synonym.
  - **RESTRICT**: refuses to delete the synonym if any objects depend on it. This is the default action.

## Examples

See [Examples](#) in **CREATE SYNONYM**.

## Helpful Links

[ALTER SYNONYM](#) and [CREATE SYNONYM](#)

## 7.14.131 DROP TABLE

### Description

Deletes a table.

### Precautions

- After DROP TABLE deletes the table, the indexes depending on the table are deleted, and the functions and stored procedures that need to use this table cannot be executed. Deleting a partitioned table also deletes all partitions in the table.
- The owner of a table, the owner of the schema of the table, users granted with the DROP permission on the table, or users granted with the DROP ANY TABLE permission can delete the specified table. The system administrator has the permission to delete the specified table by default.
- When DROP TABLE is executed, if the table to be deleted references another table as a foreign key table, triggers on the referenced table will be deleted in cascading mode. In this case, an eight-level lock needs to be added to the referenced table, which may cause service congestion.

## Syntax

```
DROP TABLE [ IF EXISTS ]  
{ [schema.]table_name } [, ...] [ CASCADE | RESTRICT ] [ PURGE ];
```

## Parameters

- **IF EXISTS**  
Reports a notice instead of an error if the specified table does not exist.
- **schema**  
Specifies the schema name.
- **table\_name**  
Specifies the name of the table to be deleted.
- **CASCADE | RESTRICT**
  - **CASCADE**: allows to delete the objects (such as views) that depend on the table.
  - **RESTRICT**: refuses to delete the table if any objects depend on it. This is the default action.
- **PURGE**  
Specifies that even if the recycle bin function is enabled, the table is physically dropped instead of being moved to the recycle bin when you use DROP TABLE to delete tables.

## Examples

See [Examples](#) in section "CREATE TABLE."

## Helpful Links

[ALTER TABLE](#) and [CREATE TABLE](#)

## 7.14.132 DROP TABLESPACE

### Function

**DROP TABLESPACE** deletes a tablespace.

### Precautions

- Only the tablespace owner or a user granted with the DROP permission can run the **DROP TABLESPACE** command. The system administrator has this permission by default.
- The tablespace to be deleted should not contain any database objects. Otherwise, an error will be reported.
- DROP TABLESPACE cannot be rolled back and therefore cannot be run in transaction blocks.
- During execution of DROP TABLESPACE, database queries by other sessions using **\db** may fail and need to be reattempted.
- If DROP TABLESPACE fails to be executed, execute DROP TABLESPACE IF EXISTS.

## Syntax

```
DROP TABLESPACE [ IF EXISTS ] tablespace_name;
```

## Parameter Description

- **IF EXISTS**  
Reports a notice instead of an error if the specified tablespace does not exist.
- **tablespace\_name**  
Specifies the name of the tablespace to be deleted.  
Value range: an existing tablespace name

## Examples

See [Examples](#) in section "CREATE TABLESPACE."

## Helpful Links

[ALTER TABLESPACE](#) and [CREATE TABLESPACE](#)

## Suggestions

- **DROP TABLESPACE**  
Do not delete tablespaces during transactions.

## 7.14.133 DROP TRIGGER

### Function

**DROP TRIGGER** deletes a trigger.

### Precautions

Only the trigger owner or a user granted with the DROP ANY TRIGGER permission can run the **DROP TRIGGER** command. The system administrator has this permission by default.

## Syntax

```
DROP TRIGGER [ IF EXISTS ] trigger_name ON table_name [ CASCADE | RESTRICT ];
```

## Parameter Description

- **IF EXISTS**  
Reports a notice instead of an error if the specified trigger does not exist.
- **trigger\_name**  
Specifies the name of the trigger to be deleted.  
Value range: an existing trigger name
- **table\_name**  
Specifies the name of the table containing the trigger.  
Value range: name of the table containing the trigger

- **CASCADE | RESTRICT**
  - **CASCADE**: automatically deletes the objects that depend on the trigger.
  - **RESTRICT**: refuses to delete the trigger if any objects depend on it. This is the default action.

## Examples

For details, see [Examples](#) in [CREATE TRIGGER](#).

## Helpful Links

[CREATE TRIGGER](#), [ALTER TRIGGER](#), and [ALTER TABLE](#)

## 7.14.134 DROP TYPE

### Function

**DROP TYPE** deletes a user-defined data type.

### Precautions

Only the owner of a type, a user granted the DROP permission on a type, or a user granted the DROP ANY TYPE permission on a sequence can run the **DROP TYPE** command. The system administrator has this permission by default.

### Syntax

```
DROP TYPE [ IF EXISTS ] name [, ...] [ CASCADE | RESTRICT ]
```

### Parameter Description

- **IF EXISTS**  
Reports a notice instead of an error if the specified type does not exist.
- **name**  
Specifies the name (optionally schema-qualified) of the type to be deleted.
- **CASCADE**  
Automatically deletes the objects (such as fields, functions, and operators) that depend on the type.  
**RESTRICT**  
Refuses to delete the type if any objects depend on it. This is the default action.

## Examples

See [Examples](#) in [CREATE TYPE](#).

## Helpful Links

[CREATE TYPE](#) and [ALTER TYPE](#)

## 7.14.135 DROP USER

### Description

Deletes a user and the schema with the same name as the user.

### Precautions

- **CASCADE** is used to delete the objects (excluding databases) that depend on the user. **CASCADE** cannot delete locked objects unless the objects are unlocked or the processes locking the objects are killed.
- If the dependent objects are other databases or reside in other databases, manually delete them before deleting the user from the current database. **DROP USER** cannot delete objects across databases.
- Before deleting a user, you need to delete all the objects owned by the user and revoke the user's permissions on other objects. Alternatively, you can specify **CASCADE** to delete the objects owned by the user and the granted permissions.

### Syntax

```
DROP USER [ IF EXISTS ] user_name [, ...] [ CASCADE | RESTRICT ];
```

### Parameters

- **IF EXISTS**  
Reports a notice instead of an error if the specified user does not exist.
- **user\_name**  
Specifies the name of the user to be deleted.  
Value range: an existing username
- **CASCADE | RESTRICT**
  - **CASCADE**: automatically deletes the objects that depend on the user.
  - **RESTRICT**: refuses to delete the user if any objects depend on it. This is the default action.

#### NOTE

In GaussDB, the **enable\_kill\_query** configuration parameter exists in the **postgresql.conf** file. This parameter affects **CASCADE**.

- If **enable\_kill\_query** is **on** and **CASCADE** is used, the statement automatically kills the processes locking dependent objects and then deletes the specified user.
- If **enable\_kill\_query** is **off** and **CASCADE** is used, the statement waits until the processes locking dependent objects stop and then deletes the specified user.

### Examples

See [Examples](#) in section "CREATE USER."

## Helpful Links

[ALTER USER](#) and [CREATE USER](#)

## 7.14.136 DROP USER MAPPING

### Function

**DROP USER MAPPING** drops a user mapping for a foreign server.

### Syntax

```
DROP USER MAPPING [ IF EXISTS ] FOR { user_name | USER | CURRENT_USER | PUBLIC } SERVER  
server_name;
```

### Parameter Description

- **IF EXISTS**  
Reports a notice instead of an error if the user mapping does not exist.
- **user\_name**  
Specifies user name of the mapping.  
CURRENT\_USER and USER match the name of the current user. PUBLIC is used to match all current and future user names in the system.
- **server\_name**  
Specifies name of the server to which the user is mapped.

## Helpful Links

[ALTER USER MAPPING](#) and [CREATE USER MAPPING](#)

## 7.14.137 DROP VIEW

### Function

**DROP VIEW** deletes a view from a database.

### Precautions

The owner of a view, owner of the schema of the view, users granted with the DROP permission on the view, or users granted with the DROP ANY TABLE permission can run the **DROP VIEW** command. By default, the system administrator has the permission to run the command.

### Syntax

```
DROP VIEW [ IF EXISTS ] view_name [, ...] [ CASCADE | RESTRICT ];
```

## Parameter Description

- **IF EXISTS**  
Reports a notice instead of an error if the specified view does not exist.
- **view\_name**  
Specifies the name of the view to be deleted.  
Value range: an existing view name
- **CASCADE | RESTRICT**
  - **CASCADE**: automatically deletes the objects (such as other views) that depend on the view.
  - **RESTRICT**: refuses to delete the view if any objects depend on it. This is the default action.

## Examples

See [Examples](#) in section "CREATE VIEW."

## Helpful Links

[ALTER VIEW](#) and [CREATE VIEW](#)

## 7.14.138 DROP WEAK PASSWORD DICTIONARY

### Function

**DROP WEAK PASSWORD DICTIONARY** clears all weak passwords in `gs_global_config`.

### Precautions

Only the initial user, system administrator, and security administrator have the permission to execute this syntax.

### Syntax

```
DROP WEAK PASSWORD DICTIONARY;
```

### Parameter Description

None

### Examples

See the examples in [CREATE WEAK PASSWORD DICTIONARY](#).

### Helpful Links

[CREATE WEAK PASSWORD DICTIONARY](#)

## 7.14.139 EXECUTE

### Function

Executes a prepared statement. Because a prepared statement exists only in the lifetime of the session, the prepared statement must be created earlier in the current session by using the **PREPARE** statement.

### Precautions

If the **PREPARE** statement creating the prepared statement declares some parameters, the parameter set passed to the **EXECUTE** statement must be compatible. Otherwise, an error will occur.

### Syntax

```
EXECUTE name [ ( parameter [, ...] ) ] ;
```

### Parameter Description

- **name**  
Specifies the name of the prepared statement to be executed.
- **parameter**  
Specifies a parameter of the prepared statement. It must be an expression that generates a value compatible with the data type of the parameter specified when the prepared statement was created. **ROWNUM** cannot be used as a parameter.

### Examples

```
-- Create a schema.
gaussdb=# CREATE SCHEMA tpcds;

-- Create the reason table.
gaussdb=# CREATE TABLE tpcds.reason (
  CD_DEMO_SK      INTEGER      NOT NULL,
  CD_GENDER      character(16) ,
  CD_MARITAL_STATUS character(100)
)
;

-- Insert data.
gaussdb=# INSERT INTO tpcds.reason VALUES(51, 'AAAAAAAADDAAAAAA', 'reason 51');

-- Create the reason_t1 table.
gaussdb=# CREATE TABLE tpcds.reason_t1 AS TABLE tpcds.reason;

-- Create a prepared statement for an INSERT statement and execute the prepared statement.
gaussdb=# PREPARE insert_reason(integer,character(16),character(100)) AS INSERT INTO tpcds.reason_t1
VALUES($1,$2,$3);

gaussdb=# EXECUTE insert_reason(52, 'AAAAAAAADDAAAAAA', 'reason 52');

-- Delete the reason and reason_t1 tables.
gaussdb=# DROP TABLE tpcds.reason;
gaussdb=# DROP TABLE tpcds.reason_t1;

-- Delete a schema.
gaussdb=# DROP SCHEMA tpcds CASCADE;
```

## 7.14.140 EXPDP DATABASE

### Function

**EXPDP DATABASE** exports all physical files in a database.

### Syntax

```
EXPDP DATABASE db_name LOCATION = 'directory';
```

### Parameter Description

- **db\_name**: name of the database to be exported.
- **directory**: directory for storing exported files.

### Example

```
expdp database test location = '/data1/expdp/database';
```

## 7.14.141 EXPDP TABLE

### Function

**EXPDP TABLE** exports all table-related index, sequence, partition, toast, and toast index files.

### Syntax

```
EXPDP TABLE table_name LOCATION = 'directory';
```

### Parameter Description

- **table\_name**: name of the table to be exported.
- **directory**: directory for storing exported files.

### Example

```
expdp table test_t location = '/data1/expdp/table0';
```

## 7.14.142 EXPLAIN

### Description

Displays the execution plan of an SQL statement.

The execution plan shows how the tables referenced by the SQL statement will be scanned, for example, by plain sequential scan or index scan. - and if multiple tables are referenced, what join algorithms will be used to bring together the required rows from each input table.

The most critical part of the display is the estimated statement execution cost, which is the planner's guess at how long it will take to run the statement.

The **ANALYZE** option causes the statement to be actually executed, not only planned. The total elapsed time expended within each plan node (in milliseconds)

and total number of rows it actually returned are added to the display. This is useful for seeing whether the planner's estimates are close to reality.

## Precautions

The statement is actually executed when ANALYZE is used. If you want to use EXPLAIN ANALYZE on an INSERT, UPDATE, DELETE, CREATE TABLE AS, or EXECUTE statement without letting the statement affect your data, use this approach:

```
START TRANSACTION;  
EXPLAIN ANALYZE ...;  
ROLLBACK;
```

## Syntax

- Display the execution plan of an SQL statement, which supports multiple options and has no requirements for the order of options.

```
EXPLAIN [ ( option [, ...] ) ] statement;
```

The syntax of the **option** clause is as follows:

```
ANALYZE [ boolean ] |  
ANALYSE [ boolean ] |  
VERBOSE [ boolean ] |  
COSTS [ boolean ] |  
CPU [ boolean ] |  
DETAIL [ boolean ] |  
BUFFERS [ boolean ] |  
TIMING [ boolean ] |  
PLAN [ boolean ] |  
BLOCKNAME [ boolean ] |  
FORMAT { TEXT | XML | JSON | YAML }  
OPTEVAL [ boolean ]
```

- Display the execution plan of an SQL statement, where options are in order.

```
EXPLAIN { [ { ANALYZE | ANALYSE } ] [ VERBOSE ] | PERFORMANCE } statement;
```

## Parameters

- **statement**  
Specifies the SQL statement to explain.
- **ANALYZE boolean | ANALYSE boolean**  
Specifies whether to display actual run times and other statistics.  
Value range:
  - **TRUE** (default): displays them.
  - **FALSE**: does not display them.
- **VERBOSE boolean**  
Specifies whether to display additional information regarding the plan.  
Value range:
  - **TRUE** (default): displays it.
  - **FALSE**: does not display it.
- **COSTS boolean**  
Specifies whether to display the estimated total cost of each plan node, estimated number of rows, estimated width of each row.  
Value range:
  - **TRUE** (default): displays them.

- **FALSE**: does not display them.
- **CPU boolean**  
Specifies whether to display CPU usage.  
Value range:
  - **TRUE** (default): displays it.
  - **FALSE**: does not display it.
- **DETAIL boolean**  
Displays information about database nodes.  
Value range:
  - **TRUE** (default): displays it.
  - **FALSE**: does not display it.
- **BUFFERS boolean**  
Specifies whether to display buffer usage.  
Value range:
  - **TRUE**: displays it.
  - **FALSE** (default): does not display it.
- **TIMING boolean**  
Specifies whether to display the actual startup time and time spent on the output node.  
Value range:
  - **TRUE** (default): displays them.
  - **FALSE**: does not display them.
- **PLAN boolean**  
Specifies whether to store the execution plan in **PLAN\_TABLE**. If this parameter is set to **on**, the execution plan is stored in **PLAN\_TABLE** and not displayed on the screen. Therefore, this parameter cannot be used together with other parameters when it is set to **on**.  
Value range:
  - **ON** (default): The execution plan is stored in **PLAN\_TABLE** and not printed on the screen. If the plan is stored successfully, "EXPLAIN SUCCESS" is returned.
  - **OFF**: The execution plan is not stored in **PLAN\_TABLE** but is printed on the screen.
- **BLOCKNAME boolean**  
Specifies whether to display the query block where each operation of the plan is located. When this option is enabled, the name of the query block where each operation is performed is displayed in the **Query Block** column. This helps users obtain the query block name and use hints to modify the execution plan.
  - **TRUE** (default value): When the plan is displayed, the name of the query block where each operation is located is displayed in the **Query Block** column. This option must be used in the pretty mode. See [Hint Specifying the Query Block Where the Hint Is Located](#).
  - **FALSE**: The plan display is not affected.

- **FORMAT**

Specifies the output format.

Value range: **TEXT**, **XML**, **JSON**, and **YAML**

Default value: **TEXT**

- **PERFORMANCE**

Prints all relevant information in execution. Some information is described as follows:

- **ex c/r**: indicates the average number of CPU cycles used by each row, which is equal to **(ex cyc) / (ex row)**.
- **ex row**: indicates the number of executed rows.
- **ex cyc**: indicates the number of used CPU cycles.
- **inc cyc**: indicates the total number of CPU cycles used by subnodes.
- **shared hit**: indicates the shared buffer hits of the operator.
- **loops**: indicates the number of operator loop execution times.
- **total\_calls**: indicates the total number of generated elements.
- **remote query poll time stream gather**: indicates the operator used to listen to the network poll time when data on each DN reaches the CN.
- **deserialize time**: indicates the time required for deserialization.
- **estimated time**: indicates the estimated time.

- **OPTEVAL boolean**

Indicates whether to display the cost elimination details of the scan operator (currently, only seqscan, indexscan, indexonlyscan and bitmapheapsan are supported). When this function is enabled, a plan block named Cost Evaluation Info (identified by plan id) is displayed in the execution plan. This option can only coexist with costs, verbose, and format. For details about the parameters in the plan block, see [Example 2](#).

Value range:

- **TRUE**: displays the cost elimination details of the SCAN operator.
- **FALSE** (default): does not display it.

## Example 1

```
-- Create a schema.
gaussdb=# CREATE SCHEMA tpcds;

-- Create the tpcds.customer_address table.
gaussdb=# CREATE TABLE tpcds.customer_address
(
ca_address_sk      INTEGER      NOT NULL,
ca_address_id     CHARACTER(16) NOT NULL
);

-- Insert multiple records into the table.
gaussdb=# INSERT INTO tpcds.customer_address VALUES (5000, 'AAAAAAAAABAAAAAAA'),(10000,
'AAAAAAAAACAAAAAAA');

-- Create the tpcds.customer_address_p1 table.
gaussdb=# CREATE TABLE tpcds.customer_address_p1 AS TABLE tpcds.customer_address;

-- Change the value of explain_perf_mode to normal.
gaussdb=# SET explain_perf_mode=normal;
```

```

-- Display an execution plan for simple queries in the table.

(20 rows)
```

 NOTE

For the Cost Evaluation Info (identified by plan id) plan block:

1. The rows **2 --** and **4 --** represent the current winning operator, and the indentation plan blocks under each row represent the operators directly eliminated by the current winning operator. For example, operator 2 eliminates the Seq Scan and Bitmap Heap Scan operators.
2. The preceding key parameters are described as follows:
  1. **id** indicates that the current operator is converted from a path with a specified ID. The value is used to locate a path in debug2 logs.
  2. **rpage** indicates the number of pages in the base table used during the cost model calculation.
  3. **ipage** indicates the number of pages in the index used during the cost model calculation.
  4. **tuples** indicates the number of tuples used in the cost model calculation.
  5. **selec** indicates the index selection rate used during cost model calculation. The value **-1** indicates that the index selection rate of the current operator is invalid.
  6. **ml** indicates the ML model event that is currently triggered during cost model calculation. The value **1** indicates that the cache specified by **effective\_cache\_size** is sufficient, the value **2** indicates that the cache specified by **effective\_cache\_size** is insufficient, and the value **3** indicates that the cache specified by **effective\_cache\_size** is severely insufficient.
  7. **iscost** indicates whether an event of ignoring the startup cost has occurred during model cost calculation.
  8. **lossy** indicates whether to trigger the lossy mechanism of bitmap heap scan during cost model calculation.
  9. **uidx** indicates whether to trigger the unique index first rule during cost model calculation.

## 7.14.143 EXPLAIN PLAN

### Function

**EXPLAIN PLAN** saves information about an execution plan into the **PLAN\_TABLE** table. Different from the **EXPLAIN** statement, **EXPLAIN PLAN** only saves plan information and does not print information on the screen.

### Syntax

```
EXPLAIN PLAN  
[ SET STATEMENT_ID = string ]  
FOR statement ;
```

### Parameter Description

- **PLAN**: saves plan information into **PLAN\_TABLE**. If information is stored successfully, "EXPLAIN SUCCESS" is returned.
- **STATEMENT\_ID**: tags each query. The tag information will be stored in **PLAN\_TABLE**.

 **NOTE**

If the **EXPLAIN PLAN** statement does not contain **SET STATEMENT\_ID**, **STATEMENT\_ID** is empty by default. In addition, the value of **STATEMENT\_ID** cannot exceed 30 bytes. Otherwise, an error will be reported.

## Precautions

- **EXPLAIN PLAN** cannot be executed on a database node.
- Plan information cannot be collected for SQL statements that failed to be executed.
- Data in **PLAN\_TABLE** is in a session-level lifecycle. Sessions are isolated from users, and therefore users can only view the data of the current session and current user.

## Example 1

You can perform the following steps to collect execution plans of SQL statements by running **EXPLAIN PLAN**:

### Step 1 Run the **EXPLAIN PLAN** statement.

 **NOTE**

After the **EXPLAIN PLAN** statement is executed, plan information is automatically stored in **PLAN\_TABLE**. **INSERT**, **UPDATE**, and **ANALYZE** cannot be performed on **PLAN\_TABLE**.

For details about **PLAN\_TABLE**, see [PLAN\\_TABLE](#).

```
explain plan set statement_id='TPCH-Q4' for
select
o_orderpriority,
count(*) as order_count
from
orders
where
o_orderdate >= '1993-07-01'::date
and o_orderdate < '1993-07-01'::date + interval '3 month'
and exists (
select
*
from
lineitem
where
l_orderkey = o_orderkey
and l_commitdate < l_receiptdate
)
group by
o_orderpriority
order by
o_orderpriority;
```

### Step 2 Query **PLAN\_TABLE**.

```
SELECT * FROM PLAN_TABLE;
```

| statement_id | plan_id  | id | operation           | options     | object_name | object_type | object_owner | projection                                    |
|--------------|----------|----|---------------------|-------------|-------------|-------------|--------------|-----------------------------------------------|
| TPCH-Q4      | 16781167 | 1  | ROW ADAPTER         |             |             |             |              | ORDERS.O_ORDERPRIORITY, (PG_CATALOG.COUNT(*)) |
| TPCH-Q4      | 16781167 | 2  | VECTOR SORT         |             |             |             |              | ORDERS.O_ORDERPRIORITY, (PG_CATALOG.COUNT(*)) |
| TPCH-Q4      | 16781167 | 3  | VECTOR AGGREGATE    | HASHED      |             |             |              | ORDERS.O_ORDERPRIORITY, PG_CATALOG.COUNT(*)   |
| TPCH-Q4      | 16781167 | 4  | VECTOR STREAMING    | GATHER      |             |             |              | ORDERS.O_ORDERPRIORITY, (COUNT(*))            |
| TPCH-Q4      | 16781167 | 5  | VECTOR AGGREGATE    | HASHED      |             |             |              | ORDERS.O_ORDERPRIORITY, COUNT(*)              |
| TPCH-Q4      | 16781167 | 6  | VECTOR NESTED LOOPS | SEMI        |             |             |              | ORDERS.O_ORDERPRIORITY                        |
| TPCH-Q4      | 16781167 | 7  | TABLE ACCESS        | CSTORE SCAN | ORDERS      | TABLE       | TPCH         | ORDERS.O_ORDERPRIORITY, ORDERS.O_ORDERKEY     |
| TPCH-Q4      | 16781167 | 8  | VECTOR MATERIALIZE  |             |             |             |              | LINEITEM.L_ORDERKEY                           |
| TPCH-Q4      | 16781167 | 9  | TABLE ACCESS        | CSTORE SCAN | LINEITEM    | TABLE       | TPCH         | LINEITEM.L_ORDERKEY                           |

### Step 3 Delete data from **PLAN\_TABLE**.

```
DELETE FROM PLAN_TABLE WHERE xxx;
```

----End

## 7.14.144 FETCH

### Description

**FETCH** retrieves rows using a previously created cursor.

A cursor has an associated position, which is used by **FETCH**. The cursor position can be before the first row of the query result, on any particular row of the result, or after the last row of the result.

- When created, a cursor is positioned before the first row.
- After fetching some rows, the cursor is positioned on the row most recently retrieved.
- If **FETCH** runs off the end of the available rows then the cursor is left positioned after the last row, or before the first row if fetching backward.
- **FETCH ALL** or **FETCH BACKWARD ALL** will always leave the cursor positioned after the last row or before the first row.

### Precautions

- If the cursor is declared with **NO SCROLL**, backward fetches like **FETCH BACKWARD** are not allowed.
- The forms **NEXT**, **PRIOR**, **FIRST**, **LAST**, **ABSOLUTE**, and **RELATIVE** fetch a single row after moving the cursor appropriately. If there is no such row, an empty result is returned, and the cursor is left positioned before the first row (backward fetch) or after the last row (forward fetch) as appropriate.
- The forms using **FORWARD** and **BACKWARD** retrieve the indicated number of rows moving in the forward or backward direction, leaving the cursor positioned on the last-returned row or after (backward fetch)/before (forward fetch) all rows if the **count** exceeds the number of rows available.
- **RELATIVE 0**, **FORWARD 0**, and **BACKWARD 0** all request fetching the current row without moving the cursor, that is, re-fetching the most recently fetched row. This will succeed unless the cursor is positioned before the first row or after the last row; in which case, no row is returned.

### Syntax

```
FETCH [ direction { FROM | IN } ] cursor_name;
```

The **direction** clause specifies optional parameters.

```
NEXT  
| PRIOR  
| FIRST  
| LAST  
| ABSOLUTE count  
| RELATIVE count  
| count  
| ALL  
| FORWARD  
| FORWARD count  
| FORWARD ALL  
| BACKWARD
```

| BACKWARD count  
| BACKWARD ALL

## Parameters

- **direction\_clause**

Defines the fetch direction.

Value range:

- **NEXT** (default value)  
Fetches the next row.
- **PRIOR**  
Fetches the prior row.
- **FIRST**  
Fetches the first row of the query (same as **ABSOLUTE 1**).
- **LAST**  
Fetches the last row of the query (same as **ABSOLUTE -1**).
- **ABSOLUTE count**

Fetches the *count*th row of the query.

**ABSOLUTE** fetches are not any faster than navigating to the desired row with a relative move: the underlying implementation must traverse all the intermediate rows anyway.

Value range: a possibly-signed integer

- If *count* is positive, the *count*th row of the query will be fetched.
- If *count* is negative, the **abs(count)**th row from the end of the query result will be fetched.
- If *count* is set to **0**, the cursor is positioned before the first row.
- **RELATIVE count**  
Fetches the *count*th succeeding row or the *count*th prior row if count is negative.  
Value range: a possibly-signed integer
  - If *count* is positive, the *count*th succeeding row will be fetched.
  - If **count** is a negative integer, fetches the abs(count)'th prior row.
  - If the current row contains no data, **RELATIVE 0** returns null.
- **count**  
Fetches the next *count* rows (same as **FORWARD count**).
- **ALL**  
Fetches all remaining rows (same as **FORWARD ALL**).
- **FORWARD**  
Fetches the next row (same as **NEXT**).
- **FORWARD count**  
Fetches the *count* succeeding rows or *count* prior rows if *count* is negative.

- FORWARD ALL  
Fetches all remaining rows.
- BACKWARD  
Fetches the prior row (same as **PRIOR**).
- BACKWARD count  
Fetches the prior *count* rows (scanning backwards).  
Value range: a possibly-signed integer
  - If *count* is positive, the prior *count* rows will be fetched.
  - If *count* is a negative, the succeeding *abs (count)* rows will be fetched.
  - **BACKWARD 0** re-fetches the current row, if any.
- BACKWARD ALL  
Fetches all prior rows (scanning backwards).
- **{ FROM | IN } cursor\_name**  
Specifies the cursor name using the keyword **FROM** or **IN**.  
Value range: an existing cursor name

## Examples

```
-- Create a schema.
gaussdb=# CREATE SCHEMA tpcds;

-- Create the tpcds.customer_address table.
gaussdb=# CREATE TABLE tpcds.customer_address
(
ca_address_sk      INTEGER      NOT NULL,
ca_address_id     CHARACTER(16) NOT NULL,
ca_street_number  INTEGER
ca_street_name    CHARACTER (20)
);

-- Insert multiple records into the table.
gaussdb=# INSERT INTO tpcds.customer_address VALUES (1, 'AAAAAAAAABAAAAAAA', '18', 'Jackson'),(2,
'AAAAAAAAACAAAAAAA', '362', 'Washington 6th'),(3, 'AAAAAAAADAAAAAAA', '585', 'Dogwood Washington');

-- (For the SELECT statement, traverse a table using a cursor.) Start a transaction.
gaussdb=# START TRANSACTION;

-- Set up cursor1.
gaussdb=# CURSOR cursor1 FOR SELECT * FROM tpcds.customer_address ORDER BY 1;

-- Fetch the first three rows in cursor1.
gaussdb=# FETCH FORWARD 3 FROM cursor1;
ca_address_sk | ca_address_id | ca_street_number | ca_street_name
-----+-----+-----+-----
1 | AAAAAAAAAABAAAAAAA | 18 | Jackson
2 | AAAAAAAAAACAAAAAAA | 362 | Washington 6th
3 | AAAAAAADAAAAAAA | 585 | Dogwood Washington
(3 rows)

-- Close the cursor and commit the transaction.
gaussdb=# CLOSE cursor1;

-- End the transaction.
gaussdb=# END;

-- (For the VALUES clause, traverse the clause using a cursor.) Start a transaction.
```

```
gaussdb=# START TRANSACTION;
-- Set up cursor2.
gaussdb=# CURSOR cursor2 FOR VALUES(1,2),(0,3) ORDER BY 1;

-- Fetch the first two rows in cursor2.
gaussdb=# FETCH FORWARD 2 FROM cursor2;
column1 | column2
-----+-----
0 |      3
1 |      2
(2 rows)

-- Close the cursor and commit the transaction.
gaussdb=# CLOSE cursor2;

-- End the transaction.
gaussdb=# END;

-- (WITH HOLD cursor) Start a transaction.
gaussdb=# START TRANSACTION;

-- Set up a WITH HOLD cursor.
gaussdb=# DECLARE cursor1 CURSOR WITH HOLD FOR SELECT * FROM tpcds.customer_address ORDER BY
1;

-- Fetch the first two rows in cursor1.
gaussdb=# FETCH FORWARD 2 FROM cursor1;
ca_address_sk | ca_address_id | ca_street_number | ca_street_name
-----+-----+-----+-----
1 | AAAAAAAAAABAAAAAA | 18 | Jackson
2 | AAAAAAACAACAAAAAA | 362 | Washington 6th
(2 rows)

-- End the transaction.
gaussdb=# END;

-- Fetch the next row in cursor1.
gaussdb=# FETCH FORWARD 1 FROM cursor1;
ca_address_sk | ca_address_id | ca_street_number | ca_street_name
-----+-----+-----+-----
3 | AAAAAAADAAAAAAA | 585 | Dogwood Washington
(1 row)

-- Close the cursor.
gaussdb=# CLOSE cursor1;

-- Delete the tpcds.customer_address table.
gaussdb=# DROP TABLE tpcds.customer_address;

-- Delete a schema.
gaussdb=# DROP SCHEMA tpcds CASCADE;
```

## 7.14.145 GRANT

### Description

Grants permissions to roles and users.

**GRANT** is used in the following scenarios:

- **Granting system permissions to roles or users**

System permissions are also called user attributes, including **SYSADMIN**, **CREATEDB**, **CREATEROLE**, **AUDITADMIN**, **MONADMIN**, **OPRADMIN**, **POLADMIN**, **INHERIT**, **REPLICATION**, **VCADMIN**, and **LOGIN**.

They can be specified only by the **CREATE ROLE** or **ALTER ROLE** statement. The **SYSADMIN** permissions can be granted and revoked using **GRANT ALL PRIVILEGE** and **REVOKE ALL PRIVILEGE**, respectively. System permissions cannot be inherited by a user from a role, and cannot be granted using **PUBLIC**.

- **Granting database object permissions to roles or users**

Grant permissions on a database object (table, view, column, database, function, schema, or tablespace) to a role or user.

**GRANT** gives specific permissions on a database object to one or more roles. These permissions are added to those already granted, if any.

The keyword **PUBLIC** indicates that the permissions are to be granted to all roles, including those that might be created later. **PUBLIC** can be thought of as an implicitly defined group that always includes all roles. Any particular role will have the sum of permissions granted directly to it, permissions granted to any role it is presently a member of, and permissions granted to **PUBLIC**.

If **WITH GRANT OPTION** is specified, the recipient of the permission can in turn grant it to others. Without a grant option, the recipient cannot do that. This option cannot be granted to **PUBLIC**, which is a unique GaussDB attribute.

GaussDB grants the permissions on certain types of objects to **PUBLIC**. By default, permissions on tables, columns, sequences, foreign data sources, foreign servers, schemas, and tablespaces are not granted to **PUBLIC**, but the following permissions are granted to **PUBLIC**: **CONNECT** and **CREATE TEMP TABLE** permissions on databases, **EXECUTE** permission on functions, and **USAGE** permission on languages and data types (including domains). An object owner can revoke the default permissions granted to **PUBLIC** and grant permissions to other users as needed. For security purposes, you are advised to create an object and set its permissions in the same transaction so that other users do not have time windows to use the object. In addition, you can restrict the permissions of the **PUBLIC** user group by referring to "Permission Management" in *Security Hardening Guide*. These default permissions can be modified using the **ALTER DEFAULT PRIVILEGES** command.

By default, an object owner has all permissions on the object. For security purposes, the owner can discard some permissions. However, the **ALTER**, **DROP**, **COMMENT**, **INDEX**, **VACUUM**, and re-grantable permissions of the object are inherent permissions implicitly owned by the owner.

- **Granting the permissions of one role or user to others**

Grant the permissions of one role or user to others. In this case, every role or user can be regarded as a set of one or more database permissions.

If **WITH ADMIN OPTION** is specified, the recipients can in turn grant the permissions to other roles or users or revoke the permissions they have granted to other roles or users. If recipients' permissions are changed or revoked later, the grantees' permissions will also change.

Database administrators can grant or revoke permissions for any roles or users. Roles with the **CREATEROLE** permission can grant or revoke permissions for non-admin roles.

- **Granting ANY permissions to roles or users**

Grant ANY permissions to a specified role or user. For details about the value range of the ANY permissions, see the syntax. If **WITH ADMIN OPTION** is specified, the grantee can grant the ANY permissions to or revoke them from other roles or users. The ANY permissions can be inherited by a role but cannot be granted to **PUBLIC**. An initial user and the system administrator when separation of duties is disabled can grant the ANY permissions to or revoke them from any role or user.

Currently, the following ANY permissions are supported: CREATE ANY TABLE, ALTER ANY TABLE, DROP ANY TABLE, SELECT ANY TABLE, INSERT ANY TABLE, UPDATE ANY TABLE, DELETE ANY TABLE, CREATE ANY SEQUENCE, CREATE ANY INDEX, CREATE ANY FUNCTION, EXECUTE ANY FUNCTION, CREATE ANY PACKAGE, EXECUTE ANY PACKAGE, CREATE ANY TYPE, ALTER ANY TYPE, DROP ANY TYPE, ALTER ANY SEQUENCE, DROP ANY SEQUENCE, SELECT ANY SEQUENCE, ALTER ANY INDEX, DROP ANY INDEX, CREATE ANY SYNONYM, DROP ANY SYNONYM, CREATE ANY TRIGGER, ALTER ANY TRIGGER, and DROP ANY TRIGGER. For details about the ANY permission scope, see [Table 7-148](#).

## Precautions

- It is not allowed to grant the ANY permissions to **PUBLIC** or revoke the ANY permissions from **PUBLIC**.
- The ANY permissions are database permissions and are valid only for database objects that are granted with the permissions. For example, **SELECT ANY TABLE** only allows a user to view all user table data in the current database, but the user does not have the permission to view user tables in other databases.
- The ANY permissions and the original permissions do not affect each other.
- If a user is granted with the **CREATE ANY TABLE** permission, the owner of a table created in a schema with the same name as the user is the owner of the schema. When the user performs other operations on the table, the user needs to be granted with the corresponding operation permission. Similarly, if a user is granted with the CREATE ANY FUNCTION, CREATE ANY PACKAGE, CREATE ANY TYPE, CREATE ANY SEQUENCE, or CREATE ANY INDEX permission, the owner of an object created in a schema with the same name is the owner of the schema. If a user is granted with the CREATE ANY TRIGGER or CREATE ANY SYNONYM permission, the owner of an object created in a schema with the same name is the creator.
- Exercise caution when granting the CREATE ANY FUNCTION or CREATE ANY PACKAGE permission to users to prevent other users from using DEFINER functions or PACKAGE for privilege escalation.
- When GRANT is used to grant the permission to use a table, if the permission is not properly used, ALTER may be used to add expressions to the default values and constraints of the table, or indexes may be created to add expressions to INDEX. In this case, the permission may be exploited.

- When GRANT is used to grant the TRIGGER permission, if the permission is not properly used, the WHEN condition may be used to create expressions. When the trigger is triggered, the permission may be exploited.
- When granting permissions to users, pay special attention to the definer permission on functions/packages. The definer permission is executed as the owner of the functions/packages. If the permission is not properly granted (including GRANT ROLE TO ROLE), the permission may be exploited.

## Syntax

- Grant the table or view access permission to a user or role.  

```
GRANT { { SELECT | INSERT | UPDATE | DELETE | TRUNCATE | REFERENCES | TRIGGER | ALTER | DROP | COMMENT | INDEX | VACUUM } [, ...]
      | ALL [ PRIVILEGES ] }
ON { [ TABLE ] table_name [, ...]
    | ALL TABLES IN SCHEMA schema_name [, ...] }
TO { [ GROUP ] role_name | PUBLIC } [, ...]
[ WITH GRANT OPTION ];
```
- Grant the column access permission to a user or role.  

```
GRANT { { SELECT | INSERT | UPDATE | REFERENCES | COMMENT } ( column_name [, ...] ) } [, ...]
      | ALL [ PRIVILEGES ] ( column_name [, ...] ) }
ON [ TABLE ] table_name [, ...]
TO { [ GROUP ] role_name | PUBLIC } [, ...]
[ WITH GRANT OPTION ];
```
- Grant the sequence access permission to a specified role or user. The **LARGE** field is optional. The assignment statement does not distinguish whether the sequence is **LARGE**.  

```
GRANT { { SELECT | UPDATE | USAGE | ALTER | DROP | COMMENT } [, ...]
      | ALL [ PRIVILEGES ] }
ON { [ [ LARGE ] SEQUENCE ] sequence_name [, ...]
    | ALL SEQUENCES IN SCHEMA schema_name [, ...] }
TO { [ GROUP ] role_name | PUBLIC } [, ...]
[ WITH GRANT OPTION ];
```
- Grant the database access permission to a user or role.  

```
GRANT { { CREATE | CONNECT | TEMPORARY | TEMP | ALTER | DROP | COMMENT } [, ...]
      | ALL [ PRIVILEGES ] }
ON DATABASE database_name [, ...]
TO { [ GROUP ] role_name | PUBLIC } [, ...]
[ WITH GRANT OPTION ];
```
- Grant the domain access permission to a user or role.  

```
GRANT { USAGE | ALL [ PRIVILEGES ] }
ON DOMAIN domain_name [, ...]
TO { [ GROUP ] role_name | PUBLIC } [, ...]
[ WITH GRANT OPTION ];
```

### NOTE

In the current version, the domain access permission cannot be granted.

- Grant the CMK access permission to a specified user or role.  

```
GRANT { { USAGE | DROP } [, ...] | ALL [ PRIVILEGES ] }
ON CLIENT_MASTER_KEY client_master_key [, ...]
TO { [ GROUP ] role_name | PUBLIC } [, ...]
[ WITH GRANT OPTION ];
```
- Grant the column encryption key (CEK) access permission to a specified user or role.  

```
GRANT { { USAGE | DROP } [, ...] | ALL [ PRIVILEGES ] }
ON COLUMN_ENCRYPTION_KEY column_encryption_key [, ...]
TO { [ GROUP ] role_name | PUBLIC } [, ...]
[ WITH GRANT OPTION ];
```
- Grant the foreign data source access permission to a user or role.

```
GRANT { USAGE | ALL [ PRIVILEGES ] }
ON FOREIGN DATA WRAPPER fdw_name [, ...]
TO { [ GROUP ] role_name | PUBLIC } [, ...]
[ WITH GRANT OPTION ];
```

- Grant the foreign server access permission to a user or role.

```
GRANT { { USAGE | ALTER | DROP | COMMENT } [, ...] | ALL [ PRIVILEGES ] }
ON FOREIGN SERVER server_name [, ...]
TO { [ GROUP ] role_name | PUBLIC } [, ...]
[ WITH GRANT OPTION ];
```

- Grant the function access permission to a user or role.

```
GRANT { { EXECUTE | ALTER | DROP | COMMENT } [, ...] | ALL [ PRIVILEGES ] }
ON { FUNCTION {function_name ( [ { [ argmode ] [ arg_name ] arg_type } [, ...] ) } [, ...]
| ALL FUNCTIONS IN SCHEMA schema_name [, ...] }
TO { [ GROUP ] role_name | PUBLIC } [, ...]
[ WITH GRANT OPTION ];
```

- Grant the procedural procedure access permission to a user or role.

```
GRANT { { EXECUTE | ALTER | DROP | COMMENT } [, ...] | ALL [ PRIVILEGES ] }
ON PROCEDURE {proc_name ( [ { [ argmode ] [ arg_name ] arg_type } [, ...] ) } [, ...]
TO { [ GROUP ] role_name | PUBLIC } [, ...]
[ WITH GRANT OPTION ];
```

- Grant the procedural language access permission to a user or role.

```
GRANT { USAGE | ALL [ PRIVILEGES ] }
ON LANGUAGE lang_name [, ...]
TO { [ GROUP ] role_name | PUBLIC } [, ...]
[ WITH GRANT OPTION ];
```

- Grant the large object access permission to a specified user or role.

```
GRANT { { SELECT | UPDATE } [, ...] | ALL [ PRIVILEGES ] }
ON LARGE OBJECT loid [, ...]
TO { [ GROUP ] role_name | PUBLIC } [, ...]
[ WITH GRANT OPTION ];
```

#### NOTE

In the current version, the large object access permission cannot be granted.

- Grant the schema access permission to a user or role.

```
GRANT { { CREATE | USAGE | ALTER | DROP | COMMENT } [, ...] | ALL [ PRIVILEGES ] }
ON SCHEMA schema_name [, ...]
TO { [ GROUP ] role_name | PUBLIC } [, ...]
[ WITH GRANT OPTION ];
```

#### NOTE

When you grant table or view permissions to other users, you also need to grant the **USAGE** permission on the schema that the tables and views belong to. Without the **USAGE** permission, the users with table or view permissions can only see the object names, but cannot access them. This syntax cannot be used to grant the permission to create tables in schemas with the same name, but you can use the syntax for granting permission of a role to another user or role to achieve the same effect.

- Grant the tablespace access permission to a user or role.

```
GRANT { { CREATE | ALTER | DROP | COMMENT } [, ...] | ALL [ PRIVILEGES ] }
ON TABLESPACE tablespace_name [, ...]
TO { [ GROUP ] role_name | PUBLIC } [, ...]
[ WITH GRANT OPTION ];
```

- Grant the type access permission to a user or role.

```
GRANT { { USAGE | ALTER | DROP | COMMENT } [, ...] | ALL [ PRIVILEGES ] }
ON TYPE type_name [, ...]
TO { [ GROUP ] role_name | PUBLIC } [, ...]
[ WITH GRANT OPTION ];
```

#### NOTE

In the current version, the type access permission cannot be granted.

- Grant the directory permission to a role.  

```
GRANT { { READ | WRITE | ALTER | DROP } [, ...] | ALL [PRIVILEGES] }  
ON DIRECTORY directory_name [, ...]  
TO { [GROUP] role_name | PUBLIC } [, ...]  
[WITH GRANT OPTION];
```
- Grant the package permission to a role.  

```
GRANT { { EXECUTE | ALTER | DROP | COMMENT } [, ...] | ALL [PRIVILEGES] }  
ON { PACKAGE package_name [, ...]  
| ALL PACKAGES IN SCHEMA schema_name [, ...] }  
TO { [GROUP] role_name | PUBLIC } [, ...]  
[WITH GRANT OPTION];
```
- Grant a role's permissions to another user or role.  

```
GRANT role_name [, ...]  
TO role_name [, ...]  
[ WITH ADMIN OPTION ];
```
- Grant the **sysadmin** permission to a role.  

```
GRANT ALL { PRIVILEGES | PRIVILEGE }  
TO role_name;
```
- Grant the ANY permissions to another user or role.  

```
GRANT { CREATE ANY TABLE | ALTER ANY TABLE | DROP ANY TABLE | SELECT ANY TABLE | INSERT  
ANY TABLE | UPDATE ANY TABLE |  
DELETE ANY TABLE | CREATE ANY SEQUENCE | CREATE ANY INDEX | CREATE ANY FUNCTION |  
EXECUTE ANY FUNCTION |  
CREATE ANY PACKAGE | EXECUTE ANY PACKAGE | CREATE ANY TYPE | ALTER ANY TYPE | DROP ANY  
TYPE | ALTER ANY SEQUENCE | DROP ANY SEQUENCE |  
SELECT ANY SEQUENCE | ALTER ANY INDEX | DROP ANY INDEX | CREATE ANY SYNONYM | DROP  
ANY SYNONYM | CREATE ANY TRIGGER | ALTER ANY TRIGGER | DROP ANY TRIGGER  
} [, ...]  
TO [ GROUP ] role_name [, ...]  
[ WITH ADMIN OPTION ];
```
- Grant the database link object permission to a specified user.  

```
GRANT { CREATE | ALTER | DROP } [PUBLIC] DATABASE LINK TO role_name;
```

#### NOTE

- **PUBLIC**: creates a public database link visible to all users. If this clause is omitted, the database link is private and used only as a compatible API. The data that can be accessed on the remote database depends on the identity used by the database link during connection.
- When the permission to create a database link is granted to a user, the user can remotely access a database by using the IP address of the remote database. Exercise caution when granting this permission to users.
- In addition to the statement for directly granting the database link permission, you can also obtain the database link permission by inheriting permission and granting permission to an administrator.
- For details about database links, see [DATABASE LINK](#).

## Parameters

The possible permissions are:

- **SELECT**  
Allows SELECT from any column, or the specific columns listed, of the specified table, view, or sequence. The SELECT permission on the corresponding column is also required for UPDATE or DELETE.
- **INSERT**  
Allows INSERT of a new row into a table.

- **UPDATE**  
Allows you to run the **UPDATE** command on any column in the specified table. The **UPDATE** command also requires the **SELECT** permission to query which rows need to be updated. **SELECT ... FOR UPDATE** and **SELECT ... FOR SHARE** also require this permission on at least one column, in addition to the **SELECT** permission.
- **DELETE**  
Allows you to run the **DELETE** command to delete data from a specified table. The **DELETE** command also requires the **SELECT** permission to query which rows need to be deleted.
- **TRUNCATE**  
Allows **TRUNCATE** on a table.
- **REFERENCES**  
Allows creation of a foreign key constraint referencing a table. This permission is required on both referencing and referenced tables.
- **TRIGGER**  
Allows the creation of a trigger on the specified table.
- **CREATE**
  - For databases, allows new schemas to be created within the database.
  - For schemas, allows new objects to be created within the schema. To rename an existing object, you must own the object and have the **CREATE** permission on the schema of the object.
  - For tablespaces, allows tables to be created within the tablespace, and allows databases and schemas to be created that have the tablespace as their default tablespace.
- **CONNECT**  
Allows the grantee to connect to the database.
- **EXECUTE**  
Allows calling a function, including use of any operators that are implemented on top of the function.
- **USAGE**
  - For procedural languages, allows use of the language for the creation of functions in that language.
  - For schemas, allows access to objects contained in the schema. Without this permission, it is still possible to see the object names.
  - For sequences, allows use of the **nextval** function.
- **ALTER**  
Allows users to modify the attributes of a specified object, excluding the owner and schema of the object.
- **DROP**  
Allows users to delete specified objects.
- **COMMENT**  
Allows users to define or modify comments of a specified object.
- **INDEX**

Allows users to create indexes on specified tables, manage indexes on the tables, and perform REINDEX and CLUSTER operations on the tables.

- **VACUUM**

Allows users to perform ANALYZE and VACUUM operations on specified tables.

- **ALL PRIVILEGES**

Grants all available permissions to a user or role at a time. Only a system administrator has the **GRANT ALL PRIVILEGES** permission.

**GRANT** parameters are as follows:

- **role\_name**

Specifies the username.

- **table\_name**

Specifies the table name.

- **column\_name**

Specifies the column name.

- **schema\_name**

Specifies the schema name.

- **database\_name**

Specifies the database name.

- **function\_name**

Specifies the function name.

- **procedure\_name**

Specifies the stored procedure name.

- **sequence\_name**

Specifies the sequence name.

- **domain\_name**

Specifies the domain type name.

- **fdw\_name**

Specifies the foreign data wrapper name.

- **lang\_name**

Specifies the language name.

- **type\_name**

Specifies the type name.

- **argmode**

Specifies the parameter mode.

Value range: a string. It must comply with the [naming convention](#).

- **arg\_name**

Specifies the parameter name.

Value range: a string. It must comply with the [naming convention](#).

- **arg\_type**

Specifies the parameter type.

- Value range: a string. It must comply with the [naming convention](#).
- **loid**  
Specifies the identifier of the large object that includes this page.  
Value range: a string. It must comply with the [naming convention](#).
  - **tablespace\_name**  
Specifies the tablespace name.
  - **client\_master\_key**  
Name of the CMK.  
Value range: a string. It must comply with the [naming convention](#).
  - **column\_encryption\_key**  
Name of the column encryption key.  
Value range: a string. It must comply with the [naming convention](#).
  - **directory\_name**  
Specifies the directory name.  
Value range: a string. It must comply with the [naming convention](#).
  - **WITH GRANT OPTION**  
If **WITH GRANT OPTION** is specified, the recipient of the permission can in turn grant it to others. Without a grant option, the recipient cannot do that. Grant options cannot be granted to **PUBLIC**.

When a non-owner of an object attempts to grant permissions on the object:

- The statement will fail outright if the user has no permissions whatsoever on the object.
- As long as some permission is available, the statement will proceed, but it will grant only those permissions for which the user has grant options.
- The **GRANT ALL PRIVILEGES** forms will issue a warning message if no grant options are held, while the other forms will issue a warning if grant options for any of the permissions specifically named in the statement are not held.

#### NOTE

Database administrators can access all objects, regardless of object permission settings. This is comparable to the permissions of **root** in a Unix system. As with **root**, it is unwise to operate as a system administrator except when necessary.

- **WITH ADMIN OPTION**  
If **WITH ADMIN OPTION** is specified for a role, the grantee can grant the role to other roles or users or revoke the role from other roles or users.  
For the ANY permissions, if **WITH ADMIN OPTION** is specified, the grantee can grant the ANY permissions to or revoke them from other roles or users.

**Table 7-148** ANY permissions

| System Permission    | Description                                                                                                                                                                                                                                                                    |
|----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CREATE ANY TABLE     | Users can create tables or views in the public and user schemas. The users must be granted with the permission to create sequences to create a table that contains serial columns.                                                                                             |
| ALTER ANY TABLE      | Users' <b>ALTER</b> permission on tables or views in the public and user schemas. If the users want to modify the unique index of a table to add a primary key constraint or unique constraint to the table, the users must be granted with the index permission on the table. |
| DROP ANY TABLE       | Users' <b>DROP</b> permission on tables or views in the public and user schemas.                                                                                                                                                                                               |
| SELECT ANY TABLE     | Users' <b>SELECT</b> permission on tables or views in the public and user schemas, which is still subject to row-level security.                                                                                                                                               |
| UPDATE ANY TABLE     | Users' <b>UPDATE</b> permission on tables or views in the public and user schemas, which is still subject to row-level security.                                                                                                                                               |
| INSERT ANY TABLE     | Users' <b>INSERT</b> permission on tables or views in the public and user schemas.                                                                                                                                                                                             |
| DELETE ANY TABLE     | Users' <b>DELETE</b> permission on tables or views in the public and user schemas, which is still subject to row-level security.                                                                                                                                               |
| CREATE ANY FUNCTION  | Users can create functions or stored procedures in the user schemas.                                                                                                                                                                                                           |
| EXECUTE ANY FUNCTION | Users' <b>EXECUTE</b> permission on functions or stored procedures in the public and user schemas.                                                                                                                                                                             |
| CREATE ANY PACKAGE   | Users' permission to create packages in the public and user schemas.                                                                                                                                                                                                           |
| EXECUTE ANY PACKAGE  | Users' <b>EXECUTE</b> permission on packages in the public and user schemas.                                                                                                                                                                                                   |
| CREATE ANY TYPE      | Users can create types in the public and user schemas.                                                                                                                                                                                                                         |
| CREATE ANY SEQUENCE  | Users can create sequences in the public and user schemas.                                                                                                                                                                                                                     |
| CREATE ANY INDEX     | Users can create indexes in the public and user schemas. The users must be granted with the permission to create tablespaces to create a partitioned table index in a tablespace.                                                                                              |
| ALTER ANY TYPE       | Users have the <b>ALTER</b> permission on types in public and user schemas, excluding modifying the owner of a type or modifying the schema of a type.                                                                                                                         |

| System Permission   | Description                                                                                                                                                                                                                                                                                                                                                                                      |
|---------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DROP ANY TYPE       | Users' <b>DROP</b> permission on types in the public and user schemas.                                                                                                                                                                                                                                                                                                                           |
| ALTER ANY SEQUENCE  | Users have the ALTER permission on sequences in public and user schemas, excluding modifying the owner of a sequence.                                                                                                                                                                                                                                                                            |
| DROP ANY SEQUENCE   | Users' <b>DROP</b> permission on sequences in the public and user schemas.                                                                                                                                                                                                                                                                                                                       |
| SELECT ANY SEQUENCE | Users' SELECT, USAGE, and UPDATE permissions on sequences in the public and user schemas.                                                                                                                                                                                                                                                                                                        |
| ALTER ANY INDEX     | Users' <b>ALTER</b> permission on indexes in the public and user schemas. To rename an index, users also need the permission to create objects in the schema where the index is located. If tablespace operations are involved, users need to have the corresponding operation permission on the tablespace. To set an index to <b>UNUSABLE</b> , users must have the DROP ANY INDEX permission. |
| DROP ANY INDEX      | Users' <b>DROP</b> permission on indexes in the public and user schemas.                                                                                                                                                                                                                                                                                                                         |
| CREATE ANY TRIGGER  | Users can create triggers in the public and user schemas.                                                                                                                                                                                                                                                                                                                                        |
| ALTER ANY TRIGGER   | Users' <b>ALTER</b> permission on triggers in the public and user schemas.                                                                                                                                                                                                                                                                                                                       |
| DROP ANY TRIGGER    | Users' <b>DROP</b> permission on triggers in the public and user schemas.                                                                                                                                                                                                                                                                                                                        |
| CREATE ANY SYNONYM  | Users can create synonyms in user schema.                                                                                                                                                                                                                                                                                                                                                        |
| DROP ANY SYNONYM    | Users' <b>DROP</b> permission on synonyms in the public and user schemas.                                                                                                                                                                                                                                                                                                                        |

 **NOTE**

If a user is granted with any ANY permission, the user has the USAGE permission on the public and user schemas but does not have the USAGE permission on the system schemas except **public** listed in [Table 13-1](#).

## Examples

### Example: Granting system permissions to a user or role

Create the **joe** user and grant the **sysadmin** permission to it.

```
gaussdb=# CREATE USER joe PASSWORD '*****';
gaussdb=# GRANT ALL PRIVILEGES TO joe;
```

Then **joe** has the **sysadmin** permission.

### Example: Granting object permissions to a user or role

1. Revoke the **sysadmin** permission from the **joe** user. Grant the usage permission of the **tpcds** schema and all permissions on the **tpcds.reason** table to **joe**.

```
gaussdb=# CREATE SCHEMA tpcds;  
CREATE SCHEMA  
gaussdb=# CREATE TABLE tpcds.reason  
(  
  r_reason_sk    INTEGER    NOT NULL,  
  r_reason_id    CHAR(16)   NOT NULL,  
  r_reason_desc  VARCHAR(20)  
);  
CREATE TABLE  
gaussdb=# REVOKE ALL PRIVILEGES FROM joe;  
gaussdb=# GRANT USAGE ON SCHEMA tpcds TO joe;  
gaussdb=# GRANT ALL PRIVILEGES ON tpcds.reason TO joe;
```

Then **joe** has all permissions on the **tpcds.reason** table, including create, retrieve, update, and delete.

2. Grant the retrieve permission of **r\_reason\_sk**, **r\_reason\_id**, and **r\_reason\_desc** columns and the update permission of the **r\_reason\_desc** column in the **tpcds.reason** table to **joe**.

```
gaussdb=# GRANT select (r_reason_sk,r_reason_id,r_reason_desc),update (r_reason_desc) ON  
tpcds.reason TO joe;
```

Then **joe** has the retrieve permission of **r\_reason\_sk** and **r\_reason\_id** columns in the **tpcds.reason** table. To enable **joe** to grant these permissions to other users, execute the following statement:

```
gaussdb=# GRANT select (r_reason_sk, r_reason_id) ON tpcds.reason TO joe WITH GRANT OPTION;
```

Grant the database connection permission and the permission to create schemas in GaussDB to user **joe**, and allow user **joe** to grant this permission to other users.

```
gaussdb=# GRANT create,connect on database testdb TO joe WITH GRANT OPTION;
```

Create the **tpcds\_manager** role, grant the access and object creation permissions of the **tpcds** schema to **tpcds\_manager**, but do not allow **tpcds\_manager** to grant these permissions to others.

```
gaussdb=# CREATE ROLE tpcds_manager PASSWORD '*****';  
gaussdb=# GRANT USAGE,CREATE ON SCHEMA tpcds TO tpcds_manager;
```

Grant all permissions on the **tpcds\_tbsp** tablespace to **joe**, but do not allow **joe** to grant these permissions to others.

```
gaussdb=# CREATE TABLESPACE tpcds_tbsp RELATIVE LOCATION 'tablespace/tablespace_1';  
gaussdb=# GRANT ALL ON TABLESPACE tpcds_tbsp TO joe;
```

### Example: Granting the permissions of one user or role to others

1. Create the **manager** role, grant **joe**'s permissions to **manager**, and allow **manager** to grant these permissions to others.

```
gaussdb=# CREATE ROLE manager PASSWORD '*****';  
gaussdb=# GRANT joe TO manager WITH ADMIN OPTION;
```

2. Create the **senior\_manager** user and grant **manager**'s permissions to it.

```
gaussdb=# CREATE ROLE senior_manager PASSWORD '*****';  
gaussdb=# GRANT manager TO senior_manager;
```

3. Revoke permissions and delete users.

```
gaussdb=# REVOKE manager FROM joe;  
gaussdb=# REVOKE senior_manager FROM manager;  
gaussdb=# DROP USER manager;
```

**Example: Granting the CMK or CEK permission to other user or role**

1. Connect to an encrypted database.

Prerequisites: You have set the parameters and used the CREATE CLIENT MASTER KEY syntax to create a master key named **MyCMK1** by referring to "Setting Encrypted Equality Queries" in *Feature Guide*.

```
gaussdb=# CREATE COLUMN ENCRYPTION KEY MyCEK1 WITH VALUES (CLIENT_MASTER_KEY = MyCMK1, ALGORITHM = AEAD_AES_256_CBC_HMAC_SHA256);  
CREATE COLUMN ENCRYPTION KEY
```

2. Create a role **newuser** and grant the key permission to **newuser**.

```
gaussdb=# CREATE USER newuser PASSWORD '*****';  
CREATE ROLE  
gaussdb=# GRANT ALL ON SCHEMA public TO newuser;  
GRANT  
gaussdb=# GRANT USAGE ON COLUMN_ENCRYPTION_KEY MyCEK1 to newuser;  
GRANT  
gaussdb=# GRANT USAGE ON CLIENT_MASTER_KEY MyCMK1 to newuser;  
GRANT
```

3. Set the user to connect to a database and use a CEK to create an encrypted table.

```
gaussdb=# SET SESSION AUTHORIZATION newuser PASSWORD '*****';  
gaussdb=> CREATE TABLE acltest1 (x int, x2 varchar(50) ENCRYPTED WITH  
(COLUMN_ENCRYPTION_KEY = MyCEK1, ENCRYPTION_TYPE = DETERMINISTIC));  
CREATE TABLE  
gaussdb=> SELECT has_cек_privilege('newuser', 'MyCEK1', 'USAGE');  
has_cек_privilege  
-----  
t  
(1 row)
```

4. Revoke permissions and delete users.

```
gaussdb=# REVOKE USAGE ON COLUMN_ENCRYPTION_KEY MyCEK1 FROM newuser;  
gaussdb=# REVOKE USAGE ON CLIENT_MASTER_KEY MyCMK1 FROM newuser;  
gaussdb=# DROP TABLE newuser.acltest1;  
gaussdb=# DROP COLUMN ENCRYPTION KEY MyCEK1;  
gaussdb=# DROP CLIENT MASTER KEY MyCMK1;  
gaussdb=# DROP SCHEMA IF EXISTS newuser CASCADE;  
gaussdb=# REVOKE ALL ON SCHEMA public FROM newuser;  
gaussdb=# DROP ROLE IF EXISTS newuser;
```

**Example: Revoking permissions and deleting roles and users**

```
gaussdb=# REVOKE ALL PRIVILEGES ON tpцds.reason FROM joe;  
gaussdb=# REVOKE ALL PRIVILEGES ON SCHEMA tpцds FROM joe;  
gaussdb=# REVOKE ALL ON TABLESPACE tpцds_tbspц FROM joe;  
gaussdb=# DROP TABLESPACE tpцds_tbspц;  
gaussdb=# REVOKE USAGE,CREATE ON SCHEMA tpцds FROM tpцds_manager;  
gaussdb=# DROP ROLE tpцds_manager;  
gaussdb=# DROP ROLE senior_manager;  
gaussdb=# DROP USER joe CASCADE;  
gaussdb=# DROP TABLE tpцds.reason;  
gaussdb=# DROP SCHEMA tpцds CASCADE;
```

[REVOKE](#) and [ALTER DEFAULT PRIVILEGES](#)

**7.14.146 IMPDP DATABASE CREATE****Function**

**IMPDP DATABASE CREATE** specifies the preparation phase for importing a database.

## Syntax

```
IMPDP DATABASE [db_name] CREATE SOURCE = 'directory' OWNER = user [LOCAL];
```

## Parameter Description

- **db\_name**: name of the new database after the import. If this parameter is not specified, the original database name is retained after the import.
- **directory**: data source directory of the imported database.
- **user**: owner of the imported database.
- **LOCAL**: If this field is specified, data is imported to the original cluster. If this field is not specified, data is imported to a new cluster.

## Example

```
impdp database test create source = '/data1/impdp/database' owner=admin;
```

## 7.14.147 IMPDP RECOVER

### Function

**IMPDP RECOVER** specifies the execution phase of importing a database.

### Syntax

```
IMPDP DATABASE RECOVER SOURCE = 'directory' OWNER = user [LOCAL];
```

### Parameter Description

- **directory**: data source directory of the imported database.
- **user**: owner of the imported database.
- **LOCAL**: If this field is specified, data is imported to the original cluster. If this field is not specified, data is imported to a new cluster.

### Example

```
impdp database recover source = '/data1/impdp/database' owner=admin;
```

## 7.14.148 IMPDP TABLE

### Function

**IMPDP TABLE** specifies the execution phase of importing a table.

### Syntax

```
IMPDP TABLE [AS table_name] SOURCE = 'directory' OWNER = user;
```

### Parameter Description

- **table\_name**: name of the new table after the import. If this parameter is not specified, the original table name is retained after the import.
- **directory**: data source directory of the imported table.

- **user**: owner of the imported table.

## Example

```
impdp table source = '/data1/impdp/table0' owner=admin;
```

## 7.14.149 IMPDP TABLE PREPARE

### Function

**IMPDP TABLE PREPARE** specifies the preparation phase for importing a table.

### Syntax

```
IMPDP TABLE PREPARE SOURCE = 'directory' OWNER = user;
```

### Parameter Description

- **directory**: data source directory of the imported table.
- **user**: owner of the imported table.

## Example

```
impdp table prepare source = '/data1/impdp/table0' owner=admin;
```

## 7.14.150 INSERT

### Description

Inserts new rows into a table.

### Precautions

- You must have the **INSERT** permission on a table to insert data to it. If a user is granted with the **INSERT ANY TABLE** permission, the user has the **USAGE** permission on all schemas except system schemas and the **INSERT** permission on tables in these schemas.
- Use of the **RETURNING** clause requires the **SELECT** permission on all columns mentioned in **RETURNING**.
- If **ON DUPLICATE KEY UPDATE** is used, you must have the **INSERT** and **UPDATE** permissions on the table and the **SELECT** permission on the columns of the **UPDATE** clause.
- If you use the **query** clause to insert rows from a query, you need to have the **SELECT** permission on any table or column used in the query.
- The generated column cannot be directly written. In the **INSERT** statement, values cannot be specified for generated columns, but the keyword **DEFAULT** can be specified.
- When you connect to a database compatible to Teradata and **td\_compatible\_truncation** is **on**, a long string will be automatically truncated. If later **INSERT** statements (not involving foreign tables) insert long strings to columns of **CHAR**- and **VARCHAR**-typed columns in the target table, the system will truncate the long strings to ensure no strings exceed the maximum length defined in the target table.

 **NOTE**

If inserting multi-byte character data (such as Chinese characters) to a database with the character set byte encoding (SQL\_ASCII, LATIN1), and the character data crosses the truncation position, the string is truncated based on its bytes instead of characters. Unexpected result will occur in tail after the truncation. If you want correct truncation result, you are advised to adopt encoding set such as UTF8, which has no character data crossing the truncation position.

## Syntax

```
[ WITH [ RECURSIVE ] with_query [, ...] ]  
INSERT [/*+ plan_hint */] INTO table_name [partition_clause] [ AS alias ] [ ( column_name [, ...] ) ]  
  { DEFAULT VALUES  
  | VALUES (( { expression | DEFAULT } [, ...] ) )[, ...]  
  | query }  
  [ ON DUPLICATE KEY UPDATE { NOTHING | { column_name = { expression | DEFAULT } } [, ...] [ WHERE  
condition ] }]  
  [ RETURNING { * | {output_expression [ [ AS ] output_name ] }[, ...] }];
```

## Parameters

- **WITH [ RECURSIVE ] with\_query [, ...]**

Specifies one or more subqueries that can be referenced by name in the main query, which is equivalent to a temporary table.

If **RECURSIVE** is specified, it allows a **SELECT** subquery to reference itself by name.

Format of **with\_query**:

```
with_query_name [ ( column_name [, ...] ) ] AS [ [ NOT ] MATERIALIZED ]  
( {SELECT | VALUES | INSERT | UPDATE | DELETE} )
```

– **with\_query\_name** specifies the name of the result set generated by a subquery. Such names can be used to access the result sets of subqueries in a query.

-- **column\_name** specifies the column name displayed in the subquery result set.

Each subquery can be a **SELECT**, **VALUES**, **INSERT**, **UPDATE** or **DELETE** statement.

– You can use **MATERIALIZED** or **NOT MATERIALIZED** to modify the CTE.

– If **MATERIALIZED** is specified, the WITH query will be materialized, and a copy of the subquery result set is generated. The copy is directly queried at the reference point. Therefore, the WITH subquery cannot be jointly optimized with the SELECT statement trunk (for example, predicate pushdown and equivalence class transfer). In this scenario, you can use **NOT MATERIALIZED** for modification. If the WITH query can be executed as a subquery inline, the preceding optimization can be performed.

– If the user does not explicitly declare the materialized attribute, comply with the following rules: If the CTE is referenced only once in the trunk statement to which it belongs and semantically supports inline execution, it will be rewritten as subquery inline execution. Otherwise, the materialized execution will be performed in CTE Scan mode.

 NOTE

- INSERT ON DUPLICATE KEY UPDATE does not support the WITH or WITH RECURSIVE clauses.
- The output of the INSERT statement displays only the number of tuples inserted into the outermost query block. For example:  
with cte as (insert into t1 values(1) returning \*) insert into t1 select \* from cte;  
Only one tuple is displayed, but two tuples are actually inserted.
- **plan\_hint** clause  
Follows the INSERT keyword in the */\*+<Plan hint> \*/* format. It is used to optimize the plan of an INSERT statement block. For details, see [Hint-based Tuning](#). In each statement, only the first */\*+ plan\_hint \*/* comment block takes effect as a hint. Multiple hints can be written.
- **table\_name**  
Specifies the name of the target table where data will be inserted.  
Value range: an existing table name

 NOTE

You can use database links to perform operations on remote tables. For details, see [DATABASE LINK](#).

- **partition\_clause**  
Inserts data to a specified partition.  

```
PARTITION { ( partition_name ) | FOR ( partition_value [, ...] ) } |  
SUBPARTITION { ( subpartition_name ) | FOR ( subpartition_value [, ...] ) }
```

  
For details about the keywords, see [SELECT](#).  
If the value of the **value** clause is inconsistent with the specified partition, an error is reported.  
For details, see [CREATE TABLE SUBPARTITION](#).
- **column\_name**  
Specifies the name of a column in a table.
  - The column name can be qualified with a subfield name or array subscript, if needed.
  - Each column not present in the explicit or implicit column list will be filled with a default value, either its declared default value or **NULL** if there is none. Inserting into only some fields of a composite column leaves the other fields null.
  - The target column names **column\_name** can be listed in any order. If no list of column names is given at all, the default is all the columns of the table in their declared order.
  - The target columns are the first *N* column names, if there are only *N* columns supplied by the **value** clause or **query**.
  - The values provided by the **value** clause and query are associated with the corresponding columns from left to right in the table.  
Value range: an existing column
- **expression**  
Specifies an expression or a value to assign to the corresponding column.
  - In the **INSERT ON DUPLICATE KEY UPDATE** statement, expression can be **VALUES(column\_name)** or **EXCLUDED.column\_name**, indicating that

the value of **column\_name** corresponding to the conflict row is referenced. Note that **VALUES(column\_name)** cannot be nested in an expression (for example, **VALUES(column\_name)+1**). **EXCLUDED** is not subject to this restriction.

- If single-quotation marks are inserted in a column, the single-quotation marks need to be used for escape.
- If the expression for any column is not of the correct data type, automatic type conversion will be attempted. If the attempt fails, data insertion fails, and the system returns an error message.
- **DEFAULT**  
Specifies the default value of a field. The value is **NULL** if no default value is assigned to it.
- **query**  
Specifies a query statement (SELECT statement) that uses the query result as the inserted data.
- **RETURNING**  
Returns the inserted rows. The syntax of the **RETURNING** list is identical to that of the output list of **SELECT**. Note that **INSERT ON DUPLICATE KEY UPDATE** does not support the **RETURNING** clause.
- **output\_expression**  
Specifies an expression used to calculate the output result of the **INSERT** statement after each row is inserted.  
Value range: The expression can use any field in the table. You can use the asterisk (\*) to return all fields of the inserted row.
- **output\_name**  
Specifies a name to use for a returned column.  
Value range: a string. It must comply with the [naming convention](#).
- **ON DUPLICATE KEY UPDATE**  
For a table with a unique constraint (**UNIQUE INDEX** or **PRIMARY KEY**), if the inserted data violates the unique constraint, the **UPDATE** clause is executed on the conflicting row to complete the update. For a table without a unique constraint, only the insert operation is performed. When **UPDATE** is used, if **NOTHING** is specified, this insertion is ignored. You can use **EXCLUDE**, or **VALUES()** to select the column corresponding to the source data.
  - Triggers are supported. The execution sequence of triggers is determined by the actual execution process.
    - Run the **insert** command to trigger the **before insert** and **after insert** triggers.
    - Run the **update** command to trigger the **before insert**, **before update**, and **after update** triggers.
    - Run the **update nothing** command to trigger the **before insert** trigger.
  - The unique constraint or primary key of **DEFERRABLE** is not supported.
  - If a table has multiple unique constraints and the inserted data violates multiple unique constraints, only the first row that has a conflict is

updated. (The check sequence is closely related to index maintenance. Generally, the conflict check is performed on the index that is created first.)

- If multiple rows are inserted and these rows conflict with the same row in the table, the system inserts or updates the first row and then updates other rows in sequence.
- Primary keys and unique index columns cannot be updated.
- Foreign tables are not supported.
- **expression** does not support subquery expressions.

## Examples

```
-- Create a schema.
gaussdb=# CREATE SCHEMA tpcds;

-- Create the tpcds.reason table.
gaussdb=# CREATE TABLE tpcds.reason
(
  r_reason_sk integer,
  r_reason_id character(16),
  r_reason_desc character(100)
);

-- Insert a record into a table:
gaussdb=# INSERT INTO tpcds.reason(r_reason_sk, r_reason_id, r_reason_desc) VALUES (0,
'AAAAAAAAAAAAAAAA', 'reason0');

-- Create the tpcds.reason_t2 table.
gaussdb=# CREATE TABLE tpcds.reason_t2
(
  r_reason_sk integer,
  r_reason_id character(16),
  r_reason_desc character(100)
);

-- Insert a record into a table:
gaussdb=# INSERT INTO tpcds.reason_t2(r_reason_sk, r_reason_id, r_reason_desc) VALUES (1,
'AAAAAAAAABAAAAAAAA', 'reason1');

-- Insert a record into the table, which is equivalent to the previous syntax:
gaussdb=# INSERT INTO tpcds.reason_t2 VALUES (2, 'AAAAAAAAABAAAAAAAA', 'reason2');

-- Insert multiple records into the table.
gaussdb=# INSERT INTO tpcds.reason_t2 VALUES (3, 'AAAAAAAACAAAAAAA', 'reason3'),(4,
'AAAAAAAADAAAAAAA', 'reason4'),(5, 'AAAAAAAEEAAAAAAA', 'reason5');

-- Insert records whose r_reason_sk in the tpcds.reason table is less than 5.
gaussdb=# INSERT INTO tpcds.reason_t2 SELECT * FROM tpcds.reason WHERE r_reason_sk <5;

-- Create a unique index for a table.
gaussdb=# CREATE UNIQUE INDEX reason_t2_u_index ON tpcds.reason_t2(r_reason_sk);

-- Insert multiple records into the table. If the records conflict, update the r_reason_id field in the conflict
data row to BBBBBBBCCA.
gaussdb=# INSERT INTO tpcds.reason_t2 VALUES (5, 'BBBBBBBCCA', 'reason5'),(6,
'AAAAAAAADAAAAAAA', 'reason6') ON DUPLICATE KEY UPDATE r_reason_id = 'BBBBBBBCCA';

-- Delete the tpcds.reason_t2.
gaussdb=# DROP TABLE tpcds.reason_t2;

-- Delete the tpcds.reason table.
gaussdb=# DROP TABLE tpcds.reason;

-- Delete a schema.
gaussdb=# DROP SCHEMA tpcds CASCADE;
```

## Suggestions

### VALUES

When you run the INSERT statement to insert data in batches, you are advised to combine multiple records into one statement to improve data loading performance. Example: **INSERT INTO sections VALUES (30, 'Administration', 31, 1900),(40, 'Development', 35, 2000), (50, 'Development' , 60 , 2001);**

## 7.14.151 LOCK

### Description

LOCK TABLE obtains a table-level lock.

GaussDB always tries to select the lock mode with minimum constraints when automatically requesting a lock for a statement referenced by a table. Use **LOCK** if users need a more strict lock mode. For example, suppose an application runs a transaction at the Read Committed isolation level and needs to ensure that data in a table remains stable in the duration of the transaction. To achieve this, you could obtain **SHARE** lock mode over the table before the query. This will prevent concurrent data changes and ensure subsequent reads of the table see a stable view of committed data. It is because the **SHARE** lock mode conflicts with the **ROW EXCLUSIVE** lock acquired by writers, and your **LOCK TABLE name IN SHARE MODE** statement will wait until any concurrent holders of **ROW EXCLUSIVE** mode locks commit or roll back. Therefore, once you obtain the lock, there are no uncommitted writes outstanding; furthermore none can begin until you release the lock.

### Precautions

- **LOCK TABLE** is useless outside a transaction block: the lock would remain held only to the completion of the statement. If **LOCK TABLE** is out of any transaction block, an error is reported.
- If no lock mode is specified, then **ACCESS EXCLUSIVE**, the most restrictive mode, is used.
- **LOCK TABLE ... IN ACCESS SHARE MODE** requires the **SELECT** permission on the target table. All other forms of **LOCK** require table-level **UPDATE** and/or the **DELETE** permission.
- There is no **UNLOCK TABLE** statement. Locks are always released at transaction end.
- **LOCK TABLE** only deals with table-level locks, and so the mode names involving **ROW** are all misnomers. These mode names should generally be read as indicating the intention of the user to acquire row-level locks within the locked table. Also, **ROW EXCLUSIVE** mode is a shareable table lock. Note that all the lock modes have identical semantics so far as **LOCK TABLE** is concerned, differing only in the rules about which modes conflict with which. For details about the rules, see [Table 7-149](#).
- If the `xc_maintenance_mode` parameter is not enabled, an error is reported when an **ACCESS EXCLUSIVE** lock is applied for a system catalog.

## Syntax

```
LOCK [ TABLE ] {[ ONLY ] name [, ...]} {name [ * ]} [, ...]
  [ IN {ACCESS SHARE | ROW SHARE | ROW EXCLUSIVE | SHARE UPDATE EXCLUSIVE | SHARE | SHARE
ROW EXCLUSIVE | EXCLUSIVE | ACCESS EXCLUSIVE} MODE ]
  [ NOWAIT ];
```

## Parameters

**Table 7-149** Lock mode conflicts

| Requested Lock Mode/<br>Current Lock Mode | ACCESS SHARE | ROW SHARE | ROW EXCLUSIVE | SHARE UPDATE EXCLUSIVE | SHARE | SHARE ROW EXCLUSIVE | EXCLUSIVE | ACCESS EXCLUSIVE |
|-------------------------------------------|--------------|-----------|---------------|------------------------|-------|---------------------|-----------|------------------|
| ACCESS SHARE                              | -            | -         | -             | -                      | -     | -                   | -         | X                |
| ROW SHARE                                 | -            | -         | -             | -                      | -     | -                   | X         | X                |
| ROW EXCLUSIVE                             | -            | -         | -             | -                      | X     | X                   | X         | X                |
| SHARE UPDATE EXCLUSIVE                    | -            | -         | -             | X                      | X     | X                   | X         | X                |
| SHARE                                     | -            | -         | X             | X                      | -     | X                   | X         | X                |
| SHARE ROW EXCLUSIVE                       | -            | -         | X             | X                      | X     | X                   | X         | X                |
| EXCLUSIVE                                 | -            | X         | X             | X                      | X     | X                   | X         | X                |
| ACCESS EXCLUSIVE                          | X            | X         | X             | X                      | X     | X                   | X         | X                |

**LOCK** parameters are as follows:

- **name**

Specifies the name (optionally schema-qualified) of an existing table to lock. Tables are locked one-by-one in the order specified in the **LOCK TABLE** statement.

Value range: an existing table name

 **NOTE**

You can use database links to perform operations on remote tables. For details, see [DATABASE LINK](#).
- **ONLY**

If **ONLY** is specified, only that table is locked. If **ONLY** is not specified, the table and all its sub-tables are locked.
- **ACCESS SHARE**

Conflicts with the ACCESS EXCLUSIVE lock mode only.

The **SELECT** statement acquires a lock of this mode on referenced tables. Typically, any command that reads a table without modifying it acquires this lock mode.
- **ROW SHARE**

It conflicts with the EXCLUSIVE and ACCESS EXCLUSIVE lock modes.

**SELECT FOR UPDATE** and **SELECT FOR SHARE** automatically acquire the **ROW SHARE** lock on the target table and add the **ACCESS SHARE** lock to other referenced tables except **FOR SHARE** and **FOR UPDATE**.
- **ROW EXCLUSIVE**

Allows concurrent read of a table but does not allow modification of data in the table like **ROW SHARE**. **UPDATE**, **DELETE**, and **INSERT** automatically acquire the **ROW SHARE** lock on the target table and add the **ACCESS SHARE** lock to other referenced tables. Generally, all statements that modify table data acquire the **ROW EXCLUSIVE** lock for tables.
- **SHARE UPDATE EXCLUSIVE**

Protects a table against concurrent schema changes and VACUUM runs.

Acquired by **VACUUM** (without **FULL**), **ANALYZE** and **CREATE INDEX CONCURRENTLY** statements, and some forms of **ALTER TABLE**.
- **SHARE**

Allows concurrent queries of a table but does not allow modification of the table.

Acquired by **CREATE INDEX** (without **CONCURRENTLY**).
- **SHARE ROW EXCLUSIVE**

Protects a table against concurrent data changes, and is self-exclusive so that only one session can hold it at a time.

No SQL statements automatically acquire this lock mode.
- **EXCLUSIVE**

Allows concurrent queries of the target table but does not allow any other operations.

This mode allows only concurrent **ACCESS SHARE** locks; that is, only reads from the table can proceed in parallel with a transaction holding this lock mode.

No SQL statements automatically acquire this lock mode on user tables. However, it will be acquired on some system catalogs in case of some operations.

- **ACCESS EXCLUSIVE**

Guarantees that the holder is the only transaction accessing the table in any way.

Acquired by the **ALTER TABLE**, **DROP TABLE**, **TRUNCATE**, and **REINDEX** statements.

This is also the default lock mode for **LOCK TABLE** statements that do not specify a mode explicitly.

- **NOWAIT**

Specifies that **LOCK TABLE** should not wait for any conflicting locks to be released: if the specified lock(s) cannot be acquired immediately without waiting, the transaction is aborted.

If **NOWAIT** is not specified, **LOCK TABLE** obtains a table-level lock, waiting if necessary for any conflicting locks to be released.

## Examples

```
-- Create a schema.
gaussdb=# CREATE SCHEMA tpcds;

-- Create the tpcds.reason table.
gaussdb=# CREATE TABLE tpcds.reason
(
  r_reason_sk      INTEGER    NOT NULL,
  r_reason_id      CHAR(16)   NOT NULL,
  r_reason_desc    INTEGER
);

-- Insert multiple records into the table.
gaussdb=# INSERT INTO tpcds.reason VALUES (1, 'AAAAAAAAABAAAAAAA', '18'),(5, 'AAAAAAAACAAAAAAA',
'362'),(7, 'AAAAAAAADAAAAAAA', '585');

-- Obtain a SHARE ROW EXCLUSIVE lock on a primary key table when going to perform a delete operation.
gaussdb=# CREATE TABLE tpcds.reason_t1 AS TABLE tpcds.reason;

gaussdb=# START TRANSACTION;

gaussdb=# LOCK TABLE tpcds.reason_t1 IN SHARE ROW EXCLUSIVE MODE;

gaussdb=# DELETE FROM tpcds.reason_t1 WHERE r_reason_desc IN(SELECT r_reason_desc FROM
tpcds.reason_t1 WHERE r_reason_sk < 6 );

gaussdb=# DELETE FROM tpcds.reason_t1 WHERE r_reason_sk = 7;

gaussdb=# COMMIT;

-- Delete the tpcds.reason_t1 table.
gaussdb=# DROP TABLE tpcds.reason_t1;

-- Delete the table.
gaussdb=# DROP TABLE tpcds.reason;

-- Delete a schema.
gaussdb=# DROP SCHEMA tpcds CASCADE;
```

## 7.14.152 MERGE INTO

### Description

**MERGE INTO** conditionally matches data in a target table with that in a source table. If data matches, **UPDATE** is executed on the target table; if data does not match, **INSERT** is executed. You can use this syntax to run **UPDATE** and **INSERT** at a time for convenience

### Precautions

You have the **INSERT** and **UPDATE** permissions for the target table and the **SELECT** permission for the source table.

### Syntax

```
MERGE [/*+ plan_hint */] INTO table_name [ partition_clause ] [ [ AS ] alias ]
USING { { table_name | view_name } | subquery } [ [ AS ] alias ]
ON ( condition )
[
  WHEN MATCHED THEN
  UPDATE SET { column_name = { expression | subquery | DEFAULT } |
    ( column_name [, ...] ) = ( { expression | subquery | DEFAULT } [, ...] ) [, ...]
  [ WHERE condition ]
]
[
  WHEN NOT MATCHED THEN
  INSERT { DEFAULT VALUES |
    [ ( column_name [, ...] ) ] VALUES ( { expression | subquery | DEFAULT } [, ...] ) [, ...] [ WHERE condition ] }
];
NOTICE: 'subquery' in the UPDATE and INSERT clauses are only available in CENTRALIZED mode!
```

### Parameters

- **plan\_hint** clause  
Follows the **MERGE** keyword in the */\*+ \*/* format. It is used to optimize the plan of a **MERGE** statement block. For details, see [Hint-based Tuning](#). In each statement, only the first */\*+ plan\_hint\*/* comment block takes effect as a hint. Multiple hints can be written.
- **INTO** clause  
Specifies the target table that is being updated or has data being inserted.
- **table\_name**  
Specifies the name of the target table.
- **partition\_clause**  
Performs **MERGE** operations on a specified partition.  

```
PARTITION { ( partition_name ) | FOR ( partition_value [, ...] ) } |
SUBPARTITION { ( subpartition_name ) | FOR ( subpartition_value [, ...] ) }
```

  
For details about the keywords, see [SELECT](#).  
If the value of the **VALUE** clause is inconsistent with that of the specified partition, an exception is displayed.  
For details, see [CREATE TABLE SUBPARTITION](#).
- **alias**  
Specifies the alias of the target table.

Value range: a string. It must comply with the [naming convention](#).

- **USING** clause  
Specifies the source table, which can be a table, view, or subquery.
- **ON** clause  
Specifies the condition used to match data between the source and target tables. Columns in the condition cannot be updated.
- **WHEN MATCHED** clause  
Performs UPDATE if data in the source table matches that in the target table based on the condition.  
System catalogs and system columns cannot be updated.
- **WHEN NOT MATCHED** clause  
Performs INSERT if data in the source table does not match that in the target table based on the condition.  
An INSERT clause can contain only one **VALUES**.  
The order of **WHEN MATCHED** and **WHEN NOT MATCHED** clauses can be reversed. One of them can be used by default, but they cannot be both used at one time. Two **WHEN MATCHED** or **WHEN NOT MATCHED** clauses cannot be specified at the same time.
- **DEFAULT**  
Specifies the default value of a column.  
The value is **NULL** if no default value is assigned to it.
- **WHERE** condition  
Specifies the conditions for the UPDATE and INSERT clauses. The two clauses will be executed only when the conditions are met. The default value can be used. System columns cannot be referenced in WHERE condition. You are not advised to use numeric types such as int for **condition**, because such types can be implicitly converted to bool values (non-zero values are implicitly converted to **true** and **0** is implicitly converted to **false**), which may cause unexpected results.

## Examples

```
-- Create the target table products and source table newproducts, and insert data to them.
gaussdb=# CREATE TABLE products
(
product_id INTEGER,
product_name VARCHAR2(60),
category VARCHAR2(60)
);

gaussdb=# INSERT INTO products VALUES (1501, 'vivitar 35mm', 'electrncs');
gaussdb=# INSERT INTO products VALUES (1502, 'olympus is50', 'electrncs');
gaussdb=# INSERT INTO products VALUES (1600, 'play gym', 'toys');
gaussdb=# INSERT INTO products VALUES (1601, 'lamaze', 'toys');
gaussdb=# INSERT INTO products VALUES (1666, 'harry potter', 'dvd');

gaussdb=# CREATE TABLE newproducts
(
product_id INTEGER,
product_name VARCHAR2(60),
category VARCHAR2(60)
);

gaussdb=# INSERT INTO newproducts VALUES (1502, 'olympus camera', 'electrncs');
```

```
gaussdb=# INSERT INTO newproducts VALUES (1601, 'lamaze', 'toys');
gaussdb=# INSERT INTO newproducts VALUES (1666, 'harry potter', 'toys');
gaussdb=# INSERT INTO newproducts VALUES (1700, 'wait interface', 'books');

-- Run MERGE INTO.
gaussdb=# MERGE INTO products p
USING newproducts np
ON (p.product_id = np.product_id)
WHEN MATCHED THEN
  UPDATE SET p.product_name = np.product_name, p.category = np.category WHERE p.product_name !=
'play gym'
WHEN NOT MATCHED THEN
  INSERT VALUES (np.product_id, np.product_name, np.category) WHERE np.category = 'books';
MERGE 4

-- Query updates.
gaussdb=# SELECT * FROM products ORDER BY product_id;
 product_id | product_name | category
-----+-----+-----
      1501 | vivitar 35mm | electrncs
      1502 | olympus camera | electrncs
      1600 | play gym      | toys
      1601 | lamaze       | toys
      1666 | harry potter | toys
      1700 | wait interface | books
(6 rows)

-- Delete the table.
gaussdb=# DROP TABLE products;
gaussdb=# DROP TABLE newproducts;
```

## 7.14.153 MOVE

### Function

**MOVE** repositions a cursor without retrieving any data. **MOVE** works exactly like the **FETCH** statement, except it only repositions the cursor and does not return rows.

### Precautions

None

### Syntax

```
MOVE [ direction [ FROM | IN ] ] cursor_name;
```

The **direction** clause specifies optional parameters.

```
NEXT
| PRIOR
| FIRST
| LAST
| ABSOLUTE count
| RELATIVE count
| count
| ALL
| FORWARD
| FORWARD count
| FORWARD ALL
| BACKWARD
| BACKWARD count
| BACKWARD ALL
```

## Parameter Description

The parameters of **MOVE** and **FETCH** are the same. For details, see [Parameters in FETCH](#).

### NOTE

On successful completion, a **MOVE** statement returns a tag of the form **MOVE count**. The **count** is the number of rows that a **FETCH** statement with the same parameters would have returned (possibly zero).

## Examples

```
-- Create a schema.
gaussdb=# CREATE SCHEMA tpcds;

-- Create the tpcds.reason table.
gaussdb=# CREATE TABLE tpcds.reason
(
  r_reason_sk      INTEGER    NOT NULL,
  r_reason_id      CHAR(16)   NOT NULL,
  r_reason_desc    VARCHAR(40)
);

-- Insert multiple records into the table.
gaussdb=# INSERT INTO tpcds.reason VALUES (1, 'AAAAAAAABAAAAAAA', 'XXXXXXXX'),(2,
'AAAAAAACAAAAAAA', 'XXXXXXXX'),(3, 'AAAAAADAAAAAAA', 'XXXXXXXX'),(4, 'AAAAAAEAAAAAAA',
'Not the product that was ordered'),(5, 'AAAAAAFAAAAAAAA', 'Parts missing'),(6, 'AAAAAAGAAAAAAA',
'Does not work with a product that I have'),(7, 'AAAAAAHAAAAAAA', 'Gift exchange');

-- Start a transaction.
gaussdb=# START TRANSACTION;

-- Define a cursor cursor1.
gaussdb=# CURSOR cursor1 FOR SELECT * FROM tpcds.reason;

-- Skip the first three rows of cursor1.
gaussdb=# MOVE FORWARD 3 FROM cursor1;

-- Fetch the first four rows from cursor1.
gaussdb=# FETCH 4 FROM cursor1;
 r_reason_sk | r_reason_id |                               r_reason_desc
-----+-----
4 | AAAAAAAEAAAAAAA | Not the product that was
ordred
5 | AAAAAAFAAAAAAAA | Parts missing
6 | AAAAAAAGAAAAAAA | Does not work with a product that I
have
7 | AAAAAAHAAAAAAA | Gift
exchange
(4 rows)

-- Close the cursor.
gaussdb=# CLOSE cursor1;

-- End the transaction.
gaussdb=# END;

-- Delete a table.
gaussdb=# DROP TABLE tpcds.reason;

-- Delete a schema.
gaussdb=# DROP SCHEMA tpcds CASCADE;
```

## Helpful Links

[CLOSE](#) and [FETCH](#)

## 7.14.154 PREDICT BY

### Description

Uses a trained model to perform prediction tasks.

### Precautions

The name of the invoked model can be viewed in the `gs_model_warehouse` system catalog.

### Syntax

```
PREDICT BY model_name (FEATURES attribute [, attribute] +])
```

### Parameters

- `model_name`  
Name of the model of a prediction task.  
Value range: a string. It must comply with the [naming convention](#).
- `attribute`  
Name of the input feature column of a prediction task.  
Value range: a string. It must comply with the [naming convention](#).

### Examples

```
SELECT id, PREDICT BY price_model (FEATURES size,lot), price  
FROM houses;
```

## Helpful Links

[CREATE MODEL](#) and [DROP MODEL](#)

## 7.14.155 PREPARE

### Function

Creates a prepared statement.

A prepared statement is a performance optimizing object on the server. When the **PREPARE** statement is executed, the specified query is parsed, analyzed, and rewritten. When EXECUTE is executed, the prepared statement is planned and executed. This avoids repetitive parsing and analysis. After the **PREPARE** statement is created, it exists throughout the database session. Once it is created (even if in a transaction block), it will not be deleted when a transaction is rolled back. It can only be deleted by explicitly calling [DEALLOCATE](#) or automatically deleted when the session ends.

## Precautions

None

## Syntax

```
PREPARE name [ ( data_type [, ...] ) ] AS statement;
```

## Parameter Description

- **name**  
Specifies the name of a prepared statement. It must be unique in the session.
- **data\_type**  
Specifies the type of an argument.
- **statement**  
Specifies a SELECT, INSERT, UPDATE, DELETE, MERGE INTO, or VALUES statement.

## Examples

See [Examples](#) in section "EXECUTE."

## Helpful Links

[DEALLOCATE](#)

# 7.14.156 PREPARE TRANSACTION

## Function

Prepares the current transaction for two-phase commit.

After this statement, the transaction is no longer associated with the current session; instead, its state is fully stored on disk, and there is a high probability that it can be committed successfully, even if a database crash occurs before the commit is requested.

Once prepared, a transaction can later be committed or rolled back with [COMMIT PREPARED](#) or [ROLLBACK PREPARED](#), respectively. Those statements can be issued from any session, not only the one that executed the original transaction.

From the point of view of the issuing session, **PREPARE TRANSACTION** is not unlike a **ROLLBACK** statement: after executing it, there is no active current transaction, and the effects of the prepared transaction are no longer visible. (The effects will become visible again if the transaction is committed.)

If the **PREPARE TRANSACTION** statement fails for any reason, it becomes a **ROLLBACK** and the current transaction is canceled.

## Precautions

- The transaction function is maintained automatically by the database, and should be not visible to users.

- When running the **PREPARE TRANSACTION** statement, increase the value of **max\_prepared\_transactions** in configuration file **postgresql.conf**. You are advised to set it to a value not less than that of **max\_connections** so that one pending prepared transaction is available for each session.

## Syntax

```
PREPARE TRANSACTION transaction_id;
```

## Parameter Description

### transaction\_id

Specifies an arbitrary identifier that later identifies this transaction for **COMMIT PREPARED** or **ROLLBACK PREPARED**. The identifier must be different from those for current prepared transactions.

Value range: The identifier must be written as a string literal, and must be less than 200 bytes long.

## Examples

```
-- Start.
gaussdb=# BEGIN;
BEGIN

-- Prepare a transaction whose identifier is trans_test.
gaussdb=# PREPARE TRANSACTION 'trans_test';
PREPARE TRANSACTION
```

## Helpful Links

[COMMIT PREPARED](#) and [ROLLBACK PREPARED](#)

## 7.14.157 PURGE

### Description

The **PURGE** statement can be used to:

- Clear tables or indexes from the recycle bin and release all space related to the objects.
- Clear the recycle bin.
- Clear the objects of a specified tablespace in the recycle bin.

### Precautions

- The PURGE operation supports tables (**PURGE TABLE**), indexes (**PURGE INDEX**), and recycle bins (**PURGE RECYCLEBIN**).
- The permission requirements for performing the PURGE operation are as follows:
  - **PURGE TABLE**: The user must be the owner of the table and must have the **USAGE** permission on the schema to which the table belongs. By default, the system administrator has this permission.

- **PURGE INDEX:** The user must be the owner of the index and have the **USAGE** permission on the schema to which the index belongs. By default, the system administrator has this permission.
- **PURGE RECYCLEBIN:** Common users can clear only the objects owned by themselves in the recycle bin. In addition, the user must have the **USAGE** permission of the schema to which the objects belong. By default, the system administrator can clear all objects in the recycle bin.

## Prerequisites

- The **enable\_recyclebin** parameter has been enabled to enable the recycle bin. Contact the administrator for details about how to use the parameter.
- The **recyclebin\_retention\_time** parameter has been set for specifying the retention period of objects in the recycle bin. The objects will be automatically deleted after the retention period expires. Contact the administrator for details about how to use the parameter.

## Syntax

```
PURGE { TABLE [schema_name.]table_name
      | INDEX index_name
      | RECYCLEBIN
      }
```

## Parameters

- [*schema\_name*.]  
Schema name
- TABLE [*schema\_name*.] *table\_name*  
Clears a specified table in the recycle bin.
- INDEX *index\_name*  
Clears a specified index in the recycle bin.
- RECYCLEBIN  
Clears all objects in the recycle bin.

## Examples

```
-- Create the tpcds role.
gaussdb=# CREATE ROLE tpcds IDENTIFIED BY '*****';

-- Create the reason_table_space tablespace.
gaussdb=# CREATE TABLESPACE REASON_TABLE_SPACE1 owner tpcds RELATIVE location 'tablespace/
tsp_reason1';

-- Create a schema.
gaussdb=# CREATE SCHEMA tpcds;

-- Create the tpcds.reason_t1 table in the tablespace.
gaussdb=# CREATE TABLE tpcds.reason_t1
(
  r_reason_sk integer,
  r_reason_id character(16),
  r_reason_desc character(100)
) tablespace reason_table_space1;
-- Create the tpcds.reason_t2 table in the tablespace.
gaussdb=# CREATE TABLE tpcds.reason_t2
(
```

```
r_reason_sk integer,
r_reason_id character(16),
r_reason_desc character(100)
) tablespace reason_table_space1;
-- Create the tpcds.reason_t3 table in the tablespace.
gaussdb=# CREATE TABLE tpcds.reason_t3
(
r_reason_sk integer,
r_reason_id character(16),
r_reason_desc character(100)
) tablespace reason_table_space1;
-- Create an index on the tpcds.reason_t1 table.
gaussdb=# CREATE INDEX index_t1 on tpcds.reason_t1(r_reason_id);
gaussdb=# DROP TABLE tpcds.reason_t1;
gaussdb=# DROP TABLE tpcds.reason_t2;
gaussdb=# DROP TABLE tpcds.reason_t3;
-- View the recycle bin.
gaussdb=# SELECT rcyname,rcyoriginname,rcytablespace FROM GS_RECYCLEBIN;
rcyname | rcyoriginname | rcytablespace
-----+-----+-----

(2 rows)
-- Purge all objects in the recycle bin.
gaussdb=# PURGE recyclebin;
gaussdb=# SELECT rcyname,rcyoriginname,rcytablespace FROM GS_RECYCLEBIN;
rcyname | rcyoriginname | rcytablespace
-----+-----+-----
(0 rows)
-- Delete the schema.
gaussdb=# DROP SCHEMA tpcds CASCADE;
```

## 7.14.158 REASSIGN OWNED

### Function

Changes the owner of the database object.

REASSIGN OWNED changes the database object owner of an old role to a new role.

### Precautions

- REASSIGN OWNED is often executed before role deletion.
- To run the REASSIGN OWNED statement, you must have the permissions of the original and target roles.

## Syntax

```
REASSIGN OWNED BY old_role [, ...] TO new_role;
```

## Parameter Description

- **old\_role**  
Specifies the role name of the old owner.
- **new\_role**  
Specifies the role name of the new owner. Note: Only the initial user can use the REASSIGN OWNED syntax to change the owner to the initial user.

## Examples

None

## 7.14.159 REFRESH INCREMENTAL MATERIALIZED VIEW

### Function

**REFRESH INCREMENTAL MATERIALIZED VIEW** refreshes a materialized view in incremental mode.

### Precautions

- Incremental refresh supports only fast-refresh materialized views.
- To refresh a materialized view, you must have the SELECT permission on the base table.

## Syntax

```
REFRESH INCREMENTAL MATERIALIZED VIEW mv_name;
```

## Parameter Description

- **mv\_name**  
Name of the materialized view to be refreshed.

## Examples

```
-- Create an ordinary table.
gaussdb=# CREATE TABLE my_table (c1 int, c2 int)
WITH(STORAGE_TYPE=ASTORE);

-- Create a fast-refresh materialized view.
gaussdb=# CREATE INCREMENTAL MATERIALIZED VIEW my_imv AS SELECT * FROM my_table;

-- Write data to the base table.
gaussdb=# INSERT INTO my_table VALUES(1,1),(2,2);

-- Fast refresh the fast-refresh materialized view my_imv.
gaussdb=# REFRESH INCREMENTAL MATERIALIZED VIEW my_imv;

-- Delete a fast-refresh materialized view.
gaussdb=# DROP MATERIALIZED VIEW my_imv;

-- Delete the my_table table.
gaussdb=# DROP TABLE my_table;
```

## 7.14.160 REFRESH MATERIALIZED VIEW

### Function

**REFRESH MATERIALIZED VIEW** refreshes materialized views in complete-refresh mode.

### Precautions

- Full refreshing can be performed on both complete- and fast-refresh materialized views.
- To refresh a materialized view, you must have the SELECT permission on the base table.

### Syntax

```
REFRESH MATERIALIZED VIEW mv_name;
```

### Parameter Description

- **mv\_name**  
Name of the materialized view to be refreshed.

### Examples

```
-- Create an ordinary table.
gaussdb=# CREATE TABLE my_table (c1 int, c2 int)
WITH(STORAGE_TYPE=ASTORE);

-- Create a complete-refresh materialized view.
gaussdb=# CREATE MATERIALIZED VIEW my_mv AS SELECT * FROM my_table;

-- Create a fast-refresh materialized view.
gaussdb=# CREATE INCREMENTAL MATERIALIZED VIEW my_imv AS SELECT * FROM my_table;

-- Write data to the base table.
gaussdb=# INSERT INTO my_table VALUES(1,1),(2,2);

-- Completely refresh the complete-refresh materialized view my_mv.
gaussdb=# REFRESH MATERIALIZED VIEW my_mv;

-- Completely refresh the fast-refresh materialized view my_imv.
gaussdb=# REFRESH MATERIALIZED VIEW my_imv;

-- Delete a fast-refresh materialized view.
gaussdb=# DROP MATERIALIZED VIEW my_imv;

-- Delete a complete-refresh materialized view.
gaussdb=# DROP MATERIALIZED VIEW my_mv;

-- Delete the my_table table.
gaussdb=# DROP TABLE my_table;
```

## 7.14.161 REINDEX

### Description

**REINDEX** rebuilds an index using the data stored in the index's table, replacing the old copy of the index.

There are several scenarios in which **REINDEX** can be used:

- An index has become corrupted, and no longer contains valid data.
- An index has become "bloated", that is, it contains many empty or nearly-empty pages.
- You have altered a storage parameter (such as a fill factor) for an index, and wish that the change takes full effect.
- An index build with the **CONCURRENTLY** option failed, leaving an "invalid" index.

### Precautions

- **REINDEX DATABASE** and **REINDEX SYSTEM** type cannot be performed in transaction blocks. Currently, REINDEX operations cannot be performed on materialized views.

### Syntax

- Rebuild a general index.  
`REINDEX { INDEX | TABLE | DATABASE | SYSTEM } [CONCURRENTLY] name [ FORCE ];`
- Rebuild an index partition.  
`REINDEX { INDEX| TABLE} name  
PARTITION partition_name [ FORCE ];`

### Parameters

- **INDEX**  
Rebuilds the specified index.
- **TABLE**  
Rebuilds all indexes of a specified table. If a table has a TOAST table, the table will also be reindexed. If an index in the table has been invalidated by running **alter unusable**, the index cannot be rebuilt. Indexes in the TOAST table cannot be rebuilt when specifying the **CONCURRENTLY** option.
- **DATABASE**  
Rebuilds all indexes within the current database. Indexes in the TOAST table within the current database cannot be rebuilt when specifying the **CONCURRENTLY** option.
- **SYSTEM**

Rebuilds all indexes on system catalogs within the current database. Indexes on user tables are not processed.

- **CONCURRENTLY**

Rebuilds an index (with ShareUpdateExclusiveLock) in non-blocking DML mode. When an index is rebuilt, other statements cannot access the table on which the index depends. If this keyword is specified, DML is not blocked during the rebuilding. Indexes in system catalogs cannot be rebuilt online. REINDEX INTERNAL TABLE CONCURRENTLY and REINDEX SYSTEM CONCURRENTLY are not supported. When REINDEX DATABASE CONCURRENTLY is executed, all indexes on user tables in the current database are rebuilt online (indexes on system catalogs are not processed). REINDEX CONCURRENTLY cannot be executed within a transaction. Only B-tree and UB-tree indexes can be created online and only common, global, and local indexes are supported. Online concurrent index rebuilding supports only Astore common indexes, global indexes, and local indexes. Ustore indexes are not supported. If online index rebuilding fails, invalid new indexes may be left. If the system cannot automatically clear the invalid indexes (for example, the database is shut down), you need to manually clear the invalid indexes (using the DROP INDEX statement) as soon as possible to prevent more resources from being occupied. Generally, the extension of an invalid index name is **\_ccnew**. The execution of REINDEX INDEX CONCURRENTLY adds a four-level session lock to the table and its first several phases are similar to those of CREATE INDEX CONCURRENTLY. Therefore, the execution may be suspended or deadlocked, which is similar to that of CREATE INDEX CONCURRENTLY. For example, if two sessions perform the REINDEX CONCURRENTLY operation on the same index or table at the same time, a deadlock occurs. For details, see [CONCURRENTLY](#).

- **name**

Specifies the name of the index, table, or database whose index needs to be rebuilt. Tables and indexes can be schema-qualified.

 **NOTE**

**REINDEX DATABASE** and **SYSTEM** can rebuild indexes for only the current database. Therefore, **name** must be the same as the current database name.

- **FORCE**

Discarded parameter. It is currently reserved for compatibility with earlier versions.

- **partition\_name**

Specifies the name of the partition or index partition to be rebuilt.

Value range:

- If **REINDEX INDEX** is used, specify the name of an index partition.
- If it is **REINDEX TABLE**, specify the name of a partition.

---

**NOTICE**

**REINDEX DATABASE** and **REINDEX SYSTEM** type cannot be performed in transaction blocks.

---

## Examples

```
-- Create a schema.
gaussdb=# CREATE SCHEMA tpcds;

-- Create the tpcds.customer table.
gaussdb=# CREATE TABLE tpcds.customer
(
  c_customer_sk      INTEGER      NOT NULL,
  c_customer_id     CHAR(16)     NOT NULL
);

-- Insert multiple records into the table.
gaussdb=# INSERT INTO tpcds.customer VALUES (1, 'AAAAAAAAABAAAAAAA'),(5, 'AAAAAAAACAAAAAAA'),
(10, 'AAAAAAAADAAAAAAA');

-- Create a row-store table tpcds.customer_t1 and create an index on the c_customer_sk column in the
table.
gaussdb=# CREATE TABLE tpcds.customer_t1
(
  c_customer_sk      integer      not null,
  c_customer_id     char(16)     not null,
  c_current_demo_sk  integer      ,
  c_current_hdemo_sk integer      ,
  c_current_addr_sk  integer      ,
  c_first_shipto_date_sk integer    ,
  c_first_sales_date_sk integer    ,
  c_salutation       char(10)     ,
  c_first_name       char(20)     ,
  c_last_name        char(30)     ,
  c_preferred_cust_flag char(1)   ,
  c_birth_day        integer      ,
  c_birth_month      integer      ,
  c_birth_year       integer      ,
  c_birth_country    varchar(20)  ,
  c_login            char(13)     ,
  c_email_address    char(50)     ,
  c_last_review_date char(10)
)
WITH (orientation = row);

gaussdb=# CREATE INDEX tpcds_customer_index1 ON tpcds.customer_t1 (c_customer_sk);

gaussdb=# INSERT INTO tpcds.customer_t1 SELECT * FROM tpcds.customer WHERE c_customer_sk < 10;

-- Rebuild a single index.
gaussdb=# REINDEX INDEX tpcds.tpcds_customer_index1;

-- Rebuild a single index online.
gaussdb=# REINDEX INDEX CONCURRENTLY tpcds.tpcds_customer_index1;

-- Rebuild all indexes in the tpcds.customer_t1 table.
gaussdb=# REINDEX TABLE tpcds.customer_t1;

-- Rebuild all indexes in the tpcds.customer_t1 table online.
gaussdb=# REINDEX TABLE CONCURRENTLY tpcds.customer_t1;

-- Delete the tpcds.customer_t1 table.
gaussdb=# DROP TABLE tpcds.customer_t1;

-- Drop the table.
gaussdb=# DROP TABLE tpcds.customer;

-- Delete a schema.
gaussdb=# DROP SCHEMA tpcds CASCADE;
```

## Suggestions

- DATABASE

- You are not allowed to re-index a database in a transaction.
- **SYSTEM**  
You are not allowed to re-index system catalogs in transactions.

## 7.14.162 RELEASE SAVEPOINT

### Function

**RELEASE SAVEPOINT** destroys a savepoint previously defined in the current transaction.

Destroying a savepoint makes it unavailable as a rollback point, but it has no other user visible behavior. It does not undo the effects of statements executed after the savepoint was established. To do that, use **ROLLBACK TO SAVEPOINT**. Destroying a savepoint when it is no longer needed allows the system to recycle some resources earlier than transaction end.

**RELEASE SAVEPOINT** also destroys all savepoints that were established after the named savepoint was established.

### Precautions

- Releasing a savepoint name that was not previously defined will cause an error.
- It is not possible to release a savepoint when the transaction is in an aborted state.
- If multiple savepoints have the same name, only the one that was most recently defined is released.

### Syntax

```
RELEASE [ SAVEPOINT ] savepoint_name;
```

### Parameter Description

**savepoint\_name**

Specifies the name of the savepoint you want to destroy.

### Examples

```
-- Create a schema.
gaussdb=# CREATE SCHEMA tpcds;

-- Create a table.
gaussdb=# CREATE TABLE tpcds.table1(a int);

-- Start a transaction.
gaussdb=# START TRANSACTION;

-- Insert data.
gaussdb=# INSERT INTO tpcds.table1 VALUES (3);

-- Establish a savepoint.
gaussdb=# SAVEPOINT my_savepoint;

-- Insert data.
gaussdb=# INSERT INTO tpcds.table1 VALUES (4);
```

```
-- Delete the savepoint.  
gaussdb=# RELEASE SAVEPOINT my_savepoint;  
  
-- Commit the transaction.  
gaussdb=# COMMIT;  
  
-- Query the table content, which should contain both 3 and 4.  
gaussdb=# SELECT * FROM tpceds.table1;  
  
-- Delete a table.  
gaussdb=# DROP TABLE tpceds.table1;  
  
-- Delete a schema.  
gaussdb=# DROP SCHEMA tpceds CASCADE;
```

## Helpful Links

[SAVEPOINT](#) and [ROLLBACK TO SAVEPOINT](#)

## 7.14.163 RESET

### Description

RESET restores GUC parameters to their default values. The default values are parameter default values compiled in the **postgresql.conf** configuration file.

RESET is an alternative spelling for:

```
SET configuration_parameter TO DEFAULT;
```

### Precautions

**RESET** and **SET** have the same transaction behavior. Their impact will be rolled back.

### Syntax

```
RESET {configuration_parameter | CURRENT_SCHEMA | TIME_ZONE | TRANSACTION ISOLATION LEVEL |  
SESSION AUTHORIZATION | ALL };
```

### Parameters

- **configuration\_parameter**  
Specifies the name of a settable GUC parameter.  
Value range: GUC parameters. You can view them by running the **SHOW ALL** statement.
- **CURRENT\_SCHEMA**  
Specifies the current schema.
- **TIME\_ZONE**  
Specifies the time zone.
- **TRANSACTION ISOLATION LEVEL**  
Specifies the transaction isolation level.
- **SESSION AUTHORIZATION**  
Specifies the session authorization.

- **ALL**  
Resets all settable GUC parameters to default values.

## Examples

```
-- Reset timezone to the default value.  
gaussdb=# RESET timezone;  
  
-- Set all parameters to their default values.  
gaussdb=# RESET ALL;
```

## Helpful Links

[SET](#) and [SHOW](#)

## 7.14.164 REVOKE

### Description

Revokes permissions from one or more roles.

### Precautions

If a non-owner user of an object attempts to the REVOKE permission on the object, the statement is executed based on the following rules:

- If the user has no permissions whatsoever on the object, the statement will fail outright.
- If an authorized user has some permissions, only the permissions with authorization options are revoked.
- If the authorized user does not have the authorization option, the **REVOKE ALL PRIVILEGES** form will issue an error message. For other forms of statements, if the permission specified in the statement does not have the corresponding authorization option, the statement will issue a warning.

### Syntax

- Revoke the permission on a specified table or view.  

```
REVOKE [ GRANT OPTION FOR ]  
  { { SELECT | INSERT | UPDATE | DELETE | TRUNCATE | REFERENCES | ALTER | DROP | COMMENT |  
    INDEX | VACUUM }[, ...]  
    | ALL [ PRIVILEGES ] }  
ON { [ TABLE ] table_name [, ...]  
    | ALL TABLES IN SCHEMA schema_name [, ...] }  
FROM { [ GROUP ] role_name | PUBLIC } [, ...]  
[ CASCADE | RESTRICT ];
```
- Revoke the permission on a specified field in a table.  

```
REVOKE [ GRANT OPTION FOR ]  
  { { SELECT | INSERT | UPDATE | REFERENCES | COMMENT } ( column_name [, ...] )[, ...]  
    | ALL [ PRIVILEGES ] ( column_name [, ...] ) }  
ON [ TABLE ] table_name [, ...]  
FROM { [ GROUP ] role_name | PUBLIC } [, ...]  
[ CASCADE | RESTRICT ];
```
- Revoke the permission on a specified sequence. The **LARGE** column is optional. The recycling statement does not distinguish whether the sequence is LARGE.

```
REVOKE [ GRANT OPTION FOR ]
{ { SELECT | UPDATE | ALTER | DROP | COMMENT } [, ...]
| ALL [ PRIVILEGES ] }
ON { [ [ LARGE ] SEQUENCE ] sequence_name [, ...]
| ALL SEQUENCES IN SCHEMA schema_name [, ...] }
FROM { [ GROUP ] role_name | PUBLIC } [, ...]
[ CASCADE | RESTRICT ];
```

- Revoke the permission on a specified database.

```
REVOKE [ GRANT OPTION FOR ]
{ { CREATE | CONNECT | TEMPORARY | TEMP | ALTER | DROP | COMMENT } [, ...]
| ALL [ PRIVILEGES ] }
ON DATABASE database_name [, ...]
FROM { [ GROUP ] role_name | PUBLIC } [, ...]
[ CASCADE | RESTRICT ];
```

- Revoke the permission on a specified domain.

```
REVOKE [ GRANT OPTION FOR ]
{ USAGE | ALL [ PRIVILEGES ] }
ON DOMAIN domain_name [, ...]
FROM { [ GROUP ] role_name | PUBLIC } [, ...]
[ CASCADE | RESTRICT ];
```

- Revoke the permission on a specified CMK.

```
REVOKE [ GRANT OPTION FOR ]
{ { USAGE | DROP } [, ...] | ALL [PRIVILEGES] }
ON CLIENT_MASTER_KEYS client_master_keys_name [, ...]
FROM { [ GROUP ] role_name | PUBLIC } [, ...]
[ CASCADE | RESTRICT ];
```

- Revoke the permission on a specified CEK.

```
REVOKE [ GRANT OPTION FOR ]
{ { USAGE | DROP } [, ...] | ALL [PRIVILEGES]}
ON COLUMN_ENCRYPTION_KEYS column_encryption_keys_name [, ...]
FROM { [ GROUP ] role_name | PUBLIC } [, ...]
[ CASCADE | RESTRICT ];
```

- Revoke the permission on a specified directory.

```
REVOKE [ GRANT OPTION FOR ]
{ { READ | WRITE | ALTER | DROP } [, ...] | ALL [ PRIVILEGES ] }
ON DIRECTORY directory_name [, ...]
FROM { [ GROUP ] role_name | PUBLIC } [, ...]
[ CASCADE | RESTRICT ];
```

- Revoke the permission on a specified external data source.

```
REVOKE [ GRANT OPTION FOR ]
{ USAGE | ALL [ PRIVILEGES ] }
ON FOREIGN_DATA_WRAPPER fdw_name [, ...]
FROM { [ GROUP ] role_name | PUBLIC } [, ...]
[ CASCADE | RESTRICT ];
```

- Revoke the permission on a specified external server.

```
REVOKE [ GRANT OPTION FOR ]
{ { USAGE | ALTER | DROP | COMMENT } [, ...] | ALL [ PRIVILEGES ] }
ON FOREIGN_SERVER server_name [, ...]
FROM { [ GROUP ] role_name | PUBLIC } [, ...]
[ CASCADE | RESTRICT ];
```

- Revoke the permission on a specified function.

```
REVOKE [ GRANT OPTION FOR ]
{ { EXECUTE | ALTER | DROP | COMMENT } [, ...] | ALL [ PRIVILEGES ] }
ON { FUNCTION {function_name ( ( [ argmode ] [ arg_name ] arg_type } [, ...] ) ) } [, ...]
| ALL FUNCTIONS IN SCHEMA schema_name [, ...] }
FROM { [ GROUP ] role_name | PUBLIC } [, ...]
[ CASCADE | RESTRICT ];
```

- Revoke the permission on a specified stored procedure.

```
REVOKE [ GRANT OPTION FOR ]
{ { EXECUTE | ALTER | DROP | COMMENT } [, ...] | ALL [ PRIVILEGES ] }
ON { PROCEDURE {proc_name ( ( [ argmode ] [ arg_name ] arg_type } [, ...] ) ) } [, ...]
| ALL PROCEDURE IN SCHEMA schema_name [, ...] }
FROM { [ GROUP ] role_name | PUBLIC } [, ...]
[ CASCADE | RESTRICT ];
```

- Revoke the permission on a specified procedural language.

```
REVOKE [ GRANT OPTION FOR ]
{ USAGE | ALL [ PRIVILEGES ] }
ON LANGUAGE lang_name [, ...]
FROM { [ GROUP ] role_name | PUBLIC } [, ...]
[ CASCADE | RESTRICT ];
```

- Revoke the permission on a specified large object.

```
REVOKE [ GRANT OPTION FOR ]
{ { SELECT | UPDATE } [, ...] | ALL [ PRIVILEGES ] }
ON LARGE OBJECT loid [, ...]
FROM { [ GROUP ] role_name | PUBLIC } [, ...]
[ CASCADE | RESTRICT ];
```

- Revoke the permission on a specified schema.

```
REVOKE [ GRANT OPTION FOR ]
{ { CREATE | USAGE | ALTER | DROP | COMMENT } [, ...] | ALL [ PRIVILEGES ] }
ON SCHEMA schema_name [, ...]
FROM { [ GROUP ] role_name | PUBLIC } [, ...]
[ CASCADE | RESTRICT ];
```

- Revoke the permission on a specified tablespace.

```
REVOKE [ GRANT OPTION FOR ]
{ { CREATE | ALTER | DROP | COMMENT } [, ...] | ALL [ PRIVILEGES ] }
ON TABLESPACE tablespace_name [, ...]
FROM { [ GROUP ] role_name | PUBLIC } [, ...]
[ CASCADE | RESTRICT ];
```

- Revoke the permission on a specified type.

```
REVOKE [ GRANT OPTION FOR ]
{ { USAGE | ALTER | DROP | COMMENT } [, ...] | ALL [ PRIVILEGES ] }
ON TYPE type_name [, ...]
FROM { [ GROUP ] role_name | PUBLIC } [, ...]
[ CASCADE | RESTRICT ];
```

- Revoke the permission on a package object.

```
REVOKE [ GRANT OPTION FOR ]
{ { EXECUTE | ALTER | DROP | COMMENT } [, ...] | ALL [ PRIVILEGES ] }
ON PACKAGE package_name [, ...]
FROM { [ GROUP ] role_name | PUBLIC } [, ...]
[ CASCADE | RESTRICT ];
```

- Revoke permissions from a role.

```
REVOKE [ ADMIN OPTION FOR ]
role_name [, ...] FROM role_name [, ...]
[ CASCADE | RESTRICT ];
```

- Revoke the sysadmin permission on a role.

```
REVOKE ALL { PRIVILEGES | PRIVILEGE } FROM role_name;
```

- Revoke the ANY permissions.

```
REVOKE [ ADMIN OPTION FOR ]
{ CREATE ANY TABLE | ALTER ANY TABLE | DROP ANY TABLE | SELECT ANY TABLE | INSERT ANY
TABLE | UPDATE ANY TABLE |
DELETE ANY TABLE | CREATE ANY SEQUENCE | CREATE ANY INDEX | CREATE ANY FUNCTION |
EXECUTE ANY FUNCTION |
CREATE ANY PACKAGE | EXECUTE ANY PACKAGE | CREATE ANY TYPE | ALTER ANY TYPE | DROP ANY
TYPE | ALTER ANY SEQUENCE | DROP ANY SEQUENCE |
SELECT ANY SEQUENCE | ALTER ANY INDEX | DROP ANY INDEX | CREATE ANY SYNONYM | DROP
ANY SYNONYM | CREATE ANY TRIGGER | ALTER ANY TRIGGER | DROP ANY TRIGGER
} [, ...]
FROM [ GROUP ] role_name [, ...];
```

- Revoke the permission on database links.

```
REVOKE { CREATE | ALTER | DROP } [PUBLIC] DATABASE LINK FROM role_name;
```

#### NOTE

For details about database links, see [DATABASE LINK](#).

## Parameters

The keyword **PUBLIC** indicates an implicitly defined group that has all roles.

For details about permission types and parameters, see [Parameters](#) in section "GRANT."

Permissions of a role include the permissions directly granted to the role, permissions inherited from the parent role, and permissions granted to **PUBLIC** users. Therefore, revoking the **SELECT** permission on an object from **PUBLIC** users does not necessarily mean that the **SELECT** permission on the object has been revoked from all roles, because the **SELECT** permission directly granted to roles and inherited from parent roles remains. Similarly, if the **SELECT** permission is revoked from a user but is not revoked from **PUBLIC** users, the user can still run the **SELECT** statement.

If **GRANT OPTION FOR** is specified, the permission cannot be granted to others, but permission itself is not revoked.

If user A holds the **UPDATE** permission on a table and the **WITH GRANT OPTION** and has granted them to user B, the permission that user B holds is called dependent permission. When user A's permission or grant option is revoked, **CASCADE** must be declared to revoke all dependent permissions.

A user can only revoke permissions that were granted directly by that user. For example, if user A has granted permission with grant option (**WITH ADMIN OPTION**) to user B, and user B has in turn granted it to user C, then user A cannot revoke the permission directly from C. However, user A can revoke the grant option held by user B and use **CASCADE**. In this way, the permission of user C is automatically revoked. For another example, if both user A and user B have granted the same permission to C, A can revoke his own grant but not B's grant, so C will still effectively have the permission.

If the role executing **REVOKE** holds permissions indirectly via more than one role membership path, it is unspecified which containing role will be used to execute the statement. In such cases, it is best practice to use **SET ROLE** to become the specific role you want to do the **REVOKE** as, and then execute **REVOKE**. Failure to do so may lead to deleting permissions not intended to delete, or not deleting any permissions at all.

## Examples

See [Examples](#) in section "GRANT."

## Helpful Links

[GRANT](#)

## 7.14.165 ROLLBACK

### Function

**ROLLBACK** rolls back the current transaction and backs out all updates in the transaction.

**ROLLBACK** backs out of all changes that a transaction makes to a database if the transaction fails to be executed due to a fault.

## Precautions

If a **ROLLBACK** statement is executed out of a transaction, no error occurs, but a notice is displayed.

## Syntax

```
ROLLBACK [ WORK | TRANSACTION ];
```

## Parameter Description

**WORK | TRANSACTION**

Specifies the optional keyword. that more clearly illustrates the syntax.

## Examples

```
-- Start a transaction.  
gaussdb=# START TRANSACTION;  
  
-- Back out all changes.  
gaussdb=# ROLLBACK;
```

## Helpful Links

[COMMIT | END](#)

## 7.14.166 ROLLBACK PREPARED

### Function

**ROLLBACK PREPARED** cancels a transaction ready for two-phase committing.

### Precautions

- The function is only available in maintenance mode (when the GUC parameter **xc\_maintenance\_mode** is set to **on**). Exercise caution when enabling the mode. It is used by maintenance engineers for troubleshooting. Common users should not use the mode.
- Only the user that initiates a transaction or the system administrator can roll back the transaction.
- The transaction function is maintained automatically by the database, and should be not visible to users.

### Syntax

```
ROLLBACK PREPARED transaction_id ;
```

### Parameter Description

**transaction\_id**

Specifies the identifier of the transaction to be committed. The identifier must be different from those for current prepared transactions.

## Examples

```
-- Start.  
gaussdb=# BEGIN;  
BEGIN  
  
-- Prepare a transaction whose identifier is trans_test.  
gaussdb=# PREPARE TRANSACTION 'trans_test';  
PREPARE TRANSACTION  
  
-- Cancel the transaction whose identifier is trans_test.  
gaussdb=# ROLLBACK PREPARED 'trans_test';  
ROLLBACK PREPARED
```

## 7.14.167 ROLLBACK TO SAVEPOINT

### Function

ROLLBACK TO SAVEPOINT rolls back to a savepoint. It implicitly destroys all savepoints that were established after the named savepoint.

Rolls back all statements that were executed after the savepoint was established. The savepoint remains valid and can be rolled back to again later, if needed.

### Precautions

- Specifying a savepoint name that has not been established is an error.
- Cursors have somewhat non-transactional behavior with respect to savepoints. Any cursor that is opened inside a savepoint will be closed when the savepoint is rolled back. If a previously opened cursor is affected by a FETCH or MOVE statement inside a savepoint that is later rolled back, the cursor remains at the position that FETCH left it pointing to (that is, the cursor motion caused by FETCH is not rolled back). Closing a cursor is not undone by rolling back, either. A cursor whose execution causes a transaction to abort is put in a cannot-execute state, so while the transaction can be restored using **ROLLBACK TO SAVEPOINT**, the cursor can no longer be used.
- Use **ROLLBACK TO SAVEPOINT** to roll back to a savepoint. Use **RELEASE SAVEPOINT** to destroy a savepoint but keep the effects of the statements executed after the savepoint was established.

### Syntax

```
ROLLBACK [ WORK | TRANSACTION ] TO [ SAVEPOINT ] savepoint_name;
```

### Parameters

**savepoint\_name**

Rolls back to a savepoint.

## Examples

```
-- Undo the effects of the statements executed after my_savepoint was established:
gaussdb=# START TRANSACTION;
gaussdb=# SAVEPOINT my_savepoint;
gaussdb=# ROLLBACK TO SAVEPOINT my_savepoint;
-- Cursor positions are not affected by savepoint rollback.
gaussdb=# DECLARE foo CURSOR FOR SELECT 1 UNION SELECT 2;
gaussdb=# SAVEPOINT foo;
gaussdb=# FETCH 1 FROM foo;
?column?
-----
1
gaussdb=# ROLLBACK TO SAVEPOINT foo;
gaussdb=# FETCH 1 FROM foo;
?column?
-----
2
gaussdb=# RELEASE SAVEPOINT my_savepoint;
gaussdb=# COMMIT;
```

## 7.14.168 SAVEPOINT

### Function

SAVEPOINT establishes a new savepoint in the current transaction.

A savepoint is a special mark inside a transaction. It allows all statements that are executed after it was established to be rolled back, restoring the transaction state to what it was at the time of the savepoint.

### Precautions

- Use ROLLBACK TO SAVEPOINT to roll back to a savepoint. Use RELEASE SAVEPOINT to destroy a savepoint but keep the effects of the statements executed after the savepoint was established.
- Savepoints can only be established when inside a transaction block. Multiple savepoints can be defined in a transaction.
- In the case of an unexpected termination of a thread or process caused by a node or connection failure, or of an error caused by the inconsistency between source and destination table structures in a **COPY FROM** operation, the transaction cannot be rolled back to the established savepoint. Instead, the entire transaction will be rolled back.
- According to the SQL standard, when a savepoint with the same name is created, the previous savepoint with the same name is automatically deleted. In GaussDB, the old savepoint is retained, but only the latest one is used during rollback or release. If the latest savepoint is released, the previous savepoint will again become accessible to ROLLBACK TO SAVEPOINT and RELEASE SAVEPOINT. In addition, SAVEPOINT fully complies with the SQL standard.

### Syntax

```
SAVEPOINT savepoint_name;
```

## Parameters

savepoint\_name

Specifies the name of the new savepoint.

### NOTICE

When using SAVEPOINT, you are advised to release SAVEPOINT promptly to avoid too many nested subtransactions. It is recommended that the number of nested subtransactions be less than or equal to 10,000. If the number of nested subtransactions is too large, the current transaction performance may deteriorate.

## Examples

```
-- Create a table.
gaussdb=# CREATE TABLE table1(a int);

-- Start a transaction.
gaussdb=# START TRANSACTION;

-- Insert data.
gaussdb=# INSERT INTO table1 VALUES (1);

-- Create a savepoint.
gaussdb=# SAVEPOINT my_savepoint;

-- Insert data.
gaussdb=# INSERT INTO table1 VALUES (2);

-- Roll back the savepoint.
gaussdb=# ROLLBACK TO SAVEPOINT my_savepoint;

-- Insert data.
gaussdb=# INSERT INTO table1 VALUES (3);

-- Commit the transaction.
gaussdb=# COMMIT;

-- Query the content of the table. You can see 1 and 3 at the same time, but cannot see 2 because 2 is
rolled back.
gaussdb=# SELECT * FROM table1;

-- Delete the table.
gaussdb=# DROP TABLE table1;

-- Create a table.
gaussdb=# CREATE TABLE table2(a int);

-- Start a transaction.
gaussdb=# START TRANSACTION;

-- Insert data.
gaussdb=# INSERT INTO table2 VALUES (3);

-- Create a savepoint.
gaussdb=# SAVEPOINT my_savepoint;

-- Insert data.
gaussdb=# INSERT INTO table2 VALUES (4);

-- Roll back the savepoint.
gaussdb=# RELEASE SAVEPOINT my_savepoint;
```

```
-- Commit the transaction.
gaussdb=# COMMIT;

-- Query the table content. You can see 3 and 4 at the same time.
gaussdb=# SELECT * FROM table2;

-- Delete the table.
gaussdb=# DROP TABLE table2;
```

## Helpful Links

[RELEASE SAVEPOINT](#) and [ROLLBACK TO SAVEPOINT](#)

## 7.14.169 SELECT

### Description

Retrieves data from a table or view.

Serving as an overlaid filter for a database table, **SELECT** filters required data from the table using SQL keywords.

### Precautions

- The owner of a table, users granted with the SELECT permission on the table, or users granted with the SELECT ANY TABLE permission can read data in the table or view. The system administrator has the permission to read data in the table or view by default.
- You must have the SELECT permission on each field used in the SELECT statement.
- Using FOR UPDATE, FOR NO KEY UPDATE, FOR SHARE, or FOR KEY SHARE also requires the UPDATE permission.

### Syntax

- Query data.

```
[ WITH [ RECURSIVE ] with_query [, ...] ]
SELECT [/*+ plan_hint */] [ ALL | DISTINCT [ ON ( expression [, ...] ) ] ]
{ * | {expression} [ [ AS ] output_name ] } [, ...] }
[ into_option ]
[ FROM from_item [, ...] ]
[ WHERE condition ]
[ [ START WITH condition ] CONNECT BY [NOCYCLE] condition [ ORDER SIBLINGS BY expression ] ]
[ GROUP BY grouping_element [, ...] ]
[ HAVING condition [, ...] ]
[ WINDOW {window_name AS ( window_definition )} [, ...] ]
[ { UNION | INTERSECT | EXCEPT | MINUS } [ ALL | DISTINCT ] select ]
[ ORDER BY {expression} [ [ ASC | DESC | USING operator ] | nlssort_expression_clause ] [ NULLS { FIRST |
LAST } ] ] [, ...] ]
[ LIMIT { [offset,] count | ALL } ]
[ OFFSET start [ ROW | ROWS ] ]
[ FETCH { FIRST | NEXT } [ count ] { ROW | ROWS } ONLY ]
[ into_option ]
[ {FOR { UPDATE | NO KEY UPDATE | SHARE | KEY SHARE } [ OF table_name [, ...] ] [ NOWAIT | WAIT N ] }
[... ] ]
[into_option];
TABLE { ONLY {(table_name)| table_name} | table_name [ * ]};
```

 NOTE

In condition and expression, you can use the aliases of expressions in **targetlist** in compliance with the following rules:

- Reference only within the same level.
- Only reference aliases in **targetlist**.
- Reference a prior expression in a subsequent expression.
- The **volatile** function cannot be used.
- The **Window** function cannot be used.
- Aliases cannot be referenced in the **join on** condition.
- An error is reported if the target list contains multiple aliases to be referenced.

**NOTICE**

In the scenario where the SELECT statement plan is cached, the WHERE IN candidate subset cannot be too large. It is recommended that the number of conditions be less than or equal to 100 to prevent high dynamic memory.

- If the WHERE IN candidate subset is too large, the memory usage of the generated plan increases.
- If the WHERE IN subsets constructed by concatenated SQL statements are different, the SQL template of the cache plan cannot be reused. A large number of different plans are generated, and the plans cannot be shared. As a result, a large amount of memory is occupied.

- The subquery **with\_query** is as follows:

```
with_query_name [ ( column_name [, ...] ) ]
AS [ [ NOT ] MATERIALIZED ] ( {select | values | insert | update | delete} )
```

- The INTO clause is as follows:

```
into_option: {
    INTO var_name [, var_name] ...
    | INTO OUTFILE 'file_name'
      [CHARACTER SET charset_name]
      export_options
    | INTO DUMPFILE 'file_name'
}
export_options: {
[FIELDS
[TERMINATED BY 'string']
[[OPTIONALLY] ENCLOSED BY 'char']
[ESCAPED BY 'char' ]
][LINES
[STARTING BY 'string']
[TERMINATED BY 'string']
]
```

- The specified query source **from\_item** is as follows:

```
{[ ONLY ] table_name [ * ] [ partition_clause ] [ [ AS ] alias [ ( column_alias [, ...] ) ] ]
[ TABLESAMPLE sampling_method ( argument [, ...] ) [ REPEATABLE ( seed ) ] ]
[ TIMECAPSULE {TIMESTAMP | CSN} expression ]
[ ( select ) [ AS ] alias [ ( column_alias [, ...] ) ] ]
|with_query_name [ [ AS ] alias [ ( column_alias [, ...] ) ] ]
|function_name ( [ argument [, ...] ] ) [ AS ] alias [ ( column_alias [, ...] | column_definition [, ...] ) ]
|function_name ( [ argument [, ...] ] ) AS ( column_definition [, ...] )
|from_item unpivot_clause
|from_item pivot_clause
|from_item [ NATURAL ] join_type from_item [ ON join_condition | USING ( join_column [, ...] ) ]}}
```

- The **group** clause is as follows:  

```
(
| expression
| ( expression [, ...] )
| ROLLUP ( { expression | ( expression [, ...] ) } [, ...] )
| CUBE ( { expression | ( expression [, ...] ) } [, ...] )
| GROUPING SETS ( grouping_element [, ...] )
```
- The specified partition **partition\_clause** is as follows:  

```
PARTITION { ( partition_name ) | FOR ( partition_value [, ...] ) } |
SUBPARTITION { ( subpartition_name ) | FOR ( subpartition_value [, ...] ) }
```

#### NOTE

The specified partition applies only to partitioned tables.

- The sorting order **nlssort\_expression\_clause** is as follows:  

```
NLSSORT ( column_name, ' NLS_SORT = { SCHINESE_PINYIN_M | generic_m_ci } ' )
```

The second parameter can be **generic\_m\_ci**, which supports only the case-insensitive order for English characters.
- Simplified query syntax, equivalent to **select \* from table\_name**.  

```
TABLE { ONLY {(table_name)| table_name} | table_name [ * ]};
```

## Parameters

- **WITH [ RECURSIVE ] with\_query [, ...]**  

Specifies one or more subqueries that can be referenced by name in the main query, which is equivalent to a temporary table. This subquery statement structure is called the common table expression (CTE) structure. When this structure is used, the execution plan contains the CTE SCAN content.

If **RECURSIVE** is specified, it allows a **SELECT** subquery to reference itself by name.

The detailed format of **with\_query** is as follows: **with\_query\_name [ ( column\_name [, ...] ) ] AS [ [ NOT ] MATERIALIZED ] ( {select | values | insert | update | delete} )**

  - **with\_query\_name** specifies the name of the result set generated by a subquery. Such names can be used to access the result sets of subqueries in a query.
  - **column\_name** specifies the column name displayed in the subquery result set.
  - Each subquery can be a **SELECT**, **VALUES**, **INSERT**, **UPDATE** or **DELETE** statement.
  - **RECURSIVE** can appear only after **WITH**. In the case of multiple CTEs, you only need to declare **RECURSIVE** at the first CTE.
  - You can use **MATERIALIZED** or **NOT MATERIALIZED** to modify the CTE.
    - If **MATERIALIZED** is specified, the **WITH** query will be materialized, and a copy of the subquery result set is generated. The copy is directly queried at the reference point. Therefore, the **WITH** subquery cannot be jointly optimized with the **SELECT** statement trunk (for example, predicate pushdown and equivalence class transfer). In this scenario, you can use **NOT MATERIALIZED** for modification. If the **WITH** query can be executed as a subquery inline, the preceding optimization can be performed.
    - If the user does not explicitly declare the materialized attribute, comply with the following rules: If the CTE is referenced only once in

the SELECT statement trunk to which it belongs and semantically supports inline execution, it will be rewritten as subquery inline execution. Otherwise, the materialized execution will be performed in CTE Scan mode.

- **plan\_hint** clause  
Follows the **SELECT** keyword in the */\*+<Plan hint>\*/* format. It is used to optimize the plan of a **SELECT** statement block. For details, see [Hint-based Tuning](#). In each statement, only the first */\*+ plan\_hint\*/* comment block takes effect as a hint. Multiple hints can be written.
- **ALL**  
Specifies that all rows that meet the conditions are returned. This is the default behavior and can be omitted.
- **DISTINCT [ ON ( expression [, ...] ) ]**  
Removes all duplicate rows from the **SELECT** result set so one row is kept from each group of duplicates.  
Retains only the first row in the set of rows that have the same result calculated on the given expression.

---

**NOTICE**

**DISTINCT ON** expression is explained with the same rule of **ORDER BY**. Unless you use **ORDER BY** to guarantee that the required row appears first, you cannot know what the first row is.

- 
- **SELECT list**  
Specifies the name of a column in the table to be queried. The value can be a part of the column name or all of the column names. The wildcard (\*) is used to represent the column name.  
You may use the **AS output\_name** clause to give an alias for an output column. The alias is used for the displaying of the output column. The name, value, and type keywords can be used as column aliases.  
Column names can be expressed in the following formats:
    - Manually input column names which are spaced using commas (,).
    - Columns computed in the **FROM** clause.
  - **INTO clause**  
Exports the SELECT result to a specified user-defined variable or file.
    - var\_name  
User-defined variable name. For details, see **var\_name** in [SET](#).
    - **OUTFILE**
      - **CHARACTER SET** specifies the encoding format.
      - **FIELDS** specifies the attribute of each column.  
**TERMINATED** specifies the separator.  
**[OPTIONALLY] ENCLOSED** specifies the quotation mark. When **OPTIONALLY** is specified, it takes effect only for the string data type.

**ESCAPED** specifies the escape character.

- **LINES** specifies the row attribute.

**STARTING** specifies the beginning of a row.

**TERMINATED** specifies the end of a row.

- **DUMPFIL**

Exports a single row of data without separators or newline characters to a file.

- **file\_name**

Specifies the absolute path of a file.

Three positions of into\_option are as follows:

```
-- Before the FROM clause
gaussdb=# select * into @my_var from t;
-- Before the LOCK clause
gaussdb=# select * from t into @my_var for update;
-- At the end of the SELECT statement
gaussdb=# select * from t for update into @my_var;
```

Export to a file.

```
gaussdb=# select * from t;
a | b
---+---
1 | a
(1 row)
```

-- Export data to an outfile file.

```
gaussdb=# select * from t into outfile '/home/gaussdb/t.txt' FIELDS TERMINATED BY '~'
ENCLOSED BY 't' ESCAPED BY '^' LINES STARTING BY '$' TERMINATED BY '&\n';
File content: $t1t~tat&, where LINES STARTING BY($), FIELDS TERMINATED BY(~), ENCLOSED
BY(t), LINES TERMINATED BY(&\n)
```

-- Export data to the dumpfile file.

```
gaussdb=# select * from t into outfile '/home/gaussdb/t.txt';
File content: 1a
```

- **FROM clause**

Specifies one or more source tables for **SELECT**.

The **FROM** clause can contain the following elements:

- **table\_name**

Specifies the name of a table or view. The schema name can be added before the table name or view name, for example, schema\_name.table\_name.

#### NOTE

You can use database link to perform operations on remote tables and synonyms. For details, see [DATABASE LINK](#).

- **alias**

Gives a temporary alias to a table to facilitate the quotation by other queries.

An alias is used for brevity or to eliminate ambiguity for self-joins. If an alias is provided, it completely hides the actual name of the table.

**NOTICE**

If an alias is specified for the *joined\_table* table created by JOIN and *joined\_table* is wrapped with "()", that is, (*joined\_table*), non-reserved keywords UNPIVOT and PIVOT cannot be used as aliases.

- TABLESAMPLE *sampling\_method* ( *argument* [, ...] ) [ REPEATABLE ( *seed* ) ]

The **TABLESAMPLE** clause following *table\_name* specifies that the specified *sampling\_method* should be used to retrieve the subset of rows in the table.

The optional **REPEATABLE** clause specifies the number of seeds used to generate random numbers in the sampling method. The seed value can be any non-null constant value. If the table was not changed during the query, the two queries having the same seed and *argument* values will select the same sampling in this table. However, different seed values usually generate different samples. If **REPEATABLE** is not specified, a new random sample will be selected for each query based on the seed generated by the system.

- TIMECAPSULE { TIMESTAMP | CSN } expression

Queries the table data of a specified CSN or at a specified time point.

Currently, the following tables do not support flashback query: system catalogs, DFS tables, global temporary tables, local temporary tables, unlogged tables, views, sequence tables, hash bucket tables, shared tables, and inherited tables.

- TIMECAPSULE TIMESTAMP

Searches for the result set of a specified time point based on the date as the flashback query flag. *date* must be a valid past timestamp

- TIMECAPSULE CSN

Searches for the result set of a specified CSN point based on the CSN flashback of the table as the flashback query flag. The CSN can be obtained from **snpcsn** recorded in **gs\_txn\_snapshot**.

 NOTE

- A flashback query cannot span statements that affect the table structure or physical storage. Otherwise, an error is reported. Between the flashback point and the current point, if a statement (TRUNCATE, DDL, DCL, or VACUUM FULL) has been executed to modify the table structure or affect physical storage, the flashback fails.
- Flashback query does not support index query. Flashback query supports only seqScan for full table scanning.
- When the flashback point is too old, the old version cannot be obtained because the flashback version is recycled. As a result, the flashback fails and the error message "Restore point too old" is displayed.
- The flashback point is specified by time. The maximum difference between the flashback point and the actual time is 3 seconds.
- After truncating a table, perform a flashback query or flashback on the table. The error message "Snapshot too old" is displayed when a flashback is performed at a specified time point. Data cannot be found or the error message "Snapshot too old" is reported during the CSN-based flashback.

- column\_alias  
Specifies the column alias.
- PARTITION  
Queries data in the specified partition in a partitioned table.
- partition\_name  
Specifies the name of a partition.
- partition\_value  
Specifies the value of the specified partition key. If there are many partition keys, use the **PARTITION FOR** clause to specify the value of the only partition key you want to use.
- SUBPARTITION  
Queries data in the specified level-2 partition in a partitioned table.
- subpartition\_name  
Specifies the name of a level-2 partition name.
- subpartition\_value  
Specifies the key values of specified level-1 and level-2 partitions. The values of the two partition keys specified by the **SUBPARTITION FOR** clause uniquely identify a level-2 partition.
- subquery  
Performs a subquery in the **FROM** clause. A temporary table is created to save subquery results.
- with\_query\_name  
Specifies that the **WITH** clause can also be used as the source of the **FROM** clause and can be referenced by the name of the **WITH** query.
- function\_name  
Function name. Function calls can appear in the **FROM** clause.
- join\_type  
The options are as follows:

- [ INNER ] JOIN

A **JOIN** clause combines two **FROM** items. You can use parentheses to determine the order of nesting. In the absence of parentheses, **JOIN** nests left-to-right.

In any case, **JOIN** binds more tightly than the commas separating **FROM** items.

- LEFT [ OUTER ] JOIN

Returns all rows that meet join conditions in the Cartesian product, plus those rows that do not match the right table rows in the left table by join conditions. This left-hand row is extended to the full width of the joined table by inserting **NULL** values for the right-hand columns. Note that only the **JOIN** clause's own condition is considered while the system decides which rows have matches. Outer conditions are applied afterward.

- RIGHT [ OUTER ] JOIN

Returns all the joined rows, plus one row for each unmatched right-hand row (extended with **NULL** on the left).

This is just a notational convenience, since you could convert it to a **LEFT OUTER JOIN** by switching the left and right inputs.

- FULL [ OUTER ] JOIN

Returns all the joined rows, plus one row for each unmatched left-hand row (extended with **NULL** on the right), and plus one row for each unmatched right-hand row (extended with **NULL** on the left).

- CROSS JOIN

Is equivalent to **INNER JOIN ON (TRUE)**, which means no rows are removed by qualification. These join types are just a notational convenience, since they do nothing you could not do with plain **FROM** and **WHERE**.

 **NOTE**

For the **INNER** and **OUTER** join types, a join condition must be specified, namely exactly one of **NATURAL ON**, **join\_condition**, or **USING (join\_column [, ...])**. For **CROSS JOIN**, none of these clauses can appear.

**CROSS JOIN** and **INNER JOIN** produce a simple Cartesian product, the same result as you get from listing the two items at the top level of **FROM**.

- ON join\_condition

Defines which rows have matches in joins. Example: ON left\_table.a = right\_table.a You are advised not to use numeric types such as int for **join\_condition**, because such types can be implicitly converted to bool values (non-zero values are implicitly converted to **true** and **0** is implicitly converted to **false**), which may cause unexpected results.

- USING(join\_column[, ...])

ON left\_table.a = right\_table.a AND left\_table.b = right\_table.b ... abbreviation. Corresponding columns must have the same name.

- NATURAL  
Is a shorthand for a **USING** list that mentions all columns in the two tables that have the same names.
- from item  
Specifies the name of the query source object connected.

- unpivot\_clause

Converts a column to a row. The syntax format is as follows:

```
UNPIVOT [ {INCLUDE | EXCLUDE} NULLS ]
(
  unpivot_col_clause
  unpivot_for_clause
  unpivot_in_clause
)
```

- {INCLUDE | EXCLUDE} NULLS

Controls whether the converted result contains NULL rows. **INCLUDE NULLS** indicates that the converted results contain NULL rows. **EXCLUDE NULLS** indicates that the converted results do not contain NULL rows. If this clause is ignored, the unpivot operation removes NULL rows from the converted results by default.

- unpivot\_col\_clause

```
unpivot_col_element
```

**unpivot\_col\_element** specifies the output column names. These columns store the values to be converted.

- unpivot\_col\_element

```
{ column | ( column [, column]... ) }
```

**unpivot\_col\_element** has two forms: column and ( column [, column]... ).

- unpivot\_for\_clause

```
FOR { unpivot_col_element }
```

**unpivot\_col\_element** contained in the **unpivot\_for\_clause** is used to specify the output column names. These columns store the alias and names of the column to be converted.

- unpivot\_in\_clause

```
IN ( unpivot_in_element [,unpivot_in_element...] )
```

**unpivot\_in\_clause** specifies the columns to be converted. The column names and column values are saved in the previously specified output columns.

```
unpivot_in_element
{ unpivot_col_element } [ AS { unpivot_alias_element } ]
```

**unpivot\_col\_element** specifies the column to be converted. If ( column [, column]... ) is used to specify the column to be converted, the *column* names are connected by underscores ( \_ ) and saved in the output columns. For example, IN ((col1, col2)) generates the column name **col1\_col2** and saves it in the output column specified by **unpivot\_for\_clause**. In addition, the AS keyword can be used to specify an alias for the column to be converted. Once an alias is specified, the alias is saved in the output column instead of the name of column to be converted.

- `unpivot_alias_element`  
{ alias | ( alias [, alias]... ) }  
Similar to `unpivot_col_element`, `unpivot_alias_element` has two forms. **alias** indicates the specified alias.

#### NOTICE

Currently, `unpivot_clause` has the following restrictions:

- This parameter can be used only in A compatibility mode.
- The `unpivot_clause` clause cannot be used with hints.
- For `unpivot_col_clause`, the number of output columns specified by `unpivot_col_element` must be the same as that of `unpivot_col_element` contained in `unpivot_in_clause`.
- For `unpivot_for_clause`, the number of output columns specified by `unpivot_col_element` must be the same as the number of aliases specified by `unpivot_alias_element` contained in `unpivot_in_clause`.
- For `unpivot_in_clause`, the alias must be a constant or an expression that can be converted to a constant.
- For `unpivot_in_clause`, constant expressions support only IMMUTABLE functions.
- For all `unpivot_col_element` parameters contained in `unpivot_in_clause`, if the column types in the same position of these `unpivot_col_element` parameters are different, UNPIVOT attempts to convert the column types in order to convert the values of columns to be converted to a public type. Similarly, for all `unpivot_alias_element` parameters, if the alias types of these `unpivot_alias_element` parameters in the same position are different, UNPIVOT attempts to do the similar type conversion.

For example, assume that there is an `unpivot_in_clause` in the form of IN (col1, col2), where col1 is of the int type and col2 is of the float type, UNPIVOT attempts to convert the column value of col1 to the public type float during the calculation.

#### - `pivot_clause`

Converts a row into column. The syntax format is as follows:

```
PIVOT [ XML ]
( aggregate_function ( expr ) [[AS] alias ]
  [, aggregate_function ( expr ) [[AS] alias ] ]...
  pivot_for_clause
  pivot_in_clause
)
```

- `aggregate_function ( expr ) [[AS] alias ]`  
Aggregates calculation on a given expression. The calculation result is saved in the output column specified by `pivot_in_clause`. [AS] alias (The AS keyword can be omitted.) can be used to specify an alias for `aggregate_function`. The alias is appended to the output column name specified by `pivot_in_clause` in the format of "\_alias".
- `pivot_for_clause`

```
FOR { column
    | ( column [, column]... )
}
```

Specifies the row to be converted. The **column** indicates a column of the row to be converted.

- **pivot\_in\_clause**

```
IN ( { { { expr
    | ( expr [, expr]... )
    } [ [AS] alias]
    }...
    }
    )
```

Specifies the name of the output column. The column name can consist of one or more expressions, for example, (expr1, expr2). When a column name consists of multiple expressions, these expressions are connected by underscores (\_) in sequence. That is, the output column name corresponding to (expr1, expr2) is "expr1\_expr2". These expressions not only generate output column names, but also determine the time when the aggregation function is triggered. If the values of row to be converted is the same as the value of these expressions, the results calculated by **aggregate\_function** are saved in the output column names that consist of these expressions. Assume that expr1 is "1" and expr2 is "2". For row "1 2", **aggregate\_function** is used for calculation. For row "1 1", the calculation is not triggered.

#### NOTICE

Currently, **pivot\_clause** has the following restrictions:

- This parameter can be used only in A compatibility mode.
- The **pivot\_clause** clause cannot be used with hints.
- If more than one **aggregate\_function** is specified, at most one **aggregate\_function** is allowed to have no alias, the rest of the **aggregate\_function** functions are required to specify an alias.
- XML supports only syntax but does not support functions.
- The expression in **pivot\_in\_clause** can be a constant or an expression that can be converted to a constant. If the expression is not a unary expression, specify an alias for the expression.
- For **pivot\_in\_clause**, constant expressions support only IMMUTABLE functions.
- For the expression in **pivot\_in\_clause**, when the keyword AS is used to specify an alias for the expression, only the non-reserved keywords can be used as aliases.
- If the length of an output column name exceeds 63 characters, subsequent characters will not be printed.

- **WHERE clause**

Forms an expression for row selection to narrow down the query range of **SELECT**. **condition** indicates any expression that returns a value of Boolean type. Rows that do not meet this condition will not be retrieved. You are

advised not to use numeric types such as int for **condition**, because such types can be implicitly converted to bool values (non-zero values are implicitly converted to **true** and **0** is implicitly converted to **false**), which may cause unexpected results.

In the **WHERE** clause, you can use the operator (+) to convert a table join to an outer join. However, this method is not recommended because it is not the standard SQL syntax and may raise syntax compatibility issues during platform migration. There are many restrictions on using the operator (+):

- a. It can appear only in the **WHERE** clause.
- b. If a table join has been specified in the **FROM** clause, the operator (+) cannot be used in the **WHERE** clause.
- c. The operator (+) can work only on columns of tables or views, instead of on expressions.
- d. If table A and table B have multiple join conditions, the operator (+) must be specified in all the conditions. Otherwise, the operator (+) will not take effect, and the table join will be converted into an inner join without any prompt information.
- e. Tables specified in a join condition where the operator (+) works cannot cross queries or subqueries. If tables where the operator (+) works are not in the **FROM** clause of the current query or subquery, an error will be reported. If a peer table for the operator (+) does not exist, no error will be reported and the table join will be converted into an inner join.
- f. Expressions where the operator (+) is used cannot be directly connected through **OR**.
- g. If a column where the operator (+) works is compared with a constant, the expression becomes a part of the join condition.
- h. A table cannot have multiple foreign tables.
- i. The operator (+) can appear only in the following expressions: comparison, NOT, ANY, ALL, IN, NULLIF, IS DISTINCT FROM, and IS OF. It is not allowed in other types of expressions. In addition, these expressions cannot be connected through **AND** or **OR**.
- j. The operator (+) can be used to convert a table join only to a left or right outer join, instead of a full join. That is, the operator (+) cannot be specified on both tables of an expression.

**NOTICE**

- For the WHERE clause, if special character "%", "\_", or "\" is queried in LIKE, add the slash "\" before each character.
- For a hierarchical query, the WHERE expression is processed as follows in a multi-table join query:

Decompose the WHERE expression based on the disjunctive and conjunctive actions and check whether each subexpression involves multiple tables (potential join conditions) queried at the current layer. If a subexpression is not a sublink and involves only multiple tables queried at the current layer, push it down to the non-recursive START WITH clause or the recursive CONNECT BY clause of the hierarchical query for prior execution as the JOIN condition. Otherwise, place it after the recursive CONNECT BY clause for execution as a filter condition.

During internal implementation, the subexpressions that do not meet pushdown requirements in the parse tree of the original WHERE expression are deleted to obtain the final expression that can be pushed down. Then, the subexpressions that meet the pushdown condition are removed from the parse tree of the original WHERE expression to obtain the final expression that is not pushed down.

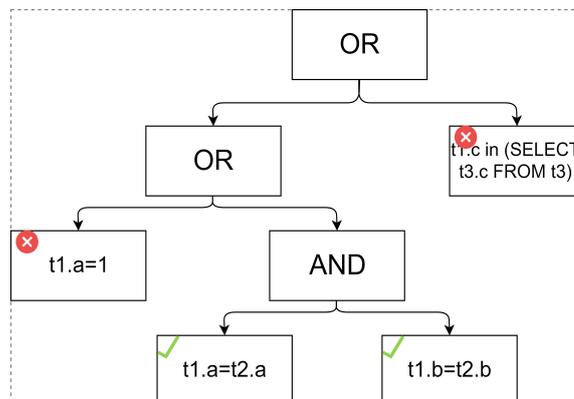

To sum up, pay attention to the following points:

- When the WHERE expression is split, the disjunctive action is also split. Therefore, the two expressions joined by OR are also split.
- Sublinks must not be pushed down.
- If an input column is not queried at the current layer, the column will not be pushed down.

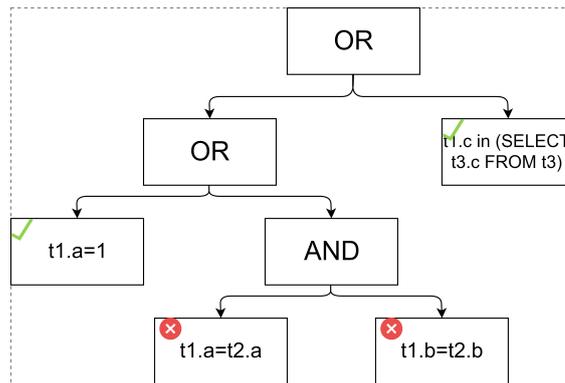

Then, for the following example:

```
SELECT * FROM t1,t2
WHERE t1.a=1 or t1.a=t2.a and t1.b=t2.b or t1.c in (SELECT t3.c FROM t3)
START WITH t1.c=1
CONNECT BY PRIOR t2.c=t1.c;
```

The following figure shows the pushdown conditions after the WHERE expression is split disjunctively and conjunctively.

It is equivalent to "t1.a=t2.a AND t1.b=t2.b". The following figure shows the conditions that are not pushed down.

It is equivalent to "t1.a=1 OR t1.c in (SELECT t3.c FROM t3)".

For another example:

```

SELECT * FROM t3 WHERE EXISTS(
SELECT * FROM t1,t2
WHERE t1.a+t2.a=t3.a
START WITH t1.c=1
CONNECT BY PRIOR t2.c=t1.c;
)

```

The WHERE condition contains **t3.a** inputted by the outer query. Therefore, the WHERE condition is not pushed down.

- **START WITH clause**

The **START WITH** clause is usually used together with the **CONNECT BY** clause and indicates the initial condition of recursion. Data is traversed recursively and hierarchically. If this clause is omitted and the **CONNECT BY** clause is used alone, all rows in the table are used as the initial set. For details, see [CONNECT BY](#).

- **CONNECT BY clause**

**CONNECT BY** indicates a recursive join condition. It is used together with **START WITH** to implement data traversal and recursion. The following is an example:

```

gaussdb=# CREATE TABLE test(name varchar, id int, fatherid int);
gaussdb=# INSERT INTO test VALUES('A', 1, 0), ('B', 2, 1), ('C', 3, 1), ('D', 4, 1), ('E', 5, 2);
gaussdb=# SELECT * FROM test START WITH id = 1 CONNECT PRIOR id = fatherid ORDER SIBLINGS
BY id DESC;
name | id | fatherid
-----+---+-----
A    | 1  | 0
D    | 4  | 1
C    | 3  | 1
B    | 2  | 1
E    | 5  | 2
(5 rows)

```

In the **CONNECT BY** condition, the **PRIOR** keyword can be specified for a column to indicate that the column is recursive. If **NOCYCLE** is added before the recursive join condition, recursion stops when a loop record is encountered. (Note: A **SELECT** statement containing the **START WITH .. CONNECT BY** clause does not support the **FOR SHARE** or **UPDATE** lock.)

The process of executing the **START WITH** statement is as follows:

- The initial dataset is selected based on the condition in the **START WITH** clause. In the preceding example, **(A, 1, 0)** is selected first. Then, this initial dataset is set as the working set.

- b. If the working set is not empty, the data in the working set is used as the input for the next query. The filter criteria are specified in the CONNECT BY clause. The keyword PRIOR indicates the current record. For example, **prior id = fatherid** in the preceding example indicates that the ID of the current record is **fatherid** of the next record.
- c. Set the dataset filtered in step 2 as the working set and repeat the operation in step 2.

In addition, the database adds the following pseudocolumns to each selected data record so that users can learn about the location of the data in the recursive or tree structure.

- **LEVEL**: node level.
- **CONNECT\_BY\_ISLEAF**: specifies whether a node is a leaf node.

**NOTICE**

**connect\_by\_isleaf**: If a node does not have any subnode, the node is a leaf node and **connect\_by\_isleaf** is set to 1. Otherwise, **connect\_by\_isleaf** is set to 0.

Assume that table T1 exists and the data in table T1 is shown in [Figure 7-12](#).

**Figure 7-12** Data structure

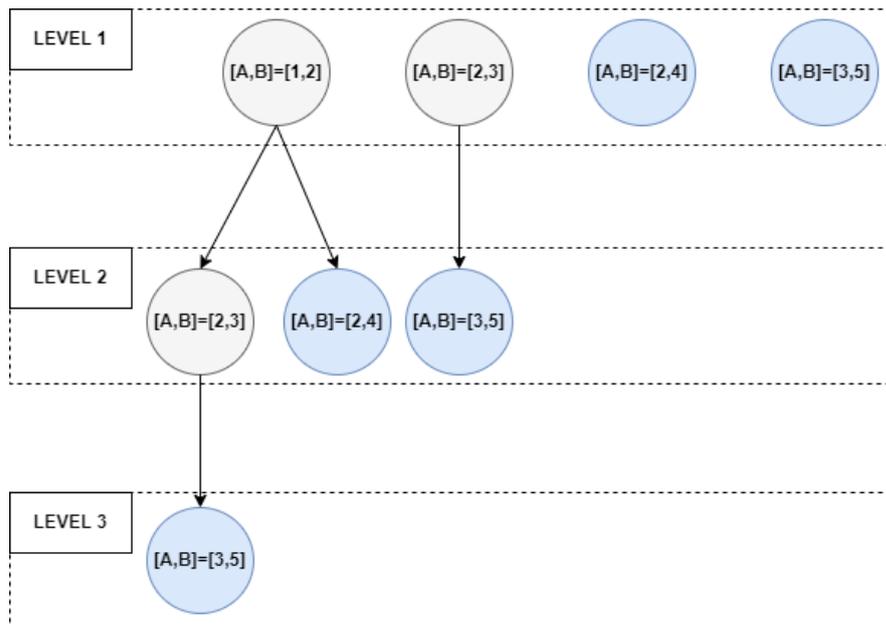

| T1 |   |
|----|---|
| A  | B |
| 1  | 2 |
| 2  | 3 |
| 2  | 4 |
| 3  | 5 |

Run the following statement:

```
SELECT * FROM T1 CONNECT BY PRIOR B=A AND LEVEL<=3;
```

The tree structure of the result is shown in [Figure 7-13](#), where the blue nodes are leaf nodes.

**Figure 7-13** Logical structure of the execution

In addition to pseudocolumns, the following query functions are provided (for details, see [Hierarchical Recursion Query Functions](#)):

- **sys\_connect\_by\_path(col, separator)**: returns the connection path from the root node to the current row. The **col** parameter indicates the name of the column displayed in the path, and the **separator** parameter indicates the connector.
- **connect\_by\_root(col)**: displays the top-level node of the node. **col** indicates the name of the output column.

If a loop exists in the dataset, the database provides loop detection. By default, if a loop is detected, an error is reported and no data is returned. In addition, the NOCYCLE keyword is provided. With it, the query can be executed normally and when the first duplicate data record is found, the query exits directly instead of reporting an error.

Besides, in the hierarchical query, the search is performed strictly according to the depth-first order. If ROWNUM is used as the filtering condition in START WITH or CONNECT BY, the value of **ROWNUM** is increased by 1 for each record to be returned. Then, the record is verified based on **ROWNUM** conditions. Records that do not satisfy the conditions are discarded and the value of **ROWNUM** is decreased by 1.

## NOTICE

- The PRIOR keyword can be used only in the CONNECT BY clause instead of the START WITH clause.
- In addition to **targetlist**, "prior (single column)" is parsed as "prior single column". User-defined functions named **prior** are not perceived.
- The PRIOR keyword can be specified only for columns in the table instead of expressions, pseudocolumns, or type conversion. For example, PRIOR (a + 1) is not allowed.
- In the CONNECT BY clause, the column using the keyword PRIOR cannot be in the same condition with pseudocolumns such as level and rownum, but they can be in different conditions. For example, (PRIOR a = level) is not allowed, but (PRIOR a = b) and (level = 1) is allowed. Different conditions refer to the conditions connected by AND at the top of the CONNECT BY clause. For example, (PRIOR a = 1 or level = 1) is considered as a condition and is not allowed.
- In the START WITH and CONNECT BY clauses, pseudocolumns cannot be used for sublinks, for example, "rownum = (subquery)" or "rownum in (subquery)".
- You are advised not to use pseudo columns in the CONNECT BY statement. If pseudocolumns need to be used, you need to test the columns to avoid inconsistency between the result and expected result.
- When START WITH and CONNECT BY are called on the CTE defined by WITH AS, if there are multiple CTEs, ensure that the definition of each CTE does not depend on other CTEs.
- If no loop exists in the data but the error message "runs into cycle" is reported, increase the value of **max\_recursive\_times**.
- **connect\_by\_isleaf**, **connect\_by\_iscycle** and **level** are of the int type.
- **connect\_by\_isleaf**, **connect\_by\_iscycle**, and **level** are parsed as pseudo columns in hierarchical queries.
- The alias defined in the projection column cannot be called for START WITH or CONNECT BY.
- Optimization suggestions for START WITH:
  - Create indexes based on the conditions in the CONNECT BY clause to improve the performance of the START WITH clause.
  - Identify bottlenecks based on the plan collected by running EXPLAIN PERFORMANCE or in WDR. If the recursive operator (inner plan) of RECURSIVE UNION is the HASH JOIN operator, but the hash table is created for the temporary table **tmp\_result** or the hash table in plan is materialized (that is, the batch size is greater than 1), the possible cause is that the value of **work\_mem** is too small. As a result, the hash table cannot be created for the outer data table. You can increase the value of **work\_mem** to improve performance.

Note: GaussDB optimizes tables with a small volume of data and caches table results in hash tables to improve performance. In this case, indexes are not required. However, if the data volume exceeds the limit specified by **work\_mem**, the optimization becomes invalid. In this case, you can create indexes for optimization.

---

 **WARNING**

You are advised not to use recursive query when creating a view definition. Otherwise, the obtained view definition is incorrect or an error is reported. This is because the bottom layer of the recursive query statement is changed to the recursive union statement, and the view display definition is obtained by reversely parsing the Recursive Union query tree. Therefore, after a view with recursive query is created, the view definition is the Recursive Union statement, instead of the original START WITH statement, or even the statement may not be valid. Although the functions of the current database view are not affected, the restore operation fails if you use tools such as **gs\_dump** and **gs\_restore** to migrate the data by viewing the view definitions. In this case, you need to manually create the view.

---

- **ORDER SIBLINGS BY** clause

The output of the START WITH statement is returned level by level. However, there is no sequence guarantee at each level because the database automatically selects the optimal execution path during each round of query. In the preceding example, A is output first, but the sequence of B, C, and D is not fixed. If you have requirements on the final output sequence, you can use ORDER SIBLINGS BY. The usage of ORDER SIBLINGS BY is the same as that of ORDER BY. ORDER SIBLINGS BY is used for sorting at each level during recursion.

---

**NOTICE**

The expression following ORDER SIBLING BY only supports sorting by calling non-aggregate and window functions for common columns, column name offsets, and column names. It does not support calling system functions related to START WITH for column names or using pseudocolumns related to START WITH.

---

- **GROUP BY** clause

Condenses query results into a single row all selected rows that share the same values for the grouped expressions.

- CUBE ( { expression | ( expression [, ...] ) } [, ...] )

A CUBE grouping is an extension to the **GROUP BY** clause that creates subtotals for all of the possible combinations of the given list of grouping columns (or expressions). In terms of multidimensional analysis, CUBE generates all the subtotals that could be calculated for a data cube with the specified dimensions. For example, given three expressions ( $n=3$ ) in the CUBE clause, the operation results in  $2^n = 2^3 = 8$  groupings. Rows grouped on the values of  $n$  expressions are called regular rows, and the rest are called superaggregate rows.

- GROUPING SETS ( grouping\_element [, ...] )

Another extension to the **GROUP BY** clause. It allows users to specify multiple **GROUP BY** clauses. This improves efficiency by trimming away unnecessary data. After you specify the required data group, the database does not need to compute a whole **ROLLUP** or **CUBE**.

### NOTICE

- If a SELECT list expression quotes some ungrouped fields and no aggregate function is used, an error is displayed. This is because multiple values may be returned for ungrouped fields.
- If a SELECT list expression references a constant, the GROUP BY clause does not need to group the constant. Otherwise, an error is reported.

- **HAVING clause**

Selects special groups by working with the **GROUP BY** clause. The **HAVING** clause compares some attributes of groups with a constant. Only groups that matching the logical expression in the **HAVING** clause are extracted.

- **WINDOW clause**

The general format is **WINDOW window\_name AS ( window\_definition ) [ , ... ]**. **window\_name** is a name can be referenced by **window\_definition**. **window\_definition** can be expressed in the following forms:

```
[ existing_window_name ]  
[ PARTITION BY expression [ , ... ] ]  
[ ORDER BY expression [ ASC | DESC | USING operator ] [ NULLS { FIRST | LAST } ] [ , ... ] ]  
[ frame_clause ]
```

**frame\_clause** defines a **window frame** for the window function. The window function (not all window functions) depends on **window frame** and **window frame** is a set of relevant rows of the current query row. **frame\_clause** can be expressed in the following forms:

```
[ RANGE | ROWS ] frame_start  
[ RANGE | ROWS ] BETWEEN frame_start AND frame_end
```

**frame\_start** and **frame\_end** can be expressed in the following forms:

```
UNBOUNDED PRECEDING  
value PRECEDING  
CURRENT ROW  
value FOLLOWING  
UNBOUNDED FOLLOWING
```

- **UNION clause**

Computes the set union of the rows returned by the involved **SELECT** statements.

The **UNION** clause has the following constraints:

- By default, the result of **UNION** does not contain any duplicate rows unless the **ALL** clause is declared.
- Multiple **UNION** operators in the same SELECT statement are evaluated left to right, unless otherwise specified by parentheses.
- **FOR UPDATE**, **FOR NO KEY UPDATE**, **FOR SHARE**, and **FOR KEY SHARE** cannot be specified in the result or input of **UNION**.
- The GUC parameter **enable\_union\_all\_order** determines whether to preserve the order of UNION ALL subqueries.
  - Enabling: **set enable\_union\_all\_order to on**
  - Disabling: **set enable\_union\_all\_order to off**
  - Querying: **show enable\_union\_all\_order**

When the **enable\_union\_all\_order** parameter is enabled, subquery order preserving is supported if **UNION** is set to **ALL** and the main query is not sorted. In other cases, subquery order preserving is not supported.

General expression:

select\_statement UNION [ALL] select\_statement

- **select\_statement** can be any **SELECT** statement without the **ORDER BY**, **LIMIT**, **FOR UPDATE**, **FOR NO KEY UPDATE**, **FOR SHARE**, or **FOR KEY SHARE** clause.
- **ORDER BY** and **LIMIT** can be attached to the subexpression if it is enclosed in parentheses.

- **INTERSECT clause**

Computes the set intersection of rows returned by the involved **SELECT** statements. The result of **INTERSECT** does not contain any duplicate rows.

The **INTERSECT** clause has the following constraints:

- Multiple **INTERSECT** operators in the same **SELECT** statement are evaluated left to right, unless otherwise specified by parentheses.
- Processing **INTERSECT** preferentially when **UNION** and **INTERSECT** operations are executed for results of multiple **SELECT** statements.

General format:

select\_statement INTERSECT select\_statement

**select\_statement** can be any **SELECT** statement without the **FOR UPDATE**, **FOR NO KEY UPDATE**, **FOR SHARE**, or **FOR KEY SHARE** clause.

- **EXCEPT clause**

Has the following common form:

select\_statement EXCEPT [ ALL ] select\_statement

**select\_statement** can be any **SELECT** statement without the **FOR UPDATE**, **FOR NO KEY UPDATE**, **FOR SHARE**, or **FOR KEY SHARE** clause.

The **EXCEPT** operator computes the set of rows that are in the result of the left **SELECT** statement but not in the result of the right one.

The result of **EXCEPT** does not contain any duplicate rows unless the **ALL** clause is declared. To execute **ALL**, a row that has  $m$  duplicates in the left table and  $n$  duplicates in the right table will appear  $\text{MAX}(m-n, 0)$  times in the result set.

Multiple **EXCEPT** operators in the same **SELECT** statement are evaluated left to right, unless parentheses dictate otherwise. **EXCEPT** binds at the same level as **UNION**.

Currently, the **FOR UPDATE**, **FOR NO KEY UPDATE**, **FOR SHARE**, and **FOR KEY SHARE** clauses cannot be specified for the result of **EXCEPT** or any input of **EXCEPT**.

- **MINUS clause**

Has the same function and syntax as **EXCEPT** clause.

- **ORDER BY clause**

Sorts data retrieved by **SELECT** in descending or ascending order. If the **ORDER BY** expression contains multiple columns:

- If two columns are equal according to the leftmost expression, they are compared according to the next expression and so on.

- If they are equal according to all specified expressions, they are returned in an implementation-dependent order.
- When used with the **DISTINCT** keyword, the columns to be sorted in **ORDER BY** must be included in the columns of the result set retrieved by the SELECT statement.
- When used with the **GROUP BY** clause, the columns to be sorted in **ORDER BY** must be included in the columns of the result set retrieved by the SELECT statement.

---

**NOTICE**

To support Chinese pinyin order, set the encoding format to **UTF-8**, **GB18030**, **GB18030\_2022**, or **GBK** when initializing the database. The statements are as follows:

```
initdb -E UTF8 -D ../data -locale=zh_CN.UTF-8, initdb -E GB18030 -D ../data -  
locale=zh_CN.GB18030, initdb -E GB18030_2022 -D ../data -locale=zh_CN.GB18030, or initdb -E  
GBK -D ../data -locale=zh_CN.GBK.
```

---

- **LIMIT clause**

Consists of two independent sub-clauses:

LIMIT { count | ALL }

**OFFSET start count** specifies the maximum number of rows to return, while **start** specifies the number of rows to skip before starting to return rows. When both are specified, **start** rows are skipped before starting to count the **count** rows to be returned.

ROWNUM cannot be used as count or offset in the LIMIT clause.

- **OFFSET clause**

The SQL: 2008 standard has introduced a different clause:

OFFSET start { ROW | ROWS }

**start** specifies the number of rows to skip before starting to return rows.

- **FETCH { FIRST | NEXT } [ count ] { ROW | ROWS } ONLY**

If **count** is omitted in a **FETCH** clause, it defaults to 1.

- **Locking clause**

The **FOR UPDATE** clause locks the rows retrieved by **SELECT**. This prevents these rows from being modified or deleted by other transactions before the current transaction ends. That is, other transactions that attempt to run **UPDATE**, **DELETE**, **SELECT FOR UPDATE**, **SELECT FOR NO KEY UPDATE**, **SELECT FOR SHARE**, or **SELECT FOR KEY SHARE** for these rows will be blocked until the current transaction ends. Any **DELETE** on a row will also acquire the **FOR UPDATE** locking mode, as will **UPDATE** that modifies values on the primary key column. Conversely, **SELECT FOR UPDATE** waits for concurrent transactions that have run the preceding commands on the same row, and then locks and returns the updated row (there may be no row because the row may have been deleted).

**FOR NO KEY UPDATE** behaves similarly to **FOR UPDATE**, except that it acquires a weaker lock that will not block **SELECT FOR KEY SHARE** that attempts to acquire the lock on the same row. Any **UPDATE** that does not acquire the **FOR UPDATE** lock will also acquire this locking mode.

**FOR SHARE** behaves similarly, except that it acquires a shared rather than exclusive lock on each retrieved row. A shared lock blocks other transactions from executing **UPDATE**, **DELETE**, **SELECT FOR UPDATE**, or **SELECT FOR NO KEY UPDATE**, but does not block **SELECT FOR SHARE** or **SELECT FOR KEY SHARE**.

**FOR KEY SHARE** is similar to **FOR SHARE** except that its lock is weak. **SELECT FOR UPDATE** is blocked but **SELECT FOR NO KEY UPDATE** is not blocked. A key-shared lock blocks other transactions from executing **DELETE** or **UPDATE** that modifies the key value, but does not block **UPDATE**, **SELECT FOR NO KEY UPDATE**, **SELECT FOR SHARE**, or **SELECT FOR KEY SHARE**.

To prevent the operation from waiting for the commit of other transactions, you can use **NOWAIT**. If the selected row cannot be locked immediately, an error is reported immediately and there is no waiting. If you use **WAIT N** and the selected row cannot be locked immediately, the operation needs to wait for *N* seconds (the value of *N* is of the int type with a range of  $0 \leq N \leq 2147483$ ). If the lock is obtained within *N* seconds, the operation is performed normally. Otherwise, an error is reported.

If specified tables are named in a locking clause, then only rows coming from those tables are locked; any other tables used in **SELECT** are simply read as usual. Otherwise, locking all tables in the statement.

If a locking clause is applied to a view or sub-query, it affects all tables used in the view or sub-query.

Multiple locking clauses can be written if it is necessary to specify different locking behaviors for different tables.

If a table appears (or implicitly appears) in multiple clauses at the same time, the strongest lock is used. Similarly, a table is processed as **NOWAIT** if that is specified in any of the clauses affecting it.

---

#### NOTICE

- Only **FOR SHARE** and **FOR UPDATE** can be used to query the Ustore table.
- For the **FOR UPDATE/SHARE** statements whose subquery is a stream plan, the same locked row cannot be concurrently updated.

---

- **NLS\_SORT**

Specifies that a field is sorted in a special order. Currently, only Chinese Pinyin and case-insensitive sorting are supported. To support this sorting mode, you need to set the encoding format to UTF8, GB18030, GB18030\_2022, or GBK when creating a database. If you set the encoding format to another format, for example, SQL\_ASCII, an error may be reported or the sorting mode may be invalid.

Value range:

- **SCHINESE\_PINYIN\_M**, sorted by Pinyin order.
- **generic\_m\_ci**: sorted in case-insensitive order (optional; only English characters are supported in the case-insensitive order.)

- **PARTITION clause**

Queries data in the specified partition in a partitioned table.

## Examples

```
-- Create a schema.
gaussdb=# CREATE SCHEMA tpcds;

-- Create the tpcds.reason table.
gaussdb=# CREATE TABLE tpcds.reason
(
  r_reason_sk    integer,
  r_reason_id    character(16),
  r_reason_desc  character(100)
);

-- Insert multiple records into the table.
gaussdb=# INSERT INTO tpcds.reason values(3,'AAAAAAAAABAAAAAAA','reason 1'),
(10,'AAAAAAAAABAAAAAAA','reason 2'),(4,'AAAAAAAAABAAAAAAA','reason 3'),
(10,'AAAAAAAAABAAAAAAA','reason 4'),(10,'AAAAAAAAABAAAAAAA','reason 5'),
(20,'AAAAAAAACAAAAAAA','N%reason 6'),(30,'AAAAAAAACAAAAAAA','W%reason 7');

-- Obtain the temp_t temporary table by a subquery and query all records in this table.
gaussdb=# WITH temp_t(name,isdba) AS (SELECT username,usesuper FROM pg_user) SELECT * FROM
temp_t;

-- Query all r_reason_sk records in the tpcds.reason table and delete duplicate records.
gaussdb=# SELECT DISTINCT(r_reason_sk) FROM tpcds.reason;

-- Example of a LIMIT clause: Obtain a record from the table.
gaussdb=# SELECT * FROM tpcds.reason LIMIT 1;

-- Query all records and sort them in alphabetic order.
gaussdb=# SELECT r_reason_desc FROM tpcds.reason ORDER BY r_reason_desc;

-- Use table aliases to obtain data from the pg_user and pg_user_status tables:
gaussdb=# SELECT a.username,b.locktime FROM pg_user a,pg_user_status b WHERE a.usesysid=b.roloid;

-- Example of the FULL JOIN clause: Join data in the pg_user and pg_user_status tables.
gaussdb=# SELECT a.username,b.locktime,a.usesuper FROM pg_user a FULL JOIN pg_user_status b on
a.usesysid=b.roloid;

-- Example of the GROUP BY clause: Filter data based on query conditions, and group the results.
gaussdb=# SELECT r_reason_id, AVG(r_reason_sk) FROM tpcds.reason GROUP BY r_reason_id HAVING
AVG(r_reason_sk) > 25;

-- Example of the GROUP BY CUBE clause: Filter data based on query conditions, and group the results.
gaussdb=# SELECT r_reason_id,AVG(r_reason_sk) FROM tpcds.reason GROUP BY
CUBE(r_reason_id,r_reason_sk);

-- Example of the GROUP BY GROUPING SETS clause: Filter data based on query conditions, and group the
results.
gaussdb=# SELECT r_reason_id,AVG(r_reason_sk) FROM tpcds.reason GROUP BY GROUPING
SETS((r_reason_id,r_reason_sk),r_reason_sk);

-- Example of the UNION clause: Merge the names started with W and N in the r_reason_desc column in
the tpcds.reason table.
gaussdb=# SELECT r_reason_sk, tpcds.reason.r_reason_desc
FROM tpcds.reason
WHERE tpcds.reason.r_reason_desc LIKE 'W%'
UNION
SELECT r_reason_sk, tpcds.reason.r_reason_desc
FROM tpcds.reason
WHERE tpcds.reason.r_reason_desc LIKE 'N%';

-- Example of the NLS_SORT clause: Sort by Chinese Pinyin.
gaussdb=# SELECT * FROM tpcds.reason ORDER BY NLSSORT( r_reason_desc, 'NLS_SORT =
SCHINESE_PINYIN_M');

-- sorting by case-insensitive order (optional; only English characters are supported in the case-insensitive
order.)
gaussdb=# SELECT * FROM tpcds.reason ORDER BY NLSSORT( r_reason_desc, 'NLS_SORT = generic_m_ci');
```

```

-- Create partitioned table tpcds.reason_p.
gaussdb=# CREATE TABLE tpcds.reason_p
(
  r_reason_sk integer,
  r_reason_id character(16),
  r_reason_desc character(100)
)
PARTITION BY RANGE (r_reason_sk)
(
  partition P_05_BEFORE values less than (05),
  partition P_15 values less than (15),
  partition P_25 values less than (25),
  partition P_35 values less than (35),
  partition P_45_AFTER values less than (MAXVALUE)
)
;

-- Insert data.
gaussdb=# INSERT INTO tpcds.reason_p values(3,'AAAAAAAABAAAAAAAA','reason 1'),
(10,'AAAAAAAABAAAAAAAA','reason 2'),(4,'AAAAAAAABAAAAAAAA','reason 3'),
(10,'AAAAAAAABAAAAAAAA','reason 4'),(10,'AAAAAAAABAAAAAAAA','reason 5'),
(20,'AAAAAAAACAAAAAAA','reason 6'),(30,'AAAAAAAACAAAAAAA','reason 7');

-- Example of the PARTITION clause: Obtain data from the P_05_BEFORE partition in the tpcds.reason_p
table.
gaussdb=# SELECT * FROM tpcds.reason_p PARTITION (P_05_BEFORE);
 r_reason_sk | r_reason_id | r_reason_desc
-----+-----+-----
          4 | AAAAAAAAABAAAAAAAA | reason 3
          3 | AAAAAAAAABAAAAAAAA | reason 1
(2 rows)

-- Example of the GROUP BY clause: Group records in the tpcds.reason_p table by r_reason_id, and count
the number of records in each group.
gaussdb=# SELECT COUNT(*),r_reason_id FROM tpcds.reason_p GROUP BY r_reason_id;
 count | r_reason_id
-----+-----
       2 | AAAAAAAAACAAAAAAA
       5 | AAAAAAABAAAAAAAA
(2 rows)

-- Example of the GROUP BY CUBE clause: Filter data based on query conditions, and group the results.
gaussdb=# SELECT * FROM tpcds.reason GROUP BY CUBE (r_reason_id,r_reason_sk,r_reason_desc);

-- Example of the GROUP BY GROUPING SETS clause: Filter data based on query conditions, and group the
results.
gaussdb=# SELECT * FROM tpcds.reason GROUP BY GROUPING SETS

## 7.14.170 SELECT INTO

### Function

**SELECT INTO** defines a new table based on a query result and inserts data obtained by query to the new table.

Different from **SELECT**, data found by **SELECT INTO** is not returned to the client. The table columns have the same names and data types as the output columns of the **SELECT**.

### Precautions

**CREATE TABLE AS** provides functions similar to **SELECT INTO** in functions and provides a superset of functions provided by **SELECT INTO**. You are advised to use **CREATE TABLE AS**, because **SELECT INTO** cannot be used in a stored procedure.

### Syntax

```
[ WITH [ RECURSIVE ] with_query [, ...] ]
SELECT [ ALL | DISTINCT [ ON ( expression [, ...] ) ] ]
```

```
{ * | {expression [ [ AS ] output_name ]} [, ...] }  
INTO [ [ GLOBAL | LOCAL ] [ TEMPORARY | TEMP ] | UNLOGGED ] [ TABLE ] new_table  
[ FROM from_item [, ...] ]  
[ WHERE condition ]  
[ GROUP BY expression [, ...] ]  
[ HAVING condition [, ...] ]  
[ WINDOW {window_name AS ( window_definition )} [, ...] ]  
[ { UNION | INTERSECT | EXCEPT | MINUS } [ ALL | DISTINCT ] select ]  
[ ORDER BY {expression [ [ ASC | DESC | USING operator ] | nlssort_expression_clause ] [ NULLS { FIRST |  
LAST } ]} [, ...] ]  
[ LIMIT { count | ALL } ]  
[ OFFSET start [ ROW | ROWS ] ]  
[ FETCH { FIRST | NEXT } [ count ] { ROW | ROWS } ONLY ]  
[ {FOR { UPDATE | SHARE } [ OF table_name [, ...] ] [ NOWAIT |WAIT N]} [, ...] ];
```

## Parameters

- **new\_table**  
**new\_table** specifies the name of the new table.
- **UNLOGGED**  
Specifies that the table is created as an unlogged table. Data written to unlogged tables is not written to the WALs, which makes them considerably faster than ordinary tables. However, they are not crash-safe: an unlogged table is automatically truncated after a crash or unclean shutdown. Contents of an unlogged table are also not replicated to standby servers. Any indexes created on an unlogged table are automatically unlogged as well.
  - Usage scenario: Unlogged tables do not ensure data security. Users can back up data before using unlogged tables; for example, users should back up the data before a system upgrade.
  - Troubleshooting: If data is missing in the indexes of unlogged tables due to some unexpected operations such as an unclean shutdown, users should re-create the indexes with errors.
- **GLOBAL | LOCAL**  
When creating a temporary table, you can specify the **GLOBAL** or **LOCAL** keyword before **TEMP** or **TEMPORARY**. If the keyword **GLOBAL** is specified, GaussDB creates a global temporary table. Otherwise, GaussDB creates a local temporary table.
- **TEMPORARY | TEMP**  
If **TEMP** or **TEMPORARY** is specified, the created table is a temporary table. Temporary tables are classified into global temporary tables and local temporary tables. If the keyword **GLOBAL** is specified when a temporary table is created, the table is a global temporary table. Otherwise, the table is a local temporary table.

The metadata of the global temporary table is visible to all sessions. After the sessions end, the metadata still exists. The user data, indexes, and statistics of a session are isolated from those of another session. Each session can only view and modify the data submitted by itself. Global temporary tables have two schemas: **ON COMMIT PRESERVE ROWS** and **ON COMMIT PRESERVE ROWS**. In session-based **ON COMMIT PRESERVE ROWS** schema, user data is automatically cleared when a session ends. In transaction-based **ON COMMIT DELETE ROWS** schema, user data is automatically cleared when the commit or rollback operation is performed. If the **ON COMMIT** option is not specified during table creation, the session level is used by default. Different from local

temporary tables, you can specify a schema that does not start with **pg\_temp\_** when creating a global temporary table.

A local temporary table is visible only in the current session and is automatically dropped at the end of the session. Therefore, you can create and use temporary tables in the current session as long as the connected database node in the session is normal. Temporary tables are created only in the current session. If a DDL statement involves operations on temporary tables, a DDL error will be generated. Therefore, you are advised not to perform operations on temporary tables in DDL statements. **TEMP** is equivalent to **TEMPORARY**.

---

**NOTICE**

- Local temporary tables are visible to the current session through the schema starting with **pg\_temp**. Users should not delete schemas starting with **pg\_temp** or **pg\_toast\_temp**.
- If **TEMPORARY** or **TEMP** is not specified when you create a table and its schema is set to that starting with **pg\_temp\_** in the current session, the table will be created as a temporary table.
- If another session is using a global temporary table or index, the **ALTER** or **DROP** operation cannot be performed on it.
- The DDL of a global temporary table affects only the user data and indexes of the current session. For example, **TRUNCATE**, **REINDEX**, and **ANALYZE** are valid only for the current session.

---

 **NOTE**

For details about other **SELECT INTO** parameters, see [Parameters](#) in "SELECT."

## Examples

```
-- Create a schema.
gaussdb=# CREATE SCHEMA tpcds;

-- Create the tpcds.reason table.
gaussdb=# CREATE TABLE tpcds.reason
(
  r_reason_sk   integer,
  r_reason_id   character(16),
  r_reason_desc character(100)
);

-- Insert multiple records into the table.
gaussdb=# INSERT INTO tpcds.reason values(1,'AAAAAAAABAAAAAAA','reason 1'),
(2,'AAAAAAAABAAAAAAA','reason 2'),(3,'AAAAAAAABAAAAAAA','reason 3'),
(4,'AAAAAAAABAAAAAAA','reason 4'),(4,'AAAAAAAABAAAAAAA','reason 5'),
(4,'AAAAAAAACAAAAAAA','reason 6'),(5,'AAAAAAAACAAAAAAA','reason 7');

-- Add the values that are less than 5 in the r_reason_sk field in the tpcds.reason table to the new table.
gaussdb=# SELECT * INTO tpcds.reason_t1 FROM tpcds.reason WHERE r_reason_sk < 5;
INSERT 0 6

-- Delete the tpcds.reason_t1 table.
gaussdb=# DROP TABLE tpcds.reason_t1;

-- Delete the table.
gaussdb=# DROP TABLE tpcds.reason;
```

```
-- Delete the schema.  
gaussdb=# DROP SCHEMA tpcds CASCADE;
```

## Helpful Links

[SELECT](#)

## Suggestions

- **DATABASE**  
You are advised not to re-index a database in a transaction.
- **SYSTEM**  
You are advised not to re-index system catalogs in transactions.

## 7.14.171 SET

### Description

Modifies a GUC parameter.

### Precautions

Most GUC parameters can be modified by executing **SET**. Some parameters cannot be modified after a server or session starts.

### Syntax

- Set the system time zone.  
SET [ SESSION | LOCAL ] TIME ZONE { timezone | LOCAL | DEFAULT };
- Set the schema of the table.  
SET [ SESSION | LOCAL ]  
  { CURRENT\_SCHEMA { TO | = } { schema | DEFAULT }  
  | SCHEMA 'schema'};
- Set client encoding.  
SET [ SESSION | LOCAL ] NAMES encoding\_name;
- Set XML parsing mode.  
SET [ SESSION | LOCAL ] XML OPTION { DOCUMENT | CONTENT };
- Set other GUC parameters.  
SET [ LOCAL | SESSION ]  
  { { config\_parameter { { TO | = } { value | DEFAULT }  
    | FROM CURRENT } } };
- Set parameters in B-compatible mode (**sql\_compatibility** set to 'B').  
SET [ SESSION | @@SESSION. | @@ ]  
  { { config\_parameter = { expr | DEFAULT } } };
- Set user-defined user variables.  
SET @var\_name := expr [, @var\_name := expr] ...  
SET @var\_name = expr [, @var\_name = expr] ...

### Parameters

- **SESSION**  
Specifies that the specified parameters take effect for the current session. This is the default value if neither **SESSION** nor **LOCAL** appears.

If **SET** or **SET SESSION** is executed within a transaction that is later aborted, the effects of the **SET** statement disappear when the transaction is rolled back. Once the surrounding transaction is committed, the effects will persist until the end of the session, unless overridden by another **SET**.

- **LOCAL**

Specifies that the specified parameters take effect for the current transaction. After **COMMIT** or **ROLLBACK**, the session-level setting takes effect again.

The effects of **SET LOCAL** last only till the end of the current transaction, whether committed or not. A special case is **SET** followed by **SET LOCAL** within a single transaction: the **SET LOCAL** value will be seen until the end of the transaction, but afterward (if the transaction is committed) the **SET** value will take effect.

- **TIME\_ZONE timezone**

Specifies the local time zone for the current session.

Value range: a valid local time zone. The corresponding GUC parameter is **TimeZone**. The default value is **PRC**.

- **CURRENT\_SCHEMA**

**schema**

Specifies the current schema.

Value range: an existing schema name. If the schema name does not exist, the value of **CURRENT\_SCHEMA** will be empty.

- **SCHEMA schema**

Specifies the current schema. Here the schema is a string.

Example: set schema 'public';

- **NAMES encoding\_name**

Specifies the client character encoding. This statement is equivalent to **set client\_encoding to encoding\_name**.

Value range: a valid character encoding name. The GUC parameter corresponding to this option is **client\_encoding**. The default encoding is **UTF8**.

- **XML OPTION option**

Specifies the XML parsing mode.

Value range: **CONTENT** (default) and **DOCUMENT**

- **config\_parameter**

Specifies the name of a configurable GUC parameter. You can use **SHOW ALL** to view available GUC parameters.

 **NOTE**

Some parameters viewed by **SHOW ALL** cannot be set by using **SET**. For example, **max\_datanodes**.

- **value**

Specifies the new value of **config\_parameter**. This parameter can be specified as string constants, identifiers, numbers, or comma-separated lists of these.

**DEFAULT** can be written to indicate resetting the parameter to its default value.

- `SESSION | @@SESSION. | @@`

The declared parameter takes effect in superuser or user mode, which can be determined by the context column in the `pg_settings` system view. If neither `GLOBAL` nor `SESSION` exists, `SESSION` is used as the default value. The value of **config\_parameter** can be an expression.

 NOTE

1. `SET SESSION` is supported only in B-compatible mode (**sql\_compatibility** set to 'B') and the value of **b\_format\_behavior\_compat\_options** is set to 'enable\_set\_variables'.
  2. When `@@config_parameter` is used for operator calculation, use spaces to separate them. For example, in the `set @@config_parameter1=@@config_parameter1*2;` command, `=@@` is used as an operator. You can change `=@@` to `set @config_parameter1= @@config_parameter1 * 2.`
- `var_name`

User-defined variable name. A variable name can contain only digits, letters, underscores (`_`), periods (`.`), and dollar signs (`$`). If a variable name is quoted using single or double quotation marks, other characters can be used, such as `'var_name'`, `"var_name"`, and ``var_name``.

 NOTE

- User-defined variables can be set only in B-compatible mode (**sql\_compatibility** set to 'B') and the value of **b\_format\_behavior\_compat\_options** is set to 'enable\_set\_variables'.
  - User-defined variables store only integers, floating point numbers, strings, bit strings, and NULL. The `BOOLEAN`, `INT1`, `INT2`, `INT4`, and `INT8` types will be converted to the `INT8` type, and the `FLOAT4`, `FLOAT8`, and `NUMERIC` types will be converted to the `FLOAT8` type for storage. Note that the precision of the floating-point type may be lost. The `BIT` type is stored in `BIT`, the `VARBIT` type is stored in `VARBIT`, and the `NULL` value is stored in `NULL`. If other types can be converted into character strings, they are converted into `TEXT` for storage.
  - When `@var_name` is used for operator calculation, use spaces to separate them. For example, in the `set @v1=@v2+1;` command, `=@` is used as an operator. You can change `=@` to `set @v1= @v2+1.`
  - When **sql\_compatibility** is set to 'B' and **b\_format\_behavior\_compat\_options** is set to 'enable\_set\_variables', for the original `@` expr of the database (see [Numeric Operator](#)), there must be a space between `@` and expr. Otherwise, `@` will be parsed into a user-defined variable.
  - The value of an uninitialized variable is NULL.
  - Character strings stored in user-defined variables in the `PREPARE` statement support only the `SELECT`, `INSERT`, `UPDATE`, `DELETE`, and `MERGE` syntax.
  - In consecutive value assignment scenarios, only `@var_name1 := @var_name2 :=... := expr` and `@var_name1 = @var_name2 :=... := expr` is supported. An equal sign (`=`) indicates a value assignment only when it is placed at the beginning, and other positions indicate comparison operators.
- `expr`
- Expression, which can be directly or indirectly converted to an integer, floating point, string, bit string, or NULL.

 NOTE

Do not use functions that contain sensitive information (such as passwords) in character string expressions, such as encryption and decryption functions `gs_encrypt` and `gs_decrypt`, to prevent sensitive information leakage.

## Examples

```
-- Set the search path of a schema.
gaussdb=# SET search_path TO tpcds, public;

-- Set the date style to the traditional POSTGRES style (date placed before month):
gaussdb=# SET datestyle TO postgres,dmy;

--Set user-defined variables.
gaussdb=# create database user_var dbcompatibility 'b';
gaussdb=# \c user_var
user_var=# SET b_format_behavior_compat_options = enable_set_variables;
user_var=# SET @v1 := 1, @v2 := 1.1, @v3 := true, @v4 := 'dasda', @v5 := x'41';
-- Query user-defined variables.
user_var=# select @v1, @v2, @v3, @v4, @v5, @v6, @v7;
-- Use user-defined variables.
user_var=# SET @sql = 'select 1';
user_var=# PREPARE stmt as @sql;
user_var=# EXECUTE stmt;

-- Set B-compatible parameters.
gaussdb=# create database test_set dbcompatibility 'B';
gaussdb=# \c test_set
test_set=# set b_format_behavior_compat_options = 'enable_set_variables';
```

[RESET](#) and [SHOW](#)

## 7.14.172 SET CONSTRAINTS

### Function

**SET CONSTRAINTS** sets the behavior of constraint checking within the current transaction.

**IMMEDIATE** constraints are checked at the end of each statement. **DEFERRED** constraints are not checked until transaction commit. Each constraint has its own **IMMEDIATE** or **DEFERRED** mode.

Upon creation, a constraint is given one of three characteristics **DEFERRABLE INITIALLY DEFERRED**, **DEFERRABLE INITIALLY IMMEDIATE**, or **NOT DEFERRABLE**. The third class is always **IMMEDIATE** and is not affected by the **SET CONSTRAINTS** statement. The first two classes start every transaction in specified modes, but its behaviors can be changed within a transaction by **SET CONSTRAINTS**.

**SET CONSTRAINTS** with a list of constraint names changes the mode of just those constraints (which must all be deferrable). If multiple constraints match a name, the name is affected by all of these constraints. **SET CONSTRAINTS ALL** changes the modes of all deferrable constraints.

When **SET CONSTRAINTS** changes the mode of a constraint from **DEFERRED** to **IMMEDIATE**, any data that is modified at the end of the transaction is checked during the execution of the **SET CONSTRAINTS** statement. If any such constraint is violated, the **SET CONSTRAINTS** fails (and does not change the constraint mode). Therefore, **SET CONSTRAINTS** can be used to force checking of constraints to occur at a specific point in a transaction. Constraints are always checked immediately when a row is inserted or modified.

## Precautions

**SET CONSTRAINTS** sets the behavior of constraint checking only within the current transaction. Therefore, if you execute this statement outside of a transaction block (**START TRANSACTION/COMMIT** pair), it will not appear to have any effect.

## Syntax

```
SET CONSTRAINTS { ALL | { name } [, ...] } { DEFERRED | IMMEDIATE };
```

## Parameter Description

- **name**  
Specifies the constraint name.  
Value range: an existing table name, which can be found in the system catalog `pg_constraint`.
- **ALL**  
Specifies all constraints.
- **DEFERRED**  
Specifies that constraints are not checked until transaction commit.
- **IMMEDIATE**  
Specifies that constraints are checked at the end of each statement.

## Examples

```
-- Set that constraints are checked when a transaction is committed.  
gaussdb=# SET CONSTRAINTS ALL DEFERRED;
```

## 7.14.173 SET ROLE

### Description

Sets the current user identifier of the current session.

### Precautions

- Users of the current session must be members of specified **rolename**, but the system administrator can choose any roles.
- Executing this statement may add rights of a user or restrict rights of a user. If the role of a session user has the **INHERITS** attribute, it automatically has all rights of roles that **SET ROLE** enables the role to be. In this case, **SET ROLE** physically deletes all rights directly granted to session users and rights of its belonging roles and only leaves rights of the specified roles. If the role of the session user has the **NOINHERITS** attribute, **SET ROLE** deletes rights directly granted to the session user and obtains rights of the specified role.

### Syntax

- Set the current user identifier of the current session.  

```
SET [ SESSION | LOCAL ] ROLE role_name PASSWORD 'password';
```
- Reset the current user identifier to that of the current session.

```
RESET ROLE;
```

## Parameters

- **SESSION**  
Specifies that the statement takes effect only for the current session. This parameter is used by default.
- **LOCAL**  
Specifies that the specified statement takes effect only for the current transaction.
- **role\_name**  
Indicates the role name.  
Value range: a string. It must comply with the [naming convention](#).
- **password**  
Specifies the password of a role. It must comply with the password convention.

### NOTE

The restrictions on using a ciphertext password are as follows:

- An administrator cannot use a ciphertext password to switch to another administrator but to a user with lower permissions.  
Ciphertext passwords are usually used in `gs_dump` and `gs_dumpall` export scenarios. In other scenarios, you are advised not to use ciphertext passwords directly.
- **RESET ROLE**  
Resets the current user identifier.

## Examples

```
-- Create a role paul.
gaussdb=# CREATE ROLE paul IDENTIFIED BY '*****';

-- Set the current user to paul.
gaussdb=# SET ROLE paul PASSWORD '*****';

-- View the current session user and the current user.
gaussdb=> SELECT SESSION_USER, CURRENT_USER;

-- Reset the current user.
gaussdb=> RESET ROLE;

-- Delete the user.
gaussdb=# DROP USER paul;
```

## 7.14.174 SET SESSION AUTHORIZATION

### Description

Sets the session user identifier and the current user identifier of the current session to a specified user.

## Precautions

The session identifier can be changed only when the initial session user has the system administrator rights. Otherwise, the system supports the statement only when the authenticated username is specified.

## Syntax

- Set the session user identifier and the current user identifier of the current session.  
`SET [ SESSION | LOCAL ] SESSION AUTHORIZATION role_name PASSWORD 'password';`
- Reset the identifiers of the session and current users to the initially authenticated usernames.  
`{SET [ SESSION | LOCAL ] SESSION AUTHORIZATION DEFAULT  
| RESET SESSION AUTHORIZATION};`

## Parameters

- **SESSION**  
Specifies that the specified parameters take effect for the current session.
- **LOCAL**  
Specifies that the specified statement takes effect only for the current transaction.
- **role\_name**  
Username.  
Value range: a string. It must comply with the [naming convention](#).
- **password**  
Specifies the password of a role. It must comply with the password convention.

### NOTE

The restrictions on using a ciphertext password are as follows:

- An administrator cannot use a ciphertext password to switch to another administrator but to a user with lower permissions.  
Ciphertext passwords are usually used in `gs_dump` and `gs_dumpall` export scenarios. In other scenarios, you are advised not to use ciphertext passwords directly.
- **DEFAULT**  
Resets the identifiers of the session and current users to the initially authenticated usernames.

## Examples

```
-- Create a role paul.
gaussdb=# CREATE ROLE paul IDENTIFIED BY '*****';

-- Set the current user to paul.
gaussdb=# SET SESSION AUTHORIZATION paul password '*****';

-- View the current session user and the current user.
gaussdb=> SELECT SESSION_USER, CURRENT_USER;

-- Reset the current user.
gaussdb=> RESET SESSION AUTHORIZATION;
```

```
-- Delete the user.  
gaussdb=# DROP USER paul;
```

## Reference

### SET ROLE

## 7.14.175 SET TRANSACTION

### Function

**SET TRANSACTION** sets characteristics of a transaction. Available transaction characteristics include the transaction separation level and transaction access mode (read/write or read only). You can set the local features of the current transaction, the default global transaction features inside a session, or the global transaction features among sessions of the current database.

### Precautions

The current transaction characteristics must be set in a transaction, that is, **START TRANSACTION** or **BEGIN** must be executed before **SET TRANSACTION** is executed. Otherwise, the setting does not take effect. The settings of the global transaction features among sessions of the current database take effect after reconnection.

### Syntax

Set the isolation level and access mode of the transaction.

```
{ SET [ LOCAL | SESSION | GLOBAL ] TRANSACTION|SET SESSION CHARACTERISTICS AS TRANSACTION }  
{ ISOLATION LEVEL { READ COMMITTED | SERIALIZABLE | REPEATABLE READ }  
| { READ WRITE | READ ONLY } };
```

### Parameter Description

- **LOCAL**  
Specifies that the specified statement takes effect only for the current transaction.
- **SESSION**  
Specifies that the specified parameters take effect for the current session. The SET SESSION TRANSACTION statement takes effect only after **b\_format\_behavior\_compat\_options** is set to **set\_session\_transaction** in mode B. In other cases, use the SET SESSION CHARACTERISTICS statement.
- **GLOBAL**  
Specifies that this command takes effect for global sessions of the current database.  
Application scope: This parameter takes effect in centralized B-compatible databases. It takes effect for subsequent sessions.
- **ISOLATION LEVEL**  
Specifies the transaction isolation level that determines the data that a transaction can view if other concurrent transactions exist.

 **NOTE**

- The isolation level cannot be changed after data is modified using SELECT, INSERT, DELETE, UPDATE, FETCH, or COPY in the current transaction.
- The SET SESSION CHARACTERISTICS AS TRANSACTION ISOLATION LEVEL in a transaction block does not take effect for the current transaction. It takes effect only after the COMMIT operation is performed.

Value range:

- **READ COMMITTED**: Only submitted data is read. It is the default value.
- **REPEATABLE READ**: Only the data committed before transaction start is read. Uncommitted data or data committed in other concurrent transactions cannot be read.
- **SERIALIZABLE**: Currently, this isolation level is not supported in GaussDB. It is equivalent to **REPEATABLE READ**.
- **READ WRITE | READ ONLY**  
Specifies the transaction access mode (read/write or read only).

## Examples

```
-- Start a transaction and set its isolation level to READ COMMITTED and access mode to READ ONLY.
gaussdb=# START TRANSACTION;
gaussdb=# SET LOCAL TRANSACTION ISOLATION LEVEL READ COMMITTED READ ONLY;
gaussdb=# COMMIT;
-- Set the transaction isolation level and read/write mode of the current session.
-- In mode B (sql_compatibility = 'B'), set b_format_behavior_compat_options to
set_session_transaction.
gaussdb=# SET SESSION TRANSACTION ISOLATION LEVEL READ COMMITTED;
gaussdb=# SET SESSION TRANSACTION READ ONLY;
-- Set the transaction isolation level and read/write mode of all sessions of the current database
(sql_compatibility = 'B').
gaussdb=# SET GLOBAL TRANSACTION ISOLATION LEVEL READ COMMITTED;
gaussdb=# SET GLOBAL TRANSACTION READ ONLY;
```

## 7.14.176 SHOW

### Function

**SHOW** shows the current value of a run-time parameter.

### Precautions

None

### Syntax

```
SHOW
{
  [VARIABLES LIKE] configuration_parameter |
  CURRENT_SCHEMA |
  TIME_ZONE |
  TRANSACTION ISOLATION LEVEL |
  SESSION AUTHORIZATION |
  ALL
};
```

### Parameter Description

See [Parameters](#) in **RESET**.

## Examples

```
-- Show the value of timezone.
gaussdb=# SHOW timezone;

-- Show all parameters.
gaussdb=# SHOW ALL;

-- Show all parameters whose names contain var.
gaussdb=# SHOW VARIABLES LIKE var;
```

## Helpful Links

[SET](#) and [RESET](#)

## 7.14.177 SHOW EVENTS

### Description

Displays basic information about all scheduled tasks in a specified schema.

### Precautions

Operations related to scheduled tasks are supported only when **sql\_compatibility** is set to **'B'**.

### Syntax

```
SHOW EVENTS
  [{FROM | IN} schema_name]
  [LIKE 'pattern' | WHERE condition]
```

### Parameters

- {FROM | IN}  
Specifies the schema to be queried. By default, the current schema is queried.
- LIKE  
Matches a scheduled task by name. If this parameter is not specified, all scheduled tasks in the current schema are printed.
- WHERE  
Forms an expression for row selection to narrow down the query range of **SHOW EVENTS**. **condition** indicates any expression that returns a value of Boolean type. Rows that do not meet this condition will not be retrieved.

### Example

```
-- View information about all scheduled tasks queried through pattern matching in the event_a schema.
gaussdb=# SHOW EVENTS IN event_a LIKE '_e';
```

## 7.14.178 SHUTDOWN

### Function

**SHUTDOWN** shuts down the currently connected database node.

## Precautions

Only the administrator can run this command.

## Syntax

```
SHUTDOWN
{
  |
  fast |
  immediate
};
```

## Parameter Description

- ""  
If the shutdown mode is not specified, the default mode **fast** is used.
- **fast**  
Rolls back all active transactions, forcibly disconnects the client, and shuts down the database node without waiting for the client to disconnect.
- **immediate**  
Shuts down the server forcibly. Fault recovery will occur on the next startup.

## Examples

```
-- Shut down the current database node.
gaussdb=# SHUTDOWN;

-- Shut down the current database node in fast mode.
gaussdb=# SHUTDOWN FAST;
```

## 7.14.179 SNAPSHOT

### Description

Controls data in a unified manner for multiple users.

### Precautions

- The GUC parameter **db4ai\_snapshot\_mode** classifies the snapshot storage models into MSS and CSS. The GUC parameter **db4ai\_snapshot\_version\_delimiter** specifies the version separator and its default value is @. The GUC parameter **db4ai\_snapshot\_version\_separator** specifies the sub-version separator and its default value is ..
- When the incremental storage mode is used for snapshots, the snapshots are dependent on each other. Snapshots must be deleted in the dependency sequence.
- The snapshot feature is used to maintain data between team members, involving data transcription between administrators and common users. Therefore, the snapshot feature is not supported in separation of duties (**enableSeparationOfDuty** is set to **ON**) scenarios.
- When you need a stable and available snapshot for tasks such as AI training, you need to publish the snapshot.

## Syntax

### 1. Create a snapshot.

You can use the CREATE SNAPSHOT... AS and CREATE SNAPSHOT... FROM statements to create a data table snapshot.

- **CREATE SNAPSHOT AS**  
CREATE SNAPSHOT qualified\_name [@ [version]]  
[COMMENT IS comment\_item]  
AS query;
- **CREATE SNAPSHOT FROM**  
CREATE SNAPSHOT qualified\_name [@ [version]]  
FROM @ version  
[COMMENT IS comment\_item]  
USING (  
{ INSERT [INTO SNAPSHOT] insert\_item  
| UPDATE [SNAPSHOT] [AS alias] SET set\_item [FROM from\_item] [WHERE where\_item]  
| DELETE [FROM SNAPSHOT] [AS alias] [USING using\_item] [WHERE where\_item]  
| ALTER [SNAPSHOT] { ADD and\_item | DROP drop\_item } [, ...]  
} [, ...]  
);

### 2. Delete a snapshot.

```
PURGE SNAPSHOT  
PURGE SNAPSHOT qualified_name @ version;
```

### 3. Sample snapshots.

```
SAMPLE SNAPSHOT  
SAMPLE SNAPSHOT qualified_name @ version  
[STRATIFY BY attr_list]  
{ AS alias AT RATIO num [COMMENT IS comment_item] } [, ...]
```

### 4. Publish snapshots.

```
PUBLISH SNAPSHOT  
PUBLISH SNAPSHOT qualified_name @ version;
```

### 5. Archive snapshots.

```
ARCHIVE SNAPSHOT  
ARCHIVE SNAPSHOT qualified_name @ version;
```

### 6. Query snapshots.

```
SELECT * FROM DB4AISHOT (qualified_name @ version );
```

## Parameters

- **qualified\_name**  
Name of the snapshot to be created  
Value range: a string. It must comply with the [naming convention](#).
- **version**  
(Optional) Version number of a snapshot. This parameter is optional. The system automatically extends the sequence number.  
Value range: string, consisting of numbers and separators.
- **comment\_item**  
Specifies the comment to be added.  
Value range: a string. It must comply with the [naming convention](#).
- **insert\_item**  
Specifies the name of the object to be inserted.

- Value range: a string. It must comply with the [naming convention](#).
- **alias**  
Specifies the alias of the current object.  
Value range: a string. It must comply with the [naming convention](#).
  - **set\_item**  
Specifies the name of the object on which the operation is performed.  
Value range: a string. It must comply with the [naming convention](#).
  - **from\_item**  
Specifies the name of the query source object connected.  
Value range: a string. It must comply with the [naming convention](#).
  - **where\_item**  
The return value is any expression of the Boolean type.  
Value range: a string. It must comply with the [naming convention](#).
  - **using\_item**  
Specifies the name of the object used for connection.  
Value range: a string. It must comply with the [naming convention](#).
  - **and\_item**  
Specifies the name of the object to be processed in parallel.  
Value range: a string. It must comply with the [naming convention](#).
  - **drop\_item**  
Specifies the name of the object to be dropped.  
Value range: a string. It must comply with the [naming convention](#).
  - **attr\_list**  
Specifies the list of target objects.  
Value range: a string. It must comply with the [naming convention](#).
  - **num**  
Specifies the ratio.  
Its value is a digit.

## Examples

```
-- Create a data table.
gaussdb=# CREATE TABLE t1 (id int, name varchar);

-- Insert data.
gaussdb=# INSERT INTO t1 VALUES (1, 'zhangsan');
gaussdb=# INSERT INTO t1 VALUES (2, 'lisi');
gaussdb=# INSERT INTO t1 VALUES (3, 'wangwu');
gaussdb=# INSERT INTO t1 VALUES (4, 'lisa');
gaussdb=# INSERT INTO t1 VALUES (5, 'jack');

-- Create a snapshot.
gaussdb=# CREATE SNAPSHOT s1@1.0 comment is 'first version' AS SELECT * FROM t1;

-- Create snapshots in iteration mode.
gaussdb=# CREATE SNAPSHOT s1@2.0 FROM @1.0 comment is 'inherits from @1.0' USING (INSERT
VALUES(6, 'john'), (7, 'tim'); DELETE WHERE id = 1);

-- View snapshot content.
```

```
gaussdb=#SELECT * FROM DB4AISHOT(s1@1.0);  
-- Sample snapshots.  
gaussdb=# SAMPLE SNAPSHOT s1@2.0 stratify by name as nick at ratio .5;  
  
-- Delete snapshots.  
gaussdb=# PURGE SNAPSHOT s1@2.0;  
gaussdb=# PURGE SNAPSHOT s1nick@2.0;  
gaussdb=# PURGE SNAPSHOT s1@1.0;  
  
-- Delete the table.  
gaussdb=# DROP TABLE t1;
```

## 7.14.180 START TRANSACTION

### Function

**START TRANSACTION** starts a transaction. If the isolation level or read/write mode is specified, a new transaction will have those characteristics. You can also specify them using [SET TRANSACTION](#).

### Precautions

None

### Syntax

Format 1: START TRANSACTION

```
START TRANSACTION  
[  
  {  
    ISOLATION LEVEL { READ COMMITTED | SERIALIZABLE | REPEATABLE READ }  
    | { READ WRITE | READ ONLY }  
  } [...]  
];
```

Format 2: BEGIN

```
BEGIN [ WORK | TRANSACTION ]  
[  
  {  
    ISOLATION LEVEL { READ COMMITTED | SERIALIZABLE | REPEATABLE READ }  
    | { READ WRITE | READ ONLY }  
  } [...]  
];
```

### Parameter Description

- **WORK | TRANSACTION**  
Specifies the optional keyword in BEGIN format without functions.
- **ISOLATION LEVEL**  
Specifies the transaction isolation level that determines the data that a transaction can view if other concurrent transactions exist.

#### NOTE

The isolation level of a transaction cannot be reset after the first clause (**SELECT**, **INSERT**, **DELETE**, **UPDATE**, **FETCH**, **COPY**) for modifying data is executed in the transaction.

Value range:

- **READ COMMITTED**: Only submitted data is read. It is the default value.
- **REPEATABLE READ**: Only the data committed before transaction start is read. Uncommitted data or data committed in other concurrent transactions cannot be read.
- **SERIALIZABLE**: Currently, this isolation level is not supported in GaussDB. It is equivalent to **REPEATABLE READ**.
- **READ WRITE | READ ONLY**  
Specifies the transaction access mode (read/write or read only).

## Examples

```
-- Create a schema.
gaussdb=# CREATE SCHEMA tpcds;

-- Create the tpcds.reason table.
gaussdb=# CREATE TABLE tpcds.reason (c1 int, c2 int);

-- Start a transaction in default mode.
gaussdb=# START TRANSACTION;
gaussdb=# SELECT * FROM tpcds.reason;
gaussdb=# END;

-- Start a transaction in default mode.
gaussdb=# BEGIN;
gaussdb=# SELECT * FROM tpcds.reason;
gaussdb=# END;

-- Start a transaction with the isolation level being READ COMMITTED and the access mode being READ WRITE:
gaussdb=# START TRANSACTION ISOLATION LEVEL READ COMMITTED READ WRITE;
gaussdb=# SELECT * FROM tpcds.reason;
gaussdb=# COMMIT;

-- Delete the tpcds.reason table.
gaussdb=# DROP TABLE tpcds.reason;

-- Delete a schema.
gaussdb=# DROP SCHEMA tpcds;
```

## Helpful Links

[COMMIT | END, ROLLBACK](#), and [SET TRANSACTION](#)

## 7.14.181 TIMECAPSULE TABLE

### Description

The **TIMECAPSULE TABLE** statement restores a table to an earlier state in the event of human or application errors.

The table can flash back to a past point in time, depending on the old version of the data stored in the system. In addition, GaussDB cannot restore a table to an earlier state through DDL operations that has changed the structure of the table.

### Precautions

- The **TIMECAPSULE TABLE** statement can be used to flash back the data of the old version or the data from the recycle bin.

- **TO TIMECAPSULE** and **TO CSN** can flash back a table to an earlier version.
- The recycle bin records the objects dropped or truncated by running **DROP** and **TRUNCATE**. **TO BEFORE DROP** and **TO BEFORE TRUNCATE** flash back from the recycle bin.
- The following object types do not support flashback: system catalogs, DFS tables, global temporary tables, local temporary tables, unlogged tables, sequence tables, encrypted tables, and hash bucket tables.
- Between the flashback point and the current point, a statement (DDL, DCL, or VACUUM FULL) that modifies the table structure or affects physical storage has been executed. Therefore, the flashback fails.
- To run **DROP**, you must have the CREATE or USAGE permission on the schema to which the junk object belongs, and you must be the owner of the schema or the owner of the junk object.  
To run **TRUNCATE**, you must have the CREATE or USAGE permission on the schema to which the junk object belongs, and you must be the owner of the schema or the junk object. In addition, you must have the TRUNCATE permission on the junk object.
- Scenarios or tables that do not support DROP or TRUNCATE:
  - Scenario where the recycle bin is disabled (**enable\_recyclebin** is set to **off**)
  - Scenario where the system is being maintained (**xc\_maintenance\_mode** is set to **on**) or is being upgraded
  - Scenario where multiple objects are deleted (The **DROP** or **TRUNCATE TABLE** command is executed to delete multiple objects at the same time.)
  - System catalogs, DFS tables, global temporary tables, local temporary tables, unlogged tables, sequence tables, and hash bucket tables
  - If the object on which the table depends is an external object (for example, a composite object or a user-defined object), the table is physically deleted and is not moved to the recycle bin.

## Prerequisites

- The **enable\_recyclebin** parameter has been enabled to enable the recycle bin. Contact the administrator for details about how to use the parameter.
- The **recyclebin\_retention\_time** parameter has been set for specifying the retention period of objects in the recycle bin. The objects will be automatically deleted after the retention period expires. Contact the administrator for details about how to use the parameter.

## Syntax

```
TIMECAPSULE TABLE [schema_name.]table_name TO { CSN expr | TIMESTAMP expr | BEFORE { DROP  
[RENAME TO table_name] | TRUNCATE } }
```

## Parameters

- **schema\_name**  
Specifies a schema containing the table to be flashed back. If this parameter is not specified, the current schema is used.

- **table\_name**  
Specifies a table name.
- **TO CSN**  
Specifies the CSN corresponding to the time point when the table is to be flashed back. *expr* must be a number representing a valid CSN.
- **TO TIMESTAMP**  
Specifies a timestamp value corresponding to the point in time to which you want to flash back the table. The result of *expr* must be a valid past timestamp (convert a string to a time type using the **TO\_TIMESTAMP** function). The table will be flashed back to a time within approximately 3 seconds of the specified timestamp.  
  
Note: When the flashback point is too old, the old version cannot be obtained because it is recycled. As a result, the flashback fails and the error message "Restore point too old" is displayed.
- **TO BEFORE DROP**  
Retrieves dropped tables and their subobjects from the recycle bin.  
You can specify either the original user-specified name of the table or the system-generated name assigned to the object when it was deleted.
  - System-generated recycle bin object names are unique. Therefore, if you specify the system-generated name, the database retrieves that specified object. To see the content in your recycle bin, run **select \* from gs\_recyclebin;**
  - If you specify the user-specified name and the recycle bin contains more than one object of that name, the database retrieves the object that was moved to the recycle bin most recently. If you want to retrieve an older version of the table, then do one of these things:
    - Specify the system-generated recycle bin name of the table you want to retrieve.
    - Run the **TIMECAPSULE TABLE ... TO BEFORE DROP** statement until you retrieve the table you want.
  - When a dropped table is restored, only the base table name is restored, and the names of other subobjects remain the same as those in the recycle bin. You can run the DDL command to manually change the names of subobjects as required.
  - The recycle bin does not support write operations such as DML, DCL, and DDL, and does not support DQL query operations (supported in later versions).
  - The **recyclebin\_retention\_time** parameter has been set for specifying the retention period of objects in the recycle bin. The objects will be automatically deleted after the retention period expires.
- **RENAME TO**  
Specifies a new name for the table retrieved from the recycle bin.
- **TRUNCATE**  
Flashes back to the point in time before the TRUNCATE operation.

## Examples

```
-- Create a schema.
gaussdb=# CREATE SCHEMA tpcds;

-- Delete the tpcds.reason_t2 table.
DROP TABLE IF EXISTS tpcds.reason_t2;
-- Create the tpcds.reason_t2 table.
gaussdb=# CREATE TABLE tpcds.reason_t2
(
  r_reason_sk integer,
  r_reason_id character(16),
  r_reason_desc character(100)
)with(storage_type = ustore);
-- Insert records into the tpcds.reason_t2 table.
gaussdb=# INSERT INTO tpcds.reason_t2 VALUES (1, 'AA', 'reason1'),(2, 'AB', 'reason2'),(3, 'AC', 'reason3');
INSERT 0 3
-- Delete data from the tpcds.reason_t2 table.
gaussdb=# TRUNCATE TABLE tpcds.reason_t2;
-- Query data in the tpcds.reason_t2 table.
gaussdb=# select * from tpcds.reason_t2;
 r_reason_sk | r_reason_id | r_reason_desc
-----+-----+-----
(0 rows)
-- Perform the TRUNCATE FLASHBACK operation.
gaussdb=# TIMECAPSULE TABLE tpcds.reason_t2 to BEFORE TRUNCATE;
gaussdb=# select * from tpcds.reason_t2;
 r_reason_sk | r_reason_id | r_reason_desc
-----+-----+-----
          1 | AA          | reason1
          2 | AB          | reason2
          3 | AC          | reason3
(3 rows)
-- Delete the tpcds.reason_t2 table.
gaussdb=# DROP TABLE tpcds.reason_t2;
-- Perform the DROP FLASHBACK operation.
gaussdb=# TIMECAPSULE TABLE tpcds.reason_t2 to BEFORE DROP;
TimeCapsule Table

-- Clear the recycle bin and delete the schema.
gaussdb=# PURGE RECYCLEBIN;
gaussdb=# DROP SCHEMA tpcds CASCADE;
```

## 7.14.182 TRUNCATE

### Function

**TRUNCATE** quickly removes all rows from a database table.

It has the same effect as an unqualified **DELETE** on each table, but it is faster since it does not actually scan the tables. This is most useful on large tables.

### Precautions

- **TRUNCATE TABLE** has the same function as a **DELETE** statement with no **WHERE** clause, emptying a table.
- **TRUNCATE TABLE** uses less system and transaction log resources as compared with **DELETE**.
  - **DELETE** deletes a row each time, and records the deletion of each row in the transaction log.

- **TRUNCATE TABLE** deletes all rows in a table by releasing the data page storing the table data, and records the releasing of the data page only in the transaction log.
- The differences between **TRUNCATE**, **DELETE**, and **DROP** are as follows:
  - **TRUNCATE TABLE** deletes content, releases space, but does not delete definitions.
  - **DELETE TABLE** deletes content, but does not delete definitions nor release space.
  - **DROP TABLE** deletes content and definitions, and releases space.

## Syntax

- Delete data from a table.

```
TRUNCATE [ TABLE ] [ ONLY ] { table_name [ * ] } [, ... ]  
[ CONTINUE IDENTITY ] [ CASCADE | RESTRICT ] [ PURGE ];
```

- Truncate the data in a partition.

```
ALTER TABLE [ IF EXISTS ] { [ ONLY ] table_name  
| table_name *  
| ONLY ( table_name ) }  
TRUNCATE PARTITION { partition_name  
| FOR ( partition_value [, ...] ) } [ UPDATE GLOBAL INDEX ];
```

## Parameter Description

- **ONLY**  
If **ONLY** is specified, only the specified table is cleared. Otherwise, the table and all its subtables (if any) are cleared.
- **table\_name**  
Specifies the name (optionally schema-qualified) of the target table.  
Value range: an existing table name
- **CONTINUE IDENTITY**  
Does not change the values of sequences. This is the default action.
- **CASCADE | RESTRICT**
  - **CASCADE**: cascadingly truncates all tables added to the group due to CASCADE.
  - **RESTRICT** (default): refuses to truncate if any of the tables have foreign-key references from tables that are not listed in the command.
- **PURGE**  
Purges table data in the recycle bin by default.
- **partition\_name**  
Specifies the partition in the target partitioned table.  
Value range: an existing table name
- **partition\_value**  
Specifies the value of the specified partition key.  
The value specified by **PARTITION FOR** can uniquely identify a partition.  
Value range: value range of the partition key for the partition to be renamed

**NOTICE**

When the **PARTITION FOR** clause is used, the entire partition where **partition\_value** is located is cleared.

**• UPDATE GLOBAL INDEX**

If this parameter is used, all global indexes in the partitioned table are updated to ensure that data can be queried correctly using global indexes. If this parameter is not used, all global indexes in the partitioned table will become invalid.

**Examples**

```
-- Create a schema.
gaussdb=# CREATE SCHEMA tpcds;

-- Create the tpcds.reason table.
gaussdb=# CREATE TABLE tpcds.reason
(
  r_reason_sk    integer,
  r_reason_id    character(16),
  r_reason_desc  character(100)
);

-- Insert multiple records into the table.
gaussdb=# INSERT INTO tpcds.reason values(1,'AAAAAAAABAAAAAAAA','reason 1'),
(5,'AAAAAAAAABAAAAAAAA','reason 2'),(15,'AAAAAAAAABAAAAAAAA','reason 3'),
(25,'AAAAAAAAABAAAAAAAA','reason 4'),(35,'AAAAAAAAABAAAAAAAA','reason 5'),
(45,'AAAAAAAACAAAAAAA','reason 6'),(55,'AAAAAAAACAAAAAAA','reason 7');

-- Create a table.
gaussdb=# CREATE TABLE tpcds.reason_t1 AS TABLE tpcds.reason;

-- Truncate the tpcds.reason_t1 table.
gaussdb=# TRUNCATE TABLE tpcds.reason_t1;

-- Delete the table.
gaussdb=# DROP TABLE tpcds.reason_t1;
-- Create a partitioned table.
gaussdb=# CREATE TABLE tpcds.reason_p
(
  r_reason_sk integer,
  r_reason_id character(16),
  r_reason_desc character(100)
)PARTITION BY RANGE (r_reason_sk)
(
  partition p_05_before values less than (05),
  partition p_15 values less than (15),
  partition p_25 values less than (25),
  partition p_35 values less than (35),
  partition p_45_after values less than (MAXVALUE)
);

-- Insert data.
gaussdb=# INSERT INTO tpcds.reason_p SELECT * FROM tpcds.reason;

-- Clear the p_05_before partition.
gaussdb=# ALTER TABLE tpcds.reason_p TRUNCATE PARTITION p_05_before;

-- Clear the p_15 partition.
gaussdb=# ALTER TABLE tpcds.reason_p TRUNCATE PARTITION for (13);

-- Clear the partitioned table.
gaussdb=# TRUNCATE TABLE tpcds.reason_p;
```

```
-- Delete the table.
gaussdb=# DROP TABLE tpcds.reason_p;

-- Delete a table.
gaussdb=# DROP TABLE tpcds.reason;

-- Delete a schema.
gaussdb=# DROP SCHEMA tpcds CASCADE;
```

## 7.14.183 UPDATE

### Description

Updates data in a table. UPDATE changes the values of the specified columns in all rows that satisfy the condition. The WHERE clause clarifies conditions. The columns to be modified need to be mentioned in the SET clause; columns not explicitly modified retain their previous values.

### Precautions

- The owner of a table, users granted with the UPDATE permission on the table, or users granted with the UPDATE ANY TABLE permission can update data in the table. The system administrator has the permission to update data in the table by default.
- You must have the SELECT permission on all tables involved in the expressions or conditions.
- The generated column cannot be directly written. In the UPDATE statement, values cannot be specified for generated columns, but the keyword DEFAULT can be specified.
- Views and tables containing RULE cannot be updated for the syntax that is used to update multiple tables.
- For the UPDATE statement whose subquery is a stream plan, the same row cannot be concurrently updated.
- You are not allowed to change the database encoding format to GB18030\_2022 or change GB18030\_2022 to another character encoding format by updating system catalogs. Otherwise, inventory data and some operations will be abnormal. If you need to change the character set encoding of a database, follow the database switching process to migrate data.

### Syntax

```
Update a single table:
[ WITH [ RECURSIVE ] with_query [, ...] ]
UPDATE [/*+ plan_hint */] [ ONLY ] table_name [ partition_clause ] [ * ] [ [ AS ] alias ]
SET {column_name = { expression | DEFAULT }
    | ( column_name [, ...] ) = {( { expression | DEFAULT } [, ...] ) |sub_query }}[, ...]
    [ FROM from_list ] [ WHERE condition | WHERE CURRENT OF cursor_name ]
    [ ORDER BY {expression [ [ ASC | DESC | USING operator ]
    [ LIMIT { count } ]
    [ RETURNING {*
        | {output_expression [ [ AS ] output_name } [, ...] }}];

Update multiple tables:
[ WITH [ RECURSIVE ] with_query [, ...] ]
UPDATE [/*+ plan_hint */] table_list
SET {column_name = { expression | DEFAULT }
    | ( column_name [, ...] ) = {( { expression | DEFAULT } [, ...] ) |sub_query }}[, ...]
    [ FROM from_list ] [ WHERE condition ];
```

```
where sub_query can be:  
SELECT [ ALL | DISTINCT [ ON ( expression [, ...] ) ] ]  
{ * | {expression [ [ AS ] output_name ] [, ...] }  
[ FROM from_item [, ...] ]  
[ WHERE condition ]  
[ GROUP BY grouping_element [, ...] ]  
[ HAVING condition [, ...] ]  
[ ORDER BY {expression [ [ ASC | DESC | USING operator ] | nlsort_expression_clause ] [ NULLS { FIRST |  
LAST } } ] [, ...] ]  
[ LIMIT { [offset,] count | ALL } ]
```

- The subquery **with\_query** is as follows:  
with\_query\_name [ ( column\_name [, ...] ) ]  
AS [ [ NOT ] MATERIALIZED ] ( {select | values | insert | update | delete} )

## Parameters

- **WITH [ RECURSIVE ] with\_query [, ...]**  
Specifies one or more subqueries that can be referenced by name in the main query, which is equivalent to a temporary table. This subquery statement structure is called the CTE structure. When this structure is used, the execution plan contains the CTE SCAN content.  
If **RECURSIVE** is specified, it allows a **SELECT** subquery to reference itself by name.  
The detailed format of **with\_query** is as follows: **with\_query\_name** [ ( **column\_name** [, ...] ) ] **AS** [ [ **NOT** ] **MATERIALIZED** ] ( {**select** | **values** | **insert** | **update** | **delete** } )
  - **with\_query\_name** specifies the name of the result set generated by a subquery. Such names can be used to access the result sets of subqueries in a query.
  - **column\_name** specifies the column name displayed in the subquery result set.
  - Each subquery can be a **SELECT**, **VALUES**, **INSERT**, **UPDATE**, or **DELETE** statement.
  - You can use **MATERIALIZED** or **NOT MATERIALIZED** to modify the CTE.
    - If **MATERIALIZED** is specified, the **WITH** query will be materialized, and a copy of the subquery result set is generated. The copy is directly queried at the reference point. Therefore, the **WITH** subquery cannot be jointly optimized with the **SELECT** statement trunk (for example, predicate pushdown and equivalence class transfer). In this scenario, you can use **NOT MATERIALIZED** for modification. If the **WITH** query can be executed as a subquery inline, the preceding optimization can be performed.
    - If the user does not explicitly declare the materialized attribute, comply with the following rules: If the CTE is referenced only once in the **SELECT** statement trunk to which it belongs and semantically supports inline execution, it will be rewritten as subquery inline execution. Otherwise, the materialized execution will be performed in CTE Scan mode.
- **plan\_hint** clause  
Follows the **UPDATE** keyword in the **/\*+ \*/** format. It is used to optimize the plan of an **UPDATE** statement block. For details, see [Hint-based Tuning](#). In

each statement, only the first */\*+ plan\_hint\*/* comment block takes effect as a hint. Multiple hints can be written.

- **table\_name**

Specifies the name (optionally schema-qualified) of the table to be updated.  
Value range: an existing table name

 **NOTE**

You can use database links to perform operations on remote tables. For details, see [DATABASE LINK](#).

- **partition\_clause**

Updates a specified partition.

PARTITION { ( partition\_name ) | FOR ( partition\_value [, ...] ) } |

SUBPARTITION { ( subpartition\_name ) | FOR ( subpartition\_value [, ...] ) }

For details about the keywords, see [SELECT](#).

For details, see [CREATE TABLE SUBPARTITION](#).

- **alias**

Specifies a substitute name for the target table.

Value range: a string. It must comply with the [naming convention](#).

- **table\_list**

Specifies an expression list of a table. It is similar to `from_list`, but can declare both the target table and associated table. It is used only in the syntax for updating multiple tables.

- **column\_name**

Specifies the name of the column to be modified.

You can refer to this column by specifying the target table alias and the column name. Example:

```
UPDATE foo AS f SET f.col_name = 'namecol';
```

Value range: an existing column

- **expression**

Specifies a value assigned to a column or an expression that assigns the value.

- **DEFAULT**

Specifies the default value of a column.

The value is **NULL** if no specified default value has been assigned to it.

- **sub\_query**

Specifies a subquery.

This statement can be executed to update a table with information for other tables in the same database. For details about clauses in the `SELECT` statement, see [SELECT](#).

When a single column is updated, the `ORDER BY` and `LIMIT` clauses can be used. When multiple columns are updated, the `ORDER BY` and `LIMIT` clauses cannot be used.

 **NOTE**

For an UPDATE statement in UPDATE t1 SET (c1,c2) = (SELECT c1, c2 FROM t2...) format, a subplan is generated for each column in the execution plan. When a large number of columns are updated, the number of subplans is large, which greatly affects the performance.

- **from\_list**

Specifies a list of table expressions, allowing columns from other tables to appear in the **WHERE** condition and the update expressions. This is similar to the list of tables that can be specified in the **FROM** clause of a **SELECT** statement.

---

**NOTICE**

Note that the target table must not appear in the **from\_list**, unless you intend a self-join (in which case it must appear with an alias in the **from\_list**).

- **condition**

Specifies an expression that returns a value of type Boolean. Only rows for which this expression returns **true** are updated. You are advised not to use numeric types such as int for **condition**, because such types can be implicitly converted to Boolean values (non-zero values are implicitly converted to **true** and 0 is implicitly converted to **false**), which may cause unexpected results.

- **WHERE CURRENT OF cursor\_name**

When the cursor points to a row in a table, you can use this syntax to update the row.

cursor\_name: specifies the name of a cursor.

---

**NOTICE**

- This syntax is not supported by the database in the B compatibility mode.
- This syntax supports only ordinary tables instead of partitioned tables.
- This syntax can be used only in stored procedures.
- This syntax cannot be used together with other WHERE conditions.
- Multi-table update is not supported.
- This syntax cannot be used together with WITH, USING, ORDER BY, or FROM.
- The SELECT statement corresponding to the CURSOR must be declared as FOR UPDATE.
- The SELECT statement corresponding to the CURSOR supports only a single table. It does not support LIMIT/OFFSET, subqueries, or sublinks.
- The CURSOR declared as FOR UPDATE in a stored procedure cannot be used after being committed or rolled back.
- If the row to which the CURSOR points does not exist, an error is reported (only when UPDATE is used instead of DELETE) in the A compatibility mode, indicating that the specified row does not exist. In other compatibility modes, no error is reported.

- **ORDER BY**  
For details about the keywords, see [SELECT](#).
- **LIMIT**  
For details about the keywords, see [SELECT](#).
- **output\_expression**  
Specifies an expression to be computed and returned by the **UPDATE** statement after each row is updated.  
Value range: The expression can use any column names of the table named by **table\_name** or tables listed in **FROM**. Write \* to return all columns.
- **output\_name**  
Specifies a name to use for a returned column.

## Examples

```
-- Create the student1 table.
gaussdb=# CREATE TABLE student1
(
  stuno  int,
  classno int
);

-- Insert data.
gaussdb=# INSERT INTO student1 VALUES(1,1);
gaussdb=# INSERT INTO student1 VALUES(2,2);
gaussdb=# INSERT INTO student1 VALUES(3,3);

-- View data.
gaussdb=# SELECT * FROM student1;

-- Update the values of all records.
gaussdb=# UPDATE student1 SET classno = classno*2;

-- View data.
gaussdb=# SELECT * FROM student1;

-- Delete the table.
gaussdb=# DROP TABLE student1;

-- Example for WHERE CURRENT OF cursor_name
gaussdb=# create table t1(c1 int, c2 varchar2) with (storage_type = 'ustore', fillfactor=100); -- Create a
table.
gaussdb=# insert into t1 values(generate_series(1,1000),'abcd'); -- Insert the data.

gaussdb=# declare
gaussdb=# cursor cur1 is select * from t1 where c1 = 1 for update;
gaussdb=# va t1%rowtype;
gaussdb=# begin
gaussdb$$ open cur1;
gaussdb$$ fetch cur1 into va;
gaussdb$$ update t1 set c2 = c2 || c2 where current of cur1; -- Use WHERE CURRENT OF cursor_name to
update data.
gaussdb$$ close cur1;
gaussdb$$ commit;
gaussdb$$ end;
gaussdb$$ /

gaussdb=# select * from t1 where c1 = 1; -- Query the data.

gaussdb=# drop table t1; -- Delete the table.
```

## 7.14.184 VACUUM

### Description

VACUUM recycles storage space occupied by deleted rows in tables or B-Tree indexes. In normal database operation, rows that have been deleted are not physically removed from their table; they remain present until a VACUUM is done. Therefore, it is necessary to execute VACUUM periodically, especially on frequently-updated tables.

### Precautions

- If no table is specified, VACUUM processes the tables on which the user has the corresponding permission in the current database. If a table is specified, VACUUM processes only the specified table.
- To perform VACUUM operation to a table, you must be a table owner or a user granted the VACUUM permission on the table. By default, the system administrator has this permission. However, database owners are allowed to VACUUM all tables in their databases, except shared catalogs. (The restriction for shared catalogs means that a true database-wide VACUUM can only be executed by the system administrator). VACUUM skips over any tables that the calling user does not have permission to vacuum.
- VACUUM cannot be executed inside a transaction block.
- It is recommended that active production databases be vacuumed frequently (at least nightly), in order to remove dead rows. After adding or deleting a large number of rows, it might be a good idea to run **VACUUM ANALYZE** for the affected table. This will update the system catalogs with the results of all recent changes, and allow the query planner to make better choices in planning queries.
- **FULL** is recommended only in special scenarios. For example, you wish to physically narrow the table to decrease the occupied disk space after deleting most rows of a table. VACUUM FULL usually shrinks a table more than VACUUM does. The **FULL** option does not clear indexes. You are advised to periodically run the **REINDEX** statement. If the physical space usage does not decrease after you run the statement, check whether there are other active transactions (that have started before you delete data transactions and not ended before you run **VACUUM FULL**). If there are such transactions, run this statement again when the transactions quit.
- VACUUM causes a significant increase in I/O traffic, which may affect the performance of other active sessions. Therefore, it is sometimes advisable to use the cost-based VACUUM delay feature.
- When **VERBOSE** is specified, VACUUM will print progress messages to indicate which table is currently being processed. Various statistics about the tables are printed as well.
- When the option list is surrounded by parentheses, the options can be written in any order. If there are no brackets, the options must be given in the order displayed in the syntax.
- VACUUM and VACUUM FULL clean up row-store table records with a delay specified by **vacuum\_defer\_cleanup\_age**, that is, tuples that have just been deleted are not cleaned up immediately.

- **VACUUM ANALYZE** executes a **VACUUM** operation and then an **ANALYZE** operation for each selected table. This is a handy combination form for routine maintenance scripts.
- A plain **VACUUM** statement (without the **FULL** option) simply recycles space and makes it available for reuse. This form of statement can operate in parallel with normal reading and writing of the table, as an exclusive lock is not obtained. **VACUUM FULL** executes wider processing, including moving rows across blocks to compress the tables so that they occupy the minimum number of disk blocks. This form is much slower and requires an exclusive lock on each table while it is being processed.
- A deadlock may occur when multiple **VACUUM FULL** statements are executed simultaneously.
- If the **xc\_maintenance\_mode** parameter is not enabled, the **VACUUM FULL** operation will skip all system catalogs.
- If you run **VACUUM FULL** immediately after running **DELETE**, the space will not be recycled. After executing **DELETE**, execute 1000 non-**SELECT** transactions, or wait for 1s and then execute one transaction. Then, run **VACUUM FULL** to the space.
- During **VACUUM FULL**, an exclusive lock is added to the table. Therefore, you are advised not to run **VACUUM FULL** during peak hours. Otherwise, the lock waiting time is too long or a deadlock occurs.

## Syntax

- Recycle space and update statistics information, without requirements for keyword orders.

```
VACUUM [ ( { FULL | FREEZE | VERBOSE | {ANALYZE | ANALYSE } } [,...] ) ]  
[ table_name [ (column_name [, ...] ) ] [ PARTITION ( partition_name ) | SUBPARTITION  
( subpartition_name ) ] ] ;
```

- Recycle space, without updating statistics information.

```
VACUUM [ FULL [COMPACT] ] [ FREEZE ] [ VERBOSE ] [ table_name  
[ PARTITION ( partition_name ) | SUBPARTITION ( subpartition_name ) ] ] ;
```

- Recycle space and update statistics information, and require keywords in order.

```
VACUUM [ FULL ] [ FREEZE ] [ VERBOSE ] { ANALYZE | ANALYSE } [ VERBOSE ]  
[ table_name [ (column_name [, ...] ) ] ] [ PARTITION ( partition_name ) ] ;
```

## Parameters

- **FULL**

Selects "FULL" vacuum, which can recycle more space, but takes much longer and exclusively locks the table.

### NOTE

Using **FULL** will cause statistics missing. To collect statistics, add the keyword **ANALYZE** to **VACUUM FULL**.

- **FREEZE**

Is equivalent to running **VACUUM** with the **vacuum\_freeze\_min\_age** parameter set to **zero**.

- **VERBOSE**

Prints a detailed **VACUUM** activity report for each table.

- **ANALYZE | ANALYSE**

Updates statistics used by the planner to determine the most efficient way to execute a query.

 **NOTE**

VACUUM is also triggered when **autovacuum** is set to **analyze** for a Ustore partitioned table.

- **table\_name**

Specifies the name (optionally schema-qualified) of a specific table to vacuum.

Value range: name of a specific table to vacuum Defaults are all tables in the current database.

- **column\_name**

Specifies the name of the column to be analyzed. This parameter must be used together with **ANALYZE**.

Value range: name of the column to be analyzed Defaults are all columns.

 **NOTE**

The mechanism of the VACUUM ANALYZE statement is to execute VACUUM and ANALYZE in sequence. Therefore, if **column\_name** is incorrect, VACUUM may be successfully executed but ANALYZE may fail to be executed. For a partitioned table, ANALYZE may fail to be executed after VACUUM is successfully executed on a partition.

- **PARTITION**

**COMPACT** and **PARTITION** cannot be used at the same time.

- **partition\_name**

Specifies the level-1 partition name of the table to be cleared. If it is left empty, all level-1 partitions are cleared.

- **subpartition\_name**

Specifies the level-2 partition name of the table to be cleared. If it is left empty, all level-2 partitions are cleared.

## Examples

```
-- Create a schema.
gaussdb=# CREATE SCHEMA tpcds;

-- Create the tpcds.reason table.
gaussdb=# CREATE TABLE tpcds.reason
(
  r_reason_sk    integer,
  r_reason_id    character(16),
  r_reason_desc  character(100)
);

-- Insert multiple records into the table.
gaussdb=# INSERT INTO tpcds.reason values(1,'AAAAAAAAABAAAAAAA','reason 1'),
(2,'AAAAAAAAABAAAAAAA','reason 2');

-- Create an index in the tpcds.reason table.
gaussdb=# CREATE UNIQUE INDEX ds_reason_index1 ON tpcds.reason(r_reason_sk);

-- Vacuum the tpcds.reason table that has indexes.
gaussdb=# VACUUM (VERBOSE, ANALYZE) tpcds.reason;
```

```
-- Delete the index.  
gaussdb=# DROP INDEX ds_reason_index1 CASCADE;  
gaussdb=# DROP TABLE tpcds.reason;  
gaussdb=# DROP SCHEMA tpcds CASCADE;
```

## Suggestions

### VACUUM

- VACUUM cannot be executed inside a transaction block.
- It is recommended that active production databases be vacuumed frequently (at least nightly), in order to remove dead rows. It is strongly recommended that you run **VACUUM ANALYZE** after adding or deleting a large number of records.
- **FULL** is recommended only in special scenarios. For example, you wish to physically narrow the table to decrease the occupied disk space after deleting most rows of a table.

## 7.14.185 VALUES

### Function

**VALUES** computes a row or a set of rows based on given values. It is most commonly used to generate a constant table within a large statement.

### Precautions

- **VALUES** lists with large numbers of rows should be avoided, as you might encounter out-of-memory failures or poor performance. **VALUES** appearing within **INSERT** is a special case, because the desired column types are known from the **INSERT**'s target table, and need not be inferred by scanning the **VALUES** list. In this case, **VALUE** can handle larger lists than are practical in other contexts.
- If more than one row is specified, all the rows must have the same number of elements.

### Syntax

```
VALUES (( expression [, ...] )) [, ...]  
  [ ORDER BY { sort_expression [ ASC | DESC | USING operator ] } [, ...] ]  
  [ LIMIT { count | ALL } ]  
  [ OFFSET start [ ROW | ROWS ] ]  
  [ FETCH { FIRST | NEXT } [ count ] { ROW | ROWS } ONLY];
```

### Parameter Description

- **expression**  
Specifies a constant or expression to compute and insert at the indicated place in the resulting table or set of rows.  
In a **VALUES** list appearing at the top level of an **INSERT**, an expression can be replaced by **DEFAULT** to indicate that the destination column's default value should be inserted. **DEFAULT** cannot be used when **VALUES** appears in other contexts.
- **sort\_expression**

Specifies an expression or integer constant indicating how to sort the result rows.

- **ASC**  
Specifies an ascending sort order.
- **DESC**  
Specifies a descending sort order.
- **operator**  
Specifies a sorting operator.
- **count**  
Specifies the maximum number of rows to return.
- **OFFSET start { ROW | ROWS }**  
Specifies the maximum number of returned rows, whereas **start** specifies the number of rows to skip before starting to return rows.
- **FETCH { FIRST | NEXT } [ count ] { ROW | ROWS } ONLY**  
The **FETCH** clause restricts the total number of rows starting from the first row of the return query result, and the default value of **count** is **1**.

## Examples

See [Examples](#) in **INSERT**.

## 7.14.186 ALTER EXTENSION

---

### NOTICE

The extended function is for internal use only. You are advised not to use it.

---

## Description

Modifies the plug-in extension.

## Precautions

**ALTER EXTENSION** modifies the definition of an installed extension. To use this API, set **support\_extended\_features** to **true**. Methods are as follows:

- **UPDATE**  
The extension is updated to a new version. The extension must be applicable to an update script (or a series of scripts) so that the current installation version can be modified to a required version.
- **SET SCHEMA**  
The extended object is moved to another schema. This extension must be relocatable to make the command successful.
- **ADD member\_object**  
An existing object is added to the extension. This is mainly useful for extension update scripts. This object is then treated as a member of the

extension. Obviously, the object can only be canceled by canceling the extension.

- **DROP member\_object**

A member object is removed from the extension. This method is useful in extension update scripts. The object is not canceled, but is simply separated from the extension.

You must have an extension before using **ALTER EXTENSION**. You must have the permission on adding or deleting an object before using the ADD or DROP statement.

## Syntax

- Modify the version of an extension.

```
ALTER EXTENSION name UPDATE [ TO new_version ];
```

- Modify the schema of the extension.

```
ALTER EXTENSION name SET SCHEMA new_schema;
```

- Add or delete member objects of the extension.

```
ALTER EXTENSION name { ADD | DROP } member_object;
```

The member object **member\_object** is written as follows:

```
AGGREGATE agg_name (agg_type [, ...] ) |
CAST (source_type AS target_type) |
COLLATION object_name |
CONVERSION object_name |
DOMAIN object_name |
EVENT TRIGGER object_name |
FOREIGN DATA WRAPPER object_name |

FUNCTION function_name ( [ [ argname ] [ argmode ] argtype [, ...] ] ) |
MATERIALIZED VIEW object_name |
OPERATOR operator_name (left_type, right_type) |
OPERATOR CLASS object_name USING index_method |
OPERATOR FAMILY object_name USING index_method |
[ PROCEDURAL ] LANGUAGE object_name |
SCHEMA object_name |
SEQUENCE object_name |
SERVER object_name |
TABLE object_name |
TEXT SEARCH CONFIGURATION object_name |
TEXT SEARCH DICTIONARY object_name |
TEXT SEARCH PARSER object_name |
TEXT SEARCH TEMPLATE object_name |
TYPE object_name |
VIEW object_name
```

## Parameters

- **name**

Name of an installed extension.

- **new\_version**

New version of the extension, which can be overridden by identifiers and string literals. If a new version of the extension is not specified, ALTER EXTENSION UPDATE updates to the default version shown in the extension's control file.

- **new\_schema**

New schema of the extension.

- **object\_name**  
**agg\_name**  
**function\_name**  
**operator\_name**  
Names of objects that are added or removed from the extension, including names of tables, aggregations, domains, external linked lists, functions, operators, operator classes, operator families, sequences, text search objects, types, and views that can be schema-qualified.
- **agg\_type**  
Input data type of the aggregate function. To reference a zero-parameter aggregate function, use \* to replace the input data type list.
- **source\_type**  
Name of the source data type to be forcibly converted.
- **target\_type**  
Name of the target data type to be forcibly converted.
- **argmode**  
Model of the function parameter. The value can be **IN**, **OUT**, **INOUT**, or **VARIADIC**. The default value is **IN**. **ALTER EXTENSION** does not relate to the **OUT** parameter, because you only need to enter parameters to confirm the consistency of functions. Therefore, the **IN**, **INOUT**, and **VARIADIC** parameters are enough.
- **argname**  
Name of a function parameter. **ALTER EXTENSION** does not relate to the parameter name. Only the parameter data type is required to confirm the consistency of the function.
- **argtype**  
Data type (optionally schema-qualified) of a function parameter.
- **left\_type**  
**right\_type**  
Data type (optionally schema-qualified) of an operator parameter. **NONE** is written for a missing parameter of a prefix or suffix operator.

## Examples

Update the PL/pgSQL extension to version 2.0.

```
ALTER EXTENSION plpgsql UPDATE TO '2.0';
```

Update the PL/pgSQL extension mode to utils.

```
ALTER EXTENSION plpgsql SET SCHEMA utils;
```

Add an existing function for PL/pgSQL extension.

```
ALTER EXTENSION plpgsql ADD FUNCTION populate_record(anyelement, plpgsql);
```

## 7.14.187 CREATE EXTENSION

### NOTICE

The extended function is for internal use only. You are advised not to use it.

### Description

Installs an extension.

### Precautions

- Before running the **CREATE EXTENSION** command to load an extension into the database, you must install the support file for the extension first.
- The **CREATE EXTENSION** command installs a new extension to a database. Ensure that no extension with the same name has been installed.
- Installing an extension means executing an extended script file that creates an SQL entity, such as a function, data type, operator, and index-supported method.
- Installing an extension requires the same permissions as creating its component objects. For most extensions, this means that the superuser or database owner's permissions are required. For subsequent permission checks and entities created by the extension script, the role that runs the **CREATE EXTENSION** command becomes the owner of the extension.
- During the execution of **CREATE EXTENSION**, if the database contains database objects with the same name as that in the **EXTENSION**, such as packages, synonyms, operators, directories, functions, stored procedures, views, and tables, the execution will fail.
- Do not directly create extensions for the database to avoid unexpected errors and incompatibility problems after the upgrade. To create an extension, set **enable\_extension** to **true**.
- During the execution of **CREATE EXTENSION**, if **enable\_object\_special\_character** is set to **off** and "@extschema@" is used in the extension script file, the value of the **schema** parameter in the extension support file cannot contain any special characters in ["\$\`"].

### Syntax

```
CREATE EXTENSION [ IF NOT EXISTS ] extension_name  
[ WITH ] [ SCHEMA schema_name ]  
[ VERSION version ]  
[ FROM old_version ]
```

### Parameters

- **IF NOT EXISTS**  
If an extension with the same name exists in the system, no error is reported. However, a message is displayed. Note that this parameter does not ensure that the existing extensions of the system are the same as those created by the script.

- **extension\_name**  
Specifies the name of the extension to be installed. The database creates the extension by using the information in the **SHAREDIR/extension/extension\_name.control** file.
- **schema\_name**  
The extension instance is installed in this schema, and the extended content can be reinstalled. The specified schema must exist. If it is not specified, the extended control file does not specify a schema either. In this case, the default schema is used.

---

 **CAUTION**

Extensions are not considered to be in any schema (no restriction is posed on the name of extensions within the scope of a database), but an extension instance belongs to a schema.

- 
- **version**  
Version of the extension to be installed, which can be written as an identifier or a string. The default version is specified in the extended control file.
  - **old\_version**  
If you want to upgrade the content that is not contained in the **old style** module, you must specify **FROM old\_version**. This option makes **CREATE EXTENSION** run an installation script to install new content into the extension instead of creating an entity. Note that **SCHEMA** specifies the schema that includes these existing entities.

## Examples

Install an extension in the current database. For example, install **testxxx**:

```
CREATE EXTENSION testxxx;
```

## 7.14.188 DROP EXTENSION

---

**NOTICE**

The extended function is for internal use only. You are advised not to use it.

---

## Description

Deletes an extension.

## Precautions

- **DROP EXTENSION** deletes an extension from the database. When you delete an extension, the components that make up the extension are also deleted.
- The **DROP EXTENSION** command can be used only by the owner of the extension.

## Syntax

```
DROP EXTENSION [ IF EXISTS ] name [, ...] [ CASCADE | RESTRICT ]
```

## Parameters

- **IF EXISTS**  
If the **IF EXISTS** parameter is used and the extension does not exist, no error is reported. Instead, a **NOTICE** is generated.
- **name**  
Name of an installed extension.
- **CASCADE**  
Automatically deletes objects that depend on the extension.
- **RESTRICT**  
If any object depends on an extension, the extension cannot be deleted (unless all its member objects and other extension objects are deleted at a time using the **DROP** command). This is a default processing.

## Examples

Delete the extension **plpgsql** from the current database.

```
DROP EXTENSION plpgsql;
```

In the current database, if an object that uses **plpgsql** exists, this command will fail. For example, a column in any table is of the **plpgsql** type. Adding the **CASCADE** option can forcibly delete the extension and objects that depend on it.

## 7.15 Appendix

### 7.15.1 Extended Functions

The following table lists the extended functions supported by GaussDB. These functions are for reference only.

| Category                          | Name                                              | Description                                                     |
|-----------------------------------|---------------------------------------------------|-----------------------------------------------------------------|
| Access privilege inquiry function | has_sequence_privilege(user, sequence, privilege) | Queries whether a specified user has privilege for sequences.   |
|                                   | has_sequence_privilege(sequence, privilege)       | Queries whether the current user has privilege for sequence.    |
| Trigger function                  | pg_get_triggerdef(oid)                            | Gets <b>CREATE [ CONSTRAINT ] TRIGGER</b> command for triggers. |
|                                   | pg_get_triggerdef(oid, boolean)                   | Gets <b>CREATE [ CONSTRAINT ] TRIGGER</b> command for triggers. |

## 7.15.2 Extended Syntax

GaussDB provides the following extended syntax:

**Table 7-150** Extended SQL syntax

| Category            | Keywords                                                                                                                                                   | Description                                                                                                                                                                        |
|---------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Creating a table    | <b>INHERITS ( parent_table [ , ... ] )</b>                                                                                                                 | Currently, the syntax of inherited tables is retained, but inherited tables are not supported.                                                                                     |
|                     | column_constraint:<br><b>REFERENCES reftable [ ( refcolumn ) ] [ MATCH FULL   MATCH PARTIAL   MATCH SIMPLE ] [ ON DELETE action ] [ ON UPDATE action ]</b> | You can run <b>REFERENCES reftable[(refcolumn)] [MATCH FULL  MATCH PARTIAL   MATCH SIMPLE] [ON DELETE action] [ON UPDATE action]</b> to create foreign key constraints for tables. |
| Loading a module    | <b>CREATE EXTENSION</b>                                                                                                                                    | Loads a new module to the current database. This feature is for internal use only. You are advised not to use it.                                                                  |
|                     | <b>DROP EXTENSION</b>                                                                                                                                      | Deletes the loaded module. This feature is for internal use only. You are advised not to use it.                                                                                   |
| Aggregate functions | <b>CREATE AGGREGATE</b>                                                                                                                                    | Defines a new aggregate function.                                                                                                                                                  |
|                     | <b>ALTER AGGREGATE</b>                                                                                                                                     | Modifies the definition of an aggregate function.                                                                                                                                  |
|                     | <b>DROP AGGREGATE</b>                                                                                                                                      | Drops an existing function.                                                                                                                                                        |

## 7.15.3 Dollar-Quoted String Constants

If a string sequence contains a single quotation mark ('), double the single quotation mark (') to two single quotation marks ("). Otherwise, the SQL statement may fail to be executed.

If a string contains many single quotation marks (') or backslashes (\), the string may be difficult to understand and error-prone because all the single quotation marks (') are doubled.

To make the query more readable in such situations, dollar quoting is provided to write string constants. A dollar-quoted string constant consists of a dollar sign (\$), a "tag" of zero or more characters, another dollar sign, an arbitrary sequence of characters that make up the string content, a dollar sign, another tag the same as the previous one, and a dollar sign.

```
gaussdb=# SELECT $$it's an example$$;  
?column?  
-----  
it's an example  
(1 row)
```

## 7.15.4 DATABASE LINK

### Description

In the local database, a database link is used to connect to and access the remote database.

A database link can be public or private. A private database link can be accessed only by the creator, while a public database link can be accessed by all users.

All created database link information is stored in the system view `gs_db_links` of the local database.

### Precautions

- The database link feature can be used only in A-compatible versions.
- The remote database connected to database link supports only 503.1 and later versions.
- Ensure that the values of the compatibility parameter **DBCOMPATIBILITY** and GUC parameters **behavior\_compat\_options**, **a\_format\_dev\_version**, and **a\_format\_version** of the local and remote databases are the same.
- When a session is enabled for a database link connection, the following GUC parameters are set:  

```
set search_path=pg_catalog, '$user', 'public';  
set datestyle=ISO;  
set intervalstyle=postgres;  
set extra_float_digits=3;
```

Other parameters are set at the remote end. If the remote parameters are different from the local parameters, the data display formats may be different. Therefore, ensure that the remote parameters are the same as the local parameters.

- Preparations: Use `gs_guc` to add a whitelist to the **pg\_hba.conf** file to allow client connections.

```
Example: gs_guc reload -I all -N all -Z datanode -h "host all all 192.168.11.11/32 sha256"
```

For details about the parameters, see the description of `gs_guc` client authentication policy settings.

- The permission to create a database link needs to be granted using the **GRANT** syntax. By default, a new user does not have the permission, but the system administrator has the permission. For details, see **GRANT** description.
- When a database link is used to perform operations on a remote table, a schema corresponding to the remote table is created locally. If the metadata of the table does not exist locally, the metadata is written to the local system catalog. In this case, a level-7 lock is used to ensure write consistency until the transaction ends. When a database link is deleted, the corresponding metadata is also deleted.
- If a long transaction uses the `dblink` to operate a remote object for the first time, the lock is held until the transaction ends. Other transactions that use

the dblink for the first time are blocked. To avoid this problem, run a quick statement, for example, "select \* from t1@dblink where 1=2;", to query the remote object to be used and flush its metadata to disks. In addition, similar problem also occurs when the structure of the remote table changes and the stored metadata is updated locally.

- If the local and remote character sets are different, an error indicating that the conversion fails may be reported. The error information is that the remote end returns an error. If the character encoding of the local database is GB18030\_2022, the character encoding sent to the remote database is converted to GB18030. Therefore, if the character set of the local database is GB18030\_2022, the character set of the remote database can only be GB18030 or GB18030\_2022.
- When a schema corresponding to the remote end is created locally, "USERNAME (available only for private database link) #remote schema@DBLINK" is used as the schema name. The maximum length of the schema name is 63 characters.

---

#### NOTICE

When the permission to create a database link is granted to a user, the user can remotely access a database by using the IP address of the remote database. Exercise caution when granting this permission to users.

---

## Syntax

- Create a database link.  

```
CREATE [ PUBLIC ] DATABASE LINK dblink  
[ CONNECT TO { CURRENT_USER | user IDENTIFIED BY password } ] [ USING ( option 'value' [...] ) ] ;
```
- Modify the database link information.  

```
ALTER [ PUBLIC ] DATABASE LINK dblink  
{ CONNECT TO user IDENTIFIED BY password } ;
```
- Delete a specified database link.  

```
DROP [ PUBLIC ] DATABASE LINK dblink ;
```

 NOTE

- **PUBLIC**: creates a public database link visible to all users. If this clause is omitted, the database link is private and available only to the current user. The data that can be accessed on the remote database depends on the identity used by the database link during connection.
  - If **CONNECT TO user IDENTIFIED BY password** is specified, the database link makes a connection as a user with specified password.
  - If **CONNECT TO CURRENT\_USER** is specified, the database link connects to the remote database as the local initial user.
  - If the preceding two clauses are omitted, the database link connects to the remote database as a local initial user.
  - **dblink**: indicates the name of the database link to be created.
  - **user**: indicates the username used by the created database link.
  - **password**: indicates the password of the username.
  - **USING ( option 'value' [, ... ] )**  
Specifies parameters such as the IP address, port number, and remote database name of the database to be connected. The supported options are as follows:
    - **host**: specifies the IP addresses to be connected. IPv6 addresses are not supported. Multiple IP addresses can be specified using character strings separated by commas (,). Currently, SSL settings, encrypted databases, and certificate authentication are not supported. If no IP address is specified, this parameter is left empty by default.
    - **port**: specifies the port number for connection. If this parameter is not specified, the default value **5432** is used.
    - **dbname**: specifies the name of the database to be connected. If this parameter is not specified, the username used for connecting to the remote end is used by default.
    - **fetch\_size**: specifies the amount of data obtained from the remote end each time. The value of **fetch\_size** ranges from 0 to 2147483647. The default value is **100**.
- Notes:**
- You can write only part of the preceding options in the brackets after USING.
  - If the keyword USING is not written, the content in the brackets is not written as well.
  - When a database link is created, the system does not check whether the connection is successful. If related keywords are missing, an error may be reported.
- Perform the SELECT operation through a database link.

 NOTE

The syntax for accessing a remote database object by using a created database link is basically the same as that for accessing a local object. The difference is that **@dblink** is added to the end of the remote object descriptor. For details about restrictions on SQL statements, see [Table 7-151](#).

```
[ WITH [ RECURSIVE ] with_query [, ...] ]
SELECT [/*+ plan_hint */] [ ALL | DISTINCT [ ON ( expression [, ...] ) ] ]
{ * | {expression [ [ AS ] output_name ]} [, ...] }
[ FROM from_item [, ...] ]
[ WHERE condition ]
[ [ START WITH condition ] CONNECT BY [NOCYCLE] condition [ ORDER SIBLINGS BY expression ] ]
[ GROUP BY grouping_element [, ...] ]
[ HAVING condition [, ...] ]
[ { UNION | INTERSECT | EXCEPT | MINUS } [ ALL | DISTINCT ] select ]
[ ORDER BY {expression [ [ ASC | DESC | USING operator ] ] nlsort_expression_clause } [ NULLS
```

```
{ FIRST | LAST } } ] [ , ... ]
[ LIMIT { [offset,] count | ALL } ]
[ OFFSET start [ ROW | ROWS ] ]
[ {FOR { UPDATE | SHARE} [ OF table_name [ , ... ] ] } { ... } ];
[[ ONLY ] table_name [ * ] [ partition_clause ] @ dblink [ [ AS ] alias [ ( column_alias [ , ... ] ) ] ]
( ( select ) [ AS ] alias [ ( column_alias [ , ... ] ) ]
|with_query_name [ [ AS ] alias [ ( column_alias [ , ... ] ) ] ]
|[function_name] ( [ argument [ , ... ] ] ) [ AS ] alias [ ( column_alias [ , ... ] | column_definition [ , ... ] ) ]
|[function_name] ( [ argument [ , ... ] ] ) AS ( column_definition [ , ... ] )
|from_item [ NATURAL ] join_type from_item [ ON join_condition | USING ( join_column [ , ... ] ) ]];
```

- Perform the INSERT operation through a database link.

```
[ WITH [ RECURSIVE ] with_query [ , ... ] ]
INSERT [/*+ plan_hint */] INTO table_name [ partition_clause ] @ dblink [ ( column_name [ , ... ] ) ]
{ DEFAULT VALUES
| VALUES { ( { expression | DEFAULT } [ , ... ] ) } [ , ... ]
| query }
[ RETURNING { {output_expression [ [ AS ] output_name ] } [ , ... ] }];
```

- Perform the UPDATE operation through a database link.

```
UPDATE [/*+ plan_hint */] [ ONLY ] table_name [ partition_clause ] @ dblink [ [ AS ] alias ]
SET {column_name = { expression | DEFAULT }
| ( column_name [ , ... ] ) = { ( { expression | DEFAULT } [ , ... ] ) |sub_query } } [ , ... ]
[ FROM from_list ] [ WHERE condition ]
[ ORDER BY {expression [ [ ASC | DESC | USING operator ] | nlssort_expression_clause ] [ NULLS
{ FIRST | LAST } } ] [ , ... ] ]
[ LIMIT { [offset,] count | ALL } ]
[ RETURNING { {output_expression [ [ AS ] output_name ] } [ , ... ] }];
where sub_query can be:
SELECT [ ALL | DISTINCT [ ON ( expression [ , ... ] ) ] ]
{ * | {expression [ [ AS ] output_name ] } [ , ... ] }
[ FROM from_item [ , ... ] ]
[ WHERE condition ]
[ GROUP BY grouping_element [ , ... ] ]
[ HAVING condition [ , ... ] ];
```

- Perform the DELETE operation through a database link.

```
[ WITH [ RECURSIVE ] with_query [ , ... ] ]
DELETE [/*+ plan_hint */] FROM [ ONLY ] table_name [ partition_clause ] @ dblink [ [ AS ] alias ]
[ USING using_list ]
[ WHERE condition ]
[ ORDER BY {expression [ [ ASC | DESC | USING operator ] | nlssort_expression_clause ] [ NULLS
{ FIRST | LAST } } ] [ , ... ] ]
[ LIMIT { [offset,] count | ALL } ]
[ RETURNING { * | { output_expr [ [ AS ] output_name ] } [ , ... ] }];
```

- Perform the LOCK TABLE operation through a database link.

```
LOCK [ TABLE ] { [ ONLY ] name @ dblink [ , ... ] }

[ IN {ACCESS SHARE | ROW SHARE | ROW EXCLUSIVE | SHARE UPDATE EXCLUSIVE | SHARE |
SHARE ROW EXCLUSIVE | EXCLUSIVE | ACCESS EXCLUSIVE} MODE ]
[ NOWAIT];
```

- Call a stored procedure or function of the remote database.

```
CALL | SELECT [ schema. ] { func_name@dblink | procedure_name@dblink } ( param_expr );
```

 **CAUTION**

- When a database link calls a remote function or stored procedure, the user-defined types, **out** output parameters, aggregate functions, window functions, and return set functions are not supported. **SELECT \* FROM func@dblink()** cannot be used to call the function or stored procedure.
- When a database link calls a remote function or stored procedure, functions under PUBLIC are called by default if no schema is specified.
- When the database link calls a remote function or stored procedure, **param\_expr** does not support the use of ":@" or "=>" to separate parameter names and parameter values.

 **NOTE**

- The meanings of the parameters irrelevant to database link in the preceding SQL statements are the same as those in the original SQL statements.
- When specifying a column name, you can add "@dblink" to the end of the column name to specify the column of the table to which the corresponding database link points.

## Restrictions

- **Transaction**

When a database link is used, the relationship between local and remote transactions is as follows:

- A local transaction synchronously controls the commit/rollback status of a remote transaction.
- The relationship between isolation levels is as follows.

| Local Isolation Level | Remote Isolation Level |
|-----------------------|------------------------|
| Read Uncommitted      | Repeatable Read        |
| Read Committed        | Repeatable Read        |
| Repeatable Read       | Repeatable Read        |
| Serializable          | Serializable           |

**NOTICE**

If you commit a local transaction, a transaction commit request is sent to the remote end. If the local transaction fails to be committed due to an exception (such as a connection exception or a local cluster instance exception) after the remote transaction is successfully committed, the committed remote transaction cannot be withdrawn. As a result, the local transaction may be inconsistent with the remote transaction.

- **Permissions of local users to use database links**

- a. If the keyword `public` is used, the link is a public database link and can be used by all users or schemas.
- b. If the keyword `public` is not used, the link is a private database link and can be used only by the current user or schema. (User `sys` cannot use database links across schemas.)
- **Permission to access remote database objects through database links**

The permissions to access remote database objects are the same as those of the remote connection user bound to the database link.
- **Supported SQL statements**
  - For details about the statements supported by database links, see [Table 7-151](#).
  - For details about the table types supported by database links, see [Table 7-152](#).
- **Function call using a database link**
  - When a database link calls a remote function, the user-defined types, OUT/INOUT parameters, PACKAGE inner functions, aggregate functions, window functions, and return set functions are not supported.
  - When a database link calls a stored procedure or function of a remote database in the PLSQL\_BODY, the user-defined types, OUT/INOUT parameters, PACKAGE inner functions, overloaded functions, aggregate functions, window functions, and return set functions are not supported.

---

#### NOTICE

- You can use the following syntax to call stored procedures or functions of a remote database in the PLSQL\_BODY: `[CALL | SELECT] [ schema. ] { func_name@dblink | procedure_name@dblink } ( param_expr )`.
  - You can use the following syntax to call parameterless stored procedures or functions of a remote database in the PLSQL\_BODY: `[CALL | SELECT] [ schema. ] { func_name@dblink | procedure_name@dblink } ( )`.
- 
- **Synonyms**
    - The database link name cannot be created as a synonym.
    - Synonyms that point to a database link object in a remote database cannot be called through database link. Example:
      - Step 1: Create table **TABLE1** on **DB1**.
      - Step 2: Create **DBLINK1** on **DB2** for connecting to **DB1**. Create the synonym "CREATE SYNONYM T1 FOR TABLE1@DBLINK1".
      - Step 3: Create **DBLINK2** on **DB3** for connecting to **DB2**. Call the synonym T1 "SELECT \* FROM T1@DBLINK2" on **DB2** through **DBLINK2**.
  - **Table type constraints**
    - HASHBUCKET: The query or DML operation cannot be performed on the remote hash bucket table through database link.

- SLICE: The query or DML operation cannot be performed on the remote slice table through database link.
- Replication table: The query or DML operation cannot be performed on the remote replication table through database link.
- TEMPORARY: The query or DML operation cannot be performed on the remote temporary table through database link.
- **Views**
  - Currently, you can create a view for a remote table of a database link. However, when the structure of the remote table changes, an exception may occur when you use the view. Example:
    - Step 1: Create table **TABLE1** on **DB1**.
    - Step 2: Create **DBLINK** on **DB2** for connecting to **DB1**. Create the view "CREATE VIEW V1 AS SELECT \* FROM TABLE1@DBLINK".
    - Step 3: Delete a column from **TABLE1** on **DB1**. An error is reported when you query the view on **DB2**.
- **Other scenarios**
  - The database link table does not support triggers, including the scenarios where a database link is used in the function called by a trigger, the function called by a trigger is a database link function, and the trigger is defined on a database link.
  - The UPSERT and MERGE syntaxes are not supported.
  - The CURRENT CURSOR syntax is not supported.
  - Hidden columns in a table cannot be queried.
- **Dump and backup**

Database objects related to database links cannot be dumped. The standby node cannot be called or connected by database links.
- **Predicate pushdown constraints**

Only the data types, operators, and functions used in the WHERE clause are built in, and the used functions are of the IMMUTABLE type.
- **Aggregate function pushdown constraints**

Only single tables that do not contain GROUP, ORDER BY, HAVING, and LIMIT clauses in the SELECT statement are supported. Window functions are not supported.
- **Hint pushdown**

Only hints in scan mode can be pushed down based on the hint conditions of database link table objects. The syntax format is as follows:

```
[no] tablescan|indexscan|indexonlyscan(table [index])
```

The table name or table alias in a query block must be unique.

**Table 7-151** Supported SQL statements

| SQL Type                  | Operation Object                                                    | Supported Option                                                                                                                                                                                                                                                                                                                                                                                                                                                             | Execution Context                                                                        |
|---------------------------|---------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------|

|                  |                                                                   | Ustore | Supported                                                           |
|                  | Partitioned table                                                 |        | Supported                                                           |
|                  | Level-2 partitioned table                                         |        | Supported                                                           |
| Views            | Remote view accessed by a database link                           |        | DQL statements are supported, but DML statements are not supported. |
|                  | Remote table associated with a local view through a database link |        | DQL statements are supported, but DML statements are not supported. |

## Examples

```
-- DDL statements
CREATE USER user2 WITH PASSWORD '*****'; -- Create a common user.
GRANT CREATE PUBLIC DATABASE LINK TO user2; -- Grant the permission to create database links to a user.
GRANT DROP PUBLIC DATABASE LINK TO user2; -- Grant the permission to drop database links to a user.
GRANT ALTER PUBLIC DATABASE LINK TO user2; -- Grant the permission to modify database links to a user.
REVOKE CREATE PUBLIC DATABASE LINK FROM user2; -- Revoke the permission to create database links to a user.
REVOKE DROP PUBLIC DATABASE LINK FROM user2; -- Revoke the permission to drop database links to a user.
```

```

REVOKE ALTER PUBLIC DATABASE LINK FROM user2; -- Revoke the permission to modify database links
to a user.
CREATE PUBLIC DATABASE LINK dblink CONNECT TO 'user1' IDENTIFIED BY '*****' USING (HOST
'192.168.11.11', PORT '5432', DBNAME 'db1'); -- Create a database link object
ALTER PUBLIC DATABASE LINK dblink CONNECT TO 'user1' IDENTIFIED BY '*****'; -- Modify database link
information.
DROP PUBLIC DATABASE LINK dblink; -- Delete a database link object.

-- Database link statements
-- Preparations
CREATE USER user1 WITH SYSADMIN PASSWORD '*****';
CREATE USER user2 WITH SYSADMIN PASSWORD '*****';
CREATE DATABASE db1; -- Remote database
CREATE DATABASE db2; -- Database for testing the database link.
\c db1 user1
-- Create an ordinary table.
db1=> CREATE TABLE remote_tb(f1 int, f2 text, f3 text[]);
db1=> INSERT INTO remote_tb VALUES (0,'a',{'a0","b0","c0"});
db1=> INSERT INTO remote_tb VALUES (1,'bb',{'a1","b1","c1"});
db1=> INSERT INTO remote_tb VALUES (2,'cc',{'a2","b2","c2"});
-- Create a function.
CREATE OR REPLACE FUNCTION f(a in int, b in int)
return int AS
    tmp int := a + b;
    begin
        return tmp;
    end;

# 8 Best Practices

---

## 8.1 Best Practices of Table Design

### 8.1.1 Using Partitioned Tables

A partitioned table is a logical table that is divided into several physical partitions based on a specific plan. The table based on the logic is called a partitioned table, and each physical block is called a partition. A partitioned table is a logical table and does not store data. Data is actually stored in partitions. A partitioned table has the following advantages over an ordinary table:

1. High query performance: You can specify partitions when querying partitioned tables, improving query efficiency.
2. High availability: If a certain partition in a partitioned table is faulty, data in the other partitions is still available.
3. Easy maintenance: To fix a partitioned table having a faulty partition, you only need to fix the partition.

Partitioned tables supported by the GaussDB database are level-1 and level-2 partitioned tables. Level-1 partitioned tables include range partitioned tables, interval partitioned tables, list partitioned tables, and hash partitioned tables. Level-2 partitioned tables include nine combinations of any two of range partitioned tables, list partitioned tables, and hash partitioned tables.

- Range partitioned table: Data within a certain range is mapped to each partition. The range is determined by the partition key specified when the partitioned table is created. This partitioning method is most commonly used. The partition key is usually a date. For example, sales data is partitioned by month.
- Interval partitioned table: a special type of range partitioned tables. Compared with range partitioned tables, interval value definition is added. When no matching partition can be found for an inserted record, a partition can be automatically created based on the interval value.
- List partitioned table: Key values contained in the data are stored in different partitions, and the data is mapped to each partition in sequence. The key values contained in the partitions are specified when the partitioned table is created.

- Hash partitioned table: Data is mapped to each partition based on the internal hash algorithm. The number of partitions is specified when the partitioned table is created.
- Level-2 partitioned table: a partitioned table obtained by randomly combining range partitioning, list partitioning, and hash partitioning. Both level-1 and level-2 partitions can be defined in the preceding three ways.

## 8.1.2 Selecting a Data type

Efficient data types include the following:

1. **Select data types that facilitate data calculation.**

Generally, the calculation of integers (including common comparison calculations, such as =, >, <, ≥, ≤, and ≠, and GROUP BY) is more efficient than that of strings and floating-point numbers.

2. **Select data types with a short length.**

Data types with short length reduce both the data file size and the memory used for computing, improving the I/O and computing performance. For example, use **SMALLINT** instead of **INT**, and **INT** instead of **BIGINT**.

3. **Use the same data type for a join.**

You are advised to use the same data type for a join. To join columns with different data types, the database needs to convert them to the same type, which leads to additional performance overheads.

## 8.2 Best Practices of SQL Queries

Based on the SQL execution mechanism and a large number of practices, SQL statements can be optimized by following certain rules to enable the database to execute SQL statements more quickly and obtain correct results.

- Replace **UNION** with **UNION ALL**.

**UNION** eliminates duplicate rows while merging two result sets but **UNION ALL** merges the two result sets without deduplication. Therefore, replace **UNION** with **UNION ALL** if you are sure that the two result sets do not contain duplicate rows based on the service logic.

- Add **NOT NULL** to the join columns.

If there are many **NULL** values in the **JOIN** columns, you can add the filter criterion **IS NOT NULL** to filter data in advance to improve the **JOIN** efficiency.

- Replace **NOT IN** with **NOT EXISTS**.

**Nested Loop Anti Join** must be used to implement **NOT IN**, and **Hash Anti Join** is required for **NOT EXISTS**. If no **NULL** value exists in the **JOIN** columns, **NOT IN** is equivalent to **NOT EXISTS**. Therefore, if you are sure that no **NULL** value exists, you can convert **NOT IN** to **NOT EXISTS** to generate hash join and to improve the query performance.

The statements for creating a foreign table are as follows:

```
DROP SCHEMA IF EXISTS no_in_to_no_exists_test CASCADE;  
CREATE SCHEMA no_in_to_no_exists_test;  
SET CURRENT_SCHEMA=no_in_to_no_exists_test;
```

```
CREATE TABLE t1(c1 int, c2 int, c3 int);
CREATE TABLE t2(d1 int, d2 int NOT NULL, d3 int);
```

The statement for implementing the query using NOT IN is as follows:

```
SELECT * FROM t1 WHERE c1 NOT IN (SELECT d2 FROM t2);
```

The plan is as follows:

```
gaussdb=# EXPLAIN SELECT * FROM t1 WHERE c1 NOT IN (SELECT d2 FROM t2);
QUERY PLAN
-----
Nested Loop Anti Join (cost=0.00..29749.02 rows=968 width=12)
  Join Filter: ((t1.c1 = t2.d2) OR (t1.c1 IS NULL))
    -> Seq Scan on t1 (cost=0.00..29.45 rows=1945 width=12)
    -> Materialize (cost=0.00..39.17 rows=1945 width=4)
        -> Seq Scan on t2 (cost=0.00..29.45 rows=1945 width=4)
(5 rows)
```

Because there is no null value in the **t2.d2** column (the **t2.d2** column is **NOT NULL** in the table definition), the query can be equivalently modified as follows:

```
SELECT * FROM t1 WHERE NOT EXISTS (SELECT * FROM t2 WHERE t1.c1=t2.d2);
```

The generated plan is as follows:

```
gaussdb=# EXPLAIN SELECT * FROM t1 WHERE NOT EXISTS (SELECT * FROM t2 WHERE t1.c1=t2.d2);
QUERY PLAN
-----
Hash Anti Join (cost=53.76..99.14 rows=972 width=12)
  Hash Cond: (t1.c1 = t2.d2)
    -> Seq Scan on t1 (cost=0.00..29.45 rows=1945 width=12)
    -> Hash (cost=29.45..29.45 rows=1945 width=4)
        -> Seq Scan on t2 (cost=0.00..29.45 rows=1945 width=4)
(5 rows)
```

- Use **hashagg**.

If a plan involving **groupAgg** and **SORT** operations generated by the **GROUP BY** statement is poor in performance, you can set **work\_mem** to a larger value to generate a **hashagg** plan, which does not require sorting and improves the performance.

- Replace functions with **CASE** statements.

The GaussDB Kernel performance greatly deteriorates if a large number of functions are called. In this case, you can change the pushdown functions to CASE statements.

- Do not use functions or expressions for indexes.

Using functions or expressions for indexes will stop indexing and enable scanning on the full table.

- Do not use operators **!=**, **<**, **>**, **NULL**, **OR**, or implicit parameter conversion in **WHERE** clauses.
- Split complex SQL statements.

You can split an SQL statement into several ones and save the execution result to a temporary table if the SQL statement is too complex to be tuned using the solutions above, including but not limited to the following scenarios:

- The same subquery is involved in multiple SQL statements of a job and the subquery contains a large amount of data.
- Incorrect plan cost causes a small hash bucket of subquery. For example, the actual number of rows is 10 million, but only 1000 rows are in hash bucket.
- Functions such as **substr** and **to\_number** cause incorrect measures for subqueries containing a large amount of data.

- BROADCAST subqueries are performed on large tables in multi-DN environment.

For details about optimization, see [Typical SQL Optimization Methods](#).

# 9 User-defined Functions

---

## 9.1 PL/SQL Functions

PL/SQL is a loadable procedural language.

Functions created using PL/SQL can be used in any place where you can use built-in functions. For example, you can create calculation functions with complex conditions and use them to define operators or use them for index expressions.

SQL is used by most databases as a query language. It is portable and easy to learn. Each SQL statement must be executed independently by a database server.

In this case, when a client application sends a query to the server, it must wait for it to be received, receive and process the results, and then perform related calculation before sending more queries to the server. If the client and server are not on the same machine, all these operations will cause inter-process communication and increase network loads.

PL/SQL enables a whole computing part and a series of queries to be grouped inside a database server. This makes procedural language available and SQL easier to use. In addition, the client/server communication cost is reduced.

- Extra round-trip communication between clients and servers is eliminated.
- Intermediate results that are not required by clients do not need to be sorted or transmitted between the clients and servers.
- Parsing can be skipped in multiple rounds of queries.

PL/SQL can use all data types, operators, and functions in SQL. For details about the PL/SQL syntax for creating functions, see [CREATE FUNCTION](#).

PL/SQL is a loadable procedural language. Its application method is similar to that of [Stored Procedure](#). The difference is that [Stored Procedure](#) has no return value, and PL/SQL functions have return values.

XML data can be used as the input parameter, output parameter, user-defined variable, and return value of a user-defined function.

# 10 Stored Procedure

---

## 10.1 Stored Procedure

In GaussDB, business rules and logics are saved as stored procedures.

A stored procedure is a combination of SQL and PL/SQL. Stored procedures can move the code that executes business rules from applications to databases. Therefore, the code storage can be used by multiple programs at a time.

For details about how to create and call a stored procedure, see [CREATE PROCEDURE](#).

The application methods for PL/SQL functions mentioned in [PL/SQL Functions](#) are similar to those for stored procedures. Unless otherwise specified, the following sections apply to stored procedures and PL/SQL functions.

## 10.2 Data Types

A data type refers to a value set and an operation set defined on the value set. GaussDB consists of tables, each of which is defined by its own columns. Each column corresponds to a data type. GaussDB uses corresponding functions to perform operations on data based on data types. For example, GaussDB can perform operations such as addition, subtraction, multiplication, and division on numeric data.

XML data can be used as input parameters, output parameters, user-defined variables, and return values of stored procedures, as well as stored procedures that support autonomous transactions.

## 10.3 Data Type Conversion

Certain data types in the database support implicit data type conversions, such as assignments and parameters called by functions. For other data types (such as int and composite types), you can use the type conversion functions provided by GaussDB, such as the CAST function, to forcibly convert them.

[Table 10-1](#) lists common implicit data type conversions in GaussDB.

**NOTICE**

The valid value range of **DATE** supported by GaussDB is from 4713 BC to 294276 AD.

**Table 10-1** Implicit data type conversions

| Raw Data Type | Target Data Type | Remarks                                      |
|---------------|------------------|----------------------------------------------|
| CHAR          | VARCHAR2         | -                                            |
| CHAR          | NUMBER           | Raw data must consist of digits.             |
| CHAR          | DATE             | Raw data cannot exceed the valid date range. |
| CHAR          | RAW              | -                                            |
| CHAR          | CLOB             | -                                            |
| VARCHAR2      | CHAR             | -                                            |
| VARCHAR2      | NUMBER           | Raw data must consist of digits.             |
| VARCHAR2      | DATE             | Raw data cannot exceed the valid date range. |
| VARCHAR2      | CLOB             | -                                            |
| NUMBER        | CHAR             | -                                            |
| NUMBER        | VARCHAR2         | -                                            |
| DATE          | CHAR             | -                                            |
| DATE          | VARCHAR2         | -                                            |
| RAW           | CHAR             | -                                            |
| RAW           | VARCHAR2         | -                                            |
| CLOB          | CHAR             | -                                            |
| CLOB          | VARCHAR2         | -                                            |
| CLOB          | NUMBER           | Raw data must consist of digits.             |
| INT4          | CHAR             | -                                            |
| INT4          | BOOLEAN          | -                                            |
| BOOLEAN       | INT4             | -                                            |

## 10.4 Arrays, Collections, and Records

### 10.4.1 Arrays

#### 10.4.1.1 Use of Array Types

Before the use of arrays, an array type needs to be defined:

Define an array type immediately after the **AS** keyword in a stored procedure. The definition method is as follows:

```
TYPE array_type IS VARRAY(size) OF data_type;
```

Related parameters are as follows:

- **array\_type**: indicates the name of the array type to be defined.
- **VARRAY**: indicates the array type to be defined.
- **size**: indicates the maximum number of members in the array type to be defined. The value is a positive integer.
- **data\_type**: indicates the types of members in the array type to be created.

#### NOTE

- In GaussDB, the array automatically increases. If out-of-bounds access occurs, a **NULL** value is returned and no error is reported. After the **varray\_compat** parameter is enabled, the subscript check is added. If out-of-bounds access occurs, an error is reported.
- The scope of an array type defined in a stored procedure takes effect only in this storage process.
- The size information is recorded in the `pg_type` system catalog. After the **varray\_compat** parameter is enabled, the length and subscript of array operations are checked. If the parameter is disabled, the size information is not used.
- **data\_type** can also be the record type defined in a stored procedure (anonymous blocks are not supported) or set type, but cannot be the array or cursor type defined in the stored procedure.
- When **data\_type** is collection, multi-dimensional arrays are not supported.
- NOT NULL syntax is not supported.
- The constructors of the array type can be used only in A-compatible mode.
- The constructor of the array type cannot be used as the default value of a function or stored procedure parameter.
- If the elements of an array are of the collection type and **data\_type** of the array is set to **varchar** or **numeric** that can define the length and precision, you need to set **behavior\_compat\_options** to **tableof\_elem\_constraints** to verify the element length of the array or convert the element to the corresponding precision.
- After the **varray\_compat** parameter is enabled (the **behavior\_compat\_options** parameter is set to **varray\_compat**), the array type defined in the anonymous block cannot be used after ROLLBACK is executed or EXCEPTION occurs in the anonymous block.
- After **enable\_recordtype\_check\_strict** is set to **on**, if the member is of the record type and a column of the record type has the not null or default attribute, an error is reported during stored procedure or package compilation.

GaussDB supports access to array elements by using parentheses, and it also supports the **extend**, **count**, **first**, **last**, **prior**, **exists**, **trim**, **next**, and **delete** functions.

#### NOTE

- If a stored procedure contains a DML statement (such as **SELECT**, **UPDATE**, **INSERT**, or **DELETE**), you are advised to use square brackets to access array elements. Using parentheses will access arrays by default. If no array exists, function expressions will be identified.
- When the CLOB size is greater than 1 GB, the table of type, record type, and CLOB cannot be used in the input or output parameter, cursor, or raise info in a stored procedure.

## Examples

```
-- Perform array operations in the stored procedure.
gaussdb=# CREATE OR REPLACE PROCEDURE array_proc AS
DECLARE
    TYPE ARRAY_INTEGER IS VARRAY(1024) OF INTEGER;--Define the array type.
    ARRINT ARRAY_INTEGER:= ARRAY_INTEGER(); --Declare the variable of the array type.
BEGIN
    ARRINT.extend(10);
    FOR I IN 1..10 LOOP
        ARRINT(I) := I;
    END LOOP;
    DBE_OUTPUT.PRINT_LINE(ARRINT.COUNT);
    DBE_OUTPUT.PRINT_LINE(ARRINT(1));
    DBE_OUTPUT.PRINT_LINE(ARRINT(10));
    DBE_OUTPUT.PRINT_LINE(ARRINT(ARRINT.FIRST));
    DBE_OUTPUT.PRINT_LINE(ARRINT(ARRINT.LAST));
    DBE_OUTPUT.PRINT_LINE(ARRINT(ARRINT.NEXT(ARRINT.FIRST)));
    DBE_OUTPUT.PRINT_LINE(ARRINT(ARRINT.PRIOR(ARRINT.LAST)));
    ARRINT.TRIM();

    IF ARRINT.EXISTS(10) THEN
        DBE_OUTPUT.PRINT_LINE('Exist 10th element');
    ELSE
        DBE_OUTPUT.PRINT_LINE('Not exist 10th element');
    END IF;
    DBE_OUTPUT.PRINT_LINE(ARRINT.COUNT);
    DBE_OUTPUT.PRINT_LINE(ARRINT(ARRINT.FIRST));
    DBE_OUTPUT.PRINT_LINE(ARRINT(ARRINT.LAST));
    ARRINT.DELETE();
END;
/

-- Call the stored procedure to display the result.
gaussdb=# CALL array_proc();
10
1
10
1
10
2
9
Not exist 10th element
9
1
9
array_proc
-----
(1 row)

-- Delete the stored procedure.
gaussdb=# DROP PROCEDURE array_proc;
```

## 10.4.1.2 Functions Supported by Arrays

### NOTE

In an inner expression, functions of the array type cannot be called in nesting mode.

- `extend[(count[, idx])]`

Parameters: *idx* and *count* are of the int4 type.

Return value: No value is returned.

Description: Extends one or *count* elements at the end of a varray variable. If the index element *idx* exists, *count* index elements are copied to the end of the variable.

Example 1: `extend(count)`. The default value is **NULL**.

```
gaussdb=# DECLARE
gaussdb-#   TYPE ARRAY_INTEGER IS VARRAY(10) OF INTEGER;
gaussdb-#   arrint ARRAY_INTEGER := ARRAY_INTEGER();
gaussdb-# BEGIN
gaussdb$$   DBE_OUTPUT.PRINT_LINE(arrint.COUNT);
gaussdb$$   arrint.EXTEND(3);
gaussdb$$   DBE_OUTPUT.PRINT_LINE(arrint.COUNT);
gaussdb$$ END;
gaussdb$$ /
0
3
ANONYMOUS BLOCK EXECUTE
```

Example 2: The value of **extend** exceeds the defined array size, and the **varray\_compat** parameter is enabled.

```
gaussdb=# set behavior_compat_options = 'varray_compat';
SET
gaussdb=# DECLARE
gaussdb-#   TYPE ARRAY_INTEGER IS VARRAY(10) OF INTEGER;
gaussdb-#   arrint ARRAY_INTEGER := ARRAY_INTEGER();
gaussdb-# BEGIN
gaussdb$$   DBE_OUTPUT.PRINT_LINE(arrint.COUNT);
gaussdb$$   arrint.EXTEND(3);
gaussdb$$   DBE_OUTPUT.PRINT_LINE(arrint.COUNT);
gaussdb$$   arrint.EXTEND(8); -- error
gaussdb$$ END;
gaussdb$$ /
0
3
ERROR: Subscript outside of limit
CONTEXT: PL/SQL function inline_code_block line 8 at assignment
```

Example 3: `extend(count, idx)`. The element at the *idx* position is extended.

```
gaussdb=# set a_format_version='10c';
SET
gaussdb=# set a_format_dev_version='s1';
SET
gaussdb=# DECLARE
gaussdb-#   TYPE ARRAY_INTEGER IS VARRAY(10) OF INTEGER;
gaussdb-#   arrint ARRAY_INTEGER := ARRAY_INTEGER(1,2);
gaussdb-# BEGIN
gaussdb$$   arrint.EXTEND(2, 1);
gaussdb$$   DBE_OUTPUT.PRINT_LINE(arrint.COUNT);
gaussdb$$   FOR i IN 1..arrint.COUNT LOOP
gaussdb$$     DBE_OUTPUT.PRINT_LINE(arrint(i));
gaussdb$$   END LOOP;
gaussdb$$ END;
gaussdb$$ /
4
1
2
1
```

```
1  
ANONYMOUS BLOCK EXECUTE
```

Example 4: `extend(count, idx)`. `idx` is out of range, and the `varray_compat` parameter is enabled.

```
gaussdb=# set a_format_version='10c';  
SET  
gaussdb=# set a_format_dev_version='s1';  
SET  
gaussdb=# set behavior_compat_options = 'varray_compat';  
SET  
gaussdb=# DECLARE  
gaussdb-# TYPE ARRAY_INTEGER IS VARRAY(10) OF INTEGER;  
gaussdb-# arrint ARRAY_INTEGER := ARRAY_INTEGER();  
gaussdb-# BEGIN  
gaussdb$$ arrint.EXTEND(10, 1); -- error index.  
gaussdb$$ END;  
gaussdb$$ /  
ERROR: Subscript beyond count  
CONTEXT: PL/SQL function inline_code_block line 5 at assignment
```

- `count[()]`

Parameter: none

Return value: int4 type

Description: Returns the number of elements in an array.

Example 1: View the number of initialized array elements.

```
gaussdb=# DECLARE  
gaussdb-# TYPE ARRAY_INTEGER IS VARRAY(10) OF INTEGER;  
gaussdb-# arrint ARRAY_INTEGER;  
gaussdb-# len int;  
gaussdb-# BEGIN  
gaussdb$$ arrint := ARRAY_INTEGER(1, 2, 3);  
gaussdb$$ len := arrint.COUNT();  
gaussdb$$ DBE_OUTPUT.PRINT_LINE(len);  
gaussdb$$ END;  
gaussdb$$ /  
3  
ANONYMOUS BLOCK EXECUTE
```

Example 2: View the number of uninitialized array elements and enable the `varray_compat` parameter.

```
gaussdb=# set behavior_compat_options = 'varray_compat';  
SET  
gaussdb=# DECLARE  
gaussdb-# TYPE ARRAY_INTEGER IS VARRAY(10) OF INTEGER;  
gaussdb-# arrint ARRAY_INTEGER;  
gaussdb-# len int;  
gaussdb-# BEGIN  
gaussdb$$ len := arrint.COUNT;  
gaussdb$$ DBE_OUTPUT.PRINT_LINE(len);  
gaussdb$$ END;  
gaussdb$$ /  
ERROR: Reference to uninitialized collection  
CONTEXT: PL/SQL function inline_code_block line 6 at assignment
```

- `trim[(n)]`

Parameter: `n` is of the int4 type.

Return value: No value is returned.

Description: Deletes an element space at the end of the array if there is no parameter. Alternatively, it deletes a specified number of element spaces at the end of the array if the input parameter is valid.

Example 1: Delete  $n$  elements from an array without enabling the **varray\_compat** parameter.

```
gaussdb=# DECLARE
gaussdb-# TYPE ARRAY_INTEGER IS VARRAY(10) OF INTEGER;
gaussdb-# arrint ARRAY_INTEGER := ARRAY_INTEGER(1,2,3);
gaussdb-# BEGIN
gaussdb$$$ DBE_OUTPUT.PRINT_LINE(arrint.COUNT);
gaussdb$$$ arrint.TRIM(1);
gaussdb$$$ DBE_OUTPUT.PRINT_LINE(arrint.COUNT);
gaussdb$$$ END;
gaussdb$$$ /
3
2
ANONYMOUS BLOCK EXECUTE
-- n > Number of array elements
gaussdb=# DECLARE
gaussdb-# TYPE ARRAY_INTEGER IS VARRAY(10) OF INTEGER;
gaussdb-# arrint ARRAY_INTEGER := ARRAY_INTEGER(1,2,3);
gaussdb-# BEGIN
gaussdb$$$ DBE_OUTPUT.PRINT_LINE(arrint.COUNT);
gaussdb$$$ arrint.TRIM(4);
gaussdb$$$ END;
gaussdb$$$ /
3
ANONYMOUS BLOCK EXECUTE
```

Example 2: Delete  $n$  elements from an array and enable the **varray\_compat** parameter.

```
-- n > Number of array elements
gaussdb=# DECLARE
gaussdb-# TYPE ARRAY_INTEGER IS VARRAY(10) OF INTEGER;
gaussdb-# arrint ARRAY_INTEGER := ARRAY_INTEGER(1,2,3);
gaussdb-# BEGIN
gaussdb$$$ DBE_OUTPUT.PRINT_LINE(arrint.COUNT); -- count > 0.
gaussdb$$$ arrint.TRIM(4);
gaussdb$$$ END;
gaussdb$$$ /
3
ERROR: Subscript outside of count
ERROR: Subscript beyond count

gaussdb-# BEGIN
gaussdb$$$ arrint.TRIM(1);
gaussdb$$$ END;
gaussdb$$$ /
ERROR: Reference to uninitialized collection
CONTEXT: PL/SQL function inline_code_block line 5 at assignment
```

- **delete[()]**

Parameter: none

Return value: No value is returned.

Description: Clears elements in an array.

Example 1: Clear the elements in the array without enabling the **varray\_compat** parameter.

```
gaussdb=# DECLARE
gaussdb-# TYPE ARRAY_INTEGER IS VARRAY(10) OF INTEGER;
gaussdb-# arrint ARRAY_INTEGER := ARRAY_INTEGER(1, 2, 3);
gaussdb-# BEGIN
gaussdb$$$ DBE_OUTPUT.PRINT_LINE(arrint.COUNT);
gaussdb$$$ arrint.DELETE();
gaussdb$$$ DBE_OUTPUT.PRINT_LINE(arrint.COUNT);
```

```
gaussdb## END;
gaussdb## /

gaussdb## /
ERROR: Reference to uninitialized collection
CONTEXT: PL/SQL function inline_code_block line 5 at assignment
```

- **delete(idx)**

Parameter: int4 type

Return value: No value is returned.

Description: Deletes an element at a certain position in an array.

Example 1: Delete an element from an array.

```
gaussdb=# DECLARE
gaussdb-# TYPE ARRAY_INTEGER IS VARRAY(10) OF INTEGER;
gaussdb-# arrint ARRAY_INTEGER := ARRAY_INTEGER(1, 2, 3);
gaussdb-# BEGIN
gaussdb## DBE_OUTPUT.PRINT_LINE(arrint.COUNT);
gaussdb## arrint.DELETE(2);
gaussdb## DBE_OUTPUT.PRINT_LINE(arrint.COUNT);

gaussdb-# v VARR := VARR();
gaussdb-# BEGIN
gaussdb$$ raise info 'FIRST is %',v.FIRST;
gaussdb$$ END;
gaussdb$$ /
INFO: FIRST is <NULL>
ANONYMOUS BLOCK EXECUTE
```

- last

Parameter: none

Return value: int4 type

Description: Returns the index of the last valid element in an array.

Example 1:

```
gaussdb=# DECLARE
gaussdb-# TYPE VARR IS VARRAY(10) OF varchar(3);
gaussdb-# v VARR := VARR('asd','zxc');
gaussdb-# BEGIN
gaussdb$$ raise info 'LAST is %',v.LAST;
gaussdb$$ END;
gaussdb$$ /
INFO: LAST is 2
ANONYMOUS BLOCK EXECUTE
-- The array is not initialized.
gaussdb=# DECLARE
gaussdb-# TYPE VARR IS VARRAY(10) OF varchar(3);
gaussdb-# v VARR := VARR();
gaussdb-# BEGIN
gaussdb$$ raise info 'LAST is %',v.LAST;
gaussdb$$ END;
gaussdb$$ /
INFO: LAST is <NULL>
ANONYMOUS BLOCK EXECUTE
```

- prior(idx)

Parameter: int4 type

Return value: int4 type

Description: Returns the index of a valid element before the current index in a collection.

Example:

```
gaussdb=# DECLARE
gaussdb-# TYPE VARR IS VARRAY(10) OF varchar(3);
gaussdb-# v VARR := VARR('asd','zxc');
gaussdb-# BEGIN
gaussdb$$ raise info 'prior is %',v.prior(2);
gaussdb$$ END;
gaussdb$$ /
INFO: prior is 1
ANONYMOUS BLOCK EXECUTE
-- The array is not initialized.
gaussdb=# DECLARE
gaussdb-# TYPE VARR IS VARRAY(10) OF varchar(3);
gaussdb-# v VARR := VARR();
gaussdb-# BEGIN
gaussdb$$ raise info 'prior is %',v.prior(2);
gaussdb$$ END;
gaussdb$$ /
INFO: prior is <NULL>
ANONYMOUS BLOCK EXECUTE
-- Out-of-bounds access
gaussdb=# DECLARE
```

```
gaussdb=# TYPE VARR IS VARRAY(10) OF varchar(3);
gaussdb=# v VARR := VARR('asd','zxc','qwe');
gaussdb=# BEGIN
gaussdb$$$ raise info 'prior is %',v.prior(10);
gaussdb$$$ END;
gaussdb$$$ /
INFO: prior is 3
ANONYMOUS BLOCK EXECUTE
```

- next(idx)

Parameter: int4 type

Return value: int4 type

Description: Returns the index of a valid element following the current index in a collection.

Example:

```
gaussdb=# DECLARE
gaussdb=# TYPE VARR IS VARRAY(10) OF varchar(3);
gaussdb=# v VARR := VARR('asd','zxc');
gaussdb=# BEGIN
gaussdb$$$ raise info 'next is %',v.next(1);
gaussdb$$$ END;
gaussdb$$$ /
INFO: next is 2
ANONYMOUS BLOCK EXECUTE
-- The array is not initialized.
gaussdb=# DECLARE
gaussdb=# TYPE VARR IS VARRAY(10) OF varchar(3);
gaussdb=# v VARR := VARR();
gaussdb=# BEGIN
gaussdb$$$ raise info 'next is %',v.next(1);
gaussdb$$$ END;
gaussdb$$$ /
INFO: next is <NULL>
ANONYMOUS BLOCK EXECUTE
-- Out-of-bounds access
gaussdb=# DECLARE
gaussdb=# TYPE VARR IS VARRAY(10) OF varchar(3);
gaussdb=# v VARR := VARR('asd','zxc','qwe');
gaussdb=# BEGIN
gaussdb$$$ raise info 'next is %',v.next(10);
gaussdb$$$ END;
gaussdb$$$ /
INFO: next is <NULL>
ANONYMOUS BLOCK EXECUTE
```

- exists(idx)

Parameter: int4 type

Return value: **true** or **false**, of the Boolean type.

Description: Checks whether a valid element exists in a specified position.

Example:

```
gaussdb=# DECLARE
gaussdb=# TYPE VARR IS VARRAY(10) OF varchar(3);
gaussdb=# v VARR := VARR('asd','zxc');
gaussdb=# flag bool;
gaussdb=# BEGIN
gaussdb$$$ flag := v.exists(1);
gaussdb$$$ raise info '%',flag;
gaussdb$$$ flag := v.exists(3);
gaussdb$$$ raise info '%',flag;
gaussdb$$$ flag := v.exists(7);
gaussdb$$$ raise info '%',flag;
gaussdb$$$ END;
gaussdb$$$ /
```

```

INFO: t
INFO: f
INFO: f
ANONYMOUS BLOCK EXECUTE
-- The array is not initialized.
gaussdb=# DECLARE
gaussdb=# TYPE VARR IS VARRAY(10) OF varchar(3);
gaussdb=# v VARR := VARR();
gaussdb=# flag bool;
gaussdb=# BEGIN
gaussdb$# flag := v.exists(1);
gaussdb$# raise info '%',flag;
gaussdb$# flag := v.exists(3);
gaussdb$# raise info '%',flag;
gaussdb$# flag := v.exists(7);
gaussdb$# raise info '%',flag;
gaussdb$# END;
gaussdb$# /
INFO: f
INFO: f
INFO: f
ANONYMOUS BLOCK EXECUTE
    
```

The following describes the behavior differences of array functions before and after the GUC parameter **varray\_compat** is enabled:

- If the count, extend, trim, delete, first, last, next, or prior function is applied to an uninitialized array, the "Reference to uninitialized collection" error is reported after the parameter is enabled. If the parameter is disabled, no error is reported.
- For the extend(count) and extend(count, idx) functions, if the array size is exceeded, the "Subscript outside of limit" error is reported after the parameter is enabled. If the parameter is not enabled, no error is reported.
- For the extend(count, idx) function, if the index is invalid, the "Subscript outside of limit" or "Subscript outside of count" is reported after the parameter is enabled. If the parameter is disabled, the "wrong number of array subscripts error" is reported.
- For the trim(n) function, if *n* is greater than the number of array elements, the "Subscript outside of count" error is reported after the parameter is enabled. If the parameter is disabled, no error is reported.
- For the delete(idx) function, if the subscript *idx* is invalid, the "Subscript outside of limit" or "Subscript outside of count" error is reported after the parameter is enabled. If the parameter is disabled, the original array is returned.

## 10.4.2 Collections

### 10.4.2.1 Use of Collection Types

Before the use of collections, a collection type must be defined.

Define a collection type immediately after the **AS** keyword in a stored procedure. The definition method is as follows:

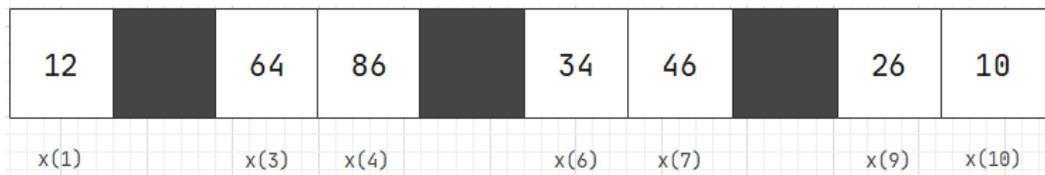

In the preceding information:

- **table\_type**: indicates the name of the collection type to be defined.
- **TABLE**: indicates the collection type to be defined.
- **data\_type**: indicates the type of members in the collection to be created.
- **indexby\_type**: indicates the type of the index set to be created.

## Nest-Table Collection Type

Members of a specified data type are stored in a variable-length array. You can use the extend function to expand the storage space and use the trim function to release the storage space. For a collection variable *x* with 10 storage units whose member type is int, members are stored as shown in the following figure.

Members *x*(2), *x*(5), and *x*(8) are invalid, but their storage space is still reserved. You can assign values to them later without re-allocating space.

After a collection type is defined, use *table\_type* as the type name to declare the variable.

```
var_name table_type [:= table_type([v1[,...]])];
```

You can use a type constructor to initialize the variable during or after declaration. If the variable is not initialized, the value of *var\_name* is **NULL**.

After the variable is declared and initialized, you can access collection members through an index set or assign values to members. The index range is *[1,upper]*. The value of *upper* is the size of the current space. If you attempt to access a deleted member, the error message "no data found" will be returned.

 NOTE

- In a non-A compatible mode (the value of **sql\_compatibility** is not **A**), the collection type cannot be created.
- In GaussDB, a nest-table collection does not automatically increase, and an error is reported when you attempt to access the index set out of the specified range.
- Collections can be defined in schemas, anonymous blocks, stored procedures, user-defined functions, and packages, among which the scopes of the collection types vary.
- **NOT NULL** has no function but only takes effect in the syntax.
- When **data\_type** is set to a type that can define the length and precision, such as varchar and numeric, you need to enable the **tableof\_elem\_constraints** parameter to verify the length of elements in the collection or convert elements to the corresponding precision.
- If **data\_type** is of the array type, the element length verification or precision conversion of the array type is also affected by whether the **tableof\_elem\_constraints** parameter is enabled.
- The value of the collection type converted from the array type does not support element length verification or precision conversion.
- The value of **data\_type** can be a base data type or a record type, collection type, or array type defined in a stored procedure. The ref cursor type is not supported.
- Variables of a collection type cannot be assigned a value of another collection type, even if their member types are the same. For example, *t1* and *t2* are of different collection types defined by **TYPE t1 IS TABLE OF int** and **TYPE t2 IS TABLE OF int**, respectively. A value of the collection type defined by **TYPE t1 IS TABLE OF int** cannot be assigned to *t2*, and vice versa. (This restriction may not take effect when the variables are of the member types because the value assignment logic of variables is affected by the parent type.)
- Only the equal (=) and non-equal operations (<> or !=) between collections are supported. Other relational and arithmetic operations are not supported.
- Use IS [ NOT ] NULL to compare a collection type with **NULL**. The result of comparison with **NULL** using the equal operator (=) is inaccurate.
- Variables of the collection type can be used as parameters and return values of functions. In this case, the type of the parameters or return values must have been defined in a schema or package.
- When a nest-table collection is used as the input parameter of a function, an array with elements of the same type can be transferred as the input parameter. Multi-dimensional arrays are not supported, and the array index set must start from 1. (This function is outdated and not recommended.) You can run the **set behavior\_compat\_options = 'disable\_rewrite\_nesttable'** command to disable the function.
- Operations on XML data are not supported.
- When creating a table, do not use the collection type or any type containing a collection as a column in the table.
- Constructors of the collection type do not support floating point numbers and expressions as indexes.
- For a collection type defined in an anonymous block, after ROLLBACK is executed or EXCEPTION occurs in an anonymous block, the collection type cannot be used.
- After **enable\_recordtype\_check\_strict** is enabled, if the member is of the record type and a column of the record type has the **not null** or **default** attribute, an error is reported during stored procedure or package compilation.

GaussDB supports access to collection elements by using parentheses, and it also supports the extend, count, first, last, prior, next, and delete functions.

The collection functions support multiset union, intersect, except all, and distinct.

## Index-By Table Collection Type

This collection type stores the index set and corresponding member values in a hash table as key-value pairs. All operations on variables of this type are actually operations on the hash table. Users do not need to expand or release storage space, but only need to assign values or delete members. The operations related to the collection type are described as follows:

1. Type definition

When defining the index-by table collection type, specify both the member type **data\_type** and index set type **indexby\_type**. The index set type can only be integer or varchar.

2. Variable declaration and initialization

After the index-by table collection type is declared, it can be initialized. There are three initialization scenarios: uninitialized, initialized to null, and initialized to specified index set and member values. The effect of uninitialized variables is the same as that of initializing variables to null. If a variable is not initialized or is initialized to null, the variable is not **NULL**. You can assign a value to the variable later. Initializing a variable to specified index set and member values will save the specified index set and member values to the variable as key-value pairs.

3. Variable assignment

Assignment to variables of the index-by table collection type is classified into member assignment and group assignment. Member assignment allows to assign a value to a member by specifying the index set. If the member does not have a value, the assigned value is used directly. If the member has a value, the member value is updated. Group assignment will clear the original members in the variable and save the new member values. In the group assignment scenario, **NULL** cannot be assigned to variables. Otherwise, an error is reported.

4. Variable value

You can specify an index set to obtain the member value of the corresponding index in the variable. If the member cannot be found based on the index set, the error message "no data found" is returned.

 NOTE

- In a non-A compatible mode (the value of **sql\_compatibility** is not **A**), no index-by table collection type can be created.
- Index-by table collection types can be defined in anonymous blocks, stored procedures, user-defined functions, and packages, among which the scopes of the collection types vary. Index-by table collection types cannot be defined in schemas.
- **NOT NULL** has no function but only takes effect in the syntax.
- When **data\_type** is set to a type that can define the length and precision, such as varchar and numeric, you need to enable the **tableof\_elem\_constraints** parameter to verify the length of elements in the collection or convert elements to the corresponding precision.
- If **data\_type** is of the array type, the element length verification or precision conversion of the array type is also affected by whether the **tableof\_elem\_constraints** parameter is enabled.
- The value of the collection type converted from the array type does not support element length verification or precision conversion.
- The value of **data\_type** can be a base data type or a record type, collection type, or array type defined in a stored procedure. The ref cursor type is not supported.
- The value of **indexby\_type** can only be **integer** or **varchar**.
- When **indexby\_type** is set to **varchar** and **tableof\_elem\_constraints** is enabled, the length of the index value is verified when a value is assigned to an index-by table collection type. The verification behavior is not affected by whether **char\_coerce\_compat** is enabled. If the index length is greater than the defined length, an error is reported. If the **tableof\_elem\_constraints** parameter is disabled, the index value length is not verified.
- An uninitialized variable of the index-by table collection type is not **NULL**.
- **NULL** cannot be assigned to a variable of the index-by table collection type. Otherwise, an error is reported.
- **NULL** and " (single quotation marks) cannot be assigned to a variable of the index-by table collection type.
- Variables of the index-by table collection type cannot be assigned values of another index-by table collection type, even if their member type and index set type are the same. For example, *t1* and *t2* are of different collection types defined by **TYPE t1 IS TABLE OF int index by int** and **TYPE t2 IS TABLE OF int index by int**, respectively. A value of the collection type defined by **TYPE t1 IS TABLE OF int index by int** cannot be assigned to *t2*, and vice versa. (This restriction may not take effect when the variables are of the member types because the value assignment logic of variables is affected by the parent type.)
- An index-by table collection type does not support relational and arithmetic operations.
- When a variable of the index-by table collection type is assigned by executing **select... bulk collect into**, the index set must be of the integer type. The index set type cannot be varchar.
- Variables of the index-by table collection type can be used as the parameters and return values of functions. In this case, the type of the parameters or return values must be a collection type defined in the package.
- When an index-by table collection is used as the input parameter of a function, an array with elements of the same type can be transferred as the input parameter. Multi-dimensional arrays are not supported, and the index type cannot be varchar. (This function is outdated and not recommended.) You can run the **set behavior\_compat\_options = 'disable\_rewrite\_nesttable'** command to disable the function.
- Currently, the type constructor supports only the collection type and the maximum number of parameters is the same as that of user-defined function parameters. For the index-by table collection type, the index value can only be a constant when the constructor is used.

- Operations on XML data are not supported.
- When creating a table, do not use the collection type or any type containing a collection as a column in the table.
- Constructors of the collection type do not support floating point numbers and expressions as indexes.
- For a collection type defined in an anonymous block, after ROLLBACK is executed or EXCEPTION occurs in an anonymous block, the collection type cannot be used.

## Examples

### Example 1: nest-table collection type

```
-- Perform operations on a collection in the stored procedure.
gaussdb=# CREATE OR REPLACE PROCEDURE table_proc AS
DECLARE
    TYPE TABLE_INTEGER IS TABLE OF INTEGER;-- Define a collection type.
    TABLEINT TABLE_INTEGER := TABLE_INTEGER(); -- Declare the variable of the collection type.
BEGIN
    TABLEINT.extend(10);
    FOR I IN 1..10 LOOP
        TABLEINT(I) := I;
    END LOOP;
    DBE_OUTPUT.PRINT_LINE(TABLEINT.COUNT);
    DBE_OUTPUT.PRINT_LINE(TABLEINT(1));
    DBE_OUTPUT.PRINT_LINE(TABLEINT(10));
END;
/
CREATE PROCEDURE

-- Call the stored procedure.
gaussdb=# CALL table_proc();

10
1
10
table_proc
-----
(1 row)

-- Drop the stored procedure.
gaussdb=# DROP PROCEDURE table_proc;
DROP PROCEDURE

-- Perform operations on a nest-table collection in the stored procedure.
gaussdb=# CREATE OR REPLACE PROCEDURE nest_table_proc AS
DECLARE
    TYPE TABLE_INTEGER IS TABLE OF INTEGER;-- Define a collection type.
    TYPE NEST_TABLE_INTEGER IS TABLE OF TABLE_INTEGER;-- Define a collection type.
    NEST_TABLE_VAR NEST_TABLE_INTEGER := NEST_TABLE_INTEGER(); --Declare a variable of the nest-
table collection type.
BEGIN
    NEST_TABLE_VAR.extend(10);
    FOR I IN 1..10 LOOP
        NEST_TABLE_VAR(I) := TABLE_INTEGER();
        NEST_TABLE_VAR(I).extend(10);
        NEST_TABLE_VAR(I)(I) := I;
    END LOOP;
    DBE_OUTPUT.PRINT_LINE(NEST_TABLE_VAR.COUNT);
    DBE_OUTPUT.PRINT_LINE(NEST_TABLE_VAR(1)(1));
    DBE_OUTPUT.PRINT_LINE(NEST_TABLE_VAR(10)(10));
END;
/
CREATE PROCEDURE

-- Call the stored procedure.
gaussdb=# CALL nest_table_proc();
```

```
10
1
10
nest_table_proc
-----

(1 row)
-- Drop the stored procedure.
gaussdb=# DROP PROCEDURE nest_table_proc;
DROP PROCEDURE
```

### Example 2: index-by table collection type

```
-- Perform operations on an index-by table collection in the stored procedure.
gaussdb=# CREATE OR REPLACE PROCEDURE index_table_proc AS
DECLARE
    TYPE TABLE_INTEGER IS TABLE OF INTEGER INDEX BY INTEGER; -- Define a collection type.
    TYPE TABLE_VARCHAR IS TABLE OF INTEGER INDEX BY VARCHAR; -- Define a collection type.
    TABLEINT_01 TABLE_INTEGER; -- Declare a variable of the collection type, which is
not initialized.
    TABLEINT_02 TABLE_INTEGER := TABLE_INTEGER(); -- Declare a variable of the collection type.
The initial value is null.
    TABLEINT_03 TABLE_INTEGER := TABLE_INTEGER(2=>3,3=>4); -- Declare a variable of the collection
type and initialize it to the specified value.
    RES INTEGER;
BEGIN
    FOR I IN 1..10 LOOP
        TABLEINT_01(I) := I; -- Assign values to members.
        TABLEINT_02(I) := I + 1; -- Assign values to members.
    END LOOP;
    TABLEINT_01 := TABLEINT_02; -- Group assignment
    RES := TABLEINT_03(2); -- Return the collection values.
    DBE_OUTPUT.PRINT_LINE(RES);
    DBE_OUTPUT.PRINT_LINE(TABLEINT_01(1));
    DBE_OUTPUT.PRINT_LINE(TABLEINT_01(10));
END;
/
CREATE PROCEDURE
-- Call the stored procedure.
gaussdb=# CALL index_table_proc();
3
2
11
index_table_proc
-----

(1 row)
-- Drop the stored procedure.
gaussdb=# DROP PROCEDURE index_table_proc;
DROP PROCEDURE

-- Perform operations on a nest-table collection in the stored procedure.
gaussdb=# CREATE OR REPLACE PROCEDURE nest_table_proc AS
DECLARE
    TYPE TABLE_INTEGER IS TABLE OF INTEGER INDEX BY INTEGER; -- Define a collection type.
    TYPE NEST_TABLE_INTEGER IS TABLE OF TABLE_INTEGER INDEX BY INTEGER;-- Define a collection
type.
    NEST_TABLE_VAR NEST_TABLE_INTEGER; -- Declare variables of the nest-table
collection type.
BEGIN
    FOR I IN 1..10 LOOP
        NEST_TABLE_VAR(I)(I) := I;
    END LOOP;
    DBE_OUTPUT.PRINT_LINE(NEST_TABLE_VAR.COUNT);
    DBE_OUTPUT.PRINT_LINE(NEST_TABLE_VAR(1)(1));
    DBE_OUTPUT.PRINT_LINE(NEST_TABLE_VAR(10)(10));
END;
/
CREATE PROCEDURE
```

```
-- Call the stored procedure.
gaussdb=# CALL nest_table_proc();

10
1
10
nest_table_proc
-----
(1 row)

-- Drop the stored procedure.
gaussdb=# DROP PROCEDURE nest_table_proc;
DROP PROCEDURE
```

## 10.4.2.2 Collection Functions

### Collection Operators

- =

Parameter: nesttable

Return value: true or false, Boolean type

Description: Checks whether two collections are equal.

Example:

```
gaussdb=# declare
gaussdb-# type nest is table of int;
gaussdb-# a nest := nest(1,2);
gaussdb-# b nest := nest(1,2);
gaussdb-# flag bool;
gaussdb-# begin
gaussdb$$$ flag := a = b;
gaussdb$$$ raise info '%', flag;
gaussdb$$$ end;
gaussdb$$$ /
INFO: t
ANONYMOUS BLOCK EXECUTE
```

- <>

Parameter: nesttable

Return value: true or false, Boolean type

Description: Checks whether two collections are not equal.

Example:

```
gaussdb=# declare
gaussdb-# type nest is table of int;
gaussdb-# a nest := nest(1,2);
gaussdb-# b nest := nest(1,2);
gaussdb-# flag bool;
gaussdb-# begin
gaussdb$$$ flag := a <> b;
gaussdb$$$ raise info '%', flag;
gaussdb$$$ end;
gaussdb$$$ /
INFO: f
ANONYMOUS BLOCK EXECUTE
```

### MULTISET

- MULTISET UNION [ALL | DISTINCT]

Parameter: nesttable

Return value: nesttable

Description: Union of two collection variables. **ALL** indicates that duplicate elements are not removed, and **DISTINCT** indicates that duplicate elements are removed.

Example:

```
gaussdb=# declare
gaussdb-# type nest is table of int;
gaussdb-# a nest := nest(1,2);
gaussdb-# b nest := nest(2,3);
gaussdb-# begin
gaussdb$$$ a := a MULTiset UNION ALL b;
gaussdb$$$ raise info '%', a;
gaussdb$$$ end;
gaussdb$$$ /
INFO: {1,2,2,3}
ANONYMOUS BLOCK EXECUTE

gaussdb=# declare
gaussdb-# type nest is table of int;
gaussdb-# a nest := nest(1,2);
gaussdb-# b nest := nest(2,3);
gaussdb-# begin
gaussdb$$$ a := a MULTiset UNION DISTINCT b;
gaussdb$$$ raise info '%', a;
gaussdb$$$ end;
gaussdb$$$ /
INFO: {1,2,3}
ANONYMOUS BLOCK EXECUTE
```

- **MULTISET EXCEPT [ALL | DISTINCT]**

Parameter: nesttable

Return value: nesttable

Description: Difference of two collection variables. Taking A MULTISET EXCEPT B as an example, **ALL** indicates that elements that are the same as those in B are removed from A. **DISTINCT** indicates that duplicate elements are removed from A first and then elements that are the same as those in B are removed from A.

Example:

```
gaussdb=# declare
gaussdb-# type nest is table of int;
gaussdb-# a nest := nest(1,2,2);
gaussdb-# b nest := nest(2,3);
gaussdb-# begin
gaussdb$$$ a := a MULTiset EXCEPT ALL b;
gaussdb$$$ raise info '%', a;
gaussdb$$$ end;
gaussdb$$$ /
INFO: {1,2}
ANONYMOUS BLOCK EXECUTE

gaussdb=# declare
gaussdb-# type nest is table of int;
gaussdb-# a nest := nest(1,2,2);
gaussdb-# b nest := nest(2,3);
gaussdb-# begin
gaussdb$$$ a := a MULTiset EXCEPT DISTINCT b;
gaussdb$$$ raise info '%', a;
gaussdb$$$ end;
gaussdb$$$ /
INFO: {1}
ANONYMOUS BLOCK EXECUTE
```

- **MULTISET INTERSECT [ALL | DISTINCT]**

Parameter: nesttable

Return value: nesttable

Description: Intersection of two collection variables. Taking A MULTiset INTERSECT B as an example, **ALL** indicates that all duplicate elements in A and B are obtained, and **DISTINCT** indicates that duplicate elements in A and B are obtained and then duplicate elements in this intersection are removed.

Example:

```
gaussdb=# declare
gaussdb-# type nest is table of int;
gaussdb-# a nest := nest(1,2,2);
gaussdb-# b nest := nest(2,2,3);
gaussdb-# begin
gaussdb$$$ a := a MULTiset INTERSECT ALL b;
gaussdb$$$ raise info '%', a;
gaussdb$$$ end;
gaussdb$$$ /
INFO: {2,2}
ANONYMOUS BLOCK EXECUTE

gaussdb=# declare
gaussdb-# type nest is table of int;
gaussdb-# a nest := nest(1,2,2);
gaussdb-# b nest := nest(2,2,3);
gaussdb-# begin
gaussdb$$$ a := a MULTiset INTERSECT DISTINCT b;
gaussdb$$$ raise info '%', a;
gaussdb$$$ end;
gaussdb$$$ /
INFO: {2}
ANONYMOUS BLOCK EXECUTE
```

## Functions of the Collection Type

### NOTE

In an inner expression, functions of the collection type cannot be called in nesting mode.

- exists(idx)

Parameter: *idx* is of the int4 or varchar type.

Return value: true or false, Boolean type

Description: Checks whether a valid element exists in a specified position.

Example:

```
gaussdb=# declare
gaussdb-# type nest is table of varchar2;
gaussdb-# a nest := nest('happy','?');
gaussdb-# flag bool;
gaussdb-# begin
gaussdb$$$ flag := a.exists(1);
gaussdb$$$ raise info '%', flag;
gaussdb$$$ flag := a.exists(10);
gaussdb$$$ raise info '%', flag;
gaussdb$$$ end;
gaussdb$$$ /
INFO: t
INFO: f
ANONYMOUS BLOCK EXECUTE

gaussdb=# declare
gaussdb-# type nest is table of varchar2 index by varchar2;
gaussdb-# a nest;
gaussdb-# flag bool;
gaussdb-# begin
```

```
gaussdb$# a('1') := 'Be';
gaussdb$# a('2') := 'happy';
gaussdb$# a('3') := '.';
gaussdb$# flag := a.exists('1');
gaussdb$# raise info '%', flag;
gaussdb$# flag := a.exists('ddd');
gaussdb$# raise info '%', flag;
gaussdb$# end;
gaussdb$# /
INFO: t
INFO: f
ANONYMOUS BLOCK EXECUTE
```

- `extend[(count[, idx])]`

Parameters: *idx* and *count* are of the int4 type.

Return value: No value is returned.

Description: Extends one or *count* elements at the end of the nest-table variable. Only the nest-table collection type is supported. If index set element *idx* exists, *count* index elements are copied to the end of the variable.

Example:

```
gaussdb=# declare
gaussdb-# type nest is table of int;
gaussdb-# a nest := nest(1);
gaussdb-# begin
gaussdb$# raise info '%', a;
gaussdb$# a.extend;
gaussdb$# raise info '%', a;
gaussdb$# end;
gaussdb$# /
INFO: {1}
INFO: {1,NULL}
ANONYMOUS BLOCK EXECUTE
```

```
gaussdb=# declare
gaussdb-# type nest is table of int;
gaussdb-# a nest := nest(1);
gaussdb-# begin
gaussdb$# raise info '%', a;
gaussdb$# a.extend(2);
gaussdb$# raise info '%', a;
gaussdb$# end;
gaussdb$# /
INFO: {1}
INFO: {1,NULL,NULL}
ANONYMOUS BLOCK EXECUTE
```

```
gaussdb=# declare
gaussdb-# type nest is table of int;
gaussdb-# a nest := nest(1);
gaussdb-# begin
gaussdb$# raise info '%', a;
gaussdb$# a.extend(2,1);
gaussdb$# raise info '%', a;
gaussdb$# end;
gaussdb$# /
INFO: {1}
INFO: {1,1,1}
ANONYMOUS BLOCK EXECUTE
```

- `delete[(idx1[, idx2])]`

Parameter: *idx1* and *idx2* are of the int4 or varchar2 type.

Return value: No value is returned.

Description: Deletes all elements and releases corresponding storage space in a nest-table collection (to use this collection, extend must be executed again),

or deletes all elements (including index set elements) in an index-by table collection but does not release corresponding storage space.

Example:

```
gaussdb=# declare
gaussdb-# type nest is table of int;
gaussdb-# a nest := nest(1,2,3,4,5);
gaussdb-# begin
gaussdb$$ raise info '%', a;
gaussdb$$ a.delete;
gaussdb$$ raise info '%', a;
gaussdb$$ end;
gaussdb$$ /

- trim[(n)]

Parameter: *n* is of the int4 type.

Return value: No value is returned.

Description: Deletes one or *n* elements and corresponding storage space from a nest-table collection. Only the nest-table collection type is supported.

Example:

```
gaussdb=# declare
gaussdb-# type nest is table of int;
gaussdb-# aa nest:=nest(11,22,33,44,55);
gaussdb-# begin
gaussdb$$ raise info 'aa:%' ,aa;
gaussdb$$ aa.trim;
gaussdb$$ raise info 'aa:%' ,aa;
gaussdb$$ aa.trim(2);
gaussdb$$ raise info 'aa:%' ,aa;
gaussdb$$ end;

INFO: aa:{11,22,33,44,55}
INFO: aa:{11,22,33,44}
INFO: aa:{11,22}
ANONYMOUS BLOCK EXECUTE
```

- count

Parameter: none

Return value: int type

Description: Returns the number of valid elements in a collection.

Example:

```
gaussdb=# declare
gaussdb-# type nest is table of int;
gaussdb-# aa nest:=nest(11,22,33,44,55);
gaussdb-# begin
gaussdb$$ raise info 'count:%' ,aa.count;
gaussdb$$ end;
gaussdb$$ /
INFO: count:5
ANONYMOUS BLOCK EXECUTE
```

```
gaussdb=# declare
gaussdb-# type nest is table of int index by varchar;
gaussdb-# aa nest;
gaussdb-# begin
gaussdb$$ aa('aaa') := 111;
gaussdb$$ aa('bbb') := 222;
gaussdb$$ aa('ccc') := 333;
gaussdb$$ raise info 'count:%' ,aa.count;
gaussdb$$ end;
gaussdb$$ /
INFO: count:3
ANONYMOUS BLOCK EXECUTE
```

- first

Parameter: none

Return value: int or varchar

Description: Returns the index of the first valid element in a collection.

Example:

```
gaussdb=# declare
gaussdb-# type nest is table of int;
gaussdb-# aa nest:=nest(11,22,33,44,55);
gaussdb-# begin
gaussdb$$ raise info 'first:%' ,aa.first;
gaussdb$$ end;
gaussdb$$ /
INFO: first:1

gaussdb$$ aa('bbb') := 222;
gaussdb$$ aa('ccc') := 333;
gaussdb$$ raise info 'first:%' ,aa.first;
gaussdb$$ end;
gaussdb$$ /
INFO: first:aaa
ANONYMOUS BLOCK EXECUTE
```

- last

Parameter: none

Return value: int or varchar

Description: Returns the index of the last valid element in a collection.

Example:

```
gaussdb=# declare
gaussdb-# type nest is table of int;
```

```
gaussdb=# aa nest:=nest(11,22,33,44,55);
gaussdb=# begin
gaussdb$$$ raise info 'last:%' ,aa.last;
gaussdb$$$ end;

ANONYMOUS BLOCK EXECUTE
```

- **prior(idx)**

Parameter: *idx* is of the int or varchar type.

Return value: int or varchar type

Description: Returns the index of a valid element before the current index in a collection.

Example:

```
gaussdb=# declare
gaussdb=# type nest is table of int;
gaussdb=# aa nest:=nest(11,22,33,44,55);
gaussdb=# begin
gaussdb$$$ raise info 'prior:%' ,aa.prior(3);
gaussdb$$$ end;
gaussdb$$$ /

gaussdb$$$ aa('ccc') := 333;
gaussdb$$$ raise info 'prior:%' ,aa.prior('bbb');
gaussdb$$$ end;
gaussdb$$$ /
INFO: prior:aaa
ANONYMOUS BLOCK EXECUTE
```

- **next(idx)**

Parameter: *idx* is of the int or varchar type.

Return value: int or varchar type

Description: Returns the index of a valid element following the current index in a collection.

Example:

```
gaussdb=# declare
gaussdb=# type nest is table of int;
gaussdb=# aa nest:=nest(11,22,33,44,55);
gaussdb=# begin
gaussdb$$$ raise info 'next:%' ,aa.next(3);
gaussdb$$$ end;
gaussdb$$$ /
```

```
INFO: next:4

gaussdb$$$ aa('ccc') := 333;
gaussdb$$$ raise info 'next:%' ,aa.next('bbb');
gaussdb$$$ end;
gaussdb$$$ /
INFO: next:ccc
ANONYMOUS BLOCK EXECUTE
```

- **limit**

Parameter: none

Return value: null

Description: Returns the maximum number of elements that can be stored in a nest-table collection. This function applies only to the array type. The return value is null.

Example:

```
gaussdb=# declare
gaussdb=# type nest is table of int;
gaussdb=# aa nest:=nest(11,22,33,44,55);
gaussdb=# begin
gaussdb$$$ raise info 'limit:%' ,aa.limit;
gaussdb$$$ end;
gaussdb$$$ /
INFO: limit:<NULL>
ANONYMOUS BLOCK EXECUTE
```

## Collection-related Functions

- **unnest\_table** (anynesttable) or **unnest** (anynesttable)

Description: Returns a collection of elements in a nest-table.

Return type: setof anyelement

Example:

```
create or replace procedure f1()
as
  type t1 is table of int;
  v2 t1 := t1(null, 2, 3, 4, null);
  tmp int;
  cursor c1 is select * from unnest_table(v2);
begin
  open c1;
  for i in 1 .. v2.count loop
    fetch c1 into tmp;
    if tmp is null then
      db_output.print_line(i || ': is null');
    else
      db_output.print_line(i || ':' || tmp);
    end if;
  end loop;
  close c1;
end;
/

gaussdb=# call f1();
1: is null
2: 2
```

```
3: 3
4: 4
5: is null
   f1
   ----
(1 row)

-- Example: nested record types in a nest-table
create or replace procedure p1() is
type rec is record(c1 int, c2 int);
type t1 is table of rec;

v t1 := t1(rec(1, 1), rec(2, null), rec(null, null), null);
v2 t1 := t1();
cursor cur is select * from unnest(v);
begin
v2.extend(v.count);
open cur;
for i in 1 .. v2.count loop
  fetch cur into v2(i);
  raise info '%', v2(i);
end loop;
close cur;
end;
/

gaussdb=# call p1();
INFO: (1,1)
INFO: (2,)
INFO: (,)
INFO: (,)
p1
----
(1 row)
```

**NOTE**

If the collection of elements are of record type and the elements are NULL, a record whose all columns are NULL is returned. For details, see the example.

- `unnest_table` (anyindexbytable) or `unnest` (anyindexbytable)

Description: Returns the collection of elements in an index-by table sorted by index.

Return type: setof anyelement

Constraint: Only the index-by int type is supported. The index-by varchar type is not supported.

Example:

```
create or replace procedure f1()
as
type t1 is table of int index by int;
v2 t1 := t1(1=>1, -10=>(-10), 6=>6, 4=>null);
tmp int;
cursor c1 is select * from unnest_table(v2);
begin
open c1;
for i in 1 .. v2.count loop
  fetch c1 into tmp;
  if tmp is null then
    db_output.print_line(i || ': is null!');
  else
    db_output.print_line(i || ':' || tmp);
  end if;
end loop;
close c1;
```

```
end;
/

gaussdb=# call f1();
1: -10
2: 1
3: is null
4: 6
f1
----
(1 row)

-- Example: nested record types in an index-by table
create or replace procedure p1() is
type rec is record(c1 int, c2 int);
type t1 is table of rec index by int;

v t1 := t1(1 => rec(1, 1), 2 => rec(2, null), 3 => rec(null, null), 4 => null);
v2 t1 := t1();
cursor cur is select * from unnest(v);
begin
open cur;
for i in 1 .. v.count loop
fetch cur into v2(i);
raise info '%', v2(i);
end loop;
close cur;
end;
/

gaussdb=# call p1();
INFO: (1,1)
INFO: (2,)
INFO: (,)
INFO: (,)
p1
----
(1 row)
```

#### NOTE

If the collection of elements are of record type and the elements are NULL, a record whose all columns are NULL is returned. For details, see the example.

## 10.4.3 Records

### record Variables

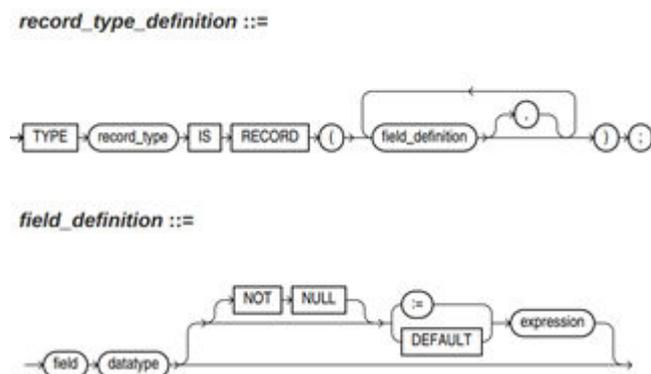

Perform the following operations to create a record variable:

Define a record type and use this type to declare a variable.

### Syntax

For the syntax of the record type, see [Figure 10-1](#).

**Figure 10-1** Syntax of the record type

The above syntax diagram is explained as follows:

- **record\_type**: record type
- **field**: record columns
- **datatype**: record data type
- **expression**: expression for setting a default value

 NOTE

In GaussDB:

- When assigning values to record variables, you can:
  - Declare a record type and define member variables of this type when you declare a function or stored procedure.
  - Assign the value of a record variable to another record variable.
  - Use **SELECT INTO** or **FETCH** to assign values to a record type.
  - Assign the **NULL** value to a record variable.
- The **INSERT** and **UPDATE** statements cannot use a record variable to insert or update data.
- The constructor of the record type cannot be used as the default value of a function or stored procedure parameter.
- When **package\_name.record\_type** is used to declare a record variable, the default value of the record type becomes invalid. Therefore, you are advised not to use **package\_name.record\_type** to declare a record variable when the record type has a default value.
- Just like a variable, a record column of the compound type does not have a default value in the declaration.
- If a member has a record type, the default value of the inner record type is not transferred to the outer record type.
- If **enable\_recordtype\_check\_strict** is set to **on** and the member is of the record type and a column of the record type has the **not null** or **default** attribute, an error is reported during stored procedure or package compilation.
- If **enable\_recordtype\_check\_strict** is set to **on**, a package contains the record type, and a column of the record type has the **not null** or **default** attribute, an error is reported during creation or compilation.
- If **enable\_recordtype\_check\_strict** is set to **on**, the not null function of the record type in the stored procedure takes effect.
- The data type can be the record type, array type, or collection type defined in a stored procedure (anonymous blocks are not supported).
- After the GUC parameter **set behavior\_compat\_options** is set to **'proc\_outparam\_override'**:
  - Functions that contain the **out** output parameter and returns data of the record type can be invoked using **SELECT** and **CALL** in external SQL statements, and can be invoked using **PERFORM** and expressions in stored procedures.
  - If the function returns data of the undefined record type, at least one **out** parameter is required. If the function returns data of the defined record type, the **out** parameter is optional. For details, see the example.
  - Functions that contain the **out** output parameter and return data of the composite or record type, ensure that the expected return type of the function is the same as the actual return type.

## Examples

The table definition used in the following is defined as follows:

```
gaussdb=# \d emp_rec
          Table "public.emp_rec"
  Column |          Type          | Modifiers
-----+-----+-----
 empno  | numeric(4,0)           | not null
  ename  | character varying(10) |
   job   | character varying(9)  |
   mgr   | numeric(4,0)           |
 hiredate | timestamp(0) without time zone |
   sal   | numeric(7,2)           |
```

```
comm | numeric(7,2) |
deptno | numeric(2,0) |

-- Perform array operations in the function.
gaussdb=# CREATE OR REPLACE FUNCTION regress_record(p_w VARCHAR2)
RETURNS
VARCHAR2 AS $$
DECLARE

    -- Declare a record type.
    type rec_type is record (name varchar2(100), epno int);
    employer rec_type;

    -- Use %type to declare the record type.
    type rec_type1 is record (name emp_rec.ename%type, epno int not null :=10);
    employer1 rec_type1;

    -- Declare a record type with a default value.
    type rec_type2 is record (
        name varchar2 not null := 'SCOTT',
        epno int not null :=10);
    employer2 rec_type2;
    CURSOR C1 IS select ename,empno from emp_rec order by 1 limit 1;

BEGIN
    -- Assign a value to a member record variable.
    employer.name := 'WARD';
    employer.epno = 18;
    raise info 'employer name: % , epno:%', employer.name, employer.epno;

    -- Assign the value of a record variable to another variable.
    employer1 := employer;
    raise info 'employer1 name: % , epno: %', employer1.name, employer1.epno;

    -- Assign the NULL value to a record variable.
    employer1 := NULL;
    raise info 'employer1 name: % , epno: %', employer1.name, employer1.epno;

    -- Obtain the default value of a record variable.
    raise info 'employer2 name: % ,epno: %', employer2.name, employer2.epno;

    -- Use a record variable in the FOR loop.
    for employer in select ename,empno from emp_rec order by 1 limit 1
    loop
        raise info 'employer name: % , epno: %', employer.name, employer.epno;
    end loop;

    -- Use a record variable in the SELECT INTO statement.
    select ename,empno into employer2 from emp_rec order by 1 limit 1;
    raise info 'employer name: % , epno: %', employer2.name, employer2.epno;

    -- Use a record variable in a cursor.
    OPEN C1;
    FETCH C1 INTO employer2;
    raise info 'employer name: % , epno: %', employer2.name, employer2.epno;
    CLOSE C1;
    RETURN employer.name;
END;
$$
LANGUAGE plpgsql;

-- Call this function.
gaussdb=# CALL regress_record('abc');

-- Delete the function.
gaussdb=# DROP FUNCTION regress_record;

-- Example of the function expression return record (the compatibility parameter proc_outparam_override
must be enabled)
```

```
set behavior_compat_options = 'proc_outparam_override';
create or replace package pkg is
type rec_type is record(c1 int, c2 int);
function test1(col1 out int,col2 out int)
return rec_type;
end pkg;
/
create or replace package body pkg

/

-- If the compatibility parameter proc_outparam_override is enabled, the data of the defined record type is
returned. The out parameter is not required for the function.
create type rec_type is (c1 int, c2 int);
create or replace function func(a in int) return rec_type
as declare
r rec_type;
begin
r.c1:=1;
r.c2:=2;
return r;
end;
/
call func(0);

-- If the compatibility parameter proc_outparam_override is enabled, the data of the undefined record
type is returned and at least one out parameter is required for the function
create or replace function func(a in int) return record
as declare
type rc is record(c1 int);
r rc;
begin
r.c1:=1;
a:=1;
return r;
end;
/
call func(1);
```

## 10.5 DECLARE Syntax

## 10.5.1 Basic Structure

### Structure

A PL/SQL block can contain a sub-block which can be placed in any section. The following describes the architecture of a PL/SQL block:

- **DECLARE:** declares variables, types, cursors, and regional stored procedures and functions used in the PL/SQL block.

```
DECLARE
```

#### NOTE

This part is optional if no variable needs to be declared.

- An anonymous block may omit the **DECLARE** keyword if no variable needs to be declared.
- For a stored procedure, **AS** is used, which is equivalent to **DECLARE**. The **AS** keyword must be reserved even if there is no variable declaration part.
- **EXECUTION:** specifies procedure and SQL statements. It is the main part of a program. Mandatory.

```
BEGIN
```

- Exception part: processes errors. Optional.

```
EXCEPTION
```

- End. Mandatory.

```
END;
```

```
/
```

---

#### NOTICE

You are not allowed to use consecutive tabs in the PL/SQL block because they may result in an exception when the **gsq** tool is executed with the **-r** parameter specified.

---

### Category

PL/SQL blocks are classified into the following types:

- Anonymous block: a dynamic block that can be executed only for once. For details about the syntax, see [Figure 10-2](#).
- Subprogram: a stored procedure, function, operator, or packages stored in a database. A subprogram created in a database can be called by other programs.

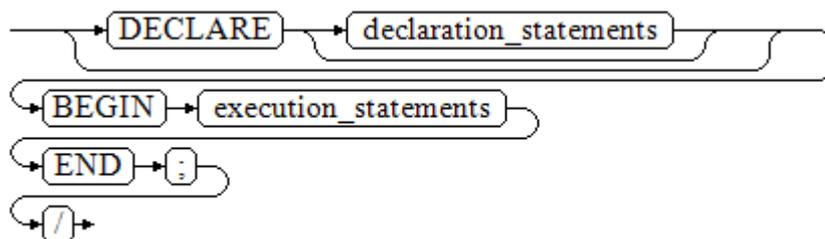

## 10.5.2 Anonymous Blocks

An anonymous block applies to a script infrequently executed or a one-off activity. An anonymous block is executed in a session and is not stored.

### Syntax

[Figure 10-2](#) shows the syntax diagrams for an anonymous block.

Figure 10-2 anonymous\_block::=

Details about the syntax diagram are as follows:

- The execute part of an anonymous block starts with a **BEGIN** statement, has a break with an **END** statement, and ends with a semicolon (;). Type a slash (/) and press **Enter** to execute the statement.

---

**NOTICE**

The terminator "/" must be written in an independent row.

---

- The declaration section includes the variable definition, type, and cursor definition.
- A simplest anonymous block does not execute any commands. At least one statement, even a **NULL** statement, must be presented in any implementation blocks.

### 10.5.3 Subprogram

A subprogram stores stored procedures, functions, operators, and advanced packages. A subprogram created in a database can be called by other programs.

## 10.6 Basic Statements

During PL/SQL programming, you may define some variables, assign values to variables, and call other stored procedures. This chapter describes basic PL/SQL statements, including variable definition statements, value assignment statements, call statements, and return statements.

**NOTE**

You are advised not to call the SQL statements containing passwords in the stored procedures because authorized users may view the stored procedure file in the database and password information is leaked. If a stored procedure contains other sensitive information, permission to access this procedure must be configured, preventing information leakage.

### 10.6.1 Variable Definition Statements

This section describes the declaration of variables in the PL/SQL and the scope of this variable in codes.

## Variable Declaration

For details about the variable declaration syntax, see [Figure 10-3](#).

**Figure 10-3** declare\_variable::=

The above syntax diagram is explained as follows:

- **variable\_name** indicates the name of a variable.
- **type** indicates the type of a variable.
- **value** indicates the initial value of the variable. (If the initial value is not given, NULL is taken as the initial value.) **value** can also be an expression.

### Examples

```
gaussdb=# DECLARE
emp_id INTEGER := 7788; -- Define a variable and assign a value to it.
BEGIN
emp_id := 5*7784; -- Assign a value to the variable.
END;
/
ANONYMOUS BLOCK EXECUTE
```

In addition to the declaration of basic variable types, **%TYPE** and **%ROWTYPE** can be used to declare variables related to table columns or table structures.

### %TYPE Attribute

**%TYPE** declares a variable to be of the same data type as a previously declared variable (for example, a column in a table). For example, if you want to define a *my\_name* variable whose data type is the same as the data type of the **firstname** column in the **employee** table, you can define the variable as follows:

```
my_name employee.firstname%TYPE
```

In this way, you can declare *my\_name* without the need of knowing the data type of **firstname** in **employee**, and the data type of *my\_name* can be automatically updated when the data type of **firstname** changes.

```
TYPE employee_record is record (id INTEGER, firstname VARCHAR2(20));
my_employee employee_record;
my_id my_employee.id%TYPE;
my_id_copy my_id%TYPE;
```

### %ROWTYPE Attribute

**%ROWTYPE** declares data types of a set of data. It stores a row of table data or results fetched from a cursor. For example, if you want to define a set of data with the same column names and column data types as the **employee** table, you can define the data as follows:

```
my_employee employee%ROWTYPE
```

The attribute can also be used on the cursor. The column names and column data types of this set of data are the same as those of the **employee** table. For the

cursor in a package, **%ROWTYPE** can be omitted. **%TYPE** can also reference the type of a column in the cursor. You can define the data as follows:

```
cursor cur is select * from employee;  
my_employee cur%ROWTYPE  
my_name cur.firstname%TYPE  
my_employee2 cur -- For the cursor defined in a package, %ROWTYPE can be omitted.
```

#### NOTICE

- **%TYPE** cannot reference the type of a composite variable or a record variable, a column type of the record type, a column type of a variable of the cross-package composite type, or a column type of a cursor variable of the cross-package type.
- **%ROWTYPE** cannot reference the type of a composite variable or a record variable and the type of a cross-package cursor.

## Scope of a Variable

The scope of a variable indicates the accessibility and availability of the variable in code block. In other words, a variable takes effect only within its scope.

- To define a function scope, a variable must declare and create a **BEGIN-END** block in the declaration section. The necessity of such declaration is also determined by block structure, which requires that a variable has different scopes and lifetime during a process.
- A variable can be defined multiple times in different scopes, and inner definition can cover outer one.
- A variable defined in an outer block can also be used in a nested block. However, the outer block cannot access variables in the nested block.

## 10.6.2 Assignment Statements

### Variable Syntax

**Figure 10-4** shows the syntax diagram for assigning a value to a variable.

**Figure 10-4** assignment\_value::=

The above syntax diagram is explained as follows:

- **variable\_name** indicates the name of a variable.
- **value** can be a value or an expression. The type of *value* must be compatible with the type of *variable\_name*.

Example:

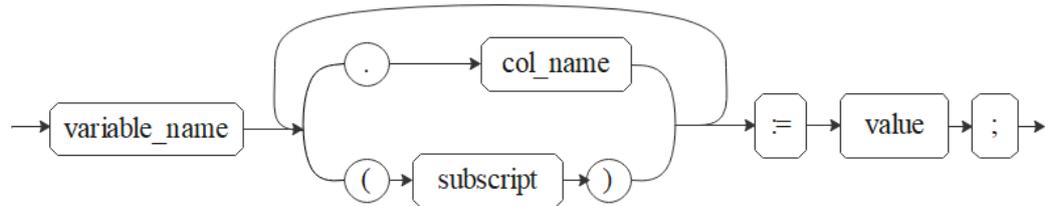

```
gaussdb=# DECLARE  
emp_id INTEGER := 7788; --Assignment  
BEGIN
```

```
emp_id := 5; --Assignment
emp_id := 5*7784;
END;
/
ANONYMOUS BLOCK EXECUTE
```

## Nested Value Assignment

**Figure 10-5** shows the syntax diagram for assigning a nested value to a variable.

**Figure 10-5** nested\_assignment\_value::=

The syntax in **Figure 10-5** is described as follows:

- **variable\_name**: variable name
- **col\_name**: column name
- **subscript**: subscript, which is used for an array variable. The value can be a value or an expression and must be of the int type.
- **value**: value or expression. The type of *value* must be compatible with the type of *variable\_name*.

Example:

```
gaussdb=# CREATE TYPE o1 as (a int, b int);
CREATE TYPE
gaussdb=# DECLARE
TYPE r1 is VARRAY(10) of o1;
emp_id r1;
BEGIN
emp_id(1).a := 5;-- Assign a value.
emp_id(1).b := 5*7784;
END;
/
ANONYMOUS BLOCK EXECUTE
```

### NOTICE

In INTO mode, values can be assigned only to the columns at the first layer. Two-dimensional or above arrays are not supported.

## INTO/BULK COLLECT INTO

- Values returned by statements in a stored procedure are stored in variables. BULK COLLECT INTO allows some or all returned values to be temporarily stored in an array.
- An empty result set can be returned.

## Syntax

```
SELECT select_expressions INTO [STRICT] target FROM ...  
SELECT INTO [STRICT] target expression [FROM ..]
```

### NOTE

- You can use basic SQL commands and INTO clauses to assign the result of a single row or multiple columns to a variable (such as record, row , or scalar variable list).
- The target parameter can be a record variable, a row variable, or a comma-separated list of simple variables and record/row fields.
- **STRICT** option

If the **set behavior\_compat\_options** is set to 'select\_into\_return\_null' (disabled by default) and the **STRICT** option is specified, the query must return a non-empty result set. Otherwise, an error is reported: "NO\_DATA\_FOUND", "TOO\_MANY\_ROWS" or "QUERY\_RETURNED\_NO\_ROWS". If the **STRICT** option is not specified, the empty result set can be returned.

### Example:

```
gaussdb=# create table customers(id int);  
CREATE TABLE  
  
gaussdb=# insert into customers values(1);  
INSERT 0 1  
  
gaussdb=# DECLARE  
my_id integer;  
BEGIN  
select id into my_id from customers limit 1; -- Assign a value.  
END;  
/  
ANONYMOUS BLOCK EXECUTE  
  
gaussdb=# DECLARE  
type id_list is varray(6) of customers.id%type;  
id_arr id_list;  
BEGIN  
select id bulk collect into id_arr from customers order by id DESC limit 20; -- Assign values in batches.  
END;  
/  
ANONYMOUS BLOCK EXECUTE  
  
gaussdb=# CREATE TABLE test(a integer);  
CREATE TABLE  
gaussdb=# insert into test values(1);  
INSERT 0 1  
gaussdb=# CREATE OR REPLACE FUNCTION check_test() RETURNS integer  
language plpgsql  
AS $function$  
DECLARE  
b integer;  
BEGIN  
SELECT INTO b a FROM test WHERE a=1; -- Return an empty result set.  
RETURN b;  
END;  
$function$;  
gaussdb=# SELECT check_test();  
check_test  
-----  
1  
(1 row)
```

**NOTICE**

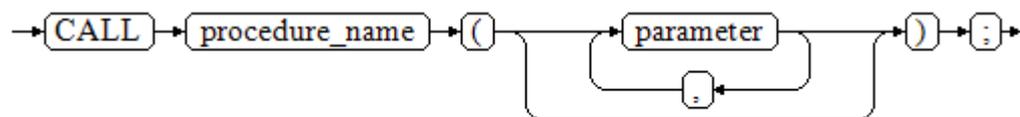

- **BULK COLLECT INTO** can only assign values to arrays or collections in batches. The collection type uses LIMIT properly to prevent performance deterioration caused by excessive operations on data.
- **INTO** and **BULK COLLECT INTO** supports only direct nesting of record type value with less than four layers.
- To return an empty result set, you need to enable PostgreSQL compatibility mode during database initialization. Set **set behavior\_compat\_options** to 'select\_into\_return\_null', the compatibility mode is enabled. If the GUC parameter **set behavior\_compat\_options** is not set, the compatibility mode is disabled.
- For array variables, elements in parentheses ( ) are preferentially identified as index sets. Therefore, expressions with parentheses cannot be written after array variables. For example, **select (1+3) into va(5)** cannot be written as **select into va(5) (1+3)** or **select into va[5] (1+3)**.
- INSERT INTO, UPDATE INTO, DELETE INTO and EXECUTION INTO cannot return an empty result set.
- Multiple variables are failed to be assigned values because the syntax of the subsequent variables is incorrect.

### 10.6.3 Call Statements

#### Syntax

Figure 10-6 shows the syntax diagram for calling a clause.

Figure 10-6 call\_clause::=

The above syntax diagram is explained as follows:

- **procedure\_name** specifies the name of a stored procedure.
- **parameter** specifies the parameters for the stored procedure. You can set no parameter or multiple parameters.

#### Examples

```

gaussdb=# CREATE TABLE staffs ( section_id INTEGER, salary INTEGER );
CREATE TABLE
gaussdb=# INSERT INTO staffs VALUES (30, 10);
INSERT 0 1
gaussdb=# INSERT INTO staffs VALUES (30, 20);
INSERT 0 1

-- Create the stored procedure proc_staffs.
gaussdb=# CREATE OR REPLACE PROCEDURE proc_staffs
  
```

```
(
section  NUMBER(6),
salary_sum out NUMBER(8,2),
staffs_count out INTEGER
)
IS
BEGIN
SELECT sum(salary), count(*) INTO salary_sum, staffs_count FROM staffs where section_id = section;
END;
/
CREATE PROCEDURE

-- Call the stored procedure proc_return.
gaussdb=# CALL proc_staffs(2,8,6);
salary_sum | staffs_count
-----+-----
          |           0
(1 row)

-- Drop the stored procedure.
gaussdb=# DROP PROCEDURE proc_staffs;
DROP PROCEDURE
```

## 10.7 Dynamic Statements

### 10.7.1 Executing Dynamic Query Statements

You can perform dynamic queries GaussDB provides two modes: EXECUTE IMMEDIATE and OPEN FOR. EXECUTE IMMEDIATE dynamically executes SELECT statements and OPEN FOR combines use of cursors. If you need to store query results in a dataset, use OPEN FOR.

#### EXECUTE IMMEDIATE

Figure 10-7 shows the syntax diagram.

Figure 10-7 EXECUTE IMMEDIATE dynamic\_select\_clause::=

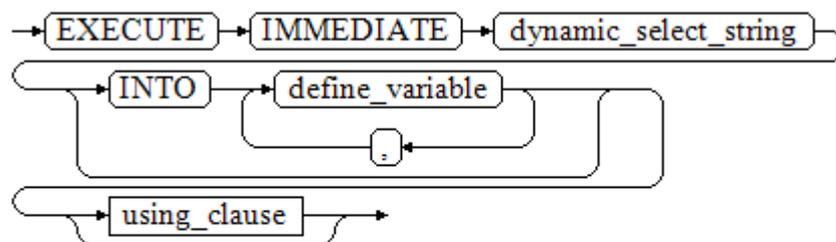

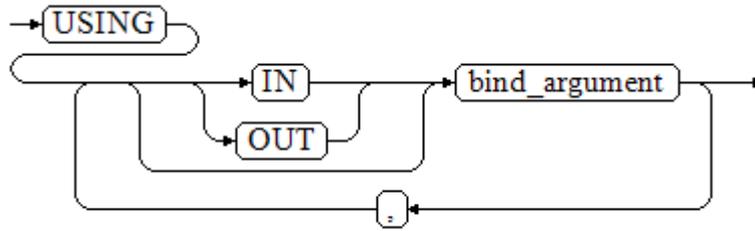

Figure 10-8 shows the syntax diagram for using\_clause.

Figure 10-8 using\_clause::=

The above syntax diagram is explained as follows:

- *define\_variable*: specifies a variable to store single-row query results.
- **USING IN** *bind\_argument*: specifies the variable whose value is passed to the dynamic SQL statement. The variable is used when a dynamic placeholder exists in *dynamic\_select\_string*.
- **USING OUT** *bind\_argument*: specifies the variable that stores a value returned by the dynamic SQL statement.

---

**NOTICE**

- In query statements, **INTO** and **OUT** cannot coexist.
- A placeholder name starts with a colon (:) followed by digits, characters, or strings, corresponding to *bind\_argument* in the **USING** clause.
- *bind\_argument* can only be a value, variable, or expression. It cannot be a database object such as a table name, column name, and data type. That is, *bind\_argument* cannot be used to transfer schema objects for dynamic SQL statements. If a stored procedure needs to transfer database objects through *bind\_argument* to construct dynamic SQL statements (generally, DDL statements), you are advised to use double vertical bars (||) to concatenate *dynamic\_select\_clause* with a database object.
- A dynamic PL/SQL block allows duplicate placeholders. That is, a placeholder can correspond to only one *bind\_argument* in the USING clause. When the GUC parameter **behavior\_compat\_options** is set to **dynamic\_sql\_compat**, the bind arguments in the USING clause are matched in sequence based on the placeholder sequence. Duplicate placeholders will not be identified as the same placeholder.

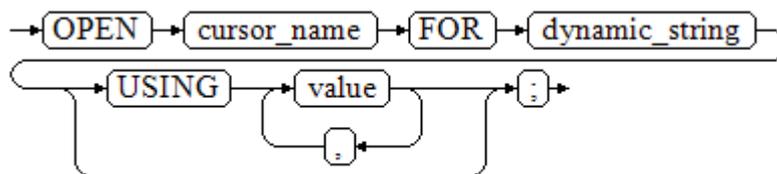

---

**OPEN FOR**

Dynamic query statements can be executed by using **OPEN FOR** to open dynamic cursors.

Figure 10-9 shows the syntax diagram.

Figure 10-9 open\_for::=

Parameter description:

- **cursor\_name**: specifies the name of the cursor to be opened.
- **dynamic\_string**: specifies the dynamic query statement.
- **USING value**: applies when a placeholder exists in `dynamic_string`.

For the use of cursors, see [Cursors](#).

## 10.7.2 Executing Dynamic Non-Query Statements

### Syntax

Figure 10-10 shows the syntax diagram.

Figure 10-10 noselect::=

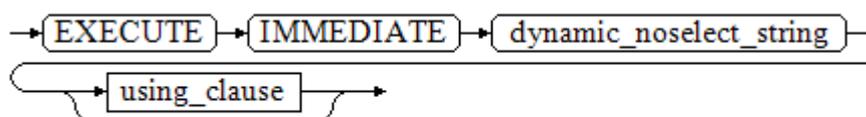

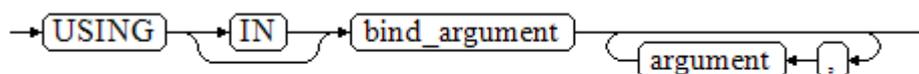

Figure 10-11 shows the syntax diagram for `using_clause`.

Figure 10-11 using\_clause::=

The above syntax diagram is explained as follows:

**USING IN** *bind\_argument* is used to specify the variable whose value is passed to the dynamic SQL statement. The variable is used when a placeholder exists in *dynamic\_noselect\_string*. That is, a placeholder is replaced by the corresponding *bind\_argument* when a dynamic SQL statement is executed. Note that *bind\_argument* can only be a value, variable, or expression, and cannot be a database object such as a table name, column name, and data type. If a stored procedure needs to transfer database objects through *bind\_argument* to construct dynamic SQL statements (generally, DDL statements), you are advised to use double vertical bars (||) to concatenate *dynamic\_select\_clause* with a database object. In addition, a dynamic PL/SQL block allows duplicate placeholders. That is, a placeholder can correspond to only one *bind\_argument*. When the GUC

parameter **behavior\_compat\_options** is set to **dynamic\_sql\_compat**, the bind arguments in the USING clause are matched in sequence based on the placeholder sequence. Duplicate placeholders will not be identified as the same placeholder.

## Examples

```
-- Create a table.
gaussdb=# CREATE TABLE sections_t1
(
  section      NUMBER(4) ,
  section_name VARCHAR2(30),
  manager_id   NUMBER(6),
  place_id     NUMBER(4)
);
CREATE TABLE

-- Declare a variable.
gaussdb=# DECLARE
  section      NUMBER(4) := 280;
  section_name VARCHAR2(30) := 'Info support';
  manager_id   NUMBER(6) := 103;
  place_id     NUMBER(4) := 1400;
  new_colname  VARCHAR2(10) := 'sec_name';
BEGIN
-- Execute the query.
  EXECUTE IMMEDIATE 'insert into sections_t1 values(:1, :2, :3, :4)'
    USING section, section_name, manager_id,place_id;
-- Execute the query (duplicate placeholders).
  EXECUTE IMMEDIATE 'insert into sections_t1 values(:1, :2, :3, :1)'
    USING section, section_name, manager_id;
-- Run the ALTER statement. (You are advised to use double vertical bars (||) to concatenate the dynamic
DDL statement with a database object.)
  EXECUTE IMMEDIATE 'alter table sections_t1 rename section_name to ' || new_colname;
END;
/
ANONYMOUS BLOCK EXECUTE
-- Query data.
gaussdb=# SELECT * FROM sections_t1;
 section | sec_name | manager_id | place_id
-----+-----+-----+-----
    280 | Info support |    103 |    1400
    280 | Info support |    103 |    280
(2 rows)

-- Drop the table.
gaussdb=# DROP TABLE sections_t1;
DROP TABLE
```

### 10.7.3 Dynamically Calling Stored Procedures

This section describes how to dynamically call store procedures. You must use anonymous statement blocks to package stored procedures or statement blocks and append **IN** and **OUT** behind the **EXECUTE IMMEDIATE...USING** statement to input and output parameters.

#### Syntax

[Figure 10-12](#) shows the syntax diagram.

Figure 10-12 call\_procedure::=

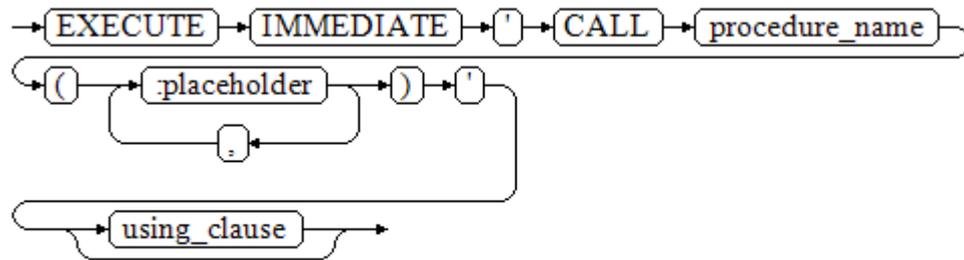

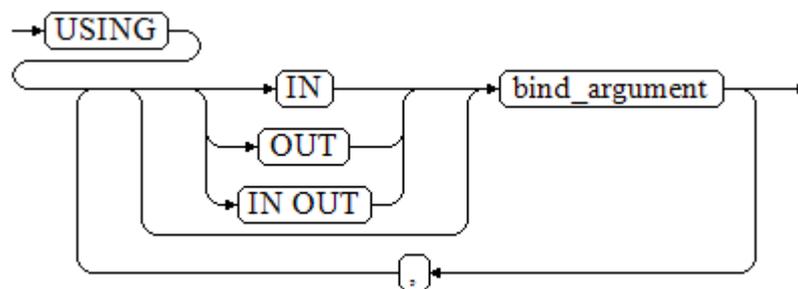

Figure 10-13 shows the syntax diagram for using\_clause.

Figure 10-13 using\_clause::=

The above syntax diagram is explained as follows:

- **CALL procedure\_name**: calls the stored procedure.
- **[:placeholder1;placeholder2,...]**: specifies the placeholder list of the stored procedure parameters. The numbers of the placeholders and parameters are the same.
- **USING [IN|OUT|IN OUT]bind\_argument**: specifies where the variable passed to the stored procedure parameter value is stored. The modifiers in front of **bind\_argument** and of the corresponding parameter are the same.
- Overloaded functions or stored procedures with placeholders cannot be called.

## 10.7.4 Dynamically Calling Anonymous Blocks

This section describes how to execute anonymous blocks in dynamic statements. Append **IN** and **OUT** behind the **EXECUTE IMMEDIATE...USING** statement to input and output parameters.

### Syntax

Figure 10-14 shows the syntax diagram.

Figure 10-14 call\_anonymous\_block::=

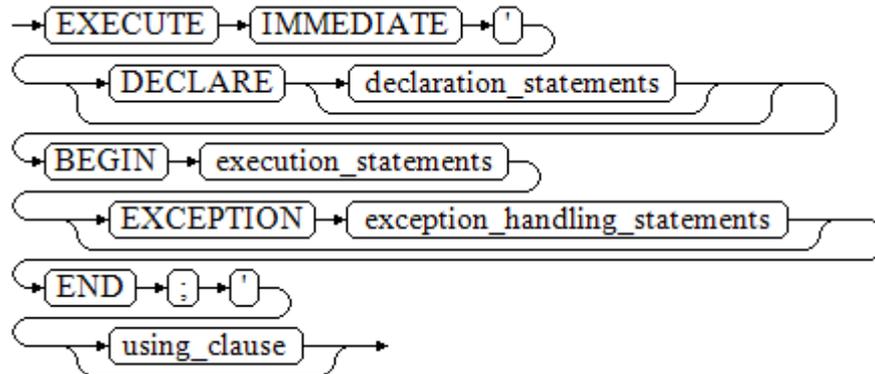

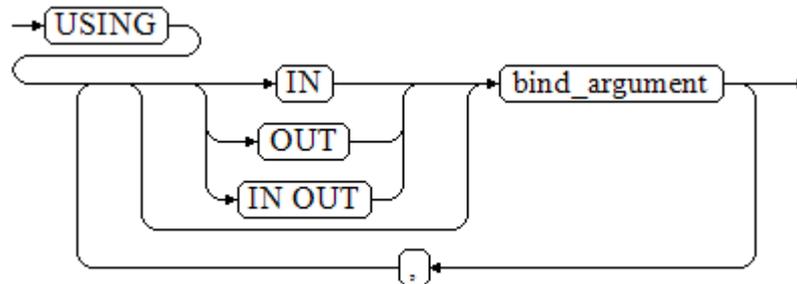

Figure 10-15 shows the syntax diagram for using\_clause.

Figure 10-15 using\_clause::=

The above syntax diagram is explained as follows:

- The execute part of an anonymous block starts with a **BEGIN** statement, has a break with an **END** statement, and ends with a semicolon (;).
- **USING [IN|OUT|IN OUT]bind\_argument**: specifies where the variable passed to the stored procedure parameter value is stored. The modifiers in front of **bind\_argument** and of the corresponding parameter are the same.
- The input and output parameters in the middle of an anonymous block are designated by placeholders. The numbers of the placeholders and parameters are the same. The sequences of the parameters corresponding to the placeholders and the USING parameters are the same.
- Currently in GaussDB, when dynamic statements call anonymous blocks, placeholders cannot be used to pass input and output parameters in an **EXCEPTION** statement.
- Overloaded functions with placeholders cannot be called.
- The PERFORM keyword cannot be used to invoke a stored procedure when parameters are bound.
- Variables declared in an anonymous block and binding parameters cannot be used in the same statement at the same time.
- Only SQL statements invoked in anonymous blocks and stored procedures with OUT/INOUT parameters can be bound to parameters. For example,

expressions and cursors are used in anonymous blocks, and dynamic statements are invoked in nested mode in anonymous blocks.

## 10.8 Control Statements

### 10.8.1 RETURN Statements

In GaussDB, data can be returned in either of the following ways: **RETURN**, **RETURN NEXT**, or **RETURN QUERY**. **RETURN NEXT** and **RETURN QUERY** are used only for functions and cannot be used for stored procedures.

#### 10.8.1.1 RETURN

##### Syntax

[Figure 10-16](#) shows the syntax diagram for a return statement.

**Figure 10-16** return\_clause::=

The above syntax diagram is explained as follows:

This statement returns control from a stored procedure or function to a caller.

##### Examples

See [Examples](#) for call statement examples.

#### 10.8.1.2 RETURN NEXT and RETURN QUERY

##### Syntax

When creating a function, specify **SETOF datatype** for the return values.

return\_next\_clause::=

return\_query\_clause::=

The above syntax diagram is explained as follows:

If a function needs to return a result set, use **RETURN NEXT** or **RETURN QUERY** to add results to the result set, and then continue to execute the next statement of the function. As the **RETURN NEXT** or **RETURN QUERY** statement is executed

repeatedly, more and more results will be added to the result set. After the function is executed, all results are returned.

**RETURN NEXT** can be used for scalar and compound data types.

**RETURN QUERY** has a variant **RETURN QUERY EXECUTE**. You can add dynamic queries and add parameters to the queries by **USING**.

## Examples

```
gaussdb=# CREATE TABLE t1(a int);
gaussdb=# INSERT INTO t1 VALUES(1),(10);

--RETURN NEXT
gaussdb=# CREATE OR REPLACE FUNCTION fun_for_return_next() RETURNS SETOF t1 AS $$
DECLARE
  r t1%ROWTYPE;
BEGIN
  FOR r IN select * from t1
  LOOP
    RETURN NEXT r;
  END LOOP;
  RETURN;
END;
$$ LANGUAGE plpgsql;
gaussdb=# call fun_for_return_next();
 a
---
 1
10
(2 rows)

-- RETURN QUERY
gaussdb=# CREATE OR REPLACE FUNCTION fun_for_return_query() RETURNS SETOF t1 AS $$
DECLARE
  r t1%ROWTYPE;
BEGIN
  RETURN QUERY select * from t1;
END;
$$
language plpgsql;
gaussdb=# call fun_for_return_query();
 a
---
 1
10
(2 rows)
```

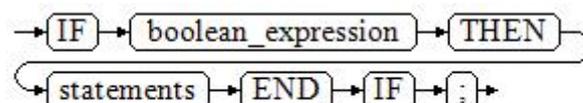

## 10.8.2 Conditional Statements

Conditional statements are used to decide whether given conditions are met. Operations are executed based on the decisions made.

GaussDB supports five usages of **IF**:

- IF\_THEN

**Figure 10-17** IF\_THEN::=

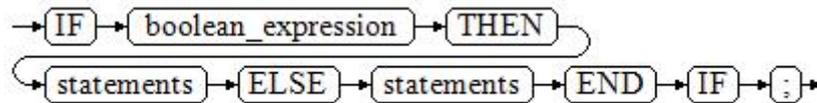

**IF\_THEN** is the simplest form of **IF**. If the condition is true, statements are executed. If it is false, they are skipped.

Example:

```
gaussdb=# IF v_user_id <> 0 THEN
        UPDATE users SET email = v_email WHERE user_id = v_user_id;
END IF;
```

- IF\_THEN\_ELSE

**Figure 10-18** IF\_THEN\_ELSE::=

**IF\_THEN\_ELSE** statements add **ELSE** branches and can be executed if the condition is false.

Example:

```
gaussdb=# IF parentid IS NULL OR parentid = ''
THEN
    RETURN;
ELSE
    hp_true_filename(parentid); -- Call the stored procedure.
END IF;
```

- IF\_THEN\_ELSE IF

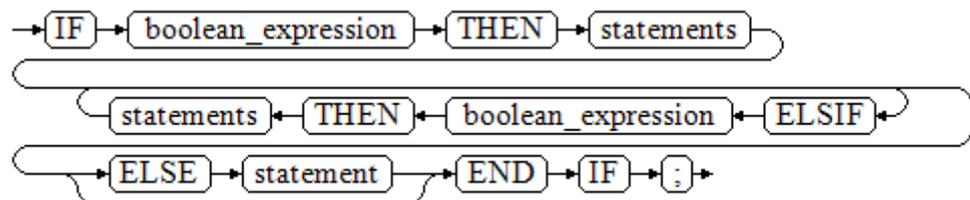

**IF** statements can be nested in the following way:

```
gaussdb=# IF sex = 'm' THEN
        pretty_sex := 'man';
ELSE
    IF sex = 'f' THEN
        pretty_sex := 'woman';
    END IF;
END IF;
```

Actually, this is a way of an **IF** statement nesting in the **ELSE** part of another **IF** statement. Therefore, an **END IF** statement is required for each nesting **IF** statement and another **END IF** statement is required to end the parent **IF-ELSE** statement. To set multiple options, use the following form:

- IF\_THEN\_ELSIF\_ELSE

**Figure 10-19** IF\_THEN\_ELSIF\_ELSE::=

Example:

```
IF number_tmp = 0 THEN
    result := 'zero';
ELSIF number_tmp > 0 THEN
```

```
result := 'positive';  
ELSIF number_tmp < 0 THEN  
    result := 'negative';  
ELSE  
    result := 'NULL';  
END IF;
```

- IF\_THEN\_ELSEIF\_ELSE

**ELSEIF** is an alias of **ELSIF**.

Example:

```
CREATE OR REPLACE PROCEDURE proc_control_structure(i in integer)  
AS  
BEGIN  
    IF i > 0 THEN  
        raise info 'i:% is greater than 0. ',i;  
    ELSIF i < 0 THEN  
        raise info 'i:% is smaller than 0. ',i;  
    ELSE  
        raise info 'i:% is equal to 0. ',i;  
    END IF;  
    RETURN;  
END;  
/  
  
CALL proc_control_structure(3);  
  
-- Delete the stored procedure.  
DROP PROCEDURE proc_control_structure;
```

## 10.8.3 Loop Statements

### Simple LOOP Statements

#### Syntax diagram

Figure 10-20 loop::=

#### Example

```
CREATE OR REPLACE PROCEDURE proc_loop(i in integer, count out integer)  
AS  
BEGIN  
    count:=0;  
    LOOP  
        IF count > i THEN  
            raise info 'count is %. ', count;  
            EXIT;  
        ELSE  
            count:=count+1;  
        END IF;  
    END LOOP;  
END;  
/  
  
CALL proc_loop(10,5);
```

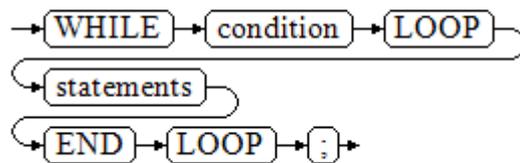

**NOTICE**

The loop must be exploited together with **EXIT**; otherwise, a dead loop occurs.

## WHILE\_LOOP Statements

### Syntax diagram

Figure 10-21 while\_loop::=

If the conditional expression is true, a series of statements in the WHILE statement are repeatedly executed and the condition is decided each time the loop body is executed.

### Example

```
CREATE TABLE integertable(c1 integer) ;
CREATE OR REPLACE PROCEDURE proc_while_loop(maxval in integer)
AS
  DECLARE
  i int :=1;
  BEGIN
    WHILE i < maxval LOOP
      INSERT INTO integertable VALUES(i);
      i:=i+1;
    END LOOP;
  END;
/

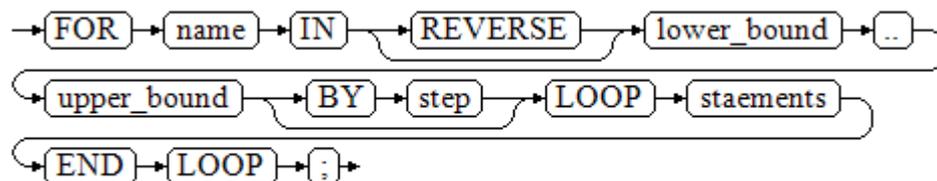

-- Invoke a function.
CALL proc_while_loop(10);

-- Delete the stored procedure and table.
DROP PROCEDURE proc_while_loop;
DROP TABLE integertable;
```

## FOR\_LOOP (*Integer variable*) Statement

### Syntax diagram

Figure 10-22 for\_loop::=

 NOTE

- The variable *name* is automatically defined as the integer type and exists only in this loop. The value of *name* ranges from **lower\_bound** to **upper\_bound**.
- When the keyword **REVERSE** is used, the value of **lower\_bound** must be greater than or equal to that of **upper\_bound**; otherwise, the loop body is not executed.

## FOR\_LOOP Query Statements

### Syntax diagram

Figure 10-23 for\_loop\_query::=

 NOTE

The variable *target* is automatically defined, its type is the same as that in the query result, and it is valid only in this loop. The value of *target* is the query result.

## FORALL Batch Query Statements

### Syntax diagram

Figure 10-24 forall::=

 NOTE

- The variable *index* is automatically defined as the integer type and exists only in this loop. The value of *index* falls between the value of **low\_bound** and the value of **upper\_bound**.
- If **SAVE EXCEPTIONS** is specified, exceptions occurred during DML execution in the loop body are saved in **SQL&BULK\_EXCEPTIONS** and an exception is thrown after the execution is complete. If there is no abnormal execution result in the loop, the loop will not be rolled back in the current subtransaction.

### Example

```

CREATE TABLE hdfs_t1 (
  title NUMBER(6),
  did VARCHAR2(20),
  data_period VARCHAR2(25),
  kind VARCHAR2(25),
  interval VARCHAR2(20),
  time DATE,
  isModified VARCHAR2(10)
);

INSERT INTO hdfs_t1 VALUES( 8, 'Donald', 'OConnell', 'DOCONNEL', '650.507.9833', to_date('21-06-1999',
'dd-mm-yyyy'), 'SH_CLERK' );

CREATE OR REPLACE PROCEDURE proc_forall()
AS
BEGIN
  FORALL i IN 100..120
    update hdfs_t1 set title = title + 100*i;
END;
/

-- Invoke a function.
CALL proc_forall();

-- Query the invocation result of the stored procedure.
SELECT * FROM hdfs_t1 WHERE title BETWEEN 100 AND 120;

-- Delete the stored procedure and table.
DROP PROCEDURE proc_forall;
DROP TABLE hdfs_t1;

```

## 10.8.4 Branch Statements

### Syntax

Figure 10-25 shows the syntax diagram for a branch statement.

Figure 10-25 case\_when::=

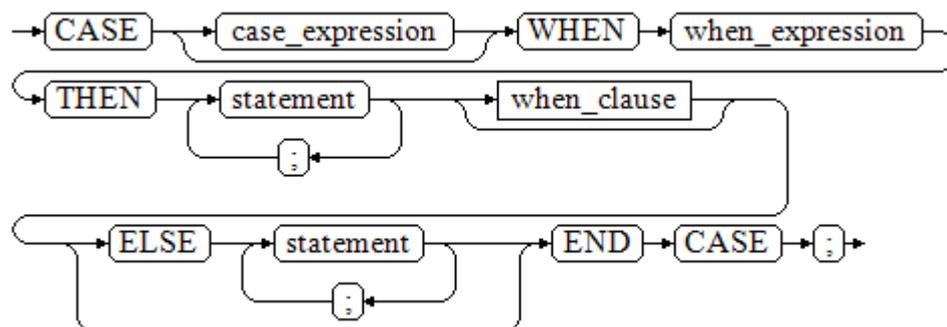

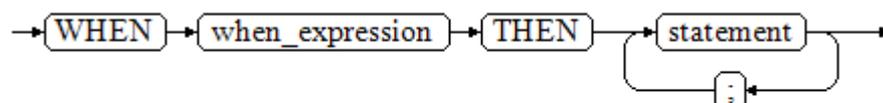

Figure 10-26 shows the syntax diagram for when\_clause.

Figure 10-26 when\_clause::=

Parameter description:

- *case\_expression*: specifies the variable or expression.
- *when\_expression*: specifies the constant or conditional expression.
- *statement*: specifies the statement to be executed.

## Examples

```
CREATE OR REPLACE PROCEDURE proc_case_branch(pi_result in integer, pi_return out integer)
AS
BEGIN
CASE pi_result
WHEN 1 THEN
pi_return := 111;
WHEN 2 THEN
pi_return := 222;
WHEN 3 THEN
pi_return := 333;
WHEN 6 THEN
pi_return := 444;
WHEN 7 THEN
pi_return := 555;
WHEN 8 THEN
pi_return := 666;
WHEN 9 THEN
pi_return := 777;
WHEN 10 THEN
pi_return := 888;
ELSE
pi_return := 999;
END CASE;
raise info 'pi_return : %',pi_return ;
END;
/

CALL proc_case_branch(3,0);

-- Delete the stored procedure.
DROP PROCEDURE proc_case_branch;
```

## 10.8.5 NULL Statements

In PL/SQL programs, **NULL** statements are used to indicate "nothing should be done", equal to placeholders. They grant meanings to some statements and improve program readability.

### Syntax

The following shows example use of **NULL** statements.

```
DECLARE
...
BEGIN
...
IF v_num IS NULL THEN
NULL; --No data needs to be processed.
END IF;
END;
/
```

## 10.8.6 Error Trapping Statements

By default, any error occurring in a PL/SQL function aborts execution of the function, and indeed of the surrounding transaction as well. You can trap errors

and restore from them by using a **BEGIN** block with an **EXCEPTION** clause. The syntax is an extension of the normal syntax for a **BEGIN** block:

```
[<<label>>]
[DECLARE
  declarations]
BEGIN
  statements
EXCEPTION
  WHEN condition [OR condition ...] THEN
    handler_statements
  [WHEN condition [OR condition ...] THEN
    handler_statements
  ...]
END;
```

If no error occurs, this form of block simply executes all the statements, and then control passes to the next statement after **END**. But if an error occurs within the statements, further processing of the statements is abandoned, and control passes to the **EXCEPTION** list. The list is searched for the first condition matching the error that occurred. If a match is found, the corresponding **handler\_statements** are executed, and then control passes to the next statement after **END**. If no match is found, the error propagates out as though the **EXCEPTION** clause were not there at all: Error codes can be used to catch other error codes of the same type.

The error can be caught by an enclosing block with **EXCEPTION**, or if there is none it aborts processing of the function.

The condition names can be any of those shown in SQL standard error codes. The special condition name **OTHERS** matches every error type except **QUERY\_CANCELED**.

If a new error occurs within the selected **handler\_statements**, it cannot be caught by this **EXCEPTION** clause, but is propagated out. A surrounding **EXCEPTION** clause could catch it.

When an error is caught by an **EXCEPTION** clause, the local variables of the PL/SQL function remain as they were when the error occurred, but all changes to persistent database state within the block are rolled back.

Example:

```
CREATE TABLE mytab(id INT,firstname VARCHAR(20),lastname VARCHAR(20)) ;
INSERT INTO mytab(firstname, lastname) VALUES('Tom', 'Jones');

CREATE FUNCTION fun_exp() RETURNS INT
AS $$
DECLARE
  x INT :=0;
  y INT;
BEGIN
  UPDATE mytab SET firstname = 'Joe' WHERE lastname = 'Jones';
  x := x + 1;
  y := x / 0;
EXCEPTION
  WHEN division_by_zero THEN
    RAISE NOTICE 'caught division_by_zero';
    RETURN x;
END;$$
LANGUAGE plpgsql;

call fun_exp();
NOTICE: caught division_by_zero
```

```
fun_exp
-----
      1
(1 row)

select * from mytab;
 id | firstname | lastname
-----+-----+-----
   1 | Tom       | Jones
(1 row)

DROP FUNCTION fun_exp();
DROP TABLE mytab;
```

When control reaches the assignment to **y**, it will fail with a **division\_by\_zero** error. This will be caught by the **EXCEPTION** clause. The value returned in the **RETURN** statement will be the incremented value of **x**.

#### NOTE

A block containing an **EXCEPTION** clause is more expensive to enter and exit than a block without one. Therefore, do not use **EXCEPTION** without need.

In the following scenario, an exception cannot be caught, and the entire transaction rolls back. The threads of the nodes participating the stored procedure exit abnormally due to node failure and network fault, or the source data is inconsistent with that of the table structure of the target table during the COPY FROM operation.

#### Example: Exceptions with **UPDATE/INSERT**

This example uses exception handling to perform either **UPDATE** or **INSERT**, as appropriate:

```
CREATE TABLE db (a INT, b TEXT);

CREATE FUNCTION merge_db(key INT, data TEXT) RETURNS VOID AS
$$
BEGIN
    LOOP
        -- First try to update the key
        UPDATE db SET b = data WHERE a = key;
        IF found THEN
            RETURN;
        END IF;
        -- Not there, so try to insert the key. If someone else inserts the same key concurrently, we could get a
        unique-key failure.
        BEGIN
            INSERT INTO db(a,b) VALUES (key, data);
            RETURN;
        EXCEPTION WHEN unique_violation THEN
            -- Do nothing, and loop to try the UPDATE again.
        END;
    END LOOP;
END;
$$
LANGUAGE plpgsql;

SELECT merge_db(1, 'david');
SELECT merge_db(1, 'dennis');

--Delete FUNCTION and TABLE:
DROP FUNCTION merge_db;
DROP TABLE db ;
```

## 10.8.7 GOTO Statements

A **GOTO** statement unconditionally transfers the control from the current statement to a labeled statement. The **GOTO** statement changes the execution logic. Therefore, use this statement only when necessary. Alternatively, you can use the **EXCEPTION** statement to handle issues in special scenarios. To run a **GOTO** statement, the labeled statement must be unique.

### Syntax

label declaration ::=

goto statement ::=

### Examples

```
gaussdb=# CREATE OR REPLACE PROCEDURE GOTO_test()
AS
DECLARE
  v1 int;
BEGIN
  v1 := 0;
  LOOP
    EXIT WHEN v1 > 100;
    v1 := v1 + 2;
    if v1 > 25 THEN
      GOTO pos1;
    END IF;
  END LOOP;
<<pos1>>
v1 := v1 + 10;
raise info 'v1 is %.', v1;
END;
/
call GOTO_test();
```

### Constraints

Using **GOTO** statements has the following constraints:

- A **GOTO** statement does not allow multiple labeled statements even if the statements are in different blocks.

```
BEGIN
  GOTO pos1;
<<pos1>>
SELECT * FROM ...
<<pos1>>
UPDATE t1 SET ...
END;
```

- A **GOTO** statement cannot transfer control to the **IF**, **CASE**, or **LOOP** statement.

```
BEGIN
  GOTO pos1;
  IF valid THEN
    <<pos1>>
```

```
SELECT * FROM ...  
END IF;  
END;
```

- A **GOTO** statement cannot transfer control from one **IF** clause to another, or from one **WHEN** clause in the **CASE** statement to another.

```
BEGIN  
IF valid THEN  
  GOTO pos1;  
  SELECT * FROM ...  
ELSE  
  <<pos1>>  
  UPDATE t1 SET ...  
END IF;  
END;
```

- A **GOTO** statement cannot transfer control from an outer block to an inner **BEGIN-END** block.

```
BEGIN  
  GOTO pos1;  
  BEGIN  
    <<pos1>>  
    UPDATE t1 SET ...  
  END;  
END;
```

- A **GOTO** statement cannot transfer control from an exception handler to the current **BEGIN-END** block. However, a **GOTO** statement can transfer control to the upper-layer **BEGIN-END** block.

```
BEGIN  
  <<pos1>>  
  UPDATE t1 SET ...  
  EXCEPTION  
    WHEN condition THEN  
      GOTO pos1;  
END;
```

- To branch to a position that does not have an executable statement, add the **NULL** statement.

```
DECLARE  
  done BOOLEAN;  
BEGIN  
  FOR i IN 1..50 LOOP  
    IF done THEN  
      GOTO end_loop;  
    END IF;  
    <<end_loop>> -- not allowed unless an executable statement follows  
    NULL; -- add NULL statement to avoid error  
  END LOOP; -- raises an error without the previous NULL  
END;  
/
```

## 10.9 Transaction Management

Calling a stored procedure automatically starts a transaction. When the calling is complete, the transaction is automatically committed, or rolled back upon an exception. In addition to automatic transaction control, you can also use **COMMIT/ROLLBACK** to control transactions in stored procedures. Running the **COMMIT/ROLLBACK** commands in a stored procedure will commit or roll back the current transaction and automatically starts a new transaction. All subsequent operations will be performed in the new transaction.

A savepoint is a special mark inside a transaction. It allows all commands that are executed after it was established to be rolled back, restoring the transaction state to what it was at the time of the savepoint. In a stored procedure, you can use

savepoints to manage transactions. Currently, you can create, roll back, and release savepoints. If a savepoint for rollback is used in a stored procedure, only the modification of the current transaction is rolled back. The execution process of the stored procedure is not changed, and the values of local variables in the stored procedure are not rolled back.

## Syntax

```
Define a savepoint.  
SAVEPOINT savepoint_name;  
Roll back a savepoint.  
ROLLBACK TO [SAVEPOINT] savepoint_name;  
Release a savepoint.  
RELEASE [SAVEPOINT] savepoint_name;
```

## Usage Scenarios

The applicable contexts are as follows:

- COMMIT, ROLLBACK, and SAVEPOINT can be used in PL/SQL stored procedures.
- COMMIT, ROLLBACK, and SAVEPOINT can be used in stored procedures that contain EXCEPTION.
- COMMIT, ROLLBACK, and SAVEPOINT can be used in EXCEPTION statements of stored procedures.
- A stored procedure that contains COMMIT, ROLLBACK, or SAVEPOINT (which means the stored procedure is controlled by BEGIN, START, or END) can be called in a transaction block.
- A stored procedure that contains savepoints can be called in a subtransaction. That is, an externally defined savepoint is used in the stored procedure to roll back the transaction to the savepoint defined outside the stored procedure.
- A stored procedure is visible to a savepoint defined in the stored procedure. That is, the modification of the transaction can be rolled back to the savepoint defined in the stored procedure.
- COMMIT, ROLLBACK, and SAVEPOINT, as well as IF, FOR, CURSOR LOOP, and WHILE, can be called in most PL/SQL contexts and statements.
- A stored procedure or function that contains COMMIT, ROLLBACK, or SAVEPOINT can be called in the return values and simple expression calculation of stored procedures.

The following content can be committed or rolled back:

- DDL statements after COMMIT/ROLLBACK can be committed or rolled back.
- DML statements after COMMIT/ROLLBACK can be committed.
- GUC parameters in stored procedures can be committed or rolled back.

## Usage Restrictions

COMMIT and ROLLBACK cannot be used in the following contexts:

- COMMIT, ROLLBACK, and SAVEPOINT cannot be called in stored procedures other than PL/SQL, such as PL/Java and PL/Python.
- COMMIT, ROLLBACK, SAVEPOINT and stored procedures that contain COMMIT, ROLLBACK, or SAVEPOINT cannot be called in functions.

- After SAVEPOINT is called in a transaction block, stored procedures that contain COMMIT/ROLLBACK cannot be called.
- Stored procedures that contain COMMIT, ROLLBACK, or SAVEPOINT cannot be called in TRIGGER.
- COMMIT, ROLLBACK, and SAVEPOINT cannot be called in EXECUTE statements.
- Stored procedures that contain COMMIT, ROLLBACK, or SAVEPOINT cannot be called in CURSOR statements.
- Stored procedures that contain IMMUTABLE or SHIPPABLE cannot call COMMIT, ROLLBACK, SAVEPOINT or another stored procedure that contain COMMIT, ROLLBACK, or SAVEPOINT.
- Stored procedures that contain COMMIT, ROLLBACK, or SAVEPOINT cannot be called in SQL statements other than SELECT PROC and CALL PROC.
- COMMIT, ROLLBACK, or SAVEPOINT cannot be called in a stored procedure whose header contains GUC parameters.
- COMMIT, ROLLBACK, or SAVEPOINT cannot be called in expressions or CURSOR and EXECUTE statements.
- Savepoints defined outside a stored procedure cannot be released in the stored procedure.
- An autonomous transaction and a stored procedure transaction are two independent transactions that cannot use the savepoints defined in each other.

The following content cannot be committed or rolled back:

- Variables declared or imported in stored procedures cannot be committed or rolled back.
- In stored procedures, GUC parameters that take effect only after a restart cannot be committed or rolled back.

## Examples

- Example 1: COMMIT and ROLLBACK can be used in PL/SQL stored procedures.

```
CREATE TABLE EXAMPLE1(COL1 INT);
CREATE TABLE

CREATE OR REPLACE PROCEDURE TRANSACTION_EXAMPLE()
AS
BEGIN
  FOR i IN 0..20 LOOP
    INSERT INTO EXAMPLE1(COL1) VALUES (i);
    IF i % 2 = 0 THEN
      COMMIT;
    ELSE
      ROLLBACK;
    END IF;
  END LOOP;
END;
/
CREATE PROCEDURE
```

- Example 2:  
COMMIT and ROLLBACK can be used in stored procedures that contain EXCEPTION.  
COMMIT and ROLLBACK can be used in EXCEPTION statements of stored procedures.

DDL statements after COMMIT or ROLLBACK can be committed or rolled back.

```
CREATE OR REPLACE PROCEDURE TEST_COMMIT_INSERT_EXCEPTION_ROLLBACK()
AS
BEGIN
  DROP TABLE IF EXISTS TEST_COMMIT;
  CREATE TABLE TEST_COMMIT(A INT, B INT);
  INSERT INTO TEST_COMMIT SELECT 1, 1;
  COMMIT;
  CREATE TABLE TEST_ROLLBACK(A INT, B INT);
  RAISE EXCEPTION 'RAISE EXCEPTION AFTER COMMIT';
EXCEPTION
  WHEN OTHERS THEN
  INSERT INTO TEST_COMMIT SELECT 2, 2;
  ROLLBACK;
END;
/
CREATE PROCEDURE
```

- Example 3: A stored procedure that contains COMMIT or ROLLBACK (which means the stored procedure is controlled by BEGIN, START, or END) can be called in a transaction block.

```
BEGIN;
  CALL TEST_COMMIT_INSERT_EXCEPTION_ROLLBACK();
END;
```

```
NOTICE: table "test_commit" does not exist, skipping
CONTEXT: SQL statement "DROP TABLE IF EXISTS TEST_COMMIT"
PL/pgSQL function test_commit_insert_exception_rollback() line 3 at SQL statement
test_commit_insert_exception_rollback
-----
```

(1 row)

```
COMMIT
```

- Example 4: COMMIT and ROLLBACK, as well as IF, FOR, CURSOR LOOP, and WHILE, can be called in most PL/SQL contexts and statements.

```
CREATE OR REPLACE PROCEDURE TEST_COMMIT2()
IS
BEGIN
  DROP TABLE IF EXISTS TEST_COMMIT;
  CREATE TABLE TEST_COMMIT(A INT);
  FOR I IN REVERSE 3..0 LOOP
  INSERT INTO TEST_COMMIT SELECT I;
  COMMIT;
  END LOOP;
  FOR I IN REVERSE 2..4 LOOP
  UPDATE TEST_COMMIT SET A=I;
  COMMIT;
  END LOOP;
EXCEPTION
WHEN OTHERS THEN
  INSERT INTO TEST_COMMIT SELECT 4;
  COMMIT;
END;
/
CREATE PROCEDURE
```

- Example 5: Return values and simple expression calculation of stored procedures are supported.

```
CREATE OR REPLACE PROCEDURE exec_func3(RET_NUM OUT INT)
AS
BEGIN
  RET_NUM := 1+1;
  COMMIT;
END;
/
```

```
CREATE OR REPLACE PROCEDURE exec_func4(ADD_NUM IN INT)
AS
SUM_NUM INT;
BEGIN
SUM_NUM := ADD_NUM + exec_func3();
COMMIT;
END;
/
CREATE PROCEDURE
```

- Example 6: GUC parameters in stored procedures can be rolled back to a commit.

```
SHOW explain_perf_mode;
explain_perf_mode
-----
normal
(1 row)
SHOW enable_force_vector_engine;
enable_force_vector_engine
-----
off
(1 row)

CREATE OR REPLACE PROCEDURE GUC_ROLLBACK()
AS
BEGIN
    SET enable_force_vector_engine = on;
    COMMIT;
    SET explain_perf_mode TO pretty;
    ROLLBACK;
END;
/
CREATE PROCEDURE

call GUC_ROLLBACK();
guc_rollback
-----

(1 row)
SHOW explain_perf_mode;
explain_perf_mode
-----
normal
(1 row)
SHOW enable_force_vector_engine;
enable_force_vector_engine
-----
on
(1 row)
SET enable_force_vector_engine = off;
SET
```

- Example 7: COMMIT, ROLLBACK, and stored procedures that contain COMMIT or ROLLBACK cannot be called in functions.

```
CREATE OR REPLACE FUNCTION FUNCTION_EXAMPLE1() RETURN INT
AS
EXP INT;
BEGIN
    FOR i IN 0..20 LOOP
        INSERT INTO EXAMPLE1(col1) VALUES (i);
        IF i % 2 = 0 THEN
            COMMIT;
        ELSE
            ROLLBACK;
        END IF;
    END LOOP;
    SELECT COUNT(*) FROM EXAMPLE1 INTO EXP;
    RETURN EXP;
END;
```

- ```

/
CREATE FUNCTION

```
- Example 8: Stored procedures that contain COMMIT or ROLLBACK cannot be called in functions.**

```

CREATE OR REPLACE FUNCTION FUNCTION_EXAMPLE2() RETURN INT
AS
EXP INT;
BEGIN
-- transaction_example is a stored procedure and contains the COMMIT/ROLLBACK statement.
CALL transaction_example();
SELECT COUNT(*) FROM EXAMPLE1 INTO EXP;
RETURN EXP;
END;
/
CREATE FUNCTION

```
  - Example 9: A TRIGGER stored procedure cannot contain COMMIT or ROLLBACK or call another stored procedure that contains COMMIT or ROLLBACK.**

```

CREATE OR REPLACE FUNCTION FUNCTION_TRI_EXAMPLE2() RETURN TRIGGER
AS
EXP INT;
BEGIN
FOR i IN 0..20 LOOP
INSERT INTO EXAMPLE1(col1) VALUES (i);
IF i % 2 = 0 THEN
COMMIT;
ELSE
ROLLBACK;
END IF;
END LOOP;
SELECT COUNT(*) FROM EXAMPLE1 INTO EXP;
END;
/
CREATE FUNCTION

CREATE TRIGGER TRIGGER_EXAMPLE AFTER DELETE ON EXAMPLE1
FOR EACH ROW EXECUTE PROCEDURE FUNCTION_TRI_EXAMPLE2();
CREATE TRIGGER

DELETE FROM EXAMPLE1;
DELETE 0

```
  - Example 10: Stored procedures that contain IMMUTABLE or SHIPPABLE cannot call COMMIT, ROLLBACK, or another stored procedure that contains COMMIT or ROLLBACK.**

```

CREATE OR REPLACE PROCEDURE TRANSACTION_EXAMPLE1()
IMMUTABLE
AS
BEGIN
FOR i IN 0..20 LOOP
INSERT INTO EXAMPLE1 (col1) VALUES (i);
IF i % 2 = 0 THEN
COMMIT;
ELSE
ROLLBACK;
END IF;
END LOOP;
END;
/
CREATE PROCEDURE

```
  - Example 11: Variables declared or passed in stored procedures cannot be committed.**

```

CREATE OR REPLACE PROCEDURE TRANSACTION_EXAMPLE2(EXP_OUT OUT INT)
AS
EXP INT;
BEGIN

```

```

EXP_OUT := 0;
COMMIT;
DBE_OUTPUT.PRINT_LINE('EXP IS:'||EXP);
EXP_OUT := 1;
ROLLBACK;
DBE_OUTPUT.PRINT_LINE('EXP IS:'||EXP);
END;
/
CREATE PROCEDURE

```

- **Example 12: Calling in SQL statements (other than Select Procedure) is not supported.**

```

CREATE OR REPLACE PROCEDURE TRANSACTION_EXAMPLE3()
AS
BEGIN
  FOR i IN 0..20 LOOP
    INSERT INTO EXAMPLE1 (col1) VALUES (i);
    IF i % 2 = 0 THEN
      EXECUTE IMMEDIATE 'COMMIT';
    ELSE
      EXECUTE IMMEDIATE 'ROLLBACK';
    END IF;
  END LOOP;
END;
/
CREATE PROCEDURE

```

- **Example 13: COMMIT or ROLLBACK cannot be called in a stored procedure whose header contains GUC parameters.**

```

CREATE OR REPLACE PROCEDURE TRANSACTION_EXAMPLE4()
SET ARRAY_NULLS TO "ON"
AS
BEGIN
  FOR i IN 0..20 LOOP
    INSERT INTO EXAMPLE1 (col1) VALUES (i);
    IF i % 2 = 0 THEN
      COMMIT;
    ELSE
      ROLLBACK;
    END IF;
  END LOOP;
END;
/
CREATE PROCEDURE

```

- **Example 14: A stored procedure whose cursor is open cannot contain COMMIT or ROLLBACK.**

```

CREATE OR REPLACE PROCEDURE TRANSACTION_EXAMPLE5(INTIN IN INT, INTOUT OUT INT)
AS
BEGIN
  INTOUT := INTIN + 1;
  COMMIT;
END;
/
CREATE PROCEDURE

CREATE OR REPLACE PROCEDURE TRANSACTION_EXAMPLE6()

## 10.10 Other Statements

## 10.10.1 Lock Operations

GaussDB provides multiple lock modes to control concurrent accesses to table data. These modes are used when Multi-Version Concurrency Control (MVCC) cannot give expected behaviors. This is a lab feature. Contact Huawei technical support before using it. Alike, most GaussDB commands automatically apply appropriate locks to ensure that called tables are not deleted or modified in an incompatible manner during command execution. For example, when concurrent operations exist, **ALTER TABLE** cannot be executed on the same table.

## 10.10.2 Cursor Operations

GaussDB provides cursors as a data buffer for users to store execution results of SQL statements. Each cursor region has a name. Users can use SQL statements to obtain records one by one from cursors and grant the records to master variables, then being processed further by host languages.

Cursor operations include cursor definition, open, fetch, and close operations.

For the complete example of cursor operations, see [Explicit Cursor](#).

## 10.11 Cursors

### 10.11.1 Overview

To process SQL statements, the stored procedure process assigns a memory segment to store context association. Cursors are handles or pointers pointing to context regions. With cursors, stored procedures can control alterations in context regions.

---

#### NOTICE

- If JDBC is used to call a stored procedure whose returned value is a cursor, the returned cursor cannot be used.
- When a stored procedure contains COMMIT/ROLLBACK, an explicit cursor caches all data of the cursor to ensure that the cursor is still available after COMMIT/ROLLBACK. If the cursor data volume is large, this process may take a long time.
- After table data is modified in a stored procedure, the cursor related to the table is started, and the data in the fetch cursor continues after rollback. In this case, an error is reported.

---

Cursors are classified into explicit cursors and implicit cursors. [Table 10-2](#) shows the usage conditions of explicit and implicit cursors for different SQL statements.

**Table 10-2** Cursor usage conditions

SQL Statement	Cursor
Non-query statements	Implicit

SQL Statement	Cursor
Query statements with single-line results	Implicit or explicit
Query statements with multi-line results	Explicit

### 10.11.2 Explicit Cursor

An explicit cursor is used to process query statements, particularly when query results are multiple records.

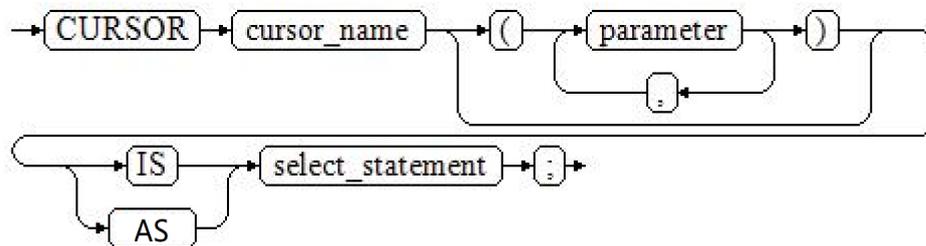

#### Procedure

An explicit cursor performs the following six PL/SQL steps to process query statements:

- Step 1** Define a static cursor: Define a cursor name and its corresponding **SELECT** statement.

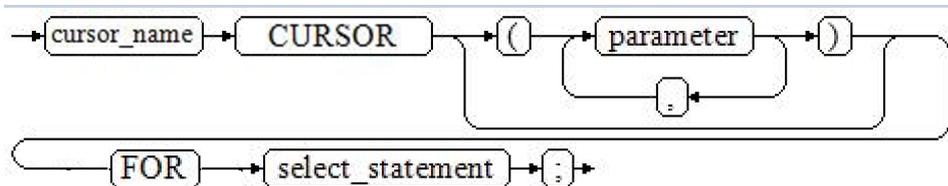

Figure 10-27 shows the syntax diagram for defining a static cursor.

Figure 10-27 static\_cursor\_define::=

or

Figure 10-28 static\_cursor\_define::=

Parameter description:

- *cursor\_name*: defines a cursor name.
- *parameter*: specifies cursor parameters. Only input parameters are allowed. Its format is as follows:

parameter\_name datatype

- *select\_statement*: specifies a query statement.

 **NOTE**

- The system automatically determines whether the cursor can be used for backward fetching based on the execution plan.
- In syntax, **parameter** can be an output parameter, but its behavior is the same as that of an input parameter.

Define a dynamic cursor: Define a **ref** cursor, which means that the cursor can be opened dynamically by a set of static SQL statements. Define the type of the **ref** cursor first, and then the cursor variable of this cursor type. Dynamically bind a **SELECT** statement through **OPEN FOR** when the cursor is opened.

**Figure 10-29** and **Figure 10-30** show the syntax diagrams for defining a dynamic cursor.

**Figure 10-29** cursor\_type\_name::=

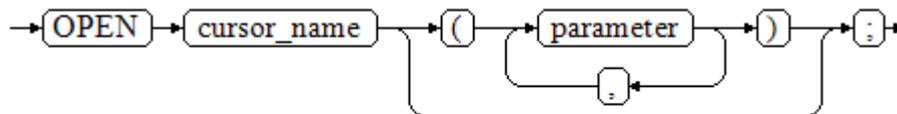

**Figure 10-30** dynamic\_cursor\_define::=

- Step 2** Open the static cursor: Execute the **SELECT** statement corresponding to the cursor. The query result is placed in the workspace and the pointer directs to the head of the workspace to identify the cursor result set. If the cursor query statement carries the **FOR UPDATE** option, the **OPEN** statement locks the data rows corresponding to the cursor result set in the database table.

**Figure 10-31** shows the syntax diagram for opening a static cursor.

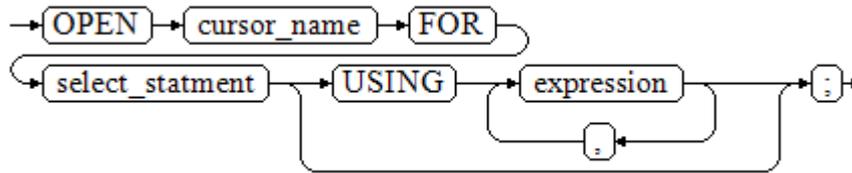

**Figure 10-31** open\_static\_cursor::=

Open the dynamic cursor: Use the **OPEN FOR** statement to open the dynamic cursor and the SQL statement is dynamically bound.

**Figure 10-32** shows the syntax diagrams for opening a dynamic cursor.

**Figure 10-32** open\_dynamic\_cursor::=

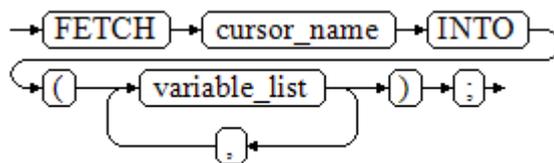

A PL/SQL program cannot use the **OPEN** statement to repeatedly open a cursor.

**Step 3** Fetch cursor data: Retrieve data rows in the result set and place them in specified output variables.

**Figure 10-33** shows the syntax diagrams for fetching cursor data.

**Figure 10-33** fetch\_cursor::=

**Step 4** Process the record.

**Step 5** Continue to process until the active set has no record.

**Step 6** Close the cursor: After you fetch and process the data in the cursor result set, close the cursor in time to release system resources used by the cursor and invalidate the workspace of the cursor so that the **FETCH** statement cannot be used to fetch data any more. A closed cursor can be reopened by an **OPEN** statement.

**Figure 10-34** shows the syntax diagram for closing a cursor.

**Figure 10-34** close\_cursor::=

----End

## Attributes

Cursor attributes are used to control program procedures or know program status. When a DML statement is executed, the PL/SQL opens a built-in cursor and processes its result. A cursor is a memory segment for maintaining query results. It is opened when a DML statement is executed and closed when the execution is finished. An explicit cursor has the following attributes:

- **%FOUND**: Boolean attribute, which returns **TRUE** if the last fetch returns a row.
- **%NOTFOUND**: Boolean attribute, which works opposite to the **%FOUND** attribute.

- **%ISOPEN**: Boolean attribute, which returns **TRUE** if the cursor has been opened.
- **%ROWCOUNT**: numeric attribute, which returns the number of records fetched from the cursor.

## Examples

DDL and DML statements are prepared. Subsequent examples in this section depend on this case.

```
gaussdb=# DROP SCHEMA IF EXISTS hr cascade;
gaussdb=# CREATE schema hr;
gaussdb=# SET current_schema = hr;
gaussdb=# DROP TABLE IF EXISTS sections;
gaussdb=# DROP TABLE IF EXISTS staffs;
gaussdb=# DROP TABLE IF EXISTS department;
-- Create a department table.
gaussdb=# CREATE TABLE sections(
    section_name varchar(100),
    place_id int,
    section_id int
);
gaussdb=# INSERT INTO sections VALUES ('hr',1,1);

-- Create an employee table.
gaussdb=# CREATE TABLE staffs(
    staff_id number(6),
    salary number(8,2),
    section_id int,
    first_name varchar(20)
);
gaussdb=# INSERT INTO staffs VALUES (1,100,1,'Tom');

-- Create a department table.
gaussdb=# CREATE TABLE department(
    section_id int

1
1
ANONYMOUS BLOCK EXECUTE

-- Delete the stored procedure.
DROP PROCEDURE proc_sys_ref;
DROP PROCEDURE
```

### 10.11.3 Implicit Cursor

Implicit cursors are automatically set by the system for non-query statements such as modify or delete operations, along with their workspace. Implicit cursors are named **SQL**, which is defined by the system.

#### Overview

Implicit cursor operations, such as definition, open, value-grant, and close operations, are automatically performed by the system and do not need users to process. Users can use only attributes related to implicit cursors to complete operations. In workspace of implicit cursors, the data of the latest SQL statement is stored and is not related to explicit cursors defined by users.

Format call: **SQL%**

#### NOTE

- **INSERT**, **UPDATE**, **DELETE**, and **SELECT** statements do not need defined cursors.
- In O-compatible mode, if the GUC parameter **behavior\_compat\_options** is set to **compat\_cursor**, implicit cursors are valid across stored procedures.

#### Attributes

An implicit cursor has the following attributes:

- **SQL%FOUND**: Boolean attribute, which returns **TRUE** if the last fetch returns a row.
- **SQL%NOTFOUND**: Boolean attribute, which works opposite to the **SQL%FOUND** attribute.
- **SQL%ROWCOUNT**: numeric attribute, which returns the number of records fetched from the cursor.
- **SQL%ISOPEN**: Boolean attribute, whose value is always **FALSE**. Close implicit cursors immediately after an SQL statement is run.

## Examples

```
-- Delete all employees in a department from the hr.staffs table. If the department has no employees,
-- delete the department from the hr.sections table.
CREATE OR REPLACE PROCEDURE proc_cursor3()
AS
  DECLARE
    V_DEPTNO NUMBER(4) := 100;
  BEGIN
    DELETE FROM hr.staffs WHERE section_ID = V_DEPTNO;
    -- Proceed based on cursor status.
    IF SQL%NOTFOUND THEN
      DELETE FROM hr.sections_t1 WHERE section_ID = V_DEPTNO;
    END IF;
  END;
/

CALL proc_cursor3();

-- Delete the stored procedure and the temporary table.
DROP PROCEDURE proc_cursor3;
```

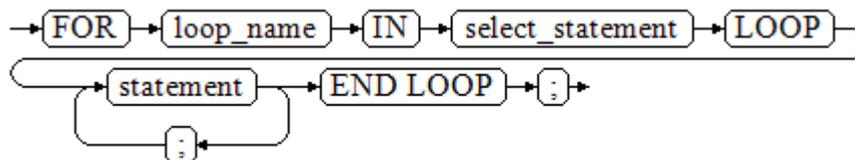

### 10.11.4 Cursor Loop

Use of cursors in **WHILE** and **LOOP** statements is called a cursor loop. Generally, **OPEN**, **FETCH**, and **CLOSE** statements are called in this kind of loop. The following describes a loop that simplifies a cursor loop without the need for these operations. This mode is applicable to a static cursor loop, without executing four steps about a static cursor.

## Syntax

Figure 10-35 shows the syntax diagram of the **FOR AS** loop.

Figure 10-35 FOR\_AS\_loop::=

## Precautions

- The **UPDATE** operation for the queried table is not allowed in the loop statement.
- The variable *loop\_name* is automatically defined and is valid only in this loop. Its type is the same as that in the query result of *select\_statement*. The value of *loop\_name* is the query result of *select\_statement*.
- The specific type of the **loop\_name** variable is not parsed during compilation. If the specific type needs to be parsed (for example, **loop\_name** is used as the input and output parameters of an overloaded function or stored procedure), a compilation error is reported. To parse the specific type of a variable, set **behavior\_compat\_options** to 'allow\_procedure\_compile\_check'.
- The **%FOUND**, **%NOTFOUND**, and **%ROWCOUNT** attributes access the same internal variable in GaussDB. Transactions and the anonymous block do not support multiple cursor accesses at the same time.

## Examples

```

BEGIN
FOR ROW_TRANS IN
    SELECT first_name FROM hr.staffs
LOOP
    DBE_OUTPUT.PRINT_LINE (ROW_TRANS.first_name );
END LOOP;
END;
/

-- Create a table.
CREATE TABLE integerTable1( A INTEGER);
CREATE TABLE integerTable2( B INTEGER);
INSERT INTO integerTable2 VALUES(2);

-- Multiple cursors share the parameters of cursor attributes.
DECLARE
CURSOR C1 IS SELECT A FROM integerTable1;-- Declare the cursor.
CURSOR C2 IS SELECT B FROM integerTable2;
PI_A INTEGER;
PI_B INTEGER;
BEGIN
OPEN C1;-- Open the cursor.
OPEN C2;
FETCH C1 INTO PI_A; ---- The values of C1%FOUND and C2%FOUND are FALSE.
FETCH C2 INTO PI_B; ---- The values of C1%FOUND and C2%FOUND are TRUE.
-- Determine the cursor status.
IF C1%FOUND THEN
    IF C2%FOUND THEN
        DBE_OUTPUT.PRINT_LINE('Dual cursor share parameter. ');
    END IF;
END IF;
CLOSE C1;-- Close the cursor.
CLOSE C2;
END;
/

-- Delete the temporary table.
DROP TABLE integerTable1;
DROP TABLE integerTable2;

```

## 10.12 Advanced Packages

Advanced packages have two sets of interfaces. The first set is basic interfaces, and the second set is secondary encapsulation interfaces that are used improve usability. The second set is recommended.

### 10.12.1 Basic Interfaces

#### 10.12.1.1 PKG\_SERVICE

[Table 10-3](#) lists all interfaces supported by the **PKG\_SERVICE** package.

**Table 10-3** PKG\_SERVICE

Interface	Description
<a href="#">PKG_SERVICE.SQL_IS_CONTEXT_ACTIVE</a>	Checks whether a context is registered.

Interface	Description
<a href="#">PKG_SERVICE.SQL_CLEAN_ALL_CONTEXTS</a>	Deregisters all registered contexts.
<a href="#">PKG_SERVICE.SQL_REGISTER_CONTEXT</a>	Registers a context.
<a href="#">PKG_SERVICE.SQL_UNREGISTER_CONTEXT</a>	Deregisters a context.
<a href="#">PKG_SERVICE.SQL_SET_SQL</a>	Sets a SQL statement for a context. Currently, only the SELECT statement is supported.
<a href="#">PKG_SERVICE.SQL_RUN</a>	Executes the configured SQL statement on a context.
<a href="#">PKG_SERVICE.SQL_NEXT_ROW</a>	Reads the next row of data in a context.
<a href="#">PKG_SERVICE.SQL_GET_VALUE</a>	Reads a dynamically defined column value in a context.
<a href="#">PKG_SERVICE.SQL_SET_RESULT_TYPE</a>	Dynamically defines a column of a context based on the type OID.
<a href="#">PKG_SERVICE.JOB_CANCEL</a>	Removes a scheduled task by task ID.
<a href="#">PKG_SERVICE.JOB_FINISH</a>	Disables or enables scheduled task execution.
<a href="#">PKG_SERVICE.JOB_SUBMIT</a>	Submits a scheduled task. Job ID can be automatically generated by the system or specified manually.
<a href="#">PKG_SERVICE.JOB_UPDATE</a>	Modifies user-definable attributes of a scheduled task, including the task content, next-execution time, and execution interval.
<a href="#">PKG_SERVICE.SUBMIT_ON_NODES</a>	Submits a task to all nodes. The task ID is automatically generated by the system.
<a href="#">PKG_SERVICE.ISUBMIT_ON_NODES</a>	Submits a job to all nodes. The job ID is specified by the user.
<a href="#">PKG_SERVICE.SQL_GET_ARRAY_RESULT</a>	Obtains the array value returned in the context.
<a href="#">PKG_SERVICE.SQL_GET_VARIABLE_RESULT</a>	Obtains the column value returned in the context.

- [PKG\\_SERVICE.SQL\\_IS\\_CONTEXT\\_ACTIVE](#)

This function checks whether a context is registered. This function transfers the ID of the context to be queried. If the context exists, **TRUE** is returned. Otherwise, **FALSE** is returned.

The prototype of the **PKG\_SERVICE.SQL\_IS\_CONTEXT\_ACTIVE** function is as follows:

```
PKG_SERVICE.SQL_IS_CONTEXT_ACTIVE(
 context_id IN INTEGER
)
RETURN BOOLEAN;
```

**Table 10-4** PKG\_SERVICE.SQL\_IS\_CONTEXT\_ACTIVE interface parameters

Parameter	Description
context_id	ID of the context to be queried

- **PKG\_SERVICE.SQL\_CLEAN\_ALL\_CONTEXTS**

This function cancels all contexts.

The prototype of the **PKG\_SERVICE.SQL\_CLEAN\_ALL\_CONTEXTS** function is as follows:

```
PKG_SERVICE.SQL_CLEAN_ALL_CONTEXTS(
)
RETURN VOID;
```

- **PKG\_SERVICE.SQL\_REGISTER\_CONTEXT**

This function opens a context, which is the prerequisite for the subsequent operations in the context. This function does not transfer any parameter. It automatically generates context IDs in an ascending order and returns values to integer variables.

The prototype of the **PKG\_SERVICE.SQL\_REGISTER\_CONTEXT** function is as follows:

```
DBE_SQL.REGISTER_CONTEXT(
)
RETURN INTEGER;
```

- **PKG\_SERVICE.SQL\_UNREGISTER\_CONTEXT**

This function closes a context, which is the end of each operation in the context. If this function is not called when the stored procedure ends, the memory is still occupied by the context. Therefore, remember to close a context when you do not need to use it. If an exception occurs, the stored procedure exits but the context is not closed. Therefore, you are advised to include this interface in the exception handling of the stored procedure.

The prototype of the **PKG\_SERVICE.SQL\_UNREGISTER\_CONTEXT** function is as follows:

```
PKG_SERVICE.SQL_UNREGISTER_CONTEXT(
 context_id IN INTEGER
)
RETURN INTEGER;
```

**Table 10-5** PKG\_SERVICE.SQL\_UNREGISTER\_CONTEXT interface parameters

Parameter	Description
context_id	ID of the context to be closed

- PKG\_SERVICE.SQL\_SET\_SQL

This function parses the query statement of a given context. The input query statement is executed immediately. Currently, only the **SELECT** query statement can be parsed. The statement parameters can be transferred only through the **TEXT** type. The length cannot exceed 1 GB.

The prototype of the **PKG\_SERVICE.SQL\_SET\_SQL** function is as follows:

```
PKG_SERVICE.SQL_SET_SQL(
context_id IN INTEGER,
query_string IN TEXT,
language_flag IN INTEGER
)
RETURN BOOLEAN;
```

**Table 10-6** PKG\_SERVICE.SQL\_SET\_SQL interface parameters

Parameter	Description
context_id	ID of the context whose query statement is to be parsed
query_string	Query statement to be parsed
language_flag	Version language number. Currently, only <b>1</b> is supported.

- PKG\_SERVICE.SQL\_RUN

This function executes a given context. It receives a context ID first, and the data obtained after execution is used for subsequent operations. Currently, only the **SELECT** query statement can be executed.

The prototype of the **PKG\_SERVICE.SQL\_RUN** function is as follows:

```
PKG_SERVICE.SQL_RUN(
context_id IN INTEGER,
)
RETURN INTEGER;
```

**Table 10-7** PKG\_SERVICE.SQL\_RUN interface parameters

Parameter	Description
context_id	ID of the context whose query statement is to be parsed

- PKG\_SERVICE.SQL\_NEXT\_ROW

This function returns the number of data rows returned after the SQL statement is executed. Each time the interface is executed, the system obtains a set of new rows until all data is read.

The prototype of the **PKG\_SERVICE.SQL\_NEXT\_ROW** function is as follows:

```
PKG_SERVICE.SQL_NEXT_ROW(  
context_id IN INTEGER,  
)  
RETURN INTEGER;
```

**Table 10-8** PKG\_SERVICE.SQL\_NEXT\_ROW interface parameters

Parameter	Description
context_id	ID of the context to be executed

- PKG\_SERVICE.SQL\_GET\_VALUE

This function returns the context element value in a specified position of a context and accesses the data obtained by **PKG\_SERVICE.SQL\_NEXT\_ROW**.

The prototype of the **PKG\_SERVICE.SQL\_GET\_VALUE** function is as follows:

```
PKG_SERVICE.SQL_GET_VALUE(  
context_id IN INTEGER,  
pos IN INTEGER,  
col_type IN ANYELEMENT  
)  
RETURN ANYELEMENT;
```

**Table 10-9** PKG\_SERVICE.SQL\_GET\_VALUE interface parameters

Parameter	Description
context_id	ID of the context to be executed
pos	Position of a dynamically defined column in the query
col_type	Variable of any type, which defines the return value type of columns

- PKG\_SERVICE.SQL\_SET\_RESULT\_TYPE

This function defines columns returned from a given context and can be used only for contexts defined by **SELECT**. The defined columns are identified by the relative positions in the query list. The prototype of **PKG\_SERVICE.SQL\_SET\_RESULT\_TYPE** is as follows:

```
PKG_SERVICE.SQL_SET_RESULT_TYPE(  
context_id IN INTEGER,  
pos IN INTEGER,  
coltype_oid IN ANYELEMENT,  
maxsize IN INTEGER  
)  
RETURN INTEGER;
```

**Table 10-10** PKG\_SERVICE.SQL\_SET\_RESULT\_TYPE interface parameters

Parameter	Description
context_id	ID of the context to be executed
pos	Position of a dynamically defined column in the query

Parameter	Description
coltype_oid	Variable of any type. The OID of the corresponding type can be obtained based on the variable type.
maxsize	Length of a defined column

- **PKG\_SERVICE.JOB\_CANCEL**

The stored procedure **CANCEL** deletes a specified task.

The prototype of the **PKG\_SERVICE.JOB\_CANCEL** function is as follows:

```
PKG_SERVICE.JOB_CANCEL(  
job IN INTEGER);
```

**Table 10-11** PKG\_SERVICE.JOB\_CANCEL interface parameters

Parameter	Type	Input/Output Parameter	Empty or Not	Description
id	integer	IN	No	Specifies the job ID.

Example:

```
CALL PKG_SERVICE.JOB_CANCEL(101);
```

- **PKG\_SERVICE.JOB\_FINISH**

The stored procedure **FINISH** disables or enables a scheduled task.

The prototype of the **PKG\_SERVICE.JOB\_FINISH** function is as follows:

```
PKG_SERVICE.JOB_FINISH(  
id IN INTEGER,  
broken IN BOOLEAN,  
next_time IN TIMESTAMP DEFAULT sysdate);
```

**Table 10-12** PKG\_SERVICE.JOB\_FINISH interface parameters

Parameter	Type	Input/Output Parameter	Empty or Not	Description
id	integer	IN	No	Specifies the job ID.
broken	Boolean	IN	No	Specifies the status flag, <b>true</b> for broken and <b>false</b> for not broken. The current job is updated based on the parameter value <b>true</b> or <b>false</b> . If the parameter is left empty, the job status remains unchanged.

Parameter	Type	Input/Output Parameter	Empty or Not	Description
next_time	timestamp	IN	Yes	Specifies the next execution time. The default value is the current system time. If <b>broken</b> is set to <b>true</b> , <b>next_time</b> is updated to '4000-1-1'. If <b>broken</b> is set to <b>false</b> and <b>next_time</b> is not empty, <b>next_time</b> is updated for the job. If <b>next_time</b> is empty, it will not be updated. This parameter can be omitted, and its default value will be used in this case.

- **PKG\_SERVICE.JOB\_SUBMIT**

The stored procedure **JOB\_SUBMIT** submits a scheduled task provided by the system.

The prototype of the **PKG\_SERVICE.JOB\_SUBMIT** function is as follows:

```
PKG_SERVICE.JOB_SUBMIT(
id      IN BIGINT,
content IN TEXT,
next_date IN TIMESTAMP DEFAULT sysdate,
interval_time IN TEXT DEFAULT 'null',
job      OUT INTEGER);
```

 **NOTE**

When a scheduled task (using **JOB**) is created, the system binds the current database and the username to the task by default. This function can be called by using **call** or **select**. If you call this function by using **select**, there is no need to specify output parameters. To call this function within a stored procedure, use **perform**. If the committed SQL statement task uses a non-public schema, specify the schema to a table schema or a function schema, or add **set current\_schema = xxx** before the SQL statement.

**Table 10-13** PKG\_SERVICE.JOB\_SUBMIT interface parameters

Parameter	Type	Input/Output Parameter	Empty or Not	Description
id	bigint	IN	No	Specifies the job ID. If the input ID is <b>NULL</b> , a job ID is generated internally.
context	text	IN	No	Specifies the SQL statement to be executed. One or multiple DMLs, anonymous blocks, and statements for calling stored procedures, or all three combined are supported.

Parameter	Type	Input/Output Parameter	Empty or Not	Description
next_time	timestamp	IN	No	Specifies the next time the job will be executed. The default value is the current system time ( <b>sysdate</b> ). If the specified time has past, the job is executed at the time it is submitted.
interval_time	text	IN	Yes	Calculates the next time to execute the job. It can be an interval expression, or <b>sysdate</b> followed by a numeric value, for example, <b>sysdate+1.0/24</b> . If this parameter is left empty or set to <b>null</b> , the job will be executed only once, and the job status will change to 'd' afterward.
job	integer	OUT	No	Specifies the job ID. The value ranges from 1 to 32767. When <b>pkg_service.job_submit</b> is called using <b>select</b> , this parameter can be omitted.

Example:

```
SELECT PKG_SERVICE.JOB_SUBMIT(NULL, 'call pro_xxx();', to_date('20180101','yyyymmdd'),'sysdate+1');
```

```
SELECT PKG_SERVICE.JOB_SUBMIT(NULL, 'call pro_xxx();', to_date('20180101','yyyymmdd'),'sysdate+1.0/24');
```

```
CALL PKG_SERVICE.JOB_SUBMIT(NULL, 'INSERT INTO T_JOB VALUES(1); call pro_1(); call pro_2();', add_months(to_date('201701','yyyymm'),1), 'date_trunc(''day'',SYSDATE) + 1 +(8*60+30.0)/(24*60)' ,:jobid);
```

```
SELECT PKG_SERVICE.JOB_SUBMIT (101, 'insert_msg_statistic1;', sysdate, 'sysdate+3.0/24');
```

- **PKG\_SERVICE.JOB\_UPDATE**

The stored procedure **UPDATE** modifies user-definable attributes of a task, including the task content, next-execution time, and execution interval.

The prototype of the **PKG\_SERVICE.JOB\_UPDATE** function is as follows:

```
PKG_SERVICE.JOB_UPDATE(
id          IN BIGINT,
next_time   IN TIMESTAMP,
interval_time IN TEXT,
content     IN TEXT);
```

**Table 10-14** PKG\_SERVICE.JOB\_UPDATE interface parameters

Parameter	Type	Input/Output Parameter	Empty or Not	Description
id	integer	IN	No	Specifies the job ID.
next_time	timestamp	IN	Yes	Specifies the next execution time. If this parameter is left empty, the system does not update the <b>next_time</b> parameter for the specified job. Otherwise, the system updates the <b>next_time</b> parameter for the specified job.
interval_time	text	IN	Yes	Specifies the time expression for calculating the next time the job will be executed. If this parameter is left empty, the system does not update the <b>interval_time</b> parameter for the specified job. Otherwise, the system updates the <b>interval_time</b> parameter for the specified job after necessary validity check. If this parameter is set to <b>null</b> , the job will be executed only once, and the job status will change to 'd' afterward.
content	text	IN	Yes	Specifies the name of the stored procedure or SQL statement block that is executed. If this parameter is left empty, the system does not update the <b>content</b> parameter for the specified job. Otherwise, the system updates the <b>content</b> parameter for the specified job.

Example:

```
CALL PKG_SERVICE.JOB_UPDATE(101, sysdate, 'sysdate + 1.0/1440', 'call userproc();');
CALL PKG_SERVICE.JOB_UPDATE(101, sysdate, 'sysdate + 1.0/1440', 'insert into tbl_a values(sysdate);');
```

- **PKG\_SERVICE.SUBMIT\_ON\_NODES**

Creates a scheduled job on a node. Only users sysadmin and monitor admin have this permission.

The prototype of the **PKG\_SERVICE.SUBMIT\_ON\_NODES** function is as follows:

```
PKG_SERVICE.SUBMIT_ON_NODES(
node_name IN NAME,
database IN NAME,
what IN TEXT,
next_date IN TIMESTAMP WITHOUT TIME ZONE,
```

```
job_interval IN TEXT,
job          OUT INTEGER);
```

**Table 10-15** PKG\_SERVICE.SUBMIT\_ON\_NODES interface parameters

Parameter	Type	Input/Output Parameter	Empty or Not	Description
node_name	text	IN	No	Specifies the node where a job is executed. Currently, the value can be <b>ALL_NODE</b> (the job is executed on all nodes) or <b>CCN</b> . (Note: <b>CCN</b> is invalid in a centralized or lite deployment environment.)
database	text	IN	No	Database used by a database instance job. When the node type is ' <b>ALL_NODE</b> ', the value can only be ' <b>postgres</b> '.
what	text	IN	No	Specifies the SQL statement to be executed. One or multiple DMLs, anonymous blocks, and statements for calling stored procedures, or all three combined are supported.
nextdate	timestamp	IN	No	Specifies the next time the job will be executed. The default value is the current system time ( <b>sysdate</b> ). If the specified time has past, the job is executed at the time it is submitted.
job_interval	text	IN	No	Calculates the next time to execute the job. It can be an interval expression, or <b>sysdate</b> followed by a numeric value, for example, <b>sysdate+1.0/24</b> . If this parameter is left empty or set to <b>null</b> , the job will be executed only once, and the job status will change to ' <b>d</b> ' afterward.
job	integer	OUT	No	Specifies the job ID. The value ranges from 1 to 32767. When <b>dbms.submit_on_nodes</b> is called using <b>select</b> , this parameter can be omitted.

Example:

```
select pkg_service.submit_on_nodes('ALL_NODE', 'postgres', 'select
capture_view_to_json("dbe_perf.statement", 0);', sysdate, 'interval "60 second"');
select pkg_service.submit_on_nodes('CCN', 'postgres', 'select
capture_view_to_json("dbe_perf.statement", 0);', sysdate, 'interval "60 second"');
```

- **PKG\_SERVICE.ISUBMIT\_ON\_NODES**  
**ISUBMIT\_ON\_NODES** has the same syntax function as **SUBMIT\_ON\_NODES**, but the first parameter of **ISUBMIT\_ON\_NODES** is an input parameter, that is, a specified task ID. In contrast, that last parameter of **ISUBMIT\_ON\_NODES** is an output parameter, indicating the task ID automatically generated by the system. Only users **sysadmin** and **monitor admin** have this permission.
- **PKG\_SERVICE.SQL\_GET\_ARRAY\_RESULT**

This function is used to return the value of the bound OUT parameter of the array type and obtain the OUT parameter in a stored procedure.

The prototype of the **PKG\_SERVICE.SQL\_GET\_ARRAY\_RESULT** function is as follows:

```
PKG_SERVICE.SQL_GET_ARRAY_RESULT(
    context_id in int,
    pos in VARCHAR2,
    column_value inout anyarray,
    result_type in anyelement
);
```

**Table 10-16** PKG\_SERVICE.SQL\_GET\_ARRAY\_RESULT parameters

Parameter	Description
context_id	ID of the context to be queried
pos	Name of the bound parameter
column_value	Return value
result_type	Return type

- **PKG\_SERVICE.SQL\_GET\_VARIABLE\_RESULT**  
This function is used to return the value of the bound OUT parameter of the non-array type and obtain the OUT parameter in a stored procedure.  
The prototype of the **PKG\_SERVICE.SQL\_GET\_VARIABLE\_RESULT** function is as follows:

```
PKG_SERVICE.SQL_GET_VARIABLE_RESULT(
    context_id in int,
    pos in VARCHAR2,
    result_type in anyelement
)
RETURNS anyelement;
```

**Table 10-17** PKG\_SERVICE.SQL\_GET\_VARIABLE\_RESULT parameters

Parameter	Description
context_id	ID of the context to be queried
pos	Name of the bound parameter
result_type	Return type

### 10.12.1.2 PKG\_UTIL

**Table 10-18** lists all interfaces supported by the PKG\_UTIL package.

**Table 10-18** PKG\_UTIL

Interface	Description
PKG_UTIL.LOB_GET_LENGTH	Obtains the length of a LOB.
PKG_UTIL.LOB_READ	Reads a part of a LOB.
PKG_UTIL.LOB_WRITE	Writes the source object to the target object in the specified format.
PKG_UTIL.LOB_APPEND	Appends the source LOB to the target LOB.
PKG_UTIL.LOB_COMPARE	Compares two LOBs based on the specified length.
PKG_UTIL.LOB_MATCH	Returns the position of the <i>M</i> th occurrence of a character string in a LOB.
PKG_UTIL.LOB_RESET	Resets the character in specified position of a LOB to a specified character.
PKG_UTIL.LOB_GET_LENGTH	Obtains and returns the specified length of a LOB.
PKG_UTIL.LOB_READ_HUGE	Reads a part of the LOB content based on the specified length and initial position offset, and returns the read LOB and length.
PKG_UTIL.LOB_WRITEAPPEND_HUGE	Reads the content of a specified length from the source BLOB or CLOB, appends the content to the target BLOB or CLOB, and returns the target object.
PKG_UTIL.LOB_APPEND_HUGE	Appends the source BLOB or CLOB to the target BLOB/CLOB and returns the target object.
PKG_UTIL.READ_BFILE_TO_BLOB	Loads the source BFILE file to the target BLOB and returns the target object.
PKG_UTIL.LOB_COPY_HUGE	Reads the content of a specified length from the specified offset position of the source BLOB or CLOB, writes the content to the specified offset position of the target BLOB or CLOB, and returns the target object.

Interface	Description
PKG_UTIL.BLOB_RESET	Sets a segment of data in a BLOB to the specified value and returns the processed BLOB and the actually processed length.
PKG_UTIL.CLOB_RESET	Sets a segment of data in a CLOB to spaces and returns the processed CLOB and the actually processed length.
PKG_UTIL.LOADBLOBFROMFILE	Reads the content of a specified length from the specified offset position of the source BFILE object, writes the content to the specified offset position of the target BLOB, and returns the target object, read position, and write position.
PKG_UTIL.LOADCLOBFROMFILE	Reads the content of a specified length from the specified offset position of the source BFILE object, writes the content to the specified offset position of the target CLOB, and returns the target object, read position, and write position.
PKG_UTIL.LOB_CONVERTTOBLOB_HUGE	Reads the content of a specified length from the specified offset position of the source CLOB, converts the content into a BLOB, and writes the BLOB to the specified position of target LOB. <i>amount</i> indicates the length to be converted.
PKG_UTIL.LOB_CONVERTTOCLOB_HUGE	Reads the content of a specified length from the specified offset position of the source CLOB, converts the content into a CLOB, and writes the CLOB to the specified position of target LOB. <i>amount</i> indicates the length to be converted.
PKG_UTIL.BFILE_GET_LENGTH	Obtains and returns the specified length of a BFILE file.
PKG_UTIL.BFILE_OPEN	Opens a BFILE file and returns its file descriptor.
PKG_UTIL.BFILE_CLOSE	Closes a BFILE file.

Interface	Description
PKG_UTIL.LOB_WRITE_HUGE	Reads the specified length of the source object from the start position, writes the content to the specified offset position of the target LOB, overrides the original content, and returns the target LOB.
PKG_UTIL.IO_PRINT	Displays character strings.
PKG_UTIL.RAW_GET_LENGTH	Obtains the length of <b>RAW</b> data.
PKG_UTIL.RAW_CAST_FROM_VARCHAR2	Converts <b>VARCHAR2</b> data to <b>RAW</b> data.
PKG_UTIL.RAW_CAST_FROM_BINARY_INTEGER	Converts binary integers to <b>RAW</b> data.
PKG_UTIL.RAW_CAST_TO_BINARY_INTEGER	Converts <b>RAW</b> data to binary integers.
PKG_UTIL.SET_RANDOM_SEED	Sets a random seed.
PKG_UTIL.RANDOM_GET_VALUE	Returns a random value.
PKG_UTIL.FILE_SET_DIRNAME	Sets the directory to be operated.
PKG_UTIL.FILE_OPEN	Opens a file based on the specified file name and directory.
PKG_UTIL.FILE_SET_MAX_LINE_SIZE	Sets the maximum length of a line to be written to a file.
PKG_UTIL.FILE_IS_CLOSE	Checks whether a file handle is closed.
PKG_UTIL.FILE_READ	Reads data of a specified length from an open file handle.
PKG_UTIL.FILE_READLINE	Reads a line of data from an open file handle.
PKG_UTIL.FILE_WRITE	Writes the data specified in the buffer to a file.
PKG_UTIL.FILE_WRITELINE	Writes the buffer to a file and adds newline characters.
PKG_UTIL.FILE_NEWLINE	Adds a line.
PKG_UTIL.FILE_READ_RAW	Reads binary data of a specified length from an open file handle.
PKG_UTIL.FILE_WRITE_RAW	Writes binary data to a file.
PKG_UTIL.FILE_FLUSH	Writes data from a file handle to a physical file.
PKG_UTIL.FILE_CLOSE	Closes an open file handle.

Interface	Description
PKG_UTIL.FILE_REMOVE	Deletes a physical file. To do so, you must have the corresponding permission.
PKG_UTIL.FILE_RENAME	Renames a file on the disk, similar to <b>mv</b> in Unix.
PKG_UTIL.FILE_SIZE	Returns the size of a file.
PKG_UTIL.FILE_BLOCK_SIZE	Returns the number of blocks contained in a file.
PKG_UTIL.FILE_EXISTS	Checks whether a file exists.
PKG_UTIL.FILE_GETPOS	Specifies the offset of a returned file, in bytes.
PKG_UTIL.FILE_SEEK	Sets the offset for file position.
PKG_UTIL.FILE_CLOSE_ALL	Closes all file handles opened in a session.
PKG_UTIL.EXCEPTION_REPORT_ERROR	Throws an exception.
PKG_UTIL.RANDOM_SET_SEED	Sets a random seed.
pkg_util.app_read_client_info	Reads the client information.
pkg_util.app_set_client_info	Sets the client information.
pkg_util.lob_converttoblob	Converts the CLOB type to the BLOB type.
pkg_util.lob_converttoclob	Converts the BLOB type to the CLOB type.
pkg_util.lob_rawtotext	Converts the raw type to the text type.
pkg_util.lob_reset	Clears data of the LOB type.
pkg_util.lob_texttoraw	Converts the text type to the raw type.
pkg_util.lob_write	Writes data to the LOB type.
pkg_util.match_edit_distance_similarity	Calculates the difference between two character strings.
pkg_util.raw_cast_to_varchar2	Converts the raw type to the varchar2 type.
pkg_util.session_clear_context	Clears the attribute values in <b>session_context</b> .
pkg_util.session_search_context	Searches for an attribute value.
pkg_util.session_set_context	Sets an attribute value.

Interface	Description
pkg_util.utility_format_call_stack	Displays the call stack of a stored procedure.
pkg_util.utility_format_error_backtrace	Displays the error stack of a stored procedure.
pkg_util.utility_format_error_stack	Displays the error information about a stored procedure.
pkg_util.utility_get_time	Displays the Unix timestamp of the system.
pkg_util.utility_compile_schema	Recompiles packages, functions and stored procedures under the specified schema. If an error is reported when compiling a PL/SQL object, the PL/SQL object is returned and the recompilation stops. This package has been discarded. <b>pkg_util.gs_compile_schema</b> is recommended.
pkg_util.gs_compile_schema	Recompiles packages, functions and stored procedures under the specified schema. If an error is reported when compiling a PL/SQL object, the exception is captured and the recompilation continues to compile other objects until all objects are compiled or the number of recompilation attempts reaches the upper limit.  When the advanced package is executed through JDBC, the SQLSTATE 00000 is displayed, which indicates that the operation is successful. For details, see "Standard SQL Error Codes" in <i>Error Code Reference</i> .

- **PKG\_UTIL.LOB\_GET\_LENGTH**

Obtains the length of the input data.

The prototype of the PKG\_UTIL.LOB\_GET\_LENGTH function is as follows:

```

PKG_UTIL.LOB_GET_LENGTH(
lob   IN CLOB
)
RETURN INTEGER;

PKG_UTIL.LOB_GET_LENGTH(
lob   IN BLOB
)
RETURN INTEGER;
```

**Table 10-19** PKG\_UTIL.LOB\_GET\_LENGTH parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
lob	clob / blob	IN	No	Indicates the object whose length is to be obtained.

- **PKG\_UTIL.LOB\_READ**

Reads an object and returns the specified part.

The prototype of the PKG\_UTIL.LOB\_READ function is as follows:

```
PKG_UTIL.LOB_READ(
lob      IN anyelement,
len      IN int,
start    IN int,
mode     IN int
)
RETURN ANYELEMENT
```

**Table 10-20** PKG\_UTIL.LOB\_READ parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
lob	clob/ blob	IN	No	Specifies CLOB or BLOB data.
len	int	IN	No	Specifies the length of the returned result.
start	int	IN	No	Specifies the offset to the first character.
mode	int	IN	No	Specifies the type of the read operation. <b>0</b> indicates <b>READ</b> , <b>1</b> indicates <b>TRIM</b> , and <b>2</b> indicates <b>SUBSTR</b> .

- **PKG\_UTIL.LOB\_WRITE**

Writes the source object to the target object based on the specified parameters and returns the target object.

The prototype of the PKG\_UTIL.LOB\_WRITE function is as follows:

```
PKG_UTIL.LOB_WRITE(
dest_lob INOUT blob,
src_lob  IN raw
len      IN int,
start_pos IN bigint
)
RETURN BLOB;
```

```

PKG_UTIL.LOB_WRITE(
dest_lob INOUT clob,
src_lob IN varchar2
len IN int,
start_pos IN bigint
)
RETURN CLOB;
    
```

**Table 10-21** PKG\_UTIL.LOB\_WRITE parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
dest_lob	clob/blob	INOUT	No	Specifies the target object that data will be written to.
src_lob	clob/blob	IN	No	Specifies the source object to be written.
len	int	IN	No	Specifies the write length of the source object.
start_pos	bigint	IN	No	Specifies the write start position of the target object.

- **PKG\_UTIL.LOB\_APPEND**

Appends the source object to the target BLOB/CLOB and returns the target BLOB/CLOB.

The prototype of the PKG\_UTIL.LOB\_APPEND function is as follows:

```

PKG_UTIL.LOB_APPEND(
dest_lob INOUT blob,
src_lob IN blob,
len IN int default NULL
)
RETURN BLOB;

PKG_UTIL.LOB_APPEND(
dest_lob INOUT clob,
src_lob IN clob,
len IN int default NULL
)
RETURN CLOB;
    
```

**Table 10-22** PKG\_UTIL.LOB\_APPEND parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
dest_lob	blob / clob	INOUT	No	Specifies the target BLOB/CLOB that data will be written to.

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
src_lob	blob / clob	IN	No	Specifies the source BLOB/CLOB to be written.
len	int	IN	Yes	Length read from <i>src</i> and appended to <i>dest</i> . The default value is null, indicating that all content of <i>src</i> is read and appended to <i>dest</i> .

- **PKG\_UTIL.LOB\_COMPARE**

Checks whether objects are the same based on the specified start position and size. If **lob1** is larger, **1** is returned. If **lob2** is larger, **-1** is returned. If **lob1** is equal to **lob2**, **0** is returned.

The prototype of the PKG\_UTIL.LOB\_COMPARE function is as follows:

```
PKG_UTIL.LOB_COMPARE(
lob1    IN anyelement,
lob2    IN anyelement,
len     IN int default 1073741771,
start_pos1 IN int default 1,
start_pos2 IN int default 1
)
RETURN INTEGER;
```

**Table 10-23** PKG\_UTIL.LOB\_COMPARE parameters

Parameter	Type	Input / Output Parameter	Can Be Empty	Description
lob1	clob/ blob	IN	No	Indicates the character string for comparison.
lob2	clob/ blob	IN	No	Indicates the character string for comparison.
len	int	IN	No	Indicates the length to be compared.
start_pos1	int	IN	No	Specifies the start offset of <b>lob1</b> .
start_pos2	int	IN	No	Specifies the start offset of <b>lob2</b> .

- **PKG\_UTIL.LOB\_MATCH**

Returns the position where a pattern is displayed in a LOB for the *match\_nth* time.

The prototype of the PKG\_UTIL.LOB\_MATCH function is as follows:

```
PKG_UTIL.LOB_MATCH(
lob      IN anyelement,
pattern  IN anyelement,
start    IN int,
match_nth IN int default 1
)
RETURN INTEGER;
```

**Table 10-24** PKG\_UTIL.LOB\_MATCH parameters

Parameter	Type	Input / Output Parameter	Can Be Empty	Description
lob	clob/blob	IN	No	Indicates the character string for comparison.
pattern	clob/blob	IN	No	Specifies the pattern to be matched.
start	int	IN	No	Specifies the start position for LOB comparison.
match_nth	int	IN	No	Specifies the matching times.

- PKG\_UTIL.LOB\_RESET

Clears a character string and resets the string to the value of **value**.

The prototype of the PKG\_UTIL.LOB\_RESET function is as follows:

```
PKG_UTIL.LOB_RESET(
lob      INOUT blob,
len      INOUT int,
start    IN int DEFAULT 1,
value    IN int default 0
)
RETURN record;
```

**Table 10-25** PKG\_UTIL.LOB\_RESET parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
lob	blob	IN	No	Indicates the character string for reset.
len	int	IN	No	Specifies the length of the string to be reset.
start	int	IN	No	Specifies the start position for reset.
value	int	IN	Yes	Sets characters. Default value: '0'

- **PKG\_UTIL.LOB\_GET\_LENGTH**

Obtains and returns the specified length of a LOB.

The prototype of the PKG\_UTIL.LOB\_GET\_LENGTH function is as follows:

```
PKG_UTIL.LOB_GET_LENGTH(
  lob IN blob)
RETURN BIGINT;

PKG_UTIL.LOB_GET_LENGTH(
  lob IN clob)
RETURN BIGINT;
```

**Table 10-26** PKG\_UTIL.LOB\_GET\_LENGTH parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
lob	BLOB/ CLOB	IN	No	LOB type

**PKG\_UTIL.LOB\_READ\_HUGE**

Reads a part of the LOB content based on the specified length and initial position offset, and returns the read LOB and length.

The prototype of the PKG\_UTIL.LOB\_READ\_HUGE function is as follows:

```
PKG_UTIL.LOB_READ_HUGE(
  lob IN CLOB,
  len IN BIGINT,
  start_pos IN BIGINT,
  mode IN INTEGER)
RETURN RECORD;

PKG_UTIL.LOB_READ_HUGE(
  lob IN BLOB,
  len IN BIGINT,
  start_pos IN BIGINT,
  mode IN INTEGER)
RETURN RECORD;

PKG_UTIL.LOB_READ_HUGE(
  fd IN INTEGER,
  len IN BIGINT,
  start_pos IN BIGINT,
  mode IN INTEGER)
RETURN RECORD;
```

**Table 10-27** PKG\_UTIL.LOB\_READ\_HUGE parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
lob/fd	BLOB/ CLOB/ INTEGER	IN	No	File descriptor of the specified LOB or BFILE file.
len	BIGINT	IN	No	Length to read.
start_pos	BIGINT	IN	No	Offset position from which read starts.
mode	INTEGER	IN	No	Read mode ( <b>0</b> : read, <b>1</b> : trim, <b>2</b> : substr).

- **PKG\_UTIL.LOB\_WRITEAPPEND\_HUGE**

Reads the content of a specified length from the source BLOB or CLOB, appends the content to the target BLOB or CLOB, and returns the target object.

The prototype of the PKG\_UTIL.LOB\_WRITEAPPEND\_HUGE function is as follows:

```
PKG_UTIL.LOB_WRITEAPPEND_HUGE(  
  dest_lob INOUT CLOB,  
  len IN INTEGER,  
  src_lob IN VARCHAR2  
)RETURN CLOB;
```

```
PKG_UTIL.LOB_WRITEAPPEND_HUGE(  
  dest_lob INOUT BLOB,  
  len IN INTEGER,  
  src_lob IN RAW  
)RETURN BLOB;
```

**Table 10-28** PKG\_UTIL.LOB\_WRITEAPPEND\_HUGE parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
dest_lob	BLOB/ CLOB	INOUT	No	Target BLOB/CLOB to which data is written.

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
len	INTEGER	IN	Yes	Length of the source object to be written. If the value is <b>NULL</b> , the entire source object is written by default.
src_lob	VARCHAR2/RAW	IN	No	BLOB/CLOB from which data is to be written.

- **PKG\_UTIL.LOB\_APPEND\_HUGE**

Appends the source BLOB or CLOB to the target BLOB/CLOB and returns the target object.

The prototype of the PKG\_UTIL.LOB\_APPEND\_HUGE function is as follows:

```
PKG_UTIL.LOB_APPEND_HUGE(
  dest_lob INOUT BLOB,
  src_lob IN BLOB)
RETURN BLOB;
PKG_UTIL.LOB_APPEND_HUGE(
  dest_lob INOUT CLOB,
  src_lob IN CLOB)
RETURN CLOB;
```

**Table 10-29** PKG\_UTIL.LOB\_APPEND\_HUGE parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
dest_lob	BLOB/CLOB	INOUT	No	Target BLOB/CLOB to which data is written.
src_lob	BLOB/CLOB	IN	No	BLOB/CLOB from which data is to be written.

- **PKG\_UTIL.READ\_BFILE\_TO\_BLOB**

Loads the source BFILE file to the target BLOB and returns the target object.

The prototype of the PKG\_UTIL.READ\_BFILE\_TO\_BLOB function is as follows:

```
PKG_UTIL.READ_BFILE_TO_BLOB(
  fd IN INTEGER)
RETURN BLOB;
```

**Table 10-30** PKG\_UTIL.READ\_BFILE\_TO\_BLOB parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
fd	BFILE	IN	No	Source BFILE file to be read.

- PKG\_UTIL.LOB\_COPY\_HUGE

Reads the content of a specified length from the specified offset position of the source BLOB or CLOB, writes the content to the specified offset position of the target BLOB or CLOB, and returns the target object.

The prototype of the PKG\_UTIL.LOB\_COPY\_HUGE function is as follows:

```

PKG_UTIL.LOB_COPY_HUGE(
  lob_obj INOUT BLOB,
  source_obj IN BLOB,
  amount IN BIGINT,
  dest_offset IN BIGINT DEFAULT 1,
  src_offset IN BIGINT DEFAULT 1
)RETURN BLOB;

PKG_UTIL.LOB_COPY_HUGE(
  lob_obj INOUT CLOB,
  source_obj IN CLOB,
  amount IN BIGINT,
  dest_offset IN BIGINT DEFAULT 1,
  src_offset IN BIGINT DEFAULT 1
)RETURN CLOB;

```

**Table 10-31** PKG\_UTIL.LOB\_COPY\_HUGE parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
lob_obj	BLOB/CLOB	INOUT	No	Target BLOB/CLOB.
source_obj	BLOB/CLOB	IN	No	Source BLOB/CLOB.
amount	BIGINT	IN	No	Length of the data to be copied (in bytes for BLOBs or in characters for CLOBs).
dest_offset	BIGINT	IN	No	Offset position of the target LOB to which the data is loaded.
src_offset	BIGINT	IN	No	Offset position of the source LOB from which the data is read.

- **PKG\_UTIL.BLOB\_RESET**

Sets a segment of data in a BLOB to the specified value and returns the processed BLOB and the actually processed length.

The prototype of the PKG\_UTIL.BLOB\_RESET function is as follows:

```
PKG_UTIL.BLOB_RESET(
  lob      INOUT BLOB,
  len      INOUT BIGINT,
  start_pos IN  BIGINT DEFAULT 1,
  value    IN  INTEGER DEFAULT 0
)RETURN RECORD;
```

**Table 10-32** PKG\_UTIL.BLOB\_RESET parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
lob	BLOB	INOUT	No	LOB to be reset.
len	INTEGER	INOUT	No	Length to reset, in bytes.
start	INTEGER	IN	No	Specifies the start position for reset.
value	INTEGER	IN	Yes	Sets characters. Default value: '0'.

- **PKG\_UTIL.CLOB\_RESET**

Sets a piece of data to spaces.

The prototype of the PKG\_UTIL.CLOB\_RESET function is as follows:

```
PKG_UTIL.CLOB_RESET(
  lob      INOUT CLOB,
  len      INOUT BIGINT,
  start_pos IN  BIGINT DEFAULT 1
)RETURN RECORD;
```

**Table 10-33** PKG\_UTIL.CLOB\_RESET parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
lob	CLOB	INOUT	No	LOB to be reset.

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
len	INTEGER	INOUT	No	Length to reset, in characters.
start	INTEGER	IN	No	Reset start position. The default value is 1.

- **PKG\_UTIL.LOADBLOBFROMFILE**

Reads the content of a specified length from the specified offset position of the source BFILE object, writes the content to the specified offset position of the target BLOB, and returns the target object, read position, and write position.

The prototype of the PKG\_UTIL.LOADBLOBFROMFILE function is as follows:

```
PKG_UTIL.LOADBLOBFROMFILE(
  dest_lob INOUT BLOB,
  fd       IN   INTEGER,
  amount   IN   BIGINT,
  dest_offset INOUT BIGINT,
  file_offset INOUT BIGINT
)RETURN RECORD;
```

**Table 10-34** PKG\_UTIL.LOADBLOBFROMFILE parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
dest_lob	BLOB	INOUT	No	Target BLOB as the INOUT parameter.
fd	INTEGER	IN	No	File descriptor of the source BFILE object.
amount	BIGINT	IN	No	Length of the data to be copied (in bytes for BLOBs or in characters for CLOBs).
dest_offset	BIGINT	INOUT	No	Offset position of the target LOB to which the data is written as the INOUT parameter.
src_offset	BIGINT	INOUT	No	Offset position of the source BFILE file from which the data is read as the INOUT parameter.

- **PKG\_UTIL.LOADCLOBFROMFILE**

Reads the content of a specified length from the specified offset position of the source BFILE object, writes the content to the specified offset position of the target CLOB, and returns the target object, read position, and write position.

The prototype of the PKG\_UTIL.LOADCLOBFROMFILE function is as follows:

```
PKG_UTIL.LOADCLOBFROMFILE(
  dest_lob INOUT CLOB,
  fd      IN  INTEGER,
  amount  IN  BIGINT,
  dest_offset INOUT BIGINT,
  file_offset INOUT BIGINT
)RETURN RECORD;
```

**Table 10-35** PKG\_UTIL.LOADCLOBFROMFILE parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
dest_lob	CLOB	INOUT	No	Target CLOB as the INOUT parameter.
fd	INTEGER	IN	No	File descriptor of the source BFILE object.
amount	BIGINT	IN	No	Length to copy (in characters for CLOBs).
dest_offset	BIGINT	INOUT	No	Offset position of the target LOB to which the data is written as the INOUT parameter.
src_offset	BIGINT	INOUT	No	Offset position of the source BFILE file from which the data is read as the INOUT parameter.

- PKG\_UTIL.LOB\_CONVERTTOBLOB\_HUGE

Reads the content of a specified length from the specified offset position of the source CLOB, converts the content into a BLOB, and writes the BLOB to the specified position of target LOB. *amount* indicates the length to be converted.

The prototype of the PKG\_UTIL.LOB\_CONVERTTOBLOB\_HUGE function is as follows:

```
PKG_UTIL.LOB_CONVERTTOBLOB_HUGE(
  dest_lob INOUT BLOB,
  src_clob IN  CLOB,
  amount  IN  BIGINT,
  dest_offset INOUT BIGINT,
  src_offset INOUT BIGINT
)RETURN RECORD;
```

**Table 10-36** PKG\_UTIL.LOB\_CONVERTTOBLOB\_HUGE parameters

Parameter	Description
dest_lob	Target LOB.
src_clob	CLOB to be converted.
amount	Length to convert, in characters.
dest_offset	Offset position of the target LOB to which the data is written as the INOUT parameter.
src_offset	Offset position of the source CLOB from which the data is read as the INOUT parameter.

- PKG\_UTIL.LOB\_CONVERTTOCLOB\_HUGE

Reads the content of a specified length from the specified offset position of the source CLOB, converts the content into a CLOB, and writes the CLOB to the specified position of target LOB. *amount* indicates the length to be converted.

The prototype of the PKG\_UTIL.LOB\_CONVERTTOCLOB\_HUGE function is as follows:

```
PKG_UTIL.LOB_CONVERTTOCLOB_HUGE(
  dest_lob INOUT CLOB,
  src_blob IN BLOB,
  amount IN BIGINT,
  dest_offset INOUT BIGINT,
  src_offset INOUT BIGINT)
)RETURN RECORD;
```

**Table 10-37** PKG\_UTIL.LOB\_CONVERTTOCLOB\_HUGE parameters

Parameter	Description
dest_lob	Target LOB.
src_blob	BLOB to be converted.
amount	Length to convert, in bytes.
dest_offset	Offset position of the target LOB to which the data is written as the INOUT parameter.
src_offset	Offset position of the source CLOB from which the data is read as the INOUT parameter.

- PKG\_UTIL.BFILE\_GET\_LENGTH

Obtains and returns the specified length of a BFILE file.

The prototype of the PKG\_UTIL.BFILE\_GET\_LENGTH function is as follows:

```
PKG_UTIL.BFILE_GET_LENGTH(
  fd INTEGER
)RETURN BIGINT;
```

**Table 10-38** PKG\_UTIL.LOB\_GET\_LENGTH parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
fd	INTEGER	IN	No	File descriptor of the specified BFILE file.

- PKG\_UTIL.BFILE\_OPEN

Opens a BFILE file and returns its file descriptor.

The prototype of the PKG\_UTIL.BFILE\_OPEN function is as follows:

```
PKG_UTIL.BFILE_OPEN(
  file_name TEXT,
  open_mode TEXT)
RETURN INTEGER;
```

**Table 10-39** PKG\_UTIL.BFILE\_OPEN parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
file_name	TEXT	IN	No	Name of the specified BFILE file.
open_mode	TEXT	IN	No	Open mode, which can only be set to r, that is, the read mode.

- PKG\_UTIL.BFILE\_CLOSE

Closes a BFILE file.

The prototype of the PKG\_UTIL.BFILE\_CLOSE function is as follows:

```
PKG_UTIL.BFILE_CLOSE(
  fd INTEGER)
RETURN bool;
```

**Table 10-40** PKG\_UTIL.BFILE\_CLOSE parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
fd	INTEGER	IN	No	File descriptor of the specified BFILE file.

- PKG\_UTIL.LOB\_WRITE\_HUGE

Reads the specified length of the source object from the start position, writes the content to the specified offset position of the target LOB, overrides the original content, and returns the target LOB.

The prototype of the PKG\_UTIL.LOB\_WRITE\_HUGE function is as follows:

```
PKG_UTIL.LOB_WRITE_HUGE(
  dest_lob INOUT BLOB,
  len      IN INTEGER,
  start_pos IN BIGINT,
  src_lob  IN RAW
)RETURN BLOB;
```

```
PKG_UTIL.LOB_WRITE_HUGE(
  dest_lob INOUT CLOB,
  len      IN INTEGER,
  start_pos IN BIGINT,
  src_lob  IN VARCHAR2
)RETURN CLOB;
```

**Table 10-41** PKG\_UTIL.LOB\_WRITE\_HUGE parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
dest_lob	BLOB/CLOB	INOUT	No	Target LOB as the INOUT parameter, to which the content is to be written.
len	INTEGER	IN	No	Length of the data to be written (in bytes for BLOBs or in characters for CLOBs)
start_pos	BIGINT	IN	No	Offset position for writing data to <i>dest_lob</i>
src_lob	RAW/VARCHAR2	IN	No	Source LOB.

- PKG\_UTIL.IO\_PRINT

Outputs a string.

The prototype of the PKG\_UTIL.IO\_PRINT function is as follows:

```
PKG_UTIL.IO_PRINT(
  format      IN text,
  is_one_line IN boolean
)
RETURN void;
```

**Table 10-42** PKG\_UTIL.IO\_PRINT parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
format	text	IN	No	Indicates the character string to be output.
is_one_line	boolean	IN	No	Indicates whether to output the string as a line.

- PKG\_UTIL.RAW\_GET\_LENGTH

Obtains the length of RAW data.

The prototype of the PKG\_UTIL.RAW\_GET\_LENGTH function is as follows:

```
PKG_UTIL.RAW_GET_LENGTH(  
value IN raw  
)  
RETURN integer;
```

**Table 10-43** PKG\_UTIL.RAW\_GET\_LENGTH parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
raw	raw	IN	No	Indicates the object whose length is to be obtained.

- PKG\_UTIL.RAW\_CAST\_FROM\_VARCHAR2

Converts VARCHAR2 data to RAW data.

The prototype of the PKG\_UTIL.RAW\_CAST\_FROM\_VARCHAR2 function is as follows:

```
PKG_UTIL.RAW_CAST_FROM_VARCHAR2(  
str IN varchar2  
)  
RETURN raw;
```

**Table 10-44** PKG\_UTIL.RAW\_CAST\_FROM\_VARCHAR2 parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
str	varchar2	IN	No	Indicates the source data to be converted

- PKG\_UTIL.RANDOM\_SET\_SEED

Sets a random seed.

The prototype of the **PKG\_UTIL.RANDOM\_SET\_SEED** function is as follows:

```
PKG_UTIL.RANDOM_SET_SEED(
seed      IN int
)
RETURN integer;
```

**Table 10-45** PKG\_UTIL.RANDOM\_SET\_SEED parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
seed	int	IN	No	Sets a random seed.

- PKG\_UTIL.RANDOM\_GET\_VALUE

Returns a 15-digit random number ranging from 0 to 1.

The prototype of the **PKG\_UTIL.RANDOM\_GET\_VALUE** function is as follows:

```
PKG_UTIL.RANDOM_GET_VALUE(
)
RETURN numeric;
```

- PKG\_UTIL.FILE\_SET\_DIRNAME

Sets the directory to be operated. It must be called to set directory for each operation involving a single directory.

The prototype of the **PKG\_UTIL.FILE\_SET\_DIRNAME** function is as follows:

```
PKG_UTIL.FILE_SET_DIRNAME(
dir IN text
)
RETURN bool
```

**Table 10-46** PKG\_UTIL.FILE\_SET\_DIRNAME parameters

Parameter	Description
dirname	Directory of a file. It is a string, indicating an object name. <b>NOTE</b> File directories need to be added to the system catalog <b>PG_DIRECTORY</b> . If the input path does not match the path in <b>PG_DIRECTORY</b> , an error indicating that the path does not exist will be reported. Functions that involve <b>location</b> as parameters also comply with this rule.

- PKG\_UTIL.FILE\_OPEN

Opens a file. A maximum of 50 files can be opened at a time. This function returns a handle of the INTEGER type.

The prototype of the **PKG\_UTIL.FILE\_OPEN** function is as follows:

```
PKG_UTIL.FILE_OPEN(
file_name IN text,
open_mode IN integer)
```

**Table 10-47** PKG\_UTIL.FILE\_OPEN parameters

Parameter	Description
file_name	File name with an extension (file type), excluding the path name. A path contained in a file name is ignored in the <b>OPEN</b> function. In Unix, the file name cannot end with the combination of a slash and a dot (/.).
open_mode	File opening mode, including <b>r</b> (read), <b>w</b> (write), and <b>a</b> (append). <b>NOTE</b> For the write operation, the system checks the file type. If the ELF file is written, an error is reported and the system exits.

- PKG\_UTIL.FILE\_SET\_MAX\_LINE\_SIZE

Sets the maximum length of a line to be written to a file.

The prototype of the PKG\_UTIL.FILE\_SET\_MAX\_LINE\_SIZE function is as follows:

```
PKG_UTIL.FILE_SET_MAX_LINE_SIZE(  
max_line_size in integer)  
RETURN BOOL
```

**Table 10-48** PKG\_UTIL.FILE\_SET\_MAX\_LINE\_SIZE parameters

Parameter	Description
max_line_size	Maximum number of characters in each line, including newline characters. The minimum value is <b>1</b> and the maximum is <b>32767</b> . If this parameter is not specified, the default value <b>1024</b> is used.

- PKG\_UTIL.FILE\_IS\_CLOSE

Checks whether a file handle is closed.

The prototype of the PKG\_UTIL.FILE\_IS\_CLOSE function is as follows:

```
PKG_UTIL.FILE_IS_CLOSE(  
file in integer  
)  
RETURN BOOL
```

**Table 10-49** PKG\_UTIL.FILE\_IS\_CLOSE parameters

Parameter	Description
file	Opened file handle

- PKG\_UTIL.FILE\_READ

Reads a line of data from an open file handle based on the specified length.

The prototype of the PKG\_UTIL.FILE\_READ function is as follows:

```
PKG_UTIL.FILE_READ(  
file IN integer,
```

```
buffer OUT text,  
len IN bigint default 1024)
```

**Table 10-50** PKG\_UTIL.FILE\_READ parameters

Parameter	Description
file	File handle opened by calling the <b>OPEN</b> function. The file must be opened in read mode. Otherwise, the <b>INVALID_OPERATION</b> exception is thrown.
buffer	Buffer used to receive data
len	Number of bytes read from a file

- PKG\_UTIL.FILE\_READLINE

Reads a line of data from an open file handle based on the specified length.

The prototype of the PKG\_UTIL.FILE\_READLINE function is as follows:

```
PKG_UTIL.FILE_READLINE(  
file IN integer,  
buffer OUT text,  
len IN integer default NULL)
```

**Table 10-51** PKG\_UTIL.FILE\_READLINE parameters

Parameter	Description
file	File handle opened by calling the <b>OPEN</b> function. The file must be opened in read mode. Otherwise, the <b>INVALID_OPERATION</b> exception is thrown.
buffer	Buffer used to receive data
len	Number of bytes read from a file. The default value is <b>NULL</b> . If the default value <b>NULL</b> is used, <b>max_line_size</b> is used to specify the line size.

- PKG\_UTIL.FILE\_WRITE

Writes the data specified in the buffer to a file.

The prototype of the PKG\_UTIL.FILE\_WRITE function is as follows:

```
PKG_UTIL.FILE_WRITE(  
file in integer,  
buffer in text  
)  
RETURN BOOL
```

**Table 10-52** PKG\_UTIL.FILE\_WRITE parameters

Parameter	Description
file	Opened file handle

Parameter	Description
buffer	Text data to be written to a file. The maximum buffer size is 32767 bytes. If no value is specified, the default value is 1024 bytes. Before the writing is performed, the buffer occupied by <b>PUT</b> operations cannot exceed 32767 bytes. <b>NOTE</b> For the write operation, the system checks the file type. If the ELF file is written, an error is reported and the system exits.

- **PKG\_UTIL.FILE\_NEWLINE**

Writes a line terminator to an open file. The line terminator is related to the platform.

The prototype of the PKG\_UTIL.FILE\_NEWLINE function is as follows:

```
PKG_UTIL.FILE_NEWLINE(  
file in integer  
)  
RETURN BOOL
```

**Table 10-53** PKG\_UTIL.FILE\_NEWLINE parameters

Parameter	Description
file	Opened file handle

- **PKG\_UTIL.FILE\_WRITELINE**

Writes a line to a file.

The prototype of the PKG\_UTIL.FILE\_WRITELINE function is as follows:

```
PKG_UTIL.FILE_WRITELINE(  
file in integer,  
buffer in text  
)  
RETURN BOOL
```

**Table 10-54** PKG\_UTIL.FILE\_WRITELINE parameters

Parameter	Description
file	Opened file handle.
buffer	Content to be written.

- **PKG\_UTIL.FILE\_READ\_RAW**

Reads binary data of a specified length from an open file handle and returns the read binary data. The return type is RAW.

The prototype of the PKG\_UTIL.FILE\_READ\_RAW function is as follows:

```
PKG_UTIL.FILE_READ_RAW(  
file in integer,  
length in integer default NULL  
)  
RETURN raw
```

**Table 10-55** PKG\_UTIL.FILE\_READ\_RAW parameters

Parameter	Description
file	Opened file handle
length	Length of the data to be read. The default value is <b>NULL</b> . By default, all data in the file is read. The maximum size is 1 GB.

- **PKG\_UTIL.FILE\_WRITE\_RAW**  
Writes the input binary object of the RAW type to an open file. If the insertion is successful, **true** is returned.

The prototype of the PKG\_UTIL.FILE\_WRITE\_RAW function is as follows:

```
PKG_UTIL.FILE_WRITE_RAW(
file in integer,
r   in raw
)
RETURN BOOL
```

**Table 10-56** PKG\_UTIL.FILE\_NEWLINE parameters

Parameter	Description
file	Opened file handle
r	Data to be written to the file <b>NOTE</b> For the write operation, the system checks the file type. If the ELF file is written, an error is reported and the system exits.

- **PKG\_UTIL.FILE\_FLUSH**  
Data in a file handle must be written into a physical file. Data in the buffer must have a line terminator. Refresh is important if a file must be read when it is opened. For example, debugging information can be refreshed to a file so that it can be read immediately.

The prototype of the PKG\_UTIL.FILE\_FLUSH function is as follows:

```
PKG_UTIL.FILE_FLUSH (
file in integer
)
RETURN VOID
```

**Table 10-57** PKG\_UTIL.FILE\_FLUSH parameters

Parameter	Description
file	Opened file handle

- **PKG\_UTIL.FILE\_CLOSE**  
Closes an open file handle.  
The prototype of the PKG\_UTIL.FILE\_CLOSE function is as follows:

```
PKG_UTIL.FILE_CLOSE (
file in integer
```

```
)  
RETURN BOOL
```

**Table 10-58** PKG\_UTIL.FILE\_CLOSE parameters

Parameter	Description
file	Opened file handle

- **PKG\_UTIL.FILE\_REMOVE**  
Deletes a disk file. To perform this operation, you must have required permissions.

The prototype of the PKG\_UTIL.FILE\_REMOVE function is as follows:

```
PKG_UTIL.FILE_REMOVE(  
file_name in text  
)  
RETURN VOID
```

**Table 10-59** PKG\_UTIL.FILE\_REMOVE parameters

Parameter	Description
file_name	Name of the file to be deleted

- **PKG\_UTIL.FILE\_RENAME**  
Renames a file on the disk, similar to mv in Unix.

The prototype of the PKG\_UTIL.FILE\_RENAME function is as follows:

```
PKG_UTIL.FILE_RENAME(  
src_dir in text,  
src_file_name in text,  
dest_dir in text,  
dest_file_name in text,  
overwrite boolean default false)
```

**Table 10-60** PKG\_UTIL.FILE\_RENAME parameters

Parameter	Description
src_dir	Source file directory (case-sensitive) <b>NOTE</b> <ul style="list-style-type: none"> <li>• Location of the file directory, which needs to be added to system catalog <b>PG_DIRECTORY</b>. If the input path does not match the path in <b>PG_DIRECTORY</b>, an error indicating that the path does not exist is reported.</li> <li>• When the GUC parameter <b>safe_data_path</b> is enabled, you can only use an advanced package to operate files in the file path specified by <b>safe_data_path</b>.</li> </ul>
src_file_name	Source file name

Parameter	Description
dest_dir	Target file directory (case-sensitive) <b>NOTE</b> <ul style="list-style-type: none"> <li>Location of the file directory, which needs to be added to system catalog <b>PG_DIRECTORY</b>. If the input path does not match the path in <b>PG_DIRECTORY</b>, an error indicating that the path does not exist is reported.</li> <li>When the GUC parameter <b>safe_data_path</b> is enabled, you can only use an advanced package to operate files in the file path specified by <b>safe_data_path</b>.</li> </ul>
dest_file_name	Target file name
overwrite	The default value is <b>false</b> . If a file with the same name exists in the destination directory, the file will not be rewritten.

- **PKG\_UTIL.FILE\_SIZE**

Returns the size of a specified file.

The prototype of the **PKG\_UTIL.FILE\_SIZE** function is as follows:

```
bigint PKG_UTIL.FILE_SIZE(  
file_name in text  
)return bigint
```

**Table 10-61** PKG\_UTIL.FILE\_SIZE parameters

Parameter	Description
file_name	File name

- **PKG\_UTIL.FILE\_BLOCK\_SIZE**

Returns the number of blocks contained in a specified file.

The prototype of the **PKG\_UTIL.FILE\_BLOCK\_SIZE** function is as follows:

```
bigint PKG_UTIL.FILE_BLOCK_SIZE(  
file_name in text  
)return bigint
```

**Table 10-62** PKG\_UTIL.FILE\_BLOCK\_SIZE parameters

Parameter	Description
file_name	File name

- **PKG\_UTIL.FILE\_EXISTS**

Checks whether a file exists.

The prototype of the **PKG\_UTIL.FILE\_EXISTS** function is as follows:

```
PKG_UTIL.FILE_EXISTS(  
file_name in text  
)  
RETURN BOOL
```

**Table 10-63** PKG\_UTIL.FILE\_EXISTS parameters

Parameter	Description
file_name	File name

- PKG\_UTIL.FILE\_GETPOS

Specifies the offset of a returned file, in bytes.

The prototype of the PKG\_UTIL.FILE\_GETPOS function is as follows:

```
PKG_UTIL.FILE_GETPOS(  
file in integer  
)  
RETURN BIGINT
```

**Table 10-64** PKG\_UTIL.FILE\_GETPOS parameters

Parameter	Description
file	Opened file handle

- PKG\_UTIL.FILE\_SEEK

Adjusts the position of a file pointer forward or backward based on the specified number of bytes.

The prototype of the PKG\_UTIL.FILE\_SEEK function is as follows:

```
void PKG_UTIL.FILE_SEEK(  
file in integer,  
start in bigint  
)  
RETURN VOID
```

**Table 10-65** PKG\_UTIL.FILE\_SEEK parameters

Parameter	Description
file	Opened file handle
start	File offset, in bytes.

- PKG\_UTIL.FILE\_CLOSE\_ALL

Closes all file handles opened in a session.

The prototype of the PKG\_UTIL.FILE\_CLOSE\_ALL function is as follows:

```
PKG_UTIL.FILE_CLOSE_ALL(  
)  
RETURN VOID
```

**Table 10-66** PKG\_UTIL.FILE\_CLOSE\_ALL parameters

Parameter	Description
None	None

- **PKG\_UTIL.EXCEPTION\_REPORT\_ERROR**

Throws an exception.

The prototype of the **PKG\_UTIL.EXCEPTION\_REPORT\_ERROR** function is as follows:

```
PKG_UTIL.EXCEPTION_REPORT_ERROR(
code integer,
log text,
flag boolean DEFAULT false
)
RETURN INTEGER
```

**Table 10-67** PKG\_UTIL.EXCEPTION\_REPORT\_ERROR parameters

Parameter	Description
code	Error code displayed when an exception occurs.
log	Log information displayed when an exception occurs.
flag	Reserved. The default value is <b>false</b> .

- **PKG\_UTIL.app\_read\_client\_info**

Reads the client information.

The prototype of the **PKG\_UTIL.app\_read\_client\_info** function is as follows:

```
PKG_UTIL.app_read_client_info(
OUT buffer text
)return text
```

**Table 10-68** PKG\_UTIL.app\_read\_client\_info parameters

Parameter	Description
buffer	Client information returned.

- **PKG\_UTIL.app\_set\_client\_info**

Sets the client information.

The prototype of the **PKG\_UTIL.app\_set\_client\_info** function is as follows:

```
PKG_UTIL.app_set_client_info(
str text
)
```

**Table 10-69** PKG\_UTIL.app\_set\_client\_info parameters

Parameter	Description
str	Client information to be set.

- **PKG\_UTIL.lob\_converttoblob**

Converts a CLOB to a BLOB. **amount** indicates the conversion length.

The prototype of the **PKG\_UTIL.lob\_converttoblob** function is as follows:

```
PKG_UTIL.lob_converttoblob(
dest_lob blob,
```

```
src_clob clob,
amount integer,
dest_offset integer,
src_offset integer
)return raw
```

**Table 10-70** PKG\_UTIL.lob\_converttoblob parameters

Parameter	Description
dest_lob	Target LOB.
src_clob	CLOB to be converted.
amount	Conversion length.
dest_offset	Start position of the target LOB.
src_offset	Start position of the source CLOB.

- PKG\_UTIL.lob\_converttoclob

Converts a BLOB to a CLOB. **amount** indicates the conversion length.

The prototype of the PKG\_UTIL.lob\_converttoclob function is as follows:

```
PKG_UTIL.lob_converttoclob(
dest_lob clob,
src_blob blob,
amount integer,
dest_offset integer,
src_offset integer
)return text
```

**Table 10-71** PKG\_UTIL.lob\_converttoclob parameters

Parameter	Description
dest_lob	Target LOB.
src_blob	BLOB to be converted.
amount	Conversion length.
dest_offset	Start position of the target LOB.
src_offset	Start position of the source CLOB.

- PKG\_UTIL.lob\_texttoraw

Converts from the text type to the raw type.

The prototype of the PKG\_UTIL.lob\_texttoraw function is as follows:

```
PKG_UTIL.lob_texttoraw(
src_lob clob
)
RETURN raw
```

**Table 10-72** PKG\_UTIL.lob\_texttoraw parameters

Parameter	Description
src_lob	LOB to be converted.

- **PKG\_UTIL.match\_edit\_distance\_similarity**  
Calculates the difference between two character strings.  
The prototype of the PKG\_UTIL.match\_edit\_distance\_similarity function is as follows:

```
PKG_UTIL.match_edit_distance_similarity(  
str1 text,  
str2 text  
)  
RETURN INTEGER
```

**Table 10-73** PKG\_UTIL.match\_edit\_distance\_similarity parameters

Parameter	Description
str1	First character string.
str2	Second character string.

- **PKG\_UTIL.raw\_cast\_to\_varchar2**  
Converts from the raw type to the varchar2 type.  
The prototype of the PKG\_UTIL.raw\_cast\_to\_varchar2 function is as follows:

```
PKG_UTIL.raw_cast_to_varchar2(  
str raw  
)  
RETURN varchar2
```

**Table 10-74** PKG\_UTIL.raw\_cast\_to\_varchar2 parameters

Parameter	Description
str	Hexadecimal string

- **PKG\_UTIL.session\_clear\_context**  
Clears the session context.  
The prototype of the PKG\_UTIL.session\_clear\_context function is as follows:

```
PKG_UTIL.session_clear_context(  
namespace text,  
client_identifier text,  
attribute text  
)  
RETURN INTEGER
```

**Table 10-75** PKG\_UTIL.session\_clear\_context parameters

Parameter	Description
namespace	Namespace of an attribute.
client_identifier	Usually the value of this parameter is the same as that of <b>namespace</b> . If this parameter is set to <b>null</b> , all namespaces are modified by default.
attribute	Attribute to be cleared.

- PKG\_UTIL.session\_search\_context

Searches for an attribute value.

The prototype of the PKG\_UTIL.session\_clear\_context function is as follows:

```
PKG_UTIL.session_clear_context(
namespace text,
attribute text
)
RETURN INTEGER
```

**Table 10-76** PKG\_UTIL.session\_clear\_context parameters

Parameter	Description
namespace	Namespace of an attribute.
attribute	Attribute to be cleared.

- PKG\_UTIL.session\_set\_context

Sets the attribute value.

The prototype of the PKG\_UTIL.session\_set\_context function is as follows:

```
PKG_UTIL.session_set_context(
namespace text,
attribute text,
value text
)
RETURN INTEGER
```

**Table 10-77** PKG\_UTIL.session\_set\_context parameters

Parameter	Description
namespace	Namespace of an attribute.
attribute	Attribute to be set.
value	Attribute value.

- PKG\_UTIL.utility\_get\_time

Prints the Unix timestamp.

The prototype of the PKG\_UTIL.utility\_get\_time function is as follows:

```
PKG_UTIL.utility_get_time()
RETURN bigint
```

- **PKG\_UTIL.utility\_format\_error\_backtrace**  
Displays the error stack of a stored procedure.  
The prototype of the PKG\_UTIL.utility\_format\_error\_backtrace function is as follows:

```
PKG_UTIL.utility_format_error_backtrace()
RETURN text
```
- **PKG\_UTIL.utility\_format\_error\_stack**  
Displays the error information of a stored procedure.  
The prototype of the PKG\_UTIL.utility\_format\_error\_stack function is as follows:

```
PKG_UTIL.utility_format_error_stack()
RETURN text
```
- **PKG\_UTIL.utility\_compile\_schema**  
Recompiles packages, functions and stored procedures under the specified schema.  
The prototype of the PKG\_UTIL.utility\_compile\_schema function is as follows:

```
pkg_util.utility_compile_schema (
schema in varchar2,
compile_all in boolean default true,
reuse_settings in boolean default false
)
returns void
```
- **PKG\_UTIL.gs\_compile\_schema**  
Recompiles packages, functions and stored procedures under the specified schema.  
The prototype of the PKG\_UTIL.gs\_compile\_schema stored procedure is as follows:

```
pkg_util.gs_compile_schema (
schema_name in varchar2 default null,
compile_all in boolean default false,
retry_times in int default 10
)
```

**Table 10-78** PKG\_UTIL.gs\_compile\_schema parameters

Parameter	Description
schema_name	Specifies the name of the namespace.
compile_all	Specifies to compile all objects. <ul style="list-style-type: none"> <li>● <b>false</b>: Compile the packages, functions, and stored procedures whose status is false in the pg_object table.</li> <li>● <b>true</b>: Compile all packages, functions, and stored procedures in the pg_object table.</li> </ul>
retry_times	Specifies the number of retry times.

- **PKG\_UTIL.utility\_format\_call\_stack**  
Displays the call stack of a stored procedure.  
The prototype of the PKG\_UTIL.utility\_format\_call\_stack function is as follows:

```
PKG_UTIL.utility_format_call_stack()
RETURN text
```

## Examples

```
-- Delete a schema.
drop schema if exists pkg_var_test cascade;
-- Create a schema named pkg_var_test.
create schema pkg_var_test;
-- Set the schema and parameters.
set current_schema = pkg_var_test;
set behavior_compat_options ='plpgsql_dependency';
-- Create a package.
create or replace package test_pkg as
    referenced_var int;
    unreferenced_var int;
end test_pkg;
/
-- Create a function.
create or replace function test_func return int
is
begin
    return 1;
end;
/
-- Create a stored procedure.
create or replace procedure test_proc
is
    proc_var int;
begin
    proc_var := 1;
end;
/
-- Recompile package functions and stored procedures under pkg_var_test.
call pkg_util.utility_compile_schema('pkg_var_test');
or
call pkg_util.gs_compile_schema(' ',false,2);
-- Delete pkg_var_test.
drop schema if exists pkg_var_test cascade;
```

### 10.12.1.3 DBE\_XML

**Table 10-79** lists all interfaces supported by the **DBE\_XML** interface.

**Table 10-79** DBE\_XML parameters

Interface	Description
<a href="#">dbe_xml.xml_free_parser</a>	Frees a parser.
<a href="#">dbe_xml.xml_parser_get_document</a>	Obtains the parsed document node.
<a href="#">dbe_xml.xml_get_validation_mode</a>	Obtains the validation attribute.
<a href="#">dbe_xml.xml_new_parser</a>	Creates a parser instance.
<a href="#">dbe_xml.xml_parse_buffer</a>	Parses the VARCHAR string.
<a href="#">dbe_xml.xml_parse_clob</a>	Parses the CLOB string.

Interface	Description
<a href="#">dbe_xml.xml_set_validation_mode</a>	Sets the validation attribute.
<a href="#">dbe_xml.xml_dom_append_child</a>	Adds the newchild node to the end of the parent(n) node and returns the newly added node.
<a href="#">dbe_xml.xml_dom_create_element</a>	Returns the DOMELEMENT object with the specified name.
<a href="#">dbe_xml.xml_dom_create_element_ns</a>	Returns the DOMELEMENT object with the specified name and namespace.
<a href="#">dbe_xml.xml_dom_create_text_node</a>	Creates and returns a DOMText object.
<a href="#">dbe_xml.xml_dom_free_document</a>	Frees a specified XML DOM object.
<a href="#">dbe_xml.xml_dom_free_element</a>	Frees a specified XML DOM object.
<a href="#">dbe_xml.xml_dom_free_node</a>	Frees a DOMNode node.
<a href="#">dbe_xml.xml_dom_free_node...</a>	Frees a DOMNodeList node.
<a href="#">dbe_xml.xml_dom_get_attribute</a>	Obtains the attributes of a specified XML DOM object.
<a href="#">dbe_xml.xml_dom_get_attributes</a>	Returns the attribute values of a DOMNode node as a map.
<a href="#">dbe_xml.xml_dom_get_child_nodes</a>	Converts several subnodes under a node into a node list.
<a href="#">dbe_xml.xml_dom_get_children_by_tagname</a>	Obtains the list of specified subnodes of a specified XML DOM object.
<a href="#">dbe_xml.xml_dom_get_children_by_tagname_ns</a>	Obtains the list of subnodes in the specified namespace of a specified XML DOM object.
<a href="#">dbe_xml.xml_dom_get_document_element</a>	Returns the first subnode of the specified document.
<a href="#">dbe_xml.xml_dom_get_first_child</a>	Returns the first subnode of a node.
<a href="#">dbe_xml.xml_dom_get_last_child</a>	Returns the last subnode of a node.
<a href="#">dbe_xml.xml_dom_get_length...</a>	Returns the number of nodes based on the content in the node of the specified type.

Interface	Description
<a href="#">dbe_xml.xml_dom_get_local_name</a>	Returns the local name of the given object.
<a href="#">dbe_xml.xml_dom_get_named_item</a>	Returns the node specified by name.
<a href="#">dbe_xml.xml_dom_get_named_item_ns</a>	Returns the node specified by name and namespace.
<a href="#">dbe_xml.xml_dom_get_next_sibling</a>	Returns the next node of the specified node.
<a href="#">dbe_xml.xml_dom_get_node_name</a>	Returns the name of a node.
<a href="#">dbe_xml.xml_dom_get_node_type</a>	Returns the type of a node.
<a href="#">dbe_xml.xml_dom_get_node_value</a>	Returns the value of a DOMNode node.
<a href="#">dbe_xml.xml_dom_get_parent...</a>	Returns the parent node of the given DOMNode node.
<a href="#">dbe_xml.xml_dom_get_tag_name</a>	Obtains the tag name of a specified XML DOM object.
<a href="#">dbe_xml.xml_dom_has_children</a>	Checks whether the DOMNode object has any subnode.
<a href="#">dbe_xml.xml_dom_import_node</a>	Copies a node to another node and mounts the copied node to a specified document.
<a href="#">dbe_xml.xml_dom_is_null</a>	Checks whether the given object is null.
<a href="#">dbe_xml.xml_dom_item</a>	Returns the element corresponding to the index in a list or map based on the index.
<a href="#">dbe_xml.xml_dom_make_element</a>	Returns the DOMELEMENT object after conversion.
<a href="#">dbe_xml.xml_dom_makenode</a>	Converts the given object to the DOMNode type.
<a href="#">dbe_xml.xml_dom_new_dom_document_empty</a>	Returns a new DOMDocument object.
<a href="#">xml_dom_new_dom_document_clob</a>	Returns a new DOMDocument instance object created from the specified CLOB type.
<a href="#">dbe_xml.xml_dom_new_dom_document_xmltype</a>	Returns a new DOMDocument instance object created from the specified XMLType type.
<a href="#">dbe_xml.xml_dom_set_attribute</a>	Sets the attributes of a specified XML DOM object.

Interface	Description
<a href="#">dbe_xml.xml_dom_set_char_set</a>	Sets the character set for a DOMDocument object.
<a href="#">dbe_xml.xml_dom_set_doctype</a>	Sets the external DTD of a DOMDocument object.
<a href="#">dbe_xml.xml_dom_set_node...</a>	Sets the value of a node in the DOMNode object.
<a href="#">dbe_xml.xml_dom_write_to_buffer_doc</a>	Writes the given DOMDocument object to the buffer.
<a href="#">dbe_xml.xml_dom_write_to_buffer_node</a>	Writes the given DOMNode object to the buffer.
<a href="#">dbe_xml.xml_dom_write_to_clob_doc</a>	Writes the given DOMDocument object to a CLOB.
<a href="#">dbe_xml.xml_dom_write_to_clob_node</a>	Writes the given DOMNode object to a CLOB.
<a href="#">dbe_xml.xml_dom_write_to_file_doc</a>	Writes an XML node to a specified file using the database character set.
<a href="#">dbe_xml.xml_dom_write_to_file_node</a>	Writes an XML node to a specified file using the database character set.
<a href="#">dbe_xml.xml_dom_get_session_tree_num</a>	Displays the number of DOM trees of all types in the current session.
<a href="#">dbe_xml.xml_dom_get_doc_trees_info</a>	Displays statistics such as the memory usage and number of nodes of the DOM tree of the document type.
<a href="#">dbe_xml.xml_dom_get_detail_doc_tree_info</a>	Displays the number of nodes of each type for a specific document variable.

- [dbe\\_xml.xml\\_free\\_parser](#)

Frees a given parser object.

The stored procedure prototype of [dbe\\_xml.xml\\_free\\_parser](#) is as follows:

```
dbe_xml.xml_free_parser(
id IN raw(13))
returns void;
```

**Table 10-80** [dbe\\_xml.xml\\_free\\_parser](#) parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
id	raw(13)	IN	Yes	Parser object

- `dbe_xml.xml_parser_get_doc`  
Returns the root node of the DOM tree document constructed by the parser.  
The prototype of the `dbe_xml.xml_parser_get_doc` function is as follows:

```
dbe_xml.xml_parser_get_doc(  
id IN raw(13))  
returns raw(13);
```

**Table 10-81** `dbe_xml.xml_parser_get_doc` parameters

Parameter	Type	Input/ Output Parameter	Can Be Empty	Description
id	raw(13)	IN	Yes	Parser object

 **NOTE**

- If the GETDOCUMENT function is empty, null is returned.
- If the parser input by the GETDOCUMENT function has not parsed any document, null is returned.
- `dbe_xml.xml_get_validation_mode`  
Obtains the parsing validation mode of a specified parser. If DTD validation is enabled, **TRUE** is returned. Otherwise, **FALSE** is returned.

The prototype of the `dbe_xml.xml_get_validation_mode` function is as follows:

```
dbe_xml.xml_get_validation_mode(  
id raw(13))  
returns bool;
```

**Table 10-82** `dbe_xml.xml_get_validation_mode` parameters

Parameter	Type	Input/ Output Parameter	Can Be Empty	Description
id	raw(13)	IN	Yes	Parser object

- `dbe_xml.xml_new_parser`  
Creates a parser object and returns a new parser instance.  
The prototype of the `dbe_xml.xml_new_parser` function is as follows:

```
dbe_xml.xml_new_parser()  
RETURNS RAW(13);
```

- `dbe_xml.xml_parse_buffer`  
Parses XML documents stored in strings.  
The stored procedure prototype of `dbe_xml.xml_parse_buffer` is as follows:

```
dbe_xml.xml_parse_buffer(  
id RAW(13),  
xmlstr VARCHAR2)  
RETURNS void;
```

**Table 10-83** dbe\_xml.xml\_parse\_buffer parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
id	raw(13)	IN	Yes	Parser object
xmlstr	VARCHAR2	IN	No	A string that stores XML documents

 **NOTE**

- The maximum length of a character string that can be parsed by the xml\_parse\_buffer function is 32767. If the length exceeds the maximum, an error is reported.
- Different from the database A, this database supports only UTF-8 in terms of character encoding, and **version** can only be set to **1.0**. If versions 1.0 to 1.9 are parsing, a warning appears but the execution is normal. For versions later than 1.9, an error is reported.
- DTD validation differences:
  - **!ATTLIST to type (CHECK|check|Check) "Ch..."** reports an error because the default value "Ch..." is not an enumerated value in the brackets. However, the database A does not report this error.
  - **<!ENTITY baidu "www.baidu.com">..... &Baidu;&writer** reports an error because the letters are case sensitive. **Baidu** cannot correspond to **baidu**. However, the database A does not report this error.
- Namespace validation difference: Undeclared namespace tags are parsed. However, the database A reports an error.
- Difference in parsing XML predefined entities: **&apos;** and **&quot;** are parsed and translated into ' and ". However, predefined entities in database A are not translated into characters.
- **db\_xml.xml\_parse\_clob**  
Parses XML documents stored in a CLOB.

The stored procedure prototype of db\_xml.xml\_parse\_clob is as follows:

```
db_xml.xml_parse_clob(
id IN raw(13),
doc IN CLOB)
returns void;
```

**Table 10-84** dbe\_xml.xml\_parse\_clob parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
id	raw(13)	IN	Yes	Parser object
doc	CLOB	IN	No	A string that stores XML documents

 NOTE

- xml\_parse\_clob cannot parse CLOBs larger than or equal to 2 GB.
- Different from the database A, this database supports only UTF-8 in terms of character encoding, and **version** can only be set to **1.0**. If versions 1.0 to 1.9 are parsing, a warning appears but the execution is normal. For versions later than 1.9, an error is reported.
- DTD validation differences:
  - **!ATTLIST to type (CHECK|check|Check) "Ch..."** reports an error because the default value "Ch..." is not an enumerated value in the brackets. However, the database A does not report this error.
  - **<!ENTITY baidu "www.baidu.com">..... &Baidu;&writer** reports an error because the letters are case sensitive. **Baidu** cannot correspond to **baidu**. However, the database A does not report this error.
- Namespace validation difference: Undeclared namespace tags are parsed. However, the database A reports an error.
- Difference in parsing XML predefined entities: **&apos;** and **&quot;** are parsed and translated into ' and ". However, predefined entities in database A are not translated into characters.

- **db\_xml.xml\_set\_validation\_mode**

Sets the parsing validation mode of a specified parser.

The stored procedure prototype of db\_xml.xml\_set\_validation\_mode is as follows:

```
db_xml.xml_set_validation_mode(
id raw(13),
validate boolean)
returns void;
```

**Table 10-85** db\_xml.xml\_set\_validation\_mode parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
id	raw(13)	IN	Yes	Parser object
validate	boolean	IN	Yes	Mode to be set: <ul style="list-style-type: none"> <li>• <b>TRUE:</b> DTD validation is enabled.</li> <li>• <b>FALSE:</b> DTD validation is disabled.</li> </ul>

 NOTE

- If the input parameter **validate** of the xml\_set\_validation\_mode function is null, the parsing validation mode of the parser is not changed.
- By default, the DTD validation is enabled during parser initialization.
- **db\_xml.xml\_dom\_append\_child**

Adds the newchild node to the end of the parent(n) node and returns the newly added node.

The stored procedure prototype of dbexml.xml\_dom\_append\_child is as follows:

```
dbexml.xml_dom_append_child(
  parentId IN RAW(13),
  childId IN RAW(13)
)
RETURNS RAW(13);
```

**Table 10-86** dbexml.xml\_dom\_append\_child parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
parentId	raw(13)	IN	No	XML DOM object
childId	raw(13)	IN	No	XML DOM object

- dbexml.xml\_dom\_create\_element

Returns the DOMELEMENT object with the specified name.

The prototype of the dbexml.xml\_dom\_create\_element function is as follows:

```
dbexml.xml_dom_create_element(
  id IN RAW(13),
  tagname IN VARCHAR2
)
RETURNS RAW(13);
```

**Table 10-87** dbexml.xml\_dom\_create\_element parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
id	raw(13)	IN	No	XML DOM object
tagname	VARCHAR2	IN	No	Name of the new DOMELEMENT object

- dbexml.xml\_dom\_create\_element\_ns

Returns the DOMELEMENT object with the specified name and namespace.

The prototype of the dbexml.xml\_dom\_create\_element\_ns function is as follows:

```
dbexml.xml_dom_create_element_ns(
  id IN RAW(13),
  tagname IN VARCHAR2,
  ns IN VARCHAR2
)
RETURNS RAW(13);
```

**Table 10-88** dbexml.xml\_dom\_create\_element\_ns parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
id	raw(13)	IN	No	XML DOM object
tagname	VARCHAR2	IN	No	Name of the new DOMElement object
ns	VARCHAR2	IN	No	Namespace

- dbexml.xml\_dom\_create\_text\_node

Creates and returns a DOMText object.

The prototype of the dbexml.xml\_dom\_create\_text\_node function is as follows:

```
dbexml.xml_dom_create_text_node(
  id IN RAW(13),
  data IN VARCHAR2
)
RETURNS RAW(13);
```

**Table 10-89** dbexml.xml\_dom\_create\_text\_node parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
id	raw(13)	IN	No	XML DOM object
data	VARCHAR2	IN	No	Content of the new DOMText node

- dbexml.xml\_dom\_free\_document

Frees a specified XML DOM object.

The stored procedure prototype of dbexml.xml\_dom\_free\_document is as follows:

```
dbexml.xml_dom_free_document(
  id RAW(13)
)
RETURNS void;
```

**Table 10-90** dbexml.xml\_dom\_free\_document parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
id	raw(13)	IN	No	XML DOM object

- dbexml.xml\_dom\_free\_element

Frees a specified XML DOM object.

The stored procedure prototype of `dbexml.xml_dom_free_element` is as follows:

```
dbexml.xml_dom_free_element (
  id RAW(13)
)
RETURNS void;
```

**Table 10-91** `dbexml.xml_dom_free_element` parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
id	raw(13)	IN	No	XML DOM object

- `dbexml.xml_dom_free_node`

Frees a DOMNode node.

The prototype of the `dbexml.xml_dom_free_node` function is as follows:

```
dbexml.xml_dom_free_node (
  id RAW(13)
)
RETURNS void;
```

**Table 10-92** `dbexml.xml_dom_free_node` parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
id	raw(13)	IN	No	XML DOM object

- `dbexml.xml_dom_free_nodelist`

Frees a DOMNodeList node.

The stored procedure prototype of `dbexml.xml_dom_free_nodelist` is as follows:

```
dbexml.xml_dom_free_nodelist(
  id IN RAW(13),
  node_value IN VARCHAR2
)
RETURNS VOID
```

**Table 10-93** `dbexml.xml_dom_free_nodelist` parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
id	raw(13)	IN	No	XML DOM object

- `dbexml.xml_dom_get_attribute`

Obtains the attributes of a specified XML DOM object.

The stored procedure prototype of `dbexml.xml_dom_get_attribute` is as follows:

```
dbexml.xml_dom_get_attribute (
  docid IN RAW(13),
  name  IN VARCHAR2
)
RETURNS VARCHAR2;
```

**Table 10-94** `dbexml.xml_dom_get_attribute` parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
docid	raw(13)	IN	No	XML DOM object
name	VARCHAR2	IN	No	String

- `dbexml.xml_dom_get_attributes`

Returns the attribute values of a DOMNode node as a map.

The prototype of the `dbexml.xml_dom_get_attributes` function is as follows:

```
dbexml.xml_dom_get_attributes (
  id RAW(13)
)
RETURNS RAW(13);
```

**Table 10-95** `dbexml.xml_dom_get_attributes` parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
id	raw(13)	IN	No	XML DOM object

- `dbexml.xml_dom_get_child_nodes`

Converts several subnodes under a node into a node list.

The prototype of the `dbexml.xml_dom_get_child_nodes` function is as follows:

```
dbexml.xml_dom_get_child_nodes(
  id IN RAW(13)
)
RETURNS RAW(13);
```

**Table 10-96** dbexml.xml\_dom\_get\_child\_nodes parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
id	raw(13)	IN	No	XML DOM object

- dbexml.xml\_dom\_get\_children\_by\_tagname  
Obtains the list of specified subnodes of a specified XML DOM object.

The stored procedure prototype of dbexml.xml\_dom\_get\_children\_by\_tagname is as follows:

```
dbexml.xml_dom_get_children_by_tagname (
  docid IN RAW(13),
  name  IN VARCHAR2
)
RETURNS RAW(13);
```

**Table 10-97** dbexml.xml\_dom\_get\_children\_by\_tagname parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
docid	raw(13)	IN	No	XML DOM object
name	VARCHAR2	IN	No	String

- dbexml.xml\_dom\_get\_children\_by\_tagname\_ns  
Obtains the list of subnodes in the specified namespace of a specified XML DOM object.

The stored procedure prototype of dbexml.xml\_dom\_get\_children\_by\_tagname\_ns is as follows:

```
dbexml.xml_dom_get_children_by_tagname_ns (
  docid IN RAW(13),
  name  IN VARCHAR2,
  ns    IN VARCHAR2
)
RETURNS RAW(13);
```

**Table 10-98** dbexml.xml\_dom\_get\_children\_by\_tagname\_ns parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
docid	raw(13)	IN	No	XML DOM object
name	VARCHAR2	IN	No	String
ns	VARCHAR2	IN	Yes	String

- `dbexml.xml_dom_get_document_element`  
Returns the first subnode of the specified document.  
The stored procedure prototype of `dbexml.xml_dom_get_document_element` is as follows:

```
dbexml.xml_dom_get_document_element(
  id RAW(13)
)
RETURNS RAW(13);
```

**Table 10-99** `dbexml.xml_dom_get_document_element` parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
id	raw(13)	IN	No	XML DOM object

- `dbexml.xml_dom_get_first_child`  
Returns the first subnode of a node.  
The prototype of the `dbexml.xml_dom_get_first_child` function is as follows:

```
dbexml.xml_dom_get_first_child(
  id IN RAW(13)
)
RETURNS RAW(13);
```

**Table 10-100** `dbexml.xml_dom_get_first_child` parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
id	raw(13)	IN	No	XML DOM object

- `dbexml.xml_dom_get_last_child`  
Returns the last subnode of a node.  
The prototype of the `dbexml.xml_dom_get_last_child` function is as follows:

```
dbexml.xml_dom_get_last_child(
  id IN RAW(13)
)
RETURNS RAW(13);
```

**Table 10-101** `dbexml.xml_dom_get_last_child` parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
id	raw(13)	IN	No	XML DOM object

- `db_xml.xml_dom_get_length`

Returns the number of nodes based on the content in the node of the specified type.

The stored procedure prototype of `db_xml.xml_dom_get_length` is as follows:

```
db_xml.xml_dom_get_length(
  id RAW(13)
)
RETURNS VOID;
```

**Table 10-102** `db_xml.xml_dom_get_length` parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
id	raw(13)	IN	Yes	XML DOM object

- `db_xml.xml_dom_get_localname`

Returns the local name of the given object.

The stored procedure prototype of `db_xml.xml_dom_get_localname` is as follows:

```
db_xml.xml_dom_get_localname (
  id RAW(13)
)
RETURNS VARCHAR2;
```

**Table 10-103** `db_xml.xml_dom_get_localname` parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
id	raw(13)	IN	Yes	XML DOM object

- `db_xml.xml_dom_get_named_item`

Returns the node specified by name.

The prototype of the `db_xml.xml_dom_get_named_item` function is as follows:

```
db_xml.xml_dom_get_named_item(
  id IN RAW(13),
  nodeName IN VARCHAR2
)
RETURNS RAW(13);
```

**Table 10-104** dbexml.xml\_dom\_get\_named\_item parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
id	raw(13)	IN	No	XML DOM object
nodeName	VARCHAR2	IN	No	Name of the element to be retrieved

- dbexml.xml\_dom\_get\_named\_item\_ns

Returns the node specified by name and namespace.

The prototype of the dbexml.xml\_dom\_get\_named\_item\_ns function is as follows:

```
dbexml.xml_dom_get_named_item_ns(
  id RAW(13),
  nodeName IN VARCHAR2,
  ns IN VARCHAR2
)
RETURNS RAW(13);
```

**Table 10-105** dbexml.xml\_dom\_get\_named\_item\_ns parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
id	raw(13)	IN	No	XML DOM object
nodeName	VARCHAR2	IN	No	Name of the element to be retrieved
ns	VARCHAR2	IN	Yes	Namespace

- dbexml.xml\_dom\_get\_next\_sibling

Returns the next node of the specified node.

The prototype of the dbexml.xml\_dom\_get\_next\_sibling function is as follows:

```
dbexml.xml_dom_get_next_sibling(
  id IN RAW(13)
)
RETURNS RAW(13);
```

**Table 10-106** dbexml.xml\_dom\_get\_next\_sibling parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
id	raw(13)	IN	No	XML DOM object

- dbexml.xml\_dom\_get\_node\_name

Returns the name of a node.

The prototype of the dbexml.xml\_dom\_get\_node\_name function is as follows:

```
dbexml.xml_dom_get_node_name(
  id IN RAW(13)
)
RETURNS VARCHAR2;
```

**Table 10-107** dbexml.xml\_dom\_get\_node\_name parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
id	raw(13)	IN	No	XML DOM object

- dbexml.xml\_dom\_get\_node\_type

Returns the type of a node.

The prototype of the dbexml.xml\_dom\_get\_node\_type function is as follows:

```
dbexml.xml_dom_get_node_type(
  id IN RAW(13)
)
RETURNS INTEGER;
```

**Table 10-108** dbexml.xml\_dom\_get\_node\_type parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
id	raw(13)	IN	No	XML DOM object

- dbexml.xml\_dom\_get\_node\_value

Returns the value of a DOMNode node.

The stored procedure prototype of dbexml.xml\_dom\_get\_node\_value is as follows:

```
dbexml.xml_dom_get_node_value(
  id IN RAW(13))
RETURNS VARCHAR2;
```

**Table 10-109** dbexml.xml\_dom\_get\_node\_value parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
id	raw(13)	IN	Yes	XML DOM object

- dbexml.xml\_dom\_get\_parent\_node

Returns the parent node of the given DOMNode node.

The stored procedure prototype of dbexml.xml\_dom\_get\_parent\_node is as follows:

```
dbexml.xml_dom_get_parent_node(
id IN RAW(13))
RETURNS RAW(13);
```

**Table 10-110** dbexml.xml\_dom\_get\_parent\_node parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
id	raw(13)	IN	Yes	XML DOM object

- dbexml.xml\_dom\_get\_tagname

Obtains the tag name of a specified XML DOM object.

The stored procedure prototype of dbexml.xml\_dom\_get\_tagname is as follows:

```
dbexml.xml_dom_get_tagname (
docid RAW(13)
)
RETURNS VARCHAR2;
```

**Table 10-111** dbexml.xml\_dom\_get\_tagname parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
docid	raw(13)	IN	Yes	XML DOM object

- dbexml.xml\_dom\_has\_child\_nodes

Checks whether the DOMNode object has any subnode.

The stored procedure prototype of dbexml.xml\_dom\_has\_child\_nodes is as follows:

```
dbexml.xml_dom_has_child_nodes(
id IN RAW(13))
RETURNS BOOLEAN
```

**Table 10-112** dbexml.xml\_dom\_has\_child\_nodes parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
id	raw(13)	IN	Yes	XML DOM object

- dbexml.xml\_dom\_import\_node

Copies a node to another node and mounts the copied node to a specified document. If the type of the copied node does not belong to the 12 types specified by constants of XML DOM, an exception indicating that the type is not supported is thrown.

The prototype of the dbexml.xml\_dom\_import\_node function is as follows:

```
dbexml.xml_dom_import_node(
  doc_id IN RAW(13),
  node_id IN RAW(13),
  deep IN BOOLEAN
)
RETURNS RAW(13);
```

**Table 10-113** dbexml.xml\_dom\_import\_node parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
doc_id	raw(13)	IN	No	Document to which the node is mounted
node_id	raw(13)	IN	No	Node to be imported
deep	BOOLEAN	IN	No	Specifies whether to perform recursive import. <ul style="list-style-type: none"> <li>• If the value is <b>TRUE</b>, the node and all its subnodes are imported.</li> <li>• If the value is <b>FALSE</b>, the node itself is imported.</li> </ul>

- dbexml.xml\_dom\_is\_null

Checks whether the given object is null. If yes, **TRUE** is returned. Otherwise, **FALSE** is returned.

The prototype of the dbexml.xml\_dom\_is\_null function is as follows:

```
dbexml.xml_dom_is_null (
  id RAW(13)
)
RETURNS boolean;
```

**Table 10-114** dbexml.xml\_dom\_is\_null parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
id	raw(13)	IN	Yes	XML DOM object

- dbexml.xml\_dom\_item

Returns the element corresponding to the index in a list or map based on the index.

The prototype of the dbexml.xml\_dom\_item function is as follows:

```
dbexml.xml_dom_item (
  id IN RAW(13),
  index IN INTEGER
)
RETURNS RAW(13);
```

**Table 10-115** dbexml.xml\_dom\_item parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
id	raw(13)	IN	No	XML DOM object
index	INTEGER	IN	No	Index of the element to be retrieved

- dbexml.xml\_dom\_make\_element

Returns the DOMElement object after conversion.

The stored procedure prototype of dbexml.xml\_dom\_make\_element is as follows:

```
dbexml.xml_dom_make_element(
  id IN RAW(13))
RETURNS RAW(13)
```

**Table 10-116** dbexml.xml\_dom\_make\_element parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
id	raw(13)	IN	No	XML DOM object

- dbexml.xml\_dom\_makenode

Converts the given object to the DOMNode type.

The stored procedure prototype of dbexml.xml\_dom\_makenode is as follows:

```

dbexml.xml_dom_makenode(
  id RAW(13)
)
RETURNS DOMNODE;

```

**Table 10-117** dbexml.xml\_dom\_makenode parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
id	raw(13)	IN	Yes	XML DOM object

- dbexml.xml\_dom\_new\_dom\_document\_empty

Returns a new DOMDocument object.

The prototype of the dbexml.xml\_dom\_new\_dom\_document\_empty function is as follows:

```

dbexml.xml_dom_new_dom_document_empty()
RETURNS RAW(13);

```

- xml\_dom\_new\_dom\_document\_clob

Returns a new DOMDocument instance object created from the specified CLOB type.

The prototype of the xml\_dom\_new\_dom\_document\_clob function is as follows:

```

dbexml.xml_dom_new_dom_document_clob(
  content IN clob
)
RETURNS RAW(13);

```

**Table 10-118** xml\_dom\_new\_dom\_document\_clob parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
content	clob	IN	No	Specified CLOB type

- dbexml.xml\_dom\_new\_document\_xmltype

Returns a new DOMDocument instance object created from the specified XMLType type.

The prototype of the dbexml.xml\_dom\_new\_document\_xmltype function is as follows:

```

dbexml.xml_dom_new_document_xmltype(
  content IN clob
)
RETURNS RAW(13);

```

**Table 10-119** dbexml.xml\_dom\_new\_document\_xmltype parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
content	clob	IN	No	Specified CLOB type

- dbexml.xml\_dom\_set\_attribute

Sets the attributes of a specified XML DOM object.

The stored procedure prototype of dbexml.xml\_dom\_set\_attribute is as follows:

```
dbexml.xml_dom_set_attribute(
  docid IN RAW(13),
  name  IN VARCHAR2,
  value IN VARCHAR2
)
RETURNS void;
```

**Table 10-120** dbexml.xml\_dom\_set\_attribute parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
id	raw(13)	IN	No	XML DOM object
name	VARCHAR2	IN	No	String
value	VARCHAR2	IN	No	String

- dbexml.xml\_dom\_set\_charset

Sets the character set for a DOMDocument object.

The prototype of the dbexml.xml\_dom\_set\_charset function is as follows:

```
dbexml.xml_dom_set_charset(
  id    IN RAW(13),
  charset IN VARCHAR2
)
RETURNS void;
```

**Table 10-121** dbexml.xml\_dom\_set\_charset parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
id	raw(13)	IN	No	XML DOM object
charset	VARCHAR2	IN	No	Character set

- `db_xml.xml_dom_set_doctype`  
Sets the external DTD of a DOMDocument object.  
The prototype of the `db_xml.xml_dom_set_doctype` function is as follows:

```
db_xml.xml_dom_set_doctype(
  id      IN RAW(13),
  dtd_name IN VARCHAR2,
  system_id IN VARCHAR2,
  public_id IN VARCHAR2
)
RETURNS void;
```

**Table 10-122** `db_xml.xml_dom_set_doctype` parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
id	raw(13)	IN	No	XML DOM object
dtd_name	VARCHAR2	IN	No	Name of the DOCType to be initialized
system_id	VARCHAR2	IN	No	ID of the system whose DOCType needs to be initialized
public_id	VARCHAR2	IN	No	Public ID of the DOCType to be initialized

- `db_xml.xml_dom_set_node_value`  
Sets the value of a node in the DOMNode object.  
The stored procedure prototype of `db_xml.xml_dom_set_node_value` is as follows:

```
db_xml.xml_dom_set_node_value(
  id IN RAW(13),
  node_value IN VARCHAR2)
RETURNS VOID
```

**Table 10-123** `db_xml.xml_dom_set_node_value` parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
id	raw(13)	IN	No	XML DOM object
node_value	VARCHAR2	IN	No	String to be set in the DOMNode object

- `db_xml.xml_dom_write_to_buffer_doc`

Writes the given DOMDocument object to the buffer.

The stored procedure prototype of `db_xml.xml_dom_write_to_buffer_doc` is as follows:

```
db_xml.db_xml.xml_dom_write_to_buffer_doc(
id IN RAW(13))
RETURNS VARCHAR2;
```

**Table 10-124** `db_xml.xml_dom_write_to_buffer_doc` parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
id	raw(13)	IN	Yes	XML DOM object

- `db_xml.xml_dom_write_to_buffer_node`

Writes the given DOMNode object to the buffer.

The stored procedure prototype of `db_xml.xml_dom_write_to_buffer_node` is as follows:

```
db_xml.db_xml.xml_dom_write_to_buffer_node(
id IN RAW(13))
RETURNS VARCHAR2;
```

**Table 10-125** `db_xml.xml_dom_write_to_buffer_node` parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
id	raw(13)	IN	Yes	XML DOM object

- `db_xml.xml_dom_write_to_clob_doc`

Writes the given DOMDocument object to a CLOB.

The stored procedure prototype of `db_xml.xml_dom_write_to_clob_doc` is as follows:

```
db_xml.xml_dom_write_to_clob_doc(
id IN RAW(13))
)
RETURNS VARCHAR2;
```

**Table 10-126** `db_xml.xml_dom_write_to_clob_doc` parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
id	raw(13)	IN	Yes	XML DOM object

- `dbexml.xml_dom_write_to_clob_node`

Writes the given DOMNode object to a CLOB.

The stored procedure prototype of `dbexml.xml_dom_write_to_clob_node` is as follows:

```
dbexml.xml_dom_write_to_clob_node(
  id      IN RAW(13)
)
RETURNS clob;
```

**Table 10-127** `dbexml.xml_dom_write_to_clob_node` parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
id	raw(13)	IN	Yes	XML DOM object

- `dbexml.xml_dom_write_to_file_doc`

Writes an XML node to a specified file using the database character set.

The stored procedure prototype of `dbexml.xml_dom_write_to_file_doc` is as follows:

```
dbexml.xml_dom_write_to_file_doc(
  id IN RAW(13),
  file_dir IN VARCHAR2)
RETURNS void

dbexml.xml_dom_write_to_file_doc(
  id IN RAW(13),
  file_dir IN VARCHAR2,
  charset IN VARCHAR2)
RETURNS void PACKAGE
```

**Table 10-128** `dbexml.xml_dom_write_to_file_doc` parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
id	raw(13)	IN	Yes	XML DOM object
file_dir	VARCHAR2	IN	No	File to be written
charset	VARCHAR2	IN	No	Specified character set

- `dbexml.xml_dom_write_to_file_node`

Writes an XML node to a specified file using the database character set.

The stored procedure prototype of `dbexml.xml_dom_write_to_file_node` is as follows:

```

dbe_xml.xml_dom_write_to_file_node(
id IN RAW(13),
filename IN VARCHAR2)
RETURNS void
    
```

**Table 10-129** dbe\_xml.xml\_dom\_write\_to\_file\_node parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
id	raw(13)	IN	No	XML DOM object
filename	VARCHAR2	IN	No	Specified file address

- dbe\_xml.xml\_dom\_get\_session\_tree\_num**  
Queries the number of DOM trees of all types in the current session.  
The prototype of the dbe\_xml.xml\_dom\_get\_session\_tree\_num function is as follows:

```

dbe_xml.xml_dom_get_session_tree_num()
RETURNS INTEGER
    
```
- dbe\_xml.xml\_dom\_get\_doc\_trees\_info**  
Queries the DOM tree information of the document type in the current session, such as the memory usage.  
The prototype of the dbe\_xml.xml\_dom\_get\_doc\_trees\_info function is as follows:

```

dbe_xml.xml_dom_get_doc_trees_info()
RETURNS VARCHAR2
    
```
- dbe\_xml.xml\_dom\_get\_detail\_doc\_tree\_info**  
Queries the number of subnodes of each type in the transferred document.  
The prototype of the dbe\_xml.xml\_dom\_get\_detail\_doc\_tree\_info function is as follows:

```

dbe_xml.xml_dom_get_detail_doc_tree_info(
id IN RAW(13))
RETURNS VARCHAR2
    
```

**Table 10-130** dbe\_xml.xml\_dom\_get\_detail\_doc\_tree\_info parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
id	raw(13)	IN	No	XML DOM object

## 10.12.2 Secondary Encapsulation Interfaces (Recommended)

## 10.12.2.1 DBE\_LOB

### Interface Description

**Table 10-131** lists all interfaces supported by the DBE\_LOB package.

 **NOTE**

- In database A, the byte content of the space is 00. However, in GaussDB, the byte content corresponding to the space is ASCII code 32.
- In a centralized environment, the maximum size of a CLOB, BLOB, and BFILE is 32 TB.

**Table 10-131** DBE\_LOB

Interface	Description
<a href="#">DBE_LOB.GET_LENGTH</a>	Obtains and returns the length of a specified LOB. The object cannot be greater than 2 GB.
<a href="#">DBE_LOB.LOB_GET_LENGTH</a>	Obtains and returns the length of a specified LOB or BFILE object.
<a href="#">DBE_LOB.OPEN</a>	Opens a LOB and returns a LOB descriptor.
<a href="#">DBE_LOB.READ</a>	Loads a part of LOB content to the buffer based on the specified length and initial position offset.
<a href="#">DBE_LOB.LOB_READ</a>	Reads a part of LOB (including BFILE) content to the buffer based on the specified length and initial position offset.
<a href="#">DBE_LOB.WRITE</a>	Copies content in the buffer to a LOB based on the specified length and initial position offset.
<a href="#">DBE_LOB.WRITE_APPEND</a>	Copies content in the buffer to the end part of a LOB based on the specified length.
<a href="#">DBE_LOB.LOB_WRITE_APPEND</a>	Copies content in the buffer to the end part of a LOB based on the specified length.
<a href="#">DBE_LOB.COPY</a>	Copies content in a LOB to another LOB based on the specified length and initial position offset.
<a href="#">DBE_LOB.LOB_COPY</a>	Copies content in a LOB to another LOB based on the specified length and initial position offset.
<a href="#">DBE_LOB.ERASE</a>	Deletes content in a LOB (smaller than or equal to 1 GB) based on the specified length and initial position offset.
<a href="#">DBE_LOB.LOB_ERASE</a>	Deletes content in a LOB based on the specified length and initial position offset.
<a href="#">DBE_LOB.CLOSE</a>	Closes a LOB descriptor.
<a href="#">DBE_LOB.MATCH</a>	Returns the position of the <i>M</i> th occurrence of a character string in a LOB.

Interface	Description
<a href="#">DBE_LOB.COMPARE</a>	Compares two LOBs (including BFILE objects) or a certain part of two LOBs.
<a href="#">DBE_LOB.SUBSTR</a>	Reads a LOB substring and returns the read substring.
<a href="#">DBE_LOB.LOB_SUBSTR</a>	Reads a LOB substring and returns the read substring.
<a href="#">DBE_LOB.STRIP</a>	Truncates the LOB of a specified length. After the execution is complete, the length of the LOB is set to the length specified by the <b>newlen</b> parameter.
<a href="#">DBE_LOB.LOB_STRIP</a>	Truncates the LOB of a specified length. After the execution is complete, the length of the LOB is set to the length specified by the <b>newlen</b> parameter.
<a href="#">DBE_LOB.CREATE_TEMPORARY</a>	Creates a temporary BLOB or CLOB.
<a href="#">DBE_LOB.APPEND</a>	Adds the content of a LOB to another LOB.
<a href="#">DBE_LOB.LOB_APPEND</a>	Adds the content of a LOB to another LOB.
<a href="#">DBE_LOB.FREETEMPORARY</a>	Deletes a temporary BLOB or CLOB.
<a href="#">DBE_LOB.FILEOPEN</a>	Opens a database BFILE file and returns its file descriptor.
<a href="#">DBE_LOB.FILECLOSE</a>	Closes a BFILE file that is opened by <b>FILEOPEN</b> .
<a href="#">DBE_LOB.BFILEOPEN</a>	Opens a database BFILE file.
<a href="#">DBE_LOB.BFILECLOSE</a>	Closes a BFILE file that is opened by <b>BFILEOPEN</b> .
<a href="#">DBE_LOB.LOADFROMFILE</a>	Loads the database BFILE file of the specified length in the specified location to the BLOB in the specified location.
<a href="#">DBE_LOB.LOADFROMBFILE</a>	Loads the database BFILE file of the specified length in the specified location to the LOB in the specified location.
<a href="#">DBE_LOB.LOADBLOBFROMFILE</a>	Loads an external database file of the specified length in the specified location to a BLOB (smaller than or equal to 1 GB) in a specified location.
<a href="#">DBE_LOB.LOADBLOBFROMBFILE...</a>	Loads the database BFILE file of the specified length in the specified location to the BLOB in the specified location.
<a href="#">DBE_LOB.LOADCLOBFROMFILE</a>	Loads an external database file of the specified length in the specified location to a CLOB (smaller than or equal to 1 GB) in a specified location.

Interface	Description
<a href="#">DBE_LOB.LOADCLOBFROMBFIL...</a>	Loads the database BFILE file of the specified length in the specified location to the CLOB in the specified location.
<a href="#">DBE_LOB.CONVERTTOBLOB</a>	Converts a CLOB file to a BLOB file (smaller than or equal to 1 GB).
<a href="#">DBE_LOB.CONVERTTOCLOB</a>	Converts a BLOB file to a CLOB file (smaller than or equal to 1 GB).
<a href="#">DBE_LOB.LOB_CONVERTTOBLO...</a>	Converts a CLOB file to a BLOB file.
<a href="#">DBE_LOB.LOB_CONVERTTOCLO...</a>	Converts a BLOB file to a CLOB file.
<a href="#">DBE_LOB.GETCHUNKSIZE</a>	Obtains the maximum size of LOB data that can be stored in the chunk structure in the database.
<a href="#">DBE_LOB.LOB_WRITE</a>	Reads the specified length of the source object from the start position, writes the content to the specified offset position of the target LOB, overrides the original content, and returns the target LOB.
<a href="#">DBE_LOB.BFILENAME</a>	Constructs and returns the DBE_LOB.BFILE object based on the directory and file name.

- [DBE\\_LOB.GET\\_LENGTH](#)  
Obtains and returns the size of a specified LOB. The maximum size of the object is 2 GB.

The prototype of the DBE\_LOB.GET\_LENGTH function is as follows:

```
DBE_LOB.GET_LENGTH (
    blob_obj IN BLOB)
RETURN INTEGER;

DBE_LOB.GET_LENGTH (
    clob_obj IN CLOB)
RETURN INTEGER;
```

**Table 10-132** DBE\_LOB.GET\_LENGTH parameters

Parameter	Description
blob_obj/ clob_obj	BLOB/CLOB whose length is to be obtained

- [DBE\\_LOB.LOB\\_GET\\_LENGTH](#)  
Obtains and returns the length of a specified LOB or BFILE file. The maximum size of the object is 32 TB.

The prototype of the DBE\_LOB.LOB\_GET\_LENGTH function is as follows:

```
DBE_LOB.LOB_GET_LENGTH (
    blob_obj IN BLOB)
```

```

RETURN BIGINT;

DBE_LOB.LOB_GET_LENGTH (
  clob_obj IN CLOB)
RETURN BIGINT;

DBE_LOB.LOB_GET_LENGTH (
  bfile IN DBE_LOB.BFILE)
RETURN BIGINT;

```

**Table 10-133** DBE\_LOB.LOB\_GET\_LENGTH parameters

Parameter	Description
blob_obj/ clob_obj/bfile	BLOB/CLOB/BFILE whose length is to be obtained

- **DBE\_LOB.OPEN**

Opens a LOB and returns a LOB descriptor. This procedure is meaningless and is used only for compatibility.

The prototype of the DBE\_LOB.OPEN function is as follows:

```

DBE_LOB.OPEN (
  lob INOUT BLOB);

DBE_LOB.OPEN (
  lob INOUT CLOB);

DBE_LOB.OPEN (
  bfile INOUT DBE_LOB.BFILE,
  open_mode IN TEXT DEFAULT 'null');

```

**Table 10-134** DBE\_LOB.OPEN parameters

Parameter	Description
lob/bfile	Opened BLOB, CLOB or BFILE.

- **DBE\_LOB.READ**

Reads a part of LOB content to the output buffer based on the specified length and initial position offset.

The prototype of the DBE\_LOB.READ function is as follows:

```

DBE_LOB.READ (
  blob_obj IN BLOB,
  amount IN INTEGER,
  off_set IN INTEGER,
  out_put OUT RAW);

DBE_LOB.READ (
  clob_obj IN CLOB,
  amount IN INTEGER,
  off_set IN INTEGER,
  out_put OUT VARCHAR2);

```

**Table 10-135** DBE\_LOB.READ parameters

Parameter	Description
blob_obj/ clob_obj	BLOB/CLOB to be read
amount	Length of read content
off_set	Start position for reading the LOB content, that is, the offset bytes to initial position of the LOB content. If the offset is less than 1 or greater than the LOB length, an error is reported. The initial position is 1.
out_put	Target buffer for storing the read LOB content

- DBE\_LOB.LOB\_READ

Reads a part of LOB/BFILE content to the output buffer based on the specified length and initial position offset.

The prototype of the DBE\_LOB.LOB\_READ function is as follows:

```
DBE_LOB.LOB_READ(
  blob_obj IN BLOB,
  amount INOUT BIGINT,
  off_set IN BIGINT,
  out_put OUT RAW);

DBE_LOB.LOB_READ(
  clob_obj IN CLOB,
  amount INOUT BIGINT,
  off_set IN BIGINT,
  out_put OUT VARCHAR2);

DBE_LOB.LOB_READ(
  bfile IN DBE_LOB.BFILE,
  amount INOUT BIGINT,
  off_set IN BIGINT,
  out_put OUT RAW);
```

**Table 10-136** DBE\_LOB.LOB\_READ parameters

Parameter	Description
blob_obj/ clob_obj/bfile	BLOB/CLOB/BFILE object (can be greater than 1 GB) to be read
amount	Length to read as the IN parameter, or actual read length as the OUT parameter. <b>NOTE</b> If the length to read is less than or equal to 0 or exceeds 32767, an error is reported.
off_set	Start position for reading the LOB content, that is, the offset bytes to initial position of the LOB content. If the offset is less than 1 or greater than the LOB length, an error is reported. The initial position is 1.
out_put	Target buffer for storing the read LOB content

- DBE\_LOB.WRITE

Writes content in the source to a LOB based on the specified length and initial position.

The prototype of the DBE\_LOB.WRITE function is as follows:

```
DBE_LOB.WRITE (
  blob_obj INOUT BLOB,
  amount IN INTEGER,
  off_set IN INTEGER,
  source IN RAW);

DBE_LOB.WRITE (
  clob_obj INOUT CLOB,
  amount IN INTEGER,
  off_set IN INTEGER,
  source IN VARCHAR2);
```

**Table 10-137** DBE\_LOB.WRITE parameters

Parameter	Description
blob_obj/ clob_obj	BLOB/CLOB to which the buffer content is written
amount	Length to write, up to 32767 characters. <b>NOTE</b> If the length to write is less than 1 or greater than the length of the content to be written, an error is reported.
off_set	Start position for writing content to the target LOB, that is, the offset bytes to the initial position of LOB content. <b>NOTE</b> If the offset is less than 1 or greater than the value of <b>LOBMAXSIZE</b> , an error is reported. The initial position is 1, and the maximum value is the maximum length of the LOB type.
source	Content to be written

- DBE\_LOB.WRITE\_APPEND

Writes content in the source object to the end part of a LOB based on the specified length.

The prototype of the DBE\_LOB.WRITE\_APPEND function is as follows:

```
DBE_LOB.WRITE_APPEND (
  blob_obj INOUT BLOB,
  amount IN INTEGER,
  source_obj IN RAW);

DBE_LOB.WRITE_APPEND (
  clob_obj INOUT CLOB,
  amount IN INTEGER,
  source_obj IN VARCHAR2);
```

**Table 10-138** DBE\_LOB.WRITE\_APPEND parameters

Parameter	Description
blob_obj/ clob_obj	BLOB/CLOB to which the buffer content is written

Parameter	Description
amount	Length to write, up to 32767 characters.
source_obj	Content to be written

- DBE\_LOB.LOB\_WRITE\_APPEND

Writes content in the source object to the end part of a LOB based on the specified length.

The prototype of the DBE\_LOB.LOB\_WRITE\_APPEND function is as follows:

```
DBE_LOB.LOB_WRITE_APPEND(
  blob_obj INOUT BLOB,
  amount IN INTEGER,
  source_obj IN RAW);
```

```
DBE_LOB.LOB_WRITE_APPEND (
  clob_obj INOUT CLOB,
  amount IN INTEGER,
  source_obj IN VARCHAR2);
```

**Table 10-139** DBE\_LOB.LOB\_WRITE\_APPEND parameters

Parameter	Description
blob_obj/ clob_obj	BLOB/CLOB to which the buffer content is written
amount	Length to write, up to 32767 characters. <b>NOTE</b> If the length to write is less than 1 or greater than the length of the content to be written, an error is reported.
source_obj	Content to be written

- DBE\_LOB.COPY

Copies content in a LOB to another LOB based on the specified length and initial position offset.

The prototype of the DBE\_LOB.COPY function is as follows:

```
DBE_LOB.COPY (
  dest_lob INOUT BLOB,
  src_lob IN BLOB,
  len IN INTEGER,
  dest_start IN INTEGER DEFAULT 1,
  src_start IN INTEGER DEFAULT 1);
```

**Table 10-140** DBE\_LOB.COPY parameters

Parameter	Description
dest_lob	LOB to which the buffer content is to be pasted
src_lob	LOB from which the buffer content is to be copied
len	Length of copied content

Parameter	Description
dest_start	Start position for pasting the buffer content to the target LOB ( <b>dest_lob</b> ), that is, the offset bytes to the initial position of LOB content.
src_start	Start position for copying the buffer content from the source LOB ( <b>src_lob</b> ), that is, the offset bytes to the initial position of LOB content.

- DBE\_LOB.LOB\_COPY

Copies content in a LOB to another LOB based on the specified length and initial position offset.

The prototype of the DBE\_LOB.LOB\_COPY function is as follows:

```
DBE_LOB.LOB_COPY(
  blob_obj INOUT BLOB,
  source_obj IN BLOB,
  amount IN BIGINT,
  dest_offset IN BIGINT DEFAULT 1,
  src_offset IN BIGINT DEFAULT 1);

DBE_LOB.LOB_COPY(
  clob_obj INOUT CLOB,
  source_obj IN CLOB,
  amount IN BIGINT,
  dest_offset IN BIGINT DEFAULT 1,
  src_offset IN BIGINT DEFAULT 1);
```

**Table 10-141** DBE\_LOB.LOB\_COPY parameters

Parameter	Description
blob_obj/ clob_obj	LOB to which the buffer content is to be pasted
source_obj	LOB from which the buffer content is to be copied
amount	Length of copied content <b>NOTE</b> If the length to copy is less than 1 or greater than the value of <b>LOBMAXSIZE</b> , an error is reported.
dest_offset	Start position for pasting the buffer content to the target LOB, that is, the offset bytes/characters to the initial position of LOB content. <b>NOTE</b> If the offset is less than 1 or greater than the value of <b>LOBMAXSIZE</b> , an error is reported.
src_offset	Start position for copying the content from the source object, that is, the offset bytes to the initial position of LOB content. <b>NOTE</b> If the offset is less than 1, an error is reported.

- DBE\_LOB.ERASE

Deletes the content in a BLOB based on the specified length and initial position offset. The bytes of the deleted part in the BLOB are filled with 0.

The prototype of the DBE\_LOB.ERASE function is as follows:

```
DBE_LOB.ERASE (
  blob_obj INOUT BLOB,
  amount INOUT INTEGER,
  off_set IN INTEGER DEFAULT 1);
```

**Table 10-142** DBE\_LOB.ERASE parameters

Parameter	Description
blob_obj	LOB whose content is to be deleted as the IN parameter, or LOB with specified content deleted as the OUT parameter. If this parameter is left empty, an error is reported.
amount	Length (in bytes for BLOBs) to delete as the IN parameter, or actual length deleted as the OUT parameter. <b>NOTE</b> If the length to delete is less than 1 or this parameter is left empty, an error is reported.
off_set	Start position from which LOB content is to be deleted, that is, the number of offset bytes to the initial position of LOB content. <b>NOTE</b> If the offset is less than 1 or this parameter is left empty, an error is reported.

- DBE\_LOB.LOB\_ERASE

Deletes the content in the LOB based on the specified length and initial position offset. The bytes of the deleted part in the BLOB are filled with 0, and the characters of the deleted part in the CLOB are filled with spaces. The LOB can be greater than 1 GB and the maximum size is 32 TB.

The prototype of the DBE\_LOB.LOB\_ERASE function is as follows:

```
DBE_LOB.LOB_ERASE (
  blob_obj INOUT BLOB,
  amount INOUT BIGINT,
  off_set IN BIGINT DEFAULT 1);
```

```
DBE_LOB.LOB_ERASE (
  clob_obj INOUT CLOB,
  amount INOUT BIGINT,
  off_set IN BIGINT DEFAULT 1);
```

**Table 10-143** DBE\_LOB.LOB\_ERASE parameters

Parameter	Description
blob_obj/ clob_obj	LOB whose content is to be deleted as the IN parameter, or LOB with specified content deleted as the OUT parameter. If this parameter is left empty, an error is reported.
amount	Length (BLOB in bytes and CLOB in characters) to delete as the IN parameter, or actual length deleted as the OUT parameter. <b>NOTE</b> If the length to delete is less than 1 or this parameter is left empty, an error is reported.
offset	Start position from which the LOB content is to be deleted, that is, the number of bytes relative to the start position of the BLOB content or the number of characters relative to the start position of the CLOB content. <b>NOTE</b> If the offset is less than 1 or this parameter is left empty, an error is reported.

- DBE\_LOB.CLOSE

Closes the LOB descriptor that has been opened.

The prototype of the DBE\_LOB.CLOSE function is as follows:

```
DBE_LOB.CLOSE(
  lob IN BLOB);

DBE_LOB.CLOSE (
  lob IN CLOB);

DBE_LOB.CLOSE (
  file IN INTEGER);
```

**Table 10-144** DBE\_LOB.CLOSE parameters

Parameter	Description
lob/file	BLOB/CLOB/File object whose LOB descriptor is to be closed

- DBE\_LOB.MATCH

Returns the *M*th occurrence position of *pattern* in a LOB or BFILE file. **NULL** is returned for any of the following conditions: The LOB or BFILE file can be greater than 1 GB, up to 32 TB.

The prototype of the DBE\_LOB.MATCH function is as follows:

```
DBE_LOB.MATCH(
  blob_obj IN BLOB,
  blob_obj2 IN RAW,
  beg_index IN BIGINT DEFAULT 1,
  occur_index IN BIGINT DEFAULT 1)
RETURN BIGINT;

DBE_LOB.MATCH(
```

```

clob_obj IN CLOB,
clob_obj2 IN VARCHAR2,
beg_index IN BIGINT DEFAULT 1,
occur_index IN BIGINT DEFAULT 1)
RETURN BIGINT;

DBE_LOB.MATCH(
bfile IN DBE_LOB.BFILE,
blob_obj2 IN RAW,
beg_index IN BIGINT DEFAULT 1,
occur_index IN BIGINT DEFAULT 1)
RETURN BIGINT;

```

**Table 10-145** DBE\_LOB.MATCH parameters

Parameter	Description
blob_obj/ clob_obj/ bfile	BLOB/CLOB descriptor to be searched for, or BFILE (which must be opened using <b>DBE_LOB.BFILEOPEN</b> first). If this parameter is left blank, null is returned.
blob_obj 2/ clob_obj2	Pattern to match. It is RAW for BLOB/BFILE objects and VARCHAR2 for CLOBs. If this parameter is left empty, null is returned.
beg_index	Absolute offset (in bytes) for BLOB/BFILE objects, or offset (in characters) for CLOBs. The start position for matching is 1.  <b>NOTE</b> The value ranges from 1 to <i>LOBMAXSIZE</i> . If a value out of the range is input, null is returned.
occur_index	Number of pattern matching times. The minimum value is 1.  <b>NOTE</b> If the value is greater than the maximum number of times that the pattern string can be matched in the LOB, <b>0</b> is returned. If the value is out of the range from 1 to <i>LOBMAXSIZE</i> , null is returned.

- **DBE\_LOB.COMPARE**

Compares LOBs or BFILE objects.

- If the compared objects are equal, **0** is returned. Otherwise, a non-zero value is returned.
- If the first LOB is smaller than the second, **-1** is returned. If the first LOB is larger than the second, **1** is returned.
- If any of the *len*, *start1*, and *start2* parameters is invalid, **NULL** is returned. The valid offset range is 1 to *LOBMAXSIZE*.
- If both the values of **start\_pos1** and **start\_pos2** exceed the LOB/BFILE length, **0** is returned.

The prototype of the DBE\_LOB.COMPARE function is as follows:

```

DBE_LOB.COMPARE (
lob1 IN BLOB,
lob2 IN BLOB,
len IN BIGINT DEFAULT 1073741312,
start_pos1 IN BIGINT DEFAULT 1,
start_pos2 IN BIGINT DEFAULT 1)
RETURN INTEGER;

```

```

DBE_LOB.COMPARE (
  lob1    IN CLOB,
  lob2    IN CLOB,
  len     IN BIGINT DEFAULT 1073741312,
  start_pos1 IN BIGINT DEFAULT 1,
  start_pos2 IN BIGINT DEFAULT 1)
RETURN INTEGER;
DBE_LOB.COMPARE (
  file1   IN DBE_LOB.BFILE,
  file2   IN DBE_LOB.BFILE,
  len     IN BIGINT DEFAULT 1073741312,
  start_pos1 IN BIGINT DEFAULT 1,
  start_pos2 IN BIGINT DEFAULT 1)
RETURN INTEGER;

```

**Table 10-146** DBE\_LOB.COMPARE parameters

Parameter	Description
lob1/file1	First BLOB/CLOB/BFILE to be compared (which must be opened using <b>DBE_LOB.BFILEOPEN</b> first).
lob2/file2	Second BLOB/CLOB/BFILE to be compared (which must be opened using <b>DBE_LOB.BFILEOPEN</b> first).
len	Number of characters or bytes to be compared. The default value is <b>1073741312</b> .
start_pos1	Offset of the first LOB descriptor. The initial position is 1, and the maximum value is the maximum length of the LOB content.
start_pos2	Offset of the second LOB descriptor. The initial position is 1, and the maximum value is the maximum length of the LOB content.

- **DBE\_LOB.SUBSTR**

Reads a LOB or BFILE substring and returns the read substring.

The prototype of the DBE\_LOB.SUBSTR function is as follows:

```

DBE_LOB.SUBSTR(
  lob_loc IN BLOB,
  amount IN INTEGER DEFAULT 32767,
  off_set IN INTEGER DEFAULT 1)
RETURN RAW;

DBE_LOB.SUBSTR(
  lob_loc IN CLOB,
  amount IN INTEGER DEFAULT 32767,
  off_set IN INTEGER DEFAULT 1)
RETURN VARCHAR2;

```

**Table 10-147** DBE\_LOB.SUBSTR parameters

Parameter	Description
lob_loc	LOB descriptor or BFILE file whose substring is to be read. For BLOBs, the return value is of the RAW type. For CLOBs, the return value is of the VARCHAR2 type.

Parameter	Description
amount	Number of bytes or characters to be read.
off_set	Number of characters or bytes offset from the start position.

- DBE\_LOB.LOB\_SUBSTR

Reads a LOB or BFILE substring and returns the read substring. The LOB or BFILE file can be greater than 1 GB, up to 32 TB.

The prototype of the DBE\_LOB.LOB\_SUBSTR function is as follows:

```
DBE_LOB.LOB_SUBSTR(
  lob_loc IN BLOB,
  amount IN INTEGER DEFAULT 32767,
  off_set IN BIGINT DEFAULT 1)
RETURN RAW;

DBE_LOB.LOB_SUBSTR(
  lob_loc IN CLOB,
  amount IN INTEGER DEFAULT 32767,
  off_set IN BIGINT DEFAULT 1)
RETURN VARCHAR2;

DBE_LOB.LOB_SUBSTR(
  bfile IN DBE_LOB.BFILE,
  amount IN INTEGER DEFAULT 32767,
  off_set IN BIGINT DEFAULT 1)
RETURN RAW;
```

**Table 10-148** DBE\_LOB.LOB\_SUBSTR parameters

Parameter	Description
lob_loc/ bfile	LOB descriptor or BFILE file whose substring is to be read. The file must be opened by DBE_LOB.BFILEOPEN first. For BLOBs/BFILE files, the return value is of the RAW type. For CLOBs, the return value is of the VARCHAR2 type.
amount	Number of bytes or characters to be read. <b>NOTE</b> The value ranges from 1 to 32767. If the value exceeds the range, null is returned.
off_set	Number of characters or bytes offset from the start position. <b>NOTE</b> The value ranges from 1 to <i>LOBMAXSIZE</i> . If the value exceeds the range, null is returned.

- DBE\_LOB.STRIP

Truncates a LOB based on a specified length. After this stored procedure is executed, the length of the LOB is set to the length specified by the **newlen** parameter.

The prototype of the DBE\_LOB.STRIP function is as follows:

```
DBE_LOB.STRIP(
  lob_loc INOUT BLOB,
  newlen IN INTEGER);

DBE_LOB.STRIP(
```

```
lob_loc INOUT CLOB,  
newlen IN INTEGER);
```

**Table 10-149** DBE\_LOB.STRIP parameters

Parameter	Description
lob_loc	LOB to read as the IN parameter, or truncated object as the OUT parameter. If this parameter is left empty, an error is reported.
newlen	New length after truncation, in bytes for BLOBs or in characters for CLOBs.

- DBE\_LOB.LOB\_STRIP

Truncates a LOB based on a specified length. After this stored procedure is executed, the length of the LOB is set to the length specified by the **newlen** parameter. The LOB can be greater than 1 GB, up to 32 TB.

The prototype of the DBE\_LOB.LOB\_STRIP function is as follows:

```
DBE_LOB.LOB_STRIP(  
lob_loc INOUT BLOB,  
newlen IN BIGINT);
```

```
DBE_LOB.LOB_STRIP(  
lob_loc INOUT CLOB,  
newlen IN BIGINT);
```

**Table 10-150** DBE\_LOB.LOB\_STRIP parameters

Parameter	Description
lob_loc	LOB to read as the IN parameter, or truncated object as the OUT parameter. If this parameter is left empty, an error is reported.
newlen	New length after truncation, in bytes for BLOBs or in characters for CLOBs.  <b>NOTE</b> If the value is less than 1, null is returned. If the value is greater than the LOB length, an error is reported.

- DBE\_LOB.CREATE\_TEMPORARY

Creates a temporary BLOB or CLOB. This interface is used only for syntax compatibility.

The prototype of the DBE\_LOB.CREATE\_TEMPORARY function is as follows:

```
DBE_LOB.CREATE_TEMPORARY (  
lob_loc INOUT BLOB,  
cache IN BOOLEAN,  
dur IN INTEGER DEFAULT 10);
```

```
DBE_LOB.CREATE_TEMPORARY (  
lob_loc INOUT CLOB,  
cache IN BOOLEAN,  
dur IN INTEGER DEFAULT 10);
```

**Table 10-151** DBE\_LOB.CREATE\_TEMPORARY parameters

Parameter	Description
lob_loc	LOB descriptor
cache	Used only for syntax compatibility.
dur	Used only for syntax compatibility.

- DBE\_LOB.APPEND

Appends *source\_obj* to the end of the target LOB.

The prototype of the DBE\_LOB.APPEND function is as follows:

```
DBE_LOB.APPEND (
  blob_obj INOUT BLOB,
  source_obj IN BLOB);

DBE_LOB.APPEND (
  clob_obj INOUT CLOB,
  source_obj IN CLOB);
```

**Table 10-152** DBE\_LOB.APPEND parameters

Parameter	Description
blob_obj/ clob_obj	BLOB/CLOB to which the buffer content is to be written
source_obj	BLOB/CLOB from which the buffer content is to be read

- DBE\_LOB.LOB\_APPEND

Appends *source\_obj* to the end of the target LOB.

The prototype of the DBE\_LOB.LOB\_APPEND function is as follows:

```
DBE_LOB.LOB_APPEND(
  blob_obj INOUT BLOB,
  source_obj IN BLOB);

DBE_LOB.LOB_APPEND(
  clob_obj INOUT CLOB,
  source_obj IN CLOB);
```

**Table 10-153** DBE\_LOB.LOB\_APPEND parameters

Parameter	Description
blob_obj/ clob_obj	BLOB/CLOB to which the buffer content is to be written
source_obj	BLOB/CLOB from which the buffer content is to be read

- DBE\_LOB.FREETEMPORARY

Frees LOB files created by CREATE\_TEMPORARY.

The prototype of the DBE\_LOB.FREETEMPORARY function is as follows:

```
DBE_LOB.FREETEMPORARY (
  blob INOUT BLOB);
```

```
DBE_LOB.FREETEMPORARY (
  clob INOUT CLOB);
```

**Table 10-154** DBE\_LOB.FREETEMPORARY parameters

Parameter	Description
blob/clob	BLOB/CLOB to be freed.

- DBE\_LOB.FILEOPEN

Opens an external database BFILE file and returns its file descriptor. A maximum of 10 BFILE files can be opened in a session. The BFILE type is defined as follows:

```
DBE_LOB.BFILE (
  directory TEXT,
  filename TEXT,
  fd INTEGER);
```

The prototype of the DBE\_LOB.FILEOPEN function is as follows:

```
DBE_LOB.FILEOPEN (
  bfile IN DBE_LOB.BFILE,
  open_mode IN TEXT)
RETURN INTEGER;
```

**Table 10-155** DBE\_LOB.FILEOPEN parameters

Parameter	Description
bfile	<p>External database file to be opened. For a BFILE file, this parameter specifies the file path , file name, and file descriptor.</p> <p><b>NOTE</b></p> <p>The <i>file</i> variable contains the location of the file directory <i>directory</i> and the file name <i>filename</i>.</p> <ul style="list-style-type: none"> <li>Location of the file directory, which needs to be added to system catalog <a href="#">20.2.57-PG_DIRECTORY</a>. If the input path does not match the path in <a href="#">20.2.57-PG_DIRECTORY</a>, an error indicating that the path does not exist is reported.</li> <li>When the GUC parameter <b>safe_data_path</b> is enabled, you can only use an advanced package to read and write files in the file path specified by <b>safe_data_path</b>.</li> <li>File name with an extension (file type), excluding the path name. The path contained in the file name will be ignored by OPEN. In Unix, the file name cannot end with the combination of a slash and a period (/.).</li> </ul>
open_mode	File open mode, which can only be r. An error is reported in other modes.

- DBE\_LOB.FILECLOSE

Closes an external BFILE file.

The prototype of the DBE\_LOB.FILECLOSE function is as follows:

```
DBE_LOB.FILECLOSE (
  file IN INTEGER);
```

**Table 10-156** DBE\_LOB.FILECLOSE parameters

Parameter	Description
file	External database file to be closed (that is opened by FILEOPEN).

- DBE\_LOB.BFILEOPEN

Opens an external database BFILE file. A maximum of 10 BFILE files can be opened in a session.

The prototype of DBE\_LOB.BFILEOPEN is as follows:

```
DBE_LOB.BFILEOPEN (
  bfile INOUT DBE_LOB.BFILE,
  open_mode IN TEXT DEFAULT 'R');
```

**Table 10-157** DBE\_LOB.BFILEOPEN parameters

Parameter	Description
bfile	Opened database BFILE file as the INOUT parameter. <b>NOTE</b> The <i>bfile</i> variable contains the location of the file directory <i>directory</i> and the file name <i>filename</i> . <ul style="list-style-type: none"> <li>• Location of the file directory, which needs to be added to system catalog <a href="#">20.2.57-PG_DIRECTORY</a>. If the input path does not match the path in <a href="#">20.2.57-PG_DIRECTORY</a>, an error indicating that the path does not exist is reported.</li> <li>• When the GUC parameter <b>safe_data_path</b> is enabled, you can only use an advanced package to read and write files in the file path specified by <b>safe_data_path</b>.</li> <li>• File name with an extension (file type), excluding the path name. The path contained in the file name will be ignored by OPEN. In Unix, the file name cannot end with the combination of a slash and a period (/).</li> </ul>
open_mode	File open mode, which can only be <b>r</b> . An error is reported in other modes.

**Examples**

```
-- Obtain the substring of the BFILE.
DECLARE
bfile dbe_lob.bfile;
BEGIN
bfile = DBE_LOB.BFILENAME(dir_name, file_name); -- Obtain the corresponding BFILE.
DBE_LOB.bfileopen(bfile, 'r'); -- Open the BFILE.
RAISE NOTICE 'res:%', DBE_LOB.lob_substr(bfile, 10, 1); -- Obtain and print the substring.
DBE_LOB.bfileclose(bfile);-- Close the BFILE.
END;
/
```

- DBE\_LOB.BFILECLOSE

Closes an external database BFILE file.

The prototype of DBE\_LOB.BFILECLOSE is as follows:

```
DBE_LOB.BFILECLOSE (
  bfile INOUT DBE_LOB.BFILE);
```

**Table 10-158** DBE\_LOB.BFILECLOSE parameters

Parameter	Description
bfile	Closed database BFILE file as the INOUT parameter.

- DBE\_LOB.LOADFROMFILE

Loads an external BFILE file to a BLOB and returns the object of the RAW type.

The prototype of the DBE\_LOB.LOADFROMFILE function is as follows:

```
DBE_LOB.LOADFROMFILE (
  dest_lob IN BLOB,
  src_file IN INTEGER,
  amount IN INTEGER,
  dest_offset IN INTEGER,
  src_offset IN INTEGER)
RETURN RAW;
```

**Table 10-159** DBE\_LOB.LOADFROMFILE parameters

Parameter	Description
dest_lob	Target BLOB. The BFILE file will be loaded to the specified offset position of the BLOB.
src_bfile	Source BFILE file to be read.
amount	Length of the content to be read from the BFILE file. <b>NOTE</b> If the length is less than 1 or greater than 32767, an error is reported.
dest_offset	Offset length of the BLOB. <b>NOTE</b> If the offset is less than 1 or greater than the value of <i>LOBMAXSIZE</i> , an error is reported.
src_offset	Offset length of the BFILE file. <b>NOTE</b> If the offset is less than 1 or greater than the value of <i>LOBMAXSIZE</i> , an error is reported.

- DBE\_LOB.LOADFROMBFILE

Loads an external BFILE file to a LOB.

The prototype of the DBE\_LOB.LOADFROMBFILE function is as follows:

```
DBE_LOB.LOADFROMBFILE (
  dest_lob INOUT BLOB,
  src_file IN DBE_LOB.BFILE,
  amount IN BIGINT,
  dest_offset IN BIGINT DEFAULT 1,
  src_offset IN BIGINT DEFAULT 1)
RETURN BLOB;
```

```
DBE_LOB.LOADFROMBFILE (
  dest_lob INOUT CLOB,
  src_file IN DBE_LOB.BFILE,
  amount IN BIGINT,
  dest_offset IN BIGINT DEFAULT 1,
  src_offset IN BIGINT DEFAULT 1)
RETURN CLOB;
```

**Table 10-160** DBE\_LOB.LOADFROMBFILE parameters

Parameter	Description
dest_lob	Target LOB as the INOUT parameter, to which the BFILE file will be loaded. The file must be opened by <b>DBE_LOB.BFILEOPEN</b> first. The LOB can be greater than 1 GB, up to 32 TB.
src_file	Source BFILE file to be read. The BFILE file can be greater than 1 GB, up to 32 TB.
amount	Length of the content to be read from the BFILE file and to be written to the LOB. <b>NOTE</b> If the length is less than 1 or greater than the value of <i>LOBMAXSIZE</i> , an error is reported.
dest_offset	Offset length of the target LOB <b>NOTE</b> If the offset is less than 1 or greater than the value of <i>LOBMAXSIZE</i> , an error is reported.
src_offset	Offset length of the source BFILE file <b>NOTE</b> <ul style="list-style-type: none"> <li>If the offset is less than 1 or greater than the value of <i>LOBMAXSIZE</i>, an error is reported.</li> <li>If the sum of <i>amount</i> and <i>src_offset</i> is greater than the length of <i>src_bfile</i> plus 1, an error is reported.</li> </ul>

- **DBE\_LOB.LOADBLOBFROMFILE**

Loads an external BFILE file to a BLOB and returns the object of the RAW type.

The prototype of the DBE\_LOB.LOADBLOBFROMFILE function is as follows:

```
DBE_LOB.LOADBLOBFROMFILE (
  dest_lob IN BLOB,
  src_file IN INTEGER,
  amount IN INTEGER,
  dest_offset IN INTEGER,
  src_offset IN INTEGER)
RETURN RAW;
```

**Table 10-161** DBE\_LOB.LOADBLOBFROMFILE parameters

Parameter	Description
dest_lob	Target BLOB, to which the BFILE file will be loaded.

Parameter	Description
src_file	Source BFILE file to be read.
amount	Length of the target BLOB. If the length of a file exceeds this threshold, the file will not be saved to the BLOB. <b>NOTE</b> If the length is less than 1 or greater than 32767, an error is reported.
dest_offset	Offset length of the BLOB. <b>NOTE</b> If the offset is less than 1 or greater than the value of <i>LOBMAXSIZE</i> , an error is reported.
src_offset	Offset length of the BFILE file. <b>NOTE</b> If the offset is less than 1 or greater than the value of <i>LOBMAXSIZE</i> , an error is reported.

- DBE\_LOB.LOADBLOBFROMBFILE

Loads an external BFILE file to a BLOB.

The prototype of the DBE\_LOB.LOADBLOBFROMBFILE function is as follows:

```
DBE_LOB.LOADBLOBFROMBFILE (
  dest_lob INOUT BLOB,
  src_file IN DEB_LOB.BFILE,
  amount IN BIGINT,
  dest_offset INOUT BIGINT,
  src_offset INOUT BIGINT)
```

**Table 10-162** DBE\_LOB.LOADBLOBFROMBFILE parameters

Parameter	Description
dest_lob	Target BLOB as the INOUT parameter, to which the BFILE file (which must be opened using <b>DBE_LOB.BFILEOPEN</b> first) is loaded. The BFILE file can be greater than 1 GB, up to 32 TB.
src_file	Source BFILE file to be read. The BFILE file can be greater than 1 GB, up to 32 TB.
amount	Length of the target BLOB. If the length of a file exceeds this threshold, the file will not be saved to the BLOB. <b>NOTE</b> If the length is less than 1 or greater than the value of <i>LOBMAXSIZE</i> , an error is reported.
dest_offset	Offset length of the BLOB. <b>NOTE</b> If the offset is less than 1 or greater than the value of <i>LOBMAXSIZE</i> , an error is reported.

Parameter	Description
src_offset	Offset length of the BFILE file. <b>NOTE</b> <ul style="list-style-type: none"> <li>If the offset is less than 1 or greater than the value of <i>LOBMAXSIZE</i>, an error is reported.</li> <li>If the sum of <i>amount</i> and <i>src_offset</i> is greater than the length of <i>src_bfile</i> plus 1, an error is reported.</li> </ul>

- DBE\_LOB.LOADCLOBFROMFILE

Loads an external BFILE file to a CLOB and returns the object of the RAW type.

The prototype of the DBE\_LOB.LOADCLOBFROMFILE function is as follows:

```
DBE_LOB.LOADCLOBFROMFILE (
  dest_lob IN CLOB,
  src_file IN INTEGER,
  amount IN INTEGER,
  dest_offset IN INTEGER,
  src_offset IN INTEGER)
RETURN raw;
```

**Table 10-163** DBE\_LOB.LOADCLOBFROMFILE parameters

Parameter	Description
dest_lob	Target CLOB, to which the BFILE file will be loaded.
src_file	Source BFILE file to be read.
amount	Length of the CLOB. <b>NOTE</b> If the length is less than 1 or greater than 32767, an error is reported.
dest_offset	Offset length of the CLOB. <b>NOTE</b> If the offset is less than 1 or greater than the value of <i>LOBMAXSIZE</i> , an error is reported.
src_offset	Offset length of the BFILE file. <b>NOTE</b> If the offset is less than 1 or greater than the value of <i>LOBMAXSIZE</i> , an error is reported.

- DBE\_LOB.LOADCLOBFROMBFILE

Loads an external BFILE file to a CLOB.

The prototype of the DBE\_LOB.LOADCLOBFROMBFILE function is as follows:

```
DBE_LOB.LOADCLOBFROMBFILE (
  dest_lob INOUT CLOB,
  src_file IN DEB_LOB.BFILE,
  amount IN BIGINT,
  dest_offset INOUT BIGINT,
  src_offset INOUT BIGINT)
```

**Table 10-164** DBE\_LOB.LOADCLOBFROMBFILE parameters

Parameter	Description
dest_lob	Target CLOB as the INOUT parameter, to which the BFILE file (which must be opened using <b>DBE_LOB.BFILEOPEN</b> first) is loaded. The BFILE file can be greater than 1 GB, up to 32 TB.
src_file	Source BFILE file to be read. The BFILE file can be greater than 1 GB, up to 32 TB.
amount	Length of the target CLOB. If the length of a file exceeds this threshold, the file will not be saved to the CLOB. <b>NOTE</b> If the length is less than 1 or greater than the value of <i>LOBMAXSIZE</i> , an error is reported.
dest_offset	Offset length of the CLOB. <b>NOTE</b> If the offset is less than 1 or greater than the value of <i>LOBMAXSIZE</i> , an error is reported.
src_offset	Offset length of the BFILE file. <b>NOTE</b> <ul style="list-style-type: none"> <li>If the offset is less than 1 or greater than the value of <i>LOBMAXSIZE</i>, an error is reported.</li> <li>If the sum of <i>amount</i> and <i>src_offset</i> is greater than the length of <i>src_bfile</i> plus 1, an error is reported.</li> </ul>

- **DBE\_LOB.CONVERTTOBLOB**

Converts a CLOB to a BLOB. The CLOB cannot be greater than 1 GB.

The prototype of the DBE\_LOB.CONVERTTOBLOB function is as follows:

```
DBE_LOB.CONVERTTOBLOB(
  dest_blob IN BLOB,
  src_clob  IN CLOB,
  amount   IN INTEGER DEFAULT 32767,
  dest_offset IN INTEGER DEFAULT 1,
  src_offset IN INTEGER DEFAULT 1)
RETURN raw;
```

**Table 10-165** DBE\_LOB.CONVERTTOBLOB parameters

Parameter	Description
dest_blob	Target BLOB, which is converted from a CLOB.
src_clob	Source CLOB to be read.
amount	Length of the target CLOB. If the length of a file exceeds this threshold, the file will not be saved to the BLOB. If the length is less than 1 or greater than the value of <i>LOBMAXSIZE</i> , an error is reported.

Parameter	Description
dest_offset	Offset length of the BLOB. If <b>dest_offset</b> is set to <b>1</b> , data is loaded from the start position of the file. The rest may be deduced by analogy.
src_offset	Offset length of the CLOB. If <b>src_offset</b> is set to <b>1</b> , data is read from the start position of the file. The rest may be deduced by analogy.

- DBE\_LOB.LOB\_CONVERTTOBLOB

Converts a CLOB to a BLOB. The LOB can be greater than 1 GB.

The prototype of the DBE\_LOB.LOB\_CONVERTTOBLOB function is as follows:

```
DBE_LOB.LOB_CONVERTTOBLOB(
  dest_blob INOUT BLOB,
  src_clob IN CLOB,
  amount IN BIGINT,
  dest_offset INOUT BIGINT,
  src_offset INOUT BIGINT)
```

**Table 10-166** DBE\_LOB.LOB\_CONVERTTOBLOB parameters

Parameter	Description
dest_blob	Target BLOB, which is converted from a CLOB.
src_clob	Source CLOB to be read.
amount	Length of the target CLOB. If the length of a file exceeds this threshold, the file will not be saved to the BLOB. If the length is less than 1 or greater than the value of <i>LOBMAXSIZE</i> , an error is reported.
dest_offset	Offset length of the BLOB. If <b>dest_offset</b> is set to <b>1</b> , data is loaded from the start position of the file. The rest may be deduced by analogy. If the offset is less than 1 or greater than the value of <i>LOBMAXSIZE</i> , an error is reported.
src_offset	Offset length of the CLOB. If <b>src_offset</b> is set to <b>1</b> , data is read from the start position of the file. The rest may be deduced by analogy. If the offset is less than 1 or greater than the value of <i>LOBMAXSIZE</i> , an error is reported.

- DBE\_LOB.CONVERTTOCLOB

Converts a BLOB to a CLOB. The BLOB cannot be greater than 1 GB.

The prototype of the DBE\_LOB.CONVERTTOCLOB function is as follows:

```
DBE_LOB.CONVERTTOCLOB(
  dest_clob IN CLOB,
  src_blob IN BLOB,
  amount IN INTEGER DEFAULT 32767,
  dest_offset IN INTEGER DEFAULT 1,
  src_offset IN INTEGER DEFAULT 1)
RETURN text;
```

**Table 10-167** DBE\_LOB.CONVERTTOCLOB parameters

Parameter	Description
dest_clob	Target CLOB, which is converted from a BLOB.
src_blob	Source BLOB to be read.
amount	Length of the target BLOB. If the length of a file exceeds this threshold, the file will not be saved to the CLOB.
dest_offset	Offset length of the CLOB. If <b>dest_offset</b> is set to <b>1</b> , data is loaded from the start position of the file. The rest may be deduced by analogy.
src_offset	Offset length of the BLOB. If <b>src_offset</b> is set to <b>1</b> , data is read from the start position of the file. The rest may be deduced by analogy.

- DBE\_LOB.LOB\_CONVERTTOCLOB

Converts a BLOB to a CLOB. The LOB can be greater than 1 GB.

The prototype of the DBE\_LOB.LOB\_CONVERTTOCLOB function is as follows:

```
DBE_LOB.LOB_CONVERTTOCLOB(
  dest_clob INOUT CLOB,
  src_blob IN BLOB,
  amount IN BIGINT,
  dest_offset INOUT BIGINT,
  src_offset INOUT BIGINT)
```

**Table 10-168** DBE\_LOB.LOB\_CONVERTTOCLOB parameters

Parameter	Description
dest_clob	Target CLOB, which is converted from a BLOB.
src_blob	Source BLOB to be read.
amount	Length of the target BLOB. If the length of a file exceeds this threshold, the file will not be saved to the CLOB.
dest_offset	Offset length of the CLOB. If <b>dest_offset</b> is set to <b>1</b> , data is loaded from the start position of the file. The rest may be deduced by analogy. If the offset is less than 1 or greater than the value of <i>LOBMAXSIZE</i> , an error is reported.
src_offset	Offset length of the BLOB. If <b>src_offset</b> is set to <b>1</b> , data is read from the start position of the file. The rest may be deduced by analogy. If the offset is less than 1 or greater than the value of <i>LOBMAXSIZE</i> , an error is reported.

- DBE\_LOB.GETCHUNKSIZE

Returns *TOAST\_MAX\_CHUNK\_SIZE*. When LOB data is stored in the database, TOAST is used internally.

The prototype of the DBE\_LOB.GETCHUNKSIZE function is as follows:

```
DBE_LOB.GETCHUNKSIZE(
  lob_loc IN CLOB
)RETURN INTEGER

DBE_LOB.GETCHUNKSIZE(
  lob_loc IN BLOB
)RETURN INTEGER
```

**Table 10-169** DBE\_LOB.GETCHUNKSIZE parameters

Parameter	Description
lob_loc	Target CLOB/BLOB.

- DBE\_LOB.LOB\_WRITE

Reads the specified length of the source object from the start position, writes the content to the specified offset position of the target LOB, overrides the original content, and returns the target LOB.

The prototype of the DBE\_LOB.LOB\_WRITE function is as follows:

```
DBE_LOB.LOB_WRITE(
  clob_obj INOUT CLOB,
  amount IN INTEGER,
  off_set IN BIGINT,
  source IN VARCHAR2
)
RETURN CLOB;

DBE_LOB.LOB_WRITE(
  blob_obj INOUT BLOB,
  amount IN INTEGER,
  off_set IN BIGINT,
  source IN RAW
)
RETURN BLOB;
```

**Table 10-170** DBE\_LOB.LOB\_WRITE parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
blob_obj / clob_obj	BLOB / CLOB	INOUT	No	Target LOB as the INOUT parameter, to which the content is to be written.
amount	INTEGER	IN	No	Length of the data to be written (in bytes for BLOBs or in characters for CLOBs)
off_set	BIGINT	IN	No	Offset position for writing data to <i>blob_obj/clob_obj</i>

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
source	RAW/VARCHAR2	IN	No	Source object

- DBE\_LOB.BFILENAME

Constructs a BFILE based on the directory and file name.

The prototype of DBE\_LOB.BFILENAME is as follows:

```
DBE_LOB.BFILENAME(
  directory IN TEXT,
  filename IN TEXT)
RETURN DBE_LOB.BFILE;
```

**Table 10-171** DBE\_LOB.BFILENAME interface parameters

Parameter	Description
directory	File path <b>NOTE</b> Location of the file directory, which needs to be added to system catalog <a href="#">20.2.57-PG_DIRECTORY</a> . If the input path does not match the path in <a href="#">20.2.57-PG_DIRECTORY</a> , an error indicating that the path does not exist is reported. <ul style="list-style-type: none"> <li>When the GUC parameter <b>safe_data_path</b> is enabled, you can only use an advanced package to read and write files in the file path specified by <b>safe_data_path</b>.</li> <li>File name with an extension (file type), excluding the path name. The path contained in the file name will be ignored by OPEN. In Unix, the file name cannot end with the combination of a slash and a period (/.).</li> </ul>
filename	File name

## Examples

```
-- Obtain the length of a string.
SELECT DBE_LOB.GET_LENGTH('12345678');

DECLARE
myraw RAW(100);
amount INTEGER :=2;
buffer INTEGER :=1;
begin
DBE_LOB.READ('123456789012345',amount,buffer,myraw);
dbe_output.print_line(myraw);
end;
/

CREATE TABLE blob_Table (t1 blob);
CREATE TABLE blob_Table_bak (t2 blob);
```

```

INSERT INTO blob_Table VALUES('abcdef');
INSERT INTO blob_Table_bak VALUES('22222');

DECLARE
str varchar2(100) := 'abcdef';
source raw(100);
dest blob;
copyto blob;
amount int;
PSV_SQL varchar2(100);
PSV_SQL1 varchar2(100);
a int :=1;
len int;
BEGIN
source := dbe_raw.cast_from_varchar2_to_raw(str);
amount := dbe_raw.get_length(source);

PSV_SQL := 'select * from blob_Table for update';
PSV_SQL1 := 'select * from blob_Table_bak for update';

EXECUTE IMMEDIATE PSV_SQL into dest;
EXECUTE IMMEDIATE PSV_SQL1 into copyto;

DBE_LOB.WRITE(dest, amount, 1, source);
DBE_LOB.WRITE_APPEND(dest, amount, source);

DBE_LOB.ERASE(dest, a, 1);
DBE_OUTPUT.PRINT_LINE(a);
DBE_LOB.COPY(copyto, dest, amount, 10, 1);
perform DBE_LOB.CLOSE(dest);
RETURN;
END;
/

-- Delete the table.
DROP TABLE blob_Table;
DROP TABLE blob_Table_bak;

```

### 10.12.2.2 DBE\_RANDOM

#### Interface Description

[Table 10-172](#) lists all interfaces supported by the **DBE\_RANDOM** package.

**Table 10-172** DBE\_RANDOM interface parameters

Interface	Description
<b>DBE_RANDOM.SET_SEED</b>	Sets a seed for a random number.
<b>DBE_RANDOM.GET_VALUE</b>	Generates a random number between a specified <b>low</b> and a specified <b>high</b> .

- **DBE\_RANDOM.SET\_SEED**

The stored procedure **SEED** is used to set a seed for a random number. The prototype of the **DBE\_RANDOM.SET\_SEED** function is as follows:

```
DBE_RANDOM.SET_SEED (seed IN INTEGER);
```

**Table 10-173** DBE\_RANDOM.SET\_SEED interface parameters

Parameter	Description
seed	Generates a seed for a random number.

- DBE\_RANDOM.GET\_VALUE

The stored procedure **VALUE** generates a random number between a specified **low** and a specified **high**. The prototype of the **DBE\_RANDOM.GET\_VALUE** function is as follows:

```
DBE_RANDOM.GET_VALUE(
min IN NUMBER default 0,
max IN NUMBER default 1)
RETURN NUMBER;
```

**Table 10-174** DBE\_RANDOM.GET\_VALUE interface parameters

Parameter	Description
min	Sets the low bound for a random number. The generated random number is greater than or equal to <b>min</b> .
max	Sets the high bound for a random number. The generated random number is less than <b>max</b> .

 **NOTE**

- The only requirement is that the parameter type is numeric regardless of the right and left bound values.
- **DBE\_RANDOM** implements pseudo-random numbers. Therefore, if the initial value (seed) remains unchanged, the sequence of the pseudo-random numbers also remains unchanged.
- The generated random number contains 15 valid digits.

## Examples

```
-- Generate a random number between 0 and 1.
SELECT DBE_RANDOM.GET_VALUE(0,1);

-- For integers within a specified range, add the arguments min and max, and truncate the decimals from
the result (the maximum value is not included as a possible value). Therefore, for integers from 0 to 99, you
can use the following code:
SELECT TRUNC(DBE_RANDOM.GET_VALUE(0,100));
```

### 10.12.2.3 DBE\_OUTPUT

 **NOTE**

When DBE\_OUTPUT.PUT\_LINE is used to print the result obtained by the DBE\_FILE.READ\_LINE\_NCHAR API, ensure that the UTF-8 character set encoding can be converted to the current database character set encoding. If the preceding conditions are met, the result can be properly output. DBE\_OUTPUT.PRINT\_LINE does not support this function.

## Interface Description

**Table 10-175** provides all interfaces supported by the **DBE\_OUTPUT** package.

**Table 10-175** DBE\_OUTPUT

Interface	Description
<b>DBE_OUTPUT.PRINT_LINE</b>	Outputs the specified text with newline characters.
<b>DBE_OUTPUT.PRINT</b>	Outputs the specified text without newline characters.
<b>DBE_OUTPUT.SET_BUFFER_SIZE</b>	Sets the size of the output buffer. If the size is not specified, the buffer can contain a maximum of 20000 bytes. If the size is set to a value less than or equal to 2000 bytes, the buffer can contain a maximum of 2000 bytes.
<b>DBE_OUTPUT.DISABLE</b>	Disables the calling of PUT, PUT_LINE, NEW_LINE, GET_LINE and GET_LINES, and clears the output buffer.
<b>DBE_OUTPUT.ENABLE</b>	Enables the buffer, allows the calling of PUT, PUT_LINE, NEW_LINE, GET_LINE, and GET_LINES, and sets the buffer size.
<b>DBE_OUTPUT.GET_LINE</b>	Obtains a line of data from the buffer with a newline character as the boundary. The obtained data is not output to the client.
<b>DBE_OUTPUT.GET_LINES</b>	Obtains the character string of a specified number of lines in the buffer as a VARCHAR array. The obtained content is cleared from the buffer and is not output to the client.
<b>DBE_OUTPUT.NEW_LINE</b>	Places a line at the end of the buffer, places an end-of-line marker, and leaves a new line empty.
<b>DBE_OUTPUT.PUT</b>	Places an input string in the buffer without a newline character at the end. When the stored procedure ends, the line ending with the newline character is displayed.
<b>DBE_OUTPUT.PUT_LINE</b>	Places an input string in the buffer with a newline character at the end. When the stored procedure ends, the line ending with the newline character is displayed.

- DBE\_OUTPUT.PRINT\_LINE

The stored procedure **PRINT\_LINE** writes a line of text carrying a line end symbol in the buffer. The function prototype of **DBE\_OUTPUT.PRINT\_LINE** is as follows:

```
DBE_OUTPUT.PRINT_LINE (  
format IN VARCHAR2);
```

**Table 10-176** DBE\_OUTPUT.PRINT\_LINE interface parameters

Parameter	Description
format	Specifies the text that was written to the buffer.

- DBE\_OUTPUT.PRINT

The stored procedure **PRINT** outputs the specified text to the front of the specified text without adding a newline character. The function prototype of **DBE\_OUTPUT.PRINT** is as follows:

```
DBE_OUTPUT.PRINT (  
format IN VARCHAR2);
```

**Table 10-177** DBE\_OUTPUT.PRINT interface parameters

Parameter	Description
format	Specifies the text that was written to the specified text.

- DBE\_OUTPUT.SET\_BUFFER\_SIZE

The stored procedure **SET\_BUFFER\_SIZE** sets the output buffer size. If the size is not specified, it contains a maximum of 20000 bytes. The function prototype of **DBE\_OUTPUT.SET\_BUFFER\_SIZE** is as follows:

```
DBE_OUTPUT.SET_BUFFER_SIZE (  
size IN INTEGER default 20000);
```

**Table 10-178** DBE\_OUTPUT.SET\_BUFFER\_SIZE interface parameters

Parameter	Description
size	Sets the output buffer size.

- DBE\_OUTPUT.DISABLE

The stored procedure **DISABLE** disables the calling of PUT, PUT\_LINE, NEW\_LINE, GET\_LINE and GET\_LINES, and clears the output buffer. The prototype of the DBE\_OUTPUT.DISABLE function is as follows:

```
DBE_OUTPUT.DISABLE;
```

- DBE\_OUTPUT.ENABLE

The stored procedure **ENABLE** enables the buffer, allows the calling of PUT, PUT\_LINE, NEW\_LINE, GET\_LINE, and GET\_LINES, and sets the buffer size. The prototype of the DBE\_OUTPUT.ENABLE function is as follows:

```
DBE_OUTPUT.ENABLE (
    buffer_size IN INTEGER DEFAULT 20000
);
```

**Table 10-179** DBE\_OUTPUT.ENABLE parameters

Parameter	Description
buffer_size	Upper limit of the buffer size, in bytes. If <b>buffer_size</b> is set to <b>NULL</b> , the default value is used.

- DBE\_OUTPUT.GET\_LINE

The stored procedure **GET\_LINE** obtains a line of data from the buffer with a newline character as the boundary. The obtained data is not output to the client. The prototype of the DBE\_OUTPUT.GET\_LINE function is as follows:

```
DBE_OUTPUT.GET_LINE (
    line OUT VARCHAR2,
    status OUT INTEGER
);
```

**Table 10-180** DBE\_OUTPUT.GET\_LINE parameters

Parameter	Description
line	Indicates the obtained character string.
status	Indicates whether the calling is normal. If a character string is obtained, the value is <b>0</b> . Otherwise, the value is <b>1</b> .

- DBE\_OUTPUT.GET\_LINES

The stored procedure **GET\_LINES** obtains the character string of a specified number of lines in the buffer as a VARCHAR array. The obtained content is cleared from the buffer and is not output to the client. The prototype of the DBE\_OUTPUT.GET\_LINES function is as follows:

```
DBE_OUTPUT.GET_LINES (
    lines OUT VARCHAR[],
    numlines IN OUT INTEGER
);
```

**Table 10-181** DBE\_OUTPUT.GET\_LINES parameters

Parameter	Description
lines	Outputs an array of multi-line strings read from the buffer.
numlines	Inputs the number of lines to be retrieved from the buffer. The output value is the number of lines actually retrieved. If the output value is less than the input value, there are no more lines in the buffer.

- DBE\_OUTPUT.NEW\_LINE

The stored procedure **NEW\_LINE** places a line at the end of the buffer, places an end-of-line marker, and leaves a new line empty. The prototype of the DBE\_OUTPUT.NEW\_LINE function is as follows:

- ```
DBE_OUTPUT.NEW_LINE;
```
- **DBE\_OUTPUT.PUT**  
The stored procedure **PUT** places an input string in the buffer without a newline character at the end. When the stored procedure ends, the line ending with the newline character is displayed. The prototype of the **DBE\_OUTPUT.PUT** function is as follows:

```
DBE_OUTPUT.PUT (  
  item IN VARCHAR2);
```

**Table 10-182** DBE\_OUTPUT.PUT parameters

| Parameter | Description                                          |
|-----------|------------------------------------------------------|
| item      | Character or string item to be placed in the buffer. |

- **DBE\_OUTPUT.PUT\_LINE**  
The stored procedure **PUT\_LINE** places an input string in the buffer with a newline character at the end. When the stored procedure ends, the line ending with the newline character is displayed. The prototype of the **DBE\_OUTPUT.PUT\_LINE** function is as follows:

```
DBE_OUTPUT.PUT_LINE (  
  item IN VARCHAR2);
```

**Table 10-183** DBE\_OUTPUT.PUT\_LINE parameters

| Parameter | Description                                          |
|-----------|------------------------------------------------------|
| item      | Character or string item to be placed in the buffer. |

## Examples

```
BEGIN
  DBE_OUTPUT.SET_BUFFER_SIZE(50);
  DBE_OUTPUT.PRINT('hello, ');
  DBE_OUTPUT.PRINT_LINE('database!');-- Output "hello, database!".
END;
/

-- Test DISABLE: Disable the calling of PUT, PUT_LINE, NEW_LINE, GET_LINE, and GET_LINES. The PUT_LINE
has no output.
BEGIN
  dbe_output.disable();
  dbe_output.put_line('1');
END;
/

-- Test ENABLE: Enable the calling of PUT, PUT_LINE, NEW_LINE, GET_LINE, and GET_LINES. The output of
PUT_LINE is 1.
BEGIN
  dbe_output.enable();
  dbe_output.put_line('1');
END;
/

-- Test PUT: Place the input character string a in the buffer without adding a newline character at the end.
a has no output.
BEGIN
  dbe_output.enable();
```

```
db_output.put('a');
END;
/

-- Test NEW_LINE. Add a new line. The output is a.
BEGIN
db_output.enable();
db_output.put('a');
    db_output.new_line;
END;
/

-- Test GET_LINE: Obtain buffer data and save the data to variables and use PUT_LINE to output the data.
DECLARE
line VARCHAR(32672);
status INTEGER := 0;
BEGIN
db_output.put_line('hello');
db_output.get_line(line, status);
db_output.put_line('-----');
db_output.put_line(line);
db_output.put_line(status);
END;
/
The expected result is as follows:
-----
hello
0

-- Test GET_LINES: Obtain multiple lines of content in the buffer and use PUT_LINE to output the content.
DECLARE
lines dbms_output.chararr;
numlines integer;
BEGIN
db_output.put_line('output line 1');
db_output.put_line('output line 2');
db_output.put_line('output line 3');
numlines := 100;
db_output.get_lines(lines, numlines);
db_output.put_line('num: ' || numlines);
db_output.put_line('get line 1: ' || lines(1));
db_output.put_line('get line 2: ' || lines(2));
db_output.put_line('get line 3: ' || lines(3));
END;
/
-- The expected result is as follows:
num: 3
get line 1: output line 1
get line 2: output line 2
get line 3: output line 3
```

### 10.12.2.4 DBE\_RAW

The DBE\_RAW package provides interfaces for operating RAW types.

#### NOTICE

RAW data is represented as hexadecimal characters externally, and stored as binary characters internally. For example, the representation of RAW data 11001011 is 'CB', that is, the input for type conversion is 'CB'.

## Interface Description

[Table 10-184](#) provides all interfaces supported by the DBE\_RAW package.

**Table 10-184** DBE\_RAW

| Interface                                               | Description                                                                         |
|---------------------------------------------------------|-------------------------------------------------------------------------------------|
| <a href="#">DBE_RAW.CAST_FROM_BINARY_INTEGER_TO_RAW</a> | Converts an INTEGER value to a RAW value.                                           |
| <a href="#">DBE_RAW.CAST_FROM_RAW_TO_BINARY_INTEGER</a> | Converts a RAW value to an INTEGER value.                                           |
| <a href="#">DBE_RAW.GET_LENGTH</a>                      | Returns the length of a RAW value.                                                  |
| <a href="#">DBE_RAW.CAST_FROM_VARCHAR2_TO_RAW</a>       | Converts a VARCHAR2 value to a RAW value.                                           |
| <a href="#">DBE_RAW.CAST_TO_VARCHAR2</a>                | Converts a RAW value to a VARCHAR2 value.                                           |
| <a href="#">DBE_RAW.BIT_OR</a>                          | Returns a RAW value after bitwise OR calculation.                                   |
| <a href="#">DBE_RAW.SUBSTR</a>                          | Returns the substring of a RAW value.                                               |
| <a href="#">DBE_RAW.BIT_AND</a>                         | Returns a RAW value after bitwise AND calculation.                                  |
| <a href="#">DBE_RAW.BIT_COMPLEMENT</a>                  | Returns a RAW value after bitwise complement calculation.                           |
| <a href="#">DBE_RAW.BIT_XOR</a>                         | Returns a RAW value after bitwise XOR calculation.                                  |
| <a href="#">DBE_RAW.CAST_FROM_BINARY_DOUBLE_TO_RAW</a>  | Converts a BINARY_DOUBLE value to a RAW value.                                      |
| <a href="#">DBE_RAW.CAST_FROM_RAW_TO_BINARY_DOUBLE</a>  | Converts a RAW value to a BINARY_DOUBLE value.                                      |
| <a href="#">DBE_RAW.CAST_FROM_RAW_TO_BINARY_FLOAT</a>   | Converts a RAW value to a FLOAT4 value.                                             |
| <a href="#">DBE_RAW.CAST_FROM_BINARY_FLOAT_TO_RAW</a>   | Converts a FLOAT4 value to a RAW value.                                             |
| <a href="#">DBE_RAW.CAST_FROM_RAW_TO_NUMBER</a>         | Converts a RAW value to a NUMERIC value.                                            |
| <a href="#">DBE_RAW.CAST_FROM_NUMBER_TO_RAW</a>         | Converts a NUMERIC value to a RAW value.                                            |
| <a href="#">DBE_RAW.CAST_FROM_RAW_TO_NVARCHAR2</a>      | Converts a RAW value to an NVARCHAR2 value.                                         |
| <a href="#">DBE_RAW.COMPARE</a>                         | Returns the first different position of two RAW values.                             |
| <a href="#">DBE_RAW.CONCAT</a>                          | Concatenates a maximum of 12 RAW values into a new RAW value and returns the value. |

| Interface                    | Description                                                                                                            |
|------------------------------|------------------------------------------------------------------------------------------------------------------------|
| <b>DBE_RAW.CONVERT</b>       | Converts a RAW value from the source encoding mode <b>from_charset</b> to the target encoding mode <b>to_charset</b> . |
| <b>DBE_RAW.COPIES</b>        | Copies a RAW value for <i>n</i> times, concatenates the values, and returns the concatenated result.                   |
| <b>DBE_RAW.OVERLAY</b>       | Overlays one RAW data with another RAW data by specifying the start position and length to be overlaid.                |
| <b>DBE_RAW.REVERSE</b>       | Reverses RAW data by byte.                                                                                             |
| <b>DBE_RAW.TRANSLATE</b>     | Converts or discards a specified byte of a RAW value.                                                                  |
| <b>DBE_RAW.TRANSLITERATE</b> | Converts a specified byte of a RAW value.                                                                              |
| <b>DBE_RAW.XRANGE</b>        | Returns a RAW value containing the succession of one-byte encodings beginning and ending with the specified byte-code. |

- **DBE\_RAW.CAST\_FROM\_BINARY\_INTEGER\_TO\_RAW**

Converts an INTEGER value to a RAW value.

The prototype of the DBE\_RAW.CAST\_FROM\_BINARY\_INTEGER\_TO\_RAW function is as follows:

```
DBE_RAW.CAST_FROM_BINARY_INTEGER_TO_RAW(
    value IN BIGINT,
    endianness IN INTEGER DEFAULT 1)
RETURN RAW;
```

**Table 10-185** DBE\_RAW.CAST\_FROM\_BINARY\_INTEGER\_TO\_RAW parameters

| Parameter | Description                                                                                                                                                                                                                                                                                                                  |
|-----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| value     | INTEGER value to be converted.<br><br><b>NOTE</b><br>The DBE_RAW.CAST_FROM_BINARY_INTEGER_TO_RAW expects to process values of the INTEGER type. For compatibility purposes, this parameter is defined as the BIGINT type. The BIGINT type has a larger range than the INTEGER type, which does not affect the interface use. |

| Parameter  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| endianness | Endianness, that is, byte order. The value can be <b>1</b> , <b>2</b> , or <b>3</b> . The value <b>1</b> indicates BIG_ENDIAN, <b>2</b> indicates LITTLE_ENDIAN, and <b>3</b> indicates MACHINE_ENDIAN. The default value is <b>1</b> . If BIG_ENDIAN is used on the host where the function is executed, the function execution result using MACHINE_ENDIAN is the same as that using BIG_ENDIAN. If LITTLE_ENDIAN is used on the host where the function is executed, the function execution result using MACHINE_ENDIAN is the same as that using LITTLE_ENDIAN. |

- DBE\_RAW.CAST\_FROM\_RAW\_TO\_BINARY\_INTEGER

Converts a RAW value to an INTEGER value.

The prototype of the DBE\_RAW.CAST\_FROM\_RAW\_TO\_BINARY\_INTEGER function is as follows:

```
DBE_RAW.CAST_FROM_RAW_TO_BINARY_INTEGER(
    value IN RAW,
    endianness IN INTEGER DEFAULT 1)
RETURN INTEGER;
```

**Table 10-186** DBE\_RAW.CAST\_FROM\_RAW\_TO\_BINARY\_INTEGER parameters

| Parameter  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| value      | RAW value to be converted.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| endianness | Endianness, that is, byte order. The value can be <b>1</b> , <b>2</b> , or <b>3</b> . The value <b>1</b> indicates BIG_ENDIAN, <b>2</b> indicates LITTLE_ENDIAN, and <b>3</b> indicates MACHINE_ENDIAN. The default value is <b>1</b> . If BIG_ENDIAN is used on the host where the function is executed, the function execution result using MACHINE_ENDIAN is the same as that using BIG_ENDIAN. If LITTLE_ENDIAN is used on the host where the function is executed, the function execution result using MACHINE_ENDIAN is the same as that using LITTLE_ENDIAN. |

- DBE\_RAW.GET\_LENGTH

Returns the length of a RAW value.

The prototype of the DBE\_RAW.GET\_LENGTH function is as follows:

```
DBE_RAW.GET_LENGTH(
    value IN RAW)
RETURN INTEGER;
```

**Table 10-187** DBE\_RAW.GET\_LENGTH parameters

| Parameter | Description |
|-----------|-------------|
| value     | RAW value.  |

- **DBE\_RAW.CAST\_FROM\_VARCHAR2\_TO\_RAW**  
Converts a VARCHAR2 value to a RAW value.  
The prototype of the DBE\_RAW.CAST\_FROM\_VARCHAR2\_TO\_RAW function is as follows:

```
DBE_RAW.CAST_FROM_VARCHAR2_TO_RAW(  
  str IN VARCHAR2)  
RETURN RAW;
```

**Table 10-188** DBE\_RAW.CAST\_FROM\_VARCHAR2\_TO\_RAW parameters

| Parameter | Description                     |
|-----------|---------------------------------|
| str       | VARCHAR2 value to be converted. |

- **DBE\_RAW.CAST\_TO\_VARCHAR2**  
Converts a RAW value to a VARCHAR2 value.  
The prototype of the DBE\_RAW.CAST\_TO\_VARCHAR2 function is as follows:

```
DBE_RAW.CAST_TO_VARCHAR2(  
  str IN RAW)  
RETURN VARCHAR2;
```

**Table 10-189** DBE\_RAW.CAST\_TO\_VARCHAR2 parameters

| Parameter | Description                |
|-----------|----------------------------|
| str       | RAW value to be converted. |

- **DBE\_RAW.BIT\_OR**  
Returns the value of two RAW values after bitwise OR calculation.  
The prototype of the DBE\_RAW.BIT\_OR function is as follows:

```
DBE_RAW.BIT_OR(  
  str1 IN TEXT,  
  str2 IN TEXT)  
RETURN TEXT;
```

**Table 10-190** DBE\_RAW.BIT\_OR parameters

| Parameter | Description                                                                                                                                                                                                                                                                                             |
|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| str1      | First character string of the bitwise OR calculation.<br><b>NOTE</b><br>Due to legacy reasons, this parameter is defined as the TEXT type. However, the DBE_RAW.SUBSTR interface expects to process RAW values. Defining this parameter as the TEXT type does not affect the processing of RAW values.  |
| str2      | Second character string of the bitwise OR calculation.<br><b>NOTE</b><br>Due to legacy reasons, this parameter is defined as the TEXT type. However, the DBE_RAW.SUBSTR interface expects to process RAW values. Defining this parameter as the TEXT type does not affect the processing of RAW values. |

- **DBE\_RAW.SUBSTR**  
Truncates a RAW value based on the start position *bit off\_set* and length *amount*.

The prototype of the DBE\_RAW.SUBSTR function is as follows:

```
DBE_RAW.SUBSTR(
  lob_loc IN BLOB,
  off_set IN INTEGER DEFAULT 1,
  amount IN INTEGER DEFAULT 32767)
RETURN RAW;
```

**Table 10-191** DBE\_RAW.SUBSTR parameters

| Parameter | Description                                                                                                                                                                                                                                                        |
|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| lob_loc   | Source RAW value.<br><b>NOTE</b><br>Due to legacy reasons, this parameter is defined as the BLOB type. However, the DBE_RAW.SUBSTR interface expects to process RAW values. Defining this parameter as the BLOB type does not affect the processing of RAW values. |
| off_set   | Start position of the substring. The default value is <b>1</b> .                                                                                                                                                                                                   |
| amount    | Substring length. The default value is <b>32767</b> .                                                                                                                                                                                                              |

- **DBE\_RAW.BIT\_AND**  
Obtains the bitwise AND result of two RAW values.  
The prototype of the DBE\_RAW.BIT\_AND function is as follows:

```
DBE_RAW.BIT_AND(
  r1 IN RAW,
  r2 IN RAW)
RETURN RAW;
```

**Table 10-192** DBE\_RAW.BIT\_AND parameters

| Parameter | Description                                                                       |
|-----------|-----------------------------------------------------------------------------------|
| r1        | The RAW value for the bitwise AND operation with r2. The maximum length is 32767. |
| r2        | The RAW value for the bitwise AND operation with r1. The maximum length is 32767. |

- **DBE\_RAW.BIT\_COMPLEMENT**  
Obtains the bitwise complement result of a RAW value.  
The prototype of the DBE\_RAW.BIT\_COMPLEMENT function is as follows:

```
DBE_RAW.BIT_COMPLEMENT(
  r IN RAW)
RETURN RAW;
```

**Table 10-193** DBE\_RAW.BIT\_COMPLEMENT parameters

| Parameter | Description                                                                      |
|-----------|----------------------------------------------------------------------------------|
| r         | The RAW value for the bitwise complement operation. The maximum length is 32767. |

- DBE\_RAW.BIT\_XOR

Obtains the bitwise XOR result of two RAW values.

The prototype of the DBE\_RAW.BIT\_XOR function is as follows:

```
DBE_RAW.BIT_XOR(
  r1 IN RAW,
  r2 IN RAW)
RETURN RAW;
```

**Table 10-194** DBE\_RAW.BIT\_XOR parameters

| Parameter | Description                                                                       |
|-----------|-----------------------------------------------------------------------------------|
| r1        | The RAW value for the bitwise XOR operation with r2. The maximum length is 32767. |
| r2        | The RAW value for the bitwise XOR operation with r1. The maximum length is 32767. |

- DBE\_RAW.CAST\_FROM\_BINARY\_DOUBLE\_TO\_RAW

Converts a BINARY\_DOUBLE value to a RAW value.

The prototype of the DBE\_RAW.CAST\_FROM\_BINARY\_DOUBLE\_TO\_RAW function is as follows:

```
DBE_RAW.CAST_FROM_BINARY_DOUBLE_TO_RAW (
  n      IN BINARY_DOUBLE,
  endianness IN INTEGER DEFAULT 1)
RETURN RAW;
```

**Table 10-195** DBE\_RAW.CAST\_FROM\_BINARY\_DOUBLE\_TO\_RAW parameters

| Parameter  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| n          | BINARY_DOUBLE value to be converted.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| endianness | Endianness, that is, byte order. The value can be <b>1</b> , <b>2</b> , or <b>3</b> . The value <b>1</b> indicates BIG_ENDIAN, <b>2</b> indicates LITTLE_ENDIAN, and <b>3</b> indicates MACHINE_ENDIAN. The default value is <b>1</b> . If BIG_ENDIAN is used on the host where the function is executed, the function execution result using MACHINE_ENDIAN is the same as that using BIG_ENDIAN. If LITTLE_ENDIAN is used on the host where the function is executed, the function execution result using MACHINE_ENDIAN is the same as that using LITTLE_ENDIAN. |

- DBE\_RAW.CAST\_FROM\_RAW\_TO\_BINARY\_DOUBLE

Converts a RAW value to a BINARY\_DOUBLE value.

The prototype of the DBE\_RAW.CAST\_FROM\_RAW\_TO\_BINARY\_DOUBLE function is as follows:

```
DBE_RAW.CAST_FROM_RAW_TO_BINARY_DOUBLE(  
r IN RAW,  
endianess IN INTEGER DEFAULT 1)  
RETURN BINARY_DOUBLE;
```

**Table 10-196** DBE\_RAW.CAST\_FROM\_RAW\_TO\_BINARY\_DOUBLE parameters

| Parameter | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| r         | The RAW value to be converted. The value contains 8 to 32767 characters.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| endianess | Endianness, that is, byte order. The value can be <b>1</b> , <b>2</b> , or <b>3</b> . The value <b>1</b> indicates BIG_ENDIAN, <b>2</b> indicates LITTLE_ENDIAN, and <b>3</b> indicates MACHINE_ENDIAN. The default value is <b>1</b> . If BIG_ENDIAN is used on the host where the function is executed, the function execution result using MACHINE_ENDIAN is the same as that using BIG_ENDIAN. If LITTLE_ENDIAN is used on the host where the function is executed, the function execution result using MACHINE_ENDIAN is the same as that using LITTLE_ENDIAN. |

- DBE\_RAW.CAST\_FROM\_RAW\_TO\_BINARY\_FLOAT

Converts a RAW value to a FLOAT4 value.

The prototype of the DBE\_RAW.CAST\_FROM\_RAW\_TO\_BINARY\_FLOAT function is as follows:

```
DBE_RAW.CAST_FROM_RAW_TO_BINARY_FLOAT(  
r IN RAW,  
endianess IN INTEGER DEFAULT 1)  
RETURN FLOAT4;
```

**Table 10-197** DBE\_RAW.CAST\_FROM\_RAW\_TO\_BINARY\_FLOAT parameters

| Parameter | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| r         | The RAW value to be converted. The value contains 4 to 32767 characters.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| endianess | Endianness, that is, byte order. The value can be <b>1</b> , <b>2</b> , or <b>3</b> . The value <b>1</b> indicates BIG_ENDIAN, <b>2</b> indicates LITTLE_ENDIAN, and <b>3</b> indicates MACHINE_ENDIAN. The default value is <b>1</b> . If BIG_ENDIAN is used on the host where the function is executed, the function execution result using MACHINE_ENDIAN is the same as that using BIG_ENDIAN. If LITTLE_ENDIAN is used on the host where the function is executed, the function execution result using MACHINE_ENDIAN is the same as that using LITTLE_ENDIAN. |

- DBE\_RAW.CAST\_FROM\_BINARY\_FLOAT\_TO\_RAW

Converts a FLOAT4 value to a RAW value.

The prototype of the DBE\_RAW.CAST\_FROM\_BINARY\_FLOAT\_TO\_RAW function is as follows:

```
DBE_RAW.CAST_FROM_BINARY_FLOAT_TO_RAW(  
n IN FLOAT4,  
endianess IN INTEGER DEFAULT 1)  
RETURN RAW;
```

**Table 10-198** DBE\_RAW.CAST\_FROM\_BINARY\_FLOAT\_TO\_RAW parameters

| Parameter | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| n         | FLOAT4 value to be converted.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| endianess | Endianness, that is, byte order. The value can be <b>1</b> , <b>2</b> , or <b>3</b> . The value <b>1</b> indicates BIG_ENDIAN, <b>2</b> indicates LITTLE_ENDIAN, and <b>3</b> indicates MACHINE_ENDIAN. The default value is <b>1</b> . If BIG_ENDIAN is used on the host where the function is executed, the function execution result using MACHINE_ENDIAN is the same as that using BIG_ENDIAN. If LITTLE_ENDIAN is used on the host where the function is executed, the function execution result using MACHINE_ENDIAN is the same as that using LITTLE_ENDIAN. |

- DBE\_RAW.CAST\_FROM\_RAW\_TO\_NUMBER  
Converts a RAW value to a NUMERIC value.

 **NOTE**

The bottom-layer implementation of the number data type in database A is different from that in GaussDB, and the raw data type is the hexadecimal representation of the binary stream implemented at the bottom layer. Therefore, the function in database A is different from that in GaussDB. You cannot obtain the same number-type data from GaussDB based on the raw data corresponding to the number-type data in database A. For details about the number-type data in GaussDB, see the example.

The prototype of the DBE\_RAW.CAST\_FROM\_RAW\_TO\_NUMBER function is as follows:

```
DBE_RAW.CAST_FROM_RAW_TO_NUMBER(  
r IN RAW)  
RETURN NUMERIC;
```

**Table 10-199** DBE\_RAW.CAST\_FROM\_RAW\_TO\_NUMBER parameters

| Parameter | Description                                                              |
|-----------|--------------------------------------------------------------------------|
| r         | The RAW value to be converted. The value contains 6 to 32767 characters. |

- DBE\_RAW.CAST\_FROM\_NUMBER\_TO\_RAW  
Converts a NUMERIC value to a RAW value.

 **NOTE**

The bottom-layer implementation of the number data type in database A is different from that in GaussDB, and the raw data type is the hexadecimal representation of the binary stream implemented at the bottom layer. Therefore, the function in database A is different from that in GaussDB. You cannot restore the raw data corresponding to the number-type data in database A to the original number type in database A in the GaussDB database. For details about the performance of this function in GaussDB, see the example.

The prototype of the DBE\_RAW.CAST\_FROM\_NUMBER\_TO\_RAW function is as follows:

```
DBE_RAW.CAST_FROM_NUMBER_TO_RAW(  
  n IN NUMERIC)  
RETURN RAW;
```

**Table 10-200** DBE\_RAW.CAST\_FROM\_NUMBER\_TO\_RAW parameters

| Parameter | Description                    |
|-----------|--------------------------------|
| n         | NUMERIC value to be converted. |

- DBE\_RAW.CAST\_FROM\_RAW\_TO\_NVARCHAR2

Converts a RAW value to an NVARCHAR2 value.

The prototype of the DBE\_RAW.CAST\_FROM\_RAW\_TO\_NVARCHAR2 function is as follows:

```
DBE_RAW.CAST_FROM_RAW_TO_NVARCHAR2(  
  r IN RAW)  
RETURN NVARCHAR2;
```

**Table 10-201** DBE\_RAW.CAST\_FROM\_RAW\_TO\_NVARCHAR2 parameters

| Parameter | Description                                                 |
|-----------|-------------------------------------------------------------|
| r         | The RAW value to be converted. The maximum length is 32767. |

- DBE\_RAW.COMPARE

Returns the first different position of two RAW values.

The prototype of the DBE\_RAW.COMPARE function is as follows:

```
DBE_RAW.COMPARE(  
  r1 IN RAW,  
  r2 IN RAW,  
  pad IN RAW DEFAULT NULL)  
RETURN INTEGER;
```

**Table 10-202** DBE\_RAW.COMPARE parameters

| Parameter | Description                                                                                              |
|-----------|----------------------------------------------------------------------------------------------------------|
| r1        | First data to be compared. The value can be <b>NULL</b> or the length is 0. The maximum length is 32767. |

| Parameter | Description                                                                                                                                                                                                                                            |
|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| r2        | Second data to be compared. The value can be <b>NULL</b> or the length is 0. The maximum length is 32767.                                                                                                                                              |
| pad       | The first byte of <b>pad</b> is used to extend the shorter one of <b>r1</b> or <b>r2</b> . The maximum length is 32767. If this parameter is set to <b>NULL</b> , the length is 0, or the default value is used, the extended value is <b>0x'00'</b> . |

- DBE\_RAW.CONCAT

Concatenates a maximum of 12 RAW values into a new RAW value and returns the value. If the length after concatenation exceeds 32767, an error is reported.

The prototype of the DBE\_RAW.CONCAT function is as follows:

```
DBE_RAW.CONCAT(
  r1 IN RAW DEFAULT NULL,
  r2 IN RAW DEFAULT NULL,
  r3 IN RAW DEFAULT NULL,
  r4 IN RAW DEFAULT NULL,
  r5 IN RAW DEFAULT NULL,
  r6 IN RAW DEFAULT NULL,
  r7 IN RAW DEFAULT NULL,
  r8 IN RAW DEFAULT NULL,
  r9 IN RAW DEFAULT NULL,
  r10 IN RAW DEFAULT NULL,
  r11 IN RAW DEFAULT NULL,
  r12 IN RAW DEFAULT NULL)
RETURN RAW;
```

**Table 10-203** DBE\_RAW.CONCAT parameters

| Parameter | Description                        |
|-----------|------------------------------------|
| r1...r12  | The RAW values to be concatenated. |

- DBE\_RAW.CONVERT

Converts a RAW value from the source encoding mode **from\_charset** to the target encoding mode **to\_charset**.

If the rule for converting between source and target encoding (for example, GBK and LATIN1) does not exist, the parameter **r** is returned without conversion. See the **pg\_conversion** system catalog for details.

The prototype of the DBE\_RAW.CONVERT function is as follows:

```
DBE_RAW.CONVERT(
  r IN RAW,
  to_charset IN VARCHAR2,
  from_charset IN VARCHAR2)
RETURN RAW;
```

**Table 10-204** DBE\_RAW.CONVERT parameters

| Parameter    | Description                                                                   |
|--------------|-------------------------------------------------------------------------------|
| r            | The RAW value to be converted. The maximum length is 32767.                   |
| to_charset   | Name of the target encoding character set.                                    |
| from_charset | Name of the source encoding character set. In this encoding, r must be valid. |

- DBE\_RAW.COPIES

Copies a RAW value for *n* times, concatenates the values, and returns the concatenated result. If the length after copying exceeds 32767, an error is reported.

The prototype of the DBE\_RAW.COPIES function is as follows:

```
DBE_RAW.COPIES(
  r IN RAW,
  n IN NUMERIC)
RETURN RAW;
```

**Table 10-205** DBE\_RAW.COPIES parameters

| Parameter | Description                                                |
|-----------|------------------------------------------------------------|
| r         | The RAW values to be copied.                               |
| n         | Number of copy times. The value must be a positive number. |

- DBE\_RAW.OVERLAY

Overlays one RAW data with another RAW data by specifying the start position and length to be overlaid.

The prototype of the DBE\_RAW.OVERLAY function is as follows:

```
DBE_RAW.OVERLAY(
  overlay_str IN RAW,
  target      IN RAW,
  pos        IN BINARY_INTEGER DEFAULT 1,
  len        IN BINARY_INTEGER DEFAULT NULL,
  pad        IN RAW              DEFAULT NULL)
RETURN RAW;
```

**Table 10-206** DBE\_RAW.OVERLAY parameters

| Parameter   | Description                                                                                                                      |
|-------------|----------------------------------------------------------------------------------------------------------------------------------|
| overlay_str | Byte used for overwriting. The value cannot be NULL.                                                                             |
| target      | Source byte string to be overlaid. The value is of the RAW type and contains a maximum of 32767 bytes. The value cannot be NULL. |

| Parameter | Description                                                                                                                                                                                                                                            |
|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| pos       | Indicates the byte from which the overlay starts. The position of the first byte is 1. The value of <b>pos</b> must be greater than or equal to 1 and the value of <b>len+pos</b> must be less than or equal to 32767. The default value is <b>1</b> . |
| len       | Length to be overlaid. The value of <b>len</b> must be greater than or equal to 0 and the value of <b>len+pos</b> must be less than or equal to 32767. The default value is the length of <b>overlay_str</b> .                                         |
| pad       | Padding byte. Only the first byte is valid. The default value is <b>NULL</b> . If the value is <b>NULL</b> , it is regarded as <b>0x00</b> by default.                                                                                                 |

- DBE\_RAW.REVERSE

Reverses RAW data by byte.

The prototype of the DBE\_RAW.REVERSE function is as follows:

```
DBE_RAW.REVERSE(
  r IN RAW
)
RETURN RAW;
```

**Table 10-207** DBE\_RAW.REVERSE parameters

| Parameter | Description                                                                                                       |
|-----------|-------------------------------------------------------------------------------------------------------------------|
| r         | The RAW value to be reversed. The maximum length is 32767. If the value is <b>NULL</b> , <b>NULL</b> is returned. |

- DBE\_RAW.TRANSLATE

Converts or discards a specified byte of a RAW value.

The prototype of the DBE\_RAW.TRANSLATE function is as follows:

```
DBE_RAW.TRANSLATE(
  r IN RAW,
  from_set IN RAW,
  to_set IN RAW)
RETURN RAW;
```

**Table 10-208** DBE\_RAW.TRANSLATE parameters

| Parameter | Description                                                                                                                               |
|-----------|-------------------------------------------------------------------------------------------------------------------------------------------|
| r         | Source byte string to be converted. The value is of the RAW type and contains a maximum of 32767 bytes. The value cannot be <b>NULL</b> . |

| Parameter | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|-----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| from_set  | Bytecode to be converted in the source byte string. The value is of the RAW type. The value cannot be NULL. The bytes in <b>from_set</b> in the source byte string are replaced with the bytes in the corresponding positions in <b>to_set</b> . If <b>from_set</b> contains multiple identical bytes, only the first byte corresponding to the byte is replaced. For example, if <b>r[x]=from_set[n]</b> , <b>r[x]</b> is replaced with <b>to_set[n]</b> . If <b>to_set[n]</b> corresponding to <b>from_set[n]</b> does not exist (that is, the number of bytes of <b>to_set</b> does not exceed <b>n</b> ), <b>r[x]</b> will be discarded. |
| to_set    | Byte code converted from the <b>from_set</b> byte. The value is of the RAW type. The value cannot be NULL.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

- DBE\_RAW.TRANSLITERATE

Converts a RAW value to a NUMERIC value.

The prototype of the DBE\_RAW.TRANSLITERATE function is as follows:

```
DBE_RAW.TRANSLITERATE(
  r      IN RAW,
  from_set IN RAW DEFAULT NULL,
  to_set  IN RAW DEFAULT NULL,
  pad    IN RAW DEFAULT NULL)
RETURN RAW;
```

**Table 10-209** DBE\_RAW.TRANSLITERATE parameters

| Parameter | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|-----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| r         | Source byte string to be converted. The value is of the RAW type and contains a maximum of 32767 bytes. The value cannot be NULL.                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| to_set    | Byte code converted from the <b>from_set</b> byte. The value is of the RAW type. The default value is <b>NULL</b> . If the value is <b>NULL</b> , all bytes in <b>r</b> that exist in <b>from_set</b> are converted to <b>pad</b> .                                                                                                                                                                                                                                                                                                                                                                            |
| from_set  | Bytecode to be converted in the source byte string <b>r</b> . The value is of the RAW type. The default value is <b>NULL</b> . If <b>from_set</b> is <b>NULL</b> , all bytes in the source byte string <b>r</b> are converted into equal-length data filled by <b>pad</b> . Otherwise, the bytes in <b>from_set</b> in the source byte string <b>r</b> are replaced with the bytes in the corresponding position in <b>to_set</b> . For example, if <b>r[x]=from_set[n]</b> , <b>r[x]</b> is converted to <b>to_set[n]</b> . If <b>to_set[n]</b> does not exist, <b>r[x]</b> will be converted to <b>pad</b> . |
| pad       | Padding byte. Only the first byte is valid. The default value is <b>NULL</b> . If the value is <b>NULL</b> , it is regarded as <b>0x00</b> by default.                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

- DBE\_RAW.XRANGE

Returns a RAW value containing the succession of one-byte encodings beginning and ending with the specified byte-code.

The prototype of the DBE\_RAW.XRANGE function is as follows:

```
DBE_RAW.XRANGE(
  start_byte IN RAW,
  end_byte IN RAW)
RETURN RAW;
```

**Table 10-210** DBE\_RAW.XRANGE parameters

| Parameter  | Description                                                                                                                                                                                                                                                                      |
|------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| start_byte | Start byte. Only the first byte is valid. If the value is <b>NULL</b> , it is regarded as <b>0x00</b> by default.                                                                                                                                                                |
| end_byte   | End byte. Only the first byte is valid. If the value is <b>NULL</b> , it is regarded as <b>0xFF</b> by default. If <b>end_byte</b> is less than <b>start_byte</b> , <b>end_byte</b> is concatenated to <b>0xFF</b> , and then <b>0x00</b> is concatenated to <b>start_byte</b> . |

## Permissions

The DBE\_RAW schema is a system catalog. Only the system administrator has the permission to create the DBE\_RAW schema during database initialization. All users have the permission to use the schema and interfaces under the schema.

## Examples

```
DECLARE
v_raw RAW;
v_int INTEGER;
v_length INTEGER;
v_str VARCHAR2;
v_double BINARY_DOUBLE;
v_float FLOAT4;
v_numeric NUMERIC;
v_nvarchar2 NVARCHAR2;
BEGIN
-- Convert an INTEGER value to a RAW value.
SELECT DBE_RAW.CAST_FROM_BINARY_INTEGER_TO_RAW(170,1) INTO v_raw; -- 000000AA
SELECT DBE_RAW.CAST_FROM_BINARY_INTEGER_TO_RAW(170,2) INTO v_raw; -- AA000000
SELECT DBE_RAW.CAST_FROM_BINARY_INTEGER_TO_RAW(170,3) INTO v_raw; -- AA000000
-- Convert a RAW value to an INTEGER value.
SELECT
DBE_RAW.CAST_FROM_RAW_TO_BINARY_INTEGER(DBE_RAW.CAST_FROM_BINARY_INTEGER_TO_RAW(170,
1),1) INTO v_int; -- 170
SELECT

### 10.12.2.5 DBE\_TASK

#### API Description

**Table 10-211** lists all APIs supported by the **DBE\_TASK** package.

**Table 10-211** DBE\_TASK

| API                        | Description                                                                            |
|----------------------------|----------------------------------------------------------------------------------------|
| <b>DBE_TASK.SUBMIT</b>     | Submits a scheduled task. The job ID is automatically generated by the system.         |
| <b>DBE_TASK.JOB_SUBMIT</b> | Same as <b>DBE_TASK.SUBMIT</b> . However, It provides syntax compatibility parameters. |
| <b>DBE_TASK.ID_SUBMIT</b>  | Submits a scheduled task. The job ID is specified by the user.                         |
| <b>DBE_TASK.CANCEL</b>     | Removes a scheduled task by job ID.                                                    |
| <b>DBE_TASK.RUN</b>        | Executes a scheduled task.                                                             |

| API                                | Description                                                                                                                      |
|------------------------------------|----------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">DBE_TASK.FINISH</a>    | Disables or enables scheduled task execution.                                                                                    |
| <a href="#">DBE_TASK.UPDATE</a>    | Modifies user-definable attributes of a scheduled task, including the task content, next-execution time, and execution interval. |
| <a href="#">DBE_TASK.CHANGE</a>    | Same as <a href="#">DBE_TASK.UPDATE</a> . However, It provides syntax compatibility parameters.                                  |
| <a href="#">DBE_TASK.CONTENT</a>   | Modifies the content attribute of a scheduled task.                                                                              |
| <a href="#">DBE_TASK.NEXT_TIME</a> | Modifies the next-execution time attribute of a scheduled task.                                                                  |
| <a href="#">DBE_TASK.INTERVAL</a>  | Modifies the execution interval attribute of a scheduled task.                                                                   |

- [DBE\\_TASK.SUBMIT](#)

The stored procedure **SUBMIT** submits a scheduled task provided by the system.

The prototype of the **DBE\_TASK.SUBMIT** function is as follows:

```
DBE_TASK.SUBMIT(
  what      IN TEXT,
  next_time IN TIMESTAMP DEFAULT sysdate,
  interval_time IN TEXT DEFAULT 'null',
  id        OUT INTEGER
)RETURN INTEGER;
```

 **NOTE**

When a scheduled task is created (using **DBE\_TASK**), the system binds the current database and the username to the task by default. The API function can be called using **CALL** or **SELECT**. If the API function is called using **SELECT**, you do not need to set the output parameter. If the API function is called using **CALL**, you need to set the output parameter. To call this function within a stored procedure, use **perform**. If the committed SQL statement task uses a non-public schema, specify the schema to a table schema or a function schema, or add **set current\_schema = xxx** before the SQL statement.

**Table 10-212** DBE\_TASK.SUBMIT parameters

| Parameter     | Type      | Input/Output Parameter | Can Be Empty | Description                                                                                                                                                                                                                                                                                                     |
|---------------|-----------|------------------------|--------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| what          | text      | IN                     | No           | SQL statement to be executed. One or multiple DDLs (excluding database-related operations), DMLs, anonymous blocks, and statements for calling stored procedures, or all four combined are supported.                                                                                                           |
| next_time     | timestamp | IN                     | No           | Specifies the next time the job will be executed. The default value is the current system time ( <b>sysdate</b> ). If the specified time has past, the job is executed at the time it is submitted.                                                                                                             |
| interval_time | text      | IN                     | Yes          | Calculates the next time to execute the job. It can be an interval expression, or <b>sysdate</b> followed by a numeric value, for example, <b>sysdate+1.0/24</b> . If this parameter is left empty or set to <b>null</b> , the job will be executed only once, and the job status will change to 'd' afterward. |
| id            | integer   | OUT                    | No           | Specifies the job ID. The value ranges from 1 to 32767. When SELECT is used for calling, this parameter cannot be added. When CALL is used for calling, this parameter must be added.                                                                                                                           |

**NOTICE**

When you create a user using the **what** parameter, the plaintext password of the user is recorded in the log. Therefore, you are not advised to do so.

**Example:**

```
select DBE_TASK.SUBMIT('call pro_xxx();', to_date('20180101','yyyymmdd'),'sysdate+1');

select DBE_TASK.SUBMIT('call pro_xxx();', to_date('20180101','yyyymmdd'),'sysdate+1.0/24');

CALL DBE_TASK.SUBMIT('INSERT INTO T_JOB VALUES(1); call pro_1(); call pro_2();',
add_months(to_date('201701','yyyymm'),1), 'date_trunc("day",SYSDATE) + 1 +(8*60+30.0)/(24*60)');

DECLARE
  jobid int;
BEGIN
  PERFORM DBE_TASK.SUBMIT('call pro_xxx();', sysdate, 'interval "5 minute"', jobid);
END;
/
```

- DBE\_TASK.JOB\_SUBMIT

The stored procedure SUBMIT submits a scheduled task provided by the system. In addition, it provides additional compatibility parameters.

The prototype of the DBE\_TASK.JOB\_SUBMIT function is as follows:

```
DBE_TASK.JOB_SUBMIT(
job      OUT INTEGER,
what     IN TEXT,
next_date IN TIMESTAMP DEFAULT sysdate,
job_interval IN TEXT DEFAULT 'null',
no_parse IN BOOLEAN DEFAULT false,
instance IN INTEGER DEFAULT 0,
force    IN BOOLEAN DEFAULT false
)RETURN INTEGER;
```

**Table 10-213** DBE\_TASK.JOB\_SUBMIT parameters

| Parameter    | Type      | Input/Output Parameter | Can Be Empty | Description                                                                                                                                                                                                                                                                                                     |
|--------------|-----------|------------------------|--------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| job          | integer   | OUT                    | No           | Specifies the job ID. The value ranges from 1 to 32767. When dbe.job_submit is called by using the SELECT statement, this parameter can be omitted.                                                                                                                                                             |
| what         | text      | IN                     | No           | SQL statement to be executed. One or multiple DDLs (excluding database-related operations), DMLs, anonymous blocks, and statements for calling stored procedures, or all four combined are supported.                                                                                                           |
| next_date    | timestamp | IN                     | Yes          | Specifies the next time the job will be executed. The default value is the current system time ( <b>sysdate</b> ). If the specified time has past, the job is executed at the time it is submitted.                                                                                                             |
| job_interval | text      | IN                     | Yes          | Calculates the next time to execute the job. It can be an interval expression, or <b>sysdate</b> followed by a numeric value, for example, <b>sysdate+1.0/24</b> . If this parameter is left empty or set to <b>null</b> , the job will be executed only once, and the job status will change to 'd' afterward. |
| no_parse     | Boolean   | IN                     | Yes          | The default value is <b>false</b> , which is used only for syntax compatibility.                                                                                                                                                                                                                                |
| instance     | integer   | IN                     | Yes          | The default value is <b>0</b> , which is used only for syntax compatibility.                                                                                                                                                                                                                                    |

| Parameter | Type    | Input/Output Parameter | Can Be Empty | Description                                                                      |
|-----------|---------|------------------------|--------------|----------------------------------------------------------------------------------|
| force     | Boolean | IN                     | Yes          | The default value is <b>false</b> , which is used only for syntax compatibility. |

Example:

```
DECLARE
  id integer;
BEGIN
  id = DBE_TASK.JOB_SUBMIT(
    what => 'insert into t1 values (1, 2)',
    job_interval => 'sysdate + 1' --daily
  );
END;
/
```

- **DBE\_TASK.ID\_SUBMIT**

ID\_SUBMIT has the same syntax function as SUBMIT, but the first parameter of ID\_SUBMIT is an input parameter, that is, a specified job ID. In contrast, that last parameter of ID\_SUBMIT is an output parameter, indicating the job ID automatically generated by the system.

```
DBE_TASK.ID_SUBMIT(
  id          IN  BIGINT,
  what        IN  TEXT,
  next_time   IN  TIMESTAMP DEFAULT sysdate,
  interval_time IN TEXT DEFAULT 'null');
```

Example:

```
CALL dbe_task.id_submit(101, 'insert_msg_statistic1;', sysdate, 'sysdate+3.0/24');
```

- **DBE\_TASK.CANCEL**

The stored procedure CANCEL deletes a specified task.

The prototype of the DBE\_TASK.CANCEL function is as follows:

```
CANCEL(id IN INTEGER);
```

**Table 10-214** DBE\_TASK.CANCEL parameters

| Parameter | Type    | Input/Output Parameter | Can Be Empty | Description           |
|-----------|---------|------------------------|--------------|-----------------------|
| id        | integer | IN                     | No           | Specifies the job ID. |

Example:

```
CALL dbe_task.cancel(101);
```

- **DBE\_TASK.RUN**

The stored procedure runs a scheduled task.

The prototype of the DBE\_TASK.RUN function is as follows:

```
DBE_TASK.RUN(
job      IN  BIGINT,
force    IN  BOOLEAN DEFAULT FALSE);
```

**Table 10-215** DBE\_TASK.RUN parameters

| Parameter | Type    | Input/Output Parameter | Can Be Empty | Description                         |
|-----------|---------|------------------------|--------------|-------------------------------------|
| job       | bigint  | IN                     | No           | Specifies the job ID.               |
| force     | Boolean | IN                     | Yes          | Used only for syntax compatibility. |

Example:

```
BEGIN
DBE_TASK.ID_SUBMIT(12345, 'insert_msg_statistic1;', sysdate, 'sysdate+3.0/24');
DBE_TASK.RUN(12345);
END;
/
```

- DBE\_TASK.FINISH

The stored procedure FINISH disables or enables a scheduled task.

The prototype of the DBE\_TASK.FINISH function is as follows:

```
DBE_TASK.FINISH(
id      IN  INTEGER,
broken  IN  BOOLEAN,
next_time IN  TIMESTAMP DEFAULT sysdate);
```

**Table 10-216** DBE\_TASK.FINISH parameters

| Parameter | Type    | Input/Output Parameter | Can Be Empty | Description                                                                                                                                                                                                                                |
|-----------|---------|------------------------|--------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| id        | integer | IN                     | No           | Specifies the job ID.                                                                                                                                                                                                                      |
| broken    | Boolean | IN                     | No           | Specifies the status flag, <b>true</b> for broken and <b>false</b> for not broken. The current job is updated based on the parameter value <b>true</b> or <b>false</b> . If the parameter is left empty, the job status remains unchanged. |

| Parameter | Type      | Input/Output Parameter | Can Be Empty | Description                                                                                                                                                                                                                                                                                                                                                                                                                    |
|-----------|-----------|------------------------|--------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| next_time | timestamp | IN                     | Yes          | Specifies the next execution time. The default value is the current system time. If <b>broken</b> is set to <b>true</b> , <b>next_time</b> is updated to '4000-1-1'. If <b>broken</b> is set to <b>false</b> and <b>next_time</b> is not empty, <b>next_time</b> is updated for the job. If <b>next_time</b> is empty, it will not be updated. This parameter can be omitted, and its default value will be used in this case. |

Example:

```
CALL dbe_task.finish(101, true);
CALL dbe_task.finish(101, false, sysdate);
```

- DBE\_TASK.UPDATE

The stored procedure UPDATE modifies user-definable attributes of a task, including the task content, next-execution time, and execution interval.

The prototype of the DBE\_TASK.UPDATE function is as follows:

```
DBE_TASK.UPDATE(
id          IN  INTEGER,
content     IN  TEXT,
next_time   IN  TIMESTAMP,
interval_time IN TEXT);
```

**Table 10-217** DBE\_TASK.UPDATE parameters

| Parameter | Type    | Input/Output Parameter | Can Be Empty | Description                                                                                                                                                                                                                                                                           |
|-----------|---------|------------------------|--------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| id        | integer | IN                     | No           | Specifies the job ID.                                                                                                                                                                                                                                                                 |
| content   | text    | IN                     | Yes          | Specifies the name of the stored procedure or SQL statement block that is executed. If this parameter is left empty, the system does not update the <b>content</b> parameter for the specified job. Otherwise, the system updates the <b>content</b> parameter for the specified job. |

| Parameter     | Type      | Input/Output Parameter | Can Be Empty | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|---------------|-----------|------------------------|--------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| next_time     | timestamp | IN                     | Yes          | Specifies the next execution time. If this parameter is left empty, the system does not update the <b>next_time</b> parameter for the specified job. Otherwise, the system updates the <b>next_time</b> parameter for the specified job.                                                                                                                                                                                                                         |
| interval_time | text      | IN                     | Yes          | Specifies the time expression for calculating the next time the job will be executed. If this parameter is left empty, the system does not update the <b>interval_time</b> parameter for the specified job. Otherwise, the system updates the <b>interval_time</b> parameter for the specified job after necessary validity check. If this parameter is set to <b>null</b> , the job will be executed only once, and the job state will change to 'd' afterward. |

Example:

```
CALL db_task.update(101, 'call userproc();', sysdate, 'sysdate + 1.0/1440');
CALL db_task.update(101, 'insert into tbl_a values(sysdate);', sysdate, 'sysdate + 1.0/1440');
```

- **DBE\_TASK.CHANGE**

The stored procedure UPDATE modifies user-definable attributes of a task, including the task content, next-execution time, and execution interval.

The prototype of the DBE\_TASK.CHANGE function is as follows:

```
DBE_TASK.CHANGE(
job          IN  INTEGER,
what         IN  TEXT   DEFAULT NULL,
next_date    IN  TIMESTAMP DEFAULT NULL,
job_interval IN  TEXT   DEFAULT NULL,
instance     IN  INTEGER DEFAULT NULL,
force       IN  BOOLEAN DEFAULT false);
```

**Table 10-218** DBE\_TASK.CHANGE parameters

| Parameter | Type    | Input/Output Parameter | Can Be Empty | Description           |
|-----------|---------|------------------------|--------------|-----------------------|
| job       | integer | IN                     | No           | Specifies the job ID. |

| Parameter    | Type      | Input/Output Parameter | Can Be Empty | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|--------------|-----------|------------------------|--------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| what         | text      | IN                     | Yes          | Specifies the name of the stored procedure or SQL statement block that is executed. If this parameter is left empty, the system does not update the <b>what</b> parameter for the specified job. Otherwise, the system updates the <b>what</b> parameter for the specified job.                                                                                                                                                                                |
| next_date    | timestamp | IN                     | Yes          | Specifies the next execution time. If this parameter is left empty, the system does not update the <b>next_time</b> parameter for the specified job. Otherwise, the system updates the <b>next_date</b> parameter for the specified job.                                                                                                                                                                                                                       |
| job_interval | text      | IN                     | Yes          | Specifies the time expression for calculating the next time the job will be executed. If this parameter is left empty, the system does not update the <b>job_interval</b> parameter for the specified job. Otherwise, the system updates the <b>job_interval</b> parameter for the specified job after necessary validity check. If this parameter is set to <b>null</b> , the job will be executed only once, and the job state will change to 'd' afterward. |
| instance     | integer   | IN                     | Yes          | Used only for syntax compatibility.                                                                                                                                                                                                                                                                                                                                                                                                                            |
| force        | Boolean   | IN                     | No           | Used only for syntax compatibility.                                                                                                                                                                                                                                                                                                                                                                                                                            |

```
BEGIN
  DBE_TASK.CHANGE(
    job => 1234,
    what => 'insert into t2 values (2);'
  );
END;
/
```

- **DBE\_TASK.CONTENT**

The stored procedure **CONTENT** modifies the procedures to be executed by a specified task.

The prototype of the **DBE\_TASK.CONTENT** function is as follows:

```
DBE_TASK.CONTENT(  
id      IN  INTEGER,  
content IN  TEXT);
```

**Table 10-219** DBE\_TASK.CONTENT parameters

| Parameter | Type    | Input/Output Parameter | Can Be Empty | Description                                                                         |
|-----------|---------|------------------------|--------------|-------------------------------------------------------------------------------------|
| id        | integer | IN                     | No           | Specifies the job ID.                                                               |
| content   | text    | IN                     | No           | Specifies the name of the stored procedure or SQL statement block that is executed. |

 **NOTE**

- If the value specified by the **content** parameter is one or multiple executable SQL statements, program blocks, or stored procedures, this procedure can be executed successfully; otherwise, it will fail to be executed.
- If the value specified by the **content** parameter is a simple statement such as **INSERT** and **UPDATE**, a schema name must be added in front of the table name.

Example:

```
CALL dbe_task.content(101, 'call userproc();');  
CALL dbe_task.content(101, 'insert into tbl_a values(sysdate);');
```

- **DBE\_TASK.NEXT\_TIME**

The stored procedure **NEXT\_TIME** modifies the next-execution time attribute of a task.

The prototype of the **DBE\_TASK.NEXT\_TIME** function is as follows:

```
DBE_TASK.NEXT_TIME(  
id      IN  BIGINT,  
next_time IN TEXT);
```

**Table 10-220** DBE\_TASK.NEXT\_TIME parameters

| Parameter | Type   | Input/Output Parameter | Can Be Empty | Description                        |
|-----------|--------|------------------------|--------------|------------------------------------|
| id        | bigint | IN                     | No           | Specifies the job ID.              |
| next_time | text   | IN                     | No           | Specifies the next execution time. |

 **NOTE**

If the specified **next\_time** value is earlier than the current date, the job is executed once immediately.

Example:

```
CALL dbe_task.next_time(101, sysdate);
```

- **DBE\_TASK.INTERVAL**

The stored procedure INTERVAL modifies the execution interval attribute of a task.

The prototype of the DBE\_TASK.INTERVAL function is as follows:

```
DBE_TASK.INTERVAL(  
id          IN  INTEGER,  
interval_time IN TEXT);
```

**Table 10-221** DBE\_TASK.INTERVAL parameters

| Parameter     | Type    | Input / Output Parameter | Can Be Empty | Description                                                                                                                                                                                                                                                                               |
|---------------|---------|--------------------------|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| id            | integer | IN                       | No           | Specifies the job ID.                                                                                                                                                                                                                                                                     |
| interval_time | text    | IN                       | Yes          | Specifies the time expression for calculating the next time the job will be executed. If this parameter is left empty or set to <b>null</b> , the job will be executed only once, and the job status will change to 'd' afterward. <b>interval</b> must be a valid time or interval type. |

Example:

```
CALL dbe_task.interval(101, 'sysdate + 1.0/1440');
```

 **NOTE**

For a job that is currently running (that is, **job\_status** is 'r'), it is not allowed to use **cancel**, **update**, **next\_time**, **content**, or **interval** to delete or modify job parameters.

## Constraints

1. You can create, update, and delete jobs only using the procedures provided by the **dbe\_task** package. These procedures synchronize job information between different primary database nodes and associate primary keys between the **pg\_job** and **pg\_job\_proc** catalogs. If you use DML statements to add, delete, or modify records in the **pg\_job** catalog, job information will become inconsistent between primary database nodes and system catalogs may fail to be associated, compromising internal job management.

- Each task created by a user is bound to a primary database node. If the primary database node fails while a task is being executed, the task status cannot be updated in real time and will stay at 'r'. The task status will be updated to 's' only after the primary database node recovers. When a primary database node fails, all tasks on this primary database node cannot be scheduled or executed until the primary database node is restored manually, or deleted and then replaced.
- For each job, the bound primary database node updates the real-time job information (including the job status, last execution start time, last execution end time, next execution start time, the number of execution failures [if any]) to the **pg\_job** system catalog, and synchronizes the information to other primary database nodes, ensuring consistent job information between different primary database nodes. In the case of primary database node failures, job information synchronization is reattempted by the hosting primary database nodes, which increases job execution time. Although job information fails to be synchronized between primary database nodes, job information can still be properly updated in the pg\_job table on the hosting primary database nodes, and jobs can be executed successfully. After a primary database node recovers, job information such as job execution time and status in its pg\_job table may be incorrect and will be updated only after the jobs are executed again on related primary database nodes.
- For each job, a thread is established to execute it. If multiple jobs are triggered concurrently as scheduled, the system will need some time to start the required threads, resulting in a latency of 0.1 ms in job execution.

### 10.12.2.6 DBE\_SCHEDULER

#### Interface Description

The advanced package **DBE\_SCHEDULER** supports more flexible creation of scheduled tasks through scheduling and programming. For details about all the supported interfaces, see [Table 10-222](#).

**Table 10-222** DBE\_SCHEDULER

| Interface                                        | Description                              |
|--------------------------------------------------|------------------------------------------|
| <a href="#">DBE_SCHEDULER.CREATE_JOB</a>         | Creates a scheduled task.                |
| <a href="#">DBE_SCHEDULER.DROP_JOB</a>           | Deletes a scheduled task.                |
| <a href="#">DROP_SINGLE_JOB</a>                  | Deletes a single scheduled task.         |
| <a href="#">DBE_SCHEDULER.SET_ATTRIBUTE</a>      | Sets object attributes.                  |
| <a href="#">DBE_SCHEDULER.RUN_JOB</a>            | Executes a scheduled task.               |
| <a href="#">DBE_SCHEDULER.RUN_BACKGROUND_JOB</a> | Runs a scheduled task in the background. |
| <a href="#">DBE_SCHEDULER.RUN_FOREGROUND_JOB</a> | Runs a scheduled task in the foreground. |

| Interface                                               | Description                                   |
|---------------------------------------------------------|-----------------------------------------------|
| <a href="#">DBE_SCHEDULER.STOP_JOB</a>                  | Stops a scheduled task.                       |

- [DBE\\_SCHEDULER.CREATE\\_JOB](#)

Creates a scheduled task.

The prototypes of the [DBE\\_SCHEDULER.CREATE\\_JOB](#) function are as follows:

```
-- Scheduled tasks of an inline schedule and a program.
DBE_SCHEDULER.CREATE_JOB(
job_name TEXT,
job_type TEXT,
job_action TEXT,
number_of_arguments INTEGER          DEFAULT 0,
start_date TIMESTAMP WITH TIME ZONE  DEFAULT NULL,
repeat_interval TEXT                  DEFAULT NULL,
end_date TIMESTAMP WITH TIME ZONE     DEFAULT NULL,
job_class TEXT                       DEFAULT 'DEFAULT_JOB_CLASS',
enabled BOOLEAN                      DEFAULT FALSE,
auto_drop BOOLEAN                    DEFAULT TRUE,
comments TEXT                        DEFAULT NULL,
credential_name TEXT                 DEFAULT NULL,
destination_name TEXT                DEFAULT NULL
)

-- Reference the created scheduled tasks of the schedule and the program.
DBE_SCHEDULER.CREATE_JOB(
job_name TEXT,
program_name TEXT,
schedule_name TEXT,
job_class TEXT                       DEFAULT 'DEFAULT_JOB_CLASS',
enabled BOOLEAN                      DEFAULT FALSE,
auto_drop BOOLEAN                    DEFAULT TRUE,
comments TEXT                        DEFAULT NULL,
job_style TEXT                       DEFAULT 'REGULAR',
credential_name TEXT                 DEFAULT NULL,
destination_name TEXT                DEFAULT NULL
)

-- Reference the created program and the scheduled task of the inline schedule.
DBE_SCHEDULER.CREATE_JOB(
job_name text,
program_name TEXT,
start_date TIMESTAMP WITH TIME ZONE  DEFAULT NULL,
repeat_interval TEXT                  DEFAULT NULL,
end_date TIMESTAMP WITH TIME ZONE     DEFAULT NULL,
job_class TEXT                       DEFAULT 'DEFAULT_JOB_CLASS',
enabled BOOLEAN                      DEFAULT FALSE,
auto_drop BOOLEAN                    DEFAULT TRUE,
comments TEXT                        DEFAULT NULL,
job_style TEXT                       DEFAULT 'REGULAR',
```

```

credential_name TEXT          DEFAULT NULL,
destination_name TEXT        DEFAULT NULL
)

-- Reference the created schedule and the scheduled task of the inline program.
DBE_SCHEDULER.CREATE_JOB(
job_name TEXT,
schedule_name TEXT,
job_type TEXT,
job_action TEXT,
number_of_arguments INTEGER  DEFAULT 0,
job_class TEXT               DEFAULT 'DEFAULT_JOB_CLASS',
enabled BOOLEAN              DEFAULT FALSE,
auto_drop BOOLEAN            DEFAULT TRUE,
comments TEXT                DEFAULT NULL,
credential_name TEXT          DEFAULT NULL,
destination_name TEXT          DEFAULT NULL
)

```

 **NOTE**

The scheduled task created through **DBE\_SCHEDULER** does not conflict with the scheduled task in **DBE\_TASK**.

The scheduled task created by **DBE\_SCHEDULER** generates the corresponding **job\_id**. However, the **job\_id** is meaningless.

**Table 10-223** DBE\_SCHEDULER.CREATE\_JOB interface parameters

| Parameter           | Type    | Input/Output Parameter | Can Be Empty | Description                                                                                                                                                                                                                                                                                                 |
|---------------------|---------|------------------------|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| job_name            | text    | IN                     | No           | Name of a scheduled task.                                                                                                                                                                                                                                                                                   |
| job_type            | text    | IN                     | No           | Inline program type of a scheduled task. | program_name        | text    | IN                     | No           | Name of the program referenced by a scheduled task.                                                                                                                                                                                                                                                         |

| Parameter        | Type                     | Input/Output Parameter | Can Be Empty | Description                                                               |
|------------------|--------------------------|------------------------|--------------|---------------------------------------------------------------------------|
| start_date       | timestamp with time zone | IN                     | Yes          | Inline scheduling start time of a scheduled task.                         |
| repeat_interval  | text                     | IN                     | Yes          | Inline scheduling period of a scheduled task.                             |
| end_date         | timestamp with time zone | IN                     | Yes          | Inline scheduling expiration time of a scheduled task.                    |
| schedule_name    | text                     | IN                     | No           | Name of the schedule referenced by a scheduled task.                      |
| job_class        | text                     | IN                     | No           | Class name of a scheduled task.                                           |
| enabled          | boolean                  | IN                     | No           | Status of a scheduled task.                                               |
| auto_drop        | boolean                  | IN                     | No           | Automatic deletion of a scheduled task.                                   |
| comments         | text                     | IN                     | Yes          | Comments.                                                                 |
| job_style        | text                     | IN                     | No           | Behavior pattern of a scheduled task. Only <b>'REGULAR'</b> is supported. |
| credential_name  | text                     | IN                     | Yes          | Certificate name of a scheduled task.                                     |
| destination_name | text                     | IN                     | Yes          | Target name of a scheduled task.                                          |

Example:

```
CALL DBE_SCHEDULER.create_job(job_name=>'job1', program_name=>'program1',
schedule_name=>'schedule1');
CALL DBE_SCHEDULER.create_job(job_name=>'job1', job_type=>'STORED_PROCEDURE',
job_action=>'select pg_sleep(1);');
CALL DBE_SCHEDULER.create_job('job1', 'program1', '2021-07-20', 'interval "3 minute"', '2121-07-20',
'DEFAULT_JOB_CLASS', false, false, 'test', 'style', NULL, NULL);
```

**NOTICE**

To create a scheduled task of the EXTERNAL\_SCRIPT type, the administrator must assign related permissions and certificates and the user who starts the database must have the read permission on the external script.

- **DBE\_SCHEDULER.DROP\_JOB**

Deletes a scheduled task.

The prototype of the **DBE\_SCHEDULER.DROP\_JOB** function is as follows:

```
DBE_SCHEDULER.drop_job(
job_name text,
force boolean          default false,
defer boolean          default false,
commit_semantics text  default 'STOP_ON_FIRST_ERROR'
)
```

 **NOTE**

You can specify one or more tasks, or specify a task class in DBE\_SCHEDULER.DROP\_JOB to delete scheduled tasks.

**Table 10-224** DBE\_SCHEDULER.DROP\_JOB interface parameters

| Parameter | Type    | Input/Output Parameter | Can Be Empty | Description                                                                                                                                                                                     |
|-----------|---------|------------------------|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| job_name  | text    | IN                     | No           | Name or class of a scheduled task. You can specify one or more scheduled tasks. If you specify multiple scheduled tasks, separate them with commas (,).                                         |
| force     | boolean | IN                     | No           | Specifies whether to delete a scheduled task.<br><b>true:</b> The current scheduled task is stopped and then deleted.<br><b>false:</b> The scheduled task fails to be deleted if it is running. |
| defer     | boolean | IN                     | No           | Specifies whether to delete a scheduled task.<br><b>true:</b> A scheduled task can be deleted after it is complete.                                                                             |

| Parameter        | Type | Input/Output Parameter | Can Be Empty | Description                                                                                                                                                                                                                                                                                                                                                                                                  |
|------------------|------|------------------------|--------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| commit_semantics | text | IN                     | No           | <p>Commit rules:</p> <p><b>STOP_ON_FIRST_ERROR:</b> The deletion operation performed before the first error is reported is committed.</p> <p><b>TRANSACTIONAL:</b> Transaction-level commit. The deletion operation performed before an error is reported will be rolled back.</p> <p><b>ABSORB_ERRORS:</b> Attempt to bypass an error and commit the deletion operation that is performed successfully.</p> |

Example:

```
CALL DBE_SCHEDULER.drop_job('job1', true, false, 'STOP_ON_FIRST_ERROR');
```

#### NOTICE

The **TRANSACTIONAL** option in **commit\_semantic** takes effect only when **force** is set to **false**.

- **DBE\_SCHEDULER.DROP\_SINGLE\_JOB**

Deletes a scheduled task.

The prototype of the **DBE\_SCHEDULER.DROP\_SINGLE\_JOB** function is as follows:

```
DBE_SCHEDULER.drop_single_job(
job_name text,
force boolean                default false,
defer boolean                default false
)
```

- **DBE\_SCHEDULER.SET\_ATTRIBUTE**

Modifies the attributes of a scheduled task.

The prototypes of the **DBE\_SCHEDULER.SET\_ATTRIBUTE** function are as follows:

```
DBE_SCHEDULER.set_attribute(
name          text,
attribute     text,
value         boolean
)
```

```

DBE_SCHEDULER.set_attribute(
name          text,
attribute     text,
value         text
)

DBE_SCHEDULER.set_attribute(
name          text,
attribute     text,
value         timestamp
)

DBE_SCHEDULER.set_attribute(
name          text,
attribute     text,
value         timestamp with time zone
)

DBE_SCHEDULER.set_attribute(
name text,
attribute text,
value text,
value2 text          default NULL
)
    
```

 **NOTE**

**name** specifies any object in **DBE\_SCHEDULE**.

**Table 10-225** DBE\_SCHEDULER.SET\_ATTRIBUTE interface parameters

| Parameter | Type | Input/Output Parameter | Can Be Empty | Description     |
|-----------|------|------------------------|--------------|-----------------|
| name      | text | IN                     | No           | Object name.    |
| attribute | text | IN                     | No           | Attribute name. |

| Parameter | Type                                                 | Input/Output Parameter | Can Be Empty | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|-----------|------------------------------------------------------|------------------------|--------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| value     | boolean/date/timestamp/timestamp with time zone/text | IN                     | No           | Attribute value. The options are as follows: <ul style="list-style-type: none"> <li>Scheduled-task-related: job_type, job_action, number_of_arguments, start_date, repeat_interval, end_date, job_class, enabled, auto_drop, comments, credential_name, destination_name, program_name, schedule_name, and job_style.</li> <li>Program-related: program_action, program_type, number_of_arguments, and comments.</li> <li>Scheduling-related: start_date, repeat_interval, end_date, and comments.</li> </ul> |
| value2    | text                                                 | IN                     | Yes          | Additional attribute value. Reserved parameter bit. Currently, the target attribute with extra attribute values is not supported.                                                                                                                                                                                                                                                                                                                                                                             |

Example:

```
CALL DBE_SCHEDULER.set_attribute('program1', 'number_of_arguments', 0);
CALL DBE_SCHEDULER.set_attribute('program1', 'program_type', 'STORED_PROCEDURE');
```

**NOTICE**

Do not use **DBE\_SCHEDULER.SET\_ATTRIBUTE** to leave the parameters empty.

The object name cannot be changed using **DBE\_SCHEDULER.SET\_ATTRIBUTE**.

- **DBE\_SCHEDULER.RUN\_JOB**

Executes a scheduled task.

The prototype of the **DBE\_SCHEDULER.RUN\_JOB** function is as follows:

```
DBE_SCHEDULER.run_job(
job_name text,
```

```
use_current_session boolean          default true
)
```

 **NOTE**

**DBE\_SCHEDULER.RUN\_JOB** is used to run scheduled tasks immediately. It is independent of the scheduling of scheduled tasks and can even run at the same time.

**Table 10-226** DBE\_SCHEDULER.RUN\_JOB interface parameters

| Parameter           | Type    | Input/Output Parameter | Can Be Empty | Description                                                                                                                                                                                                                                     |
|---------------------|---------|------------------------|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| job_name            | text    | IN                     | No           | Name of a scheduled task. You can specify one or more scheduled tasks. If you specify multiple scheduled tasks, separate them with commas (,).                                                                                                  |
| use_current_session | boolean | IN                     | No           | Specifies whether to run a scheduled task.<br><b>true:</b> Use the current session to check whether the scheduled task can run properly.<br><b>false:</b> Start the scheduled task in the background. The execution result is recorded in logs. |

Example:  
CALL DBE\_SCHEDULER.run\_job('job1', false);

**NOTICE**

**use\_current\_session** cannot be used to record execution results.

- DBE\_SCHEDULER.RUN\_BACKEND\_JOB**  
Runs a scheduled task in the background.  
The prototype of the **DBE\_SCHEDULER.RUN\_BACKEND\_JOB** function is as follows:

```
DBE_SCHEDULER.run_backend_job(
job_name text
)
```
- DBE\_SCHEDULER.RUN\_FOREGROUND\_JOB**  
Executes a scheduled task in the current session.  
Only external tasks can be executed.

Return value: text

The prototype of the **DBE\_SCHEDULER.RUN\_FOREGROUND\_JOB** function is as follows:

```
DBE_SCHEDULER.run_foreground_job(
job_name text
)return text
```

- **DBE\_SCHEDULER.STOP\_JOB**

Stops a scheduled task.

The prototype of the **DBE\_SCHEDULER.STOP\_JOB** function is as follows:

```
DBE_SCHEDULER.stop_job(
job_name text,
force boolean                default false,
commit_semantics text        default 'STOP_ON_FIRST_ERROR'
)
```

**Table 10-227** DBE\_SCHEDULER.STOP\_JOB interface parameters

| Parameter        | Type    | Input/Output Parameter | Can Be Empty | Description                                                                                                                                                                                                                                                                                                                     |
|------------------|---------|------------------------|--------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| job_name         | text    | IN                     | No           | Name or class of a scheduled task. You can specify one or more scheduled tasks. If you specify multiple scheduled tasks, separate them with commas (,).                                                                                                                                                                         |
| force            | boolean | IN                     | No           | Specifies whether to delete a scheduled task. <ul style="list-style-type: none"> <li>• <b>true</b>: The scheduler sends a termination signal to end the task thread immediately.</li> <li>• <b>false</b>: The scheduler attempts to use the interrupt signal to terminate the scheduled task thread.</li> </ul>                 |
| commit_semantics | text    | IN                     | No           | Commit rules: <ul style="list-style-type: none"> <li>• <b>'STOP_ON_FIRST_ERROR'</b>: The interrupt operation performed before the first error is reported is committed.</li> <li>• <b>'ABSORB_ERRORS'</b>: The system attempts to bypass an error and commit the interrupt operation that is performed successfully.</li> </ul> |

- DBE\_SCHEDULER.STOP\_SINGLE\_JOB

Stops a single scheduled task.

The prototype of the **DBE\_SCHEDULER.STOP\_SINGLE\_JOB** function is as follows:

```
DBE_SCHEDULER.stop_single_job(
job_name text,
force boolean                default false
)
```

- DBE\_SCHEDULER.GENERATE\_JOB\_NAME

Generates the name of a scheduled task.

The prototype of the **DBE\_SCHEDULER.GENERATE\_JOB\_NAME** function is as follows:

```
DBE_SCHEDULER.generate_job_name(
prefix text                default 'JOB$_'
)return text
```

### NOTICE

When DBE\_SCHEDULER.GENERATE\_JOB\_NAME is executed for the first time, a temporary sequence is created in **public** to store the sequence number of the current name. A common user does not have the create permission in **public**. Therefore, if a common user calls the function for the first time in the current database, the function fails to be called. In this case, you need to grant the create permission in **public** to the common user or call the API as a user with the create permission to create a temporary sequence.

- DBE\_SCHEDULER.CREATE\_PROGRAM

Creates a program.

The prototype of the **DBE\_SCHEDULER.CREATE\_PROGRAM** function is as follows:

```
DBE_SCHEDULER.create_program(
program_name text,
program_type text,
program_action text,
number_of_arguments integer    default 0,
enabled boolean                default false,
comments text                  default NULL
)
```

- DBE\_SCHEDULER.DEFINE\_PROGRAM\_ARGUMENT

Defines program parameters.

An API with the default value **default\_value** will not convert characters to lowercase letters by default. In this version, characters are case sensitive.

The prototype of the **DBE\_SCHEDULER.DEFINE\_PROGRAM\_ARGUMENT** function is as follows:

```
DBE_SCHEDULER.define_program_argument(
program_name text,
argument_position integer,
argument_name text            default NULL,
argument_type text,
out_argument boolean          default false
)
```

-- With a default value --

```
DBE_SCHEDULER.define_program_argument(  
program_name text,  
argument_position integer,  
argument_name text          default NULL,  
argument_type text,  
default_value text,  
out_argument boolean        default false  
)
```

- **DBE\_SCHEDULER.DROP\_PROGRAM**

Deletes a program.

The prototype of the **DBE\_SCHEDULER.DROP\_PROGRAM** function is as follows:

```
DBE_SCHEDULER.drop_program(  
program_name text,  
force boolean          default false  
)
```

- **DBE\_SCHEDULER.DROP\_SINGLE\_PROGRAM**

Deletes a single program.

The prototype of the **DBE\_SCHEDULER.DROP\_SINGLE\_PROGRAM** function is as follows:

```
DBE_SCHEDULER.drop_single_program(  
program_name text,  
force boolean          default false  
)
```

- **DBE\_SCHEDULER.SET\_JOB\_ARGUMENT\_VALUE**

Sets the parameters of a scheduled task. The **argument\_value** can be left empty.

The prototype of the **DBE\_SCHEDULER.SET\_JOB\_ARGUMENT\_VALUE** function is as follows:

```
DBE_SCHEDULER.set_job_argument_value(  
job_name text,  
argument_position integer,  
argument_value text  
)  
  
DBE_SCHEDULER.set_job_argument_value(  
job_name text,  
argument_name text,  
argument_value text  
)
```

- **DBE\_SCHEDULER.CREATE\_SCHEDULE**

Creates a schedule.

The prototype of the **DBE\_SCHEDULER.CREATE\_SCHEDULE** function is as follows:

```
DBE_SCHEDULER.create_schedule(  
schedule_name text,  
start_date timestamp with time zone default NULL,  
repeat_interval text,  
end_date timestamp with time zone default NULL,  
comments text          default NULL  
)
```

- **DBE\_SCHEDULER.DROP\_SCHEDULE**

Deletes a schedule.

The prototype of the **DBE\_SCHEDULER.DROP\_SCHEDULE** function is as follows:

```
DBE_SCHEDULER.drop_schedule(  
schedule_name text,  
force boolean          default false  
)
```

- **DBE\_SCHEDULER.DROP\_SINGLE\_SCHEDULE**

Deletes a single schedule.

The prototype of the **DBE\_SCHEDULER.DROP\_SINGLE\_SCHEDULE** function is as follows:

```
DBE_SCHEDULER.drop_single_schedule(  
schedule_name text,  
force boolean          default false  
)
```

- **DBE\_SCHEDULER.CREATE\_JOB\_CLASS**

Creates the class of a scheduled task.

The prototype of the **DBE\_SCHEDULER.CREATE\_JOB\_CLASS** function is as follows:

```
DBE_SCHEDULER.create_job_class(  
job_class_name text,  
resource_consumer_group text    default NULL,  
service text                    default NULL,  
logging_level integer           default 0,  
log_history integer             default NULL,  
comments text                   default NULL  
)
```

- **DBE\_SCHEDULER.DROP\_JOB\_CLASS**

Deletes the class of a scheduled task.

The prototype of the **DBE\_SCHEDULER.DROP\_JOB\_CLASS** function is as follows:

```
DBE_SCHEDULER.drop_job_class(  
job_class_name text,  
force boolean          default false  
)
```

- **DBE\_SCHEDULER.DROP\_SINGLE\_JOB\_CLASS**

Deletes the class of a single scheduled task.

The prototype of the **DBE\_SCHEDULER.DROP\_SINGLE\_JOB\_CLASS** function is as follows:

```
DBE_SCHEDULER.drop_single_job_class(  
job_class_name text,  
force boolean          default false  
)
```

- **DBE\_SCHEDULER.GRANT\_USER\_AUTHORIZATION**

Grants the scheduled task permissions to the database user. The user who calls this function must have the SYSADMIN permission.

The prototype of the **DBE\_SCHEDULER.GRANT\_USER\_AUTHORIZATION** function is as follows:

```
DBE_SCHEDULER.grant_user_authorization(  
username      text,  
privilege     text  
)
```

- **DBE\_SCHEDULER.REVOKE\_USER\_AUTHORIZATION**  
Revokes the scheduled task permissions from the database user. The user who calls this function must have the SYSADMIN permission.

The prototype of the **DBE\_SCHEDULER.REVOKE\_USER\_AUTHORIZATION** function is as follows:

```
DBE_SCHEDULER.revoke_user_authorization(  
username          text,  
privilege         text  
)
```

- **DBE\_SCHEDULER.CREATE\_CREDENTIAL**  
Creates an authorization certificate. The user who calls this function must have the SYSADMIN permission.

The prototype of the **DBE\_SCHEDULER.CREATE\_CREDENTIAL** function is as follows:

```
DBE_SCHEDULER.create_credential(  
credential_name  text,  
username         text,  
password        text          default NULL,  
database_role   text          default NULL,  
windows_domain  text          default NULL,  
comments        text          default NULL  
)
```

---

**NOTICE**

The **password** parameter of **DBE\_SCHEDULER.CREATE\_CREDENTIAL** must be set to **NULL** or '\*\*\*\*\*'. This parameter is used only for compatibility and does not indicate any actual meaning. Do not use the OS username corresponding to the installation user to create a certificate.

- **DBE\_SCHEDULER.DROP\_CREDENTIAL**  
Destroys an authorization certificate. The user who calls this function must have the SYSADMIN permission.

The prototype of the **DBE\_SCHEDULER.DROP\_CREDENTIAL** function is as follows:

```
DBE_SCHEDULER.drop_credential(  
credential_name text,  
force          boolean default false  
)
```

- **DBE\_SCHEDULER.ENABLE**  
Enables an object.

The prototype of the **DBE\_SCHEDULER.ENABLE** function is as follows:

```
DBE_SCHEDULER.enable(  
name text,  
commit_semantics text          default 'STOP_ON_FIRST_ERROR'  
)
```

- **DBE\_SCHEDULER.ENABLE\_SINGLE**  
Enables a single object.

The prototype of the **DBE\_SCHEDULER.ENABLE\_SINGLE** function is as follows:

```
DBE_SCHEDULER.enable_single(  
name text  
)
```

- **DBE\_SCHEDULER.DISABLE**

Disables an object.

The prototype of the **DBE\_SCHEDULER.DISABLE** function is as follows:

```
DBE_SCHEDULER.disable(  
name text,  
force boolean                default false,  
commit_semantics text        default 'STOP_ON_FIRST_ERROR'  
)
```

- **DBE\_SCHEDULER.DISABLE\_SINGLE**

Disables a single object.

The prototype of the **DBE\_SCHEDULER.DISABLE\_SINGLE** function is as follows:

```
DBE_SCHEDULER.disable_single(  
name text,  
force boolean                default false  
)
```

- **DBE\_SCHEDULER.EVAL\_CALENDAR\_STRING**

Analyzes the scheduling task period.

Return type: timestamp with time zone

The prototype of the **DBE\_SCHEDULER.EVAL\_CALENDAR\_STRING** function is as follows:

```
DBE_SCHEDULER.evaluate_calendar_string(  
IN calendar_string text,  
IN start_date timestamp with time zone,  
IN return_date_after timestamp with time zone  
)return timestamp with time zone
```

- **DBE\_SCHEDULER.EVALUATE\_CALENDAR\_STRING**

Analyzes the scheduling task period.

The prototype of the **DBE\_SCHEDULER.EVALUATE\_CALENDAR\_STRING** function is as follows:

```
DBE_SCHEDULER.evaluate_calendar_string(  
IN calendar_string text,  
IN start_date timestamp with time zone,  
IN return_date_after timestamp with time zone,  
OUT next_run_date timestamp with time zone  
)return timestamp with time zone
```

## 10.12.2.7 DBE\_SQL

### Data Types

- **DBE\_SQL.DESC\_REC**

This type is a composite type and is used to store the description of the SQL\_DESCRIBE\_COLUMNS API.

The prototype of the **DBE\_SQL.DESC\_REC** function is as follows:

```
CREATE TYPE DBE_SQL.DESC_REC AS (
  col_type      int,
  col_max_len   int,
  col_name      VARCHAR2(32),
  col_name_len  int,
  col_schema_name VARCHAR2(32),
  col_schema_name_len int,
  col_precision int,
  col_scale     int,
  col_charsetid int,
  col_charsetform int,
  col_null_ok   BOOLEAN
);
```

- **DBE\_SQL.DESC\_TAB**

This type is the TABLE type of DESC\_REC and is implemented through the TABLE OF syntax.

The prototype of the DBE\_SQL.DESC\_TAB function is as follows:

```
CREATE TYPE DBE_SQL.DESC_TAB AS TABLE OF DBE_SQL.DESC_REC INDEX BY INTEGER;
```

- **DBE\_SQL.DATE\_TABLE**

This type is the TABLE type of DATE and is implemented through the TABLE OF syntax.

The prototype of the DBE\_SQL.DATE\_TABLE function is as follows:

```
CREATE TYPE DBE_SQL.DATE_TABLE AS TABLE OF DATE INDEX BY INTEGER;
```

- **DBE\_SQL.NUMBER\_TABLE**

This type is the TABLE type of NUMBER and is implemented through the TABLE OF syntax.

The prototype of the DBE\_SQL.NUMBER\_TABLE function is as follows:

```
CREATE TYPE DBE_SQL.NUMBER_TABLE AS TABLE OF NUMBER INDEX BY INTEGER;
```

- **DBE\_SQL.VARCHAR2\_TABLE**

This type is the TABLE type of VARCHAR2 and is implemented through the TABLE OF syntax.

The prototype of the DBE\_SQL.VARCHAR2\_TABLE function is as follows:

```
CREATE TYPE DBE_SQL.VARCHAR2_TABLE AS TABLE OF VARCHAR2(32767) INDEX BY INTEGER;
```

- **DBE\_SQL.BLOB\_TABLE**

This type is the TABLE type of BLOB and is implemented through the TABLE OF syntax.

The prototype of the DBE\_SQL.BLOB\_TABLE function is as follows:

```
CREATE TYPE DBE_SQL.BLOB_TABLE AS TABLE OF BLOB INDEX BY INTEGER;
```

## API Description

**Table 10-228** lists APIs supported by the **DBE\_SQL** package.

**Table 10-228** DBE\_SQL

| API                             | Description     |
|---------------------------------|-----------------|
| <b>DBE_SQL.REGISTER_CONTEXT</b> | Opens a cursor. |

| API                                             | Description                                                       |
|-------------------------------------------------|-------------------------------------------------------------------|
| <a href="#">DBE_SQL.SQL_UNREGISTER_CONTEXT</a>  | Closes an open cursor.                                            |
| <a href="#">DBE_SQL.SQL_SET_SQL</a>             | Passes a set of SQL statements or anonymous blocks to a cursor.   |
| <a href="#">DBE_SQL.SQL_RUN</a>                 | Executes SQL statements or anonymous blocks in a given cursor.    |
| <a href="#">DBE_SQL.NEXT_ROW</a>                | Reads a row of cursor data.                                       |
| <a href="#">DBE_SQL.SET_RESULT_TYPE</a>         | Dynamically defines a column.                                     |
| <a href="#">DBE_SQL.SET_RESULT_TYPE_CHAR</a>    | Dynamically defines a column of the <b>CHAR</b> type.             |
| <a href="#">DBE_SQL.SET_RESULT_TYPE_INT</a>     | Dynamically defines a column of the <b>INT</b> type.              |
| <a href="#">DBE_SQL.SET_RESULT_TYPE_LONG</a>    | Dynamically defines a column of the <b>LONG</b> type.             |
| <a href="#">DBE_SQL.SET_RESULT_TYPE_RAW</a>     | Dynamically defines a column of the <b>RAW</b> type.              |
| <a href="#">DBE_SQL.SET_RESULT_TYPE_BYTEA</a>   | Dynamically defines a column of the bytea type.                   |
| <a href="#">DBE_SQL.SET_RESULT_TYPE_TEXT</a>    | Dynamically defines a column of the <b>TEXT</b> type.             |
| <a href="#">DBE_SQL.SET_RESULT_TYPE_UNKNOWN</a> | Dynamically defines a column of an unknown type.                  |
| <a href="#">DBE_SQL.GET_RESULT</a>              | Reads a dynamically defined column value.                         |

| <a href="#">DBE_SQL.SET_RESULT_TYPE_BYTEAS</a>  | Dynamically defines a column of the <b>BYTEA</b> array type.                                      |
| <a href="#">DBE_SQL.SET_RESULT_TYPE_CHARS</a>   | Dynamically defines a column of the <b>CHAR</b> array type.                                       |
| <a href="#">DBE_SQL.SET_RESULTS_TYPE</a>        | Dynamically defines a column of the array type.                                                   |
| <a href="#">DBE_SQL.GET_RESULTS_INT</a>         | Reads a dynamically defined column value of the <b>INT</b> array type.                            |
| <a href="#">DBE_SQL.GET_RESULTS_TEXT</a>        | Reads a dynamically defined column value of the <b>TEXT</b> array type.                           |
| <a href="#">DBE_SQL.GET_RESULTS_RAW</a>         | Reads a dynamically defined column value of the <b>RAW</b> array type.                            |
| <a href="#">DBE_SQL.GET_RESULTS_BYTEA</a>       | Reads a dynamically defined column value of the <b>BYTEA</b> array type.                          |

| API                                                    | Description                                                             |
|--------------------------------------------------------|-------------------------------------------------------------------------|
| <a href="#">DBE_SQL.GET_RESULTS_CHAR</a>               | Reads a dynamically defined column value of the <b>CHAR</b> array type. |
| <a href="#">DBE_SQL.GET_RESULTS</a>                    | Reads a dynamically defined column value.                               |
| <a href="#">DBE_SQL.SQL_DESCRIBE_COLUMNS</a>           | Describes the column information read by the cursor.                    |
| <a href="#">DBE_SQL.DESCRIBE_COLUMNS</a>               | Describes the column information read by the cursor.                    |
| <a href="#">DBE_SQL.BIND_VARIABLE</a>                  | Binds parameters.                                                       |
| <a href="#">DBE_SQL.SQL_SET_RESULTS_TYPE_C</a>         | Dynamically defines a column of the array type.                         |
| <a href="#">DBE_SQL.SQL_GET_VALUES_C</a>               | Reads a dynamically defined column value.                               |
| <a href="#">DBE_SQL.GET_VARIABLE_RESULT</a>            | Reads the return value of an SQL statement.                             |
| <a href="#">DBE_SQL.GET_VARIABLE_RESULT_CHAR</a>       | Reads the return value (of the char type) of an SQL statement.          |
| <a href="#">DBE_SQL.GET_VARIABLE_RESULT_RAW</a>        | Reads the return value (of the raw type) of an SQL statement.           |
| <a href="#">DBE_SQL.GET_VARIABLE_RESULT_TEXT</a>       | Reads the return value (of the text type) of an SQL statement.          |
| <a href="#">DBE_SQL.GET_VARIABLE_RESULT_INT</a>        | Reads the return value (of the int type) of an SQL statement.           |
| <a href="#">DBE_SQL.GET_VARIABLE_RESULT_TEXT</a>       | Reads the return value (of the text array type) of an SQL statement.    |
| <a href="#">DBE_SQL.GET_ARRAY_RESULT_RAW</a>           | Reads the return value (of the raw array type) of an SQL statement.     |
| <a href="#">DBE_SQL.GET_ARRAY_RESULT_CHAR</a>          | Reads the return value (of the char array type) of an SQL statement.    |
| <a href="#">DBE_SQL.GET_ARRAY_RESULT_INT</a>           | Reads the return value (of the int array type) of an SQL statement.     |
| <a href="#">DBE_SQL.SQL_SET_TABLEOF_RESULTS_TYPE_C</a> | Dynamically defines a column of the tableof type.                       |
| <a href="#">DBE_SQL.SQL_GET_TABLEOF_VALUES_C</a>       | Reads a dynamically defined column value of the tableof type.           |

 NOTE

- You are advised to use **dbe\_sql.set\_result\_type** and **dbe\_sql.get\_result** to define columns.
- If the size of the result set is greater than the value of **work\_mem**, the result set will be spilled to a disk temporarily. The value of **work\_mem** must be no greater than 512 MB.
- **DBE\_SQL.REGISTER\_CONTEXT**  
This function opens a cursor, which is the prerequisite for the subsequent **dbe\_sql** operations. This function does not transfer any parameter. It automatically generates cursor IDs in an ascending order and returns values to integer variables.

 CAUTION

Cursors opened by DBE\_SQL are session-level variables. Cross-session call of opened cursors (such as autonomous transactions) is not supported. If a cross-session cursor is called, the behavior is unpredictable.

The prototype of the DBE\_SQL.REGISTER\_CONTEXT function is as follows:

```
DBE_SQL.REGISTER_CONTEXT(
)
RETURN INTEGER;
```

- **DBE\_SQL.SQL\_UNREGISTER\_CONTEXT**

This function closes a cursor, which is the end of each **dbe\_sql** operation. If this function is not called when the stored procedure ends, the memory is still occupied by the cursor. Therefore, remember to close a cursor when you do not need to use it. If an exception occurs, the stored procedure exits but the cursor is not closed. Therefore, you are advised to include this API in the exception handling of the stored procedure.

The prototype of the DBE\_SQL.SQL\_UNREGISTER\_CONTEXT function is as follows:

```
DBE_SQL.SQL_UNREGISTER_CONTEXT(
    context_id IN INTEGER
)
RETURN INTEGER;
```

**Table 10-229** DBE\_SQL.SQL\_UNREGISTER\_CONTEXT parameters

| Parameter  | Description                   |
|------------|-------------------------------|
| context_id | ID of the cursor to be closed |

- **DBE\_SQL.SQL\_SET\_SQL**

Parses SQL statements or anonymous blocks in a given cursor. The statement parameters can be transferred only through the text type. The length cannot exceed 1 GB.

The prototype of the **DBE\_SQL.SQL\_SET\_SQL** function is as follows:

```
DBE_SQL.SQL_SET_SQL(
    context_id IN INTEGER,
    query_string IN TEXT,
    language_flag IN INTEGER
```

```
)  
RETURN BOOLEAN;
```

**Table 10-230** DBE\_SQL.SQL\_SET\_SQL parameters

| Parameter     | Description                                                                                                                    |
|---------------|--------------------------------------------------------------------------------------------------------------------------------|
| context_id    | ID of the cursor whose query statement is to be parsed                                                                         |
| query_string  | Query statement to be executed for parsing                                                                                     |
| language_flag | Version language. The value <b>1</b> indicates an incompatible version, and the value <b>2</b> indicates a compatible version. |

- DBE\_SQL.SQL\_RUN

This function executes a given cursor. This function receives a cursor ID and executes SQL statements or anonymous blocks in a given cursor.

The prototype of the **DBE\_SQL.SQL\_RUN** function is as follows:

```
DBE_SQL.SQL_RUN(  
    context_id IN INTEGER,  
)  
RETURN INTEGER;
```

**Table 10-231** DBE\_SQL.SQL\_RUN parameters

| Parameter  | Description                                            |
|------------|--------------------------------------------------------|
| context_id | ID of the cursor whose query statement is to be parsed |

- DBE\_SQL.NEXT\_ROW

This function returns the number of data rows that meet query conditions. Each time the API is executed, the system obtains a set of new rows until all data is read.

The prototype of the **DBE\_SQL.NEXT\_ROW** function is as follows:

```
DBE_SQL.NEXT_ROW(  
    context_id IN INTEGER,  
)  
RETURN INTEGER;
```

**Table 10-232** DBE\_SQL.NEXT\_ROW parameters

| Parameter  | Description                     |
|------------|---------------------------------|
| context_id | ID of the cursor to be executed |

- DBE\_SQL.SET\_RESULT\_TYPE

This function defines columns returned from a given cursor and can be used only for the cursors defined by **SELECT**. The defined columns are identified by the relative positions in the query list. The data type of an input variable determines the corresponding column type.

The prototype of the **DBE\_SQL.SET\_RESULT\_TYPE** function is as follows:

```
DBE_SQL.SET_RESULT_TYPE(
  context_id IN INTEGER,
  pos      IN INTEGER,
  column_ref IN ANYELEMENT,
  maxsize  IN INTEGER default 1024
)
RETURN INTEGER;
```

**Table 10-233** DBE\_SQL.SET\_RESULT\_TYPE parameters

| Parameter  | Description                                                                                                    |
|------------|----------------------------------------------------------------------------------------------------------------|
| context_id | ID of the cursor to be executed                                                                                |
| pos        | Relative position of the queried columns in the returned result. The value starts from 1.                      |
| column_ref | Variable of any type. You can select an appropriate API to dynamically define columns based on variable types. |
| maxsize    | Length of the defined column return type.                                                                      |

- **DBE\_SQL.SET\_RESULT\_TYPE\_CHAR**

This function defines columns of the **CHAR** type returned from a given cursor and can be used only for the cursors defined by **SELECT**. The defined columns are identified by the relative positions in the query list. The data type of an input variable determines the corresponding column type.

The prototype of the **DBE\_SQL.SET\_RESULT\_TYPE\_CHAR** function is as follows:

```
DBE_SQL.SET_RESULT_TYPE_CHAR(
  context_id IN INTEGER,
  pos      IN INTEGER,
  column_ref IN TEXT,
  column_size IN INTEGER
)
RETURN INTEGER;
```

**Table 10-234** DBE\_SQL.SET\_RESULT\_TYPE\_CHAR parameters

| Parameter   | Description                                           |
|-------------|-------------------------------------------------------|
| context_id  | ID of the cursor to be executed                       |
| pos         | Position of a dynamically defined column in the query |
| column_ref  | Parameter to be defined                               |
| column_size | Length of a dynamically defined column                |

- **DBE\_SQL.SET\_RESULT\_TYPE\_INT**

This function defines columns of the **INT** type returned from a given cursor and can be used only for the cursors defined by **SELECT**. The defined columns are identified by the relative positions in the query list. The data type of an input variable determines the corresponding column type.

The prototype of the **DBE\_SQL.SET\_RESULT\_TYPE\_INT** function is as follows:

```
DBE_SQL.SET_RESULT_TYPE_INT(  
    context_id IN INTEGER,  
    pos      IN INTEGER  
)  
RETURN INTEGER;
```

**Table 10-235** DBE\_SQL.SET\_RESULT\_TYPE\_INT parameters

| Parameter  | Description                                           |
|------------|-------------------------------------------------------|
| context_id | ID of the cursor to be executed                       |
| pos        | Position of a dynamically defined column in the query |

- **DBE\_SQL.SET\_RESULT\_TYPE\_LONG**

This function defines columns of a long type (not **LONG**) returned from a given cursor and can be used only for the cursors defined by **SELECT**. The defined columns are identified by the relative positions in the query list. The data type of an input variable determines the corresponding column type. The maximum size of a long column is 1 GB.

The prototype of the **DBE\_SQL.SET\_RESULT\_TYPE\_LONG** function is as follows:

```
DBE_SQL.SET_RESULT_TYPE_LONG(  
    context_id IN INTEGER,  
    pos      IN INTEGER  
)  
RETURN INTEGER;
```

**Table 10-236** DBE\_SQL.SET\_RESULT\_TYPE\_LONG parameters

| Parameter  | Description                                           |
|------------|-------------------------------------------------------|
| context_id | ID of the cursor to be executed                       |
| pos        | Position of a dynamically defined column in the query |

- **DBE\_SQL.SET\_RESULT\_TYPE\_RAW**

This function defines columns of the **RAW** type returned from a given cursor and can be used only for the cursors defined by **SELECT**. The defined columns are identified by the relative positions in the query list. The data type of an input variable determines the corresponding column type.

The prototype of the **DBE\_SQL.SET\_RESULT\_TYPE\_RAW** function is as follows:

```
DBE_SQL.SET_RESULT_TYPE_RAW(  
    context_id IN INTEGER,  
    pos      IN INTEGER,  
    column_ref IN RAW,  
    column_size IN INTEGER
```

```
)
RETURN INTEGER;
```

**Table 10-237** DBE\_SQL.SET\_RESULT\_TYPE\_RAW parameters

| Parameter   | Description                                           |
|-------------|-------------------------------------------------------|
| context_id  | ID of the cursor to be executed                       |
| pos         | Position of a dynamically defined column in the query |
| column_ref  | RAW variable                                          |
| column_size | Column length                                         |

- DBE\_SQL.SET\_RESULT\_TYPE\_BYTEA

Defines columns of the **BYTEA** type returned from a given cursor and can be used only for cursors defined by **SELECT**. The defined columns are identified by the relative positions in the query list. The data type of an input variable determines the corresponding column type.

The prototype of the **DBE\_SQL.SET\_RESULT\_TYPE\_BYTEA** function is as follows:

```
DBE_SQL.SET_RESULT_TYPE_BYTEA(
  context_id IN INTEGER,
  pos       IN INTEGER,
  column_ref IN BYTEA,
  column_size IN INTEGER
)
RETURN INTEGER;
```

**Table 10-238** DBE\_SQL.SET\_RESULT\_TYPE\_BYTEA parameters

| Parameter   | Description                                           |
|-------------|-------------------------------------------------------|
| context_id  | ID of the cursor to be executed                       |
| pos         | Position of a dynamically defined column in the query |
| column_ref  | BYTEA variable                                        |
| column_size | Column length                                         |

- DBE\_SQL.SET\_RESULT\_TYPE\_TEXT

This function defines columns of the **TEXT** type returned from a given cursor and can be used only for the cursors defined by **SELECT**. The defined columns are identified by the relative positions in the query list. The data type of an input variable determines the corresponding column type.

The prototype of the **DBE\_SQL.SET\_RESULT\_TYPE\_TEXT** function is as follows:

```
DBE_SQL.DEFINE_COLUMN_CHAR(
  context_id IN INTEGER,
  pos       IN INTEGER,
  maxsize   IN INTEGER
```

```
)  
RETURN INTEGER;
```

**Table 10-239** DBE\_SQL.SET\_RESULT\_TYPE\_TEXT parameters

| Parameter  | Description                                           |
|------------|-------------------------------------------------------|
| context_id | ID of the cursor to be executed                       |
| pos        | Position of a dynamically defined column in the query |
| maxsize    | Maximum length of the defined <b>TEXT</b> type        |

- DBE\_SQL.SET\_RESULT\_TYPE\_UNKNOWN**  
 This function processes columns of unknown data types returned from a given cursor. It is used only for the system to report an error and exist when the type cannot be identified.

The prototype of the **DBE\_SQL.SET\_RESULT\_TYPE\_UNKNOWN** function is as follows:

```
DBE_SQL.SET_RESULT_TYPE_UNKNOWN(  
    context_id IN INTEGER,  
    pos      IN INTEGER,  
    col_type IN TEXT  
)  
RETURN INTEGER;
```

**Table 10-240** DBE\_SQL.SET\_RESULT\_TYPE\_UNKNOWN parameters

| Parameter  | Description                                           |
|------------|-------------------------------------------------------|
| context_id | ID of the cursor to be executed                       |
| posn       | Position of a dynamically defined column in the query |
| col_type   | Dynamically defined parameter                         |

- DBE\_SQL.GET\_RESULT**  
 This function returns the cursor element value in a specified position of a cursor and accesses the data obtained by **DBE\_SQL.NEXT\_ROW**.

The prototype of the **DBE\_SQL.GET\_RESULT** function is as follows:

```
DBE_SQL.GET_RESULT(  
    context_id IN INTEGER,  
    pos      IN INTEGER,  
    column_value INOUT ANYELEMENT  
)  
RETURN ANYELEMENT;
```

**Table 10-241** DBE\_SQL.GET\_RESULT parameters

| Parameter  | Description                     |
|------------|---------------------------------|
| context_id | ID of the cursor to be executed |

| Parameter    | Description                                                                               |
|--------------|-------------------------------------------------------------------------------------------|
| pos          | Relative position of the queried columns in the returned result. The value starts from 1. |
| column_value | Return value of the query result of a specified column                                    |

- DBE\_SQL.GET\_RESULT\_CHAR

This stored procedure returns the value of the **CHAR** type in a specified position of a cursor and accesses the data obtained by **DBE\_SQL.NEXT\_ROW**.

The prototype of the DBE\_SQL.GET\_RESULT\_CHAR stored procedure is as follows:

```
DBE_SQL.GET_RESULT_CHAR(
  context_id IN INTEGER,
  pos      IN INTEGER,
  tr       INOUT CHARACTER,
  err      INOUT NUMERIC,
  actual_length INOUT INTEGER
);
```

**Table 10-242** DBE\_SQL.GET\_RESULT\_CHAR parameters

| Parameter     | Description                                                                                                                                              |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------|
| context_id    | ID of the cursor to be executed                                                                                                                          |
| pos           | Relative position of the queried columns in the returned result. The value starts from 1.                                                                |
| tr            | Return value                                                                                                                                             |
| err           | Error No. It is an output parameter. The input parameter must be a variable. Currently, the output value is <b>-1</b> regardless of the input parameter. |
| actual_length | Length of a return value                                                                                                                                 |

The overloading of the DBE\_SQL.GET\_RESULT\_CHAR stored procedure is as follows:

```
DBE_SQL.GET_RESULT_CHAR(
  context_id IN INTEGER,
  pos      IN INTEGER,
  tr       INOUT CHARACTER
);
```

**Table 10-243** DBE\_SQL.GET\_RESULT\_CHAR parameters

| Parameter  | Description                     |
|------------|---------------------------------|
| context_id | ID of the cursor to be executed |

| Parameter | Description                                           |
|-----------|-------------------------------------------------------|
| pos       | Position of a dynamically defined column in the query |
| tr        | Return value                                          |

- DBE\_SQL.GET\_RESULT\_INT

This function returns the value of the **INT** type in a specified position of a cursor and accesses the data obtained by **DBE\_SQL.NEXT\_ROW**. The prototype of the **DBE\_SQL.GET\_RESULT\_INT** function is as follows:

```
DBE_SQL.GET_RESULT_INT(
    context_id IN INTEGER,
    pos      IN INTEGER
)
RETURN INTEGER;
```

**Table 10-244** DBE\_SQL.GET\_RESULT\_INT parameters

| Parameter  | Description                                           |
|------------|-------------------------------------------------------|
| context_id | ID of the cursor to be executed                       |
| pos        | Position of a dynamically defined column in the query |

- DBE\_SQL.GET\_RESULT\_LONG

This function returns the value of a long type (not **LONG** or **BIGINT**) in a specified position of a cursor and accesses the data obtained by **DBE\_SQL.NEXT\_ROW**.

The prototype of the **DBE\_SQL.GET\_RESULT\_LONG** function is as follows:

```
DBE_SQL.GET_RESULT_LONG(
    context_id IN INTEGER,
    pos      IN  INTEGER,
    lgth     IN  INTEGER,
    off_set  IN  INTEGER,
    vl      INOUT TEXT,
    vl_length INOUT INTEGER
)
RETURN RECORD;
```

**Table 10-245** DBE\_SQL.GET\_RESULT\_LONG parameters

| Parameter  | Description                                           |
|------------|-------------------------------------------------------|
| context_id | ID of the cursor to be executed                       |
| pos        | Position of a dynamically defined column in the query |
| lgth       | Length of a return value                              |
| off_set    | Start position of a return value                      |
| vl         | Return value                                          |

| Parameter | Description              |
|-----------|--------------------------|
| vl_length | Length of a return value |

- DBE\_SQL.GET\_RESULT\_RAW

Returns the value of the RAW type in a specified position of a cursor and accesses the data obtained by DBE\_SQL.NEXT\_ROW.

The prototype of the DBE\_SQL.GET\_RESULT\_RAW stored procedure is as follows:

```
DBE_SQL.GET_RESULT_RAW(
  context_id IN INTEGER,
  pos      IN INTEGER,
  tr       INOUT RAW,
  err      INOUT NUMERIC,
  actual_length INOUT INTEGER
);
```

**Table 10-246** DBE\_SQL.GET\_RESULT\_RAW parameters

| Parameter     | Description                                                                                                                                              |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------|
| context_id    | ID of the cursor to be executed                                                                                                                          |
| pos           | Position of a dynamically defined column in the query                                                                                                    |
| tr            | Returned column value                                                                                                                                    |
| err           | Error No. It is an output parameter. The input parameter must be a variable. Currently, the output value is <b>-1</b> regardless of the input parameter. |
| actual_length | Length of a return value. The value longer than this length will be truncated.                                                                           |

The overloading of the DBE\_SQL.GET\_RESULT\_RAW stored procedure is as follows:

```
DBE_SQL.GET_RESULT_RAW(
  context_id IN INTEGER,
  pos      IN INTEGER,
  tr       INOUT RAW
);
```

**Table 10-247** DBE\_SQL.GET\_RESULT\_RAW parameters

| Parameter  | Description                                           |
|------------|-------------------------------------------------------|
| context_id | ID of the cursor to be executed                       |
| pos        | Position of a dynamically defined column in the query |
| tr         | Returned column value                                 |

- **DBE\_SQL.GET\_RESULT\_BYTEA**

Returns the value of the BYTEA type in a specified position of a cursor that is obtained by DBE\_SQL.NEXT\_ROW.

The prototype of the DBE\_SQL.GET\_RESULT\_BYTEA stored procedure is as follows:

```
DBE_SQL.GET_RESULT_BYTEA(
    context_id IN INTEGER,
    pos      IN INTEGER
)
RETURN BYTEA;
```

**Table 10-248** DBE\_SQL.GET\_RESULT\_BYTEA parameters

| Parameter  | Description                                           |
|------------|-------------------------------------------------------|
| context_id | ID of the cursor to be executed                       |
| pos        | Position of a dynamically defined column in the query |

- **DBE\_SQL.GET\_RESULT\_TEXT**

This function returns the value of the TEXT type in a specified position of a cursor and accesses the data obtained by DBE\_SQL.NEXT\_ROW.

The prototype of the DBE\_SQL.GET\_RESULT\_TEXT function is as follows:

```
DBE_SQL.GET_RESULT_TEXT(
    context_id IN INTEGER,
    pos      IN INTEGER
)
RETURN TEXT;
```

**Table 10-249** DBE\_SQL.GET\_RESULT\_TEXT parameters

| Parameter  | Description                                           |
|------------|-------------------------------------------------------|
| context_id | ID of the cursor to be executed                       |
| pos        | Position of a dynamically defined column in the query |

- **DBE\_SQL.GET\_RESULT\_UNKNOWN**

This function returns the value of an unknown type in a specified position of a cursor. It serves as an error handling API when the type is not unknown.

The prototype of the DBE\_SQL.GET\_RESULT\_UNKNOWN function is as follows:

```
DBE_SQL.GET_RESULT_UNKNOWN(
    context_id IN INTEGER,
    pos      IN INTEGER,
    col_type  IN TEXT
)
RETURN TEXT;
```

**Table 10-250** DBE\_SQL.GET\_RESULT\_UNKNOWN parameters

| Parameter  | Description                                           |
|------------|-------------------------------------------------------|
| context_id | ID of the cursor to be executed                       |
| pos        | Position of a dynamically defined column in the query |
| col_type   | Returned parameter type                               |

- DBE\_SQL.DBE\_SQL\_GET\_RESULT\_CHAR

This function returns the value of the **CHAR** type in a specified position of a cursor and accesses the data obtained by **DBE\_SQL.NEXT\_ROW**. Different from **DBE\_SQL.GET\_RESULT\_CHAR**, the length of the return value is not set and the entire string is returned.

The prototype of the **DBE\_SQL.DBE\_SQL\_GET\_RESULT\_CHAR** function is as follows:

```
DBE_SQL.DBE_SQL_GET_RESULT_CHAR(
    context_id IN INTEGER,
    pos      IN INTEGER
)
RETURN CHARACTER;
```

**Table 10-251** DBE\_SQL.DBE\_SQL\_GET\_RESULT\_CHAR parameters

| Parameter  | Description                                           |
|------------|-------------------------------------------------------|
| context_id | ID of the cursor to be executed                       |
| pos        | Position of a dynamically defined column in the query |

- DBE\_SQL.DBE\_SQL\_GET\_RESULT\_LONG

This function returns the value of a long type (not **LONG** or **BIGINT**) in a specified position of a cursor and accesses the data obtained by **DBE\_SQL.NEXT\_ROW**.

Different from **DBE\_SQL.GET\_RESULT\_LONG**, the length of the return value is not set and the entire **BIGINT** value is returned.

The prototype of the **DBE\_SQL.DBE\_SQL\_GET\_RESULT\_LONG** function is as follows:

```
DBE_SQL.DBE_SQL_GET_RESULT_LONG(
    context_id IN INTEGER,
    pos      IN INTEGER
)
RETURN BIGINT;
```

**Table 10-252** DBE\_SQL.DBE\_SQL\_GET\_RESULT\_LONG parameters

| Parameter  | Description                     |
|------------|---------------------------------|
| context_id | ID of the cursor to be executed |

| Parameter | Description                                           |
|-----------|-------------------------------------------------------|
| pos       | Position of a dynamically defined column in the query |

- DBE\_SQL.DBE\_SQL\_GET\_RESULT\_RAW

This function returns the value of the **RAW** type in a specified position of a cursor and accesses the data obtained by **DBE\_SQL.NEXT\_ROW**.

Different from **DBE\_SQL.GET\_RESULT\_RAW**, the length of the return value is not set and the entire string is returned.

The prototype of the **DBE\_SQL.DBE\_SQL\_GET\_RESULT\_RAW** function is as follows:

```
DBE_SQL.GET_RESULT_RAW(
  context_id IN INTEGER,
  pos      IN INTEGER,
  tr       INOUT RAW
)
RETURN RAW;
```

**Table 10-253** DBE\_SQL.GET\_RESULT\_RAW parameters

| Parameter  | Description                                           |
|------------|-------------------------------------------------------|
| context_id | ID of the cursor to be executed                       |
| pos        | Position of a dynamically defined column in the query |

- DBE\_SQL.IS\_ACTIVE

This function returns the status of a cursor. The status can be **open**, **parse**, **execute**, or **define**. If the status is **open**, the value is **TRUE**. If the status is unknown, an error is reported. In other cases, the value is **FALSE**.

The prototype of the **DBE\_SQL.IS\_ACTIVE** function is as follows:

```
DBE_SQL.IS_ACTIVE(
  context_id IN INTEGER
)
RETURN BOOLEAN;
```

**Table 10-254** DBE\_SQL.IS\_ACTIVE parameters

| Parameter  | Description                    |
|------------|--------------------------------|
| context_id | ID of the cursor to be queried |

- DBE\_SQL.LAST\_ROW\_COUNT

Returns the accumulated count of data rows obtained after the latest **NEXT\_ROW** execution.

The prototype of the **DBE\_SQL.LAST\_ROW\_COUNT** function is as follows:

```
DBE_SQL.LAST_ROW_COUNT(
)
RETURN INTEGER;
```

- **DBE\_SQL.RUN\_AND\_NEXT**

Equivalent to calling SQL\_RUN and NEXT\_ROW in sequence.

The prototype of the DBE\_SQL.RUN\_AND\_NEXT function is as follows:

```
DBE_SQL.RUN_AND_NEXT(
    context_id IN INTEGER
)
RETURNS INTEGER;
```

**Table 10-255** DBE\_SQL.RUN\_AND\_NEXT parameters

| Parameter  | Description                                            |
|------------|--------------------------------------------------------|
| context_id | ID of the cursor whose query statement is to be parsed |

- **DBE\_SQL.SQL\_BIND\_VARIABLE**

This function is used to bind a parameter to an SQL statement. When an SQL statement is executed, the SQL statement is executed based on the bound value.

The prototype of the **DBE\_SQL.SQL\_BIND\_VARIABLE** function is as follows:

```
DBE_SQL.SQL_BIND_VARIABLE(
    context_id IN int,
    query_string IN text,
    value IN anyelement,
    out_value_size IN int default null
)
RETURNS void;
```

**Table 10-256** DBE\_SQL.SQL\_BIND\_VARIABLE parameters

| Parameter      | Description                                                                                                                                                                                         |
|----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| context_id     | ID of the cursor to be queried                                                                                                                                                                      |
| query_string   | Name of the bound variable                                                                                                                                                                          |
| value          | Bound value                                                                                                                                                                                         |
| out_value_size | Size of the return value. Default value: <b>NULL</b> . In A-compatible mode, the parameter behavior is the same as that of database A only when the parameter type of the value is VARCHAR or CHAR. |

- **DBE\_SQL.SQL\_BIND\_ARRAY**

This function is used to bind a set of parameters to an SQL statement. When an SQL statement is executed, the SQL statement is executed based on the bound array.

The prototype of the **DBE\_SQL.SQL\_BIND\_ARRAY** function is as follows:

```
DBE_SQL.SQL_BIND_ARRAY(
    context_id IN int,
    query_string IN text,
    value IN anyarray
)
```

```

RETURNS void;
DBE_SQL.SQL_BIND_ARRAY(
  context_id IN int,
  query_string IN text,
  value IN anyarray,
  lower_index IN int,
  higher_index IN int
)
RETURNS void;

DBE_SQL.SQL_BIND_ARRAY(
  context_id IN int,
  query_string IN text,
  value IN anyindexbytable
)
RETURNS void;
DBE_SQL.SQL_BIND_ARRAY(
  context_id IN int,
  query_string IN text,
  value IN anyindexbytable,
  lower_index IN int,
  higher_index IN int
)
RETURNS void;

```

**Table 10-257** DBE\_SQL.SQL\_BIND\_ARRAY parameters

| Parameter    | Description                          |
|--------------|--------------------------------------|
| context_id   | ID of the cursor to be queried       |
| query_string | Name of the bound variable           |
| value        | Bound array                          |
| lower_index  | Minimum subscript of the bound array |
| higher_index | Maximum subscript of the bound array |

 **NOTE**

DBE\_SQL.SQL\_BIND\_ARRAY does not support user-defined table types. Use the table types provided in [Data Types](#).

- **DBE\_SQL.SET\_RESULT\_TYPE\_INTS**

This function defines columns of the **INT** array type returned from a given cursor and can be used only for the cursors defined by **SELECT**. The defined columns are identified by the relative positions in the query list. The data type of an input variable determines the corresponding column type.

The prototype of the **DBE\_SQL.SET\_RESULT\_TYPE\_INTS** function is as follows:

```

DBE_SQL.SET_RESULT_TYPE_INTS(
  context_id IN int,
  pos IN int,
  column_ref IN anyarray,
  cnt IN int,
  lower_bnd IN int
)
RETURNS integer;

```

**Table 10-258** DBE\_SQL.SET\_RESULT\_TYPE\_INTS parameters

| Parameter  | Description                                           |
|------------|-------------------------------------------------------|
| context_id | ID of the cursor to be queried                        |
| pos        | Position of a dynamically defined column in the query |
| column_ref | Type of the returned array                            |
| cnt        | Number of values obtained at a time                   |
| lower_bnd  | Start subscript when an array is returned             |

- DBE\_SQL.SET\_RESULT\_TYPE\_TEXTS

This function defines columns of the **TEXT** array type returned from a given cursor and can be used only for the cursors defined by **SELECT**. The defined columns are identified by the relative positions in the query list. The data type of an input variable determines the corresponding column type.

The prototype of the **DBE\_SQL.SET\_RESULT\_TYPE\_TEXTS** function is as follows:

```
DBE_SQL.SET_RESULT_TYPE_TEXTS(
  context_id IN int,
  pos      IN int,
  column_ref IN anyarray,
  cnt      IN int,
  lower_bnd IN int,
  maxsize  IN int
)
RETURNS integer;
```

**Table 10-259** DBE\_SQL.SET\_RESULT\_TYPE\_TEXTS parameters

| Parameter  | Description                                           |
|------------|-------------------------------------------------------|
| context_id | ID of the cursor to be queried                        |
| pos        | Position of a dynamically defined column in the query |
| column_ref | Type of the returned array                            |
| cnt        | Number of values obtained at a time                   |
| lower_bnd  | Start subscript when an array is returned             |
| maxsize    | Maximum length of the defined TEXT type               |

- DBE\_SQL.SET\_RESULT\_TYPE\_RAWS

This function defines columns of the **RAW** array type returned from a given cursor and can be used only for the cursors defined by **SELECT**. The defined columns are identified by the relative positions in the query list. The data type of an input variable determines the corresponding column type.

The prototype of the **DBE\_SQL.SET\_RESULT\_TYPE\_RAWS** function is as follows:

```
DBE_SQL.set_result_type_raws(
  context_id IN int,
  pos       IN int,
  column_ref IN anyarray,
  cnt       IN int,
  lower_bnd IN int,
  column_size IN int
)
RETURNS integer;
```

**Table 10-260** DBE\_SQL.SET\_RESULT\_TYPE\_RAWS parameters

| Parameter   | Description                                           |
|-------------|-------------------------------------------------------|
| context_id  | ID of the cursor to be queried                        |
| pos         | Position of a dynamically defined column in the query |
| column_ref  | Type of the returned array                            |
| cnt         | Number of values obtained at a time                   |
| lower_bnd   | Start subscript when an array is returned             |
| column_size | Column length                                         |

- **DBE\_SQL.SET\_RESULT\_TYPE\_BYTEAS**

This function defines columns of the **BYTEA** array type returned from a given cursor and can be used only for the cursors defined by **SELECT**. The defined columns are identified by the relative positions in the query list. The data type of an input variable determines the corresponding column type.

The prototype of the **DBE\_SQL.SET\_RESULT\_TYPE\_BYTEAS** function is as follows:

```
DBE_SQL.set_result_type_byteas(
  context_id IN int,
  pos       IN int,
  column_ref IN anyarray,
  cnt       IN int,
  lower_bnd IN int,
  column_size IN int
)
RETURNS integer;
```

**Table 10-261** DBE\_SQL.SET\_RESULT\_TYPE\_BYTEAS parameters

| Parameter  | Description                                           |
|------------|-------------------------------------------------------|
| context_id | ID of the cursor to be queried                        |
| pos        | Position of a dynamically defined column in the query |
| column_ref | Type of the returned array                            |
| cnt        | Number of values obtained at a time                   |

| Parameter   | Description                               |
|-------------|-------------------------------------------|
| lower_bnd   | Start subscript when an array is returned |
| column_size | Column length                             |

- **DBE\_SQL.SET\_RESULT\_TYPE\_CHARS**

This function defines columns of the **CHAR** array type returned from a given cursor and can be used only for the cursors defined by **SELECT**. The defined columns are identified by the relative positions in the query list. The data type of an input variable determines the corresponding column type.

The prototype of the **DBE\_SQL.SET\_RESULT\_TYPE\_CHARS** function is as follows:

```
DBE_SQL.SET_RESULT_TYPE_CHARS(
  context_id IN int,
  pos      IN int,
  column_ref IN anyarray,
  cnt      IN int,
  lower_bnd IN int,
  column_size IN int
)
RETURNS integer;
```

**Table 10-262** DBE\_SQL.SET\_RESULT\_TYPE\_CHARS parameters

| Parameter   | Description                                           |
|-------------|-------------------------------------------------------|
| context_id  | ID of the cursor to be queried                        |
| pos         | Position of a dynamically defined column in the query |
| column_ref  | Type of the returned array                            |
| cnt         | Number of values obtained at a time                   |
| lower_bnd   | Start subscript when an array is returned             |
| column_size | Column length                                         |

- **DBE\_SQL.SET\_RESULTS\_TYPE**

This function defines columns returned from a given cursor and can be used only for the cursors defined by **SELECT**. The defined columns are identified by the relative positions in the query list. The data type of an input variable determines the corresponding column type.

The prototype of the **DBE\_SQL.SET\_RESULTS\_TYPE** function is as follows:

```
DBE_SQL.SET_RESULTS_TYPE(
  context_id IN int,
  pos      IN int,
  column_ref IN anyarray,
  cnt      IN int,
  lower_bnd IN int,
  maxsize  IN int DEFAULT 1024
) returns void;

DBE_SQL.SET_RESULTS_TYPE(
  context_id IN int,
```

```

pos      IN int,
column_ref IN db_sql.number_table,
cnt      IN int,
lower_bnd IN int,
maxsize  IN int DEFAULT 1024
);

DBE_SQL.SET_RESULTS_TYPE(
context_id IN int,
pos      IN int,
column_ref IN db_sql.varchar2_table,
cnt      IN int,
lower_bnd IN int,
maxsize  IN int DEFAULT 32767
);

DBE_SQL.SET_RESULTS_TYPE(
context_id IN int,
pos      IN int,
column_ref IN db_sql.date_table,
cnt      IN int,
lower_bnd IN int,
maxsize  IN int DEFAULT 1024
);

DBE_SQL.SET_RESULTS_TYPE(
context_id IN int,
pos      IN int,
column_ref IN db_sql.blob_table,
cnt      IN int,
lower_bnd IN int,
maxsize  IN int DEFAULT 32767
);

```

**Table 10-263** DBE\_SQL.SET\_RESULTS\_TYPE parameters

| Parameter  | Description                                           |
|------------|-------------------------------------------------------|
| context_id | ID of the cursor to be queried                        |
| pos        | Position of a dynamically defined column in the query |
| column_ref | Type of the returned array                            |
| cnt        | Number of values obtained at a time                   |
| lower_bnd  | Start subscript when an array is returned             |
| maxsize    | Maximum length of the defined type                    |

 **NOTE**

DBE\_SQL.SET\_RESULTS\_TYPE does not support user-defined table types. Use the table types provided in "Data Types".

- **DBE\_SQL.GET\_RESULTS\_INT**

This function returns the value of the **INT** array type in a specified position of a cursor and accesses the data obtained by **DBE\_SQL.NEXT\_ROW**.

The prototype of the **DBE\_SQL.GET\_RESULTS\_INT** function is as follows:

```

DBE_SQL.GET_RESULTS_INT(
context_id IN int,

```

```
pos      IN int,
column_value INOUT anyarray
);
```

**Table 10-264** DBE\_SQL.GET\_RESULTS\_INT parameters

| Parameter    | Description                                           |
|--------------|-------------------------------------------------------|
| context_id   | ID of the cursor to be queried                        |
| pos          | Position of a dynamically defined column in the query |
| column_value | Return value                                          |

- DBE\_SQL.GET\_RESULTS\_TEXT

This function returns the value of the **TEXT** array type in a specified position of a cursor and accesses the data obtained by **DBE\_SQL.NEXT\_ROW**.

The prototype of the **DBE\_SQL.GET\_RESULTS\_TEXT** function is as follows:

```
DBE_SQL.GET_RESULTS_TEXT(
context_id IN int,
pos      IN int,
column_value INOUT anyarray
);
```

**Table 10-265** DBE\_SQL.GET\_RESULTS\_TEXT parameters

| Parameter    | Description                                           |
|--------------|-------------------------------------------------------|
| context_id   | ID of the cursor to be queried                        |
| pos          | Position of a dynamically defined column in the query |
| column_value | Return value                                          |

- DBE\_SQL.GET\_RESULTS\_RAW

This function returns the value of the **RAW** array type in a specified position of a cursor and accesses the data obtained by **DBE\_SQL.NEXT\_ROW**.

The prototype of the **DBE\_SQL.GET\_RESULTS\_RAW** function is as follows:

```
DBE_SQL.GET_RESULTS_RAW(
context_id IN int,
pos      IN int,
column_value INOUT anyarray
);
```

**Table 10-266** DBE\_SQL.GET\_RESULTS\_RAW parameters

| Parameter  | Description                                           |
|------------|-------------------------------------------------------|
| context_id | ID of the cursor to be queried                        |
| pos        | Position of a dynamically defined column in the query |

| Parameter    | Description  |
|--------------|--------------|
| column_value | Return value |

- DBE\_SQL.GET\_RESULTS\_BYTEA

This function returns the value of the **BYTEA** array type in a specified position of a cursor and accesses the data obtained by **DBE\_SQL.NEXT\_ROW**.

The prototype of the **DBE\_SQL.GET\_RESULTS\_BYTEA** function is as follows:

```
DBE_SQL.GET_RESULTS_BYTEA(
  context_id IN int,
  pos       IN int,
  column_value INOUT anyarray
);
```

**Table 10-267** DBE\_SQL.GET\_RESULTS\_BYTEA parameters

| Parameter    | Description                                           |
|--------------|-------------------------------------------------------|
| context_id   | ID of the cursor to be queried                        |
| pos          | Position of a dynamically defined column in the query |
| column_value | Return value                                          |

- DBE\_SQL.GET\_RESULTS\_CHAR

This function returns the value of the **CHAR** array type in a specified position of a cursor and accesses the data obtained by **DBE\_SQL.NEXT\_ROW**.

The prototype of the **DBE\_SQL.GET\_RESULTS\_CHAR** function is as follows:

```
DBE_SQL.GET_RESULTS_CHAR(
  context_id IN int,
  pos       IN int,
  column_value INOUT anyarray
);
```

**Table 10-268** DBE\_SQL.GET\_RESULTS\_CHAR parameters

| Parameter    | Description                                           |
|--------------|-------------------------------------------------------|
| context_id   | ID of the cursor to be queried                        |
| pos          | Position of a dynamically defined column in the query |
| column_value | Return value                                          |

- DBE\_SQL.GET\_RESULTS

This function returns the value of the array type in a specified position of a cursor and accesses the data obtained by **DBE\_SQL.NEXT\_ROW**.

 **NOTE**

The bottom-layer mechanism of DBE\_SQL.GET\_RESULTS is implemented through arrays. When different arrays are used to obtain the return value of the same column, NULL values are filled in the array due to discontinuous internal indexes to ensure the continuity of array indexes. As a result, the length of the returned result array is different from that of the Oracle database.

The prototype of the **DBE\_SQL.GET\_RESULTS** function is as follows:

```
DBE_SQL.GET_RESULTS(
  context_id IN int,
  pos      IN int,
  column_value INOUT anyarray
);

DBE_SQL.GET_RESULTS(
  context_id IN int,
  pos      IN int,
  column_value INOUT dbe_sql.varchar2_table
);

DBE_SQL.GET_RESULTS(
  context_id IN int,
  pos      IN int,
  column_value INOUT dbe_sql.number_table
);

DBE_SQL.GET_RESULTS(
  context_id IN int,
  pos      IN int,
  column_value INOUT dbe_sql.date_table
);

DBE_SQL.GET_RESULTS(
  context_id IN int,
  pos      IN int,
  column_value INOUT dbe_sql.blob_table
);
```

**Table 10-269** DBE\_SQL.GET\_RESULTS parameters

| Parameter    | Description                                           |
|--------------|-------------------------------------------------------|
| context_id   | ID of the cursor to be queried                        |
| pos          | Position of a dynamically defined column in the query |
| column_value | Return value                                          |

 **NOTE**

DBE\_SQL.GET\_RESULTS does not support user-defined table types. Use the table types provided in [Data Types](#).

- **DBE\_SQL.SQL\_DESCRIBE\_COLUMNS**

This function is used to describe column information and can be used only for cursors defined by **SELECT**.

The prototype of the **DBE\_SQL.SQL\_DESCRIBE\_COLUMNS** function is as follows:

```
DBE_SQL.SQL_DESCRIBE_COLUMNS(
  context_id IN int,
```

```
col_cnt INOUT int,
desc_t INOUT db_sql.desc_tab
)RETURNS record ;
```

**Table 10-270** DBE\_SQL.SQL\_DESCRIBE\_COLUMNS parameters

| Parameter  | Description                        |
|------------|------------------------------------|
| context_id | ID of the cursor to be queried     |
| col_cnt    | Number of columns returned         |
| desc_t     | Description of the returned column |

- **DBE\_SQL.DESCRIBE\_COLUMNS**  
Describes column information and can be used only for cursors defined by SELECT. This API is developed for compatibility purposes.  
The prototype of the DBE\_SQL.DESCRIBE\_COLUMNS function is as follows:

```
DBE_SQL.DESCRIBE_COLUMNS(
context_id IN int,
col_cnt OUT int,
desc_t OUT db_sql.desc_tab
)
```

**Table 10-271** DBE\_SQL.DESCRIBE\_COLUMNS parameters

| Parameter  | Description                        |
|------------|------------------------------------|
| context_id | ID of the cursor to be queried     |
| col_cnt    | Number of columns returned         |
| desc_t     | Description of the returned column |

- **DBE\_SQL.BIND\_VARIABLE**  
This function is used to bind parameters. You are advised to use **DBE\_SQL.SQL\_BIND\_VARIABLE**.
- **DBE\_SQL.SQL\_SET\_RESULTS\_TYPE\_C**  
This function is used to dynamically define a column of the array type. You are not advised to use it.  
The prototype of the **DBE\_SQL.SQL\_SET\_RESULTS\_TYPE\_C** function is as follows:

```
DBE_SQL.sql_set_results_type_c(
context_id IN int,
pos IN int,
column_ref IN anyarray,
cnt IN int,
lower_bnd IN int,
col_type IN anyelement,
maxsize IN int
)return integer;
```

**Table 10-272** DBE\_SQL.SQL\_SET\_RESULTS\_TYPE\_C parameters

| Parameter  | Description                                            |
|------------|--------------------------------------------------------|
| context_id | ID of the cursor to be queried                         |
| pos        | Position of a dynamically defined column in the query  |
| column_ref | Type of the returned array                             |
| cnt        | Number of values obtained at a time                    |
| lower_bnd  | Start subscript when an array is returned              |
| col_type   | Variable type corresponding to the returned array type |
| maxsize    | Maximum length of the defined type                     |

- DBE\_SQL.SQL\_GET\_VALUES\_C

This function is used to read a dynamically defined column value. You are not advised to use it.

The prototype of the **DBE\_SQL.SQL\_GET\_VALUES\_C** function is as follows:

```
DBE_SQL.sql_get_values_c(
  context_id IN int,
  pos       IN int,
  results_type INOUT anyarray,
  result_type IN anyelement
) return anyarray;
```

**Table 10-273** DBE\_SQL.SQL\_GET\_VALUES\_C parameters

| Parameter    | Description                    |
|--------------|--------------------------------|
| context_id   | ID of the cursor to be queried |
| pos          | Parameter position             |
| results_type | Obtained result                |
| result_type  | Type of the obtained result    |

- DBE\_SQL.GET\_VARIABLE\_RESULT

This function is used to return the value of the bound OUT parameter and obtain the OUT parameter in a stored procedure.

The prototype of the **DBE\_SQL.GET\_VARIABLE\_RESULT** function is as follows:

```
DBE_SQL.get_variable_result(
  context_id IN int,
  pos       IN VARCHAR2,
  column_value INOUT anyelement
);
```

**Table 10-274** DBE\_SQL.GET\_VARIABLE\_RESULT parameters

| Parameter    | Description                    |
|--------------|--------------------------------|
| context_id   | ID of the cursor to be queried |
| pos          | Name of the bound parameter    |
| column_value | Return value                   |

- DBE\_SQL.GET\_VARIABLE\_RESULT\_CHAR

This function is used to return the value of the bound OUT parameter of the **CHAR** type and obtain the OUT parameter in a stored procedure.

The prototype of the **DBE\_SQL.GET\_VARIABLE\_RESULT\_CHAR** function is as follows:

```
DBE_SQL.get_variable_result_char(
    context_id IN int,
    pos      IN VARCHAR2
)
RETURNS char
```

**Table 10-275** DBE\_SQL.GET\_VARIABLE\_RESULT\_CHAR parameters

| Parameter  | Description                    |
|------------|--------------------------------|
| context_id | ID of the cursor to be queried |
| pos        | Name of the bound parameter    |

- DBE\_SQL.GET\_VARIABLE\_RESULT\_RAW

This function is used to return the value of the bound OUT parameter of the **RAW** type and obtain the OUT parameter in a stored procedure.

The prototype of the **DBE\_SQL.GET\_VARIABLE\_RESULT\_RAW** function is as follows:

```
CREATE OR REPLACE FUNCTION DBE_SQL.get_variable_result_raw(
    context_id IN int,
    pos      IN VARCHAR2,
    value     INOUT anyelement
)
RETURNS anyelement
```

**Table 10-276** DBE\_SQL.GET\_VARIABLE\_RESULT\_RAW parameters

| Parameter  | Description                    |
|------------|--------------------------------|
| context_id | ID of the cursor to be queried |
| pos        | Name of the bound parameter    |
| value      | Return value                   |

- DBE\_SQL.GET\_VARIABLE\_RESULT\_TEXT

This function is used to return the value of the bound OUT parameter of the **TEXT** type and obtain the OUT parameter in a stored procedure.

The prototype of the **DBE\_SQL.GET\_VARIABLE\_RESULT\_TEXT** function is as follows:

```
CREATE OR REPLACE FUNCTION DBE_SQL.get_variable_result_text(
    context_id IN int,
    pos      IN VARCHAR2
)
RETURNS text
```

**Table 10-277** DBE\_SQL.GET\_VARIABLE\_RESULT\_TEXT parameters

| Parameter  | Description                    |
|------------|--------------------------------|
| context_id | ID of the cursor to be queried |
| pos        | Name of the bound parameter    |

- **DBE\_SQL.GET\_VARIABLE\_RESULT\_INT**

This function is used to return the value of the bound OUT parameter of the **INT** type and obtain the OUT parameter in a stored procedure.

The prototype of the **DBE\_SQL.GET\_VARIABLE\_RESULT\_INT** function is as follows:

```
DBE_SQL.get_variable_result_int(
    context_id IN int,
    pos      IN VARCHAR2,
    value     INOUT anyelement
)
RETURNS anyelement
```

**Table 10-278** DBE\_SQL.GET\_VARIABLE\_RESULT\_INT parameters

| Parameter  | Description                    |
|------------|--------------------------------|
| context_id | ID of the cursor to be queried |
| pos        | Name of the bound parameter    |
| value      | Return value                   |

- **DBE\_SQL.GET\_ARRAY\_RESULT\_TEXT**

This function is used to return the value of the bound OUT parameter of the **TEXT** array type and obtain the OUT parameter in a stored procedure.

The prototype of the **DBE\_SQL.GET\_ARRAY\_RESULT\_TEXT** function is as follows:

```
DBE_SQL.get_array_result_text(
    context_id IN int,
    pos      IN VARCHAR2,
    column_value INOUT anyarray
)
RETURNS anyarray
```

**Table 10-279** DBE\_SQL.GET\_ARRAY\_RESULT\_TEXT parameters

| Parameter  | Description                    |
|------------|--------------------------------|
| context_id | ID of the cursor to be queried |

| Parameter    | Description                 |
|--------------|-----------------------------|
| pos          | Name of the bound parameter |
| column_value | Return value                |

- **DBE\_SQL.GET\_ARRAY\_RESULT\_RAW**

This function is used to return the value of the bound OUT parameter of the **RAW** array type and obtain the OUT parameter in a stored procedure.

The prototype of the **DBE\_SQL.GET\_ARRAY\_RESULT\_RAW** function is as follows:

```
DBE_SQL.get_array_result_raw(
  context_id IN int,
  pos      IN VARCHAR2,
  column_value INOUT anyarray
)
```

**Table 10-280** DBE\_SQL.GET\_ARRAY\_RESULT\_RAW parameters

| Parameter    | Description                    |
|--------------|--------------------------------|
| context_id   | ID of the cursor to be queried |
| pos          | Name of the bound parameter    |
| column_value | Return value                   |

- **DBE\_SQL.GET\_ARRAY\_RESULT\_CHAR**

This function is used to return the value of the bound OUT parameter of the **CHAR** array type and obtain the OUT parameter in a stored procedure.

The prototype of the **DBE\_SQL.GET\_ARRAY\_RESULT\_CHAR** function is as follows:

```
DBE_SQL.get_array_result_char(
  context_id IN int,
  pos      IN VARCHAR2,
  column_value INOUT anyarray
)
```

**Table 10-281** DBE\_SQL.GET\_ARRAY\_RESULT\_CHAR parameters

| Parameter    | Description                    |
|--------------|--------------------------------|
| context_id   | ID of the cursor to be queried |
| pos          | Name of the bound parameter    |
| column_value | Return value                   |

- **DBE\_SQL.GET\_ARRAY\_RESULT\_INT**

This function is used to return the value of the bound OUT parameter of the **INT** array type and obtain the OUT parameter in a stored procedure.

The prototype of the **DBE\_SQL.GET\_ARRAY\_RESULT\_INT** function is as follows:

```
DBE_SQL.get_array_result_int(
  context_id IN int,
  pos      IN VARCHAR2,
  column_value INOUT anyarray
)
```

**Table 10-282** DBE\_SQL.GET\_ARRAY\_RESULT\_INT parameters

| Parameter    | Description                    |
|--------------|--------------------------------|
| context_id   | ID of the cursor to be queried |
| pos          | Name of the bound parameter    |
| column_value | Return value                   |

- **DBE\_SQL.SQL\_SET\_TABLEOF\_RESULTS\_TYPE\_C**  
Dynamically defines a column of the tableof type. You are not advised to use it.

The prototype of the DBE\_SQL.SQL\_SET\_TABLEOF\_RESULTS\_TYPE\_C function is as follows:

```
DBE_SQL.SQL_SET_TABLEOF_RESULTS_TYPE_C(
  context_id IN int,
  pos      IN int,
  column_ref IN anyindexbytable,
  cnt      IN int,
  lower_bnd IN int,
  col_type IN anyelement,
  maxsize  IN int
) return integer;
```

**Table 10-283** DBE\_SQL.SQL\_SET\_TABLEOF\_RESULTS\_TYPE\_C parameters

| Parameter  | Description                                            |
|------------|--------------------------------------------------------|
| context_id | ID of the cursor to be queried                         |
| pos        | Position of a dynamically defined column in the query  |
| column_ref | Type of the returned array                             |
| cnt        | Number of values obtained at a time                    |
| lower_bnd  | Start subscript when an array is returned              |
| col_type   | Variable type corresponding to the returned array type |
| maxsize    | Maximum length of the defined type                     |

- **DBE\_SQL.SQL\_GET\_TABLEOF\_VALUES\_C**  
Reads a dynamically defined column value of the tableof type. You are not advised to use it.

The prototype of the DBE\_SQL.SQL\_GET\_TABLEOF\_VALUES\_C function is as follows:

```
DBE_SQL.SQL_GET_TABLEOF_VALUES_C(
  context_id IN int,
  pos IN int,
  results_type INOUT anyindexbytable,
  result_type IN anyelement
)return anyindexbytable;
```

**Table 10-284** DBE\_SQL.SQL\_GET\_TABLEOF\_VALUES\_C parameters

| Parameter    | Description                    |
|--------------|--------------------------------|
| context_id   | ID of the cursor to be queried |
| pos          | Parameter position             |
| results_type | Obtained result                |
| result_type  | Type of the obtained result    |

## Examples

```
-- Example 1
-- Create a table and insert data into the table.
CREATE TABLE test_desc_cols(
  id NUMBER,
  name VARCHAR2(50)
);
INSERT INTO test_desc_cols(id, name) VALUES (1, 'xiaoming');
INSERT INTO test_desc_cols(id, name) VALUES (2, 'xiaohong');
INSERT INTO test_desc_cols(id, name) VALUES (3, 'xiaolan');

DECLARE
context_id INTEGER;
col_cnt INTEGER;
v_id int;
v_name varchar2;
execute_ret INTEGER;
BEGIN
-- Open a cursor.
context_id := DBE_SQL.REGISTER_CONTEXT();
-- Compile the cursor.
DBE_SQL.SQL_SET_SQL(context_id, 'SELECT * FROM test_desc_cols', 2);
-- Set the return value type of a column.
DBE_SQL.SET_RESULT_TYPE(context_id, 1, v_id);
DBE_SQL.SET_RESULT_TYPE(context_id, 2, v_name);
execute_ret := DBE_SQL.SQL_RUN(context_id);

loop
exit when (DBE_SQL.NEXT_ROW(context_id) <= 0);
-- Obtain values.
DBE_SQL.GET_RESULT(context_id, 1, v_id);
DBE_SQL.GET_RESULT(context_id, 2, v_name);
-- Output the result.
dbe_output.print_line('id:' || v_id || ' name:' || v_name);
end loop;

DBE_SQL.SQL_UNREGISTER_CONTEXT(context_id);
END;
/

CREATE OR REPLACE PROCEDURE test_square(n NUMBER, square OUT NUMBER) IS
BEGIN
square := n * n;
END;
/
```

```
DECLARE
cur NUMBER;
query varchar(2000);
ret integer;
n NUMBER;
square Integer;
BEGIN
  n := 2;
  cur := DBE_SQL.REGISTER_CONTEXT();
  query := 'BEGIN test_square(:n_bnd, :square_bnd); END;';
  DBE_SQL.SQL_SET_SQL(cur, query, 2);
  DBE_SQL.SQL_BIND_VARIABLE(cur, 'n_bnd', n);
  DBE_SQL.SQL_BIND_VARIABLE(cur, 'square_bnd', square);
  ret := DBE_SQL.SQL_RUN(cur);
  DBE_SQL.GET_VARIABLE_RESULT(cur, 'square_bnd', square);
  DBE_OUTPUT.PRINT_LINE('square = ' || square);
  DBE_SQL.SQL_UNREGISTER_CONTEXT(cur);
END;
/

-- Example 2
-- Examples of executing DESCRIBE_COLUMNS, RUN_AND_NEXT, and LAST_ROW_COUNT
-- Create a stored procedure for printing column description information.
CREATE OR REPLACE PROCEDURE print_rec(
  rec in DBE_SQL.DESC_REC
)package AS
BEGIN
  raise INFO 'col_type      = %', rec.col_type;
  raise INFO 'col_name      = %', rec.col_name;
  raise INFO 'col_name_len   = %', rec.col_name_len;
END;
/

-- Verify functions.
DECLARE
context_id INTEGER;
col_cnt   INTEGER;
rec_tab   DBE_SQL.DESC_TAB;
excute_ret INTEGER;
nextrow_ret INTEGER;
last_row_count INTEGER;
BEGIN
  -- Open a cursor.
  context_id := DBE_SQL.REGISTER_CONTEXT();
  -- Compile the cursor.
  DBE_SQL.SQL_SET_SQL(context_id, 'SELECT * FROM test_desc_cols', 2);
  -- Print the column description information.
  DBE_SQL.DESCRIBE_COLUMNS(context_id, col_cnt, rec_tab);
  FOR var IN 1..col_cnt LOOP
    print_rec(rec_tab(var));
  END LOOP;
  -- Execute and obtain a row of data.
  excute_ret := DBE_SQL.RUN_AND_NEXT(context_id);
  -- Obtain a row of data.
  nextrow_ret := DBE_SQL.NEXT_ROW(context_id);
  -- Obtain the number of obtained data rows.
  last_row_count := DBE_SQL.LAST_ROW_COUNT;
  DBE_OUTPUT.PRINT_LINE('last_row_count = ' || last_row_count);
  DBE_SQL.SQL_UNREGISTER_CONTEXT(context_id);
END;
/
```

### 10.12.2.8 DBE\_FILE

The DBE\_FILE package provides the capabilities of reading and writing operating system text files for stored procedures.

## Precautions

- DBE\_FILE requires that files opened using DBE\_FILE.FOPEN be encoded using the database character set. If the opened files are not encoded using the expected character set, an encoding verification error occurs when DBE\_FILE.READ\_LINE is used to read files. DBE\_FILE requires that files opened using DBE\_FILE.FOPEN\_NCHAR be encoded using the UTF-8 character set. If the opened files are not encoded using the expected character set, an encoding verification error occurs when DBE\_FILE.READ\_LINE\_NCHAR is used to read files.
- When DBE\_OUTPUT.PUT\_LINE is used to print the result obtained by the DBE\_FILE.READ\_LINE\_NCHAR API, ensure that the UTF-8 character set encoding can be converted to the current database character set encoding. If the preceding conditions are met, the result can be properly output. DBE\_OUTPUT.PRINT\_LINE does not support this function.
- DBE\_FILE requires that the character set encoding of the client be the same as that of the database.
- If the database character set encoding format is ASCII and the client character set encoding format is Chinese, when the client calls DBE\_FILE.WRITE\_NCHAR or DBE\_FILE.WRITE\_LINE\_NCHAR to write Chinese content, the written content may be in UTF-8 encoding format. An error may be reported when the DBE\_FILE.READ\_LINE\_NCHAR is used.

## Data Types

- DBE\_FILE.FILE\_TYPE  
Defines the representation of files in the DBE\_FILE package. The fields in DBE\_FILE.FILE\_TYPE are private fields of the DBE\_FILE package. Do not change the field value of the type defined in DBE\_FILE.FILE\_TYPE.

```
CREATE TYPE DBE_FILE.FILE_TYPE AS(
  id INTEGER,
  datatype INTEGER,
  byte_mode BOOLEAN
);
```

**Table 10-285** DBE\_FILE.FILE\_TYPE columns

| Parameter | Description                                                                                                                                                                  |
|-----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| id        | File handle                                                                                                                                                                  |
| datatype  | File data type (CHAR, NCHAR, or binary). Currently, only CHAR and NCHAR files are supported. For a CHAR file, <b>1</b> is returned. For an NCHAR file, <b>2</b> is returned. |
| byte_mode | Indicates that the file is opened in binary mode ( <b>TRUE</b> ) or text mode ( <b>FALSE</b> ).                                                                              |

## API Description

**Table 10-286** lists all APIs supported by the **DBE\_FILE** package.

**Table 10-286** DBE\_FILE

| API                                         | Description                                                                                                                      |
|---------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">DBE_FILE.OPEN/DBE_FILE.F...</a> | Opens a file based on the specified directory and file name.                                                                     |
| <a href="#">DBE_FILE.IS_CLOSED</a>          | Checks whether a file is closed.                                                                                                 |
| <a href="#">DBE_FILE.IS_OPEN</a>            | Checks whether a file is opened.                                                                                                 |
| <a href="#">DBE_FILE.READ_LINE</a>          | Reads a line of a specified length from an open file.                                                                            |
| <a href="#">DBE_FILE.WRITE</a>              | Writes data to an open file.                                                                                                     |
| <a href="#">DBE_FILE.NEW_LINE</a>           | Writes one or more line terminators to an open file.                                                                             |
| <a href="#">DBE_FILE.WRITE_LINE</a>         | Writes data to an open file and automatically appends a line terminator.                                                         |
| <a href="#">DBE_FILE.FORMAT_WRITE</a>       | Writes formatted data to an open file. It is a DBE_FILE.WRITE API that allows formatting.                                        |
| <a href="#">DBE_FILE.GET_RAW</a>            | Reads RAW data from an open file.                                                                                                |
| <a href="#">DBE_FILE.PUT_RAW</a>            | Writes RAW data to an open file.                                                                                                 |
| <a href="#">DBE_FILE.FLUSH</a>              | Writes cached data to a physical file.                                                                                           |
| <a href="#">DBE_FILE.CLOSE</a>              | Closes an open file.                                                                                                             |
| <a href="#">DBE_FILE.CLOSE_ALL</a>          | Closes all files opened in a session.                                                                                            |
| <a href="#">DBE_FILE.REMOVE</a>             | Deletes a disk file. To perform this operation, you must have required permissions.                                              |
| <a href="#">DBE_FILE.RENAME</a>             | Renames a disk file, which is similar to the mv command of Unix.                                                                 |
| <a href="#">DBE_FILE.COPY</a>               | Copies data in a continuous area to a new file. If <b>start_line</b> and <b>end_line</b> are omitted, the entire file is copied. |
| <a href="#">DBE_FILE.GET_ATTR</a>           | Reads and returns the attributes of a disk file.                                                                                 |
| <a href="#">DBE_FILE.SEEK</a>               | Adjusts the position of a file pointer forward or backward based on the specified number of bytes.                               |
| <a href="#">DBE_FILE.GET_POSITION</a>       | Returns the current offset of a file, in bytes.                                                                                  |

| API                                         | Description                                                                                     |
|---------------------------------------------|-------------------------------------------------------------------------------------------------|
| <a href="#">DBE_FILE.FOPEN_NCHAR</a>        | Opens a file based on the specified directory and file name.                                    |
| <a href="#">DBE_FILE.WRITE_NCHAR</a>        | Writes data to an open file.                                                                    |
| <a href="#">DBE_FILE.WRITE_LINE_NCHAR</a>   | Writes data to an open file and automatically appends a line terminator.                        |
| <a href="#">DBE_FILE.FORMAT_WRITE_NCHAR</a> | Writes formatted data to an open file. It is a DBE_FILE.WRITE_NCHAR API that allows formatting. |
| <a href="#">DBE_FILE.READ_LINE_NCHAR</a>    | Reads a line of a specified length from an open file.                                           |

- DBE\_FILE.OPEN/DBE\_FILE.FOPEN**  
 Opens a file. You can specify the maximum line size. A maximum of 50 files can be opened in a session. This function returns a file handle of the INTEGER type. The function of DBE\_FILE.FOPEN is similar to that of DBE\_FILE.OPEN. It returns an object of the type defined in DBE\_FILE.FILE\_TYPE.

The prototype of the DBE\_FILE.OPEN function is as follows:

```
DBE_FILE.OPEN(
    dir          IN TEXT,
    file_name    IN TEXT,
    open_mode    IN TEXT,
    max_line_size IN INTEGER DEFAULT 1024)
RETURN INTEGER;

DBE_FILE.FOPEN(
    dir          IN TEXT,
    file_name    IN TEXT,
    open_mode    IN TEXT,
    max_line_size IN INTEGER DEFAULT 1024)
RETURN DBE_FILE.FILE_TYPE;
```

**Table 10-287** DBE\_FILE.OPEN/DBE\_FILE.FOPEN parameters

| Parameter | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| dir       | Directory of a file. It is a string, indicating an object name.<br><br><b>NOTE</b> <ul style="list-style-type: none"> <li>Location of the file directory, which needs to be added to system catalog <b>PG_DIRECTORY</b>. If the input path does not match the path in <b>PG_DIRECTORY</b>, an error indicating that the path does not exist is reported.</li> <li>When the GUC parameter <b>safe_data_path</b> is enabled, you can only use an advanced package to read and write files in the file path specified by <b>safe_data_path</b>.</li> </ul> |

| Parameter     | Description                                                                                                                                                                                                                                                                                                                                      |
|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| file_name     | File name with an extension (file type), excluding the path name. A path contained in a file name is ignored in the <b>OPEN</b> function. In Unix, the file name cannot end with the combination of a slash and a dot (/.).                                                                                                                      |
| open_mode     | Open mode of a specified file, including <b>r</b> (read text), <b>w</b> (write text), <b>a</b> (append text), <b>rb</b> (read byte), <b>wb</b> (write byte), and <b>ab</b> (append byte).<br><br><b>NOTE</b><br>For the write operation, the system checks the file type. If the ELF file is written, an error is reported and the system exits. |
| max_line_size | Maximum number of characters in each line, including newline characters. The minimum value is <b>1</b> and the maximum is <b>32767</b> . If this parameter is not specified, the default value <b>1024</b> is used.                                                                                                                              |

- DBE\_FILE.IS\_CLOSE

Checks whether a file is closed. A Boolean value is returned. If an invalid file handle is detected, the **INVALID\_FILEHANDLE** exception is thrown.

The prototype of the DBE\_FILE.IS\_CLOSE function is as follows:

```
DBE_FILE.IS_CLOSE(
  file IN INTEGER)
RETURN BOOLEAN;

DBE_FILE.IS_CLOSE(
  file IN DBE_FILE.FILE_TYPE)
RETURN BOOLEAN;
```

**Table 10-288** DBE\_FILE.IS\_CLOSE parameters

| Parameter | Description                                            |
|-----------|--------------------------------------------------------|
| file      | File handle or DBE_FILE.FILE_TYPE object to be checked |

- DBE\_FILE.IS\_OPEN

Checks whether a file is opened. A Boolean value is returned. If an invalid file handle is detected, the **INVALID\_FILEHANDLE** exception is thrown.

The prototype of the DBE\_FILE.IS\_OPEN function is as follows:

```
DBE_FILE.IS_OPEN(
  file IN INTEGER)
RETURN BOOLEAN;

DBE_FILE.IS_OPEN(
  file IN DBE_FILE.FILE_TYPE)
RETURN BOOLEAN;
```

**Table 10-289** DBE\_FILE.IS\_OPEN parameters

| Parameter | Description                                            |
|-----------|--------------------------------------------------------|
| file      | File handle or DBE_FILE.FILE_TYPE object to be checked |

- DBE\_FILE.READ\_LINE

Reads data from an open file and stores the read result to the buffer. It reads data to the end of each line excluding the line terminator, to the end of the file, or to the size specified by the **len** parameter. The length of the data to be read cannot exceed the value of **max\_line\_size** specified when the file is opened.

The prototype of the DBE\_FILE.READ\_LINE stored procedure is as follows:

```
DBE_FILE.READ_LINE(
  file IN INTEGER,
  buffer OUT TEXT,
  len IN INTEGER DEFAULT NULL);

DBE_FILE.READ_LINE(
  file IN DBE_FILE.FILE_TYPE,
  buffer OUT TEXT,
  len IN INTEGER DEFAULT NULL);
```

**Table 10-290** DBE\_FILE.READ\_LINE parameters

| Parameter | Description                                                                                                                                                                            |
|-----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| file      | File handle opened using OPEN or object of the DBE_FILE.FILE_TYPE type opened using FOPEN. The file must be opened in read mode. Otherwise, the INVALID_OPERATION exception is thrown. |
| buffer    | Buffer for receiving data.                                                                                                                                                             |
| len       | Number of bytes read from the file. The default value is <b>NULL</b> . If the default value <b>NULL</b> is used, <b>max_line_size</b> is used to specify the line size.                |

- DBE\_FILE.WRITE

Writes data in the buffer to a file. The file must be opened in write mode. This operation does not write a line terminator, and the return value is always **TRUE**.

The prototype of the **DBE\_FILE.WRITE** function is as follows:

```
DBE_FILE.WRITE(
  file IN INTEGER,
  buffer IN TEXT)
RETURN BOOLEAN;

DBE_FILE.WRITE(
  file IN DBE_FILE.FILE_TYPE,
  buffer IN TEXT)
RETURN VOID;
```

**Table 10-291** DBE\_FILE.WRITE parameters

| Parameter | Description                                                                                                                                                                                                                                                                                                                                                                                              |
|-----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| file      | File handle opened using OPEN or object of the DBE_FILE.FILE_TYPE type opened using FOPEN. The file must be opened in write mode. This operation does not write line terminators.                                                                                                                                                                                                                        |
| buffer    | Text data to be written to the file. The accumulated write length of each line cannot be greater than or equal to the value of <b>max_line_size</b> specified when OPEN or FOPEN is used. Otherwise, an error is reported when the file is refreshed.<br><b>NOTE</b><br>For the write operation, the system checks the file type. If the ELF file is written, an error is reported and the system exits. |

- DBE\_FILE.NEW\_LINE

Writes one or more line terminators to an open file. The line terminators are related to the platform used, and the return value is always **TRUE**.

The prototype of the **DBE\_FILE.NEW\_LINE** function is as follows:

```
DBE_FILE.NEW_LINE(
    file IN INTEGER,
    line_nums IN INTEGER DEFAULT 1)
RETURN BOOLEAN;

DBE_FILE.NEW_LINE(
    file IN DBE_FILE.FILE_TYPE,
    line_nums IN INTEGER DEFAULT 1)
RETURN VOID;
```

**Table 10-292** DBE\_FILE.NEW\_LINE parameters

| Parameter | Description                                                                                |
|-----------|--------------------------------------------------------------------------------------------|
| file      | File handle opened using OPEN or object of the DBE_FILE.FILE_TYPE type opened using FOPEN. |
| line_nums | Number of line terminators written to a file.                                              |

- DBE\_FILE.WRITE\_LINE

Writes data in the buffer to a file. The file must be opened in write mode. This operation automatically appends line terminators, and the return value is always **TRUE**.

The prototype of the **DBE\_FILE.WRITE\_LINE** function is as follows:

```
DBE_FILE.WRITE_LINE(
    file IN INTEGER,
    buffer IN TEXT,
    flush IN BOOLEAN DEFAULT FALSE)
RETURN BOOLEAN;

DBE_FILE.WRITE_LINE(
    file IN DBE_FILE.FILE_TYPE,
    buffer IN TEXT,
    flush IN BOOLEAN DEFAULT FALSE)
RETURN VOID;
```

**Table 10-293** DBE\_FILE.WRITE\_LINE parameters

| Parameter | Description                                                                                                                                                                                                                                                                                                                                                                                                                               |
|-----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| file      | File handle opened using OPEN or object of the DBE_FILE.FILE_TYPE type opened using FOPEN.                                                                                                                                                                                                                                                                                                                                                |
| buffer    | Text data to be written to the file. The length of each line (including the newline character) cannot be greater than the value of <b>max_line_size</b> specified when OPEN or FOPEN is executed or the default value. Otherwise, an error is reported when the file is refreshed.<br><br><b>NOTE</b><br>For the write operation, the system checks the file type. If the ELF file is written, an error is reported and the system exits. |
| flush     | Whether to flush data to disks after WRITE_LINE. The default value is <b>FALSE</b> .                                                                                                                                                                                                                                                                                                                                                      |

- DBE\_FILE.FORMAT\_WRITE

Writes formatted data to an open file. It is a DBE\_FILE.WRITE API that allows formatting. The return value is always **TRUE**.

The prototype of the **DBE\_FILE.FORMAT\_WRITE** function is as follows:

```
DBE_FILE.FORMAT_WRITE(
  file IN INTEGER,
  format IN TEXT,
  arg1 IN TEXT DEFAULT NULL,
  ...
  arg6 IN TEXT DEFAULT NULL)
RETURN BOOLEAN;

DBE_FILE.FORMAT_WRITE(
  file IN DBE_FILE.FILE_TYPE,
  format IN TEXT,
  arg1 IN TEXT DEFAULT NULL,
  ...
  arg6 IN TEXT DEFAULT NULL)
RETURN VOID;
```

**Table 10-294** DBE\_FILE.FORMAT\_WRITE parameters

| Parameter     | Description                                                                                                                                                                                                                                     |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| file          | File handle opened using OPEN or object of the DBE_FILE.FILE_TYPE type opened using FOPEN.                                                                                                                                                      |
| format        | Formatted string, containing the text and format characters \n and %s.                                                                                                                                                                          |
| [arg1. .arg6] | Six optional parameters. The parameters and the positions of characters to be formatted are in one-to-one correspondence. If the parameter corresponding to a character to be formatted is not provided, an empty string is used to replace %s. |

- **DBE\_FILE.GET\_RAW**  
Reads RAW data from an open file, stores the read result in the buffer, and returns the result from *r*.

The prototype of the DBE\_FILE.GET\_RAW stored procedure is as follows:

```
DBE_FILE.GET_RAW(
  file IN INTEGER,
  r OUT RAW,
  length IN INTEGER DEFAULT NULL);

DBE_FILE.GET_RAW(
  file IN DBE_FILE.FILE_TYPE,
  r OUT RAW,
  length IN INTEGER DEFAULT NULL);
```

**Table 10-295** DBE\_FILE.GET\_RAW parameters

| Parameter | Description                                                                                                                                                          |
|-----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| file      | File handle opened using OPEN or object of the DBE_FILE.FILE_TYPE type opened using FOPEN.                                                                           |
| r         | Buffer for receiving RAW data.                                                                                                                                       |
| length    | Number of bytes read from the file. The default value is <b>NULL</b> . If the value is <b>NULL</b> , the maximum length of the RAW type is used to specify the size. |

- **DBE\_FILE.PUT\_RAW**  
Writes RAW data to a file. The return value is always **TRUE**.

The prototype of the DBE\_FILE.PUT\_RAW function is as follows:

```
DBE_FILE.PUT_RAW (
  file IN INTEGER,
  r IN RAW,
  flush IN BOOLEAN DEFAULT FALSE)
RETURN BOOLEAN;

DBE_FILE.PUT_RAW (
  file IN DBE_FILE.FILE_TYPE,
  r IN RAW,
  flush IN BOOLEAN DEFAULT FALSE)
RETURN VOID;
```

**Table 10-296** DBE\_FILE.PUT\_RAW parameters

| Parameter | Description                                                                                                                                                                          |
|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| file      | File handle opened using OPEN or object of the DBE_FILE.FILE_TYPE type opened using FOPEN.                                                                                           |
| r         | RAW data to be written to a file.<br><b>NOTE</b><br>For the write operation, the system checks the file type. If the ELF file is written, an error is reported and the system exits. |

| Parameter | Description                                                                       |
|-----------|-----------------------------------------------------------------------------------|
| flush     | Whether to flush data to disks after PUT_RAW. The default value is <b>FALSE</b> . |

- DBE\_FILE.FLUSH

Writes cached data to a physical file. The cached data must have a line terminator.

The prototype of the DBE\_FILE.FLUSH function is as follows:

```
DBE_FILE.FLUSH(
  file IN INTEGER)
RETURN VOID;

DBE_FILE.FLUSH(
  file IN DBE_FILE.FILE_TYPE)
RETURN VOID;
```

**Table 10-297** DBE\_FILE.FLUSH parameters

| Parameter | Description                                                                                |
|-----------|--------------------------------------------------------------------------------------------|
| file      | File handle opened using OPEN or object of the DBE_FILE.FILE_TYPE type opened using FOPEN. |

- DBE\_FILE.CLOSE

Closes an open file. When this function is called, if there is cached data to be written, exception information may be received and the return value is always **TRUE**.

The prototype of the DBE\_FILE.CLOSE function is as follows:

```
DBE_FILE.CLOSE(
  file IN INTEGER)
RETURN BOOLEAN;

DBE_FILE.CLOSE(
  file IN DBE_FILE.FILE_TYPE)
RETURN BOOLEAN;
```

**Table 10-298** DBE\_FILE.CLOSE parameters

| Parameter | Description                                                                                |
|-----------|--------------------------------------------------------------------------------------------|
| file      | File handle opened using OPEN or object of the DBE_FILE.FILE_TYPE type opened using FOPEN. |

- DBE\_FILE.CLOSE\_ALL

Closes all file handles opened in a session. This function can be used for emergency cleanup.

The prototype of the DBE\_FILE.CLOSE\_ALL function is as follows:

```
DBE_FILE.CLOSE_ALL()
RETRUN VOID;
```

**Table 10-299** DBE\_FILE.CLOSE\_ALL parameters

| Parameter | Description |
|-----------|-------------|
| None      | None        |

- DBE\_FILE.REMOVE

Deletes a disk file. To use this function, you must have the required permission.

The prototype of the DBE\_FILE.REMOVE function is as follows:

```
DBE_FILE.REMOVE(
  dir      IN TEXT,
  file_name IN TEXT)
RETURN VOID;
```

**Table 10-300** DBE\_FILE.REMOVE parameters

| Parameter | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| dir       | Directory of a file. It is a string, indicating an object name.<br><b>NOTE</b> <ul style="list-style-type: none"> <li>• Location of the file directory, which needs to be added to system catalog <a href="#">PG_DIRECTORY</a>. If the input path does not match the path in <a href="#">PG_DIRECTORY</a>, an error indicating that the path does not exist is reported.</li> <li>• When the GUC parameter <b>safe_data_path</b> is enabled, you can only use an advanced package to operate files in the file path specified by <b>safe_data_path</b>.</li> </ul> |
| file_name | File name.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

- DBE\_FILE.RENAME

Renames a disk file. This function is similar to the mv command of Unix.

The prototype of the DBE\_FILE.RENAME function is as follows:

```
DBE_FILE.RENAME(
  src_dir      IN TEXT,
  src_file_name IN TEXT,
  dest_dir     IN TEXT,
  dest_file_name IN TEXT,
  overwrite    IN BOOLEAN DEFAULT FALSE)
RETURN VOID;
```

**Table 10-301** DBE\_FILE.RENAME parameters

| Parameter      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| src_dir        | Directory of the original file (case-sensitive)<br><b>NOTE</b> <ul style="list-style-type: none"> <li>Location of the file directory, which needs to be added to system catalog <b>PG_DIRECTORY</b>. If the input path does not match the path in <b>PG_DIRECTORY</b>, an error indicating that the path does not exist is reported.</li> <li>When the GUC parameter <b>safe_data_path</b> is enabled, you can only use an advanced package to operate files in the file path specified by <b>safe_data_path</b>.</li> </ul> |
| src_file_name  | Original file to be renamed                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| dest_dir       | Target directory (case-sensitive).<br><b>NOTE</b> <ul style="list-style-type: none"> <li>Location of the file directory, which needs to be added to system catalog <b>PG_DIRECTORY</b>. If the input path does not match the path in <b>PG_DIRECTORY</b>, an error indicating that the path does not exist is reported.</li> <li>When the GUC parameter <b>safe_data_path</b> is enabled, you can only use an advanced package to operate files in the file path specified by <b>safe_data_path</b>.</li> </ul>              |
| dest_file_name | New file name                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| overwrite      | Whether to overwrite the file. The default value is <b>FALSE</b> . If a file with the same name exists in the target directory, the file will not be overwritten.                                                                                                                                                                                                                                                                                                                                                            |

- DBE\_FILE.COPY

Copies data in a continuous area to a new file. If **start\_line** and **end\_line** are omitted, the entire file is copied.

The prototype of the DBE\_FILE.COPY function is as follows:

```
DBE_FILE.COPY(
  src_dir      IN TEXT,
  src_file_name IN TEXT,
  dest_dir     IN TEXT,
  dest_file_name IN TEXT,
  start_line   IN INTEGER DEFAULT 1,
  end_line     IN INTEGER DEFAULT NULL)
RETURN VOID;
```

**Table 10-302** DBE\_FILE.COPY parameters

| Parameter      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| src_dir        | Directory of the original file<br><b>NOTE</b> <ul style="list-style-type: none"> <li>Location of the file directory, which needs to be added to system catalog <b>PG_DIRECTORY</b>. If the input path does not match the path in <b>PG_DIRECTORY</b>, an error indicating that the path does not exist is reported.</li> <li>When the GUC parameter <b>safe_data_path</b> is enabled, you can only use an advanced package to operate files in the file path specified by <b>safe_data_path</b>.</li> </ul>    |
| src_file_name  | Original file                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| dest_dir       | Directory of the destination file<br><b>NOTE</b> <ul style="list-style-type: none"> <li>Location of the file directory, which needs to be added to system catalog <b>PG_DIRECTORY</b>. If the input path does not match the path in <b>PG_DIRECTORY</b>, an error indicating that the path does not exist is reported.</li> <li>When the GUC parameter <b>safe_data_path</b> is enabled, you can only use an advanced package to operate files in the file path specified by <b>safe_data_path</b>.</li> </ul> |
| dest_file_name | Target file<br><b>NOTE</b><br>For the write operation, the system checks the file type. If the ELF file is written, an error is reported and the system exits.                                                                                                                                                                                                                                                                                                                                                 |
| start_line     | Number of the line where the copy starts. The default value is <b>1</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| end_line       | Number of the line where the copy ends. The default value is <b>NULL</b> , indicating the end of the file.                                                                                                                                                                                                                                                                                                                                                                                                     |

- DBE\_FILE.GET\_ATTR

Reads and returns the attributes of a disk file.

The prototype of the DBE\_FILE.GET\_ATTR stored procedure is as follows:

```
DBE_FILE.GET_ATTR(
  location IN TEXT,
  filename IN TEXT,
  fexists OUT BOOLEAN,
  file_length OUT BIGINT,
  block_size OUT INTEGER);
```

**Table 10-303** DBE\_FILE.GET\_ATTR parameters

| Parameter   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| location    | File directory<br><b>NOTE</b> <ul style="list-style-type: none"> <li>Location of the file directory, which needs to be added to system catalog <b>PG_DIRECTORY</b>. If the input path does not match the path in <b>PG_DIRECTORY</b>, an error indicating that the path does not exist is reported.</li> <li>When the GUC parameter <b>safe_data_path</b> is enabled, you can only use an advanced package to operate files in the file path specified by <b>safe_data_path</b>.</li> </ul> |
| filename    | File name.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| fexists     | Whether the file exists.                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| file_length | File length (unit: byte). If the file does not exist, <b>NULL</b> is returned.                                                                                                                                                                                                                                                                                                                                                                                                              |
| block_size  | Block size of the file system (unit: byte). If the file does not exist, <b>NULL</b> is returned.                                                                                                                                                                                                                                                                                                                                                                                            |

- DBE\_FILE.SEEK

Adjusts the position of a file pointer forward or backward based on the specified number of bytes.

The prototype of the **DBE\_FILE.SEEK** function is as follows:

```
DBE_FILE.SEEK(
    file      IN INTEGER,
    absolute_start IN BIGINT DEFAULT NULL,
    relative_start IN BIGINT DEFAULT NULL)
RETURN VOID;

DBE_FILE.SEEK(
    file      IN DBE_FILE.FILE_TYPE,
    absolute_start IN BIGINT DEFAULT NULL,
    relative_start IN BIGINT DEFAULT NULL)
RETURN VOID;
```

**Table 10-304** DBE\_FILE.SEEK parameters

| Parameter      | Description                                                                                                                                                                                                                                                            |
|----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| file           | File handle opened using OPEN or object of the DBE_FILE.FILE_TYPE type opened using FOPEN.                                                                                                                                                                             |
| absolute_start | Absolute offset of a file. The default value is <b>NULL</b> .                                                                                                                                                                                                          |
| relative_start | Relative offset of a file. A positive number indicates forward offset and a negative number indicates backward offset. The default value is <b>NULL</b> . If both <b>absolute_start</b> and this parameter are specified, the <b>absolute_start</b> parameter is used. |

- DBE\_FILE.GET\_POS

Returns the current offset of the file in bytes.

The prototype of the DBE\_FILE.FGETPOS function is as follows:

```
DBE_FILE.GET_POS(
  file IN INTEGER)
RETURN BIGINT;

DBE_FILE.GET_POS(
  file IN DBE_FILE.FILE_TYPE)
RETURN BIGINT;
```

**Table 10-305** DBE\_FILE.GET\_POS parameters

| Parameter | Description                                                                                |
|-----------|--------------------------------------------------------------------------------------------|
| file      | File handle opened using OPEN or object of the DBE_FILE.FILE_TYPE type opened using FOPEN. |

- DBE\_FILE.FOPEN\_NCHAR

Opens a file. You can specify the maximum line size. A maximum of 50 files can be opened in a session. This function returns a file handle of the DBE\_FILE.FILE\_TYPE type. This function opens a file in national character set mode for input or output.

The prototype of the DBE\_FILE.FOPEN\_NCHAR function is as follows:

```
DBE_FILE.FOPEN_NCHAR(
  dir      IN TEXT,
  file_name IN TEXT,
  open_mode IN TEXT,
  max_line_size IN INTEGER DEFAULT 1024)
RETURN DBE_FILE.FILE_TYPE;
```

**Table 10-306** DBE\_FILE.FOPEN\_NCHAR parameters

| Parameter | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| dir       | Directory of a file. It is a string, indicating an object name.<br><b>NOTE</b> <ul style="list-style-type: none"> <li>• Location of the file directory, which needs to be added to system catalog <b>PG_DIRECTORY</b>. If the input path does not match the path in <b>PG_DIRECTORY</b>, an error indicating that the path does not exist is reported.</li> <li>• When the GUC parameter <b>safe_data_path</b> is enabled, you can only use an advanced package to read and write files in the file path specified by <b>safe_data_path</b>.</li> </ul> |
| file_name | File name with an extension (file type), excluding the path name. A path contained in a file name is ignored in the <b>FOPEN_NCHAR</b> function. In Unix, the file name cannot end with the combination of a slash and a dot (/.).                                                                                                                                                                                                                                                                                                                      |

| Parameter     | Description                                                                                                                                                                                                                                                                                                                                      |
|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| open_mode     | Open mode of a specified file, including <b>r</b> (read text), <b>w</b> (write text), <b>a</b> (append text), <b>rb</b> (read byte), <b>wb</b> (write byte), and <b>ab</b> (append byte).<br><br><b>NOTE</b><br>For the write operation, the system checks the file type. If the ELF file is written, an error is reported and the system exits. |
| max_line_size | Maximum number of characters in each line, including newline characters. The minimum value is <b>1</b> and the maximum is <b>32767</b> . If this parameter is not specified, the default value <b>1024</b> is used.                                                                                                                              |

- DBE\_FILE.WRITE\_NCHAR

Writes data in the buffer to a file. The file must be opened in national character set or write mode. This operation does not write a line terminator, and the return value is always **TRUE**. The text string is written in the UTF8 character set format.

The prototype of the DBE\_FILE.WRITE\_NCHAR function is as follows:

```
DBE_FILE.WRITE_NCHAR(
    file IN DBE_FILE.FILE_TYPE,
    buffer IN NVARCHAR2)
RETURN VOID;
```

**Table 10-307** DBE\_FILE.WRITE parameters

| Parameter | Description                                                                                                                                                                                                                                                                                                                                                                                              |
|-----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| file      | Object of the DBE_FILE.FILE_TYPE type opened using FOPEN_NCHAR. The file must be opened in write mode. This operation does not write line terminators.                                                                                                                                                                                                                                                   |
| buffer    | Text data to be written to the file. The accumulated write length of each line cannot be greater than or equal to the value of <b>max_line_size</b> specified by <b>FOPEN_NCHAR</b> . Otherwise, an error is reported when the file is refreshed.<br><br><b>NOTE</b><br>For the write operation, the system checks the file type. If the ELF file is written, an error is reported and the system exits. |

- DBE\_FILE.WRITE\_LINE\_NCHAR

Writes data in the buffer to a file. The file must be opened in national character set or write mode. This operation automatically appends line terminators, and the return value is always **TRUE**. The text string is written in the UTF8 character set format.

The prototype of the DBE\_FILE.WRITE\_LINE\_NCHAR function is as follows:

```
DBE_FILE.WRITE_LINE_NCHAR(
    file IN DBE_FILE.FILE_TYPE,
    buffer IN NVARCHAR2)
RETURN VOID;
```

**Table 10-308** DBE\_FILE.WRITE\_LINE parameters

| Parameter | Description                                                                                                                                                                                                                                                                                                                                                                                                                      |
|-----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| file      | Object of the DBE_FILE.FILE_TYPE type opened using FOPEN_NCHAR.                                                                                                                                                                                                                                                                                                                                                                  |
| buffer    | Text data to be written to the file. The length of each line (including the newline character) cannot be greater than the value of <b>max_line_size</b> specified by <b>FOPEN_NCHAR</b> or the default value. Otherwise, an error is reported when the file is refreshed.<br><br><b>NOTE</b><br>For the write operation, the system checks the file type. If the ELF file is written, an error is reported and the system exits. |

- DBE\_FILE.FORMAT\_WRITE\_NCHAR

Writes formatted data to an open file. It is a DBE\_FILE.WRITE\_NCHAR API that allows formatting. The return value is always **TRUE**.

The prototype of the DBE\_FILE.FORMAT\_WRITE\_NCHAR function is as follows:

```
DBE_FILE.FORMAT_WRITE_NCHAR(
    file IN DBE_FILE.FILE_TYPE,
    format IN NVARCHAR2,
    arg1 IN NVARCHAR2 DEFAULT NULL,
    . . .
    arg5 IN NVARCHAR2 DEFAULT NULL)
RETURN VOID;
```

**Table 10-309** DBE\_FILE.FORMAT\_WRITE\_NCHAR parameters

| Parameter         | Description                                                                                                                                                                                                                                      |
|-------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| file              | Object of the DBE_FILE.FILE_TYPE type opened using FOPEN_NCHAR.                                                                                                                                                                                  |
| format            | Formatted string, containing the text and format characters \n and %s.                                                                                                                                                                           |
| [arg1 . . . arg5] | Five optional parameters. The parameters and the positions of characters to be formatted are in one-to-one correspondence. If the parameter corresponding to a character to be formatted is not provided, an empty string is used to replace %s. |

- DBE\_FILE.READ\_LINE\_NCHAR

Reads data from an open file and stores the read result to the buffer. It reads data to the end of each line excluding the line terminator, to the end of the file, or to the size specified by the **len** parameter. The length of the data to be read cannot exceed the value of **max\_line\_size** specified by **FOPEN\_NCHAR**.

The prototype of the DBE\_FILE.READ\_LINE\_NCHAR stored procedure is as follows:

```
DBE_FILE.READ_LINE_NCHAR(
    file IN DBE_FILE.FILE_TYPE,
    buffer OUT NVARCHAR2,
    len IN INTEGER DEFAULT NULL);
```

**Table 10-310** DBE\_FILE.READ\_LINE parameters

| Parameter | Description                                                                                                                                                             |
|-----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| file      | Object of the DBE_FILE.FILE_TYPE type opened using FOPEN_NCHAR. The file must be opened in read mode. Otherwise, the INVALID_OPERATION exception is thrown.             |
| buffer    | Buffer for receiving data.                                                                                                                                              |
| len       | Number of bytes read from the file. The default value is <b>NULL</b> . If the default value <b>NULL</b> is used, <b>max_line_size</b> is used to specify the line size. |

## Examples

```
-- Add the /temp/ directory to the PG_DIRECTORY system catalog as a system administrator.
CREATE OR REPLACE DIRECTORY dir AS '/tmp/';
-- Open a file and write data into the file.

DECLARE
f DBE_FILE.FILE_TYPE;
buffer VARCHAR2;
BEGIN
-- Write a file.
f := DBE_FILE.FOPEN('dir', 'sample.txt', 'w');
DBE_FILE.WRITE(f, 'A');
DBE_FILE.WRITE(f, 'B');
DBE_FILE.WRITE(f, 'C');
DBE_FILE.NEW_LINE(f);
DBE_FILE.WRITE_LINE(f, 'ABC');
DBE_FILE.FORMAT_WRITE(f, '[1 -> %s, 2 -> %s]\n', 'GaussDB', 'DBE_FILE');
DBE_FILE.CLOSE(f);
-- Read a file.
f := DBE_FILE.FOPEN('dir', 'sample.txt', 'r');
DBE_FILE.READ_LINE(f, buffer); -- ABC
DBE_FILE.READ_LINE(f, buffer); -- ABC
DBE_FILE.READ_LINE(f, buffer); -- [1 -> GaussDB, 2 -> DBE_FILE]
DBE_OUTPUT.PRINT_LINE(buffer);
DBE_FILE.CLOSE(f);
END;
/

-- Offset the position of the file handle and obtain the current position of the file.
DECLARE
f DBE_FILE.FILE_TYPE;
buffer VARCHAR2;
pos BIGINT;
BEGIN
-- Read a file.
f := DBE_FILE.FOPEN('dir', 'sample.txt', 'r');
DBE_FILE.SEEK(f, 8);
DBE_FILE.READ_LINE(f, buffer); -- [1 -> GaussDB, 2 -> DBE_FILE]
DBE_OUTPUT.PRINT_LINE(buffer);
pos := DBE_FILE.GET_POS(f); -- 38
DBE_OUTPUT.PRINT_LINE(pos);
DBE_FILE.CLOSE(f);
END;
/

-- NCHAR read/write API cases
DECLARE
f DBE_FILE.FILE_TYPE;
buffer NVARCHAR2;
BEGIN
-- Write a file.
```

```
f := DBE_FILE.FOPEN_NCHAR('dir', 'sample02.txt', 'w');
DBE_FILE.WRITE_NCHAR(f, 'A');
DBE_FILE.WRITE_NCHAR(f, 'B');
DBE_FILE.WRITE_NCHAR(f, 'C');
DBE_FILE.NEW_LINE(f);
DBE_FILE.WRITE_LINE_NCHAR(f, 'ABC');
DBE_FILE.FORMAT_WRITE_NCHAR(f, '[1 -> %s, 2 -> %s]\n', 'GaussDB', 'DBE_FILE');
DBE_FILE.CLOSE(f);
-- Read a file.
f := DBE_FILE.FOPEN_NCHAR('dir', 'sample02.txt', 'r');
DBE_FILE.READ_LINE_NCHAR(f, buffer); -- ABC
DBE_FILE.READ_LINE_NCHAR(f, buffer); -- ABC
DBE_FILE.READ_LINE_NCHAR(f, buffer); -- [1 -> GaussDB, 2 -> DBE_FILE]
DBE_OUTPUT.PRINT_LINE(buffer);
DBE_FILE.CLOSE(f);
END;
/
```

### 10.12.2.9 DBE\_UTILITY

#### Interface Description

[Table 10-311](#) provides all interfaces supported by the **DBE\_UTILITY** package.

**Table 10-311** DBE\_UTILITY

| Interface                                           | Description                                                                                                                                                                                                          |
|-----------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">DBE_UTILITY.FORMAT_ERROR_BACK TRACE</a> | Outputs the call stack of an abnormal stored procedure.                                                                                                                                                              |
| <a href="#">DBE_UTILITY.FORMAT_ERROR_STACK</a>      | Outputs detailed information about a stored procedure exception.                                                                                                                                                     |
| <a href="#">DBE_UTILITY.FORMAT_CALL_STACK</a>       | Outputs the call stack of a stored procedure.                                                                                                                                                                        |
| <a href="#">DBE_UTILITY.GET_TIME</a>                | Outputs the current time, which is used to obtain the execution duration.                                                                                                                                            |
| <a href="#">DBE_UTILITY.COMPILE_SCHEMA</a>          | Recompiles the PL/SQL packages and functions (except the packages and functions provided by the system) under a specified schema. This package has been discarded. <b>pkg_util.gs_compile_schema</b> is recommended. |
| <a href="#">DBE_UTILITY.CANONICALIZE</a>            | Canonicalizes the character string of a table name.                                                                                                                                                                  |
| <a href="#">DBE_UTILITY.COMMA_TO_TABLE</a>          | Converts a comma-delimited string of names into a PL/SQL table of names.                                                                                                                                             |
| <a href="#">DBE_UTILITY.DB_VERSION</a>              | Returns the version number and compatibility version number of the database.                                                                                                                                         |

| Interface                                        | Description                                                                                                                   |
|--------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">DBE_UTILITY.EXEC_DDL_STATEMENT</a>   | Executes DDL statements entered by users.                                                                                     |
| <a href="#">DBE_UTILITY.EXPAND_SQL_TEXT_PROC</a> | Expands the view of the SQL query.                                                                                            |
| <a href="#">DBE_UTILITY.GET_CPU_TIME</a>         | Returns the measured value of the current CPU processing time.                                                                |
| <a href="#">DBE_UTILITY.GET_ENDIANNESS</a>       | Obtains the big-endian and little-endian information of the byte order on the platform where the database is located.         |
| <a href="#">DBE_UTILITY.GET_HASH_VALUE</a>       | Returns the hash value of a given string.                                                                                     |
| <a href="#">DBE_UTILITY.GET_SQL_HASH</a>         | Outputs the hash value of a given string. This stored procedure is used when <b>proc_outparam_override</b> is not enabled.    |
| <a href="#">DBE_UTILITY.IS_BIT_SET</a>           | Checks whether parameter <b>n</b> exists in <b>r</b> .                                                                        |
| <a href="#">DBE_UTILITY.IS_CLUSTER_DATABASE</a>  | Determines whether the current database is running in database cluster mode.                                                  |
| <a href="#">DBE_UTILITY.NAME_RESOLVE</a>         | Parses the given object name, including synonym translation and necessary authorization checks.                               |
| <a href="#">DBE_UTILITY.NAME_TOKENIZE</a>        | Parses the name in the <b>a [ . b [ . c ] ] [ @ dblink ]</b> format.                                                          |
| <a href="#">DBE_UTILITY.OLD_CURRENT_SCHEMA</a>   | Returns the name of the database schema in the current user environment.                                                      |
| <a href="#">DBE_UTILITY.OLD_CURRENT_USER</a>     | Returns the name of the current user.                                                                                         |
| <a href="#">DBE_UTILITY.TABLE_TO_COMMA</a>       | Converts a PL/SQL table of names into a comma-delimited string of names.                                                      |
| <a href="#">DBE_UTILITY.GET_SQL_HASH_FUNC</a>    | Equivalent to <a href="#">DBE_UTILITY.GET_SQL_HASH</a> . This function is used when <b>proc_outparam_override</b> is enabled. |
| <a href="#">DBE_UTILITY.EXPAND_SQL_TEXT</a>      | This is an internal function and is not recommended.                                                                          |
| <a href="#">DBE_UTILITY.CANONICALIZE_RET</a>     | This is an internal function and is not recommended.                                                                          |

| Interface                                      | Description                                          |
|------------------------------------------------|------------------------------------------------------|
| DBEUTILITY.COMMA_TO_TABLE_FUN                  | This is an internal function and is not recommended. |
| DBEUTILITY.COMPILE_SCHEMA                      | This is an internal function and is not recommended. |
| DBEUTILITY.NAME_SEPARATE                       | This is an internal function and is not recommended. |
| DBEUTILITY.NAME_TOKENIZE_FUNC                  | This is an internal function and is not recommended. |
| DBEUTILITY.NAME_TOKENIZE_LOWER                 | This is an internal function and is not recommended. |
| DBEUTILITY.NAME_TOKENIZE_LOWER_FUNC            | This is an internal function and is not recommended. |
| DBEUTILITY.PRIVILEGE_CHECK                     | This is an internal function and is not recommended. |
| DBEUTILITY.SEARCH_CLASS_WITH_NSPOID_ONAME_TYPE | This is an internal function and is not recommended. |
| DBEUTILITY.SEARCH_OBJECTS                      | This is an internal function and is not recommended. |
| DBEUTILITY.SEARCH_OBJECTS_SYNONYM_FILL_SEHEMA  | This is an internal function and is not recommended. |
| DBEUTILITY.SEARCH_PROCEDURE_WITH_NSPOID_ONAME  | This is an internal function and is not recommended. |
| DBEUTILITY.SEARCH_SYNONYM_WITH_NSPOID_ONAME    | This is an internal function and is not recommended. |
| DBEUTILITY.TABLE_TO_COMMA_FUNC                 | This is an internal function and is not recommended. |
| DBEUTILITY.USER_NAME                           | This is an internal function and is not recommended. |

- DBEUTILITY.FORMAT\_ERROR\_BACKTRACE**

Returns the call stack where an error occurs during execution. The prototype of the DBEUTILITY.FORMAT\_ERROR\_BACKTRACE function is as follows:

```
DBEUTILITY.FORMAT_ERROR_BACKTRACE()
RETURN TEXT;
```
- DBEUTILITY.FORMAT\_ERROR\_STACK**

Returns the detailed information about the error location when an error occurs during the execution. The prototype of the DBEUTILITY.FORMAT\_ERROR\_STACK function is as follows:

```
DBEUTILITY.FORMAT_ERROR_STACK()
RETURN TEXT;
```

- DBEUTILITY.FORMAT\_CALL\_STACK**

Sets the call stack of the output function. The prototype of the DBEUTILITY.FORMAT\_CALL\_STACK function is as follows:

```
DBEUTILITY.FORMAT_CALL_STACK()
RETURN TEXT;
```
- DBEUTILITY.COMPILE\_SCHEMA**

Recompiles the PL/SQL packages and functions (except the packages and functions provided by the system) under a specified schema. The prototype of the DBEUTILITY.COMPILE\_SCHEMA function is as follows:

```
DBEUTILITY.COMPILE_SCHEMA (
SCHEMA IN VARCHAR2,
COMPILE_ALL IN BOOLEAN DEFAULT TRUE,
REUSE_SETTINGS IN BOOLEAN DEFAULT FALSE
)
RETURNS VOID;
```

For details about the example, see the usage of the pkg\_util.utility\_compile\_schema function in 11.12.1.2. To call the schema, run the following command:  
call DBEUTILITY.compile\_schema('pkg\_var\_test');
- DBEUTILITY.GET\_TIME**

Sets the output time, which is usually used for difference. A separate return value is meaningless. The prototype of the DBEUTILITY.GET\_TIME function is as follows:

```
DBEUTILITY.GET_TIME()
RETURN BIGINT;
```
- DBEUTILITY.CANONICALIZE**

Canonicalizes the character string of a table name. The procedure handles a single reserved word or keyword, and removes white spaces for a single identifier so that "table" becomes TABLE. The prototype of the DBEUTILITY.CANONICALIZE function is as follows:

```
DBEUTILITY.CANONICALIZE(
name IN VARCHAR2,
canon_name OUT VARCHAR2,
canon_len IN BINARY_INTEGER
);
```

**Table 10-312** DBEUTILITY.CANONICALIZE parameters

| Parameter  | Description                                                                                                                                                                                                         |
|------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| name       | Character string to be canonicalized.                                                                                                                                                                               |
| canon_name | Canonicalized character string.                                                                                                                                                                                     |
| canon_len  | Length of the string to be canonicalized, in bytes. If the value of this parameter is less than the actual length (in bytes) of the character string to be standardized, the character string is truncated by byte. |

- DBEUTILITY.COMMA\_TO\_TABLE**

Converts a comma-delimited string of names into a PL/SQL table of names. The prototype of the DBEUTILITY.COMMA\_TO\_TABLE function is as follows:

```
DBE_UTILITY.COMMA_TO_TABLE (
  list IN VARCHAR2,
  tablen OUT BINARY_INTEGER,
  tab OUT uncl_array
);
```

**Table 10-313** DBE\_UTILITY.COMMA\_TO\_TABLE parameters

| Parameter | Description                                      |
|-----------|--------------------------------------------------|
| list      | A comma-delimited string of names.               |
| tablen    | Number of names in the PL/SQL table.             |
| tab       | PL/SQL table which contains the string of names. |

- DBE\_UTILITY.DB\_VERSION

Returns the version number and compatibility version number of the database. The prototype of the DBE\_UTILITY.DB\_VERSION function is as follows:

```
DBE_UTILITY.DB_VERSION (
  version OUT VARCHAR2
);
```

**Table 10-314** DBE\_UTILITY.DB\_VERSION parameters

| Parameter | Description                                                                                                |
|-----------|------------------------------------------------------------------------------------------------------------|
| version   | Output parameter, which indicates the internal database software version. The value is a character string. |

- DBE\_UTILITY.EXEC\_DDL\_STATEMENT

Executes DDL statements entered by users. DBE\_UTILITY. The prototype of the EXEC\_DDL\_STATEMENT function is as follows:

```
DBE_UTILITY.EXEC_DDL_STATEMENT (
  parse_string IN VARCHAR2
);
```

**Table 10-315** DBE\_UTILITY.EXEC\_DDL\_STATEMENT parameters

| Parameter    | Description                    |
|--------------|--------------------------------|
| parse_string | DDL statements to be executed. |

- DBE\_UTILITY.EXPAND\_SQL\_TEXT\_PROC

Expands the view of the SQL query. It recursively expands the view objects in the view until a table is displayed. The function prototype of DBE\_UTILITY.EXPAND\_SQL\_TEXT\_PROC is as follows:

```
DBE_UTILITY.EXPAND_SQL_TEXT_PROC (
  input_sql_text IN CLOB,
```

```
output_sql_text OUT NOCOPY CLOB
);
```

**Table 10-316** DBEUTILITY.EXPAND\_SQL\_TEXT\_PROC parameters

| Parameter       | Description                           |
|-----------------|---------------------------------------|
| input_sql_text  | Input SQL text.                       |
| output_sql_text | Output SQL text of the expanded view. |

 **NOTE**

In the **input\_sql\_text** parameter entered by a user, a schema prefix must be added to the object in the SQL statement. Otherwise, the function reports an error indicating that no object is found. If **set behavior\_compat\_options** is set to **bind\_procedure\_searchpath**, you do not need to forcibly specify the schema prefix.

- **DBEUTILITY.GET\_CPU\_TIME**

Returns the measured value of the current CPU processing time, in hundredths of a second. The prototype of the DBEUTILITY.GET\_CPU\_TIME function is as follows:

```
DBEUTILITY.GET_CPU_TIME()
RETURN NUMBER;
```

- **DBEUTILITY.GET\_ENDIANNES**

Obtains the big-endian and little-endian information of the byte order on the platform where the database is located. The prototype of the DBEUTILITY.GET\_ENDIANNES function is as follows:

```
DBEUTILITY.GET_ENDIANNES
RETURN INTEGER;
```

- **DBEUTILITY.GET\_HASH\_VALUE**

Returns the hash value of a given string. The prototype of the DBEUTILITY.GET\_HASH\_VALUE function is as follows:

```
DBEUTILITY.GET_HASH_VALUE(
  name   IN VARCHAR2(n),
  base   IN INTEGER,
  hash_size IN INTEGER)
RETURN INTEGER;
```

**Table 10-317** DBEUTILITY.GET\_HASH\_VALUE parameters

| Parameter | Description                                         |
|-----------|-----------------------------------------------------|
| name      | Character string to be hashed.                      |
| base      | Start value of the returned hash value.             |
| hash_size | Size of the hash table to which the hash is mapped. |

- **DBEUTILITY.GET\_SQL\_HASH**

Outputs the hash value of a given character string using the MD5 algorithm. The prototype of the DBE\_UTILITY.GET\_SQL\_HASH function is as follows:

```
DBE_UTILITY.GET_SQL_HASH(
  name    IN VARCHAR2,
  hash    OUT RAW,
  last4bytes OUT BIGINT
);
```

**Table 10-318** DBE\_UTILITY.GET\_SQL\_HASH parameters

| Parameter  | Description                                                                       |
|------------|-----------------------------------------------------------------------------------|
| name       | Character string to be hashed.                                                    |
| hash       | Complete hexadecimal MD5 hash value.                                              |
| last4bytes | Last four bytes of the MD5 hash value, which is displayed as an unsigned integer. |

 **NOTE**

After setting **set behavior\_compat\_options** to a value other than **proc\_outparam\_override**, call the DBE\_UTILITY.GET\_SQL\_HASH function. If DBE\_UTILITY.GET\_SQL\_HASH\_FUNC is called, the value assignment fails.

- **DBE\_UTILITY.IS\_BIT\_SET**

Checks whether parameter **n** exists in **r**. The prototype of the DBE\_UTILITY.IS\_BIT\_SET function is as follows:

```
DBE_UTILITY.IS_BIT_SET (
  r IN RAW,
  n IN INTEGER)
RETURN INTEGER;
```

**Table 10-319** DBE\_UTILITY.IS\_BIT\_SET parameters

| Parameter | Description                                               |
|-----------|-----------------------------------------------------------|
| r         | 4 bytes plus the actual hexadecimal string.               |
| n         | Determines whether the value exists in the binary system. |

- **DBE\_UTILITY.IS\_CLUSTER\_DATABASE**

Determines whether the current database is running in database cluster mode. The prototype of the DBE\_UTILITY.IS\_CLUSTER\_DATABASE function is as follows:

```
DBE_UTILITY.IS_CLUSTER_DATABASE
RETURN BOOLEAN;
```

- **DBE\_UTILITY.NAME\_RESOLVE**

Parses the given object name, including synonym translation and necessary authorization checks. The prototype of the DBE\_UTILITY.NAME\_RESOLVE function is as follows:

```
DBE_UTILITY.NAME_RESOLVE (
  name      IN  VARCHAR2,
  context   IN  INTEGER,
  schema    OUT VARCHAR2,
  part1     OUT VARCHAR2,
  part2     OUT VARCHAR2,
  dblink    OUT VARCHAR2,
  part1_type OUT INTEGER,
  object_number OUT OID
);
```

**Table 10-320** DBE\_UTILITY.NAME\_RESOLVE parameters

| Parameter     | Description                                                                                                                                                                                                            |
|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| name          | Name of the object to be parsed. The structure is [[a.]b.]c[@d].                                                                                                                                                       |
| context       | Start value of the returned hash value.                                                                                                                                                                                |
| schema        | Schema of an object.                                                                                                                                                                                                   |
| part1         | First part of the name. The type of this column is specified by <b>part1_type</b> .                                                                                                                                    |
| part2         | If this column is not empty, the value is the subprogram name.                                                                                                                                                         |
| dblink        | Database link.                                                                                                                                                                                                         |
| part1_type    | Part 1 types: <ul style="list-style-type: none"> <li>● 5: synonym</li> <li>● 7: procedure (top level)</li> <li>● 8: function (top level)</li> <li>● 9: package</li> </ul>                                              |
| object_number | Object ID. In database A, <b>object_number</b> is of the numeric type, indicating the object ID. In GaussDB, <b>object_number</b> is of the OID type and does not support implicit conversion from a number to an OID. |

- DBE\_UTILITY.NAME\_TOKENIZE

Parses names in the **a [ . b [ . c ] ] [ @ dblink ]** format. If a name contains double quotation marks, the double quotation marks are deleted. Otherwise, the name becomes uppercase letters. The prototype of the DBE\_UTILITY.NAME\_TOKENIZE function is as follows:

```
DBE_UTILITY.NAME_TOKENIZE (
  name      IN  VARCHAR2,
  a         OUT VARCHAR2,
  b         OUT VARCHAR2,
  c         OUT VARCHAR2,
  dblink    OUT VARCHAR2,
  nextpos  OUT INTEGER
);
```

**Table 10-321** DBE\_UTILITY.NAME\_TOKENIZE parameters

| Parameter | Description                                                                  |
|-----------|------------------------------------------------------------------------------|
| name      | Name, consisting of SQL identifiers (for example, <b>scott.foo@dblink</b> ). |
| a         | First token of the name.                                                     |
| b         | Second token of the name.                                                    |
| c         | Third token of the name.                                                     |
| dblink    | Database link.                                                               |
| nextpos   | Next position of a parsed character string.                                  |

- **DBE\_UTILITY.OLD\_CURRENT\_SCHEMA**

Returns the name of the database schema in the current user environment. The prototype of the DBE\_UTILITY.OLD\_CURRENT\_SCHEMA function is as follows:

```
DBE_UTILITY.OLD_CURRENT_SCHEMA()
RETURN VARCHAR;
```

- **DBE\_UTILITY.OLD\_CURRENT\_USER**

Returns the name of the current user. The prototype of the DBE\_UTILITY.OLD\_CURRENT\_USER function is as follows:

```
DBE_UTILITY.OLD_CURRENT_USER()
RETURN VARCHAR2;
```

- **DBE\_UTILITY.TABLE\_TO\_COMMA**

Converts a PL/SQL table of names into a comma-delimited string of names. The prototype of the DBE\_UTILITY.TABLE\_TO\_COMMA function is as follows:

```
DBE_UTILITY.TABLE_TO_COMMA (
  tab IN UNCL_ARRAY,
  tablen OUT BINARY_INTEGER,
  list OUT VARCHAR2
);
```

**Table 10-322** DBE\_UTILITY.TABLE\_TO\_COMMA parameters

| Parameter | Description                                      |
|-----------|--------------------------------------------------|
| tab       | PL/SQL table which contains the string of names. |
| tablen    | Number of names in the PL/SQL table.             |
| list      | A comma-delimited string of names.               |

- **DBE\_UTILITY.GET\_SQL\_HASH\_FUNC**

Uses the MD5 algorithm to output the hash value of a given character string. The function prototype of DBE\_UTILITY.GET\_SQL\_HASH\_FUNC is:

```
DBE_UTILITY.GET_SQL_HASH_FUNC(
  name IN VARCHAR2,
```

```

hash      OUT RAW,
last4bytes OUT BIGINT
);

```

**Table 10-323** DBE\_UTILITY.GET\_SQL\_HASH\_FUNC parameters

| Parameter  | Description                                                                       |
|------------|-----------------------------------------------------------------------------------|
| name       | Character string to be hashed.                                                    |
| hash       | Complete hexadecimal MD5 hash value.                                              |
| last4bytes | Last four bytes of the MD5 hash value, which is displayed as an unsigned integer. |

 **NOTE**

After setting **set behavior\_compat\_options** to 'proc\_outparam\_override', invoke the DBE\_UTILITY.GET\_SQL\_HASH\_FUNC function. If you invoke the DBE\_UTILITY.GET\_SQL\_HASH function, a parameter mismatch error is reported.

## Examples

```

CREATE OR REPLACE PROCEDURE test_get_time1()
AS
declare
    start_time bigint;
    end_time bigint;
BEGIN
    start_time:= dbe_utility.get_time ();
    pg_sleep(1);
    end_time:=dbe_utility.get_time ();
    dbe_output.print_line(end_time - start_time);
END;
/
-- Canonicalize the character string of a table name.
declare
    cname varchar2(50);
begin
    dbe_utility.canonicalize('seg1', cname, 50);
    dbe_output.put_line(cname);
end;
/
-- Convert the input character string into an array of table names.
DECLARE
tab_list VARCHAR2(100) := 't1,t2';
len BINARY_INTEGER;
tab DBMS_UTILITY.LNAME_ARRAY;
BEGIN
dbe_output.put_line('table list is : ' || tab_list);
dbe_utility.comma_to_table(tab_list, len, tab);
END;
/
-- Check the version number and compatibility version number of the database.
declare
    v_version varchar2;
begin
    dbe_utility.db_version(v_version);
    v_version:=left(v_version, 8);
    dbe_output.print_line('version:' || v_version);
end;

```

```

/
-- Check the measured value of the current CPU processing time.
DECLARE
  cputime NUMBER;
BEGIN
  cputime := dbe_utility.get_cpu_time;
  dbe_output.put_line('cpu time:' || cputime);
END;
/
-- Obtain the big-endian and little-endian information of the byte order on the platform where the
database is located.
BEGIN
  dbe_output.PUT_LINE(dbe_utility.GET_ENDIANNES);
END;
/
-- Obtain the hash value of a given string.
DECLARE
  result NUMBER(28);
BEGIN
  result := dbe_utility.get_hash_value('hello',10,10);
  dbe_output.put_line(result);
END;
/
-- Check whether the current database is in cluster mode.
DECLARE
  is_cluster BOOLEAN;
BEGIN
  is_cluster := dbe_utility.IS_CLUSTER_DATABASE;
  dbe_output.put_line('CLUSTER DATABASE: ' || CASE WHEN is_cluster THEN 'TRUE' ELSE 'FALSE' END);
END;
/
-- Obtain the name of the database schema in the current user environment.
DECLARE
  schm varchar2(100);
BEGIN
  schm := dbe_utility.old_current_schema;
  dbe_output.put_line('current schema: ' || schm);
END;
/
-- Obtain the current username.
select dbe_utility.old_current_user from sys_dummy;

```

## 10.12.2.10 DBE\_SESSION

### Interface Description

**Table 10-324** provides all interfaces supported by the **DBE\_SESSION** package. **DBE\_SESSION** takes effect at the session level.

**Table 10-324** DBE\_SESSION

| Interface                                  | Description                                               |
|--------------------------------------------|-----------------------------------------------------------|
| <a href="#">DBE_SESSION.SET_CONTEXT</a>    | Sets the value of an attribute in a specified context.    |
| <a href="#">DBE_SESSION.CLEAR_CONTEXT</a>  | Clears the value of an attribute in a specified context.  |
| <a href="#">DBE_SESSION.SEARCH_CONTEXT</a> | Queries the value of an attribute in a specified context. |

- DBE\_SESSION.SET\_CONTEXT

Sets the value of an attribute in a specified namespace (context). The prototype of the **DBE\_SESSION.SET\_CONTEXT** function is as follows:

```
DBE_SESSION.SET_CONTEXT(
    namespace text,
    attribute text,
    value text
)returns void;
```

**Table 10-325** DBE\_SESSION.SET\_CONTEXT interface parameters

| Parameter | Description                                                                                                                                                                      |
|-----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| namespace | Name of the context to be set. If the context does not exist, create a context. The value contains a maximum of 128 bytes. If the value exceeds 128 bytes, it will be truncated. |
| attribute | Attribute name. The value contains a maximum of 1024 bytes. If the value exceeds 1024 bytes, it will be truncated.                                                               |
| value     | Name of the value to be set. The value contains a maximum of 1024 bytes. If the value exceeds 1024 bytes, it will be truncated.                                                  |

- DBE\_SESSION.CLEAR\_CONTEXT

Clears the value of an attribute in a specified namespace (context). The prototype of the **DBE\_SESSION.CLEAR\_CONTEXT** function is as follows:

```
DBE_SESSION.CLEAR_CONTEXT (
    namespace text,
    client_identifier text default null,
    attribute text default null
)returns void ;
```

**Table 10-326** DBE\_SESSION.CLEAR\_CONTEXT interface parameters

| Parameter         | Description                                                                                                                                                                                                                                                                                                                                                                      |
|-------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| namespace         | Context specified by the user. The value contains a maximum of 128 bytes. If the value exceeds 128 bytes, it will be truncated.                                                                                                                                                                                                                                                  |
| client_identifier | Client authentication. The default value is <b>null</b> . Generally, you do not need to manually set this parameter.                                                                                                                                                                                                                                                             |
| attribute         | Attribute to be cleared. The default value is <b>null</b> , indicating that all attributes of the specified context are cleared. The value contains a maximum of 1024 bytes. If the value exceeds 1024 bytes, it will be truncated.<br><b>CAUTION</b><br>To ensure forward compatibility, if the parameter value is 'null', all attributes of the specified context are cleared. |

- DBE\_SESSION.SEARCH\_CONTEXT

Queries the value of an attribute in a specified namespace (context). The prototype of the **DBE\_SESSION.SEARCH\_CONTEXT** function is as follows:

```
DBE_SESSION.SEARCH_CONTEXT (
    namespace text,
    attribute text
)returns text;
```

**Table 10-327** DBE\_SESSION.SEARCH\_CONTEXT interface parameters

| Parameter | Description                                                                                                                      |
|-----------|----------------------------------------------------------------------------------------------------------------------------------|
| namespace | Context specified by the user. The value contains a maximum of 128 bytes. If the value exceeds 128 bytes, it will be truncated.  |
| attribute | Attribute to be searched for. The value contains a maximum of 1024 bytes. If the value exceeds 1024 bytes, it will be truncated. |

## Example

```
BEGIN
    select DBE_SESSION.set_context('test', 'gaussdb', 'one'); -- Set the gaussdb attribute of the test context to one.
    select DBE_SESSION.search_context('test', 'gaussdb');
    select DBE_SESSION.clear_context('test', 'test','gaussdb');
END;
```

### 10.12.2.11 DBE\_MATCH

#### Interface Description

**Table 10-328** provides all interfaces supported by the **DBE\_MATCH** package.

**Table 10-328** DBE\_MATCH

| Interface                                 | Description                                                                                                                                                                                                                                                                                                                            |
|-------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>DBE_MATCH.EDIT_DISTANCE_SIMILARITY</b> | Compares the difference between two character strings (minimum steps of deletion, addition, and conversion) and normalizes the difference to a value ranging from 0 to 100. The value <b>100</b> indicates that the two character strings are the same, and the value <b>0</b> indicates that the two character strings are different. |

- **DBE\_MATCH.EDIT\_DISTANCE\_SIMILARITY**  
Compares the difference between two character strings (minimum steps of deletion, addition, and conversion) and normalizes the difference to a value ranging from 0 to 100. The value **100** indicates that the two character strings

are the same, and the value **0** indicates that the two character strings are different. The prototype of the **DBE\_MATCH.EDIT\_DISTANCE\_SIMILARITY** function is as follows:

```
DBE_MATCH.EDIT_DISTANCE_SIMILARITY(  
    str1 IN text,  
    str2 IN text  
)returns integer ;
```

**Table 10-329** DBE\_MATCH.EDIT\_DISTANCE\_SIMILARITY interface parameters

| Parameter | Description                                                                  |
|-----------|------------------------------------------------------------------------------|
| str1      | First character string. If the value is <b>null</b> , <b>0</b> is returned.  |
| str2      | Second character string. If the value is <b>null</b> , <b>0</b> is returned. |

## 10.12.2.12 DBE\_APPLICATION\_INFO

### Interface Description

**Table 10-330** provides all interfaces supported by the **DBE\_APPLICATION\_INFO** package. **DBE\_APPLICATION\_INFO** applies to the current session.

**Table 10-330** DBE\_APPLICATION\_INFO

| Interface                                    | Description                |
|----------------------------------------------|----------------------------|
| <b>DBE_APPLICATION_INFO.SET_CLIENT_INFO</b>  | Writes client information. |
| <b>DBE_APPLICATION_INFO.READ_CLIENT_INFO</b> | Reads client information.  |

- **DBE\_APPLICATION\_INFO.SET\_CLIENT\_INFO**  
Writes client information. The prototype of the **DBE\_APPLICATION\_INFO.SET\_CLIENT\_INFO** function is as follows:

```
DBE_APPLICATION_INFO.SET_CLIENT_INFO(  
    str text  
)returns void;
```

**Table 10-331** DBE\_APPLICATION\_INFO.SET\_CLIENT\_INFO interface parameters

| Parameter | Description                |
|-----------|----------------------------|
| str       | Writes client information. |

- **DBE\_APPLICATION\_INFO.READ\_CLIENT\_INFO**  
The prototype of the **DBE\_APPLICATION\_INFO.READ\_CLIENT\_INFO** function is as follows:

```
DBE_APPLICATION_INFO.READ_CLIENT_INFO(  
OUT client_info text);
```

**Table 10-332** DBE\_APPLICATION\_INFO.READ\_CLIENT\_INFO interface parameters

| Parameter   | Description        |
|-------------|--------------------|
| client_info | Client information |

### 10.12.2.13 DBE\_XMLDOM

#### Interface Description

The advanced function package DBE\_XMLDOM is used to access XMLType objects and implement Document Object Model (DOM), which is an interface used to access HTML and XML documents. For details about all types supported by the advanced function package DBE\_XMLDOM, see [Table 10-333](#). For details about all interfaces supported by DBE\_XMLDOM, see [Table 10-334](#).

#### NOTE

When the character set of the database is set to **SQL\_ASCII** and the **DBE\_XMLDOM** advanced package is used, an error message is displayed if the input characters exceed the ASCII range.

**Table 10-333** DBE\_XMLDOM data types

| Type            | Description                               |
|-----------------|-------------------------------------------|
| DOMATTR         | Implements the DOMAttributes interface.   |
| DOMDOCUMENT     | Implements the DOMDocument interface.     |
| DOMELEMENT      | Implements the DOMELEMENT interface.      |
| DOMNAMEDNODEMAP | Implements the DOMNamedNodeMap interface. |
| DOMNODELIST     | Implements the DOMNodeList interface.     |
| DOMNODE         | Implements the DOMNode interface.         |
| DOMTEXT         | Implements the DOMText interface.         |

**Table 10-334** DBE\_XMLDOM parameters

| Interface                                       | Description                                                                               |
|-------------------------------------------------|-------------------------------------------------------------------------------------------|
| <a href="#">DBE_XMLDOM.APPENDCHILD</a>          | Adds the newchild node to the end of the parent(n) node and returns the newly added node. |
| <a href="#">DBE_XMLDOM.CREATEELEMENT</a>        | Creates a DOMELEMENT object with the specified name.                                      |
| <a href="#">DBE_XMLDOM.CREATETEXTNODE</a>       | Creates a DOMText node.                                                                   |
| <a href="#">DBE_XMLDOM.FREEDOCUMENT</a>         | Frees resources related to DOMDocument nodes.                                             |
| <a href="#">DBE_XMLDOM.FREEELEMENT</a>          | Frees resources related to DOMELEMENT nodes.                                              |
| <a href="#">DBE_XMLDOM.FREENODE</a>             | Frees resources related to DOMNode nodes.                                                 |
| <a href="#">DBE_XMLDOM.FREENODELIST</a>         | Frees resources related to DOMNodeList nodes.                                             |
| <a href="#">DBE_XMLDOM.GETATTRIBUTE</a>         | Returns the attribute values of a DOMELEMENT object by name.                              |
| <a href="#">DBE_XMLDOM.GETATTRIBUTES</a>        | Returns the attribute values of a DOMNode node as a map.                                  |
| <a href="#">DBE_XMLDOM.GETCHILDNODES</a>        | Converts several subnodes under a node into a node list.                                  |
| <a href="#">DBE_XMLDOM.GETCHILDRENBYTAGNAME</a> | Returns the subnodes of a DOMELEMENT node by name.                                        |
| <a href="#">DBE_XMLDOM.GETDOCUMENTELEMENT</a>   | Returns the first subnode of the specified document.                                      |
| <a href="#">DBE_XMLDOM.GETFIRSTCHILD</a>        | Returns the first subnode.                                                                |
| <a href="#">DBE_XMLDOM.GETLASTCHILD</a>         | Returns the last subnode.                                                                 |
| <a href="#">DBE_XMLDOM.GETLENGTH</a>            | Obtains the number of subnodes under a specified node.                                    |
| <a href="#">DBE_XMLDOM.GETLOCALNAME</a>         | Returns the local name of a node.                                                         |
| <a href="#">DBE_XMLDOM.GETNAMEDITEM</a>         | Returns the node specified by name.                                                       |
| <a href="#">DBE_XMLDOM.GETNEXTSIBLING</a>       | Returns the next node of the specified node.                                              |
| <a href="#">DBE_XMLDOM.GETNODENAME</a>          | Returns the name of a node.                                                               |
| <a href="#">DBE_XMLDOM.GETNODETYPE</a>          | Returns the type of a node.                                                               |

| Interface                              | Description                                                                                            |
|----------------------------------------|--------------------------------------------------------------------------------------------------------|
| <b>DBE_XMLDOM.GETNODEVALUE</b>         | Obtains the value of a node, depending on its type.                                                    |
| <b>DBE_XMLDOM.GETPARENTNODE</b>        | Returns the parent node of a node.                                                                     |
| <b>DBE_XMLDOM.GETTAGNAME</b>           | Returns the tag name of the specified DOMElement node.                                                 |
| <b>DBE_XMLDOM.HASCHILDNODES</b>        | Checks whether the DOMNode object has any subnode.                                                     |
| <b>DBE_XMLDOM.IMPORTNODE</b>           | Copies a node and specifies the document to which the node belongs.                                    |
| <b>DBE_XMLDOM.ISNULL</b>               | Checks whether a node is null.                                                                         |
| <b>DBE_XMLDOM.ITEM</b>                 | Returns the item corresponding to the index parameter in the mapping.                                  |
| <b>DBE_XMLDOM.MAKEELEMENT</b>          | Converts a DOMNode object to the DOMElement type.                                                      |
| <b>DBE_XMLDOM.MAKENODE</b>             | Forcibly converts a node to the DOMNode type.                                                          |
| <b>DBE_XMLDOM.NEWDOMDOCUMENT</b>       | Returns a new DOMDocument object.                                                                      |
| <b>DBE_XMLDOM.SETATTRIBUTE</b>         | Sets the value of the DOMElement attribute by name.                                                    |
| <b>DBE_XMLDOM.SETCHARSET</b>           | Sets the character set for a DOMDocument object.                                                       |
| <b>DBE_XMLDOM.SETDOCTYPE</b>           | Sets the external DTD of a DOMDocument object.                                                         |
| <b>DBE_XMLDOM.SETNODEVALUE</b>         | Sets the value of a node in the DOMNode object.                                                        |
| <b>DBE_XMLDOM.WRITETOBUFFER</b>        | Writes an XML node to a specified buffer.                                                              |
| <b>DBE_XMLDOM.WRITETOCLOB</b>          | Writes an XML node to a specified CLOB.                                                                |
| <b>DBE_XMLDOM.WRITETOFILE</b>          | Writes an XML node to a specified file.                                                                |
| <b>DBE_XMLDOM.GETSESSIONTREENUM</b>    | Displays the number of DOM trees of all types in the current session.                                  |
| <b>DBE_XMLDOM.GETDOCTREESINFO</b>      | Displays statistics such as the memory usage and number of nodes of the DOM tree of the document type. |
| <b>DBE_XMLDOM.GETDETAILDOCTREEINFO</b> | Displays the number of nodes of each type for a specific document variable.                            |

- DBE\_XMLDOM.APPENDCHILD

Adds the newchild node to the end of the parent(n) node and returns the newly added node. The prototype of the DBE\_XMLDOM.APPENDCHILD function is as follows:

```
DBE_XMLDOM.APPENDCHILD(
  n IN DOMNode,
  newchild IN DOMNode)
RETURN DOMNODE;
```

**Table 10-335** DBE\_XMLDOM.APPENDCHILD parameters

| Parameter | Description      |
|-----------|------------------|
| n         | Node to be added |
| newchild  | New node added   |

 **NOTE**

1. The error message "operation not support" is displayed for the APPEND ATTR node under the DOCUMENT node. Database A does not report an error in this scenario, but the mounting fails.
2. The error message "operation not support" is displayed for the APPEND ATTR node under the ATTR node. Database A does not report an error in this scenario, but the mounting fails.
3. When multiple child nodes of the ATTR type are added to a parent node, the child nodes with the same key value cannot exist under the same parent node.

**Example:**

-- Add a DOMNode node to a specified DOC tree and use DBE\_XMLDOM.HASCHILDNODES() to check whether the subnode is successfully added.

```
DECLARE
  doc DBE_XMLDOM.DOMDocument;
  doc1 DBE_XMLDOM.DOMDocument;
  root DBE_XMLDOM.DOMELEMENT;
  rootnode DBE_XMLDOM.DOMNode;
  child1 DBE_XMLDOM.DOMELEMENT;
  child2 DBE_XMLDOM.DOMELEMENT;
  attr DBE_XMLDOM.DOMAttr;
  text DBE_XMLDOM.DOMTEXT;
  node DBE_XMLDOM.DOMNode;
  child1_node DBE_XMLDOM.DOMNode;
  attr_node DBE_XMLDOM.DOMNode;
  parent DBE_XMLDOM.DOMNode;
  buf varchar2(1000);
BEGIN
  doc := DBE_XMLDOM.newDOMDocument();
  root := DBE_XMLDOM.createElement(doc, 'root');
  rootnode := DBE_xmlldom.makeNode(root);
  node := DBE_XMLDOM.appendChild(DBE_xmlldom.makeNode(doc), rootnode);
  child1 := DBE_XMLDOM.createElement(doc, 'child1');
  child1_node := DBE_XMLDOM.makeNode(child1);
  node := DBE_XMLDOM.appendChild(rootnode, child1_node);
  attr := DBE_XMLDOM.createAttribute(doc, 'abc');
  attr_node := DBE_XMLDOM.makeNode(attr);
  node := DBE_XMLDOM.appendChild(child1_node, attr_node);
  IF DBE_XMLDOM.HASCHILDNODES(child1_node) THEN
    DBE_OUTPUT.print_line('HAS CHILD NODES');
```

```

ELSE
  DBE_OUTPUT.print_line('NOT HAS CHILD NODES ');
END IF;
parent := DBE_XMLDOM.GETPARENTNODE(attr_node);
buf := DBE_XMLDOM.GETNODENAME(parent);
DBE_OUTPUT.print_line(buf);
END;
/

```

- **DBE\_XMLDOM.CREATEELEMENT**

Returns the DOMELEMENT object with the specified name. The prototype of the DBE\_XMLDOM.CREATEELEMENT function is as follows:

```

DBE_XMLDOM.CREATEELEMENT(
  doc IN DOMDOCUMENT,
  tagName IN VARCHAR2)
RETURN DOMELEMENT;

```

Returns the DOMELEMENT object with the specified name and namespace. The prototype of the DBE\_XMLDOM.CREATEELEMENT function is as follows:

```

DBE_XMLDOM.CREATEELEMENT(
  doc IN DOMDOCUMENT,
  tagName IN VARCHAR2,
  ns IN VARCHAR2)
RETURN DOMELEMENT;

```

**Table 10-336** DBE\_XMLDOM.CREATEELEMENT parameters

| Parameter | Description                       |
|-----------|-----------------------------------|
| doc       | Specified DOMDocument object      |
| tagName   | Name of the new DOMELEMENT object |
| ns        | Namespace                         |

 **NOTE**

1. When the **tagName** parameter is set to null or an empty character string, the exception "NULL or invalid TagName argument specified" is thrown.
2. The default maximum length of **tagName** and **ns** is 32767. If the length exceeds 32767, an exception is thrown.

**Example:**

-- 1. Create a DOMELEMENT object with the specified name.

```

DECLARE
  doc db_xmldom.domdocument;
  attr DBE_XMLDOM.DOMATTR;
  elem DBE_XMLDOM.DOMELEMENT;
  ans DBE_XMLDOM.DOMATTR;
  buf varchar2(1010);
BEGIN
  doc := db_xmldom.newdomdocument('<?xml version="1.0" encoding="UTF-8"?>
  <computer size="ITX"><cpu>Ryzen 9 3950X</cpu>
  <ram>32GBx2 DDR4 3200MHz</ram>
  <motherboard>ROG X570i</motherboard>
  <gpu>RTX2070 Super</gpu>
  <ssd>1TB NVMe Toshiba + 2TB NVMe WD Black</ssd>
  <hdd>12TB WD Digital</hdd>
  <psu>CORSAIR SF750</psu>
  <case>LIANLI TU150</case>
  </computer>');

```

```

elem := dbe_xmlDOM.createelement(doc,'elem');
DBE_XMLDOM.WRITETOBUFFER(dbe_xmlDOM.makenode(elem), buf);
DBE_OUTPUT.print_line(buf);
END;
/

-- 2. Create a DOMELEMENT object with the specified name and namespace.
DECLARE
doc dbe_xmlDOM.DOMDOCUMENT;
attr DBE_XMLDOM.DOMATTR;
elem DBE_XMLDOM.DOMELEMENT;
ans DBE_XMLDOM.DOMNODE;
buf varchar2(1010);
list DBE_XMLDOM.DOMNODELIST;
node DBE_XMLDOM.DOMNODE;
BEGIN
doc := dbe_xmlDOM.newdomdocument('<h:data xmlns:h="http://www.w3.org/TR/html4/">
<h:da1 len="10">test namespace</h:da1><h:da1>bbbbbbbb</h:da1></h:data>');
elem := dbe_xmlDOM.createelement(doc,'elem','http://www.w3.org/TR/html5/');
ans := DBE_XMLDOM.APPENDCHILD(dbe_xmlDOM.makenode(doc), dbe_xmlDOM.makenode(elem));
DBE_XMLDOM.WRITETOBUFFER(doc, buf);
DBE_OUTPUT.print_line(buf);
END;
/

```

- **DBE\_XMLDOM.CREATETEXTNODE**

Creates and returns a DOMText object. The prototype of the DBE\_XMLDOM.CREATETEXTNOD function is as follows:

```

DBE_XMLDOM.CREATETEXTNODE(
doc IN DOMDOCUMENT,
data IN VARCHAR2)
RETURN DOMTEXT;

```

**Table 10-337** DBE\_XMLDOM.CREATETEXTNODE parameters

| Parameter | Description                  |
|-----------|------------------------------|
| doc       | Specified DOMDocument object |
| data      | Content of the DOMText node  |

 **NOTE**

1. You can enter an empty string or null value for **data**.
2. The default maximum length of **data** is 32767. If the length exceeds 32767, an exception is thrown.

- **DBE\_XMLDOM.FREEDOCUMENT**

Frees a DOMDocument node. The prototype of the DBE\_XMLDOM.FREEDOCUMENT function is as follows:

```

DBE_XMLDOM.FREEDOCUMENT(
doc IN DOMDOCUMENT);

```

**Table 10-338** DBE\_XMLDOM.FREEDOCUMENT parameters

| Parameter | Description                |
|-----------|----------------------------|
| doc       | Specified DOMDocument node |

**Example:**

```
-- Free the entire DOC tree after the DOMNode node is added to the DOC tree.
DECLARE
  doc dbe_xmldom.domdocument;
  elem dbe_xmldom.domelement;
  doc_node dbe_xmldom.DOMNODE;
  root_elmt dbe_xmldom.DOMELEMENT;
  root_node dbe_xmldom.DOMNODE;
  value varchar(1000);
BEGIN
  doc := dbe_xmldom.newdomdocument();
  doc_node := dbe_xmldom.MAKENODE(doc);
  root_elmt := dbe_xmldom.CREATEELEMENT(doc,'staff');
  root_node:=dbe_xmldom.APPENDCHILD(doc_node, dbe_xmldom.MAKENODE(root_elmt));
  dbe_xmldom.freedocument(doc);
END;
/
```

- **DBE\_XMLDOM.FREEELEMENT**

Frees a DOMELEMENT node. The prototype of the DBE\_XMLDOM.FREEELEMENT function is as follows:

```
DBE_XMLDOM.FREEELEMENT(
  elem IN DOMELEMENT);
```

**Table 10-339** DBE\_XMLDOM.FREEELEMENT parameters

| Parameter | Description               |
|-----------|---------------------------|
| elem      | Specified DOMELEMENT node |

- **DBE\_XMLDOM.FREENODE**

Frees a DOMNode node. The prototype of the DBE\_XMLDOM.FREENODE function is as follows:

```
DBE_XMLDOM.FREENODE(
  n IN DOMNODE);
```

**Table 10-340** DBE\_XMLDOM.FREENODE parameters

| Parameter | Description            |
|-----------|------------------------|
| n         | Specified DOMNode node |

 **NOTE**

1. After GaussDB performs the FREENODE operation, the freed node is not available again. After the database A performs the FREENODE operation, the freed node is available again and becomes another node.
  2. When other interfaces call the freed DOMNode node, the calling is different from that in database A.
- **DBE\_XMLDOM.FREENODELIST**

Frees a DOMNodeList node. The prototype of the DBE\_XMLDOM.FREENODE function is as follows:

```
DBE_XMLDOM.GETLENGTH(  
nl IN DOMNODELIST);
```

**Table 10-341** DBE\_XMLDOM.FREENODELIST parameters

| Parameter | Description                |
|-----------|----------------------------|
| nl        | Specified DOMNodeList node |

 **NOTE**

1. A DOMNodeList node will be completely freed by FREENODELIST.
  2. When other interfaces call the freed DOMNodeList node, the calling is different from that in database A.
  3. The input parameter **freenodelist** cannot be empty.
- **DBE\_XMLDOM.GETATTRIBUTE**

Returns the attribute values of a DOMELEMENT object by name. The prototype of the DBE\_XMLDOM.GETATTRIBUTE function is as follows:

```
DBE_XMLDOM.GETATTRIBUTE(  
elem IN DOMELEMENT,  
name IN VARCHAR2)  
RETURN VARCHAR2;
```

Returns the attribute values of a DOMELEMENT object by name and namespace URI. The prototype of the DBE\_XMLDOM.GETATTRIBUTE function is as follows:

```
DBE_XMLDOM.GETATTRIBUTE(  
elem IN DOMELEMENT,  
name IN VARCHAR2,  
ns IN VARCHAR2)  
RETURN VARCHAR2;
```

**Table 10-342** DBE\_XMLDOM.GETATTRIBUTE parameters

| Parameter | Description               |
|-----------|---------------------------|
| elem      | Specified DOMELEMENT node |
| name      | Attribute name            |
| ns        | Namespace                 |

 NOTE

1. The **ns** parameter of the DBE\_XMLDOM.GETATTRIBUTE interface does not support the asterisk (\*) parameter.
2. GaussDB does not support the namespace prefix as an attribute, and the value of the prefix cannot be queried through the DBE\_XMLDOM.GETATTRIBUTE interface.

## Example:

```
-- 1. Return the attribute values of a DOMELEMENT object by name.
```

```
DECLARE
  doc dbe_xmlDOM.domdocument;
  elem dbe_xmlDOM.domelement;
  docnode DBE_XMLDOM.DOMNode;
  buffer varchar2(1010);
  value varchar2(1000);
BEGIN
  doc := dbe_xmlDOM.newDOMDocument();
  elem := DBE_XMLDOM.CREATEELEMENT(doc, 'root');
  DBE_XMLDOM.setattribute(elem, 'len', '50cm');
  docnode := DBE_XMLDOM.appendChild(DBE_XMLDOM.makeNode(doc),
  DBE_XMLDOM.makeNode(elem));
  value := DBE_XMLDOM.getattribute(elem, 'len');
  dbe_output.print_line('value: ');
  dbe_output.print_line(value);
  dbe_xmlDOM.writetobuffer(doc, buffer);
  dbe_output.print_line('buffer: ');
  dbe_output.print_line(buffer);
END;
/
```

```
-- 2. Return the attribute values of a DOMELEMENT object by name and namespace URI.
```

```
DECLARE
  doc dbe_xmlDOM.domdocument;
  elem dbe_xmlDOM.domelement;
  docnode DBE_XMLDOM.DOMNode;
  buffer varchar2(1010);
  value varchar(1000);
BEGIN
  doc := dbe_xmlDOM.newDOMDocument();
  elem := DBE_XMLDOM.CREATEELEMENT(doc, 'root');
  DBE_XMLDOM.setattribute(elem, 'len', '50cm', 'www.huawei.com');
  docnode := DBE_XMLDOM.appendChild(DBE_XMLDOM.makeNode(doc),
  DBE_XMLDOM.makeNode(elem));
  value := DBE_XMLDOM.getattribute(elem, 'len', 'www.huawei.com');
  dbe_output.print_line('value: ');
  dbe_output.print_line(value);
  dbe_xmlDOM.writetobuffer(doc, buffer);
  dbe_output.print_line('buffer: ');
  dbe_output.print_line(buffer);
END;
/
```

- DBE\_XMLDOM.GETATTRIBUTES

Returns the attribute values of a DOMNode node as a map. The prototype of the DBE\_XMLDOM.GETATTRIBUTES function is as follows:

```
DBE_XMLDOM.GETATTRIBUTES(
  n IN DOMNode)
RETURN DOMNAMEDNODEMAP;
```

**Table 10-343** DBE\_XMLDOM.GETATTRIBUTES parameters

| Parameter | Description            |
|-----------|------------------------|
| n         | Specified DOMNode node |

- DBE\_XMLDOM.GETCHILDNODES

Converts several subnodes under a node into a node list. The prototype of the DBE\_XMLDOM.GETCHILDNODES function is as follows:

```
DBE_XMLDOM.GETCHILDNODES(  
  n IN DOMNode)  
RETURN DOMNodeList;
```

**Table 10-344** DBE\_XMLDOM.GETCHILDNODES parameters

| Parameter | Description            |
|-----------|------------------------|
| n         | Specified DOMNode node |

- DBE\_XMLDOM.GETCHILDRENBYTAGNAME

Returns the subnodes of a DOMELEMENT node by name. The prototype of the DBE\_XMLDOM.GETCHILDRENBYTAGNAME function is as follows:

```
DBE_XMLDOM.GETCHILDRENBYTAGNAME (  
  elem IN DOMELEMENT,  
  name IN VARCHAR2)  
RETURN DOMNODELIST;
```

Returns the subnodes of a DOMELEMENT node by name and namespace. The prototype of the DBE\_XMLDOM.GETCHILDRENBYTAGNAME function is as follows:

```
DBE_XMLDOM.GETCHILDRENBYTAGNAME (  
  elem IN DOMELEMENT,  
  name IN VARCHAR2,  
  ns IN VARCHAR2)  
RETURN DOMNODELIST;
```

**Table 10-345** DBE\_XMLDOM.GETCHILDRENBYTAGNAME parameters

| Parameter | Description               |
|-----------|---------------------------|
| elem      | Specified DOMELEMENT node |
| name      | Attribute name            |
| ns        | Namespace                 |

 **NOTE**

The **ns** parameter of the DBE\_XMLDOM.GETCHILDRENBYTAGNAME interface does not support the asterisk (\*) parameter. To obtain all attributes of a node, use the DBE\_XMLDOM.GETCHILDNODES interface.

Example:

```
-- 1. Return the subnodes of a DOMELEMENT node by name.
DECLARE
  doc dbe_xmlDOM.DOMDOCUMENT;
  elem dbe_xmlDOM.DOMELEMENT;
  docnodelist dbe_xmlDOM.DOMNODELIST;
  node_elem dbe_xmlDOM.DOMELEMENT;
  node dbe_xmlDOM.DOMNODE;
  buffer varchar2(1010);
  value varchar2(1000);
BEGIN
  doc := dbe_xmlDOM.newDOMDOCUMENT('<?xml version="1.0" encoding="UTF-8"?>
  <students age="16" hight="176">
  <student>
  <name>Jerry</name><age>519</age><sex>man</sex><abc>12345</abc>
  </student>
  <student>
  <name>Bob</name><age>245</age><sex>woman</sex><abc>54321</abc>
  </student>
  </students>');
  elem := dbe_xmlDOM.GETDOCUMENTELEMENT(doc);
  docnodelist := dbe_xmlDOM.GETCHILDRENBYTAGNAME(elem, 'student');
  node := dbe_xmlDOM.ITEM(docnodelist, 0);
  node_elem := dbe_xmlDOM.makeelement(node);
  value := DBE_XMLDOM.gettagname(node_elem);
  dbe_output.print_line('value: ');
  dbe_output.print_line(value);
  dbe_xmlDOM.writetobuffer(doc, buffer);
  dbe_output.print_line('buffer: ');
  dbe_output.print_line(buffer);
END;
/
```

- DBE\_XMLDOM.GETDOCUMENTELEMENT

Returns the first subnode of the specified document. The prototype of the DBE\_XMLDOM.GETDOCUMENTELEMENT function is as follows:

```
DBE_XMLDOM.GETDOCUMENTELEMENT(
  doc IN DOMDOCUMENT)
RETURN DOMELEMENT;
```

**Table 10-346** DBE\_XMLDOM.GETDOCUMENTELEMENT parameters

| Parameter | Description                |
|-----------|----------------------------|
| doc       | Specified DOMDocument node |

**Example:**

```
-- Obtain the first subnode in the DOC tree and output the node name.
DECLARE
  doc dbe_xmlDOM.DOMDOCUMENT;
  elem dbe_xmlDOM.DOMELEMENT;
  doc_node dbe_xmlDOM.DOMNODE;
  root_elmt dbe_xmlDOM.DOMELEMENT;
  root_node dbe_xmlDOM.DOMNODE;
  value varchar(1000);
BEGIN
  doc := dbe_xmlDOM.newDOMDOCUMENT();
  doc_node := dbe_xmlDOM.MAKENODE(doc);
  root_elmt := dbe_xmlDOM.CREATEELEMENT(doc,'staff');
  root_node:=dbe_xmlDOM.APPENDCHILD(doc_node, dbe_xmlDOM.MAKENODE(root_elmt));
  elem := dbe_xmlDOM.GETDOCUMENTELEMENT(doc);
  value := DBE_XMLDOM.gettagname(elem);
  dbe_output.print_line(value);
```

```
END;  
/
```

- **DBE\_XMLDOM.GETFIRSTCHILD**

Returns the first subnode of a node. The prototype of the DBE\_XMLDOM.GETFIRSTCHILD function is as follows:

```
DBE_XMLDOM.GETFIRSTCHILD(  
    n IN DOMNODE)  
RETURN DOMNODE;
```

**Table 10-347** DBE\_XMLDOM.GETFIRSTCHILD parameters

| Parameter | Description            |
|-----------|------------------------|
| n         | Specified DOMNode node |

**Example:**

-- Obtain the name and type of the first subnode after the DOC tree is converted to the DOMNode type, and then obtain the name of the first subnode of the obtained first DOMNode node.

```
DECLARE  
    doc dbe_xmldom.domdocument;  
    doc_node dbe_xmldom.domnode;  
    root_node dbe_xmldom.domnode;  
    inside_node dbe_xmldom.domnode;  
    node_name varchar2(1000);  
    node_type integer;  
BEGIN  
    doc := dbe_xmldom.newdomdocument('<?xml version="1.0" encoding="UTF-8"?>  
    <students age="16" hight="176">  
    <student1>  
        <name>Jerry</name><age>519</age><sex>man</sex><abc>12345</abc>  
    </student1>  
    <student2>  
        <name>Bob</name><age>245</age><sex>woman</sex><abc>54321</abc>  
    </student2>  
    </students>');  
    doc_node := DBE_XMLDOM.MAKENODE(doc);  
    root_node := DBE_XMLDOM.GETFIRSTCHILD(doc_node);  
    node_name := DBE_XMLDOM.GETNODENAME(root_node);  
    node_type := DBE_XMLDOM.GETNODETYPE(root_node);  
    dbe_output.print_line(node_name);  
    dbe_output.print_line(node_type);  
    inside_node := DBE_XMLDOM.GETFIRSTCHILD(root_node);  
    node_name := DBE_XMLDOM.GETNODENAME(inside_node);  
    dbe_output.print_line(node_name);  
END;  
/
```

- **DBE\_XMLDOM.GETLASTCHILD**

Returns the last subnode of a node. The prototype of the DBE\_XMLDOM.GETLASTCHILD function is as follows:

```
DBE_XMLDOM.GETLASTCHILD(  
    n IN DOMNODE)  
RETURN DOMNODE;
```

**Table 10-348** DBE\_XMLDOM.GETLASTCHILD parameters

| Parameter | Description            |
|-----------|------------------------|
| n         | Specified DOMNode node |

**Example:**

-- Obtain the name and type of the last subnode after the DOC tree is converted to the DOMNode type, and then obtain the name of the last subnode of the obtained last DOMNode node.

```
DECLARE
  doc dbe_xmldom.domdocument;
  doc_node dbe_xmldom.domnode;
  root_node dbe_xmldom.domnode;
  inside_node dbe_xmldom.domnode;
  node_name varchar2(1000);
  node_type integer;
BEGIN
  doc := dbe_xmldom.newdomdocument('<?xml version="1.0" encoding="UTF-8"?>
  <students age="16" hight="176">
  <student1>
  <name>Jerry</name><age>519</age><sex>man</sex><abc>12345</abc>
  </student1>
  <student2>
  <name>Bob</name><age>245</age><sex>woman</sex><abc>54321</abc>
  </student2>
  </students>');
  doc_node := DBE_XMLDOM.MAKENODE(doc);
  root_node := DBE_XMLDOM.GETFIRSTCHILD(doc_node);
  node_name := DBE_XMLDOM.GETNODENAME(root_node);
  node_type := DBE_XMLDOM.GETNODETYPE(root_node);
  db_output.print_line(node_name);
  db_output.print_line(node_type);
  inside_node := DBE_XMLDOM.GETLASTCHILD(root_node);
  node_name := DBE_XMLDOM.GETNODENAME(inside_node);
  db_output.print_line(node_name);
END;
/
```

- **DBE\_XMLDOM.GETLENGTH**

Returns the number of subnodes under a DOMNamedNodeMap node. The prototype of the DBE\_XMLDOM.GETLENGTH function is as follows:

```
DBE_XMLDOM.GETLENGTH(
  nnm IN DOMNAMEDNODEMAP)
RETURN NUMBER;
```

Returns the number of subnodes under a DOMNodeList node. The prototype of the DBE\_XMLDOM.GETLENGTH function is as follows:

```
DBE_XMLDOM.GETLENGTH(
  nl IN DOMNODELIST)
RETURN NUMBER;
```

**Table 10-349** DBE\_XMLDOM.GETLENGTH parameters

| Parameter | Description                    |
|-----------|--------------------------------|
| nnm       | Specified DOMNamedNodeMap node |
| nl        | Specified DOMNodeList node     |

**Example:**

```
-- 1. Declare a DOMNamedNodeMap parameter in a function.
DECLARE
  doc DBE_XMLDOM.DOMDocument;
  elem DBE_XMLDOM.DOMELEMENT;
  map DBE_XMLDOM.DOMNAMEDNODEMAP;
  node DBE_XMLDOM.DOMNODE;
  buf varchar2(10000);
  len INTEGER;
BEGIN
  doc := dbe_xmldom.newdomdocument('<?xml version="1.0"?>
  <bookstore category="web" cover="paperback">
  <book category="cooking">
  <title lang="en">Everyday Italian</title>
  <author>Giada De Laurentiis</author>
  <year>2005</year>
  <price>30.00</price>
  </book>
  </bookstore>');
  elem := DBE_XMLDOM.GETDOCUMENTELEMENT(doc);
  node := DBE_XMLDOM.MAKENODE(elem);
  map := DBE_XMLDOM.GETATTRIBUTES(node);
  len := DBE_XMLDOM.GETLENGTH(map);
  DBE_OUTPUT.print_line(len);
END;
/

-- 2. Declare a NodeList parameter in a function.
DECLARE
  doc dbe_xmldom.domdocument;
  node dbe_xmldom.domnode;
  node1 dbe_xmldom.domnode;
  nodelist DBE_XMLDOM.DOMNODELIST;
  len INTEGER;
  buffer1 varchar2(1010);
BEGIN
  doc := dbe_xmldom.newdomdocument('<?xml version="1.0" encoding="UTF-8"?>
  <students age="16" hight="176">
  <student>
  <name>Jerry</name><age>519</age><sex>man</sex><abc>12345</abc>
  </student>
  <student>
  <name>Jerry</name><age>519</age><sex>man</sex><abc>12345</abc>
  </student>
  </students>');
  node := dbe_xmldom.makenode(doc);
  node := dbe_xmldom.GETFIRSTCHILD(node);
  nodelist := DBE_XMLDOM.GETCHILDNODES(node);
  len := DBE_XMLDOM.GETLENGTH(nodelist);
  RAISE NOTICE 'len : %', len;
END;
/
```

- **DBE\_XMLDOM.GETLOCALNAME**

Returns the local name of the given DOMAttr node. The prototype of the DBE\_XMLDOM.MAKENODE function is as follows:

```
DBE_XMLDOM.GETLOCALNAME(
  a IN DOMATTR)
RETURN VARCHAR2;
```

Returns the local name of the given DOMELEMENT node. The prototype of the DBE\_XMLDOM.MAKENODE function is as follows:

```
DBE_XMLDOM.GETLOCALNAME(
  elem IN DOMELEMENT)
RETURN VARCHAR2;
```

Returns the local name of the given DOMNode node. The prototype of the DBE\_XMLDOM.MAKENODE function is as follows:

```
DBE_XMLDOM.GETLOCALNAME(  
n IN DOMNODE,  
data OUT VARCHAR2);
```

**Table 10-350** DBE\_XMLDOM.GETLOCALNAME parameters

| Parameter | Description               |
|-----------|---------------------------|
| a         | Specified DOMAttr node    |
| elem      | Specified DOMELEMENT node |
| n         | Specified DOMNode node    |
| data      | Returned local name       |

**Example:**

```
-- 2. Use the createElement function to generate a DOMELEMENT node and obtain its local name.  
DECLARE  
doc DBE_xmlDOM.domdocument;  
elem DBE_xmlDOM.domelement;  
value varchar2(10000);  
BEGIN  
doc := DBE_xmlDOM.newdomdocument();  
elem := DBE_XMLDOM.createElement(doc, 'root');  
value := DBE_XMLDOM.getLocalName(elem);  
DBE_output.print_line('value: ');  
DBE_output.print_line(value);  
END;  
/  
  
-- 3. Convert a DOMELEMENT to a DOMNode node and obtain its local name.  
DECLARE  
doc DBE_xmlDOM.domdocument;  
elem DBE_xmlDOM.domelement;  
node DBE_xmlDOM.domnode;  
value varchar2(100);  
buf varchar2(100);  
BEGIN  
doc := DBE_xmlDOM.newdomdocument();  
elem := DBE_XMLDOM.createElement(doc, 'root');  
node := DBE_xmlDOM.makeNode(elem);  
DBE_XMLDOM.getLocalName(node, buf);  
DBE_output.print_line('buf: ');  
DBE_output.print_line(buf);  
END;  
/  
/
```

- **DBE\_XMLDOM.GETNAMEDITEM**

Returns the node specified by name. The prototype of the DBE\_XMLDOM.GETNAMEDITEM function is as follows:

```
DBE_XMLDOM.GETNAMEDITEM(  
nnm IN DOMNAMEDNODEMAP,  
name IN VARCHAR2)  
RETURN DOMNODE;
```

Returns the node specified by name and namespace. The prototype of the DBE\_XMLDOM.GETNAMEDITEM function is as follows:

```
DBE_XMLDOM.GETNAMEDITEM(  
nnm IN DOMNAMEDNODEMAP,  
name IN VARCHAR2,
```

```
ns IN VARCHAR2)
RETURN DOMNODE;
```

**Table 10-351** DBE\_XMLDOM.GETNAMEDITEM parameters

| Parameter | Description                         |
|-----------|-------------------------------------|
| nnm       | Specified DOMNamedNodeMap object    |
| name      | Name of the element to be retrieved |
| ns        | Namespace                           |

 **NOTE**

1. The values of **name** and **nnm** can be null, but they are required arguments.
2. The default maximum length of **name** and **ns** is 32767. If the length exceeds 32767, an error is reported.
3. The values of **name** and **ns** can be of the int type and contain more than 127 bits.

**Example:**

```
-- 1. Return the node specified by name.
DECLARE
doc DBE_XMLDOM.DOMDocument;
elem DBE_XMLDOM.DOMELEMENT;
map DBE_XMLDOM.DOMNAMEDNODEMAP;
node DBE_XMLDOM.DOMNODE;
node2 DBE_XMLDOM.DOMNODE;
buf varchar2(1000);
buf2 varchar2(1000);
BEGIN
doc := dbe_xmldom.newdomdocument('<bookstore category="web" cover="paperback">
<book category="cooking"><title lang="en">Everyday Italian</title>
<author>Giada De Laurentiis</author><year>2005</year>
<price>30.00</price></book></bookstore>');
elem := DBE_XMLDOM.GETDOCUMENTELEMENT(doc);
node := DBE_XMLDOM.MAKENODE(elem);
map := DBE_XMLDOM.GETATTRIBUTES(node);
node2:= DBE_XMLDOM.GETNAMEDITEM(map,'category');
DBE_XMLDOM.writeToBuffer(node2, buf2);
dbe_output.print_line(buf2);
END;
/

-- 2. Return the node specified by name and namespace.
DECLARE
doc DBE_XMLDOM.DOMDocument;
root DBE_XMLDOM.DOMELEMENT;
elem DBE_XMLDOM.DOMELEMENT;
map DBE_XMLDOM.DOMNAMEDNODEMAP;
node DBE_XMLDOM.DOMNODE;
buf varchar2(1000);
buf2 varchar2(1000);
BEGIN
doc := dbe_xmldom.newdomdocument('<h:table xmlns:h="http://www.w3.org/TR/html4/">
<h:tr h:id="10"><h:td >Apples</h:td>
<h:td>Bananas</h:td></h:tr></h:table>');
root := DBE_XMLDOM.getDocumentElement(doc);
node := DBE_XMLDOM.MAKENODE(root);
node := dbe_xmldom.GETFIRSTCHILD(node);
map := DBE_XMLDOM.GETATTRIBUTES(node);
node := DBE_XMLDOM.GETNAMEDITEM(map,'id','http://www.w3.org/TR/html4/');
```

```
DBE_XMLDOM.writeToBuffer(node, buf2);
dbe_output.print_line(buf2);
END;
/
```

- DBE\_XMLDOM.GETNEXTSIBLING

Returns the next node. The prototype of the DBE\_XMLDOM.GETNEXTSIBLING function is as follows:

```
DBE_XMLDOM.GETNEXTSIBLING(
  n IN DOMNODE)
RETURN DOMNODE;
```

**Table 10-352** DBE\_XMLDOM.GETNEXTSIBLING parameters

| Parameter | Description            |
|-----------|------------------------|
| n         | Specified DOMNode node |

**Example:**

-- Obtain the first subnode after the DOC tree is converted into the DOMNode type, and obtain the name of the first subnode of the obtained first DOMNode node. Then, obtain the name of the next node through DBE\_XMLDOM.GETNEXTSIBLING.

```
DECLARE
  doc dbe_xmldom.domdocument;
  doc_node dbe_xmldom.domnode;
  root_node dbe_xmldom.domnode;
  inside_node dbe_xmldom.domnode;
  node_name varchar2(1000);
  node_type integer;
BEGIN
  doc := dbe_xmldom.newdomdocument('<computer size="ITX">
    <cpu>Ryzen 9 3950X</cpu>
    <ram>32GBx2 DDR4 3200MHz</ram>
    <motherboard>X570i</motherboard>
  </computer>');
  doc_node := DBE_XMLDOM.MAKENODE(doc);
  root_node := DBE_XMLDOM.GETFIRSTCHILD(doc_node);
  node_name := DBE_XMLDOM.GETNODENAME(root_node);
  node_type := DBE_XMLDOM.GETNODETYPE(root_node);
  dbe_output.print_line(node_name);
  dbe_output.print_line(node_type);
  inside_node := DBE_XMLDOM.GETFIRSTCHILD(root_node);
  node_name := DBE_XMLDOM.GETNODENAME(inside_node);
  dbe_output.print_line(node_name);
  inside_node := DBE_XMLDOM.GETNEXTSIBLING(inside_node);
  node_name := DBE_XMLDOM.GETNODENAME(inside_node);
  dbe_output.print_line(node_name);
END;
/
```

- DBE\_XMLDOM.GETNODENAME

Returns the name of a node. The prototype of the DBE\_XMLDOM.GETNODENAME function is as follows:

```
DBE_XMLDOM.GETNODENAME(
  n IN DOMNODE)
RETURN VARCHAR2;
```

**Table 10-353** DBE\_XMLDOM.GETNODENAME parameters

| Parameter | Description            |
|-----------|------------------------|
| n         | Specified DOMNode node |

**Example:**

```
-- Obtain the name of the specified DOMNode node from the DOC tree.
DECLARE
doc DBE_XMLDOM.DOMDocument;
root DBE_XMLDOM.DOMELEMENT;
root_node DBE_XMLDOM.DOMNode;
inside_node DBE_XMLDOM.DOMNode;
buf VARCHAR2(1000);
BEGIN
doc := dbe_xmldom.newdomdocument('<bookstore category="web" cover="paperback">
<book category="cooking"><title lang="en">Everyday Italian</title>
<author>Giada De Laurentiis</author><year>2005</year>
<price>30.00</price></book></bookstore>');
root := DBE_XMLDOM.getDocumentElement(doc);
root_node := DBE_XMLDOM.MAKENODE(root);
inside_node := DBE_XMLDOM.GETFIRSTCHILD(root_node);
buf := DBE_XMLDOM.GETNODENAME(inside_node);
dbe_output.print_line(buf);
END;
/
```

- DBE\_XMLDOM.GETNODETYPE

Returns the type of a node. The prototype of the DBE\_XMLDOM.GETNODETYPE function is as follows:

```
DBE_XMLDOM.GETNODETYPE(
n IN DOMNODE)
RETURN NUMBER;
```

**Table 10-354** DBE\_XMLDOM.GETNODETYPE parameters

| Parameter | Description            |
|-----------|------------------------|
| n         | Specified DOMNode node |

**Example:**

```
-- Obtain the type of the specified DOMNode node from the DOC tree.
DECLARE
doc DBE_XMLDOM.DOMDocument;
doc_node DBE_XMLDOM.DOMNode;
num number;
buf varchar2(1000);
BEGIN
doc := dbe_xmldom.newdomdocument('<bookstore category="web" cover="paperback">
<book category="cooking"><title lang="en">Everyday Italian</title>
<author>Giada De Laurentiis</author><year>2005</year>
<price>30.00</price></book></bookstore>');
doc_node := DBE_XMLDOM.makeNode(doc);
num := DBE_XMLDOM.GETNODETYPE(doc_node);
dbe_output.print_line(num);
buf := DBE_XMLDOM.GETNODENAME(doc_node);
dbe_output.print_line(buf);
END;
/
```

- DBE\_XMLDOM.GETNODEVALUE

Returns the value of a DOMNode node. The prototype of the DBE\_XMLDOM.GETNODEVALUE function is as follows:

```
DBE_XMLDOM.GETNODEVALUE(
  n IN DOMNODE)
RETURN VARCHAR2;
```

**Table 10-355** DBE\_XMLDOM.GETNODEVALUE parameters

| Parameter | Description              |
|-----------|--------------------------|
| n         | Specified DOMNode object |

**Example:**

```
-- Convert a DOMText node to a DOMNode node and obtain the value of the node.
DECLARE
  buf VARCHAR2(1000);
  doc DBE_XMLDOM.DOMDocument;
  text DBE_XMLDOM.DOMText;
  elem2 DBE_XMLDOM.DOMELEMENT;
  node DBE_XMLDOM.DOMNode;
begin
  doc := DBE_XMLDOM.NEWDOMDOCUMENT();
  text := DBE_XMLDOM.createTextNode(doc, 'aaa');
  DBE_XMLDOM.SETNODEVALUE(DBE_XMLDOM.makeNode(text), 'ccc');
  buf := DBE_XMLDOM.GETNODEVALUE(DBE_XMLDOM.makeNode(text));
  DBE_OUTPUT.print_line(buf);
end;
/
```

- DBE\_XMLDOM.GETPARENTNODE

Returns the parent node of the given DOMNode node. The prototype of the DBE\_XMLDOM.GETPARENTNODE function is as follows:

```
DBE_XMLDOM.GETPARENTNODE(
  n IN DOMNODE)
RETURN DOMNODE;
```

**Table 10-356** DBE\_XMLDOM.GETPARENTNODE parameters

| Parameter | Description              |
|-----------|--------------------------|
| n         | Specified DOMNode object |

**Example:**

```
-- Add a node to the DOC tree and obtain the name of its parent node.
DECLARE
  doc DBE_XMLDOM.DOMDocument;
  doc1 DBE_XMLDOM.DOMDocument;
  root DBE_XMLDOM.DOMELEMENT;
  child1 DBE_XMLDOM.DOMELEMENT;
  child2 DBE_XMLDOM.DOMELEMENT;
  attr DBE_XMLDOM.DOMAttr;
  text DBE_XMLDOM.DOMTEXT;
  node DBE_XMLDOM.DOMNode;
  parent DBE_XMLDOM.DOMNode;
  buf varchar2(1000);
```

```

BEGIN
  doc := DBE_XMLDOM.newDOMDocument();
  root := DBE_XMLDOM.createElement(doc, 'root');
  node := DBE_XMLDOM.appendChild(DBE_xmldom.makeNode(doc),DBE_xmldom.makeNode(root));
  child1 := DBE_XMLDOM.createElement(doc, 'child1');
  node := DBE_XMLDOM.appendChild(DBE_XMLDOM.makeNode(root),
DBE_XMLDOM.makeNode(child1));
  child2 := DBE_XMLDOM.createElement(doc, 'child2');
  node := DBE_XMLDOM.appendChild(DBE_XMLDOM.makeNode(child1),
DBE_XMLDOM.makeNode(child2));
  parent := DBE_XMLDOM.GETPARENTNODE(DBE_XMLDOM.makeNode(child2));
  buf := DBE_XMLDOM.GETNODENAME(parent);
  DBE_OUTPUT.print_line(buf);
END;
/

```

- **DBE\_XMLDOM.GETTAGNAME**

Returns the tag name of the specified DOMELEMENT node. The prototype of the DBE\_XMLDOM.GETTAGNAME function is as follows:

```

DBE_XMLDOM.GETTAGNAME(
  elem IN DOMELEMENT)
RETURN VARCHAR2;

```

**Table 10-357** DBE\_XMLDOM.GETTAGNAME parameters

| Parameter | Description               |
|-----------|---------------------------|
| elem      | Specified DOMELEMENT node |

**Example:**

-- Obtain the tag name of a DOMELEMENT node.

```

DECLARE
  doc dbe_xmldom.domdocument;
  elem dbe_xmldom.domelement;
  buffer varchar2(1010);
  value varchar(1000);
BEGIN
  doc := dbe_xmldom.newDOMDocument();
  elem := DBE_XMLDOM.CREATEELEMENT(DBE_XMLDOM.NEWDOMDOCUMENT(), 'root');
  value := DBE_XMLDOM.gettagname(elem);
  dbe_output.print_line('value: ');
  dbe_output.print_line(value);
  dbe_xmldom.writetobuffer(doc, buffer);
  dbe_output.print_line('buffer: ');
  dbe_output.print_line(buffer);
END;
/

```

- **DBE\_XMLDOM.HASCHILDNODES**

Checks whether the DOMNode object has any subnode. The prototype of the DBE\_XMLDOM.HASCHILDNODES function is as follows:

```

DBE_XMLDOM.HASCHILDNODES(
  n IN DOMNODE)
RETURN BOOLEAN;

```

**Table 10-358** DBE\_XMLDOM.HASCHILDNODES parameters

| Parameter | Description              |
|-----------|--------------------------|
| n         | Specified DOMNode object |

**Example:**

```
-- Create a node named child1, mount it to the DOC tree, and add a node to child1. Then, check
whether the child1 node has any subnode.
DECLARE
  doc DBE_XMLDOM.DOMDocument;
  doc1 DBE_XMLDOM.DOMDocument;
  root DBE_XMLDOM.DOMELEMENT;
  child1 DBE_XMLDOM.DOMELEMENT;
  child2 DBE_XMLDOM.DOMELEMENT;
  attr DBE_XMLDOM.DOMAttr;
  text DBE_XMLDOM.DOMTEXT;
  node DBE_XMLDOM.DOMNode;
  buf varchar2(1000);
BEGIN
  doc := DBE_XMLDOM.newDOMDocument();
  root := DBE_XMLDOM.createElement(doc, 'root');
  node := DBE_XMLDOM.appendChild(DBE_xmlldom.makeNode(doc),DBE_xmlldom.makeNode(root));
  child1 := DBE_XMLDOM.createElement(doc, 'child1');
  node := DBE_XMLDOM.appendChild(DBE_XMLDOM.makeNode(root),
DBE_XMLDOM.makeNode(child1));
  child2 := DBE_XMLDOM.createElement(doc, 'child2');
  node := DBE_XMLDOM.appendChild(DBE_XMLDOM.makeNode(child1),
DBE_XMLDOM.makeNode(child2));
  IF DBE_XMLDOM.HASCHILDNODES(DBE_XMLDOM.makeNode(child1)) THEN
    DBE_OUTPUT.print_line('HAS CHILD NODES');
  ELSE
    DBE_OUTPUT.print_line('NOT HAS CHILD NODES ');
  END IF;
END;
/
```

- **DBE\_XMLDOM.IMPORTNODE**

Copies a node to another node and mounts the copied node to a specified document. If the type of the copied node does not belong to the 12 types specified by constants of XML DOM, an exception indicating that the type is not supported is thrown. The prototype of the DBE\_XMLDOM.IMPORTNODE function is as follows:

```
DBE_XMLDOM.IMPORTNODE(
  doc IN DOMDOCUMENT,
  importedNode IN DOMNODE,
  deep IN BOOLEAN)
RETURN DOMNODE;
```

**Table 10-359** DBE\_XMLDOM.IMPORTNODE parameters

| Parameter    | Description                           |
|--------------|---------------------------------------|
| doc          | Document to which the node is mounted |
| importedNode | Node to be imported                   |

| Parameter | Description                                                                                                                                                                                                                                          |
|-----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| deep      | <p>Specifies whether to perform recursive import.</p> <ul style="list-style-type: none"> <li>If the value is <b>TRUE</b>, the node and all its subnodes are imported.</li> <li>If the value is <b>FALSE</b>, the node itself is imported.</li> </ul> |

**Example:**

-- Obtain the **root2\_node** node in the **DOC2** tree, copy it, and mount it to the **DOC** tree.

```
DECLARE
  doc dbe_xmlDOM.domdocument;
  doc2 dbe_xmlDOM.domdocument;
  doc_node dbe_xmlDOM.domnode;
  doc2_node dbe_xmlDOM.domnode;
  root_node dbe_xmlDOM.domnode;
  root2_node dbe_xmlDOM.domnode;
  import_node dbe_xmlDOM.domnode;
  result_node dbe_xmlDOM.domnode;
  buffer varchar2(1010);
BEGIN
  doc := dbe_xmlDOM.newDOMdocument('<bookstore category="web" cover="paperback">
    <book category="cooking"><title lang="en">Everyday Italian</title>
    <author>Giada De Laurentiis</author><year>2005</year>
    <price>30.00</price></book></bookstore>');
  doc2 := dbe_xmlDOM.newDOMdocument('<case>LIANLI TU150</case>');
  doc_node := DBE_XMLDOM.MAKENODE(doc);
  doc2_node := DBE_XMLDOM.MAKENODE(doc2);
  root_node := DBE_XMLDOM.GETFIRSTCHILD(doc_node);
  root2_node := DBE_XMLDOM.GETFIRSTCHILD(doc2_node);
  DBE_XMLDOM.WRITETOBUFFER(doc, buffer);
  dbe_output.print_line(buffer);
  import_node := DBE_XMLDOM.IMPORTNODE(doc, root2_node, TRUE);
  result_node := DBE_XMLDOM.APPENDCHILD(root_node, import_node);
  DBE_XMLDOM.WRITETOBUFFER(doc, buffer);
  dbe_output.print_line(buffer);
END;
/
```

- **DBE\_XMLDOM.ISNULL**

Checks whether the given DOMAttr node is null. If yes, **TRUE** is returned. Otherwise, **FALSE** is returned. The prototype of the DBE\_XMLDOM.ISNULL function is as follows:

```
DBE_XMLDOM.ISNULL(
  a IN DOMATTR)
RETURN BOOLEAN;
```

Checks whether the given DOMDocument node is null. If yes, **TRUE** is returned. Otherwise, **FALSE** is returned. The prototype of the DBE\_XMLDOM.ISNULL function is as follows:

```
DBE_XMLDOM.ISNULL(
  doc IN DOMDOCUMENT)
RETURN BOOLEAN;
```

Checks whether the given DOMELEMENT node is null. If yes, **TRUE** is returned. Otherwise, **FALSE** is returned. The prototype of the DBE\_XMLDOM.ISNULL function is as follows:

```
DBE_XMLDOM.ISNULL(  
  elem IN DOMELEMENT)  
RETURN BOOLEAN;
```

Checks whether the given DOMNamedNodeMap node is null. If yes, **TRUE** is returned. Otherwise, **FALSE** is returned. The prototype of the DBE\_XMLDOM.ISNULL function is as follows:

```
DBE_XMLDOM.ISNULL(  
  nnm IN DOMNAMEDNODEMAP)  
RETURN BOOLEAN;
```

Checks whether the given DOMNode node is null. If yes, **TRUE** is returned. Otherwise, **FALSE** is returned. The prototype of the DBE\_XMLDOM.ISNULL function is as follows:

```
DBE_XMLDOM.ISNULL(  
  n IN DOMNODE)  
RETURN BOOLEAN;
```

Checks whether the given DOMNodeList node is null. If yes, **TRUE** is returned. Otherwise, **FALSE** is returned. The prototype of the DBE\_XMLDOM.ISNULL function is as follows:

```
DBE_XMLDOM.ISNULL(  
  nl IN DOMNODELIST)  
RETURN BOOLEAN;
```

Checks whether the given DOMText node is null. If yes, **TRUE** is returned. Otherwise, **FALSE** is returned. The prototype of the DBE\_XMLDOM.ISNULL function is as follows:

```
DBE_XMLDOM.ISNULL(  
  t IN DOMTEXT)  
RETURN BOOLEAN;
```

**Table 10-360** DBE\_XMLDOM.ISNULL parameters

| Parameter | Description                    |
|-----------|--------------------------------|
| a         | Specified DOMAttr node         |
| doc       | Specified DOMDocument node     |
| elem      | Specified DOMELEMENT node      |
| nnm       | Specified DOMNamedNodeMap node |
| n         | Specified DOMNode node         |
| nl        | Specified DOMNodeList node     |
| t         | Specified DOMText node         |

 **NOTE**

Due to the implementation difference of DBE\_XMLDOM.FREEDOCUMENT, an error is reported when the DBE\_XMLDOM.ISNULL interface calls the freed DOMDocument node.

**Example:**

```
--1. Use createAttribute to create a DOMAttr node and check whether the node is empty.  
-- 2. Declare (but not initialize) a DOMELEMENT node and check whether the node is empty.  
DECLARE  
docelem DBE_XMLDOM.DOMELEMENT;
```

```
BEGIN
  if DBE_XMLDOM.ISNULL(docelem) then
    DBE_OUTPUT.print_line('null');
  else
    DBE_OUTPUT.print_line('not null');
  end if;
END;
/
```

- **DBE\_XMLDOM.ITEM**

Returns the element corresponding to the index in a list based on the index. The prototype of the DBE\_XMLDOM.ITEM function is as follows:

```
DBE_XMLDOM.ITEM(
  nl IN DOMNODELIST,
  index IN NUMBER)
RETURN DOMNODE;
```

Returns the element corresponding to the index in a map based on the index. The prototype of the DBE\_XMLDOM.ITEM function is as follows:

```
DBE_XMLDOM.ITEM(
  nnm IN DOMNAMEDNODEMAP,
  index IN NUMBER)
RETURN DOMNODE;
```

**Table 10-361** DBE\_XMLDOM.ITEM parameters

| Parameter | Description                          |
|-----------|--------------------------------------|
| nl        | Specified DOMNodeList object         |
| nnm       | Specified DOMNamedNodeMap object     |
| index     | Index of the element to be retrieved |

 **NOTE**

For improper input parameters such as Boolean and CLOB, the item function of the map type points to the value of the first index by default.

**Example:**

```
-- 1. Return the element corresponding to the index in a map based on the index.
DECLARE
  doc DBE_XMLDOM.DOMDocument;
  elem DBE_XMLDOM.DOMELEMENT;
  map DBE_XMLDOM.DOMNAMEDNODEMAP;
  node DBE_XMLDOM.DOMNODE;
  node2 DBE_XMLDOM.DOMNODE;
  buf varchar2(1000);
BEGIN
  doc := dbe_xmldom.newdomdocument('<bookstore category="web" cover="paperback"><book
category="cooking">
  <title lang="en">Everyday Italian</title><author>Giada De Laurentiis</author>
  <year>2005</year><price>30.00</price></book></bookstore>');
  elem := DBE_XMLDOM.GETDOCUMENTELEMENT(doc);
  node := DBE_XMLDOM.MAKENODE(elem);
  map := DBE_XMLDOM.GETATTRIBUTES(DBE_XMLDOM.getFirstChild(node));
  node2:= DBE_XMLDOM.item(map,0);
  DBE_XMLDOM.writeToBuffer(node2, buf);
  dbe_output.print_line(buf);
  dbe_xmldom.freedocument(doc);
  RAISE NOTICE '%', buf;
```

```

END;
/

-- 2. Return the element corresponding to the index in a list based on the index.
DECLARE
  doc dbexml.domdocument;
  node dbexml.domnode;
  node1 dbexml.domnode;
  nodelist DBEXML.DOMNODELIST;
  len INTEGER;
  buffer1 varchar2(1010);
BEGIN
  doc := dbexml.newdomdocument('<bookstore category="web" cover="paperback"><book
category="cooking">
  <title lang="en">Everyday Italian</title><author>Giada De Laurentiis</author>
  <year>2005</year><price>30.00</price></book></bookstore>');
  node := dbexml.makenode(doc);
  node := dbexml.getfirstchild(node);
  node := dbexml.getfirstchild(node);
  nodelist := DBEXML.getchildnodes(node);
  len := DBEXML.getlength(nodelist);
  RAISE NOTICE 'len : %', len;
  node1 := DBEXML.item(nodelist, 0);
  IF DBEXML.isnull(node1) THEN
    db_output.print_line('IS NULL');
  ELSE
    db_output.print_line('NOT NULL');
  END IF;
  dbexml.writetobuffer(node1, buffer1);
  db_output.print_line('buffer1: ');
  db_output.print_line(buffer1);
END;
/

```

- DBEXML.MAKEELEMENT

Returns the DOMElement object after conversion. The prototype of the DBEXML.MAKEELEMENT function is as follows:

```

DBEXML.MAKEELEMENT(
  n IN DOMNODE)
RETURN DOMELEMENT;

```

**Table 10-362** DBEXML.MAKEELEMENT parameters

Parameter	Description
n	Specified DOMNode object

**Example:**

-- Forcibly convert the DOMNode node converted from the DOMElement type back to the DOMElement type.

```

DECLARE
  buf VARCHAR2(1000);
  doc DBEXML.DOMDOCUMENT;
  elem DBEXML.DOMELEMENT;
  elem2 DBEXML.DOMELEMENT;
  node DBEXML.DOMNODE;
BEGIN
  doc := DBEXML.newdomdocument();
  elem := DBEXML.createElement(doc, 'aaa');
  node := DBEXML.makeNode(elem);
  elem2 := DBEXML.makeElement(node);
  buf := DBEXML.getnodename(DBEXML.makeNode(elem2));
  DB_OUTPUT.print_line(buf);

```

```
END;  
/
```

- DBE\_XMLDOM.MAKENODE

Forcibly converts a specified DOMAttr node to a DOMNode node and returns the DOMNode node. The prototype of the DBE\_XMLDOM.MAKENODE function is as follows:

```
DBE_XMLDOM.MAKENODE(  
  a    IN  DOMATTR)  
RETURN DOMNODE;
```

Forcibly converts a specified DOMDocument node to a DOMNode node and returns the DOMNode node. The prototype of the DBE\_XMLDOM.MAKENODE function is as follows:

```
DBE_XMLDOM.MAKENODE(  
  doc  IN  DOMDOCUMENT)  
RETURN DOMNODE;
```

Forcibly converts a specified DOMELEMENT node to a DOMNode node and returns the DOMNode node. The prototype of the DBE\_XMLDOM.MAKENODE function is as follows:

```
DBE_XMLDOM.MAKENODE(  
  elem IN  DOMELEMENT)  
RETURN DOMNODE;
```

Forcibly converts a specified DOMText node to a DOMNode node and returns the DOMNode node. The prototype of the DBE\_XMLDOM.MAKENODE function is as follows:

```
DBE_XMLDOM.MAKENODE(  
  t    IN  DOMTEXT)  
RETURN DOMNODE;
```

**Table 10-363** DBE\_XMLDOM.MAKENODE parameters

Parameter	Description
a	Specified DOMAttr node
doc	Specified DOMDocument node
elem	Specified DOMELEMENT node
t	Specified DOMText node

 **NOTE**

Due to syntax restrictions, when DBE\_XMLDOM.MAKENODE is used as the return value of a function, it cannot be directly implemented by running the following command:

```
return DBE_XMLDOM.MAKENODE(doc);
```

You are advised to run the following command:

```
tmp_node := DBE_XMLDOM.MAKENODE(doc );  
return tmp_node;
```

Example:

```
--3. Use newdomdocument to create a parameter of the DOMDocument type. The parameter is not empty and is used as the input parameter of MAKENODE.
```

```
-- 4. Declare (but not initialize) a DOMText variable, and use it as the input parameter of MAKENODE.
DECLARE
text DBE_XMLDOM.DOMTEXT;
buf VARCHAR2(1000);
dom_node DBE_XMLDOM.DOMNODE;
BEGIN
dom_node := DBE_XMLDOM.makeNode(text);
buf := DBE_XMLDOM.GETNODENAME(dom_node);
DBE_OUTPUT.print_line(buf);
END;
/
```

- **DBE\_XMLDOM.NEWDOMDOCUMENT**

Returns a new DOMDocument object. The prototype of the DBE\_XMLDOM.NEWDOMDOCUMENT function is as follows:

```
DBE_XMLDOM.NEWDOMDOCUMENT
RETURN DOMDOCUMENT;
```

Returns a new DOMDocument instance object created from the specified XMLType type. The prototype of the DBE\_XMLDOM.NEWDOMDOCUMENT function is as follows:

```
DBE_XMLDOM.NEWDOMDOCUMENT(
xml doc IN SYS.XMLTYPE)
RETURN DOMDOCUMENT;
```

Returns a new DOMDocument instance object created from the specified CLOB type. The prototype of the DBE\_XMLDOM.NEWDOMDOCUMENT function is as follows:

```
DBE_XMLDOM.NEWDOMDOCUMENT(
cl IN CLOB)
RETURN DOMDOCUMENT;
```

**Table 10-364** DBE\_XMLDOM.NEWDOMDOCUMENT parameters

Parameter	Description
xml doc	Specified XMLType type
cl	Specified CLOB type

 **NOTE**

- The size of the input parameter must be less than 2 GB.
- Currently, external DTD parsing is not supported.
- The document created by NEWDOMDOCUMENT uses the UTF-8 character set by default.
- Each document parsed from the same XMLType instance is independent, and the modification of the document does not affect the XMLType.
- For details about the differences between our database and database A, see [DBE\\_XMLPARSER.PARSECLOB](#).

**Example:**

```
-- 1. Return a new DOMDocument object.
DECLARE
doc dbe_xmldom.domdocument;
buffer varchar2(1010);
BEGIN
doc := dbe_xmldom.newdomdocument();
```

```

dbe_xmldom.setdoctype(doc, 'note', 'sysid', 'pubid');
dbe_xmldom.writetobuffer(doc, buffer);
dbe_output.print_line('buffer: ');
dbe_output.print_line(buffer);
dbe_xmldom.freedocument(doc);
END;
/

-- 2. Return a new DOMDocument instance object created from the specified CLOB type.
DECLARE
doc dbe_xmldom.domdocument;
buffer varchar2(1010);
BEGIN
doc := dbe_xmldom.newdomdocument('<?xml version="1.0"?>
<note><to>test</to><from>Jani</from><heading>Reminder</heading>
<body>Don"t forget me this weekend!</body></note>');
dbe_xmldom.writetobuffer(doc, buffer);
dbe_output.print_line('buffer: ');
dbe_output.print_line(buffer);
dbe_xmldom.freedocument(doc);
END;
/

-- 3. Return a new DOMDocument instance object created from the specified XMLType type.
DECLARE
doc dbe_xmldom.domdocument;
xt xmltype;
buffer varchar2(1010);
BEGIN
xt := xmltype('<h:data xmlns:h="http://www.w3.org/TR/html4/">
<h:da1 len="10">test namespace</h:da1>
<h:da1>bbbbbbbbbb</h:da1>
</h:data>');
doc := dbe_xmldom.newdomdocument(xt);
dbe_xmldom.writetobuffer(doc, buffer);
dbe_output.print_line('buffer: ');
dbe_output.print_line(buffer);
dbe_xmldom.freedocument(doc);
END;
/

```

- **DBE\_XMLDOM.SETATTRIBUTE**

Sets the value of the DOMELEMENT attribute by name. The prototype of the DBE\_XMLDOM.SETATTRIBUTE function is as follows:

```

DBE_XMLDOM.SETATTRIBUTE(
elem IN DOMELEMENT,
name IN VARCHAR2,
value IN VARCHAR2);

```

Sets the attribute values of a DOMELEMENT object by name and namespace URI. The prototype of the DBE\_XMLDOM.SETATTRIBUTE function is as follows:

```

DBE_XMLDOM.SETATTRIBUTE(
elem IN DOMELEMENT,
name IN VARCHAR2,
value IN VARCHAR2,
ns IN VARCHAR2);

```

**Table 10-365** DBE\_XMLDOM.SETATTRIBUTE parameters

Parameter	Description
elem	Specified DOMELEMENT node
name	Attribute name

Parameter	Description
value	Attribute value
ns	Namespace

**NOTE**

Multiple attributes can be added through the DBE\_XMLDOM.SETATTRIBUTE interface. The attribute name cannot be null, and attributes with the same name cannot exist in the same DOMELEMENT node. If you want to add attributes with the same name, you should explicitly set a namespace for each attribute with the same name, but you are advised not to perform such operations. If an attribute exists in a namespace, the specified namespace must be displayed when you modify the attribute. Otherwise, the attribute with the same name is added.

**Example:**

-- 1. Set the value of the DOMELEMENT attribute by name.

```
DECLARE
  doc dbe_xmldom.domdocument;
  elem dbe_xmldom.domelement;
  docnode DBE_XMLDOM.DOMNode;
  buffer varchar2(1010);
  value varchar(1000);
BEGIN
  doc := dbe_xmldom.newDOMDocument();
  elem := DBE_XMLDOM.CREATEELEMENT(doc, 'root');
  DBE_XMLDOM.setattribute(elem, 'len', '50cm');
  docnode := DBE_XMLDOM.appendChild(DBE_XMLDOM.makeNode(doc),
  DBE_XMLDOM.makeNode(elem));
  dbe_xmldom.writetobuffer(doc, buffer);
  dbe_output.print_line('buffer: ');
  dbe_output.print_line(buffer);
END;
/
```

-- 2. Set the attribute values of a DOMELEMENT object by name and namespace URI.

```
DECLARE
  doc dbe_xmldom.domdocument;
  elem dbe_xmldom.domelement;
  docnode DBE_XMLDOM.DOMNode;
  buffer varchar2(1010);
  value varchar(1000);
begin
  doc := dbe_xmldom.newDOMDocument();
  elem := DBE_XMLDOM.CREATEELEMENT(doc, 'root');
  DBE_XMLDOM.setattribute(elem, 'len', '50cm', 'www.huawei.com');
  docnode := DBE_XMLDOM.appendChild(DBE_XMLDOM.makeNode(doc),
  DBE_XMLDOM.makeNode(elem));
  dbe_xmldom.writetobuffer(doc, buffer);
  dbe_output.print_line('buffer: ');
  dbe_output.print_line(buffer);
END;
/
```

-- 3. Change the values of the DOMELEMENT attributes by name.

```
DECLARE
  doc dbe_xmldom.domdocument;
  elem dbe_xmldom.domelement;
  docnode DBE_XMLDOM.DOMNode;
  buffer varchar2(1010);
  value varchar(1000);
BEGIN
  doc := dbe_xmldom.newDOMDocument();
  elem := DBE_XMLDOM.CREATEELEMENT(doc, 'root');
```

```

DBE_XMLDOM.setattribute(elem, 'len', '50cm');
DBE_XMLDOM.setattribute(elem, 'len', '55cm');
docnode := DBE_XMLDOM.appendChild(DBE_XMLDOM.makeNode(doc),
DBE_XMLDOM.makeNode(elem));
dbe_xmldom.writetobuffer(doc, buffer);
dbe_output.print_line('buffer: ');
dbe_output.print_line(buffer);
END;
/

-- 4. Change the values of the DOMELEMENT attributes by name and namespace URI.
DECLARE
doc dbe_xmldom.domdocument;
elem dbe_xmldom.domelement;
docnode DBE_XMLDOM.DOMNode;
buffer varchar2(1010);
value varchar(1000);
begin
doc := dbe_xmldom.newDOMDocument();
elem := DBE_XMLDOM.CREATEELEMENT(doc, 'root');
DBE_XMLDOM.setattribute(elem, 'len', '50cm', 'www.huawei.com');
DBE_XMLDOM.setattribute(elem, 'len', '55cm', 'www.huawei.com');
docnode := DBE_XMLDOM.appendChild(DBE_XMLDOM.makeNode(doc),
DBE_XMLDOM.makeNode(elem));
dbe_xmldom.writetobuffer(doc, buffer);
dbe_output.print_line('buffer: ');
dbe_output.print_line(buffer);
END;
/

```

- DBE\_XMLDOM.SETCHARSET

Sets the character set for a DOMDocument object. The prototype of the DBE\_XMLDOM.SETCHARSET function is as follows:

```

DBE_XMLDOM.SETCHARSET(
doc IN DOMDocument,
charset IN VARCHAR2);

```

**Table 10-366** DBE\_XMLDOM.SETCHARSET parameters

Parameter	Description
doc	Specified DOMDocument node
charset	Character set

 **NOTE**

- The value of **charset** contains a maximum of 60 bytes.
- Currently, the following character sets are supported: UTF-8, UTF-16, UCS-4, UCS-2, ISO-8859-1, ISO-8859-2, ISO-8859-3, ISO-8859-4, ISO-8859-5, ISO-8859-6, ISO-8859-7, ISO-8859-8, ISO-8859-9, ISO-2022-JP, Shift\_JIS, EUC-JP and ASCII. If you enter other character sets, an error is reported or garbled characters may be displayed.

**Example:**

```

-- Set the UTF-16 character set for the DOC tree and print the DOC tree to the buffer.
DECLARE
doc dbe_xmldom.domdocument;
buffer varchar2(1010);
BEGIN
doc := dbe_xmldom.newdomdocument('<?xml version="1.0"?>
<!DOCTYPE note [<!ELEMENT note (to,from,heading,body)><!ELEMENT to (#PCDATA)>

```

```

<!ELEMENT from (#PCDATA)><!ELEMENT heading (#PCDATA)><!ELEMENT body (#PCDATA)>]
<note><to>test</to><from>Jani</from><heading>Reminder</heading>
<body>Don't forget me this weekend!</body></note>');
dbe_xmlDOM.setcharset(doc, 'utf-16');
dbe_xmlDOM.writetobuffer(doc, buffer);
dbe_output.print_line('buffer: ');
dbe_output.print_line(buffer);
dbe_xmlDOM.freedocument(doc);
END;
/

```

- **DBE\_XMLDOM.SETDOCTYPE**  
Sets the external DTD of a DOMDocument object. The prototype of the DBE\_XMLDOM.SETDOCTYPE function is as follows:

```

DBE_XMLDOM.SETDOCTYPE(
  doc IN DOMDocument,
  name IN VARCHAR2,
  sysid IN VARCHAR2,
  pubid IN VARCHAR2);

```

**Table 10-367** DBE\_XMLDOM.SETDOCTYPE parameters

Parameter	Description
doc	Specified DOMDocument node
name	Name of the DOCTYPE to be initialized
sysid	ID of the system whose DOCTYPE needs to be initialized
pubid	Public ID of the DOCTYPE to be initialized

 **NOTE**

The total length of **name**, **sysid**, and **pubid** cannot exceed 32500 bytes.

**Example:**

-- After the initial system ID, public ID, and name are set for the external DTD of the DOMDocument, the DOC tree modified each time is output to the buffer.

```

DECLARE
  doc dbe_xmlDOM.domdocument;
  buffer varchar2(1010);
begin
  doc := dbe_xmlDOM.newdomdocument('<?xml version="1.0"?>
<!DOCTYPE note [<!ELEMENT note (to,from,heading,body)><!ELEMENT to (#PCDATA)>
<!ELEMENT from (#PCDATA)><!ELEMENT heading (#PCDATA)><!ELEMENT body (#PCDATA)>]
<note><to>test</to><from>Jani</from><heading>Reminder</heading>
<body>Don't forget me this weekend!</body></note>');
dbe_xmlDOM.setdoctype(doc, 'note', 'sysid', 'pubid');
dbe_xmlDOM.writetobuffer(doc, buffer);
dbe_output.print_line('buffer: ');
dbe_output.print_line(buffer);
dbe_output.print_line('-----');
dbe_xmlDOM.setdoctype(doc, 'n0te', NULL, '');
dbe_xmlDOM.setdoctype(doc, 'n0t1e', NULL, '');
dbe_xmlDOM.writetobuffer(doc, buffer);
dbe_output.print_line('buffer: ');
dbe_output.print_line(buffer);

```

```
dbe_xmlDOM.freedocument(doc);
END;
/
```

- DBE\_XMLDOM.SETNODEVALUE

Sets the value of a node in the DOMNode object. The prototype of the DBE\_XMLDOM.SETNODEVALUE function is as follows:

```
DBE_XMLDOM.SETNODEVALUE(
n IN DOMNODE,
nodeValue IN VARCHAR2);
```

**Table 10-368** DBE\_XMLDOM.SETNODEVALUE parameters

Parameter	Description
n	Specified DOMNode object
nodeValue	String to be set in the DOMNode object

 **NOTE**

1. You can enter an empty string or null value for **nodeValue**, but the node value will not be changed.
2. Currently, **nodeValue** does not support the escape character '&'. If the character string contains the escape character, the node value will be cleared.
3. The default maximum length of **nodeValue** is restricted by the VARCHAR2 type and is 32767 bytes. If the length exceeds 32767 bytes, an exception is thrown.

**Example:**

-- After setting a node value different from the initial value for the DOMNode node that is converted from DOMText, obtain and output the node value.

```
DECLARE
buf VARCHAR2(1000);
doc DBE_XMLDOM.DOMDOCUMENT;
text DBE_XMLDOM.DOMTEXT;
elem2 DBE_XMLDOM.DOMELEMENT;
node DBE_XMLDOM.DOMNODE;
BEGIN
doc := DBE_XMLDOM.NEWDOMDOCUMENT();
text := DBE_XMLDOM.CREATETEXTNODE(doc, 'aaa');
DBE_XMLDOM.SETNODEVALUE(DBE_XMLDOM.MAKENODE(text), 'ccc');
buf := DBE_XMLDOM.GETNODEVALUE(DBE_XMLDOM.MAKENODE(text));
DBE_OUTPUT.PRINT_LINE(buf);
END;
/
```

- DBE\_XMLDOM.WRITETOBUFFER

Writes an XML node to a specified buffer using the database character set. The prototype of the DBE\_XMLDOM.WRITETOBUFFER function is as follows:

```
DBE_XMLDOM.WRITETOBUFFER(
doc IN DOMDOCUMENT,
buffer INOUT VARCHAR2);
```

Writes an XML document to a specified buffer using the database character set. The prototype of the DBE\_XMLDOM.WRITETOBUFFER function is as follows:

```
DBE_XMLDOM.WRITETOBUFFER(
n      IN      DOMNODE,
buffer INOUT  VARCHAR2);
```

**Table 10-369** DBE\_XMLDOM.WRITETOBUFFER parameters

Parameter	Description
doc	Specified DOMDocument node
buffer	Buffer for the write operation
n	Specified DOMNode node

 **NOTE**

- The buffer to which the writetobuffer function writes is less than 1 GB.
- This function adds content such as indentation to format the output. The output document will contain the XML declaration version and encoding.
- By default, XML files are output in the UTF-8 character set.

**Example:**

```
-- 1. Enter a parameter of the DOMNode type.
DECLARE
  doc dbe_xmldom.domdocument;
  elem DBE_XMLDOM.DOMELEMENT;
  buf varchar2(1000);
BEGIN
  doc := dbe_xmldom.newdomdocument();
  elem := dbe_xmldom.createelement(doc,'elem');
  DBE_XMLDOM.WRITETOBUFFER(dbe_xmldom.makenode(elem), buf);
  DBE_OUTPUT.print_line(buf);
END;
/

-- 2. Enter a parameter of the DOMDocument type.
DECLARE
  doc DBE_XMLDOM.DOMDocument;
  buf VARCHAR2(1000);
BEGIN
  doc := dbe_xmldom.newdomdocument('<?xml version="1.0"?>
<!DOCTYPE note [<!ELEMENT note (to,from,heading,body)><!ELEMENT to (#PCDATA)>
<!ELEMENT from (#PCDATA)><!ELEMENT heading (#PCDATA)><!ELEMENT body (#PCDATA)>]
<note><to>test</to><from>Jani</from><heading>Reminder</heading>
<body>Don"t forget me this weekend!</body></note>');
  DBE_XMLDOM.WRITETOBUFFER(doc, buf);
  DBE_OUTPUT.print_line('doc: ');
  DBE_OUTPUT.print_line(buf);
  DBE_XMLDOM.FREEDOCUMENT(doc);
END;
/
```

- **DBE\_XMLDOM.WRITETOCLOB**

Writes an XML node to a specified CLOB using the database character set. The prototype of the DBE\_XMLDOM.WRITETOCLOB function is as follows:

```
DBE_XMLDOM.WRITETOCLOB(
  doc IN  DOMDOCUMENT,
  cl   INOUT CLOB);
```

Writes an XML node to a specified CLOB using the database character set. The prototype of the DBE\_XMLDOM.WRITETOCLOB function is as follows:

```
DBE_XMLDOM.WRITETOCLOB(
n    IN    DOMNODE,
cl   INOUT CLOB);
```

**Table 10-370** DBE\_XMLDOM.WRITETOCLOB parameters

Parameter	Description
doc	Specified DOMDocument node
cl	CLOB to be written
n	Specified DOMNode node

 **NOTE**

- The **doc** parameter is an input parameter. The value of **writetoclob** is less than 2 GB.
- This function adds content such as indentation to format the output. The output document will contain the XML declaration version and encoding.
- By default, XML files are output in the UTF-8 character set.

**Example:**

```
-- 1. Enter a parameter of the DOMNode type.
DECLARE
CL CLOB;
N DBE_XMLDOM.DOMNODE;
BEGIN
DBE_XMLDOM.WRITETOCLOB(N, CL);
DBE_OUTPUT.PRINT_LINE(CL);
END;
/

-- 2. Enter a parameter of the DOMDocument type.
DECLARE
doc dbe_xmldom.domdocument;
mclob clob;
BEGIN
doc := dbe_xmldom.newdomdocument('<?xml version="1.0"?>
<!DOCTYPE note [<!ELEMENT note (to,from,heading,body)><!ELEMENT to (#PCDATA)>
<!ELEMENT from (#PCDATA)><!ELEMENT heading (#PCDATA)><!ELEMENT body (#PCDATA)>]>
<note><to>test</to><from>Jani</from><heading>Reminder</heading>
<body>Don"t forget me this weekend!</body></note>');
dbe_xmldom.writetoclob(doc, mclob);
dbe_output.print_line('mclob: ');
dbe_output.print_line(mclob);
dbe_xmldom.freedocument(doc);
END;
/
```

- **DBE\_XMLDOM.WRITETOFILE**

Writes an XML node to a specified file using the database character set. The prototype of the DBE\_XMLDOM.WRITETOFILE function is as follows:

```
DBE_XMLDOM.WRITETOFILE(
doc IN DOMDOCUMENT,
fileName IN VARCHAR2);
```

Writes an XML node to a specified file using the database character set. The prototype of the DBE\_XMLDOM.WRITETOFILE function is as follows:

```
DBE_XMLDOM.WRITETOCLOB(
  n      IN      DOMNODE,
  fileName IN   VARCHAR2);
```

Writes an XML document to a specified file using the specified character set. The prototype of the DBE\_XMLDOM.WRITETOCLOB function is as follows:

```
DBE_XMLDOM.WRITETOCLOB(
  doc IN   DOMDOCUMENT,
  fileName IN   VARCHAR2,
  charset IN VARCHAR2);
```

Writes an XML document to a specified file using the specified character set. The prototype of the DBE\_XMLDOM.WRITETOCLOB function is as follows:

```
DBE_XMLDOM.WRITETOCLOB(
  n      IN      DOMNODE,
  fileName IN   VARCHAR2,
  charset IN VARCHAR2);
```

**Table 10-371** DBE\_XMLDOM.WRITETOCLOB parameters

Parameter	Description
doc	Specified DOMDocument node
fileName	File to be written
n	Specified DOMNode node
charset	Specified character set

 **NOTE**

- The **doc** parameter is an input parameter. The value of **filename** can contain a maximum of 255 bytes, and the value of **charset** can contain a maximum of 60 bytes. For details about the character sets supported by **charset**, see the [DBE\\_XMLDOM.SETCHARSET](#) interface.
- This function adds content such as indentation to format the output. The output document will contain the XML declaration version and encoding.
- If `newdomdocument()` is used to create a document without parameters, no error is reported when **charset** is not specified. The UTF-8 character set is used by default.
- The **filename** must be in the path created in **pg\_directory**. The backslash (\) in the filename will be converted to a slash (/). Only one slash (/) is allowed. The file name must be in the **pg\_directory\_name/file\_name.xml** format. The output file must be in the XML format.
- When the GUC parameter **safe\_data\_path** is enabled, you can only use the advanced package to read and write files in the file path specified by **safe\_data\_path**.
- Before creating a directory, ensure that the directory exists in the operating system and the user has the read and write permissions on the directory. For details about how to create a directory, see [CREATE DIRECTORY](#).

**Example:**

```
-- Before creating a directory, ensure that the directory exists in the operating system and the user
has the read and write permissions on the directory.
create directory dir as '/tmp';
-- 1. Write an XML node to a specified file using the database character set.
DECLARE
  FPATH VARCHAR2(1000);
  DOC   DBE_XMLDOM.DOMDOCUMENT;
```

```
BEGIN
DOC := DBE_XMLDOM.NEWDOMDOCUMENT('<ROOT>
<A ATTR1="A_VALUE">
<ACHILD>ACHILD TXT</ACHILD>
</A>
<B>B TXT</B>
<C/>
</ROOT>');
FPATH := 'dir/simplexml.xml';
DBE_XMLDOM.WRITETOFILE(DOC, FPATH);
END;
/

-- 2. Write an XML document to a specified file using the specified character set.
DECLARE
SRC VARCHAR(1000);
FPATH VARCHAR2(1000);
DOC DBE_XMLDOM.DOMDOCUMENT;
ELE DBE_XMLDOM.DOMELEMENT;
BEGIN
FPATH := 'dir/simplexml.xml';
SRC := '<ROOT>
<A ATTR1="A_VALUE">
<ACHILD>ACHILD TXT</ACHILD>
</A>
<B>B TXT</B>
<C/>
</ROOT>';
DOC := DBE_XMLDOM.NEWDOMDOCUMENT(SRC);
ELE := DBE_XMLDOM.GETDOCUMENTELEMENT(DOC);
DBE_XMLDOM.WRITETOFILE(DBE_XMLDOM.MAKENODE(ELE), FPATH, 'ASCII');
DBE_XMLDOM.FREEDOCUMENT(DOC);
END;
/
drop directory dir;
```

- **DBE\_XMLDOM.GETSESSIONTREENUM**

Queries the number of DOM trees of all types in the current session. The prototype of the DBE\_XMLDOM.GETSESSIONTREENUM function is as follows:

```
DBE_XMLDOM.GETSESSIONTREENUM()
RETURN INTEGER;
```

#### NOTE

For DOM trees that have used FREEElement and FREENode, this function still counts them.

#### Example:

-- Create three documents and obtain the number of DOM trees in the current session.

```
DECLARE
doc DBE_XMLDOM.DOMDocument;
doc2 DBE_XMLDOM.DOMDocument;
doc3 DBE_XMLDOM.DOMDocument;

buffer varchar2(1010);
BEGIN
-- Create three documents.
doc := DBE_XMLDOM.NEWDOMDOCUMENT('<?xml version="1.0"?>
<root>
<elem1 attr="attrtest">
<elem2>Im text</elem2>
<elem3>Im text too</elem3>
</elem1>
<elem4>Text</elem4>
</root>
');
doc2 := DBE_XMLDOM.NEWDOMDOCUMENT('<?xml version="1.0"?>
<computer size="ITX" price="19999">
<cpu>Ryzen 9 3950X</cpu>
```

```
<ram>32GBx2 DDR4 3200MHz</ram>
<motherboard>ROG X570i</motherboard>
<gpu>RTX2070 Super</gpu>
<ssd>1TB NVMe Toshiba + 2TB NVMe WD Black</ssd>
<hdd>12TB WD Digital</hdd>
<psu>CORSAIR SF750</psu>
<case>LIANLI TU150</case>
</computer>
');
doc3 := DBE_XMLDOM.NEWDOMDOCUMENT('<?xml version="1.0"?>
<bookstore>
  <book genre="autobiography" publicationdate="1981" ISBN="1-861003-11-0">
    <title>The Autobiography of Benjamin Franklin</title>
    <author>
      <first-name>Benjamin</first-name>
      <last-name>Franklin</last-name>
    </author>
    <price>8.99</price>
  </book>
  <book genre="novel" publicationdate="1967" ISBN="0-201-63361-2">

    <author>
      <first-name>Herman</first-name>
      <last-name>Melville</last-name>
    </author>
    <price>11.99</price>
  </book>
  <book genre="philosophy" publicationdate="1991" ISBN="1-861001-57-6">
    <title>The Gorgias</title>
    <author>
      <name>Plato</name>
    </author>
    <price>9.99</price>
  </book>
</bookstore>
');

-- Print IDs.
DBE_OUTPUT.PRINT_LINE(doc.id);
DBE_OUTPUT.PRINT_LINE(doc2.id);
DBE_OUTPUT.PRINT_LINE(doc3.id);
-- Call functions and print them.
DBE_OUTPUT.PRINT_LINE(DBE_XMLDOM.GETSESSIONTREENUM());
-- Release the documents.
DBE_XMLDOM.FREEDOCUMENT(doc);
DBE_XMLDOM.FREEDOCUMENT(doc2);
DBE_XMLDOM.FREEDOCUMENT(doc3);
END;
/
```

- **DBE\_XMLDOM.GETDOCTREESINFO**

Queries the DOM tree information of the document type in the current session, such as the memory usage. The prototype of the `DBE_XMLDOM.GETDOCTREESINFO` function is as follows:

```
DBE_XMLDOM.GETDOCTREESINFO()
RETURN VARCHAR2;
```

#### **NOTE**

This function collects statistics only on DOM tree nodes of the document type.

#### Example:

```
-- Create three documents and obtain the information about the document tree in the current session.
DECLARE
doc DBE_XMLDOM.DOMDocument;
doc2 DBE_XMLDOM.DOMDocument;
doc3 DBE_XMLDOM.DOMDocument;

buffer varchar2(1010);
```

```
BEGIN
-- Create three documents.
doc := DBE_XMLDOM.NEWDOMDOCUMENT('<?xml version="1.0"?>
<root>
  <elem1 attr="attrtest">
    <elem2>Im text</elem2>
    <elem3>Im text too</elem3>
  </elem1>
  <elem4>Text</elem4>
</root>
');
doc2 := DBE_XMLDOM.NEWDOMDOCUMENT('<?xml version="1.0"?>
<computer size="ITX" price="19999">
  <cpu>Ryzen 9 3950X</cpu>
  <ram>32GBx2 DDR4 3200MHz</ram>
  <motherboard>ROG X570i</motherboard>

DBE_XMLDOM.FREEDOCUMENT(doc2);
DBE_XMLDOM.FREEDOCUMENT(doc3);
END;
/
```

- **DBE\_XMLDOM.GETDETAILDOCTREEINFO**

Queries the number of subnodes of each type in the transferred document. The prototype of the DBE\_XMLDOM.GETDETAILDOCTREEINFO function is as follows:

```
DBE_XMLDOM.GETDETAILDOCTREEINFO(
  doc IN  DOMDOCUMENT
)
RETURN VARCHAR2;
```

**Table 10-372** DBE\_XMLDOM.GETDETAILDOCTREEINFO parameters

Parameter	Description
doc	Specified DOMDocument node

 **NOTE**

This function collects statistics only on DOM tree nodes of the document type.

**Example:**

-- Create three documents and use this function to obtain the number of nodes of each type in each document.

```
DECLARE
  doc DBE_XMLDOM.DOMDocument;
  doc2 DBE_XMLDOM.DOMDocument;
  doc3 DBE_XMLDOM.DOMDocument;

  buffer varchar2(1010);
BEGIN
  -- Create three documents.
  doc := DBE_XMLDOM.NEWDOMDOCUMENT('<?xml version="1.0"?>

## 10.12.2.14 DBE\_XMLPARSER

### Interface Description

The DBE\_XMLPARSER interface is used to deserialize XML character strings and convert the character strings that store XML documents to document nodes. [Table 10-373](#) lists all interfaces supported by the DBE\_XMLPARSER advanced package.

The XMLParser data type can be used to store XMLParser data. The maximum number of XMLParser data records that can be stored is 16777215. The XMLPARSER data type can parse and create the DOMDocument node according to the input character string. The advanced package also provides the corresponding set and get interfaces to perform operations on the constraint attributes of the parsing process.

#### NOTE

When the DBE\_XMLPARSER advanced package is used in the database whose character set is set to **SQL\_ASCII**, an error is reported if characters beyond the ASCII range are input.

The DBE\_XMLPARSER advanced package supports only the O-compatible mode.

**Table 10-373** DBE\_XMLPARSER parameters

Interface	Description
<a href="#">DBE_XMLPARSER.FREEPARSER</a>	Frees an parser.
<a href="#">DBE_XMLPARSER.GETDOCUMENT</a>	Obtains the parsed document node.
<a href="#">DBE_XMLPARSER.GETVALIDATIONMODE</a>	Obtains the validation attribute.

Interface	Description
<a href="#">DBE_XMLPARSER.NEWPARSER</a>	Creates a parser instance.
<a href="#">DBE_XMLPARSER.PARSEBUFFER</a>	Parses the VARCHAR string.
<a href="#">DBE_XMLPARSER.PARSECLOB</a>	Parses the CLOB string.
<a href="#">DBE_XMLPARSER.SETVALIDATIONMODE</a>	Sets the validation attribute.

- [DBE\\_XMLPARSER.FREEPARSER](#)

Frees a given parser object.

The stored procedure prototype of [DBE\\_XMLPARSER.FREEPARSER](#) is as follows:

```
DBE_XMLPARSER.FREEPARSER (
p IN parser);
```

**Table 10-374** [DBE\\_XMLPARSER.FREEPARSER](#) parameters

Parameter	Description
p	Parser object

Example:

```
-- Create a parser and then release it.
DECLARE
  l_parser dbe_xmlparser.parser;
BEGIN
  l_parser := dbe_xmlparser.newparser;
-- Directly release the l_parser instance.
  dbe_xmlparser.freeparser(l_parser);
END;
/
```

Result: The operation is successful.

- [DBE\\_XMLPARSER.GETDOCUMENT](#)

Returns the root node of the DOM tree document constructed by the parser. This function can be called only after the document is parsed.

The prototype of the [DBE\\_XMLPARSER.GETDOCUMENT](#) function is as follows:

```
DBE_XMLPARSER.GETDOCUMENT (
p IN parser)
RETURN DOMDocument;
```

**Table 10-375** [DBE\\_XMLPARSER.GETDOCUMENT](#) parameters

Parameter	Description
p	Parser object

 **NOTE**

- If the GETDOCUMENT function has no input parameter, an error is reported.
- If the **parser** parameter of the GETDOCUMENT function is null, null is returned.
- If the parser input by the GETDOCUMENT function has not parsed any document, null is returned.

**Example:**

```
-- Create a parser to parse character strings and print the obtained document.
DECLARE
  l_parser dbe_xmlparser.parser;
  l_doc dbe_xmldom.domdocument;
  buffer varchar2 :=
'<?xml version="1.0" encoding="UTF-8"?>
<note>
<to>Tove</to>
<from>Jani</from>
<heading>Reminder</heading>
<body>Donot forget me this weekend!</body>
</note>';
  buffer2 varchar2;
BEGIN
  l_parser := dbe_xmlparser.newparser;
  dbe_xmlparser.PARSEBUFFER(l_parser, buffer);
  l_doc := dbe_xmlparser.getdocument(l_parser);
-- The l_parser parses the character string and obtains the DOMDocument node through
GETDOCUMENT.
  dbe_xmldom.writetobuffer(l_doc, buffer2);
  RAISE NOTICE '%', buffer2;
-- Print the content in l_doc.
  dbe_xmlparser.freeparser(l_parser);
  dbe_xmldom.freedocument(l_doc);
END;
/
```

**Execution result:**

```
NOTICE: <?xml version="1.0" encoding="UTF-8"?>
<note>
<to>Tove</to>
<from>Jani</from>
<heading>Reminder</heading>
<body>Donot forget me this weekend!</body>
</note>
```

- **DBE\_XMLPARSER.GETVALIDATIONMODE**

Obtains the parsing validation mode of a specified parser. If DTD validation is enabled, **TRUE** is returned. Otherwise, **FALSE** is returned.

The prototype of the DBE\_XMLPARSER.GETVALIDATIONMODE function is as follows:

```
DBE_XMLPARSER.GETVALIDATIONMODE (
  p IN parser)
RETURN BOOLEAN;
```

**Table 10-376** DBE\_XMLPARSER.GETVALIDATIONMODE parameters

Parameter	Description
p	Parser object

**Example:**

```
-- Create a parser and use GETVALIDATIONMODE to check whether the parser validation mode is
enabled.
```

```

DECLARE
  l_parser dbe_xmlparser.parser;
BEGIN
  l_parser := dbe_xmlparser.newparser();
  if (dbe_xmlparser.GETVALIDATIONMODE(L_parser) = true) then
  RAISE NOTICE 'validation';
  else
  RAISE NOTICE 'no validation';
  end if;
  dbe_xmlparser.freeparser(L_parser);
END;
/

```

Execution result:

```
NOTICE: validation
```

- **DBE\_XMLPARSER.NEWPARSER**

Creates a parser object and returns a new parser instance.

The prototype of the DBE\_XMLPARSER.NEWPARSER function is as follows:

```

DBE_XMLPARSER.NEWPARSER
RETURN Parser;

```

Example:

-- Create a parser to parse character strings and then free the parser.

```

DECLARE
-- Create a parser.
  l_parser dbe_xmlparser.parser;
  l_doc dbe_xmldom.domdocument;
  buffer varchar2(1000) :=
    '<?xml version="1.0" encoding="UTF-8"?>
    <note>
    <to>Tove</to>
    <from>Jani</from>
    <heading>Reminder</heading>
    <body>Donot forget me this weekend!</body>
    </note>;
  buffer2 varchar2(1000);
BEGIN
  l_parser := dbe_xmlparser.newparser;
  -- Parse the document and create a new DOM document.
  dbe_xmlparser.PARSEBUFFER(L_parser, buffer);

  dbe_xmlparser.freeparser(L_parser);
END;
/

```

Result: The operation is successful.

- **DBE\_XMLPARSER.PARSEBUFFER**

Parses XML documents stored in strings.

The stored procedure prototype of DBE\_XMLPARSER.PARSEBUFFER is as follows:

```

DBE_XMLPARSER.PARSEBUFFER (
  p IN parser,
  doc IN VARCHAR2);

```

**Table 10-377** DBE\_XMLPARSER.PARSEBUFFER parameters

Parameter	Description
p	Parser object
doc	A string that stores XML documents

 NOTE

- The maximum length of a character string that can be parsed by the PARSEBUFFER function is 32767. If the length exceeds the maximum, an error is reported.
- Different from the database A, this database supports only UTF-8 in terms of character encoding, and **version** can only be set to **1.0**. If versions 1.0 to 1.9 are parsing, a warning appears but the execution is normal. For versions later than 1.9, an error is reported.
- DTD validation differences:
  - **!ATTLIST to type (CHECK|check|Check) "Ch..."** reports an error because the default value "Ch..." is not an enumerated value in the brackets. However, the database A does not report this error.
  - **<!ENTITY baidu "www.baidu.com">..... &Baidu;&writer** reports an error because the letters are case sensitive. **Baidu** cannot correspond to **baidu**. However, the database A does not report this error.
- Namespace validation difference: Undeclared namespace tags are parsed. However, the database A reports an error.
- Difference in parsing XML predefined entities: **&apos;** and **&quot;**; are parsed and translated into ' and ". However, predefined entities in database A are not translated into characters.

## Example:

```
-- Create a parser to parse character strings and print the obtained document.
```

```
DECLARE
  l_parser db_xmlparser.parser;
  l_doc db_xmldom.domdocument;
  buffer varchar2 :=
'<?xml version="1.0" encoding="UTF-8"?>
<note>
<to>Tove</to>
<from>Jani</from>
<heading>Reminder</heading>
<body>Donot forget me this weekend!</body>
</note>';
  buffer2 varchar2;
BEGIN
  l_parser := db_xmlparser.newparser;
  db_xmlparser.PARSEBUFFER(l_parser, buffer);
  l_doc := db_xmlparser.getdocument(l_parser);

  db_xmldom.writetobuffer(l_doc, buffer2);
  RAISE NOTICE '%', buffer2;

  db_xmlparser.freeparser(l_parser);
  db_xmldom.freedocument(l_doc);
END;
/
```

## Execution result:

```
NOTICE: <?xml version="1.0" encoding="UTF-8"?>
<note>
<to>Tove</to>
<from>Jani</from>
<heading>Reminder</heading>
<body>Donot forget me this weekend!</body>
</note>
```

- **DBE\_XMLPARSER.PARSECLOB**

Parses XML documents stored in a CLOB.

The stored procedure prototype of **DBE\_XMLPARSER.PARSECLOB** is as follows:

```
DBE_XMLPARSER.PARSECLOB (
  p IN parser,
  doc IN CLOB);
```

**Table 10-378** DBE\_XMLPARSER.PARSECLOB parameters

Parameter	Description
p	Parser object
doc	A CLOB that stores XML documents

 **NOTE**

- PARSECLOB cannot parse CLOBs larger than or equal to 2 GB.
- Different from the database A, this database supports only UTF-8 in terms of character encoding, and **version** can only be set to **1.0**. If versions 1.0 to 1.9 are parsing, a warning appears but the execution is normal. For versions later than 1.9, an error is reported.
- DTD validation differences:
  - **!ATTLIST to type (CHECK|check|Check) "Ch..."** reports an error because the default value "Ch..." is not an enumerated value in the brackets. However, the database A does not report this error.
  - **<!ENTITY baidu "www.baidu.com">..... &Baidu;&writer** reports an error because the letters are case sensitive. **Baidu** cannot correspond to **baidu**. However, the database A does not report this error.
- Namespace validation difference: Undeclared namespace tags are parsed. However, the database A reports an error.
- Difference in parsing XML predefined entities: **&apos;** and **&quot;** are parsed and translated into ' and ". However, predefined entities in database A are not translated into characters.

**Example:**

-- Create a parser to parse character strings and print the obtained document.

```

DECLARE
L_clob clob :=
'<?xml version="1.0" encoding="UTF-8"?>
<note>
<to>Tove</to>
<from>Jani</from>
<heading>Reminder</heading>
<body>this weekend!</body>
</note>';
-- Create a parser.
L_parser dbe_xmlparser.parser;
L_doc dbe_xmldom.domdocument;
buffer varchar2(1000);
BEGIN
L_parser := dbe_xmlparser.newparser;
-- Parse the document and create a new DOM document.
dbe_xmlparser.parseclob(L_parser, L_clob);
L_doc := dbe_xmlparser.getdocument(L_parser);
dbe_xmldom.writetobuffer(L_doc, buffer);
RAISE NOTICE '%',buffer;

dbe_xmlparser.freeparser(L_parser);
dbe_xmldom.freedocument(L_doc);

END;
/

```

**Execution result:**

```

NOTICE: <?xml version="1.0" encoding="UTF-8"?>
<note>
<to>Tove</to>

```

```
<from>Jani</from>
<heading>Reminder</heading>
<body>this weekend!</body>
</note>
```

- DBE\_XMLPARSER.SETVALIDATIONMODE

Sets the parsing validation mode of a specified parser.

The stored procedure prototype of DBE\_XMLPARSER.SETVALIDATIONMODE is as follows:

```
DBE_XMLPARSER.SETVALIDATIONMODE(
  p IN parser)
yes IN BOOLEAN);
```

**Table 10-379** DBE\_XMLPARSER.SETVALIDATIONMODE parameters

Parameter	Description
p	Parser object
yes	Mode to be set: <ul style="list-style-type: none"> <li>• <b>TRUE</b>: DTD validation is enabled.</li> <li>• <b>FALSE</b>: DTD validation is disabled.</li> </ul>

 **NOTE**

- If the input parameter **yes** of the SETVALIDATIONMODE function is null, the parsing validation mode of the parser is not changed.
- By default, the DTD validation is enabled during parser initialization.

**Example 1:**

```
-- Create a parser. The XML character string to be parsed does not match the DTD format.
-- If setValidationMode is set to false, the string can be parsed. If setValidationMode is set to true,
an error is reported during parsing.
DECLARE
  l_clob clob :=
'<!DOCTYPE note [
<!ELEMENT note (to,from,heading,body)>
<!ELEMENT to (#PCDATA)>
<!ELEMENT from (#PCDATA)>
<!ELEMENT heading (#PCDATA)>
<!ELEMENT body (#PCDATA)>
]>
<table>
<name attr1="WEB" attr2="web2">African Coffee Table</name>
<width>80</width>
<length>120</length>
</table>;
  l_parser dbe_xmlparser.parser;
  l_doc dbe_xmlldom.domdocument;
  buffer varchar2(1000);
BEGIN
  l_parser := dbe_xmlparser.newparser;
  -- Set it to false for parsing.
  dbe_xmlparser.setValidationMode(l_parser, false);
  dbe_xmlparser.parseclob(l_parser, l_clob);
  l_doc := dbe_xmlparser.getdocument(l_parser);
  dbe_xmlldom.writetobuffer(l_doc, buffer);
  RAISE NOTICE '%', buffer;
  dbe_xmlparser.freeparser(l_parser);
  dbe_xmlldom.freedocument(l_doc);
```

```
END;  
/
```

**Execution result:**

```
NOTICE: <?xml version="1.0" encoding="UTF-8"?>  
<!DOCTYPE note [  
<!ELEMENT note (to , from , heading , body)>  
<!ELEMENT to (#PCDATA)>  
<!ELEMENT from (#PCDATA)>  
<!ELEMENT heading (#PCDATA)>  
<!ELEMENT body (#PCDATA)>  
>]  
<table>  
<name attr1="WEB" attr2="web2">African Coffee Table</name>  
<width>80</width>  
<length>120</length>  
</table>
```

**Example 2:**

```
-- Create a parser. The XML character string to be parsed does not match the DTD format.  
-- An error is reported during parsing after setValidationMode is set to true.  
DECLARE  
  l_clob clob :=  
  '<!DOCTYPE note [  
<!ELEMENT note (to,from,heading,body)>  
<!ELEMENT to (#PCDATA)>  
<!ELEMENT from (#PCDATA)>  
<!ELEMENT heading (#PCDATA)>  
<!ELEMENT body (#PCDATA)>  
>]  
<table>  
<name attr1="WEB" attr2="web2">African Coffee Table</name>  
<width>80</width>  
<length>120</length>  
</table>';  
  l_parser dbexmlparser.parser;  
  l_doc dbexmlDOM.domdocument;  
  buffer varchar2(1000);  
BEGIN  
  l_parser := dbexmlparser.newparser;  
  -- Set it to true for parsing.  
  --The XML character string does not match the DTD format. An error is expected.  
  dbexmlparser.setValidationMode(l_parser, true);  
  dbexmlparser.parseclob(l_parser, l_clob);  
  l_doc := dbexmlparser.getdocument(l_parser);  
  dbexmlDOM.writetobuffer(l_doc, buffer);  
  dbexmlparser.freeparser(l_parser);  
  dbexmlDOM.freedocument(l_doc);  
END;  
/
```

**Execution result:**

```
An error is reported during xmlparser parsing.  
ERROR: invalid XML document
```

## 10.13 Retry Management

Retry is a process in which the database executes a SQL statement or stored procedure (including anonymous block) again in the case of execution failure, improving the execution success rate and user experience. The database checks the error code and retry configuration to determine whether to retry.

- If the execution fails, the system rolls back the executed statements and executes the stored procedure again.

Example:

```
CREATE TABLE t1(a int);
CREATE TABLE

gaussdb=# CREATE OR REPLACE PROCEDURE retry_basic ( IN x INT)
AS
BEGIN
  INSERT INTO t1 (a) VALUES (x);
  INSERT INTO t1 (a) VALUES (x+1);
END;
/
CREATE PROCEDURE

gaussdb=# CALL retry_basic(1);
retry_basic
-----
(1 row)
```

## 10.14 Debugging

### Syntax

#### RAISE

The syntax of RAISE is as follows:

Figure 10-36 raise\_format::=

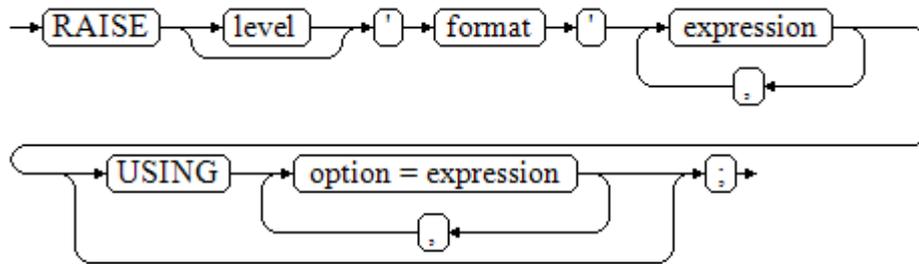

Figure 10-37 raise\_condition::=

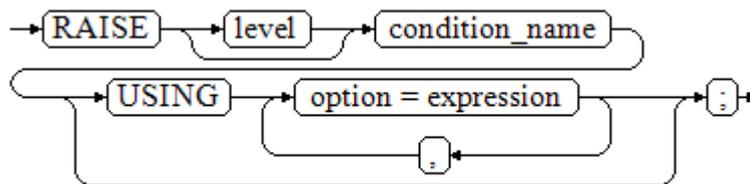

Figure 10-38 raise\_sqlstate::=

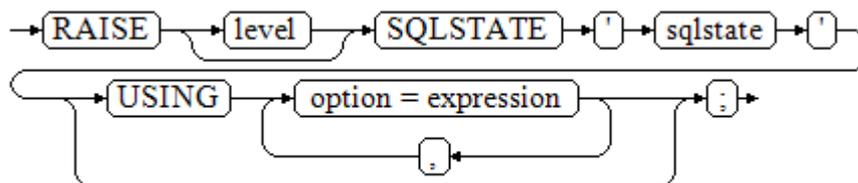

Figure 10-39 raise\_option::=

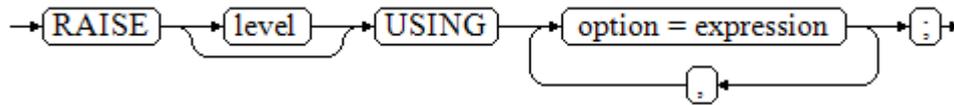

Figure 10-40 raise::=

#### Parameter description:

- The level option is used to specify the error level, that is, **DEBUG**, **LOG**, **INFO**, **NOTICE**, **WARNING**, or **EXCEPTION** (default). **EXCEPTION** throws an error that normally terminates the current transaction and the others only generate information at their levels. The GUC parameters **log\_min\_messages** and **client\_min\_messages** control whether the error messages of specific levels are reported to the client and are written to the server log.
- **format**: specifies the error message text to be reported, a format string. The format string can be appended with an expression for insertion to the message text. In a format string, **%** is replaced by the parameter value attached to format and **%%** is used to print **%**. For example:  

```
--v_job_id replaces % in the string.  
RAISE NOTICE 'Calling cs_create_job(%)',v_job_id;
```
- **option = expression**: inserts additional information to an error report. The keyword option can be **MESSAGE**, **DETAIL**, **HINT**, or **ERRCODE**, and each expression can be any string.
  - **MESSAGE**: specifies the error message text. This option cannot be used in a **RAISE** statement that contains a format character string in front of **USING**.
  - **DETAIL**: specifies detailed information of an error.
  - **HINT**: prints hint information.
  - **ERRCODE**: designates an error code (SQLSTATE) to a report. A condition name or a five-character SQLSTATE error code can be used.
- **condition\_name**: specifies the condition name corresponding to the error code.
- **sqlstate**: specifies the error code.

If neither a condition name nor an **SQLSTATE** is designated in a **RAISE EXCEPTION** command, the **RAISE EXCEPTION (P0001)** is used by default. If no message text is designated, the condition name or SQLSTATE is used as the message text by default.

**NOTICE**

- If the **SQLSTATE** designates an error code, the error code is not limited to a defined error code. It can be any error code containing five digits or ASCII uppercase rather than **00000**. Do not use an error code ended with three zeros because such error codes are category codes and can be captured by the whole category.
- In O-compatible mode, **SQLCODE** is equivalent to **SQLSTATE**.

**NOTE**

The syntax described in [Figure 10-40](#) does not append any parameter. This form is used only for the **EXCEPTION** statement in a **BEGIN** block so that the error can be re-processed.

**EXCEPTION\_INIT**

In O-compatible mode, **EXCEPTION\_INIT** can be used to define the **SQLCODE** error code. The syntax is as follows:

**Figure 10-41** exception\_init::=

**Parameter description:**

- **exception\_name** indicates the name of the exception declared by the user. The **EXCEPTION\_INIT** syntax must follow the declared exception.
- **sqlcode** is a customized SQL code, which must be a negative integer ranging from -2147483647 to -1.

**NOTICE**

When **EXCEPTION\_INIT** is used to customize an SQL code, **SQLSTATE** is equivalent to **SQLCODE**, and **SQLERRM** is in the format of **xxx: non-GaussDB Exception**. For example, if the customized SQL code is **-1**, **SQLSTATE** is **-1** and **SQLERRM** is **1: non-GaussDB Exception**.

**Example**

Display error and hint information when a transaction terminates:

```
CREATE OR REPLACE PROCEDURE proc_raise1(user_id in integer)
AS
BEGIN
RAISE EXCEPTION 'Noexistence ID --> %',user_id USING HINT = 'Please check your user ID';
END;
/

call proc_raise1(300011);

-- Execution result:
ERROR: Noexistence ID --> 300011
HINT: Please check your user ID
```

Two methods are available for setting **SQLSTATE**:

```
CREATE OR REPLACE PROCEDURE proc_raise2(user_id in integer)
AS
BEGIN
RAISE 'Duplicate user ID: %',user_id USING ERRCODE = 'unique_violation';
END;
/

\set VERBOSITY verbose
call proc_raise2(300011);

-- Execution result:
ERROR: Duplicate user ID: 300011
SQLSTATE: 23505
LOCATION: exec_stmt_raise, pl_exec.cpp:3482
```

If the main parameter is a condition name or **SQLSTATE**, the following applies:

```
RAISE division_by_zero;
```

```
RAISE SQLSTATE '22012';
```

For example:

```
CREATE OR REPLACE PROCEDURE division(div in integer, dividend in integer)
AS
DECLARE
res int;
BEGIN
IF dividend=0 THEN
RAISE division_by_zero;
RETURN;
ELSE
res := div/dividend;
RAISE INFO 'division result: %', res;
RETURN;
END IF;
END;
/

call division(3,0);

-- Execution result:
ERROR: division_by_zero
```

Alternatively:

```
RAISE unique_violation USING MESSAGE = 'Duplicate user ID: ' || user_id;
```

In O-compatible mode, **EXCEPTION\_INIT** can be used to customize error codes **SQLCODE**.

```
declare
deadlock_detected exception;
pragma exception_init(deadlock_detected, -1);
begin
if 1 > 0 then
raise deadlock_detected;
end if;
exception
when deadlock_detected then
raise notice 'sqlcode:%,sqlstate:%,sqlerrm:%',sqlcode,sqlstate,sqlerrm;
end;
/

-- Execution result:
NOTICE: sqlcode:-1,sqlstate:-1,sqlerrm: 1: non-GaussDB Exception
```

## 10.15 Package

A package is a combination of PL/SQL programs, such as stored procedures, functions, variables, constants, and cursors. It is object-oriented and can encapsulate PL/SQL program design elements. Functions in a package are created, deleted, and modified in a unified manner.

A package contains two parts: package specifications and package body. The declaration contained in the package specifications can be accessed by external functions and anonymous blocks. The declaration contained in the package body cannot be accessed by external functions or anonymous blocks, but can be accessed only by functions and stored procedures in the package body.

For details about how to create a package, see [CREATE PACKAGE](#).

---

### NOTICE

- Cross-package variables cannot be used as control variables in the for loops.
  - Types defined in a package cannot be deleted or modified, and cannot be used to define tables.
  - Cursor variables cannot be referenced in SCHEMA.PACKAGE.CUROSUR mode.
  - A cursor with parameters can be opened only in the current package.
  - A package variable cannot be used as the default value of a function or stored procedure parameter.
-

# 11 Autonomous Transaction

An autonomous transaction is an independent transaction that is started during the execution of a primary transaction. Committing and rolling back an autonomous transaction does not affect the data that has been committed by the primary transaction. In addition, an autonomous transaction is not affected by the primary transaction.

Autonomous transactions are defined in stored procedures, functions, anonymous blocks, and packages, and are declared using the **PRAGMA AUTONOMOUS\_TRANSACTION** keyword.

## 11.1 Stored Procedure Supporting Autonomous Transaction

An autonomous transaction can be defined in a stored procedure. The identifier of an autonomous transaction is **PRAGMA AUTONOMOUS\_TRANSACTION**. The syntax of an autonomous transaction is the same as that of creating a stored procedure. The following is an example.

```
-- Create a table.
gaussdb=# create table t2(a int, b int);
CREATE TABLE
gaussdb=# insert into t2 values(1,2);
INSERT 0 1
gaussdb=# select * from t2;
 a | b
---+---
 1 | 2
(1 row)

-- Create a stored procedure that contains an autonomous transaction.
gaussdb=# CREATE OR REPLACE PROCEDURE autonomous_4(a int, b int) AS
DECLARE
    num3 int := a;
    num4 int := b;
    PRAGMA AUTONOMOUS_TRANSACTION;
BEGIN
    insert into t2 values(num3, num4);
    db_output.print_line('just use call.');
```

```
END;
```

```
/
```

```
CREATE PROCEDURE
```

```
-- Create a common stored procedure that calls an autonomous transaction stored procedure.
```

```
gaussdb=# CREATE OR REPLACE PROCEDURE autonomous_5(a int, b int) AS
```

```
DECLARE
BEGIN
  dbe_output.print_line('just no use call.');
```

666	666
-----	-----

```
insert into t2 values(666, 666);
autonomous_4(a,b);
rollback;
END;
/
CREATE PROCEDURE
-- Call a common stored procedure.
gaussdb=# select autonomous_5(11,22);
just no use call.
just use call.
autonomous_5
-----
(1 row)

-- View the table result.
gaussdb=# select * from t2 order by a;
 a | b
---+---
  1 |  2
 11 | 22
(2 rows)
```

In the preceding example, a stored procedure containing an autonomous transaction is finally executed in a transaction block to be rolled back, which directly illustrates a characteristic of the autonomous transaction, that is, rollback of the primary transaction does not affect content that has been committed by the autonomous transaction.

## 11.2 Anonymous Block Supporting Autonomous Transaction

An autonomous transaction can be defined in an anonymous block. The identifier of an autonomous transaction is **PRAGMA AUTONOMOUS\_TRANSACTION**. The syntax of an autonomous transaction is the same as that of creating an anonymous block. The following is an example.

```
gaussdb=# create table t1(a int ,b text);
CREATE TABLE

gaussdb=# START TRANSACTION;
START TRANSACTION

gaussdb=# DECLARE
  PRAGMA AUTONOMOUS_TRANSACTION;
BEGIN
  dbe_output.print_line('just use call.');
```

1	you are so cute,will commit!
---	------------------------------

```
insert into t1 values(1,'you are so cute,will commit!');
END;
/
just use call.
ANONYMOUS BLOCK EXECUTE

gaussdb=# insert into t1 values(1,'you will rollback!');
INSERT 0 1
gaussdb=# rollback;
ROLLBACK

gaussdb=# select * from t1;
 a | b
---+---
  1 |  you will rollback!
```

```
1 | you are so cute,will commit!  
(1 row)
```

In the preceding example, an anonymous block containing an autonomous transaction is finally executed before a transaction block to be rolled back, which directly illustrates a characteristic of the autonomous transaction, that is, rollback of the primary transaction does not affect content that has been committed by the autonomous transaction.

## 11.3 Function Supporting Autonomous Transaction

An autonomous transaction can be defined in a function. The identifier of an autonomous transaction is **PRAGMA AUTONOMOUS\_TRANSACTION**. The syntax of an autonomous transaction is the same as that of creating a function. The following is an example.

```
gaussdb=# create table t4(a int, b int, c text);  
  
gaussdb=# CREATE OR REPLACE function autonomous_32(a int ,b int ,c text) RETURN int AS  
DECLARE  
    PRAGMA AUTONOMOUS_TRANSACTION;  
BEGIN  
    insert into t4 values(a, b, c);  
    return 1;  
END;  
/  
CREATE FUNCTION  
gaussdb=# CREATE OR REPLACE function autonomous_33(num1 int) RETURN int AS  
DECLARE  
    num3 int := 220;  
    tmp int;  
    PRAGMA AUTONOMOUS_TRANSACTION;  
BEGIN  
    num3 := num3/num1;  
    return num3;  
EXCEPTION  
    WHEN division_by_zero THEN  
        select autonomous_32(num3, num1, sqlerrm) into tmp;  
        return 0;  
END;  
/  
CREATE FUNCTION  
  
gaussdb=# select autonomous_33(0);  
autonomous_33  
-----  
0  
(1 row)  
  
gaussdb=# select * from t4;  
a | b | c  
-----  
220 | 0 | division by zero  
(1 row)
```

## 11.4 Package Supporting Autonomous Transaction

An autonomous transaction can be defined in a stored procedure or function in a package. The identifier of an autonomous transaction is **PRAGMA AUTONOMOUS\_TRANSACTION**. The syntax of an autonomous transaction is the same as that of creating a stored procedure or function in a package. The following is an example.

```
-- Create a table.
gaussdb=# drop table if exists t2;
gaussdb=# create table t2(a int, b int);
CREATE TABLE
gaussdb=# insert into t2 values(1,2);
INSERT 0 1
gaussdb=# select * from t2;
 a | b
----+----
  1 |  2
(1 row)

-- Create a stored procedure or function in a package that contains autonomous transactions.
gaussdb=# CREATE OR REPLACE PACKAGE autonomous_pkg AS
  PROCEDURE autonomous_4(a int, b int);
  FUNCTION autonomous_32(a int ,b int) RETURN int;
END autonomous_pkg;
/
CREATE PACKAGE
gaussdb=# CREATE OR REPLACE PACKAGE body autonomous_pkg AS
PROCEDURE autonomous_4(a int, b int) AS
DECLARE
  num3 int := a;
  num4 int := b;
  PRAGMA AUTONOMOUS_TRANSACTION;
BEGIN
  insert into t2 values(num3, num4);
END;
FUNCTION autonomous_32(a int ,b int) RETURN int AS
DECLARE
  PRAGMA AUTONOMOUS_TRANSACTION;
BEGIN
  insert into t2 values(a, b);
  return 1;
END;
END autonomous_pkg;
/
CREATE PACKAGE BODY
-- Create a common stored procedure that calls a stored procedure or function from a package that
contains autonomous transactions.
gaussdb=# CREATE OR REPLACE PROCEDURE autonomous_5(a int, b int) AS
DECLARE
va int;
BEGIN
  insert into t2 values(666, 666);
  autonomous_pkg.autonomous_4(a,b);
  va := autonomous_pkg.autonomous_32(a + 1, b + 1);
  rollback;
END;
/
CREATE PROCEDURE
-- Call a common stored procedure.
gaussdb=# select autonomous_5(11,22);
autonomous_5
-----
(1 row)

-- View the table result.
gaussdb=# select * from t2 order by a;
 a | b
----+----
  1 |  2
 11 | 22
 12 | 23
(3 rows)
```

In the preceding example, a stored procedure or function in a package containing autonomous transactions is finally executed in a transaction block that is rolled

back, which directly illustrates a characteristic of the autonomous transaction, that is, rollback of the primary transaction does not affect content that has been committed by an autonomous transaction.

## 11.5 Restrictions

### CAUTION

- When an autonomous transaction is executed, an autonomous transaction session is started in the background. You can use **max\_concurrent\_autonomous\_transactions** to set the maximum number of concurrent autonomous transactions. The value range is 0 to 10000, and the default value is **10**.
- When **max\_concurrent\_autonomous\_transactions** is set to **0**, autonomous transactions cannot be executed.
- After a new session is started for an autonomous transaction, the default session parameters are used and objects (including session-level variables, local temporary variables, and global temporary table data) of the primary session are not shared.
- Theoretically, the upper limit of autonomous transactions is 10000. Actually, the upper limit is a dynamic value. For details, see the description of the GUC parameter **max\_concurrent\_autonomous\_transactions**.
- Autonomous transactions are affected by the communication buffer. The size of the information returned to the client is limited by the length of the communication buffer. If the size exceeds the length of the communication buffer, an error is reported.

- A trigger function does not support autonomous transactions.

```
gaussdb=# CREATE TABLE test_trigger_des_tbl(id1 INT, id2 INT, id3 INT);
CREATE TABLE
gaussdb=# CREATE OR REPLACE FUNCTION tri_insert_func() RETURNS TRIGGER AS
$$
DECLARE
    PRAGMA AUTONOMOUS_TRANSACTION;
BEGIN
    INSERT INTO test_trigger_des_tbl VALUES(NEW.id1, NEW.id2, NEW.id3);
    RETURN NEW;
END
$$ LANGUAGE plpgsql;
ERROR: Triggers do not support autonomous transactions
DETAIL: N/A
CONTEXT: compilation of PL/pgSQL function "tri_insert_func" near line 4
```

- Autonomous transactions cannot be called by non-top-layer anonymous blocks (but can only be called by top-layer autonomous transactions, including stored procedures, functions, and anonymous blocks).

```
gaussdb=# drop table if exists t1;
gaussdb=# create table t1(a int ,b text);
CREATE TABLE
gaussdb=# DECLARE
--PRAGMA AUTONOMOUS_TRANSACTION;
BEGIN
    DECLARE
    PRAGMA AUTONOMOUS_TRANSACTION;
    BEGIN
        db_output.print_line('just use call.');
```

```

insert into t1 values(1,'can you rollback!');
END;
insert into t1 values(2,'I will rollback!');
rollback;
END;
/
just use call.
ANONYMOUS BLOCK EXECUTE

gaussdb=# select * from t1;
 a | b
---+---
(0 rows)

```

- In an autonomous transaction, the **ref cursor** parameter can be passed only through the **PROCEDURE OUT** parameter. The **ref cursor** parameter cannot be passed through the **IN**, **INOUT**, or **FUNCTION** parameter.

```

gaussdb=# create table sections(section_ID int);
CREATE TABLE
gaussdb=# insert into sections values(1);
INSERT 0 1

```

1. The **PROCEDURE OUT** output parameter passes the **ref cursor** parameter (supported).

```

gaussdb=# CREATE OR REPLACE PROCEDURE proc_sys_ref(OUT c1 refcursor)
IS
declare
PRAGMA AUTONOMOUS_TRANSACTION;
BEGIN
OPEN c1 FOR SELECT section_ID FROM sections ORDER BY section_ID;

```

```

END;
/
CREATE PROCEDURE

```

```

gaussdb=# CREATE OR REPLACE PROCEDURE proc_sys_call() AS
DECLARE
c1 SYS_REFCURSOR;
TEMP NUMBER(4);
BEGIN
proc_sys_ref(c1);
if c1%isopen then
raise notice '%','ok';
end if;

```

```

LOOP
FETCH C1 INTO TEMP;
raise notice '%',C1%ROWCOUNT;
EXIT WHEN C1%NOTFOUND;
END LOOP;

```

```

END;
/
CREATE PROCEDURE

```

2. The **PROCEDURE IN** or **INOUT** output parameter passes the **ref cursor** parameter (not supported).

```

gaussdb=# CREATE OR REPLACE PROCEDURE proc_sys_ref(IN c1 refcursor)
IS
declare
PRAGMA AUTONOMOUS_TRANSACTION;
TEMP NUMBER(4);
BEGIN
if c1%isopen then
raise notice '%','ok';
end if;

```

```

LOOP
  FETCH C1 INTO TEMP;
  raise notice '%',C1%ROWCOUNT;
  EXIT WHEN C1%NOTFOUND;
END LOOP;
END;
/
CREATE PROCEDURE

gaussdb=# CREATE OR REPLACE PROCEDURE proc_sys_call() AS
DECLARE
  c1 SYS_REFCURSOR;
  TEMP NUMBER(4);
BEGIN
  OPEN c1 FOR SELECT section_ID FROM sections ORDER BY section_ID;
  proc_sys_ref(c1);
END;
/
CREATE PROCEDURE
gaussdb=# CALL proc_sys_call();
ERROR: Unsupported: ref_cursor parameter is not supported for autonomous transactions.
CONTEXT: SQL statement "CALL proc_sys_ref(c1)"
PL/pgSQL function proc_sys_call() line 7 at PERFORM

```

3. **FUNCTION RETURN** passes the **ref cursor** parameter (not supported)

```

gaussdb=# CREATE OR REPLACE function proc_sys_ref()
return SYS_REFCURSOR
IS
declare
  PRAGMA AUTONOMOUS_TRANSACTION;
  C1 SYS_REFCURSOR;
BEGIN
  OPEN C1 FOR SELECT section_ID FROM sections ORDER BY section_ID;
  return C1;
END;
/
gaussdb=# DROP PROCEDURE proc_sys_ref;
DROP PROCEDURE

```

4. The **FUNCTION OUT** output parameter passes the **ref cursor** parameter (not supported).

```

gaussdb=# CREATE OR REPLACE function proc_sys_ref(C1 out SYS_REFCURSOR)
return SYS_REFCURSOR
IS
declare
  PRAGMA AUTONOMOUS_TRANSACTION;
BEGIN
  OPEN C1 FOR SELECT section_ID FROM sections ORDER BY section_ID;
  return 1;
END;
/
ERROR: Autonomous function do not support ref cursor as return types or out, inout arguments.

# 12 System Catalogs and System Views

---

## 12.1 Overview of System Catalogs and System Views

System catalogs store structured metadata of GaussDB. They are the source of information used by GaussDB to control system running and are a core component of the database system.

System views provide ways to query the system catalogs and internal database status.

System catalogs and system views are visible to either system administrators or all users. Some system catalogs and views have marked the need of administrator permissions, so they are accessible only to administrators.

You can delete and re-create system catalogs, add columns to them, and insert and update values in them, but doing so may make system information inconsistent and cause system faults. Generally, users should not modify system catalogs or system views, or rename their schemas. They are automatically maintained by the system.

---

### NOTICE

- You are advised not to modify the permissions on system catalogs or system views.
  - Do not add, delete, or modify system catalogs because doing so will result in exceptions or even database unavailability.
  - For details about column types in system catalogs and system views, see [Data Types](#).
- 

## 12.2 System Catalogs

## 12.2.1 GS\_ASP

GS\_ASP displays the persistent ACTIVE SESSION PROFILE samples. This catalog can be queried only in the system database but cannot be queried in the user database.

**Table 12-1** GS\_ASP columns

Name	Type	Description
sampleid	bigint	Sample ID
sample_time	timestamp with time zone	Sampling time
need_flush_sample	Boolean	Specifies whether the sample needs to be flushed to disks. <ul style="list-style-type: none"><li>• <b>t</b> (true): yes</li><li>• <b>f</b> (false): no</li></ul>
databaseid	oid	Database ID
thread_id	bigint	Thread ID
sessionid	bigint	Session ID
start_time	timestamp with time zone	Start time of a session
event	text	Event name
lwtid	integer	Lightweight thread ID of the current thread
psessionid	bigint	Parent thread of the streaming thread
tlevel	integer	Level of the streaming thread, which corresponds to the level ( <b>id</b> ) of the execution plan
smpid	integer	Concurrent thread ID in SMP execution mode
userid	oid	ID of a session user
application_name	text	Name of an application
client_addr	inet	IP address of a client
client_hostname	text	Name of a client
client_port	integer	TCP port number used by a client to communicate with the backend
query_id	bigint	Debug query ID

Name	Type	Description
unique_query_id	bigint	Unique query ID
user_id	oid	User ID in the key of the unique query
cn_id	integer	ID of the node that delivers the unique SQL statement. <b>cn_id</b> is in the key of the unique query.
unique_query	text	Standardized unique SQL text string.
locktag	text	Information of a lock that the session waits for, which can be parsed using <b>locktag_decode</b>
lockmode	text	Mode of a lock that the session waits for <ul style="list-style-type: none"> <li>● <b>LW_EXCLUSIVE</b>: exclusive lock</li> <li>● <b>LW_SHARED</b>: shared lock</li> <li>● <b>LW_WAIT_UNTIL_FREE</b>: waits for the <b>LW_EXCLUSIVE</b> to be available</li> </ul>
block_sessionid	bigint	Blocks a session from obtaining the session ID of a lock if the session is waiting for the lock.
wait_status	text	Provides more details about an event column.
global_sessionid	text	Global session ID
xact_start_time	timestamp with time zone	Start time of the transaction
query_start_time	timestamp with time zone	Time when the statement starts to be executed

Name	Type	Description
state	text	<p>Current transaction state.</p> <p>The options are as follows:</p> <ul style="list-style-type: none"> <li>● <b>active</b>: The backend is executing a query.</li> <li>● <b>idle in transaction</b>: The backend is in a transaction, but there is no statement being executed in the transaction.</li> <li>● <b>idle in transaction (aborted)</b>: The backend is in a transaction, but there are statements failed in the transaction.</li> <li>● <b>fastpath function call</b>: The backend is executing a fast-path function.</li> <li>● <b>disabled</b>: This state is reported if <b>track_activities</b> is disabled in this backend.</li> </ul>

## 12.2.2 GS\_AUDITING\_POLICY

GS\_AUDITING\_POLICY records the main information about the unified audit. Each record corresponds to a design policy. Only a system administrator or security policy administrator can access this system catalog.

**Table 12-2** GS\_AUDITING\_POLICY columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified)
polname	name	Policy name, which must be unique
polcomments	name	Policy description field, which records policy-related description information and is represented by the <b>COMMENTS</b> keyword
modifydate	timestamp without time zone	Latest timestamp when a policy is created or modified
polenabled	boolean	<p>Specifies whether to enable a policy.</p> <ul style="list-style-type: none"> <li>● <b>t</b> (true): enabled.</li> <li>● <b>f</b> (false): disabled</li> </ul>

### 12.2.3 GS\_AUDITING\_POLICY\_ACCESS

GS\_AUDITING\_POLICY\_ACCESS records the unified audit information about DML database operations. Only a system administrator or security policy administrator can access this system catalog.

**Table 12-3** GS\_AUDITING\_POLICY\_ACCESS columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).
accesstype	name	DML database operation type. For example, SELECT, INSERT, and DELETE.
labelname	name	Resource label name. This column corresponds to the <b>polname</b> column in the <a href="#">13.2.2 GS_AUDITING_POLICY</a> system catalog.
policyoid	oid	OID of the audit policy, corresponding to the OID in the <a href="#">13.2.2 GS_AUDITING_POLICY</a> system catalog.
modifydate	timestamp without time zone	Latest creation or modification timestamp.

### 12.2.4 GS\_AUDITING\_POLICY\_FILTERS

GS\_AUDITING\_POLICY\_FILTERS records the filtering policies about the unified audit. Each record corresponds to a design policy. Only a system administrator or security policy administrator can access this system catalog.

**Table 12-4** GS\_AUDITING\_POLICY\_FILTERS columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).
filtertype	name	Filter type. Currently, the value is <b>logical_expr</b> .
labelname	name	Name. Currently, the value is <b>logical_expr</b> .
policyoid	oid	OID of the audit policy, corresponding to the OID in the <a href="#">13.2.2 GS_AUDITING_POLICY</a> system catalog.

Name	Type	Description
modifydate	timestamp without time zone	Latest creation or modification timestamp.
logicaloperator	text	Logical character string of a filter criterion.

## 12.2.5 GS\_AUDITING\_POLICY\_PRIVILEGES

GS\_AUDITING\_POLICY\_PRIVILEGES records the DDL database operations about the unified audit. Each record corresponds to a design policy. Only a system administrator or security policy administrator can access this system catalog.

**Table 12-5** GS\_AUDITING\_POLICY\_PRIVILEGES columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).
privilege_type	name	DDL database operation type. For example, CREATE, ALTER, and DROP.
labelname	name	Resource label name. This column corresponds to the <b>polname</b> column in the <a href="#">13.2.2 GS_AUDITING_POLICY</a> system catalog.
policyoid	oid	This column corresponds to the OID in the <a href="#">13.2.2 GS_AUDITING_POLICY</a> system catalog.
modifydate	timestamp without time zone	Latest creation or modification timestamp.

## 12.2.6 GS\_CLIENT\_GLOBAL\_KEYS

GS\_CLIENT\_GLOBAL\_KEYS records information about the CMK in the encrypted equality feature. Each record corresponds to a CMK.

**Table 12-6** GS\_CLIENT\_GLOBAL\_KEYS columns

Name	Type	Description
oid	oid	Row identifier (hidden column)

Name	Type	Description
global_key_name	name	CMK name
key_namespace	oid	Namespace OID that contains the CMK
key_owner	oid	CMK owner
key_acl	aclitem[]	Access permissions that the key should have on creation
create_date	timestamp without time zone	Time when the key is created

## 12.2.7 GS\_CLIENT\_GLOBAL\_KEYS\_ARGS

**GS\_CLIENT\_GLOBAL\_KEYS\_ARGS** records the metadata about the CMK in the encrypted equality feature. Each record corresponds to a key-value pair of the CMK.

**Table 12-7** GS\_CLIENT\_GLOBAL\_KEYS\_ARGS columns

Name	Type	Description
oid	oid	Row identifier (hidden column)
global_key_id	oid	CMK OID
function_name	name	The value is <b>encryption</b> .
key	name	CMK metadata name
value	bytea	Value of the CMK metadata name

## 12.2.8 GS\_COLUMN\_KEYS

**GS\_COLUMN\_KEYS** records information about the CEK in the encrypted equality feature. Each record corresponds to a CEK.

**Table 12-8** GS\_COLUMN\_KEYS columns

Name	Type	Description
oid	oid	Row identifier (hidden column)
column_key_name	name	CEK name
column_key_distributed_id	oid	ID obtained based on the hash value of the fully qualified domain name (FQDN) of the CEK

Name	Type	Description
global_key_id	oid	Foreign key, which is the CMK OID
key_namespace	oid	Namespace OID that contains the CEK
key_owner	oid	CEK owner
create_date	timestamp without time zone	Time when the CEK is created
key_acl	aclitem[]	Access permissions that the CEK should have on creation

## 12.2.9 GS\_COLUMN\_KEYS\_ARGS

**GS\_COLUMN\_KEYS\_ARGS** records the metadata about the CMK in the encrypted equality feature. Each record corresponds to a key-value pair of the CMK.

**Table 12-9** GS\_COLUMN\_KEYS\_ARGS columns

Name	Type	Description
oid	oid	Row identifier (hidden column)
column_key_id	oid	CEK OID
function_name	name	The value is <b>encryption</b> .
key	name	CEK metadata name
value	bytea	Value of the CEK metadata name

## 12.2.10 GS\_DATABASE\_LINK

**GS\_DATABASE\_LINK** stores database link information, mainly recording detailed information about database links. Only sysadmin can read this system catalog. Currently, the database link function is not supported.

**Table 12-10** GS\_DATABASE\_LINK columns

Name	Type	Description
oid	oid	Unique ID of the current database link object (hidden attribute, which must be specified).
dlname	name	Name of the current database link.
downer	oid	ID of the owner of the current DATABASE LINK. If the owner is <b>public</b> , the value is <b>0</b> .

Name	Type	Description
dlfdw	oid	OID of the foreign-data wrapper of the current DATABASE LINK.
dlcreator	oid	ID of the creator of the current database link.
options	text[]	Current DATABASE LINK connection information in the format of "keyword=value".
useroptions	text[]	User information used by the current DATABASE LINK to connect to the remote end, in the format of "keyword=value".
dlacl	aclitem[]	Current database link access permission.

## 12.2.11 GS\_DB\_PRIVILEGE

**GS\_DB\_PRIVILEGE** records the granting of ANY permissions. Each record corresponds to a piece of authorization information.

**Table 12-11** GS\_DB\_PRIVILEGE columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).
roleid	oid	User ID.
privilege_type	text	ANY permission of a user. For details about the value, see <a href="#">Table 7-148</a> .
admin_option	boolean	Whether the ANY permission recorded in the <b>privilege_type</b> column can be re-granted. <ul style="list-style-type: none"> <li>t: yes.</li> <li>f: no.</li> </ul>

## 12.2.12 GS\_DEPENDENCIES

**GS\_DEPENDENCIES** records object dependency information and has a one-to-many relationship with the [13.2.13 GS\\_DEPENDENCIES\\_OBJ](#) system catalog.

**Table 12-12** GS\_DEPENDENCIES columns

Name	Type	Description
schemaname	name	Name of a namespace

Name	Type	Description
packagename	name	Name of a package
refobjpos	integer	Position of the referenced object <ul style="list-style-type: none"> <li>• 1: type</li> <li>• 2: package header</li> <li>• 4: function header</li> <li>• 8: function body</li> <li>• 16: package body</li> <li>• 32: view</li> </ul>
refobjoid	oid	OID of the referenced object
objectname	text	Name of the dependent object

### 12.2.13 GS\_DEPENDENCIES\_OBJ

**GS\_DEPENDENCIES\_OBJ** records the detailed information about the referenced object.

**Table 12-13** GS\_DEPENDENCIES\_OBJ columns

Name	Type	Description
schemaname	name	Name of a namespace
packagename	name	Name of a package
type	integer	Type of the referenced object <ul style="list-style-type: none"> <li>• 1: unknown type</li> <li>• 2: variable</li> <li>• 3: type</li> <li>• 4: function</li> <li>• 5: view</li> <li>• 6: function header</li> </ul>
name	text	Name of the referenced object
objnode	pg_node_tree	Detailed information about the referenced object

### 12.2.14 GS\_ENCRYPTED\_COLUMNS

**GS\_ENCRYPTED\_COLUMNS** records information about encrypted columns in the encrypted equality feature. Each record corresponds to an encrypted column.

**Table 12-14** GS\_ENCRYPTED\_COLUMNS columns

Name	Type	Description
oid	oid	Row identifier (hidden column)
rel_id	oid	Table OID
column_name	name	Name of an encrypted column.
column_key_id	oid	Foreign key, which is the CEK OID
encryption_type	tinyint	Encryption type. The value can be <b>2 (DETERMINISTIC)</b> or <b>1 (RANDOMIZED)</b> .
data_type_original_oid	oid	ID of the original data type of the encrypted column. For details about the value, see <b>oid</b> in the <b>PG_TYPE</b> system catalog.
data_type_original_mod	integer	Original data type modifier of the encrypted column. For details about the value, see <b>atttypmod</b> in the <b>PG_ATTRIBUTE</b> system catalog. The value of <b>data_type_original_mod</b> is generally <b>-1</b> when data types are not specific.
create_date	timestamp without time zone	Time when an encrypted column is created

## 12.2.15 GS\_ENCRYPTED\_PROC

GS\_ENCRYPTED\_PROC provides information such as the parameters of encrypted functions and stored procedure functions, original data type of return values, and encrypted columns.

**Table 12-15** GS\_ENCRYPTED\_PROC columns

Name	Type	Description
oid	oid	Row identifier (hidden column)
func_id	oid	OID of the function, corresponding to the OID row identifier in the <b>13.2.84 PG_PROC</b> system catalog.
prorettype_original	integer	Original data type of the return value
last_change	timestamp without time zone	Last modification time of the encrypted function information

Name	Type	Description
proargcached col	oidvector	OID of the encrypted column corresponding to the <b>INPUT</b> parameter of the function, corresponding to the OID row identifier in the <a href="#">13.2.14 GS_ENCRYPTED_COLUMNS</a> system catalog
proallargtypes _orig	oid[]	Original data type of all function parameters

## 12.2.16 GS\_GLOBAL\_CONFIG

**GS\_GLOBAL\_CONFIG** records the parameter values specified by users during database instance initialization. In addition, it also stores weak passwords set by users. Initial database users can write, modify, and delete parameters in system catalogs by using **ALTER** and **DROP**. Only the initial user, system administrator, and security administrator can access this system catalog. Other users do not have such permission.

**Table 12-16** GS\_GLOBAL\_CONFIG columns

Name	Type	Description
name	name	Specifies the preset parameter name, weak password name, or parameter required by users during database instance initialization.
value	text	Specifies the preset parameter value, weak password value, or parameter value required by users during database instance initialization.

## 12.2.17 GS\_JOB\_ARGUMENT

**GS\_JOB\_ARGUMENT** provides the parameter attributes of DBE\_SCHEDULER scheduled tasks and programs.

**Table 12-17** GS\_JOB\_ARGUMENT columns

Name	Type	Description
oid	oid	Row identifier (hidden column)
argument_position	integer	Location of a parameter of a scheduled task or program.
argument_type	name	Parameter type of a scheduled task or program.

Name	Type	Description
job_name	text	Name of a scheduled task or program.
argument_name	text	Parameter name of a scheduled task or program. The scheduled task inherits the parameter name of the program. Therefore, this parameter is null.
argument_value	text	Parameter value of a scheduled task. (The program cannot bind a value.)
default_value	text	Default parameter value of a program.

## 12.2.18 GS\_JOB\_ATTRIBUTE

GS\_JOB\_ATTRIBUTE records attributes of DBE\_SCHEDULER scheduled tasks, including basic attributes of scheduled tasks, scheduled task classes, certificates, authorization, programs, and schedules. Common users do not have the permission to access the newly installed database instance.

**Table 12-18** GS\_JOB\_ATTRIBUTE columns

Name	Type	Description
oid	oid	Row identifier (hidden column)
job_name	text	Names of scheduled tasks, scheduled task classes, certificates, programs, and schedules, and authorized user names.
attribute_name	text	Attribute names of scheduled tasks, scheduled task classes, certificates, programs, and schedules, and authorized content.
attribute_value	text	Attribute values of scheduled tasks, scheduled task classes, certificates, programs, and schedules.

## 12.2.19 GS\_MASKING\_POLICY

GS\_MASKING\_POLICY records the main information about dynamic data masking policies. Each record corresponds to a masking policy. Only a system administrator or security policy administrator can access this system catalog.

**Table 12-19** GS\_MASKING\_POLICY columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).
polname	name	Policy name, which must be unique
polcomments	name	Policy description field, which records policy-related description information and is represented by the <b>COMMENTS</b> keyword
modifydate	timestamp without time zone	Latest timestamp when a policy is created or modified
polenabled	boolean	Specifies whether to enable a policy. <ul style="list-style-type: none"> <li>• <b>t</b> (true): enabled.</li> <li>• <b>f</b> (false): disabled</li> </ul>

## 12.2.20 GS\_MASKING\_POLICY\_ACTIONS

**GS\_MASKING\_POLICY\_ACTIONS** records the masking actions of a masking policy in the dynamic data masking policies. One masking policy corresponds to one or more rows of records in the catalog. Only the system administrator or security policy administrator can access this system catalog.

**Table 12-20** GS\_MASKING\_POLICY\_ACTIONS columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).
actiontype	name	Name of a masking function used by a masking policy
actparams	name	Parameter information transferred to a masking function
actlabelname	name	Name of a masked label
policyoid	oid	OID of a masking policy to which a record belongs, corresponding to the OID in <a href="#">GS_MASKING_POLICY</a>
actmodifydate	timestamp without time zone	Latest timestamp when a record is created or modified

## 12.2.21 GS\_MASKING\_POLICY\_FILTERS

**GS\_MASKING\_POLICY\_FILTERS** records the user filter criteria corresponding to the dynamic data masking policies. The corresponding masking policy takes effect only when the user information meets the filter criteria. Only the system administrator or security policy administrator can access this system catalog.

**Table 12-21** GS\_MASKING\_POLICY\_FILTERS columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).
filtertype	name	Filter type. Currently, the value is <b>logical_expr</b> .
filterlabelname	name	Filter range. Currently, the value is <b>logical_expr</b> .
policyoid	oid	OID of the masking policy to which a user filter criterion belongs, which corresponds to the OID in <a href="#">GS_MASKING_POLICY</a>
modifydate	timestamp without time zone	Latest timestamp when a user filter criterion is created or modified
logicaloperator	text	Polish notation of a filter criterion

## 12.2.22 GS\_MATVIEW

**GS\_MATVIEW** provides information about each materialized view in the database.

**Table 12-22** GS\_MATVIEW columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified)
matviewid	oid	OID of a materialized view
mapid	oid	OID of a map table associated with a materialized view. Each map table corresponds to one materialized view. If a complete-refresh materialized view does not correspond to a map table, the value of this column is <b>0</b> .

Name	Type	Description
ivm	boolean	Type of a materialized view. The value <b>t</b> indicates a fast-refresh materialized view, and the value <b>f</b> indicates a complete-refresh materialized view.
needrefresh	boolean	Reserved column
refresh_time	timestamp without time zone	Last time when a materialized view was refreshed. If the materialized view is not refreshed, the value is null. This column is maintained only for fast-refresh materialized views. For complete-refresh materialized views, the value is null.

### 12.2.23 GS\_MATVIEW\_DEPENDENCY

**GS\_MATVIEW\_DEPENDENCY** provides association information about each fast-refresh materialized view, base table, and Mlog table in the database. The Mlog table corresponding to the base table does not exist in the complete-refresh materialized view. Therefore, no record is written into the Mlog table.

**Table 12-23** GS\_MATVIEW\_DEPENDENCY columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified)
matviewid	oid	OID of a materialized view
relid	oid	OID of a base table of a materialized view
mlogid	oid	OID of a Mlog table which is the log table of a materialized view. Each Mlog table corresponds to one base table.
mxmin	integer	Reserved column

### 12.2.24 GS\_MODEL\_WAREHOUSE

**GS\_MODEL\_WAREHOUSE** stores AI engine training models, including the models and detailed description of the training process.

**Table 12-24** GS\_MODEL\_WAREHOUSE columns

Name	Data Type	Description
oid	oid	Hidden column
modelname	name	Unique constraint
modelowner	oid	OID of a model owner
createtime	timestamp without time zone	Time when a model is created
processedtuples	integer	Number of tuples involved in training
discardedtuples	integer	Number of unqualified tuples not involved in training
preprocesstime	real	Data preprocessing time
exectime	real	Training duration
iterations	integer	Iteration round
outputtype	oid	OID of the output data type
modeltype	text	AI operator type
query	text	Query statement executed to create a model
modeldata	bytea	Stored binary model information
weight	real[]	Currently, this column applies only to GD operator models.
hyperparametersnames	text[]	Involved hyperparameter name
hyperparametersvalues	text[]	Hyperparameter value
hyperparametersoids	oid[]	OID of the data type corresponding to a hyperparameter
coefnames	text[]	Model parameter
coefvalues	text[]	Value of a model parameter
coefoids	oid[]	OID of the data type corresponding to a model parameter

Name	Data Type	Description
trainingscoresname	text[]	Method used to measure model performance
trainingscoresvalue	real[]	Value used to measure model performance
modeldescribe	text[]	Model description

## 12.2.25 GS\_OPT\_MODEL

GS\_OPT\_MODEL is a data table used when the AI engine is enabled to predict the planned time. It records the configurations, training results, features, corresponding system functions, and training history of machine learning models.

**Table 12-25** GS\_OPT\_MODEL columns

Name	Type	Description
template_name	name	Template name of the machine learning model, which determines the APIs called for training and prediction. Currently, only rlstm is implemented.
model_name	name	Model name. Each model corresponds to a set of parameters, training logs, and model coefficients in the AI engine online learning process. The name must be unique.
datname	name	Name of the database served by the model. Each model is specific to a single database. This parameter determines data used for training.
ip	name	IP address of the host where the AI engine is deployed
port	integer	Listening port number of the AI engine
max_epoch	integer	Maximum number of iterations in an epoch

Name	Type	Description
learning_rate	real	Learning rate of model training. The default value <b>1</b> is recommended.
dim_red	real	Number of model feature dimensions whose retention is reduced
hidden_units	integer	Number of neurons in the model's hidden layer. If the model cannot be converged for a long time, increase the value of this parameter.
batch_size	integer	Size of a batch in each iteration. It is recommended that the size be greater than or equal to the total training data volume to accelerate model convergence.
feature_size	integer	Length of the model feature, which is used to trigger retraining. This parameter is automatically updated after model training and does not need to be specified.
available	Boolean	Whether the model is converged. This parameter does not need to be specified.
Is_training	Boolean	Whether the model is being trained. This parameter does not need to be specified.

Name	Type	Description
label	"char"[]	Target task of the model. <ul style="list-style-type: none"> <li>• S: startup time</li> <li>• T: total time</li> <li>• R: rows</li> <li>• M: peak memory</li> </ul> Currently, {S, T} or {R} is recommended due to model performance restrictions.
max	bigint[]	Maximum value of each task label of the model, which is used to trigger retraining. This parameter does not need to be specified.
acc	real[]	Accuracy of each model task. This parameter does not need to be specified.
description	text	Model comment

## 12.2.26 GS\_PACKAGE

GS\_PACKAGE records package information.

Table 12-26 GS\_PACKAGE columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified)
pkgnamespace	oid	Schema to which a package belongs
pkgowner	oid	Owner of a package
pkgname	name	Name of a package
pkgspecsrc	text	Package specification
pkgbodydeclsrc	text	Package body
pkgbodyinitsrc	text	Package initialization source
pkgacl	aclitem[]	Access permission

Name	Type	Description
pkgsecdef	boolean	Whether a user has the definer permission on the package.

## 12.2.27 GS\_PLAN\_TRACE

GS\_PLAN\_TRACE stores plan traces. It records details about the plan generation process of DML statements. Only initial users have the write permission on this system catalog. Users with the sysadmin permission can read this system catalog.

**Table 12-27** GS\_PLAN\_TRACE columns

Name	Type	Description
query_id	text	Unique ID of the current request
query	text	SQL statement of the current request. The value of this field cannot exceed the value of <b>track_activity_query_size</b> .
unique_sql_id	bigint	Unique ID of the SQL statement of the current request
plan	text	Query plan text corresponding to the current request SQL statement. The value of this field cannot exceed 10 KB.
plan_trace	text	Details about the query plan generation process corresponding to the SQL statement of the current request. The value of this field cannot exceed 300 MB.
owner	oid	OID of the user who initiates the current SQL request
modifydate	timestamp with time zone	Time when the current plan trace is updated (that is, time when the plan trace is created)

## 12.2.28 GS\_POLICY\_LABEL

GS\_POLICY\_LABEL records the resource label configuration information. One resource label corresponds to one or more records, and each record identifies the resource label to which a database resource belongs. Only the system administrator or security policy administrator can access this system catalog.

Fully Qualified Domain Name (FQDN) identifies an absolute path of a database resource.

**Table 12-28** GS\_POLICY\_LABEL columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified)
labelname	name	Resource label name
labeltype	name	Resource tag type. Currently, the value is <b>RESOURCE</b> .
fqdnnamespace	oid	OID of a namespace to which an identified database resource belongs
fqdnid	oid	OID of an identified database resource. If the database resource is a column, this column is the OID of the catalog.
relcolumn	name	Column name. If the identified database resource is a column, this column indicates the column name. Otherwise, this column is empty.
fqdntype	name	Type of the identified database resource, for example, schema, table, column, or view

## 12.2.29 GS\_RECYCLEBIN

GS\_RECYCLEBIN describes details about objects in the recycle bin.

**Table 12-29** GS\_RECYCLEBIN columns

Name	Type	Description
oid	oid	System column.
rcybaseid	oid	Base table object ID, which references <b>gs_recyclebin.oid</b> .
rcydbid	oid	OID of the database to which the current object belongs.
rcyrelid	oid	OID of the current object.
rcyname	name	Name of the object in the recycle bin. The format is BIN.\$unique_id\$oid\$. <i>unique_id</i> indicates the unique identifier with a maximum of 16 characters, and <i>oid</i> indicates the OID.

Name	Type	Description
rcyoriginname	name	Original object name.
rcyoperation	char	Operation type. <ul style="list-style-type: none"> <li>• <b>d</b>: drop</li> <li>• <b>t</b>: truncate</li> </ul>
rcytype	integer	Object type. <ul style="list-style-type: none"> <li>• <b>0</b>: table</li> <li>• <b>1</b>: index</li> <li>• <b>2</b>: TOAST table</li> <li>• <b>3</b>: TOAST index</li> <li>• <b>4</b>: sequence, indicating the sequence object that is automatically associated with the serial, bigserial, smallserial, and largeserial types.</li> <li>• <b>5</b>: partition.</li> <li>• <b>6</b>: global index.</li> <li>• <b>7</b>: materialized view</li> </ul>
rcyrecyclecsn	bigint	CSN when an object is dropped or truncated.
rcyrecycletime	timestamp with time zone	Time when an object is dropped or truncated.
rcycreatecsn	bigint	CSN when an object is created.
rcychangeocsn	bigint	CSN when an object definition is modified.
rcynamespace	oid	OID of the namespace that contains this relationship
rcyowner	oid	Relationship owner
rcytablespace	oid	Tablespace where the relationship is stored. If the value is <b>0</b> , the default tablespace of the database is used. This column is meaningless if the relationship has no on-disk file.
rcyrelfilenode	oid	File name of the recycle bin object on a disk, or <b>0</b> if none, which is used to restore the physical file when the TRUNCATE object is restored.
rcycanrestore	Boolean	Specifies whether flashback can be performed separately.
rcycanpurge	Boolean	Specifies whether the purge operation can be performed independently.

Name	Type	Description
rcyfrozenxid	xid32	All transaction IDs before this one have been replaced with a permanent (frozen) transaction ID in the table.
rcyfrozenxid64	xid	All transaction IDs before this one have been replaced with a permanent (frozen) transaction ID in the table.

## 12.2.30 GS\_SQL\_PATCH

**GS\_SQL\_PATCH** records the status information about all SQL patches.

**Table 12-30** GS\_SQL\_PATCH columns

Name	Type	Description
patch_name	name	Patch name.
unique_sql_id	bigint	Global unique ID.
owner	oid	ID of the user who creates the patch.
enable	boolean	Specifies whether the patch takes effect.
status	"char"	Patch status (reserved column).
abort	boolean	Specifies whether the patch is an abort hint.
hint_string	text	Hint text.
hint_node	pg_node_tree	Hint parsing and serialization result.
original_query	text	Original statement (reserved column).
patched_query	text	Patched statement (reserved column).
original_query_tree	pg_node_tree	Original statement parsing result (reserved column).
patched_query_tree	pg_node_tree	Patched statement parsing result (reserved column).
description	text	Patch description.

Name	Type	Description
parent_uniqu e_sql_id	bigint	Globally unique ID of the outer statement of the SQL statement for which the patch takes effect. The value of this parameter is <b>0</b> for statements outside a stored procedure. For statements inside the stored procedure, and the value of this parameter is the globally unique ID of the statement that invokes the stored procedure.

### 12.2.31 GS\_TXN\_SNAPSHOT

GS\_TXN\_SNAPSHOT is a timestamp-CSN mapping table. It periodically samples and maintains an appropriate time range to estimate the CSN value corresponding to the timestamp in the range.

**Table 12-31** GS\_TXN\_SNAPSHOT columns

Name	Data Type	Description
snptime	timestamp with time zone	Snapshot time
snpxmin	bigint	Minimum snapshot ID
snpcsn	bigint	Snapshot CSN
snpsnapshot	text	Serialized snapshot text

### 12.2.32 GS\_UID

GS\_UID records the unique identification meta information of the hasuids attribute table in the database.

**Table 12-32** GS\_UID columns

Name	Type	Description
relid	oid	OID of a table.
uid_backup	bigint	Largest unique identifier that can be assigned to a table.

### 12.2.33 GS\_WORKLOAD\_RULE

The GS\_WORKLOAD\_RULE system catalog records information about SQL concurrency control rules. There is no permission restriction on this system catalog. All users can query this system catalog.

**Table 12-33** GS\_WORKLOAD\_RULE columns

Name	Type	Description
rule_id	bigint	Concurrency control rule ID, which is automatically generated by the system.
rule_name	name	Name of the concurrency control rule, which is used for search. The name may not be unique and can be <b>NULL</b> .
databases	name[]	List of databases on which the concurrency control rules take effect. If the value is <b>NULL</b> , the concurrency control rules take effect for all databases.
max_workload	bigint	Maximum number of concurrent rule settings.
is_valid	boolean	Determines whether the concurrency control rules take effect. If the concurrency control rules time out, the value is set to <b>false</b> .
start_time	timestamp with time zone	Start time of the concurrency control rules. The value <b>NULL</b> indicates that the rules take effect from now on.
end_time	timestamp with time zone	End time of the concurrency control rules. The value <b>NULL</b> indicates that the rules are always effective.
rule_type	text	Concurrency control rule type. Currently, only <b>"sqlid"</b> , <b>"select"</b> , <b>"insert"</b> , <b>"update"</b> , <b>"delete"</b> , <b>"merge"</b> , and <b>"resource"</b> are supported. Other values are invalid.
option_val	text[]	Parameter values of concurrency control rules, including SQL ID, keyword list, and resource restriction. For details, see the description of the <a href="#">gs_add_workload_rule</a> API.
node_names	text[]	List of nodes on which the concurrency control rules take effect. This parameter is reserved and does not take effect currently.
user_names	text[]	List of users for which the concurrency control rules take effect. This parameter is reserved and does not take effect currently.

## 12.2.34 PG\_AGGREGATE

PG\_AGGREGATE records information about aggregate functions. Each entry in PG\_AGGREGATE is an extension of an entry in PG\_PROC. The PG\_PROC entry carries the aggregate's name, input and output data types, and other information that is similar to ordinary functions.

**Table 12-34** PG\_AGGREGATE columns

Name	Type	Reference	Description
aggfnoid	regproc	<a href="#">PG_PROC.proname</a>	<a href="#">PG_PROC</a> proname of the aggregate function
aggtransfn	regproc	<a href="#">PG_PROC.proname</a>	Transition function
aggcollectfn	regproc	<a href="#">PG_PROC.proname</a>	Collect function
aggfinalfn	regproc	<a href="#">PG_PROC.proname</a>	Final function ( <b>0</b> if none)
aggstortop	oid	<a href="#">PG_OPERATOR.oid</a>	Associated sort operator ( <b>0</b> if none)
aggtranstype	oid	<a href="#">PG_TYPE.oid</a>	Data type of the aggregate function's internal transition (state) data  The possible values and their meanings are defined by the types in <a href="#">pg_type.h</a> . The main two types are polymorphic (isPolymorphicType) and non-polymorphic.
agginitval	text	-	Initial value of the transition state. This is a text column containing the initial value in its external string representation. If this column is null, the transition state value starts from null.
agginitcollect	text	-	Initial value of the collection state. This is a text column containing the initial value in its external string representation. If this column is null, the collection state value starts from null.
aggkind	"char"	-	Type of the aggregate function: <ul style="list-style-type: none"> <li>● <b>n</b>: normal aggregate</li> <li>● <b>o</b>: ordered set aggregate</li> </ul>

Name	Type	Reference	Description
aggnumdirect args	smallint	-	Number of direct parameters (non-aggregation-related parameters) of the aggregate function of the ordered set aggregate type. For an aggregate function of the normal aggregate type, the value is <b>0</b> .

## 12.2.35 PG\_AM

PG\_AM records information about index access methods. There is one row for each index access method supported by the system.

**Table 12-35** PG\_AM columns

Name	Type	Reference	Description
oid	oid	-	Row identifier (hidden attribute, which must be specified)
amname	name	-	Name of the access method
amstrategies	smallint	-	Number of operator strategies for the access method ( <b>0</b> if the access method does not have a fixed set of operator strategies)
amsupport	smallint	-	Number of support routines for the access method
amcanorder	Boolean	-	Whether the access method supports ordered scans sorted by the indexed column's value
amcanorderbyop	Boolean	-	Whether the access method supports ordered scans sorted by the result of an operator on the indexed column
amcanbackward	Boolean	-	Whether the access method supports backward scanning
amcanunique	Boolean	-	Whether the access method supports unique indexes
amcanmulticol	Boolean	-	Whether the access method supports multi-column indexes

Name	Type	Reference	Description
amoptionalky	Boolean	-	Whether the access method supports scanning without any constraint for the first index column
amsearcharray	Boolean	-	Whether the access method supports <b>ScalarArrayOpExpr</b> searches
amsearchnulls	Boolean	-	Whether the access method supports <b>IS NULL/NOT NULL</b> searches
amstorage	Boolean	-	Whether the index storage data type can differ from the column data type
amclusterable	Boolean	-	Whether an index of this type can be clustered on
ampredlocks	Boolean	-	Whether an index of this type manages fine-grained predicate locks
amkeytype	oid	<b>oid</b> in <b>PG_TYPE</b>	Type of data stored in index ( <b>0</b> if it is not a fixed type)
aminsert	regproc	<b>PG_PROC.proname</b>	"Insert this tuple" function
ambeginscan	regproc	<b>PG_PROC.proname</b>	"Prepare for index scan" function
amgettupl	regproc	<b>PG_PROC.proname</b>	"Next valid tuple" function ( <b>0</b> if none)
amgetbitmap	regproc	<b>PG_PROC.proname</b>	"Fetch all valid tuples" function ( <b>0</b> if none)
amrescan	regproc	<b>PG_PROC.proname</b>	"(Re)start index scan" function
amendscan	regproc	<b>PG_PROC.proname</b>	"Clean up after index scan" function
ammarkpos	regproc	<b>PG_PROC.proname</b>	"Mark current scan position" function
amrestrpos	regproc	<b>PG_PROC.proname</b>	"Restore marked scan position" function
ammerge	regproc	<b>PG_PROC.proname</b>	"Merge multiple indexes" function
ambuild	regproc	<b>PG_PROC.proname</b>	"Build new index" function

Name	Type	Reference	Description
ambuildempty	regproc	<a href="#">PG_PROC.proname</a>	"Build empty index" function
ambulkdelete	regproc	<a href="#">PG_PROC.proname</a>	Bulk-delete function
amvacuumcleanup	regproc	<a href="#">PG_PROC.proname</a>	Post- <b>VACUUM</b> cleanup function
amcanreturn	regproc	<a href="#">PG_PROC.proname</a>	Function to check whether the index supports index-only scans ( <b>0</b> if none)
amcostestimate	regproc	<a href="#">PG_PROC.proname</a>	Function to estimate cost of an index scan
amoptions	regproc	<a href="#">PG_PROC.proname</a>	Function to parse and validate <b>reloptions</b> for an index

## 12.2.36 PG\_AMOP

PG\_AMOP records information about operators associated with access method operator families. There is one row for each operator that is a member of an operator family. A family member can be either a search operator or an ordering operator. An operator can appear in more than one family, but cannot appear in more than one search position nor more than one ordering position within a family.

**Table 12-36** PG\_AMOP columns

Name	Type	Reference	Description
oid	oid	-	Row identifier (hidden attribute, which must be specified).
amopfamily	oid	<a href="#">PG_OPFAMILY.oid</a>	Operator family of this entry.
amoplefttype	oid	<b>oid</b> in <a href="#">PG_TYPE</a>	Left-hand input data type of the operator. For details about the possible values and their descriptions, see <a href="#">8.3 Data Type</a> .

Name	Type	Reference	Description
amoprighthtype	oid	oid in <a href="#">PG_TYPE</a>	Right-hand input data type of the operator For details about the possible values and their descriptions, see <a href="#">8.3 Data Type</a> .
amopstrategy	smallint	-	Number of operator strategies.
amoppurpose	"char"	-	Purpose of the operator. <ul style="list-style-type: none"> <li>• s: search</li> <li>• o: order</li> </ul>
amopopr	oid	<a href="#">PG_OPERATOR</a> .oid	OID of the operator.
amopmethod	oid	<a href="#">PG_AM</a> .oid	Operator family of the index access method.
amopsortfamily	oid	<a href="#">PG_OPFAMILY</a> .oid	The B-tree operator family according to which this entry sorts for an ordering operator ( <b>0</b> for a search operator)

A search operator entry indicates that an index of this operator family can be searched to find all rows satisfying **WHERE indexed\_column operator constant**. Obviously, such an operator must return a Boolean value, and its left-hand input type must match the index's column data type.

An ordering operator entry indicates that an index of this operator family can be scanned to return rows in the order represented by **ORDER BY indexed\_column operator constant**. Such an operator could return any sortable data type, though again its left-hand input type must match the index's column data type. The exact semantics of **ORDER BY** are specified by the **amopsortfamily** column, which must reference the B-tree operator family for the operator's result type.

## 12.2.37 PG\_AMPROC

PG\_AMPROC records information about the support procedures associated with the access method operator families. There is one row for each support procedure that belongs to an operator family.

**Table 12-37** PG\_AMPROC columns

Name	Type	Reference	Description
oid	oid	-	Row identifier (hidden attribute, which must be specified).

Name	Type	Reference	Description
amprocfamily	oid	<a href="#">PG_OPFAMILY.oid</a>	Operator family of this entry.
amproclefttype	oid	<b>oid</b> in <a href="#">PG_TYPE</a>	Left-hand input data type of the associated operator. For details about the possible values and their descriptions, see <a href="#">8.3 Data Type</a> .
amprocrighttype	oid	<b>oid</b> in <a href="#">PG_TYPE</a>	Right-hand input data type of the associated operator. For details about the possible values and their descriptions, see <a href="#">8.3 Data Type</a> .
amprocnum	smallint	-	Support procedure number.
amproc	regproc	<a href="#">PG_PROC.proname</a>	OID of the procedure.

The usual interpretation of the **amproclefttype** and **amprocrighttype** columns is that they identify the left and right input types of the operator(s) that a particular support procedure supports. For some access methods, these match the input data type(s) of the support procedure itself; for others not. There is a notion of "default" support procedures for an index, which are those with **amproclefttype** and **amprocrighttype** both equal to the index opclass's **opcintype**.

## 12.2.38 PG\_APP\_WORKLOADGROUP\_MAPPING

**PG\_APP\_WORKLOADGROUP\_MAPPING** provides load mapping group information in the database.

**Table 12-38** PG\_APP\_WORKLOADGROUP\_MAPPING columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified)
appname	name	Application name
workload_gpname	name	Mapped workload group name

## 12.2.39 PG\_ATTRDEF

**PG\_ATTRDEF** records default values of columns.

**Table 12-39** PG\_ATTRDEF columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified)
adrelid	oid	Table to which a column belongs
adnum	smallint	Number of columns
adbin	pg_node_tree	Internal representation of the default value of a column or of a generated expression
adsrc	text	Internal representation of a readable default value or of a generated expression
adgencol	"char"	Specifies whether a column is a generated column. The value <b>s</b> indicates that the column is a generated column, and the value <b>\0</b> indicates that the column is a common column. The default value is <b>\0</b> .

## 12.2.40 PG\_ATTRIBUTE

PG\_ATTRIBUTE records information about table columns.

**Table 12-40** PG\_ATTRIBUTE columns

Name	Type	Description
attrelid	oid	Table to which a column belongs
attname	name	Column name
atttypid	oid	Column type
attstattarget	integer	<p>Level of details of statistics collected for this column by <b>ANALYZE</b>.</p> <ul style="list-style-type: none"> <li>The value <b>0</b> indicates that no statistics should be collected.</li> <li>A negative value indicates that the system default statistic object is used.</li> <li>The exact meaning of positive values is data type-dependent.</li> </ul> <p>For scalar data types, <b>attstattarget</b> is both the target number of "most common values" to collect, and the target number of histogram bins to create.</p>
attlen	smallint	Copy of typlen in <a href="#">13.2.108 PG_TYPE</a> of the column type.
attnum	smallint	Number of the column

Name	Type	Description
attndims	integer	Number of dimensions if the column is an array ( <b>0</b> in other cases)
attcacheoff	integer	This column is always set to <b>-1</b> on disks. When it is loaded into a row descriptor in the memory, it may be updated to cache the offset of the columns in the row.
atttypmod	integer	Type-specific data supplied at the table creation time (for example, the maximum length of a <b>varchar</b> column). This column is used as the third parameter when passing to type-specific input functions and length coercion functions. The value will generally be <b>-1</b> for types that do not need <b>atttypmod</b> .
attbyval	Boolean	Copy of typbyval in <b>13.2.108 PG_TYPE</b> of the column type.
attstorage	"char"	Copy of typstorage in <b>13.2.108 PG_TYPE</b> of the column type.
attalign	"char"	Copy of typalign in <b>13.2.108 PG_TYPE</b> of the column type.
attnotnull	Boolean	A non-null constraint. It is possible to change this column to enable or disable the constraint.
atthasdef	Boolean	This column has a default value, in which case there will be a corresponding entry in <b>13.2.47 PG_ATTRDEF</b> that actually defines the value.
attisdropped	Boolean	Indicates that this column has been deleted and is no longer valid. A deleted column is still physically present in the table but is ignored by the analyzer, so it cannot be accessed through SQL.
attislocal	Boolean	Indicates that this column is locally defined in the relationship. Note that a column can be locally defined and inherited simultaneously.
attcmprmode	tinyint	Compressed modes for a specific column. The compressed mode includes: <ul style="list-style-type: none"> <li>• <b>0</b>: not compressed (<b>ATT_CMPR_NOCOMPRESS</b>)</li> <li>• <b>1</b>: DELTA compression algorithm (<b>ATT_CMPR_DELTA</b>)</li> <li>• <b>2</b>: dictionary compression algorithm (<b>ATT_CMPR_DICTIONARY</b>)</li> <li>• <b>3</b>: prefix compression algorithm (<b>ATT_CMPR_PREFIX</b>)</li> <li>• <b>4</b>: digital string compression algorithm (<b>ATT_CMPR_NUMSTR</b>)</li> </ul>

Name	Type	Description
attinhcount	integer	Number of direct ancestors that this column has. A column with an ancestor cannot be dropped nor renamed.
attcollation	oid	Defined collation of a column.
attacl	aclitem[]	Permissions for column-level access.
attoptions	text[]	Column attribute. Currently, the following attributes are supported: <b>n_distinct</b> : number of <b>distinct</b> values of a column (excluding subtables). <b>n_distinct_inherited</b> : number of <b>distinct</b> values of a column (including subtables).
atfdwoptions	text[]	Column attribute of a foreign table. Currently, <b>dist_fdw</b> , <b>file_fdw</b> , and <b>log_fdw</b> do not use foreign table column attributes.
attinitdefval	bytea	<b>attinitdefval</b> stores the default value expression. <b>ADD COLUMN</b> in the row-store table must use this column.
attkvtype	tinyint	Specifies the key value type for a column. Value: <b>0</b> : default value ( <b>ATT_KV_UNDEFINED</b> ) <b>1</b> : dimension ( <b>ATT_KV_TAG</b> ) <b>2</b> : indicator ( <b>ATT_KV_FIELD</b> ) <b>3</b> : time column ( <b>ATT_KV_TIMETAG</b> )

## 12.2.41 PG\_AUTHID

PG\_AUTHID records information about database authentication identifiers (roles). The concept of users is contained in that of roles. A user is actually a role whose **rolcanlogin** has been set. Any role, whether its **rolcanlogin** is set or not, can use other roles as members.

For GaussDB, only one PG\_AUTHID exists, which is not available for every database. This system catalog is accessible only to system administrators.

**Table 12-41** PG\_AUTHID columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).
rolname	name	Name of a role

Name	Type	Description
rolsuper	Boolean	Specifies whether a role is the initial system administrator with the highest permission. <ul style="list-style-type: none"> <li>• <b>t</b> (true): yes</li> <li>• <b>f</b> (false): no</li> </ul>
rolinherit	Boolean	Specifies whether a role automatically inherits permissions of roles of which it is a member. <ul style="list-style-type: none"> <li>• <b>t</b> (true): automatically inherited</li> <li>• <b>f</b> (false): not automatically inherited</li> </ul>
rolcreatorole	Boolean	Specifies whether a role can create more roles. <ul style="list-style-type: none"> <li>• <b>t</b> (true): yes</li> <li>• <b>f</b> (false): no</li> </ul>
rolcreatedb	Boolean	Specifies whether a role can create databases. <ul style="list-style-type: none"> <li>• <b>t</b> (true): yes</li> <li>• <b>f</b> (false): no</li> </ul>
rolcatupdate	Boolean	Specifies whether the role can directly update system catalogs. Only the initial system administrator whose <b>usesysid</b> is set to <b>10</b> has this permission. It is unavailable for other users. <ul style="list-style-type: none"> <li>• <b>t</b> (true): yes</li> <li>• <b>f</b> (false): no</li> </ul>
rolcanlogin	Boolean	Specifies whether the role can log in, that is, whether the role can be given as the initial session authorization identifier. <ul style="list-style-type: none"> <li>• <b>t</b> (true): yes</li> <li>• <b>f</b> (false): no</li> </ul>
rolreplication	Boolean	Specifies whether the role has the replication permission. <ul style="list-style-type: none"> <li>• <b>t</b> (true): yes</li> <li>• <b>f</b> (false): no</li> </ul>
rolauditadmin	Boolean	Specifies whether the role has the audit administrator permission. <ul style="list-style-type: none"> <li>• <b>t</b> (true): yes</li> <li>• <b>f</b> (false): no</li> </ul>

Name	Type	Description
rolsystemadmin	Boolean	Specifies whether the role has the system administrator permission. <ul style="list-style-type: none"> <li>• <b>t</b> (true): yes</li> <li>• <b>f</b> (false): no</li> </ul>
rolconnlimit	integer	Maximum number of concurrent connections that the role can make (valid for roles that can log in). The value <b>-1</b> indicates there is no limit.
rolpassword	text	Password (possibly encrypted); <b>NULL</b> if no password.
rolvalidbegin	timestamp with time zone	Account validity start time ( <b>NULL</b> if no start time).
rolvaliduntil	timestamp with time zone	Password expiry time ( <b>NULL</b> if no expiration).
rolrespool	name	Resource pool that a user can use.
roluseft	Boolean	Specifies whether the role can perform operations on foreign tables. <ul style="list-style-type: none"> <li>• <b>t</b> (true): yes</li> <li>• <b>f</b> (false): no</li> </ul>
rolparentid	oid	OID of a group user to which the user belongs.
roltabspace	text	Maximum size of a user data table.
rolkind	"char"	Type of a user. <ul style="list-style-type: none"> <li>• <b>n</b>: common user</li> <li>• <b>p</b>: permanent user</li> </ul>
rolnodegroup	oid	Unsupported currently
roltempespace	text	Maximum size of a user's temporary table, in KB.
rolspillspace	text	Maximum size of data that can be written to disks when a user executes a job, in KB.
rolexcpdata	text	Query rules that can be set by users (reserved).
rolmonitoradmin	Boolean	Specifies whether the role has the monitor administrator permission. <ul style="list-style-type: none"> <li>• <b>t</b> (true): yes</li> <li>• <b>f</b> (false): no</li> </ul>

Name	Type	Description
roloperatorad min	Boolean	Specifies whether the role has the O&M administrator permission. <ul style="list-style-type: none"> <li>• <b>t</b> (true): yes</li> <li>• <b>f</b> (false): no</li> </ul>
rolpolicyadmi n	Boolean	Specifies whether the role has the security policy administrator permission. <ul style="list-style-type: none"> <li>• <b>t</b> (true): yes</li> <li>• <b>f</b> (false): no</li> </ul>

## 12.2.42 PG\_AUTH\_HISTORY

PG\_AUTH\_HISTORY records the authentication history of a role. This system catalog is accessible only to system administrators.

**Table 12-42** PG\_AUTH\_HISTORY columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).
roloid	oid	ID of a role.
passwordti me	timestamp with time zone	Time of password creation and change.
rolpasswor d	text	Ciphertext of the role password. The encryption mode is determined by the GUC parameter <b>password_encryption_type</b> .

## 12.2.43 PG\_AUTH\_MEMBERS

PG\_AUTH\_MEMBERS records the membership between roles.

**Table 12-43** PG\_AUTH\_MEMBERS columns

Name	Type	Description
roleid	oid	ID of a role that has a member.
member	oid	ID of a role that is a member of ROLEID.
grantor	oid	ID of a role that grants this membership.

Name	Type	Description
admin_option	Boolean	Specifies whether a member can grant membership in ROLEID to others. The value can be <b>true</b> (yes) and <b>false</b> (no).

## 12.2.44 PG\_CAST

PG\_CAST records the conversion relationship between data types.

**Table 12-44** PG\_CAST columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).
castsource	oid	OID of the source data type
casttarget	oid	OID of the target data type
castfunc	oid	OID of the conversion function ( <b>0</b> if no conversion function is required)
castcontext	"char"	Conversion mode between the source and target data types. <ul style="list-style-type: none"> <li>• <b>e</b>: Only explicit conversion can be performed (using the CAST or :: syntax).</li> <li>• <b>i</b>: Implicit conversion can be performed.</li> <li>• <b>a</b>: Both explicit and implicit conversion can be performed between data types.</li> </ul>
castmethod	"char"	Conversion method. <ul style="list-style-type: none"> <li>• <b>f</b>: Conversion is performed using the specified function in the <b>castfunc</b> column.</li> <li>• <b>b</b>: Binary forcible conversion rather than the specified function in the <b>castfunc</b> column is performed between data types.</li> </ul>

## 12.2.45 PG\_CLASS

PG\_CLASS records database objects and their relationship.

**Table 12-45** PG\_CLASS columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).
relname	name	Name of an object, such as a table, index, or view.
relnamespace	oid	OID of the namespace that contains the relationship.
reltype	oid	Data type that corresponds to the table's row type. The index is 0 because the index does not have <b>PG_TYPE</b> records.
reloftype	oid	OID of the composite type ( <b>0</b> for other types).
relowner	oid	Owner of the relationship.
relam	oid	Access method used, such as B-tree, if the row is an index.
relfilenode	oid	Name of the on-disk file of this relationship ( <b>0</b> if such file does not exist).
reltablespace	oid	Tablespace in which this relationship is stored. If the value is <b>0</b> , the default tablespace in this database is used. This column is meaningless if the relationship has no on-disk file.
relpages	double precision	Size of the on-disk representation of the table in pages (of size <b>BLCKSZ</b> ). This is only an estimate used by the optimizer.
reltuples	double precision	Number of rows in the table. This is only an estimate used by the optimizer.
relallvisible	integer	Number of pages marked as all visible in the table. This column is used by the optimizer for optimizing SQL execution. It is updated by <b>VACUUM</b> , <b>ANALYZE</b> , and a few DDL statements such as <b>CREATE INDEX</b> .
reltoastrelid	oid	OID of the TOAST table associated with the table ( <b>0</b> if no TOAST table exists). The TOAST table stores large columns "offline" in a secondary table.
reltoastidxid	oid	OID of the index for a TOAST table ( <b>0</b> for a table other than a TOAST table).

Name	Type	Description
relhasindex	Boolean	Its value is <b>true</b> if this column is a table and has (or recently had) at least one index. It is set by <b>CREATE INDEX</b> but is not immediately cleared by <b>DROP INDEX</b> . If the <b>VACUUM</b> process detects that a table has no index, it clears the <b>relhasindex</b> column and sets the value to <b>false</b> .
relisshared	Boolean	Its value is <b>true</b> if the table is shared across all database nodes in the database. Only certain system catalogs (such as PG_DATABASE) are shared.
relpersistence	"char"	<ul style="list-style-type: none"> <li>● <b>p</b>: permanent table</li> <li>● <b>u</b>: non-log table</li> <li>● <b>t</b>: temporary table</li> <li>● <b>g</b>: global temporary table.</li> </ul>
relkind	"char"	<ul style="list-style-type: none"> <li>● <b>r</b>: ordinary table</li> <li>● <b>i</b>: index</li> <li>● <b>I</b>: global index of a partitioned table</li> <li>● <b>s</b>: sequence</li> <li>● <b>L</b>: long sequence</li> <li>● <b>v</b>: view</li> <li>● <b>c</b>: composite type</li> <li>● <b>t</b>: TOAST table</li> <li>● <b>f</b>: foreign table</li> <li>● <b>m</b>: materialized view</li> </ul>
relnatts	smallint	Number of user columns in the relationship (excluding system columns). <a href="#">13.2.48 PG_ATTRIBUTE</a> has the same number of rows as the user columns.
relchecks	smallint	Number of check constraints in the table. For details, see the system catalog <a href="#">13.2.55 PG_CONSTRAINT</a> .
relhasoids	Boolean	Its value is <b>true</b> if an OID is generated for each row of the relationship. Otherwise, the value is <b>false</b> .
relhaspkey	Boolean	Its value is <b>true</b> if the table has (or once had) a primary key. Otherwise, the value is <b>false</b> .
relhasrules	Boolean	Its value is <b>true</b> if the table has rules. For details, see the system catalog <a href="#">13.2.90 PG_REWRITE</a> .
relhastriggers	Boolean	The value is <b>true</b> if the table has (or once had) triggers. Triggers of the table and view are recorded in the system catalog <a href="#">13.2.102 PG_TRIGGER</a> .

Name	Type	Description
relhassubclass	Boolean	Its value is <b>true</b> if the table has (or once had) any inheritance child table. Otherwise, the value is <b>false</b> .
relcmprs	tinyint	Specifies whether the compression feature is enabled for the table. Note that only batch insertion triggers compression, so ordinary CRUD does not trigger compression. <ul style="list-style-type: none"> <li>• <b>0</b>: Tables that do not support compression (primarily system catalogs, on which the compression attribute cannot be modified).</li> <li>• <b>1</b>: The compression feature of the table data is NOCOMPRESS or has no specified keyword.</li> <li>• <b>2</b>: The compression feature of the table data is COMPRESS.</li> </ul>
relhasclusterkey	Boolean	Specifies whether the local cluster storage is used. <ul style="list-style-type: none"> <li>• <b>true</b>: yes</li> <li>• <b>false</b>: no</li> </ul>
relrowmovement	Boolean	Whether row migration is allowed when the partitioned table is updated. <ul style="list-style-type: none"> <li>• <b>true</b>: Row migration is allowed.</li> <li>• <b>false</b>: Row migration is not allowed.</li> </ul>
parttype	"char"	Whether the table or index has the property of a partitioned table. <ul style="list-style-type: none"> <li>• <b>p</b>: The table or index has the property of a partitioned table.</li> <li>• <b>n</b>: The table or index does not have the property of a partitioned table.</li> <li>• <b>s</b>: The table is a level-2 partitioned table.</li> </ul>
relfrozenxid	xid32	All transaction IDs before this one have been replaced with a permanent ("frozen") transaction ID in the table. This column is used to track whether the table needs to be vacuumed to prevent transaction ID wraparound (or to allow <b>PG_CLOG</b> to be shrunk). The value is <b>0 (InvalidTransactionId)</b> if the relationship is not a table.  To ensure forward compatibility, this column is reserved. The <b>relfrozenxid64</b> column is added to record the information.

Name	Type	Description
relacl	aclitem[]	<p>Access permissions. For details about the ACLItem type, see <a href="#">ACLItem</a>.</p> <p>The command output of the query is as follows:  <i>user1=privs/user2</i> indicates that the permission granted by user 2 to user 1 is <b>privs</b>.  <i>=privs/user3</i> indicates that the permission granted to the <b>public</b> role by user 3 is <b>privs</b>.</p> <p>In the preceding command, user 1, user 2, and user 3 are the existing users or roles in the database, and <b>privs</b> indicates the permissions supported by the database. For details on permission descriptions, see <a href="#">Table 12-46</a>.</p>
reloptions	text[]	Table or index access method, using character strings in the format of "keyword=value"
relreplident	"char"	<p>Identifier of a decoding column in logical decoding.</p> <ul style="list-style-type: none"> <li>• <b>d</b>: default (primary key, if any)</li> <li>• <b>n</b>: none</li> <li>• <b>f</b>: all columns</li> <li>• <b>i</b>: The indisreplident of the index is specified or the default index is used.</li> </ul>
relfrozenxid64	xid	<p>All transaction IDs before this one have been replaced with a permanent ("frozen") transaction ID in the table. This column is used to track whether the table needs to be vacuumed to prevent transaction ID wraparound (or to allow PG_CLOG to be shrunk). The value is <b>0 (InvalidTransactionId)</b> if the relationship is not a table.</p> <p>For a global temporary table, this field is meaningless. You can view <b>relfrozenxid64</b> of the global temporary table of each session in the <code>pg_catalog.pg_gtt_relstats</code> view.</p>
relbucket	oid	Specifies whether the current catalog contains hash bucket shards. A valid OID points to the specific shard information recorded in the PG_HASHBUCKET system catalog. <b>NULL</b> indicates that hash bucket shards are not included.
relbucketkey	int2vector	Hash partition column information. <b>NULL</b> indicates that the column information is not included.

Name	Type	Description
relminmxid	xid	All multi-transaction IDs before this one have been replaced with a transaction ID in the table. This is used to track whether the table needs to be vacuumed in order to prevent multi-transaction IDs wraparound or to allow PG_CLOG to be shrunk. The value is <b>0 (InvalidTransactionId)</b> if the relationship is not a table.

**Table 12-46** Description of permissions

Parameter	Description
r	SELECT (read)
w	UPDATE (write)
a	INSERT (insert)
d	DELETE
D	TRUNCATE
x	REFERENCES
t	TRIGGER
X	EXECUTE
U	USAGE
C	CREATE
c	CONNECT
T	TEMPORARY
A	ALTER
P	DROP
m	COMMENT
i	INDEX
v	VACUUM
*	Authorization options for preceding permissions

## 12.2.46 PG\_COLLATION

PG\_COLLATION describes available collations, which are essentially mappings from an SQL name to OS local categories.

**Table 12-47** PG\_COLLATION columns

Name	Type	Reference	Description
oid	oid	-	Row identifier (hidden attribute, which must be specified)
collname	name	-	Collation name (unique per namespace and encoding)
collnamespace	oid	<b>oid</b> in <b>PG_NAMESPACE</b>	OID of the namespace that contains this collation
collowner	oid	<b>oid</b> in <b>PG_AUTHID</b>	Owner of the collation
collencoding	integer	-	Encoding in which the collation is applicable, or <b>-1</b> if it works for any encoding. It is compatible with PostgreSQL.
collcollate	name	-	<b>LC_COLLATE</b> for this collation object
collctype	name	-	<b>LC_CTYPE</b> for this collation object
collpadattr	text	-	Collation padding attribute. <ul style="list-style-type: none"> <li>• <b>NULL</b>: not applicable.</li> <li>• <b>NO PAD</b>: no padding.</li> <li>• <b>PAD SPACE</b>: blank spaces padded at the end.</li> </ul>
collisdef	boolean	-	Determines whether the collation is the default collation of the character set.

## 12.2.47 PG\_CONSTRAINT

PG\_CONSTRAINT records check, primary key, and unique constraints on tables.

**Table 12-48** PG\_CONSTRAINT columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).
conname	name	Constraint name (not necessarily unique).
connamespace	oid	OID of the namespace that contains the constraint

Name	Type	Description
contype	"char"	<ul style="list-style-type: none"> <li>• <b>c</b>: check constraint</li> <li>• <b>p</b>: primary key constraint</li> <li>• <b>u</b>: unique constraint</li> <li>• <b>t</b>: trigger constraint</li> <li>• <b>x</b>: mutual exclusion constraint</li> <li>• <b>f</b>: foreign key constraint</li> <li>• <b>s</b>: clustering constraint</li> <li>• <b>i</b>: invalid constraint</li> </ul>
condeferrable	Boolean	Specifies whether the constraint is deferrable. <ul style="list-style-type: none"> <li>• <b>true</b>: yes</li> <li>• <b>false</b>: no</li> </ul>
condeferred	Boolean	Specifies whether the constraint can be deferrable by default. <ul style="list-style-type: none"> <li>• <b>true</b>: yes</li> <li>• <b>false</b>: no</li> </ul>
convalidated	Boolean	Specifies whether the constraint is valid. Currently, it can be set to <b>false</b> only for foreign key and check constraints. <ul style="list-style-type: none"> <li>• <b>true</b>: valid</li> <li>• <b>false</b>: invalid</li> </ul>
conrelid	oid	Table containing this constraint ( <b>0</b> if it is not a table constraint).
contypid	oid	Domain containing this constraint ( <b>0</b> if it is not a domain constraint).
conindid	oid	ID of the index associated with the constraint.
confrelid	oid	Referenced table if this constraint is a foreign key. Otherwise, the value is <b>0</b> .
confupdtype	"char"	Foreign key update action code. <ul style="list-style-type: none"> <li>• <b>a</b>: no action.</li> <li>• <b>r</b>: restriction.</li> <li>• <b>c</b>: cascading.</li> <li>• <b>n</b>: The parameter is set to null.</li> <li>• <b>d</b>: The default value is used.</li> </ul>

Name	Type	Description
confdeltype	"char"	Foreign key deletion action code <ul style="list-style-type: none"> <li>• <b>a</b>: no action.</li> <li>• <b>r</b>: restriction.</li> <li>• <b>c</b>: cascading.</li> <li>• <b>n</b>: The parameter is set to null.</li> <li>• <b>d</b>: The default value is used.</li> </ul>
confmatchtype	"char"	Foreign key match type. <ul style="list-style-type: none"> <li>• <b>f</b>: full match.</li> <li>• <b>p</b>: partial match.</li> <li>• <b>u</b>: unspecified (The NULL value can be matched if <b>f</b> is specified.)</li> </ul>
conislocal	Boolean	Specifies whether the constraint is defined locally for the relation. <ul style="list-style-type: none"> <li>• <b>true</b>: yes</li> <li>• <b>false</b>: no</li> </ul>
coninhcount	integer	Number of direct inheritance parent tables that this constraint has. When the value is not <b>0</b> , the constraint cannot be deleted or renamed.
connoinherit	Boolean	Specifies whether the constraint can be inherited. <ul style="list-style-type: none"> <li>• <b>true</b>: yes</li> <li>• <b>false</b>: no</li> </ul>
consoft	Boolean	Specifies whether the column indicates an informational constraint. <ul style="list-style-type: none"> <li>• <b>true</b>: yes</li> <li>• <b>false</b>: no</li> </ul>
conopt	Boolean	Specifies whether you can use the informational constraint to optimize the execution plan. <ul style="list-style-type: none"> <li>• <b>true</b>: yes</li> <li>• <b>false</b>: no</li> </ul>
conkey	smallint[]	Column list of the constrained control if this column is a table constraint.
confkey	smallint[]	List of referenced columns if this column is a foreign key.
confpeqop	oid[]	ID list of the equality operators for PK = FK comparisons if this column is a foreign key.

Name	Type	Description
conppeqop	oid[]	ID list of the equality operators for PK = PK comparisons if this column is a foreign key.
conffeqop	oid[]	ID list of the equality operators for FK = FK comparisons if this column is a foreign key. The value is empty because foreign keys are not supported currently.
conexclp	oid[]	ID list of the per-column exclusion operators if this column is an exclusion constraint.
conbin	pg_node_tree	Internal representation of the expression if this column is a check constraint.
consrc	text	Readable representation of the expression if this column is a check constraint.
conincluding	smallint[]	Not for constraint, but will be included in the attribute column of <b>INDEX</b> .

#### NOTICE

- **consrc** is not updated when referenced objects change and does not track new column names. Instead of relying on this column to update, you are advised to use `pg_get_constraintdef()` to extract the definition of a check constraint.
- **relchecks** of [13.2.53 PG\\_CLASS](#) must agree with the number of check-constraint entries found in the table for each relationship.

## 12.2.48 PG\_CONVERSION

PG\_CONVERSION describes encoding conversion information.

**Table 12-49** PG\_CONVERSION columns

Name	Type	Reference	Description
oid	oid	-	Row identifier (hidden attribute, which must be specified)
conname	name	-	Conversion name (unique within a namespace)
connamespace	oid	<a href="#">PG_NAMESPACE</a> .oid	OID of the namespace that contains this conversion
conowner	oid	<a href="#">PG_AUTHID</a> .oid	Owner of the conversion
conforencoding	integer	-	Source encoding ID

Name	Type	Reference	Description
contoencoding	integer	-	Destination encoding ID
conproc	regproc	<a href="#">PG_PROC.proname</a>	Conversion procedure
condefault	Boolean	-	If this is the default conversion, the value is <b>true</b> . Otherwise, the value is <b>false</b> .

## 12.2.49 PG\_DATABASE

PG\_DATABASE records information about available databases.

**Table 12-50** PG\_DATABASE columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).
datname	name	Database name
datdba	oid	Owner of the database, usually the user who created it.
encoding	integer	Character encoding for the database.
datcollate	name	Sequence used by the database.
datctype	name	Character type used by the database.
datistemplate	Boolean	Whether the database can be used as a template database.
datallowconn	Boolean	If the value is <b>true</b> , users can connect to the database. If the value is <b>false</b> , no one can connect to this database. This column is used to protect the <b>template0</b> database from being altered.
datconnlimit	integer	Maximum number of concurrent connections allowed on this database. The value <b>-1</b> indicates no limit.
datlastsysoid	oid	Last system OID in the database.

Name	Type	Description
datfrozenxid	xid32	Tracks whether the database needs to be vacuumed to prevent transaction ID wraparound. This column is discarded in the current version. To ensure forward compatibility, this column is reserved. The <b>datfrozenxid64</b> column is added to record the information.
dattablespace	oid	Default tablespace of the database.
datcompatibility	name	Database compatibility mode. Currently, four compatibility modes are supported: A, B, C, and PG, indicating that the Oracle, MySQL, Teradata, and Postgres databases are compatible.
datacl	aclitem[]	Access permission.
datfrozenxid64	xid	Tracks whether the database needs to be vacuumed to prevent transaction ID wraparound.
datminmxid	xid	All multi-transaction IDs before this one have been replaced with a transaction ID in the database. This is used to track whether the database needs to be vacuumed in order to prevent transaction IDs wraparound or to allow PG_CLOG to be shrunk. It is the minimum value of <b>relminmxid</b> in <a href="#">13.2.53 PG_CLASS</a> of all tables in the database.
dattimezone	name	Database time zone. The default is PRC.

## 12.2.50 PG\_DB\_ROLE\_SETTING

**PG\_DB\_ROLE\_SETTING** records the default values of configuration items bound to each role and database when the database is running.

**Table 12-51** PG\_DB\_ROLE\_SETTING columns

Name	Type	Description
setdatabase	oid	Database corresponding to the configuration items ( <b>0</b> if no database is specified)
setrole	oid	Role corresponding to the configuration items ( <b>0</b> if no role is specified)

Name	Type	Description
setconfig	text[]	Default value of runtime configuration items. Contact the administrator to configure it.

## 12.2.51 PG\_DEFAULT\_ACL

**PG\_DEFAULT\_ACL** records initial permissions assigned to newly created objects.

**Table 12-52** PG\_DEFAULT\_ACL columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified)
defaclrole	oid	ID of the role associated with the permission
defaclnamespace	oid	Namespace associated with the permission ( <b>0</b> if no ID)
defaclobjtype	"char"	Object type of the permission <ul style="list-style-type: none"> <li>• <b>r</b> indicates a table or view.</li> <li>• <b>S</b> indicates a sequence.</li> <li>• <b>f</b> indicates a function.</li> <li>• <b>T</b> indicates a type.</li> <li>• <b>K</b> indicates the client master key.</li> <li>• <b>k</b> indicates the column encryption key.</li> </ul>
defaclacl	aclitem[]	Access permissions that this type of object should have on creation

## 12.2.52 PG\_DEPEND

**PG\_DEPEND** records the dependency between database objects. This information allows **DROP** commands to find which other objects must be dropped by **DROP CASCADE** or prevent dropping in the **DROP RESTRICT** case.

See also [PG\\_SHDEPEND](#), which performs a similar function for dependencies involving objects that are shared across databases.

**Table 12-53** PG\_DEPEND columns

Name	Type	Reference	Description
classid	oid	<b>oid</b> in <a href="#">PG_CLASS</a>	OID of the system catalog where a dependent object resides
objid	oid	Any OID column	OID of the dependent object
objsubid	integer	-	For a table column, this is the column number ( <b>objid</b> and <b>classid</b> refer to the table itself). The value is <b>0</b> for all other object types.
refclassid	oid	<b>oid</b> in <a href="#">PG_CLASS</a>	OID of the system catalog where a referenced object resides
refobjid	oid	Any OID column	OID of the referenced object
refobjsubid	integer	-	For a table column, this is the column number ( <b>refobjid</b> and <b>refclassid</b> refer to the table itself). The value is <b>0</b> for all other object types.
deptype	"char"	-	A code defining the specific semantics of this dependency

In all cases, a PG\_DEPEND entry indicates that the referenced object cannot be dropped without also dropping the dependent object. However, there are several subflavors identified by **deptype**:

- **DEPENDENCY\_NORMAL** (n): A normal relationship between separately created objects. The dependent object can be dropped without affecting the referenced object. The referenced object can only be dropped by specifying **CASCADE**, in which case the dependent object is dropped too. Example: a table column has a normal dependency on its data type.
- **DEPENDENCY\_AUTO** (a): The dependent object can be dropped separately from the referenced object, and should be automatically dropped (regardless of RESTRICT or CASCADE mode) if the referenced object is dropped. Example: a named constraint on a table is made autodependent on the table, so that it will go away if the table is dropped.
- **DEPENDENCY\_INTERNAL** (i): The dependent object was created as part of creation of the referenced object, and is only a part of its internal implementation. A DROP of the dependent object will be disallowed outright (We'll tell the user to issue a DROP against the referenced object, instead). A DROP of the referenced object will be propagated through to drop the dependent object whether CASCADE is specified or not.
- **DEPENDENCY\_EXTENSION** (e): The dependent object is a member of the extension of the referenced object (see [PG\\_EXTENSION](#)). The dependent object can be dropped only via DROP EXTENSION on the referenced object. Functionally this dependency type acts the same as an internal dependency, but it is kept separate for clarity and to simplify GS\_DUMP.

**NOTICE**

The extended function is for internal use only. You are advised not to use it.

- **DEPENDENCY\_PIN** (p): There is no dependent object; this type of entry is a signal that the system itself depends on the referenced object, and so that object must never be deleted. Entries of this type are created only by **initdb**. The columns for the dependent object contain zeroes.

## 12.2.53 PG\_DESCRIPTION

**PG\_DESCRIPTION** records optional descriptions (comments) for each database object. Descriptions of many built-in system objects are provided in the initial contents of **PG\_DESCRIPTION**.

See also **PG\_SHDESCRIPTION**, which provides a similar function for descriptions involving objects that are shared within the entire database.

**Table 12-54** PG\_DESCRIPTION columns

Name	Type	Reference	Description
objoid	oid	Any OID column	OID of the object that this description pertains to
classoid	oid	<b>oid</b> in <b>PG_CLASS</b>	OID of the system catalog where the object appears
objsubid	integer	-	Column number for a comment on a table column ( <b>objoid</b> and <b>classoid</b> refer to the table itself); <b>0</b> for all other object types
description	text	-	Arbitrary text that serves as the description of the object

## 12.2.54 PG\_DIRECTORY

**PG\_DIRECTORY** stores directory objects added by users. You can execute the **CREATE DIRECTORY** statement to add records to this system catalog. When **enable\_access\_server\_directory** is set to **off**, only the initial user can create directory objects. When **enable\_access\_server\_directory** is set to **on**, users with the **SYSADMIN** permission and users inheriting the built-in role permission **gs\_role\_directory\_create** can create directory objects. Common users can access this system catalog only after being authorized.

**Table 12-55** PG\_DIRECTORY columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified)

Name	Type	Description
dirname	name	Name of a directory object
owner	oid	Owner of a directory object
dirpath	text	Directory path.
diracl	aclitem[]	Access permissions.

## 12.2.55 PG\_ENUM

PG\_ENUM contains entries showing the values and labels for each enumerated type. The internal representation of a given enumerated value is actually the OID of its associated row in PG\_ENUM.

**Table 12-56** PG\_ENUM columns

Name	Type	Reference	Description
oid	oid	-	Row identifier (hidden attribute, which must be specified).
enumtypid	oid	<b>oid</b> in <b>PG_TYPE</b>	OID of <b>13.2.108 PG_TYPE</b> owning this enumerated value.
enumsortorder	real	-	Sort position of this enumerated value within its enumerated type.
enumlabel	name	-	Textual label for this enumerated value.

The OIDs for **PG\_ENUM** rows follow a special rule: even-numbered OIDs are guaranteed to be ordered in the same way as the sort ordering of their enumerated type. If two even OIDs belong to the same enumerated type, the smaller OID must have the smaller **enumsortorder** value. Odd-numbered OID values need bear no relationship to the sort order. This rule allows the enumerated comparison routines to avoid catalog lookups in many common cases. The routines that create and alter enumerated types attempt to assign even OIDs to enumerated values whenever possible.

When an enumerated type is created, its members are assigned sort-order positions from 1 to *n*. However, members added later might be given negative or fractional values of **enumsortorder**. The only requirement on these values is that they be correctly ordered and unique within each enumerated type.

## 12.2.56 PG\_EXTENSION

PG\_EXTENSION records information about the installed extensions. The default GaussDB extensions are PL/pgSQL, DIST\_FDW, FILE\_FDW, LOG\_FDW, DBLINK\_FDW, PACKAGES, SECURITY\_PLUGIN, GSSTAT\_PLUGIN, PKG\_DBE\_RAW,

PKG\_DBE\_OUTPUT, PKG\_DBE\_UTILITY, and PKG\_DBE\_XML. This system catalog is for internal use only. You are advised not to use it.

**Table 12-57** PG\_EXTENSION

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).
extname	name	Extension name.
extowner	oid	Owner of the extension.
extnamespace	oid	Namespace containing the extension's exported objects.
extrelocatable	Boolean	Whether the extension can be relocated to another namespace. Value <b>true</b> indicates that relocation is allowed.
extversion	text	Version number of the extension.
extconfig	oid[]	Configuration information about the extension.
extcondition	text[]	Filter conditions for the extension's configuration information.

## 12.2.57 PG\_FOREIGN\_DATA\_WRAPPER

**PG\_FOREIGN\_DATA\_WRAPPER** records foreign-data wrapper definitions. A foreign-data wrapper is the mechanism by which external data, residing on foreign servers, is accessed.

**Table 12-58** PG\_FOREIGN\_DATA\_WRAPPER columns

Name	Type	Reference	Description
oid	oid	-	Row identifier (hidden attribute, which must be specified)
fdwnam e	name	-	Name of a foreign-data wrapper
fdwown er	oid	OID in <b>PG_AUTHID</b>	Owner of a foreign-data wrapper
fdwhan dler	oid	OID in <b>PG_PROC</b>	References a handler function that is responsible for supplying execution routines for a foreign-data wrapper The value is <b>0</b> if no handler is provided.

Name	Type	Reference	Description
fdwvalidator	oid	OID in <a href="#">PG_PROC</a>	References a validator function that is responsible for checking the validity of the options given to a foreign-data wrapper, as well as options for foreign servers and user mappings using the foreign-data wrapper. The value is <b>0</b> if no validator is provided.
fdwacl	aclitem[]	-	Access permissions
fdwoptions	text[]	-	Foreign-data wrapper specific option, expressed in a string in the format of keyword=value

## 12.2.58 PG\_FOREIGN\_SERVER

**PG\_FOREIGN\_SERVER** records foreign server definitions. A foreign server describes a source of external data, such as a remote server. Foreign servers are accessed via foreign-data wrappers.

**Table 12-59** PG\_FOREIGN\_SERVER columns

Name	Type	Reference	Description
oid	oid	-	Row identifier (hidden attribute, which must be specified)
srvname	name	-	Name of a foreign server
srvowner	oid	OID in <a href="#">PG_AUTHID</a>	Owner of the foreign server
srvfdw	oid	OID in <a href="#">PG_FOREIGN_DATA_WRAPPER</a>	OID of the foreign-data wrapper on a foreign server
srvtype	text	-	Type of the server (optional)
srvversion	text	-	Version of the server (optional)
srvacl	aclitem[]	-	Access permissions
srvoptions	text[]	-	Option used for foreign servers, expressed in a string in the format of keyword=value

## 12.2.59 PG\_HASHBUCKET

PG\_HASHBUCKET records hash bucket information.

**Table 12-60** PG\_HASHBUCKET columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified)
bucketid	oid	Hash value calculated for a bucket vector. The hash value can be used to accelerate the search for a bucket vector.
bucketcnt	integer	Number of shards
bucketmap size	integer	Total number of shards on all DNs
bucketref	integer	Reserved column with 1 as its default value
bucketvector	oidvector_extend	Records all bucket IDs contained in the bucket information in this row. A unique index is created in this column. Tables with the same bucket ID share the PG_HASHBUCKET data in the same row.

## 12.2.60 PG\_INDEX

PG\_INDEX records part of index information. The rest is mostly recorded in PG\_CLASS.

**Table 12-61** PG\_INDEX columns

Name	Type	Description
indexrelid	oid	OID of <a href="#">13.2.53 PG_CLASS</a> for the index.
indrelid	oid	OID of <a href="#">13.2.53 PG_CLASS</a> for the table that uses the index.
indnatts	smallint	Number of columns in the index.
indisunique	Boolean	Specifies whether the index is unique. <ul style="list-style-type: none"> <li><b>true:</b> The index is unique.</li> <li><b>false:</b> The index is not unique.</li> </ul>

Name	Type	Description
indisprimary	Boolean	Specifies whether the index is the primary key of the table. <ul style="list-style-type: none"> <li>● <b>true</b>: The index is the primary key of the table. <b>indisunique</b> should always be <b>true</b> when the value of this column is <b>true</b>.</li> <li>● <b>false</b>: The index is not the primary key of the table.</li> </ul>
indisexclusion	Boolean	Specifies whether the index supports exclusive constraints. <ul style="list-style-type: none"> <li>● <b>true</b>: The index supports exclusive constraints.</li> <li>● <b>false</b>: The index does not support exclusive constraints.</li> </ul>
indimmediate	Boolean	Specifies whether to perform the uniqueness check immediately when data is inserted <ul style="list-style-type: none"> <li>● <b>true</b>: The uniqueness check is performed immediately when data is inserted.</li> <li>● <b>false</b>: The uniqueness check is not performed when data is inserted.</li> </ul>
indisclustered	Boolean	Specifies whether the table is clustered on the index. <ul style="list-style-type: none"> <li>● <b>true</b>: The table is clustered on the index.</li> <li>● <b>false</b>: The table is not clustered on the index.</li> </ul>
indisusable	Boolean	Specifies whether the index is available for insert and select operations. <ul style="list-style-type: none"> <li>● <b>true</b>: The index is available for insert and select operations.</li> <li>● <b>false</b>: The index is unavailable for insert and select operations.</li> </ul>
indisvalid	Boolean	<ul style="list-style-type: none"> <li>● <b>true</b>: The index can be used for query.</li> <li>● <b>false</b>: The index is possibly incomplete and must still be modified by INSERT or UPDATE operations, but it cannot be securely used for queries. If it is a unique index, the uniqueness property is also not <b>true</b>.</li> </ul>
indcheckxmin	Boolean	<ul style="list-style-type: none"> <li>● <b>true</b>: Queries must not use the index until the xmin of this row in PG_INDEX is lower than their <b>TransactionXmin</b>, because the table may contain broken HOT chains with incompatible rows that they can see.</li> <li>● <b>false</b>: Indexes can be used for query.</li> </ul>

Name	Type	Description
indisready	Boolean	<ul style="list-style-type: none"> <li>• <b>true</b>: The index is available for inserting data.</li> <li>• <b>false</b>: The index is ignored when data is inserted or modified.</li> </ul>
indkey	int2vector	This is an array of <b>indnatts</b> values indicating that this index creates table columns. For example, a value of <b>1 3</b> indicates that the first and the third columns make up the index key. The value <b>0</b> in this array indicates that the corresponding index attribute is an expression over the table columns, rather than a simple column reference.
indcollation	oidvector	OID of the collation corresponding to each index column. For details, see <a href="#">PG_COLLATION</a> .
indclass	oidvector	For each column in the index key, this contains the OID of the operator class to use. See <a href="#">PG_OPCLASS</a> for details.
indoption	int2vector	Array of values that store per-column flag bits. The meaning of the bits is defined by the index's access method.
indexprs	pg_node_tree	Expression trees (in <b>nodeToString()</b> representation) for index attributes that are not simple column references. It is a list with one element for each zero entry in indkey. The value is null if all index attributes are simple references.
indpred	pg_node_tree	Expression tree (in <b>nodeToString()</b> representation) for partial index predicate. If the index is not a partial index, this column is an empty string.
indisreplident	Boolean	Specifies whether the column of this index is a decoded column of logical decoding. <ul style="list-style-type: none"> <li>• <b>true</b>: The column of this index is a decoded column of logical decoding.</li> <li>• <b>false</b>: The column of this index is not a decoded column of logical decoding.</li> </ul>
indnkeyatts	smallint	Total number of columns in the index. The columns that exceed the value of <b>indnatts</b> are not involved in the index query.

## 12.2.61 PG\_INHERITS

**PG\_INHERITS** records information about table inheritance hierarchies. There is one entry for each direct child table in the database. Indirect inheritance can be determined by following chains of entries.

**Table 12-62** PG\_INHERITS columns

Name	Type	Reference	Description
inhrelid	oid	<a href="#">PG_CLASS.oid</a>	OID of a child table
inhparent	oid	<a href="#">PG_CLASS.oid</a>	OID of a parent table
inhseqno	integer	-	If there is more than one direct parent for a child table (multiple inheritances), this number tells the order in which the inherited columns are to be arranged. The count starts at 1.

## 12.2.62 PG\_JOB

PG\_JOB records detailed information about jobs created by users. Dedicated threads poll the system catalog PG\_JOB and trigger jobs based on scheduled job execution time, and update job status in PG\_JOB. This system catalog belongs to the Shared Relation category. All job records are visible to all databases. Common users can access this system catalog only after being authorized.

**Table 12-63** PG\_JOB columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified)
job_id	bigint	Job ID, primary key, unique (with a unique index)
current_postgres_pid	bigint	If the current job has been executed, the thread ID of this job is recorded. The default value is <b>-1</b> , indicating that the job has not yet been executed.
log_user	name	Username of the job creator
priv_user	name	Username of the job executor
dbname	name	Name of the database in which the job will be executed
node_name	name	Primary database node on which the job will be executed

Name	Type	Description
job_status	"char"	<p>Execution status of the current task. The default value is 's'. The options are as follows:</p> <ul style="list-style-type: none"> <li>• 'r': running</li> <li>• 's': successfully finished</li> <li>• 'f': job failed</li> <li>• 'd': disable</li> </ul> <p>If a job fails to be executed for 16 consecutive times, <b>job_status</b> is automatically set to 'd', and no more attempt will be made on this job.</p> <p>Note: When you disable a scheduled task (by setting <b>job_queue_processes</b> to 0), the thread that monitors the job execution is not started, and the job status will not be updated. You can ignore this status. Only when the scheduled task function is enabled (<b>job_queue_processes</b> is not set to 0), the system updates the value of this column based on the real-time job status.</p>
start_date	timestamp without time zone	Start time of the first job execution, accurate to millisecond
next_run_date	timestamp without time zone	Time when a scheduled job is executed next time. The time is accurate to milliseconds.
failure_count	smallint	Number of times the job has started and failed. If a job fails to be executed for 16 consecutive times, no more attempt will be made on it.
interval	text	Job execution interval
last_start_date	timestamp without time zone	Start time of the last job execution, accurate to millisecond
last_end_date	timestamp without time zone	End time of the last job execution, accurate to millisecond
last_suc_date	timestamp without time zone	Start time of the last successful job execution, accurate to millisecond
this_run_date	timestamp without time zone	Start time of the ongoing job execution, accurate to millisecond
nspname	name	Name of the schema used for job execution
job_name	text	Name of the DBE_SCHEDULER scheduled task.

Name	Type	Description
end_date	timestamp without time zone	Expiration time of the DBE_SCHEDULER scheduled task, accurate to millisecond.
enable	Boolean	The DBE_SCHEDULER scheduled task enabling status. The options are as follows: <ul style="list-style-type: none"> <li>• <b>true</b>: enabled</li> <li>• <b>false</b>: disabled</li> </ul>
failure_message	text	Error information about the latest task execution.

## 12.2.63 PG\_JOB\_PROC

PG\_JOB\_PROC records the content of each job in [13.2.71 PG\\_JOB](#), including the PL/SQL code blocks and anonymous blocks. Storing such information in the system catalog PG\_JOB and loading it to the shared memory will result in excessive memory usage. Therefore, such information is stored in a separate table and is retrieved when needed. Common users can access this system catalog only after being authorized.

**Table 12-64** PG\_JOB\_PROC columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).
job_id	integer	Foreign key, which is associated with <b>job_id</b> in the system catalog <a href="#">13.2.71 PG_JOB</a> .
what	text	Job content, which is the program content in the DBE_SCHEDULER scheduled task.
job_name	text	Name of the DBE_SCHEDULER scheduled task or program.

## 12.2.64 PG\_LANGUAGE

PG\_LANGUAGE registers programming languages. You can use them and APIs to write functions or stored procedures.

**Table 12-65** PG\_LANGUAGE columns

Name	Type	Reference	Description
oid	oid	-	Row identifier (hidden attribute, which must be specified).
lanname	name	-	Language name.
lanowner	oid	<b>oid</b> in <b>PG_AUTHID</b>	Owner of the language.
lanispl	Boolean	-	The value is <b>false</b> for internal languages (such as SQL) and <b>true</b> for user-defined languages. Currently, <b>gs_dump</b> still uses this column to determine which languages need to be dumped, but this might be replaced by a different mechanism in the future.
lanpltrusted	Boolean	-	The value is <b>true</b> if this is a trusted language, which means that it is believed not to grant access to anything outside the normal SQL execution environment. The value is <b>false</b> if this is a untrusted language. Only the initial user can create functions in untrusted languages.
lanplcallfoid	oid	<b>oid</b> in <b>PG_PROC</b>	For non-internal languages, this column references the language handler, which is a special function responsible for executing all functions that are written in the particular language.
laninline	oid	<b>oid</b> in <b>PG_PROC</b>	This column references a function responsible for executing "inline" anonymous code blocks (DO blocks). The value is <b>0</b> if inline blocks are not supported.
lanvalidator	oid	<b>oid</b> in <b>PG_PROC</b>	This column references a language validator function responsible for checking the syntax and validity of new functions when they are created. The value is <b>0</b> if no validator is provided.
lanacl	aclitem[]	-	Access permissions

## 12.2.65 PG\_LARGEOBJECT

**PG\_LARGEOBJECT** records data making up large objects. A large object is identified by an OID assigned when it is created. Each large object is broken into segments or "pages" small enough to be conveniently stored as rows in **PG\_LARGEOBJECT**. The amount of data per page is defined as **LOBLKSIZE**.

This system catalog is accessible only to system administrators.

**Table 12-66** PG\_LARGEOBJECT columns

Name	Type	Reference	Description
loid	oid	<a href="#">PG_LARGEOBJECT_METADATA.oid</a>	Identifier of the large object that includes this page
pageno	integer	-	Page number of this page within its large object (counting from zero)
data	bytea	-	Data stored in the large object. This will never be more than <b>LOBLKSIZE</b> bytes and might be less.

Each row of **PG\_LARGEOBJECT** holds data for one page of a large object, beginning at byte offset (**pageno \* LOBKSIZE**) within the object. The implementation allows sparse storage: pages might be missing, and might be shorter than **LOBLKSIZE** bytes even if they are not the last page of the object. Missing regions within a large object read as zeroes.

## 12.2.66 PG\_LARGEOBJECT\_METADATA

**PG\_LARGEOBJECT\_METADATA** records metadata associated with large objects. The actual large object data is stored in **PG\_LARGEOBJECT**.

**Table 12-67** PG\_LARGEOBJECT\_METADATA columns

Name	Type	Reference	Description
oid	oid	-	Row identifier (hidden attribute, which must be specified)
lomowner	oid	<a href="#">PG_AUTHID.oid</a>	Owner of the large object
lomacl	aclitem[]	-	Access permissions

## 12.2.67 PG\_NAMESPACE

**PG\_NAMESPACE** records namespaces, that is, schema-related information.

**Table 12-68** PG\_NAMESPACE columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified)
nspname	name	Name of a namespace
nspowner	oid	Owner of a namespace
nsptimeline	bigint	Timeline when a namespace is created on the database node. This column is for internal use and valid only on the database node.
nspacl	aclitem[]	Access permission
in_redistribution	"char"	Specifies whether the content is in the redistribution state.
nspcollation	oid	Default collation of the namespace (a value may exist only when <b>sql_compatibility='b'</b> is set).

## 12.2.68 PG\_OBJECT

**PG\_OBJECT** records the creator, creation time, and last modification time of objects of specified types (ordinary tables, indexes, sequences, views, stored procedures, and functions).

**Table 12-69** PG\_OBJECT columns

Name	Type	Description
object_oid	oid	Object identifier
object_type	"char"	Object type <ul style="list-style-type: none"> <li>• <b>r</b>: ordinary table</li> <li>• <b>i</b>: index</li> <li>• <b>s</b>: sequence</li> <li>• <b>v</b>: view</li> <li>• <b>P</b>: stored procedure and function</li> <li>• <b>S</b>: package header</li> <li>• <b>B</b>: package body</li> </ul>
creator	oid	ID of a creator
ctime	timestamp with time zone	Creation time of an object

Name	Type	Description
mtime	timestamp with time zone	Last modification time of an object. The modification operations include <b>ALTER</b> , <b>GRANT</b> , and <b>REVOKE</b> .
createcsn	bigint	CSN when an object is created
changeagn	bigint	CSN when DDL operations are performed on a table or an index
valid	boolean	Validity of an object. <b>t</b> indicates valid, and <b>f</b> indicates invalid.

#### NOTICE

- Objects created or modified during database initialization (initdb) cannot be recorded. **PG\_OBJECT** does not contain these object records.
- When an object created before the upgrade is modified again, the modification time (specified by **mtime**) is recorded. When DDL operations are performed on a table or an index, the transaction commit sequence number (specified by **changeagn**) of the transaction to which the table or index belongs is recorded. Because the creation time of the object cannot be obtained, **ctime** and **createcsn** are empty.
- The time recorded by **ctime** and **mtime** is the start time of the transaction to which the current operation belongs.
- The time of object modification due to capacity expansion is also recorded.
- **createcsn** and **changeagn** record the transaction commit sequence number of the transaction to which the current operation belongs.
- When **enable\_gtt\_concurrent\_truncate** is set to **on**, the **mtime** field is not updated when the global temporary table is truncated.
- If the statement for creating an object has an undefined object, or the referenced object is modified or deleted, the object to be created will be invalid.

## 12.2.69 PG\_OPCLASS

**PG\_OPCLASS** defines index access method operator classes.

Each operator class defines semantics for index columns of a particular data type and a particular index access method. An operator class essentially specifies that a particular operator family is applicable to a particular indexable column data type. The set of operators from the family that are actually usable with the indexed column are whichever ones accept the column's data type as their left-hand input.

**Table 12-70** PG\_OPCLASS columns

Name	Type	Reference	Description
oid	oid	-	Row identifier (hidden attribute, which must be specified)
opcmethod	oid	OID in <a href="#">PG_AM</a>	Index access method operator class served by an operator class
opcname	name	-	Name of the operator class
opcnamespace	oid	OID in <a href="#">PG_NAMESPACE</a>	Namespace of the operator class
opcowner	oid	OID in <a href="#">PG_AUTHID</a>	Owner of the operator class
opcfamily	oid	OID in <a href="#">PG_OPFAMILY</a>	Operator family containing the operator class
opcintype	oid	OID in <a href="#">PG_TYPE</a>	Data type that the operator class indexes
opcdefault	boolean	-	The value is <b>true</b> if this operator class is the default for <b>opcintype</b> .
opckeytype	oid	OID in <a href="#">PG_TYPE</a>	Type of data stored in an index, or zero if same as <b>opcintype</b>

An operator class's **opcmethod** must match the **opfmetho**d of its containing operator family.

## 12.2.70 PG\_OPERATOR

PG\_OPERATOR records information about operators.

**Table 12-71** PG\_OPERATOR columns

Name	Type	Reference	Description
oid	oid	-	Row identifier (hidden attribute, which must be specified)
oprname	name	-	Name of an operator
oprnamespace	oid	<b>oid</b> in <a href="#">PG_NAMESPACE</a>	OID of the namespace that contains the operator.
oprowner	oid	<b>oid</b> in <a href="#">PG_AUTHID</a>	Owner of the operator.

Name	Type	Reference	Description
oprkind	"char"	-	<ul style="list-style-type: none"> <li>• <b>b</b>: infix (both sides)</li> <li>• <b>l</b>: prefix (left side)</li> <li>• <b>r</b>: suffix (right side)</li> </ul>
oprcanmerge	Boolean	-	<p>Specifies whether the operator supports merge joins.</p> <ul style="list-style-type: none"> <li>• <b>t (true)</b>: yes</li> <li>• <b>f (false)</b>: no</li> </ul>
oprcanhash	Boolean	-	<p>Whether the operator supports hash joins</p> <ul style="list-style-type: none"> <li>• <b>t (true)</b>: yes</li> <li>• <b>f (false)</b>: no</li> </ul>
oprleft	oid	<b>oid</b> in <b>PG_TYPE</b>	Type of the left operand.
oprright	oid	<b>oid</b> in <b>PG_TYPE</b>	Type of the right operand.
oprresult	oid	<b>oid</b> in <b>PG_TYPE</b>	Type of the result.
oprcom	oid	<b>oid</b> in <b>PG_OPERATOR</b>	<ul style="list-style-type: none"> <li>• If it exists, the value is the exchange character of this operator.</li> <li>• If it does not exist, the value is <b>0</b>.</li> </ul>
oprnegate	oid	<b>oid</b> in <b>PG_OPERATOR</b>	<ul style="list-style-type: none"> <li>• If it exists, the value is the inverter of this operator.</li> <li>• If it does not exist, the value is <b>0</b>.</li> </ul>
oprcode	regproc	<b>prname</b> in <b>PG_PROC</b>	Function that implements the operator
oprrest	regproc	<b>prname</b> in <b>PG_PROC</b>	Restriction selectivity estimation function for the operator.
oprjoin	regproc	<b>prname</b> in <b>PG_PROC</b>	Join selectivity estimation function for the operator.

## 12.2.71 PG\_OPFAMILY

**PG\_OPFAMILY** defines operator families.

Each operator family is a collection of operators and associated support routines that implement semantics specified for a particular index access method. Furthermore, the operators in a family are all compatible, in a way that is

specified by the access method. The operator family allows cross-data-type operators to be used with indexes and to be reasoned about using knowledge of access method semantics.

**Table 12-72** PG\_OPFAMILY columns

Name	Type	Reference	Description
oid	oid	-	Row identifier (hidden attribute, which must be specified)
opfmethod	oid	<a href="#">PG_AM.oid</a>	Index access method used by an operator family
opfname	name	-	Name of the operator family
opfnamespace	oid	<a href="#">PG_NAMESPACE.oid</a>	Namespace of the operator family
opfowner	oid	<a href="#">PG_AUTHID.oid</a>	Owner of the operator family

The majority of the information defining an operator family is not in its **PG\_OPFAMILY** row, but in the associated rows in [PG\\_AMOP](#), [PG\\_AMPROC](#), and [PG\\_OPCLASS](#).

## 12.2.72 PG\_PARTITION

PG\_PARTITION records all partitioned tables, table partitions, and index partitions in the database. Partitioned index information is not stored in the system catalog PG\_PARTITION. The partitioned table does not have actual physical files. Therefore, pg\_partition does not record information such as **relfilenode**, **relpages**, **reltuples**, **reltoastrelid**, and **reltoastidxid**.

**Table 12-73** PG\_PARTITION columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).
relname	name	Names of the partitioned tables, table partitions, TOAST tables on table partitions, and index partitions.
parttype	"char"	Object type. <ul style="list-style-type: none"> <li>● <b>r</b>: partitioned table</li> <li>● <b>p</b>: table partition</li> <li>● <b>s</b>: table subpartition</li> <li>● <b>x</b>: index partition</li> </ul>

Name	Type	Description
parentid	oid	<ul style="list-style-type: none"> <li>• OID of the partitioned table in PG_CLASS when the object is a partitioned table or a partition.</li> <li>• OID of the level-1 partition in PG_PARTITION when the object is a level-2 partition.</li> <li>• OID of the partitioned index when the object is an index partition.</li> </ul>
rangenum	integer	Reserved column.
intervalnum	integer	Reserved column.
partstrategy	"char"	Partition policy of the partitioned table <ul style="list-style-type: none"> <li>• <b>r</b>: range partition</li> <li>• <b>v</b>: numeric partition</li> <li>• <b>i</b>: interval partition</li> <li>• <b>l</b>: list partition</li> <li>• <b>h</b>: hash partition</li> <li>• <b>n</b>: invalid partition</li> </ul>
relfilenode	oid	Physical storage locations of the table partition, index partition, and TOAST table on the table partition
reltablespace	oid	OID of the tablespace containing the table partition, index partition, and TOAST table on the table partition
relpages	double precision	Statistics: numbers of data pages of the table partition and index partition
reltuples	double precision	Statistics: numbers of tuples of the table partition and index partition
relallvisible	integer	Statistics: number of visible data pages of the table partition and index partition
reltoastrelid	oid	OID of the TOAST table corresponding to the table partition
reltoastidxid	oid	OID of the TOAST table index corresponding to the table partition
indextblid	oid	OID of the table partition corresponding to the index partition
indisusable	boolean	Whether the index partition is available

Name	Type	Description
relfrozenxid	xid32	Frozen transaction ID To ensure forward compatibility, this column is reserved. The <b>relfrozenxid64</b> column is added to record the information.
intspnum	integer	Number of tablespaces that the interval partition belongs to
partkey	int2vector	Column number of the partition key
intervaltablespace	oidvector	Tablespace that the interval partition belongs to. Interval partitions fall in the tablespaces in the round-robin manner.
interval	text[]	Interval value of the interval partition
boundaries	text[]	Upper boundary of the range partition and interval partition
transit	text[]	Transit of the interval partition
reloptions	text[]	Storage property of a partition used for collecting online scale-out information. Same as <b>pg_class.reloptions</b> , it is expressed in a string in the format of keyword=value.
relfrozenxid64	xid	Frozen transaction ID
relminmxid	xid	Frozen multi-transaction ID
partitionno	integer	Used for maintaining the partition map of a partitioned table. <ul style="list-style-type: none"> <li>• If the object is a partition, this field indicates the partition ID, which starts from 1 in ascending order.</li> <li>• If the object is a partitioned table, this field indicates the maximum partition ID and a negative value is used for special meaning. The value increases with the DDL syntax of some partitions.</li> <li>• If the object is of other types, this field is null and has no meaning.</li> </ul> <b>partitionno</b> is a permanent auto-increment column, which can be reset or reclaimed by using the syntax <b>ALTER TABLE t_name RESET PARTITION</b> or <b>VACUUM FULL</b> .

Name	Type	Description
subpartitionno	integer	<p>Used for maintaining the map of level-2 partitions in a partitioned table.</p> <ul style="list-style-type: none"> <li>If the object is a level-2 partition, this field indicates the level-2 partition ID, which starts from 1 in ascending order.</li> <li>If the object is a level-1 partition in a level-2 partitioned table, this field indicates the maximum level-2 partition ID and a negative value is used for special meaning. This value increases with the DDL syntax of some partitions.</li> <li>If the object is of other types, this field is null and has no meaning.</li> </ul> <p><b>subpartitionno</b> is a permanent auto-increment column, which can be reset or reclaimed by using the syntax <b>ALTER TABLE t_name RESET PARTITION</b> or <b>VACUUM FULL</b>.</p>

## 12.2.73 PG\_PLTEMPLATE

PG\_PLTEMPLATE records template information for procedural languages.

**Table 12-74** PG\_PLTEMPLATE columns

Name	Type	Description
tmplname	name	Name of the language for which this template is used.
tmpltrusted	Boolean	The value is <b>true</b> if the language is considered trusted. Otherwise, the value is <b>false</b> .
tmpldbcreate	Boolean	The value is <b>true</b> if the language is created by the owner of the database. Otherwise, the value is <b>false</b> .
tmplhandler	text	Name of the call handler function
tmplinline	text	Name of the anonymous block handler ( <b>NULL</b> if no name of the block handler exists).
tmplvalidator	text	Name of the verification function ( <b>NULL</b> if no verification function is available).
tmpllibrary	text	Path of the shared library that implements languages.

Name	Type	Description
tmplacl	aclitem[]	Access permissions for template (not yet used).

## 12.2.74 PG\_PROC

PG\_PROC records information about functions or procedures.

**Table 12-75** PG\_PROC columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).
proname	name	Function name.
pronamespace	oid	OID of the namespace that contains the function.
proowner	oid	Owner of the function.
prolang	oid	Implementation language or call API of the function.
procost	real	Estimated execution cost.
prorows	real	Estimated number of rows that are influenced.
provariadic	oid	Data type of parameter element.
protransform	regproc	Simplified call method for the function.
proisagg	Boolean	Specifies whether the function is an aggregate function. <ul style="list-style-type: none"> <li>• <b>t</b> (true): yes</li> <li>• <b>f</b> (false): no</li> </ul>
proiswindow	Boolean	Specifies whether the function is a window function. <ul style="list-style-type: none"> <li>• <b>t</b> (true): yes</li> <li>• <b>f</b> (false): no</li> </ul>
prosecdef	Boolean	Specifies whether the function is a security definer (or a setuid function). <ul style="list-style-type: none"> <li>• <b>t</b> (true): yes</li> <li>• <b>f</b> (false): no</li> </ul>

Name	Type	Description
proleakproof	Boolean	Specifies whether the function has side effects. If no leakproof treatment is provided for parameters, the function throws errors. <ul style="list-style-type: none"> <li>• <b>t</b> (true): There is no side effect.</li> <li>• <b>f</b> (false): There are side effects.</li> </ul>
proisstrict	Boolean	<ul style="list-style-type: none"> <li>• <b>t</b> (true): When this function is used, the function does not call the function and returns null if the input parameter is null.</li> <li>• <b>f</b> (false): When this function is used, it is called even if the input parameter is null. Therefore, this function must process null input.</li> </ul>
proretset	Boolean	Specifies whether the return value of the function is a set (that is, multiple values of the specified data type). <ul style="list-style-type: none"> <li>• <b>true</b>: The return value of the function is a set.</li> <li>• <b>false</b>: The return value of the function is not a set.</li> </ul>
provolatile	"char"	Specifies whether the function's result depends only on its input parameters, or is affected by outside factors. <ul style="list-style-type: none"> <li>• <b>i</b>: immutable functions, which always deliver the same result for the same inputs.</li> <li>• <b>s</b>: stable functions, whose results (for fixed inputs) do not change within a scan.</li> <li>• <b>v</b>: volatile functions, whose results may change at any time. Use <b>v</b> also for functions with side-effects, so that the engine cannot get optimized if volatile functions are called.</li> </ul>
pronargs	smallint	Number of parameters.
pronargdefaults	smallint	Number of parameters that have default values.
prorettype	oid	Data type of return values.
proargtypes	oidvector	Array that stores the data types of function parameters. This array includes only input parameters (including <b>INOUT</b> parameters), and indicates the call signature (API) of the function.

Name	Type	Description
proallargtypes	oid[]	Array that contains the data types of function parameters. This array includes all parameter types (including <b>OUT</b> and <b>INOUT</b> parameters); however, if all the parameters are <b>IN</b> parameters, this column is null. Note that array subscripting is 1-based, whereas for historical reasons, <b>proargtypes</b> is subscripted from 0.
proargmodes	"char"[]	Array with the modes of the function parameters, encoded as follows: <ul style="list-style-type: none"> <li>• <b>i</b> indicates the IN parameter.</li> <li>• <b>o</b> indicates the OUT parameter.</li> <li>• <b>b</b> indicates the INOUT parameter.</li> <li>• <b>v</b> indicates the VARIADIC parameter.</li> </ul> If all the parameters are <b>IN</b> parameters, this column is null. Note that subscripts correspond to positions of <b>proallargtypes</b> , not <b>proargtypes</b> .
proargnames	text[]	Array that stores the names of the function parameters. Parameters without a name are set to empty strings in the array. If none of the parameters have a name, this column is null. Note that subscripts correspond to positions of <b>proallargtypes</b> , not <b>proargtypes</b> .
proargdefaults	pg_node_tree	Expression tree of the default value. This is the list of <b>pronargdefaults</b> elements.
prosrc	text	A definition that describes a function or stored procedure. In an interpreting language, it is the function source code, a connection symbol, a file name, or any body content specified when a function or stored procedure is created, depending on how a language or call is used.
probin	text	Additional information about how to call the function. Again, the interpretation is language-specific.
proconfig	text[]	Function's local settings for run-time configuration variables.
proacl	aclitem[]	Access permissions. For details, see <a href="#">GRANT</a> and <a href="#">REVOKE</a> .
prodefaultargpos	int2vector	Position of the input parameter of a function with a default value.

Name	Type	Description
proshippable	Boolean	Whether the function can be pushed down to database nodes. The default value is <b>false</b> . <ul style="list-style-type: none"> <li>Functions of the IMMUTABLE type can always be pushed down to the database nodes.</li> <li>A STABLE or VOLATILE function can be pushed down to the database nodes only if SHIPPABLE is specified for it.</li> </ul>
propackage	Boolean	Whether the function supports overloading. The default value is <b>false</b> . <ul style="list-style-type: none"> <li><b>t</b> (true): supported.</li> <li><b>f</b> (false): not supported.</li> </ul>
prokind	"char"	Specifies whether the object is a function or a stored procedure. <ul style="list-style-type: none"> <li><b>'f'</b>: The object is a function.</li> <li><b>'p'</b>: The object is a stored procedure.</li> </ul>
proargsrc	text	Describes the parameter input strings of functions or stored procedures that are A-compatible syntax, including parameter comments. The default value is <b>NULL</b> .
proisprivate	Boolean	Whether a function is a private function in the package. The default value is <b>false</b> .
propackageid	oid	OID of the package to which the function belongs. If the function is not in the package, the value is <b>0</b> .
proargtypesext	oidvector _extend	Data type array used to store function parameters when there are a large number of function parameters. This array includes only input parameters (including <b>INOUT</b> parameters), and indicates the call signature (API) of the function.
prodefaultargposext	int2vector _extend	Position of the input parameter with a default value when the function has a large number of parameters.
allargtypes	oidvector	Array for storing the data types of stored procedure parameters, including all parameters (input parameters, output parameters, and <b>INOUT</b> parameters) of the stored procedure.

Name	Type	Description
allargtypesext	oidvector _extend	Array for storing the data types of stored procedure parameters when the number of function parameters is greater than 666. The array contains all parameters (including input parameters, output parameters, and <b>INOUT</b> parameters).

 **NOTE**

When a function is created, data is inserted into the PG\_PROC catalog to update the index. When there are a large number of input and output parameters, the index length may exceed one third of the page length. As a result, the error "Index row size xxx exceeds maximum xxx for index 'pg\_proc\_proname\_all\_args\_nsp\_index'" may be reported as expected. You can reduce the number of parameters to avoid this error.

## 12.2.75 PG\_RANGE

PG\_RANGE records information about range types, except for records of types in [PG\\_TYPE](#).

**Table 12-76** PG\_RANGE columns

Name	Type	Reference	Description
rngtypid	oid	<b>oid</b> in <a href="#">PG_TYPE</a>	OID of the range type.
rngsubtype	oid	<b>oid</b> in <a href="#">PG_TYPE</a>	OID of the element type (subtype) of this range type.
rngcollation	oid	<b>oid</b> in <a href="#">PG_COLLATION</a>	OID of the collation used for range comparisons ( <b>0</b> if none).
rngsubopc	oid	<b>oid</b> in <a href="#">PG_OPCLASS</a>	OID of the subtype's operator class used for range comparisons.
rngcanonical	regproc	<b>prname</b> in <a href="#">PG_PROC</a>	Name of the function to convert a range value into canonical form ( <b>0</b> if none).
rngsubdiff	regproc	<b>prname</b> in <a href="#">PG_PROC</a>	Name of the function used to calculate the difference between two elements in a range. The return value of the function is of the double-precision type. If the function does not exist, the value of <b>rngsubdiff</b> is <b>0</b> .

If the element type is discrete, **rngcanonical** determines the collation used for the range type. If the element type is not collatable, **rngsubopc** determines the

collation used for the range type. If the element type is collatable, **rngsubopc** and **rngcollation** determine the collation used for the range type.

## 12.2.76 PG\_REPLICATION\_ORIGIN

PG\_REPLICATION\_ORIGIN contains all created replication sources. This catalog is shared among all databases of a database instance. That is, there is only one copy for each instance, not for each database.

**Table 12-77** PG\_REPLICATION\_ORIGIN columns

Name	Type	Description
roident	oid	Unique replication source identifier within a cluster.
roname	text	External user-defined replication source name.

## 12.2.77 PG\_RESOURCE\_POOL

PG\_RESOURCE\_POOL provides information about database resource pools.

**Table 12-78** PG\_RESOURCE\_POOL columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).
respool_name	name	Name of the resource pool.
mem_percent	integer	Percentage of the memory configuration.
cpu_affinity	bigint	Value of cores bound to the CPU.
control_group	name	Name of the Cgroup where the resource pool is located.
active_statements	integer	Maximum number of concurrent statements in the resource pool.
max_dop	integer	Maximum scanning concurrency during data redistribution. This column is used for scaling.
memory_limit	name	Maximum memory of the resource pool.
parentid	oid	OID of the parent resource pool.
io_limits	integer	Upper limit of I/O operations per second. It is counted by 10 thousands per second.

Name	Type	Description
io_priority	name	I/O priority set for jobs that consume many I/O resources. It takes effect when I/O usage reaches 90%.
nodegroup	name	Name of the logical database to which the resource pool belongs. This column is not supported in the centralized system.
is_foreign	Boolean	Specifies whether the resource pool can be used for users outside the logical database. This column is not supported in the centralized system. <ul style="list-style-type: none"> <li>• <b>true</b>: The resource pool controls the resources of common users who do not belong to the current resource pool.</li> <li>• <b>false</b>: The resources of common users who do not belong to the current resource pool are not controlled.</li> </ul>
max_worker	integer	Concurrency in a table during data redistribution. This column is used only for scaling.
max_connections	integer	Maximum number of connections that can be used by a resource pool.

Note: **max\_dop** and **max\_worker** are used for scaling and are not applicable to the centralized deployment.

## 12.2.78 PG\_REWRITE

PG\_REWRITE records rewrite rules defined for tables and views.

**Table 12-79** PG\_REWRITE columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified)
rulename	name	Rule name
ev_class	oid	Name of the table that uses the rule
ev_attr	smallint	Column to which this rule applies (always <b>0</b> to indicate the entire table)

Name	Type	Description
ev_type	"char"	Event type for the rule. <ul style="list-style-type: none"> <li>• 1: SELECT</li> <li>• 2: UPDATE</li> <li>• 3: INSERT</li> <li>• 4: DELETE</li> </ul>
ev_enabled	"char"	Controls the mode in which the rule is triggered. <ul style="list-style-type: none"> <li>• O: The rule is triggered in origin and local modes.</li> <li>• D: The rule is disabled.</li> <li>• R: The rule is triggered in replica mode.</li> <li>• A: The rule is always triggered.</li> </ul>
is_instead	Boolean	The value is <b>true</b> if the rule is of the <b>INSTEAD</b> type. Otherwise, the value is <b>false</b> .
ev_qual	pg_node_tree	Expression tree (in the form of a nodeToString() representation) for the rule's qualifying condition.
ev_action	pg_node_tree	Query tree (in the form of a nodeToString() representation) for the rule's action.

## 12.2.79 PG\_RLSPOLICY

PG\_RLSPOLICY records row-level security policies.

**Table 12-80** PG\_RLSPOLICY columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).
polname	name	Name of an access control policy.
polrelid	oid	OID of the table object on which the row-level access control policy takes effect.
polcmd	"char"	SQL operations affected by the row-level access control policy.
polpermissive	Boolean	Attribute of the row-level security policy. <ul style="list-style-type: none"> <li>• t: OR condition concatenation of expressions.</li> <li>• f: AND condition concatenation of expressions.</li> </ul>

Name	Type	Description
polroles	oid[]	OID list of users affected by the row-level access control policy. If this parameter is not specified, all users are affected.
polqual	pg_node_tree	Expression of the row-level access control policy.

## 12.2.80 PG\_SECLABEL

PG\_SECLABEL records security labels on database objects.

See also [PG\\_SHSECLABEL](#), which provides a similar function for security labels of database objects that are shared within one database.

**Table 12-81** PG\_SECLABEL columns

Name	Type	Reference	Description
objoid	oid	Any OID column	OID of the object that this security label pertains to
classoid	oid	<b>oid</b> in <a href="#">PG_CLASS</a>	OID of the system catalog where the object appears
objsubid	integer	-	Column number for a security label on a table column
provider	text	-	Label provider associated with the label
label	text	-	Security label applied to the object

## 12.2.81 PG\_SHDEPEND

PG\_SHDEPEND records the dependency between database objects and shared objects, such as roles. Based on this information, GaussDB can ensure that those objects are unreferenced before attempting to delete them.

See also [PG\\_DEPEND](#), which provides a similar function for dependencies involving objects within a single database.

PG\_SHDEPEND is shared among all databases of a database instance. That is, there is only one PG\_SHDEPEND for each instance, not for each database.

**Table 12-82** PG\_SHDEPEND columns

Name	Type	Reference	Description
dbid	oid	<b>oid</b> in <b>PG_DATABASE</b>	OID of the database where a dependent object is ( <b>0</b> for a shared object)
classid	oid	<b>oid</b> in <b>PG_CLASS</b>	OID of the system catalog where a dependent object resides
objid	oid	Any OID column	OID of the dependent object
objsubid	integer	-	Column number for a table column ( <b>objid</b> and <b>classid</b> refer to the table itself); The value is <b>0</b> for all other object types.
refclassid	oid	<b>oid</b> in <b>PG_CLASS</b>	OID of the system catalog (must be a shared catalog) where a referenced object is located.
refobjid	oid	Any OID column	OID of the referenced object
deptype	"char"	-	Code segment defining the specific semantics of this dependency relationship. See the following for details.
objfile	text	-	Path of a user-defined function library file

In all cases, a PG\_SHDEPEND entry indicates that the referenced object cannot be dropped without also dropping the dependent object. However, there are several subflavors identified by **deptype**:

- SHARED\_DEPENDENCY\_OWNER (o)  
The referenced object (which must be a role) is the owner of the dependent object.
- SHARED\_DEPENDENCY\_ACL (a)  
The referenced object (which must be a role) is mentioned in the access control list (ACL) of the dependent object. SHARED\_DEPENDENCY\_ACL does not add a record to the owner of the object because the owner will have a SHARED\_DEPENDENCY\_OWNER record.
- SHARED\_DEPENDENCY\_PIN (p)  
This type of record indicates that the system itself depends on the depended object. Therefore, such an object cannot be deleted. Entries of this type are created only by **initdb**. The columns for the dependent object contain zeroes.
- SHARED\_DEPENDENCY\_DBPRIV(d)

The referenced object (must be a role) has the ANY permission on the dependent object (the specified OID of the dependent object corresponds to a row in the [13.2.11 GS\\_DB\\_PRIVILEGE](#) system catalog).

## 12.2.82 PG\_SHDESCRIPTION

PG\_SHDESCRIPTION records optional comments for shared database objects. Descriptions can be manipulated with the **COMMENT** command and viewed with the `\d` command.

See also PG\_DESCRIPTION, which provides a similar function for descriptions involving objects within a single database.

PG\_SHDESCRIPTION is shared among all databases of a database instance. That is, there is only one PG\_SHDESCRIPTION for each instance, not for each database.

**Table 12-83** PG\_SHDESCRIPTION columns

Name	Type	Reference	Description
objoid	oid	Any OID column	OID of the object that this description pertains to.
classoid	oid	<b>oid</b> in <a href="#">PG_CLASS</a>	OID of the system catalog where the object appears.
description	text	-	Arbitrary text that serves as the description of the object.

## 12.2.83 PG\_SHSECLABEL

PG\_SHSECLABEL records security labels on shared database objects. Security labels can be manipulated with the **SECURITY LABEL** command.

For an easier way to view security labels, see [PG\\_SECLABELS](#).

See also [PG\\_SECLABEL](#), which provides a similar function for security labels involving objects within a single database.

Unlike most system catalogs, **PG\_SHSECLABEL** is shared across all databases in the system. There is only one copy of **PG\_SHSECLABEL** in the GaussDB system, not one per database.

**Table 12-84** PG\_SHSECLABEL columns

Name	Type	Reference	Description
objoid	oid	Any OID column	OID of the object that this security label pertains to
classoid	oid	<a href="#">PG_CLASS</a> .oid	OID of the system catalog where the object appears

Name	Type	Reference	Description
provider	text	-	Label provider associated with the label
label	text	-	Security label applied to the object

## 12.2.84 PG\_SET

PG\_SET records metadata defined by the SET data type.

Table 12-85 PG\_SET columns

Name	Type	Description
settypid	oid	OID of the SET data type
setnum	tinyint	Number of members of the SET data type. A maximum of 64 members are supported.
setsortorder	tinyint	Sorting order of members when the SET data type is defined. The value starts from 0.
setlabel	text	Member name of the SET data type

## 12.2.85 PG\_STATISTIC

PG\_STATISTIC stores statistics about tables and index columns in a database. By default, only a system administrator can access the system catalog. Common users can access this system catalog only after being authorized.

Table 12-86 PG\_STATISTIC columns

Name	Type	Description
starelid	oid	Table or index that the described column belongs to.
starekind	"char"	Type of an object.
staattnum	smallint	Number of the described column in the table, starting from 1.
stainherit	Boolean	Specifies whether to collect statistics for objects that have inheritance relationship.
stanullfrac	real	Percentage of column entries that are null.
stawidth	integer	Average stored width, in bytes, of non-null entries.

Name	Type	Description
stadistinct	real	<p>Number of distinct, non-null data values in the column for database nodes.</p> <ul style="list-style-type: none"> <li>• A value greater than 0 is the actual number of distinct values.</li> <li>• A value less than 0 is the ratio of the <b>distinct</b> value to the total number of rows. For example, if <b>stadistinct</b> is <b>-0.5</b>, the actual <b>distinct</b> value is the total number of rows multiplied by 0.5.</li> <li>• The value <b>0</b> indicates that the number of distinct values is unknown.</li> </ul>
stakindN	smallint	<p>Code number stating that the type of statistics is stored in slot <i>N</i> of the <i>pg_statistic</i> row.</p> <p>The value of <i>N</i> ranges from 1 to 5.</p>
staopN	oid	<p>Operator used to generate the statistics stored in slot <i>N</i>. For example, a histogram slot shows the &lt; operator that defines the sort order of the data.</p> <p>The value of <i>N</i> ranges from 1 to 5.</p>
stanumbers N	real[]	<p>Numerical statistics of the appropriate type for slot <i>N</i>. The value is <b>NULL</b> if the slot does not involve numerical values.</p> <p>The value of <i>N</i> ranges from 1 to 5.</p>
stavaluesN	anyarray	<p>Column data values of the appropriate type for slot <i>N</i>. The value is <b>NULL</b> if the slot type does not store any data values. Each array's element values are actually of the specific column's data type, so there is no way to define these columns' type more specifically than anyarray.</p> <p>The value of <i>N</i> ranges from 1 to 5.</p>
stadndistinct	real	<p>Number of unique non-null data values in the <b>DN1</b> column.</p> <ul style="list-style-type: none"> <li>• A value greater than 0 is the actual number of distinct values.</li> <li>• A value less than 0 is the ratio of the <b>distinct</b> value to the total number of rows. For example, if <b>stadistinct</b> is <b>-0.5</b>, the actual <b>distinct</b> value is the total number of rows multiplied by 0.5.</li> <li>• The value <b>0</b> indicates that the number of distinct values is unknown.</li> </ul>
staextinfo	text	<p>Information about extension statistics. This is reserved.</p>

**NOTICE**

PG\_STATISTIC stores sensitive information about statistical objects, such as MCVs. The system administrator and authorized users can access the PG\_STATISTIC system catalog to query the sensitive information about the statistical objects.

## 12.2.86 PG\_STATISTIC\_EXT

PG\_STATISTIC\_EXT displays extended statistics of tables in a database, such as statistics of multiple columns. Statistics of expressions will be supported later. You can specify the extended statistics to collect. This system catalog is accessible only to system administrators.

**Table 12-87** PG\_STATISTIC\_EXT columns

Name	Type	Description
starelid	oid	Table or index that the described column belongs to.
starelkind	char	Type of the object to which a table belongs. <b>c</b> indicates an ordinary table, and <b>p</b> indicates a partitioned table.
stainherit	Boolean	Specifies whether to collect statistics for objects that have inheritance relationship.
stanullfrac	real	Percentage of column entries that are null.
stawidth	integer	Average stored width, in bytes, of non-null entries.
stadistinct	real	Number of distinct, non-null data values in the column for database nodes. <ul style="list-style-type: none"> <li>A value greater than 0 is the actual number of distinct values.</li> <li>A value less than 0 is the ratio of the <b>distinct</b> value to the total number of rows. For example, if <b>stadistinct</b> is <b>-0.5</b>, the actual <b>distinct</b> value is the total number of rows multiplied by 0.5.</li> <li>The value <b>0</b> indicates that the number of distinct values is unknown.</li> </ul>
stadndistinct	real	Number of unique non-null data values in the <b>DN1</b> column. <ul style="list-style-type: none"> <li>A value greater than 0 is the actual number of distinct values.</li> <li>A value less than 0 is the ratio of the <b>distinct</b> value to the total number of rows. For example, if <b>stadistinct</b> is <b>-0.5</b>, the actual <b>distinct</b> value is the total number of rows multiplied by 0.5.</li> <li>The value <b>0</b> indicates that the number of distinct values is unknown.</li> </ul>

Name	Type	Description
stakindN	smallint	Code number stating that the type of statistics is stored in slot <i>N</i> of the <i>pg_statistic</i> row. The value of <i>N</i> ranges from 1 to 5.
staopN	oid	Operator used to generate the statistics stored in slot <i>N</i> . For example, a histogram slot shows the < operator that defines the sort order of the data. The value of <i>N</i> ranges from 1 to 5.
stakey	int2vector	Array of a column ID.
stanumbers N	real[]	Numerical statistics of the appropriate type for slot <i>N</i> . The value is <b>NULL</b> if the slot does not involve numerical values. The value of <i>N</i> ranges from 1 to 5.
stavaluesN	anyarray	Column data values of the appropriate type for slot <i>N</i> . The value is <b>NULL</b> if the slot type does not store any data values. Each array's element values are actually of the specific column's data type so there is no way to define these columns' type more specifically than anyarray. The value of <i>N</i> ranges from 1 to 5.
staexprs	pg_node_ tree	Expression corresponding to the extended statistics information.
stasource	char	Source of extended statistics: <ul style="list-style-type: none"> <li>• 'a': indicates that the statistics data is automatically created, which is controlled by the GUC parameter <b>auto_statistic_ext_columns</b>.</li> <li>• 'm': indicates that a user manually creates the statistics data using analyze tablename ((column list)) or alter table tablename add statistics ((column list)).</li> </ul>
stastatus	char	Status of extended statistics: <ul style="list-style-type: none"> <li>• 'a': active and available.</li> <li>• 'd': disabled. Related information is not collected, and the optimizer does not use the data when generating a plan. You can use the alter table tablename disable/enable statistics((column list)) syntax to modify the status of extended statistics.</li> </ul>

**NOTICE**

PG\_STATISTIC\_EXT stores sensitive information about statistical objects, such as MCVs. The system administrator and authorized users can access the PG\_STATISTIC\_EXT system catalog to query the sensitive information about the statistical objects.

## 12.2.87 PG\_SYNONYM

PG\_SYNONYM records the mapping between synonym object names and other database object names.

**Table 12-88** PG\_SYNONYM columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).
synname	name	Synonym name
synnamespace	oid	OID of the namespace that contains a synonym
synowner	oid	Owner of a synonym, usually the OID of the user who created it
synobjschema	name	Schema name specified by an associated object
synobjname	name	Name of an associated object
syndblinkname	name	Name of the associated DATABASE LINK object.

## 12.2.88 PG\_TABLESPACE

PG\_TABLESPACE records tablespace information.

**Table 12-89** PG\_TABLESPACE columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).
spcname	name	Tablespace name.
spcowner	oid	Owner of the tablespace, usually the user who created it.

Name	Type	Description
spcacl	aclitem[]	Access permissions. For details, see <a href="#">GRANT</a> and <a href="#">REVOKE</a> .
spcoptions	text[]	Options of the tablespace.
spcmaxsize	text	Maximum size of the available disk space, in bytes.
relative	Boolean	Specifies whether the storage path specified by the tablespace is a relative path. <ul style="list-style-type: none"> <li>• <b>t</b> (true): yes</li> <li>• <b>f</b> (false): no</li> </ul>

## 12.2.89 PG\_TRIGGER

PG\_TRIGGER records trigger information.

**Table 12-90** PG\_TRIGGER columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).
tgrelid	oid	OID of the table where the trigger is located.
tgname	name	Trigger name.
tgfoid	oid	Function to be invoked by a trigger.
tgtype	smallint	Trigger type.
tgenabled	"char"	<b>O</b> : The trigger is triggered in origin or local mode. <b>D</b> : The trigger is disabled. <b>R</b> : The trigger is triggered in replica mode. <b>A</b> : The trigger is always triggered.
tgisinternal	Boolean	Internal trigger ID. If the value is <b>true</b> , it indicates an internal trigger.
tgconstrrelid	oid	Table referenced by the integrity constraint.
tgconstrindid	oid	Index of the integrity constraint.
tgconstraint	oid	OID of the constraint trigger in <b>PG_CONSTRAINT</b> .
tgdeferrable	Boolean	Specifies whether the constraint trigger is of the DEFERRABLE type.

Name	Type	Description
tginitdeferred	Boolean	Specifies whether the trigger is of the INITIALLY DEFERRED type.
tgnargs	smallint	Number of input parameters of the trigger function.
tgattr	int2vector	Column ID specified by the trigger. If no column is specified, an empty array is used.
tgargs	bytea	Parameter transferred to the trigger.
tgqual	pg_node_tree	WHEN condition of the trigger ( <b>NULL</b> if the WHEN condition does not exist).
tgowner	oid	Trigger owner.

## 12.2.90 PG\_TS\_CONFIG

**PG\_TS\_CONFIG** contains entries representing text search configurations. A configuration specifies a particular text search parser and a list of dictionaries to use for each of the parser's output token types.

The parser is shown in the **PG\_TS\_CONFIG** entry, but the token-to-dictionary mapping is defined by subsidiary entries in [PG\\_TS\\_CONFIG\\_MAP](#).

**Table 12-91** PG\_TS\_CONFIG columns

Name	Type	Reference	Description
oid	oid	-	Row identifier (hidden attribute, which must be specified)
cfgname	name	-	Text search configuration name
cfgnamespace	oid	<a href="#">PG_NAMESPACE.oid</a>	OID of the namespace that contains the configuration
cfgowner	oid	<a href="#">PG_AUTHID.oid</a>	Owner of the configuration
cfgparser	oid	<a href="#">PG_TS_PARSER.oid</a>	OID of the text search parser for this configuration
cfgoptions	text[]	-	Configuration options

## 12.2.91 PG\_TS\_CONFIG\_MAP

**PG\_TS\_CONFIG\_MAP** contains entries showing which text search dictionaries should be consulted, and in what order, for each output token type of each text search configuration's parser.

**Table 12-92** PG\_TS\_CONFIG\_MAP columns

Name	Type	Reference	Description
mapcfg	oid	OID in <a href="#">PG_TS_CONFIG</a>	OID of the <a href="#">PG_TS_CONFIG</a> entry owning this map entry
maptokentype	integer	-	Token type generated by the configuration's parser
mapseqno	integer	-	Sequence number of a token type when the values of <b>mapcfg</b> or <b>maptokentype</b> are the same
mapdict	oid	OID in <a href="#">PG_TS_DICT</a>	OID of the text search dictionary to consult

## 12.2.92 PG\_TS\_DICT

**PG\_TS\_DICT** contains entries that define text search dictionaries. A dictionary depends on a text search template, which specifies all the implementation functions needed; the dictionary itself provides values for the user-settable parameters supported by the template.

This division of labor allows dictionaries to be created by unprivileged users. The parameters are specified by a text string **dictinoption**, whose format and meaning vary depending on the template.

**Table 12-93** PG\_TS\_DICT columns

Name	Type	Reference	Description
oid	oid	-	Row identifier (hidden attribute, which must be specified)
dictname	name	-	Text search dictionary name
dictnamespace	oid	<a href="#">PG_NAMESPACE</a> .oid	OID of the namespace that contains the dictionary
dictowner	oid	<a href="#">PG_AUTHID</a> .oid	Owner of the dictionary
dicttemplate	oid	<a href="#">PG_TS_TEMPLATE</a> .oid	OID of the text search template for the dictionary
dictinoption	text	-	Initialization option string for the template

## 12.2.93 PG\_TS\_PARSER

**PG\_TS\_PARSER** contains entries defining text search parsers. A parser is responsible for splitting input text into lexemes and assigning a token type to each lexeme. The new parser must be created by the database system administrator.

**Table 12-94** PG\_TS\_PARSER columns

Name	Type	Reference	Description
oid	oid	-	Row identifier (hidden attribute, which must be specified)
prsname	name	-	Text search parser name
prsnamespace	oid	<a href="#">PG_NAMESPACE</a> .oid	OID of the namespace that contains the parser
prsstart	regproc	<a href="#">PG_PROC</a> .praname	Name of the parser's startup function
prstoken	regproc	<a href="#">PG_PROC</a> .praname	Name of the parser's next-token function
prsend	regproc	<a href="#">PG_PROC</a> .praname	Name of the parser's shutdown function
prsheadline	regproc	<a href="#">PG_PROC</a> .praname	Name of the parser's headline function
prsllextype	regproc	<a href="#">PG_PROC</a> .praname	Name of the parser's lextype function

## 12.2.94 PG\_TS\_TEMPLATE

**PG\_TS\_TEMPLATE** contains entries defining text search templates. A template provides a framework for text search dictionaries. Since a template must be implemented by C-language-level functions, templates can be created only by database administrators.

**Table 12-95** PG\_TS\_TEMPLATE columns

Name	Type	Reference	Description
oid	oid	-	Row identifier (hidden attribute, which must be specified)
tmplname	name	-	Text search template name
tmplnamespace	oid	<a href="#">PG_NAMESPACE</a> .oid	OID of the namespace that contains the template

Name	Type	Reference	Description
tmplinit	regproc	<a href="#">PG_PROC.proname</a>	Name of the template's initialization function
tmpllexize	regproc	<a href="#">PG_PROC.proname</a>	Name of the template's lexize function

## 12.2.95 PG\_TYPE

PG\_TYPE stores information about data types.

**Table 12-96** PG\_TYPE columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).
typename	name	Data type name.
typnamespace	oid	OID of the namespace that contains the type.
typowner	oid	Owner of the type.
typplen	smallint	Number of bytes in the internal representation of the type for a fixed-size type. It is a negative number for a variable-length type. <ul style="list-style-type: none"> <li>The value <b>-1</b> indicates a "varlena" type (one that has a length word).</li> <li>The value <b>-2</b> indicates a null-terminated C string.</li> </ul>
typbyval	Boolean	<ul style="list-style-type: none"> <li><b>true</b>: A value of this type is transferred by value internally.</li> <li><b>false</b>: A value of this type is transferred by reference internally.</li> </ul> <p>If <b>typplen</b> of this type is not <b>1</b>, <b>2</b>, <b>4</b>, or <b>8</b>, you are advised to transfer a reference value for <b>typbyval</b>. You can also transfer a value for <b>typbyval</b>. Variable-length types are usually passed by reference or by value.</p>

Name	Type	Description
typtype	"char"	<ul style="list-style-type: none"> <li>• <b>b</b>: basic type.</li> <li>• <b>c</b>: composite type (for example, the row type of a table).</li> <li>• <b>d</b>: domain type.</li> <li>• <b>p</b>: pseudo type.</li> <li>• <b>u</b>: undefined type.</li> <li>• <b>o</b>: set type.</li> </ul> For details, see <b>typrelid</b> and <b>typbasetype</b> .
typcategory	"char"	Fuzzy classification of data types, which can be used by parsers as the basis for data conversion.
typispreferred	Boolean	<ul style="list-style-type: none"> <li>• <b>true</b>: Data is converted when it complies with the conversion rule specified by <b>typcategory</b>.</li> <li>• <b>false</b>: Data is not converted.</li> </ul>
typisdefined	Boolean	<ul style="list-style-type: none"> <li>• <b>true</b>: The type has been defined.</li> <li>• <b>false</b>: The placeholder of an undefined type is used. In this case, there is no reliable information except the name, namespace, and OID of the type.</li> </ul>
typdelim	"char"	Character that separates two values of this type when parsing an array input. Note that the delimiter is associated with the array element data type, not the array data type.
typrelid	oid	If this is a composite type (see <b>typtype</b> ), then this column points to <b>13.2.53 PG_CLASS</b> that defines the corresponding table. For a free-standing composite type, <b>13.2.53 PG_CLASS</b> does not represent a table, but it is required for the type's <b>13.2.48 PG_ATTRIBUTE</b> to link to. It is <b>0</b> for non-composite type.
typelem	oid	If <b>typelem</b> is not <b>0</b> , it identifies another row in PG_TYPE. The current type can be described as an array yielding values of type <b>typelem</b> . A "true" array type has a variable length ( <b>typlen = -1</b> ), but some fixed-length types ( <b>typlen &gt; 0</b> ) also have non-zero <b>typelem</b> , for example <b>name</b> and <b>point</b> . If a fixed-length type has a <b>typelem</b> , its internal representation must be a number of values of the <b>typelem</b> data type with no other data. Variable-length array types have a header defined by the array subroutines.
typarray	oid	If the value is not <b>0</b> , the corresponding type record is available in PG_TYPE.

Name	Type	Description
typinput	regproc	Input conversion function (text format).
typoutput	regproc	Output conversion function (text format).
typreceive	regproc	Input conversion function (binary format); <b>0</b> for non-input conversion function.
typsend	regproc	Output conversion function (binary format); <b>0</b> for non-output conversion function.
typmodin	regproc	Input type modifier function; <b>0</b> if none.
typmodout	regproc	Output type modifier function; <b>0</b> if none.
typanalyze	regproc	Custom <b>ANALYZE</b> function; <b>0</b> if the standard function is used.
typalign	"char"	<p>Alignment required when storing a value of this type. It applies to storage on disks as well as most representations of the value. When multiple values are stored consecutively, such as in the representation of a complete row on disk, padding is inserted before a data of this type so that it begins on the specified boundary. The alignment reference is the beginning of the first datum in the sequence. Possible values are:</p> <ul style="list-style-type: none"> <li>• <b>c</b>: char alignment, that is, no alignment required</li> <li>• <b>s</b>: short alignment (2 bytes on most machines)</li> <li>• <b>i</b>: integer alignment (4 bytes on most machines)</li> <li>• <b>d</b>: double alignment (8 bytes on many machines, but by no means all)</li> </ul> <p><b>NOTICE</b> For types used in system tables, the size and alignment defined in PG_TYPE must agree with the way that the compiler lays out the column in a structure representing a table row.</p>
typstorage	"char"	<p><b>typstorage</b> tells for varlena types (those with <b>typlen = -1</b>) if the type is prepared for toasting and what the default strategy for attributes of this type should be. Possible values are:</p> <ul style="list-style-type: none"> <li>• <b>p</b>: Values are always stored plain.</li> <li>• <b>e</b>: Values can be stored in a secondary relationship (if the relation has one, see <b>reltoastrelid</b> in <a href="#">13.2.53 PG_CLASS</a>).</li> <li>• <b>m</b>: Values can be stored compressed inline.</li> <li>• <b>x</b>: Values can be stored compressed inline or stored in secondary storage.</li> </ul> <p><b>NOTICE</b> <b>m</b> domains can also be moved out to secondary storage, but only as a last resort (<b>e</b> and <b>x</b> domains are moved first).</p>

Name	Type	Description
typnotnull	Boolean	Specifies whether the type has a NOTNULL constraint. Currently, it is used for domains only.
typbasetype	oid	If this is a domain (see <b>typtype</b> ), then <b>typbasetype</b> identifies the type that this one is based on. The value is <b>0</b> if this type is not a derived type.
typtypmod	integer	<ul style="list-style-type: none"> <li>Records the <b>typtypmod</b> to be applied to domains' base types by domains (the value is <b>-1</b> if the base type does not use <b>typmod</b>). This is <b>-1</b> if this type is not a domain.</li> <li>If the type is array, <b>typtypmod</b> indicates the maximum capacity of the array type.</li> <li>If the type is index-by table collection, <b>typtypmod</b> indicates the maximum index length of the collection type.</li> </ul>
typndims	integer	If a field is an array, <b>typndims</b> is the number of array dimensions. This is <b>0</b> for types other than domains over array types.
typcollation	oid	Sequence rule for specified types. For details about the value, see the <b>PG_COLLATION</b> system catalog. ( <b>0</b> if sequencing is not supported)
typdefaultbin	pg_node_tree	nodeToString() representation of a default expression for the type if the value is non-null. Currently, this column is only used for domains.
typdefault	text	<p>The value is <b>NULL</b> if a type has no associated default value.</p> <ul style="list-style-type: none"> <li>If <b>typdefaultbin</b> is not <b>NULL</b>, <b>typdefault</b> must contain a default expression represented by <b>typdefaultbin</b>.</li> <li>If <b>typdefaultbin</b> is <b>NULL</b> and <b>typdefault</b> is not, then <b>typdefault</b> is the external representation of the type's default value, which can be fed to the type's input converter to produce a constant.</li> </ul>
typacl	aclitem[]	Access permission.
typelemmod	integer	<ul style="list-style-type: none"> <li><b>-1</b>: <b>typmod</b> is not required for the element type corresponding to the set and array types.</li> <li>Value greater than or equal to <b>0</b>: <b>typmod</b> of the element type corresponding to the set and array types is used.</li> <li><b>NULL</b>: <b>typmod</b> of the element type corresponding to the set and array types is unknown.</li> </ul> <p><b>typmod</b> usually refers to the maximum length of a type.</p>

## 12.2.96 PG\_USER\_MAPPING

**PG\_USER\_MAPPING** records mappings from local users to remote.

This system catalog is accessible only to system administrators. Common users can query the **PG\_USER\_MAPPINGS** view.

**Table 12-97** PG\_USER\_MAPPING columns

Name	Type	Reference	Description
oid	oid	-	Row identifier (hidden attribute, which must be specified)
umuser	oid	<a href="#">PG_AUTHID.oid</a>	OID of the local role being mapped ( <b>0</b> if the user mapping is public)
umserver	oid	<a href="#">PG_FOREIGN_SERVER.oid</a>	OID of the foreign server that contains the mapping
umoptions	text[]	-	User mapping specific options, expressed in a string in the format of keyword=value

## 12.2.97 PG\_USER\_STATUS

**PG\_USER\_STATUS** records the states of users who access the database. This system catalog is accessible only to system administrators.

**Table 12-98** PG\_USER\_STATUS columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).
roloid	oid	ID of the role.
failcount	integer	Number of failed attempts.
locktime	timestamp with time zone	By default, the creation date of the role is displayed. If the role is locked by the administrator or the role is locked because the number of login failures exceeds the threshold, the date when the role is locked is displayed.

Name	Type	Description
rolstatus	smallint	Role state. <ul style="list-style-type: none"> <li>• <b>0</b>: normal</li> <li>• <b>1</b>: The role is locked for a specific period of time because the failed login attempts exceed the threshold.</li> <li>• <b>2</b>: The role is locked by the administrator.</li> </ul>
permstorage	bigint	Size of the permanent table storage space used by the role.
tempstorage	bigint	Size of the temporary table storage space used by the role.
password_expired	smallint	Specifies whether a password is valid. <ul style="list-style-type: none"> <li>• <b>0</b>: The password is valid.</li> <li>• <b>1</b>: The password is invalid.</li> </ul>

## 12.2.98 PGXC\_CLASS

PGXC\_CLASS records the replicated or distributed information for each table. PGXC\_CLASS can only be used to query table definitions in centralized mode.

**Table 12-99** PGXC\_CLASS columns

Name	Type	Description
pcrelid	oid	Table OID
plocator_type	"char"	Locator type <ul style="list-style-type: none"> <li>• <b>H</b>: Hash</li> <li>• <b>G</b>: Range</li> <li>• <b>L</b>: List</li> <li>• <b>M</b>: Modulo</li> <li>• <b>N</b>: Round Robin</li> <li>• <b>R</b>: Replication</li> </ul>
pchashalgorithm	smallint	Distributed tuple using the hash algorithm
pchashbuckets	smallint	Value of a hash container
pgroup	name	Name of the node
redistributed	"char"	Indicates that a table has been redistributed.

Name	Type	Description
redis_order	integer	Redistribution sequence. Tables whose values are <b>0</b> will not be redistributed in this round of redistribution.
pccattnum	int2vector	Column number used as a distributed key
nodeoids	oidvector_extend	List of distributed table node OIDs
options	text	Extension status information. This is a reserved column in the system.

## 12.2.99 PGXC\_GROUP

PGXC\_GROUP records information about node groups. PGXC\_GROUP can only be used to query table definitions in centralized mode.

**Table 12-100** PGXC\_GROUP columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).
group_name	name	Node group name.
in_redistribution	"char"	Specifies whether redistribution is required. Valid value: <ul style="list-style-type: none"> <li><b>n</b>: The node group is not redistributed.</li> <li><b>y</b>: The source node group is in redistribution.</li> <li><b>t</b>: The destination node group is in redistribution.</li> </ul>
group_members	oidvector_extend	Node OID list of the node group.
group_buckets	text	Distributed data bucket group.
is_installation	Boolean	Specifies whether to install a sub-database instance. <ul style="list-style-type: none"> <li><b>t</b> (true): yes</li> <li><b>f</b> (false): no</li> </ul>
group_acl	aclitem[]	Access permission.

Name	Type	Description
group_kind	"char"	Node group type. The options are as follows: <ul style="list-style-type: none"> <li>• <b>i</b>: installation node group</li> <li>• <b>n</b>: node group in a common non-logical database instance</li> <li>• <b>v</b>: node group in a logical database instance</li> <li>• <b>e</b>: elastic database instance</li> </ul>
group_parent	oid	For a child node group, this field indicates the OID of the parent node group. For a parent node group, this field is left blank.

## 12.2.100 PGXC\_NODE

PGXC\_NODE stores information about database instance nodes. It has specific meanings only in distributed scenarios. Centralized systems can query only the table definition.

**Table 12-101** PGXC\_NODE columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified)
node_name	name	Node name
node_type	"char"	Node type <ul style="list-style-type: none"> <li>• <b>C</b>: CN</li> <li>• <b>D</b>: DN</li> <li>• <b>S</b>: standby node</li> </ul>
node_port	integer	Port number of the node
node_host	name	Host name or IP address of a node. (If a virtual IP address is configured, its value is a virtual IP address.)
node_port1	integer	Port number of a replication node
node_host1	name	Host name or IP address of a replication node. (If a virtual IP address is configured, its value is a virtual IP address.)
hostis_primary	boolean	Whether a primary/standby switchover occurs on the current node <ul style="list-style-type: none"> <li>• <b>t</b> (true): yes</li> <li>• <b>f</b> (false): no</li> </ul>

Name	Type	Description
nodeis_primary	boolean	Whether the current node is preferred to execute non-query operations in the <b>replication</b> table <ul style="list-style-type: none"> <li>• <b>t</b> (true): yes</li> <li>• <b>f</b> (false): no</li> </ul>
nodeis_preferred	boolean	Whether the current node is preferred to execute queries in the <b>replication</b> table <ul style="list-style-type: none"> <li>• <b>t</b> (true): yes</li> <li>• <b>f</b> (false): no</li> </ul>
node_id	integer	Node identifier. The value is obtain by calculating the value of <b>node_name</b> using the hash function.
sctp_port	integer	Port used by the TCP proxy communications library of the primary node to listen to the data channel. (The SCTP communications library is no longer supported in the current version.)
control_port	integer	Port used by the TCP proxy communications library of the primary node to listen to the control channel
sctp_port1	integer	Port used by the TCP proxy communications library of the standby node to listen to the data channel. (The SCTP communications library is no longer supported in the current version.)
control_port1	integer	Port used by the TCP proxy communications library of the standby node to listen to the control channel
nodeis_central	boolean	Whether the current node is a CN. It is invalid for DNS. <ul style="list-style-type: none"> <li>• <b>t</b> (true): yes</li> <li>• <b>f</b> (false): no</li> </ul>
nodeis_active	boolean	Whether the current node is normal. It is invalid for DNS. <ul style="list-style-type: none"> <li>• <b>t</b> (true): yes</li> <li>• <b>f</b> (false): no</li> </ul>

## 12.2.101 PGXC\_SLICE

PGXC\_SLICE is a system catalog created for recording range distribution and list distribution details. Currently, range interval cannot be used to automatically scale out shards. It is reserved in the system catalog.

In the centralized system, only the definition of this table can be queried.

**Table 12-102** PGXC\_SLICE columns

Name	Type	Description
relname	name	Table name or shard name, which is distinguished by <b>type</b> .
type	"char"	<ul style="list-style-type: none"> <li>• 't': <b>relname</b> is the table name.</li> <li>• 's': <b>relname</b> is the shard name.</li> </ul>
strategy	"char"	<ul style="list-style-type: none"> <li>• 'r': range distribution table.</li> <li>• 'l': list distribution table.</li> </ul> This value will be extended for subsequent interval shards.
relid	oid	OID of the distribution table to which the tuple belongs.
referenc eoid	oid	OID of the referenced distribution table, which is used for slice reference table creation syntax.
sindex	integer	Position of the current boundary in a shard when the table is a list distribution table.
interval	text[]	Reserved column.
transitb oundary	text[]	Reserved column.
transitn o	integer	Reserved column.
nodeoid	oid	When <b>relname</b> is set to a shard name, <b>nodeoid</b> indicates the OID of the DN where the shard data is stored.
boundar ies	text[]	When <b>relname</b> is set to a shard name, this parameter indicates the boundary value of the shard.
specifie d	Boolean	Whether the DN corresponding to the current segment is explicitly specified in the DDL.
sliceord er	integer	User-defined shard sequence.

## 12.2.102 PLAN\_TABLE\_DATA

PLAN\_TABLE\_DATA stores plan information collected by EXPLAIN PLAN. Different from the PLAN\_TABLE view, the system catalog PLAN\_TABLE\_DATA stores EXPLAIN PLAN information collected by all sessions and users.

**Table 12-103** PLAN\_TABLE\_DATA columns

Name	Type	Description
session_id	text	Session that inserts the data. Its value consists of a service thread start timestamp and a service thread ID. Values are constrained by <b>NOT NULL</b> .
user_id	oid	User who inserts the data. Values are constrained by <b>NOT NULL</b> .
statement_id	character varying(30)	Query tag specified by a user.
plan_id	bigint	Query ID The ID is automatically generated in the plan generation phase and is used by kernel engineers for debugging.
id	integer	Node ID in a plan
operation	character varying(30)	Operation description.
options	character varying(255)	Operation action.
object_name	name	Name of an operated object. It is defined by users.
object_type	character varying(30)	Object type.
object_owner	name	Schema to which the object belongs. It is defined by users.
projection	character varying(4000)	Returned column information.
cost	double precision	Execution cost estimated by the optimizer for an operator
cardinality	double precision	Number of rows estimated by the optimizer for an operator

 NOTE

- PLAN\_TABLE\_DATA records data of all users and sessions on the current node. Only administrators can access all the data. Common users can view their own data in the [PLAN\\_TABLE](#) view.
- Data is automatically inserted into PLAN\_TABLE\_DATA after **EXPLAIN PLAN** is executed. Therefore, do not manually insert data into or update data in PLAN\_TABLE\_DATA. Otherwise, data in PLAN\_TABLE\_DATA may be disordered. To delete data, you are advised to use the [PLAN\\_TABLE](#) view.
- Information in the **statement\_id**, **object\_name**, **object\_owner**, and **projection** columns is stored in letter cases specified by users and information in other columns is stored in uppercase.

## 12.2.103 STATEMENT\_HISTORY

Displays information about statements executed on the current node. To query this system catalog, you must have the sysadmin permission. The result can be queried only in the system database but cannot be queried in the user database.

The constraints on the query of this system catalog are as follows:

- Data must be queried in the Postgres database. No data exists in other databases.
- This system catalog is controlled by **track\_stmt\_stat\_level**. The default value is **OFF,L0**, where the first part controls full SQL statements, and the second part controls slow SQL statements. For details about the record level of each field, see the following table. To ensure system performance, you are advised to use the SET statement to change the value of this parameter so that the parameter takes effect only for the current session.
- For slow SQL statements, if the value of **track\_stmt\_stat\_level** is not **OFF** and the SQL execution time exceeds the value of **log\_min\_duration\_statement**, the SQL statement is recorded as a slow SQL statement.

**Table 12-104** STATEMENT\_HISTORY columns

Name	Type	Description	Record Level
db_name	name	Database name.	L0
schema_name	name	Schema name.	L0
origin_node	integer	Node name.	L0
user_name	name	Username.	L0
application_name	text	Name of the application that sends a request.	L0
client_addr	text	IP address of the client that sends a request.	L0
client_port	integer	Port number of the client that sends a request.	L0

Name	Type	Description	Record Level
unique_query_id	bigint	ID of the normalized SQL statement.	L0
debug_query_id	bigint	ID of the unique SQL statement. Some statements are not unique. For example, the value of <b>debug_query_id</b> in the Parse packet, DCL statements, and TCL statements is <b>0</b> .	L0
query	text	Normalized SQL statement. When the <b>track_stmt_parameter</b> parameter is enabled, the complete SQL statement is displayed.	L0
start_time	timestamp with time zone	Time when a statement starts.	L0
finish_time	timestamp with time zone	Time when a statement ends.	L0
slow_sql_threshold	bigint	Standard for slow SQL statement execution.	L0
transaction_id	bigint	Transaction ID.	L0
thread_id	bigint	ID of an execution thread.	L0
session_id	bigint	Session ID of a user.	L0
n_soft_parse	bigint	Number of soft parsing times. The value of <b>n_soft_parse</b> plus the value of <b>n_hard_parse</b> may be greater than the value of <b>n_calls</b> because the number of subqueries is not counted in the value of <b>n_calls</b> .	L0
n_hard_parse	bigint	Number of hard parsing times. The value of <b>n_soft_parse</b> plus the value of <b>n_hard_parse</b> may be greater than the value of <b>n_calls</b> because the number of subqueries is not counted in the value of <b>n_calls</b> .	L0
query_plan	text	Statement execution plan. For <b>query_plan</b> of Slow SQL, if <b>execution_time</b> is greater than <b>slow_sql_threshold</b> , <b>query_plan</b> may be empty in scenarios such as deadlock.	L0

Name	Type	Description	Record Level
n_returned_rows	bigint	Number of rows in the result set returned by the <b>SELECT</b> statement.	L0
n_tuples_fetched	bigint	Number of rows randomly scanned.	L0
n_tuples_returned	bigint	Number of rows sequentially scanned.	L0
n_tuples_inserted	bigint	Number of rows inserted.	L0
n_tuples_updated	bigint	Number of rows updated.	L0
n_tuples_deleted	bigint	Number of rows deleted.	L0
n_blocks_fetched	bigint	Number of buffer block access times.	L0
n_blocks_hit	bigint	Number of buffer block hits.	L0
db_time	bigint	Valid DB time, which is accumulated if multiple threads are involved (unit: $\mu$ s).	L0
cpu_time	bigint	CPU time (unit: $\mu$ s).	L0
execution_time	bigint	Execution time in the executor (unit: $\mu$ s).	L0
parse_time	bigint	SQL parsing time (unit: $\mu$ s).	L0
plan_time	bigint	SQL plan generation time (unit: $\mu$ s).	L0
rewrite_time	bigint	SQL rewriting time (unit: $\mu$ s).	L0
pl_execution_time	bigint	Execution time of PL/pgSQL (unit: $\mu$ s).	L0
pl_compilation_time	bigint	Compilation time of PL/pgSQL (unit: $\mu$ s).	L0
data_io_time	bigint	I/O time (unit: $\mu$ s).	L0
net_send_info	text	Network status of messages sent through a physical connection, including the time (unit: $\mu$ s), number of calls, and throughput (unit: byte). This column is not supported in the centralized system.	L0

Name	Type	Description	Record Level
net_rcv_info	text	Network status of messages received through a physical connection, including the time (unit: $\mu$ s), number of calls, and throughput (unit: byte). This column is not supported in the centralized system.	L0
net_stream_send_info	text	Network status of messages sent through a logical connection, including the time (unit: $\mu$ s), number of calls, and throughput (unit: byte). This column is not supported in the centralized system.	L0
net_stream_recv_info	text	Network status of messages received through a logical connection, including the time (unit: $\mu$ s), number of calls, and throughput (unit: byte). This column is not supported in the centralized system.	L0
lock_count	bigint	Number of locks.	L0
lock_time	bigint	Time required for locking.	L1
lock_wait_count	bigint	Number of lock waits.	L0
lock_wait_time	bigint	Time required for lock waiting.	L1
lock_max_count	bigint	Maximum number of locks.	L0
lwlock_count	bigint	Number of lightweight locks (reserved).	L0
lwlock_wait_count	bigint	Number of lightweight lock waits.	L0
lwlock_time	bigint	Time required for lightweight locking (reserved).	L1
lwlock_wait_time	bigint	Time required for lightweight lock waiting.	L1

Name	Type	Description	Record Level
details	bytea	<p>List of wait events and statement lock events.</p> <p>When the value of <b>track_stmt_stat_level</b> is greater than or equal to <b>L0</b>, the list of wait events starts to be recorded. Statistics about the wait events of the current statement are displayed. For details about the events, see <a href="#">Table 12-351</a>, <a href="#">15.3.67-Table 3 List of wait events corresponding to lightweight locks</a>, <a href="#">Table 12-353</a>, and <a href="#">Table 12-354</a>. For details about the impact of each transaction lock on services, see <a href="#">LOCK</a>.</p> <p>When the value of <b>track_stmt_stat_level</b> is <b>L2</b>, the list of statement lock events starts to be recorded. The list records events in chronological order. The number of records is determined by the <b>track_stmt_details_size</b> parameter.</p> <p>This field is in binary format and needs to be read by using the parsing function <code>pg_catalog.statement_detail_decode</code>. For details, see <a href="#">Table 7-63</a>.</p> <p>Events include:</p> <ul style="list-style-type: none"> <li>• Start locking.</li> <li>• Complete locking.</li> <li>• Start lock waiting.</li> <li>• Complete lock waiting.</li> <li>• Start unlocking.</li> <li>• Complete unlocking.</li> <li>• Start lightweight lock waiting.</li> <li>• Complete lightweight lock waiting.</li> </ul>	L0/L2
is_slow_sql	Boolean	<p>Whether the SQL statement is a slow SQL statement.</p> <ul style="list-style-type: none"> <li>• <b>t</b> (true): yes</li> <li>• <b>f</b> (false): no</li> </ul>	L0
trace_id	text	Driver-specific trace ID, which is associated with an application request.	L0

Name	Type	Description	Record Level
advise	text	Risk information that may cause the SQL statement to be a slow SQL statement.	L0
parent_unique_sql_id	bigint	Normalized SQL ID of the outer SQL statement. For statements executed in a stored procedure, the value is the normalized SQL ID of the statement that calls the stored procedure. For statements outside the stored procedure, the value is <b>0</b> .	L0

## 12.2.104 STREAMING\_STREAM

**STREAMING\_STREAM** records the metadata of all STREAM objects.

**Table 12-105** STREAMING\_STREAM columns

Name	Type	Description
relid	oid	STREAM object ID.
queries	bytea	Bitmap mapping of the CONTVIEW corresponding to the STREAM.

## 12.2.105 STREAMING\_CONT\_QUERY

**STREAMING\_CONT\_QUERY** records the metadata of all CONTVIEW objects.

**Table 12-106** STREAMING\_CONT\_QUERY columns

Name	Type	Description
id	integer	Unique identifier of the CONTVIEW object.
type	"char"	CONTVIEW type. <ul style="list-style-type: none"> <li><b>r</b> indicates that the CONTVIEW is based on the row-store model.</li> </ul>
relid	oid	CONTVIEW object ID.
defrelid	oid	ID of the continuous computing rule view corresponding to CONTVIEW.

Name	Type	Description
active	Boolean	Determines whether the CONTVIEW is in the continuous computing state. <ul style="list-style-type: none"> <li>• <b>t</b> (true): yes</li> <li>• <b>f</b> (false): no</li> </ul>
streamrelid	oid	ID of STREAM corresponding to CONTVIEW.
matrelid	oid	ID of the materialized table corresponding to CONTVIEW.
lookupidxid	oid	ID of GROUP LOOK UP INDEX corresponding to CONTVIEW. This column is for internal use and is available only in row-store tables.
step_factor	smallint	CONTVIEW step mode. The main values are <b>0</b> (no overlapping window) and <b>1</b> (sliding window, with one step).
ttd	integer	Value of <b>ttd_interval</b> set by CONTVIEW.
ttd_attno	smallint	Number of a time column corresponding to the TTL function set by CONTVIEW.
dictrelid	oid	ID of the dictionary table corresponding to CONTVIEW.
grpnum	smallint	Number of dimension columns in the CONTVIEW continuous computing rule. This column is for internal use.
grpidx	int2vector	Index of the dimension column in TARGET LIST in the CONTVIEW continuous computing rule. This column is for internal use.

## 12.3 System Views

### 12.3.1 ADM\_ARGUMENTS

ADM\_ARGUMENTS displays parameter information of all stored procedures or functions. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in both PG\_CATALOG and SYS schema.

**Table 12-107** ADM\_ARGUMENTS columns

Name	Type	Description
owner	character varying(128)	Owner of a function or stored procedure.

Name	Type	Description
object_name	character varying(128)	Name of a function or stored procedure.
package_name	character varying(128)	Package name.
object_id	oid	OID of a function or stored procedure.
overload	character varying(40)	<i>n</i> th overloaded function of the name.
subprogram_id	numeric	Location of a function or stored procedure in a package.
argument_name	character varying(128)	Parameter name.
position	numeric	Position of the parameter in the parameter list. The value is <b>0</b> for the return value of the function by default.
sequence	numeric	Sequence of a parameter, which starts from 1, with the return type before all parameters.
data_level	numeric	Nesting depth of parameters of the composite type. The value is fixed at <b>0</b> because only one line is displayed for each parameter.
data_type	character varying(64)	Data type of a parameter.
defaulted	character varying(1)	Specifies whether a parameter has a default value: <ul style="list-style-type: none"> <li>• <b>Y</b>: yes.</li> <li>• <b>N</b>: no.</li> </ul>
default_value	text	Not supported. Its value is <b>NULL</b> .
default_length	numeric	Not supported. Its value is <b>NULL</b> .

Name	Type	Description
in_out	character varying(9)	Input and output attributes of a parameter: <ul style="list-style-type: none"> <li>• <b>IN</b>: input parameter.</li> <li>• <b>OUT</b>: output parameter.</li> <li>• <b>IN_OUT</b>: input and output parameters.</li> <li>• <b>VARIADIC</b>: VARIADIC parameter.</li> </ul>
data_length	numeric	Not supported. Its value is <b>NULL</b> .
data_precision	numeric	Not supported. Its value is <b>NULL</b> .
data_scale	numeric	Not supported. Its value is <b>NULL</b> .
radix	numeric	Radix of a number, which is <b>10</b> when the data type is smallint, integer, bigint, numeric, or float, and is <b>NULL</b> for other data types.
character_set_name	character varying(44)	Not supported. Its value is <b>NULL</b> .
type_owner	character varying(128)	Owner of the data type.
type_name	character varying(128)	Parameter type name. Only the customized type is displayed.
type_subname	character varying(128)	Not supported. Its value is <b>NULL</b> .
type_link	character varying(128)	Not supported. Its value is <b>NULL</b> .

Name	Type	Description
type_object_type	character varying(7)	Types of types of the <b>type_owner</b> , <b>type_name</b> , and <b>type_subname</b> columns: <ul style="list-style-type: none"> <li>• <b>TABLE</b>: The parameter is of the table type.</li> <li>• <b>VIEW</b>: The parameter is of the view type.</li> <li>• Leave it empty for other types.</li> </ul>
pls_type	character varying(128)	Name of the PL/SQL type for parameters of the number type. Otherwise, this column is empty.
char_length	numeric	Not supported. Its value is <b>NULL</b> .
char_used	character varying(1)	Not supported. Set it to <b>B</b> if the data type is varchar, nvarchar2, bpchar, or char, and to <b>NULL</b> for other data types.
origin_con_id	character varying(256)	Not supported. Its value is <b>0</b> .

## 12.3.2 ADM\_AUDIT\_OBJECT

ADM\_AUDIT\_OBJECT displays the audit trail records of all objects in the database. This view exists in both PG\_CATALOG and SYS schema. By default, only the system administrator can access this view. Common users can access the view only after being authorized.

**Table 12-108** ADM\_AUDIT\_OBJECT columns

Name	Type	Description
os_username	character varying(255)	Not supported. Its value is <b>NULL</b> .
username	character varying(128)	Name of the user whose operation is audited, not the user ID.

Name	Type	Description
userhost	character varying(128)	Not supported. Its value is <b>NULL</b> .
terminal	character varying(255)	Not supported. Its value is <b>NULL</b> .
timestamp	timestamp(0) without time zone	Date and time when an audit trace entry is created in the local database session time zone (user login date and time of the entry created by the audit session)
owner	character varying(128)	Creator of the object affected by the operation
obj_name	character varying(128)	Name of the object affected by the operation
action_name	character varying(28)	Action name corresponding to the numeric code in the <b>ACTION</b> column in DBA_AUDIT_TRAIL <b>NOTE</b> The <b>action_name</b> column in GaussDB is inconsistent with the audit action of database A.
new_owner	character varying(128)	Not supported. Its value is <b>NULL</b> .
new_name	character varying(128)	Not supported. Its value is <b>NULL</b> .
ses_actions	character varying(19)	Not supported. Its value is <b>NULL</b> .
comment_text	character varying(4000)	Not supported. Its value is <b>NULL</b> .
sessionid	numeric	Not supported. Its value is <b>NULL</b> .
entryid	numeric	Not supported. Its value is <b>NULL</b> .
statementid	numeric	Not supported. Its value is <b>NULL</b> .
returncode	numeric	Not supported. Its value is <b>NULL</b> .
priv_used	character varying(40)	Not supported. Its value is <b>NULL</b> .

Name	Type	Description
client_id	character varying(128)	Not supported. Its value is <b>NULL</b> .
econtext_id	character varying(64)	Not supported. Its value is <b>NULL</b> .
session_cpu	numeric	Not supported. Its value is <b>NULL</b> .
extended_timestamp	timestamp(6) with time zone	Timestamp when an audit trace entry is created (user login timestamp of the entry created by the audit session in UTC).
proxy_sessionid	numeric	Not supported. Its value is <b>NULL</b> .
global_uid	character varying(32)	Not supported. Its value is <b>NULL</b> .
instance_numeric	numeric	Not supported. Its value is <b>NULL</b> .
os_process	character varying(16)	Not supported. Its value is <b>NULL</b> .
transactionid	text	Identifier of the transaction that accesses or modifies an object. <b>NOTE</b> The type of the <b>transactionid</b> column in GaussDB must be the same as that in database A.
scn	numeric	Not supported. Its value is <b>NULL</b> .
sql_bind	Ncharacter varying(2000)	Not supported. Its value is <b>NULL</b> .
sql_text	Ncharacter varying(2000)	SQL text of the query. <b>NOTE</b> The <b>sql_text</b> column in GaussDB is the parsed SQL description statement, which is not completely the same as the executed SQL statement.
obj_edition_name	character varying(128)	Not supported. Its value is <b>NULL</b> .

### 12.3.3 ADM\_AUDIT\_SESSION

ADM\_AUDIT\_SESSION displays all audit trail records concerning CONNECT and DISCONNECT. The audit information of GaussDB is mainly queried through the

pg\_query\_audit function. This view exists in both PG\_CATALOG and SYS schema. Only users with the AUDITADMIN attribute can view audit information.

**Table 12-109** ADM\_AUDIT\_SESSION columns

Name	Type	Description
os_username	character varying(255)	Not supported. Its value is <b>NULL</b> .
username	character varying(128)	Name of the user whose operation is audited, not the user ID.
userhost	character varying(128)	Not supported. Its value is <b>NULL</b> .
terminal	character varying(128)	Not supported. Its value is <b>NULL</b> .
timestamp	timestamp(0) without time zone	Date and time when an audit trace entry is created (user login date and time of the entry created by AUDIT SESSION).
action_name	character varying(28)	Action name corresponding to the numeric code in the <b>ACTION</b> column in DBA_AUDIT_TRAIL. <b>NOTE</b> The <b>action_name</b> column in GaussDB is inconsistent with the audit action of database A.
logoff_time	timestamp(0) without time zone	Not supported. Its value is <b>NULL</b> .
logoff_lread	numeric	Not supported. Its value is <b>NULL</b> .
logoff_pread	numeric	Not supported. Its value is <b>NULL</b> .
logoff_lwrite	numeric	Not supported. Its value is <b>NULL</b> .
logoff_dlock	character varying(40)	Not supported. Its value is <b>NULL</b> .
sessionid	numeric	Not supported. Its value is <b>NULL</b> .
returncode	numeric	Not supported. Its value is <b>NULL</b> .
client_id	character varying(128)	Not supported. Its value is <b>NULL</b> .

Name	Type	Description
session_cpu	numeric	Not supported. Its value is <b>NULL</b> .
extended_timestamp	timestamp(6) with time zone	Timestamp when an audit trace entry is created (user login timestamp of the entry created by AUDIT SESSION in UTC).
proxy_sessionid	numeric	Not supported. Its value is <b>NULL</b> .
global_uid	character varying(32)	Not supported. Its value is <b>NULL</b> .
instance_numeric	numeric	Not supported. Its value is <b>NULL</b> .
os_process	character varying(16)	Not supported. Its value is <b>NULL</b> .

### 12.3.4 ADM\_AUDIT\_STATEMENT

ADM\_AUDIT\_STATEMENT displays all grant and revoke audit trace entries. The audit information of GaussDB is mainly queried through the pg\_query\_audit function. This view exists in both PG\_CATALOG and SYS schema. Only users with the AUDITADMIN attribute can view audit information.

**Table 12-110** ADM\_AUDIT\_STATEMENT columns

Name	Type	Description
os_username	character varying(255)	Not supported. Its value is <b>NULL</b> .
username	character varying(128)	Name of the user whose operation is audited, not the user ID.
userhost	character varying(128)	Not supported. Its value is <b>NULL</b> .
terminal	character varying(255)	Not supported. Its value is <b>NULL</b> .
timestamp	timestamp(0) without time zone	Date and time when an audit trace entry is created (user login date and time of the entry created by AUDIT SESSION).

Name	Type	Description
owner	character varying(128)	Not supported. Its value is <b>NULL</b> .
obj_name	character varying(128)	Name of the object affected by the operation
action_name	character varying(28)	Action name corresponding to the numeric code in the <b>ACTION</b> column in <b>DBA_AUDIT_TRAIL</b> . <b>NOTE</b> The <b>action_name</b> column in GaussDB is inconsistent with the audit action of database A.
new_name	character varying(128)	Not supported. Its value is <b>NULL</b> .
obj_privilege	character varying(32)	Not supported. Its value is <b>NULL</b> .
sys_privilege	character varying(40)	Not supported. Its value is <b>NULL</b> .
admin_option	character varying(1)	Not supported. Its value is <b>NULL</b> .
grantee	character varying(128)	Not supported. Its value is <b>NULL</b> .
audit_option	character varying(40)	Not supported. Its value is <b>NULL</b> .
ses_actions	character varying(19)	Not supported. Its value is <b>NULL</b> .
comment_text	character varying(4000)	Not supported. Its value is <b>NULL</b> .
sessionid	numeric	Not supported. Its value is <b>NULL</b> .
entryid	numeric	Not supported. Its value is <b>NULL</b> .
statementid	numeric	Not supported. Its value is <b>NULL</b> .
returncode	numeric	Not supported. Its value is <b>NULL</b> .

Name	Type	Description
priv_used	character varying(40)	Not supported. Its value is <b>NULL</b> .
client_id	character varying(128)	Not supported. Its value is <b>NULL</b> .
econtext_id	character varying(64)	Not supported. Its value is <b>NULL</b> .
session_cpu	numeric	Not supported. Its value is <b>NULL</b> .
extended_timestamp	timestamp(6) with time zone	Timestamp when an audit trace entry is created (user login timestamp of the entry created by AUDIT SESSION in UTC).
proxy_sessionid	numeric	Not supported. Its value is <b>NULL</b> .
global_uid	character varying(32)	Not supported. Its value is <b>NULL</b> .
instance_number	numeric	Not supported. Its value is <b>NULL</b> .
os_process	character varying(16)	Not supported. Its value is <b>NULL</b> .
transactionid	text	Identifier of the transaction that accesses or modifies an object. <b>NOTE</b> The type of the <b>transactionid</b> column in GaussDB must be the same as that in database A.
scn	numeric	Not supported. Its value is <b>NULL</b> .
sql_bind	nvarchar2(2000)	Not supported. Its value is <b>NULL</b> .
sql_text	character varying(2000)	SQL text of the query. <b>NOTE</b> The <b>sql_text</b> column in GaussDB is the parsed SQL description statement, which is not completely the same as the executed SQL statement.
obj_edition_name	character varying(128)	Not supported. Its value is <b>NULL</b> .

### 12.3.5 ADM\_AUDIT\_TRAIL

ADM\_AUDIT\_TRAIL displays all standard audit trail entries. The audit information of GaussDB is mainly obtained through the pg\_query\_audit function. This view

exists in both PG\_CATALOG and SYS schema. Only users with the AUDITADMIN attribute can view audit information. The **action\_name** column of GaussDB is different from that of the A database in terms of the audit actions. The type of the **transactionid** column is the same as that in the A database. In GaussDB, the **sql\_text** column is the parsed SQL statement, which is not completely the same as the executed SQL statement.

**Table 12-111** ADM\_AUDIT\_TRAIL columns

Name	Type	Description
os_username	character varying(255)	Not supported. Its value is <b>NULL</b> .
username	character varying(128)	Name of the user whose operation is audited, not the user ID.
userhost	character varying(128)	Not supported. Its value is <b>NULL</b> .
terminal	character varying(255)	Not supported. Its value is <b>NULL</b> .
timestamp	timestamp(0) without time zone	Date and time when an audit trace entry is created in the local database session time zone (user login date and time of the entry created by the audit session)
owner	character varying(128)	Creator of the object affected by the operation
obj_name	character varying(128)	Name of the object affected by the operation
action	numeric	Not supported. Its value is <b>NULL</b> .
action_name	character varying(28)	Action type corresponding to the code in the action column. <b>NOTE</b> The <b>action_name</b> column in GaussDB is inconsistent with the audit action of database A.
new_owner	character varying(128)	Not supported. Its value is <b>NULL</b> .
new_name	character varying(128)	Not supported. Its value is <b>NULL</b> .
obj_privilege	character varying(32)	Not supported. Its value is <b>NULL</b> .
sys_privilege	character varying(40)	Not supported. Its value is <b>NULL</b> .
admin_option	character varying(1)	Not supported. Its value is <b>NULL</b> .

Name	Type	Description
grantee	character varying(128)	Not supported. Its value is <b>NULL</b> .
audit_option	character varying(40)	Not supported. Its value is <b>NULL</b> .
ses_actions	character varying(19)	Not supported. Its value is <b>NULL</b> .
logoff_time	timestamp(0) without time zone	Not supported. Its value is <b>NULL</b> .
logoff_lread	numeric	Not supported. Its value is <b>NULL</b> .
logoff_pread	numeric	Not supported. Its value is <b>NULL</b> .
logoff_lwrite	numeric	Not supported. Its value is <b>NULL</b> .
logoff_dlock	character varying(40)	Not supported. Its value is <b>NULL</b> .
comment_text	character varying(4000)	Not supported. Its value is <b>NULL</b> .
sessionid	numeric	Not supported. Its value is <b>NULL</b> .
entryid	numeric	Not supported. Its value is <b>NULL</b> .
statementid	numeric	Not supported. Its value is <b>NULL</b> .
returncode	numeric	Not supported. Its value is <b>NULL</b> .
priv_used	character varying(40)	Not supported. Its value is <b>NULL</b> .
client_id	character varying(128)	Not supported. Its value is <b>NULL</b> .
econtext_id	character varying(64)	Not supported. Its value is <b>NULL</b> .
session_cpu	numeric	Not supported. Its value is <b>NULL</b> .
extended_timestamp	timestamp(6) with time zone	Time zone of the timestamp when an audit trail entry is created (user login date and time of the entry created by the audit session in UTC).
proxy_sessionid	numeric	Not supported. Its value is <b>NULL</b> .
global_uid	character varying(32)	Not supported. Its value is <b>NULL</b> .
instance_number	numeric	Not supported. Its value is <b>NULL</b> .

Name	Type	Description
os_process	character varying(16)	Not supported. Its value is <b>NULL</b> .
transactionid	text	Identifier of the transaction that accesses or modifies an object. <b>NOTE</b> The type of the <b>transactionid</b> column in GaussDB must be the same as that in database A.
scn	numeric	Not supported. Its value is <b>NULL</b> .
sql_bind	nvarchar2(2000)	Not supported. Its value is <b>NULL</b> .
sql_text	nvarchar2	SQL text of the query. <b>NOTE</b> The <b>sql_text</b> column in GaussDB is the parsed SQL description statement, which is not completely the same as the executed SQL statement.
obj_edition_name	character varying(128)	Not supported. Its value is <b>NULL</b> .
dbid	numeric	Not supported. Its value is <b>NULL</b> .
rls_info	clob	Not supported. Its value is <b>NULL</b> .
current_user	character varying(128)	Not supported. Its value is <b>NULL</b> .

### 12.3.6 ADM\_COL\_COMMENTS

ADM\_COL\_COMMENTS displays information about table column comments in the database. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in both PG\_CATALOG and SYS schema.

**Table 12-112** ADM\_COL\_COMMENTS columns

Name	Type	Description
owner	character varying(128)	Table owner.
table_name	character varying(128)	Table name.
column_name	character varying(128)	Column name.
comments	text	Comments.

Name	Type	Description
origin_con_id	numeric	Not supported. Its value is <b>0</b> .
schema	character varying(64)	Name of the namespace to which the column belongs.

### 12.3.7 ADM\_COL\_PRIVS

ADM\_COL\_PRIVS displays permission granting information about all columns. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in both PG\_CATALOG and SYS schema.

**Table 12-113** ADM\_COL\_PRIVS columns

Name	Type	Description
grantor	character varying(128)	Name of the user who grants the permission.
owner	character varying(128)	Object owner.
grantee	character varying(128)	Name of the user or role to which the permission is granted.
table_schema	character varying(128)	Schema of an object.
table_name	character varying(128)	Object name.
column_name	character varying(128)	Column name.
privilege	character varying(40)	Permission on a column.
grantable	character varying(3)	Specifies whether to grant privileges. <ul style="list-style-type: none"> <li>• <b>YES</b>: The privileges are granted.</li> <li>• <b>NO</b>: The privileges are not granted.</li> </ul>
common	character varying(3)	Not supported. Its value is <b>NULL</b> .
inherited	character varying(3)	Not supported. Its value is <b>NULL</b> .

### 12.3.8 ADM\_COLL\_TYPES

ADM\_COLL\_TYPES displays information about all collection types. By default, only the system administrator can access this view. Common users can access the view

only after being authorized. This view exists in both PG\_CATALOG and SYS schema.

**Table 12-114** ADM\_COLL\_TYPES columns

Name	Type	Description
owner	character varying(128)	Owner of a cluster.
type_name	character varying(128)	Name of a collection.
coll_type	character varying(128)	Description of a set.
upper_bound	numeric	Not supported. Its value is <b>NULL</b> .
elem_type_mod	character varying(7)	Not supported. Its value is <b>NULL</b> .
elem_type_owner	character varying(128)	Owner of the element type on which the collection is based. This parameter is mainly used for user-defined types.
elem_type_name	character varying(128)	Name of the data type or user-defined type on which the collection is based.
length	numeric	Not supported. Its value is <b>NULL</b> .
precision	numeric	Not supported. Its value is <b>NULL</b> .
scale	numeric	Not supported. Its value is <b>NULL</b> .
character_set_name	character varying(44)	Not supported. Its value is <b>NULL</b> .
elem_storage	character varying(7)	Not supported. Its value is <b>NULL</b> .
nulls_stored	character varying(3)	Not supported. Its value is <b>NULL</b> .
char_used	character varying(1)	Not supported. Its value is <b>NULL</b> .

### 12.3.9 ADM\_CONS\_COLUMNS

ADM\_CONS\_COLUMNS displays information about constraint columns in database tables. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in both PG\_CATALOG and SYS schema.

**Table 12-115** ADM\_CONS\_COLUMNS columns

Name	Type	Description
owner	character varying(64)	Constraint creator.
constraint_name	character varying(64)	Constraint name.
table_name	character varying(64)	Name of a constraint-related table.
column_name	character varying(64)	Name of a constraint-related column.
position	smallint	Position of a column in a table.

## 12.3.10 ADM\_CONSTRAINTS

ADM\_CONSTRAINTS displays information about table constraints in database. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in both PG\_CATALOG and SYS schema.

**Table 12-116** ADM\_CONSTRAINTS columns

Name	Type	Description
owner	character varying(64)	Constraint creator.
constraint_name	character varying(64)	Constraint name.
constraint_type	text	Constraint type. <ul style="list-style-type: none"> <li>● <b>c</b>: check constraint.</li> <li>● <b>f</b>: foreign key constraint.</li> <li>● <b>p</b>: primary key constraint.</li> <li>● <b>u</b>: unique constraint.</li> </ul>
table_name	character varying(64)	Name of a constraint-related table.
index_owner	character varying(64)	Owner of a constraint-related index (only for the unique constraint and primary key constraint).
index_name	character varying(64)	Name of a constraint-related index (only for the unique constraint and primary key constraint).
status	character varying(8)	Constraint status.

Name	Type	Description
generated	character varying(14)	Not supported. Its value is <b>NULL</b> .
search_condition	text	Not supported. Its value is <b>NULL</b> .
search_condition_v c	character varying(4000)	Not supported. Its value is <b>NULL</b> .
r_owner	character varying(128)	Not supported. Its value is <b>NULL</b> .
r_constraint_name	character varying(128)	Not supported. Its value is <b>NULL</b> .
delete_rule	character varying(9)	Not supported. Its value is <b>NULL</b> .
con_deferrable	character varying(14)	Not supported. Its value is <b>NULL</b> .
deferred	character varying(9)	Not supported. Its value is <b>NULL</b> .
validated	character varying(13)	Not supported. Its value is <b>NULL</b> .
bad	character varying(3)	Not supported. Its value is <b>NULL</b> .
rely	character varying(4)	Not supported. Its value is <b>NULL</b> .
last_change	timestamp(0) without time zone	Not supported. Its value is <b>NULL</b> .
invalid	character varying(7)	Not supported. Its value is <b>NULL</b> .
view_related	character varying(14)	Not supported. Its value is <b>NULL</b> .
origin_con_id	character varying(256)	Not supported. Its value is <b>NULL</b> .

### 12.3.11 ADM\_DATA\_FILES

ADM\_DATA\_FILES displays the description of database files. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in both PG\_CATALOG and SYS schema.

**Table 12-117** ADM\_DATA\_FILES columns

Name	Type	Description
tablespace_name	name	Name of the tablespace to which a file belongs
bytes	double precision	Length of a file, in bytes

### 12.3.12 ADM\_DEPENDENCIES

ADM\_DEPENDENCIES displays the dependency relationships between types, tables, views, stored procedures, functions, and triggers in the database. By default, only the system administrator can access this view. Common users can

access the view only after being authorized. This view exists in both PG\_CATALOG and SYS schema.

**Table 12-118** ADM\_DEPENDENCIES columns

Name	Type	Description
owner	name	Object owner.
name	name	Object name.
type	character varying(18)	Object type.
referenced_owner	name	Owner of the referenced object.
referenced_name	name	Name of the referenced object.
referenced_type	character varying(18)	Type of the referenced object.
referenced_link_name	character varying(128)	Not supported. Its value is <b>NULL</b> .
dependency_type	character varying(4)	Not supported. Its value is <b>NULL</b> .

### 12.3.13 ADM\_DIRECTORIES

ADM\_DIRECTORIES displays all directory objects in the database. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in both PG\_CATALOG and SYS schema.

**Table 12-119** ADM\_DIRECTORIES columns

Name	Type	Description
owner	oid	Directory owner
directory_name	name	Directory name
directory_path	text	OS path name of a directory.
origin_con_id	character varying(256)	Not supported. Its value is <b>NULL</b> .

### 12.3.14 ADM\_HIST\_SNAPSHOT

ADM\_HIST\_SNAPSHOT records the WDR snapshot data stored in the current system. By default, only the system administrator can access this view. Common

users can access the view only after being authorized. This view exists in both PG\_CATALOG and SYS schema. This view can be accessed only when the GUC parameter **enable\_wdr\_snapshot** is set to **on**. To access the PG\_CATALOG.ADM\_HIST\_SNAPSHOT and SYS.ADM\_HIST\_SNAPSHOT views, you must have the permission to access the **snapshot schema**, **snapshot**, and **tables\_snap\_timestamp** tables.

**Table 12-120** ADM\_HIST\_SNAPSHOT columns

Name	Type	Description
snap_id	bigint	Unique snapshot ID.
dbid	oid	Database ID of the snapshot.
instance_number	oid	Not supported. The value is the same as that of DBID.
startup_time	timestamp(3) without time zone	Instance start time.
begin_interval_time	timestamp without time zone	Start time of the snapshot interval (the end time of the last snapshot).
end_interval_time	timestamp without time zone	End time of the snapshot interval. Actual time when the snapshot is taken (that is, the end time of the snapshot).
flush_elapsed	interval	Amount of time to perform the snapshot.
snap_level	numeric	Not supported. Its value is <b>NULL</b> .
error_count	numeric	Not supported. Its value is <b>NULL</b> .
snap_flag	numeric	Not supported. Its value is <b>NULL</b> .
snap_timezone	interval day to second(0)	Time offset between the snapshot time zone and the coordinated universal time (UTC).
begin_interval_time_tz	timestamp with time zone	Start time of the snapshot interval with the time zone (end time of the last snapshot).
end_interval_time_tz	timestamp with time zone	End time of the snapshot interval. Actual time when the snapshot is taken (that is, the end time of the snapshot), with the time zone.
con_id	numeric	Not supported. Its value is <b>0</b> .

### 12.3.15 ADM\_HIST\_SQL\_PLAN

ADM\_HIST\_SQL\_PLAN displays plan information collected by the current user by running the **EXPLAIN PLAN** statement. By default, only the system administrator

can access this view. Common users can access the view only after being authorized. This view exists in both PG\_CATALOG and SYS schema.

**Table 12-121** ADM\_HIST\_SQL\_PLAN columns

Name	Type	Description
dbid	text	Database ID.
sql_id	character varying(30)	Session that inserts the data. Its value consists of a service thread start timestamp and a service thread ID. Values are constrained by <b>NOT NULL</b> .
id	integer	Number assigned to each step in the execution plan.
plan_hash_value	bigint	Query ID.
operation	character varying(30)	Operation description.
options	character varying(255)	Operation option.
object_name	name	Name of the operated object. It is defined by users.
object_node	character varying(128)	Not supported. Its value is <b>NULL</b> .
object#	numeric	Not supported. Its value is <b>NULL</b> .
object_owner	name	Object number of a table or an index.
object_alias	character varying(261)	Not supported. Its value is <b>NULL</b> .
object_type	character varying(30)	Object type.
optimizer	character varying(20)	Not supported. Its value is <b>NULL</b> .
parent_id	numeric	Not supported. Its value is <b>NULL</b> .
depth	numeric	Not supported. Its value is <b>NULL</b> .
position	numeric	Not supported. Its value is <b>NULL</b> .
search_columns	numeric	Not supported. Its value is <b>NULL</b> .
cost	double precision	Execution cost estimated by the optimizer for an operator.

Name	Type	Description
cardinality	double precision	Cardinality estimated by the optimizer for an operator to access table records.
bytes	numeric	Not supported. Its value is <b>NULL</b> .
other_tag	character varying(35)	Not supported. Its value is <b>NULL</b> .
partition_start	character varying(64)	Not supported. Its value is <b>NULL</b> .
partition_stop	character varying(64)	Not supported. Its value is <b>NULL</b> .
partition_id	numeric	Not supported. Its value is <b>NULL</b> .
other	character varying(4000)	Not supported. Its value is <b>NULL</b> .
distribution	character varying(20)	Not supported. Its value is <b>NULL</b> .
cpu_cost	numeric	Not supported. Its value is <b>NULL</b> .
io_cost	numeric	Not supported. Its value is <b>NULL</b> .
temp_space	numeric	Not supported. Its value is <b>NULL</b> .
access_predicates	character varying(4000)	Not supported. Its value is <b>NULL</b> .
filter_predicates	character varying(4000)	Not supported. Its value is <b>NULL</b> .
projection	character varying(4000)	Returned column information.
time	numeric	Not supported. Its value is <b>NULL</b> .
qblock_name	character varying(128)	Not supported. Its value is <b>NULL</b> .
remarks	character varying(4000)	Not supported. Its value is <b>NULL</b> .
timestamp	timestamp(0) without time zone	Not supported. Its value is <b>NULL</b> .
other_xml	clob	Not supported. Its value is <b>NULL</b> .

Name	Type	Description
con_dbid	text	Database ID of a container, which is currently set to a value the same as that of <b>dbid</b> .
con_id	numeric	Container ID. Containers are not supported. Its value is <b>0</b> .

## 12.3.16 ADM\_HIST\_SQLSTAT

ADM\_HIST\_SQLSTAT displays information about statements executed on the current node. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in both PG\_CATALOG and SYS schema.

After the WDR snapshot function is enabled (that is, the GUC parameter **enable\_wdr\_snapshot** is set to **on**), users can view the data in this view.

**Table 12-122** ADM\_HIST\_SQLSTAT columns

Name	Type	Description
instance_number	integer	Instance ID of a snapshot.
sql_id	bigint	Query ID.
plan_hash_value	integer	ID of the normalized SQL statement.
module	integer	Name of the module that is executing when the SQL statement is first parsed.
elapsed_time_delta	bigint	Valid DB time, which is accumulated if multiple threads are involved (unit: $\mu$ s).
cpu_time_delta	bigint	CPU time (unit: $\mu$ s).
executions_delta	bigint	Increment in the number of executions that have occurred on this object since it was brought into the cache.
iowait_delta	bigint	I/O time (unit: $\mu$ s).
apwait_delta	integer	Delta value of the application wait time.
rows_processed_delta	bigint	Number of rows in the result set returned by the SELECT statement.
snap_id	bigint	Unique snapshot ID.
parsing_schema_name	character varying	Not supported. Its value is <b>NULL</b> .

Name	Type	Description
disk_reads_delta	bigint	Not supported. Its value is <b>NULL</b> .
buffer_reads_delta	bigint	Not supported. Its value is <b>NULL</b> .
clwait_delta	bigint	Not supported. Its value is <b>NULL</b> .

### 12.3.17 ADM\_HIST\_SQLTEXT

ADM\_HIST\_SQLTEXT displays information about statements executed on the current node. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in both PG\_CATALOG and SYS schema.

After the WDR snapshot function is enabled (that is, the GUC parameter **enable\_wdr\_snapshot** is set to **on**), users can view the data in this view.

**Table 12-123** ADM\_HIST\_SQLTEXT columns

Name	Type	Description
dbid	integer	Database ID.
sql_id	bigint	Query ID.
sql_text	clob	Text corresponding to the query.
command_type	integer	Not supported. Its value is <b>0</b> .
con_dbid	integer	Database ID of a container, which is currently set to a value the same as that of <b>dbid</b> .
con_id	integer	Container ID. Containers are not supported. Its value is <b>0</b> .

### 12.3.18 ADM\_IND\_COLUMNS

ADM\_IND\_COLUMNS displays information about index columns in the database. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in both PG\_CATALOG and SYS schema.

**Table 12-124** ADM\_IND\_COLUMNS columns

Name	Type	Description
index_owner	character varying(64)	Index owner.
index_name	character varying(64)	Index name.
table_owner	character varying(64)	Table owner.
table_name	character varying(64)	Table name.
column_name	name	Column name.
column_position	smallint	Position of a column in an index.
column_length	numeric	Length of the column. For the variable-length type, its value is <b>NULL</b> .
char_length	numeric	Maximum length of a column, in bytes.
descend	character varying	Specifies whether columns are sorted in descending ( <b>DESC</b> ) or ascending ( <b>ASC</b> ) order.
collated_column_id	numeric	Not supported. Its value is <b>NULL</b> .

## 12.3.19 ADM\_IND\_EXPRESSIONS

ADM\_IND\_EXPRESSIONS displays information about expression indexes in the database. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in both PG\_CATALOG and SYS schema.

**Table 12-125** ADM\_IND\_EXPRESSIONS columns

Name	Type	Description
table_owner	character varying(64)	Table owner.
table_name	character varying(64)	Table name.
index_owner	character varying(64)	Index owner.
index_name	character varying(64)	Index name.
column_expression	text	Function-based index expression of a specified column.

Name	Type	Description
column_position	smallint	Position of a column in an index.

## 12.3.20 ADM\_IND\_PARTITIONS

ADM\_IND\_PARTITIONS displays the partition information about local indexes of level-1 partitioned table in the database. Each local index partition of level-1 index partitioned table in the database (if any) has a row of records in ADM\_IND\_PARTITIONS. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in both PG\_CATALOG and SYS schema.

**Table 12-126** ADM\_IND\_PARTITIONS columns

Name	Type	Description
index_owner	character varying(64)	Owner name of the partitioned table index to which an index partition belongs.
index_name	character varying(64)	Index name of the partitioned table index to which an index partition belongs.
partition_name	character varying(64)	Name of an index partition.
def_tablespace_name	name	Tablespace name of an index partition.
high_value	text	Upper limit of the partition corresponding to the index partition. <ul style="list-style-type: none"> <li>• For range partitioning and interval partitioning, the upper limit of each partition is displayed.</li> <li>• For list partitioning, the value list of each partition is displayed.</li> <li>• For hash partitioning, the number of each partition is displayed.</li> </ul>

Name	Type	Description
index_partition_usable	boolean	Specifies whether an index partition is available. <ul style="list-style-type: none"> <li>• <b>t</b> (true): yes.</li> <li>• <b>f</b> (false): no.</li> </ul>
schema	character varying(64)	Schema of the partitioned table index to which an index partition belongs.
high_value_length	integer	Character length of the limit of the partition corresponding to an index partition.
composite	character varying(3)	Specifies whether the index is a local index on the level-2 partitioned table. This table does not store level-2 partition information. Therefore, the value is <b>NO</b> .
subpartition_count	numeric	Number of level-2 partitions in a partition. The value is <b>0</b> because this table does not store level-2 partition information.
partition_position	numeric	Position of an index partition in the index.
status	character varying(8)	Specifies whether the index partition is available.
tablespace_name	name	Name of the tablespace that contains the partition.
pct_free	numeric	Minimum percentage of available space in a block.
ini_trans	numeric	Initial number of transactions. The default value is <b>4</b> . The value is <b>NULL</b> for non-Ustore partitioned tables.

Name	Type	Description
max_trans	numeric	Maximum number of transactions. The default value is <b>128</b> . The value is <b>NULL</b> for non-Ustore partitioned tables.
initial_extent	numeric	Not supported. Its value is <b>NULL</b> .
next_extent	numeric	Not supported. Its value is <b>NULL</b> .
min_extent	numeric	Not supported. Its value is <b>NULL</b> .
max_extent	numeric	Not supported. Its value is <b>NULL</b> .
max_size	numeric	Not supported. Its value is <b>NULL</b> .
pct_increase	numeric	Not supported. Its value is <b>NULL</b> .
freelists	numeric	Not supported. Its value is <b>NULL</b> .
freelist_groups	numeric	Not supported. Its value is <b>NULL</b> .
logging	character varying(7)	Specifies whether changes to an index are recorded.
compression	character varying(13)	Specifies whether an index compression is enabled for a partitioned index.
blevel	numeric	Not supported. Its value is <b>NULL</b> .
leaf_blocks	numeric	Not supported. Its value is <b>NULL</b> .
distinct_keys	numeric	Not supported. Its value is <b>NULL</b> .
avg_leaf_blocks_per_key	numeric	Not supported. Its value is <b>NULL</b> .
avg_data_blocks_per_key	numeric	Not supported. Its value is <b>NULL</b> .

Name	Type	Description
clustering_factor	numeric	Sequence of a row in the table based on the index value. You need to run the analyze command to collect statistics.
num_rows	numeric	Number of rows in a partition. You need to run the vacuum command to collect statistics.
sample_size	numeric	Not supported. Its value is <b>NULL</b> .
last_analyzed	timestamp with time zone	Last date when the partition was analyzed.
buffer_pool	character varying(7)	Actual buffer pool of a partition.
flash_cache	character varying(7)	Not supported. Its value is <b>NULL</b> .
cell_flash_cache	character varying(7)	Not supported. Its value is <b>NULL</b> .
user_stats	character varying(3)	Not supported. Its value is <b>NULL</b> .
pct_direct_access	numeric	Not supported. Its value is <b>NULL</b> .
global_stats	character varying(3)	Not supported. Its value is <b>NULL</b> .
domidx_opstatus	character varying(6)	Not supported. Its value is <b>NULL</b> .
parameters	character varying(1000)	Not supported. Its value is <b>NULL</b> .
interval	character varying(3)	Specifies whether the partition is a partition in an interval partitioned table.
segment_created	character varying(3)	Specifies whether an index partition segment has been created.
orphaned_entries	character varying(3)	Not supported. Its value is <b>NULL</b> .

## 12.3.21 ADM\_IND\_SUBPARTITIONS

ADM\_IND\_SUBPARTITIONS displays the partition information about local indexes of level-2 partitioned table in the database (excluding global indexes on partitioned tables). Each local index partition of level-2 index partitioned table in the database (if any) has a row of records in ADM\_IND\_SUBPARTITIONS. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in both PG\_CATALOG and SYS schema.

**Table 12-127** ADM\_IND\_SUBPARTITIONS columns

Name	Type	Description
index_owner	character varying(64)	Owner name of the partitioned table index to which an index partition belongs.
index_name	character varying(64)	Index name of the partitioned table index to which an index partition belongs.
partition_name	character varying(64)	Name of the level-1 partition where an index is located.
subpartition_name	character varying(64)	Name of the level-2 partition where an index is located.
def_tablespace_name	name	Tablespace name of an index partition.
high_value	text	Limit of the partition corresponding to an index partition. <ul style="list-style-type: none"> <li>For range partitioning and interval partitioning, the upper limit of each partition is displayed.</li> <li>For list partitioning, the value list of each partition is displayed.</li> <li>For hash partitioning, the number of each partition is displayed.</li> </ul>

Name	Type	Description
index_partition_usable	boolean	Specifies whether an index partition is available. <ul style="list-style-type: none"> <li>• <b>t</b> (true): yes.</li> <li>• <b>f</b> (false): no.</li> </ul>
schema	character varying(64)	Schema of the partitioned table index to which an index partition belongs.
high_value_length	integer	Character length of the limit of the partition corresponding to an index partition.
partition_position	numeric	Position of an index partition in the index.
subpartition_position	numeric	Position of the level-2 partition in the partition.
status	character varying(8)	Specifies whether the index partition is available.
tablespace_name	name	Tablespace name of an index partition.
pct_free	numeric	Minimum percentage of available space in a block.
ini_trans	numeric	Initial number of transactions. The default value is <b>4</b> . The value is <b>NULL</b> for non-Ustore partitioned tables.
max_trans	numeric	Maximum number of transactions. The default value is <b>128</b> . The value is <b>NULL</b> for non-Ustore partitioned tables.
initial_extent	numeric	Not supported. Its value is <b>NULL</b> .
next_extent	numeric	Not supported. Its value is <b>NULL</b> .
min_extent	numeric	Not supported. Its value is <b>NULL</b> .

Name	Type	Description
max_extent	numeric	Not supported. Its value is <b>NULL</b> .
max_size	numeric	Not supported. Its value is <b>NULL</b> .
pct_increase	numeric	Not supported. Its value is <b>NULL</b> .
freelists	numeric	Not supported. Its value is <b>NULL</b> .
freelist_groups	numeric	Not supported. Its value is <b>NULL</b> .
logging	character varying(7)	Specifies whether changes to an index are recorded.
compression	character varying(13)	Compression type used for level-2 partitions.
blevel	numeric	Not supported. Its value is <b>NULL</b> .
leaf_blocks	numeric	Not supported. Its value is <b>NULL</b> .
distinct_keys	numeric	Not supported. Its value is <b>NULL</b> .
avg_leaf_blocks_per_key	numeric	Not supported. Its value is <b>NULL</b> .
avg_data_blocks_per_key	numeric	Not supported. Its value is <b>NULL</b> .
clustering_factor	numeric	Sequence of a row in the table based on the value of the index. You need to run the analyze command to collect statistics.
num_rows	numeric	Number of rows in a level-2 partition. You need to run the vacuum command to collect statistics.
sample_size	numeric	Not supported. Its value is <b>NULL</b> .
last_analyzed	timestamp with time zone	Last date when the partition was analyzed.

Name	Type	Description
buffer_pool	character varying(7)	Buffer pool of a level-2 partition.
flash_cache	character varying(7)	Not supported. Its value is <b>NULL</b> .
cell_flash_cache	character varying(7)	Not supported. Its value is <b>NULL</b> .
user_stats	character varying(3)	Not supported. Its value is <b>NULL</b> .
global_stats	character varying(3)	Not supported. Its value is <b>NULL</b> .
interval	character varying(3)	Specifies whether the partition is a partition in an interval partitioned table.
segment_created	character varying(3)	Specifies whether an index partition segment has been created.
domidx_opstatus	character varying(6)	Not supported. Its value is <b>NULL</b> .
parameters	character varying(1000)	Not supported. Its value is <b>NULL</b> .

## 12.3.22 ADM\_INDEXES

ADM\_INDEXES displays all indexes in the database. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in both PG\_CATALOG and SYS schema.

**Table 12-128** ADM\_INDEXES columns

Name	Type	Description
owner	character varying(64)	Index owner.
index_name	character varying(64)	Index name.
table_name	character varying(64)	Name of a table corresponding to an index.

Name	Type	Description
uniqueness	text	Specifies whether the index is unique. <ul style="list-style-type: none"> <li>• <b>UNIQUE</b>: unique index.</li> <li>• <b>NONUNIQUE</b>: non-unique index.</li> </ul>
partitioned	character(3)	Specifies whether the index has the property of partitioned tables. <ul style="list-style-type: none"> <li>• <b>Yes</b>: The index has the property of a partitioned table.</li> <li>• <b>No</b>: The index does not have the property of a partitioned table.</li> </ul>
generated	character varying(1)	Specifies whether the name of the index is generated by the system. <ul style="list-style-type: none"> <li>• <b>y</b>: The index name is generated by the system.</li> <li>• <b>n</b>: The index name is not generated by the system.</li> </ul>
index_type	character varying(27)	Index type. <ul style="list-style-type: none"> <li>• <b>NORMAL</b>: Index attributes are simple references, and the expression tree is empty.</li> <li>• <b>FUNCTION-BASED NORMAL</b>: Expression trees are used for index attributes that are not simple column references.</li> </ul>
table_owner	character varying(128)	Owner of an index object.
table_type	character(11)	Type of an index object. <ul style="list-style-type: none"> <li>• <b>TABLE</b>: The index object is of the table type.</li> </ul>

Name	Type	Description
tablespace_name	character varying(30)	Name of a tablespace that contains the index.
status	character varying(8)	Status of a non-partitioned index. <ul style="list-style-type: none"> <li>• <b>VALID</b>: Non-partitioned indexes can be used for query.</li> <li>• <b>UNUSABLE</b>: The non-partitioned index is unavailable.</li> <li>• <b>N/A</b>: The index has the property of a partitioned table.</li> </ul>
compression	character varying(13)	Not supported. Its value is <b>NULL</b> .
prefix_length	numeric	Not supported. Its value is <b>NULL</b> .
ini_trans	numeric	Not supported. Its value is <b>NULL</b> .
max_trans	numeric	Not supported. Its value is <b>NULL</b> .
initial_extent	numeric	Not supported. Its value is <b>NULL</b> .
next_extent	numeric	Not supported. Its value is <b>NULL</b> .
min_extents	numeric	Not supported. Its value is <b>NULL</b> .
max_extents	numeric	Not supported. Its value is <b>NULL</b> .
pct_increase	numeric	Not supported. Its value is <b>NULL</b> .
pct_threshold	numeric	Not supported. Its value is <b>NULL</b> .
include_column	numeric	Not supported. Its value is <b>NULL</b> .
freelists	numeric	Not supported. Its value is <b>NULL</b> .
freelist_groups	numeric	Not supported. Its value is <b>NULL</b> .

Name	Type	Description
pct_free	numeric	Not supported. Its value is <b>NULL</b> .
logging	character varying(3)	Not supported. Its value is <b>NULL</b> .
blevel	numeric	Not supported. Its value is <b>NULL</b> .
leaf_blocks	numeric	Not supported. Its value is <b>NULL</b> .
distinct_keys	numeric	Not supported. Its value is <b>NULL</b> .
avg_leaf_blocks_per_key	numeric	Not supported. Its value is <b>NULL</b> .
avg_data_blocks_per_key	numeric	Not supported. Its value is <b>NULL</b> .
clustering_factor	numeric	Not supported. Its value is <b>NULL</b> .
num_rows	numeric	Not supported. Its value is <b>NULL</b> .
sample_size	numeric	Not supported. Its value is <b>NULL</b> .
last_analyzed	timestamp(0) without time zone	Not supported. Its value is <b>NULL</b> .
degree	character varying(40)	Not supported. Its value is <b>NULL</b> .
instances	character varying(40)	Not supported. Its value is <b>NULL</b> .
temporary	character varying(1)	Not supported. Its value is <b>NULL</b> .
secondary	character varying(1)	Not supported. Its value is <b>NULL</b> .
buffer_pool	character varying(7)	Not supported. Its value is <b>NULL</b> .
flash_cache	character varying(7)	Not supported. Its value is <b>NULL</b> .
cell_flash_cache	character varying(7)	Not supported. Its value is <b>NULL</b> .
user_stats	character varying(3)	Not supported. Its value is <b>NULL</b> .

Name	Type	Description
duration	character varying(15)	Not supported. Its value is <b>NULL</b> .
pct_direct_access	numeric	Not supported. Its value is <b>NULL</b> .
ityp_owner	character varying(128)	Not supported. Its value is <b>NULL</b> .
ityp_name	character varying(128)	Not supported. Its value is <b>NULL</b> .
parameters	character varying(1000)	Not supported. Its value is <b>NULL</b> .
global_stats	character varying(3)	Not supported. Its value is <b>NULL</b> .
domidx_status	character varying(12)	Not supported. Its value is <b>NULL</b> .
domidx_opstatus	character varying(6)	Not supported. Its value is <b>NULL</b> .
funcidx_status	character varying(8)	Not supported. Its value is <b>NULL</b> .
join_index	character varying(3)	Not supported. Its value is <b>NULL</b> .
iot_redundant_pkey_elim	character varying(3)	Not supported. Its value is <b>NULL</b> .
dropped	character varying(3)	Not supported. Its value is <b>NULL</b> .
visibility	character varying(9)	Not supported. Its value is <b>NULL</b> .
domidx_management	character varying(14)	Not supported. Its value is <b>NULL</b> .
segment_created	character varying(3)	Not supported. Its value is <b>NULL</b> .
orphaned_entries	character varying(3)	Not supported. Its value is <b>NULL</b> .
indexing	character varying(7)	Not supported. Its value is <b>NULL</b> .
auto	character varying(3)	Not supported. Its value is <b>NULL</b> .

## 12.3.23 ADM\_OBJECTS

ADM\_OBJECTS displays all database objects in the database. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in both PG\_CATALOG and SYS schema.

**Table 12-129** ADM\_OBJECTS columns

Name	Type	Description
owner	name	Object owner.
object_name	name	Object name.
object_id	oid	Object OID.
object_type	name	Object type. For example, table, schema, and index.
namespace	oid	Namespace containing an object.
temporary	character(1) )	Specifies whether an object is a temporary object.
status	character varying(7)	Object status. <ul style="list-style-type: none"><li>• <b>valid</b></li><li>• <b>invalid</b></li></ul>
subobject_name	name	Subobject name of an object.
generated	character(1) )	Specifies whether an object name is generated by the system.
created	timestamp with time zone	Creation time of an object.
last_ddl_time	timestamp with time zone	Last modification time of an object.
default_collation	character varying(10 0)	Default collation of objects.
data_object_id	numeric	Not supported. Its value is <b>NULL</b> .
timestamp	character varying(19)	Not supported. Its value is <b>NULL</b> .
secondary	character varying(1)	Not supported. Its value is <b>NULL</b> .
edition_name	character varying(12 8)	Not supported. Its value is <b>NULL</b> .

Name	Type	Description
sharing	character varying(18)	Not supported. Its value is <b>NULL</b> .
editionable	character varying(1)	Not supported. Its value is <b>NULL</b> .
oracle_maintained	character varying(1)	Not supported. Its value is <b>NULL</b> .
application	character varying(1)	Not supported. Its value is <b>NULL</b> .
duplicated	character varying(1)	Not supported. Its value is <b>NULL</b> .
sharded	character varying(1)	Not supported. Its value is <b>NULL</b> .
created_appid	numeric	Not supported. Its value is <b>NULL</b> .
modified_appid	numeric	Not supported. Its value is <b>NULL</b> .
created_vsnid	numeric	Not supported. Its value is <b>NULL</b> .
modified_vsnid	numeric	Not supported. Its value is <b>NULL</b> .

#### NOTICE

For details about the value ranges of **created** and **last\_ddl\_time**, see [PG\\_OBJECT](#).

## 12.3.24 ADM\_PART\_COL\_STATISTICS

ADM\_PART\_COL\_STATISTICS displays the column statistics and histogram information about all table partitions in the database. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in both PG\_CATALOG and SYS schema.

**Table 12-130** ADM\_PART\_COL\_STATISTICS columns

Name	Type	Description
owner	character varying(128)	Owner of the partitioned table.
table_name	character varying(128)	Table name.
partition_name	character varying(128)	Table partition name.
column_name	character varying(4000)	Column name.

Name	Type	Description
num_distinct	numeric	Not supported. Its value is <b>NULL</b> .
low_value	raw	Not supported. Its value is <b>NULL</b> .
high_value	raw	Not supported. Its value is <b>NULL</b> .
density	numeric	Not supported. Its value is <b>NULL</b> .
num_nulls	numeric	Not supported. Its value is <b>NULL</b> .
num_buckets	numeric	Not supported. Its value is <b>NULL</b> .
sample_size	numeric	Not supported. Its value is <b>NULL</b> .
last_analyzed	date	Not supported. Its value is <b>NULL</b> .
global_stats	character varying(3)	Not supported. Its value is <b>NULL</b> .
user_stats	character varying(3)	Not supported. Its value is <b>NULL</b> .
notes	character varying(63)	Not supported. Its value is <b>NULL</b> .
avg_col_len	numeric	Not supported. Its value is <b>NULL</b> .
histogram	character varying(15)	Not supported. Its value is <b>NULL</b> .
schema	character varying(64)	Name of the namespace to which the column belongs.

### 12.3.25 ADM\_PART\_INDEXES

ADM\_PART\_INDEXES stores information about all partitioned table indexes (excluding global indexes of partitioned tables) in the database. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in both PG\_CATALOG and SYS schema.

**Table 12-131** ADM\_PART\_INDEXES columns

Name	Type	Description
def_tablespace_name	name	Tablespace name of a partitioned table index.
index_owner	character varying(64)	Owner name of a partitioned table index.
index_name	character varying(64)	Name of a partitioned table index.
partition_count	bigint	Number of index partitions of a partitioned table index.
partitioning_key_count	integer	Number of partition keys of the partitioned table.
partitioning_type	text	Partitioning policy of the partitioned table. <b>NOTE</b> For details about the supported partitioning policies of the current partitioned table, see <a href="#">CREATE TABLE PARTITION</a> .
schema	character varying(64)	Name of the schema to which a partitioned table index belongs.
table_name	character varying(64)	Name of the partitioned table to which a partitioned table index belongs.
subpartitioning_type	text	Partitioning policy of a level-2 partitioned table. If the partitioned table is a level-1 partitioned table, <b>NONE</b> is displayed. <b>NOTE</b> For details about the supported partitioning policies of the current level-2 partitioned table, see <a href="#">CREATE TABLE SUBPARTITION</a> .
def_subpartition_count	integer	Default number of level-2 partitions to be created. The value is <b>1</b> for level-2 partition tables and <b>0</b> for level-1 partition tables.
subpartitioning_key_count	integer	Number of level-2 partition keys of the partitioned table.

## 12.3.26 ADM\_PART\_TABLES

ADM\_PART\_TABLES displays information about all partitioned tables in the database. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in both PG\_CATALOG and SYS schema.

**Table 12-132** ADM\_PART\_TABLES columns

Name	Type	Description
table_owner	character varying(64)	Owner name of a partitioned table.
table_name	character varying(64)	Name of the partitioned table.
partitioning_type	text	Partitioning policy of the partitioned table. <b>NOTE</b> For details about the supported partitioning policies of the current partitioned table, see <a href="#">CREATE TABLE PARTITION</a> .
partition_count	bigint	Number of partitions of the partitioned table.
partitioning_key_count	integer	Number of partition keys of the partitioned table.
def_tablespace_name	name	Tablespace name of the partitioned table.
schema	character varying(64)	Schema of the partitioned table.
subpartitioning_type	text	Partitioning policy of a level-2 partitioned table. If the partitioned table is a level-1 partitioned table, <b>NONE</b> is displayed. <b>NOTE</b> For details about the supported partitioning policies of the current level-2 partitioned table, see <a href="#">CREATE TABLE SUBPARTITION</a> .
def_subpartition_count	integer	Default number of level-2 partitions to be created. The value is <b>1</b> for a level-2 partitioned table and <b>0</b> for a level-1 partitioned table.

Name	Type	Description
subpartitioning_key_count	integer	Number of level-2 partition keys of the partitioned table.
status	character varying(8)	Not supported. Its value is <b>valid</b> .
def_pct_free	numeric	Default value of <b>PCTFREE</b> used when a partition is added.
def_pct_used	numeric	Not supported. Its value is <b>NULL</b> .
def_ini_trans	numeric	Default value of <b>INITRANS</b> used when a partition is added.
def_max_trans	numeric	Default value of <b>MAXTRANS</b> used when a partition is added.
def_initial_extent	character varying(40)	Not supported. Its value is <b>NULL</b> .
def_next_extent	character varying(40)	Not supported. Its value is <b>NULL</b> .
def_min_extents	character varying(40)	Not supported. Its value is <b>NULL</b> .
def_max_extents	character varying(40)	Not supported. Its value is <b>NULL</b> .
def_max_size	character varying(40)	Not supported. Its value is <b>NULL</b> .
def_pct_increase	character varying(40)	Not supported. Its value is <b>NULL</b> .
def_freelists	numeric	Not supported. Its value is <b>NULL</b> .
def_freelist_groups	numeric	Not supported. Its value is <b>NULL</b> .
def_logging	character varying(7)	Not supported. Its value is <b>NULL</b> .
def_compression	character varying(8)	Default compression mode used when a partition is added. Value range: <ul style="list-style-type: none"> <li>● <b>NONE</b></li> <li>● <b>ENABLED</b></li> <li>● <b>DISABLED</b></li> </ul>

Name	Type	Description
def_compress_for	character varying(30)	Default compression mode used when a partition is added. <b>NOTE</b> For available compression modes and compression levels, see <a href="#">WITH ( { storage_paramet...</a>
def_buffer_pool	character varying(7)	Not supported. Its value is <b>DEFAULT</b> .
def_flash_cache	character varying(7)	Not supported. Its value is <b>NULL</b> .
def_cell_flash_cache	character varying(7)	Not supported. Its value is <b>NULL</b> .
ref_ptn_constraint_name	character varying(128)	Not supported. Its value is <b>NULL</b> .
interval	character varying(1000)	Interval.
autolist	character varying(3)	Not supported. Its value is <b>NO</b> .
interval_subpartition	character varying(1000)	Not supported. Its value is <b>NULL</b> .
autolist_subpartition	character varying(3)	Not supported. Its value is <b>NO</b> .
is_nested	character varying(3)	Not supported. Its value is <b>NO</b> .
def_segment_creation	character varying(4)	Currently, the segment page mode is not supported. When the segment page mode is enabled, set it to <b>YES</b> .
def_indexing	character varying(3)	Not supported. Its value is <b>ON</b> .
def_inmemory	character varying(8)	Not supported. Its value is <b>NONE</b> .
def_inmemory_priority	character varying(8)	Not supported. Its value is <b>NULL</b> .
def_inmemory_distribute	character varying(15)	Not supported. Its value is <b>NULL</b> .
def_inmemory_compression	character varying(17)	Not supported. Its value is <b>NULL</b> .
def_inmemory_duplicate	character varying(13)	Not supported. Its value is <b>NULL</b> .
def_read_only	character varying(3)	Not supported. Its value is <b>NO</b> .

Name	Type	Description
def_cellmemory	character varying(24)	Not supported. Its value is <b>NULL</b> .
def_inmemory_service	character varying(12)	Not supported. Its value is <b>NULL</b> .
def_inmemory_service_name	character varying(1000)	Not supported. Its value is <b>NULL</b> .

## 12.3.27 ADM\_PROCEDURES

ADM\_PROCEDURES displays information about all stored procedures, functions, and triggers in the database. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in both PG\_CATALOG and SYS schema.

**Table 12-133** ADM\_PROCEDURES columns

Name	Type	Description
owner	character varying(64)	Owner of a stored procedure, function, trigger, or package.
object_name	character varying(64)	Name of a stored procedure, function, or trigger. This column will be a package name if the object is a function in a package or a stored procedure.
procedure_name	character varying(128)	This column will be the name of a function or stored procedure in a package if <b>object_name</b> is a package name. Otherwise, the column is empty.
object_id	oid	OID of a stored procedure, function, trigger, or package.
subprogram_id	numeric	Location of a function or stored procedure (if any) in a package. In other cases, this column is left blank.
overload	character varying(40)	<i>n</i> th overloaded function of the name.
object_type	character varying(13)	Object type name.

Name	Type	Description
aggregate	character varying(3)	Specifies whether the function is an aggregate function: <ul style="list-style-type: none"> <li>• <b>YES</b></li> <li>• <b>NO</b></li> </ul>
pipelined	character varying(3)	Not supported. Its value is <b>NO</b> .
impltypeowner	character varying(128)	Owner of an implementation type.
impltypename	character varying(128)	Name of an implementation type.
parallel	character varying(3)	Not supported. Its value is <b>NO</b> .
interface	character varying(3)	Not supported. Its value is <b>NO</b> .
deterministic	character varying(3)	Not supported. Its value is <b>NO</b> .
authid	character varying(12)	Specifies whether to use the creator permission or caller permission: <ul style="list-style-type: none"> <li>• <b>DEFINER</b>: The creator permission is used.</li> <li>• <b>CURRENT_USER</b>: The caller permission is used.</li> </ul> This column conflicts with reserved keywords. Therefore, add the view name when calling this column.
result_cache	character varying(3)	Not supported. Its value is <b>NULL</b> .
origin_con_id	character varying(256)	Not supported. Its value is <b>0</b> .
polymorphic	character varying(5)	Not supported. Its value is <b>NULL</b> .
argument_number	smallint	Number of input parameters in a stored procedure.

## 12.3.28 ADM\_RECYCLEBIN

ADM\_RECYCLEBIN displays information about all recycle bins. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in both PG\_CATALOG and SYS schema.

**Table 12-134** ADM\_RECYCLEBIN columns

Name	Type	Description
owner	character varying(128)	Original owner name of the object.
object_name	character varying(128)	New name of an object.
original_name	character varying(128)	Original name of an object.
operation	character varying(9)	Operation performed on an object. The options are as follows: <ul style="list-style-type: none"> <li>● <b>DROP</b>: The object has been dropped (the object is no longer needed).</li> <li>● <b>TRUNCATE</b>: The object is truncated.</li> </ul>
type	character varying(25)	Object type.
ts_name	character varying(30)	Name of the tablespace to which the object belongs.
createtime	character varying(19)	Timestamp when an object is created.
droptime	character varying(19)	Timestamp when an object is deleted.
dropscn	numeric	System change number (SCN) of the transaction that moves an object to the recycle bin.
partition_name	character varying(128)	Name of a deleted partition.
can_undrop	character varying(3)	Specifies whether to flash back an object.

Name	Type	Description
can_purge	character varying(3)	Specifies whether to purge an object.
related	numeric	ID of the parent object.
base_object	numeric	ID of a base object.
purge_object	numeric	ID of the purged object.
space	numeric	Number of blocks used by an object.

### 12.3.29 ADM\_ROLE\_PRIVS

ADM\_ROLE\_PRIVS displays information about roles granted to all users and roles. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in both PG\_CATALOG and SYS schema.

**Table 12-135** ADM\_ROLE\_PRIVS columns

Name	Type	Description
grantee	character varying(128)	Name of the user or role to which the permission is granted.
granted_role	character varying(128)	Name of the role to be granted.
admin_option	character varying(3)	Specifies whether the grant contains the <b>ADMIN</b> option. <ul style="list-style-type: none"> <li>• <b>YES</b></li> <li>• <b>NO</b></li> </ul>
delegate_option	character varying(3)	Not supported. Its value is <b>NULL</b> .
default_role	character varying(3)	Not supported. Its value is <b>NULL</b> .
os_granted	character varying(3)	Not supported. Its value is <b>NULL</b> .
common	character varying(3)	Not supported. Its value is <b>NULL</b> .
inherited	character varying(3)	Not supported. Its value is <b>NULL</b> .

### 12.3.30 ADM\_ROLES

ADM\_ROLES displays information about database roles. By default, only the system administrator can access the system view. This view exists in both PG\_CATALOG and SYS schema.

**Table 12-136** ADM\_ROLES columns

Name	Type	Description
role	character varying(128)	Role name.
role_id	oid	Role ID.
authentication_type	text	Role authentication mechanism. <ul style="list-style-type: none"> <li>• <b>password</b>: Password authentication is required.</li> <li>• <b>NULL</b>: Authentication is not required.</li> </ul>
common	character varying(3)	Not supported. Its value is <b>NULL</b> .
oracle_maintained	character varying(1)	Not supported. Its value is <b>NULL</b> .
inherited	character varying(3)	Not supported. Its value is <b>NULL</b> .
implicit	character varying(3)	Not supported. Its value is <b>NULL</b> .
external_name	character varying(4000)	Not supported. Its value is <b>NULL</b> .

### 12.3.31 ADM\_SCHEDULER\_JOB\_ARGS

ADM\_SCHEDULER\_JOB\_ARG displays parameters related to all jobs in the database. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in both PG\_CATALOG and SYS schema.

**Table 12-137** ADM\_SCHEDULER\_JOB\_ARGS columns

Name	Type	Description
owner	character varying(128)	Owner of the job to which the parameter belongs.
job_name	character varying(128)	Name of the job to which the parameter belongs.
argument_name	character varying(128)	Parameter name.

Name	Type	Description
argument_position	numeric	Position of the parameter in the parameter list.
argument_type	character varying(257)	Data type of a parameter, which can be a user-defined data type.
value	character varying(4000)	Parameter value.
anydata_value	character varying(4000)	Not supported. Its value is <b>NULL</b> .
out_argument	character varying(5)	Reserved column. Its value is <b>NULL</b> .

### 12.3.32 ADM\_SCHEDULER\_JOBS

ADM\_SCHEDULER\_JOBS displays information about all DBE\_SCHEDULER scheduled jobs in the database. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in both PG\_CATALOG and SYS schema.

**Table 12-138** ADM\_SCHEDULER\_JOBS columns

Name	Type	Description
owner	name	Owner of a scheduled job.
job_name	text	Name of a scheduled job.
job_subname	character varying(128)	Not supported. Its value is <b>NULL</b> .
job_style	text	Action mode of a scheduled job. It is specified during creation. Its value can only be " <b>REGULAR</b> ". If this parameter is not specified, the value is <b>NULL</b> .
job_creator	name	Creator of a scheduled job.
client_id	character varying(65)	Not supported. Its value is <b>NULL</b> .
global_uid	character varying(33)	Not supported. Its value is <b>NULL</b> .
program_owner	character varying(4000)	Owner of a program referenced by a scheduled job.

Name	Type	Description
program_name	text	Name of the program referenced by a scheduled job.
job_type	character varying(16)	Inline program type of a scheduled job. The options are as follows: <ul style="list-style-type: none"> <li>• <b>PLSQL_BLOCK</b>: anonymous block of a stored procedure.</li> <li>• <b>STORED_PROCEDURE</b>: stored procedure that is saved.</li> <li>• <b>EXTERNAL_SCRIPT</b>: external script.</li> </ul>
job_action	text	Program content of a scheduled job.
number_of_arguments	text	Number of parameters of a scheduled job.
schedule_owner	character varying(4000)	Not supported. Its value is <b>NULL</b> .
schedule_name	text	Name of the schedule referenced by a scheduled job.
schedule_type	character varying(12)	Not supported. Its value is <b>NULL</b> .
start_date	timestamp without time zone	Start time of a scheduled job.
repeat_interval	text	Period of a scheduled job.
event_queue_owner	character varying(128)	Not supported. Its value is <b>NULL</b> .
event_queue_name	character varying(128)	Not supported. Its value is <b>NULL</b> .
event_queue_agent	character varying(523)	Not supported. Its value is <b>NULL</b> .
event_condition	character varying(4000)	Not supported. Its value is <b>NULL</b> .
event_rule	character varying(261)	Not supported. Its value is <b>NULL</b> .
file_watcher_owner	character varying(261)	Not supported. Its value is <b>NULL</b> .

Name	Type	Description
file_watcher_name	character varying(261)	Not supported. Its value is <b>NULL</b> .
end_date	timestamp without time zone	End time of a scheduled job.
job_class	text	Name of the scheduled job class to which a scheduled job belongs.
enabled	boolean	Status of a scheduled job.
auto_drop	text	Status of the automatic deletion function of a scheduled job.
restart_on_recovery	character varying(5)	Not supported. Its value is <b>NULL</b> .
restart_on_failure	character varying(5)	Not supported. Its value is <b>NULL</b> .
state	"char"	Status of a scheduled job.
job_priority	numeric	Not supported. Its value is <b>NULL</b> .
run_count	numeric	Not supported. Its value is <b>NULL</b> .
uptime_run_count	numeric	Not supported. Its value is <b>NULL</b> .
max_runs	numeric	Not supported. Its value is <b>NULL</b> .
failure_count	smallint	Number of scheduled job failures.
uptime_failure_count	numeric	Not supported. Its value is <b>NULL</b> .
max_failures	numeric	Maximum number of failures allowed before the status of a scheduled job is marked as broken.
retry_count	numeric	Not supported. Its value is <b>NULL</b> .
last_start_date	timestamp without time zone	Last time when a scheduled job was started.
last_run_duration	interval day to second(6)	Last execution duration of a scheduled job.

Name	Type	Description
next_run_date	timestamp without time zone	Next execution time of a scheduled job.
schedule_limit	interval day to second(0)	Not supported. Its value is <b>NULL</b> .
max_run_duration	interval day to second(0)	Not supported. Its value is <b>NULL</b> .
logging_level	character varying(11)	Not supported. Its value is <b>NULL</b> .
store_output	character varying(5)	Specifies whether to store the output information of all scheduled jobs.
stop_on_window_close	character varying(5)	Not supported. Its value is <b>NULL</b> .
instance_stickiness	character varying(5)	Not supported. Its value is <b>NULL</b> .
raise_events	character varying(4000)	Not supported. Its value is <b>NULL</b> .
system	character varying(5)	Not supported. Its value is <b>NULL</b> .
job_weight	numeric	Not supported. Its value is <b>NULL</b> .
nls_env	character varying(4000)	Not supported. Its value is <b>NULL</b> .
source	character varying(128)	Not supported. Its value is <b>NULL</b> .
number_of_destinations	numeric	Not supported. Its value is <b>NULL</b> .
destination_owner	character varying(261)	Not supported. Its value is <b>NULL</b> .
destination	text	Target name of a scheduled job.
credential_owner	character varying(128)	Not supported. Its value is <b>NULL</b> .
credential_name	text	Credential name of a scheduled job.
instance_id	oid	OID of the current database.
deferred_drop	character varying(5)	Not supported. Its value is <b>NULL</b> .

Name	Type	Description
allow_runs_in_restricted_mode	character varying(5)	Not supported. Its value is <b>NULL</b> .
comments	text	Comments of a scheduled job.
flags	numeric	Not supported. Its value is <b>NULL</b> .
restartable	character varying(5)	Not supported. Its value is <b>NULL</b> .
has_constraints	character varying(5)	Not supported. Its value is <b>NULL</b> .
connect_credential_owner	character varying(128)	Not supported. Its value is <b>NULL</b> .
connect_credential_name	character varying(128)	Not supported. Its value is <b>NULL</b> .
fail_on_script_error	character varying(5)	Not supported. Its value is <b>NULL</b> .

### 12.3.33 ADM\_SCHEDULER\_PROGRAM\_ARGS

ADM\_SCHEDULER\_PROGRAM\_ARG displays parameters related to all programs in the database. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in both PG\_CATALOG and SYS schema.

**Table 12-139** ADM\_SCHEDULER\_PROGRAM\_ARGS columns

Name	Type	Description
owner	character varying(128)	Owner of the program to which the parameter belongs.
program_name	character varying(128)	Name of the program to which the parameter belongs.
argument_name	character varying(128)	Parameter name.
argument_position	numeric	Position of the parameter in the parameter list.
argument_type	character varying(257)	Data type of a parameter, which can be a user-defined data type.
metadata_attribute	character varying(19)	Not supported. Its value is <b>NULL</b> .

Name	Type	Description
default_value	character varying(4000)	Default parameter value.
default_anydata_value	character varying(4000)	Not supported. Its value is <b>NULL</b> .
out_argument	character varying(5)	Reserved column. Its value is <b>NULL</b> .

### 12.3.34 ADM\_SCHEDULER\_PROGRAMS

ADM\_SCHEDULER\_PROGRAMS displays information about all programs that can be scheduled in the database. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in both PG\_CATALOG and SYS schema.

**Table 12-140** ADM\_SCHEDULER\_PROGRAMS columns

Name	Type	Description
owner	name	Owner of a scheduler program
program_name	text	Name of a scheduler program
program_type	character varying(16)	Type of the scheduler. The options are as follows: <ul style="list-style-type: none"> <li>• <b>PLSQL_BLOCK</b>: anonymous block of a stored procedure.</li> <li>• <b>STORED_PROCEDURE</b>: stored procedure that is saved.</li> <li>• <b>EXTERNAL_SCRIPT</b>: external script.</li> </ul>
program_action	text	Action performed by a scheduler program
number_of_arguments	numeric	Number of scheduler program parameters
enabled	character varying(5)	Specifies whether a scheduler program is enabled.
comments	text	Comments of a scheduler program

Name	Type	Description
detached	character varying(5)	Not supported. Its value is <b>NULL</b> .
schedule_limit	interval day to second(0)	Not supported. Its value is <b>NULL</b> .
priority	numeric	Not supported. Its value is <b>NULL</b> .
weight	numeric	Not supported. Its value is <b>NULL</b> .
max_runs	numeric	Not supported. Its value is <b>NULL</b> .
max_failures	numeric	Not supported. Its value is <b>NULL</b> .
max_run_duration	interval day to second(0)	Not supported. Its value is <b>NULL</b> .
has_constraints	character varying(5)	Not supported. Its value is <b>NULL</b> .
nls_env	character varying(4000)	Not supported. Its value is <b>NULL</b> .

### 12.3.35 ADM\_SCHEDULER\_RUNNING\_JOBS

ADM\_SCHEDULER\_RUNNING\_JOBS displays information about all DBE\_SCHEDULER jobs that are being executed in the database. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in both PG\_CATALOG and SYS schema.

**Table 12-141** ADM\_SCHEDULER\_RUNNING\_JOBS columns

Name	Type	Description
owner	character varying(128)	Owner of a scheduled job.
job_name	character varying(128)	Name of a scheduled job.
job_subname	character varying(128)	Not supported. Its value is <b>NULL</b> .

Name	Type	Description
job_style	character varying(17)	Style of a scheduled job, which is specified during creation. Its value can only be "REGULAR". If this parameter is not specified, the value is <b>NULL</b> .
detached	character varying(5)	Not supported. Its value is <b>NULL</b> .
session_id	numeric	ID of the session that executes a scheduled job.
slave_process_id	numeric	Not supported. Its value is <b>NULL</b> .
slave_os_process_id	character varying(12)	ID of the process that executes a scheduled job.
running_instance	numeric	Not supported. Its value is <b>NULL</b> .
resource_consumer_group	character varying(32)	Not supported. Its value is <b>NULL</b> .
elapsed_time	interval day to second(2)	Execution duration of a scheduled job.
cpu_used	interval day to second(2)	Not supported. Its value is <b>NULL</b> .
destination_owner	character varying(261)	Not supported. Its value is <b>NULL</b> .
destination	character varying(261)	Target name of a scheduled job.
credential_name	character varying(128)	Credential name of a scheduled job.
credential_owner	character varying(128)	Not supported. Its value is <b>NULL</b> .
log_id	numeric	Not supported. Its value is <b>NULL</b> .

### 12.3.36 ADM\_SEGMENTS

ADM\_SEGMENTS displays the storage space allocated to all segments in the database. It exists in the PG\_CATALOG and SYS schemas. Only the system administrator can access this view.

**Table 12-142** ADM\_SEGMENTS columns

Name	Type	Description
owner	character varying(128)	Not supported. Its value is <b>NULL</b> .
segment_name	character varying(128)	Not supported. Its value is <b>NULL</b> .
partition_name	character varying(128)	Not supported. Its value is <b>NULL</b> .
segment_type	character varying(18)	Not supported. Its value is <b>NULL</b> .
segment_subtype	character varying(10)	Not supported. Its value is <b>NULL</b> .
tablespace_name	character varying(30)	Not supported. Its value is <b>NULL</b> .
header_file	numeric	Not supported. Its value is <b>NULL</b> .
header_block	numeric	Not supported. Its value is <b>NULL</b> .
bytes	numeric	Not supported. Its value is <b>NULL</b> .
blocks	numeric	Not supported. Its value is <b>NULL</b> .
extents	numeric	Not supported. Its value is <b>NULL</b> .
initial_extent	numeric	Not supported. Its value is <b>NULL</b> .
next_extent	numeric	Not supported. Its value is <b>NULL</b> .
min_extents	numeric	Not supported. Its value is <b>NULL</b> .
max_extents	numeric	Not supported. Its value is <b>NULL</b> .
max_size	numeric	Not supported. Its value is <b>NULL</b> .
retention	character varying(7)	Not supported. Its value is <b>NULL</b> .
minretention	numeric	Not supported. Its value is <b>NULL</b> .

Name	Type	Description
pct_increase	numeric	Not supported. Its value is <b>NULL</b> .
freelists	numeric	Not supported. Its value is <b>NULL</b> .
freelist_groups	numeric	Not supported. Its value is <b>NULL</b> .
relative_fno	numeric	Not supported. Its value is <b>NULL</b> .
buffer_pool	character varying(7)	Not supported. Its value is <b>NULL</b> .
flash_cache	character varying(7)	Not supported. Its value is <b>NULL</b> .
cell_flash_cache	character varying(7)	Not supported. Its value is <b>NULL</b> .
inmemory	character varying(8)	Not supported. Its value is <b>NULL</b> .
inmemory_priority	character varying(8)	Not supported. Its value is <b>NULL</b> .
inmemory_distribute	character varying(15)	Not supported. Its value is <b>NULL</b> .
inmemory_duplicate	character varying(13)	Not supported. Its value is <b>NULL</b> .
inmemory_compression	character varying(17)	Not supported. Its value is <b>NULL</b> .
cellmemory	character varying(24)	Not supported. Its value is <b>NULL</b> .

### 12.3.37 ADM\_SEQUENCES

ADM\_SEQUENCES displays information about all sequences in the database. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in both PG\_CATALOG and SYS schema.

**Table 12-143** ADM\_SEQUENCES columns

Name	Type	Description
sequence_owner	character varying(64)	Owner of a sequence.

Name	Type	Description
sequence_name	character varying(64)	Name of the sequence.
min_value	int16	Minimum value of the sequence.
max_value	int16	Maximum value of the sequence.
increment_by	int16	Increment of the sequence.
last_number	int16	Value of the previous sequence.
cache_size	int16	Size of the sequence disk cache.
cycle_flag	character(1)	Specifies whether a sequence is a cyclic sequence. Value range: <ul style="list-style-type: none"><li>• <b>Y</b>: It is a cyclic sequence.</li><li>• <b>N</b>: It is not a cyclic sequence.</li></ul>

### 12.3.38 ADM\_SOURCE

ADM\_SOURCE displays the definition information about all stored procedures, functions, triggers, and packages in the database. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in both PG\_CATALOG and SYS schema.

**Table 12-144** ADM\_SOURCE columns

Name	Type	Description
owner	name	Object owner.
name	name	Object name.
type	name	Object type. Its values can be <b>function</b> , <b>package</b> , <b>package body</b> , <b>procedure</b> , and <b>trigger</b> .
line	numeric	Number of the line in the definition information.
text	text	Text source of the storage object.
origin_con_id	character varying(256)	Not supported. Its value is <b>0</b> .

## 12.3.39 ADM\_SUBPART\_COL\_STATISTICS

ADM\_SUBPART\_COL\_STATISTICS displays the column statistics and histogram information about all level-2 partitions in the database. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in both PG\_CATALOG and SYS schema.

**Table 12-145** ADM\_SUBPART\_COL\_STATISTICS columns

Name	Type	Description
owner	character varying(128)	Table owner.
table_name	character varying(128)	Table name.
subpartition_name	character varying(128)	Name of a level-2 partition.
column_name	character varying(4000)	Column name.
num_distinct	numeric	Not supported. Its value is <b>NULL</b> .
low_value	raw	Not supported. Its value is <b>NULL</b> .
high_value	raw	Not supported. Its value is <b>NULL</b> .
density	numeric	Not supported. Its value is <b>NULL</b> .
num_nulls	numeric	Not supported. Its value is <b>NULL</b> .
num_buckets	numeric	Not supported. Its value is <b>NULL</b> .
sample_size	numeric	Not supported. Its value is <b>NULL</b> .
last_analyzed	timestamp(0) without time zone	Not supported. Its value is <b>NULL</b> .
global_stats	character varying(3)	Not supported. Its value is <b>NULL</b> .
user_stats	character varying(3)	Not supported. Its value is <b>NULL</b> .
notes	character varying(41)	Not supported. Its value is <b>NULL</b> .
avg_col_len	numeric	Not supported. Its value is <b>NULL</b> .
histogram	character varying(15)	Not supported. Its value is <b>NULL</b> .

Name	Type	Description
schema	character varying(64)	Name of the namespace to which the column belongs.

### 12.3.40 ADM\_SUBPART\_KEY\_COLUMNS

ADM\_SUBPART\_KEY\_COLUMNS displays information about the partition key columns of level-2 partitioned tables or partitioned indexes in the database. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in both PG\_CATALOG and SYS schema.

**Table 12-146** ADM\_SUBPART\_KEY\_COLUMNS columns

Name	Type	Description
owner	character varying(128)	Owner of a level-2 partitioned table or index.
name	character varying(128)	Name of a level-2 partitioned table or index.
object_type	character varying(128)	Object type. <ul style="list-style-type: none"> <li>Its value is <b>table</b> for a level-2 partitioned table.</li> <li>Its value is <b>index</b> for a level-2 partitioned index.</li> </ul>
column_name	character varying(4000)	Partition key column name of a level-2 partitioned table or index.
column_position	numeric	Position of a column in a partition.
collated_column_id	numeric	Not supported. Its value is <b>NULL</b> .

### 12.3.41 ADM\_SYNONYMS

ADM\_SYNONYMS displays all synonyms in the database. This view is accessible only to system administrators. This view exists in both PG\_CATALOG and SYS schema.

**Table 12-147** ADM\_SYNONYMS columns

Name	Type	Description
owner	text	Owner of a synonym.
schema_name	text	Name of the schema to which the synonym belongs.

Name	Type	Description
synonym_name	text	Synonym name.
table_owner	text	Owner of the associated object. Although the column is called <b>table_owner</b> , its associated object is not necessarily a table. It can be any common database object, such as a view, stored procedure, or synonym.
table_name	text	Name of the associated object. Although the column is called <b>table_name</b> , its associated object is not necessarily a table. It can be any common database object, such as a view, stored procedure, or synonym.
table_schema_name	text	Schema name of the associated object. Although the column is called <b>table_schema_name</b> , the associated object is not necessarily a table. It can be any common database object, such as a view, stored procedure, or synonym.

### 12.3.42 ADM\_SYS\_PRIVS

ADM\_SYS\_PRIVS displays information about system permissions granted to users and roles. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in both PG\_CATALOG and SYS schema.

**Table 12-148** ADM\_SYS\_PRIVS columns

Name	Type	Description
grantee	character varying(128)	Name of the user or role to which the permission is granted.
privilege	character varying(40)	System permission System permissions include rolsuper, rolinherit, rolcreatorole, rolcreatedb, rolcatupdate, rolcanlogin, rolreplication, rolauditadmin, rolsystemadmin, roluseft, rolmonitoradmin, roloperatoradmin, and rolpolicyadmin.
admin_option	character varying(3)	Specifies whether the grant contains the <b>ADMIN</b> option. <ul style="list-style-type: none"> <li>● YES</li> <li>● NO</li> </ul>

Name	Type	Description
common	character varying(3)	Not supported. Its value is <b>NULL</b> .
inherited	character varying(3)	Not supported. Its value is <b>NULL</b> .

### 12.3.43 ADM\_TAB\_COL\_STATISTICS

ADM\_TAB\_COL\_STATISTICS displays column statistics and histogram information extracted from ADM\_TAB\_COLUMNS. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in both PG\_CATALOG and SYS schema. The values of the **LOW\_VALUE** and **HIGH\_VALUE** columns in this view are different from those in database A due to different underlying table structures. When the value of **LOW\_VALUE** is a high-frequency value, the value of **LOW\_VALUE** in GaussDB is the second smallest value. When **HIGH\_VALUE** is a high-frequency value, **HIGH\_VALUE** of GaussDB is the second highest value. The value of the **HISTOGRAM** column is different from that of database A due to different statistical methods. GaussDB supports only two types of histograms: frequency and equi-width. The value of the **SCOPE** column in GaussDB is different from that in database A because GaussDB does not support global temporary table statistics. GaussDB database supports only local temporary table statistics, and the default value is **SHARED**.

**Table 12-149** ADM\_TAB\_COL\_STATISTICS columns

Name	Type	Description
owner	character varying(128)	Table owner.
table_name	character varying(128)	Table name.
column_name	character varying(128)	Column name.
num_distinct	numeric	Number of different values in a column.
low_value	raw	Low value in a column.
high_value	raw	High value in a column.

Name	Type	Description
density	numeric	<ul style="list-style-type: none"> <li>• If there is a histogram on <b>COLUMN_NAME</b>, this column displays the selectivity of values in the histogram that span less than two endpoints. It does not represent the selectivity of values that span two or more endpoints.</li> <li>• If no histogram is available on <b>COLUMN_NAME</b>, the value of this column is <b>1/NUM_DISTINCT</b>.</li> </ul>
num_nulls	numeric	Number of empty values in a column.
num_buckets	numeric	Number of buckets in the histogram of a column.
sample_size	numeric	Sample size used to analyze a column.
last_analyzed	timestamp(0) without time zone	Date when a column was last analyzed. After the database is restarted, data loss will occur.
global_stats	character varying(3)	Not supported. Its value is <b>NULL</b> .
user_stats	character varying(3)	Not supported. Its value is <b>NULL</b> .
notes	character varying(99)	Not supported. Its value is <b>NULL</b> .
avg_col_len	numeric	Average length of a column, in bytes.
histogram	character varying(15)	Specifies whether the histogram exists and the type of the histogram. <ul style="list-style-type: none"> <li>• <b>NONE</b>: no histogram.</li> <li>• <b>FREQUENCY</b>: frequency histogram.</li> <li>• <b>EQUI-WIDTH</b>: equal-width histogram.</li> </ul>

Name	Type	Description
scope	character varying(7)	For statistics collected on any table other than global temporary tables, the value is <b>SHARED</b> (indicating that the statistics are shared among all sessions).
schema	character varying(64)	Name of the namespace to which the column belongs.

### 12.3.44 ADM\_TAB\_COLS

ADM\_TAB\_COLS displays information about table and view columns. Each column of each table and view in the database has a row of data in ADM\_TAB\_COLS. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in both PG\_CATALOG and SYS schema. The number of rows displayed in this view is the same as that in the ADM\_TAB\_COLUMNS view. Only columns are different.

**Table 12-150** ADM\_TAB\_COLS columns

Name	Type	Description
owner	character varying(64)	Owner of a table or view.
table_name	character varying(128)	Name of the table or view.
column_name	character varying(128)	Column name.
data_type	character varying(128)	Data type of a column, which can be a user-defined data type.
data_type_mod	character varying(3)	Not supported. Its value is <b>NULL</b> .
data_type_owner	character varying(128)	Owner of the data type of a column.
data_length	numeric	Length of a column, in bytes.
data_precision	numeric	Precision of a data type. This column is valid for the numeric data type and <b>NULL</b> for other data types.

Name	Type	Description
data_scale	numeric	Number of decimal places. This column is valid for the numeric data type and is set to <b>0</b> for other data types.
nullable	character varying(1)	Specifies whether a column can be empty ( <b>n</b> for the primary key constraint and non-null constraint).
column_id	numeric	Sequence number of a column when a table is created.
default_length	numeric	Length of the default value of a column, in bytes.
data_default	text	Default value of a column.
num_distinct	numeric	Number of different values in a column.
low_value	raw	Minimum value in a column.
high_value	raw	Maximum value in a column.
density	numeric	Column density.
num_nulls	numeric	Number of empty values in a column.
num_buckets	numeric	Number of buckets in the histogram of a column.
last_analyzed	timestamp(0) without time zone	Last analysis date.
sample_size	numeric	Sample size used to analyze a column.
character_set_name	character varying(44)	Not supported. Its value is <b>NULL</b> .
char_col_decl_length	numeric	Declaration length of a column of the character type.
global_stats	character varying(3)	Not supported. Its value is <b>NO</b> .
user_stats	character varying(3)	Not supported. Its value is <b>NO</b> .
avg_col_len	numeric	Average length of a column, in bytes.

Name	Type	Description
char_length	numeric	Column length (in bytes) which is valid only for the varchar, nvarchar2, bpchar, and char types.
char_used	character varying(1)	Not supported. Set it to <b>B</b> if the data type is varchar, nvarchar2, bpchar, or char, and to <b>NULL</b> for other data types.
v80_fmt_image	character varying(3)	Not supported. Its value is <b>NULL</b> .
data_upgraded	character varying(3)	Not supported. Its value is <b>YES</b> .
hidden_column	character varying(3)	Not supported. Its value is <b>NULL</b> .
virtual_column	character varying	Specifies whether a column is a virtual column (a generated column). <b>YES</b> <b>NO</b>
segment_column_id	numeric	Not supported. Its value is <b>NULL</b> .
internal_column_id	numeric	Internal sequence number of a column. The value is the same as that of <b>COLUMN_ID</b> .
histogram	character varying(15)	Histogram type: <ul style="list-style-type: none"> <li>• <b>NONE</b>: no histogram.</li> <li>• <b>FREQUENCY</b>: frequency histogram.</li> <li>• <b>EQUI_WIDTH</b>: equal-width histogram.</li> </ul>
qualified_col_name	character varying(64)	Qualified column name, which is the same as <b>COLUMN_NAME</b> .
user_generated	character varying(3)	Not supported. Its value is <b>YES</b> .
default_on_null	character varying(3)	Not supported. Its value is <b>NULL</b> .
identity_column	character varying(3)	Not supported. Its value is <b>NULL</b> .

Name	Type	Description
sensitive_column	character varying(3)	Not supported. Its value is <b>NULL</b> .
evaluation_edition	character varying(128)	Not supported. Its value is <b>NULL</b> .
unusable_before	character varying(128)	Not supported. Its value is <b>NULL</b> .
unusable_beginning	character varying(128)	Not supported. Its value is <b>NULL</b> .
collation	character varying(100)	Collation rule of a column. This column conflicts with reserved keywords. Therefore, add the view name when calling this column.
collated_column_id	numeric	Not supported. Its value is <b>NULL</b> .
schema	character varying(64)	Name of the namespace to which the column belongs.

### 12.3.45 ADM\_TAB\_HISTOGRAMS

ADM\_TAB\_HISTOGRAMS displays the histogram information about all tables and views in the database. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in both PG\_CATALOG and SYS schema.

**Table 12-151** ADM\_TAB\_HISTOGRAMS columns

Name	Type	Description
owner	character varying(128)	Table owner.
table_name	character varying(128)	Table name.
column_name	character varying(4000)	Column name.
endpoint_number	numeric	Bucket ID of the histogram
endpoint_value	numeric	Not supported. Its value is <b>NULL</b> .
endpoint_actual_value	character varying(4000)	Actual value of the bucket endpoint
endpoint_actual_value_raw	raw	Not supported. Its value is <b>NULL</b> .

Name	Type	Description
endpoint_repeat_count	numeric	Not supported. Its value is <b>NULL</b> .
scope	character varying(7)	Not supported. Its value is <b>SHARED</b> .

## 12.3.46 ADM\_TAB\_PRIVS

ADM\_TAB\_PRIVS displays authorization information about all objects in the database. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in both PG\_CATALOG and SYS schema.

**Table 12-152** ADM\_TAB\_PRIVS columns

Name	Type	Description
grantee	character varying(128)	Name of the user or role to which the permission is granted.
owner	character varying(128)	Object owner.
table_name	character varying(128)	Object name.
grantor	character varying(128)	Name of the user who grants the permission.
privilege	character varying(40)	Permissions on an object, including USAGE, UPDATE, DELETE, INSERT, CONNECT, SELECT, and EXECUTE.
grantable	character varying(3)	Specifies whether the grant contains the <b>GRANT</b> option. <ul style="list-style-type: none"> <li>• <b>YES</b></li> <li>• <b>NO</b></li> </ul>

Name	Type	Description
type	character varying(24)	Object types, including NODE GROUP, COLUMN_ENCRYPTION_KEY, PACKAGE, COLUMN, TABLE, VIEW, SEQUENCE, TYPE, INDEX, DATABASE, DIRECTORY, FOREIGN DATA WRAPPER, FOREIGN SERVER, LANGUAGE, LARGE OBJECT, SCHEMA, TEMPLATE, FUNCTION, PROCEDURE, and TABLESPACE.
hierarchy	character varying(3)	Not supported. Its value is <b>NULL</b> .
common	character varying(3)	Not supported. Its value is <b>NULL</b> .
inherited	character varying(3)	Not supported. Its value is <b>NULL</b> .

### 12.3.47 ADM\_TAB\_STATISTICS

ADM\_TAB\_STATISTICS displays optimizer statistics for all tables in the database. This view exists in both PG\_CATALOG and SYS schema. By default, only the system administrator can access this view. Common users can access the view only after being authorized.

**Table 12-153** ADM\_TAB\_STATISTICS columns

Name	Type	Description
owner	character varying(128)	Object owner.
table_name	character varying(128)	Table name.
partition_name	character varying(128)	Not supported. Its value is <b>NULL</b> .
partition_position	numeric	Not supported. Its value is <b>NULL</b> .
subpartition_name	character varying(128)	Not supported. Its value is <b>NULL</b> .
subpartition_position	numeric	Not supported. Its value is <b>NULL</b> .

Name	Type	Description
object_type	character varying(12)	Object type. <ul style="list-style-type: none"> <li>• TABLE</li> <li>• PARTITION</li> <li>• SUBPARTITION</li> </ul>
num_rows	numeric	Number of rows in an object
blocks	numeric	Not supported. Its value is <b>NULL</b> .
empty_blocks	numeric	Not supported. Its value is <b>NULL</b> .
avg_space	numeric	Not supported. Its value is <b>NULL</b> .
chain_cnt	numeric	Not supported. Its value is <b>NULL</b> .
avg_row_len	numeric	Average row length, including the row overhead
avg_space_freelist_blocks	numeric	Not supported. Its value is <b>NULL</b> .
num_freelist_blocks	numeric	Not supported. Its value is <b>NULL</b> .
avg_cached_blocks	numeric	Not supported. Its value is <b>NULL</b> .
avg_cache_hit_ratio	numeric	Not supported. Its value is <b>NULL</b> .
im_imcu_count	numeric	Not supported. Its value is <b>NULL</b> .
im_block_count	numeric	Not supported. Its value is <b>NULL</b> .
im_stat_update_time	timestamp(9) without time zone	Not supported. Its value is <b>NULL</b> .
scan_rate	numeric	Not supported. Its value is <b>NULL</b> .
sample_size	numeric	Number of samples used for analyzing a table
last_analyzed	timestamp with time zone	Date when a table was last analyzed Database restart is not supported. Otherwise, data loss will occur.
global_stats	character varying(3)	Not supported. Its value is <b>NULL</b> .
user_stats	character varying(3)	Not supported. Its value is <b>NULL</b> .
stattype_locked	character varying(5)	Not supported. Its value is <b>NULL</b> .

Name	Type	Description
stale_stats	character varying(7)	Not supported. Its value is <b>NULL</b> .
notes	character varying(25)	Not supported. Its value is <b>NULL</b> .
scope	character varying(7)	Not supported. The default value is <b>SHARED</b> .

### 12.3.48 ADM\_TAB\_STATS\_HISTORY

ADM\_TAB\_STATS\_HISTORY provides historical statistics about all tables in the database. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in both PG\_CATALOG and SYS schema.

**Table 12-154** ADM\_TAB\_STATS\_HISTORY columns

Name	Type	Description
owner	character varying(128)	Object owner
table_name	character varying(128)	Table name.
partition_name	character varying(128)	Not supported. Its value is <b>NULL</b> .
subpartition_name	character varying(128)	Not supported. Its value is <b>NULL</b> .
stats_update_time	timestamp(6) with time zone	Time when statistics are updated. Database restart is not supported. Otherwise, data loss will occur.

### 12.3.49 ADM\_TAB\_SUBPARTITIONS

ADM\_TAB\_SUBPARTITIONS stores information about all level-2 partitions in the database. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in both PG\_CATALOG and SYS schema.

**Table 12-155** ADM\_TAB\_SUBPARTITIONS columns

Name	Type	Description
table_owner	character varying(64)	Table owner.

Name	Type	Description
table_name	character varying(64)	Relational table name.
partition_name	character varying(64)	Partition name.
subpartition_name	character varying(64)	Name of a level-2 partition.
